Some time ago I noticed that a deputation waited on you with reference to a bridge to the North Shore. Having given some attention to the subject, I may state that I have formulated a plan by which I can show that a bridge can be constructed from Fort Macquarie to the North Shore for less than £250,000 clear of the approaches—that is, if the span does not exceed 1,500 feet, and the prices of the proposed material (steel) does not exceed £12 per ton, f.o.b. in London. On seeing the prices I have named, and knowing the prices you had arranged to give, you will no doubt consider that the structure must be a very flimsy one to be constructed for the sum I have named, the structure would be a most substantial one which will require over 9,000 tons of steel to construct. The difference

difference in cost arises from the different mode of construction. The plan I propose to carry out this work is a bold one, but the plan I propose will admit the work to be carried out with absolute safety. The plan is an entirely new one and novel in character, and has not, to my knowledge, ever been adopted in a bridge or other construction. Now if you will inform me the amount of commission you will award me in the event of my mode of construction being adopted and carried out, I am prepared to detail to you the plan I propose to be adopted in carrying out this work. I may state that the bridge is constructed of eight girders 26·8 deep and $\frac{1}{4}$ inch thick, and has three roadways, one for the railway and two for the ordinary road traffic, each road 20 feet wide; the bridge would be 70 feet wide outside; the footways are on the top of the bridge; these footways are utilised to strengthen the bridge. If my figures are correct the bridge has a surplus strength of over 700 tons beyond the limit of engineers limit of safety; but, of course, I cannot vouch for these figures as I am only a novice in these matters, your officers would soon test them and make the specifications to their requirements this being only a matter of detail.

I am, &c.,

R. J. HARDY.

No. 7.

Mr. A. R. Perry to The Colonial Secretary.

Sir,

28, John-street, Woollahra, Sydney, 7 March, 1889.

I had the honor some seven years ago, to submit to the then Government, plans for the erection of a high level bridge connecting Dawes' Point with the North Shore. The proposal was to carry the roadway on a single arch of 1,550 foot-span, composed of seven parallel steel ribs and two diagonal ribs. The height above high-water mark at crown to be 150 feet, and the width of the roadway sufficient for two lines of railway, carriage way, and foot pavements. The cost was estimated at under one million sterling, and the time of erection three years.

I should be happy to submit these plans again, or prepare fresh ones, should sufficient encouragement be offered, and would also undertake to carry out the work, and to complete it within the time and at the cost specified.

I have, &c.,

ALEX. R. PERRY, C.E.

No. 8.

Mr. S. Pollitzer to The Secretary for Public Works.

Plan of Bridge to North Shore.

Sir,

Sydney, 17 October, 1889.

By the morning papers I notice that you are going to examine the merits of the various schemes submitted for the erection of the North Shore bridge. This is the reason that I have the honor of forwarding my design, which I had submitted to the hon. Sir Henry Parkes two years ago, but, owing to his having come to no decision, I withdrew it quite recently.

The prominent features of my design are the following:—Being a suspension bridge the central span is 700 feet and the two side spans 350 feet each; the clear headway for ships to pass underneath it is 160 feet from H.W.S.T. for underline of girders; the structure is proposed from Dawes' to Milson's Points on the Sydney side the approaches would meet the surface at about Argyle Cut in Princes-street.

The bridge is calculated to carry on one platform a railway in the centre, adjoining on either side ordinary vehicular traffic, and adjoining to these footpaths for pedestrians. Except the land abutments the whole bridge is of steel and iron, and the more important details are of gun-metal, the estimates, carefully prepared, amount to £366,000 sterling.

Eventually, I am prepared to carry out this bridge with the assistance of a Company, in case your Government would be prepared to give a consideration in the shape of a guarantee of $4\frac{1}{2}$ per cent. on the invested capital.

I have, &c.,

S. POLLITZER.

No. 9.

The Council Clerk, St. Leonards, to The Colonial Secretary.

Sir,

Borough of St. Leonards, Council Chambers, 5 March, 1890.

I have the honor, by direction of His Worship the Mayor, to inform you that at a meeting of this Council, held last evening, a resolution was unanimously carried affirming the desirability of proceeding with the erection of a high-level bridge to connect the northern end of Sydney with St. Leonards, of a sufficient height to allow the largest vessels to pass under it.

I have therefore to request that, in view of the importance of the undertaking to the City of Sydney, as well as to the populous and rapidly increasing district this side of the harbour, that you will cause the necessary steps to be taken to secure the fulfilment of the object desired.

I have, &c.,

W. BARNETT SMITH,
Council Clerk.

1890.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

BRIDGES OVER MIHI AND DANGAR CREEKS.

(REPORTS, &c., RESPECTING ERECTION OF.)

Ordered by the Legislative Assembly to be printed, 22 October, 1890.

SCHEDULE.

NO.	PAGE.
1. H. Copeland, Esq., M.P., to the Commissioner for Roads and Bridges, urging the erection of a bridge over Mihi Creek; reports and minutes thereon. 31 January, 1890	1
2. J. Inglis, Esq., M.P., to the Secretary for Public Works (Mr. Bruce Smith), forwarding an extract from the <i>Armistale Chronicle</i> , urging the erection of bridges over Dangar, Mihi, and Grocer's Creeks; report and minutes thereon. 5 March, 1890.....	2
3. Under Secretary for Public Works to J. Inglis, Esq., M.P., informing him that a report had been called for, as asked in his letter of 5th March (Telegram). 8 March, 1890	3
4. Under Secretary for Public Works to the Under Secretary for Finance and Trade <i>re</i> provision from Advance Account for bridges over Dangar and Mihi Creeks. 25 March, 1890	3
5. Under Secretary for Public Works to J. Inglis, Esq., M.P., informing him that Minister had approved of erection of bridges over Dangar and Mihi Creeks. 25 March, 1890	3
6. Mr. W. C. McCrossin to the Secretary for Public Works urging the erection of a bridge at Mihi Creek, and minutes thereon. 4 April, 1890	3
7. Under Secretary for Public Works to H. Copeland, Esq., M.P., informing him of action taken. 3 May, 1890 ...	4
8. Under Secretary for Public Works to J. Inglis, Esq., M.P., informing him of action taken. 3 May, 1890	4
9. Mr. S. A. Donnelly to the Commissioner for Roads and Bridges, forwarding section for a bridge over Mihi Creek. 3 June, 1890	4
10. H. Copeland, Esq., M.P., to the Under Secretary for Public Works, forwarding an extract from the <i>Armistale Chronicle</i> , urging the erection of bridges over Mihi and Dangar's Creeks. 20 June, 1890.....	4
11. Under Secretary for Public Works to H. Copeland, Esq., M.P., informing him of action taken. 21 June, 1890 ..	5
12. Mr. S. A. Donnelly to the Commissioner for Roads and Bridges <i>re</i> means of providing funds for the extra cost involved by the erection of a truss bridge over Mihi Creek, and minutes thereon. 23 June, 1890	5
13. Mr. S. A. Donnelly to the Engineer for Bridges <i>re</i> the site of the proposed bridge over Mihi Creek, and minutes thereon. 10 July, 1890	5
14. Mr. S. A. Donnelly, forwarding section of the proposed bridge over Dangar's Creek, and minutes thereon. 10 July, 1890	6
15. Engineer-in-Chief for Roads and Bridges instructing Mr. A. W. Stilwell (Assistant Engineer) to report <i>re</i> estimates for bridges over Mihi and Dangar's Creeks. 6 September, 1890	7
16. Report of Mr. A. W. Stilwell to Engineer-in-Chief for Roads and Bridges <i>re</i> estimates for bridges over Mihi and Dangar's Creek. 13 September, 1890	7
17. <i>Précis</i> of action <i>re</i> bridges over Mihi and Dangar's Creeks, and Minister's minute thereon. 25 September, 1890 ..	7
18. Under Secretary for Public Works to H. Copeland, Esq., M.P., conveying Minister's decision. 29 September, 1890	8
19. Under Secretary for Public Works to J. Inglis, Esq., M.P., conveying Minister's decision. 29 September, 1890 ..	8
20. Memorandum of J. Inglis, Esq., M.P., urging reconsideration of decision, and minutes thereon. 1 October, 1890 ..	8
21. H. Copeland, Esq., M.P., to the Under Secretary for Public Works, complaining that his letters had not been answered. 4 October, 1890	8
22. Under Secretary for Public Works to H. Copeland, Esq., M.P., in answer to his communication of 4th October. 20 October, 1890	9

No. 1.

II. Copeland, Esq., M.P., to The Commissioner for Roads and Bridges.

Sir,

Legislative Assembly, 31 January, 1890.

I desire to point out to you that there is a great necessity for a bridge over the Mihi Creek, on the road Uralla to Melrose. At the latter place there is a great development of mining, causing a very large amount of traffic on the road. It is estimated there are 400 people there at present, and large numbers of houses are being erected, and much machinery is likely to be required. In addition to this I am informed that the people on seventeen selections and two sheep and cattle stations require to cross the creek, which, however, is frequently uncrossable. Only a few days the mail coach was delayed six hours waiting for the creek to become crossable, and when next winter comes on I am afraid very great inconvenience and delay will result to the people of Melrose and district unless a bridge is built in the meantime.

I may say that no great expenditure is needed, as probably £200 will be sufficient for all requirements.

I have, &c.,

HENRY COPELAND.

Mr. Donnelly,—For report.—J.B., 31/1/88. Report herewith.—S.A.D., 3/2/90. The Commissioner.

Report upon the application of Mr. Copeland, M.P., for erection of bridge over Mihi Creek, upon road Uralla to Melrose.

THE direct road from Uralla to Melrose gold-field crosses Mihi Creek, nearly midway between those places. There is much traffic upon the road, and a population of 467 persons are located upon the field, besides there is much good land in the neighbourhood, capable of supporting a comparatively large population (agricultural), which, I may state, are being attracted to the vicinity of the local market which the gold-field is establishing. Uralla is the nearest outlet, as well as practically, if not in reality, being the nearest point of the railway.

I am of opinion £400 will be required to erect a suitable bridge here, a section has not been taken, but knowing the creek at the point in question flows over a bed somewhat that in its cross section it is evident that more than £200 will be required to bridge such a flood of water as would stop the mail coach at such a place. Still I am of opinion the larger sum (£400) would be well expended in erecting a bridge at such place, and would recommend such amount be granted, if possible, as Mr. Copeland suggests, so as to have the bridge ready by incoming winter. A section may be made, if approved.

S. A. DONNELLY,

The Commissioner for Roads.

Superintendent of Roads, 3/1/90.

Subject :—Urging erection of bridge over the Mihi Creek, road Uralla to Melrose.

THE local officer reports that the road from Uralla to Melrose gold-field crosses the Mihi Creek about midway. There is considerable traffic on the road and a population of nearly 500 is located on the field, and the adjacent country is capable of supporting a comparatively large agricultural population also. Uralla is the nearest outlet, as well as being the nearest point of the railway.

He recommends the erection of this bridge, which he estimates to cost £400.

Commissioner.

P.H.F.

Mr. Stilwell for report.—R.H., 11/2/90.

This creek offers a serious obstruction to traffic, and a bridge would, in flood times, serve not only the Uralla traffic, but that from Armidale to Melrose also. It should, I think, be provided for, and with that view I will have section made.—A.W.S., 27/3/90. Commissioner for Roads.

Submitted.—P.H.F., 1/4/90. Resubmit with section and estimate.—R.H., 2/4/90. Mr. McDonald.—J.B., 9/4/90. £400 approved from Advance Account, for bridge Mihi Creek, on papers 90-1800.—U.S., 10/4/90. Wire sent for section. Resubmit on receipt.—J.A.McD., 15/4/90. Chief draftsman.

No. 2.

J. Inglis, Esq., M.P., to The Secretary for Public Works.

Dear Sir,

Uralla, 5 March, 1890.

Please read enclosed cutting from *Armidale Chronicle*, to-day's issue. Do send for a report on this Enmore road at once. There is now a very large population there and the creeks are simply awful. The want of bridges is retarding the development of the mines, and jeopardising every interest in the place. Already the revenue derived from the mines must have been very large, and the place is fast becoming quite a large town. I go there to speak on Friday, and I dread the journey, even with a light buggy. On public grounds alone, I ask your very speedy attention to these crying wants, and hope to have a favourable reply addressed to Armidale, as I will be there till Tuesday next. The most urgently required help is *bridge over Dangar's Creek*, *bridge over Mihi Creek at Mihi Station*, and *bridge over Dangar's Creek at Gostwyck Station*, also *bridge over Grocer's Creek*. Please consider this matter *urgent*, and favour with reply.

Yours truly,

JAS. INGLIS.

Inform Mr. Inglis that we have wired for a report. Mr. Hickson,—the Minister would like you to get a report on this subject at once. Please wire to-day.—J.B., 7/3/90. Wire sent for report, 8/3/90. Reply attached, 12/3/90.

[Enclosure.]

THE ENMORE ROAD.

NOTWITHSTANDING the vast importance Enmore is now assuming as a mining centre, the roads are almost in an impassable state, and the creeks during the recent floods were quite impracticable. During the winter no vehicle will be able to reach the field; the roads have been so fearfully cut up that a very little rain turns them into a bog. It would take a great deal of money to make the roads themselves any way decent, but something should certainly be done to the creeks, even if the roads were left untouched. To make the road from Armidale to Enmore practicable in flood time there should be a bridge over Dangar's Creek and another over Mihi Creek, at the Mihi Station. To keep Uralla in communication with Enmore there should be a bridge over Dangar's Creek, at Gostwyck Station. Both Armidale and Uralla, in flood time, could use the same crossing over Mihi Creek, though this would make the road about 2 miles longer from Armidale. There could also be an inexpensive bridge put over Grocer's Creek, which both Armidale and Uralla travellers have to cross. The cost of these would not be much, and at least traffic on horseback would not be suspended. Some very narrow escapes were made last week in crossing Dangar's and Mihi Creeks; and at the end of the week, though Mihi Creek could be crossed at great risk, Dangar's Creek must have been 10 feet deep in the middle, and travellers from Enmore to Armidale had to go round by Salisbury, a distance of over 50 miles instead of 30. It is necessary that this matter should be looked to without delay. [Since writing the above poor Marthny has met his death in trying to cross the Beady, 2½ miles from Glen Innes. Why cannot the Government at least erect posts at the creeks liable to be swollen, showing whether there is danger or not in crossing?]

Telegram from Mr. Road Superintendent Donnelly to The Commissioner for Roads.

TELEGRAM, re Mr. Inglis proposed bridges, Enmore road, delayed. Interruption to wire. Bridge cost £500. Very urgent, Dangar's Creek. Also Mihi Creek. £400 already recommended on Mr. Copeland's application 31st January last. Dangar's Creek, Gostwyck, £500. Not very urgent; good ford. Grocer's Creek, £250; desirable; not very urgent. Total, £1,650. All desirable, if funds permit. Have already, 26th ultimo. Urged £163 for Melrose-street; not less; urgent work. All these proposed bridges on roads leading to that place.

S. A. DONNELLY,

Road Superintendent.

Subject :—

3

Subject:—Urging necessity of erection of bridges on Enmore road, viz., over Dangar's Creek; over Mihi Creek, at Mihi Station; over Dangar's Creek, at Gostwyck Station; and over Grocer's Creek. The local officer reports by wire, that cost of bridge over Dangar's Creek would be £500, and is very urgently required.

That bridge over Mihi Creek is also urgently required. Cost, £400. Recommended on application of Mr. Copland, 31st January last.

That bridge over Dangar's Creek at Gostwyck Station would cost £500, but is not very urgently required, there being a good ford.

That bridge over Grocer's Creek, would cost £250, is desirable, but not very urgent.

The total cost would be £1,650. All the bridges are desirable, if funds permit. He also states that on the 26th February he recommended a grant as urgent of £163 for Melrose-street, a not less necessary work. All the proposed bridges are on roads leading to Melrose.

Two of these bridges, costing £400 and £500 are reported as very urgent. Two others, costing £500 and £250, desirable, but not very urgent. There are no funds available.—R.H., Under Sec., 15/3/90. Submitted.—J.B., 18/3/90. First two bridges can be carried out, and Treasury asked to pay from Advance Account.—W.M., 24/3/90. Inform then to Mr. Hickson.—J.B., 24/3/90.

No. 3.

Telegram from The Under Secretary for Public Works to J. N. Inglis, Esq., M.P.

8 March, 1890.

Your letter received *re* state of Enmore road. Minister has called for immediate report upon the matter.

No. 4.

The Under Secretary for Public Works to The Under Secretary for Finance and Trade.

Sir,

25 March, 1890.

I am directed to request that you will have the goodness to move the Honorable the Colonial Treasurer to cause to be charged against the Advance Account the sums of £500 and £400 for the erection of bridges over Dangar and Mihi Creeks respectively, on the Enmore road.

I have, &c.,
J. BURLING,
Under Secretary.

No. 5.

The Under Secretary for Public Works to J. Inglis, Esq., M.P.

Sir,

25 March, 1890.

In reply to your letter of the 5th instant, urging the erection of certain bridges on the Enmore road, I am directed to inform you that the Secretary for Public Works has approved of the erection of bridges over Dangar and Mihi Creeks, on the road in question.

I have, &c.,
J. BURLING,
Under Secretary.

No. 6.

Mr. W. C. M'Crossan to The Secretary for Public Works.

Sir,

Melrose, via Uralla, 4 April, 1890.

We have been instructed by the local Progress Committee to communicate with you *re* the necessity of a bridge at Mihi Creek, road Uralla to Melrose. We most respectfully request that you will grant this, as it is needless to say it is urgently required. During the late rains teams loaded with provisions were frequently delayed, and it has greatly interfered with mail communication.

Trusting you will give this matter your early and favourable consideration.

We have, &c.,

Chairman,
W. C. M'CROSSAN,
Secretary.
(On behalf Melrose Progress Committee).

Roads, for report.—J.B., B.C., 14/4/90. Papers.—U.S., 17/4/90. Papers now herewith.—A.S., 25/4/90. Mr. M'Donald.—P.H.F. (*per* U.S.), 29/4/90. £400 approved from Advance Account. Might be informed that local officer has been instructed to send in sections when to hand. Drawings will at once be put in hand.—P.A. (*pro*. Under Secretary), 1/5/90. Inform.—J.B., 2/5/90. The question of funds for this and an other bridge has been raised on papers 90-1800. Resubmit when they are returned from P.U.S.—P.H.F. (*per* U.S.), 6/5/90. 90-1800 now returned.—U.S., 12/5/90.

No. 7.

No. 7.

The Under Secretary for Public Works to H. Copeland, Esq., M.P.

Sir,

3 May, 1890.

Referring to a letter which has been received from the Melrose Progress Committee, urging the erection of a bridge over Mihi Creek on the road Uralla to Melrose, I am directed to inform you that the local roads' officer has been instructed to submit sections, and when these shall have been received, the necessary drawings will be at once put in hand.

I have, &c.,
J. BARLING,
Under Secretary.

No. 8.

The Under Secretary for Public Works to J. Inglis, Esq., M.P.

Sir,

3 May, 1890.

Referring to a letter which has been received from the Melrose Progress Committee, urging the erection of a bridge over the Mihi Creek on the road Uralla to Melrose, I am directed to inform you that the local roads' officer has been instructed to submit sections, and when these shall have been received the necessary drawings will be at once put in hand.

J. BARLING.

No. 9.

Mr. Road-Superintendent Donnelly to The Commissioner and Engineer-in-Chief for Roads and Bridges.

Forwarding section for bridge over Mihi Creek, Uralla to Melrose Road.

3 June, 1890.

UNDER another cover I forward the above. The site is upon reserve No. 36, parish of Lawrence, county of Sandon. Rocks show themselves in various parts of the bottom, showing it unlikely that piles can be driven. As trial holes cannot be conveniently sunk at present, none have been attempted, it being thought time to do so when sketch* of design is sent as hitherto. Not much drift timber comes down; the bed of creek has but a very moderate fall, about 1 in 100. The soil is granitic. There is no timber at the site; no old bridge.

S. A. DONNELLY,
Superintendent of Roads.

Mr. Stilwell.

Section forwarded.—A.W.S., 12/6/90. Commissioner and Engineer-in-Chief for Roads and Bridges. Mr. Donnelly reports that rock is from 2½ feet to 3½ feet from surface right across the channel on line sectioned.—A.W.S., 21/7/90. Commissioner and Engineer-in-Chief for Roads and Bridges. Mr. M'Donald.—P.H.F., 24/7/90.

No. 10.

H. Copeland, Esq., M.P., to The Under Secretary for Public Works.

Bridges at Enmore road (Armidale), Dangar's Creek, and Mihi Creek.

Dear Mr. Barling,—

20 June, 1890.

Will you kindly bring attached leader under the notice of the Minister, and ask him when he expects to expiate his officers, should any of these "narrow escapes" culminate in loss of life. I wrote you some months ago with reference to this matter, pointing out the importance of the place, and the urgent necessity of keeping communications open, but, although some five or six months have elapsed, I have had no intimation that anything was being done.

I may mention that Enmore and Melrose are one and the same. A bridge over Dangar's Creek is required for several squatters, as well as the large number of miners located at Melrose.

Yours, &c.,
HENRY COPELAND.

Will Mr. Hickson please expedite.—J.B., 21/6/90. Very urgent. Mihi Creek—design sent for report (90-5,076); Dangar's Creek—section not received. Hurry this work up. Inform Under Secretary of action taken.—R.H., 28/6/90. Mr. M'Donald. Wire sent to expedite section of Dangar's Creek, Enmore road.—P.A., 1/7/90. Will Mr. Donnelly please say when report and section will be received.—P.H.F., 8/7/90. Section herewith and report.—S.A.D., 10/7/90.

[Enclosure.]

EXTRACT from the *Armidale Chronicle*, 18th June, 1890.
THE ENMORE ROAD.

THE Enmore road is in a terrible state, and the last 10 miles are almost impassable for vehicles. This is nothing, however, compared with the dangers and difficulties caused by the swollen creeks in flood time. Last week two gentlemen and a lady had to camp for seventeen hours on the Armidale side of Dangar's Creek during the pouring rain, and several other parties were camped on either side waiting for the waters to subside. When they did cross it was at some personal risk. On Saturday again the creeks were very high, and a party returning to Armidale had to wait for twelve hours in one of the Gostwyck huts, and then cross at Dangar's crossing, and make their way round by Uralla. One day last week, a man and his wife attempted to pass over Dangar's crossing in a spring cart, and were very nearly drowned. Had it not been for the courage and energy of some of the station men, who took them off in a boat, they would almost certainly have been drowned. The men released the man and his wife at great peril to themselves, and rescued the horse, and took the luggage out of the trap, being for several hours up to the neck in water. The trap had to be tied to a log till the water went down. All this is very unsatisfactory, considering what a large income the Crown derives from the Lumore field. As we have mentioned before, three bridges are absolutely necessary—one over Dangar's crossing, and another over Mihi Creek at the station to suit Uralla, and another over Dangar's Creek on the Armidale road. Then there would always be communication with Enmore, both from Armidale and Uralla, for Armidale could use the same crossing as Uralla over Mihi Creek. There is a great deal of traffic now on both roads, and it is wonderful that no lives have yet been lost; very narrow escapes there have certainly been.

No. 11.

No. 11.

The Under Secretary for Public Works to H. Copeland, Esq., M.P.

Dear Mr. Copeland,

Department of Public Works, Sydney, 21 June, 1890.

With reference to your letter of yesterday respecting the three bridges required on the Enmore road, I find the following are the facts of the case:—

Mihi Creek Bridge:—The design of the bridge has been prepared, and will be sent to the local officer for revision on Monday,

Dangar's Creek Bridge:—Section not yet to hand, but the local officer has been wired to, asking him to forward it.

Dangar's Creek Bridge at Gostwyck:—It is reported this is not a very urgent work, as there is a good ford.

With regard to the first two bridges we shall do our best to get them put in hand at once. The Minister, knowing the importance of the matter, has already arranged for the necessary funds:

Yours, &c.,

J. BARLING.

No. 12.

Mr. Road Superintendent Donnelly to The Commissioner for Roads and Bridges.

Subject:—Respecting the means of providing necessary funds to meet increase of cost between £400 for beam bridge, and that of truss bridge for Mihi Creek, at intersection of road Uralla to Enmore and Melrose.

Upon referring to the letter of Mr. Copeland, M.P., of 31st January, 1890, No. 90-1,909 attached, it will be seen that that gentleman asks that £200, to erect a bridge at the place referred to, and intimating that the flood of water had stopped the coach thereat. In my report, which will be seen was written from recollections of a former visit—the only one previously made. It is stated that the flood which could stop the coach at such a place could not be bridged under £400, but intimating no section had been made, but that such would be done if so instructed. Hence could I then tell with precision the cost of truss bridge, or even if a truss was required at all at the place until the depth to the bed rock was ascertained and the quantity and length of drift timber which the floods bring down were indicated.

As the ford has almost sufficed during the last six months of unprecedented rain, and as there are reasons to hope finer weather is at hand, and also as signs are not wanting to show the prosperity of Melrose Gold-field is not assured as yet, this proposed bridge might, I think, without seriously inconveniencing the public, stand over until 1891.

I may add I did not think a truss bridge would be required until after the depth to the rock was ascertained; a beam bridge was in view, and I do not think so bad an estimate—of £400 for same before the section was taken, when the official estimate, made afterwards, is but £450.

S. A. DONNELLY,

P.S.—This is upon one of the roads recently transferred to Mr. Scarborough, and just at the point—17 miles from Armidale—where one of my roads end. It is distant about 25 miles from Walcha.—S.A.D.

£400 is granted for this bridge. The cost of truss bridge and approaches would be (say) £650. The work is not regarded as urgent this year, but if not now proceeded with the Members for the district will make an outcry; so, if possible, £250 additional should be allotted, and the work proceeded with.—A.W.S., 16/8/90. Commissioner and Engineer-in-Chief for Roads and Bridges.

Telegram from The Engineer for Bridges to Mr. Assistant Engineer Stilwell, Tamworth.

Sydney.

PLEASE instruct Mr. Donnelly to at once take section and forward plan and report for Dangar's Creek, on Enmore road. Very urgent.

PERCY ALLAN,

(*Pro* Engineer for Bridges.)

I have wired Mr. Donnelly for this section; will he please send it in with report attached to this paper early as possible.—A.W.S., 2/7/90. Mr. Donnelly, B.C. The section was sent a few days ago (10th inst.), with report, but this paper was overlooked at the time.—S. A. DONNELLY, 16/7/90. Mr. Stilwell. A.W.S., 21/7/90. Put with papers.—J.B., 24/7. Commissioner and Engineer for Roads and Bridges. Mr. McDonald.—P.H.F., 18/8/90. Let me have estimate for 65 feet truss bridge and approaches, timber at 5s. per cubic foot.—P.A. (*pro* Engineer for Bridges), 1/9/90. Chief Draftsman.

Truss bridges and approaches will cost £850; it is certainly the most suitable design for this site, but only £400 is available from Treasurer's Advance Account submitted as to funds.—P.A. (*pro* Engineer for Bridges), 3/9/90. Commissioner and Engineer-in-Chief for Roads and Bridges.

No. 13.

Memo. from The Engineer for Bridges and Field Officer's Report.

Department of Public Works, Roads and Bridges Branch, Sydney, 23 June, 1890.

Memo.

Field Officer's Report.

Will Mr. Donnelly please report on the suitability to site of attached outline design of proposed bridge and approaches for Mihi Creek road, Uralla to Melrose. Plot local sketch on tracing. State:—

When here on 4th July, water too high to ascertain depth of rock in creek at line of section; rock is showing a little lower down; an opinion piles cannot be driven in pier, but can in abutments; hence should prefer one span—a truss. Local sketch is on

(1.) If bridge will be square, or, if not, at what angle to the stream when in flood.

(1.) Square with axis of stream when in flood.

(2.) Nature of formation.

(2.) Loam on rock.

(3.)

(3.) The depths to which piles can be driven at positions shown, and, if a rock bottom, its nature and the most suitable mode of securing piers and abutments.

(4.) Should piles be coppered, or is turpentine timber obtainable in locality for piles.

(5.) The maximum lengths, character, and quality of timber obtainable; whether turpentine, iron bark, blue gum, red gum, or box, should be specified for piles, girders, corbels, capsills; iron bark, blue gum, red gum, or box, for sheathing; tallow-wood, red gum, or iron bark for planking; and give approximate cost per cubic foot for each class of timber erected in position.

(6.) The highest flood level, and if ascertained from reliable data; and, if backwater, at what height current ceases, also its maximum velocity.

(7.) If much drift timber comes down in flood, and its probable length.

(8.) If there is an old bridge at proposed site, and, if so, should material become the property of the Contractor, or be retained by Department.

(10.) If site for bridge and approaches is clear of alienated land; and if not, show same with boundaries, and report if owners require compensation, and how much.

(11.) Whether bridge and approaches should be let separately; or, if not, what material is available for banks and backing.

(12.) Will it be necessary to provide a temporary crossing for traffic during the erection of bridge.

(13.) When calling for tenders, at what towns it would be advisable to exhibit plans.

(14.) The amount available for this work is £400, and the approximate cost of bridge and approaches will be £450. How do you propose to provide for the balance?

Fix the position of permanent bench-mark on plan and section, with its reduced level.

Return papers and plans without delay to Head Office.

PERCY ALLAN,

(*pro* Engineer for Bridges).

Mr. Donnelly, Armidale.

(3.) Piles in abutments might be driven 15 feet.

(4.) Not necessary to copper; no water insects.

(5.) Red gum, box, stringybark, blue gum, good lengths, 18 in. dia to square 12 in. x 12 in. may be got up to 40 feet, within 10 or 15 miles. Stringybark chiefly say—piles, 5s. per lineal foot planking, and hewn timber, 3s. 6d. to 4s., cubic foot.

(6.) Highest flood been is shown on section.

(7.) Not a great deal of drift timber various lengths up to 40 feet.

(8.) No old bridge.

(10.) The site is on a reserve as shown.

(11.) Let together.

(12.) No; but the contractor might be directed to keep present ford passable.

(13.) Armidale and Uralla (nearest), and perhaps Maitland besides U.O.

(14.) A special grant is all I can suggest. Road vote is insufficient for road work, and nothing from it can be spared.

S. A. DONNELLY.

10/7/90.

Mr. M'Donald.—A.W.S., 11/7/90. Commissioner and Engineer-in-Chief for Roads and Bridges.

Funds are insufficient for a truss bridge: definite information must be obtained as to depth of rock at site of pier and abutments.—P.A. (*pro* Engineer for Bridges), 14/7/90. Mr. Donnelly. The bottom has been tried all over, and for about 36 feet each side of section line, and rock found in all places at from 2 feet 6 inches to 3 feet 6 inches throughout bed of creek.—S. A. DONNELLY, 19/7/90.

Mr. Donnelly recommended £400, and now asks for a truss bridge. How does he propose to pay the difference in cost. Without doubt a truss bridge is the right thing here, but should have been recommended in the first instance when sufficient funds could have been provided. Can the work stand till next year for a further vote?—J.A.M'D., 11/8/90. Mr. Donnelly.

Report herewith.—S. A. DONNELLY, 14/8/90.

No. 14.

Memo. by Mr. Road Superintendent Donnelly.

Appendix B.

Forwarding section over Dangar's Creek upon road, Armidale to Mihi Creek and Walcha, and Armidale to Melrose, with previous paper, 90-5,118.

I REGRET that pressure of other important duties sending the above sooner. The bed of creek is rocky, the fall is about 1 in 200; about 3 miles below site of section, the waters of the creek flow over Dangar's Falls, between 600 and 700 feet deep, the creek flows into the Macleay River. The flood marks show a width of flood surface, nearly 450 feet, and a depth of 21 feet in deepest part. A great deal of timber does not come down. Abutment piles, north side of large bridge, might be driven, but other parts must be fastened, &c., to rock. The place is about 12 miles from Armidale. Settlement and population seem to be increasing in this direction.

I should have stated the site of section is near the old crossing, when the water is a little higher than shown on section, the creek is uncrossable except by swimming.

S. A. DONNELLY.

Mr. Stilwell.

10 July, 1890.

Mr. M'Donald.—Section sent under separate cover.—A.W.S., 11/7/90. Commissioner and Engineer-in-Chief for Roads and Bridges. See with sketch design.—P.A. (*pro* Engineer for Bridges), 14/7/90. Chief Draftsman.

Bridge and approaches will cost £2,400. Authority has been obtained for expenditure of £500 from Treasurer's Advance Account. Submit as to funds.—P.A. (*pro* Engineer for Bridges), 3/9/90. Commissioner and Engineer-in-Chief for Roads and Bridges.

No. 15.

No. 15.

Minute Paper.

Subject :—Bridges over Mihi and Dangar's Creek.

Department of Public Works, Roads and Bridges Branch,

Sydney, 6 September, 1890.

On receipt of a telegram from the local officers that these bridges were urgently required, and would cost respectively £400 and £500, the Minister approved of the work being carried out, and paid from Treasurer's Advance Account. It now appears that the bridges will cost £850 and £2,400.

I should like Mr. Stilwell to look carefully into this matter, and report before it is submitted to the Minister. It appears to me there must have been great carelessness, or utter incompetency on the part of the officer, who submitted the estimates in the first instance, and Mr. Stilwell will at once see the false position it puts me into, in obtaining approval for two works estimated by me to cost £900, whereas the net amount should have been £3,250 nearly four times the original estimate.

ROB. HICKSON.

Mr. Assistant-Engineer Stilwell. Report attached.—A.W.S., 13/9/90. Commissioner and Engineer-in-Chief for Roads and Bridges.

No. 16.

Minute Paper.

Subject :—Bridges over Mihi and Dangar's Creeks as to defective estimates for.

Tamworth, 13 September, 1890.

MR. DONNELLY furnished estimates of cost and made recommendations for these bridges before I took charge of the division. I have just seen him as to the errors in estimates. His explanation is :—in both instances he reported from memory only, without visiting or ever having measured the channels. With respect to Mihi Creek he points out that he estimated for a beam bridge, and that, for this there is a difference of £50 only between his and Mr. McDonald's estimate—the estimate afterwards made by Mr. McDonald is for a truss bridge; and this is at £850. But this truss bridge is in accordance with Mr. Donnelly's recommendation (90-5,076), after he had measured and inspected the site.

As to Dangar's Creek Mr. Donnelly admits he was much surprised, on having channel measured, to find the provision required to be so much greater than he had thought; but he cannot charge himself with carelessness in making the recommendation—his view is that at a time when the country was in a flooded state, and many urgent demands being made, he did his best, not wishing to delay the recommendation.

I think Mr. Donnelly has evinced a want of discretion and caution in jumping to conclusions as to the estimates in these cases. It is just at a time such as this that extra discretion is demanded of an officer—that he should withhold himself from the hysterical outcry, and with a firmness and circumspection due to his great knowledge and experience, "make haste slowly," that action may be effectual as well as prompt. Beyond this I cannot charge Mr. Donnelly with either carelessness or incompetence—the errors have arisen from his tendency to office, rather than field work, as to which I have before had occasion to report with reference to his contractors and day men.

Both the sites in question are within very moderate distances of Armidale. Dangar's Creek where the greater discrepancy occurs, only 12 miles.

As to Dangar's Creek Bridge Mr. Donnelly does not think the larger outlay of £2,400 warranted by the circumstances. The mines in this direction are decreasing in importance—traffic and population diminishing—the crossing of the creek good, and floods to suspend traffic of rare occurrence. I concur with him in advising that the question of bridging the creek here be held in abeyance for the present.

As to Mihi Creek, which appears from the applications and reports to offer a greater obstacle to traffic, and where the cost of bridging is much less than at Dangar Creek. I would suggest that both the amounts approved of, viz. : £400 and £500 be applied to constructing the bridge—if approval to this course can be obtained, and the work proceeded with.

A.W.S.

Commissioner and Engineer-in-Chief for Roads and Bridges.

No. 17.

Minute Paper.

Subject :—Proposed Bridges over Mihi and Dangar's Creeks.

Department of Public Works, Roads and Bridges Branch,

Sydney, 23 September, 1890.

In March last, in reply to an application from Mr. J. Inglis, M.P., the local officer reported by telegraph that the above bridges were very urgently required, and would cost about £400 and £500 respectively. The Minister approved of their construction, and Treasury was asked to pay from Advance Account.

Sections of creeks were then taken, and drawings, &c., prepared, when the Engineer for Bridges estimated cost of suitable structures at £850 and £2,400 respectively.

The Assistant Engineer now reports that he does not think the larger outlay of £2,400 for Dangar's Creek bridge warranted, and he concurs with the local officer in advising that the question of bridging this creek be held in abeyance for the present.

As to Mihi Creek, which appears from the applications and reports to offer a greater obstacle to traffic, and where the cost of bridging is much less than at Dangar's Creek, he suggests that both the amounts approved of, viz., £400 for Mihi Creek, and £500 for Dangar's Creek, be applied to its construction, if approval to this course can be obtained, and the work proceeded with.

With

With regard to the discrepancy in the estimates of cost as furnished by local officer, and as calculated in Head Office, it appears that for Mihi Creek Bridge the local officer's estimate of £400 was for a beam bridge (which in Head Office was estimated at £450), but after section had been received, a truss bridge was considered more suitable, and for the latter design the cost was estimated at £850.

As to Dangar's Creek Bridge (£500 recommended and approved), the original estimate was furnished by local officer without having measured the channel, and he admits that he was very much surprised, on making such measurement, to find the provision required was so much greater than he had thought. The recommendations were made when the country was in a flooded state, and he did not wish to delay them.

Submitted.—P.H.F. (*per* U.S.), 24/9/90. Submitted for Instruction.—J.B., 25/9/90. Inform Members as to the increased estimate, and state that the amounts required cannot be granted at present.—B.S., 25/9/90. Write.—J.B., 26/9/90. Mr. M'Donald to see.—P.H.F., 1/10/90.

No. 18.

The Under Secretary for Public Works to H. Copeland, Esq., M.P.

Sir,

29 September, 1890.

Referring to my letter of the 25th March last, addressed to Mr. J. Inglis, M.P., in which it was stated that the Minister had approved of the erection of bridges over Dangar's Creek and Mihi Creek, on the Enmore road, I am directed to inform you that the Minister's approval was then based on a report submitted to him, in which the estimated cost was set down at £500 for a bridge over Dangar's Creek, and £400 for a bridge over Mihi Creek. Upon a more detailed examination of the sites being made, however, it has been found that suitable structures cannot be erected for less than £800 for Mihi Creek and £2,400 for Dangar's Creek. In these circumstances the Secretary for Public Works regrets that the question of their erection must stand over for the present.

I have, &c.,
J. BARLING,
Under Secretary.

No. 20.

Memo. by J. Inglis, Esq., M.P.

Memo. for Under Secretary, Public Works.

Dear Sir,

1 October, 1890.

In the light of the long conversation had with you and Mr. Hickson at our interview to-day, when I was accompanied by Capt. A. H. Richardson, Uralla, and in view of the constantly-increasing traffic to and from the important mining centre at Enmore, and the imminent risk to life owing to the absence of proper crossings, I would earnestly urge that this decision be reconsidered. I do not think a costly high-level bridge is at all needed on either creek; a low-level bridge would meet all requirements. Even a strong causeway, with stout protecting posts and wire might suffice for Dangar's Creek, and a substantial low-level bridge for Mihi Creek. I trust you will not lose sight of this, but come to a speedy and favourable decision.

Yours, &c.,
JAS. INGLIS.

Mr. Hickson.—J.B., B.C., 1/10/90. Mr. M'Donald for estimates as explained verbally.—R.H., 1/10/90. Wire Donnelly for information as to class of stone obtainable for masonry, and within what distance of each site.—J.A.M'D., 1/10/90. Chief Draftsman.

No. 21.

H. Copeland, Esq., M.P., to The Under Secretary for Public Works.

Sir,

Legislative Assembly, 4 October, 1890.

I am in receipt of your letter No. 90-7,314, R. & B., dated September 29th, from which it appears that you addressed a letter on 25th March last to my colleague, Mr. J. Inglis, informing him that the Minister had approved of the erection of bridges over Dangar's Creek and the Mihi Creek on Enmore road, and without referring to other matters contained in your letter I desire to know how it is that

that I received no similar intimation on 25th March last, nor during the time which has since elapsed—some six months, seeing that the correspondence on this subject was opened by me in the first instance on 31st January last, and on the 20th June last I again urged this matter on your attention. Yet, notwithstanding these facts, my correspondence is ignored, and you base your present correspondence in a letter addressed by you to Mr. Inglis on 25th March, which was in reply to one of his bearing same date so that while my colleague can obtain a reply on same date, my letters of January and June are deliberately treated with contempt, or at least are ignored.

As this is the third occasion within a few weeks on which I have had to draw your attention to similar treatment, I can only come to the conclusion that there are some mysterious influences at work in your department, and take this opportunity of formally drawing your attention to the matter, feeling well assured that neither yourself or the Minister would countenance conduct of this character which, from the frequency of its occurrence I can only conclude to be of deliberate intention.

I am, &c.,
HENRY COPELAND.

No. 22.

The Under Secretary for Public Works to H. Copeland, Esq., M.P.

Sir, Department of Public Works, Sydney, 20 October, 1890.

I am in receipt of your letter of the 4th instant, in which you complain that your communications respecting the erection of bridges over Dangar and Mihi Creeks, on the Enmore road, have been ignored. I regret very much that you should have had any cause of complaint in regard to this matter, but the papers show, that as far as your letter of 20th June is concerned, it was replied to by me on the following day. I have since learned from yourself that this letter did not reach you, but it is duly copied in our letter-book, and the messenger's delivery book shows that it went out of the office; where the failure has been, therefore, I am at a loss to know. I must at once admit that the letter of 29th September, in which the name of Mr. Inglis only was referred to, was an entire mistake. It was, however, signed for me, as, of necessity, many official letters have to be. I well knew that you had taken a prominent interest in the matter, and I regret exceedingly that by an oversight this fact was not acknowledged in the letter. I can assure you that you do the Minister and myself no more than justice when you state that you are sure we should discountenance any neglect of the kind complained of by you, and I trust, therefore, you will accept my assurance that the mistake was purely accidental, to prevent the recurrence of which I have given special instructions that more care shall be exercised in future.

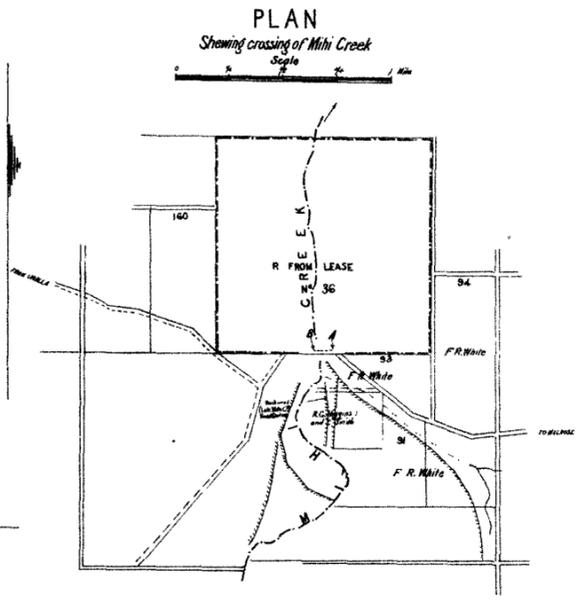

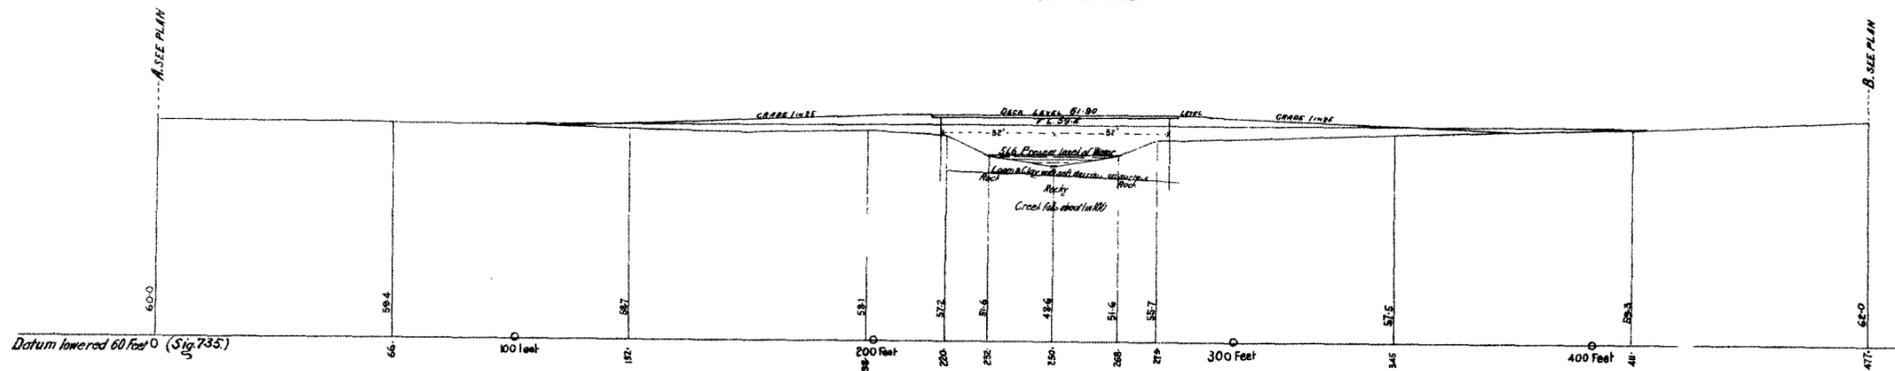

In conclusion, I may add that the papers, which, at your request, are to be laid upon the Table of the House, will show clearly the action you took in the matter.

I have, &c.,
J. BURLING,
Under Secretary.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

BRIDGE OVER THE MURRUMBIDGEE RIVER, AT
FRESHFORD.

(REPORT RESPECTING PROPOSED.)

Ordered by the Legislative Assembly to be printed, 30 September, 1890.

P. Scarr, Esq., to The Under Secretary for Public Works.

Sir,

Department of Public Works, Sydney, 19 September, 1890.

In accordance with your instructions, I proceeded to Queanbeyan, for the purpose of inquiring as to the necessity for a bridge over the Murrumbidgee in the vicinity of Freshford, and now have the honor to report.

I have carefully perused the reports made from time to time by the officers of the Government, who have long resided in the district, and in the course of their duties gained an intimate knowledge of the country in question.

I have also had interviews with such of the officers as are now in the district, and with a number of residents who are acquainted with it.

I also visited the bridge site proposed by the petitioners, and other portions of the river and the adjacent country.

As a result of my inquiries, the facts of the case present themselves to me as follows:—

- 1st. That the stretch of country in question—forming the greater part of the county of Cowley, and bounded on the south and east by the Murrumbidgee River, on the west by the Cooradigbee River, and on the north by a line running west from the junction of the Molonglo and Murrumbidgee Rivers—consists of a mass of high broken mountain ranges, intersected by rapid streams, and embraces little or no land fit for agriculture, unless it be a few patches of extremely limited area along the banks of some of the creeks, and that it is entirely incapable of supporting anything more than a very small population, who can only engage in sheep-farming.
- 2nd. That west of the Cooradigbee, upon the high lands, or "snow country," beginning at Cooleman Plain, is some good plain land, which is for many months of the year covered with snow, and can only be used during the summer months.
- 3rd. That the cultivation of this land is for several reasons out of the question. Even if crops could be produced in such an inhospitable region, and a first-class road were provided, the distance from market would be an effectual bar against its occupation for agricultural purposes.
- 4th. That in the vicinity of Yaouk, in the extreme southern portion of the area mentioned, there is some good open grazing country; but from its comparative nearness to the railway at Cooma and Bredbo those places are the proper outlet from that point.
- 5th. That already a good road exists from Cooma to Kiandra, capable of carrying the traffic for a place much more important than Kiandra, which has a population within a radius of 5 miles of only 138 persons. Further, that a special grant of £12,000 is now being expended in making a cart-road from Tumut to Kiandra; in addition to which funds are being expended upon the following roads, all of which afford access more or less to the "Snow Lands":—
 - (1.) Queanbeyan *via* Lanyon Ford (Tharwa) to Naas, 21 miles, £210.
 - (2.) Canberra to Uriarra, 13 miles, £64.
 - (3.) Queanbeyan to Uriarra, 22 miles, £216.
 - (4.) Uriarra to Brindabella, £300 in 1889, and £130 in 1890.
 - (5.) Billyingra (Bredbo) to Adaminaby, 30 miles, £294.
 - (6.) Cooma to Bolairo, 30 miles, £294.
 - (7.) Warro *via* Boambolo to Mullion, 15 miles, £147.

So that, considering the traffic to the snow lands is only stock and the attendant vehicles, it does not appear necessary further provision should be made.

- 6th. That the anticipated addition to the population of the district, as the result of throwing open the land for selection, has not been fulfilled.

An

An estimate carefully compiled by Mr. Surveyor Wood in April last gives the population residing west of the river, and who would be likely to use the bridge, as 104; the sheep, 43,974; cattle, 4,569; horses, 672.

Now, I find from a return supplied by the Lands Office, Cooma, that of forty-eight applications for land, comprising 28,061 acres in thirteen parishes, thirty-four for 19,181 acres are known to be those of persons previously holding land there. These selections are made either for the purpose of securing the runs or as extensions of previous holdings.

This goes to show that there has not been any large increase of population, but that the land is now largely held by previous holders, with the difference that it is under new conditions, and that the limit of profitable occupation was probably reached under the old system of leasing.

These facts should largely dispose of the assertion that under the new Land Act population would largely increase in the locality in question.

BRIDGE SITES.

The site proposed by the petitioners is that at Freshford.

In connection with it, it is proposed by the petitioners that a road should be constructed, known as Campbell's or Kelleher's line, leading from Freshford, *via* Baroomba, Ororal Valley, and the Cotter River, to Cooleman Plain.

To carry out these proposals the cost would be as follows:—

Bridge at Freshford	£6,000	0	0
Road, Freshford to Cooleman (exclusive of bridges and culverts, for which no estimate has been made)	7,075	0	0
	<u>£13,075</u>	<u>0</u>	<u>0</u>

Of cost of resumption of road through Cunningham's estate no complete estimate has been given, but it will be considerable.

It appears to me that to erect the bridge and construct the road to Cooleman, with resumptions, &c., an outlay of £15,000 to £16,000 will be necessary, and, keeping in view the probability of still further expenditure for improvement and maintaining in the early future, the Department would, by adopting these proposals, be entering upon an outlay of £20,000 to £30,000.

The other site proposed is that at Tharwa (or Lanyon) Ford.

There is a good road to this point from Queanbeyan, and this good road extends to Naas, 5 miles further. The road has been scheduled and in the hands of trustees for several years.

The cost of a bridge at Tharwa would not be greater than at Freshford, and no resumptions would be needed. The position is also the most central.

It has been suggested that a road should be opened from Naas, along Gudgenby Creek and Yaouk, to Nungar Plain, near Kiandra.

To carry out this proposal the cost would be:—

Bridge at Tharwa	£6,000	0	0
Opening ground (as estimated by Mr. Boot, Road Supt.)	3,500	0	0
	<u>£9,500</u>	<u>0</u>	<u>0</u>

to merely open the road; and, allowing for further improvement and maintenance, the cost would probably be before long £15,000 to £20,000.

Mr. Boot, who framed the road estimates, speaks in unqualified condemnation of Campbell's track, and states it would be a most expensive one to maintain when made.

As regards distance, from the report of Mr. Wood, who appears to have gone carefully into the question, there would, after allowing for the detours necessary to obtain grades on Campbell's line, be little difference in the lengths of the two roads, say 70 miles in each case.

The conclusion I arrive at is that:—

- 1st. The population, present and prospective, is insufficient to justify the erection of the bridge at either site, but that, if it was to be erected, Tharwa is the most central and suitable in the public interest, and the least expensive as to contingent cost.
- 2nd. That there is nothing to warrant the large expenditure necessary to open either of the lines of road referred to, but that, of the two, that *via* Tharwa, Naas, and Gudgenby Creek is the least expensive, and would best suit the public.

In view of these conclusions, the opening of the road through Messrs. Cunningham's estate will not be required.

I have, &c.,
PERCY SCARR.

1890.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

COWRA BRIDGE BILL.

(MESSAGE No. 21.)

Ordered by the Legislative Assembly to be printed, 2 July, 1890.

By Deputation from the Governor,
ALFRED STEPHEN,
Lieutenant-Governor.

Message No. 21.

In accordance with the provisions contained in the 54th section of the Constitution Act, the Governor recommends for the consideration of the Legislative Assembly the expediency of making provision to meet the requisite expenses in connection with a Bill to sanction the erection of a bridge over the Lachlan River, at Cowra.

Government House,
Sydney, 2nd July, 1890.

1890.

NEW SOUTH WALES.

LANDS FOR PUBLIC PURPOSES ACQUISITION ACT.

(RESUMPTION AT RYDALMERE FOR AN APPROACH TO BRIDGE OVER BISHOP'S CREEK.)

Presented to Parliament, pursuant to Act 44 Vic. No. 16, sec. 6.

NOTIFICATION OF RESUMPTION OF LAND UNDER
44 VICTORIA No. 16.

NEW SOUTH WALES, } By His Excellency The Right Honourable
to wit, } CHARLES ROBERT, BARON CARRINGTON,
a Member of Her Majesty's Most
(L.S.) Honourable Privy Council, Knight
CARRINGTON, } Grand Cross of the Most Distinguished
Governor. } Order of Saint Michael and Saint
George, Governor and Commander-in-
Chief of the Colony of New South
Wales and its Dependencies.

WHEREAS I, the Governor aforesaid, with the advice of the Executive Council of the said Colony, have duly sanctioned the carrying out of certain works for and in connection with the construction of a Bridge over Bishop's Creek, Rydalmore, in the said Colony, for and towards the completion of which said works public funds are available; and whereas the land hereinafter described is required for approaches to the said works: Now I, the Governor of the said Colony, with the advice of the Executive Council of the said Colony, in pursuance of the powers in this behalf given to or vested in me by the "Lands for Public Purposes Acquisition Act," do, by this notification, published in the Gazette, and in a newspaper, that is to say, in the "Cumberland Mercury," circulated in the Police District wherein the said land is situated, declare that the land hereinafter described has been resumed for the public purposes hereinafter mentioned, that is to say, for and in connection with the approaches to the above bridge, to the intent that, upon the publication of this notification in the Gazette, the legal estate in the said land shall forthwith be vested in the Minister for Public Works and his successors, on behalf of Her Majesty, for the purpose of the said last-mentioned Act, for an

estate of inheritance in fee simple in possession, freed and discharged from all trusts, obligations, estates, interest, contracts, charges, rates, rights-of-way, or other easements whatsoever; and to the intent further that the legal estate therein, together with all powers incident thereto or conferred by the said Act, shall be vested in the said Minister as a trustee, with the powers stated in the said last-mentioned Act. And I declare that the following is the description of the land hereinbefore referred to, that is to say:—

All that piece or parcel of land containing 21 perches more or less, being a part of and commencing at the north-west corner of portion 4 of section D of the Vineyard Estate, parish of Field of Mars, county of Cumberland, Colony of New South Wales, on the east side of Wharf-street, 1 chain wide, and on the southern boundary of a reserve from sale; and bounded thence on the north by part of the northern boundary of that portion aforesaid, being a line bearing east 72 feet; thence on the south-east by a line bearing south 24 degrees 14 minutes west 175 feet 6 inches to Wharf-street; thence on the west by that street, being also part of the western boundary of portion 4, bearing north 160 feet, to the point of commencement; and said to be in the possession of F. Randall.

In witness whereof I have hereunto set my Hand, and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this twenty-seventh day of December, in the year of our Lord one thousand eight hundred and eighty-nine, and in the fifty-third year of Her Majesty's Reign.

By His Excellency's Command,
W. McMILLAN.

GOD SAVE THE QUEEN!

1890.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

THE HINTON PUNT.

(PETITION FROM CERTAIN PERSONS, PRAYING FOR THE ABOLISHMENT OF TOLLS ON)

Ordered by the Legislative Assembly to be printed, 30 July, 1890.

To the Honorable the Legislative Assembly of New South Wales.

The Petition of the undersigned, being persons who have occasion to make use of the Hinton Punt,—

HUMBLY SHOWETH:—

That the imposition of tolls on the said punt is felt to be unfair, burdensome, and impolitic.

Unfair—inasmuch as costly bridges, maintained at considerable annual outlay, are free.

Burdensome—inasmuch as so many persons are driven to avail themselves of the risk and uncertainties of water-carriage in preference to the speedier and safer transit by rail; and traffic is diverted from its natural channel of the shortest and easiest route, *via* Hinton, to the longer route, because of the free bridges, to the injury of Hinton and Morpeth; and bears heavily on the small farmer when bringing his weekly stock of eggs and butter to the market.

Impolitic—inasmuch as the charge tends to deprive the railway of the produce of the district, and to take from the inhabitants on the Hinton side those benefits which Government has been at the cost to provide in the way of technical classes, and also the great advantages of public lectures, agricultural shows, political gatherings, and the various agencies, which are no inconsiderable factors in the advancement of the community, supplied by the proximity of Maitland and Morpeth.

Inasmuch, therefore, as the tolls are felt to be a grievance, and hinder the development of the community out of all proportion to the revenue derived by Government from this source; and, moreover, as the claims of this district, in comparison with less important ones, have received scant attention in the past,—

Your Petitioners hereby pray that you will abolish the tolls on the Hinton punt forthwith.

And your Petitioners, as in duty bound, will ever pray.

[Here follow 640 signatures.]

1890.

NEW SOUTH WALES.

NEW SOUTH WALES GOVERNMENT RAILWAYS AND
TRAMWAYS.

(ANNUAL REPORT OF RAILWAY COMMISSIONERS, YEAR ENDING 30TH JUNE, 1890.)

Presented to Parliament pursuant to Act 51 Vic. No. 35.

Offices of the Railway Commissioners of New South Wales,
Sydney, 27th August, 1890.

TO THE HONORABLE THE MINISTER OF RAILWAYS,—

Sir,

In accordance with the provisions of the 45th clause of the Railways Act of 1888, 51 Vic. No. 35, we have the honor to present, for the information of Parliament, our Annual Report upon the working of the Railways and Tramways for the year ending June 30th, 1890.

GENERAL REMARKS.

Since the date of our last Annual Report, we have inspected the whole of the lines, and authorized many works required in the interests of the country, and for the development of the Railways.

The general result of the working of the Railways and Tramways during the year shows that the total traffic amounted to £2,902,048, and the net profit to £1,012,140. The following table will show the progress and result of the Railway and Tramway working for a period of seven years before our taking office, and since that date:—

	MILEAGE OPEN.				TOTAL EARNINGS.			
	1882.	1888.	1889.	1890.	1882.	1888.	1889.	1890.
Railways	1,276	2,114	2,171	2,182	£ 1,701,016	£ 2,295,124	£ 2,538,477	£ 2,633,086
Tramways	22	38½	38½	39½	126,202	236,519	243,563	268,962
	1,298	2,152½	2,209½	2,221½	£1,827,218	£2,531,643	£2,782,040	£2,902,048
	CAPITAL.				PROFIT ON WORKING.			
	1882.	1888.	1889.	1890.	1882.	1888.	1889.	1890.
Railways	£ 15,843,616	£ 27,722,748	£ 29,839,167	£ 30,555,123	£ 763,661	£ 764,573	£ 903,875	£ 967,251
Tramways	452,818	930,561	905,595	933,614	23,066	17,323	21,728	44,889
£	16,296,434	28,659,309	30,744,762	31,488,737	£786,727	£781,896	£925,603	£1,012,140
		16,296,434			Increase over 1888 year in which pre- sent Commissioners took office.		£143,707	£230,244
		£ 12,362,875					£373,951	

Showing a net gain to the Treasury from Railways and Tramways during the two years we have been in office of £373,951, whilst in the seven years preceding our taking office, although the traffic had increased by £704,425 and the capital by over £12,000,000, the net return to the Treasury showed a decrease.

440—A

RAILWAYS.

[1620 copies—Approximate Cost of Printing (labour and material), £239 11s. 5d.]

RAILWAYS.

On the 30th of June, 1889, 2,171½ miles were open, and on the 1st January, 1890, the line from Hornsby to St. Leonards, a length of 10½ miles, was brought into use, making a total milcage on the 30th of June, 1890, of 2,182 miles.

The cost of the lines opened for traffic has been £30,555,123.

To meet this expenditure, £27,734,581 has been raised by the issue of debentures of the nominal value of £28,983,967, the balance having been provided out of the General Funds of the Colony.

Debentures of the value of £1,109,075 have been finally paid off, leaving £27,874,892 outstanding on the 30th of June, 1890.

The revenue derived from working the lines during the year was £2,633,086, and the expenses amounted to £1,665,835, or 63·26 per cent. of the gross revenue, a decrease of 3·43 per cent. since we took office, leaving a net revenue of £967,251 towards paying interest upon capital, or a return of 3·47 per cent. on the total debenture capital outstanding, and 3·28 per cent. per annum on the total amount outstanding against the capital cost of the railways.

The details of the revenue and working expenditure will be found in the Appendix, Nos. 5 to 7.

The increase in revenue amounted to £94,609. Of this increase, the coaching traffic contributed £24,362, the merchandise and live stock traffic £69,014, and miscellaneous £1,233.

The revenue for the year ending 30th June, 1889, was materially augmented by the traffic to the Melbourne Exhibition, whereas this year there has not been any special attraction of the kind. The continuous and unprecedented rains also interfered with general traffic, and, by keeping the rivers open throughout the year, diverted a considerable quantity of merchandise which would otherwise have been conveyed by railway.

Working expenses increased by £31,233 (33·01 per cent. of the increased traffic) leaving an increased net result of £63,376.

The totals of, and increases in, the various classes of traffic will be seen below :

	Total.	Increase.
Passengers (number)	10,787,307	502,327
Season Tickets issued (number)	196,248	18,307
Goods, minerals, and live stock (tons) ...	3,788,950	303,111

The train miles run were 8,008,826, being an increase of 367,057 miles over the preceding year.

The earnings per train mile amounted to 78·90d., and the expenditure per train mile was 49·91d., leaving a net earning of 28·99d., as against 28·38d. last year, and 27·43d. in 1888, being an increased profit since 1888 of 1·56d. per train mile.

It is gratifying to report that in spite of the exceptional difficulties we have had to contend with during the year, owing to the excessive rains, and also the additional expenditure incurred in improving the rolling stock and permanent way, we have been enabled to increase the net return to the Treasury from the railways, as compared with the year preceding our taking office by £202,678.

The

The phenomenal rainfall during the past year has had a most disastrous effect upon the lines, which were already in such a defective condition, as, in consequence of the almost entire absence of drainage in many places, and the want of proper ballast, the sleepers were practically floating in mud. The exceptional state of the weather also seriously retarded the work of reballasting, as also relaying, &c., the contractors having been unable to deliver the sleepers at the rate required, and the line was in such a condition in many localities as to render it unwise to interfere with it.

The rainfall for the fourteen months ending 30th June has for the past fifty years averaged 59.58 inches; but the record for the period closing 30th June last amounts to 108.48 inches. Mr. Russell, the Government Astronomer, states that, apart from the mere quantity, a remarkable feature about the recent rain was its persistence, the ground never having a chance to dry after one deluge of rain before another was pouring upon it.

It has been necessary for a long time past to employ a largely increased staff upon the permanent way, in order to keep the lines in running order, and it was only by the exercise of the greatest vigilance on the part of the officers and men, and running the trains at reduced speed, that the traffic was conducted so satisfactorily as has been the case. For many months the average number of additional men employed on the permanent-way amounted to about 800, as against a normal staff of about 3,100.

Several exceedingly heavy landslips took place at various places, entailing heavy expenditure, and the great flood at Bourke seriously damaged the railway lines for many miles.

The extra expenditure incurred up to the end of June in connection with the floods and slips amounts to over £40,000, and this exceptional expenditure is still continuing.

A land-slip at Bell, in the Blue Mountains, caused the traffic of the Main Western Line to be obstructed for five days whilst a deviation was being made. The flood in the Darling River in April and May last was the most disastrous ever experienced. The line was inundated and seriously damaged for 13 miles; and, from the 17th April until the 19th May the communication with Bourke was maintained by the Department by a service of boats between the point at which the line became impassable for trains and the town, and by this means over 2,000 persons were conveyed and supplies kept up.

On three occasions since May, 1889, the traffic of the Great Northern Line was suspended in consequence of the floods in the Hunter River at Maitland. We have, therefore, decided to raise the railway embankment above flood level for a distance of 3,740 yards, so as to avoid a repetition of this interruption.

During the year the cost of relaying 44 miles 15 chains of line was debited against working expenses, as compared with 35 miles 10 chains last year, and 20 miles 52 chains in the previous year.

There have unfortunately been several serious accidents to passenger trains during the year; but the amount of money paid as compensation for personal injury to passengers during the time we have been in office has been at a considerably less rate per annum and per passenger carried than was the case for the four
years

years preceding our taking office. We feel sure that the steps being taken by us in improving the rolling-stock and permanent-way, and extending the use of safety appliances, will materially add to the security of the lines.

The following return will show the progress made in extending the Interlocking of Points and Signals and the Absolute Block system of working.

RETURN showing number of miles of Line on which the traffic is worked under the **Absolute Block System**; also, number and percentage of places which have or have not **Points and Signals interlocked**.

Date, to end of—	Number of miles of line opened for traffic.			Number of miles of line on which the traffic is worked under Absolute Block System.			Number and Percentage of Places which have or have not Points and Signals interlocked.				
	Double.	Single.	Total.	Double.	Single.	Total.	Number of Places.			Percentage.	
							Inter-locked.	Not inter-locked.	Total.	Inter-locked.	Not inter-locked.
October, 1888	71½	2,042½	2,114	28	Nil.	28	104	318	422	24·64	75·36
October, 1889	75	2,096	2,171	51½	80½	132	126	327	453	27·81	72·19
July, 1890	79	2,103	2,182	72½	189½	262	173	291	464	37·29	62·71

Six trains have also been fitted with electric communication between passengers and guards, and in a short time the whole of the through trains will be equipped in this way.

The Westinghouse and Vacuum Break Companies are each fitting up a train of fifty goods waggons for the purpose of conducting competitive break trials, so as to enable us to decide upon the form of automatic continuous break to adopt for the goods stock.

MERCHANDISE RATES.

On the 1st of January last a reduction of 10 per cent. was made in the whole of the rates for agricultural produce, to operate all the year round, and from the 1st of February to 31st of August, when the pressure upon the rolling stock is not so great as at other times, a further reduction of 10 per cent. was brought into operation, making a reduction of 20 per cent. during the period most advantageous to the farmers. The rates for this class of traffic are now the lowest in Australia.

The rates for the carriage of low-class ores and coke were materially reduced during the year in order to encourage the mining industry.

A general revision of the goods rates has taken place, and came into operation as from the 1st instant, the main features being the simplification and enlargement of the classification so as to cover every known article likely to be conveyed over the railways, and a modification of the rates in various ways, including the total abolition of the 4th Class. The articles so classed were conveyed at about 9d. per ton per mile, whereas now the highest rate will be 7d. per ton per mile, excepting for a few exceptional articles.

We have every reason to believe that the concessions in rates will not only be a great benefit to the country, but will also speedily lead to a considerable increase of traffic on the railways.

OPENING OF NEW LINES AND THEIR EFFECT UPON THE TRAFFIC.

Since the date of our last report the only additional line opened for traffic has been that from St. Leonards to Hornsby, but in consequence of the position of the terminus it has been an absolute loss to the country, the working from the 1st January to the 30th June showing a total earning of £886 only, while the cost of the line for working and interest amounts to £6,849. Little improvement can be expected until the line is brought to the waters of Port Jackson, and when this has been done an opportunity will be afforded of creating a good suburban traffic, so that in a few years in all probability the expenditure on the whole scheme will cease to be a burden upon the existing lines.

ACCOMMODATION FOR THE TRAFFIC AND CONDITION OF LINES AND ROLLING STOCK.

On all the lines alterations and additions to the accommodation have been authorized for the purpose of improving the facilities for the public and encouraging traffic, but, in consequence of so much work being in hand, and the exceptional weather we have experienced, many of the works have not made that progress which we could have wished.

The duplication of the line from Hurstville to Oatley, and Sutherland to Loftus Junction, was opened on the 4th April last.

The duplicating of the lines from Granville to Picton, Adamstown to Teralba, Oatley to George's River, George's River to Waterfall, and Strathfield to Ryde, has been proceeded with, and the engineers expect to be able to open several of the sections before the end of the year.

The letting of the contracts for quadrupling the Suburban Line has been delayed in consequence of it having been found necessary to resurvey the whole of the line. Fair progress has been made with the two additional lines between Redfern Station and the Illawarra Junction at Eveleigh, and it is hoped that this work will be completed before the end of the year. Tenders are now being invited for quadrupling the line from Illawarra Junction, Eveleigh, to Petersham, and we hope shortly to be able to call for tenders for quadrupling the line from Petersham to Homebush.

Several quarry properties have been acquired for the purpose of reballasting the lines, and, now that more settled weather is approaching, it is hoped that rapid progress will be made in relaying, resleepering, and draining the lines, and we expect that before the close of 1891 the lines will be in first-class order.

The rolling stock has received very special attention during the year, and a sum of over £60,000 has been spent upon repairs and renewals out of working expenses in excess of the sum spent in the year preceding our taking office.

In spite of the liberal expenditure in repairing the locomotives, it has been with the greatest difficulty that the traffic has been kept going, only thirteen additional locomotives having been delivered during the past year, but we hope that within the next few months some of the engines which have been under order since August last will be delivered, and so afford the much-needed relief.

The

The proposal to establish Locomotive Works in the Colony, under the management of an eminent locomotive engineer and builder, with ample capital at his command, will, we trust, not only be the means of enabling us to properly equip our lines with engines built under the personal inspection of our own officers, but will also create an entirely new industry for the Colony, and give employment to a large number of skilled workmen.

The new rolling stock which has been brought into work between the 1st July last year and the 30th June this year is shown on table (page 16), in addition to which there have been delivered since the 1st July this year:—Six lavatory first-class carriages; ten second-class express (46 ft.) carriages; three first and three second American cars, for suburban working, and there are under order the following:—

110 carriages	Makers—Various Colonial firms.
456 goods waggons and vans	„ „ „ „
500 coal hopper waggons	„ „ „ „
25 locomotives	Makers—Messrs. Dubs & Co., Glasgow.
27 „	„ „ Beyer, Peacock, & Co., Manchester.

There is almost an entire absence of shelter-sheds for the carriage stock on the Railways, and now that the carriages are being so materially improved it is absolutely necessary in so trying a climate that shelter should be provided, so as to preserve the property. Active steps are being taken to supply this want.

The sharp curves in the line across the Blue Mountains have a prejudicial effect upon the rolling stock and the comfort of travelling, and we are modifying many of them where the work can be carried out at a reasonable cost.

The severe grades over the main lines materially increase the working expenses, and of necessity the rates are much higher than would be the case if the grades were easier. We therefore propose to ask the Government to move Parliament to place a sum of money at our disposal in order that, where practicable, grades which materially affect the loading of trains may be reduced, and so contribute, with other things, to enable us to work the lines with greater economy, and thus lead to reduction in rates for goods traffic.

UNIVERSAL GAUGE FOR AUSTRALIA.

We regret that the question of an universal gauge for Australia has not made much progress since we referred to the subject in our last Annual Report; but we would take the opportunity of strongly urging that active steps should be taken to bring about this necessary change; the great disadvantage of the break of gauge is at the present moment being more felt than at any previous period, in consequence of the suspension of the shipping trade, owing to the Maritime strike, and the consequent necessity for greater interchange of goods and coal by railway.

STAFF.

The condition of the staff has been materially improved in various ways, and as the labour question is so seriously before the public at the present time, we attach as an Appendix (page 57) a list of the concessions which have been granted to the staff since we assumed office, together with a new classification showing the rates of pay of the various grades of employees, which was brought into force since our last Annual Report was made. The value of the advances of pay and concessions granted to the staff since we took office amounts to more than £70,000 per annum.

It

It has only been possible to act in this liberal manner by carrying out economies in various ways, and it will therefore be seen how much the interests of the staff are wrapped up in the efficient and economical administration of the railways.

An institute for the staff, containing lecture hall capable of accommodating 550 persons, class-room, reading-room, library, &c., is being erected at Redfern, and we hope it will be ready for opening on the 1st January next. Tenders have been accepted for the supply of 3,000 volumes of selected books for the library. It is hoped that this institute will be an element of much good to the staff.

The Government has promised to introduce into Parliament a scheme worked out by us for establishing Provident and Pension Funds for the whole of the weekly staff, and we trust Parliament will give us the needful authority to contribute to the funds out of the railway revenue. The allowances to the staff are based on a very liberal scale, and the contributions required from the men are very moderate.

The question of establishing a Convalescent Home for the staff is also under consideration, and, to assist the movement, the Government has generously granted 19 acres of land in the Field of Mars, near Beecroft.

The appendices to the report will give complete information as to the general condition of the railway traffic and expenses. The diagrams also will enable the whole of the transactions of the department to be readily grasped.

RECAPITULATION.

TRAMWAYS.

TRAMWAYS.

ON the 30th of June, 1889, $38\frac{1}{2}$ miles were open, and on the 14th of August, 1889, the section from Marrickville to Dulwich Hill, a length of 1 mile, was opened, making a total mileage, on the 30th June, 1890, of $39\frac{1}{2}$ miles.

The cost of the lines opened for traffic has been £933,614.

A sum of £975,340 has been raised by the issue of debentures to the amount of £1,000,000 for Tramway purposes.

The result of the year's working of the Tramways is satisfactory, as the lines have, for the first time for some years past, ceased to be a burden upon the country, and have also contributed a profit to the Treasury. At the same time, whilst this has been done, the property has been considerably increased in value during the twelve months, no less than 31 tram-cars and 1 water-tank waggon having been renewed out of the revenue, making a total of 41 tram-cars and 1 water-tank renewed out of revenue within eighteen months; this is nearly one-third of the total rolling stock we found in existence when we took office. The condition of the remainder of the stock has been considerably improved, and the service to the public increased.

A new piece of line is about to be constructed from Castlereagh-street along Cleveland-street, to a junction with the Randwick line. This connecting line will enable a large amount of traffic from the Redfern Railway Station and the districts lying to the west thereof, going to and from the Association Cricket Ground, the Randwick Racecourse, and Coogee, to be accommodated.

A scheme of cable trams running from the Circular Quay to the Railway Station and Pyrmont, and from the foot of King-street, at the wharf, to Woollahra *via* William-street, is at the present time under the consideration of the Public Works Committee, and we trust the proposal will be carried out, as we feel sure that not only would the lines be a great convenience to the public but that they would also be extremely profitable.

The work in connection with the fitting up of a section of the tram-line with the Thomson-Houston system of electric traction will be ready to be tested very shortly, and we trust that the trial may demonstrate the advisability of the system being experimented with on a larger scale on the existing lines.

Fifty new tram-cars are under construction, and also 12 motors, which are being built in the Colony.

CITY AND SUBURBAN LINES.

(Length, $30\frac{1}{2}$ miles.)

The gross revenue from working the lines during the year was £249,508, and the expenses amounted to £207,517, or 83·17 per cent. of the Revenue, as against 91·25 per cent. last year, leaving a net result of £41,991 towards paying interest upon the capital.

The cost of the city and suburban section was £790,555, and the net return gives 5·31 per cent. upon the capital invested, as against 2·56 per cent. in the preceding year, and 2·27 in 1888.

The

The working gives the following results :—

	1888.	1889.	1890.
Gross revenue	£221,060	225,833	249,508
Working expenses	204,227	206,092	207,517
Net profit	16,833	19,741	41,991
Passengers fares collected...	51,563,197	52,810,026	57,463,650
Miles run by cars	1,246,543	1,388,386	1,474,646
Earnings per car mile	42·56d.	40·49d.	40·60d.
Expenses per car mile	39·32d.	36·95d.	33·77
Net profit per car mile	3·24d.	3·54d.	6·83

During the year 31 new cars and 1 water-tank wagon have been paid for out of revenue at a cost of £11,392.

NORTH SHORE CABLE TRAMWAYS (*Length*, 1½ miles).

The revenue amounted to £9,483—expenses, £8,339; net profit, £1,144.

The total cost of the line and its equipment was £73,812, and upon this sum the net profits give 1·55 per cent., a decrease of 0·59 per cent. upon the previous year, the working expenses having been unduly increased by the cost of renewing the cable on two occasions and in rearranging the guides and running gear, which were found to be very defective, and so caused the cables to be damaged.

The car miles run were 66,187, being an increase of 399.

There was an increase of 314,007 in the number of fares collected, the total being 2,269,721.

NEWCASTLE TO PLATTSBURG (*Length*, 7½ miles).

The construction and equipment cost £69,247, and the net return gives 2·53 per cent. on the capital invested, an increase of 1·87 per cent. upon the previous year.

The gross revenue derived from working was £9,972, and the working expenses, £8,217, leaving £1,755 to pay the interest upon the capital cost of the line.

The improvement in the financial result of the working of this line is very satisfactory.

The car miles run were 105,133, an increase of 5,668.

The earnings per car mile were 22·76d., expenditure, 18·76d., and net profit, 4·00d.

CONDITION OF EXISTING LINES.

Improvement has been effected in the condition of the lines during the year, and 2 miles 18 chains of relaying has been done. The exceptional rainfall added materially to the difficulty of keeping the lines in order as well as to the cost.

ACCOMMODATION FOR THE TRAFFIC.

The considerable number of new cars added to the equipment has enabled the service to be conducted in a much more satisfactory manner, and when the additional cars, now under order, are supplied, we hope that the exceptional holiday traffic will also be fully provided for.

The pressure upon the space in Bridge-street yard is very great; we are, however, unable to take any action regarding the question until the cable-tram schemes are finally dealt with.

Better waiting-room accommodation at various points has been provided in the Newcastle district, and several additional and improved rooms are authorized in connection with the Sydney lines.

Improved lighting has been provided in all the cars.

RECAPITULATION.

RECAPITULATION.

The following summary will show the principal items of interest in the Tramway transactions for the year ending the 30th of June, 1890; and, for the purposes of comparison, the figures for the years 1888 and 1889 are shown:—

	1888.	1889.	1890.
Total Debentures issued and outstanding ...	£1,000,000	£1,000,000	£1,000,000
Amount added to Capital Account for the year	67,929	32,351	24,019
Total spent in Construction and Equipment...	877,244	909,595	933,614
Total cost per mile open for traffic	22,786	23,626	23,636
Total mileage open	38½	38½	39½
Gross Revenue	£236,519	£243,563	£268,962
Working Expenditure	219,196	221,835	224,073
Profit on working	17,323	21,728	44,889

CITY AND SUBURBAN LINES.

Total cost of Construction and Equipment ...	£742,555	£771,255	£790,555
Gross Revenue	221,060	225,833	240,508

APPENDIX 1.

Report of Engineer for Existing Lines.

Railway Department, Office of Engineer for Existing Lines, Sydney, 22 July, 1890.

Annual Report for year ending 30 June, 1890.

Gentlemen,

I have the honor to report that the condition of the permanent-way and works has been maintained as efficiently as possible during the year.

There have been, however, considerable difficulties to contend with, owing to the excessive rainfall, and in consequence there has been increased expenditure, caused by floods and slips, some of which have been of a very serious nature.

I may mention that the places which have suffered most have been the Western Line, at and near Bourke, and between Katoomba and Bell. The Northern Line between East and West Maitland, and in the vicinity of Murrurundi and Ben Lomond, and also between Strathfield and Cowan Creek, and from Gosford to Adamstown. The Southern Line, between Granville Junction and Campbelltown, and between Picton and Goulburn, and the Illawarra Line, near Clifton.

At Ben Lomond and Bell it was found necessary to deviate the line. The Mudgee Line has given considerable trouble owing to slips, and unless several deviations are made further expense and delays will take place.

Relaying and refencing have also been unavoidably retarded owing to the bush roads being impassable for the conveyance of sleepers and fencing material.

There has, however, been 44 miles 15 chains relaid, and 18 miles 26 chains refenced.

Draining and reballasting have also been retarded through bad weather.

The Suburban line has been redrained and reballasted thoroughly from Redfern to Ashfield on the Up line, and from Redfern to Summer Hill on the Down line, and as the most difficult portion has been completed more rapid progress will be made in future.

Bombo quarries are being worked to the best advantage, but considerable delays have resulted, owing to bad weather.

Quarries for ballasting purposes are being opened out at Bowral, on the Southern line, and advantage is being taken of any suitable rock found in the cuttings further south. Rock is also being worked at 111 miles 60 chains, Western line, and quarries at 126½, 163½, and 203½ miles, Northern line, are in hand.

The duplication works have made fair progress, but have been delayed in consequence of the severe weather.

The double line, Hurstville to Oatley, and between Sutherland and Loftus Junction, was completed in time for the Easter traffic.

The quadruplication between Sydney and Homebush has been commenced, the section between Redfern and Illawarra Junction having been let by contract, and the work is being rapidly pushed forward. The section from Illawarra Junction to Petersham will be advertised shortly, as also the curve between the Northern and Southern line at Homebush, and a rearrangement of that station. These works have been delayed owing to the line having to be resurveyed.

Bourke Floods.—Considerable expenditure has taken place in filling timber waterway openings, which were so damaged as to prevent ordinary repairs being executed, as also the portions of embankment which were washed away. As the flood water has not sufficiently subsided the repair of existing bridges has only been dealt with in a temporary manner, but arrangements are being made to provide additional openings, as also to repair the structures which have given way.

The station buildings and bridges have been carefully looked after, and at many stations additional accommodation, both in sidings and buildings, has been provided.

During the year the extension from Hornsby to St. Leonards, a length of 10 miles 37 chains, was opened for traffic. This portion of the line has also given a considerable amount of trouble owing to subsidence of banks.

RETURN

J. ANGUS,
Acting Engineer for Existing Lines.

APPENDIX 2.

Locomotive Engineer's Report.

New South Wales Government Railways,
Locomotive Engineer's Office,

Eveleigh, Sydney, 9 August, 1890.

Dear Sir,

I hand you herewith my report to the Railway Commissioners for the year's working. Had I not been pressed for time before going away to England, I should have liked to have gone a little further into detail, but the main points are touched upon as given below.

Yours faithfully,

W. THOW,

Locomotive Engineer.

The Secretary.

[Enclosure.]

[Enclosure.]

Locomotive Engineer's Report.

Railways.

PROGRESS has been made in improving the Rolling Stock during the year, the boilers of locomotives especially have received attention, but none of the new boilers ordered came to hand sufficiently early to be used before the year closed.

Two hundred and twenty-seven locomotive boilers in all were repaired during the year, 173 of them at Eveleigh, and 54 at Newcastle. Nine stationary or pumping boilers, and 12 boilers of tram motors, were also dealt with. Of the above 103 locomotive boilers were internally examined, retubed, and received heavy repairs.

One hundred and seventy-seven locomotives at Eveleigh, and 43 at Newcastle, or 220 in all, passed through the repairing shops during the year. Of these 168 received heavy repairs and thorough overhaul. The remaining 52 received general repairs of a lighter character. Two steam cranes also were thoroughly overhauled at Eveleigh.

Seven hundred and fifty-seven carriages or coaching vehicles at Eveleigh, and 283 at Newcastle, or 1,041 vehicles in all, were overhauled. Many of those dealt with at Eveleigh received heavy repairs.

Four thousand one hundred and sixty-seven merchandise vehicles passed through the principal workshops during the year, and received more than mere running repairs. The ordinary attentions to Rolling Stock are, of course, not included in the above.

Many of the locomotives, especially those running the Melbourne Express Trains, have executed exceptionally heavy mileages, far beyond their economic duty, which shows the necessity for additions to the stock.

The consumption of fuel, 62.16 lb. per train mile, or 45.72 per engine mile, after allowing for our heavy grades, is too heavy. It is chiefly caused by the inadequate heating surfaces in most of the boilers, necessitating small blast orifices and quick draught in order to generate steam for the cylinders.

The workshop machinery, hydraulic plant, and pumping appliances belonging to the Department have been maintained in efficient working order.

* Interest for six months on £231,700. † For the redemption of this loan a sum of £70,000 is set apart to pay interest and principal. ‡ At the end of 1902 the loans raised at 5 per cent. will have been redeemed, with the exception of £2,700 permanent and a small balance on 31 Vic. No. 11. § Interminable (Funded Stock). ¶ To make up the total of the 4 per cent. loans the Interminable Debentures under 36 Victoria No. 21 must be added. †† Does not include Tramway loans.

APPENDIX 9.

Morpeth Branch	4	60,586	15,146
Hornsby and St. Leonards	11	203,389	18,490
Campbelltown to Camden } Tram lines	7 $\frac{1}{2}$	38,434	5,124
Kogarah to San Souci }	5	11,956	2,391
Average cost of construction	2,182	26,212,996	12,013
Rolling stock		£3,460,860	
Machinery		245,928	
Workshops		627,828	
Furniture		7,511	
		4,342,127	
Average and total cost, all charges.....	2,182	30,555,123	14,003

APPENDIX 12.

STATEMENT showing cost of Additions and Improvements to Stations, Buildings, Siding Accommodation, &c., and Rolling Stock, the cost of which was charged to Capital Account, during the year ending 30th June, 1890.

Particulars.	Amount.	Total.
	£	£
Additions to stations and buildings	78,598	
Equipment of stations, &c., cranes and weighing appliances	2,593	
Overbridges and subways	4,680	
Improvements to water supply	4,600	
Extending sidings and making additional sidings, loops, &c.	35,784	
Additions to signals and interlocking.....	38,040	
Additional flood-openings and waterways	2,251	
Cost of land resumed	36,390	
	202,936	
Additional rolling stock	£87,414	
Additional machinery.....	2,166	
	89,580	
		292,516

APPENDIX 13.

RETURN of the Milage of Suburban Passengers on all Lines of Railway during the years ending 30th June, 1888, 1889, and 1890.

Description.	1888.	1889.	1890.
Number of Passengers	No. 7,413,868	8,086,908	8,504,942
„ Workmen's Journeys	1,738,294	1,796,520	1,990,368
„ Season Ticket Holders' Journeys	3,227,760	3,460,320	3,936,180
Total, Passenger Journeys	12,379,912	13,343,748	14,521,490
Number of miles travelled	Miles 70,172,793	77,823,971	83,216,224
Average milage per passenger	5.67	5.79	5.73
Amount received from passengers.....	£ 186,393	205,393	233,465
Average receipts per mile per passenger	0.64	0.64	0.67

NOTE.—Suburban Lines include only distances within 20 miles of Sydney and Newcastle, Liverpool and Morpeth included

TRAMWAYS.

APPENDIX 25.

REPORT of the Tramway Locomotive Superintendent.

To the Commissioners for Railways,—

Gentlemen,

Randwick, 14 August, 1890.

I have the honor to report as follows, with regard to the Tramway Locomotive Branch under my charge, during the past year:—

Workshops.

The whole of the machinery in the engine-repairing, boiler, and carriage shops has been maintained in efficient working order. Two machines have been transferred here from the Railway Permanent-way Workshops, to meet the increased work now performed by this branch for the Permanent-way of the Tramways.

Electric Lighting.

The engine and dynamos in this department have been kept in running order, and the lighting of the Randwick Yard and Running Shed efficiently carried out.

Engines.

The total number of engines on the books is 88, but 80 only are available for present traffic. These have been maintained in efficient condition, and the requirements of the traffic met without interruption.

Boilers.

Extensive repairs have been carried out in this branch. Thirteen boilers have had their fire-boxes taken out and all defective parts renewed; 12 have had all tubes taken out, internally examined and repaired, and one new boiler has been made and turned into service.

Cars.

Forty-seven new cars, including one built by the department, have been supplied during the year. An average of five cars per month have been repainted, or touched up and varnished, and the whole stock has been maintained in efficient running order.

General Remarks.

In addition to the ordinary work of the Locomotive branch, one new travelling iron water-tank was made and turned into service. New points and crossings, point-boxes, &c., have been made and supplied to the Permanent-way branch. A large number of wood blocks, for road paving, were also cut and supplied to the latter branch.

During the year, the number of engines in steam daily was increased by 3·72, and the extra mileage, compared with that of the previous year, amounted to 165,656 miles, notwithstanding which the locomotive service, as a whole, has been conducted at a less cost for maintenance than on the preceding year.

NORTH SHORE CABLE TRAMWAY.

Cable.

The new wire rope put in in November last became stranded in January, after working about two and a half months. It was with difficulty kept running until April, when it had to be replaced.

Running Gear.

The running gear has been partially remodelled, after the most modern pattern, with good results, and the further improvements authorized are being pushed forward as rapidly as possible.

Cars.

Four new cars have been added during the year to cope with increased traffic. Four cars have been thoroughly repaired and repainted, and the remainder maintained in efficient working order. The dummy cars require overhaul, and will be taken in hand shortly.

Pumps.

The pumps originally fixed and worked by the cable have been taken out and an improved supply secured by effecting a connection with the new main of the Water and Sewerage Board, adjoining the engine-house, to the tanks for supply water to the boilers at the depôt.

General Remarks.

The working of this line has not been as satisfactory as could be desired, but when all the improvements authorized by the Commissioners have been effected, the line will be in a more efficient condition than it has been at any time since it was opened for traffic.

GEO. DOWNE,

Locomotive Superintendent.

APPENDIX 26.

APPENDIX 26.

REPORT of Tramway Engineer.

Tramway Department, Office of Engineer for Tramways, 18 August, 1890.

To the Commissioners for Railways,—

Gentlemen,

I have the honor to report as follows on the condition of the Existing Tramways for the year ending 30 June, 1890.

Owing to the unusual amount of rain which fell during the year the work of maintaining the lines in good order has necessitated great care and heavy expenditure. This is especially the case in George-street West and Oxford-street, where the existing rails are unsuitable for streets paved with wood. When the rails of heavier and altered pattern, expected to arrive shortly, are laid, the cost of maintenance in these streets will be considerably reduced.

During the year portions of the Randwick line, through Moore Park and the Centennial Park, have been relaid for a distance of 2 miles 18 chains with 60lb. steel rails, in place of the 42lb. iron rails used when the line was first constructed.

The Botany tram-line is in course of duplication, a new departure being made in discontinuing the concrete foundation. By this it is believed the life of both rails and sleepers will be greatly extended, and the cost of maintenance reduced.

I have, &c.,

G. R. COWDERY.

TOTAL, TRAMWAYS.....£	159,662	*153,255	147,327

NOTE. Includes all wages paid by the Department, whether on maintenance or new works.
* Adjusted figures

APPENDIX 38.

RETURN of the number and nature of Accidents, and the Injuries to Life and Limb, which occurred on the Tramways from 1st July, 1889, to 30th June, 1890.

Date.	Servants of Department.		Passengers.		Other than Passengers.		Nature and Cause of Accident.
	Killed.	Injured.	Killed.	Injured.	Killed.	Injured.	
1889.							
1 July					1		Man killed, entering tram in motion.
27 ".....						1	Man ran against motor, King-street.
5 August					1		Man killed, entering tram in motion.
21 ".....					1		" " "
3 September					1		Man run over.
15 ".....		1					Conductor jammed between cars, Bridge-street.
24 ".....						1	Man jumped on tram in motion.
4 October						2	Women injured—cart collided with tram.
4 ".....		1					Conductor knocked off car, Waverley.
7 ".....						1	Boy injured.
26 ".....	1						Conductor knocked off car.
29 ".....						1	Man injured—cart collided with tram, North Shore.
30 ".....			1				Man knocked off car, Belmore.
4 December				1			Boy injured—jumping off tram in motion.
6 ".....						1	" crossing in front of tram.
6 ".....						1	Man injured—knocked down by motor.
10 ".....						1	Child injured—knocked down by motor.
26 ".....				1			Man fell from tram whilst in motion.
29 ".....			1				Chinaman jumped off tram whilst in motion.
1890.							
9 January.....					1		Child run over.
14 ".....						1	Man injured—cart in collision with motor.
28 ".....						1	" " " " "
6 February	1						Driver killed—motor turned over.
14 ".....		1					Car-examiner jammed between cars.
15 ".....					1		Child run over.
8 March						1	Chinaman injured—cart in collision with tram.
20 ".....		1					Conductor knocked off tram.
5 April						1	Woman crossing in front of motor.
9 ".....						1	Chinaman jumped off tram in motion.
18 ".....					1		Man stepped suddenly in front of cars.
2 May						1	Chinaman injured—cart in collision with tram.
8 ".....				1			Man jumped off tram in motion.
22 ".....						1	Man injured—vehicle in collision with motor.
27 ".....						1	Child run over—leg amputated.
27 ".....		1					Junior Conductor injured by cart running against him.
29 ".....						1	Man injured—cart in collision with tram.
14 June						1	Boy injured—fish-cart in collision with tram.
14 ".....			1				Boy jumped off tram in motion.
14 ".....			1				Lady left tram whilst in motion.
18 ".....				1			Man left tram in motion.
23 ".....			1				" " " "
23 ".....				1			Woman left tram in motion.

APPENDIX 39.

RETURN of Miscellaneous Articles imported for the Tramways during the year ending 30th June, 1890.

Date of Arrival.	Name of Ship.	Description of Material.	Supplied by	Weight.	Rate.	Invoice Cost.	Freight.	English Charges	Colonial Charges	Total Cost.	Cost.

LIST of concessions granted to the Staff since the Commissioners took office:—

The wages of all extra men increased from 6s. to 6s. 6d. per day, and a further increase to 7s. at the end of twelve months.

The salaries of Night Officers raised and the minimum rate increased £10; maximum rate, £20 per annum.

A new classification of signalmen introduced, giving a large number of advances to men in the Metropolitan and Newcastle districts; advance of pay given to signalmen continuously employed in country boxes.

Enginemmen and firemen's hours reduced from 55 to 54 hours per week, and nothing less than half-day to be paid for Sunday duty. Sunday duty also to be paid for at the rate of time and a quarter.

Fottlers' time to count from the time they were inside the railway fences and starting for work.

Permanent-way men paid 7s. 6d. per day after eighteen months' service, 7s. being the maximum for new hands when the Commissioners' took office.

Gangers allowed one quarter day's pay for walking their lengths on Sundays, and also supplied with tricycles. Also allowed six days good conduct holidays, instead of three which had been granted in August, 1888.

Good conduct holidays, six each year, extended to shunters, signalmen, assistant guards, and assistant conductors.

The minimum pay to gate-keepers increased to 7s. per week, in place of 2s. 6d. per week as previously.

An allowance of 6d. per night made to extra gangs when away from home. In addition a number of old carriages are being fitted with sleeping accommodation for the use of extra gangs, and vans with cooking-stoves, &c., are also being built. More liberal arrangements also made for visits to their homes.

Wages of workmen in shops more equitably adjusted.

Junior porters paid for Sunday duty, formerly the weekly wage covered the seven days work.

Goods-shed porters, Sydney and Darling Harbour, paid overtime at increase on ordinary rates. Ordinary pay only previously given.

Employees temporarily filling superior positions paid the rate attaching to the superior grade.

In addition to the above a large number of other concessions have been given which, although not of general application as they would only affect certain branches, yet all have a bearing upon the improvement of the Staff and have entailed an increase in the expenditure. For instance, the expenses to 3rd class operators were increased from 3s. to 5s. per day; additional holidays given to head porters, foremen, and platform inspectors; Sydney car examiners increased to a maximum of 8s. 6d. per day; gripmen, North Shore Tram line placed on same footing as conductors; conductors on Newcastle Tram lines pay increased to same standard as Sydney; employees detained through late running of trains not to lose pay; medical certificates not to be demanded from fettlers except in special cases; sick pay allowances to be paid irrespective of any consideration as to whether employees belong to benefit society.

APPENDIX 40.

NEW SOUTH WALES GOVERNMENT RAILWAYS.

BY-LAW No. 34.

The Railway Commissioners of New South Wales, in pursuance of the powers conferred by the Government Railways Act of 1888, do hereby make the following By-law in respect of permanent appointments in the Railway Service; and all previous regulations conflicting therewith are hereby repealed.

Conditions of Employment of Staff in the various Branches.

GENERAL CONDITIONS APPLICABLE TO THE WHOLE STAFF.

All future appointments and promotions will be made under the following regulations:—

No person over the age of 35 years shall be appointed to any grade in the Traffic Branch, or over the age of 40 years in the Engineering and Stores Branches, except with the special authority of the Board of Commissioners, and no one having once left the service (except in consequence of reduction of staff) will be readmitted except upon similar authority.

Whenever the Commissioners require additional permanent officers, notice thereof will be given three times in a Sydney daily paper; this notice will state the branches for which such additional officers are required, the necessary qualifications, and also the time and place of examination, which will be so arranged that, where it is considered necessary, persons residing in the country districts shall have reasonable facilities for being examined in the district in which they reside.

No person shall be appointed as an additional permanent officer who has not obtained a certificate of fitness from the Examiners.

If a greater number of candidates than are required for appointment obtain certificates from the Examiners, the Commissioners will appoint as many persons as are required, in such grades and to such situations as they may consider best. The persons in excess of the number required will be eligible for appointment for a period of twelve months then next ensuing from the date of such determination, without further examination. If the number of candidates for examination exceed three times the number to be employed, the most eligible candidates for examination will be selected, not exceeding the number specified.

All appointments will be made to the lowest position of the grade in each of the various branches of the Railway service, and on probation only, for a period of six months. After the period of such probation, and upon production of a certificate of fitness from the officer at the head of the branch in which such probationer was employed, and upon proof to the satisfaction of the Commissioners that all the provisions of the Railway Act have been complied with, such appointments will be confirmed by the Commissioners.

Mr. A. Richardson and Mr. D. H. Neale to be the Board of Examiners of candidates for employment. The heads of each Branch to be *ex officio* members of the Board.

No probationer shall have his appointment confirmed until he shall have insured his life as provided for in By-law No. 35, of the 12th December, 1889, issued in accordance with section 64 of the Government Railways Act of 1888.

Every person in the Railway Department will hold his situation conditionally on his being subject to and strictly observing the rules and regulations established from time to time for his guidance, whether published with the General Rules and Regulations or otherwise; and every employé must consider all rules of general application equally as binding upon him as those specially pertaining to his own particular position or duties.

Men who leave the service in consequence of reduction of staff or slackness of work, and are subsequently re-employed within six months of having left, to be paid at the same rate as they were previously in receipt of, if they are engaged on similar duties.

Promotion and increases of pay in all grades of the several branches will be made, except where scales are in operation, according to merit, and will be considered by the Commissioners on the recommendation of the head of the Branch.

The annual advances of pay, where scales are in operation, will be dependent and continued upon a certificate of efficiency and good conduct being given.

Only competent workmen will be engaged for service in the Locomotive, Permanent Way, and other shops; they will be paid the average rates of wages found to be prevailing in private establishments for work similar to that which they are required to perform.

No employé is allowed to engage in any business or employment outside the duties of his office.

All employés in every branch of the Railway Service, whether the same be officers or servants, shall retire from the Railway Service at the age of sixty years. *Provided*, however, that the Railway Commissioners may at their discretion, and with consent of the parties, require any of such officers or servants to continue in the said service after the age of sixty years, if it shall appear to the Commissioners that the retention of such officers or servants would be advantageous to the Service.

Before

Before any one is appointed to the Railway Service he must undergo a medical examination, and produce a certificate from the authorized medical officer that he is free from all bodily and mental infirmity, is physically able to perform the duties of the position he seeks, and that his eyesight and hearing are perfect. He must also produce certificates of good character.

Sons of employes of the Department are not to be employed at stations or in offices under their father's charge, except youths receiving salaries under £80 per annum, who are to be removed to some other station or office when their salaries are £80 per annum or upwards.

EXAMINATIONS.

SALARIED STAFF.

The educational examination for clerical apprentices and telegraph operators is to be as follows:—

Arithmetic.—The simple rules, and proportion, practice, interest, fractions, and decimals.

Reading, and writing from dictation.

In the case of telegraph operators such technical examination shall be added as the Telegraph Inspector shall think fit.

The candidate having had a sufficient opportunity of looking over the arithmetical examination paper, shall be timed in working it, and shall not be passed unless he obtain such marks as the Examiner may fix upon as the minimum number to be obtained.

APPRENTICE CLERKS.

Apprentice Clerks will be taken on from 15 to 17 years of age at the following rates:—

15 to 16 years	£30 per annum.
16 to 17 "	40 "
17 to 18 "	50 "
18 to 19 "	70 "

And subsequently according to merit and the class of work which has to be performed.

JUNIOR CLERKS IN CHIEF OFFICES.

Candidates for employment in the chief offices and the principal offices of the District Officers will be required to pass a superior examination, and if appointed, to make themselves proficient in Pitman's system of Shorthand within 12 months of entering the service. Failing to do this, they will not be eligible for promotion, and will be liable to be removed from their offices.

The examination paper to be specially prepared and signed by the Secretary, Chief Traffic Manager, Locomotive Engineer, and Engineer for Existing Lines for their respective Departments, and submitted to the Commissioners for approval.

Youths appointed to vacancies in the offices named must not be under the age of 16 years.

The following scale of salaries to be adopted, subject to an annual report of efficiency to the Commissioners:—

1st year	£60 per annum.
2nd "	£80 "
3rd "	£100 "
4th "	£120 "

Subsequent promotion to be by merit.

Youths who are already in the service, and who are not under 16 years of age, will be allowed to compete for these appointments.

CLERICAL STAFF.

To be paid according to merit and class of work to be performed.

Minimum salary	£75 per annum.
Maximum "	350 "

The following are the conditions for the various Branches:—

LOCOMOTIVE BRANCH.

WORKSHOPS.

Lads will be taken into the shops as required, to learn the trades of fitter, turner, &c. They will not be taken in under the age of 15 years, and will not be out of their apprenticeship until the age of 21 years. They must be of good constitution, and able to read and write with facility; they will not be bound apprentice, but will be able to resign, and will be liable to dismissal, in the same way as the men; they will also be subject to the same rules and regulations as the men. The remuneration for their services will be as follows:—

1st period — or up to 17 years of age	10d. per day.
2nd " of a year	1s. 3d. "
3rd "	2s. "
4th "	3s. "
5th "	5s. "

At the end of the term of apprenticeship they will be paid wages proportionate to the value of their services.

SHOP BOYS.

Boys, other than apprentices, will be taken on to assist workmen in the running sheds and workshops at the following rates of pay:—

14 to 15 years	1s. 9d. per day.
15 " 16 "	2s. 0d. "
16 " 17 "	2s. 3d. "
17 " 18 "	2s. 6d. "
18 " 19 "	3s. 0d. "
19 " 20 "	4s. 0d. "
20 " 21 "	5s. 0d. "

The following will be the conditions for acquiring the positions of Cleaner, Fireman, and Engine-driver:—

CLEANERS.

Only youths between 15 and 18 years of age will be eligible for appointment as Cleaners. Each youth must undergo a medical examination, and produce a certificate from the authorized Medical Officer to the effect that he is free from bodily or mental infirmity, possesses good eyesight and hearing, and is not afflicted with colour blindness either by day or night; he must also produce satisfactory testimonials of character, and be able to read and write.

The rates of wages will be as follows:—

1st year—15 to 16 years	2s. 6d. per day.
2nd " 16 to 17 "	3s. 3d. "
3rd " 17 to 18 "	4s. 0d. "
4th " 18 to 19 "	4s. 9d. "
5th " 19 to 20 "	5s. 6d. "
6th " 20 to 21 "	6s. 0d. "
7th " 21 and over	7s. 0d. "

6d. per night additional will be allowed for night work.

When additional Firemen are required, Cleaners will be promoted according to efficiency and seniority, provided their general conduct has been satisfactory, and that they are eligible in all other respects.

FIREMEN.

All Firemen must have served as Cleaners, or have acted as Firemen or Drivers on other Railways. Before being appointed as Fireman, each man who has not previously passed a medical examination will have to produce a certificate from the authorized Medical Officer similar to that required from Cleaners when entering the Service. He must also undergo an examination in the Rules and Regulations applicable to Enginemmen, especially those relating to the working of trains, signalling, &c.

The rates of wages will be as follows:—

3rd class—1st 18 months	8s. per day.
2nd " 2nd 18 months	9s. "
1st " after 3 years' service (maximum rate)	10s. "

Firemen must always commence in the 3rd class.

As vacancies for Drivers occur, Firemen who have been not less than twelve months in the 1st class, or Firemen who have previously served as Engine-drivers on other Railways, will be promoted according to efficiency, provided their general conduct has been satisfactory.

ENGINE-DRIVERS.

No person will be allowed to undertake the duties of Engine-driver unless he has previously served as Fireman on the New South Wales Railways, and is eligible for promotion. Before being appointed as Driver, each man must hold a certificate from the Locomotive Engineer, showing that he has passed the necessary examination, and is competent to take charge of a Locomotive Engine.

The subjects of examination must embrace a knowledge of the road, gradients, approaches to stations and sidings, positions of signals, &c., the examination of engine before joining a train, firing, trimming of syphons, oiling, testing of valves and pistons, and the various modes of uncoupling engines when they fail on the road, and the methods to be adopted to surmount any slight breakdown, &c., &c.

The rates of wages will be as follows:—

Shunting Engines	11s. per day.
5th class	11s. "
4th " after 1 year's service as Driver of Goods or Passenger trains	12s. "
3rd " " 2 " " " " " " " " " "	13s. "
2nd " " 3 " " " " " " " " " "	14s. "
1st " " " " " " " " " " " "	15s. "

The position of first-class Driver will only be obtainable as vacancies in that grade occur, and after serving as a Driver at least ten years. The number of Drivers in the first class shall never exceed one-seventh of the whole number of Drivers employed.

Drivers must always commence in the fifth class.

PERMANENT-WAY BRANCH.

The Permanent-way labourers must be strong able-bodied men, in good health, and capable of performing rough hard work. They must have perfect eyesight and hearing, be of good character, and able to read and write. Promotion and increase of wages will be in accordance with merit.

These

These conditions will not apply to temporary men such as are employed in the flying gangs (except as to their ability to perform the work required of them), but qualified temporary men will be eligible for the permanent staff as vacancies occur.

The rates of wages will be as follows :—

FETTLERS AND LABOURERS.

First 6 months	6s. 6d. per day.
From 6 to 18 months	7s. "
After 18 months' service	7s. 6d. "

GANGERS.

When gangers are required suitable men will be selected from the fettleers or labourers. They must be steady and reliable, thoroughly understand the work, be able to read and write, and be quite competent to undertake all the duties of the position.

GANGERS.

First 6 months	8s. 6d. per day.
After 6 "	on certificate of fitness	9s. "

For inspecting their lengths on Sundays Gangers will be allowed one-quarter day's pay.

INSPECTORS AND FOREMEN.

Gangers and Mechanics will be promoted to Foremen and Inspectors as required, in cases where they are qualified to fill such positions.

INSPECTORS AND FOREMEN.

Minimum salary	£200 per annum.
Maximum "	300 "

CHIEF INSPECTORS.

Minimum salary	£300 per annum.
Maximum "	400 "

TOOL COLLECTORS.

Youths, from 15 to 17 years of age, will be taken on as Tool Collectors at the following rates of pay :—

15 to 16 years of age	2s. per day.
16 to 17 "	2s. 6d. "
17 to 18 "	3s. "
18 to 19 "	4s. "

At the end of the term they will be paid wages proportionate to the value of their services.

TRAFFIC BRANCH.

GENERAL OUT-DOOR STAFF.

The employes comprised in the general out-door staff will be classified and paid as follows :—

PLATFORM INSPECTORS, FOREMEN (GOODS, COACHING, AND SHUNTING).

10s. to 12s. per day; increases of 6d. per day per annum.

SUBURBAN PASSENGER GUARDS.

8s. 6d. per day for 2 years; 9s., 2 to 5 years; 10s., 5 to 10 years.

If promoted to Through Passenger Guards, to take up pay applicable to length of service as Guards.

THROUGH PASSENGER AND GOODS GUARDS.

9s. per day,	first year.
9s. 6d. after 1 year and up to 2 years.	
10s. "	2 " 5 "
10s. 6d. "	5 " 10 "
11s. "	10 years.

COAL TRAIN GUARDS.

8s. per day first 6 months; 8s. 6d. second 6 months; 9s. 1 year to 4 years; 9s. 6d. per day after.

ASSISTANT GOODS GUARDS.

8s. per day for first 6 months, 8s. 6d. per day after.

SHUNTERS.

2nd class, 7s. per day for six months, 7s. 6d. after six months.
1st class, 8s. to 9s.; increase of 6d. per day per annum.

SIGNALMEN.

4th class (men who do not deal with passenger traffic), 7s. per day first year, 7s. 6d. after one year.
3rd class, 8s. per day first year; 8s. 6d. after one year's service.
2nd class, 9s. " " 6d. per day per annum until maximum of 10s. is reached.
1st class, 10s. 6d. per day for first year; 11s. per day after first year.

All men appointed as Signalmen must have had 12 months railway experience.

PORTERS

PORTERS (GOODS AND COACHING).

3rd class, 6s. per day for first 6 months; 6s. 6d. for second 6 months; 7s. after 12 months.

2nd class, 7s. 6d. per day.

1st class and Leading Porters, 8s. per day.

Head Porters, 8s. 6d. to 10s. per day; increases of 6d. per day per annum.

LEAD PORTERS

Will be taken on from 16 to 18 years of age.

2s. 6d. per day up to 18 years of age.

3s. 4d. " 18 to 19 "

4s. 2d. " 19 to 20 "

5s. " 20 to 21 "

Over 21 to be appointed to first vacancy for 3rd class Porters.

Vacancies for Guards will be filled by promoting the most suitable men from the other grades. Every Guard must have had at least two years' railway experience before being allowed to take independent charge of a train. Every man must also pass an examination in the duties, &c., before being appointed Assistant Guard, and also before being promoted to Guard. The chief subjects of the examinations will be as follows:—

ASSISTANT GUARDS.

Knowledge of Rules and Regulations, especially those relating to train working.

Shunting.

Signalling.

Working of brakes.

Securing of loading.

Single and double line working under the different systems.

Protection of trains.

Steep gradient working.

GUARDS.

Will be carefully re-examined on the subjects for Assistant Guards.

Knowledge of road, gradients, &c.

positions and description of signals.

approaches to stations and sidings.

station yards.

General railway working.

Men who have not previously undergone a medical examination—such as those who joined the Service before these conditions came into operation—must be examined as to their eye-sight before being allowed to run as Assistant Guard or Guard.

The minimum height for Out-door Staff will be 5 ft. 6 in.

STATION STAFF.

In all cases the maximum salaries are to be obtained by merit, and the importance of the post filled.

OFFICERS IN CHARGE.

Minimum salary, £130 per annum, with house, or 10s. per week in lieu thereof.

Maximum " £150 " " " "

NIGHT OFFICERS IN CHARGE.

Minimum salary £120 per annum.

Maximum " *£140 "

STATION-MASTERS.

Minimum salary £150 per annum, with house.

Maximum " 400 " "

RELIEVING STATION-MASTERS.

Minimum salary £180 per annum.

Maximum " 300 "

STATION-MASTERS.

Only persons having a thorough Railway experience, and who are able to compile the various returns and accounts required by the Department, will be eligible for promotion to the position of Station-master. The officers must possess a knowledge of all the outside duties, such as signalling, shunting, and general yard work, loading and unloading of all descriptions of traffic, and the working of trains, &c., as well as be able to perform the inside or office work. The position of Station-master is therefore one which any member of the staff can obtain by making himself thoroughly conversant with the duties of the office. A practical acquaintance with Morse telegraphy (which should be acquired by every employé in the Traffic Branch) will also be greatly conducive to such promotion, as some of the positions will only be given to those officers who are conversant with the telegraph. Good conduct will always be indispensable.

The foregoing classification does not include small wayside stations and platforms which are in charge of Porters.

No person will be appointed Station-master until the Chief Traffic Manager and Traffic Auditor have reported to the Commissioners that he is thoroughly conversant with the general working of a Railway, and also with the mode of keeping the accounts.

TELEGRAPH

* Subsequently advanced to £150.

TELEGRAPH OPERATORS.

Lads of not less than 15 years of age will be received into the Service, as required, to learn the duties of Telegraph Operator. Before any lads are appointed, they will be required to pass an examination. While on probation they will receive a nominal salary of 2s. 6d. per week.

LEAVE.

Every servant, except Salaried Officers, will be entitled to a day's leave on full pay for each proclaimed general public holiday. Those servants who cannot take such leave on the proclaimed holidays, in consequence of being required to work, will, on making application, be allowed the same number of days at a future time, provided the head of the Branch decides that they can be conveniently spared. Should, however, the exigencies of the Service not admit of the whole or any of the holidays being taken before the 31st of July of the year following that for which they are due, an equivalent in money will be paid.

In addition to the above, Engine-drivers, Firemen, Guards, Signalmen, and Gangers of Fettlers may be allowed six days' leave of absence in each year, on full pay, if their general conduct has been satisfactory. This leave will only be granted at times most convenient to the Department, and the Locomotive Engineer, Engineer for Existing Lines, or Chief Traffic Manager will have the power to disallow it altogether, or reduce the time, in cases where it is considered the employé is not entitled to the full leave.

Officers paid by annual salary will, if they can be conveniently spared, be allowed three weeks' leave of absence in each year. Leave not taken when due will lapse.

FREE PASSES.

Holiday free passes will not be granted to employés who, through misconduct, are not deserving of such indulgence, nor at times when there is likely to be any difficulty in providing sufficient carriage accommodation for the public.

APPEALS.

In any case where an employé considers he has been unjustly dealt with, he must, in the first instance, appeal to the head of his Branch, and then, if he still consider he has been unfairly treated, after such appeal, he has the right of appealing to the Commissioners, such appeal to pass through his Departmental Head.

The Commissioners will hear any appeal made by an employé against the adoption or confirmation of the advice or decision of the officer at the head of his branch, with regard to his right to promotion, or with respect to any charge made against such employé, or with respect to any penalty imposed by such officer; and will confirm or modify such decision, or make such order as they think fit; and their decision will be final. Every such appeal will be heard within thirty days from the date of the appeal being lodged with the Commissioners.

(L.S.) E. M. G. EDDY, Chief Commissioner.
W. M. FEHON, Commissioner.
CHARLES N. J. OLIVER, Commissioner.

The Common Seal of the Railway Commissioners of New South Wales was hereto affixed this second day of December, in the year of our Lord 1889, in the presence of—

HUGH M'LACHLAN.

Confirmed by the Governor-in-Council on the 10th day of December, 1889,—

ALEX. C. BUDGE,
Clerk of the Executive Council.

NEW SOUTH WALES GOVERNMENT RAILWAYS.

BY-LAW No. 35.

THE Railway Commissioners of New South Wales, in pursuance of the powers conferred by the Government Railways Act of 1888, do hereby make the following By-law regulating the conditions under which persons appointed to the Railway Service must effect insurances on their lives; and all previous regulations conflicting therewith are hereby repealed.

GENERAL REGULATIONS—LIFE INSURANCE.

REGULATIONS ISSUED IN ACCORDANCE WITH SECTION 64 OF THE GOVERNMENT RAILWAYS ACT OF 1888.

ALL officers or servants appointed or to be appointed after 22nd October, 1888, to the Railway Service, must insure their lives, and shall hold their offices on the express condition that a deduction will be made from their salaries or wages for the payment of the premium on the policy to keep their lives insured, should they fail to pay the necessary premium to the Insurance Company.

The insurance shall be effected with some Life Insurance Company carrying on business in New South Wales approved by the Commissioners, which shall have agreed with the Commissioners, upon a condition, to increase the amount of insurance from time to time according to these Regulations, at the rates specified in the tables of the insurance company forming the basis of the contract, and without any further medical examination beyond that instituted by the said insurance company when the agreement or policy with each officer or servant shall have been taken out; it being the intention of these Regulations that the contract shall continue until the assured shall die or attain the age of sixty, whichever may first happen.

The

The amount of the insurance shall at all times be in accordance with the following scale:—

Salary or Wages.	Amount of Insurance.
Under £100 a year	£100
£100 to £199	£200
£200 to £299	£300
£300 to £399	£400
£400 to £499	£500
£500 and over	£600 as a maximum.

All insurances shall be for a fixed sum and at rates according to tables of the Insurance Companies, which shall be signed by the manager or other accredited officer by order of the Board of Management, and shall be deposited with the Commissioners, and the premiums shall be payable in advance. The contract once entered into with a company shall not be varied, but all succeeding increases are to be made with the same company. The said increases, as hereinbefore provided, shall be made at the rates fixed by the said tables according to the ages of the assured at the time of increased insurance being required consequent upon increased salary or wages according to these Regulations. All promotions shall be advised to the insurance company by the Railway Accountant.

All insurances shall be in the names of the assured; but all policies shall be lodged with the Railway Commissioners, and shall remain in their possession, and shall be unassignable either at law or in equity.

Provided that the amount so insured shall be payable to the employé on his leaving the service upon attaining the age of sixty, or to his legal representatives should he die before attaining that age.

Provided further, that in case any employé shall be retained in the Railway Service after attaining the age of retirement, the amount then due to such employé under such contract of insurance shall be by him invested in Government stocks or debentures, mortgages, or such other securities as shall be approved by the Commissioners, and the securities shall be handed over to the Commissioners until such employé die or leave the Railway Service, when they shall be handed over to him or to his legal representative in the event of his death.

No company shall be compelled to insure the life of any officer or servant for a larger sum than is provided by these Regulations; but any additional insurance shall be matter of contract between the assurer and the assured, and the policies in such cases shall not be lodged with the Commissioners, or be in anywise subject to these Regulations.

A record of all insurances made in pursuance of these Regulations shall be kept by the Railway Accountant, and shall show the date and amount of the original insurance, and of each successive increase.

The insurance shall be by way of endowment, and shall be payable when the assured attains the age of sixty years, or sooner in the event of earlier death.

The Commissioners may require any persons appointed by them under the 63rd section of the said Act, without examination or probation, to insure their lives as nearly as may be after the method prescribed by these Regulations.

Any employé, whether officer or servant, on resigning, being dismissed, or otherwise leaving the service of the Commissioners, shall have all policies in his name delivered to him, and the Commissioners shall not thereafter have any charge of the policies or liability in respect of the premiums; but the Accountant shall give notice to the insurance company interested, and the said policies shall thereafter cease to be subject to these Regulations, but shall not be otherwise affected as a contract between the insurer and the insured so long as the premiums thereon are paid by the insured.

(L.S.) E. M. G. BDDY, Chief Commissioner.
W. M. FEHON, Commissioner.
CHARLES N. J. OLIVER, Commissioner.

The Common Seal of the Railway Commissioners was hereunto affixed this second day of December, in the year of our Lord 1889, in the presence of—

HUGH M'LACHLAN.

Confirmed by the Governor-in-Council this 10th day of December, 1889,—

ALEX. C. BUDGE,
Clerk of the Executive Council.

NEW SOUTH WALES GOVERNMENT TRAMWAYS.

BY-LAW No. 36.

THE Railway Commissioners of New South Wales, in pursuance of the powers conferred by the Government Railways Act of 1888, do hereby make the following By-law in respect of permanent appointments in the Tramway Service; and all previous regulations conflicting therewith are hereby repealed.

Conditions of Employment of Staff in the various Branches.

GENERAL CONDITIONS APPLICABLE TO THE WHOLE STAFF.

All future appointments and promotions will be made under the following regulations;—

No person over the age of 35 years shall be appointed to any grade in the Traffic Branch, or over the age of 40 years in other Branches, except with the special authority of the Board of Commissioners, and no one having once left the Service (except in consequence of reduction of staff) will be readmitted except upon similar authority.

Whenever

Whenever the Commissioners require additional permanent officers, notice thereof will be given three times in a Sydney daily paper; this notice will state the branches for which such additional officers are required, the necessary qualifications, and also the time and place of examination, which will be so arranged that, where it is considered necessary, persons residing in the country districts shall have reasonable facilities for being examined in the district in which they reside.

No person shall be appointed as an additional permanent officer who has not obtained a certificate of fitness from the Examiners.

If a greater number of candidates than are required for appointment obtain certificates from the Examiners, the Commissioners will appoint as many persons as are required, in such grades and to such situations as they may consider best. The persons in excess of the number required will be eligible for appointment for a period of twelve months then next ensuing from the date of such determination, without further examination. If the number of candidates for examination exceed three times the number to be employed, the most eligible candidates for examination will be selected, not exceeding the number specified.

All appointments will be made to the lowest position of the grade in each of the various branches of the Service, and on probation only, for a period of six months. After the period of such probation, and upon production of a certificate of fitness from the officer at the head of the branch in which such probationer was employed, and upon proof to the satisfaction of the Commissioners that all the provisions of the Railway Act have been complied with, such appointments will be confirmed by the Commissioners.

Mr. J. Roberts, Mr. G. Downe, and Mr. Geo. Cowdery, junr., to be the Board of Examiners of candidates for employment.

No probationer shall have his appointment confirmed until he shall have insured his life as provided for in By-law No. 35, of the 12th December, 1889, issued in accordance with section 64 of the Government Railways Act of 1888.

Every person in the Tramway Department will hold his situation conditionally on his being subject to and strictly observing the rules and regulations established from time to time for his guidance, whether published with the General Rules and Regulations or otherwise; and every employé must consider all rules of general application equally as binding upon him as those specially pertaining to his own particular position or duties.

Men who leave the Service in consequence of reduction of staff or slackness of work, and are subsequently re-employed within six months of having left, to be paid at the same rate as they were previously in receipt of, if they are engaged on similar duties.

Promotion and increases of pay in all grades of the several branches will be made, except where scales are in operation, according to merit, and will be considered by the Commissioners on the recommendation of the head of the Branch.

The annual advance of pay, where scales are in operation, will be dependent and continued upon a certificate of efficiency and good conduct being given.

Only competent workmen or labourers will be engaged for service in the workshops; they will be paid the average rates of wages found to be prevailing in private establishments for work similar to that which they are required to perform.

No employé is allowed to engage in any business or employment outside the duties of his office.

All employés in every branch of the Tramway Service, whether the same be officers or servants, shall retire from the Tramway Service at the age of sixty years. *Provided*, however, that the Railway Commissioners may at their discretion, and with consent of the parties, require any of such officers or servants to continue in the said service after the age of sixty years, if it shall appear to the Commissioners that the retention of such officers or servants would be advantageous to the Service.

Before any one is appointed to the Tramway Service he must undergo a medical examination, and produce a certificate from the authorized medical officer that he is free from all bodily and mental infirmity, is physically able to perform the duties of the position he seeks, and that his eyesight and hearing are perfect. He must also produce certificates of good character.

Sons of employés of the Department are not to be employed under their father's charge, except youths receiving salaries under £80 per annum, who are to be removed to some other position when their salaries are £80 per annum or upwards.

EXAMINATIONS.

SALARIED STAFF.

The educational examination for clerical apprentices is to be as follows:—

Arithmetic.—The simple rules, and proportion, practice, interest, fractions, and decimals.

Reading, and writing from dictation.

The candidate having had a sufficient opportunity of looking over the arithmetical examination paper, shall be timed in working it, and shall not be passed unless he obtain such marks as the Examiner may fix upon as the minimum number to be obtained.

APPRENTICE CLERKS.

Apprentice Clerks will be taken on from 15 to 17 years of age at the following rates:—

15 to 16 years	£30 per annum.
16 to 17 "	40 "
17 to 18 "	50 "
18 to 19 "	70 "

And subsequently according to merit and the class of work which has to be performed.

CLERICAL STAFF.

To be paid according to merit and class of work to be performed.

Minimum salary	£75 per annum.
Maximum	„	350 „

The following are the conditions for the various Branches:—

LOCOMOTIVE BRANCH.

WORKSHOPS.

Lads will be taken into the shops as required, to learn the trades of fitter, turner, &c. They will not be taken in under the age of 15 years, and will not be out of their apprenticeship until the age of 21 years. They must be of good constitution, and able to read and write with facility; they will not be bound apprentice, but will be able to resign, and will be liable to dismissal, in the same way as the men; they will also be subject to the same rules and regulations as the men. The remuneration for their services will be as follows:—

1st period—	or up to 17 years of age	10d. per day.
2nd	„ of a year	1s. 3d. „
3rd	„	2s. „
4th	„	3s. „
5th	„	5s. „

At the end of the term of apprenticeship they will be paid wages proportionate to the value of their services.

SHOP BOYS.

Boys, other than apprentices, will be taken on to assist workmen in the running sheds and workshops at the following rates of pay:—

14 to 15 years	1s. 9d. per day.
15 „ 16	„	2s. 0d. „
16 „ 17	„	2s. 3d. „
17 „ 18	„	2s. 6d. „
18 „ 19	„	3s. 0d. „
19 „ 20	„	4s. 0d. „
20 „ 21	„	5s. 0d. „

THE following will be the conditions for acquiring the positions of Cleaner, Fireman, and Engine-driver:—

CLEANERS.

Only youths between 17 and 18 years of age will be eligible for appointment as Cleaners. Each youth must undergo a medical examination, and produce a certificate from the authorized Medical Officer to the effect that he is free from bodily or mental infirmity, possesses good eyesight and hearing, and is not afflicted with colour blindness either by day or night; he must also produce satisfactory testimonials of character, and be able to read and write.

The rates of wages will be as follows:—

1st year—	17 to 18	„	„	...	4s. 0d. per day.
2nd	„ 18 to 19	„	„	...	4s. 9d. „
3rd	„ 19 to 20	„	„	...	5s. 6d. „
4th	„ 20 to 21	„	„	...	6s. 0d. „
5th	„ 21 and over	„	„	...	7s. 0d. „

6d. per night additional will be allowed for night work.

When additional Firemen are required, Cleaners will be promoted according to efficiency and seniority, provided their general conduct has been satisfactory, and that they are eligible in all other respects.

FIREMEN.

All Firemen must have served as Cleaners, or have acted as Firemen or Drivers on other Lines. Before being appointed as Fireman, each man who has not previously passed a medical examination will have to produce a certificate from the authorized Medical Officer similar to that required from Cleaners when entering the Service. He must also undergo an examination in the Rules and Regulations applicable to Enginemen.

The rates of wages will be as follows:—

3rd class—	1st 6 months...	7s. 6d. per day.
2nd	„ from 6 months to 3 years service	8s. 0d. „
1st	„ after 3 years service (maximum rate)	9s. 0d. „

Firemen must always commence in the 3rd class.

As vacancies for Drivers occur, Firemen who have not been less than 12 months in the 1st class, or Firemen who have had previous service qualifying them for the position, will be promoted according to efficiency, provided their general conduct has been satisfactory.

ENGINE-DRIVERS.

ENGINE-DRIVERS.

No person will be allowed to undertake the duties of driver unless he has previously served as Fireman on the New South Wales Tramways, and is eligible for promotion. Before being appointed as Driver, each man must hold a certificate from the Locomotive Superintendent, showing that he has passed the necessary examination, and is competent to take charge of a motor.

The subject of examination must embrace a knowledge of the road, approaches to stopping places, positions of signals, &c., the examination of engine before joining a train, firing, trimming of syphons, oiling, testing of valves and pistons, and the various modes of uncoupling trams when they fail on the road, and the methods to be adopted to surmount any slight breakdown, derailment, &c., &c.

The rates of wages will be as follows:—

For shunting engines and water-tanks	11s. per day.
4th class for first year	11s. "
3rd " from 1 year to 3 years	12s. "
2nd " after 3 years	13s. "
1st class	14s. "

The position of first-class Driver will only be obtainable as vacancies in that grade occur, and after serving as a Driver at least five years. The number of Drivers in the first class shall never exceed one-seventh of the whole number of Drivers employed.

Drivers must always commence in the fourth class.

PERMANENT-WAY BRANCH.

The Permanent-way labourers must be strong able-bodied men, in good health, and capable of performing rough hard work. They must have perfect eyesight and hearing, be of good character, and able to read and write. Promotion and increase of wages will be in accordance with merit.

These conditions will not apply to temporary men (except as to their ability to perform the work required of them), but qualified temporary men will be eligible for the permanent staff as vacancies occur.

The rates of wages will be as follows:—

FETTLERS AND LABOURERS.

First 6 months	6s. 6d. per day.
From 6 " to 18 months	7s. "
After 18 months' service	7s. 6d. "

GANGERS.

When gangers are required suitable men will be selected from the fettlers or labourers. They must be steady and reliable, thoroughly understand the work, be able to read and write, and be quite competent to undertake all the duties of the position.

GANGERS.

First 6 months	8s. 6d. per day.
After 6 months, on certificate of fitness	9s. "

INSPECTORS AND FOREMEN.

Gangers and Mechanics will be promoted to Foremen and Inspectors as required, in cases where they are qualified to fill such positions.

INSPECTORS AND FOREMEN.

Minimum salary	£200 per annum.
Maximum "	300 "

TRAFFIC BRANCH.

GENERAL OUT-DOOR STAFF.

The employes comprised in the general out-door staff will be classified and paid as follows:—

Inspectors—Min., 12s. per day; Max., 15s.

Foremen—Min., 10s. per day; max., 12s.

Junior Conductors—Young men between the ages of 18 and 21 years will be eligible for appointment as Junior Conductors, and will be paid—

1st year	5s. per day.
2nd "	6s. "
3rd "	7s. "
4th "	8s. "

After 4 years service they will be appointed to the position of Conductors, as vacancies occur.

Conductors—8s. 6d. per day first 12 months; after 12 months, 9s.

Staffmen—8s. per day.

Head Pointsmen and Shunters—8s. 6d. to 10s. per day.

Pointsmen—3rd class—7s. per day.

2nd class—7s. 6d. "

1st class—8s. "

Labourers—6s. 6d. per day, first 6 months; after 6 months, 7s.

Watchmen—£2 2s. to £2 5s. per week.

Every man must pass a satisfactory examination, and hold a certificate from the Tramway Manager that he is competent to perform the duties required of him.

A good address and respectful bearing will be essential qualifications.

LEAVE

LEAVE.

Every servant, except Salaried Officers, will be entitled to a day's leave on full pay for each proclaimed general public holiday. Those servants who cannot take such leave on the proclaimed holidays, in consequence of being required to work, will, on making application, be allowed the same number of days at a future time, provided the Head of the Branch decides that they can be conveniently spared. Should, however, the exigencies of the Service not admit of the whole or any of the holidays being taken before the 31st of July of the year following that for which they are due, an equivalent in money will be paid.

In addition to the above, Engine-drivers, Firemen, Conductors, and Gangers of Fettlers may be allowed six days' leave of absence in each year, on full pay, if their general conduct has been satisfactory. This leave will only be granted at times most convenient to the Department, and the officers in charge of branches will have the power to disallow it altogether, or reduce the time, in cases where it is considered the employé is not entitled to the full leave.

Officers paid by annual salary will, if they can be conveniently spared, be allowed three weeks' leave of absence in each year. Leave not taken when due will lapse.

APPEALS.

In any case where an employé considers he has been unjustly dealt with, he must, in the first instance, appeal to the Head of his Branch, and then, if he still considers he has been unfairly treated, after such appeal, he has the right of appealing to the Commissioners, such appeal to pass through his Departmental Head.

The Commissioners will hear any appeal made by an employé against the adoption or confirmation of the advice or decision of the officer at the head of his branch, with regard to his right to promotion, or with respect to any charge made against such employé, or with respect to any penalty imposed by such officer; and will confirm or modify such decision, or make such order as they think fit; and their decision will be final. Every such appeal will be heard within thirty days from the date of the appeal being lodged with the Commissioners.

(L.S.) E. M. G. EDDY, Chief Commissioner.
W. M. FEHON, Commissioner.
CHARLES N. J. OLIVER, Commissioner.

The Common Seal of the Railway Commissioners of New South Wales was hereunto affixed this second day of December, in the year of our Lord 1889, in the presence of—

HUGH M'LACHLAN.

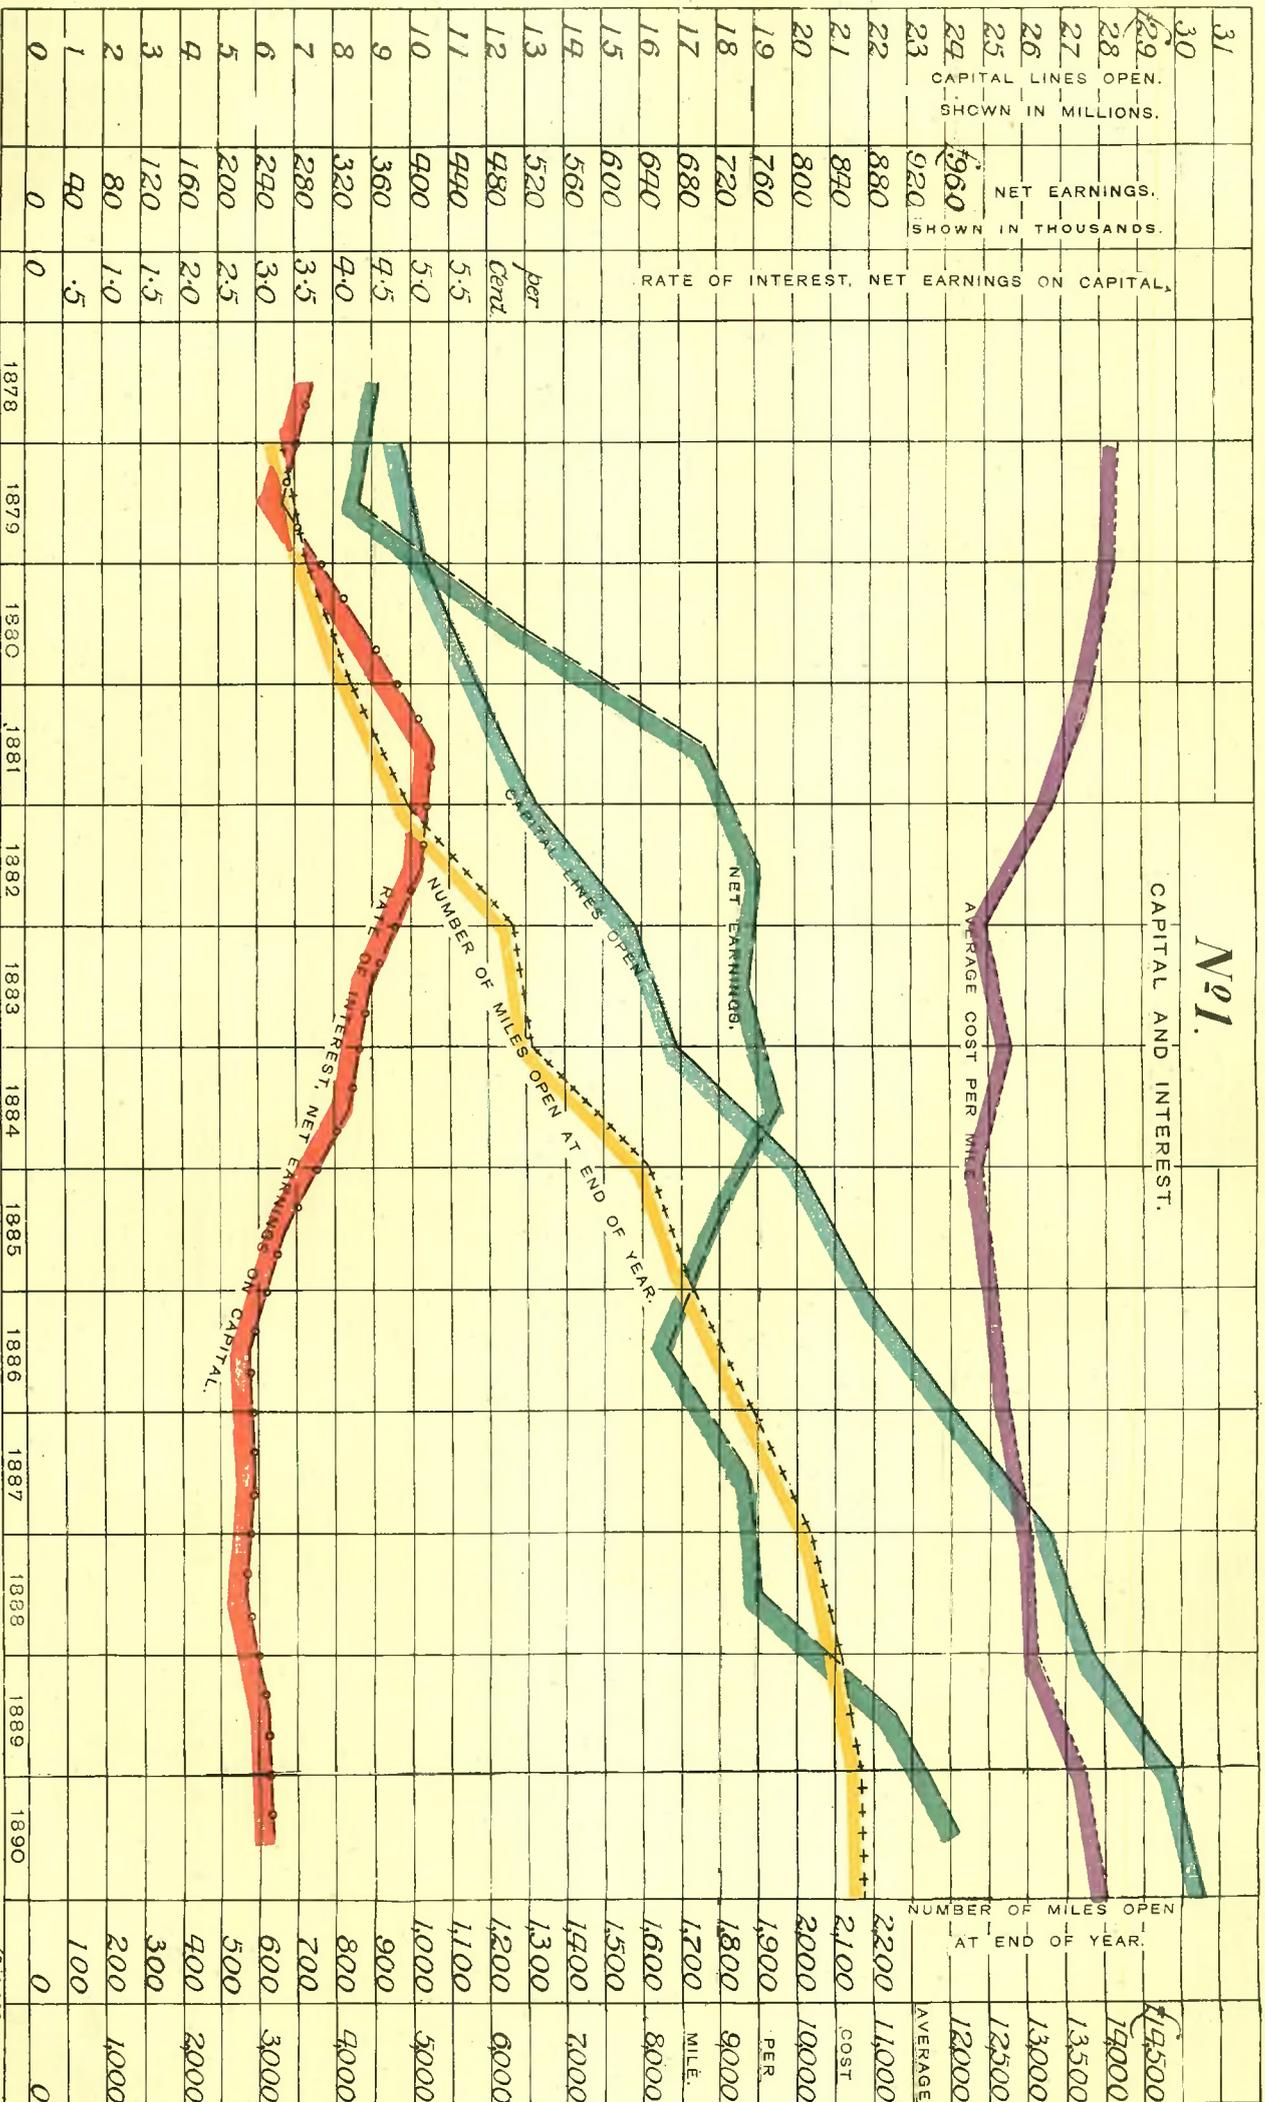

Confirmed by the Governor-in-Council, on the 10th day of December, 1889,—

NEW SOUTH WALES.

RAILWAYS AND TRAMWAYS.

(REPORT OF RAILWAY COMMISSIONERS, QUARTER ENDING DECEMBER, 1889.)

Presented to Parliament, pursuant to Act 51 Vic. No. 35, sec. 44.

Offices of the Railway Commissioners of New South Wales,
31 January, 1890.

TO THE HONORABLE THE MINISTER OF RAILWAYS,—

Sir,

In accordance with the provisions of the 44th clause of the Railway Act of 1888, 51 Vic. No. 35, we have the honor to submit, for the information of Parliament, our Report for the quarter ending 31st December, 1889, upon the subjects specified, viz. :—

- (I.) "The state of the traffic returns, with the approximate cost and earnings of trains, per ton per train mile, in respect of goods and passengers respectively, carried during the past quarter."
- (II.) "The general condition of the lines, and accommodation for the traffic."
- (III.) "The special rates, if any, which have been made, and the reasons for making such rates."
- (IV.) "The appointments and removals, with the circumstances attending each case."

I.—STATE OF THE TRAFFIC.

Railways.	Quarter ending 31st December, 1888.	Quarter ending 31st December, 1889.
Average number of miles open	2,126	2,171
Revenue from all sources	£771,486	£805,160
Expenditure	£441,602	£445,000
Number of passengers	4,170,030	4,359,840
Tonnage of goods traffic	688,150	884,172
Tonnage of live-stock traffic	29,805	29,734
Train miles run	2,099,567	2,167,037
Earnings per train mile	7/4½	7/5½
Expenditure per train mile	4/2½	4/1½
Percentage—Expenditure to earnings	57.24	55.27

NOTE.—Information as to the cost and earnings of trains per ton per mile cannot be given, as a large proportion of the train mileage is used for carrying both goods and passenger traffic.

* NOTE.—This column shows adjusted figures after final settlement of accounts for quarter.

Tramways.	Quarter ending 31st Dec., 1888.	Quarter ending 31st Dec., 1889.
Revenue from all sources	* £62,402	£68,614
Expenditure	£58,797	£59,900
Number of fares collected	14,346,102	16,015,250
Train miles run	377,387	414,597
Earnings per train mile	3/3¼	3/3¼
Expenditure per train mile	3/1½	2/10¼
Percentage—Expenditure to Earnings	94.22	87.30

* NOTE.—This column shows adjusted figures after final settlement of accounts for quarter.

II.—CONDITION OF THE LINES.

A report as to the condition of the lines will be found as an Appendix, page 4.

III.—SPECIAL RATES.

A statement of the special rates, and the reasons for making the same, will be found attached—Appendix, page 4.

IV.—STAFF.

These returns are given as an Appendix, pages 5 and 6, showing a saving of £9,655 per annum.

GENERAL REMARKS.

The traffic as a whole shows a satisfactory increase over the corresponding quarter of the preceding year. The improvement shown in the passenger traffic is specially marked, as during the 1888 quarter the Melbourne Exhibition and other attractions existed, which induced an exceptional traffic, while in 1889 there were no special inducements for travellers beyond the facilities offered by the improved train service and cheap Excursion Trips.

In goods traffic a very large increase is shown, arising mainly from wool, 328,078 bales having been carried, as against 234,746 bales during the quarter ending 31st December, 1888, showing an excess of 43,332 bales. Allowing for the quantity short carried during quarter ending 30th September, 1889, as compared with the corresponding quarter of the preceding year, the increased traffic to date reaches 16,625 bales.

CONDITION OF THE LINES AND ACCOMMODATION FOR THE TRAFFIC.

The condition of the lines is being improved as rapidly as possible, and relaying, &c., is being pushed forward.

The accommodation for the traffic is also being improved as occasion demands.

The various duplication works on the Southern, North Coast, and Illawarra Lines are progressing satisfactorily, and it is hoped that in a few weeks the plans for the quadrupling of the lines from Eveleigh to Homebush will be sufficiently completed to enable tenders to be invited.

TRAMWAYS.

TRAMWAYS.

The improved facilities given on the tram-lines continue to encourage the traffic, and the quarter's working shows a net increase in revenue of £5,100 after defraying the cost of eleven new tram-cars out of the working expenses for the quarter.

We have the honor to be,
Sir,
Your obedient Servants,

E. M. G. EDDY,
Chief Commissioner.

W. M. FEHON,
Commissioner.

CHARLES OLIVER,
Commissioner.

APPENDICES.

APPENDIX I.

Minute from The Acting Engineer for Existing Railways to The Secretary to The Railway Commissioners.

New South Wales Government Railways,
Engineer for Existing Lines Branch, Sydney, 6 January, 1890.

Subject:—Report on condition of lines for the quarter ending 31st December, 1889.

I HAVE the honor to report as follows on the condition of the Railways for the quarter ending 31st December, 1889:—

During the last three months considerable progress has been made in the improvement of the lines generally, by resceporing, relaying, and reballasting. There has been some difficulty in getting a sufficient quantity of ballast; but, now that the Kiama quarries have been purchased, we shall have greater facilities for obtaining it.

The new permanent-way materials which were ordered some few months ago are now coming in, and the relaying will be pushed on rapidly.

The station buildings, goods warehouses, bridges, and other works have been well maintained, and the whole of the lines are now in fair running order.

The duplication works have made considerable progress, and a tender has been accepted from Messrs. Angus & Co. for the completion of same.

Plans for suburban widening are well in hand, and I expect that we shall be able to let the work during next month.

J. ANGUS,
Acting Engineer.

APPENDIX II.

NEW SOUTH WALES GOVERNMENT RAILWAYS.

STATEMENT, in accordance with clause No. 44 of the Railway Act, showing the special rates which have been made, and the reasons for making such rates, quarter ending 31st December, 1889.

Article.	Rate.	Reason for such Rates
Members of theatrical companies ...	1½ cwt. of luggage each, free	To foster traffic.
Do do ..	Of not less than six to be allowed 1st class tickets at 2nd class rates between Sydney and Brisbane.	do
Tickets from Adelaide to Brisbane ..	To be issued at the following rates:—1st class—single, £10; return, £15. 2nd class—single, £6 10s.; return, £9 15s.	do
Meat hooks on return journey.....	Free	do
Hair for plastering purposes	A. rate. Minimum, 5 tons; four-wheeled truck ...	do
Circus and theatrical	Baggage, horses, &c.; 20 per cent. reduction allowed, also 20 per cent. allowed if part of Company travel, 2nd class.	do
Milk from Wilton's Siding to Darling	10d. per van per mile carried in owners' vans	do
Coal.....	Hauled over Government line in owners' trucks and by their engines and men; from Mount Keira to Mount Kembla Jetty, 2d. per ton; from Corrimal to Mount Kembla Jetty, 3½d. per ton.	do
Meat trucks shunted into Mort's Siding at Darling Harbour.	1s. per four-wheeled truck	do
Coal, L.V.C. Co. to brick-yard	Hauled in Department's vehicles, 5s. per four-wheeled truck, at Lithgow.	do
Fish baskets	Empty returns; free.	do
Empty jars.....	Sydney to Cooma; to be filled with mineral water, and return by rail; free.	do
Ale and beer	Returned to brewers, half rates back journey.....	do
Steam and crane charges	Charges at Bullock Island same as at Darling Harbour; 1½d. per ton to be paid to the contractor for shipping general cargo, from 1st January, 1890.	To obtain traffic.
Mineral water	Katoomba to Darling Harbour in owner's truck, 1s. per mile.	To foster traffic.
Small quantities of goods, West Maitland to Guyra and stations north.	May be sent to Newcastle or Morpeth to make up truck load, same rate as from Newcastle, viz., £5 5s. per ton for 1st and 2nd class, and £6 for 3rd and 4th class goods; no charge to be made for haulage from West Maitland to Newcastle or Morpeth.	do
Meat, Clarendon to Sydney... ..	Beef, veal, or pork, 2½s. per van; mutton, 18s. per van; minimum, 4 tons.	do
Wool, from Narrabri	If 3,000 bales belonging to one owner be sent during present season, rebate 10 per cent. allowed.	do

1890.

NEW SOUTH WALES.

RAILWAYS AND TRAMWAYS.

(REPORT OF RAILWAY COMMISSIONERS FOR QUARTER ENDING MARCH 31, 1890.)

Presented to Parliament, pursuant to Act 51 Vic. No. 35, sec. 44.

Offices of the Railway Commissioners of New South Wales,
29 April, 1890.

THE HONORABLE THE MINISTER OF RAILWAYS,—

Sir,

In accordance with the provisions of the 44th clause of the Railway Act of 1888, 51 Vic. No. 35, we have the honor to submit, for the information of Parliament, our Report for the quarter ending the 31st of March, 1890, upon the subjects specified, viz. :—

- (I.) "The state of the traffic returns, with the approximate cost and earnings of trains, per ton per train mile, in respect of goods and passengers respectively, carried during the past quarter."
- (II.) "The general condition of the lines, and accommodation for the traffic."
- (III.) "The special rates, if any, which have been made, and the reasons for making such rates."
- (IV.) "The appointments and removals, with the circumstances attending each case."

I.—STATE OF THE TRAFFIC.

Railways.	Quarter ending 31st March, 1889.	Quarter ending 31st March, 1890.
Miles open	* 2,126	2,182
Revenue from all sources	£587,985	£615,512
Expenditure	£388,563	£388,324
Train miles run	1,780,194	1,896,027
Earnings per train mile	6s. 7½d.	6s. 6d.
Expenditure per train mile	4s. 4½d.	4s. 1½d.
Percentage—Expenditure to earnings	66·08	63·09
Number of passengers	3,975,581	4,164,998
Tonnage of goods traffic	949,671	820,586
Tonnage of live stock traffic	26,342	23,621

NOTE—Information as to the cost and earnings of trains, per ton per mile, cannot be given for goods and passengers separately, as a large proportion of the train mileage is used for carrying both goods and passenger traffic.

* This column shows the adjusted figures after final settlement of accounts for the quarter.

144—

[1,403 copies—Approximate cost of printing (labour and material), £11 6s. 3d.]

Tramways.	Quarter ending 31st March, 1889.	Quarter ending 31st March, 1890.
Miles open	* 38½	39½
Revenue from all sources	£62,120	£68,509
Expenditure	£52,307	£53,553
Train miles run	380,996	411,425
Earnings per train mile	3s. 3d.	3s. 4d.
Expenditure per train mile	2s. 9d.	2s. 7½d.
Percentage—Expenditure to earnings	84.20	78.17
Number of fares collected	15,211,755	15,599,802

* This column shows the adjusted figures after final settlement of accounts for the quarter.

II.—CONDITION OF THE LINES.

A report as to the condition of the lines will be found as an Appendix, page 4.

III.—SPECIAL RATES.

A Statement of the Special Rates, and the reasons for making the same, will be found attached, Appendix, page 4.

IV.—STAFF.

These Returns are given as an Appendix, pages 5 to 8.

GENERAL REMARKS.

The Passenger Traffic shows an increase both in numbers and revenue.

The tonnage of Goods Traffic shows a decrease of 129,085 tons. This arises in consequence of the great impetus given to the shipment of coal in the Newcastle district after the "strike" in the latter part of 1888, which made the quarter ending March, 1889, an exceptionally heavy one.

The general Goods Traffic, however, shows a large increase both in tonnage and revenue.

It is satisfactory to find that the revenue has improved, when it is borne in mind that the grain and other agricultural produce rates have been reduced by 20 per cent.

The economies effected in various ways have enabled us to provide for the carrying on of the largely increased traffic without increasing the working expenses, although heavy additional expenditure has been incurred on the Permanent Way in consequence of the unusual floods, and also in pushing forward with the work of repairing and renovating the locomotive and carriage and waggon stock.

The branch line between Hornsby and St. Leonards was opened for traffic on the 1st January last, but we regret to say the traffic does not provide for the working expenses, and we would call attention to the following extract from our report, dated January, 1889, upon the proposed line of railway to connect this branch with the waters of Port Jackson :—

The construction of the line is, however, essential in connection with the line of railway from Hornsby to Pierce's Corner, now almost complete, as without the extension to the waters of Port Jackson the former line can prove of but limited commercial value, having no outlet.

The line from Pierce's Corner passes through country admirably adapted for residential purposes, and will probably at no distant date become, with the aid of railway communication, an attractive suburb, capable of furnishing a traffic which will make the line a profitable one.

CONDITION OF THE LINES AND ACCOMMODATION FOR THE TRAFFIC.

The condition of the lines has, during the quarter, been a source of considerable anxiety, as the exceptional rainfall seriously affected the condition of the roads, and rendered it necessary to run the trains at considerably reduced speed so as to ensure safety.

The bad state of the bush roads also prevented the contractors from bringing in sleepers for relaying, and consequently retarded this important work very materially.

The accommodation for the traffic is being improved at various places.

TRAMWAYS.

The working of the tramways continues to show improved results. The expenses of the quarter have been debited with the cost of six new cars, and we fully expect to show a surplus for the year ending 30th June next, after paying working expenses and interest on the capital outlay.

We have the honor to be,

Sir,

Your most obedient Servants,

E. M. G. EDDY,

Chief Commissioner.

W. M. FEHON,

Commissioner.

CHARLES OLIVER,

Commissioner.

APPENDICES.

APPENDIX I.

Minute from The Acting Engineer for Existing Lines to The Secretary to the Railway Commissioners.

New South Wales Government Railways,
Engineer for Existing Lines Branch, Sydney, 18 April, 1890.

Subject :—Report on Condition of Lines for the quarter ending the 31st March, 1890.

I HAVE the honor to report as follows on the condition of the Railways for the quarter ending the 31st of March, 1890 :—

During the last three months the work of maintenance has been considerably affected by the heavy rains, especially on the Metropolitan, Northern, and Western Divisions.

Several heavy slips have taken place, more particularly at Katoomba and Bell, on the Western Line, Ben Lomond on the Northern Line, Clifton on the Illawarra Line, and on the Mudgee Branch, and it has been found necessary to lay in short deviations at the two places first named, and it would be advisable to consider the question of deviating several portions of the Mudgee Line, to prevent delays to traffic in consequence of slips.

The continued wet weather has, to a great extent, prevented any large quantity of stone being taken out at Bombo Quarries, and consequently retarded the work of reballasting. The new machines for these quarries will shortly arrive, when we shall be able to turn out a much larger quantity than at present.

The Up Line, Eveleigh to Petersham, and the Down Line, Eveleigh to Newtown, have been lifted, reballasted, and drained. Instructions have been given for the relaying and fencing to be pushed on as rapidly as possible, but in consequence of the very wet weather we have had, the contractors have been unable to deliver either sleepers or fencing materials.

The station buildings, goods warehouses, and bridges, have been well maintained.

Good progress has been made with the duplication works, and the portions Hurstville to George's River and Sutherland to Loftus Junction, are nearly completed.

Plans for widening the suburban line are nearly completed, and I expect tenders for this work may be invited in a very short time.

The extension, Hornsby to St. Leonards, a length of 10 miles 37 chains, was opened for public traffic on 1st of January last. During the late heavy rains the embankments have suffered considerably, and several slips have taken place.

J. ANGUS,
Acting Engineer.

APPENDIX II.

New South Wales Government Railways.

STATEMENT, in accordance with clause No. 44 of the Railway Act, showing the special rates which have been made, and the reasons for making such rates, quarter ending 31st March, 1890.

Article.	Rate.	Reason for such Rate.
Scrap tin	Same as scrap zinc. "B" rate.	To equalize rates.
Iron and steel	For manufacture by Messrs. Ball & Co., of Goulburn, of 100 railway waggons. "M" rate.	To encourage inland manufactures.
Old sleepers	From Kiama to Darling Harbour and Rookwood. "M" rate.	To obtain traffic.
Wool	Greasy, from Tarago, Bungendore, and Goulburn to Queanbeyan; then scoured and sent to Darling Harbour. To be charged actual mileage proportion only, without the additional 2s. 6d. per ton previously charged.	To encourage industry in the interior.
Graphite or plumbago	"M" rate, and conditions	To foster traffic.
Grapes	Albury to Sydney by mail train, at goods rates	do.
Contractors' material	2s. 6d. per 4-wheeled truck, from Rookwood to head of contractor's private lines. (Subject to usual demurrage charges.)	To increase revenue.
Do	Penrith Station; 5s. per truck for trucks loaded locally, and 1s. for those arriving by train.	To obtain traffic.
Live-stock	10s. for every ten or part of ten trucks conveyed from Penrith to Kingswood, in addition to ordinary mileage rates.	To obtain revenue.
Coal	½d. per ton per mile for haulage over the Government line, from Illawarra Coal Company's Mine to Mount Kembla Jetty, in owner's trucks, and hauled by colliery engines. Empty waggon trains free of toll.	To increase revenue.
Phosphorized wheat for extermination of rabbits.	"A" rate	To foster traffic.
Coal	Coal carried between Greta and Newcastle in excess of 150,000 tons per year to be allowed a reduction of 1d. per ton on the whole quantity, if conveyed in full train loads.	To encourage traffic.

APPENDIX III.

NEW SOUTH WALES GOVERNMENT RAILWAYS AND TRAMWAYS.

RETURN, in accordance with clause No. 44 of the Railway Act, showing the Appointments of Employees from the 1st of January to the 31st of March, 1890.

1890.

NEW SOUTH WALES.

RAILWAYS AND TRAMWAYS.

(REPORT OF RAILWAY COMMISSIONERS FOR QUARTER ENDING 30 JUNE, 1890.)

Presented to Parliament, pursuant to Act 51 Vic. No. 35, sec. 44.

Offices of the Railway Commissioners of New South Wales,
Sydney, 29 July, 1890.

TO THE HONORABLE THE MINISTER OF RAILWAYS,—

Sir,

In accordance with the provisions of the 44th clause of the Railway Act of 1888, 51 Vic. No. 35, we have the honor to submit, for the information of Parliament, our Report for the quarter ending the 30th of June, 1890, upon the subjects specified, viz. :—

- (I.) "The state of the traffic returns, with the approximate cost and earnings of trains per ton per train mile, in respect of goods and passengers, respectively, carried during the past quarter."
- (II.) "The general condition of the lines, and accommodation for the traffic."
- (III.) "The special rates (if any) which have been made, and the reasons for making such rates."
- (IV.) "The appointments and removals, with the circumstances attending each case."

I.—STATE OF THE TRAFFIC.

Railways.	Quarter ending 30th June, 1889.	Quarter ending 30th June, 1890.
Miles open	*	
	2,171	2,182
Revenue from all sources	£545,962	£583,584
Expenditure	£411,514	£485,612
Train miles run	1,834,579	1,925,313
Earnings per train mile	5s. 11½d.	6s. 0½d.
Expenditure per train mile	4s. 6d.	4s. 6½d.
Percentage—Expenditure to earnings	75·37	74·64
Number of passengers	4,100,577	4,420,107
Tonnage of goods traffic	914,955	978,525
Tonnage of live stock traffic	23,946	26,441

NOTE—Information as to the cost and earnings of trains per ton per mile cannot be given for goods and passengers separately, as a large proportion of the train mileage is used for carrying both goods and passenger traffic.

* This column shows the adjusted figures after final settlement of accounts for the quarter.

Earnings per train mile	3s. 3¼d.	3s. 3d.
Expenditure per train mile	3s. 1d.	2s. 9¼d.
Percentage—Expenditure to earnings	92.89	86.81
Number of fares collected	14,148,862	15,841,187

* This column shows the adjusted figures after final settlement of accounts for the quarter.

II.—CONDITION OF THE LINES.

A report as to the condition of the lines will be found as an Appendix, page 4.

III.—SPECIAL RATES.

A statement of the Special Rates, and the reasons for making the same, will be found attached, Appendix, page 4.

IV.—STAFF.

These Returns are given as an Appendix, pages 5 to 8.

GENERAL REMARKS.

The revenue for the quarter shows an increase of £37,622 over the corresponding period in 1889, all descriptions of traffic (except coal) having contributed to the improvement. This is a satisfactory state of things, having in view the continuous wet weather experienced throughout the quarter, and the consequent bad state of the country roads in all directions.

The increase in goods, live-stock, and other traffic amounts to 66,065 tons.

ROLLING STOCK.

The contractors are beginning to deliver the new rolling stock more rapidly, and shortly all the fast trains will be composed of carriages of the new description.

Several new Suburban Trains are also in work, and others are approaching completion.

Special efforts continue to be made in improving the condition of the locomotives and waggons, and also in renovating the best of the existing carriage stock.

CONDITION

CONDITION OF THE LINES AND ACCOMMODATION FOR THE TRAFFIC.

The rainfall during the quarter amounted to 21·69 inches, making a total for the 14 months ending June of 108·48 inches. For the corresponding periods of 14 months for the years ending—

June, 1889	49·49 inches.
„ 1888	46·08 „
„ 1887	62·90 „
„ 1886	47·78 „

This continued exceptional rainfall has been the cause of great anxiety in connection with the Railways, and has called for the greatest vigilance and care on the part of the officers and men, to keep the lines open for traffic in some places, and in fair running order generally.

A large additional staff has been employed, and it has been necessary to run the trains at reduced speed in many places. This has materially interfered with punctual working, and little improvement can be expected in this respect until more favourable weather is experienced.

The work of relaying, draining, and reballasting of the lines has been pushed forward as expeditiously as possible, but progress has been much retarded by the almost incessant rainfall, and also by the inability of the contractors to deliver sleepers, in consequence of the all but impassable state of the bush roads.

The heavy floods in the Darling River caused serious damage to the railway line approaching Bourke, and an expenditure in repairing the line was incurred in the current quarter of £13,300, and this expense is still continuing. When the waters have completely receded, a large expenditure will have to be incurred in dealing with the bridges and waterways, and providing more flood openings.

Unremunerated services were also rendered to the Bourke people, in various ways, amounting in value to £4,000.

TRAMWAYS.

The working of the Tramways continues to show improved results. The receipts exhibit an increase of £3,871, and the expenses show a slight decrease.

Four (4) new cars have been debited to working expenses during the quarter, making a total of thirty-one (31) during the current financial year.

A water-tank waggon has also been provided out of revenue.

We have the honor to be,

Sir,

Your most obedient Servants,

E. M. G. EDDY,

Chief Commissioner.

W. M. FEHON,

Commissioner.

CHARLES OLIVER,

Commissioner.

APPENDICES.

APPENDIX I.

Minute from The Acting Engineer for Existing Lines to The Secretary to the Railway Commissioners.

New South Wales Government Railways,
Engineer for Existing Lines Branch, Sydney, 24 July, 1890.

Subject :—Report on Condition of Lines for the quarter ending the 30th June, 1890.

I HAVE the honor to report as follows on the condition of the Railways for the quarter ending the 30th of June, 1890 :—

The continued wet weather has rendered the maintenance of the road both difficult and expensive, especially on the Northern and Western Divisions.

The heavy floods in the Darling caused immense damage at Bourke, where several miles of line were entirely destroyed. The work of reconstruction was pushed forward as energetically as possible ; but although the line was speedily opened for traffic, the complete repairs have, on account of the slow subsidence of water, taken longer than could be wished.

Several slips have taken place on the Mudgee Line.

The work of relaying and reballasting the Suburban Line has been seriously retarded by the heavy rains, but has been completed to Summer Hill on the down, and Ashfield on the up, line.

Fair progress has been made with the duplication works. The portions between Sutherland and Loftus Junction, and between Mustville and Oakley's, were completed before Easter, and the other portions are being energetically pushed forward. The section which composes the Darling Harbour widening, from Redfern to Eveleigh Junction, has been let, and the contractor is making good progress. The plans for the other portions will be completed without delay, and it is hoped that tenders may be invited in a month.

The bridges and buildings have been carefully looked after, and at many stations additional accommodation has been provided.

J. ANGUS,
Acting Engineer.

APPENDIX II.

New South Wales Government Railways.

STATEMENT, in accordance with clause No. 44 of the Railway Act, showing the special rates which have been made, and the reasons for making such rates, quarter ending 30th June, 1890.

Article.	Rate.	Reason for such Rate.
Coal.....	Corrimal to Australian Coal Company's Siding, 1s. per ton loaded in Commissioners' trucks, but hauled by owners' engines.	To create revenue.
Roburite, Non- Bones of deceased Chinamen	Third class	To encourage manufacture
Butter.....	Fourth class.	
Meat	From Mudgee to stations west of Wallerawang by mail-train, goods rates.	To foster traffic.
Chicory	In refrigerating car, Tenterfield to Sydney, 1½d. per ton per mile.	do
Marble dust	Grain rate.....	To encourage traffic.
Gravel.....	" M " rate.	To foster traffic.
Specimens for the Technological Museum.	Coolabah to Bourke, 8s. 9d. per ton.	To obtain traffic.
Leather	Free	For educational purposes.
	Reduced from first-class to " B " rate for 6-ton loads .	To encourage traffic.

APPENDIX III.

NEW SOUTH WALES GOVERNMENT RAILWAYS AND TRAMWAYS.

1890.

NEW SOUTH WALES.

RAILWAYS AND TRAMWAYS.

(REPORT OF RAILWAY COMMISSIONERS FOR QUARTER ENDING 30 SEPTEMBER, 1890.)

Presented to Parliament, pursuant to Act 51 Vic. No. 35, sec. 44.

Offices of the Railway Commissioners of New South Wales,
Sydney, 28 October, 1890.

TO THE HONORABLE THE MINISTER OF RAILWAYS,—

Sir,

In accordance with the provisions of the 44th clause of the Railway Act of 1888, 51 Vic. No. 35, we have the honor to submit, for the information of Parliament, our Report for the quarter ending the 30th of September, 1890, upon the subjects specified, viz. :—

- (I.) "The state of the traffic returns, with the approximate cost and earnings of trains per ton per train mile, in respect of goods and passengers, respectively, carried during the past quarter."
- (II.) "The general condition of the lines, and accommodation for the traffic."
- (III.) "The special rates (if any) which have been made, and the reasons for making such rates."
- (IV.) "The appointments and removals, with the circumstances attending each case."

I.—STATE OF THE TRAFFIC.

Railways.	Quarter ending 30th September, 1889.	Quarter ending 30th September, 1890.
Miles open	*	2,182
Revenue from all sources	£629,464	£655,172
Expenditure	£405,111	£430,437
Train miles run	2,020,449	2,054,340
Earnings per train mile	74.77	76.54
Expenditure per train mile	48.12	50.29
Percentage—Expenditure to earnings	64.36	65.70
Number of passengers	4,126,915	4,458,478
Tonnage of goods traffic	997,424	881,384
Tonnage of live stock traffic	28,388	30,471

NOTE.—Information as to the cost and earnings of trains per ton per mile cannot be given for goods and passengers separately, as a large proportion of the train mileage is used for carrying both goods and passenger traffic.

* This column shows the adjusted figures after final settlement of accounts for the quarter.

772—A

[1,453 copies—Approximate cost of printing (labour and material), £15 10s. 0d.]

Tranways.	Quarter ending 30th September, 1889.	Quarter ending 30th September, 1890.
Miles open	* 39½	39½
Revenue from all sources	£65,111	£67,597
Expenditure	£51,880	£52,094
Train miles run	403,183	421,249
Earnings per train mile	38·75	38·51
Expenditure per train mile	30·88	29·68
Percentage—Expenditure to earnings	79·68	77·06
Number of fares collected	14,701,282	15,556,749

* This column shows the adjusted figures after final settlement of accounts for the quarter.

II.—CONDITION OF THE LINES.

A report as to the condition of the lines will be found as an Appendix, page 4.

III.—SPECIAL RATES.

A statement of the Special Rates, and the reasons for making the same, will be found attached, Appendix, page 5.

IV.—STAFF.

These Returns are given as an Appendix, pages 5 to 10.

GENERAL REMARKS.

The traffic for the quarter shows an increase of £25,708, the passenger branch contributing £22,690 towards this result, 331,563 additional passengers having been carried.

The Maritime Strike, which began on the 15th of August, and which was soon after followed by the stoppage of work at the collieries in the Newcastle, South Coast and Lithgow Districts, has seriously interfered with the revenue from the Goods Department, the mineral traffic showing a decrease of 168,765 tons, whilst in wool only 62,395 bales were carried during the quarter to Darling Harbour, Newcastle, and Morpeth, a decrease of 25,086 bales.

Extra work on the permanent-way in repairing the damage done by the floods during the winter season has increased the working expenses in that Department for the current quarter by over £15,000.

The traffic expenses also show a considerable increase in consequence of additional staff employed owing to the extension of the absolute-block, tablet, and interlocking systems, and concessions granted to the staff.

CONDITION

CONDITION OF THE LINES AND ACCOMMODATION FOR THE TRAFFIC.

Special steps continue to be taken in improving the condition of the lines, and a considerable amount of relaying and reballasting has been done.

The accommodation for traffic has been improved in various directions.

TRAMWAYS.

The working of the Tramways continues to show improved results.

We have the honor to be,

Sir,

Your most obedient Servants,

E. M. G. EDDY,
Chief Commissioner.

W. M. FEHON,
Commissioner.

CHARLES OLIVER,
Commissioner.

APPENDICES.

APPENDIX I.

Minute from the Acting Engineer for Existing Lines to the Secretary to the Railway Commissioners.

New South Wales Government Railways,
Engineer for Existing Lines Branch, Sydney, 23 October, 1890.

Subject :—Report on Condition of Lines for the quarter ending the 30th September, 1890.

I HAVE the honor to report as follows on the condition of the Railways for the quarter ending the 30th of September, 1890 :—

During the quarter many portions of the Permanent-way, which had become defective in consequence of continuous heavy rains, have been repaired, and I hope, if the weather will permit, to dispense with all notices for the reduction of speed on that account, in a very short time.

The work of reconstructing the Western Line, near Bourke, will now be pushed on rapidly, and more waterway openings provided.

The heavy slips on the Mudgee, Northern, and Illawarra Lines have received every attention, and, to prevent stoppages from slips on the Mudgee Line, the work of deviating the worst portions has been commenced. The Illawarra Line has also received special attention with respect to slips, particularly at Stanwell Park and Clifton.

Considerable progress has been made in re-ballasting and draining the Suburban Lines, which have been completed on both up and down lines to Burwood, as also the Northern Line, between Strathfield and Ryde.

Relaying and resleepering have also made considerable progress generally, but the work is still delayed through slow delivery of sleepers, caused by the contractors being unable to get them from the bush.

The duplication works are making rapid progress especially on the Illawarra section. The portion from Oatley's to Como Station, as also from Sutherland to Heathcote will be open for traffic in the course of a few weeks.

The Southern Line from Granville Junction to Picton is also in a forward condition, the whole of the earthwork in the cuttings having been completed, a considerable portion of ballasting done, and a large number of bridges and platform walls built. Owing to the difficulty in procuring sleepers the laying down of permanent-way has been retarded.

The duplication between Teralba and Adamstown has also progressed in a satisfactory manner, and the work of ballasting and laying permanent-way, which is in hand, only remains to complete the section.

The duplication from Strathfield to Ryde is also in an advanced state.

The quadruplication of the line from Eveleigh to Macdonaldtown is being carried out with considerable energy by the contractor.

The contract for connecting the Northern and Southern Lines by a curve at Homebush, as also the quadruplication of the line to Strathfield, has been let and is progressing satisfactorily.

Tenders have also been invited for quadrupling the line from Macdonaldtown to Lewisham to include the Petersham Viaduct.

The deviations necessary for improving the mountain curves between Springwood and Katoomba are also well in hand.

Several buildings have been completed and a large number of others are progressing satisfactorily.

J. ANGUS,
Acting Engineer.

APPENDIX

APPENDIX II.

New South Wales Government Railways.

STATEMENT, in accordance with clause No. 44 of the Railway Act, showing the special rates which have been made, and the reasons for making such rates, quarter ending 30th September, 1890.

Article.	Rate.	Reason for such Rate.
"Eureka" (Meal)	"A" rate and conditions. A new article of consumption.	To provide rate.
Grass Rops.....	First-class rate and conditions	To secure traffic.
Haulage of goods (mostly gravel) in 4-wheeled trucks on the Greenwood Tram-line.	1s. per truck, subject to usual demurrage charges	do
Coal, from Greta Colliery to Newcastle.	1s. 8½d. per ton if less than 150,000 tons is sent per year, and 1s. 7½d. per ton if over that quantity. The company to haul by their own locomotive the coal between the pit and railway junction.	To increase traffic.
Coal.....	Hauled over the branch line of the Centennial Coal and Coke Company at Curlewis, other than for Railway Department. The Curlewis distance plus 2 miles.	To provide charge for new service.
Coal for shipment, carried in Commissioners' hopper trucks to Bullock Island or Darling Harbour.	Ordinary rates to be charged as per classification, and a charge of 3d. per ton to be added for the use of the cranes.	
Coal.....	Hauled over the branch line of the Centennial Coal and Coke Company for the Railway Department. From the pit to Curlewis, 1s. per truck; minimum, 6 tons; empty trucks, free.	do do
Gravel.....	Coolabah to Bourke, 3s. 9d. per ton.....	To facilitate repair of damage to public roads caused by floods.
Biscuits, Newcastle to Sydney	1st class, 35s. 5d. per ton in 4-wheeled trucks; minimum, 5 tons; and loaded by senders.	To secure traffic.

1890.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(REPORT OF BOARD OF INQUIRY ON ACCIDENT AT BATHURST.)

Ordered by the Legislative Assembly to be printed, 21 May, 1890.
(In substitution for paper laid on Table 14 May, 1890.)

REPORT of the Board of Inquiry appointed under the 51st section of the "Government Railways Act of 1888," together with the remarks of the Railway Commissioners thereon.

Accident to No. 26 Up Mixed Train at Bathurst, at 143 miles 62 $\frac{1}{2}$ chains from Sydney, on 25th April, 1890.

THE Report of the Board of Inquiry appointed, in accordance with the provisions of section 51 of the "Government Railways Act of 1888," to inquire into the recent accident at Bathurst, is forwarded for the information of the Minister.

The draw-bar which broke, and caused the unfortunate accident, was one of the light description which was referred to when the condition of the rolling-stock was under discussion in Parliament on the 15th August last. So far back as 1884 it appears to have been decided to replace the then existing draw gear by gear of a stronger description,—(the reasons which prompted this decision cannot, however, be stated by us, as the papers are, unfortunately, not now obtainable) and, although the defect was recognized so far back as 1884, at the close of the year 1888 only 500 waggons had been dealt with. During the year 1889 and that part of the current year which has expired the draw-gear has been changed in 627 waggons; at the present time the work is progressing at the rate of about 100 waggons per month, and the progress will shortly be accelerated, over 3,000 waggons still remaining to be done.

While forwarding this Report, we deem it necessary to allude to an attempt made at the Coroner's inquiry into the accident, to divert attention from the main point into side issues, with the evident desire to attack the present Railway management. One of the points raised was in respect to an order said to have been issued prohibiting the use of side-chains, which order has had no existence; and another point in regard to assistant guards not being run on the through goods trains.

As

As to the first question, it is well to give an extract from the official records of our action on the subject of side-chains, and also the result of a reconsideration of the whole question in September last.

The first minute was passed on a tour of inspection of the Northern lines in January, 1889, when the question of the utility of side-chains was discussed with the Officers, and the Commissioners decided that side-chains should be discontinued on all vehicles *fitted with the strongest draw-gear. Chains to remain in those vehicles having the light draw-gear until such gear was replaced.*

In August last, some members of the Amalgamated Railway and Tramway Service Association waited upon the Commissioners on various subjects regarding pay and other concessions, and the subject of side-chains was referred to as follows :—

“The deputation drew attention to a circular which had recently been issued by the Traffic Branch, instructing the men, even when side-chains were provided, that they were not to be used. The centre coupling might at any time snap, and they thought that the side-chains should be used for the protection of the men, particularly as in many cases the trains running in the distant districts were mixed trains. They had several instances, one particularly, of a train arriving at Harden where the trucks were held in three places by the side-chains only.”

The Commissioners stated in reply that they were unaware of the order referred to, but would look into the question.

The Commissioners on the 9th September last had a meeting with the Chief Traffic Manager and Locomotive Engineer, and it was found that no order of the kind referred to had been issued. The whole question of the use of side-chains was then reconsidered, and it was agreed—

“That the present description of side-chains was of little value, and if they were to be continued and looked to as an element of security, the arrangement and strengthening of same would have to be reconsidered, and that it was unnecessary to do this in view of the proposed early adoption of continuous automatic brakes on the goods stock.”

It will therefore be seen that no order has been given which in the slightest degree justifies the allegation made that something had been done by the Commissioners to reduce the security of the traffic. The *order No. 221*, dated 2nd July, 1889, issued by the Chief Traffic Manager, referred to, is a reproduction of the following order, viz. :—

“The staff are hereby informed that all vehicles fitted with the strong draw-gear are being marked with a cross (thus X), on the buffer beam on each side of the draw-bar on each end of the vehicle.

“Waggons marked in this manner are only to be single coupled.

“In cases where strong and weak couplings come together, vehicles are to be attached by the strong couplings only.

“Please acknowledge receipt.

“W. V. READ,

“Traffic Manager’s Office,

“Traffic Manager.

“Sydney, 10th February, 1888.”

This

This order was issued, as will be observed from the date, before this present administration came into office, and we fail to see any objections to its provisions.

The order that the vehicles should be attached by means of the strong coupling when a waggon so fitted came next to a waggon with weak couplings, referred to the non-user of both sets of coupling-chains, as illustrated by diagram attached hereto, and had no reference whatever to the side-chains;—this system of coupling is from experience found to be the best.

The side chains of the vehicles of which the draw-bar broke should have been hooked into the main connecting chain (the strong coupling referred to in the order quoted) of the vehicle in rear, but we quite concur with the Board of Inquiry, that had this been done the result would have been the same, the staff however, has been warned to invariably do this in future as required by rule No. 235, which is as follows:—

“COUPLING OF VEHICLES.

“Rule 235.

“Carriages or waggons must be properly coupled by the side-chains as well as the centre couplings—no side chains or couplings to be left hanging down, and no one is to pass between buffers of vehicles, but must get over or stoop under them. The lamps must be lighted, or removed when not required.”

Side-chains in goods waggons are a source of danger to the working staff, as they necessitate the shunters and guards going between the waggons to couple and uncouple, and for years past railway companies have been discontinuing their use. When the whole of the waggons are fitted with the strong draw-gear without side-chains this work can be accomplished from the side of the waggon by means of a properly constructed pole and hook. This question of risk to the working staff has occupied great attention in other parts of the world, and the English Board of Trade has pressed the subject strongly upon the railway companies; this led to the introduction of the shunting-poles, and, from returns just received from the Board of Trade, it would appear that the mode of working we are anxious to introduce, and so ensure greater safety to our men, is now almost universal in England, Wales, and Scotland, as out of a total of 15,192 guards, brakemen, and shunters employed, 13,156 are supplied with these poles.

With regard to the question of assistant guards, it was also raised without any justification. It will be seen from the Chief Traffic Manager's Report appended hereto that no change has been made in this respect for years past, and unless two brakes are run (except with local shunting trains with which two men are on duty, the object of sending the second man being solely to assist in the shunting operations at stations without reference to the brake question) there would be no advantage gained. Our stock of vans is so deficient that, if we wished, we could not supply two vans to through trains.

The stock of brake-vans is being increased as rapidly as possible, and a number of exceptionally heavy vans have recently been ordered for trains running on the heaviest parts of the lines.

In connection with the break-away at the Raglan Station, it is proper to point out that the station is situated on a very severe grade (1 in 50), and is unguarded with the security of runaway points, which would have effectually prevented the accident
which

which occurred, as the trucks would have only been able to run a few yards before being arrested. With regard to this very important matter, we have given directions for the station to be removed a short distance nearer Sydney, where it can be placed on an easier grade, and for a double line to be provided through the station with throw-off points, as provided for by the regulations of the English Board of Trade.

We shall deal with all similar stations on the lines as speedily as possible; but so much has to be done in all Departments that time must necessarily be occupied in bringing the lines and stock up to a proper standard.

The adoption of an automatic continuous brake on the goods rolling stock is a most important matter. Had such a brake been on the train which met with the accident, the separated section would at once have been arrested. The importance of this subject was referred to as under in our last annual report, dated 31st October, 1889:—

“Looking at the severe grades upon our lines, it is very desirable to provide continuous brakes for the goods trains. The following statement, showing grades steeper than 1 in 150, and the total length of same, will show how necessary it is to have the maximum amount of controlling power upon the trains. This subject of brakes has, previously to our taking office, received special attention, and a Board reported upon the subject in May, 1887. We propose to gradually introduce a continuous automatic brake on all the goods stock.”

Since that date the South Australian Government decided to have some brake trials before settling the form of brake for use in that Colony, and, in view of the desirability of having an uniform continuous brake for Australia, as interchanging of rolling stock must come about in a few years, we endeavoured, through the Government, to get these experiments conducted by an Intercolonial Board. This, however, the South Australian Government were unable to agree to, and we then decided to carry out experiments on our own account, and the Westinghouse and Vacuum Brake Companies undertook in February last to each fit up a train, and their experiments will, we trust, be made on an early date, the Westinghouse Co. having their materials on hand, and those of the Vacuum Co. are upon a steamer which will arrive before the end of the month. When the trials are over we purpose asking that Parliament be moved to vote the needful money to fit up all the stock with this great security.

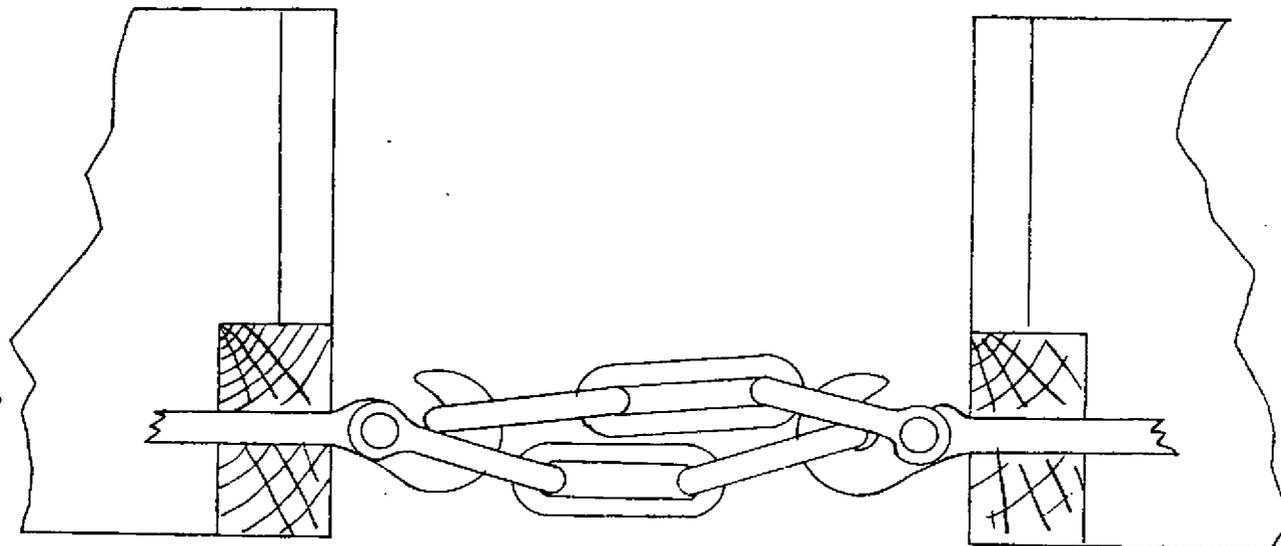

E. M. G. EDDY,
Chief Commissioner.

W. M. FEHON,
Commissioner.

STRONG DRAW GEAR

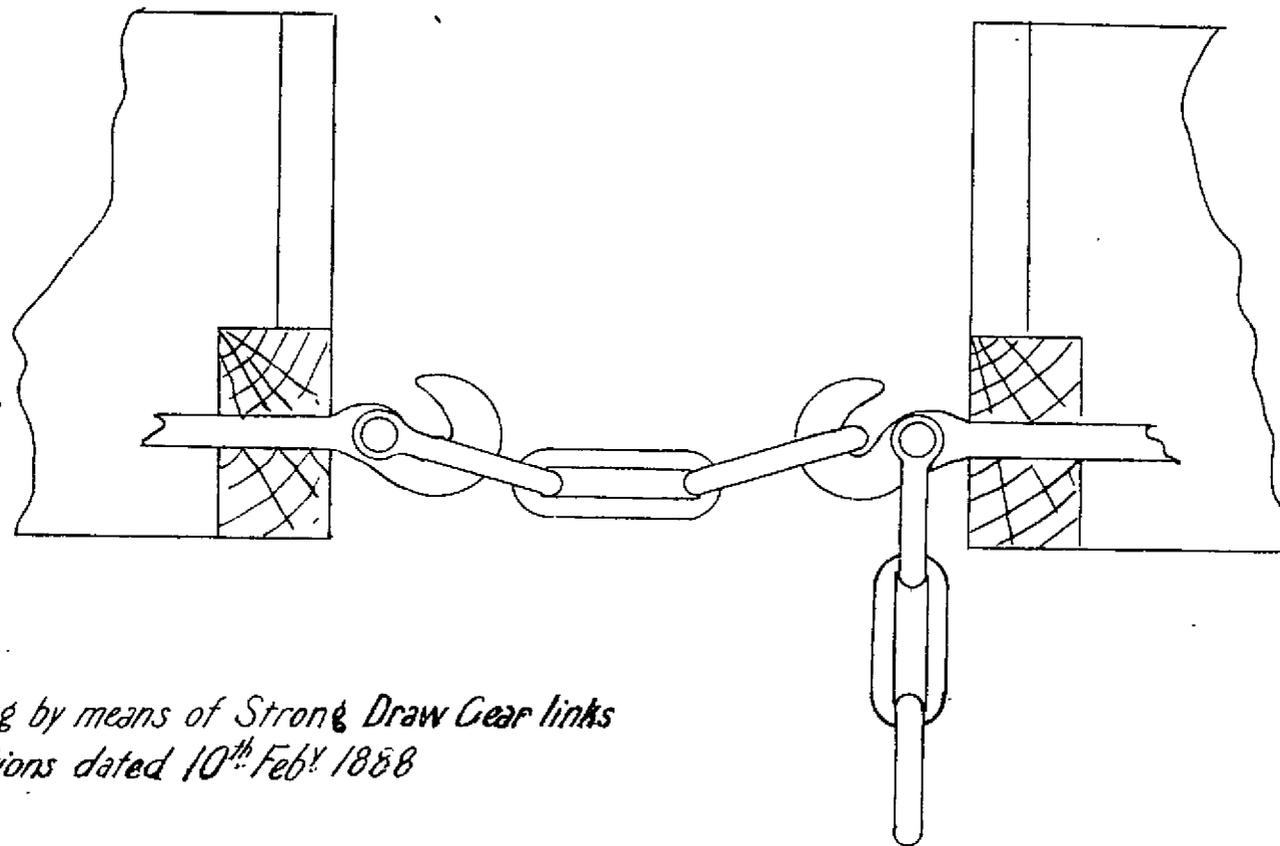

LIGHT DRAW GEAR

*Double Coupling in vogue prior to issue of order
dated 10th Feb. 1888*

(166-)

STRONG DRAW GEAR

LIGHT DRAW GEAR

*Mode of Single Coupling by means of Strong Draw Gear links
as ordered by instructions dated 10th Feb^y 1888*

Chief Traffic Manager's Office, Sydney, 6 May, 1890.

I BEG to report for the information of the Commissioners that no order has ever been issued, or even contemplated, authorizing the disuse of side-chains on vehicles of any description where they are provided. And the general practice has been that where waggons with the old or light description of draw-gear have been attached to the new vehicles, which are provided with strong centre draw-gear and without side-chains, to place the coupling of the strong on the draw-hook of the light draw-gear, and to place the hooks of the side-chains on the latter in the centre chain of the other or strong gear.

With respect to the assistant guard question, I am in a position to state that no alteration has been made in the practice for the last ten years at least. Except between Penrith and Katoomba, where the gradient is of an exceptionally long and severe character, it has not been customary to provide assistant guards for through goods trains.

Where assistants have been employed on through trains, it has been simply to utilise the services of men returning to their homes, after having run either as head or assistant guards in the opposite direction, or when on their way to a station to take charge of a train.

The practice has been to provide assistant guards only on local or "pick up" trains which have a considerable amount of work to do at stations in transit.

The Secretary for Railways.

DAVID KIRKCALDIE,
Chief Traffic Manager.

Government Railways of New South Wales,
Sydney, 6th May, 1890.

Gentlemen,

We have the honor to report that, in accordance with your instructions of the 27th ultimo, we have held an inquiry into the cause of the accident which occurred to No. 26 Up Mixed Train from Bathurst to Penrith on the evening of the 25th April.

We find this train was due to leave Bathurst at 4:50 p.m., but did not depart until 5:40 p.m., being 50 minutes late. The train was made up as follows:—

- 1 American 8-wheeled coupled Bogie engine and tender, weighing 72 tons.
- 12 loaded goods waggons.
- 1 first-class carriage.
- 1 empty horse-box.
- 1 compo. brake-van, about 12½ tons weight.

The total weight of the train, exclusive of engine and tender, was 147 tons.

The train left Bathurst as before stated at 5:40 p.m., and arrived at Kelso at 5:46 p.m., where four waggons of goods were detached, and eight vans, containing 800 sheep were attached. The train left Kelso at 6:10 p.m., having been delayed by waiting for the arrival of a Down Goods Train, which had to be crossed. The train then consisted of:—

- 8 waggons of goods next the engine.
- 8 vans of sheep.
- 1 empty horse-box.
- 1 first-class carriage.
- 1 compo. brake-van.

The total weight of train, exclusive of engine and tender being 184 tons 4 cwt.

Nothing unusual occurred to the running of the train between Kelso and Raglan. On arriving at the latter place at 6:23 p.m. the rear end of the brake-van came to a stand at the wooden column, which supports the platform awning at the Bathurst end of the station. Immediately the train stopped, the draw-bar of the third waggon (No. 3,008) from the engine broke, and the rear portion of the train, consisting of sixteen vehicles, weighing 154¾ tons, began to move quickly backwards down the incline of 1 in 50 in the direction of Bathurst. The guard was in the brake-van and endeavoured to further screw on his brake (which was already on), but the recoil caused the waggons to move so quickly that, although the guard jumped out of his van and attempted to sprag the waggons he failed in doing so, owing to the velocity they had attained. The telegraph operator also attempted to put a waggon brake down, but was unsuccessful.

The train ran down the incline at a great speed, and was not in any way checked until it dashed into the engine of No. 28 Up Goods Train, which had just left Bathurst Station at 6:30 p.m., and had travelled about 250 yards. The collision occurred at a point about 70 yards on the east side of Russell-street level crossing, the distance from where the train broke loose at Raglan to this point being about 4 miles 4 yards; the first 2 miles 56 chains of the distance being down a gradient of 1 in 50.

The rolling stock of No. 26 train was considerably damaged, as follows:—

- Compo. brake-van completely wrecked.
- First-class carriage completely wrecked.
- Horse-box completely wrecked.
- Eight sheep-vans completely wrecked, and about 300 sheep killed.
- Goods waggons only slightly damaged.

Unfortunately, four people were killed, namely, Rebecca Franklin, Maud Radford, Michael Downey, Henry O'Connor, and three injured, viz., Mrs. Condon, William Condon, Jeremiah Noonan.

The engine of No. 28 up train was also considerably damaged, as also four waggons slightly.

The permanent way was but slightly injured.

The estimated cost of damage to rolling stock being £2,660, and the permanent way £2 17s. 6d.

Evidence.

Evidence.

James Palmer : I was driver of No. 26 up goods train, which left Bathurst on night of 25th April; the number of engine being 132, an American engine; I had two firemen; we left Bathurst at 5:40 p.m., and stopped at Kelso; we detached four trucks of goods and put eight of stock on; this made up our full load; we arrived at Kelso at 5:45 and left at 6:10 p.m.: between Kelso and Raglan I had no occasion to slacken the speed of my train; it was a direct pull; I was advised by the guard to pull up at Raglan; he did not tell me for what purpose I had to pull up; it would be about 90 yards from the Sydney end of the platform where I pulled up; I pulled my train up in the usual way; the brakes on engine and tender were put on by my firemen; the firemen took up the signal given by the guard; I believe the guard showed the firemen a red light which caused them to put on the brakes; the engine came to a stand in the usual manner and I felt nothing to cause me to think that anything had taken place to the train; I felt no jerk; a jerk might have taken place without my knowledge; there must have been a recoil of the train; I was standing on the right hand side of the engine, which would be the inside of the curve, looking out for a hand signal light from the guard (as it was dark), when I noticed the side lights of the brake-van disappearing; I immediately thought the train was running back; I immediately got off the foot-plate of the engine with my hand lamp and went to the rear of the train; I found that there were three waggons (loaded waggons) attached to the rear of the tender, but that the remaining portion of the train was out of sight; the first thing that I did was to look at the couplings of the last waggon, when I found that the draw-bar was hanging half way out of the waggon head-stock; side chains were hanging down; I pulled the draw-bar out; I looked for broken end of the draw-bar three times, but could not find it; I have no idea when it was found; when I arrived at Raglan I could not see without a lamp or light to do any work; the first time I saw Guard Davis was when he came up to me where I was standing on the rails near the third truck, and the station-master came shortly afterwards; the first question I asked Davis was, "Have you blocked the road?" he said he had done so, so it shows that Davis had been to the telegraph office; I could not say what time had elapsed from the moment I pulled my engine up till I spoke to Guard Davis; I did not ask him what precaution he had taken to stop the runaway train; I could not do anything myself; I was powerless to prevent the train from running away; total number of vehicles on leaving Kelso was eighteen and brake-van; the brake-van, then the carriage—I could not say what class of carriage it was—horse-box next,—could not say whether anything was in it—eight of sheep came after the horse-box, then eight loaded goods waggons; I did not count the number of vehicles myself, but was informed by the guard; I cannot form any idea how the centre chain came off the draw-bar hook; if anything, the draw-bar and hook were inclined upwards; the position that I pointed out on ground, as where the rear end of the third waggon was standing after the runaway took place, is about as near the point as possible; this distance is about 66 feet on Sydney side of three-quarter mile post.

By Mr. Kirkcaldie : After the train had parted I put the engine and three trucks into siding, and remained at Raglan for orders.

By Mr. Thow : Engine did not move back when we stopped; I have no recollection of it on this occasion. I cannot remember that either guard or station-master suggested that I should go back after the train that broke away; the rails were in good condition on this night, and quite dry; I saw the lights of the brake-van disappearing from my side over the hill; the first indication I had of train having parted was the lights going over the hill; I have given you all the information that I possibly can on this matter. I have been an engine-driver on these lines eight years; altogether have been twenty years a driver. When I first commenced on these lines I was a third-class man; I am now a second-class driver.

JAMES PALMER, 1/5/90.

James Palmer, recalled. When passing Raglan Station fireman Donald was looking out for a signal and said "Whoa"; at this particular time I was steaming ahead; as soon as I heard fireman Donald sing out "Whoa" I shut the regulator put the reversing screw full forward and the two firemen applied the brakes of engine and tender; at that particular moment I do not think we were travelling more than 3 miles an hour; I cannot say how far I travelled, but the train was stopped as quickly as possible.

JAMES PALMER, 1/5/90.

James Donald states: On night of 25th April I was fireman on engine No. 132 of the No. 26 up goods; engine was one of the consolidated class; I am first fireman; I cannot say what time we left Bathurst, but we left Kelso at 6:10 p.m.; we did some shunting, and we picked up eight trucks of stock; I noticed nothing particular in reference to train between Kelso and Raglan; we pulled up steadily when going into Raglan Station; I cannot say what time we arrived, but I was told we arrived at about 6:23 p.m.; we were standing at Raglan about 5 or 6 minutes before I heard that a portion of the train had broken away; the driver was off the engine during this time; we had been stopped about a minute when driver had got off his engine; he returned in about 3 minutes; as the driver was getting up on the engine Guard Davis got up on the opposite side; I was then made aware that the train had broken away; the next thing that was done we put the engine and three waggons in the siding; the engine was standing about 100 yards from platform when we pulled up; I went into the office and inquired of the station-master if it was a fact that train had broken away; I knew that the van was at the platform when the train stopped as the guard gave me a red light to stop; I was on the left hand side of engine; I applied the engine brake hard on whilst we were moving ahead and when I got a red light from the guard; the engine was steaming when I saw the red light; I am positive I felt no jerk and felt nothing unusual in stopping; I cannot give any idea as to the cause of the draw-bar breaking; I have seen a little shunting; I have been a fireman five years; I have seen several draw-bars broken; I have seen them broken during shunting operations; cannot say that I have seen any draw-bar broken in running.

By Mr. Thow : I was subpoenaed by the Court but did not give evidence; no one asked me what information I could give; this is the first time I have been asked any question about the matter; I never heard what the driver said; I was not in the Court; the driver did not make any remark to me when he got off the engine; it was a very dark night; the engine never moved after

after we stopped at Raglan; from the conversation which I heard between the driver and the guard I made out that the train had broken away; just at the time that this conversation was going on the station-master came up and said, "There is room for the engine and three trucks in the dock;" we then shunted into the dock; this occupied only about a couple of minutes; the driver and guard then left the engine and proceeded up the line to get the drawbar; the drawbar was in the four-foot on the main line; I remained on the engine during the time the guard and driver were getting the bar; I did not see where they put the bar; the driver, on his return, told me to see that the tail-lamp was lit; after lighting the tail-lamp I went to the station to make enquiry about the breakaway.

By Mr. Kirkcaldie: I am perfectly certain that after the engine had passed the platform at Raglan some distance I looked back and saw a red light from the guard's van; at that moment we were still steaming ahead, and I at once said "Whoa," to the driver, and put on the engine-brake myself, and the other fireman put on the tender-brake at the same moment.

JAMES DONALD, 1/5/90.

Thomas Prince states:—I was one of the firemen of the No. 26 up train on night of 25th April; do not know what time I left Bathurst; do not know what time I arrived at or left Kelso; at Kelso we put off four trucks of goods and took on eight trucks of sheep; we made two or three shunts in doing this work; after leaving Kelso and before arrival at Raglan I noticed nothing unusual to the train; I was firing between Kelso and Raglan; when we arrived at Raglan I stood by the tender brake; I put the tender brake on; I believe the brake of engine was put on; I cannot say whether the tender brake was put on at the same time as the engine brake; I put tender brake on because the other fireman told me that guard had given him a red light, and the fireman sang out "whoa, whoa;" when we got the signal to stop, the engine was about opposite the sheep race; we were going very slowly when the brakes were applied we were travelling about four miles an hour when we got the signal to stop; I did not know for some considerable time that the train had broken away; it would be fully eight minutes; after the train had stopped I was going to open the fire-hole door, and I noticed the driver looking out of the cab, driver being on the right side of the engine looking back, and he suddenly asked me for the hand-lamp; I gave him a signal-lamp, and he got off the engine and went back; I watched him; I had no idea what he was going back for; I saw him disappear as I thought in between the trucks; I then went across to the firemen's side of the engine to look for the signal for starting, and saw the driver come up from the other side of the trucks; the guard came up to him and both walked up towards the engine; I did not hear what they said, and I thought we were going to do some shunting; presently I heard the station-master say, "There is room for three in the dock," and he gave us the signal to put back over the points; I thought we went back very easily and stopped easily; we then went ahead to get into the dock, and backed into the dock and stood there; after a minute or two the other fireman lit the flare-lamp, and went along the platform to the station-master's office; at that time I was not aware that anything was wrong; I thought I would go and inquire for myself what was the matter; when I arrived at the office I heard some one say that they would not mind so much if there were not some passengers in the train; I said, "What is the matter?" and the reply was, "Don't know until we get word"; from the remarks I heard made at the door I learned for the first time that the train had broken away; they were then waiting for a reply from Bathurst whether she had gone clear; a few minutes after word came that she had struck No. 28 up; everyone seemed excited that were about the station door; I waited for orders; I know the station-master asked for line clear for us to go back to Kelso; during this time the driver was at the office; word came to keep the engine at Raglan for the present; we then stood by for further orders; the driver had previously gone to see what was the cause of the accident; while I was standing at the office door I saw the driver, guard, and station-master go and pick up the drawbar, which they found about where the third truck stood after the train came to a standstill; I did not feel any unusual jerk while the train was pulling; I cannot form any idea as to what caused the drawbar to break; I could not be certain whether the driver got on to the engine again before train was put in the dock; I did not hear the conversation between the guard and driver; the guard rode on footstep of the engine; I think it was the fireman's side; I was a fireman on the leading engine of a train on one occasion when the signal was against us, and then signal was lowered for us to come in when the drawhook of second engine broke; this was between the two engines and at Lawson Station; I have been a witness to a good many drawbars breaking when shunting operations were carried on at Eskbank.

By Mr. Kirkcaldie: I feel satisfied that the engine was steaming until the other fireman said "Whoa," and as soon as I heard the other fireman say "Whoa" I began to apply the tender brake; I cannot tell how many yards we travelled after we put the brakes on; I fancy that while I was putting the brakes on the tender the other fireman was putting the brakes on the engine.

By Mr. Thow: When I arrived at the station-master's office the other fireman was there; the driver was also in the office; I had no conversation with the driver or fireman; the driver did not give me any information as to what had happened when he came back to the engine; I was not subpoenaed to appear at the Court, but was instructed by the driver that I had to be there; I did not hear the driver's evidence.

By Mr. Kirkcaldie: I have been four and a half years in the service; for the last five months as fireman.

THOMAS PRINCE, 1/5/90.

Edwin Brady Davies states:—I have been about nine years in the Railway service; I was first at Darling Harbour; I have been running assistant guard and guard for a period of about seven years; I have been running principally between Penrith and Bathurst; I have run all classes of goods trains, and have had all classes of goods brakes on; on the night of the 25th April I was guard of No. 26 up goods train from Bathurst to Penrith; my train is due to leave Bathurst at 4:50 p.m., but on the night of the accident I did not leave till 5:40 p.m.; on leaving Bathurst my train consisted of twelve loaded goods trucks, one first-class carriage, one empty horse-box and compo. brake-van, a total of fifteen vehicles altogether; I examined the whole of the couplings between the brake-van and tender of engine; I did so by going up one side of the train and down the other; the station-master gave me the word "alright" to start from Bathurst; we arrived at Kelso, time booked by me at 5:46 p.m.; at this place we detached four waggons of goods, and attached eight vans of sheep; we left Kelso at 6:10 p.m.; the reason for
being

being so long at Kelso was owing to the delay in consequence of waiting a down goods train; we proceeded safely along the road from Kelso to Raglan; on leaving Kelso the train from the engine consisted of eight trucks of goods, eight trucks of sheep, one empty horse-box, one first-class carriage, and compo. brake-van—nineteen altogether; we proceeded safely until we arrived at Raglan station; I felt no unusual motion or jerk to my train between these two points; on approaching Raglan station I gave the signal to engine-driver with the white light, waving him forward; when I gave the signal my van would be somewhere about the gate at level crossing on the Kelso side of station; I afterwards gave the engine a red light; these signals were given on the station side of the van; when I gave my last signal the van would be about the point where my van came to a standstill. The rear end of the van came to a stand at the wooden column carrying the awning of platform at Bathurst end of station; the telegraph operator stepped right into the brake-van just about the time the brake-van came to a stand; I then found that my van was travelling backwards, and I said to the operator, "What! is she away?" At the same time that I spoke to him I had hold of the brake-wheel, and feeling that the train was travelling backwards I applied greater force to the brake; I am positive that I did not skid the wheels by applying the extra force; I am positive I put the brake on as hard as it could be; after doing this I took a sprag from the shelf and jumped out on to the right-hand side of the line; the place where I jumped out would be about 115 feet from where the brake-van had come to a stand; (this is the place I pointed out on the ground to-day as being the distance from awning-post on platform; it is as near as I can tell the spot where I jumped out;) I attempted to sprag the wheels of the first sheep-van, the third vehicle from the brake-van, but failed to do so; in doing this I was knocked over, and at the present time I feel the effects of the blow I received from the sprag; I then made three more attempts with the sprag, but I could not succeed in spragging; I then threw the sprag on to the rails in front of one of the wheels, but it was knocked off; I did not feel any recoil or sharp jerk when my train came to a stand; the only thing I felt was the train coming back, and all at once it seemed as if a great weight had come upon the brake-van; it was sufficiently dark to require to use a lamp; when I jumped out of the brake-van I thought the train had broken away, but I was not sure of it until the last vehicle had passed me; I then ran to the telegraph office and called out to wire Kelso and Bathurst.

By Mr. Kirkcaldie: I believe the engine was steaming ahead when I showed the red light to engine; the train was just moving ahead when I showed the red light; the train only travelled a few yards after I held it out; I did not feel any recoil of the train; have been goods guard for seven years; my experience is that I have had a goods train stop at Raglan without the slightest recoil, and have had them start away bodily, and other times drivers have attempted to start away, and have had to put back to get a start; as a rule, more often than not, I feel a certain amount of sagging and stops of the train at Raglan on the up journey, and I have known what I call sagging, that the whole train and engine came back; many a time I have jumped out of my van to put a sprag in the wheel of a waggon at Raglan, owing to the whole train, including the engine, coming back.

By Mr. Thow: I should think the speed would be about 13 miles an hour up the bank between Kelso and Raglan; the strain on the draw-bar would be greater going up the bank at this rate of speed, and I cannot account for the draw-bar breaking at Raglan when the train was only travelling 8 miles an hour; I cannot give any reason for coupling breaking; the train was travelling about 15 miles an hour when I jumped out of the brake van; I jumped out of the van on the station side of Home Signal; at the time I said something to the Raglan operator I thought something had gone wrong, but I could not tell what; I did not think the engine was backing the train; my idea was that the train had parted.

By Mr. Kirkcaldie: The telegraph operator was some distance on the Bathurst side of platform before I jumped out of the brake-van, and my conviction then was that something had broken away; in this particular case the brake was a good one.

E. B. DAVIES, 1/5/90.

Francis Davidson states: I am station-master at Raglan; on the night of the 25th April, when the No. 26 up-goods came to the station, I was standing on the platform opposite my house door; when the engine passed me they were not going more than 2 miles an hour; I noticed one man was looking out on the side next the platform when the engine passed me; she was going under steam; the brake-van came up and stopped about the Bathurst end of platform awning; I saw the guard then; he was stooping in his van to hand out some parcels; I do not think he got out of the van; I saw him signal to the engine; it was a white light which I first observed, and he afterwards waved a red light to the engine; he then stooped down, and appeared to be sorting parcels.

By Mr. Kirkcaldie: After the guard turned the red light on to the engine the train travelled about the length of a carriage forward.

By Mr. Angus: Then I noticed that the train was moving backwards; I thought when I saw the train moving backwards it was a rebound of the train; I believe the guard had his brake on at this time; I cannot say whether the wheels of the brake were skidded; I afterwards saw the guard jump up to the wheel of the brake, and he was exerting himself to a considerable extent, so much so that it appeared the brakes were hard on; I then turned up the platform and noticed that the train was then moving gently backwards, and I turned a red light on towards the driver; at the time I showed the driver a red light I was under the impression that the train was moving back with the engine and tender attached; it is a very common thing to see a train move back at the same rate of speed; I was beginning to be aware that there was something wrong with the train owing to the speed it was coming backwards, but was not aware that train had parted until the last waggon had passed me; when the last waggon passed me it would be going about 6 or 7 miles an hour; I jumped down off the platform on to the line with the intention to stop the train, but before I could do so it was out of my reach.

By Mr. Kirkcaldie: I am confident that the speed of the waggon at the time it passed me was not more than 7 miles an hour, and it was impossible for me to check the runaway portion.

By Mr. Angus: I did not see the guard on account of the darkness; when I found that I could do nothing in stopping the train, I waved my hand-lamp to the driver with the view of bringing him back for the purpose of seeing if he could catch his train, and I called out to him to try and come back and catch his train; at the time I called out to the driver I was standing about opposite the ladies' waiting-room door; as I found he was not coming back, and would be useless for him to do so, I jumped on to the platform, with the intention of going to the operator, and on glancing in the office I did not see him

him there, and as I saw a light on the Bathurst end of the platform I went towards it and found it was the operator, and as I was running down the platform I called out to him to come here and wire Bathurst and Kelso that the larger portion of No. 26 Up had broken away; from the time I saw the last waggon pass me the operator was at the instrument in about a minute and a half, and would not take more than half a minute to get a message off; the train arrived at Raglan 6.23 p.m., and from the time of the arrival until the last waggon passed me would not be more than one minute; no exertion on my part would have prevented the train from running away after I found that the train had parted; when the operator was sending away the message and while I was standing in the office Guard Davis came in and called out to the operator, "Wire Kelso and Bathurst;" after the message had been sent away I went in the direction of the portion of the train that was left behind attached to the engine and found the driver beside the draw-bar, which was lying in the four-foot, and looking at it; the driver made some remark to "Wire Kelso and Bathurst"; Guard Davis then spoke and said that Kelso and Bathurst had already been advised; after taking the draw-bar away and putting it beside the lamp-room, I shunted the train into the siding.

By Mr. Kirkcaldie: According to instructions from Mr. Duff, I looked for the broken end of draw-bar, and found it on Sunday afternoon about 12 or 15 feet on the east or Sydney side of where the draw-bar was found.

By Mr. Thow: This train passed me at a rate of about 2 miles an hour; this is the usual speed for trains coming into Raglan Station; I did not see guard jump out of the brake-van; I did not see any fire from the wheels of the brake-van as the broken part of the train passed the platform; when train was coming back I took it to be the recoil; I have seen them go back two or three truck lengths, and sometimes with the engine attached to the waggons; this is a usual experience with all goods trains to go back more or less; I have jumped across the couplings and put a sprag in; it is my usual practice when I see anything going away like that two or three waggons length backwards; I saw brake-van and fifteen waggons pass me while I was standing on the platform; it was impossible to put a sprag in as the train was between the sprags and myself, and the speed was high.

By Mr. Kirkcaldie: I cannot account for the draw-bar breaking.

By Mr. Thow: I have seen when a train is about to start that the whole train has come back four or five truck lengths; generally put a sprag in under such circumstances; I have been station-master at Raglan five years, and nearly eleven years in the Service.

F. DAVIDSON, 1/5/90.

John Collins states: I am the operator at Raglan Station; I remember the night of the accident (25th April, 1890); No. 26 arrived at 6.23 p.m.; on its arrival I went to the carriage and called out "Raglan," and no passengers seemed to get out; I then went to the brake-van; I stood on the step of the brake-van; the front end of the brake-van was just at the post of the Bathurst end of the awning of Raglan platform; brake-van was not stationary, but still travelling towards Raglan—only a few feet, when the recoil of the train caused it to go in the Bathurst direction; I did not feel any jerk, and the train continued to move gradually faster in the direction of Bathurst; the brake was hard on, but the wheels were not skidding; I rode on the footstep of the brake-van to within 5 yards of the end of the platform, when the guard said, "Is she away?" I did not reply; I ran down the platform-ramp and put one waggon brake down near the centre of the train; had there been a sprag on the platform I would have attempted to sprag one of the wheels; I never have done anything of the kind; when I put the brake of one of the waggons down I was nearly knocked down in doing so; the train would be going at a speed of about 7 to 10 miles an hour; it would be above 10 yards from end of platform close to where I jumped down when train had got away; I immediately rushed to the telegraph instrument to call Kelso; it would not be more than two minutes after train arrived; I only called twice when I raised him and informed him that a portion of No. 26 Up had broken away; this would only take half a minute; Kelso at once called Bathurst; I heard him on the instrument; I heard Kelso call Bathurst about a minute before he got him; and I am of opinion that Bathurst would receive the message about No. 26 Up breaking away about three and a half minutes after the train arrived at Raglan; the station-master was at the office door when I rushed to the instrument; he was coming down the platform towards Bathurst and I was at the end of platform when I heard the station-master call; I wired Kelso but did not wire Bathurst as I thought No. 23 Up would be at Kelso; the guard came into the office just as I had told Kelso; he said, "Have you told Kelso and Bathurst?" I have been in the Service about four years, and have been telegraph operator at Raglan for the last eight months; I have seen trains arrive at Raglan, and recoil, and have never seen a train on the up journey arrive without a recoil; I have seen the trains recoiling, the engine has also gone back occasionally; I have seen a train recoil about 6 yards, the usual practice of guards on arrival at Raglan is to only put the brake of brake-van on, sprags are only used to put in wheels of trucks when engines are detached for shunting, and sometimes the waggon brakes are put down.

By Mr. Thow: Brake was hard on; I saw a guard putting it on; I did not see any fire fly from brake-van wheels; guard asked me, "Is she away" before I got off the footstep of the brake-van; I did not think control of the train was lost; I knew when I put the brake down the train had broken away; I have seen the station-master go across couplings to sprag a truck for shunting purposes only; this is the first occasion in my time that I have seen an accident of the kind at Raglan; I saw the guard waving the driver up near the home signal, which is about half-way between level crossing and platform; when brake-van was at end of platform guard gave driver a red light; I was at the office door when engine passed me; I noticed it passing; engine was travelling at rate of 4 to 5 miles an hour; driver did not increase the speed when he got the guard's signal to go on; the driver steadied a little before he got the signal from guard to go on; he was then running at about 3 miles an hour; I do not remember the buffers striking together; I have often heard them strike when waggons come together; I think the breaking of coupling was due to recoil, but I did not observe anything unusual in the motion of the train during its up journey.

By Mr. Kirkcaldie: When I was standing on platform engine was steaming ahead, and driver shut off steam after the engine passed me; after steam was shut off they pulled up pretty quickly; when they pulled up I do not remember hearing buffers striking; yet all trains stopping at Raglan on the up journey have a certain amount of recoil.

JOHN COLLINS, 1/5/90.

George

George Watsford states: I am station-master at Kelso, and have been in the Service fifteen years next August, and station-master about five years; have been station-master at Kelso about three years, previous to which I was twelve months at Brewongle as station-master; on the night of 25th April, No. 26 Up goods train arrived from Bathurst at Kelso at 5:47 p.m. and detached four loaded D trucks and picked up eight loaded sheep vans containing about 800 sheep; it left Kelso at 6:9 p.m.; it did not have much shunting in attaching or detaching; the reason why the train was so long at Kelso was waiting the arrival of a Down train which it had to cross at Kelso; I was advised from Raglan by wire about twenty-five to twenty-seven minutes past six that the train—26 Up—had broken loose; I was standing at the office door when informed of it, and I immediately advised Bathurst, and, at the same time, told one of the porters to run and open the level-crossing gates; the porter had just time to open them when the train dashed through the station; I have no idea of the speed at which it was travelling, but I never saw a train travel faster; the porter had a distance of about sixty yards to run to open the gates; he ran back from the level-crossing gates and jumped on platform, at the same time exclaiming that the train had crossed over the bridge (Macquarie Bridge); it would take porter about half-a-minute to run from gates to platform.

By Mr. Thow: I did not think a brake was on; so far as I could see there was no fire coming from the wheels of brake-van; my porters informed me that they did not see any fire.

G. H. WATSFORD, 1/5/90.

Joseph Dowling states: I am the telegraph-operator at Kelso; have been operator at Kelso about ten months, and have been in the Service about two years; I was on duty when the No. 26 Up passed there; I cannot say what time she arrived, but she left at 6:9 p.m.; after the train had left, Raglan told me that it had broken away; this was about 6:28 p.m.; I was in the office the whole of the time, so that Raglan had not to call much before I answered; when I received the message, "A portion of No. 26 Up broken away," I called out to the station-master, who was standing opposite the door, and told him No. 26 Up had broken away; I then proceeded to call Bathurst at the request of station-master, Mr. Watsford; I raised Bathurst in about three-quarters of a minute, and I told him No. 26 had broken away, and was running down the bank; I know the operator at Bathurst received the message; from the time I received message from Raglan to the time train passed Kelso it would be about a minute; I cannot say the time definitely; I cannot say what time had elapsed after train had left Kelso to the time of collision; I did not hear the collision; I stood by the instrument all the time.

JOSEPH DOWLING, 1/5/90.

William Nash states: I am operator at Bathurst Station; on the night the accident occurred I was on duty, and received a message from the operator at Kelso that the No. 26 had broken away and was running back into Bathurst; I received the message at 6:30 p.m.; I immediately informed the station-master; I did so instantly, as the station-master, Mr. Farquhar, was standing at the office window.

By Mr. Kirkcaldie: Mr. Farquhar immediately rushed away out on the platform, with the purpose of stopping the train.

By Mr. Angus: The accident or collision occurred almost immediately I informed Mr. Farquhar.

W. NASH, 1/5/90.

George Farquhar states: I am station-master at Bathurst, and will have been so six years on the 14th of September; No. 26 Up is recorded as having left Bathurst station at 5:37 p.m. on the 25th April, making her 47 minutes late leaving here; the train on this occasion had about its usual load on; I started it myself; on the departure of No. 28 Up at 6:30 p.m. I went to the window of telegraph office and entered the train number in the Train Book, when the operator turned round to me and said, "No. 26 is broken away"; I do not remember him saying where she had broken away; I then rushed out on the platform exclaiming "Too late"; she (No. 28) had then just started and was going through the Russell-street gates; I exclaimed at the same time, "26 has broken away," and Goods-guard Payne, who was standing alongside me, said "Yes, and there she comes across the bridge"; I may here state that immediately afterwards the collision occurred; it was out of human power for anything to be done then to prevent the collision; I, with others, proceeded to the spot and commenced at once to search for the injured; everything that was possible was done to alleviate their sufferings; I may add that I received valuable assistance from the residents of the town in looking for the injured and clearing up the debris; from the time I received the message to the time the collision occurred scarcely a moment had elapsed.

GEORGE FARQUHAR, 1/5/90.

Hugh Miller, driver of No. 28 Up Goods train, states: I was driver of train on the 25th April; I had a big Consolidated engine, No. 140; I had two firemen, Henry Bannister and Charles Towle; I usually leave Bathurst at 5:40 p.m.; on this date I left at 6:30 p.m.; I believe there were eleven waggons and brake-van on the train, and one guard; it is a pick-up train generally; I got about 70 yards on Sydney side of Russell-street crossing when the collision took place; the first intimation of an approaching train was a red light hanging very low; this, no doubt, would be the tail lamp of the train with which I collided; I never heard or noticed any noise of an approaching train until I saw the light; I shut the regulator and called out "Whoa, whoa"; I remained on the engine until she was struck, and possibly half a minute afterwards, when I was swung off the engine and rolled half-way down the embankment; I was slightly giddy, but not unconscious; somebody came to me and said, "You are hurt, old fellow, you had better sit down," which I did; the firemen also remained on the engine and put the brakes on; I believe the engine brake was put on by Henry Bannister; cannot say whether tender brakes were put on; I believe the fireman was putting coal in the fire-box at the time; I would be going about 10 miles an hour at the time of the collision; I had run about 250 yards before the collision took place; there was nothing that I could have done to prevent the accident.

To Mr. Kirkcaldie: I believe my engine was driven back by the force of the collision to Bathurst side of Russell-street crossing, a distance of about 70 yards; I do not think that any of the waggons were knocked off the road; my engine was not derailed.

To Mr. Thow: I had engine No. 140; I did not know that the engine and tender had parted after the accident.

HUGH MILLER, 1/5/90.

William

William Henry Bannister states: On the night of the 25th April I was first fireman of No. 28 up train; No. 28 Up is due to leave Bathurst at 5:40 p.m.; according to the driver's watch it was 6:30 p.m. when we left there; we had eleven loaded trucks and C vans, chiefly loaded with grain; we started from a point near the turn-table at the carriage dock, Sydney end of Bathurst platform; we had travelled about 80 yards on the Sydney side of Russell-street crossing when we came into the runaway train; I just watched our own train over the Russell-street crossing and looked forward and saw the tail lamp of a train coming; when I first saw the tail lamp of the runaway train it would be about the length of the engine and tender from us; I made for the engine brake and was screwing it on all the time until we came to a standstill after the collision; I kept screwing on the brake after we were struck; I was not knocked down by the force of the collision, nor yet was I injured; the bogie wheels of the engine were on Russell-street crossing, so that we must have been knocked back; we would be going about 10 miles an hour at the time of the collision; our engine was not knocked off the line; the casting securing the draw-bar on the engine, which secures the draw-pin, was broken, as also the draw-bar pin itself, allowing the tender and train to go apart from the engine to a distance of about 48 feet; side chains were connected between engine and tender; when we came to a stand I found that the tender had parted, and on looking round I found that the driver was not on the foot-plate; I took the staff-ticket from the rack and put it in my pocket; I then made an attempt to go past the engine on driver's side, but was unable to get past; however, on getting round to the other side, I found the driver in charge of two or three persons, who were assisting him, and took him to driver Watley's, who resides near the Russell-street gates; I then assisted the other fireman to put the fire out in the firebox; while we were doing this our attention was drawn to a little boy on the top of the boiler whose name was O'Connor; my mate handed him down from the top of the boiler; afterwards we searched about the tender to see if any others were about the tender of the engine; nothing that my driver, mate, or myself could do would have prevented the collision.

H. BANNISTER, 1/5/90.

Charles Towle: I was one of the firemen of No. 28 Up goods train (second fireman), on night of 25th April, 1890, and was making up the fire at the time the collision took place, and the first intimation I had was the driver calling out "Whoa, whoa;" I made to put on the tender brake on hearing this. before I could reach the brake-handle I was knocked down, and fell on the tender foot-plate on the coals; I was not hurt that I know of; I cannot say whether I was rendered unconscious; I got up and got hold of the cab stanchion, as I felt the engine and tender was parting; I was partly knocked off and fell on the ground; I did not roll down the embankment; the coupling between the engine and tender parted owing to the pin on the draw-bar being broken on the foot-plate of the engine; it was a plain draw-bar; there were two side chains; I cannot remember whether the side chains were broken; I heard no noise of an approaching train prior to the driver calling out "whoa;" this train was due to leave Bathurst at 5:40 p.m.; I think we left at about 6:30 p.m.; we were standing at the end of the platform near the signal box; I could not say what distance we had travelled when the collision took place; I could not say exactly how far the engine was knocked back; the tender and portion of the train were a greater distance than the engine as the couplings had parted; I believe my driver and fireman did all they could to prevent the accident; I did all I could possibly do myself; I may also state while I was endeavouring to put the fire out after the accident had taken place I got my foot scalded, but it is getting on fairly well; it was I who found the little boy O'Connor; I found him on the top of the boiler, between the dome and sand-box; he was lying on his side; he was not dead, but crying; I handed him down to fireman Bannister; I could not say if he was scalded; I do not think the fire-box was injured.

By Mr. Thow: We had engine No. 140; the first thing I did after the accident was to look for the driver; I put the fire out with water; I did not know the full extent of the accident until about half an hour after it occurred; we were travelling engine first.

CHARLES TOWLE, 1/5/90.

George Weekes states: I am an examiner of carriages and waggons at Bathurst, and have been seven years in the service, and seventeen years in railway service in England; I remember the No. 26 up goods leaving Bathurst on the night of 25th April; every part of each vehicle, so far as examination could go, I examined; I examined the brake of the brake-van on No. 26 up, and the brake gear was good; in my opinion, if the brake had been put hard on, as hard on, as the guard could possibly get it, the wheels would have skidded; the same class of van going out of Bathurst with brakes on, I have seen the wheels skidded.

By Mr. Thow: But I am aware that the rails in Bathurst yard are more greasy than between stations; I therefore think the wheels would be skidded more easily in the yard than between stations; the van started from here; I went inside and tried the handle; lately I have known of nuts being stripped, and this has caused me to always go and try the handles of brakes; I see where the brake screw is broken off, and I examined the other part left on, and the conclusion I come to is that the brake must have been hard on judging from the position of the screw in the nut.

By Mr. Angus: I also examined the brake blocks—they were about half worn out; about three weeks to a month is the maximum time for brake blocks to be on vehicles; there would be four blocks on the brake-van, and I am perfectly sure they were in good order.

G. WEEKES, 1/5/90.

Conclusion.

From the foregoing evidence the cause of the accident was the breaking of the screwed end of the draw-bar of the third waggon (No. 3,008) from the engine.

This waggon was built by Messrs. Hudson Brothers in 1882, and we have no reason to doubt that the broken draw-bar was the one originally supplied with the waggon; at all events it is a duplicate in all respects with the standard draw-bar of that date; it has thus been in use for seven or eight years, and engaged like others of the same kind in the ordinary traffic of the railways. The original links and shackle have been changed and stronger links substituted. The strain which passed through the draw-bar due to mere haulage of the load behind it, up the grade on which it broke, did not amount to 4 tons, and from the section of the iron which broke we have no doubt that a strain of not less than 28 or 30 tons must have been sustained by it before fracture ensued. This additional strain must have acted on the draw-bar as the result of the recoil on the stoppage of the train at Raglan Station.

The evidence of engineman, James Palmer, and his firemen, James Donald and Thomas Prince, who were engaged upon the engine of No. 26 train, shows clearly that at a red signal from guard's-van steam was shut off, and both engine and tender brake applied with force. The stoppage of the engine on this rising grade of 1 in 50 would thus be suddenly checked, and the waggons following it would run in upon the engine compressing their buffers, and creating a recoil, and a strain at least sufficient, but in all probability much more than sufficient to fracture the draw-bar. We cannot accept the statement of the station-master at Raglan, and other witnesses who said that no recoil occurred, as there are four facts in the case which seem to us to render such a view incredible.

First.—The sudden breaking of the draw-bar on stopping, when the stoppage and haulage strain were least.

Second.—That to cause the fracture the draw-bar must have been subjected to a strain about eight times that of the haulage strain.

Third.—That the steam was shut off, and the brakes of both engine and tender applied with force at the same moment.

Fourth.—That the draw-bar of waggon No. 3,008 was not drawn completely out of the waggon, which would certainly have been the case had there been any gentle parting; but from the engineman's evidence it will be seen that he found the draw-bar sticking half way out of the waggon and pointing upwards, showing that it must have sustained a disturbance sufficiently violent to jerk the heavy centre coupling links of the following waggon off the hook, and at the same time throw the inner end of the draw-bar downwards, allowing it to catch underneath some framing timbers of its own waggon.

The evidence of John Collins, telegraph operator at Raglan Station, is very pertinent to this point of recoil. He shows that the train made a rapid movement backwards, and such would be the exact result caused by the compression of the buffers. It would be a smooth movement, comparatively speaking, not as if the engine had pushed the train in a backward direction.

The side-chains of waggon No. 3,008 were not made use of as required by Rules 235 and 372; but we are of opinion that if the side-chains had been in use they would not, under the circumstances of the recoil which, we believe, occurred, have prevented the accident. We consider the recoil must have been violent, and far more than enough to fracture both main and side couplings from the fact disclosed by the evidence of the witnesses at Raglan Station, which show that the train immediately began to descend the incline at a high velocity, estimated by them at from 7 to 10, and even up to 15 miles an hour before many yards had been traversed. In consequence of this high speed their efforts to sprag the wheels were defeated. The brake-van of No. 26 Up Goods Train on the date of the accident was a composite van, No. 59. It weighed $12\frac{1}{4}$ tons; it has a brake-power equal to skidding the wheels of a van weighing $10\frac{3}{4}$ tons, and therefore is, we consider, as powerful a retarding brake-van as any in use for this service on the lines. The engine, No. 132, of No. 26 Up Goods Train was capable of taking a load up the incline in question of 211 tons; it will therefore be seen that the load behind it was well within that mark.

It

It is also known that the strongest draw-gear which has been made is liable to fracture through violent shunting or undue strains by jerking, and that, such being the case stations should not be erected or sidings laid down on gradients such as the one where this breakaway took place unless an up and down line be put in through the station or sidings which enables runaway points to be used, thereby preventing such mishaps; and we strongly urge the necessity for these precautions to be carried out, as also avoiding the erection of stations on gradients of less than 1 in 260, which latter grade has been found from long experience to be the heaviest for safety.

It is clearly proved that the guard put his brake as hard on as it was in his power to do, but the recoil of the waggons, owing to the steep grade of 1 in 50, was of such a sudden nature that no other means, either spragging or putting brakes down, could be effected, and that, had there been two guards, it would not have been avoided as the evidence of the Raglan telegraph operator proves, who, it will be seen from his evidence, endeavoured to do what a second guard would have attempted.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

ADMINISTRATION OF JUSTICE.

(DEPOSITIONS TAKEN AT INQUEST INTO RAILWAY ACCIDENT NEAR BATHURST.)

Ordered by the Legislative Assembly to be printed, 3 June, 1890.

RETURN to an *Order* of the Legislative Assembly of New South Wales, dated 29th May, 1890, That there be laid upon the Table of this House,—

“Copies of the Depositions taken in the late Inquest into the Railway Accident at Bathurst.”

(*Mr. Crick.*)

The Coroner to The Under Secretary of Justice.

Sir,

Coroner's Court, Bathurst District, 2 May, 1890.

I have the honor to forward herewith depositions at the inquest heard before me on the 26th and three following days into the cause of death of Rebecca Franklin at the late Railway collision at Bathurst.

The proceedings would have been forwarded earlier but for my unavoidable absence at Sofala on official duty.

I have, &c.,

W. A. STEEL,

Coroner.

A copy of the verdict and rider in this case might be forwarded for the information of the Railway Commissioners. Submitted.—A.C.F., 5/5/90. Approved.—A.J.G., 5/5/90.

The Under Secretary of Justice to The Secretary to the Railway Commissioners.

Sir,

Department of Justice, Sydney, 8 May, 1890.

Referring to an inquest held at Bathurst on the 26th, 28th, 29th, and 30th ultimo, by Watson A. Steel, Coroner, touching the cause of death of the woman named in the margin, I am directed by the Minister of Justice to forward herewith, for the information of the Railway Commissioners, a copy of the verdict and rider in the case referred to.

I have, &c.,

ARCH. C. FRASER,

Under Secretary.

[*Enclosure.*]

New South Wales, }
Bathurst, to wit. }

INQUIRY held at the Bathurst Hospital, at Bathurst, in the Colony of New South Wales, this 26th day of April, 1890, before me, Watson Augustus Steel, one of the Coroners of our Sovereign Lady, the Queen, for the Colony aforesaid, on view of the body of Rebecca Franklin, then and there lying dead.

Upon the oaths of William J. Pascoe, Alfred W. Avery, Charles J. Pruett, John M'Donald, James Kellaher, Walter Hall, Alfred Jones, William Mackie, Frederick Lumley, Richard Kenna, Robert Waters, Patrick J. Parker, good and lawful men of Bathurst aforesaid; who, having been sworn and charged to inquire (on the part of our said lady the Queen) when, where, how, and by what means the said Rebecca Franklin came to her death, do, upon their oaths say that the deceased Rebecca Franklin met her death at the Russell-street Crossing on the 25th of April, 1890, caused by an accident through the breaking away of a portion of No. 26 up train, which collided with No. 28 leaving the Bathurst Station.

In witness whereof, as well the said Coroner as the Jurors aforesaid, have to this Inquisition set their hands and seals, this day and year aforesaid.

W. A. STEEL,
Coroner.

Jurors.

RIDER.

RIDER.

And that the jury are of opinion that the safety of the travelling public and the railway employees has been endangered by the discontinuance of the use of side-couplings while the weak gear is in operation, and recommend the use of side-couplings to be resumed pending the fitting of all rolling-stock throughout the Colony with the strong gear; and they further recommend that the practice of carrying assistant-guards on all goods trains be resumed. And the jury desire further to exonerate Guard Davies and the engine-driver, Palmer, from all blame in this accident.

New South Wales, }
Bathurst, to wit, }

INFORMATION and depositions of witnesses, taken on oath, before me, Watson Augustus Steel, one of the coroners of Our Sovereign Lady the Queen, for the Colony of New South Wales, this 26th day of April, 1890, at Bathurst Hospital, at Bathurst, in the said Colony, on view of the body of Rebecca Franklin, then and there lying dead.

Richard Musgrove, having been sworn, states:—I am a senior constable of police stationed at Bathurst; at 10 minutes to 7 o'clock last night I received information that an accident happened at the railway station, near the Russell-street crossing; I hastened down, and there saw the body of the deceased Rebecca Franklin lying on the town side of the embankment; I had the body removed to the gates, and had it put on the police van and forwarded to the hospital; I also saw the body of a man, Michael Downey; that body was cut to pieces.

By Mr. Webb: The body of deceased was about 75 yards from the gate.

R. MUSGROVE.

Taken on oath before me, this 26th April, 1890,—

W. A. STEEL, Coroner.

Thomas Franklin, on oath, states:—I am a blacksmith, living at Mount Victoria; I have viewed the body of Rebecca Franklin, now lying dead; she was my mother; I have not seen her for some months; she was 60 years of age, and a married woman; she lived at Tarana.

THOMAS FRANKLIN.

Taken on oath before me, this 26th April, 1890,—

W. A. STEEL, Coroner.

This inquest stands adjourned until Monday, the 28th instant, at 10 o'clock in the forenoon, at the Bathurst Court-house.

W. A. STEEL,
Coroner.

Adjourned inquest from 26th instant.

Court-house, Bathurst, 28 April, 1890

Sidney Ferguson, on oath, states:—I am a carpenter; I was standing on my back door on Friday evening last; I heard a great noise, as if by a collision, and saw the steam escape; I saw the steam escape from the engine; I saw an engine standing at the gate, and went to the broken carriages; I saw a woman lying near the broken carriages, and she was still alive; her name was Mrs. Connor; I proceeded to look about the wreckage, and saw the body of a dying woman; she was about 12 feet from the rails, and when I felt her face she was still alive; her name was Mrs. Franklin; afterwards I saw her dead at the hospital; I assisted in removing the body from the wreckage; I live in Seymour-street; I saw there was a collision between two trains.

SIDNEY FERGUSON.

Taken on oath before me, this 28th April, 1890,—

W. A. STEEL, Coroner.

Arthur Henry, on oath, states:—I am a legally qualified medical practitioner, and Resident Medical Officer at the Bathurst Hospital; about 8 o'clock on the evening of the 25th instant, I remember the body of Mrs. Connor being brought to the hospital at the same time as the bodies of Michael Downey and Rebecca Franklin were; they were put under treatment at the Bathurst Hospital; I examined the body of Rebecca Franklin on the 26th instant; on the external appearance, there were marks of bruises on both sides of the body; the left thigh was fractured, midway between the knee and the body; there was a lacerated wound at the back of the head, extending one inch and a half to the bone; on opening the skull the brain was very pale, paler than natural; there were no signs of injury to the brain; on opening the chest, I found there had been hemorrhage behind the right lung, while on the left lung, it was still more marked; I then noticed that the fifth, sixth, and seventh ribs on the left side were fractured; the broken ends piercing the lungs; on opening the abdomen, I noticed no injury at all; these are the injuries I discovered on the body; I think an injury to the brain and to the chest would cause instant death; the body must have been crushed very severely; the brain was paler than if death was due to natural causes; four other patients were brought in; they were a little girl, named Maud Radford, and a little boy, named Harry Connors; the boy died at 11 o'clock in the same night; the little girl died at half-past five on Saturday morning; a man named William Condon and Jeremiah Newnan, are still in the hospital.

By Mr. Kenny: Condon was brought into the hospital about the same time, and he was injured, and the two children were injured in the same accident; Mrs. Franklin was a well nourished woman, and I did not detect any disease.

ARTHUR HENRY.

Taken on oath before me, this 28th April, 1890,—

W. A. STEEL, Coroner.

Edwin Brady Davies, on oath, states:—I am a railway guard at the Bathurst railway station, and I was the guard of the train that left Bathurst railway station at 5:40 p.m.; the number of the train was 26, and it was a mixed train; I started on my journey to Penrith; the train consisted of twelve of goods, an empty horse-box, and a first-class carriage, and a brake-van; I arrived at Kelso, 46 minutes past 5 o'clock; I left at 10 minutes past 6, having attached eight sheep vans, loaded with sheep, a D truck, and four of goods; speaking from memory, I arrived at Raglan at 6:23 p.m.; before leaving Kelso, I told the driver to stop at Raglan, Brewongle, and Locksley; on approaching the station, there was a green light shown me; I waved the driver up with a white light, and turned a red light on to stop him, having a number of parcels to put out of the van at Raglan; before the brake-van came to a standstill, I applied the brake on; I thought it was sagging; I caught hold of the brake again, and tried to put it on tighter than it was; it immediately came away so fast, and the brake being on as tight as I could put it; I opened the sand-box, took a sprag, and jumped out; I had a light in my hand also; I attempted to sprag the truck; it flew back knocking me on my chest, and knocking me down; I then made three attempts to sprag the lower part of the wheel and failed; the sprag flying each time; I then threw the sprag on the rails; the truck knocked it away; I made an attempt at the brake, but could not stop it; I then ran towards the station calling out, "Wire Kelso and Bathurst"; when I got to the station, I looked round, but could not see the train at all; at arriving at the office, I saw the boy at the instrument; after a few minutes I wrote out a telegram to the Superintendent and Out-door Superintendent; hearing of the accident, I proceeded on foot to Kelso, thinking it possible some passengers had jumped out; the fettlers overtook me, and I then proceeded to the scene of the accident at Bathurst; I knew there was a break away when I noticed the trucks passed me; I did not know how many passengers there were in the train; I had no assistant-guard; there was nobody in the van but myself; it is a very common occurrence for the guards to travel alone.

By

By Mr. Thompson : It is a common occurrence for the guards to travel alone ; I have been on the Railway for ten or eleven years ; I can't say how long it has been that guards travel alone ; there was no special brake on this train ; I would certainly call it a heavy brake-van compared to the light brake-van ; a part of the train did not come away ; fifteen trucks and a van broke away ; it was stopped as carefully as ever a train was stopped ; I examined the couplings at the break away ; I saw the truck with the draw-bar drawn out, and the side-chains hanging on the truck that was left ; this produced is the one I refer to, it is known as the light-gear, and when light-gear is used there should be side-chains, but it could not be used, and when light-gear comes together we must use it ; there were no means of fastening the side-chains ; rule 372 (means) side-chains, but I could not comply with it because they were not there ; rule 519 ; there are general orders put in the books for our guidance ; circular 221 ; I have seen and signed a book, and I have acted in accordance with the circular ; the gear produced is not strong gear, one truck had the strong gear, and the other had the light gear ; I have known cases where the centre coupling has broken or been disconnected and held together by the side-chains going up an incline ; the brake on the present occasion was not one of the best ; if there had been an automatic brake this accident would not have happened.

By Mr. Kenny : There are some in the compo. part of the brake-van, but I did not know how many ; I know Mrs. Franklin ; she was in the carriage at the time ; she got in at Bathurst ; I knew a man named Condon at the hospital who got in at Bathurst.

By Jury : It is possible if it had side-chains it would not have occurred ; it has never been represented to the Commissioners about doing away with the side-chains ; we always couple the side-chains if it is possible as an assistant, first, because it is required, second, because of promotion ; I had to do without an assistant ; I would have been pleased to have one ; I think I was there five minutes writing the telegram, it took six or seven to go to Bathurst ; I have heard of trains going without a van, the brakes were slow of action and were used in a horizontal position.

By Mr. Webb : This was a mixed train, by that I mean a stock goods and a passenger train ; it is known as a through train on the time-table ; I had some shunting at Kelso ; I would have had to put the carriage off at Esk Bank, as it only went that far ; the next shunting would possibly have been at Bell or Mount Victoria—some of the through trains have at the present time an assistant-guard, they are just the same as this train ; some of the through trains carry an assistant-guard ; I have been running as a guard in this train for a long time at a period ; I have run with an assistant and without one ; the brake is regulated by the screw ; I had my brake on as we came up to the station so as to prevent a recoil ; there is a sagging at times ; sagging means fetching the train back, in most cases the train always goes a little back ; when I reached Raglan there were eight trucks of sheep, eight of goods, an empty horse-box, a carriage, and the van ; fifteen of these trucks broke away and the van ; they were all loaded except the horse-box and the carriage ; rule 516 relates to passenger trains ; I can't say when the Department did away with the light gear ; at Wentworth Falls I was in charge of a train which had its draw-bar broken whilst travelling, and reached Lawson before I was aware of the fact ; it was an up train and broke opposite Wentworth Falls ; it is not quite a level ground ; I took it off at Lawson ; the truck that broke was nearer the engine than the middle ; the draw-bar broke going up grade near Wentworth Falls ; the rest was down grade ; the telegrams were merely to report to the superintendent ; I attempted to put the sprag in the first truck but it had gained too much speed to do so.

By Mr. Thompson : Rule 516, referring to passenger trains ; rule 520, referring to all heavy vans.

By Jury : The grade from Wentworth Falls is 66, and a bit 33 ; the grade here is 50 ; I had a break away two or three weeks ago, when the side-chains parted ; it took place at Hartley Vale platform ; it was a similar case as this.

By Mr. Thompson : We were just steady up when it broke, but we did not use the sprag ; I had an assistant with me ; there was no jerk whatever.

By Jury : I have seen instance in shunting when I could couple on ; I have seen them pulled by the side-chains ; the brake was as good as the average.

By Mr. Kenny : I would not consider it an inferior van of its class ; I do not know how long it has been in use ; I cannot say what its defects were ; there are brakes of the same description which held better ; it was not one of the heaviest trains, and they are not supposed to take a heavier load up that grade ; a train loaded with wheat would be heavier than this ; there is no order to take up a heavier load with two engines in front that grade ; a double load means equal to two engines ; on this side of the mountains we never use two engines, one in front and one behind ; the assistants are nearly always running as full guards, and there are less men to do the work ; I think it advisable to have an assistant ; it is very unsatisfactory among the guards to have no assistant ; at one time it was, on this particular train, a custom to have two guards, and I cannot tell when this was altered ; it might be a couple of years ago ; it was dark and I had to use a lamp ; I would have to have a lamp in one hand and a sprag in the other ; it is almost an impossibility to stop a train at night time ; if I had had an assistant, the assistant might have attempted sooner to stop the train ; I could do nothing until I had stopped the brake ; the weight of a sprag would be about 20 to 25 pounds ; I screwed the brake on as hard as I possibly could do it, but it was not sufficient to stop the train ; there is no brake power possible to stop the train ; the grade is 1 in 50 ; there is no brake that would hold the train ; the brake-van was a compo. brake, but it is not as heavy as some of them ; the light brake-van never comes up here, and the one I was using was strong.

By Mr. Webb : The draw-bar broke at Wentworth Falls.

By Mr. Thompson : I would not say that, knowing the same draw-bar to draw heavier loads, it struck me the iron was inferior because it broke so short.

Taken on oath before me, this 28th April, 1890,—

W. A. STEEL, Coroner.

F. B. DAVIES.

*James Palmer, on oath, states :—*I am an engine-driver on the Bathurst Station, and am driving between Bathurst and Penrith ; I was driver of engine No. 26 up on Friday night ; it was a mixed train ; it left Bathurst at 5.40 p.m. ; I arrived at Raglan at 6.25 p.m. ; the draw-bar of the third truck from the engine broke ; sixteen trucks broke away ; I was looking for a light from the guard, and I saw the light from the brake-van disappearing, so I concluded there was something wrong ; this is the draw-bar from the truck 3008.

By Mr. Thompson : I stopped the engine at Raglan in the ordinary way, but felt no jerk ; the guard told me to stop at Raglan ; there was nothing but hand-brakes on the engine, and I could not stop it suddenly so as to jerk it.

By Mr. Kenny : I did not go far from the station ; the brake-van was pretty near this end of the platform ; I did not consider it a heavy train ; I have taken up heavier loads up the same grade ; I call a heavier load eighteen and the brake ; I saw some of the passengers, and I saw the girl and boy running to get into the brake at Kelso ; I saw the draw-bar half-way out of the truck ; I could not tell whether this draw-bar is any different.

By Jury : I think if the side-chains were on it would have been a preventive.

By Mr. Thompson : I have been driving nine years, and it was usual to have two guards ; we have always had two guards in this train, as far as I can remember.

By Mr. Kenny : It is exceptional not to have two guards on this train, especially in a pick-up train.

Taken on oath before me, this 28th April, 1890,—

W. A. STEEL, Coroner.

JAMES PALMER.

*Thomas Parry, on oath, states :—*I am a carriage and waggon examiner ; I was so on the 25th instant ; I recollect No. 26, and I examined the train that day ; I saw it was in proper working order, and safe to go on any journey ; I am a coach-builder by trade, and have twenty years experience on the railway.

By Mr. Thompson : I noticed all couplings ; I noticed that several trucks had a strong draw-gear, and were fastened on light gear ; that coupling was safe to travel on its journey ; the side-chains were hanging down ; I don't know what the side-chains were for ; I know that in accordance with the rules of the working of the Department the side-chains should be coupled ; I have seen the order before, but the couples were not in accordance with the order, but they were safe to go on the journey ; I was to see if it was in the proper running order, but it was not in accordance with the order ; I did it in custom with the Department ; I passed the train on Friday, as it was properly coupled with the rules of the working of the Department for coupling of the trucks ; I do not couple the trucks.

By Mr. Kenny : The shunters couple the trucks, and I examine them on the platform ; I go by my common-sense and experience that they were coupled right ; I have an intimate knowledge of stock trucks ; when the weak draw-gear is used we use the side-chains ; the draw-gear produced is one of the weak gear ; the last couple of years the continuance draw

draw-gear has been introduced; the strong gear is $1\frac{1}{2}$ inch thick at the end, and the weak is $1\frac{3}{4}$; the weak draw-gear is not connected from end to end; the strong draw-gear is expected to be the stronger draw-gear of the two; there are no side-chains in the strong gear; there is a strong draw-gear on that produced; when the weak gear wants repairing we replace them by strong gear.

By Jury: I cannot say whether the new gear came in before the Commissioners arrived.

By Mr. Kenny: I have seen a few small draw-gears break, and within the last few months I have seen them broken at the end, and one or two more broken through accident at the shoulder, and I have seen some with flaws in them; I have seen, within the last two weeks, similar draw-gear broken at Brewongle at the screw end; I never saw one come from Tarana, but I saw one with a broken hook.

By Mr. Thompson: I am not aware of any rule, and I don't know whether it is printed or not.
Taken on oath before me, this 28th April, 1890,—

THOS. PARRY.

W. A. STEEL, Coroner.

George Farquhar, on oath, states:—I am the railway station-master at Bathurst; on Friday, the evening of the 25th of April, instant, about 6:32 p.m., I received intimation from the operator that 26 up-goods had broken away an hour previous; I had despatched it from Bathurst; on receiving that intimation I rushed out on the platform, exclaiming "Too late, too late," and the guard said "There she comes, across the bridge"; 28 goods had started about two minutes previous to that; it was drawing up by Russell-street gates; from the time the runaway train and up train struck I may say it was only a moment; by the time I had got to the scene of the accident a number of people had congregated there, everyone exerting himself to the utmost looking for those who were injured; I sent for the doctors, and on turning back to where the engine was standing, inside Russell-street gates, I found the body of Downey; from the description of his clothes I took him to be the guard; he was quite dead; I arrived at the telegraph-office, and reported, by wire, all what had taken place; I saw the remains of Rebecca Franklin taken out, but could not say where she was found; I did not examine anything that led to the accident; ten trucks were demolished and six were intact; the train consisted of nineteen of goods, and there was one passenger carriage; I know nothing that caused the accident, except that which was reported.

By Mr. Thompson: I have been station-master at Bathurst for six years; it is not customary to have two guards, but they do when they are not required otherwise; only one guard has generally gone out with this train, and I cannot see that it is necessary for two guards; when two guards go away it is because they are not wanted; I have gone through as a guard up to my present position; we don't usually change men on the railway when they can be of use on their way, and home-guards who have been acting as assistant-guards have been sent to take charge of a train; the rules require not only centre couplings, but also side-chains; the side-chains would have been gone just the same in this accident; a strong gear being fastened on to a weak gear would be quite sufficient; side-chains were used, but they did not hold the trains when they broke away; it is because of the strengthening of the centre-chains that they did away with the side-chains; if it was necessary to make a centre-chain heavier it was necessary to make the draw-bar heavier; the strong bar is marked with a cross: the centre-chains and the old gear we considered quite sufficient to hold the train with the side-chains; if the side-chains had been applied it would not have held the train; so far as the appliances we had at hand it was properly made up; rule 235 I am acquainted with; there was no means of complying with the rule.

By Mr. Kenny: I did not see another body carried away or any other passengers except Mrs. Connors, who was brought into the waiting-room; I did not know what the injuries were; we don't run an assistant-guard west of Bathurst, and on the east of Bathurst in stock-trains the assistants are sometimes used; the van used in this train was a heavy van; she was a 12-ton; she was a compo., and it is among the heaviest class of vans among goods trains; sometimes we have been ordered to put heavier centre-chains on; there is no provision for the side-chains to be used: the new trucks are used with the old trucks, and having no provision for the side-chains; I have known instances where the draw-bars have broken, and side-chains have held the train.

By Mr. Webb: It would depend upon the weight of the train which the chains had to hold; sixteen trucks, equal to 160 tons, broke away; the side-chains are $\frac{1}{2}$ -inch thick; they were pulling on dead wood, and there are no springs with the side-chains; there is a spring with the draw-bar; two similar trains broke away at the bottom point of the Zig-Zag; the coupling broke and the two side-chains broke away, which caused a collision with the other train; it was equal, if not more, to train in question; I don't believe the side-chains would have been any use in the grade she stopped in; I have observed the brake, and I think it was the rail of the train running on to the engine; the brakes could not stop it from recoiling; a G truck has been used as a brake-van, and has the same weight of a van; these rules were promulgated about five years ago, and there is general order book for the guard's information; under the general order the train was coupled, as it should be; the van was one of the heaviest used on the line for goods train.

By Mr. Thompson: The driver told me that at the Zig Zag the side-chains at the brake snapped like a bit of wire; the brake, I think; it was the recoil that caused the draw-bar to break; there are very few springs on the side-chains; I cannot say there were side-springs on these trucks; there is a general order referring to single couplings, and that is the order produced; this order is our authority.

By Mr. Kenny: There was a first-class carriage and compo. brake-van for second-class passengers that was wrecked; all passenger carriages attached to the train have a centre coupling screwed on, and two side-chains, which are always used, in addition to centre coupling, the kind used in all passenger trains; it was not reported to me that a similar break had taken place near Raglan; the side-chains would not have held; they may have held if they had springs between them.

GEO. FARQUHAR.

Taken on oath before me, this 28th April, 1890,—

W. A. STEEL, Coroner.

29th April, 1890.

George Watsford, on oath, states:—I am station-master at Kelso; I recollect Friday the 25th, and remember being at Kelso; the train took eight more trucks on at Kelso; they were eight sheep trucks; the couplings were examined on the sheep trucks before leaving Kelso by the carriage examiner, named Weeks; the train left Kelso at 9 minutes past 6; shortly after the train left Kelso I received a telegram from the station-master at Raglan that 26 had run away and was running towards Bathurst; I then sent one of my men to open the gates at the level crossing; by that time the train dashed through the station; I had just got the gates open; I then got on the platform, and asked the operator if he had told Bathurst; he said he had done so.

By Mr. Thompson: I have been employed for fifteen years on the railway; I was employed in Sydney as station-master's clerk; my occupation only gave me experience in the suburban trains; I was employed as a porter first on some trains; there are two guards used, and on some one.

By Jury: I have never been shunting; I have been as guard in a second brake-van.

By Mr. Thompson: On a train that would pick up or do shunting there would be two guards, and on through trains there would be one guard; there would be two guards if the men were available; two guards would be necessary over the mountains.

By Mr. Kenny: While at Brewongle I never heard of a similar accident between Raglan and Brewongle; I never heard of one last night; Maud Radford and Edward O'Connor got in at Kelso; no one else got in; I did not notice any other passengers; I know the centre chains have been strengthened; I have seen instructions about coupling of the trucks; I have seen some of the strong gear marked with a cross; the strong gear is stouter; where two trucks come together with strong gear we only use one coupling; when two trucks come together one strong gear and one weak we connect the strong with the weak gear.

By Jury: I put the trucks with the perishable stock next the engine, and the live stock next the brake-van.

By Mr. Webb: On this side of the mountains a good load would be eighteen trucks, and from Penrith to Sydney forty-five trucks; the train in question that left Kelso was a through train, and it is the custom in through trains to have one guard; I never heard of any break in the gear since I have been at Brewongle.

By Mr. Thompson: Two guards are required between Sydney and Penrith to do the shunting; in a shunting train between Bathurst and Penrith there ought to be two guards; on a through train from Penrith only one guard is used.

By Jury: I have seen a coupling smash at a station and the side-chains hold.

G. H. WATSFORD.

Taken on oath before me, this 29th April, 1890,—

W. A. STEEL, Coroner.

Hugh

Hugh Millen, on oath, states : I am an engine-driver at Penrith station, No 2 section ; I drove 28 up on Friday, the 25th instant ; I left Bathurst station at 6.30 p.m. ; shortly after I left Bathurst station I collided with No. 26, about one or two minutes after I left Bathurst ; No. 26 was about 10 yards off when I first saw it ; it would be about 75 yards from the Russell-street gates ; I had no time to avert the collision ; I had only just time to shut the regulator ; I was swung outside the engine ; I had hold of the pannel ; my firemen were Henry Bannister and Charles Cowle.

By Mr. Thompson : I have been driving four years and five months ; I have some times two guards and sometimes one ; until lately, on all through trains, we had on up the journey two guards ; it is within the last month or two I have had only one guard ; in a shunting train it would be better to have two guards ; in a train such as No. 26 it would be better to have two guards ; in my experience I have known the centre-chain or draw-bar break ; side-chains were used on those occasions ; on a grade 1 in 60 it would very likely break the side-chains ; No. 28 was a through train ; I have been in about six smashes ; some through trains stopping.

By Jury : There are four guards from Penrith to Katoomba.

By Mr. Kenny : I do not know what sort of brake-van this was on No. 26 ; the compo. van has accommodation for passengers ; I could not say if it was the largest kind of van.

By Mr. Thompson : With the assistance of the brake power on the waggon I could have power with my engine ; in some parts of road we have to stop the goods train and put on the hand-brakes altogether.

By Mr. Webb : If a train is divided into two trains it would be necessary to have two guards on ; the trains from Sydney to Penrith, we run more carriages, on account of an assistant engine from Bathurst to Penrith ; on through trains I think two guards would be the best, but it all depends on the work they have to do.

HUGH MILLEN.

Taken on oath before me, this 29th April, 1890,—

W. A. STEEL, Coroner.

George Weeks, on oath states : I am a carriage and waggon examiner, stationed at Bathurst ; I recollect Friday, the 25th instant ; I inspected all the trains at Kelso, and found them all in good order and fit for the journey ; I could not say anything about the truck that broke.

By Jury : I did not examine the train at Bathurst.

By Mr. Thompson : I examined a part of it at Bathurst and also at Kelso ; I examined all the sheep-trucks and couplings belonging to them ; I did not examine the couplings where the break was ; I understand what is known as weak gear ; two years ago, about February or March, we used both couplings, and my colleague wrote to Mr. Turton for instructions, because the shunters got into the habit of using one coupling ; we have to use the materials we have, and they are coupled according to the rules and instructions I have to go by ; until the issue of general order No. 8, trucks were coupled according to the rules and regulations, and from the time of the issue of that we have made a departure from that rule, and have not used the side-chains ; the side-chains were not thought necessary when a weak gear and a strong gear came together ; the side-chains were used to make it stronger ; I examined the van of No. 26 ; it was what you call a medium ; I have found some of the light vans very good ; under ordinary circumstances it was a good brake ; I have seen two guards and have seen one on this train.

By Mr. Kenny : I have seen the circular produced ; the strong coupling only is attached to the strong gear ; to the weak gear ; I went to Brewongle, and attached a draw-gear to a truck out of which it had been drawn ; I replaced it by a stronger gear, and it was stronger than the one produced ; it was fitted the same, only it had a steel spiral spring ; the spar was broken near the nut.

By Mr. Kenny : Last week a train of empties came in with both side-chains and centre-chains broken ; I do not know how it was coupled when it came in ; the side-chain had drawn and cracked ; it was the last truck next the guard-van ; when the shunters began to use only single couplings we asked for instructions ; when the side-chains were there I always used them ; the side-chains are a check ; I have seen trains come into Bathurst with centre-chains and side-chains broken, which were replaced by the guard on the journey ; the centre-chains can be broken by shunting ; if the train had come up easily it would have held.

By Jury : I might pass a draw-bar out of the yard with a flaw in it ; you cannot tell whether there is a flaw till you unscrew it ; I cannot tell for a certainty if it's safe.

By Mr. Kenny : I think some precaution should be taken about the draw-bar ; if there was a flaw I could see it in the continuance ones but not on the others.

By Mr. Webb : I hook them up when there are side-chains ; it is more often that centre-chains break than centre-bars ; centre-chains are often broken while shunting ; when the centre-chains break and the side-chains hold it would be a great strain, 1 in 50 ; I should say more than ordinary care is taken in this engine.

By Mr. Thompson : Cross-coupling is used as an extra precaution ; I have crossed them on my own authority ; I cannot say if they were cross-coupled ; I call the gear produced a strong gear ; heavier links are put on the weak gear ; the weak gear have hooks on them as strong as strong gear.

By Jury : I was seventeen years on the railway in England and seven years here.

By Mr. Thompson : I heard of no break last night.

Taken on oath before me, this 29th April, 1890,—

GEORGE EDWARD WEEKS.

W. A. STEEL, Coroner.

Francis Davidson, on oath, states : I am station-master at Raglan ; I recollect Friday, the 25th instant, and I also recollect No. 26, which arrived at Raglan at 6.23 ; Palmer was the driver, and Davies was the guard ; on the arrival of the train at Raglan the brake-van drew up nearly opposite the door of the station ; the train then stopped ; I went to the brake-van, together with my porter, to assist in taking out parcels, and to see if there were any passengers requiring to get out ; Guard Davies was stooping in the act of handing the parcels out when the train seemed to be coming back ; Guard Davies immediately jumped to the brake-wheel, and he seemed to be in the act of turning it on when I last saw him ; thinking it was only the recoil of the train I turned up the platform towards the engine, and turned the red light on the driver and sang out, "What the devil are you doing" ; seeing the train still going by I continued up towards the engine ; when I saw the train had parted I jumped down the forefoot, and crossed the line, and sang out to the driver, "For God's sake come back, and try and catch the train" ; realizing it was too far away to hear me I rushed back on the platform towards where I had last seen the porter, and called out to him, "Jack ! Jack ! come on quick, and wire Kelso and Bathurst" ; he was then at the end of the platform nearest Bathurst ; he ran into the office, and went to the instrument immediately ; Guard Davies then ran in crying out, "Wire Kelso and Bathurst" ; I sent a message to Kelso to look out, that the larger portion of 26 train had broken away, and was proceeding towards Kelso at a terrible rate ; as soon as that was done, I turned my attention towards the engine that was standing on the line ; I saw the driver there with a light and broken draw-bar laying on the forefoot ; I took charge of the draw-bar and instructed the driver to come back and put the train in the siding ; this he did ; I then went into the office, and instructed the operator to wire Kelso for line clear ; I think the answer returned was, "The station-master is away," and the operator could not give line clear ; I had sent over for my night officer and all the available men that were about the station, and instructed them to put the trolley on the line, and proceed down the road as quick as possible ; myself and Guard Davies then proceeded down the line ; the ganger and one or two of his men had already proceeded on foot down the line ; we overtook them, and I gave them instructions to the ganger to go back and put the trolley on and bring his men, and I and Davies would walk on and see if anyone had been thrown out or jumped out on the line ; we found nothing along the road, and when the trolley pulled us up about 2 miles from Raglan ; we got on the trolley, and proceeded to the scene of the wreck ; I there saw Mr. Farquhar and several other officials but I do not remember any particular conversation, beyond a few questions as to how the train got away ; that is all I know about the accident.

By Jury : I have never seen a train held by side-chains ; it is quite possible if there had been two guards it would have been prevented.

By Mr. Kenny : I have been station-master five and a half years ; I could not say if there was usually always two guards ; the draw-bar produced on this particular occasion is the same that was broken ; I have not examined the bar ; I believe there was provision for the side-chains on the truck that broke away ; I could not see the guard spragging the truck ; the passenger trains have a centre coupling and two side-chains always fastened ; I do not think passenger trains are

are as heavy as goods trains; sometimes there were passengers carriages attached, and sometimes only the brake-van on this train; the chain produced is the side-chain that is generally used in stock trucks, and it is about the ordinary size of side-chains; if they had been hooked, the side-chains would not have felt the jerk that broke the bar until after the bar was broken.

By Mr. Kenny: There is not the slightest doubt about it; I don't remember ever seeing a train stop steadier than that; I think if the side-chains had been on the train, it might have been stopped by the spragging; the side-chains would have held it temporarily and we would have had time to put the sprag in.

By Mr. Webb: There is always a certain amount of recoil; the guard should have his break on when the train stops; heavier the train, more the recoil; the strain would just come on the bar, and then on the side-chains, some trains run with two guards and some with only one; the guard would not get out till the train did stop.

By Mr. Thompson: I have never known them to stop without using the brakes at all.

By Jury: I have heard of two or three breakings lately; I did not hear of two or three draw-bars breaking last night. Taken on oath before me, at Bathurst, this 29th April, 1890,—

W. A. STEEL, Coroner.

G. DAVIDSON.

William Brady, on oath, states:—I am a carriage and waggon builder by trade, but a carriage examiner now and am employed at Bathurst; I remember Friday the 25th instant; I did not inspect the trucks and carriages attached to No. 26; I saw No. 28 go out; I was standing on the down platform about 25 yards from the signal-box; I heard a noise and I looked over towards Kelso, and saw a red light, and saw a train shoot over the bridge, it was travelling very fast; I could see the carriages lighted up; I saw the engine No. 28 go outside the gate; I threw the tools I had in my hands down; I had not run very far when the collision took place; when I got to the engine I met one of the firemen, he said "Look for my mate, the driver, I don't know where he is, I ran round the fence, the driver was lying down the bank, his name was Millen; I asked him if he was badly hurt, and he said, "No"; I then left him and went down further and found a man about thirty yards from the driver; he was a fletcher on the line, his name is Condon; I could see he was badly hurt, and my mate and I moved him; one shunter came up and he sent for the doctors; when I left him I went up a bit farther and I saw a woman under a pair of wheels, that was Mrs. Condon; more assistance came then; I saw a little girl on the top of bank, two axle-boxes were across her legs and a piece of panel of a carriage, I believe her name was Radford; I lifted her out to Signalman Stewart; I could then see her two legs were broken; some one sang out there is some one on the other side; I went round and I could see he was jammed with a spring across his legs; I have heard his name was Jeremiah Newnan; I removed the spring off his leg, and I could see the foot was taken off the other leg; some assistance came then and we took him to where the other injured people were lying; when we were carrying him down the bank, he asked us what he had been doing; I went up again and picked up a leg of a man with a boot on it; I brought it down to the bottom of the bank where I had left the other ones; I went up again on the Russell-street side and some one told me there was a woman at the bottom of the bank; there I saw a woman lying on two cushions; I thought first she was alive, and felt if her pulse was beating, I could then see that she was dead; her name was Mrs. Franklin; I went back to the other side and picked up another leg and brought it where I had left the other one; I went then and assisted in getting the wreckage off the line, while doing so a man picked up another part of a human being, this is all I know about the accident; the body of Mrs. Franklin, and the other people were taken to the hospital.

By Jury: I have been eleven years at England in the railway, and six years here.

By Mr. Kenny: I was engaged in County Down the last time at home.

By Mr. Thompson: I have been six years here; there is only one guard running now; I used to see two; lately I have seen one; it is about the last six months that I noticed one guard; I examine trains leaving Bathurst, and have a knowledge about the couplings; one of the trucks at the breakage was a weak gear, and one strong gear; I fastened the weak gear and strong gear, according to instructions, and the side-chains left hanging, as the weak gear go into the shop; they are taken off, and the strong gear put on; the weak gear and the strong gear are coupled together, as they cannot do otherwise.

By Mr. Kenny: I did not see the body of Downey; I only saw the legs; I never saw the order about coupling the weak and strong gear, but the late Mr. Turton told me that an order was out to that effect; where the side-chains could be used they were used; the new trucks have no provision for side-chains; I have heard the men speaking about the order, but no dissatisfaction; I know the matter has been represented to the Commissioners about the side-chains within the last twelve months; I saw that in the paper, passenger trains have a centre coupling, two side-chains always hooked, and have automatic brakes.

By Mr. Webb: I did not see train No. 26 go out; when trains draw up, there is always a recoil, unless there was tight coupling; I know nothing of the deputation to the Commissioners, except what I saw in the newspapers; the coupling up of the trains is done by the shunters; I have to see it is properly done; they are putting the strong chain on the old trucks; but I cannot say about the bar; by single coupling only; one chain is fastened on, and the other left hanging down; it was the custom to hook two centre-chains; the passenger trains are coupled by screw couplings, and it would not be more than six seconds when the train collided after I saw it; I have nothing to do with the arrangement of the guards; I cannot say it is customary for one guard to run on through trains.

By Mr. Kenny: If the chain is left slack, it will not come out of the hook.

By Jury: I have known an instance where the train has come in drawn by the side-chains.

By Mr. Webb: The centre coupling was broken and drawing on the side-chains; I have seen it happen a couple of times; the last accident like this, the train was partly loaded and partly not; the last one was about twelve months ago, and the draw-bar was pulled out.

WILLIAM BRADY.

Taken on oath before me, this 29th April, 1890,—

W. A. STEEL, Coroner.

William Nash, on oath, states:—I am an operator at Bathurst Railway Station; I recollect the night of Friday, the 25th instant; I received the wire from Kelso about 6:30 p.m. that No. 26 had broken away, and was running back into Bathurst; I immediately informed Mr. Farquhar; I told Mr. Farquhar verbally.

By Mr. Kenny: As far as I can remember, I got the telegram about 6:30 p.m.

By Mr. Webb: Mr. Farquhar was standing near the window of the telegraph office, and I told him at once; I did not see the collision.

By Mr. Kenny: I believe No. 28 had just started when we got the message; it had started about a minute.

W. NASH.

Taken on oath before me, this 29th April, 1890,—

W. A. STEEL, Coroner.

Edwin Davies recalled.

By Mr. Thompson: I have heard the evidence of Mr. Weeks about the cross-coupling; the cross-couplings spoken of by the witness Weeks could not have been defective in this case.

By Mr. Kenny: I do not recognize the heavy draw-bar; I only recognize the centre-chain; the cross directs me to the centre-chain.

By Mr. Webb: The gear produced I do not recognize as strong gear; I hooked the chain on the other carriage into this hook produced, and left the chain hanging; I hooked the strong gear into the other chain according to instructions.

T. B. DAVIES.

Taken on oath before me, this 29th April, 1890.

W. A. STEEL, Coroner.

David Kirkcaldie, on oath, states:—I am Traffic Manager; I have been so for twelve or fourteen months; as Traffic Manager I have the management of running of the trains under my supervision; from Sydney to Penrith is practically the same on all portions of the line except Penrith and Katoomba, where there is much shunting to do on the journey or a quantity of goods put in trucks or taken out of trucks at intermediate stations; the practice is to give the guard an assistant

so as to minimise the delay at stations; under no circumstances do we provide assistant-guards on through trains except when sent to take charge of a train at that point or returning to his home, the only exception being between Penrith and Katoomba, where assistant-guards are provided for all goods trains in consequence of the exceptional character of the road; No. 26 would be considered a through train; this train would not require two guards; beyond detaching the carriages at Esk Bank and reducing the load at Katoomba in order to allow the train to go down the heavy grade safer; there would be no shunting all the way to Penrith; I have a good deal of practical experience; I have had nearly thirty years of it, ever since I left school; I know what the contents of this train was, and the weight would be about 190 tons; I considered a load from this end for that class of engine from 205 to 210 tons; the grade at Raglan is 1 in 48; I do not consider it possible to draw up this train without a recoil; if the side-chains had been attached there would not have held, but they might on a level road; there have been no instructions from the Commissioners about curtailing the number of guards; we have not reduced the number of guards; I have no knowledge about the deputation to the Commissioners about the removal of the side-chains; had such been made, I would certainly have heard it.

By Jury: They frequently increased their loads from Bell to Katoomba.

By Mr. Thompson: I would not call it a shunting train unless it shunted at nearly every station; we have not shunters at every station; it has not been customary to have two guards on this train; these through goods trains have been running for some years; Brady's evidence is incorrect; notwithstanding the evidence of Brady, I say he is incorrect; they only send two guards when one is returning home, but they are not employed; they go in uniform, and we make use of their services on their return to their home; the guards are paid for the hours on duty, and they would not have held their work on their way home; they help to a certain extent; a very heavy train would be over 210 tons (about); the running of assistant-guards is left for the District Superintendents, and it might not come under my notice; rule 379: the guards are supposed to use their brakes to the best advantage; on a level road they could stop a recoil; on a bank they could not; I know about the side-chains being coupled, and they were set aside because of a stronger centre draw-gear being put on the trucks; the alteration was made by the authority of the late Commissioner, about five years ago; the circular produced was printed before I became Traffic Manager, and it was reprinted since I was Traffic Manager; the Commissioners can make rules and regulations, approved by the Executive Council; the circular is sent to all the men; the Commissioners are using the strong gear as quickly as they can; all the light draw-gear should be replaced by strong draw-gear; I say the gear produced was sufficient for the train; the side-chains can be used when the strong and light gear meet; stronger centre couplings are to be used; there is no reason why the side-chains should not be used; if the side-chains had been used it might have helped to hold it; they could have been used by cross-coupling; the side-chains should have been hooked on the centre-chains; no order was made as to the cross-coupling; the guards are to take every precaution to ensure the safety of the trains; the weak draw-bars are being replaced by strong draw-gear as soon as possible; strong gear has been put on to the weak draw-bar (produced) since 1884; all the waggons that have been built have had strong draw-gear; within the last twelve or eighteen months they have altered 550 with strong draw-bars; an accident like this might happen at any time; every precaution has been taken to prevent accidents; the Commissioners are putting down special machinery to deal with it as quickly as possible; I have never heard of a deputation waiting on the Commissioners; I know a number of brakes have been ordered from England; I don't know if a deputation waited on the Commissioners in September about automatic brakes; there is no goods train in the world controlled with automatic brakes; there was a trial made some years ago with the automatic brakes; I remembered trials were made five or six years ago between the Westinghouse brake and the Vacuum brake.

By Mr. Kenny: In two places there are 1 in 33, and several grades 1 in 40 between Kelso and Katoomba, but they are very short pieces; in a great many cases we run double trains between Penrith and Katoomba, but we have an assistant-guard, because it is an exceptionally difficult part of the line; more empty trucks go eastwards from here than go westward.

By Jury: I think it a great mistake to use double coupling; there have been instances where both centre couplings and side-chains broke; the break in this case was caused by recoil.

By Mr. Webb: You always feel a recoil; I attach no blame to Guard Davies; I have heard of representations for assistance to guards; I have not seen it in the Press.

By Mr. Kenny: I don't think the side-chains would have held if they had been hooked; formerly both centre couplings were used; the train in question was a mixed train; no greater precaution is taken in a train like this; links frequently break through rough shunting; we cannot take any extra precaution more than we do; these side-chains are done away with in England; there are heavier grades between Penrith and Katoomba than between Kelso and Katoomba.

By Jury: There is a bond in other colonies to be signed before you enter a goods train.

By Mr. Webb: We have between 4,000 and 5,000 old waggons, and during the last eighteen months 550 have been altered, and we are altering them at the rate of 1,000 a year, and that will be doubled with the new machinery; on the passenger trains we have screw coupling side-chains, and Westinghouse brake; guards are always expected to keep other guards, and in order to utilize, we send them as assistant-guards.

By Jury: I don't think if they had had six assistants it would have done any good.

Mr. Thompson: I have heard the evidence of Davidson, Palmer, and Brady, and still say it must have been caused by a jerk; I have known Davies as a very intelligent man; there is no order to the contrary of not using side-chains; I think Davies' evidence about an assistant-guard is incorrect.

Taken on oath before me, this 29th day of April, 1890,—

W. A. STEEL, Coroner.

DAVID KIRKCALDIE.

Police Court, Bathurst, 30 April, 1890.

Adjourned inquest from the 29th instant.

David Kirkcaldie, recalled, on oath, says:—There were other orders issued beside order No. 8; this order does not supersede any rules and regulations excepting so far as relates to the central draw-bar; I remember general order No. 4, relating to screw couplings and side-chains; there was no order ever issued from my office authorizing the disuse of side-chains, and where possible they are used; it does happen that screw couplings are used between vehicles, one only of which are fitted with side-chains; in this case the side-chains would be used by hooking into the screw couplings; it is the only way they could be used.

By Mr. Thompson: General order No. 4 relates to screw couplings, and screw couplings were used on the stock trucks on this train in question; the side-chains are not intended to apply to the rule referred to; it is a rule of the Department to make all orders explicit; I don't remember whether there was an assistant-guard at the accident at Bell, as I was out of the colony; No. 23 down train was a fast through goods train; I have never heard an instance where a goods train has been brought up a grade 1 in 40 with side-chains; I can't speak from memory about the accident at Harden, on the 22nd June, 1889; I could not tell how it occurred, whether it was a centre-chain that broke, or whether the end was drawn out of the waggon; I have no doubt that a notice of that accident was brought before the Commissioners; it would be a private inquiry about the break at Harden.

Mr. Kenny: The trucks are only supposed to be marked with a cross when they have been fitted with strong gear; I am surprised to learn that the men think they are forbidden to use side-chains.

By Jury: The side-chains would not be as effective as if they were used opposite each other as when coupled to the centre coupling.

By Mr. Webb: I don't think the side-chains would be any use.

By Jury: I think it has been the custom for men to couple the side-chains to the centre-chains.

By Mr. Webb: The carriage on which this bar produced was fixed was not marked with a cross.

By Mr. Thompson: The side-chains have not been removed from the old trucks, but the new ones have not side-chains.

By Mr. Kenny: The side-chains that have been thrown aside are from off the old trucks that have been broken up.

DAVID KIRKCALDIE.

Taken on oath before me, this 30th April, 1890,—

W. A. STEEL, Coroner.

William

William Thow, on oath, states:—I am Locomotive Engineer on the New South Wales railways; I have charge of the rolling-stock; I have been in this position in this Colony nearly twelve months; when I came here I found the rolling-stock in a somewhat decayed condition, and have used my best endeavours to remedy this; we have changed a great many axles, and have strengthened about 450 waggons since I came here; it was in process of being done before I came here—about six or twelve months before; this work is proceeding as rapidly as possible; we are putting fresh plant down, a new steam-hammer, and we are building a furnace for the purpose of increasing the output of new draw-bars; about 4,000 were considered to be defective when I came here; the other repairs to the vehicles are extremely heavy; we have now workshops full repairing trucks, carriages, &c.; I estimate the weight of No. 26 train to be about 190 tons, exclusive of the engine; the haulage power of the engine would be something over 200 tons up the grade in question; the load was a fair one; the weight of the part that broke away was about 160 tons; the resisting power of the broken bar equals 28 or 30 tons, assuming the iron to be of good quality; one of the continuous draw-bars, of equal diameter to the one produced, would have been subjected to the same strain under the same conditions; I think that the broken draw-bar, if it had not been subjected to any severe jerk, would have been sufficient to hold the train together; in order to haul 160 tons up the grade the force passing through the bar is not quite 4 tons; there must have been some unusual strain to have broken the bar produced; this bar appears to be fair iron; it is following a natural law of decay, as all iron does, after being in use for some time; I think the strain must have been caused by a recoil of the train; when the engine-driver stopped his engine with the brake, the vehicles which were not braked ran forward upon the engine, compressing the buffers as they did so, and when they began to recoil the strain brought upon the bar by the recoil of the buffers was sufficient to snap it; we are not putting side-chains where we are putting stronger draw-gear; the side-chains are not being used in England now; the side-chains cannot be tightened up in going round curves, and there is no strain on them unless the draw-gear breaks; if the main draw-gear breaks the strain is so great on the side-chains that they snap; I do not think each chain in a case like this would bear more than a strain of 8 tons; I do not believe the side-chains would have held the trucks on the train which broke away; the strain was, in my opinion, too great; the weight of the van was a little over 12 tons, and the power of the brake was equal to skidding the wheels of a van weighing 10½ tons; this is a high proportion of brake power; this brake was just about the same as the mountain brakes, the same power; the brake on the train, No. 26, was a very good one; I understand the principle of the couplings of trains, and am conversant with the rules and regulations of the Department; the strong coupling ought to have been thrown over the hook of the waggon next to the one that became detached, over the weaker draw-bar; the side-chains, I take it, would be attached to the strong chain from the draw-gear; rule 372 provides that the side-chains were to be used as effectively as the circumstances would permit; the general order, No. 8, refers. I take it, only to the centre couplings.

By Mr. Thompson: The draw-bar broken produced is defective, not sufficiently strong; I think where the accident occurred the line is nearly straight; if the side-chains were of the same length, the strain, no doubt, would take place on each chain at the same time; this would have added a resisting power of about 16 tons; the bar in its present condition would stand a breaking strain of 28 or 30 tons; the side-chains have been discontinued in all new stock; the cross mark would show that the waggons were supplied with new draw-gear not requiring side-chains; I think the side-chains not being used on the occasion of the accident was a violation of the rules; to my mind, rule 221 does not convey that the side-chains were to be discontinued; the stronger draw-gear was commenced to be used at the latter end of 1884; there are side-chains on the passenger trains, also the automatic continuous brakes; the passenger trains are all fitted with screw couplings and are of a weaker nature than the ordinary bar; if the train was drawn up very gently there would be no recoil; the mere hauling of the train up the incline would not be sufficient to fracture the bar; the only way to explain the fracture, in my opinion, is a sudden and violent jerk; it must have been subject to a sufficient strain to break it; I detect no flaw in the broken parts of the bar; I do not think the draw-bars frequently break; they do break on all railways; the workshops are full at Eveleigh; we have no steam-hammers anywhere, except at Eveleigh, that would make the draw-hooks; a full load would be about 200 tons; the guard would have a fair idea of the weight of the trucks he has every means of ascertaining the weight.

By Juror: I have been connected with railways for thirty years in Great Britain and South Australia, from the time I was 17 years of age.

By Mr. Kenny: The haulage of the strong draw-gear will be and is from 48 to 50 tons; the side-chains and the bar produced would draw up steadily, without any jerk, a weight of 600 or 700 tons; if there had been no jerk the side-chains would probably have held the train, that is, if the train had been drawn up very steadily.

By Mr. Webb: If the side-chains had been fastened there would have been a severe jerk on these chains after the breakage of the bar; side-chains are not used on the waggons of the London and North-western Railway; I attach no blame to Guard Davies; I believe he acted up to what he thought was intended by the circulars.

By Mr. Thompson: The whole weight of the train would be on the draw-bar; this bar would hold the weight of the train, and a good deal more under ordinary traction; side-chains have been done away on most of the leading railways in England.

By Mr. Kenny: The side-chains were done away with in January, 1889, in this Colony, on trucks on which the strong gear has been fixed; there are some very steep grades in England—several 1 in 40.

By Juror: I have known strong bars to break in all parts; the side-chains were attached to the waggons in which the new draw-gear had been fixed—those made between 1884 and 1889.

W. THOW.

Sworn at Bathurst, this 30th day of April, 1890, before me,—

W. A. STEEL, Coroner.

George Farquhar, recalled, states:—I have the books which show the running of the trains; I produce them; No. 26 is a through train; on the 1st April this train had two guards; 17th April, two guards; 22nd April, two guards; 23rd and 24th, two guards; and on the 25th, the night of the accident, one guard; on these occasions, when there were two guards, the second guard was returning, either to his home or to take charge from another point.

By Mr. Thompson: I produce the book showing the time-table for April, 1889; train No. 40, I find that two guards travelled on the 1st, 2nd, 4th, 5th, 6th, 9th, 11th, 12th, 13th, 15th, 16th, 17th, 18th, 19th, 20th, 22nd, 23rd, 24th, 25th, 26th, 27th, 29th, 30th April, 1889; I cannot say why there was only one guard on the 3rd and 10th April, 1889; this train was a pick-up in April, 1889; this is the reason there were two guards; pick-up trains going out now do not take two guards; No. 40 ran as a pick-up for a considerable time before April last year; the second guard was in many instances returning to his home; I have had no instruction to send an assistant-guard with No. 26 train; I do not send an assistant-guard with the guard of 23 for the purpose of assisting the guard; during February, 1889, the train was run as a pick-up; in February, 1888, it was running as a pick-up and numbered 10; in October, 1889, she was running as a through train; I produce the guard's book for this month; she carried two guards on the 1st, 2nd, 3rd, 4th, 7th, 8th, 11th, 12th, 13th, 14th, 15th, 16th, 21st, 24th, 25th, 26th, 28th, 29th of this month; on the 30th October thirteen trains went away, all carried only one guard, with the exception of one they all went eastward.

By Mr. Webb: I take November, 1889, and find that on the 7th there were ten trains, and only one assistant-guard, and he was returning.

By Mr. Thompson: I cannot say how it was the train carried two guards nearly every day in October, 1889; the assistant-guards were returning as assistants on their way home; they were run as assistants because they were not required for other work.

By Mr. Webb: October is generally a month of heavy traffic; the trains would not wait for these assistants if they were not in readiness to proceed.

GEO. FARQUHAR.

Sworn at Bathurst, this 30th April, 1890, before me,—

W. A. STEEL, Coroner.

William Francis Schey, on oath, states:—I am aware that representations were made to the Commissioners that the practice of coupling with centre couplings and no side-chains was dangerous to the public safety; I brought under the notice of the Commissioners the fact that a train had broken away at the Fish River just prior to the deputation that waited on the Commissioners; a train travelling from Harden to Goulburn had broken away near the Fish River bank, and had run back a distance of about 4 miles; the train consisted of twelve trucks and a brake-van; ten of the trucks, a passenger carriage, and a brake-van became detached by the breaking of the centre coupling; the special point made upon was that

that an order had lately been issued that side-chains were not to be used ; and the employees expressed this opinion concerning it, " That it is desirable in the interests of the travelling public, and the railway employees in general, that the Commissioners be interviewed or communicated with respecting the Acting Traffic Manager's order regarding the coupling of vehicles in use for the carriage of coal and goods, as it is contrary to the rules laid down in the book of rules and regulations ; and further, that we are of opinion that sooner or later some serious accident will happen owing to the disuse of the necessary couplings " ; the Chief Commissioner told us that the Commissioners were about to fit automatic continuous brakes on all goods stock, and that would cure the risk ; a remark was further made to him as to what might occur in the interval, to which he replied that we might remain satisfied, as the responsibility on the shoulders of the Commissioners was much greater than rested on ours ; this is substantially what took place between the Commissioners and me ; I know that it is a matter of general complaint among the goods guards that the assistants have been done away with ; my service ended in August, 1886 ; I had been seven years on the railways ; up to this time, as far as my knowledge went, it was the custom to have two guards on all goods trains, except under exceptional circumstances ; I referred to order No. 3 when we waited on the Commissioners ; Mr. Eddy said he did not know anything about the order, and did not say that it had not the effect of doing away with the side-chains ; in my opinion it is the general opinion of the guards that the order does away with the side-chains ; No. 221 was also referred to at the deputation.

By Mr. Webb : I was stationed part of the time at Darling Harbour, at Granville, and at Parramatta ; as a labourer at Darling Harbour, as a porter at Granville, at Parramatta the first portion of the time as a goods clerk, and the latter part as parcels clerk ; I was specially engaged at shunting at Granville.

WM. F. SCHEY.

Sworn at Bathurst, this 30th April, 1890, before me,—

W. A. STEEL, Coroner.

*Isaac Hadden, on oath, states :—*I have been an acting-guard between six and seven years between Penrith and Bathurst ; No. 26 has been running all this time ; as a rule there were always two guards ; the practice has been discontinued ; I was employed as assistant-guard ; had to work up here and back ; I never returned as a passenger ; before leaving Penrith I was marked down as No. so-and-so up and No. so-and-so down.

ISAAC HADDEN.

Sworn at Bathurst, this 30th April, 1890, before me,—

W. A. STEEL, Coroner.

*Charles William Lawes, on oath, states :—*I am a guard, running between Penrith and Bathurst about eight years ; I have frequently run No. 26 train of late, odd times by myself ; formerly I had an assistant-guard ; this was the rule ; I am acquainted with order No 8 ; if there are side-chains we used them ; if a vehicle having the strong gear is attached to a vehicle having the weaker bar and the side-chains we use or attach, if possible, the side-chains ; I believe the purport of the order is to do away with side-chains.

By Juror : If I had been guard of No. 26 at the time of the accident I would have coupled the trucks as they were coupled.

By Mr. Webb : Of late years it has been the custom to keep assistants back, so that they can travel by certain trains.

By Juror : There are many instances where the train has been carried by the side-chains after the centre coupling has given way.

C. W. LAWES.

Sworn at Bathurst, this 30th April, 1890, before me,—

W. A. STEEL, Coroner.

*Charles Davidson, on oath, states :—*I found the end of the broken bar about 1 foot from the rail, and about the length of a rail from where the mark appeared made by this draw-bar.

By Juror : I found it on Sunday afternoon, at 3 o'clock.

C. DAVIDSON.

Sworn at Bathurst, this 30th April, 1890, before me,—

W. A. STEEL, Coroner.

The Secretary to the Railway Commissioners to The Under Secretary of Justice.

Government Railways of New South Wales,

Sir,

Secretary's Office, Sydney, 15 May, 1890.

In reply to your letter of the 8th instant, referring to the verdict and rider of the Jury in connection with the accident at Bathurst, whereby Rebecca Franklin met with her death, I am directed to say that the rider appears to have been framed in consequence of a complete misapprehension of the Jury of the facts regulating the traffic management of the New South Wales Railway Service.

The Jury say " they are of opinion that the safety of the travelling public and the railway employees has been endangered by the discontinuance of the use of side-couplings, whilst the weak gear is in operation, and recommend the use of side-couplings be resumed pending the fitting of all rolling stock throughout the Colony with strong gear." This implies that something has been done which lessens the safety of the travelling public, whereas there is no foundation for such an imputation, as evidenced by the report herewith from the Chief Traffic Manager.

The Jury further say they recommend " that the practice of carrying assistant-guards on all goods trains be resumed." In this respect also the Jury has been under a misapprehension, as from the Chief Traffic Manager's Report, it will be seen that no change has been made in the mode of running goods trains ; and that there has been no alteration in the number of guards accompanying trains for the past ten years.

I am to add that the Commissioners regret the evident desire of certain persons who attended the inquest to influence and mislead the Jury in regard to the management of the Railway Department, and which interference resulted in the rider accompanying their verdict.

I have, &c.,

H. M'LACHLAN,
Secretary.

[Enclosure.]

Sir,

Chief Traffic Manager's Office, Sydney, 6 May, 1890.

I beg to report, for the information of the Commissioners, that no order has ever been issued, or even contemplated, authorizing the disuse of side-chains on vehicles of any description where they are provided. And the general practice has been that where waggons with the old or light description of draw-gear have been attached to the new vehicles, which are provided with strong centre draw-gear and without side-chains, to place the coupling of the strong on the draw-hook of the light draw-gear, and to place the hooks of the side-chains on the latter in the centre chain of the other or stronger gear.

With

With respect to the assistant-guard question, I am in a position to state that no alteration has been made in the practice for the past ten years at least. Except between Penrith and Katoomba, where the gradient is of an exceptionally long and severe character, it has not been customary to provide assistant-guards for through goods trains.

Where assistants have been employed on through trains it has been simply to utilize the services of men returning to their homes after having run either as head or assistant-guards in the opposite direction, or when on their way to a station to take charge of a train.

The practice has been to provide assistant-guards only on local or "pick-up" trains which have a considerable amount of work to do at stations in transit.

I have, &c.,
DAVID KIRKCALDIE,
Chief Traffic Manager.

The Secretary for Railways.

Sydney : Charles Potter, Government Printer.—1896.

1890.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(PAPERS RELATING TO CHARGES MADE BY THE COMMISSIONERS AGAINST MR. SCHEY, M.P., IN REFERENCE TO ACCIDENT NEAR BATHURST.)

Ordered by the Legislative Assembly to be printed, 20 August, 1890.

TRANSCRIPT of Interviews, Minutes, Correspondence, Investigations, Resolutions, &c., between the Railway Commissioners of New South Wales and the Representatives of the New South Wales Amalgamated Railway and Tramway Service Association, and of the last named body, having reference to the position of the Association and of the General Secretary thereof, towards, and relating to, the late Railway Accident at Bathurst, on 25th April, 1890.

On 20th May, 1890, while the Annual General Meeting of the Association was in session, a special messenger delivered the following letter to the President:—

“Dear Sir, New South Wales Railways, Secretary’s Office, Sydney, 20 May, 1890.

“I am directed by the Railway Commissioners to say that they would like to have a few minutes conversation with yourself, Mr. Schey, and two or three other members of your Council, and would be glad if you could come down this afternoon, as one of the Commissioners will be leaving town to-night and will not be back for some days.

“Yours, &c.,
“H. M’LACHLAN,
“Secretary.”

“Mr. H. C. Hoyle, President,

“Railway and Tramway Association, Temperance Hall, Pitt-street.”

The letter having been read to the Conference and received, the following resolutions in regard thereto are transcribed from the official Minutes:—

“Resolved,—That so much of the Standing Orders be suspended as will admit of the letter of the Railway Commissioners being dealt with.

“Resolved,—That the Executive, together with Messrs. Young and Dean, attend to the Commissioners.
* * * * *

“Resolved,—That this Conference do now adjourn, to allow the Delegates to wait on the Commissioners.
“Conference rose at 4 p.m.”

A few minutes later the deputation was ushered into the presence of the Commissioners, who then addressed the deputation as per following copy, furnished to Mr. Hoyle, President of the Association, in answer to his request on behalf of the deputation for same, a week or so after it had occurred.

On receipt, the Executive of the Association handed it over to Mr. Schey, the General Secretary, to reply to, before going into a searching investigation into the grave charges made therein against Mr. Schey. His reply is attached to the report in parallel columns.

Office of the Railway Commissioners of
New South Wales,
Sydney, 20 May, 1890.

Mr. President and Gentlemen,—

After very careful consideration, I have come to the conclusion that this list of grave charges will be best answered, for the sake of accuracy, and rendering it capable of being easily understood, by adopting the parallel column method, which I have accordingly done.

NOTES of interview between the Railway Commissioners and Representatives of the Railway and Tramway Association, *re* relationship of the Society and the Commissioners.

Present:—The Railway Commissioners; Mr. Hoyle (President of the Association); Mr. Schey (General Secretary of the Association); Representatives of the Amalgamated Society.

The Chief Commissioner stated that the Commissioners had deemed it advisable to ask the representatives of the Association to meet them, in view of events which had recently occurred at the Coroner’s inquest which had been held at Bathurst in connection with the breakaway of a goods train at Raglan on the 25th April last.

(1) The Commissioners felt compelled to ask whether the position taken up by the General Secretary of the Association at the inquest was one that the Association intended to take up in connection with the Railway Commissioners—that was, to appear as prosecutors, to misrepresent orders, and to do everything that could be done to fix blame where blame was not attached. *It went so far as that, as the*

(2) *whole proceedings showed it was not a question of getting evidence.* Of course he was speaking of Mr. Schey's action, and referred to him as their representative and not as a Member of Parliament. He held two positions, and the Commissioners had their views about that also; but in this matter he (the Chief Commissioner) was simply dealing with Mr. Schey as the representative of the Association. (3) He knew nothing whatever of the accident itself, but went into the witness-box as a witness against the Railway Com-

missioners (4) and gave the lie direct to him, as the Chief Commissioner for Railways, in connection with

a certain (5) order, which order had no importance in connection with the case at all. It had never been submitted to the Commissioners, and if it had it would have been approved, because it was simply a

(6) repetition of an order which, as he would show, had been issued before they took office, and which had nothing objectionable in its provisions. This order had been referred to by a deputation which waited upon the Commissioners, when they (the Commissioners) stated that they had no knowledge whatever of the order; and, notwithstanding this, Mr. Schey stated, and he was specially recalled by

counsel to again make the statement, that (7) "he had very good grounds for knowing that the Chief Commissioner was well aware of it, although he had informed the deputation that it was not a fact that he knew the order had been issued." Then statements were made by Mr. Schey to people that the result of the inquest would get the Commissioners into trouble, especially the Chief Commissioner; and this, it must be remembered, was at a place where there was a strong feeling against him personally, and the Commissioners as a body, for doing their duty in transferring workmen to other places where they could be employed with greater advantage to the Department. (8) Within an hour or two of the accident it was stated that a verdict of manslaughter would be brought against myself, although the cause

of the accident was unknown. (9) The Association newspaper also, detailing an interview with the Commissioners on the subject of side-chains, was distributed in Bathurst, and extracts published in the Bathurst papers, all apparently with one object. The counsel employed by the Association also tried to influence the jury (10) by saying that he (the Chief Commissioner) had shown great callousness in not being present at the inquiry. But how were the railways to be administered if the Commissioners were to go to every inquiry? There was one, for

(1) Of course I cannot presume to say what course or position is likely to be taken up by the Association in any future case; but, so far as this Bathurst case is concerned, I, as General Secretary, certainly *did not appear as prosecutor; neither did I misrepresent any order, nor did I in any way endeavour to fix blame on any one.* I acted throughout with the fixed purpose of eliciting the whole truth, or as much of it as circumstances rendered possible; and if the evidence elicited had the effect of fixing the blame in any particular direction, I submit that I am in no way blamable for it.

(2) What this is intended to convey, I am at a loss to understand, and can therefore say nothing in regard to it. This remark seems to me to require a further definition and explanation.

(3) *I gave no evidence as to the circumstances of the accident.* I went into the box merely to prove the fact that the deputation of employees waited on the Commissioners in August, 1889, to draw attention to their opinion of the dangerous practice of disusing side-chains and of using single coupling only.

(4) I certainly did not give the lie to the Chief Commissioner; I simply told the truth, as my oath bound me to do; and I submit that I cannot be blamed if that should contradict the statement of any person whatever.

(5) As to the order (221, I presume), I have my opinion as to its importance, which certainly does not coincide with that of the Commissioners. It is certainly not my business to inquire whether such order was submitted to the Commissioners for approval or no; neither can I have anything to say as to whether it would have been approved of or no, if it had been so submitted.

(6) As to its being a repetition of a previous order,—that is true, but with this qualification: that the previous order (No. 8) was never fully issued, but was withdrawn and cancelled within a week of its first issue, and was never acted on at all. Everyone can have his own opinion as to whether the provisions of the order were objectionable or not, and the Association certainly did think them objectionable, for they waited on the Commissioners in August last and expressed the very strongest objections.

(7) This is variously stated by various newspapers. The *Bathurst Free Press*, which gave the best and fullest report, and whose leading articles on the matter were favourable to the Commissioners, reports me as saying, "I have the best of reasons for saying that the order was issued by immediate authority of the Commissioners, yet I have told the jury that he (the Chief Commissioner) said he knew nothing about it." This I believe to be quite correct, and I have already fully explained the circumstances, and my reasons, both in the public press and to Mr. Eddy personally. (As see copy correspondence marked "X" attached to these papers.)

(8) If this statement were made, it is a thing incidental to all such occurrences; but it was not made by me, as I did not arrive in Bathurst for about thirty-three hours after the accident, and then went immediately to bed for another five hours or so, and I did not say so afterwards.

(9) I took six copies of each of three issues of the *Review* to Bathurst with me, out of which I brought back more than half, giving the remainder to the local press; but not until after the jury had returned their verdict. Of course, many men there had already the *Review* in question in their possession.

(10) I did not suggest this to the Association's solicitor, and, of course, cannot direct any such person as to what he should say in his address to the jury. No solicitor would submit to such dictation, and certainly I had no idea of interfering in that way.

instance, being held at Maitland now, which should have been settled in three hours; but Mr. Kirkealdie had already been there for a week, and, from information to hand, it appeared he might be there until the end of the present week. If the Commissioners attended to all these cases, how could the administration go on? What greater attention could have been paid than was, in sending the three principal officers of the railways (the Chief Traffic Manager, the Locomotive Engineer, and Engineer for Existing Lines) to attend the inquiry? (11) The whole of the examination and address of the Counsel for the Association revealed the strongest animus against the Commissioners personally, he having been directed, apparently, to make a direct attack upon him (the Chief Commissioner), and endeavour to influence the jury to bring in a verdict adverse to the Commissioners. (12) Was that calculated to make cordial relations between the Commissioners and the Association? He did not say it would make the slightest difference. They would do their duty in every respect to the staff; but it was not the fair play Englishmen should expect, and it was to him degrading that he should have to defend himself, and he thought it wrong that the Association should have taken up the position of attempting (13) to show to the country that he had failed to state the truth, as, if such was the case, he was not fit for his position. Then again, it appeared in the last issue of the Association paper (14), and the paper misrepresents the verdict of the jury when it states, "The verdict, condemning as it does the imperilment of human life by single couplings only." As a matter of fact it did nothing of the sort. The verdict simply said what the Railway Commissioners say, as he would show presently, the rider to the verdict of the jury being, "The safety of the travelling public and the railway employees have been endangered by the discontinuance of the use of side couplings while the weak gear is in operation, and recommend the use of the side-chains be resumed, pending the fitting of all rolling stock throughout the Colony with the strong

gear." That (15) was exactly the order of the Railway

Commissioners. The jury thought it unnecessary for side-chains to be used when the strong gear is in opera-

tion. (16) Mr. Schey seemed to be trusting to Mr. Midelton, and to believe him before the Chief Commissioner, as in the Association paper he states:—"Mr. Midelton, who was Locomotive Engineer at the time the order was issued, states just as emphatically that the Chief Commissioner gave him the order personally, and that he executed it against his own better judgment, and with fear as to the consequences"; (17) but, as a matter of fact, Mr. Midelton did not utter one word of objection when the subject was under discussion, and Mr. Kirkealdie, the Chief Traffic Manager, who was also present, said he remembered distinctly that (18) Mr. Midelton stated at the time that he saw no use for side-chains with the strong draw-gear. The Chief Commissioner did not recollect that, but he knew

The solicitor conducts the case, and must be left to use his own judgment as to his address.

(11) This is a matter of opinion, and I do not coincide with the opinion expressed by the Commissioners, and need only add that no instructions of the kind insinuated were given by me to the Association's solicitor. Most assuredly there was no idea of making any special attack on the Chief Commissioner. See 10 and 45.

(12) This would appear to me to indicate that suppression of the truth, when so desired, is expected as the price of cordial relations. I have never understood that I was to govern my official actions by any such consideration.

(13) No such attempt was made. I cannot be held responsible if the sworn evidence contradicts any statement which may have been made by any person.

(14) The *Review* does not misrepresent the verdict of the jury. The verdict, of which I attach a copy, certainly does condemn this disuse of side-chains, and the sentence in the *Review* is synonymous with the corresponding sentence in the jury's verdict. The jury found that public safety was "endangered"—"That the deceased, Rebecca Franklin, met her death at the Russell-street crossing, on the 25th April instant, caused by an accident through the breaking away of part of No. 26 up train, which collided with No. 28, leaving Bathurst Station; and the jury further find that the safety of the travelling public and the railway employees has been endangered by the discontinuance of the use of side couplings while the weak gear is in operation, and they recommend the use of the side couplings be resumed, pending the fitting of all rolling stock throughout the Colony with the strong gear; and they further recommend that the practice of carrying assistant guards on all goods trains be resumed; and the jury desire further to exonerate Guard Davis and Driver Palmer from all blame in the matter."

(15) This was not the order of the Commissioners. See 20 and 21. They ordered side-chains to be taken off vehicles with strong draw-gear, while the jury recommended that they be replaced on all vehicles until all were fitted with the strong draw-gear. The strongest proof of this is found in the fact that side-chains are being replaced on all vehicles, in accordance with the recommendation of the jury.

(16) I did not trust to Mr. Midelton. See 22. Both statements, directly contradictory, were made in the public press, and the *Review* simply drew attention to and contrasted them, and said, in relation thereto, "It is not our province to decide."

(17) Here Mr. Eddy admits that the subject See 5, 19, 20, 30. was discussed with Mr. Midelton prior to his leaving office.

(18) If Mr. Midelton did say what is alleged, it certainly does not say that he said side-chains were of no use while weak draw-gear was still in use, which was the case at the Bathurst accident, and apparently the record referred to in No. 20, presently considered, was disobeyed by some person as to the "chains."

that not one word of objection was raised. (19) The original minute taken down at the time of the Northern Inspection Tour in January, 1889, when the question was discussed with the officers, which he now quoted from the original record book, was as follows:—“The Commissioners decided (20) that side-chains should be discontinued on all vehicles fitted with the strongest draw-gear, chains to remain on those vehicles having the light draw-

gear until such gear is replaced. (21) Now, that was exactly the verdict of the jury. Then the Commissioners had an interview with representatives of the Association in August last, when the matter of side-chains was mentioned, and the following minute was written:—(21 a) “The deputation drew attention to a circular which had recently been issued by the Traffic Manager, instructing the men, even when side-chains were provided, that they were not to be used. The centre coupling might at any time snap, and they thought that the side-chains should be used for the protection of the men, particularly as in many cases the trains running in the distant districts were mixed trains. They had several instances, one particularly of a train arriving at Harden, where the trucks were held in three places by the side-chains only.” (22) The Commissioners then stated that they were unaware of the order, but promised to look into the question, and shortly after-

wards (23) they had a meeting with the officers, and it was found that no such order had been issued.

(24) There was evidently some misapprehension in Mr. Schey's mind with regard to the whole matter. He did not wish to say that it was intentional; but there was a misapprehension in his mind as to the meaning of the order No. 221 (which was evidently the one referred to by the deputation), which was simply a re-issue of the order (25) of the 11th February, 1888, which simply deals with the double

shackling of the waggons. (26) The question was first raised in 1885 by a memo. of Mr. Loughrey's recommending the discontinuance of the double couplings, which was endorsed by Mr. Scott asking for an order to be issued. Copy of memorandum given below.

“Memo. to Locomotive Engineer.

“Sir,

“I have to report, for your information, that the practice of double coupling the centre chains on our goods stock is still continued, even with the last new couplings, which were made considerably stronger than the old ones, and were intended to be used singly.

“As the couplings are apt to be damaged in this way, I think an order should be issued to the effect that whenever the new couplings are in use they should only be single coupled.

“E. A. LOUGHREY.”

“I forward these reports for your information. I trust that you will issue an order to prevent the double coupling of the strong couplings in the future.—W. SCOTT, 4/9/85. Traffic Manager.”

(19) This was therefore six or seven months before the issue of Traffic Order 221. See 17, 5, 20.

(20) The Commissioners here admit that a mechanical order was given to remove these side-chains from vehicles with strong draw-gear, thus doing the very thing which, as soon as carried out, caused the issue of Traffic Order 221 in July, 1889, and the deputation to point out the danger and objection in August, 1889. See 5, 15, 17, 19

(21) As already shown, this order and the verdict of the jury are not the same, but radically different. See 15.

See 24.

(22) They have been unaware of the actual issue or wording of Traffic Order 221; but, as above, they have already admitted giving the very mechanical order which caused the state of things here brought under notice by the deputation. See 6, 17, 19, 20.

(23) If such were found, when we had already explained to the Commissioners that the employees at large understood order 221 as complained of, why were we not informed that we had misread the order; and as it was known that it was so misunderstood, why was not another order issued, making the exact meaning of 221 clear to all persons.

(24) There was no misapprehension on my part. If I did not understand Traffic Order 221, neither did the men at large. It was they who complained; I acted only as their mouthpiece. See 21a.

(25) This order of 11th February, I have already explained, was never acted upon, and was cancelled within one week of its first issue. Mr. Goodchap saw that it was not only dangerous but contrary to the Regulations, and so had it immediately cancelled. See 6, 27.

(26.) This is not correct; the question was first raised some years before 1885—in 1883, I think.

" Government Railways,
 " Locomotive Engineer's Branch,
 " Junco Station, 28 August, 1885.

" Memo. to Locomotive Engineer *re* Double Coupling
 of Trucks.

" I NOTICED a few days ago that our travelling water-tanks, furnished with continuous draw-gear, the new standard hook, and 1½-inch couplings, were double coupled. If I remember aright, the 1½-inch couplings and new hook were intended to do away with this.

" I should be glad if you would give me some information on the subject.

" T. A. SOWELL,
 (*pro* J. CLOSE)."

(27) A lot of correspondence passed on the matter, ranging over 2½ years, the order finally being issued in February, 1888, and repeated by Mr. Kirkcaldie in July 1889. There are no papers showing how the order came to be reissued, and the reason for it cannot be traced, but it would probably be in consequence of some of the inspectors seeing the waggons double shackled being a source of weakness, and drawing attention to the matter.

(28) That was the story of the order concerning which so much had been said; and after all it had no bearing on the question of side-chains in any shape, as it simply dealt with the mode of using the two main chains. The side-chains, as he had shown, have not been disused except in the case where the strong draw-gear had been put in. Tests had been made as to the breaking strain of the draw-gear. Some of the strong draw-bars stood a test of 42 tons, whilst the side-chain on the truck concerned in the Bathurst accident broke on a strain of 7½ tons. These tests were made by the use of a machine which brings the strain gradually upon the iron; and the strain upon the side-chains would not be so severe as in the case of the Raglan accident, where the chains would have been subjected to a sudden snatch. Cases might be brought forward where, with a falling or an easy gradient, or where the parting had been effected without any severe jerk, side-chains have held; but that had no bearing on a breakaway on a gradient of one in fifty when the strain must have been so great; and this has been proved by Mr. Thow, by actual tests. The Association paper goes on further to state:—
 " Neither is it our province to decide on whom must

rest the responsibility of issuing (29) General Order 221, which is the cause of the disuse of the side-chains. The Chief Commissioner states emphatically that he gave no authority for the order, while (30) Mr. Midelton, who was Locomotive Engineer at the time the order was issued, states just as emphatically that the Chief Commissioner gave him the order personally"; so that the man who was put up to give him (the Chief Commissioner) the lie direct, and on whose authority he was held up to every man as unfit for his position, was Mr. Midelton, who was further said to have been the Locomotive Engineer at the time the

(27) I repeat, G. Order No. 8, of February, 1888, ^{Sec 6 & 25.} was never acted on. The double coupling was continued until the issue of G. Order 221, in July, 1889. I have already given the reason above. The former Commissioner would not sanction such an order. ^{Sec 21a.} Whatever may now be contended, it is patent to all that the men understood the order 221, as doing away ^{Sec 21a.} with side-chains, and if not aware of it before, the Commissioners were certainly aware of the order and the way it was construed, and also that the side-chains were being disused in consequence of such order. This was plainly told to the Commissioners by the Association deputation, in August, 1889, eight months before the Bathurst accident. Again, the ^{Sec 5, 15, 17, 19, and No. 6.} Commissioners admit that they had a consultation with the officers, in September, 1889, when they saw the order 221, and notwithstanding what the deputation had pointed out, they found no fault with its provisions (*vide* Commissioners' Report to Minister on the accident). Surely then, from September, 1889, the order 221 existed with the full knowledge, authority, and concurrence of the Commissioners. Again, side-chains were taken off many ^{Sec 20.} trucks, thus rendering it impossible to use them in a great many cases.

(28) With these tests I have nothing to do. It is within the knowledge of a large number of our guards here, that side-chains have held heavier trains than the one which broke away at Raglan, and on heavier grades than the one at Raglan: witness the accident at Singleton, on 28th May, 1890. I can quote several other instances. All the sworn evidence at the inquest proves that there was no "sudden snatch."

(29) I have already abundantly shown that this ^{Sec 16 & 21a.} order (221) was the cause of the disuse of side-chains.

(30) Mr. Midelton was Locomotive Engineer at ^{Sec 17.} the time the mechanical order to take off the side-chains was issued. Mr. Eddy has already admitted that fact, and states that Mr. Midelton raised no objection. Traffic Order 221 was merely the result of what had been done to the trucks, and which naturally took some time to carry out; and, as already admitted by Mr. Eddy, the order was given to Mr. Midelton, who was Locomotive Engineer

See 20.

order was issued. As a matter of fact Mr. Midelton left the service on the 1st April, 1889, months before

the order 221 was issued, so (31) that simple fact shows that Mr. Midelton is not to be relied upon. Regarding the statement previously referred to in the Association paper as to (32) Mr. Midelton having carried out the order about side-chains against his better judgment, was there any man, in any position, worthy of the name who would do anything to

See 17 and 80

imperil public safety without putting on (33) record his objections? Mr. Midelton was the technical adviser of the Commissioners, and if he had any objections to any course being followed, he should have written back a minute stating he considered it unsafe; he did not do so, as he was a consenting party in the discussion. (34) Then with regard to the alleged statements from the staff, as to the risk of running without side-chains, we have the direct assurance of the officers that they have not had one word of complaint from any man on the subject, therefore if the men had any feeling surely they ought to have gone to their own officers. (34) He did not believe in a system by which the staff would go to people other than their officers regarding the work, and if that is the way matters are to be conducted, the railways could never be managed properly. Then a further matter

was taken up at the Bathurst inquiry (35) as to assistant-guards being knocked off. He said with all seriousness that since the Commissioners had been in office they had been untiring in their efforts to press

the officers (36) in the direction of safe working. For instance, with regard to increased appliances, they authorized, on going over the Illawarra line, the introducing special signal-boxes for the block system instead of allowing the system they found in operation of the station-masters working the block to continue, and on this and other lines the cost of increased staff was between £5,000 and £6,000 annually for signalling alone, and, as they mentioned last night, where 28 miles of block working existed when the Commissioners took office there was now 194 miles worked under the block system. They had done everything to increase the safety of working since they took office, but notwithstanding all that had been done the Association, (37) through their representative at the inquiry, endeavoured in all ways to fix the blame upon the Commissioners.

See 18, 10, 48.

Mr. Commissioner Fehon stated that they should quite understand the spirit in which they had been asked to call. The Commissioners felt they had no explanation to make, but it was simply with a desire that cordial relations (38) should exist between the society and the Commissioners that they deemed it wise that the interview should take place. The Commissioners have their duties to fulfil, and there should be no such spirit of hostility (39) to them as was shown at the Bathurst inquiry.

See 18, 10, 48, 87

The Chief Commissioner stated the principal point that they wished to know was, if it was by the instructions of the Association that Mr. Schey's action was taken (40). The Commissioners had no desire to limit fair inquiry, as their instructions to their counsel and the officers who attended the inquest were that everything should be done to bring out the actual state of things, and that he took to be the object of the inquiry, and no one had more interest than the Railway Commissioners to see

at the time. The record is in January, 1889, while Mr. Midelton was Locomotive Engineer. He left in April, 1889. The record is turned into an order (221) in July, 1889; the objection is in August, 1889.

(31) This has no bearing whatever on Mr. Midelton's reliability. He did not make the statement, but the writer of the article.

(32) Of course on this matter I can say nothing, but it was universally understood, when the Board took office, that it was not healthy for any officer to raise any objection or protest to any order given him by the Commissioners.

(33) Here again Mr. Eddy fully admits his responsibility for the mechanical order, of which traffic order 221 was merely the natural sequence. No. 20 says, "The Commissioners decided, &c., &c."

(34) We have on this point direct assurance that representations were made to the responsible officers on the subject of order 221 and its effects; that they were pooh-poohed, and no notice taken of them. Therefore, of course, no record can be found of such, and no officer would condemn himself by remembering any such circumstance after the accident.

They did not go to "other people." Surely they went in proper departmental fashion when they respectfully represented the matter to the Commissioners failing the lower officers, a practice, it must be observed, which Mr. Eddy sedulously commends when speaking publicly.

(35) I did not, nor did the Association, ever lay it at the door of the Commissioners that these assistant-guards were taken off the trains. When in the box at Bathurst, and asked the question as to whether complaints on this head had reached the Commissioners, I distinctly said I could not say that they had, as many complaints had a habit of stopping short before they reached the Commissioners.

(36) With all this I have nothing to do. I admit at once that I believe not only that these statements are quite correct, but that the Commissioners have evinced every desire to make the railway work and travelling as safe as possible in the directions indicated.

(37) I have already pointed out that I did not do so, and must again disclaim any such intention.

(38) No one has striven harder after cordial relations than myself, and, certainly, I have not been the first to rupture them.

(39) I again repeat that there was no such spirit of hostility as is here attributed.

(40) On this point I leave the Association itself to decide. I need only point to my duties and instructions under Association rules 23 and 93; also to the plenary authority from the Council under which I have always acted in all such cases. The Council also have approved, by resolution, of my actions at this Bathurst inquest, and I could also remind you of other consultations and authorities having reference to this class of cases.

that the truth was arrived at (41). To show their wishes in this matter, in connection with the Farley accident, a request was made to Mr. Thow by a deputation of the drivers that one of their number should be allowed to go and sit by the side of the drivers' counsel to prompt him in questions as to the rules and regulations, so as to ensure everything possible being brought out on behalf of the driver concerned. Mr. Thow, knowing the spirit of the Commissioners, said certainly permission would be granted. We had nothing to hide, and in every inquiry that is conducted fairly the Commissioners knew that they would stand with clear consciences. He was afraid that they might go away without understanding the matter, and that was the reason in asking them to come (42), so that they could really ascertain whether Mr. Schey appeared at Bathurst, taking the line of action he did, at the instance of the society, so that the society should appear as prosecutor; putting in the general secretary as a witness, although he knew nothing whatever of the merits of the case, to give the lie direct to him as the Chief Commissioner, and that the counsel for the Association should urge the jury to fix the responsibility on him in the first place (43), and also on the Commissioners, although, as he had shown, what the Commissioners had done had not had one fraction of weight in connection with the matter, and they were

simply the administrators of the Railways (44), and not the executive officers, who could be held personally responsible for the carrying out of the details of the working.

(41) This is entirely foreign to the matter under discussion, and I have therefore nothing to say to it.

(42) I have already traversed the whole of this matter. I repeat that I proffered no evidence on the facts of the accident, and what I did give was not proffered at all but given at the request, and in answer to, questions of the Association's solicitor, who must be permitted to conduct any case committed to his charge as he thinks best.

(43) This is not correct. Mr. Thompson, in commencing his address to the jury, said "He must state at the outset that he was not present, as some persons might think, to endeavour to fix the blame of this dreadful occurrence on the shoulders of any particular person, 'Nothing of the kind.'"

(44) On this I have nothing to say, but, of course, we all have our own opinions on the matter.

In conclusion, I have only to say that I think, in view of the foregoing, that the serious charges made against myself must fall to the ground. Of course, a portion of them are nominally directed against the Association, but, after all, only through the way in which I have administered its affairs. The whole thing therefore is, I take it, directed personally against myself. I need only add that, had I so chosen, I had abundant facts in my possession which, if produced at the coronial inquiry, would have badly damaged and discredited two of the principal departmental officers who went into the witness box, and who certainly had no more right than myself in the box, for if, as Mr. Eddy contends, I knew nothing of the accident personally, neither did they, but no objection is raised to their going into the box and giving evidence, some of which, at all events, was deliberately untrue. I have to say, therefore, that everything was not done either to prosecute or discredit the Department or the Commissioners. I now leave the matter confidently in your hands, feeling that I have fully vindicated the position of the Association as well as my own in the foregoing pages.

Copy of correspondence marked "X," and referred to by that designation in No. 7 of foregoing papers. The correspondence fully explains itself:—

Sir,

2 May, 1890.

I do myself the honor to enclose herewith a copy of a letter which I have this day addressed to the editor of the *Australian Star* for publication. Reference to Mr. Angus will corroborate the statement which I have made therein as to the explanation of the answers given by me to questions asked.

I deem it due to you, as to myself, to make this explanation to you as well as to the public Press.

Regretting that such a construction should have been put upon the words used,

I have, &c.,

WM. F. SCHEY,

General Secretary.

E. M. G. Eddy, Esq., J.P., Chief Commissioner for New South Wales Railways.

[Enclosure.]

The Bathurst Accident.—An Explanation.

Sir,

To the Editor, *Australian Star*.

2 May, 1890.

I notice in your "Current Topics" of last night that I am represented as having made "a most serious charge against Mr. Eddy" in my evidence at the late inquest into the Bathurst disaster. I admit that the evidence bears that construction; but had I been permitted to explain, as I did immediately afterwards to the Departmental Solicitor, Mr. S. E. Webb, and to Messrs. Angus and Kirkealdie, my meaning would have been at once clear. I said I was of opinion that general order 221 had been issued by the authority of the Chief Commissioner, as undoubtedly it was, because no traffic manager,

manager, or any officer of similar grade, under our system, has power to issue any such order without the authority of the heads of the Department. At the same time it is perfectly possible that Mr. Eddy was quite ignorant of this and many other orders which have been issued under his authority. Thus the "serious charge" vanishes into thin air. These things are necessarily so, and I had no intention of imputing untruthfulness to Mr. Eddy.

Thanking you in anticipation,

I am, &c.,
WM. F. SCHEY,
General Secretary.

Bathurst Accident.

Sir,

5 May, 1890.

I have received your letter of 2nd May, but I cannot think you really expected that I could accept any "explanation" of the statement you made with so much deliberation on *oath*, and which, no doubt, influenced the verdict of the Coroner's Jury.

The statement was absolutely false; yet you practically reiterate it in your letter above referred to.

I am, &c.,
E. M. G. EDDY.

W. F. Schey, Esq., M.P., Secretary, N.S.W. Amalgamated Railway and Tramway Association.

Bathurst accident.

Sir.

9 May, 1890.

I do myself the honor to acknowledge the receipt of your letter of 5th inst., in reply to mine of 2nd idem, both dealing with the above subject.

I deeply regret that you should have considered it necessary to impute to me so grave an offence, as you virtually do by drawing my attention to my evidence on *oath*, and by then declaring that such a statement was absolutely false.

I am far from imputing to you a desire to be offensive or insulting to me, as I still consider that you are under a misapprehension of what really did occur, and of the effect of my evidence; and I am sure that your sense of what is right will induce you to withdraw this imputation, which is necessarily offensive, even though not intended to be so, if I can convince you that I have in no way departed from the truth in my evidence.

On the 16th August, 1889, a deputation of the railway employees waited upon yourself and your respected colleagues, and were courteously favoured with the opportunity of discussing many matters which they considered of moment to them. Amongst others, the subject of centre couplings only was dealt with, and the attention of the Commissioners drawn to the then recent Rule or General Order 221, which virtually does away with side couplings; and the interview on that point terminated by your promising to look into the question and by your saying that without knowing the facts you could not say that you would countermand the order.

I now assume that the portion of my evidence to which you take such grave exception is that in which I say, "I have the best reasons for saying that the order was issued by immediate authority of the Commissioners."

If I am correct in my assumption, will you permit me to point out that as you and your colleagues were then vested with supreme authority in such matters, no one in the Department could have ventured to promulgate so serious an infraction on previous rules without some knowledge or authority or acquiescence on the part of the Commissioners.

In the interview referred to you did not appear to be aware that there was so grave a difference between some of the Rules and Regulations guiding guards on trains and that comparatively new Rule or General Order 221, yet you did not in any way lead your deputationists to believe that the rule or order had been issued without sufficient authority, though you said you knew nothing of it.

Surely, therefore, it must be admitted that I am right in stating that I have the best reasons for saying that the order was issued by immediate authority of the Commissioners; and yet, immediately afterwards, in reply to your solicitor, in stating that he (meaning yourself as Chief Commissioner) said he knew nothing about it, which I do not for a moment dispute.

I beg you to observe that I do not say that I know this, but my reasons are so plainly the natural inference arising out of what had occurred, that I cannot help feeling amazed that you have not seen that this is the true way of reading the matter.

In my previous letter to you I referred to my having stated in explanation what my reasons were both to Mr. Webb (who prevented me stating them on oath when I wished to do so) and to Mr. Angus; and the reasons were that I was perfectly satisfied that no traffic manager, or any officer under you and under our system, could have power of his own motion to issue such an order or rule.

If you take any exception to any other part of my evidence, or if I am incorrect in supposing that the portion quoted is that which you consider open to so grave a charge, I beg that you will state it—so that I may have an opportunity for reply; as I am sure that your sense of justice will incline you to what appears to me a fair and right course.

I regret that anything should have arisen to disturb the otherwise friendly relations between myself, as the accredited official of the Railway and Tramway Service Association, and yourself; and I have every hope that a little further explanation will pave the way to a restoration of such relations.

I have, &c.,
WM. F. SCHEY,
Gen. Sec.

E. M. G. Eddy, Esq., J.P.,
Chief Commissioner for Railways.
Sydney.

Sir,

13 May, 1890.

I have to acknowledge the receipt of your further letter regarding the Bathurst accident, but the action you took on behalf of your society, at the inquiry, was so extraordinary and without justification that I must decline to correspond any further on the subject.

I am, &c.,
E. M. G. EDDY.

W. F. Schey, Esq., M.P.,
Secretary, New South Wales Amalgamated Railway and Tramway Association.

The day after the deputation, viz., on 21st May, Mr. Hoyle was sent for privately by the Chief Commissioner, who showed him a private report which had been received by him from the solicitor and departmental officers who attended at the inquest at Bathurst on behalf of the Commissioners. [*Copy of this report is attached in full further on, and is marked A.*] This report detailed other and still more serious charges against Mr. Schey, and was shown to Mr. Hoyle by the Chief Commissioner in strict confidence. Mr. Hoyle, feeling that, in justice to all concerned, such further charges should be thoroughly investigated, wrote to the Commissioners on 5th June, asking for a copy of such report, for the purpose of enabling such inquiry to be made. On 9th June the Secretary for Railways furnished Mr. Hoyle with a copy of the said report, at the same time stipulating in a "private" letter that the same should be used only for "the purpose of confidential inquiry," and that it should not be "made public." Mr. Schey being informed of the receipt of such report, at once informed Mr. Hoyle, in the presence of a witness, that he had already had a copy of such report in his possession for nearly a week, and was also prepared with an ample refutation of all it contained. On investigation this was found to be true, Mr. Schey having obtained possession of it in the following way:—

In the course of an ordinary letter to Mr. Schey, under date 16th May (thus being before the conference, deputation, &c.), Mr. Alfred G. Thompson, the solicitor at Bathurst, who represented the Association at the inquest, wrote: "Can you not get the report on the inquest as furnished by Webb, Kirkcaldie, Angus, and Thow? It is a tissue of lies, and will go far to show how little confidence can be placed in any report they may prepare.—I can. The Coroner, any of the jurors—in fact, the whole panel if necessary—with Kenny" (another solicitor) "and myself to give the lie direct to most of the statements. Let me have a line to-morrow as to chances of getting this document before the public." This aroused Mr. Schey's suspicion, who, seeing that the remarks could not apply to the departmental report on the accident, which had been laid before Parliament, and that he was unaware of any other report being in existence, at once wrote to Mr. Thompson for further information and explanation. Mr. Thompson then said that he had a copy of the report in question, which he would send to Mr. Schey, together with refutations of the statements made therein. This he did, forwarding the papers, covered by a letter of explanation, on 5th June. Thus the report and the refutation were in Mr. Schey's hands four days before the copy furnished by the Commissioners reached Mr. Hoyle. The following is the report referred to, and is marked A, and is the document previously referred to in these papers by that designation:—

Railway Department, Office of Engineer for Existing Lines, Sydney, 2 May, 1890.

INQUIRY into accident at Bathurst commenced at Hospital on Saturday, when the various parties were represented by Mr. Palmer, solicitor, instructed by Mr. Thompson's clerk. On this occasion Mr. Schey was not present.

On Monday morning Mr. Schey appeared at the inquiry, instructing Mr. Thompson, as we were informed, on behalf of the Railway and Tramway Association. Mr. Thompson also appeared on behalf of Guard Davis and Driver Palmer.

During the progress of the inquiry Mr. Schey instructed Mr. Thompson both as to the mode of conducting the inquiry and as to the questions that should be asked, in almost every instance his questions being directed particularly in attempting to attach blame to the Department generally, and to the Commissioners in particular.

His instructions in this respect at length became so irksome to his solicitor that he was imperatively ordered to desist from this course of procedure.

In attempting to attach blame to the Department, Mr. Schey went into the box himself, and detailed at great length a conversation which he said he had had with the Chief Commissioner at one or two interviews, tending to show that the Chief Commissioner was aware of the defectiveness of the rolling stock of the order dated 10th February, 1888, and that this order had been issued under his direct instructions, though the Commissioner had asserted, when a deputation of the railway employees waited upon him, that he had no knowledge whatever of the order.

On being recalled, Mr. Schey reiterated the statement having reference to the Chief Commissioner's personal knowledge of the order, stating that he had very good ground for knowing that the Chief Commissioner was well aware of the order, notwithstanding that he had informed a deputation that he had no knowledge of it.

During the progress of proceedings Mr. Schey distributed liberally a newspaper published, we believe, by his Association, which contains a long account of the meeting of the Commissioners with the deputation above referred to, and *he got* the various local papers to insert this report in *extenso*.

So persistent were the attempts of counsel and Mr. Schey throughout to attach blame to the Commissioners, and particularly to the Chief Commissioner, and also to the heads of the various departments, that at last the foreman of the jury rose in his place, and in open Court called the Coroner's attention, and the attention of counsel, to the fact that the inquiry was one being held to inquire into the cause of the death of Mrs. Franklin, and not as to the working and management of the Railway Department and the conduct of the Chief Commissioner or other Commissioners, and those remarks were endorsed by two or three other jurymen, who said they considered a great waste of time was being carried on by this course of procedure; and this matter went so far at last, that, after the remarks of the foreman of the jury, the Coroner himself stated that he considered matters *irrelevant* to the inquiry were being introduced unnecessarily, and apparently with an object.

On Monday, after the morning sitting, during lunch-hour, Guard Davis, who was the guard in charge of the train which was wrecked, stated to the Commissioners' solicitor, and to one or two of the officers of the Department, that he had no knowledge that such a course of examination was to be pursued, and he was very much annoyed at Mr. Schey for instructing the solicitor as he had done, and that until the questions were asked he had no knowledge whatever what questions were to be asked, or of the course that was to be pursued. Again, several other times during the inquiry Guard Davis expressed his disgust and disapprobation of the course which was being pursued by his counsel, and informed several parties that so far as he was concerned he repudiated having given any instructions for such a course of procedure, and that he did not see that he could in any way be held responsible for it, as the instructions were wholly Mr. Schey's. Several other railway employees stated outside Court to officers of the Department concerned in the inquiry that Schey seemed to have a particular "edge" on the Commissioners, and that he had expressed himself as being certain that the finding of the jury would get the Commissioners into trouble, especially the Chief Commissioner.

The counsel appearing for Mr. Schey and Davis appeared to find himself in a very awkward position, considering the position taken by Davis and that taken by Schey, and asserted in the commencement of his address that he did not desire to attach the blame to the Commissioners, or to the Chief Commissioner, or to anyone, in fact; still the whole burden of his address was to the effect that the Commissioners had been grossly negligent, and that Mr. Eddy had shown an utter want of feeling and consideration for human life in connection with this matter by remaining absent from the inquiry, and by merely sending three officers of the Department.

He urged the jury, in very impassioned language, to add a rider to their verdict which would fix the blame of this accident on the shoulders of the Chief Commissioner in the first place, and of the Commissioners in the next place. During the whole of the inquiry Mr. Schey's conduct and behaviour was indicative of the keenest feelings of animus towards Mr. Eddy and the officers of the Department. Whenever any circumstance was elicited tending in any way to make a point against the Department or against Mr. Eddy, Mr. Schey would throw himself back in his chair and laugh and nod at the representatives of the Department in a way which indicated as plainly as words could speak, "I have got you on that point."

During Mr. Thompson's address his conduct in this respect was very unseemly, and, also, his manner when he went into the box as a witness indicated the strongest ill-feeling and animus towards Mr. Eddy in particular, though this ill-feeling seemed to extend in some measure to the other Commissioners and the officers of the Department present.

When the jury went to view the couplings of the train at the station, Mr. Schey accompanied them, with others, and whilst the jury were inspecting the identical couplings which were the cause of the inquiry, Mr. Schey perched himself on top of the truck, over the couplings, and persisted in interfering with the members of the jury, and in pointing out the various difficulties and improbabilities and other matters tending to show that the contention of the officers of the Department was not possible, to such an extent that the foreman of the jury on two occasions literally sat on him.

S. W. WEBB.

J. ANGUS.

DAVID KIRKCALDIE.

W. THOW.

Referring to the statement of Mr. Schey, that the Chief Commissioner was aware of the issue of the order dated July, 1889, I may point out that the general order was merely a reissue of an order issued on the 10th February, 1888, by my predecessor months before the present Commissioners assumed office, and was issued entirely on *my own responsibility*, and without reference to any of the Commissioners.

DAVID KIRKCALDIE.

The following is the covering letter, written by Mr. A. G. Thompson, when forwarding the report, and previously referred to:—

W. F. Schey, Esq., M.L.A., Sydney,—

Bathurst, 5 June, 1890.

Dear Sir,

In reply to your letter of 26th May last, I have to state that I have had the report signed by Messrs. Webb, Angus, Kirkcaldie, and Thow, perused by eleven of the jurors, and so that no doubt may exist as to their opinion of its untruthfulness, a document has been signed by ten of the number, which I have annexed to the copy report, and forward herewith for your use.

As to the portions of the report dealt with by the jurors, I will have little to say beyond the fact that I not only agree with what is stated, but go further and state emphatically that the report in those particulars is wilfully false. The remarks alleged to have been made by me in my address to the jury are without the slightest colour of truth, and in that I am supported by the jurors, by many who heard me, and by the reports of my address contained in *The Times* and *Free Press*.

With regard to what is reported of statements made by Davis, I can only say that in my opinion the whole is untrue, but I am not in a position to give the *best evidence* of the untruthfulness of what is said by Davis, although I could give cogent reasons for my opinion. Davis himself, however, would, I feel sure, add his share of denial of this fabrication.

I will not dwell upon what is stated with regard to yourself. Let it suffice for me to say that as to your conduct during the inquiry, and as to my having asked you to desist from irksome instructions to myself, the statements made are utterly false.

Now with reference to the whole report. Does it not seem an appalling state of things that three officers at the heads of various branches of our great Railway Service should have deliberately affixed their signatures to a document which is absolutely, wilfully, and grossly untrue from beginning to end.

What confidence can the public place in future in any report of the result of any departmental inquiry emanating from men who could degrade themselves by the issue of an undignified, childish, and withal grossly-perverted document such as that under consideration.

Apart altogether from the attack upon yourself, or the untruthful references to me, there is underlying the whole matter a principle, viz., the credibility or otherwise of responsible public servants, whose characters for reliability and integrity should be unassailable and invulnerable qualities, which, if open to doubt, should render them unfit for their positions. As to the other gentleman signing the report, it is a matter for his own personal consideration. If he chooses to affix his signature to a document which he knows to be misleading and untrue, he is not answerable to the public; but it is not so with the others, who are the servants of the public.

I may mention that I have spoken to the newspaper proprietors, who deny the statement that you "got them to publish the report of the deputation which waited on the Commissioners." You will observe that only ten jurors have signed the document annexed to the report; of the other two, one declines to sign, and the other is away from Bathurst.

Trusting that what I have done may be of some service to you and to the public whom you desire to serve.

I remain, &c.,

A. G. THOMPSON.

In refutation of the statements made in the report as to the actions and words of the Coroner and jury, the following is the refutation signed by ten jurors, referred to in Mr. Thompson's letter, which also explains why the other two jurors did not sign also:—

We,

We, the undersigned jurors, who sat as such at the inquest on the body of the late Rebecca Franklin, who was killed on 25th April last, through the breaking away of part of the No. 26 up-train which collided with No. 28 leaving Bathurst station, having read the copy report herunto annexed, have to say with regard thereto :—

1. It is not true, as stated, that "the foreman of the jury rose in his place, and in open Court called the Coroner's attention and the attention of counsel to the fact that the inquiry was one being held to inquire into the cause of the death of Mrs. Franklin, and not as to the working and management of the Railway Department, and the conduct of the Chief Commissioner or other Commissioners; nor is it true that such remarks were endorsed by two or three other jurymen, who did not say that a great waste of time was being carried on by this course of procedure."
2. It is not true that "the Coroner himself stated that he considered matters irrelevant to the inquiry were being introduced unnecessarily, and apparently with an object."
3. Mr. Thompson did not say in his address "that the Commissioners had been grossly negligent, and that Mr. Eddy had shown an utter want of feeling and consideration for human life."
4. Mr. Thompson did not urge the jury in "impassioned language to add a rider to their verdict which would fix the blame of this accident on the shoulders of the Chief Commissioner in the first place, and of the Commissioners in the next place, but he did say that he hoped the jury would return such a special verdict as the evidence warranted."
4. Mr. Schey's conduct during Mr. Thompson's address was not unseemly, as he listened attentively, having his hand to his ear the whole of the time. Mr. Schey's conduct during the inquiry showed great earnestness, but in no way was his conduct unseemly.
5. It is not true that at the station the foreman of the jury "literally sat on him," meaning Mr. Schey.

JAMES KEHAHER.	R. W. WATERS.
W. MACKIE.	WALTER HALL.
ALFRED W. AVERY.	P. J. PARKER.
ALFRED JONES.	R. B. KENNA.
FREDK. LUMLEY.	WILLIAM PASCOE.

Further information being asked concerning the charges in the report that Mr. Schey unduly interfered with coupling operations, &c., &c., and that "the foreman of the jury literally sat on him" (Mr. Schey), Mr. A. G. Thompson wrote again, as follows :—

W. F. Schey, Esq., M.L.A., Sydney,—

Bathurst, 10 June, 1890.

Dear Sir,

In reply to yours of 6th instant, I have to state that I was present at the railway station with you when the couplings were being examined by the jury, and I assure you that you did not interfere with the jury, and the foreman of the jury did not complain of your conduct, or, to use the undignified words of the report, the foreman of the jury did not literally sit on you.

The Coroner being a public officer, I have not asked him to contradict what is said of him, but if he is asked for a report you may rest assured he will deny the statement.

I enclose two letters, one from the editor and general manager of the *National Advocate*, and one from the editor and senior proprietor of the *Free Press*, which will speak for themselves. I trust you will now be able to deal with the report, and that the House may see the importance of the matter.

Yours, &c.,

A. G. THOMPSON.

The following are the two certificates from the Bathurst newspapers referred to by Mr. Thompson in his letter :—

To A. G. Thompson, Esq., Bathurst,—

Bathurst, 10 June, 1890.

Dear Sir,

If it has been reported that Mr. Schey induced the various local papers to insert a report from the *Railway and Tramway Review*, during the inquest in connection with the recent railway accident at Bathurst, so far as this journal is concerned, the report is altogether without foundation. An extract from the report was published in the *Free Press*, but that was taken from the *Sydney Daily Telegraph*.

Yours, &c.,

C. & G. S. WHITE.

The *National Advocate*.

To A. G. Thompson, Esq., Bathurst,—

Bathurst, 10 June, 1890.

Dear Sir,

If it is alleged by anyone that Mr. Schey requested the *National Advocate* to publish anything in connection with the late Bathurst railway accident, I desire to give the statement an unqualified denial. No such request was made by Mr. Schey, either as regards reprint or any other matter.

I am, &c.,

FITZ-ALAN JAMES.

Further, in relation to the charges made in the report that "Mr. Schey freely distributed a newspaper, and got the Press to publish matter condemnatory of the Commissioners, &c.," Mr. Schey desires to add to the foregoing denials the fact that not only did he not attempt to "noble" the Press, as charged against him in the report, but that Messrs. Angus, Kirkcaldie, and Thow did most certainly attempt to "noble" such local press, as they invited the representatives of the whole of the Bathurst Press to dinner at Hurley's "Royal Hotel," where said officers not only treated said pressmen to an excellent dinner, but to champagne, cigars, &c., *ad libitum*.

To refute the statements made by the report as to the "disapproval and disgust of Guard Davis at the course taken by Mr. Schey and the Association solicitor," a copy of that portion of the report was submitted to Guard Davis, who wrote as follows :—

Penrith, 7 June, 1890.

In reference to the report laid before the meeting on the 7th June, 1890, which refers to my actions during the inquiry into the lamentable accident at Bathurst, I did say I was not aware what course of examination would be pursued, or what questions would be asked. I did not say I was annoyed with Mr. Schey instructing the solicitor as he had done.

I did not express my disgust or disapprobation of the course which was being pursued by my Council, nor did I say the instructions were wholly Mr. Schey's.

Nor did I hear Mr. Schey express the opinion that the jury would get the Commissioners into trouble. Nor do I think Mr. Schey desired any such verdict.

Yours respectfully,
E. B. DAVIS.

As to the opinions expressed by other employees, and the employees at large, which the report states are or were condemnatory of the course of action pursued by Mr. Schey and the solicitor who appeared for the Association, acting under Mr. Schey's instructions, the following are deemed amply sufficient to refute any such imputation:—

At a meeting of the Council held on Monday, May 12th, after hearing Mr. Schey's report on the matter, and the steps he had taken, the following resolution was unanimously carried:—"That the action of the General Secretary be approved and ratified."

At a Meeting of the Penrith Branch of the Association held on Saturday, 7th June, it was resolved that the Branch Secretary furnish Mr. Schey with a copy of the vote of thanks accorded to him by the members of the Penrith Branch, on the 3rd May, 1890. Mr. Henry Hoyle and Mr. Schey having paid the Branch an official visit, Mr. E. B. Davis, who is a member, and who was the guard of the train which was wrecked at Bathurst, spoke at some length, complimenting Mr. Schey for the action he had taken at the recent inquiry held at Bathurst *re* the accident to his train, and he asked, as a member of the Penrith Branch, that the members should express their approval of his action. It was then resolved "that a hearty vote of thanks be accorded to Mr. Schey from the members of the Penrith Branch for the action he took at the recent inquiry held at Bathurst?" This was carried unanimously, and with acclamation, there being present fifty to sixty members. The minutes of that meeting were read and confirmed at the meeting held on 7th June, when the following resolution was carried unanimously, "That the members of the Penrith Branch of the Association approve of Mr. W. F. Schey's action *re* the investigation recently held at Bathurst *re* the accident to Guard Davis' train, that they consider that Mr. Schey acted in accordance with the rules of the Association, and that he still retains the confidence and esteem of the members of the Penrith Branch of the Association as their General Secretary."

Mr. E. B. Davis, guard of the train that was *wrecked* at Bathurst, was present at the meeting. He stated that he did not say those things at Bathurst during the inquiry which the report to the Commissioners says he did. The Bathurst Branch met on Saturday, May the 3rd. The following resolution was carried unanimously by the twenty-six members present, "That this Branch approves of the course of action pursued by the Branch officers, and also the action of the General Secretary in reference to the recent accident at Bathurst."

On Saturday, 7th June, the Bathurst Branch met again, and the following resolution was passed by the unanimous vote of the twenty members present:—"That this meeting approves of the steps taken by the General Secretary at the inquiry in reference to the late accident at Bathurst, in so far as the employees were concerned, and we believe that his motive was to elicit the fullest amount of evidence necessary to show the cause of the accident."

At the regular monthly meeting of the Sydney Branch, held in the Wesleyan School-room, Regent-street, Chippendale, on Thursday, 3rd July, the following resolution, of which due notice had been given, was discussed:—

"That this meeting of the members of the Sydney Branch of the Railway and Tramway Service Association hereby expresses regret that the General Secretary, Mr. Wm. F. Schey, should have taken so prominent a part in condemnation of the management of the railways by the Commissioners, more especially with reference to the recent accident at Bathurst. Furthermore, this meeting is of opinion that the best interests of the Association would be served if Mr. Schey would endeavour to work more in sympathy with the Railway Commissioners."

"That the foregoing resolution, if passed, be forwarded on to the Council."

And being negatived, only a couple of hands being held up in favour of it, the standing orders were then suspended by resolution, so as to admit of the following resolution, which, having been discussed, was carried unanimously, amid great cheering, there being about 200 members present:—

"That this meeting of the Sydney Branch endorse the action of Mr. Wm. F. Schey, General Secretary, at the recent accident at Bathurst, and desires to place on record its confidence in his administration of the office of General Secretary."

In the meantime, the matter of the accident having been referred to in Parliament, and Mr. M'Millan, the Colonial Treasurer, having stated that Mr. Hoyle, the President of the Association, had expressed at a deputation to the Commissioners that he (Mr. Hoyle) entirely disapproved of Mr. Schey's course of action in reference to the inquest into the late Bathurst accident, and also that he (Mr. Schey) had gone to Bathurst without his (Mr. Hoyle's) knowledge and consent, the following refutation was drawn up and signed. A copy of the proceedings of such interview was afterwards furnished by Mr. M'Millan to Mr. Schey, thus putting beyond doubt as to what interview was referred to by Mr. M'Millan.

New South Wales Amalgamated Railway and Tramway Service Association,
Sydney, Friday, 6th June, 1890.

We, the undersigned members of this Association, having seen in the press that Mr. M'Millan stated in Parliament that, in an interview between the Railway Commissioners and Mr. Hoyle, he (Mr. Hoyle) stated that Mr. Schey went to Bathurst to attend inquest at that place concerning late railway accident at that place without his (Mr. Hoyle's) knowledge, and that he (Mr. Hoyle) entirely disapproved of Mr. Schey's actions and sayings in that case, beg to declare:—

1. That the interview in question took place at the special request of the Railway Commissioners, and was between the Railway Commissioners and a deputation of seven members of this Association.
2. That we whose names are affixed hereto were such seven members.
3. That we heard all conversation which took place.

4. That Mr. Hoyle did *not* say that Mr. Schey went to Bathurst without his knowledge or consent.
5. That, on the contrary, Mr. Hoyle distinctly said that Mr. Schey *did* consult him prior to starting for Bathurst.
6. That Mr. Hoyle *did not* express either disapproval or disgust at the actions or sayings of Mr. Schey at the Bathurst inquest.
7. The Commissioners having made several grave charges against Mr. Schey, Mr. Hoyle did say that "If Mr. Schey were guilty of the things charged against him by the Commissioners, he (Mr. Schey) had undoubtedly exceeded the wishes of the Association."
8. We cannot agree that such expression can be in any way construed into disapproval, as the charges are now being investigated by the officers of the Association, and, up to the present, Mr. Schey has not been found guilty of the charges made.
9. When such investigation is completed a full report will be communicated to the Railway Commissioners.

H. C. HOYLE, President.
 WILLIAM H. MANUELL, Vice-President.
 J. REID, Vice-President.
 T. PICKLES, General Treasurer.
 W. W. YOUNG, Delegate.
 GEORGE DEAN, Delegate.
 WM. F. SCHEY, General Secretary.

P.S.—As our deputation was not informed by our Commissioners, prior to being interviewed, for what purpose we were called, and as no direct questions were asked of our President, but simply a reply to our Chief Commissioner's charges, the whole substance of what transpired between the Commissioners and our President is contained in clause 7, which I distinctly understood; and, so far as any expressions of disgust, such never transpired. I affix my name to clauses 1, 2, 3, 4, 5, 6, and 7, which was the substance of what I understood at this meeting of our deputation with the Commissioners.—G. DEAN.

When the copy of the Report reached Mr. Hoyle from the Commissioners, he laid same before the Executive, who decided to get some evidence independent of that in Mr. Schey's possession, and which they had not seen. Mr. Hoyle accordingly wrote to Mr. A. G. Thompson, solicitor, Bathurst, as follows:—

The Bathurst Accident.

Dear Sir,

18 June.

I regret to say that serious complications have arisen in connection with the late lamentable railway accident at Bathurst, in which the Railway and Tramway Association is concerned.

The Railway Commissioners have made the following charges against Mr. Schey, for which, of course, they hold the Association responsible:—

- 1st. That Mr. Schey so instructed you that all the blame in connection with the accident should be fastened on to the Commissioners, and that, if possible, a verdict of manslaughter should be secured against them.
- 2nd. That Mr. Schey's conduct was most insolent towards the witnesses for the Department, so much that the foreman and another of the jury publicly protested.
- 3rd. That you yourself found it necessary to publicly protest against Mr. Schey's conduct towards yourself, and found it necessary to order Mr. Schey to allow you to conduct the case your own way, which protest was made within the hearing of the Court.
- 4th. That when the jury were viewing the coupling operations, Mr. Schey stood at the end of one of the trucks, and interfered in the most unjustifiable way with the coupling operations.
- 5th. That Mr. Schey's conduct was the subject of common talk in Bathurst after the inquiry.

The Railway Commissioners have laid the abovementioned charges before me in my official capacity as President of the Association, and they further infer that the Association has taken up an antagonistic position towards them.

You will observe that the charges are very serious as far as the Association is concerned; I will therefore be glad if you will give me your opinion unreservedly on the clauses herein named, as we are desirous of making the fullest inquiry into the whole matter, to enable the Council of the Association to come to an impartial decision on the matter.

Soliciting an early reply,

I remain, &c.,
 H. C. HOYLE,
 President.

A. G. Thompson, Esq., solicitor, Russell-street, Bathurst.

NOTE.—I will be glad if you would furnish me with the names and addresses of the gentlemen who were on the jury.

And eliciting the following reply:—

Bathurst, 21 June, 1890.

H. C. Hoyle, Esq., President N.S.W. Amalgamated Railway and Tramway Service Association, Sydney,—

Dear Sir,

I have to acknowledge the receipt of your letter of 18th instant, which reached me yesterday morning, and to which I would have replied by return post had time permitted.

I regret that the serious complications you refer to have arisen, and can only say that while the charges made against Mr. Schey remain uncontradicted, it is quite natural that the Railway Commissioners should regard the attitude of your Association, of which Mr. Schey is General Secretary, as antagonistic.

I feel assured that the charges made against Mr. Schey are based upon a report furnished a few days after the inquest at Bathurst by Messrs. Webb, solicitor for the Commissioners, Kirkcaldie, Thow, and Angus. A copy of that report was supplied to me forthwith, but not by Mr. Schey, nor with his knowledge. My astonishment at its contents was followed by indignation, when I found it bore the signatures of the three gentlemen last named, inasmuch as it was an invention, to put it mildly, from first to last, and entirely unsupported by facts. I at once obtained and have since forwarded to Mr. Schey overwhelming refutation of the allegations in the document.

I will endeavour to reply to the charges set forth in your letter *seriatim* :

1. I have carefully perused the instructions I took in writing from Mr. Schey, and there is not one word reflecting upon the Commissioners—and I assert that Mr. Schey did not at any time instruct me to fix the blame on these gentlemen nor upon any of them.
2. Mr. Schey's conduct was not insolent towards the witnesses, and the statement that the foreman and another of the jury publicly protested, is a wicked and deliberate falsehood.
3. I did not and had not the least occasion to complain of Mr. Schey's conduct towards me. I would not have submitted to conduct of the kind alleged against Mr. Schey for one instant.
4. Mr. Schey did not interfere unjustifiably with the coupling operations.
5. I cannot say whether Mr. Schey's conduct was common talk in Bathurst after the accident or not, but I can say this, that I never heard any persons expressing opinions adverse to Mr. Schey's conduct, although personal references of an uncomplimentary character have been freely made with regard to other persons concerned in the inquiry. I attach as a rule very little importance to "common talk."

I may add that, so far as Mr. Schey is concerned, I have no interest to serve. My services have been paid for in the ordinary way. Anything I have done since the verdict was given has been done as a matter of duty, and in no way as a matter of business. I find that Mr. Schey has been grossly maligned. All that he did was conscientiously performed as the trusted servant of the Association with the single object of eliciting the truth; having in view as an all pervading incentive the protection of railway employees, and as a natural consequence of such protection the safety of the travelling public.

I enclose the names and addresses of the jurors as requested. If I can give any further information or assistance I will be happy to do so.

Yours, &c.,

A. G. THOMPSON.

Mr. Hoyle then wrote to Messrs. Kelaher and Pascoe, two of the jurymen, and also to Guard Davis, making inquiry as to the truth of the statements made by the said report. He received the following replies :—

To H. C. Hoyle, Esq., Sydney,—

Bathurst, 27 June, 1890.

Dear Sir,

With reference to your note of the 24th instant, regarding Mr. Schey's conduct at the Bathurst railway inquiry, I have no hesitation in saying that the charges made against him, as quoted in your letter, are a tissue of misrepresentations, and have no foundation in fact. I have no acquaintance with Mr. Schey; in fact, have never spoken to him, consequently have no interest to serve. I believe the expression of opinion I have given will be borne out by nine-tenths of my brother jurymen.

I have, &c.,

JAMES KELAHER.

The executive of the Association met from time to time, thoroughly going into and investigating the whole matter. At a meeting held on 25th June, the investigation being finished, the following resolutions were passed :—

1. Resolved,—That after going very carefully into the whole matter, we find that the evidence produced by the President and General Secretary completely refuted the whole of the charges made against the General Secretary by the Railway Commissioners.
2. Resolved,—That this meeting recommends to the Council that the whole of the papers, &c., be printed for the information of the Railway Commissioners and all concerned.

At this meeting there were present, Messrs. Hoyle, Manuell, Reid, Pickles, Dean, and Schey. The whole of the papers were then taken to Bathurst, and submitted to Mr. Young, who, on 27th June, minuted his entire approval of all that had been done and proposed by the executive.

At a meeting of the Council, held on Monday, 30th June, the executive presented their report, when the Council passed the following resolutions unanimously :—

1. Resolved,—That recommendations of executive *re* printing be carried out, and that a special meeting of the Council be summoned to deal further with the matter.
2. Resolved,—That, in the opinion of this Council, the whole of the charges made against the General Secretary have been entirely disproved.

Mr. Schey then submitted the whole of the papers to Mr. R. W. Thompson, M.L.A., the Association solicitor, for his advice on the question of publication. Mr. Thompson advised as follows :—

Sydney, 2 July, 1890.

W. F. Schey, Esq., M.L.A., General Secretary, N.S.W.A.R. and T.S. Association,—

Dear Sir,

I have perused carefully all the papers submitted to me by you with respect to the Bathurst accident, with a view of advising your Council as to the best course to adopt to keep that body, your executive, and yourself not only free from blame but from any chance of legal proceedings, either of a civil or criminal character, by the publishing some of the documents placed before me for perusal.

Indisputably some of them are libellous, though I assume that they are absolutely true, and capable of proof up to the hilt, and by their publication, whoever assisted or assented in any way in their publication, would render himself liable to action, or prosecution, provided such publication were made before they became public property.

As the very fact of an action or prosecution being commenced must damage not only the man against whom it is brought but the Association generally and its officials, even though I might safely predict a successful issue for our side, I strongly advise that there be no publication until that step can be taken safely, or with comparative safety.

They can be published safely after they have come before the House on a motion for production, and with comparative safety if that motion is negatived, but the papers in the meantime have been in the hands of the Commissioners.

Your Council can however with safety, in my opinion, submit copies of all the documents attested to the Commissioners: Firstly, because they are *prima facie* privileged communications, coming from a body of men having an interest in the subject under discussion to the heads of the department to which those men belong; and, secondly, because to a great extent they are a reply to accusations already levelled against a responsible officer belonging to that body, and invited by the letter of the Commissioners.

I advise, therefore, that such copies be so submitted, and that immediately thereupon that a motion be tabled in the Assembly asking for their production, and that thereupon, whether they be produced or not, your Council take such action as they deem advisable.

I am, &c.,
R. W. THOMPSON.

The executive, having previously met and resolved to recommend to the Council compliance with Mr. Thompson's advice, a Council meeting was held on Monday, 7th July, when Mr. Thompson's advice having been read, it was resolved,—

“That the advice tendered by the Association solicitor, Mr. R. W. Thompson, be acted upon, and that action be continued on the lines therein indicated.”

A special Council meeting was then summoned for Monday, 14th July, to finally deal with the whole matter, when the executive submitted the following report:—

Bathurst Accident.

To the Council of the Railway and Tramway Service Association,—

Gentlemen,

The executive of our Association do ourselves the honor to report that having carefully gone through the papers containing the charges made against the General Secretary, Mr. Schey, by the Railway Commissioners, and the report made by certain officers of the department reflecting very seriously upon the conduct of the General Secretary of our Association in connection with the inquest on the late Mrs. Franklin, arising out of the abovementioned accident, and having also carefully perused the report of Mr. A. G. Thompson, the solicitor employed on behalf of the Association, and the documents accompanying that report and some other documents bearing upon the matter, we have come to the conclusions as follows:—

- 1st. That the General Secretary in this matter acted after consultation with the President, Mr. Hoyle.
- 2nd. That, in so doing, he in no way exceeded the authority given to him to act in similar circumstances.
- 3rd. That he acted in the interests of our Association and the members personally concerned in this particular matter.
- 4th. That the imputations and accusations made against the General Secretary, Mr. Schey, are not only not proved but in our opinion are absolutely disproved by the overwhelming evidence disclosed by the documents submitted to us, and without reference to Mr. Schey's version of the matter, in which we have now every reason to place the utmost reliance.

In conclusion, we beg to express our strong desire to bring about the most harmonious relations between the Railway Commissioners and the Association, as we are convinced that the best interests of the department can only be served by the existence of such relations.

We have, &c.,
H. C. HOYLE, President.
W. H. MANUELL, Vice-President.
J. REID, Vice-President.
T. PICKLES, General Treasurer.
G. DEAN, Delegate.
W. W. YOUNG, Delegate.

After fully considering the whole matter the following resolutions were carried unanimously, there being twenty members of the Council present:—

1. Resolved,—That this Council, having thoroughly investigated the whole matter, and made searching inquiry, hereby adopt the report of the executive on the matter of the charges made by the Railway Commissioners against the General Secretary, Mr. Schey, and thoroughly endorse all the findings of such executive.
2. Resolved,—That a copy of the whole of the papers be sent to the Railway Commissioners, with a covering letter from the General Secretary.
3. Resolved,—That the draft letter, as read by the General Secretary, be approved as the covering letter for the purposes of the foregoing resolution.

Accordingly, on the 16th July, a full copy of all these papers was transmitted to the Secretary for Railways for the Commissioners, covered by the annexed letter, which is the one approved by the above-quoted resolution of the Council of the Association:—

New South Wales Amalgamated Railway and Tramway Service Association,
Head Office, Corner Elizabeth and Bathurst streets, Sydney, 16 July, 1890.

Sir,

I do myself the honor, by direction of my Council, and in compliance with a promise already made in respect to the matters arising out of the late lamentable accident at Bathurst, to submit, for the consideration of the Railway Commissioners, the following replies to the two questions submitted by the Commissioners to the deputation of this Association on 20th May last, and subsequently submitted in writing by yourself on behalf of the Commissioners:—

1. That, in the course which was taken by myself, as the General Secretary of the Association, in proceeding to Bathurst, and in instructing Mr. A. G. Thompson to act on behalf of the Association, I so acted after consultation with the President, Mr. Hoyle, and with his full assent, and that our action in the matter has been ratified and approved by the Council.

I am desired to add, very respectfully, that the Council trusts that a perusal of the correspondence and documents which accompany this letter will not only justify them, but myself, in the course which was so taken, and thus ratified, and exonerate me from the imputation or accusation of having gone out of my way to attack or annoy the Railway Commissioners.

2. As to whether the Association or its council would adopt a similar course under similar circumstances is a question which the Council is not prepared to answer directly; but I am requested to say, with very great respect, and with an earnest desire on the part of the Council, as representing the Association, and as charged with its interests, to be in absolute accord with the Commissioners, that they trust that, as in the present matter, they will succeed in convincing the Commissioners that no wrong has been done to those gentlemen in the exercise of the high, onerous, and responsible duties cast upon them, and no offence intended to be offered to them, either officially or personally, in all future questions of a similar character arising, and in which the Council deems it right to act, or take part, that their action will be such as will be in no way wrongful or offensive or open to adverse criticism; and they trust that in any case, if a misconception arise, or any apparent ground of complaint is given to the Commissioners, they may be at once fully and fairly apprised thereof.

With regard to the documents above mentioned, and which are the outcome of the report of Messrs. Webb, Angus, Kirkcaldie, and Thow, I am desired to request that the Commissioners will peruse them as not only a justification of the action actually taken, but as a denial of all the alleged offensive conduct on my part, as to which the Commissioners most justifiably took grave exception, and as to which I am permitted to add I have given a most emphatic denial ever since I heard of it.

It has been noted by the Council that the copy of the report as furnished by you is requested to be treated as private, but I am desired to say that a copy was in the possession of the Council before the office copy was received, and was in course of being dealt with.

The Council, in conclusion, desire me to say that they trust that this matter, which has given them both personally, as officers under the Commissioners, and officially, as members of the Council and Association, very considerable trouble and anxiety, is now satisfactorily dealt with as far as they are concerned.

I have, &c.,

WM. F. SCHEY,
General Secretary.

H. M'Lachlan, Esq., Secretary for Railways.

We, the undersigned, hereby certify that we have seen and read the original documents, of which the above are copies, and we further certify that these papers are true copies of the originals.

E. CHURCH,

Type-writers, 3, Barristers' Court, Elizabeth-street.

1890.

LEGISLATIVE ASSEMBLY,
NEW SOUTH WALES.

RAILWAYS.

(FURTHER CORRESPONDENCE RESPECTING THE RAILWAY ACCIDENT NEAR BATHURST.)

Ordered by the Legislative Assembly to be printed, 27 August, 1890.

The Secretary for Railways to The Under Secretary for Finance and Trade.

Sir,

Government Railways of New South Wales,

Secretary's Office, Sydney, 27 August, 1890.

With reference to my letter of the 21st instant, forwarding a paper relative to the Bathurst accident, with a request that it might be placed before the Honorable the Minister, with a view to its being laid upon the Table of the Legislative Assembly, and printed with the papers on the same subject placed upon the Table by Mr. Schey, M.P., on the 20th instant, I am directed by the Railway Commissioners to inform you that the paper referred to contained a complete refutation of the statements made by Mr. Schey, Secretary of the Railway and Tramway Association, being a *verbatim* report of the Chief Commissioner's remarks to a deputation consisting of the President, Vice-President, and other members of the Association and the Secretary; and that while making the remarks it was impossible to avoid allusions to Mr. Schey's utterances in Parliament in his capacity as one of the Members for Redfern.

It having been ruled that the paper could not be laid on the Table of the House, the Commissioners deem it proper to state in broad terms that the document presented by the Association to them, and which has been laid upon the Table, is in many respects untrue and misleading, and was evidently prepared for the purpose of creating an adverse feeling towards the Railway Commissioners; and further, the paper on which the whole of that document is based was signed by many of the jurors under a misapprehension as to the real issues, and is completely refuted by the statements of the Coroner, the foreman of the Jury, by some members of the Jury, by the officers of the Court, and other residents of Bathurst, who at the same time most distinctly confirm the report of the officers of the Department.

In conclusion, I am to ask, in order to prevent the whole matter being misunderstood, that the Minister will be pleased to lay this letter upon the Table of the House, with a request that it may be printed with the papers relating to the Bathurst accident which have already been placed before Parliament.

I have, &c.,

H. M'LACHLAN,
Secretary.

1890.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(PAPERS, &c., IN CONNECTION WITH ACCIDENT AT COOLABAH.)

Ordered by the Legislative Assembly to be printed, 5 August, 1890

Minute by The Secretary for Railways.
Accident.

I HAVE the honor, by direction of the Railway Commissioners, to forward herewith, for the information of the Honorable the Minister for Railways, copy of the Report of the Board appointed to inquire into the accident to the down Western mail on the 28th ultimo.

H. M'LACHLAN,

The Under Secretary, Finance and Trade.

Secretary, 17/6/90.

Seen.—W.M.C.M., 18/6/90.

Accident to Down Western Mixed Mail at 431 miles 33 chains, between Coolabah and Glenariff, on 28th May, 1890.

Gentlemen,

Sydney, 3 June, 1890.

In accordance with your directions, we have held an inquiry into the cause of the accident which occurred to the down Western mail at 431 miles 33 chains on Wednesday last, the 28th ultimo, and have now the honor to submit our report thereon.

The train, as is well known, runs as a "mixed" train between Nyngan and Bourke, and on the date named left Coolabah at 2.30 p.m., made up as follows:—

Engine No. 120, weighing 52 tons, 1 tank truck, 6 loaded D trucks, 2 loaded L trucks, 2 loaded G trucks, 5 empty cattle waggons, 1 second class bogie carriage, 1 first class bogie carriage, 1 bogie brake-van; weighing approximately 226 tons, exclusive of the engine—the load for this class of engine being 245 tons when working the mixed mail trains on that part of the line.

The first intimation of anything having gone wrong was at 431 miles 30 chains, where there are distinct indications of a vehicle having left the rails, and immediately afterwards the whole of the following vehicles except the brake-van became derailed as well.

The speed at the time of the accident is estimated to have been between 25 and 30 miles an hour, 29 miles an hour being the time-table speed.

Four passengers, who were travelling in the second class carriage, sustained injuries, but, with the exception that one young girl had her leg broken, all were of an unimportant character.

Considerable damage was done to the rolling stock, the cost of replacing and repairing which is estimated at £800 approximately.

In the permanent way 7 rails were bent, and 25 sleepers, 8 fish-plates, 566 fish-bolts, and 570 screws and spikes broken, the cost of which is £40 approximately.

Evidence.

Evidence.

Thomas Mannix, ganger, states:—I have been nearly six years in the service, and have been ganger for twelve months; I have been in charge of the length from 427 miles to 433 miles 50 chains since the 1st September, 1889; I was on duty yesterday, the 23th May, and while at work with my men at 431 miles 67 chains, shortly before 3 p.m., I saw the down mail train approaching and stepped back to let it pass, and the moment I did so I saw a lot of gravel flying from the wheels of the vehicles; I immediately saw that something had happened, and held up both my hands and shouted to the driver to stop; the engine was passing me at that moment; I did not see the driver, as I was on the fireman's side; I could see the fireman, and he was in the act of firing up; I do not think that either the driver or the fireman saw me, at all events they gave no indication of having done so; I cannot say whether the engine was steaming at the time, but I should say that the train was travelling at a speed of from 27 to 32 miles an hour when the engine passed me; I saw that the train had parted about 30 chains before the engine passed me; the previous evening I packed up three joints at 431 miles 33 or 34 chains, but I am satisfied that I left the road in perfect order; that portion of my length has never given me any trouble.

THOMAS MANNIX.

Michael Slattery, fettler, states:—I have been six years in the service, and have been in the length from 427 miles to 433 miles 50 chains for the last fifteen months; I was on duty on the 23th May, and was at work with my mates at 431 miles 76 chains, and between 2:30 and 3 p.m. I saw the down mail train approaching; I stepped aside to let it pass, and, just as the engine was passing me, I saw fish plates falling from the rails and gravel flying from under the vehicles; seeing that there were only a few trucks attached to the engine, and no brake-van, we all held up our hands to warn the driver or fireman; I was on the driver's side, and saw him, but do not think he saw me; I was excited at what I saw, and cannot say whether the engine was steaming at the time; immediately afterwards the engine and trucks began to slacken speed and pulled up within a distance of 17 to 20 chains; subsequently, I saw a number of trucks and passenger carriages off the rails, but cannot give any idea of the cause of derailment; I was at work all day yesterday, prior to the accident, about 431 miles 76 chains; two or three days previously we packed some sleepers somewhere about the spot where the accident occurred, but did not perform any other work of importance at that particular place; I consider that the road was in very good order where the derailments took place; when the engine passed me, I could not tell at what speed it was travelling.

MICHAEL SLATTERY.

John Southall, fettler, states:—I have been upwards of four years in the service, and for the last two years in the length from 427 miles to 433 miles 50 chains; I was at work with my mates on the 28th May, within 3 or 4 chains on the Sydney side of the 432nd mile-post; between 2:30 and 3 p.m. I saw the down mail train approaching; it was then about 15 chains from where I was at work; I stepped aside to let the train pass, and first heard a peculiar rumbling noise, and then saw a truck off the rails; at that particular moment I could not see that the train had parted, but I immediately held up my hands and shouted to the fireman; he was then firing up the engine, and did not see me; the driver did not see me either, so far as I know; to the best of my belief the train was then travelling at a speed of about 30 miles an hour; I cannot say whether or not the engine was steaming; subsequently I saw that the train had parted, and that a number of vehicles had got off the rails; I have not done any work for some days to the permanent way in the immediate vicinity of where the trucks got off the rails; I consider that the road was in very fair order; I may add that I was standing on the fireman's side when the engine passed me; the ganger and Slattery were on the same side; Acourt was standing on the driver's side.

JOHN SOUTHALL.

Frank Acourt, fettler, states:—I have been seven years in the service, and for the last eighteen months on the length from 427 miles to 433 miles 50 chains; I was at work on the 23th May at about 431 miles 73 chains with my mates, and between 2:30 and 3 p.m. I saw the down mail train approaching, it was then about 15 chains from the place where I was at work; I thought I saw some lumps of coal falling from the trucks, and I stepped further back from the line than usual so that I might not be struck; I was on the driver's side; I could see gravel flying from under the vehicles, and I at once drew the driver's attention to it as the engine passed me, he saw me do so, and at once looked back, and to the best of my knowledge stopped the train; I cannot say whether or not the engine was steaming at the time, but I should say that it was travelling at a speed of 25 miles an hour or perhaps a little over; I do not think the driver knew any trucks were off the rails until I signalled to him; at that particular moment I was not aware that the train had parted, but immediately afterwards I saw that there was not a brake-van behind the trucks, and I looked back and saw the remainder of the train some distance off; the ganger and I went back to the rear portion of the train and saw that it was wrecked; the evening before the accident my mates and I packed some sleepers somewhere about the spot where the trucks got off the rails, but I consider that the road was left in perfect order; I could not see the engine-brake handles from where I stood.

FRANK ACOURT.

Richard Joseph Cosgrove, states:—I have been twelve years in the service, and for the last eight years have held the position of guard; I was in charge of the mail train from Girilambone to Bourke on the 23th May; when we left Coolabah at 2:30 p.m. my train was made up as follows—Engine and tender, water tank, six D trucks, two L's, two G's, all loaded, and five cattle trucks empty; when we reached somewhere about 431½ miles I noticed the luggage tumbling about and immediately afterwards I was knocked down myself; I attempted to get up and was knocked down again; I got up again and looked out and saw the passengers leaving the carriages; I at once got out myself and for the first time saw that an accident had occurred, and that a number of trucks and the two passenger carriages were off the rails, the brake-van kept the rails; I saw that the trucks and the second class carriage were very much damaged; by that time they were at a standstill, and when I looked forward I saw the engine about a hundred yards

in

in front steaming ahead, with several trucks behind it; when I was first knocked down in the brake-van I should say that we were travelling at from 25 to 30 miles an hour; I did not hear the driver sound his whistle for the brakes; I did not see either the driver or fireman looking back; no jerking was felt by me during the journey.

R. J. COSGROVE.

William Walker, states:—I have been in the service between seven and eight years, and with the exception of four or five months, have been driving all that time; previously I had had three years' experience as driver on the North British Railway in Scotland; I have been principally employed driving live stock and goods trains but have occasionally driven the mixed mail train between Nyngan and Bourke; I ran that train on the 28th May; left Coolabah at about 2.35 p.m. with four vehicles less than my full load; the first thing I noticed after leaving Coolabah was some fettlers at work on the line close to the level crossing at mileage 431, 77 chains; they signalled to me look back and I did so and noticed that the third waggon from the engine was off the rails, and that the train had parted, the rear portion of it being about $\frac{3}{4}$ of a mile behind the place I stopped at; I walked back and saw that the rear portion was wrecked; I should say that I was travelling at a speed of 30 miles an hour when we passed the spot where the vehicles left the rails; I had been running without steam for some distance and am of opinion that I put on steam again somewhere about the place where the derailments took place; I have no difficulty in graduating the application of steam on my engine; I did not feel any jerk when I applied the steam; my fireman began to put on some fire as I opened the regulator; the engine I had (No. 120) is in very good order—one of the best in the district; I had the air-brake on the tender and the donkey was working well, the air gauge showed a pressure of about 50 lb.; I cannot account for so many vehicles having become detached from my train without my knowing it; I had looked back several times while running down the bank and saw all my train intact, but I did not look back about the spot where the accident occurred; I felt the engine give a lurch somewhere about the spot where the accident occurred, and I remarked to my fireman that that was a soft part and it was time it was attended to but I took no further notice of it at the time; it did not occur to me after the lurch to look back so see whether all the train was following; when I got to Byrock, about 6 p.m., I asked one of the drivers (Perkins is his name) whether he knew of any bad spots on the line between there and Coolabah, and he replied that there was a bad part at the bottom of the gradient just somewhere about where the accident occurred; I cannot account in any way for the accident.

WM. WALKER,
Driver.

George Edis states:—I have been about six years in the service, and have been acting temporarily as fireman, on and off, for the last four months; I was firing on the mixed mail train from Nyngan to Bourke on the 28th May—engine No. 120; I cannot say at what time we left Coolabah, nor what load we had on; I was employed firing several times after leaving Coolabah until the accident occurred; I cannot say how often I looked back after leaving that station, perhaps twice; I was not aware of anything being wrong until the driver called to me to stop just as we were passing the level-crossing gates; I was putting some fire on at the time, and I at once threw down the shovel and applied the engine-brake as hard as I could, while the driver applied the air-brake on the tender; prior to that I should say that we had been travelling at the rate of 25 miles an hour at the least; we had been running without steam for some time previously, but it had been reapplied before the driver called to me to apply the brakes; when I looked back I saw that a truck was off the rails close to the engine, and the rear portion of the train in the distance, but I thought there was nothing wrong further than the parting of the couplings; I remained in charge of the engine while the driver went back to the rear portion, and when he returned he told me it was wrecked; I did not notice where the driver put on steam again; I did not feel any jerk when he did so; just before I applied the brakes the driver remarked that that was a bad bit of road; I felt the tender give a lurch just then, but it was not of such a character as to cause me to look back to the train; I cannot account for the greater portion of the train becoming detached and being left behind without my knowing it, nor do I know what caused the accident; I should say that we travelled very nearly half a mile after the driver made the remark about the bad spot in the road until he told me to put the brakes on.

GEORGE EDIS.

John Bentley Hyslop, carriage and waggon examiner at Nyngan, for eighteen months, states:—I examined the down mixed mail yesterday, the 28th inst., the trains consisted of—4 D trucks of coal for Coolabah, 1 D truck of goods for Coolabah, 2 trucks of goods, 4 empty cattle waggons, 1 L truck of coal for Byrock, 1 G truck of coal for Byrock, and other trucks; I carefully examined every waggon with respect to wheels, axles, drawgear, and springs, everything was in first-class order as far as could be seen; I have no reason to think that the L trucks with spiral springs are not as safe as other trucks with the elliptical springs.

JOHN B. HYSLOP.

CONCLUSION.

We are of opinion that the accident was not caused by any defect in the Permanent Way (which appeared to be in perfect order), but that it was due to some sudden failure of one of the waggons on the train. It is impossible, however, to say which waggon with any degree of certainty, owing to the extent of the wreckage, but from our inspection of the latter we are inclined to think that L truck, No. 25, was the first to leave the rails.

It is shown, in evidence, that the driver applied steam to his engine somewhere about the spot where the accident occurred, and it was most probably a jerk occasioned thereby which, combined with the oscillation of the L truck, caused that truck

truck to become derailed; that this resulted in the breakage of the coupling connection between L 25 and cattle waggon No. 198, which was immediately in front of it, and that then L 25 was pushed aside by the waggons which followed, and which were themselves derailed and upset.

It was also, we think, the jerk occasioned by the derailed trucks and the breakage of the coupling referred to, combined with a sudden increase of speed consequent upon the sudden lightening of the load on engine draw-hook that caused L 29 to leave the rails.

We cannot understand how it was that the driver and fireman failed to notice that they had left about two-thirds of their load behind them. In his evidence the driver states he felt a lurch when passing over the spot where a vehicle first mounted the rail, which he attributed to a bad place in the road, and that neither he nor the fireman thought it necessary to look back. This lurch, we believe, was in reality the jerk consequent upon the parting of the train.

Moreover the driver steamed on with a derailed truck, L 29, until signalled to stop by the permanent way men who were at work upon the line, nearly $\frac{3}{4}$ of a mile beyond where the accident occurred.

DAVID KIRKCALDIE.
C. H. STANGER.
J. B. SUTTOR.

The Commissioners for Railways.

Minute by The Secretary for Railways.

I HAVE the honor, by desire of the Commissioners, to report, for the information of the Honorable the Minister, that the down mixed mail-train from Nyngan to Bourke became derailed at 2.50 p.m. yesterday at 431 miles 35 chains.

The following passengers have been injured:—Miss Low, fracture of left leg between knee and ankle, right leg slightly bruised; Mrs. Low, injuries to left ankle; Mrs. Miller, slight injuries to lower extremities.

One first-class bogie carriage, one second-class bogie carriage, and eight trucks have been very much damaged. The cause of the derailment cannot yet be stated. Medical assistance from Bourke and Dubbo was obtained as speedily as possible and the injured persons attended to.

The Chief Traffic Manager, Mr. Kirkcaldie, Dr. Woodward, Railway Medical Officer, and Mr. Stanger, Inspector, Locomotive Department, left by mail-train last night for the scene of the accident. About half-a-mile of line is damaged, and passengers from the up mail-train from Bourke to-day will, in all probability, have to be transhipped. A large gang of men is already on the spot putting the road in order, and it will be cleared, it is expected, by to-night. An inquiry will be made in the matter, and further information forwarded.

The Under Secretary for Finance and Trade.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(REPORT OF BOARD OF INQUIRY ON ACCIDENT AT FARLEY STATION.)

Ordered by the Legislative Assembly to be printed 26 June, 1890.

Accident to No. 25 Down and No. 10 Up Northern Mail Trains at Farley Station,
13th May, 1890.

Gentlemen,

We have the honor to report that in accordance with your instructions we have held an inquiry into the cause of the above accident.

These trains should, according to time-table, have crossed at Lochinvar, but in consequence of the down mail being 30 minutes late on the night in question and the up mail running to time, it was determined to bring the up mail on to Farley and cross there.

The trains were made up as follows:—

Down Mail.

Engine No. 418 (class C), weighing 59 tons, 1 horse-box, 1 carriage truck, 1 second bogie carriage, 1 sleeping car, 1 first class bogie carriage, 1 6-wheeled composite carriage, 1 mail-van, and 1 brake-van; weighing in all $153\frac{1}{4}$ tons, exclusive of passengers, luggage, mails, &c. The whole of the train, with the exception of two vehicles, was fitted with the Westinghouse Automatic Brake. The engine was fitted with hand and the tender with air brakes. The driver had 19 tons of hand-brake and $58\frac{1}{4}$ tons of air-brake power at command, total $77\frac{1}{2}$ tons brake power.

Up Mail.

Engine No. 181 (class C), weighing 59 tons, 2 composite carriages, 1 sleeping car, 1 mail-van, 1 first class bogie carriage, and 1 brake-van; weighing in all 143 tons, exclusive of passengers, luggage, mails, &c.

The up mail was the first to reach Farley Station at 12.9 a.m., and according to the evidence it had not been many seconds at the platform when the driver hearing and seeing the down mail approaching at a speed which caused him to think that it could not be pulled up in time to avert the accident, sounded his whistle for the brakes to warn the down train, and commenced to back his own train, but had not gone more than 4 or 5 yards when his engine was struck by the engine of the down mail at a speed estimated at from 10 to 12 miles per hour. The point at which the two trains met is about 21 yards inside the home signal.

A young man, named Bernard M'Fadyen, who was travelling in the horse-box next the engine, was killed, together with the horse he was in charge of, and the horse-box itself and the carriage truck next to it were totally demolished. There were also nine passengers more or less injured.

The injury to the engines is not great. The approximate amount of damage to rolling stock and permanent way is £300. Evidence.

Evidence.

To Mr. Kirkcaldie:—David E. Palmer, night officer, Farley, states: I have been in the service about seven years, and have held my present position nearly four years eight months; my hours are 6 p.m. to 6 a.m., and I came on duty at the usual time on Monday, 12th May; when I took charge from the station-master the whole of the signals were at danger; I could see the whole of them distinctly, except the up distant signal, the repeater of which showed that it was at danger too; from the time I came on duty to the arrival of the up mail two down trains and one up train had passed my station, the first being No. 19 passenger, which passed at 6.10 p.m.; I lowered the signals for that train to come into the station, and placed them at danger the moment it passed them; the next train was the No. 29 down goods, at 8.55 p.m.; in that case too I lowered the signals, and am perfectly sure that I placed them at danger the moment the train passed them; the signals stood at danger from 8.55 p.m. until the wreck of the damaged train had been cleared away the following morning; I was in and out the office all the evening of 12th instant, and repeatedly saw the green back lights of the down distant and home and up-home signals; about 10.30 p.m. I walked down the line in the direction of the up distant signal until I could see the back green light, and then returned to the station; the last time I saw the green back light of the down distant signal was at 12.8 a.m.; I am aware of the importance of this statement, and am perfectly sure that I saw the green back light at that particular time; the reason I remember it so well is because the up mail was coming into the station, and I knew that the down mail had left West Maitland station at 12.5 a.m.; there was a fog at the time, but not dense; not sufficiently dense to interrupt my view of the down distant signal; knowing that the up mail was coming in, and down mail had left West Maitland station, I kept up distant signal at danger for the purpose of ensuring the driver of up mail coming in steadily, which he did, not overshooting the platform; when up mail arrived at platform I was opposite the levers, and as soon as the train had passed up home signal I placed it at danger; I received line clear report from the driver, and went along the train calling out name of "Farley," handed the mail guard post-bags, and gave the cash to train guard; I then ran to the points to hold them while up mail backed into the loop; the points are 107 yards from the platform; assistant guard Went was on the platform; I told him to bring train back into the siding, which he did; the train had started to come back, but none of the vehicles had entered the points prior to collision taking place; the force of the concussion had the effect of driving the up mail back into siding about 50 yards; Went had a lamp in his hand when I saw him on the platform, showing a white light; of this I am positive; my lamp also showed a white light; I did not give the driver of up mail any signal with my lamp; when collision took place I remained holding on to the points until Mr. Brett called me into the office, where I stayed for about quarter of an hour, sending telegrams to West Maitland for doctors, and to the District Superintendent, Mr. Robinson, as instructed by Mr. Inspector Brett; Mr. Brett told me then to go down to the engine, get the West Maitland staff, and send it back to that station; I went down to the engine, and heard Guard W. Downie tell Mr. Brett he had sent a man back to West Maitland with the staff; after that I did not leave the office more than twice until about daylight; the engine of up mail stood well within the down home signal when it stopped; I spoke to Guard Downie about the signals; he asked me if I had the down distant signal at danger, and I replied yes; the station-master, Mr. Crothers, was in and out of the office all the morning; I had no conversation with the station-master about the signals, but about messages only; I do not remember seeing Assistant-guard George Irwin that morning; I did not ask anyone any questions about the signals, and am quite sure there was no fog sufficient to intercept my view of the green back light of the down distant signal that night; I am equally sure there were no green lights at the station; Mr. Brett took charge of the place after the accident; the up-mail arrived at Farley at 12.9 a.m.; it remained not more than a quarter of a minute before starting to back; it was hardly moving before down train struck it.

To Mr. Thow: The distance (50 yards) the up-mail was driven into the siding was attributable to the combined movement, i.e., the concussion and backing of train; in admitting the up-mail into platform I acted in accordance with rule 74.

DAVID E. PALMER, 24/5/90.

To Mr. Kirkcaldie:—George Ernest Crothers, station-master, Farley, states: I have been at Farley five years in the capacity of station-master, and in the service altogether seven years; my usual hours of duty are 6 a.m. to 6 p.m.; I left the station for a short time at 6 p.m. on 12th May, leaving it in charge of Night-officer Palmer; when I left the signals were all at danger and the lights all in; I returned to the station at a little after 7 p.m., to proceed to Maitland in a goods train; I noticed the signals down home and down distant were both standing at danger, showing clear red lights front and green at the back; I have not the slightest doubt about this; I returned from West Maitland to Farley by mail train, which left West Maitland at 12.5 a.m. on the morning of the 13th instant; I travelled in a second-class carriage, the fifth vehicle from the engine, I think; when leaving West Maitland I did not notice whether it was foggy or not, but if it had been dense I should have noticed it; I noticed by my own watch that down mail left West Maitland at 12.5 a.m.; about Maitland Colliery I heard the driver whistle to challenge the down distant signal; I looked out of carriage when train was about 10 yards Maitland side of down distant signal, which was then showing a red light; I realize the importance of this statement, and am perfectly sure the light was a clear red one; there was no compound light; I did not look back to see what the signal showed after train passed it; I have no idea what the rate of speed was passing the down distant signal; I heard no whistling again until about a second before the collision; just prior to this I had seen the down home signal from a distance of about 150 yards, and it showed a red light also; I am unable to say at what rate the train was going then; immediately after the second whistle I felt a slight bump, as though the train had been pulled up suddenly; after train had come to a stand I got out of carriage, which was over the bridge, and proceeded as quickly as possible to the wreck; it was slightly foggy then; I could not call it a heavy fog; I did not look back to the down distant signal; I noticed nothing resting on the distant signal wire, but something between the down home signal and the platform—some of the wreckage resting on the wires; I did not look at my watch at the time of the accident, but consider it was between 12.9 and 12.10 a.m.; I met Mr. Brett at the wreck; he asked me where I had come from, to which I replied, "By No. 25 down"; he then asked me how the signals were, or if I had noticed them, meaning both down distant and home; I replied, "They are right—both at danger"; no further conversation ensued; I then went to the station office, and sent the necessary telegrams

telegrams to Mr. Robinson, District Superintendent, for accident van, and to Maitland for medical assistance; I spoke to night-officer Palmer, telling him to remain in the office and attend to telegrams; nothing took place about signals.

To Mr. Thow: I am quite satisfied, in my own mind, that the signals were right.

To Mr. Kirkcaldie: I had a few words with assistant-guard George Irwin about half an hour after the accident; the first time I had spoken to him to my knowledge; he was on the Maitland end of platform; he asked me if I could get a sofa for an injured man to lie on; he said nothing about having been down near the down distant signal.

To Mr. Thow: After the accident I spoke to Farnham, driver of down mail, advising him to sit down, as he was limping about the platform; I asked him if he was badly hurt; he replied he did not think so; there was nothing in his manner to indicate that he was not sober; he appeared perfectly sober; I do not recollect having any conversation with the fireman; I did not know when I left West Maitland, that the mail trains were to cross at Farley; I am sure that I saw the down home signal from a distance of about 150 yards before reaching it; the light was clear and bright; the oil used is kerosene, which gives a brighter light than colza.

To Mr. Kirkcaldie: I am quite sure that I did not see any lights, hand-lamp, or any other about the station; I merely looked at the signals; when speaking to Farnham, he said nothing about the down distant signal showing a white light, nor did I say anything to him about having passed a danger signal.

G. E. CROTHERS.

To Mr. Kirkcaldie:—William Downie, guard of the down mail on 12th May, states: I have been in the service over twenty years, and have been running as guard on passenger trains for three or four years; on the 12th May, mail train left Newcastle 10.57 p.m., arriving at West Maitland at 11.58 p.m.; assistant guard was Wm. T. Evans; I left West Maitland at 12.5 a.m. on 13th instant, and train travelled at the usual speed; at West Maitland I noticed there was a slight fog, not dense enough to obscure signals to any great extent; between West Maitland and Farley I was very busy arranging parcels, luggage, and bills; after leaving West Maitland I did not hear any whistle until near the down distant signal, when driver challenged it; I did not look out at the time, being so busy; I felt no check on the train at the time, neither did I look at the distant signal; but soon after the whistle, knowing that we could not be far from Farley, I looked out of the small side window of brake-van and noticed the home signal at danger; train was then from 100 to 150 yards away from home signal; there was no perceptible difference in the train's speed than just the ordinary running; I saw from the distance stated the home signal, showing a bright red light; it was foggy then, but to no great extent; I saw the signal clearly when I looked for it; at that time I saw no other lights about the platform, *i.e.*, before the accident; when seeing the home signal at danger I did not keep on looking at it, but turned my attention to other duties, having confidence in the driver keeping train well under control; I had every confidence in the driver; I have never had any occasion when going into a station to apply the air-brake from the brake-van; the manipulation of that brake being always left to the driver; when the two trains met I heard and felt the bump; I am satisfied that when this took place the engine of down mail had passed the home signal about 21 yards, as stepped by me; I know that something serious had happened, and made all haste to attend to the requirements of passengers; Inspector Brett was the first employee I saw after the accident; I cannot be sure, but I think he spoke to me about the signals; he said shortly afterwards that they were at danger; he then told me to send back the staff to West Maitland, which was done; I took steps to protect the train, as required by rule 388; I do not remember having any conversation with station-master nor driver about the state of the signals; the night officer (Palmer) distinctly told me the signals stood at danger; about 9 minutes after the accident I saw assistant-guard George Irwin, who was rendering assistance generally; I remarked to him "This is a bad job"; he said nothing about who was to blame; so far as I can remember he was at the scene for some time; about 9 minutes from time of accident Irwin approached me from Farley side; he said nothing to me about having been down or going down to see the down distant signal; he was at wreck for some time afterwards; besides sending Evans to West Maitland with the staff about 20 minutes after the accident; I also sent assistant-guard John H. Went in the direction of Maitland with a red hand lamp; but seeing Went shortly afterwards I asked him had he carried out my instructions to protect train on the West Maitland side; he replied he had got Irwin to do the duty for him; I told Went that I did not think it was right, and sent him back again to make sure that all protection was afforded; I did not look at my watch at the time of the accident.

To Mr. Thow: As guard of a passenger train I know that it is my duty to keep an eye to signals, and be acquainted with the rules relating thereto; I am aware of the provisions of rule 69; I think that guards are called upon to act under the rules 69, 306, 461; I did not carry out rule 380 on approaching Farley; I have heard 381 rule read, which refers to brake or brakes, and particularly the last clause of it, which requires guards to apply their brakes whether they receive signals from driver or not when they see danger signal ahead, or any obstruction; I understood at West Maitland from the night-officer that the mail trains would cross at Farley on the morning of 13th; he having told me so; the night-officer at West Maitland told me the driver had the staff, and the mail trains would cross at Farley; knowing that the trains would cross at Farley I did not look out for the down distant signal at Farley because of other duties requiring my full attention; I could have looked out to see the distant signal, in accordance with rule 380, had I not been so terribly engaged; there was an air-tap in the brake-van; I did not apply it when I saw the home signal at danger, not having received any signal whistles from the driver, and naturally thinking the road was clear; I know the last clause of rule 381, but did not apply the brakes, not thinking the application of the brake necessary, no warning whistles having been given by the driver; I had every confidence in my driver, and considering the distance from station, when home signal was noticed at danger by me; I thought the driver was able to pull up clear of any obstruction; I noticed the danger signal at 100 or 150 yards, but did not continue watching it, as I turned round to attend to other duties required of me in the brake-van; I consider the air-tap is put in van for public safety in cases of emergency; I would apply this brake under the following circumstances; seeing any danger ahead; a danger ahead I would consider to be passengers getting out of train in motion, or any circumstances of that kind calling for instant action; fixed signals are used to indicate "danger," or "all clear"; when a home signal stands at danger, I consider that it is a sign of danger ahead, and a train is not supposed to pass it; when seeing danger-signal ahead I did not act on rule 381, as I consider the

the driver had ample time to pull up, were there any danger ahead, and I gave my attention to the other duties, the extent of which can be supported by other guards (mail), not knowing but that my driver had the clear road; I did not neglect to carry out rule 381 on this occasion under the circumstances; I did nothing to carry out rule 381, with regard to putting on the brake or brakes, *i.e.*, hand or Westinghouse as the driver applies the latter from the engine independently of the guard; in the matter of protecting train after the accident, I put down fog signals myself, and sent Assistant-Guard John H. Went to rear of train with hand signal lamp showing red; after Went's unexpected return, I cannot say whether he still had this lamp, but fancy not, and think he had given it to Irwin; about twenty minutes after the accident, Evans went to West Maitland, with the staff, and Went was sent with red hand signal, about ten minutes afterwards; about three to five minutes after the accident, I looked back and saw a green back light to the down distant signal; I am quite sure of this; I never told Assistant-Guard Irwin anything about the signals, and am positive that I did not tell him the distant signal was half down when we passed it.

W. DOWNIE.

To Mr. Kirkcaldie:—William Thomas Evans states: I have been in the Service four years on the 21st of this month; I am porter, but usually go to Lochinvar with down mail, and return by up mail to assist; I went out to assist the guard of down mail on the 12th May; I did not notice time of departure from Newcastle or arrival at West Maitland; after leaving there, I was very busy sorting parcels, &c.; I noticed a sort of fog at Maitland, more particularly at East Maitland; after leaving West Maitland I did not hear the driver give any whistle, nor did I notice the distant signal when passing it, being so busy; I did not notice the home signal either, and the first intimation I had of the accident was the sudden stop; I thought a coupling had broken, but did not think there was any other accident until about ten minutes after; immediately the train stopped, Guard Downie left the van and went forward; when leaving the van, I went to the opposite side from platform where passengers were calling me; they said some were injured; it was not until about twenty minutes after the accident, that I saw Guard Downie again, and he told me to go to West Maitland with the staff, which I went to do, but meeting three porters and a policeman about 700 or 800 yards on the Maitland side of the Farley distant signal I gave the staff to Porter Greig; when walking down the line it was very foggy; I carried a hand signal lamp showing white; when I got out of van first the fog was pretty thick, but it subsequently got thinner; the men I met were carrying lamps; I saw the lights at a distance of 150 yards; after giving Greig the staff, I returned to Farley; one of the three was Mr. Phillips; the other I do not know; I know Assistant-Guard Irwin, whom I saw after my return from Maitland colliery; I had not seen him anywhere previously; I think it was close to the engine of the down mail where I first saw Irwin; I did not speak to him unless it were to say "Good night"; when I saw the men coming from Maitland the fog was about the same as on arrival at Farley.

To Mr. Thow: When going from Farley with the staff, I walked between the rails; I saw nothing resting on the signal wires; I saw no one between the vehicles of the down train and the distant signal.

W. T. EVANS.

To Mr. Kirkcaldie:—William Edwards, guard of the up mail train on the morning of 13th May, states: I have been over twenty-six years in the Service, and been running trains for about twenty years; running mail trains about ten years. From Singleton and at all stations to Lochinvar inclusive I gave the right away signal to driver; I did not see Went, who was acting as my assistant, with a green lamp at any time that night; I left Lochinvar at 12.0 midnight, and came on at the usual speed; I heard driver challenge the distant signal, which was seen by me to be red; he slackened speed; I did not apply the break; train passed the distant signal at about 15 miles an hour; when train passed the distant signal the driver steamed away again, but at all times had his train under perfect control; I did not alight from the train when it reached Farley; Mr. Inspector Brett got out; Assistant-Guard Went got out of van immediately on arrival at Farley with lamp in his hand showing white; he got out at platform; I heard two short whistles from the engine of my train; immediately Mr. Brett got out on the platform; he had no lamp in his hand; I was just in the act of putting Farley cash in the box when I was knocked down by the down mail running into my train; at that time my train had begun to move backward; the van was just clear of northern end of platform; when the collision occurred and I had picked myself up, I left the van with a lamp showing a white light; I could then see the carriage next the engine was off the road, and in a slanting position; I then called out to Night-Officer Palmer to leave the points and get to his office at once, which he did; I then went along the train opening doors which were shut, to see if anybody was hurt, until I came to Driver Sanderson, whom I assisted from engine to the station; when this was done I went to see the wreck; it was not very foggy when leaving Lochinvar; when I first saw the up distant signal at danger I considered we were about half a mile from it; when leaving the van at Farley, it was not very foggy; I could plainly see the back light of the up home signal, which I should think is somewhere about 400 yards away; I could also see the back light of the down home signal when approaching the platform, and about 100 yards away; immediately I got out of van I saw the back light of the down home signal showing a green light at a distance of about 80 yards; when I alighted my van was standing in siding clear of the points, and I could then see the back light of the down home signal at Farley Station; it was very foggy at that time—the fog coming over in gusts; I did not attempt to look at the back light of the down distant signal nor the levers; I did not hold any conversation with anyone about the position of the levers; only Mr. Brett and Assistant-Guard Went were travelling in break-van with me that night; I did not speak to Mr. Brett, the Station-master or night officer about the signals, nor did I hear any mention of them; my train was driven back about 50 yards into siding by the collision with down mail; I saw Assistant-Guard Irwin at Farley; he did not travel in my van so far as I could see; I cannot remember where or when I saw him after the accident, but I think it was he who called out immediately I got out of van that Driver Sanderson was dead; no conversation ensued after that; up mail arrived at Farley at 12.9 a.m.; the train had not stopped half a minute before we got the alarm; I have never at any time applied the Westinghouse brake when coming into a station, always leaving that to the driver; I have applied it at Wallsend when the engine has been disconnected from the train.

To Mr. Thow: I don't remember rule 381; seeing a danger signal ahead I do not think I would apply the brake if I saw that the air brake was in proper order by the pressure in my van, and if the driver were travelling cautiously; I do not remember any other rule than 67 which justifies a train being brought into a station by hand signal, the fixed signals showing danger; I would not allow a train to pass
home

home signal at danger at a speed greater than 5 or 6 miles an hour; I do not think the latter part of rule 381 is carried out by guards in practice in all cases; I have only been able to point out one rule, *i.e.*, 67 which justifies a driver passing a home signal at danger.

To Mr. Kirkcaldie: As a matter of fact I have never known a guard to apply the Westinghouse brake when approaching a station, and I would not apply it unless I saw an obstacle in the way, or something to be avoided.

WILLIAM EDWARDS.

John Herbert Went, acting assistant guard, Murrurundi, states: I have been in the Service about seven years, and was acting as assistant guard on up mail on 12th May; I travelled from Murrurundi; I have no recollection, nor do I believe that I gave the right away, to driver at any station from Singleton and Lochinvar inclusive; I am almost sure that I did not give the right away at Lochinvar; we arrived at Farley at 12:9 a.m., according to the clock there; I did not notice either of the up signals on coming into Farley station; on arrival of train I put out a parcel, and walked along the platform with a lamp in my hand, showing a white light; of this I am perfectly sure, as I looked at the light before getting out of the van; I could not say whether it was foggy then or not; it may have been, but I did not look for it; besides myself there were in the van on arrival at Farley, Guard W. Edwards, Inspector Brett, and Assistant-Guard Geo. Irwin; I did not notice any of them get out when I alighted; I passed Night-Officer Palmer as I walked to southern end of the platform; he came past on his way to Lochinvar end of platform, to the points, with a lamp in his hand, showing white light; I am sure it was a white light; Palmer told me to call the train back, while he went to the points; I called train back after walking a bit nearer to engine by waving a white light; previously to this I noticed the back light of down home signal showing a clear green light; this I had noticed immediately I got out of my brake-van; the distance walked to Sydney end of platform was about 12 or 15 yards from levers; I had given signal to driver to come back before getting that distance away; while walking, as stated, I heard Driver Sanderson give two short sharp whistles, which attracted my attention, as I thought something was wrong; after these whistles sounded I saw the down mail approaching about 20 yards away; I had not seen it previously; I could not form any idea at what speed the down mail was coming; the accident then occurred; the engine of up mail was about 10 or 12 yards inside home signal; when trains struck I stood about a second, then went to look at the levers, which all showed danger; from the time of the accident until I saw them no one could have touched them; just after I saw the position of levers Inspector Brett came up and asked me how the levers were; I replied, "All up"; I did not attempt to look for the back light of the down distant signal, and cannot say whether it was foggy or not, as I did not look or take any notice at any time on the night in question; Mr. Brett told me to stand by the levers, and see that no one touched them, which I did until a man with a cut in his head came up after five or six minutes and asked if I could do anything for him; I took him into the lamp-room, and dressed his head; I then went to look at the up mail; while standing guarding the levers no one passed me; I did not see Assistant-Guard Irwin pass me; about half an hour after the accident a man called to me to bring a light to where a horse was; it was then I saw Irwin again, but did not have any conversation with him; I then, at request of Guard Wm. Downie, went down to rear of down mail with a red hand-lamp; I went a good three-fourths of the distance between the distant signal and van, about 1:30 a.m.; some men passed me on their way to the wreck, but I did not take notice of them; they held lanterns which I saw about 30 or 40 yards from me; after standing awhile protecting down mail, about 2 a.m., Geo. Irwin came up to me from the direction of Farley; I believe he had a lamp; he said something about a big piece of wood being on the plank near the signal wires, and asked me if I saw it; I replied "Yes; I think it is a piece of a buffer"; feeling cold, I asked him would he protect the train, and I would go back to the wreck; he complied and held a red light; while standing guarding the train I could see the home signal and back light of distant signal which showed green; I saw no one with a green light, either on the arrival of up mail or after; I am not quite sure it was between half-past 1 and 2 when Irwin came to me as I stood protecting the down mail, but somewhere about that time as closely as I can judge.

To Mr. Thow: I do not think Irwin was among the men who passed me on their way to the wreck, but he may have been, as I did not see their faces; I saw Irwin when down at the horse; three or four minutes after seeing Irwin I went in the direction of the down mail van when Guard Downie asked me to go and protect the train; before meeting the three men on the line, as stated, a woman passed me walking along the line—no one else; the piece of timber referred to as seen by me was inside the home signal; brake-van on up mail was a long one with ladies and gents' compartments at the end; assistant-guard Irwin travelled in the luggage compartment; I believe he got in at Singleton; I think the guard could have seen him; the time I stood at the levers was about five or six minutes, during which time Guard Downie did not come to me; Guard Downie requested me to go back to protect down mail at a time not less than three-quarters of an hour after the accident; I cannot say anything nearer as to the time; I am quite positive that when I went to protect the train, as stated, I could plainly see the home signal and the back light of down distant signal; after relieved by Irwin I went back to the station and saw Guard Downie who asked me why I had left my post; I told him Irwin was there and he said "Are you quite sure of that?" I replied "Yes."

J. WENT.

James Whybourne, night officer, West Maitland, states: I have been nine years in the Service, about five years as night officer; I have been not quite five weeks at West Maitland as night officer; down mail arrived at West Maitland on the night of the 12th instant, at midnight, and left at 12:5 a.m.; I handed the staff to the driver of the down mail on arrival, but he let it fall; it was then handed to Porter Groig to give to the driver; train was thirty minutes late leaving West Maitland; up mail was running to time; by that I expected trains would cross at Farley; I got the operator to ask the question of Lochinvar, and reply came that he was going to see if arrangements could be so made to cross at Farley; I did not speak to the driver of down mail at all, only to the guard saying to get away as quickly as possible, as the driver had the staff; I believe I passed a remark to Guard Downie that the trains would cross at Farley, but am not positive; at 12:10 a.m. I heard that a collision had occurred at Farley; I called at High-street to get medical men; got the staff together and sent them out to collect as many permanent way men as possible; I then called Mr. Ferris, station-master, who got up and came to the station with me; he then took

took charge, and I took a cab to Farley, as the cab was going out; it was very foggy in places, especially in the low-lying ground; I could see lights distinctly at near 400 yards; about quarter to 1 I arrived at Farley; fog was heaviest in the hollow close to Farley Station; I was not in a position to see the distant signal when passing along in a cab, but could see the carriage-lights of train from the hill quite 150 yards away; I was not in a position to see the tail-lights of train, but could see the home-signal light quite 150 yards away; this light was red; on reaching Farley Station I saw Mr. Crothers, station-master, Inspector Brett, and Night-officer Palmer, and spoke to them about what was the best thing to do; I asked Palmer how the signals were, were they at danger; he replied, "Yes"; I was at Farley about two hours; I did not see Assistant-guard George Irwin; the fireman of down mail came off engine and asked me to send a wire to Singleton for relief, as he was unable to proceed further.

To Mr. Thow: I had no reason to suppose he was under the influence of liquor; he seemed quite smart and active.

J. WHYBOURNE.

To Mr. Kirkcaldie:—George Irwin, assistant-guard, Newcastle, states: On the night of 12th May I was returning from Singleton as a passenger in B van of up mail; besides myself there were in the van Guard W. Edwards, Assistant-guard Went, and Mr. Brett; Guard Edwards started the train from Singleton, and Whittingham and I noticed that he gave the right away at all places; I cannot say whether Went repeated it at any place; I did not see Went use a green light at any of the stations so far as I can remember; the up mail left Lochinvar to time at midnight; I heard the driver challenge the distant signal which was at danger at Farley; the driver slackened speed before he came to the distant signal and got his train well under control, in fact he had to steam to get into station; when we came in view of the home signal at Farley I saw that it showed a green light, and the train ran into platform; I did not get out of van on arrival at platform; Assistant-guard Went got out of van as soon as train arrived at platform; he had a lamp in his hand showing a white light; I am quite sure it was a white light; a few seconds afterwards Mr. Brett got out, and immediately called out, "Look out boys, she's into us"; I went to look out of door of B van, but did not alight; when the collision occurred I fell in the van, and then got out; the driver had given two short sharp whistles and backed the train a few feet into siding before the trains struck; I did not notice how far the up mail was driven back by the impact; I got out of van at the northern end of platform, and noticed it was foggy at Farley side, but not much at Lochinvar side; when I saw the back light of home signal it was showing a green light, but, being misty, not altogether clear, still I could see it; I then went to inquire of down mail, and saw the number was 418; I thought the driver was — Wallace, and seeing Fireman Buchanan asked who was driver of down mail; some one called out it was "Jack Farnham"; I went along the down mail and saw a piece of wood lying upon the distant signal wire; as to the weight of the wood, I do not think it was as heavy as a sleeper; it was lying north end of the second bridge; I did not speak to anyone else; to the query whether anyone was hurt, I received the answer "No"; I believe I saw Guard Downie coming along the down mail train, but would not be certain; I cannot recollect what remarks I made to him; I did not see the station-master at that time; I have never walked along the line between Farley and West Maitland before; to get along over the bridge I had to hold on to the footboards of carriages; passengers wanted to get out of down mail, but I advised them to stay; I went right down the line to the level crossing on the Farley side of distant signal; I could then see a white light in the distant signal; I would not say it was a round white light, although it was a distinct white one; I could also see the signal-arm, because of a fire burning brightly at the Maitland colliery; it was not very foggy at this particular place; it was heavier near Maitland, also between where I was and Farley; the extreme end of arm of distant signal was about a foot from the post; I was over a hundred yards, say 150 yards, from the distant signal; the colliery is, I should say, more than 300 yards from the signal; I should be surprised to hear that the distance was 700 yards; when down near the distant signal, about five or six minutes after the accident, there was very little fog; I am quite sure that I saw the arm of distant signal, as previously stated, although such a distance away; I did not go beyond the level crossing to see what sort of a light was showing from the distant signal; I could see from where I stood the red light of home signal—that is, from a distance of over 400 yards; from the time of the accident until the time I started to go to see the distant signal not a minute elapsed; on the way I touched the piece of wood resting on the signal wires with my hand, and gave it a kick with my foot; I had a hand-lamp with me, which would not burn; I got down to the level crossing referred to within five or six minutes of the time of the accident; I gave the wire a pull, *i.e.*, a straight pull, and then looking saw a green light; I then went back to the scene of the accident, not meeting any one on the Maitland side of van; on arrival at the train I met a commercial traveller—the first one I addressed after return, but did not speak about railway matters; this was about twelve minutes after the accident; the railway men I then saw I cannot distinctly remember, but think they were Downie and Went; I had a conversation with Downie, but am not sure whether it was at this particular time or not; I remember asking Downie how the signal, meaning the distant signal, was when he passed it, and he replied, "Half-down"; this conversation occurred about half-an-hour after the accident; after that I went back to train, when some ladies expressed a wish to get out; I persuaded them to stay, but they insisted upon getting out, and I assisted them; I then went down again to see the man who was injured; he complained about pains in the chest; I told him I would look out a place for him to lie down; I saw the station-master, Mr. Crothers, somewhere about the engine; I returned to the wreck about three-quarters of an hour after the accident; about an hour after the accident, knowing the accident train had been telegraphed for, and not knowing any one had been sent back, I went a second time to the level crossing, and there met Assistant-guard Went, who informed me Guard Downie requested him to comply with rule 388; I asked Went if he had put fog signals on the line; he said, "Yes"; also said that he felt cold, and asked if I would take his place; I think I mentioned to him about the piece of wood on the signal wire; he replied, "Oh, that buffer"; I said, "No, there was something else besides that"; he then left, and I stayed; I do not remember telling him that it was the second time I had been out to that spot that night; I remember telling him "That signal was down"; he said, "No"; I did not tell him that I had seen the back light of the distant signal, or that I had found it necessary to pull the signal-wire to place it at danger; I remained until break-down train arrived about 3.15 a.m.; Went had put two fog signals south of where I stood; when the driver of break-down train went over the second one he stopped; I then went down and brought up the train; it was about 5.30 a.m. when I first spoke to Mr. Brett, who called to me when I was on the platform, about 10 yards away, to get the engines ready; Mr. Brett travelled to Waratah in the sleeping-car, then got out and came in
break-van,

break-van, where he travelled to Hamilton; I had no opportunity to speak to Mr. Brett; I saw Mr. Crothers, but had no further conversation than arranging a place for the injured man; nothing was said on either side about cause of the accident; I did not see Night-officer Palmer to speak to after the accident; I did not see Guard W. Edwards from time of accident until day-break, and did not say anything to him as to the cause of the accident; I arrived in Newcastle at 7:20 a.m., and signed off in the guards' book, then made out my time and occurrence sheet; I spoke to Driver Farnham when he was walking round the engine somewhere about fifty minutes after the accident; I asked him how he managed it; I said, "How did you manage this, Jack?" he replied, "The distant signal was off for me; I had the staff; I could not see the home signal until I was very close to it, it was so foggy; I applied my brakes, but unfortunately it was too late"; the answer I gave him then was, "From what I have seen there is something in it," meaning I had seen the distant signal showing a back white light; I went out from Newcastle again, running the 9:50 p.m. special on Tuesday 13th, and got back on Wednesday night about 10:45 p.m.; next time of leaving Newcastle was 5:15 p.m. next day, Thursday 15th, and got back 9:15 Friday evening; I was in Newcastle Tuesday and Thursday, yet made no mention of the foregoing; I came to Newcastle about 4 p.m. on Tuesday 13th, and saw that I was to run No. 29 goods 7:15 p.m.; I arranged with Mr. Marchant, station-master's clerk, to send word to the guard who was to run the stock special to come and run No. 29 in my place, as I was feeling a bit sore about the shoulder, and the stock train would be an easier one for me; when I got home I sat down to write a report of what I had seen, when I received word that there was a relative of mine dead at Dungog; that is the reason I did not make a written report that day; I did not avail myself of any opportunity to make a verbal report to any of the officers as I consider that I was occupying rather a curious position; on Wednesday night 14th I was sent for to go and see Driver Farnham; I went next morning to his house at 8:45, when I told him exactly what I saw about the signals; I then came to Newcastle and made inquiries as to the whereabouts of Mr. Robinson, District Superintendent; I saw Mr. Marchant, but made no communication to him; on Friday Mr. Robinson called me, when I made a statement to him; I intended to see the Superintendent that evening about the matter; I intended making verbal report to Mr. Nield, acting station-master, but was thwarted by some one coming up claiming his attention; Farnham told me he would call me to make a statement at the inquest.

To Mr. Thow: I made my written statement on the Saturday following the accident, after seeing Mr. Robinson; I referred in it to seeing the distant signal showing off; I cannot exactly account for the signal showing white light, but think it was the timber lying on the wire; I saw the signal showing a white light and the arm down after I had moved the piece of timber; when I pulled the wire and looked round I saw a green light; I pulled the wire in a straight direction with my back to the signal, pulling it from Farley station; I think I got it in about a yard, but cannot say exactly how much, perhaps 2 or 3 feet; when I pulled the wire it slackened up, and seemed to back towards the distant signal; in pulling the wire I do not think my hands would slip that much; there was a blaze from the furnace at Maitland Colliery, which showed a light all round; this light was not immediately behind the signal, which is situated on higher ground than the colliery; the height of the flame or blaze which showed me the arm of the signal I cannot give; I cannot say whether it was coming out of a chimney or not; I made one written report only of what I had seen; I wished to have advice from Mr. Robinson before making my statement, simply because the driver and fireman belong to another department; I heard that I would very likely get into trouble and get dismissed if I stated what I had seen; I do not care to say who told me this; I would rather suffer; it might do that man an injury; I refrained from reporting earlier because I thought what I had to tell would support the driver who belonged to another department; I wished advice from my superior officer, Mr. Robinson, but could not succeed in seeing him at Newcastle; from Tuesday until Friday I failed to report the occurrence to any of my superior officers, thinking I might get into trouble with my own department; when I made up my mind after seeing Farnham I went to Mr. Robinson and found he knew the circumstances, which I related again; among the majority of the men here there is an idea that they would get disliked by their superior officers if they told the truth respecting matters concerning the men of another department, if by doing so it would implicate any of the traffic men; I do not care to mention the names of any others who hold this idea; I have been in the service since July, 1883.

To Mr. Kirkcaldie: I do not know of anyone having got into trouble through telling the truth, implicating any employees in either branch; I think it very likely that the other men would say they never made such a statement if I give their names; I decline to give the names of any of these men, although it has been pointed out to me that the statements made are sweeping and damaging to the men in the Traffic Department; my idea was that I might be disliked by my superior officers if I made any report about the discovery I had made, if I did so without first getting advice from them; to my knowledge no one else other than Guard Downie, who said it was half down, and Driver Farnham, who said it was off, saw the signal as I saw it that night; I have read the evidence wherein Guard Downie says he did not see the distant signal on the morning in question, and although hearing Downie's evidence that he did not see the distant signal at all, I still repeat that Downie told me on the morning of the accident that the signal was half down.

G. IRWIN.

*To Mr. Kirkcaldie:—John M. Phillips, porter, West Maitland, states:—*I have been in the service nine years, seven years of which have been served at West Maitland; I do night duty, and was on on the night of 12th May; I saw down mail pass; it left West Maitland at 12:5 a.m. on 13th instant; it was very foggy when mail train left; at the time one could see a light about 150 yards away; after train had left I heard of the accident at Farley, which occurred about 12:15 a.m.; night-officer then gave me instructions to call the men together, and set off to Farley as soon as possible, which we did; Porter John Tulip, James Greig, Constable Hickey, and myself, left about 12:25 a.m. for the scene, proceeding along the line, and calling up three permanent-way men along the road; I could see the Farley down distant signal about 200 yards before I came to it; it was showing a full danger signal; I walked on to the scene of the accident, arriving there about 12:50 a.m.; on the road I met the assistant guard of No. 25 down mail about midway between West Maitland and Farley; he was carrying a hand-signal lamp showing a white light, which we could see about 150 yards off; he was carrying the West Maitland and Farley staff back to West Maitland; Assistant-guard Evans handed over the staff to Porter Jas. Creig, who took it
back

back to West Maitland; Evans then accompanied us to the scene of the accident; before reaching Farley, and just as we were going into the small cutting, about 350 yards from Farley home signal, we could see the home signal, showing a red light, although not so plainly seen, as the tail lights of the down mail; I saw Assistant-Guard George Irwin at the wreck a few minutes after our arrival (say fifteen minutes); the time would be a little after 1 a.m.; he was standing somewhere about the home signal; we had no conversation about the signals whatever; I think the fog was most dense between the distant and home signal when we were on the road to Farley; still I could see the red light in the home signal about 350 yards away; the fog was drifting a good deal on the night of 12th May, and morning of the 13th.

JOHN M'PHILLIPS.

To Mr. Kirkcaldie:—*Arthur Lane*, fireman, states: I have been about eight years in the service, firing nearly six years; ago, twenty-nine years; I was firing on up mail on night of 12th; my mate told me we were running to time on leaving Lochinvar; when we came in sight of the Farley distant signal, about 200 yards, I saw the red light very distinctly; we slackened speed and had the train well under control; we had to steam to get into the station; when getting into Farley station, the home up signal showed a green light, and we drew up to the platform, on which I saw no one; I saw the back light of the down home signal, which showed green; our engine stood about 10 or 12 yards inside the home signal, not half a minute; I could not see the back light of the down distant signal; it was so foggy, that it was useless looking for it; the first I saw of the down mail was the head lights about 10 or 12 yards beyond the home signal; I could not see at what rate of speed the down mail was travelling, as my driver was making all speed to get back into siding; it was after we stopped at station that I heard a whistle from down mail; my driver, after this, and before I saw the lights of down mail, sounded his whistle for the brakes; I turned on the sand because our engine gave a slip; I then jumped off on the side opposite the platform; next thing I knew was the down mail had struck up train; when our engine stopped again after being struck it was about 7 to 9 yards from platform, northern end; I saw no one on the Farley platform, or anywhere else, with a hand-lamp before the accident.

To Mr. Thow: I heard the engine of down mail sound the ordinary whistle; I was looking ahead when I saw the head-lights of engine of down mail about 10 or 12 yards from home signal; I could not see them further off because of the thick fog; our engine was reversed and had started to go back under steam at the time of the collision; I have no idea how the regulator was shut; it was shut when I got on the engine, which was stationary; I am almost sure it was the driver who had pulled the regulator back; from my position on the engine it was not possible for me to see a hand-lamp on the station; on my engine there were two head lights, both on the buffer beam, and burning brightly; some of the vehicles on up mail were derailed; a bogie carriage next the tender was off the line altogether, *i.e.*, all the wheels at the Lochinvar end of platform; I did not notice any mark on the ballast showing where the carriage had run; I think this carriage must have got off at the points leading to cattle siding, and any marks shown on the ballast might be caused by my drawing the carriage up to platform before it was again put on the rails.

ARTHUR LANE.

Driver William Robert Sanderson states: I was driver of the No. 10 up mail on the night of the collision at Farley; left Lochinvar about 12 (midnight), and reached Farley at 12.9 a.m.; up distant signal was at danger, so I ran with caution up to the home signal, which was showing a green light; I was at platform about one minute when I heard No. 25 approaching; No. 25 was about 100 yards distant when I first noticed it, and I at once commenced to clear, by backing my train into siding; I gave two short whistles before I commenced to back; almost immediately my train was struck by No. 25, both engines colliding, buffer to buffer; the night officer must have had the loop points set for me to run back, as my train went into the siding all right; cannot say at what rate No. 25 was travelling; I did not notice the down distant signal; I do not think it could be seen from the platform, owing to the fog; the down home showed a green back light, and I noticed it as soon as I reached the platform; the fog was thicker on the Maitland side of Farley than on the Lochinvar side; did not see the night officer touch the leavers after my train arrived; did not hear No. 25 whistle; my train was struck on the Lochinvar side of the home signal; I do not think my train stood more than half a minute at the platform before I set back, and I had gone back about half the length of the engine before the down mail struck me; I set back of my own accord to get out of the way of the down mail; I did not get any hand signal to do so; I did not notice anyone on the platform with a hand-lamp.

W. SANDERSON, 21/5/90.

To Mr. Kirkcaldie:—*Walter Brett*, inspector, states:—I was travelling in up mail in brake-van on the night of 12th May from Scone; besides myself there were in the van Guard Wm. Edwards and Assistant Guard John H. Went; Assistant Guard Irwin might have been there but I did not see him; I invariably travel in the small compartment, to look out of side windows; up mail left Lochinvar to time, 12 a.m.; I cannot say who gave the rightaway signal from Lochinvar; I cannot remember hearing the driver challenge the Farley distant signal, which I did not see; I cannot remember seeing the home signal either, but I noticed that speed was reduced, and train ran cautiously into station; I cannot say who stepped out of van first at Farley, but as a rule Went always got out first; train stopped about three-quarters of a minute, and then started to go back; I did not hear the down mail whistle; I heard Driver Sanderson, of up mail, give two short, sharp, whistles, which caused me to rush to brake-van door, when I saw the down mail coming from where I stood in the van; down mail appeared to be some distance the other side of home signal; of this I am sure, because I walked quickly along the platform and got as far as the station-master's door before the two mail trains struck; I cannot form an idea as to distance from van to where I saw down mail, but I am certain the train was the other side of home signal, and I should take the distance to be 100 yards to the home signal from where I was; as soon as I saw the down mail I called to the men to look out, and jumped from van to platform; immediately after the collision I went to the signal levers and found Went standing a few paces away; I spoke to him; I fancy I asked him how he found the levers, and practically we looked at them simultaneously and found them all at danger; Went had a hand-lamp in his hand, showing a light the colour of which I cannot remember, everything being done so quickly; I then gave Went instructions to remain near the levers, allowing

allowing no one to touch them ; I then proceeded to see the position of down mail ; on finding it stood on two bridges I called out to passengers to keep their seats ; I should mention here that the moment I got out of van at the Lochinvar end of platform I looked at the down home signal and noticed that it showed a clear green back light ; as I was going along the down mail I noticed it was foggy towards Maitland, but not thick round about Farley ; I looked for the back light of distant signal, but failed to see it on account of the fog ; I think I met the station-master when going along down mail ; I asked him where he had come from ; he replied " Out of this train " ; then I asked him had he noticed the signals in passing them ; he replied " They were both at danger " ; I then went back to station-master's office ; called the Night-officer Palmer, who was up at the loop points ; he came running along the platform ; I gave orders for telegrams to be sent to West Maitland for the doctors, and to Newcastle for the accident van, and to report the collision ; when I saw Night-officer Palmer he had a lamp in his hand, but I cannot remember what light it was showing ; I then gave orders for all the injured people to be brought to waiting-room and attended to ; about twenty minutes after the accident I gave Guard Downie orders to work the staff back to West Maitland ; I have no recollection of speaking to Downie about the signals ; I spoke to Driver Farnham, who said it was a bad job, but nothing passed about the signals ; I saw Assistant-guard Irwin ; I have a slight recollection of seeing him about half-an-hour after the accident ; I don't remember speaking to him then, but between 3 and 4 a.m. I gave him orders about the train that was being worked back to West Maitland ; he made no communication to me about the signals ; I have no recollection of seeing him on our way to Newcastle ; when next I saw him, for the first time after the accident it was Saturday ; I remember seeing the night-officer (Whybourne), and Porter M'Phillips who came from Maitland.

To Mr. Thow : As soon as I looked out of van of up mail I saw the down mail approaching ; I spoke to Driver Farnham ; I have no reason to believe that he was under the influence of liquor ; I went to the doctor (Dr. Russell, I think) having heard some rumours that Driver Farnham was under the influence of drink, and I asked the doctor if Farnham was the worse for liquor, and he replied, " I don't know what he may have been, but he is perfectly sober now." Farnham was walking very lame, holding his hip, when I spoke to him.

To Mr. Kirkcaldie : I cannot say who gave rise to the rumours ; Farnham being badly hurt probably had something to do with these rumours ; I cannot say how long after the accident it was when I spoke to Dr. Russell ; I did walk a distance of about 100 yards behind the down mail, and from that point looked for the back light of the down distant signal, but failed to see it on account of the fog ; this was after I had told Downie to work the staff back to West Maitland.

To Mr. Thow : Standing at a distance of about 412 yards from the distant signal, at which I looked for the second time, but failed to see the back light, on account of a belt of fog ; I would not consider it necessary to put fog signals at the distance signal, because I consider that had I been on the other side of the signal I could have seen the large light in front of the signal.

To Mr. Kirkcaldie : Where I was standing about 100 yards behind down mail there was no fog worth speaking about at that point, or between that and Farley station ; from that point I could plainly see the red light of the home signal.

To Mr. Thow : The grounds on which I arrive at the conclusion that the front of the signal light could have been seen at a distance of 100 yards was because the fog was belty, and I consider the fog was at the Farley side of the distant signal ; I was led to this conclusion from general conversation with different people about the fog being belty and in patches ; I took no steps to find this out, having no time, and I accepted the statement of Mr. Crothers, station-master, Farley, as to his seeing both distant and home signals at danger ; the conditions under which I would use fog signals would be when a signal could not be seen at a distance of 40 or 50 yards ; I took no steps to see whether the Farley down distant signal could be seen at a distance of 40 or 50 yards ; station-masters should use fog signals when they cannot see the fixed signals at a distance of 40 or 50 yards ; on this particular night I think fog signals were unnecessary, because I could see hand signal lamps about 300 yards outside the down home signal at Farley, and I called Guard Downie's attention to the light ; as near as I can tell, the down mail ran past the home signal at a speed of 15 miles an hour at Farley ; when I asked Fireman Buchanan what light he saw at the distant signal he replied it was a green light ; I then asked Buchanan if he did not know that the distant signal showed only red and white ; he said he got a green light ; the next day Mr. M'Carney and I looked at the spectacles which were both red on the distant signal ; I then called Buchanan over and told him to inform Mr. M'Carney what light he got from this distant signal ; Buchanan then said he got a green light, but it was further away, near to the platform.

W. BRETT.

To Mr. Kirkcaldie :—John Farnham, driver of the No. 25 down-mail on 12th May, states : I have been upwards of twenty years in the service, driving thirteen years, and running passenger trains occasionally, principally engaged on goods and stock trains ; I understand thoroughly how to manipulate the Westinghouse brake ; on this particular night, 12th May, I had nothing to drink before leaving Newcastle, nor up to the time of the accident ; I left Newcastle at 10:57 p.m., with a train equal to fourteen vehicles, twelve of which were controlled by the Westinghouse brake ; we arrived at West Maitland at 11:58 p.m., and left there at 12:5 a.m. on 13th inst. ; I had no conversation with anyone at West Maitland, and did not see the night officer to speak to ; I was not told at West Maitland that I was to cross the up-mail at Farley ; some night officers tell where we are to cross certain trains, but it is not always done ; we have crossed the up-mail at Farley before, but cannot give dates ; on the previous occasion, when I crossed up-mail at Farley, I was told so at West Maitland, and twice when driving the up-mail I have crossed the down-mail at Farley, and on each occasion I was told so by the night officer at Lochinvar ; it was foggy, but not extraordinarily so, when leaving West Maitland ; we ran at usual speed, and on approaching Maitland Colliery I challenged the Farley down distant signal, which I could not see ; I eased the steam, but did not shut it off altogether ; I eased the speed then from 28 miles an hour to 15 or 16 miles an hour, when crawling up steadily to the distant signal ; this signal I saw when within 20 or 25 yards of it ; it showed a white light ; I saw no part of it red in front, and in passing looked up and saw a clear white light ; I generally look back, although I see a white front light, to see the back light, and I did so on this occasion ; after passing the distant signal I put on light steam, and proceeded on the journey ; when passing the down distant signal, which is on the fireman's side, he was standing on his

side looking out; he was not engaged firing at the time; he made no remark about the signal, but said it was very foggy; after that, when about midway between the distant and home signals, I sounded the ordinary challenge whistle again, without having shut off steam; immediately after I did shut off steam; it was then so foggy in the cutting that I could not see where I was; I did not see the fireman using his hand-brake; after shutting off steam I made one slight application of the air-brake; I did not think we were through the cutting, but after proceeding along my mate said, "For God's sake stop the train;" I could not, at that particular moment, see the light of the home signal, nor the head lights of the up mail; I applied the Westinghouse brake with full force, and my fireman likewise applied his engine-brake; I did not see the home signal at all, but immediately afterwards saw the two headlights of the engine of up-mail, about 60 yards away; the reason I could not see the home signal was because the fog was rising at the time; my fireman applied the sand, which was applied both sides; I was in the act of reversing the engine when the collision occurred, and I was knocked stupid for a few seconds; my hip was hurt badly; after the collision I got off the engine and walked round, and could then see that the horse-box and carriage truck next the engine were smashed up; I looked at the back of the tender, and could see the legs of a man; not being able to stand on my legs or render any assistance, I went on to the platform, where I saw a lot of people; I saw and spoke to Mr. Brett, to whom I remarked that it was a serious job; I saw Guard William Downie a few minutes afterwards, and asked him if he noticed the distant signal; he said he did not, as he was sorting the bills, parcels, &c.; I saw the station-master some time afterwards, but did not speak to him; I saw Night-officer Palmer, but did not speak to him; I saw Assistant-guard George Irwin very shortly, just a few minutes after the accident, say 10 or 15 minutes; he spoke to me first saying, "This is a bad job Jack; how did it happen?" I replied, "The distant signal was showing a white light, and we were travelling with the staff; the night being very foggy I could not see exactly where I was, and was further advanced than I thought I was"; Irwin then said he had every reason to believe the signal was as stated by me, or words to that effect; nothing else took place; I do not remember his giving any reason for the signal showing a white light; it was about 20 or 25 minutes after the accident that I went from the engine to the platform; it was before I went to the platform that I had the above conversation with Irwin; when I went to the platform those who assisted me were a constable and some others, who were not railway men so far as I remember; so far as I am aware I did not ask any of the men on the station what they meant by having the distant signal at all clear while there was a train at the station; when my train struck the up mail we were travelling at the rate of 10 miles an hour; I have got a copy of weekly notice No. 18, dated 6th May; beyond asking the guard whether he had noticed the down distant signal, I had no conversation with anybody else about the signals that morning, except Guard Irwin; I was too unwell to make any report about the accident; I saw Irwin again on Thursday morning, after the accident, having sent for him; what transpired at the interview was the following: I asked Irwin if it was true that he walked down the line and saw the back light of the distance signal showing white light, and he replied "yes," and also said that he had removed a piece of timber from the signal wire; this was all the conversation I had with him; I heard in conversation at my own home on the previous day that Irwin had walked down the line to the distant signal, and that was the reason for my sending for him; I have had no conversation with him since about the accident; I am acquainted with rule 456, and my reason for going into Farley as I did was the fact of the distant signal showing a white light, and I considered the home signal would be the same; after leaving Newcastle on the night in question we stopped at Honeysuckle Point, Hamilton, Waratah, Hexham, East Maitland, High-street, and West Maitland; I found the brake acted well at all these places.

To Mr. Thow: The light I saw at the down distant signal was a full white one—no red about it, and the back light of this signal showed full white—no green about it; while the tender was passing the distant signal I looked up and saw it; when looking up and seeing the full white light of distant signal in front of me we were 16 or 20 yards from it; I did not look back at back light of the distant signal after having seen once when the foot plate passed it showing it was white; it may have been 60 or 70 yards or more from the home signal when my mate called out "For God's sake, stop"; at that moment we were travelling 15 or 16 miles an hour; when I looked at my watch at Farley it was 12:11 a.m.; I cannot mention any rule in the rule-book which permits of an engine passing the home signal at danger unless called on by hand lamp; on this occasion I was not called in to Farley by hand lamp; I believe there was a hand lamp being waved, but I did not see it; I cannot say who told me about the hand lamp being waved, but I heard it mentioned; I do not say that the reason I passed the home signal at danger was because I had been waved in by hand lamp; the reason was on account of the fog being so thick in the cutting I had got further advanced than I thought, consequently could not stop outside the home signal; I know the rules and the working of them, also the wording; there are many rules forbidding the passing of home signals at danger, but practically I did not violate the whole of these rules on that occasion; I cannot say that I obeyed any of these rules on this occasion.

To Mr. Kirkcaldie: It was about a minute after the accident that I looked at my watch, and it was about 5 minutes from the time I left West Maitland until we struck up mail; the fireman, from his position on the engine, would get a clearer view of both distant and home signals than I could.

To Mr. Thow: I am aware that when I look at a signal too close to it that I cannot see the light so well as from a further distance off; I must admit that when I looked up at the distant signal as foot-plate of engine was passing and saw a white light with no green at all; I did not look back after getting further away; I do not consider that the fireman neglected his duty in the breaking of the train in any way; in ordinary cases it is not usual for the fireman to apply the hand-brake some distance back from a station on trains controlled by the Westinghouse brake.

JOHN FARNHAM.

John Buchanan, fireman of the down mail, 12th May, states: I have been in the Service over seven years, firing five years nine months; our train left Newcastle about 11 p.m., and stopped at several stations between Newcastle and West Maitland; the Westinghouse brake worked satisfactorily at all these places; I only applied my hand-brake at the platforms so as to admit of the driver releasing the air-brake; I have no idea when we arrived at West Maitland, where I noticed the night-officer holding up the staff; it was not caught in the first instance, but dropped on the platform; I did not see the driver receive the staff, but knew we were travelling with it to Farley; I had a conversation with the night-officer

night-officer at West Maitland whom I told to wire to the Locomotive Department at Singleton, saying I was unwell, and did not think I could go beyond that station; that was all that took place between us; I noticed it was foggy when at West Maitland, but nothing extraordinary; after getting the signal we left there and proceeded at the usual rate; the driver sounded whistle challenging the down distant signal when we were opposite Maitland Colliery and then travelling at about 20 miles an hour; speed was then reduced to 14 to 16 miles an hour; at that particular time I was looking out for signals ahead; I saw the distant signals, but not before train was within 20 yards of it, and the light was white, not full; there was a speck of red on top of the signal, the rest was white; I did not notice the arm of signal; could not see it, being prevented by the darkness and the fog; I said nothing to the driver about this, because I thought from what I saw that it was a clear signal; if I had any doubts I should have drawn his attention; I still kept looking ahead, and did not speak to the driver; I was standing erect, looking towards Farley; next thing I saw was the home signal, which showed a red light; it was very foggy between the distant and the home signal, right up to the latter up to the time I saw it; the home signal was about 50 yards away when I first saw it, and we were travelling about 11 or 12 miles an hour; the first thing I did on seeing the home signal was to say to my mate, "For God's sake, stop her"; I was in a better position to see the home signal than the driver, as it was on my side; I saw the head lights of up-mail before I saw the home signal, and it was the sight of them which caused me to call out to the driver, "For God's sake, stop her"; it was in the interval between seeing the head-lights of up-mail and the home signal that I called out to the driver to stop; I heard two sharp whistles from driver of up-mail; it was not these which caused me to look and see the two head-lights; I saw them before hearing the two short sharp whistles referred to; I then applied the hand-brake; the driver had applied the air-brake before I heard the sound of the whistles; I, immediately after the accident occurred, went and inquired for the men belonging to the other engine; the engine struck inside of the home signal, about 16 to 18 yards from the signal; I inquired of the driver if he was hurt; he replied he did not feel the effects of the concussion at the time; I then went and inquired about the men in the up-mail; I was not hurt; I then came back to my own engine, and remained there for a little while, when Inspector Brett came to me, inquiring how we were; we then went round to the front part of the engine; Inspector Brett remained with me about 7 minutes; I cannot remember whether he said anything to me about the accident, or that I made any remark about the signals; I did not speak to the station-master or night officer; I did not ask any one at the station what they meant by having the distant signal at "all clear," while there was a train at the platform; our guard, Downie, came to me, and I gave him the staff, but said nothing to him; I heard Inspector Brett telling him to go and get the staff; I cannot say that I saw Assistant-guard Irwin that morning; I did not hold any conversation with him; I heard no one speak about the position of the signals; it was very foggy when we got to Farley; I remained there until 8:30 a.m.; the fog was very dense at the time of the accident; it did not seem to clear at all about that time, but kept drifting.

To Mr. Thow: I saw a green hand-light either on the platform or under the home signal; it was about 60 yards away; I saw the green light before seeing the red light of the home signal because the fog was lifting at the time; my impression as to the cause of the accident was the green hand signal which I saw first; I did not mention this to anyone at the time; I took no further trouble to ascertain whether there was a green light or not; I did not see the red home signal until we were within 50 yards of it; although many have stated that they could see the green light of home signal more than 50 yards away from Lochinvar side I cannot say why I could not see the larger red light of home signal more than 50 yards away; from the time of passing Homeville Colliery I did nothing but look out for signals; this colliery is between the distant and home signals, so far as I can say, and about 250 yards from the home signal; I still say I did nothing but look out for the home signal, 250 yards away; I looked out for the distant signal when opposite Maitland Colliery, about 300 yards from this signal.

To Mr. Kirkcaldie: I do not remember saying anything to Inspector Brett about the signals; I may have said that I saw a green light at the distant signal, but do not remember; I was aware that when travelling on this trip in question there was no green light at the distant signal; I will undertake to say that I did not mention to either Mr. Brett or Mr. Newton that I did see a green light at the distant signal; when I saw the green light on the platform or near home signal I took it to be a signal to come in as it was a waving light.

JOHN BUCHANAN.

To Mr. Kirkcaldie:—William Henry Blezard states: I am employed at the Maitland Colliery, and was on night duty on the night of 12th May; on this night it was very foggy; I noticed the Farley distant signal about half-an-hour before the mail train from Newcastle passed; it showed a red light towards Maitland, a clear red light; when the train was approaching I heard it coming, but did not hear it whistle; it was then so foggy that I could not see the signal; I saw the train pass; I looked to see if I could see the signal when I thought the train would be about passing it, but could not see it, and I could not tell whether the train slackened speed or not; at the colliery that night there was no great blaze except from kerosene lamp, unless from the chimney of the boilers, which frequently takes fire; it takes fire nearly every night; about an hour afterwards I looked again and saw the signal, showing red same as before; the fog had cleared away by that time; during that night the fog lifted, and fell frequently; at one time I could scarcely see; at another moment it was quite clear; I could see the red lights (tail-lamps) of the train as it passed me, but that was all; I was then about 60 yards from the line, and that would be 150 yards from the tail-lamps when I saw them; I think the distant signal is about 700 yards from where I was at work that night.

To Mr. Thow: When the chimneys take fire the blaze rises about 2 yards above their tops; the blaze is a dull red light, not a big flame, and does not illuminate very much all round.

W. H. BLEZARD.

To Mr. Kirkcaldie:—David Williams states: I am employed in the bridge gang, Railway Department; I travelled from Ben Lomond to West Maitland on the night of 12th May in up mail, and was in second carriage from engine awake; I remember the train arriving at Farley, and consider the train was at Farley Platform about half a minute before it started to set back; I heard the train approaching from Newcastle, but did not see it; I did not get out but looked out and saw the night-officer, who was standing

standing opposite the station door calling out "Farley" as the train drew up to platform; then I saw him change the mail-bags, and he seemed to run back to the points; I think he had a hand lamp while he stood, but did not see it when he was running back to the points; I saw the assistant guard of up mail who had a lamp showing a green light; he seemed to be calling the train from the north back; he was standing opposite the waiting-room door, about 50 yards behind where I was, and I saw him wave the green light several times from side to side; I did not see the down mail at all before it struck the other train; I am quite sure it was a green light I saw, and that it was 50 yards behind from where I was in the carriage; the fog was very heavy overhead, but I think I could see a light about 100 yards ahead; I said to Permanent-way Inspector Lee that I thought the driver of down mail had mistaken the green light waving on platform for a signal waving him in, and that was the cause of the accident; I also spoke to Night-officer Palmer several days after to the same effect; he said he thought it was a white light which called the up mail back into siding.

To Mr. Thow: I did not get out of the carriage; I was leaning out when I saw the green light; there were four or five in same compartment with me; we chatted nearly all the way down; I got out after the accident, but spoke to no one about the cause of the accident, except Lee, to whom I spoke about an hour after the engines struck; I am quite sure the green light was not in front of me towards Maitland, but about opposite the waiting-room door; when I heard the down train puffing up the hill I looked at the back light of home signal, and saw that it was green; I could just notice this light through the fog; I was in the carriage when the collision occurred, and was not pitched about, but bumped by a fellow passenger.

To Mr. Kirkcaldie: I was sitting the whole time with my back to the engine, and merely turned my head to notice the back light of the home signal.

D. WILLIAMS.

Conclusion.

The evidence as to the density of the fog is conflicting, but all witnesses agree that there was more or less. Some of the witnesses such as Palmer, Crothers, Downie, Edwards, Went, M'Phillips, Whyburne, and Brett describe it as very slight, but others as very foggy.

It appears to have been a shifting fog not sufficiently dense to render the fixed signals invisible at a distance great enough to give timely warning to men looking out for them, as to make the use of fog signals advisable.

W. H. Blezard gave very trustworthy evidence on this question. He is an independent witness (not connected with the railway staff), and was engaged at the boilers of the Maitland colliery on the evening in question, which is situated about 60 yards from the line on the left hand side going north, and about 700 yards on the Maitland side of the distant signal. From where he stood, 700 yards away, he saw the distant signal showing a clear red light half an hour before the accident occurred, and although this signal was obscured from his sight when the down mail passed the colliery he saw the red tail lamps of the train as it passed at 150 yards distance. With regard to the fixed down signals, neither of them is high; the distant signal especially is short and low, and well within the line of vision of an approaching train. They were burning brightly at midnight on the 12th instant, and we consider that the evidence is conclusive as to their having been both at danger when the down mail approached and passed them. On this point the evidence of Palmer, Crothers, Downie, Blezard, Brett, Went, and others, is very strong. The only witnesses who contradict them are the engineman, fireman, and assistant guard Irwin, who was a passenger in the up mail. We do not place the slightest reliance upon Irwin's evidence. His refusal to furnish us with the names of his fellow employees in support of his extraordinary statement produced in our minds an adverse impression, and we consider his statement as to seeing a white back light at a distant signal, and also that the arm of that signal had fallen to within 1 foot of the signal-post, as seen by him at the distance of fully 150 yards—immediately after the accident—a mere fabrication. On that account we have excluded from our consideration the whole of his evidence as utterly worthless.

The

The engineman and fireman admit that the home signal was at danger when they approached and passed it, but they assert that the distant was off. Against their testimony, which was given in a feeble and indirect manner, we place the opposite testimony of numerous witnesses, and do not entertain a doubt that both signals were against the train.

We cannot account for the men of the down mail passing the home signal, except on the supposition that they did not look out for it until just before entering Farley Station, and when too late to avoid the accident. The engineman admits that he did not see the home signal at all and only took steps to stop his train when the fireman called out to him to do so. The fireman shelters himself for disregarding the home signal on the plea that a green light (hand lamp) was waving from or near the platform; but the rules are very explicit on this point; they emphatically forbid the men to pass home signals when at danger, except under clearly expressed conditions which have no bearing in this case.

The engineman of the up mail, W. Sanderson, appears to have acted with great judgment in starting to move his train back immediately he saw the speed at which the down mail was approaching the station. There is no doubt that the accident might have been much more serious but for the prompt action of this driver.

DAVID KIRKCALDIE,
Chief Traffic Manager.

W. THOW,
Locomotive Engineer.

The Commissioners for Railways.

26th May, 1890.

APPENDIX.

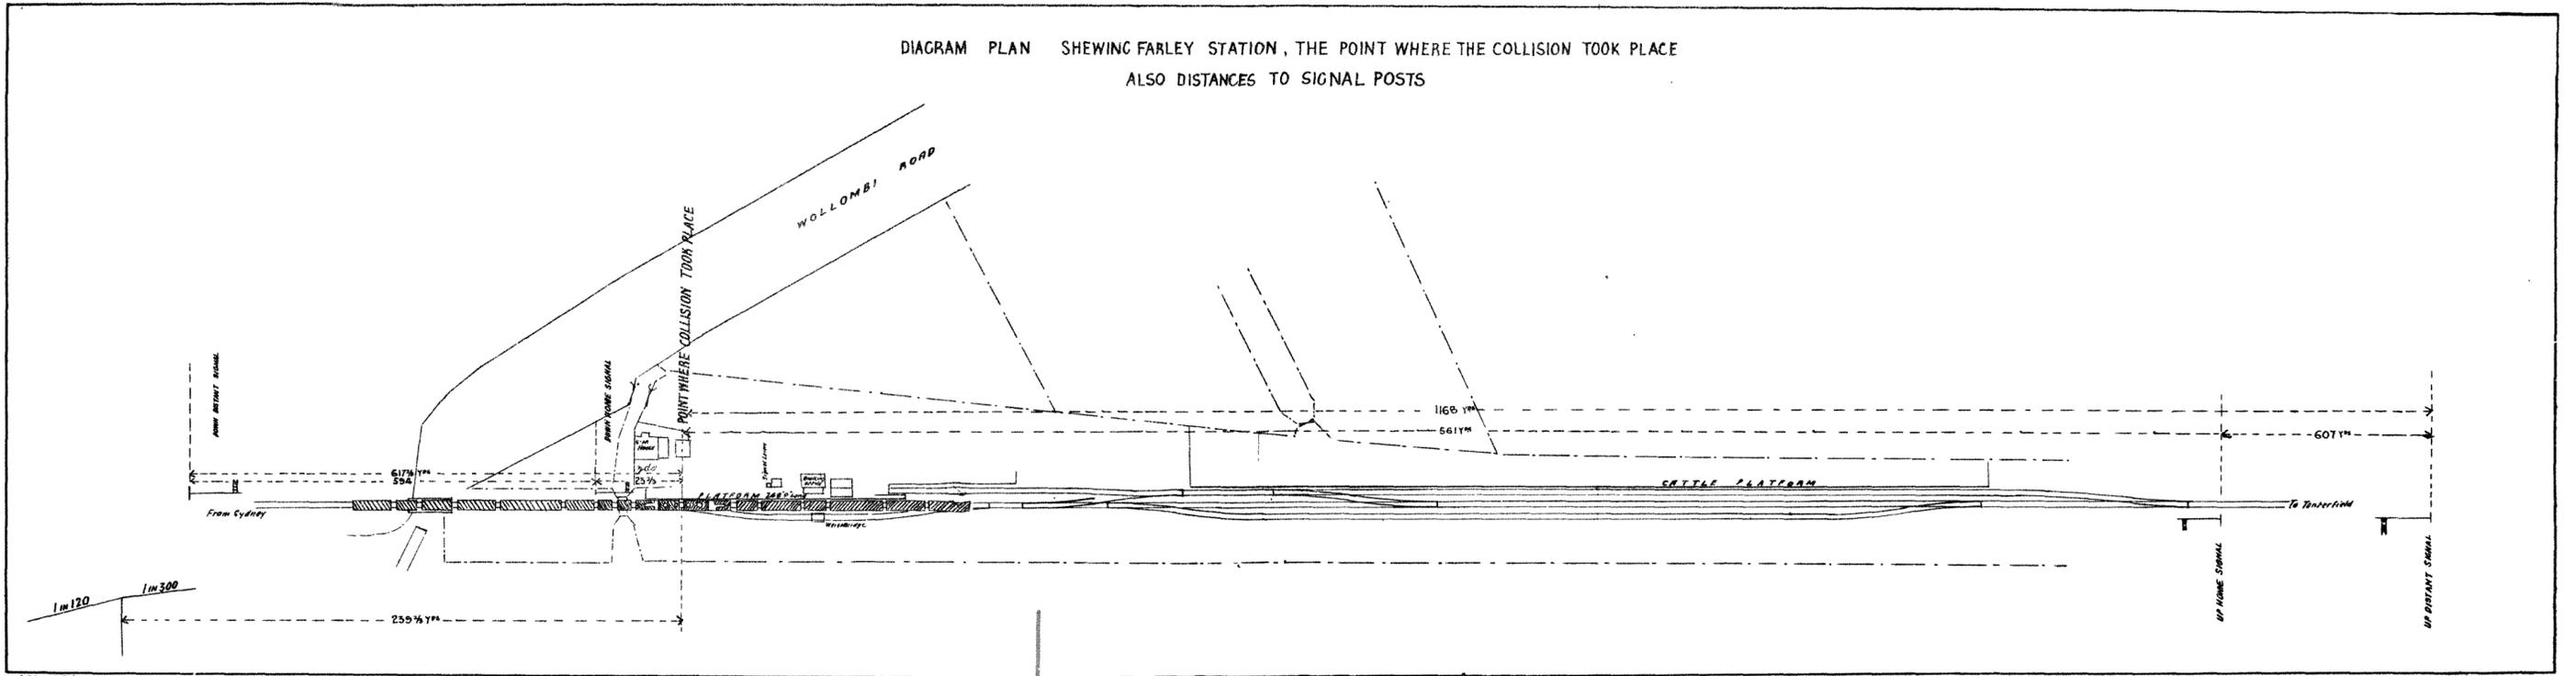

(Evidence given by Mr. Henry Lee on 30th May, 1890.)

To Mr. Thow:—Henry Lee, Permanent Way Inspector, Glen Innes, says:—I was in the up mail on the 12th May; left Glen Innes on 12th, and arrived at Farley Station; was not asleep at the time of arrival at Farley; was travelling in the van; I remember Guard Edwards, Went, another man, and Mr. Brett were in the van; just as the train was stopping I stepped out of the van; Mr. Brett followed me, and said, "Look out, she will be into us"; walked 10 or 12 yards towards the Maitland end of Farley platform; as I stepped out of the van I heard a long whistle from the engine of the down mail; then I heard Driver Sanderson on the up mail give two sharp whistles as a warning to the other train; I saw Sanderson's engine moving backwards, and beginning to slip; he turned towards the sand-box as if to put sand on the rails; he had moved back about the length of an engine when the collision occurred; before the collision my attention was called to the home signal by Mr. Brett, and I saw the green back-light plainly from where I stood soon after getting out of the van; it was not foggy at Farley Station; it looked hazy ahead, towards Maitland, but clear overhead; I did not look for the back-light of the distant signal, as I am not acquainted with Farley Station; I saw the head-lights of the down mail engine at least four or five seconds before she passed the home signal; I did not notice any hand-lamp being used on the platform that night; I saw a man named D. Williams in the train; he came with me from Glen Innes; he travelled in a second-class carriage; I said to him, "Are you hurt, David?" and he said, "I have lost my hat"; he showed me a mark on his forehead which looked like a scratch, and blood was flowing from it; I told him he was not hurt much, and he had better keep to one side, so as not to alarm passengers; he did not say to me that he thought that the driver of the down mail had mistaken a green light waving on the platform for a signal waving him into the station, and he did not say to me that he thought that that was the cause of the accident, neither at the time nor afterwards; I remained at Farley until the road was clear, assisting as far as I could in the matter; the clouds overhead were not so low as to obscure the home signal; the green light was distinctly clear at the back just before the accident.

HENRY LEE.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(REPORT OF BOARD OF INQUIRY ON ACCIDENT TO EXPRESS TRAIN AT THIRLMERE.)

Ordered by the Legislative Assembly to be printed, 30 July, 1890.

Accident to Up Express Train at 57 miles 58 chains south, 23rd July, 1890.

Gentlemen,

Sydney, 24 July, 1890.

Having, by your directions, held an inquiry into the cause of the accident to the Up Southern Express yesterday, we have now the honor to submit our Report thereon.

The train was made up as follows:—Engines Nos. 271 and 273, each weighing 63 tons 16 cwt. 3 qrs.; 1 mail-van, 1 first-class lavatory carriage, 1 composite carriage, 1 first-class lavatory carriage, 2 sleeping-cars, 1 mail-van and brake-van—all being bogie vehicles with the exception of the two mail-vans, and the weight, exclusive of the engines and of the passengers' luggage and mails, was 129 tons 14 cwt. 2 qrs.

It left Albury 7 minutes late, owing to the late arrival of the Victorian train; 15 minutes more were lost at Binalong waiting the arrival of the down mail train, and it left Mittagong at 9:55 a.m.—20 minutes behind time.

According to the evidence of all the engine-men and the guard, the train ran at the usual speed until when passing a gang of men who were engaged in re-sleeping the line at 57 miles 58 chains from Sydney both drivers felt their engines lurch; the train engine having, according to the evidence, lurched considerably more than the one in front of it, and, on looking back, the drivers observed that the mail-van next to the engine was off the rails, and that, after running for some distance in that manner, the lavatory carriage immediately behind it became derailed too.

The guard at the rear of the train also felt the lurch, and, on looking out to see the cause, noticed that the mail-van next his brake was also off the rails. The air-brake was immediately applied by both the driver of the train engine and the guard, but the train ran 25 chains after the first vehicle became derailed before it was pulled up.

The speed at the time the lurch occurred is estimated at from 30 to 35 miles an hour, and it may be here observed that the speed from Mittagong to the spot where the accident took place barely averaged 35 miles an hour.

The train parted in three different places, viz.:—Between the engine and mail-van, between the second and third vehicles, and between the mail and brake vans at the rear.

No one was injured.

The damage to the rolling stock is estimated at £50; in the permanent way 390 chairs were broken, and 15 sleepers rendered useless, the cost of which is, approximately, £45.

Evidence

Evidence.

William Cox, states:—I have been twelve years next month a guard, and seven of these on the express train; we were seven minutes late leaving Albury on the night of Tuesday, 22nd July; Melbourne train late; delayed fifteen minutes at Binalong Crossing through the down mail, which was running late; we had two engines on train, and left Mittagong at 9:57; train made up on leaving Mittagong—

Leading engine...	No. 273
Train "	" 271
Mail-van	" 2
Lavatory carriage	" 163
Composite "	" 89
First-class lavatory	" 165
Sleeping-car	" 16
" "	" 2
Mail-van	" 15
Brake-van	" 151

All being bogie vehicles with the exception of the two mail-vans; mail van No. 2 was attached next engine at Mittagong, and we left at 9:57 a.m.; did not stop anywhere till accident happened; the accident happened at 10:30 a.m.; I looked at my watch; after passing Picton Lakes I was looking out on right-hand side of brake-van, and turning round, a box of flowers came down and struck me on the shoulder, caused by the oscillation of train; before looking to see what was wrong—I knew there was something amiss—I applied the air-brake full force; I then looked out of the window and saw the mail-van next my brake was off the line; I did not notice any other vehicles off the line; when I put on air-brake I should think we were running at the rate of 30 or 35 miles an hour—not more; am a pretty good judge of speed; the train ran, I should think, 20 or 30 chains after the accident; the first thing I observed when I got out of my B van was that mail-van No. 15 was off the rails, and my B van, which was on the rails, had become detached; I am not sure whether the couplings were broken or not; I did not look, being anxious to attend to the passengers; I next called out to the car-conductor to see whether anyone was hurt, and went to fore part of train; at the end of the compo. 89 and lavatory carriage 163 the draw-bar was broken; I did not notice the side-chains; between these two carriages there were eight lengths of rails displaced; I found lavatory car No. 163 and M. van No. 2 were both off the road, and the engines were standing some distance ahead of them, so that the train was in four parts; the leading engine was sent on for some carriages, and the train engine went to Thirlmere; I am positive we were not going at 50 miles or over.

To Mr. Kirkcaldie: I have an idea that the buffers of lavatory carriage 163 were locked with mail-van No. 15, but I did not see any other carriage's buffer locked; I sent the conductor back to Picton Lakes to protect the train, while I remained by the train; I have never travelled 50 miles per hour down the grade where the accident occurred.

By Mr. Angus: I don't care for a four-wheeled vehicle on the express train; I have noticed more oscillation with the small vehicles; I did not pass any flagmen or see the man in charge of relaying gang; we have travelled 50 miles an hour in places between Wagga and Albury.

WM. COX, 24/7/90.

James Fergusson, driver of the leading engine on the up express, on Wednesday, 23rd July, states:—My engine, 273, four-wheel coupled, was in good order; I left Mittagong at 9:55 a.m., being twenty minutes late; we did not stop anywhere; on approaching the place where the accident happened I sounded the whistle, and they all cleared away; when passing over the place where the men were at work I felt a nasty jar right side of engine, as if there was a bad bit in the road; looked back immediately to see if the train was coming, and saw the ballast flying; the brake was immediately applied by the train engine; I could not say how far the train ran before it was stopped; when the train did stop, I went back and had a conversation with the guard regarding the passengers; at the time the accident happened I am of opinion that we were travelling at a speed of from 30 to 35 miles an hour; there were three vehicles off the line altogether—the first was mail-van No. 2, second lavatory carriage No. 163, third was mail-van next the brake with overland mails; the mail-van loaded with milk was the first to go off the road; I noticed that the train ran a considerable distance before the next one left the rails; the draw-bar broke between the lavatory carriage No. 163 and the composite carriage No. 89.

To Mr. Thow: The couplings between the train and the second engine jumped off in consequence of the derailment of the mail-van, and the iron pipe for the air-brake broke; the flying gang were at work where the accident occurred; did not get any signal; I challenged them by whistle; did not see any flag; I did not go back to see how the road was after the accident.

To Mr. Angus: Slight curve where the engine left the line; I did not notice anything wrong with the road before I felt a severe jerk; have been a driver here thirteen years; have felt a severer lurch, and train has not left line; there were a large number of men at work where I felt the jerk; no flagmen out, and I was not slackened in any way; examined my engine before leaving Goulburn; the mail-van first left the road; have never heard of such a van being off the road before; it is customary to put on at Mittagong a similar vehicle every morning.

To Mr. Kirkcaldie: Did not notice whether any of the buffers were locked after the accident.

To Mr. Angus: Was not exceeding 30 or 35 miles an hour at time of accident; could not see anything wrong with engine; the jerk would be on inside of curve on the right-hand side of the engine.

To Mr. Thow: Was not slackening at time accident occurred; after passing Picton Lakes we check speed; consider the road brought about the accident.

To Mr. Kirkcaldie: Did not notice any buffers locked.

J. S. FERGUSSON, 24/7/90.

The buffers were in a direct line at Mittagong.

Ebenezer

Ebenezer Ingleton : I was fireman to driver Ferguson assisting engine of up express yesterday ; have been two-and-half years a fireman ; have frequently run on the express, ran from Goulburn yesterday ; we left Mittagong at about 9:55 or 9:57 a.m. ; did not stop anywhere after leaving Mittagong ; we came down on a bit of level road and saw a number of fettlers working there and driver whistled, and they got out of road ; did not see any signal of any kind ; the road looked alright ; felt the road rough about 20 yards from where the men were at work ; my driver seemed to put the air-brake on a bit ; at the same time I put engine brakes on hard and driver sang out to stop ; driver looked back as soon as he felt engine jump ; I did not notice anything more till train was brought to a stand ; I remained on engine while driver went back ; the engines had become detached from the train ; when the driver returned to the engine we proceeded to Thirlmere with the tablet, and went on to Picton with tablet, and to see whether there were any carriages there ; after that went on to Douglas Park with tablet and returned to Picton, and then took part of the carriages which had come by the 9:30 a.m. train from Sydney into which passengers were transferred at the scene of the accident ; I could only see two carriages detached from the train ; I think we were travelling at 30 or 35 miles an hour, not faster than usual ; when the accident happened I think we ran a $\frac{1}{4}$ of a mile after feeling the jerk.

EBENEZER INGLETON, 24/7/90.

Joseph Paul states :—I have been a driver about ten and a half years, principally on the Southern Line ; have been running the express and passenger trains for the past four months between Sydney and Goulburn ; I was driver of the up express from Goulburn to Sydney on Wednesday, 23rd July ; at Mittagong we attached a mail-van next to my engine, and left there at 9:55 a.m. ; did not stop anywhere after leaving Mittagong till accident occurred ; slackened down at Picton Lakes to pick up tablet ; I saw the men at work at the foot of the 1 in 40 grade on a straight road ; there were about eight or nine men on my side of engine ; I heard the whistle from leading engine as a warning for the men to get out of the way ; I noticed, within a very few yards where the men were at work, I felt the surging of the engine to such an extent that I thought she was off the road ; did not see any signal exhibited ; I think we were travelling at about 35 miles an hour, not faster ; when I felt surging of engine was running with steam off, applied the air-brake ; when I looked back I saw that the milk-van next the engine was off the road, but no others ; then we ran some considerable distance before the lavatory, next the mail-van, left the road ; the draw-bar between the second and third vehicles from my engine was broken, and the hose of air-brake was uncoupled ; we must have run between 20 and 25 chains after we saw the mail-van off the road ; I cannot account for train running 20 to 25 chains, but I had the air-brake applied and sand running ; the next thing I noticed was that the coupling had become disconnected ; the side chain was broken, also the air-pipe on the train engine was broken ; the engines when they came to a stop were about 50 yards in front of the mail-van ; went back to see if anyone was hurt (driver Ferguson and I), and guard made arrangements with fettlers to go back and protect the train ; the guard then arranged with driver Ferguson to go to Picton for carriages, while we went on to Thirlmere and was put in siding in order to let the break-down train pass ; I went back to place where milk-van first left the rails, and found the road out of line ; I am of opinion that the road was soft when the first engine passed over it, and that put it out of line, which I think accounts for my engine rolling about when we passed over the spot ; I noticed that the permanent-way men had been at work putting in new sleepers at the place where the accident occurred ; the ballast had been removed away from sleepers ; I spoke to some of the permanent-way men and they seemed to think the accident had been caused by the mail-van ; my engine was disconnected from the mail-van, then the lavatory was disconnected from the Redfern type carriage ; the draw-bar of the lavatory carriage was broken ; I did not see any other part of the train, but was told the couplings had parted between the mail-van and brake-van at the rear of train ; the only vehicles which were off the road were the mail-van, next the engine, the lavatory-carriage next, and the mail-van immediately before the brake-van ; I didn't notice any of the buffers locked.

To Mr. Thow : When I went back to examine the road I noticed 25 chains bare of ballast ; I think the accident was caused through the bad state of the road where it occurred ; the men have been relaying four months, from Picton up ; could not say how long the men have been working at this particular place ; the air-brake gripped as soon as it was applied ; between the derailed portion of the train and that on the line, it was about 65 feet, I think ; I applied the air as soon as I felt the lurch ; I noticed lavatory-carriage come off.

To Mr. Angus : I did not take particular notice of the position of the buffers between engine and mail-van at Mittagong. On the right-hand side I received the jerk first ; there were a larger number of men than usual at the place ; was on the right-hand side of engine when jerk was felt on straight road ; there were 50 yards between engine and mail-van ; I ran a considerable distance after I felt the jerk—about 25 chains ; I felt the leading engine-brake go on ; I last travelled over this part of the line with the same train on Saturday morning last ; the sleepers were bare ; have never been slackened with a flag at this place ; when we left the line it was 10:29 ; left Mittagong at 9:55 ; the brake was in good order in coming down the inclines—of 1:30 from Mittagong.

JOSEPH PAUL, 24/7/90.

Henry Alfred Bennett states :—Have been a fireman for this last seven years ; have been employed on Southern Line for about eighteen months between Sydney and Goulburn ; I was fireman of the train engine of express on Wednesday last ; at Mittagong a mail-van was attached to my engine and the shunter attached all the couplings ; the driver looked at the couplings ; we left Mittagong at 9:55 a.m. with an assistant engine in front ; after passing Picton Lakes some distance the first thing I heard was a whistle, and saw the fettlers stepping back from road ; the next thing I noticed was the leading engine oscillating, and then felt our engine oscillate too ; was looking out at the time ; driver remarked to me that it was very rough, and at once applied the air-brake while I applied the engine hand-brake and opened the sand ; I then looked behind and saw that the mail-van next my engine was off the rails ; the lavatory carriage next the mail-van did not leave the rails till sometime afterwards ; I think we ran about 20 chains after brakes were applied ; I think speed was 30 to 35 miles an hour at this time ; did all in our power to stop the train ; the soft place in the road was about 10 yards from where fettlers were standing ; the driver got off the engine and went back whilst I stopped to fill the boiler up ; while the driver was away I got down and looked at the couplings, and I noticed that the air-pipe on the tender was broken

broken and one side chain of the mail-van hanging to the side chain of the tender; the main coupling was hanging on the hook of the engine, having jumped off; the mail-van was about 30 yards from my engine; I noticed that the train had parted again between the lavatory and Redfern carriages (Nos. 163 and 89), but did not see any other parting in the train; we went down to Thirlmere and got into siding; there were no signals out for us coming down; after the train stopped I noticed that the buffers between lavatory carriage and mail-van were locked; did not see any others; could not say where milk-van left the road.

HENRY A. BENNETT, 24/7/90.

John Reeves states:—I was driver of an up special goods which left Mittagong at 8.30 a.m. on 23rd July; I passed Thirlmere at about 10.5 a.m.; speed was about 15 to 25 miles an hour after passing Thirlmere; did not notice any soft place where men were relaying; I saw John Sladen, relaying ganger, coming back with a flag, as if he had been out; I did not see a flag-man on the Sydney side of the men; I was driving engine 204, inside cylinder; I thought line in good order, with good top,

JOHN REEVES, 24/7/90.

Thomas Cornthwaite states:—I am Chief Inspector of the southern division of permanent-way, and I have been rerailling and resleeping a portion of the permanent-way between Picton and Picton Lakes; have not been doing the resleeping under the slackening notice; flag-men have been placed, and recalled when road has been made safe; I examined the road about a fortnight ago; the sub-inspector (White) has taken his instructions from me; the relaying ganger has been carrying out my instructions through Sub-inspector White; I am satisfied that if those instructions were carried out there was no fear of accident; have had no trouble to keep the embankment up at the place where the accident occurred; there are from 6 to 7 inches of ballast under the sleepers; width of ballast on formation about 11 feet wide, or 1 foot at each end of sleeper; the ballast is clean sandstone; I consider that the road was well packed, in fact as well as any man could make it; trains could travel at any speed they liked over the line where accident happened; my opinion is that the accident was caused through the milk-van between the engines and a heavy train—I don't think that the road had anything to do with it; have been an inspector since 15th April, 1878; I have had derailments before; I never remember seeing one of these small vans on a fast train; have never heard of them oscillating very much; I consider Ganger Sladen an experienced man for relaying and resleeping; I do not know that he has had any accident before; I saw this particular spot about a fortnight ago, and examined the line about 2.40 p.m. on the day of the accident; Sladen has never represented to me that the speed was too great for the road until yesterday; I did not consider it necessary for a slackening notice to be issued; when I saw the road at 2.40 p.m. yesterday it was safe to pass trains over at any speed, but, of course, I could not tell what condition it was in at the time of the accident; I don't think it would be better for the flagmen to remain out all day when resleeping.

THOMAS CORNTHWAITE, 24/7/90.

John White: I am Sub-inspector of permanent-way from Picton to Tarago; have been resleeping the portion of line where accident happened having been previously rerailled; we are resleeping between 57 and 58 miles without slackening notice, and at the time of the accident there were no flagmen out, as the inspector states he had made the road right, and had recalled the flagmen; I think we have put in about sixty sleepers a day; have been doing this work without a slackening notice; have had flagmen out in both directions till the road was made good; have no idea how many sleepers the ganger had put in on the morning of the accident; have recalled flagmen when road has been made good; this is the practice; the ganger has no other instructions than those contained in the rule-book; I was at Wangello, and proceeded to the spot as quickly as I could and arrived there about a quarter to 3; the ganger had not touched the line only where it had been knocked out of line by the accident; I walked over the line and saw that the sleepers were very fairly packed underneath; I am of opinion that the road was good enough to carry a train running at 40 miles an hour; cannot account for the accident; should think train was running considerably over 40 miles an hour to cause the accident.

JOHN WHITE, 24/7/90.

John Sladen states:—I am the ganger in charge of the relaying gang; have been relaying road; have been putting in sleepers; have not had a printed slackening notice, but flagmen have been out 800 yards on all occasions; had just called flagmen in before express came, as I considered road safe; have sixteen men at work; could not say how many sleepers had been put in—average, eighty a day; more than a foot of ballast was under the sleepers; the ballast extended 2 ft. 6 in. from the end of sleeper; ballast is sandstone; road was well packed and in line, and consider it was safe; might carry a train at 35 miles an hour; do not consider it safe for greater speed; I noticed the road go out of line when the train passed; should say speed was not less than 50 miles per hour; I think the train was going excessively fast; the carriages and engine were oscillating; I noticed the milk-van attached to second engine leave the rails first; it was on an embankment where the engine lurched; it is a soft formation; there is sand in the bank, and therefore I should think it is soft; have had no difficulty in keeping a top on the road; after a fast train has gone over it I have seen it go slightly out of line, both in cuttings and embankments; I saw the van leave the road, the front wheels first; did not notice the back wheels leave the rails then; the train ran about 25 chains after the carriages left the road; the milk-van got off the road at 57 miles 58 chains, and train stopped at 57 miles 32 chains; I am a judge of speed, and consider train was travelling at 50 miles an hour; have seen trains travel at this speed before; I do not think that the road is fit for a train at a greater speed than 35 miles an hour, and yet it is pointed out that the express is timed to run from Mittagong to Picton at a speed of 36 miles an hour, which points to the necessity for a slackening notice; have never reported that road was not fit for over a 30-mile an hour speed; would think I am correct in saying that train was travelling at

at 50 miles an hour at time of accident, in the face of the speed of 35 miles, as per time-table; I am quite sure that the train was travelling more than 35 miles an hour; I called the flagmen in about 23 minutes before express was due; the names of flagmen were Peter Moran and John Watson; the road was thrown about 6 inches out of line for a considerable distance.

JOHN SLADEN, 24/7/90.

Flagman Moran had been out since 9 a.m. when recalled; I have a full supply of flags and detonating signals; I did not say I could not signal train for want of them; Watson was the flagman in the other direction.

JOHN SLADEN, 24/7/90.

CONCLUSION.

We are of opinion that the accident was caused primarily by a defect in the permanent-way.

It is shown in the evidence that the first engine lurched heavily, that the second moved still further, and that in consequence of the depression or movement in the road the light vehicle immediately behind the engines jumped the track.

It will be seen from Ganger Sladen's evidence, however, that he considered the line so safe that he recalled the flagman, who had been out protecting the operations in the usual way, about 20 minutes before the express was due; and it may also be mentioned that he had some reason for this belief in the fact that an up goods train passed safely over the road, although naturally at a speed much slower than the express, about 20 minutes before the accident occurred.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(REPORT OF MR. E. B. PRICE, TEMPORARY EXAMINER OF PUBLIC WORKS PROPOSALS, ON
PROPOSED BRANCH LINE TO BALLINA.)

Ordered by the Legislative Assembly to be printed, 3 December, 1890.

Lismore to Tweed Railway.—Proposed Branch to Ballina.

Sir,

I beg to report that I have been through the district traversed by the route of this proposed branch to Ballina.

With the exception of the swamps about Ballina, the whole country is of the richest description, and when cleared and cultivated should yield large crops of sugar-cane and other semi-tropical products.

Owing to there being navigable water along the course of the proposed line for nearly half its distance, the wayside traffic in heavy goods and cane could never be great; and certainly at present the wayside traffic would not make a line pay working expenses.

All traffic which may be gained from the interior will be so much lost to the line between Lismore and Byron Bay.

As at present authorised the line will connect two ports, neither very good, but both capable of very great improvement.

It appears to me that Byron Bay, even in its present unprotected state, will get all the goods traffic from Murwillumbah, and also a portion of the traffic towards Lismore.

Lismore will get the remainder, but if this line is made it will go to Ballina instead.

Certainly passenger traffic would come that way, and save 75 miles of river journey from Lismore to Ballina; and this saving to passengers is about the only point in favour of the line.

When Byron Bay Breakwater is constructed (as it eventually will be) the whole trade of the district will be drawn to an outlet at Byron Bay. Passengers will then come by rail from Lismore and Casino to Byron Bay.

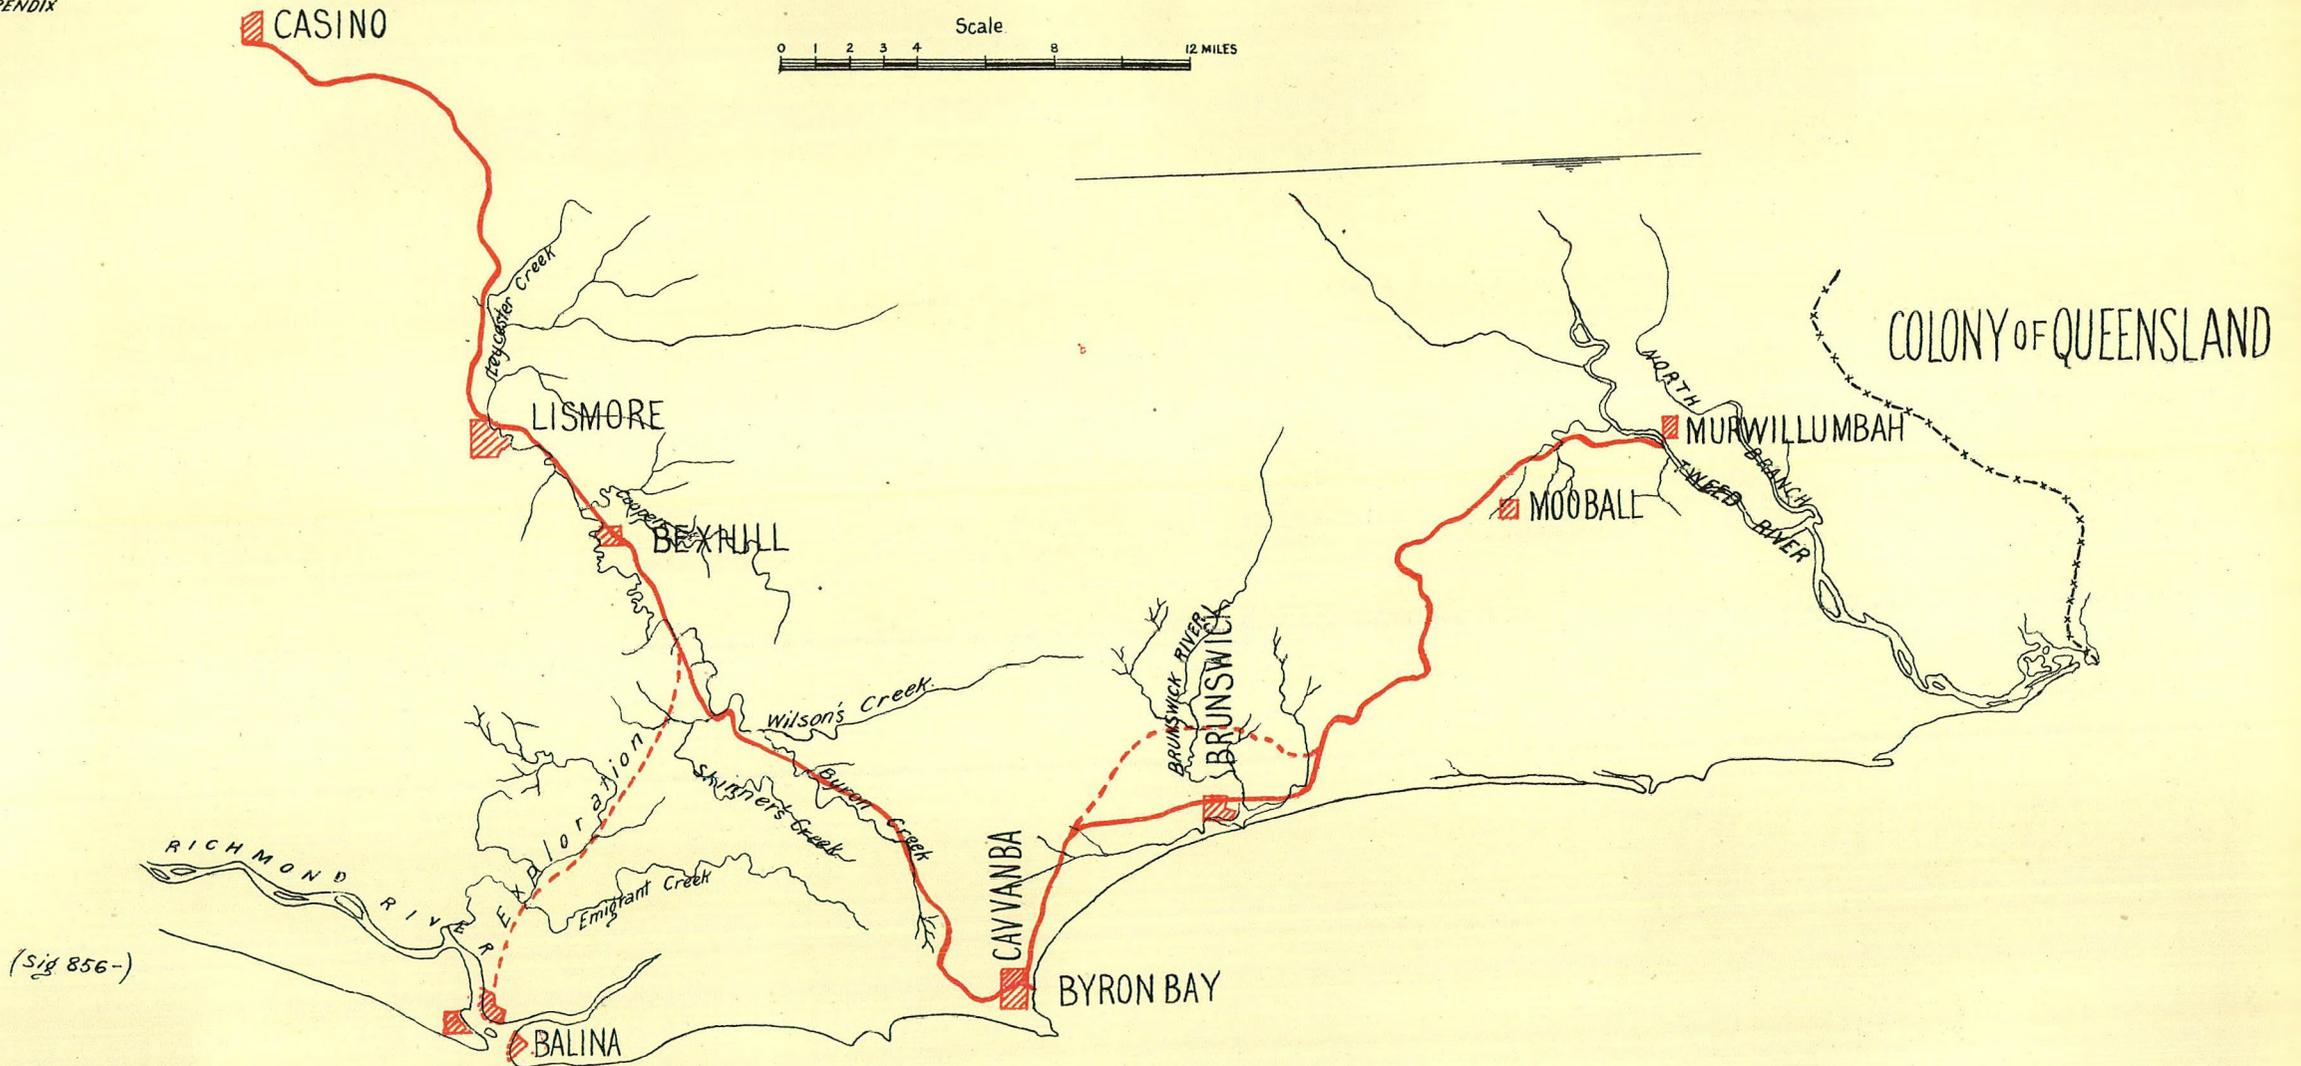

So that no traffic would remain for the branch to Ballina, unless what was derived locally.

The conclusion I have arrived at is that this line, though of benefit to Ballina, does not present sufficient advantages to warrant its construction at present.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(REPORT ON PROPOSED BRANCH LINE FROM BYROCK TO BREWARRINA.)

Ordered by the Legislative Assembly to be printed, 23 October, 1890.

Mr. P. Scarr to The Under Secretary for Public Works.

Proposed Branch Railway, Byrock to Brewarrina.

Sir,

Department of Public Works, 9 October, 1890.

In accordance with your instructions I went over this line, and made inquiry respecting it, and have the honor to report.

Route.

From Byrock, as far as Charlton Station, where the trial survey crosses the Bogan River, the line passes through undulating country, unaffected by flood, and free from engineering difficulties.

From Charlton to the crossing of the Tarrion Creek (an ana-branch of the Barwon), the country is all flooded to a greater or less depth—first by the overflow channels of the Bogan, and next by those of the Tarrion, the two waters meeting during floods.

Altogether, between these two points, there is 16 miles of flooded ground, where extensive openings and embankments would have to be provided, adding materially to the cost of construction, so that this line will probably not be found to be so inexpensive as might, from the level nature of the country, have been expected.

I am induced to draw attention to this fact from observing that through the papers and arguments in favor of the line, the very level nature of the country has been dwelt upon as a strongly favorable feature in the case.

Area to be served.

The proposed line would drain a tract of country within New South Wales approximately 100 miles square. Having Gongolgan as its most southerly point, and bounded on the west by the Bogan River to its junction with the Barwon, and thence by a line northerly to the Queensland border; on the north by the border as far as its intersection with the Narran River; and on the east by a line running south to the Barwon, at about 20 miles below Walgett; and on the south by a line thence to Gongolgan—an area of about 10,000 square miles. This piece of country is purely pastoral, and from it no produce can be expected other than that arising from pastoral operations. On it there are at present 1,158,000 sheep, yielding (say) 3,000 tons of wool.

In addition to this area within the Colony, the traffic from a considerable tract lying beyond the border would be drawn to Brewarrina.

A large quantity of wool already finds its way from Southern Queensland to the New South Wales Railways at Bourke and Narrabri; and it is claimed that Brewarrina, being so much easier of access than either of those places, this Queensland traffic would be largely increased by the proposed extension. So much so, that it is estimated the wool from more than 1,000,000 sheep depasturing in Queensland would be sent to the railway at Brewarrina.

This assertion is probably, in the main, correct; but not to over estimate, I would reduce the quantity by one-fourth, which would give, roughly, 2,000 tons wool to come from Queensland, making, with the 3,000 tons from within New South Wales, 5,000 tons of wool per annum to be trucked at Brewarrina.

It is, however, to be remembered that the greater part of this traffic already comes to the existing railways either at Narrabri or Bourke, and it would be only such additional traffic as the easier access to Brewarrina would draw from Queensland that could be considered new; in fact, to provide the traffic I have stated above for the proposed line, the existing lines must be made to suffer heavily.

It is claimed that Brewarrina is the natural outlet for the tract of country I have indicated, and that it is in both wet and dry seasons more accessible than either Bourke or Narrabri.

Taking Angledool for example,—I have a letter written by Messrs. Sherwin & Co., of Nulliwa, Angledool, wherein it is stated that a carrier who left Walgett in May last had not reached Angledool on the 30th August, when the letter was written, whilst one who left Brewarrina in July, delivered his loading at Angledool in five weeks, and "saved the people from a famine." What applies to Walgett would so, quite as strongly, to Narrabri. The distance from Angledool to Narrabri is 200 miles, whilst to Brewarrina is 100 miles.

As regards the outwards or return traffic to be expected, the lines of traffic are subject to so much disturbance that it is difficult to obtain any reliable estimate of the probable annual amount of goods to be sent out, and the figures are likely to mislead.

During wet seasons, when the rivers are navigable, the station supplies are obtained by steamers, and delivered at places along the river where most convenient, whilst during dry seasons they are sent by road direct from the railway stations.

Stock

Stock Traffic.

A large number of both sheep and cattle, entering this Colony from Queensland, at Barrington, travel by way of Brewarrina, and thence up the Bogan, on the Marra River, to Nyngan and Nevertire, and it is very probable that with a railway station a considerable number of these would be trucked at Brewarrina.

During 1889 there crossed the border, at Barrington, 95,926 cattle. Of these, between 60,000 and 70,000 crossed the Barwon, near Brewarrina, only 29,879 crossing at Bourke.

The numbers of Queensland cattle trucked at Nyngan and Nevertire I could not ascertain, as no record is kept at the railway stations of where the stock came from.

Of sheep, there entered this Colony at Barrington, during 1889, 97,948, but as they enter a district stocked with sheep it is not possible to trace them further.

There crossed Brewarrina bridge during that year 165,432 sheep.

These figures will suffice to show that a large traffic in stock exists at this place, and it is only reasonable to suppose that of these large numbers a considerable proportion would make use of the railway at the first point of contact.

Passenger Traffic.

It is not possible to obtain any reliable estimate of the probable numbers of passengers. The coach proprietors keep no record of the numbers travelling, and in any case that would be no reliable guide as to what might be expected on the railway. Nor is it likely the passenger traffic would be an item of much importance on this line.

It is chiefly from the wool, stock, and goods returns must be looked for.

Increased Settlement.

Since the Land Act of 1884 came into operation almost the whole of the available land in the Brewarrina Land District has been taken up under homestead lease. There only now remains east of the Culgoa four blocks available, and to the west of that river very little. 237 homestead leases have been taken in all.

This means an important increase to the population, and also, probably, a considerable increase to the production of wool, as the land will no doubt be made to carry a much larger number of stock than it did under the pastoral leases.

Need for improved access to Brewarrina.

This town does not present the appearance to a stranger of one rapidly increasing. There are no evidences of activity in building, but it was stated to me new premises for the Bank of New South Wales were shortly to be erected.

It is as a depôt from which supplies are distributed to the adjacent country it has importance.

In consequence of the bad road to Byrock, and the infrequency of the river being navigable, it is practically cut off from obtaining these supplies readily, and it is to remedy this evil the railway is asked for.

Both roads to Byrock—that *via* Gongolgan, and the more direct one *via* Charlton—are bad, and pass over a good deal of flooded country, making traffic most difficult in wet weather.

Material for road making is scarcely obtainable, and to construct a road would be most expensive.

The capitalized cost of constructing and maintaining the 55 miles of road between the two towns would be little short of £150,000.

Whether such an expenditure is ever likely to be undertaken it is not my province here to discuss, but, as has been pointed out by the Railway Commissioners, the choice between an expensive road and a railway is an aspect of the case worthy of consideration, apart from the commercial view of the question.

Possible Extension from Narrabri.

Should the North-western line be carried on to Walgett and the branch to Brewarrina also be constructed, these two lines would be in direct and commercially disastrous competition.

If, on the other hand, any extension from Narrabri took a more northerly course, say to Mungindi, the competition would not be so great.

The two lines would be merely bidding for the Southern Queensland traffic at different points, and practically no greater competition would take place than if the termini were at Brewarrina and Narrabri.

Conclusions.

Upon careful consideration of the case the conclusions I arrive at are:—

1. That upon the proposed line, if carried out, the traffic will be confined to the items of wool, stock, station and store goods, and a limited number of passengers. No agricultural produce is likely to be raised for many years.
2. That the proposed line upon its own merits affords a fair promise of sufficient traffic to make it commercially successful, as compared with similar lines running into purely pastoral country. But that such success must be at the direct expense of the existing lines. Of this there can be little doubt, as the area from which the traffic must come is already commanded by those lines.
3. That there is a fair prospect of a considerable stock traffic, which does not at present touch the railway until it reaches Nyngan and Nevertire, but that this new traffic in stock will be insufficient to compensate for the loss to the existing lines by the competition created in the wool and goods traffic.
4. That if in the policy of the Government any extension from Narrabri to Walgett is contemplated, the proposed Byrock to Brewarrina should not be carried out, as the two lines would be in ruinous competition.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(REPORT OF MR. E. B. PRICE ON PROPOSED COLO VALLEY LINE.)

Ordered by the Legislative Assembly to be printed, 19 November, 1890.

Mr. E. B. Price to The Under Secretary for Public Works.

Sir,

November 10, 1890.

In connection with my recent report on the Blacktown-Blayney and Richmond-Esk Bank alternative lines, I have the honor to submit the following short report on the Colo Valley Railway:

Not having gone over this route I can only judge of it from what appears in previous papers.

The line has been surveyed from Emu Plains to Rylstone on the Mudgee line; but I believe no survey has been made of the second section, from Mudgee to where it rejoins the existing line at Narramine; there appears to be little doubt that 1 in 100 grades, and 20-chain curves can be obtained right through, though at enormous expense.

Mr. Townsend estimates the cost at £3,500,000, but Mr. Whitton considers the line could not be constructed under £5,000,000.

The greater portion of the new country that would be opened up appears to be of little value—so the additional traffic which would be brought to the railway system must of necessity be small—too small in fact to do more than pay for the maintenance of the line.

Its principal traffic therefore would be derived from the area at present served by the existing railway, so that nothing is to be gained except what can be set down to the saving in carrying the extreme western traffic over a line with 1 in 100 grades and a lower summit level.

The cost per ton mile on the Colo Valley line would certainly be much less than on the existing Mountain line; and if only sufficient tonnage could be diverted over it, the saving in working expenses would, of course, finally warrant its construction.

But as only about one-fifth of the present western traffic could be diverted over the Colo line, the saving in working expenses would go but a short way towards paying interest on even £3,500,000 (Mr. Townsend's estimate).

And at the same time the present congestion of traffic would be very little relieved.

In the future, when the western system is extended to Broken Hill and South Australia, and the Darling District developed by irrigation, the traffic from the extreme west will probably become so great as to justify the expenditure of a large sum in order to obtain a really good line with flat grades.

From the nature of the mountain ranges it would seem to be impossible that such a line can be obtained, except by enormously expensive works.

It is not in my province to look for new lines but simply to examine those schemes submitted to me, and no scheme has yet been brought under my notice which offers equal advantages to the proposal to duplicate and improve the mountain section of the existing railway.

Even should a suitable alternative line be afterwards discovered the money spent in duplication would not be lost, as the mountain traffic alone will, before long, become too great for a single track. Map appended.

I have, &c.,

EDWD. B. PRICE.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(REPORT OF MR. P. SCARR ON PROPOSED LINE FROM GALONG TO BURROWA.)

Ordered by the Legislative Assembly to be printed, 19 December, 1890.

Department of Public Works, Sydney, 8 December, 1890.

Proposed Railway from Galong to Burrowa.

The Under Secretary for Public Works,—

Sir,

In accordance with your instructions I have the honor to submit the following report upon the proposed line of railway from Galong to Burrowa.

Area to be Served.

This will be comparatively limited, extending from Kalangan (half-way between Galong and Burrowa) on the south, to Numby and Kenyu on the north; Rye Park and Narrawa on the east, to Calabash and Douglas on the west,—an area of about 750 square miles.

Beyond these places the traffic would go southward to the Great Southern Railway, eastward to Goulburn and Gunning, northward to Cowra, and westward to Young.

It will thus be seen the existing railways practically so drain the outlying portions of the district that no traffic can be expected from distant places, as in other places where branch railways have been constructed.

No back country would be drained by this line. The district itself would have to entirely support it—that is the area I have named above.

And further, if the proposed extension to Crookwell be eventually carried out an additional slice of the traffic from the east and north-east will in all probability be filched from Burrowa.

Nature of the Country.

I have traversed a considerable part of the Burrowa district in several directions and followed the course of the line between Galong and Burrowa.

The country through which the line passes as well as that in the vicinity of Burrowa is of good quality and a large proportion fit for agriculture.

Such as is not adapted for that purpose may be called superior grazing country.

This character prevails for some miles in every direction round the town, but to the north and east the land gradually becomes more hilly, whilst to the north-east a good deal of rough broken country exists, having only a small proportion fit for agriculture, chiefly along the banks of the creeks, where some good alluvial flats exist.

Size of Holdings.

At present the land is generally held in large estates, ranging up to 10,000, 13,000, and even 25,000 acres. These are within 20 miles of the town of Burrowa fourteen or more estates of 5,000 acres and over, besides numerous others between 1,000 and 5,000 acres.

The average size of the holdings in the electorate is 883 acres—a high average as compared with others in the eastern division. These estates are used almost entirely for grazing purposes.

The holdings used for agricultural purposes are small and comparatively few in number.

It would appear that in years past a much larger number of selectors existed in the district, and that for some years a process of absorption of the small holdings into the large estates has been steadily going on until the result as stated above has been reached.

On the whole, the agricultural industry throughout the district is evidently languishing, with little prospect, so far as can be seen, of a revival.

Agriculture.

The total area cultivated in the whole of the Burrowa Electorate for the year ending 31. March, 1890, is given in the Statistical Register as 8,655 acres, being but 1.98 of the total area alienated, or 0.89 of the whole area of the electorate.

The wheat produced being 78,403 bushels, besides other produce which appears to have been only sufficient to supply local wants.

In the article flour it does not appear that the one local mill now at work has been able to compete successfully with those on the existing line of railway.

The flour produced has been used principally for home consumption.

As an agricultural district, then, Burrowa does not compare favourably with other districts having a similar climate and position.

The following table will afford an easy reference for comparison with some of these districts :—

District	Distance from Sydney.	Proportion of Land Cultivated to Area Alienated.	Area Cultivated.	Remarks.
	Miles.		Acres.	
Carcoar	181	4.82	33,023	
Gundagai	287	4.53	35,647	
Young	249	6.33	57,994	
Orange	192	11.67	31,248	
Tumut	307	2.78	11,396	20 miles from rail.
Inverell	466	4.38	14,453	45 " "
Burrowa	232	1.98	8,655	16 " "

Of the sixty-two country electorates Burrowa stands forty-first on the list, both as to the proportion of land cultivated and to the average size of holdings.

These statistics will give some idea as to the position of the agricultural industry in the district at the present time.

As a source of remunerative employment to the proposed railway it affords little encouragement. And unless it can be shown that an extensive change would be likely to take place as a result of the opening of the line traffic must be looked for from some other sources.

Prospective increase in Agriculture.

It has been asserted that the cause of the present position of things has been brought about by the absence of railway communication with a market for produce—and that with the construction of the proposed line the present position of things would be so altered as to cause large areas of land to be placed under cultivation; either by the division of the larger estates, by sale or lease, amongst agriculturists or by the present holders themselves cultivating on a large scale.

After careful investigation and consideration, and comparing the position of this district with others in which agriculture has been successfully carried on, I have come to the conclusion that sufficient grounds do not exist for these expectations.

As a matter of fact a large quantity of the best land in the Burrowa district lies between that town and the railway line at Binalong and Galong and yet is not largely cultivated.

Burrowa, itself surrounded by excellent farming land, is but 16 miles from Galong and 20 from Binalong—not a sufficient distance to bar profitable cultivation entirely.

Take the case of Tumut; where maize is grown to the amount of 231,468 bushels per annum and sent by road in large quantities to Gundagai Railway Station (20 miles) for the Sydney market.

Whilst it will be found upon inquiry, that in the other districts referred to above, grain and other produce are carted long distances to the railway.

Only two of the railway stations of the districts quoted are nearer Sydney than Binalong and Galong.

It would not appear then that to the distance from the railway is the absence of cultivation to be attributed, but more likely to the fact that the land can be applied more profitably to sheep farming by capitalists than to agriculture by others.

And instead of the large estates being subdivided or placed under the plough, instances are not wanting to show that the reverse is taking place, even along with the existing railways.

In the Burrowa Electorate during the last few years the immense Bendinine Estate, having the Great Southern Railway running through it, has been accumulated by the aggregation of the smaller holdings and by selection.

The selectors have been bought out and farms added to the estate until now, as I am informed, it consists of considerably over 50,000 acres. A large quantity of the land being eminently adapted for agriculture.

The whole tendency throughout the Colony seems rather to be in the direction of the accumulation of large estates than the breaking up of those already existing, and there is no apparent reason why the Burrowa district should form an exception.

At the sale of the Ballyryan Estate near Burrowa twelve (12) months since, the principal purchaser was an adjoining land owner who bought largely and now uses the land entirely for grazing purposes.

Instances of landholders cultivating for market on an extensive scale are exceedingly rare throughout the Colony.

Nor are cases where leasing of land for this purpose prevails numerous.

The principal exception, and almost the only one, is on the Bathurst Plains, unless it be where very rich alluvial land along river banks are used for special purposes.

I have dwelt at some length upon this question of the extension of agriculture, as a possible result of the construction of the proposed railway as it appears to be the key to the whole question.

Wool and other Traffic.

The district to be tapped is now heavily stocked with sheep, on many of the estates up to one and a quarter to one and a half sheep per acre, and the chief product of the district consequently is wool.

There was received from the Burrowa district at Binalong, during the year ending 30th September, 1890, 502 tons wool, and at Galong 169 tons.

Allowing for some increase in the quantity from places which now send wool to Goulburn, Cowra, and Young, yet no substantial increase can be expected in this item of freight.

The present quantity may be therefore almost taken as a fixed quantity.

The extension of the line to Crookwell would be to some extent competing with the extension to Burrowa.

Mineral Traffic.

A good deal has been said as to the probable traffic from the mines of the district.

The principal one is the Wallah Silver Mine, 20 miles east of Burrowa.

I visited and went through the workings of this mine, and so far as can be seen and judged by one who is not an expert, there appears to be a large body of ore available.

Of its value I do not presume to offer any opinion. The shareholders however, appear to be very sanguine as to the ultimate results of their operations.

If their expectations are realised no doubt the mine will support a considerable number of people, and produce a corresponding amount of traffic.

But so far the eventual success of the venture does not appear so well assured as to make it an important factor in the present question.

At Frogmore, 10 miles north of Burrowa is a copper mine at present being worked. This I did not see.

This mine was first opened some fifteen years ago, and after several attempts to work it, which for certain reasons proved failures, operations were renewed by the present owners who are sanguine as to their prospects, which are reported to be very favourable.

So far there is not yet sufficient development to prove the ultimate success of this venture, as a means of support to a large population.

Passenger Traffic.

This is a difficult item to estimate. I have credited Burrowa with two-thirds of the total tickets issued at the two stations for the year.

Summary.

The whole question of the prospect of the proposed line proving a financially successful undertaking must depend upon how far it would have the effect of improving the industries of the district to be tapped.

It has been shown that at present the land is held in large estates which are used as grazing farms, and that little agricultural produce is at present available for export.

No other industries exist on a scale worth bringing into consideration.

Therefore the chief product is wool; and as the land is already stocked up to, or nearly up to, its full carrying capacity, little or no increase can be expected in the quantity of wool to be produced.

To the increase in agricultural operations, then, must be looked such an increase in freight as will afford remunerative employment for the railway, unless the mines of the district are so developed in the future as to provide a means of living for a population to come in from outside.

This last probability is so uncertain as to make it unwise to at present take it into consideration.

The question then presents itself: Is there such a prospect of the district being so devoted to the pursuit of agriculture as a result of the construction of the railway that a payable traffic will arise from that source?

From no other source does it appear at present is such a traffic likely to be obtained.

The result of my inquiry leads me to the conclusion that this is not likely to come to pass.

Conclusions.

After careful consideration, and being guided by the experience of what has taken place in other parts of the Colony I arrived at the following conclusions:—

- 1st. That the present traffic is altogether insufficient to provide even for working expenses.
- 2nd. That the traffic would not increase sufficiently within a reasonable time to return working expenses and interest upon the cost.
- 3rd. Therefore that for years the line, if constructed, must be run at a heavy loss, even if it should ever become payable, which, from the small area to be drained by it, is very doubtful.
- 4th. Consequently, looking at the question from a commercial point of view, the railway should not be carried out.

I have, &c.,

PERCY SCARR.
Proposed

Proposed Railway Galong to Burrowa.

Traffic Burrowa to Binalong and Galong, to and from, during year ending 30th September, 1890.

Estimated revenue per annum :—							£	s.	d.
Interest at 3½ per cent. on capital expenditure	3,419	0	0
Working expenses	3,780	0	0
Total ...							7,199	0	0

1890.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(REPORT OF COMMISSIONERS ON PROPOSED LINE, WAGGA WAGGA TO TUMBERUMBA.)

Ordered by the Legislative Assembly to be printed, 1 May, 1890.

Proposed branch line of Railway, Wagga Wagga to Tumberumba, 65 miles.

Sydney, June, 1889.

IN accordance with section 13 of the Public Works Act, 1838, we beg to report as under:—

<i>Cost of construction.</i>	
The Engineer-in-Chief estimates the cost of construction of a single line of railway, exclusive of land and compensation, at	£700,000
<i>Annual cost.</i>	
Interest on cost of construction, at $3\frac{1}{2}$ per cent.	£24,500
The cost of working the line would be as under:—	
Traffic expenses	£1,366
Permanent-way expenses	8,125
Locomotive expenses	3,300
	12,791
Total annual cost	£37,291

The district through which the proposed line passes is very fertile, and no doubt capable of considerable development if supplied with railway communication to a market.

With regard to the revenue which is likely to be derived in the near future from the line, if constructed, no reliable statement can be made. Not many months ago the question was gone into by the Traffic Branch, and an estimate given of £8,610 per annum from all sources. Assuming that this is 50 per cent. below what might prove to be the actual result, even the increased amount would but pay working expenses, leaving the railway revenue from other sources burdened with the payment of £24,500 per annum for interest on the cost of construction, to which must be added a considerable sum for the interest on the cost of resumption of land and provision of rolling stock.

In view of other extensions into agricultural districts at a much lower cost already favorably reported on and from a commercial aspect, the construction of the line cannot be recommended until the railway revenue is in position to bear so large an additional burden.

If the line is made at some future date we consider that the residents in the district should combine together to have the land necessary for the construction of the line conveyed to the Department free of cost, and that a substantial sum derived from the enhanced value of the Crown lands should be credited to the cost of construction.

1890.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAY EXTENSION—NORTHERN DISTRICT.

REPORT BY MESSRS. SCARR AND PRICE.)

Ordered by the Legislative Assembly to be printed, 17 September, 1890.

Department of Public Works,
Sydney, 31st May, 1890.

MINUTE PAPER.

RAILWAY EXTENSION—NORTHERN DISTRICT.

THE Minister desires Messrs. Scarr and Price to at once proceed to undertake the following inquiry in connection with Railway Extension in the Northern districts of this Colony.

The first matter for determination is the best way of connecting Inverell with the Great Northern Railway, for which the following points of junction have been proposed, viz. :—

- (1) Glen Innes.
- (2) Guyra.
- (3) Uralla.
- (4) Kentucky.

It will be necessary to give these routes the most careful investigation, with the view of determining which of them presents the promise of securing the most favourable results in the general public interest.

The second branch of the inquiry will embrace the consideration of the question as to the best means of connecting the Great Northern Railway with the proposed coast line. For this purpose the following routes have been suggested, viz. :—

Tenterfield to Casino,
Glen Innes to Grafton, and
Guyra, *viâ* the Don Dorrigo Scrub, to Grafton.

The third matter for attention is the connection between Guyra and the Coast about Coff's Harbour.

The merits of the proposed line from Tamworth *viâ* Manilla towards Inverell should also be inquired into.

The

The placing of these instructions under distinct headings must not be taken to imply that the different sections are each independent of the other. On the contrary, every branch of the inquiry must be looked at from the standpoint of its relation to the others. For instance, in taking up the subject of the connection of Inverell with the Great Northern Railway, regard must be had to the trend of its traffic, whether to Queensland on the one hand, or to the coast on the other. This will then bring in the question of the connection of the Great Northern Railway with the proposed Coast Line, either *via* Tenterfield or perhaps Guyra; and in the event of Guyra being found to afford the best means of connection, that may be taken as determining the best connection between Inverell and the Great Northern Railway—that is to say, if the trade of Inverell is likely to find its outlet (say) at the Clarence or Coff's Harbour. This must not be taken as an indication of what may be the solution of the question, but merely as showing the inter-dependence of one branch of the inquiry on the others.

In carrying out these inquiries, Messrs. Scarr and Price should carefully abstain from expressing any opinions on the subject-matter of their inquiry, but they are empowered and enjoined to obtain every kind of information bearing on the questions submitted to them, from whatever sources may be available. No statistics should be regarded as data which have not been carefully verified; and, in fact, the inquiry should be of such a character that whatever the conclusions arrived at may be, it should not be in the power of anyone to say that the whole of the facts have not been collected.

All available office plans and papers will be placed at their disposal.

These instructions are purposely given in outline only, with a view of leaving the freest scope to the judgment of the Officers selected to carry out the important work entrusted to them.

J. BARRING.

RAILWAY EXTENSION—NORTHERN DISTRICTS.

The Under Secretary for Public Works.

Sir,

Department of Public Works, Sydney, 12 August, 1890.

We have the honor to report that, in accordance with the instructions contained in minute No. 1,672 of 31st May, 1890, we proceeded to the Northern Districts to prosecute the inquiry forming the subject-matter of these instructions.

As our instructions stated we were "to investigate with the view of determining which of the routes submitted, presents the promise of securing the most favourable results in the general public interests," we understood that we were to examine and report in a comprehensive manner upon the whole question, having regard rather to its commercial aspect than to enter into a discussion on the engineering merits of rival lines.

To do which thoroughly would require a great expenditure of time, with a view to discovering possible improvements, and would be trespassing unnecessarily on the duties of the Railway Construction Branch.

We trust then this report will be taken as an expression of the views of two independent and unprejudiced persons, engineers, who have gone carefully over the whole district, and looked at the question from every outside standpoint, but who, not having at the time seen the plans or sections of the lines, had no means of judging the engineering merits of any line further than by the knowledge gained from following its route as closely as possible, and from a rough statement furnished to them of the estimated cost, length, curves, and grades of some of the lines; and have, therefore, gone only briefly into engineering matters.

The necessity for this plea will be the more apparent when it is borne in mind the great extent of country travelled over, and that the survey of one of the most important lines is not yet completed.

An inspection, since our return from the field, of the existing plans and sections of the several lines has given us no reason to in any way modify our views.

We went over each of the several routes of proposed railway lines referred to us, examining the land passed through, and as far as possible the adjacent country—trying to gather from every source available all information bearing at all upon the question.

With this aim we invited the heads of public bodies, such as Municipal Councils, Progress Committees, &c., as well as the residents generally to make such statements as they might wish, and to furnish us with evidence for or against any proposed route.

And in order to afford every facility for their so doing, we arranged for interviews with those bodies collectively, and with the residents individually—noting the statements made and evidence furnished.

So that we consider no person can justly say that full opportunity has not been afforded for bringing forward any evidence or statement in support or otherwise of any particular line.

And here we might remark that we were met at the outset with this difficulty, namely, a disinclination on the part of the people to undertake the labour of again supplying the same statistical information, &c., they had already furnished to various officials and Government Departments.

Again, some statements made to us proved, on investigation, so utterly biassed and unreliable that we had, whilst refusing to hear no one, to put a good deal of what was stated aside, and trust largely to our own observation, and to information derived from disinterested persons.

At

At the same time we feel called upon to recognize the great trouble taken by some of the public bodies and private individuals in the matter, and the large amount of information they supplied us with.

In this report we do not propose furnishing a mass of statistics to show the probable traffic of any particular line or lines either for comparison or otherwise, for the reason that the whole traffic area under consideration is of such a comparatively untouched character that it appears to us any comparative calculations, based on present statistics, would be misleading, and no guide as to future traffic development.

The whole question of production and the consequent traffic must be very largely speculative, and can only be estimated from an investigation of the apparent capabilities of the country passed through and the facilities offered for settlement.

With this view then, we propose to give a detailed description of the nature of the country along each route separately as to its fertility, present and latent resources, settlement, and trend of traffic, and afterwards to summarize the whole, and state such conclusions as appear to us may be fairly drawn.

The routes travelled over by us were as follows:—

1. Guyra, <i>via</i> Tingha, to Inverell	55 miles.
2. Glen Innes, <i>via</i> Swanbrook, to Inverell	41 $\frac{3}{4}$ "
3. Glen Innes, <i>via</i> Wellingrove, to Inverell	41 $\frac{1}{2}$ "
4. Inverell, <i>via</i> Bundarra, to Kentucky	52 $\frac{3}{4}$ "
5. Inverell, <i>via</i> Yarrowick, to Uralla	80 $\frac{1}{2}$ "
6. Guyra, <i>via</i> Don Dorrigo Scrub, to South Grafton (estimated at)	145 "
7. Grafton, <i>via</i> Newton Boyd, to Glen Innes	102 "
8. Tenterfield, <i>via</i> Fairfield and Tabulam, to Casino	86 "
9. Inverell, <i>via</i> Bingera and Barraba, to Tamworth	147 "

We also inspected the country adjacent to Coff's Harbour, with a view to a connection between the Guyra and Grafton line, and the coast at that place.

Of the routes named, the surveys of No. 6, Guyra to Grafton, and the Coff's Harbour connection have not yet been completed. The former is in progress, but there remained, at the time of our visit, an interval yet unsurveyed of (say) 40 miles, between Guy Fawkes (to which point Messrs. Jamieson and Thornbury had worked from Guyra), and the head of Tallawadja Creek, near Glen Reagh, to where Mr. Cumming had surveyed from Grafton.

The connection between the Guyra-Grafton line and Coff's Harbour had not yet been even explored.

Of these unsurveyed portions then we can only speak in general terms from an inspection of the intervening country.

Guyra to Inverell.

Statements much at variance with facts have been persistently made by some of the opponents of this route, as to the quality of the land over which it passes. It being freely described as "worthless," "thoroughly rotten," &c.

On the contrary, though a considerable portion of the country traversed by the line is of very inferior character for agricultural purposes, the wholesale condemnation of the country is certainly not justified.

From Guyra, for a distance of 8 miles, the soil is of a rich red volcanic nature, capable of producing heavy crops of cereals, &c., suitable to the climate.

Thence to Wade's selection, 3 miles west of Tenterden and about 23 miles from Guyra, the land consists of black alluvial flats and volcanic ridges.

This class of country extends for some miles on either side of the line. On the northern side merging into the Ben Lamond Range, and on the south into the high granite country bordering on the Bundarra River.

From the point last named (23 miles from Guyra) the line passes over poor stony land of porphyry and granite formation, to a point about 1 mile beyond Moredun Creek, whence to New Valley Range the country is fair pastoral land, but unfit for cultivation.

From New Valley to Tingha (40 miles from Guyra) the soil is decomposed granite of the worst quality, poor grazing land, and quite unfit for agriculture.

This character prevails for some 4 or 5 miles beyond Tingha, when volcanic ridges of red soil are met, which extend at intervals, alternating with granite slopes to the Gilgai, 5 miles from Inverell and 50 from Guyra.

Thence to Inverell the soil is generally rich and good, with the exception of some rocky ridges.

On the whole the land along this line may be said to consist for 30 out of the total length of 55 miles of soil, good above the average.

The other 25 miles being unfit for agricultural, and of only second rate quality for pastoral purposes.

A considerable portion is held in freehold by Tenterden and Ollera Stations.

There is, however, not nearly so large a proportion of land held in this way by the stations on this line as on the Glen Innes to Inverell route.

Timber.

There is along this line little timber fit for bridge building or other railway purposes.

Between Tenterden and New Valley are some ridges of stringybark, with a little ironbark, and along the line are forest reserves amounting to 14,000 acres; but as two sawmills have been working there for some time, no doubt the limited quantity originally available has been much reduced.

So that nearly all the timber for railway construction would have to be brought from elsewhere.

Minerals.

At Tingha is a large reserve for tin-mining purposes, from which, during the last eight years, a large quantity of stream tin has been obtained, stated to be 16,000 tons, valued at £828,722.

The output for last year was 1,200 tons, of a value of £62,000.

The question of the probable permanency of this field appears to depend largely upon the development of the tin lodes, as the output of stream tin is steadily decreasing.

On this point, we find in the Annual Report of the Department of Mines for 1899, Mr. Warden Fraser says:—"Several reefs have been discovered and are being tested, and I have no doubt the prosperity of this field will mainly depend upon the many reefs which are known to exist all over the field, and which prospectors are from time to time discovering. Then when capital * * * and approved appliances * * * are brought to bear on them, I anticipate a permanent source of profitable industry for this field."

Mr. Litchfield, one of the oldest residents, and who is intimately identified with this field, also states that with greater facility for carriage of machinery and tin ore by railway, and the encouragement this would give to investors, he is sanguine the Tingha tin-field will be a lasting and important one.

At present there seems to be no doubt that tin-mining on this field is languishing, a steady decrease in the output being apparent for several years past.

The prosperity and permanence of the field is therefore contingent upon fresh development.

Whether this will occur remains to be seen.

If it does, and the output of tin be maintained, Tingha, as a feeder to the railway, will be of considerable importance.

On the other hand, the failure of the tin yield, and the comparative unfitness of the land for other purposes, will inevitably lead to the complete or partial disappearance of Tingha as a town.

From Guyra Railway Station there were forwarded to Tingha during the year ending 30th June, 1890, 512 tons of goods, and received from that place for despatch by rail, 566 tons, the greater part of this last being tin.

For other places on the line, distant over 10 miles west of Guyra, there were forwarded during the same period 150 tons, and received for despatch by rail, 148 tons.

A considerable proportion of the Tingha tin is now sent to Glen Innes Railway Station.

Population.

The population residing on the Tingha mining reserve is 2,500, most of whom are depending more or less upon the tin mines.

Of these 1,000 are miners, three-fourths of whom are Chinese.

The population within 6 miles of Tingha is 1,800, a large proportion being Chinese.

Omitting that around Tingha, the population residing along the line is comparatively small.

The numbers between Guyra and Tingha, within 5 miles on either side of the line, as given by the police, are 250. Those within a radius of 5 miles of Guyra are not included.

Within that radius there are eighty-five families residing.

Between Inverell and Guyra there are ten public schools (excluding Inverell and Guyra), having 509 children on the roll, representing 119 families. Of these 171 children, representing 74 families, attend Tingha School.

The land for the first 30 miles out of Guyra is capable of supporting a much increased population so far as it extends. But as the area feeding the railway along this length will be limited in width, this population in the aggregate cannot ever be very large, as the good land bordering the line is bounded on the south and west by a tract of hilly and somewhat barren country between it and the Bundarra River, country too hilly to admit of traffic being freely drawn from that direction; and on the north and east by the hilly country in the direction of Ben Lamond and the head waters of the McIntyre River, where also it comes within the influence of the Great Northern Railway.

Engineering.

There appear to be no engineering difficulties to contend with on this route, much of it being a surface line, the curves and grades are easy, except through the New Valley Range, and at a few other points.

By slightly increasing the cost of works, we believe the ruling grade of 1 in 40 could be reduced, and the curves improved.

The line as laid out will terminate in the centre of Inverell, after crossing the Macintyre River at the town.

The necessity for this does not seem clear, as the line might be very well stopped at the southern side of the river, and so save the cost of a large bridge, and the purchase of valuable town allotments, as well as avoid the necessity of a second bridge in the event of the line being extended still further westward.

There is already one road bridge, and a new one under consideration, which could be erected to suit the traffic to and from the railway station.

Glen Innes, *via* Swanbrook, to Inverell.

This line, after leaving the Great Northern Railway, near Glen Innes Station, crosses Furrucabad Plain, and the range forming the watershed between the creek of that name and Reddeston (or Clairvaux) Creek, and the latter creek near its source then descending Waterloo Range by a steep gorge emerges on Waterloo Plain, above Balaclava Station, thence ascending by an easy grade to the summit of the watershed between Waterloo (or Wellingrove) Creek and Swanbrook, tributaries at the same point as the main road from Glen Innes to Inverell, goes over this range, crossing and re-crossing the road near this point—say 16 miles from Glen Innes.

The land along the line to here, with the exception of the descent to Waterloo Creek, where it is stony, is of the best quality—rich black or red volcanic soil—and extending for some miles on either side.

Fully three-fourths of the land on this length is fit for cultivation.

It appears to be all alienated and chiefly used for pasturage.

From the point last named, 16 miles from Glen Innes, the line descends by a steep grade to the head of Swanbrook Creek, and for, say, 4 miles passes through barren stony gullies, and along rocky sidelings, on the right bank of the creek, until it again comes out into less hilly country, near Mansfield's selection. Which open country continues through Young's selections, and to a point where the line again crosses from left to right, near the road crossing.

At Swanbrook Village it crosses the creek about 12 chains below the road, and again three-quarters of a mile lower down.

From Mansfield's selection to this point, about 3 miles, the land is good, and the greater part fit for cultivation.

From

From this second crossing of Swanbrook, the line follows closely the right bank as far as Littler's selection, at the western boundary of the Newstead Pastoral Holding, where it crosses the creek a third time.

The greater part of this $6\frac{1}{2}$ miles, between the second and third crossing, is closely shut in by a high range on the north, and on the south is cut off by the creek from a considerable area of good land, which lies in the direction of the main road.

From the third crossing of Swanbrook, at Newstead boundary, right through to Inverell—a distance of 15 miles—the land, with the exception of a few stony ridges, may be said to be of first-class quality, rich black or red soil for miles on either side of the line—a considerable area, as on the Long Plain—being free from timber.

Out of the total length of 44 miles, we estimate that 29 miles of first-class land is passed through, the remainder being excellent pastoral land.

Timber.

There is along this line no timber of any value for construction purposes, and the whole of that required for the works would have to be brought from a distance.

Minerals.

There is no mining of any kind in progress on or near the line, except a little tin mining at Elsmore, 5 miles to the south.

Here, we find from the Report of the Mines Department for 1889, there were raised 113 tons of tin during that year, valued at £5,923.

Population.

The population is sparse throughout, and settlement, for other than pastoral purposes, small.

We find the number of schools, exclusive of Inverell and Glen Innes, to be 10, with an enrolment of 263 children, representing 73 families.

The numbers of persons residing along the line we were enabled to obtain, but the school numbers will afford a fair comparative test.

The land throughout the greater part of the length is undeniably capable of supporting a large population, being of the most fertile description, and a large percentage of it fit for the plough.

But it would appear that so far comparatively few persons reside and cultivate the land, as it is chiefly held in four large estates, viz., Inverell, Newstead, Waterloo, and Balaclava.

And as a very large portion of these estates are either freehold or conditionally purchased there appears little prospect of further settlement on a large scale taking place. As, although it was asserted to us, that some of these estates would be cut up and sold as soon as the railway was made, we, judging from results where railways have already been made through large estates, cannot place much value upon such assertions.

The tendency at the present time throughout the Colony being apparently to increase the size of estates, rather than to break them up.

Engineering.

The chief difficulties on this line are at the descent of the Waterloo Range, where a grade of 1 in 33 occurs, and in following the Swanbrook Creek, above Swanbrook Village.

The Waterloo Range is so steep and difficult at this place that we fear the grade can only be improved at the expense of much injury to the curves, which are already sharp, or by the substitution of tunnels.

The cross section of the land is very steep, and will considerably add to the apparent quantities of excavation and embankment.

To avoid the descent of Waterloo Range at this place a line was surveyed up Maid's Valley to connect the first portion of the Wellingrove line with the remainder of the Swanbrook line.

This, though an easy connection, would much increase the total length between Glen Innes and Inverell, without corresponding advantage.

This line terminates about $1\frac{1}{2}$ mile to the north of the centre of the town of Inverell, and if extended to the westward would require a bridge across the M'Intyre River.

Glen Innes, *via* Wellingrove, to Inverell.

Leaving the Great Northern Line immediately north of Glen Innes Station, this line crosses Furrucabad Plain, and ascends the range between that and Reddeston (or Clairvaux) Creek, on the northern side of the Inverell Road, with which it runs parallel and close to as far as Beaufort School, 5 miles from Glen Innes.

Here it leaves the road and crosses Clairvaux Swamp and Creek, ascending the Waterloo Range, which is here comparatively low, reaching the Head of Punch's Gully, down which it runs, crosses Wellingrove Creek, about $1\frac{1}{2}$ mile above Ryan's homestead, 15 miles from Glen Innes.

From Glen Innes to this point, the land is generally of excellent quality, the exception being the descent of Punch's Gully, where the granite crops out, and the land, though well grassed, is unfit for agriculture; also in some places the tops of the ridges are too stony for cultivation.

From Waterloo Plain the line ascends a somewhat difficult range, and, descending to Creer's selection, passes through the King's Plains Estate for 11 miles, until the travelling stock reserve is met, 27 miles from Glen Innes.

This 11 miles is open, undulating country, of first-class soil, little of it being unfit for cultivation, the only exception being a length of 2 to 3 miles, where the country is ridgy, and the soil not of very good quality. There appears to be a comparatively small extent of this.

From the intersection with the travelling stock route the line follows more or less close to the road, through first-class red or black soil, to near Munzie's selection, where it crosses Swanbrook Creek; and thence to Inverell it is nearly identical with the Swanbrook route, the lines at two places almost touching, and at no point between this crossing of Swanbrook and Inverell more than a mile distant from each other.

Land.

Land.

Estimating in the same way as we have done in the cases of the two lines previously dealt with, out of the total length of 44 miles, 37 miles of first-class land is passed through, the remainder being excellent pastoral land.

A large proportion of the country passed through is, however, held in large estates—Inverell, King's Plains, Waterloo, and others.

The amount of land taken up and occupied by *bona fide* selectors being comparatively very small, and unless the estates referred to be broken up, which experience shows is not at all certain, there would appear to be little prospect of any large quantity of traffic being obtained by the way apart from what may be gathered from country further back to the north.

Timber.

Of timber for construction purposes, there is none along the line, and what will be required for railway purposes must be brought from a distance.

Minerals.

Of minerals, there do not appear to be any on this line.

Population.

The land being, as already stated, held in large estates for grazing purposes, the population along the line is small.

The schools have been included in those referred to on the Swanbrook line. The two routes being so close to each other, it is difficult to separate the schools.

Engineering questions.

The chief difficulty, as on the Swanbrook line, is the descent of the Waterloo Range; this is accomplished by a long grade of 1 in 40.

The crossing of the range from Waterloo Plain to King's Plains will also be rather difficult, but on the whole this would appear to be a superior line to that *via* Swanbrook.

The extension of this line westward from Inverell would also necessitate a bridge across the Macintyre River.

Inverell, *via* Bundarra, to Kentucky.

Leaving Inverell, on the left or southern bank of the Mackintyre (the opposite side to the main portion of the town), the line as far as Gilgai is common to the Guyra-Inverell line already dealt with, and to that point, as described under that head, the soil is generally rich and good, with the exception of some rocky ridges.

Land.

From the point of divergence, 5 miles from Inverell, at Gilgai, for a distance of 3 miles, the land is good, consisting of low ridges of red volcanic soil.

From that point, however, so far as soil is concerned, it may be described in a few words; granite and slate formation, inferior second class or fair third class land for agricultural purposes, excepting round Bundarra, where there is a limited area of good land.

Being undulating and generally lightly timbered, it might, in course of time, be taken up for combined agricultural and pastoral purposes, and would, perhaps, for a few years produce light crops of wheat of good quality, but the soil is too light and shallow ever to support any considerable population.

The line, as far as Toryburn, runs at no great distance from the Bundarra River; at some places quite close.

This, to some extent, cuts it off from the country beyond, as the river is, in most places, difficult to cross.

The land on the opposite side is generally of the same quality as that traversed by the line—granite formation, with some good flats of limited extent along the banks of the river and its tributary creeks, but with no large extent of agricultural land.

On the western side of the line this same inferior quality of soil prevails generally, right back to the ridge between Bundarra and the Namoi waters, where high broken country prevails.

There is a considerable quantity of land available for selection along the route, and some large reserves.

Timber.

Throughout this line there is little or no timber of any value, and that for railway purposes would have to be brought from a distance.

Minerals.

In former years a considerable quantity of tin was produced between Bundarra and Gilgai, in the neighbourhood of the now deserted village of Kimberley (on Cope's Creek), and at Stanborough, where, however, very little is now obtained, and this little is included in the return from Tingha.

At the present time very little mining can be said to be carried on in close proximity to this line.

Population.

The land between Gilgai and King's Gap, 5 miles from Bundarra, being chiefly a mining reserve, few, but miners, live along it, and these are included in the estimate of the Tingha mining reserve.

The population residing in the district between King's Gap and Toryburn, through which the line runs for 27 miles north and south—and which extends 25 miles back towards Barraba on the west, and to the hilly country east of the Bundarra River—is stated by the police to be 1,500, including the population of Bundarra Village (about 500).

The line crosses the Bundarra River just above the iron road-bridge (a large bridge will here be necessary), and passes through the village of Bundarra, which is the only settlement of any importance on this line.

The

The wayside village of Bundarra, containing about 500 inhabitants, is substantially built, and is the commercial centre of a limited district.

There is a moderate quantity of fairly good land in the vicinity; but farming does not appear to be carried on to any large extent, the chief support of the town being the pastoral industry.

The town can hardly be said to be a progressive one, as would appear evident from the fact of the only bank which existed for some years having lately been closed.

The traffic of the place could not be considered of much importance in connection with railway extension. The Guyra-Inverell line would secure its traffic at Tingha, 18 miles by road; but the Glen Innes-Inverell line would not, as the nearest station on that route would be Inverell, 30 miles by road; whilst Uralla, 124 miles nearer Sydney, is but 52 miles.

Inverell, *via* Yarrowick, to Uralla.

This line branches from the Inverell to Guyra line at Swinton's station, 4 miles from Tingha, and runs generally parallel with the Inverell to Kentucky route, varying in distance from 4 to 10 miles from that route, and passing about 7 miles to the east of Bundarra.

The country passed through is, on the whole, of the same inferior quality as that on the Kentucky line, with the exception of some limited areas of good land near the banks of the creeks tributary to the Bundarra River, being generally of granite formation with poor gravelly soil.

The country is more ridgy than on the Kentucky line, but little distinction as to quality of soil can be made between the two lines.

The comparison being rather in favour of this route.

The same remarks will apply to this line as to the Kentucky line as to population, resources, and prospective traffic.

Timber.

There is scarcely any timber of value, and all required for purposes of construction would have to be brought from a distance.

Minerals.

The only mineral being worked is gold—in the vicinity of Uralla on the old Rocky River Gold-field—and this in a limited way.

As these workings are so near the Great Northern Railway, the proposed line would not be affected in any way by them.

Grafton, *via* Newton-Boyd, to Glen Innes.

In the inspection of this line we were, at the outset, met with by the difficulty of traversing it through at all, and the impossibility of doing so on horseback on account of the mountainous and broken nature of the country along a considerable part of its length.

From Grafton to Jackadgery, near where the line enters the valley of the Mann River, the country is described as being fairly level, undulating, good grazing country, with only a limited quantity of arable land, and this of only medium quality.

We were advised by persons well acquainted with the country and the route that it would be impossible to follow it through except on foot, and then only in fine weather, when the rivers are crossable.

This being the case, after examining the country round Grafton, we decided to travel by road to Newton Boyd, and there, striking the line, follow it down the valley of the Mann River, and then in the reverse direction towards Glen Innes.

Here, again, we were stopped by a fresh in the Mann River preventing us crossing, and, as we were informed that to carry out our intention it would be necessary to cross and re-cross the river many times, we were compelled to give up this idea.

In order to obtain a view of the surrounding country at Newton-Boyd, we ascended one of the mountain ranges rising out of the Mann River to a height of 2,000 feet, and from this, so far as the eye could reach, little could be seen but precipitous mountain ranges similar to that upon which we stood, excepting a strip of fairly good land lying along the banks of the Mann and Henry Rivers, in the vicinity of Newton Boyd, which, we were informed, belonged to the station of that name.

From Newton Boyd the line follows the Mann River up for 19 miles to the foot of the Big Hill, and is hemmed in on both sides the whole distance by broken, mountainous country, presenting no appearance, so far as can be seen from the road or line (which are near each other) or from the mountain tops, of any land available for settlement.

From the top of the big hill, on the main road, 2,500 feet above the river, a point commanding an extensive view—the same prospect is afforded as that described above—high mountains and broken country.

To quote from official papers, we have Mr. Hyndman, Railway Surveyor, in September, 1873, saying:—"The country along the Mann River is high granite ranges, with rough rocky peaks. From Big Hill to Jackadgery is of the same character, loose trap and clay slate on schist—mountains fall steeply to the river. Steep rocky bluffs at every bend. Country is inaccessible for horses. From Jackadgery to Grafton the country is undulating." (See Parliamentary papers to order, 20th April, 1875.)

Mr. Cowdery in the same year, 1873, says:—"The granite mountains rise up on either side to a great height—some at least 1,000 feet, and the bed of the river is full of boulders, making it impassable for horses." (See same paper.)

Mr. Palmer says:—"The whole of the country is very mountainous. The creeks, as they approach the table-land, become a succession of falls and rapids, and are very often enclosed by perpendicular slopes of great height." (See same papers.)

Our own observations confirms these reports, and shows not only the enormous expense of constructing a line here—an expense so great as to make it in effect commercially impracticable—but also that little or no traffic would come to the railway by the way, except perhaps a little timber.

Of this we saw little or none, though it is stated that patches of good timber do exist amongst the ranges.

The

The inaccessibility of the country would, however, militate very much against this being brought to the railway.

The line for about 50 miles would, if constructed, be practically inaccessible from any little good country that may exist adjacent to it amongst the ranges, because of the steep broken nature of the mountains.

In fact, speaking in general terms, from where the line enters the valley of the Mann River, near Jackadgery, to its exit on the table-land a few miles from Glen Innes, it runs through a mountain gorge hemmed in, and cut off from the surrounding country by precipitous ranges, rising in not a few places to a height of 1,500 to 2,000 feet above the beds of the rivers.

This being the case, it must be apparent to any unprejudiced and disinterested person that to adopt this line as the coast connection would be to throw upon the 45 miles between Inverell and Glen Innes the strain of earning interest upon the whole of the enormous capital required for the construction of this line. That is to say,—the 45 miles between those two places would have to earn interest upon the whole of the 147 miles from Inverell to Grafton.

We cannot think it necessary for us to say more upon the subject of this line.

The nature of the country through which it passes is admitted on all sides. The consequent cost is in evidence from the reports of the Engineer-in-Chief, who estimates this at £19,600 per mile, or a total of £1,999,000, and the impossibility of this section earning even a reasonable proportion of working expenses must be apparent.

The grades and curves are also shown to be such as are beyond the limit of a reasonably safe railway—8-chain curves and 1 in 33 grades,—and the cost of working must necessarily be great.

And though even improvements in curves and grades should be found possible, the barren and rugged nature of the country and the absence of any probable wayside traffic should be sufficient to condemn it.

In the face of all these facts, we feel justified in reporting this line to be an impracticable one,—commercially, if not absolutely so from an engineering point of view,—and we do not therefore feel called upon to say more on the subject of it.

Guyra, *via* Don Dorrigo, to Grafton.

This line leaves the Great Northern Railway, near Llangothlin Platform, 7 miles north of Guyra Station, and after crossing a small stream which is the head of the Falconer or Guyra River, rises to the summit of the range forming the watershed between the Macleay and the Clarence Rivers, and follows it to near Alfreda Station, a distance of 43 miles. Throughout this length it leaves the actual summit for no great distance at any point, and only to avoid high points and maintain grades.

From Alfreda—the range bearing away to the south and rising to a considerable height in the Snowy Hills—the line is carried in a more easterly direction to Rigney's Station, where it crosses the Armidale and Grafton Road. Thence it continues easterly past Moles's house and through the Guy Fawkes country.

At the time of our visit, the survey had been carried by Mr. Jamieson to Biscuit Creek, 48 miles from Guyra, and within 2 or 3 miles of the point where he would connect with Mr. Thornbury's starting point.

Mr. Thornbury had carried the survey on some 17 miles further, making a total of 65 miles from Guyra.

From that point, a gap of about 40 miles remained unsurveyed, to the point at the head of Tallawadja Creek, where we saw Mr. Cumming who had carried the survey thus far from Grafton, *via* Glen Reagh, a distance of 40 miles.

Land.

From Guyra, for a distance of 43 miles, the land is of superior quality, consisting for the most part of rich volcanic soil, a large proportion of which is fit for cultivation. The only obstruction being a few stony patches on the summit of the range.

The same character of land appears to prevail for some miles on either side of the line, and from the elevated plateau along which the line runs, commanding an extensive view throughout, we had full opportunity of seeing this.

The country presents the appearance of open ridges, free from deep gullies, lightly wooded, and well adapted for agricultural purposes.

From the point referred to—43 miles from the Great Northern Railway—an interval of poor granite country is passed through, extending for (say) 7 miles until approaching the Armidale-Grafton Road, where the rich volcanic soil again appears and extends for several miles in length.

This character of soil prevails over the whole of this Guy Fawkes country, embracing a considerable area from the coast fall on the south of Rigney's to Tyringham (Perrott's) Station on the Armidale-Grafton Road, 25 miles in one direction northwards and right through to the Little Nymboida, north-easterly along the proposed line of survey.

As we failed to obtain a guide through the Don Dorrigo scrub, along the course of the proposed line, or to ascertain that any track existed in close proximity to it, practicable for horses, we travelled by the Armidale-Grafton Road, as far as Perrott's, and then struck across *via* Bostobrick and the Little Murray Creek through the Don Dorrigo scrub to Coghlan's, on the Brelsdow Creek, and thence to the head of the Bellinger River.

Thus cross cutting the country and the scrub from north-west to south-east.

Mr. Simpson had previously explored, on foot, the proposed line from north-east to south-west through the scrub. He describes the land thus:—"From the Armidale-Grafton Road to the Deer Park the land is open for considerable stretches and of a very superior nature, covered with a fine growth of natural grasses."

"From the Deer Park, right away to the Little Nymboida, the land is very good, and is covered with a fine forest of beautifully grown timber."

"The whole district is abundantly watered by perennial streams." (See Mr. Simpson's report, 23/8/89.)

Our route was for 25 miles, as far as Perrott's, generally parallel with and on the average 10 miles distant from Mr. Simpson's; and then at right angles to his line for a distance of 25 miles, through the Don Dorrigo to where we descended the coast fall to the head of the Bellinger. We

We found, from the crossing of the Little Murray Creek right through to the verge of the coast slope above the Bellinger, the land to be of the richest description of scrub land, and capable of producing heavy crops of cereals, &c.

This tract of country, so far as the dense scrubs permitted, has been well examined and found to possess land of superior quality throughout.

A large part of it is covered with so dense a growth of scrub and vines that except along tracks cut by the cedar getters, it is impossible to force a way with horses.

As Guy Fawkes is at about the same elevation as Guyra—4,400 feet above the sea-level—the rigorous climate of New England prevails there.

Thence through the Don Dorrigo scrub to the head of the Little Nymboida the fall is considerable though gradual, and a more temperate though still cold climate prevails, which will permit of the growth of cereals, potatoes, and other products of temperate climates.

This stretch of country appears to be an elevated tableland, falling abruptly towards the coast on the east and south, and sloping, at first gently, to the north, and finally pitching suddenly into the valley of the Nymboida, with a gradual inclination throughout to the north-east.

On the range forming the division between the heads of the Orara and the Little Nymboida Rivers, we found Mr. Cumming's camp.

Here the elevation was about 2,800 feet above sea-level.

Thence to the valley of the Orara at Glen Reagh—12 miles—the country falls rapidly, and, in the immediate vicinity of the line, consists of high ridges with deep valleys between, presenting along this 12 miles no land fit for cultivation except small flats close to the creeks in the vicinity of Glen Reagh.

From Glen Reagh to Grafton the land is generally of good quality.

Along the valley of the Orara it is superior, whilst the slopes are, though lighter and sandy, fairly good.

Taking the whole length of line from Guyra to Grafton, a distance we estimate at from 140 to 150 miles, a remarkable stretch of country is passed over; for with the exception of the space of 7 miles west of Guy Fawkes, and the length of 12 miles west from Glen Reagh, both referred to above, there is no part which does not present large areas of land fit for cultivation.

The greater part of it is of the most fertile nature, with a temperature ranging from the rigorous climate of New England, 4,400 feet above the sea, to the semi-tropical one of the northern sea-coast. And it is probable that in no part of New South Wales is there a finer stretch of rich land of equal extent so little broken in upon by barren intervals as this.

The rainfall is considerable, and the whole is intersected at short intervals by perennial streams.

Timber.

Not only is the soil of this tract eminently fitted for cultivation and capable, when properly tilled, of supporting a dense population, but the splendid forests of marketable timber of almost every kind indigenous to the colony, which prevail over a large extent of it would, with railway communication, find employment for hundreds of persons and supply the principal markets of the colonies for many years to come. Commencing about the Deer Park, and extending northwards beyond the Arndale-Grafton Road and eastwards to the sea shore, a forest of magnificent timber covers the whole face of the country.

In the Don Dorrigo scrub is cedar, beech, pine, and all the varieties of scrub timbers, whilst beyond this vine scrub itself in the densely-timbered land extending right up to the town of South Grafton forests of the finest ironbark, tallowwood, turpentine, blackbutt, &c., exist in lavish abundance.

Fortunately very large areas of this splendidly-timbered country have been reserved, so that the forests may be said to be practically untouched, and directly railway communication is established a large traffic must at once spring up in carrying timber to the nearest port as well as to the badly-timbered country towards the western interior.

Unlike many timber forests where the land is comparatively valueless after removal of the timber, the greater part of this land may be at once put under the plough, and support a large population.

The value of this stretch of country can scarcely be exaggerated.

We take leave to suggest for consideration whether, large as are the existing forest reserves along this route, they might not be extended with advantage. This suggestion we would apply also to the Tenterfield to Casino route.

Minerals.

At Nana Creek and the vicinity mining for gold has been carried on more or less for some years past, but at present this industry does not appear to be giving very satisfactory results.

Near Glen Reagh Station we were informed coal existed, but nothing appears to have been done towards proving or developing the seam.

Thirty-five miles from Guyra, in a north-easterly direction, is the Kookoobookra Goldfield, upon which there is a population at the present time of 250 persons, and between the two places 70 others.

This goldfield does not at the present time appear to be in a very flourishing condition.

Population.

The population along this line is very small. From Guyra to Guy Fawkes there are very few selectors, and only some half-dozen stations. A large quantity of the land is unalienated. About Guy Fawkes are a few selectors, and three or four stations chiefly stocked with cattle. Thence to Glen Reagh the country may be said to be practically unsettled and uninhabited, except by a few cedar-cutters. From Glen Reagh to Grafton the country is more thickly settled, and on the better land are a good number of selectors.

On the whole the tract of country along this line has a sparse population, but is capable, when supplied with railway communication, of supporting a large number of people.

Engineering.

The line from the Great Northern Railway to near Guy Fawkes appears to be very easy; in fact the greater portion is a surface line, requiring no large bridges and few culverts. For the next 10 miles occasionally difficult pieces occur. The following 40 miles is still unsurveyed, but we think no difficulty will be found in securing a good line.

The

The descent from the Don Dorrigo table-land to Glen Reagh is considerable, and some difficulty is being experienced in the route now under survey, and it may be necessary to try a line down the valley or along the spurs of one of the creeks further west—perhaps Kangaroo Creek.

From Glen Reagh to Grafton presents no difficulties.

Advantages.

As a link between the Great Northern Railway and the proposed coast line, this route has the following advantages:—

1. So far as has been yet ascertained, it will be comparatively inexpensive for 60 miles at the Guyra end, and also for 30 miles at the Grafton end. The intermediate portion, the position of which is yet unfixd, will be probably found more expensive; but as far as can be seen no great difficulty will be encountered.
- (2.) For the greater part of its length it passes through land of excellent quality and abundantly watered, most of which is still unalienated.
- (3.) Along 70 to 80 miles of the route it runs through a forest of fine timber of nearly every description known in the Colony.
- (4.) Along the route a range of climate exists, gradually changing from the cold of New England to the semi-tropical heat of Grafton, thus permitting of the production of a variety of crops.
- (5.) It will afford direct connection between the coastal districts of the Macleay and Bellinger, as well as those further north, with New England and the west.
- (6.) That it will, at Guy Fawkes, where it crosses the Armidale to Grafton Road, be within 36 miles, by a fairly good road, of the Hillgrove Gold-field, which has, at the present time, according to the statement of the police, a population of 3,000 persons.

This field is now in a prosperous condition, and likely to be permanent.

Disadvantages.

The only serious disadvantage in connection with this line, so far as can be judged before completion of the survey now in progress, is the somewhat circuitous route between Inverell and Grafton.

The distances by the alternative routes would be:—

Inverell, *via* Glen Innes and Llangothlin, 219 miles.

 " " Guyra and Llangothlin, 207 "

as against 146 miles by the more direct, but almost impracticable route, *via* Glen Innes and Newton Boyd.

The distance from Llangothlin (the actual point of departure of this line from the Northern Railway) to Grafton being estimated at 115 miles.

In the absence of this completed survey, it is not possible to say what engineering difficulties may exist, but it is not thought there are many to be encountered, nor can the exact distance be stated until the survey is completed.

If this line be found practicable throughout, the length of it would appear to be the only real disadvantage it has.

And this objection is modified to some extent by the quantity of excellent land passed through, and the abundance of timber on the way.

Coff's Harbour Connection.

This is a question which must depend largely, first, upon the route finally determined upon for that part of the Guyra to Grafton line, between the Don Dorrigo scrub and the Orara Valley, and, secondly, the position of that section of the projected North Coast Railway between Coff's Harbour and Grafton.

At present the former line is being surveyed from the Orara Valley, at Glen Reagh, up the right or east bank of the Tallawadja Creek, on to the table-land.

If this survey result in a practicable line being obtained by that route, it would appear more judicious to deviate the proposed coast line north of Coff's Harbour from its present position, and striking off a little north of Coff's Harbour to cross the coast range (which is here very low) and run into the valley of the Orara, near Sherwood's, and then, *via* Bagawa to join the Guyra-Grafton line at Glen Reagh, making the one-line serve thence to Grafton, and so avoid having two lines nearly parallel in close proximity.

This would form a fairly good connection with Coff's Harbour, and the fertile country lying along the sea and the coast range from the Bellinger northwards, and also bring the Macleay District into touch with New England and the interior.

If, however, the rise from Glen Reagh, *via* Tallawidja Creek to the Don Dorrigo, is found too abrupt, it may be necessary to look for a line up the valley or along the spurs of one of the creeks further west—for instance, Kangaroo Creek; in which case, as a greater distance would exist between the two lines, it might be advisable to continue the coast line, *via* Woolgoolga, as originally proposed. Considerations of coast defence may be of weight here.

As to a direct connection between the Guyra-Grafton line at the verge of the table-land and Coff's Harbour.

The most direct course would be to leave the Guyra to Grafton line on the water-shed between the heads of the Little Nymboi and Orara Rivers, and striking nearly due east, descend by the head of the Orara, which here apparently flows nearly west to east, and, crossing the coast range, skirt the northern side of the high bluffs which abut on the sea above Coff's Harbour.

Without some exploration it would be presumptuous to offer any decided opinion on the possibility of a practicable line being obtained here, but from observation of the country from several commanding points, it appears likely that considerable difficulty will be experienced in doing so. It is entirely a matter for exploration and survey.

Should, however, this be found a practicable route, it becomes a question whether it would not be advisable to continue the Guyra to Grafton line direct to Coff's Harbour, and there connecting with the North Coast line carry the traffic over that line to Grafton, either by Woolgoolga as surveyed or by the suggested deviation, *via* Bagawa, Glen Reagh, and the Valley of the Orara.

From

From the Bellinger northwards along the littoral there is a large quantity of most fertile scrub land, and the table-land connection being made at Coff's Harbour, greater facility would be given for the interchange of produce between that part of the coast and New England.

The land from Coff's Harbour across the coast range to the Orara Valley at Sherwood's, and thence down that valley to Glen Reagh, is of the most fertile description, the greater part being thick scrub and heavily timbered.

The whole question of this connection with Coff's Harbour, however, is, as previously stated, a matter for exploration and survey, but we think it well worthy of attention before a final decision is arrived at.

Tenterfield to Casino.

From Tenterfield, for some 7 miles, the line runs through moderately hilly country, which gradually merges into ranges, and thence to Black or Plumbago Creek, near Tabulam, a distance of 45 miles from Tenterfield, the country consists of high ranges with steep slopes, but not generally of a rocky or broken character.

From Tabulam to Casino the country is of an open character and the ranges more moderate in height, presenting no great engineering difficulties.

The land as far as Barney Downs Station, some 6 miles out of Tenterfield, is good, and a considerable quantity of it is under cultivation. From that point it gradually merges into the high ranges mentioned above, and until Tabulam is reached there is little land adapted for cultivation. Though the soil on some of the hills is good, they are generally too steep to admit of tillage.

From Tabulam to Casino the land is generally very good, and a large proportion of it fit for agriculture; it consists of rich black soil flats, with lighter sandy loam on the ridges. On the Richmond—or Sandilands—Range and its spurs, the soil is of the rich nature usually found in the dense vine-scrubs such as cover this range.

We have statements from police officers and other reliable persons that the good land extends north to the Queensland border, and south as far as Yulgilbar, and that of this a considerable quantity is rich scrub land.

The forest land is good, except in places where broken.

Along the valley of the Upper Richmond there is a large area of good land fit for cultivation.

Timber.

From Sandy Hill, 20 miles from Tenterfield, right through to near Casino, the proposed railway line runs for about 60 miles through a forest of splendid timber of varied kind, a forest probably unsurpassed in the Colony.

On the Richmond Range large quantities of "hoop pine" exist, whilst cedar is found in the same district.

This timber forest, we learn from good authority—the police and others—extends north to the Queensland border, and for many miles southward.

A large and profitable timber traffic may therefore be relied on as soon as this line is constructed.

A limited trade now exists in wattle-bark, which is forwarded from Tenterfield into Queensland. The quantity exported through Wallangarra Station for the year 1889 was 107 tons, and for the half-year ending 30th June, 1890, 80 tons.

It is claimed that this trade would be largely developed if this line of railway was constructed, and this, we think, probable, as much of the rich land between Tenterfield and Drake, too steep for other purposes, is now clothed with wattle.

Minerals.

An important point in connection with this proposed line is, that it would pass through the extensive mineral field in the vicinity of Drake, known as Fairfield.

The Prospecting Board, in a report dated 12th of March, 1889, say:—

"From the foregoing it will be seen that in this district there are numerous ore deposits, containing gold, silver, copper, lead, zinc, &c. * * * * With more efficient gold-saving appliances * * * * steady and profitable yields may be anticipated."

We find that large sums of money have been spent in erecting machinery, and in mining on a number of claims on this field, and several are still working more or less actively, but, on the whole, so far unsuccessfully as regards dividends, and mining would, therefore, appear to be at a low ebb.

It still remains to be proved how far the field can be profitably worked. The construction of a railway, and the consequent saving in freight, would materially assist towards the successful working, especially of the baser metals.

The yield of gold would appear to have steadily increased during the three years 1887, 8, and 9, amounting to £4,798, £5,999, and £8,522 in those years respectively; and at the time of our visit good yields were being obtained at Long Gully.

At the Richmond Range, in close proximity to the proposed line, we saw the coal seams which had been discovered near "Ross' Inn."

There were five seams varying in thickness from 9 inches to 4 feet 3 inches.

These cropped out of the hill in the bed of a watercourse where we were enabled to take samples, of which we obtained the attached analysis kindly furnished by the Mines Department.

The analysis goes to show that the samples we submitted contain too large a percentage of ash to be of commercial value.

Should exploration of these seams prove that good steam coal can be obtained at a greater depth or further into the hill, it would be an important factor in connection with this line by providing coal for railway and other purposes in the north.

We append a statement furnished to us by the Tenterfield Progress Association giving statistics, and setting forth the case generally in favour of the construction of this line. It was impossible for us to verify this in every particular as to figures, but, taking it as a whole, it appears to be a fair statement of the case.

Population.

Population.

The population is generally small along this route, except on the Fairfield diggings. Here the numbers given by the police are 1,288 Europeans and 62 Chinese for Drake and the neighbouring district, and for Tooloom, whence the traffic would join at Tabulam, 200.

The population along the other parts of the route—exclusive of Tenterfield and Casino—would probably amount to less than another thousand.

The numbers of the present population along these lines affords but little criterion, however, as to the value of the country as a support for future railways.

The whole country may be said to be nearly in a virgin state and the results of railway communication can only be estimated by taking the whole of the circumstances as to each line together, and can only be speculative.

Cattle Traffic.

The land along the route is principally occupied by large cattle stations, and some of it will never be fit for any other than grazing purposes, owing to its hilly nature.

It is probable that a considerable traffic would accrue to the railway in fat cattle. At present the greater part of the fat cattle go to Ramornie Meat Preserving Works, near Grafton, or are consumed locally. The remainder are driven to and trucked at Tenterfield for the southern markets.

We were unable to obtain any reliable estimate of the number of fat cattle likely to be forwarded by rail in the event of this line being constructed, but it would probably be large judging from the total number of cattle in the Richmond Electorate, *viz.*, 152,000, and from the fact that fat cattle deteriorate so much when sent by sea that few are despatched that way, and only low prices are given at Ramornie.

Engineering.

With regard to engineering matters, the opinion we arrived at as to this line was that the curves would prove the chief trouble.

The nature of the mountain ranges should allow of good grades being obtained.

As much of this line will be along steep sidelings of a rather unstable nature, precautions will be necessary to guard against land slips in wet seasons.

Several tunnels will be required, but none of them of very great length, and one large bridge across the Clarence at Tabulam, where, owing to the great height to which the flood rises, a very long approach will be required on the western side.

This line would appear to be capable of great improvement in some places.

Advantages.

The advantages possessed by this line are:—

- 1st. That it passes through a large extent of good land between Tabulam and Casino. In addition to which it would afford an outlet to another large area of good land which extends some distance north of Tabulam, along the Upper Richmond in the direction of Mount Lindsay, and also to the fertile country on the Clarence below Tabulam.
- 2nd. It would tap and connect with the interior the districts of the Richmond and Tweed, which, we gather from the evidence given before the Works Committee on several occasions, are unsurpassed in the Colony for fertility, and have a rapidly-increasing population.
- 3rd. That, upon the completion of the proposed harbour works at Byron Bay, a capacious port, with deep water, will be afforded to the inland districts within a reasonable distance—232 miles from Inverell.
- 4th. That it passes for nearly the whole distance through a fine forest of magnificent timber, in which there must be a large traffic, both towards the interior and the coast. The Forest Reserves here, as on the Guyra to Grafton line, are very extensive.
- 5th. That it will traverse and assist to develop the very promising mineral field about Drake—a field which, although at present not yielding largely or profitably, may later on when the evil effects of rash speculation have passed away become a valuable one.

It has been stated that “of the sixty-seven known minerals, forty-seven have been discovered in Drake and the neighbourhood.”

Whether this be literally correct or not we are unable to say, but it appears very certain that a large number of the metals of commerce exist here, and it is possible that this field may yet become so developed as to support a very large population.

- 6th. That by this route, upon the completion of the line from Casino to the Queensland border at the Tweed, with the short interval thence to the present Queensland terminus, near Southport, a second connection with Brisbane will be had; and by altering the gauge on this length (about 50 miles) of the Queensland line an uniform gauge would be had between Sydney and Brisbane, and the distance lessened by 16 miles as compared with route *via* Wallangarra and Toowoomba.

Disadvantages.

The disadvantages are:—

- 1st. That the line between Tenterfield and Casino will be a costly one, estimated at £15,000 per mile, and a total cost for 86 miles of £1,290,000. The curves between Tenterfield and Tabulam numerous and sharp, and the grades in some places steep. There is, however, nothing impracticable about the route and further examination will probably prove that these objections may be considerably modified.
- 2nd. That for the greater part of the distance between Tenterfield and Tabulam (50 miles) the land is unfit for cultivation; an objection largely compensated for by the wealth of timber and promise of a valuable mineral field upon it.
- 3rd. That the line would be so far north as to neutralise in a great measure any benefit the more southern coast districts would otherwise derive from a connection with the interior.

And it is here the Guyra-Grafton line possesses the advantage. That it would strike the coast-line fairly midway and so, as far as any single connection can do, afford equal facilities to all parts of the coast between (say) the Macleay on the south and the Richmond on the north.

Tamworth,

Tamworth, *via* Manilla to Inverell.

We travelled from Inverell to Bingera and thence *via* Barraba and Minilla to Tamworth.

Land.

Although there is along this route, between Tamworth and Bingera, a considerable quantity of good land, it, on the east, quickly merges into the high granite country running out northward from the Moonbi Range and that forming the watershed between the Bundarra and Minilla Rivers, whilst on the westward the better country soon falls within the influence of the Narrabri line of railway.

We, therefore, do not consider that at present this line is necessary.

A large traffic, however, now exists, coming from Warialda and the north and north-west, in the direction of Goondiwindi and Moree, and trending to Tamworth Railway Station.

Inverell to Bingera Extension.

And this, we would suggest, may be best met by the extension of the Inverell line to Bingera, thus effectually intercepting this traffic at Bingera.

This extension would also serve to carry produce such as flour, forage, potatoes, &c., from New England and Inverell to the westward, as well as to bring in further traffic from the west to the sea coast when the coast connection is carried out.

This Bingera extension would run through one of the most fertile parts of the Inverell District.

For nearly 20 miles this is thickly occupied by farms, and on it are some of the best in the district.

The rich red or black soil extends for 15 miles further, though principally occupied by the Myall Creek Station, while the remaining 12 miles to Bingera is on the whole fairly good land.

The land at Bingera, and for about 12 miles in the direction of Tamworth, is also of a very rich quality, and will doubtless be cut into farms and cultivated—when the alluvial gold-mining ceases—and prove an additional feeder to this suggested extension from Inverell.

Traffic.

The question will probably be asked,—Will the Warialda to Tamworth traffic make use of the railway if extended to Bingera?

The position would be this,—Bingera is 100 miles from Tamworth by road, the greater part of which is still unmetalled, whereas Bingera would be, with a railway *via* Inverell and Glen Innes, from Tamworth 231 miles.

It may be thought that goods can be sent 100 miles by road at less cost than 231 by rail.

Taking wool, at present one of the most important items of carriage.—The Railway Commissioners carry wool from Glen Innes to Sydney, 422 miles, at £3 15s. per ton; add to this the full ordinary rates for wool 90 miles, Bingera to Glen Innes, say £1 10s., and we have a total of £5 5s., Bingera to Sydney per rail.

The road freight, Bingera to Tamworth, 100 miles, would be say £3 10s.; add rail freight, Tamworth to Sydney, £3 15s.; total, £7 5s. per road and rail. Showing a saving in carriage by rail against road of £2.

And if the wool traffic be intercepted and taken by rail it follows the return loading must go by the same route.

As to passenger traffic.—The coach fare, Bingera to Tamworth, 100 miles, is £1 17s. 6d., and rail Tamworth to Sydney, 281 miles first-class, is £2 7s. 5d.; total, £4 4s. 11d.

Bingera to Sydney by rail would be say 512 miles, and we find the first-class fare for that distance would be say £4 3s. 6d., or in round numbers, about the same amount for a first-class rail fare (with comfort), as for a day and a night's coaching with a night's train travelling to follow.

If the extension from Glen Innes stops at Inverell, this large traffic now passing from the north and north-west, *via* Warialda and Bingera, to Tamworth will continue as at present, and none, or very little of it, be obtained for the railway until Tamworth is reached.

This Inverell to Bingera extension, as we have above stated, passes through a rich stretch of country studded with farms, so that considerable wayside traffic would be picked up.

We, therefore, after due investigation, confidently urge consideration of the advisability of this extension to Bingera in connection with any from the Great Northern Railway to Inverell, and the propriety of drawing sooner to the rail a traffic which, although not sufficient to justify the construction of a railway for itself, is large enough to become a very valuable addition to that of the Northern Railway and proposed branch.

A railway from Tamworth to Inverell would be practically a competing one against the Great Northern and any connection with Inverell.

Trend of Traffic.

Assuming Inverell to be connected with the Great Northern Railway either at Glen Innes or Guyra, and no connection made with the coast, it is clearly apparent that by far the greater part of the resulting traffic must be with Sydney and Newcastle.

As part of the traffic going south, taking the item of wool, we estimate that the clip from 750,000 sheep—equal to 2,000 tons—which is at present sent to Sydney and Newcastle from the country around and west of Inverell, would be trucked at Inverell; to which must be added 1,352 tons of tin now trucked at Glen Innes and Guyra—the produce of the Elsmore and Tingha fields. (*See Mines Report, 1889*).

We also find that for the twelve months ending March, 1890, 2,648 tons of general goods were received from Sydney and Newcastle at Glen Innes Station for despatch to Inverell, and that 512 tons were received at Guyra for Tingha, which would probably come by rail to Inverell in the event of the Glen Innes line being made. So that, without going into the consideration of probable increase, we have this large amount of tonnage going to or coming from the south; and, until a connection is made with the coast near Grafton, and an interchange of products established between there and the west, this Sydney and Newcastle traffic must be the principal. The

The coast connection effected, however, a considerable traffic will no doubt arise in supplying the coast districts near the Clarence with breadstuffs and other articles not produced there, and a corresponding return of products from that semi-tropical district.

This will also apply to the coast districts north of the Richmond River, where the population is increasing at a rapid rate, and if the connection from Tenterfield to Casino and Lismore were also made, these districts would be supplied with the same products, breadstuffs, &c, and a northern traffic established.

It is contended that, with a railway to Grafton, the products of Inverell would all go to that port for shipment to Sydney; but a comparison of the rates of carriage would hardly support this.

From Inverell to Sydney, *via* Glen Innes, 466 miles, calculated at present rates, wool would be carried to consignees' stores for £3 15s. per ton.

From Inverell to Grafton, *via* Glen Innes and Don Dorrigo lines, at present mileage rates would be £3 1s. 8d., add to which, sea freight, extra handling, insurance, and cartage from wharfs in Sydney, and the margin of difference would hardly be enough to divert the traffic, once loaded.

With an improved port, however, goods would probably be sent to Grafton for direct shipment to other countries.

It has been stated that with the construction of the Inverell-Glen Innes line, a considerable trade in breadstuffs would spring up between Inverell and Queensland, in supplying the country west of Toowoomba.

It does not, however, appear that such is likely to occur at present, as the following will show.

The distance, Inverell to Wallangarra, *via* Glen Innes, is 112 miles, and the freight upon wheat would be 9s. per ton, or 2.92 pence per bushel.

Wallangarra to Toowoomba is 132 miles, and the cost of carriage, at Queensland rates, 11s. 9d. per ton, or 3.81 pence per bushel. Total, 6.73 pence per bushel, Inverell to Toowoomba.

Brisbane to Toowoomba is 101 miles, and the cost of carriage, 10s. 5d. per ton = 3.38 pence per bushel, leaving a difference in favor of Brisbane of 3.35 pence per bushel, to cover the cost of landing sea-borne wheat at Brisbane.

Inverell to Sydney, *via* Glen Innes, would be 466 miles, and the cost of freight, 17s. 4d. per ton = 5.62 pence per bushel to land the wheat in a large market, as against 6.73 pence to land it in a limited one at Toowoomba.

Further, the area put under wheat in the three districts in the Darling Downs, *viz.*, Allora, Warwick, and Toowoomba was, for 1889, 14,242 acres, as against 10,485 acres in Inverell, Glen Innes, and Tenterfield. And Queensland statistics show that the area put under wheat was as great in 1889 as in any previous year, except 1881 when it was slightly in excess of 1889.

With regard to maize, the area planted in the three Darling Downs Districts above named has steadily increased, being in—

1887—13,269 acres	} Darling Downs District,
1888—16,651 „	
1889—19,339 „	

with an average yield equal to that of the Inverell District, and an area under cultivation largely in excess of Inverell, Glen Innes, and Tenterfield Districts combined, which stand for those years respectively.

1887—6,541 acres	} Combined districts of Inverell, Glen Innes, and Tenterfield.
1888—7,332 „	
1889—7,971 „	

This would go to show that wheat and maize growing has been so fairly successful in the Darling Downs District as to make any competition in these products a very questionable matter from places so distant as Inverell.

It has been proved to us that at present neither Glen Innes or Tenterfield, which claim to be wheat-producing districts and possess mills, are sending wheat or flour (in quantity) into Queensland, as we find that, although a considerable quantity of flour crosses the border at Wallangarra, it is all brought from Sydney and sent only a few miles into the adjacent Colony, principally to Stanthorpe and the vicinity. And it would appear that the special rate charged in Queensland on imported flour is practically prohibitive. Nevertheless this Toowoomba market would still be open to Inverell, when paying prices prevailed, owing to failure of crops in Queensland.

But that a traffic must eventually spring up across the border is inevitable, as it would seem inconceivable that with federation accomplished and tariffs assimilated two great Colonies should not have an important interchange both of passenger and goods traffic, more particularly when an uniform railway-gauge is adopted.

SUMMARY.

OF the immediate necessity for connecting the magnificent and extensive country about Inverell with the Railway system, no one who has travelled through the district can have any doubt.

It requires neither figures nor statistics to prove it—it is self-evident (and it is to be regretted that want of unanimity amongst the people should have delayed its construction so long).

We, therefore, confine ourselves to the question submitted to us, namely: What connection will be conducive of the greatest good to the greatest number?

The Uralla and Kentucky lines, though possessing many engineering merits, and having the great advantage of being the most direct routes to Sydney, besides having been shown to run through very poor country, present to us the insuperable objection, that neither would form any direct link towards connecting the western interior with the north coast districts.

We, therefore, dismiss them from further consideration.

We also dismiss the "Swanbrook" route from Glen Innes, as that *via* Wellingrove seems superior. This leaves only the Guyra to Inverell, and the Glen Innes to Inverell, *via* Wellingrove, to be discussed, and their advantages and disadvantages compared.

As a connection with the Great Northern Railway, the Guyra to Inverell line has the following advantages:—

- 1st. It is the least expensive, the estimated cost being £103,861.
- 2nd. It is, as to grades and curves, the better line.
- 3rd. It passes through a fair quantity of good land, much of which is unalienated.
- 4th. It offers the more direct connection with Sydney.

5th.

5th. It would also be the more direct connection between Inverell and the proposed Guyra to Grafton line.

6th. It passes through the mining district and town of Tingha; though, as pointed out previously, the permanence of this tin-field remains to be proved.

7th. It would get the Bundarra traffic, which would hardly come to the Glen Innes line.

The single disadvantage is, however, that in the possible event of the Tenterfield to Casino line being constructed at no distant date, as a second connection with the coast, all traffic to and fro between Inverell and the country north of Grafton, as well as that with Queensland, would have to be taken 48 miles out of the way, *via* Guyra, as compared with the Glen Innes to Inverell route.

The advantages possessed by the Glen Innes to Inverell line are:—

1st. The length to be constructed and worked is less than the Guyra line, although the cost of construction will be greater.

2nd. It passes for almost the whole distance through land of the most fertile character.

3rd. It strikes the main line nearly midway between the proposed coast connections from Guyra and from Tenterfield, and, as the result of our investigations, tends to show that both these connections will be justified within a reasonable future, it seems desirable when this occurs that the line to the western interior should be midway between them.

4th. That it is the shorter route to Queensland from Inverell.

5th. That it will connect two important towns, *viz.*, Inverell and Glen Innes, between which there is at present a considerable local traffic.

On the other hand the disadvantages are:—

1st. That the estimated cost of the line is £402,400, or £88,530 in excess of that to Guyra.

2nd. The grades are heavier and the curves sharper.

3rd. That the traffic to Sydney and southern parts, and that to the coast at Grafton, by way of the Don Dorrigo, would be taken 26 and 12 miles respectively out of the more direct course *via* Guyra.

4th. That almost the whole of the land along the route is alienated and principally held in large pastoral estates.

Taken by itself, as a connection between Inverell and the Great Northern Railway, the Guyra line possesses advantages over its remaining rival from Glen Innes.

We must now consider how the proposed connections with the coast will effect it, and this is really the key of the whole question.

The Grafton to Glen Innes line we have already dismissed on account of its many disadvantages both engineering and commercial, which the saving in mileage, its single advantage is quite insufficient to out weigh.

The line from near Guyra, *via* Don Dorrigo to South Grafton, though rather circuitous in route, possesses many merits and is apparently the best line that can be got from Grafton to the table-land.

That the present and future prosperity of the Clarence depends on such a connection being made is pretty well apparent, for it has now practically ceased to be the Scaport of New England.

That the present prosperity of Inverell or New England depends on getting this connection, has not been made clear to us, although we heard it freely stated, though the future in a measure does.

For if the Clarence is made a first-class port for direct shipment to England, as Sir John Coode's Report indicates, it will be when the proposed improvement works are carried out in their entirety. It will then be a matter of great importance to the interior to have this port as an outlet, and be able to ship produce by deep-sea vessels.

We, therefore, think that the Don Dorrigo line, from near Guyra to Grafton, should be constructed.

If this were to be the only connection with the coast, then the Guyra to Inverell line should undoubtedly be made as being the more direct.

But we cannot help being impressed with the necessity for constructing, in the future, the line from Tenterfield to Casino, for the following reasons:—

It will connect the fertile and populous Richmond District and Byron Bay with Tenterfield and the interior.

It will tend to develop the important mining district of Fairfield.

It will open up a large area of good land *en route*.

It will pass through one of the finest forests in the Colony.

It will form a link in a more direct route between Sydney and Brisbane.

And will open up a traffic area, which would not be served by any line to Grafton from the table land.

Conclusion.

Being, therefore, convinced that soon after the completion of the Guyra to Grafton line, the Tenterfield to Casino Railway must also be constructed, we are of opinion that the general interest of the whole country would be better served by the line from Glen Innes to Inverell than by the line from Guyra to Inverell, for the reason that Glen Innes is between the two points of connection with the coast.

The advantages of such a position were fully shown when discussing the trend of traffic.

It would appear to us desirable, rather, for all time, to take the southern traffic 26 miles round than, by effecting this saving to commit, what appears likely ultimately to be a considerable Queensland and Richmond traffic, to a detour of 48 miles, with the ascent and descent of Ben Lomond, and at the risk of it afterwards proving necessary to construct a second western connection to meet this northern traffic.

And on these grounds we found our disposition to favour—

1st. The construction of the Glen Innes to Inverell line.

2nd. The construction of the Guyra, *via* Don Dorrigo to Grafton line.

And at a later date that from Tenterfield to Casino.

We have, &c.,
PERCY SCARR,
EDWARD B. PRICE.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

PYRMONT AND GLEBE ISLAND BRIDGES—TRAMWAY TO BALMAIN.

(REPORT OF BOARD APPOINTED TO INQUIRE INTO QUESTION OF CONSTRUCTION OF.)

Ordered by the Legislative Assembly to be printed, 11 September, 1890.

Pyrmont Bridge—Glebe Island Bridge—Tramway to Balmain.

THE appointment of a Board, consisting of C. W. DARLEY, Engineer-in-Chief for Harbours and Rivers, Chairman; R. R. HICKSON, Commissioner and Engineer-in-Chief for Roads, etc.; H. DEANE, Acting Engineer-in-Chief for Railways; T. ANGUS, Acting Engineer for Existing Lines; G. GORDON, Hydraulic Engineer of Melbourne,—

To consider the above questions originated in a minute of the Minister for Works, dated 21st October, 1889. The duties of the Board were at first to be confined to the consideration of the question of the construction of a new bridge to replace the existing Pyrmont Bridge, but that of the Glebe Island Bridge was added by order of the Minister on the 18th November. Further, on the 23rd November of the same year, the Under Secretary informed the Chairman of the Board that it was the wish of the Minister that the question of the tramway communication with Balmain should also be considered by the Board as an opportunity seemed to offer itself of connecting that suburb with the proposed cable tramway in Harris-street, by taking the Pyrmont Road, crossing the Glebe Island Bridge, the design of which might possibly be adapted for the passage of such a tramway.

Much delay has occurred in collecting information and preparing the report, and the Board wish to point out that at first there was difficulty in finding days to suit Mr. Gordon, who is a resident of Melbourne, and whose duties when in the Colony took him to the Hunter River District and other places. With a view to meet the difficulty of calling together all the members, the Minister, on the 23rd of November, decided that for the purpose of deliberation three should form a quorum. This improved matters very much, but it has never been easy to fix upon a day or an hour when even three members (heads of branches) can make it convenient to meet, and the Board finding no other time have repeatedly had evening sittings. Again, there was the delay in getting witnesses to come; it has frequently happened that important witnesses have disappointed the Board and the proposed meeting has had to be put off from time to time in order to get their evidence.

The Board from the commencement felt the great difficulty of dealing with these matters, especially with that of the Pyrmont Bridge. It was most desirable therefore that they should not come to a hasty conclusion, but should weigh the matter in the most careful manner, and with that end in view evidence has been taken from some of the leading residents, business men, and Members of Parliament, who seemed likely to be in a position to give valuable and impartial opinions on the question at issue.

The Board began their deliberations by considering all the schemes that had been proposed; they visited the sites of the present bridges and examined on the ground other routes which had been suggested with a view to divert the present traffic and obviate the construction of new bridges with swing spans, but it was soon apparent to the Board that it would be absolutely necessary that the Glebe Island Bridge at least should be rebuilt closely adjacent to its present position, and that the question of tramway communication with Balmain would have to be taken on its own merits and adapted to the bridges after those matters had been decided, that is to say, that the question of the renewal of the bridges on their present sites or removal to others must be treated as the main point at issue, and that the tramway must either be made afterwards to fit in or must be treated as a separate question altogether.

Pyrmont Bridge.

The Board having come to this conclusion as regards the tramway, then had to consider what they should recommend as the best means for providing for the heavy and increasing traffic across Darling Harbour at present passing over Pyrmont Bridge, and in dealing with this question they found it surrounded with many difficulties, more indeed than could possibly at first sight appear, owing to the numerous interests affected.

These may be classed as follows:—

In favour of present site.

1. Vested interests in present bridge by owners of property adjacent to each end of the bridge, and the thoroughfares leading thereto, viz. :—Market-street on the east, and Union-street on the west.
2. Those of the Commissioners for Railways who are now fitting up the large goods-shed, recently erected, with all modern appliances to enable almost the whole of the inward and outward goods traffic to be conducted at the Pymont end of the Darling Harbour yard, and therefore require easy and direct access with the City.
3. Those of a large labouring population who work amongst the stores and wharfs on the City side, but reside over the water and pass to and from their homes, in many cases several times a day. The census of traffic taken (see Appendix A), showing clearly how large this interest is, and how necessary it is that it should be provided for.

Opposed to present site.

1. Those of wharf-owners above the bridge whose property would be enhanced in value by having uninterrupted communication with the rest of the harbour.
2. Those of the residents of Balmain and of other suburbs who drive to the City, and who suffer from the inconvenience arising from the frequent opening of the bridge, and would prefer a fixed bridge with a certainty of crossing higher up the harbour. Keeping these interests in sight, what the Board had to consider was that of the reconstruction of Pymont Bridge on its present site, its removal higher up the harbour, or the erection of a high-level bridge, which would give sufficient headway for vessels to pass clear underneath, and thus obviate the necessity of a movable span.

Several schemes have been brought forward.

1. Renewal of the bridge on or near the present site.
2. Erection of a new bridge on line of Druitt-street.
3. Erection of a new bridge on line of Bathurst-street.
4. Erection of a fixed bridge on the line of Liverpool-street, and reclaiming the small covered portion of the head of Darling Harbour.
5. Erection of a high-level bridge somewhere near the position of the present bridge. Two or three positions have been suggested for such a bridge, but the various proposals may be treated as one.

Commencing with the latter proposals, viz., that of a high-level bridge, this would seem at first sight to have much to recommend it, and its advantages have been urged by many who gave evidence to the Board; but it is evident that unless the trade of the upper part of the harbour is to be restricted to vessels with low masts, and as a consequence of doing so the Government is prepared to pay very large compensation to the wharf-owners thus injured, the headway of such a bridge must be sufficient to enable vessels of all classes to pass under it unimpeded. Captain Chadfield, of the U. B. S. Co., whose premises are now established above the bridge, says masts vary from 125 to 150 feet, and many masts of the latter height cannot be struck; a bridge should therefore possess this clear headway. The adoption of a bridge giving the maximum headway would have the effect of sending all carts and other vehicles passing from Pymont to Sydney, and *vice versa*, over a height of 90 feet above York-street, and the traffic between the Railway Goods Station and Sussex-street would have to mount 150 feet when proceeding from one side of the harbour to the other, and the length of the journey would be increased from 1,500 feet to 6,200 feet, and on gradients of 1 in $17\frac{1}{2}$ from the city and 1 in $18\frac{1}{4}$ to the city. (See diagram, section attached.) It is evident that such a bridge would be a serious impediment to road traffic, and drivers of vehicles would probably much prefer to pass round the head of the harbour than rise this useless height. Foot-passengers would also have serious cause for complaint. The cost also would be excessive. The question of the construction of a high-level bridge may therefore be dismissed.

Several gentlemen, who gave evidence in support of a high-level bridge, explained afterwards that they meant a bridge of 50 or 60 feet headway, which would allow most of the traffic to pass under, and that they would have a movable span in the centre for large vessels. A bridge of this height would obviously be very little better than one with 22 feet clear headway; it would only be productive of cost without having any of the advantages of a fixed bridge.

The proposal to erect the bridge on the line of Druitt-street appears to have very little to recommend it, and the difficulty of giving suitable access to the Railway Station yard caused the scheme to be laid aside.

The proposal to erect the bridge in line of Bathurst-street is open to the same objections.

There remain therefore two proposals, which, in the opinion of the Board, are alone worthy of consideration, and about these they have had very great difficulty in coming to a conclusion. These are the erection of a bridge of improved construction adjoining the site of the present one, or the erection of a fixed bridge in a line with Liverpool-street.

The relative merits of these two sites will now be compared, and for that purpose it must be assumed that the bridges which would occupy those positions are the most suitable for their respective purposes. The assumed new bridge on the present site for example would be one with greater headway, broader roadway, and a larger opening span than the present structure, while the Liverpool-street site would involve a bridge starting from Sussex-street, and rising to such a height as to pass over the Darling Harbour Station yard, without interference with the traffic or the arrangements of the yard, and terminating at Pymont-street.

The evidence in favor of these two proposals appears to be nearly equally divided, and were it not for one most important consideration, to be mentioned below, the Board would have decided to recommend the removal of the bridge from its present site, and so do away for all time with the hindrance and obstruction to navigation which must necessarily exist even with the most approved structure.

Residents in Balmain, Birkenhead, and all those not immediately adjacent to the present bridge strongly advocate the Liverpool-street site. It is also evident that the same site would be supported by wharf-owners on the eastern side of the harbour above the present bridge.

On

On the other hand Pymont residents and those having business adjacent to the ends of the bridge on either side of the harbour strongly object to its removal. Further, there is a large daily foot passenger traffic between Balmain and Sydney, people having been induced to take up their residences in Pymont, and these would lose much were the bridge removed. The claims of these persons, however, could well be met, the Board consider, by means of a subsidised ferry.

In order to test the importance of the bridge on its present site the Board obtained a return of the traffic across the bridge for seven days between the hours of 5 a.m. and 7 p.m. A synopsis of this is appended.

Before deciding on any recommendations as to the bridge, it has to be carefully considered how each proposal affected the goods traffic at the Darling Harbour Station. It was found, after consultation with the Chief Commissioner for Railways and Mr. Angus, one of the members of the Board, that it would be very difficult to meet the requirements of the Railway Department as the station-yard is now constructed at the Liverpool-street site, as the existing goods-shed would be completely useless. Had the goods-yard to be freshly laid out it might be possible to so dispose the sidings and goods-shed as to suit that site, but with the yard laid out as it is the Liverpool-street site would involve sending the traffic a very long way round, which would prove injurious to all concerned, and the approaches to the goods-shed would have to be the same as if the present bridge were renewed, and the removal of the goods-shed would involve very great expense in itself and a radical alteration in the arrangement of the sidings.

Having taken these matters into consideration the Board find themselves compelled, though somewhat reluctantly, to recommend the erection of a new bridge adjoining the present site.

The description of bridge recommended is one with iron or steel superstructure on cast iron cylinders, roadway 42 feet, two 12 feet footpaths, surface of roadway to be wood blocked, and a clear headway of 20 feet above high water, two opening swing spans 60 feet clear with a headway of 22 feet under the span to enable the small steamers and lighters to pass. The estimated cost of such a structure being £220,000.

Glebe Island Bridge.

With regard to the Glebe Island Bridge the Board decided, as already mentioned, that the new bridge ought to be built at a point adjacent to its present site as shown in plan herewith by which the heavy grades now existing can be abolished.

The Board recommend the construction of a bridge with cast iron cylinders, wrought iron or steel superstructure, roadway 36 feet wide, two 7 feet footpaths, and clear headway of 12 feet. A draw span to be provided in the centre of the bridge. The estimated cost of which would be about £140,000.

Tramway to Balmain.

Various schemes for connecting Balmain and the City by tramway have been under consideration, and may briefly be enumerated as follows:—

1. *Via* Market-street, Pymont, and Glebe Island Bridges direct.
2. *Via* Harris-street and Glebe Island Bridge.
3. *Via* the Glebe, extending present tramway from end of Glebe Point by a new bridge over Rozelle Bay to Darling-street.
4. *Via* Forest Lodge, extending existing tramway round *via* Annandale, heading Rozelle Bay up to Darling-street.

The first two projects were proposed on the cable system, and the latter two on the steam motor system.

Owing to the opening spans in the two bridges referred to we consider the cable system inapplicable, as to work No. 1 scheme from Market-street would necessitate the establishment of three different engine-stations, with driving power for the cables,—first on the Sydney side, second at Pymont, and third on Balmain side, with two breaks in the route, *viz.*, on the bridges, where it would be necessary to horse the cars over the opening spans. On the other hand the cable system may be the only one suitable for working a tramway safely on the Market-street gradient of 1 in 11; were it not for the opening spans we would have no hesitation in recommending this route as it would open up direct communication with the cable system proposed for the eastern suburbs, Woollabra, &c.

No. 2 scheme is open to the same objection as No. 1, though in a lesser degree, as it would require two separate engine-stations and one break.

Either of these routes, however, would probably be capable of being worked by electricity, and we are of the opinion that if the experiments now being conducted by the Railway Commissioners should prove that electricity can be successfully applied as a motive power that force should be made use of for the tramway to Balmain, in which case they would recommend the advisability of taking the tram to the foot of Market-street where it might be found necessary to have a transfer to change into the cars worked on the cable system up Market-street.

Should electricity not be found suitable, it will be necessary to consider the schemes Nos. 3 and 4.

No. 3 being the prolongation of the Glebe Point tramway by a new bridge across Rozelle Bay to the Abattoir road, thence along Western-street, or along Mullins and Beattie Streets to Darling-street. By casing the grade at some points along these routes a ruling gradient of 1 in 18 can be obtained, and steam traction could be adopted. The erection of a fixed bridge across Rozelle Bay would cut off valuable frontages, and considerable compensation will have to be paid to owners. The cost of works only by this route would be about £37,000, *via* Mullins-street.

No. 4 is the prolongation of the Forest Lodge tramway through Annandale, heading Rozelle Bay to the junction of Western and Darling Streets, Balmain. By some slight alteration of present road level in Weston-street this route can also be adapted to steam traction. The Annandale people as well as the Balmain residents would be benefited by this route. We estimate the cost at £13,000, one half of which might be debited to Annandale. We are of the opinion that unless electricity can be proved successful and suitable for the direct route from foot of Market-street, that route No. 4, *via* Forest Lodge and Annandale, is the best to adopt, and accordingly have no hesitation in recommending it.

A comparison of the distances by the various routes proposed is given below :—

From Market-street *via* George-street, Harris-street, Pymont, Glebe Island Bridge, Weston-street to Darling-street—3 miles 77½ chains.

From Market-street *via* Elizabeth-street, George-street (West), Glebe Point Road, Bridge over Rozelle Bay, Weston-street to Darling-street—4 miles.

From Market-street *via* Elizabeth-street, George-street (West), Forest Lodge, Annandale, Weston-street to Darling-street—4 miles 4 chains.

The direct distance from George-street, to the same point *via* Pymont and Glebe Island Bridges, is 2 miles 26 chains.

1890.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

LOCOMOTIVE WORKS IN THE COLONY.

(CORRESPONDENCE RESPECTING ESTABLISHMENT OF.)

Ordered by the Legislative Assembly to be printed, 1 May, 1890.

No. 1.

The Chief Commissioner of Railways to The Minister for Railways.

Establishment of Locomotive Works in the Colony.

Sir,

14 May, 1889.

The Commissioners are anxious to see locomotive engines manufactured in the Colony; but the experiments which have been tried in the past have been very unsuccessful, and at this moment we are placed in a very awkward position in consequence of the loss of time during the last three years in ordering new engines, so as to endeavour to get fifty built in the Colony, as within the last week one of the firms which had a contract for twenty-five has notified its inability to go on with the work, and we shall experience great difficulty in carrying on the traffic until we can get engines built in England. There is no proper machinery in the Colony for manufacturing engines, and no persons skilled in the work; and we would suggest to the Government the wisdom of advertising in England and the Colonies simultaneously somewhat as under:—

The Government of New South Wales is anxious to see workshops for the construction of locomotives erected in the Colony, either in the vicinity of Sydney or Newcastle.

The works must be capable of turning out locomotives equal in character to the best English-built engines, and the managing director or manager, who must reside on the spot, must be an engine-builder of known repute. No restrictions will be placed upon the firm in regard to importing any parts of the engines, if such a course is found to be advantageous.

The price to be paid for the engines must be nearly approximate to the cost of the present imported engines when erected and ready for work in the Colony.

The Railway Commissioners will be prepared to place orders for at least seventy-five engines during the next five years with any firm starting works under the conditions above referred to.

The number of locomotives at present in use on the New South Wales Government Railways is 429. It will therefore be seen that ordinary renewals will call for a good number of engines to be built annually.

A considerable sum of money is about to be spent in building new passenger and goods rolling stock. Preference will be given to any firm prepared to begin operations at once.

In the London advertisements:—Communications are invited through the Agent-General, Sir Samuel Samuel, 5, Victoria Chambers, Westminster.

In the colonial advertisements:—To the Railway Commissioners.

The Commissioners will be glad if the Government will come to an early decision hereon.

I am, &c.,

E. M. G. EDDY,
Chief Commissioner.

No. 2.

A. Greenwood, Esq., to The Colonial Secretary.

Proposal for the establishment in New South Wales of Works for the entire manufacture of Locomotives, Carriages, and Waggon.

Dear Sir,

Albion Works, Leeds, 15 August, 1889.

In view of the rapid development of the railway system in the Australian Colonies, and the consequent growing demand for locomotives and rolling stock, we venture to lay before you the following proposal for the establishment in the Colony of New South Wales of works for the entire manufacture of locomotives, carriages, and waggon, on the system of duplicate parts, adopted by the best managed railways in this country, and equal in every respect to those manufactured by our leading makers.

We are prepared to form a private limited company, with a capital of £200,000, of which we propose to subscribe at once £100,000, in ten shares of £10,000 each, so that in fact the company will be a private partnership, and not brought out for stock exchange or speculative purposes.

One of the subscribers is one of the most able and distinguished mechanical railway engineers in this country, who has had great practical experience in designing and building locomotives and rolling stock. He is prepared, if a suitable arrangement can be made with your Government, to give up his present position, and to settle permanently in the Colony and take the management of the company's proposed works.

The works would be established on the latest and most improved principles, with the best and most powerful machine-tools and appliances. Their capacity would be for an annual output of—

50 locomotive engines,
300 passenger carriages, and
1,000 waggons.

It is proposed to establish these works within twelve months of a satisfactory arrangement being arrived at with your Government. To enable us to carry out the above programme, we venture, in the first instance, to approach your Government in the hopes that, not only to secure an ample and reliable source of supply for your own railway system, but to encourage a new and important industry in your Colony, you will give our proposal favourable consideration.

The conditions we would respectfully submit to your consideration, upon which we are prepared to carry out the scheme, are as follows:—

First—That the Government of New South Wales make us a free grant of land, of suitable area for the erection of our works, in direct communication with your railway system, at or near the town of Newcastle, and within reasonable distance of the harbour. We have selected this town from its central position in the Australian railway system, its harbour, and its being the centre of the Australian coal-field.

Second—That the Government of New South Wales give us a monopoly of the supply of locomotives and carriages for a period of ten years, on the condition of our being able to supply all your requirements at prices to be agreed upon, these prices to be based on those paid to first-class English builders, with a reasonable allowance for freight of material and the extra cost of labour in the Colony. In fact, all we ask is that we may stand upon the same footing as first-class English builders.

Third—That the Government of New South Wales agree to take annually a reasonable minimum number of engines, carriages, and waggons from the company.

Fourth—That the company, so long as they supply your requirements, are at liberty to build all descriptions of engines and of railway and tramway plant for other Colonies and companies.

We are prepared to give you any references you may require as to our financial ability to carry out this scheme, and we shall be glad to furnish any information to your Agent-General in London, the Colonial Office, or elsewhere. We are prepared to find all the capital ourselves here, but at the same time we have no wish to exclude colonial capital; indeed we should welcome two or three colonial gentlemen to join our company.

We are further prepared to send out at once, on hearing from you by cable, addressed "Greenwood, Leeds," a gentleman with full power and authority to discuss and settle the details of a contract with your Government.

Trusting that our proposal may receive favourable consideration at your hands,

We are, dear sir, your most obedient servants,

(For the proposed Colonial Locomotive and Waggon Company),

ARTHUR GREENWOOD,

Chairman of Greenwood and Batley (Limited).

P.S.—The writer is also Chairman of the Colonial Ammunition Co. (Limited), who have recently concluded a contract with the Victorian Government, through their Managing Director, Captain Whitney, for the establishment of a cartridge factory in Melbourne, and your Government has agreed to take cartridges from them. He hopes that the proposed locomotive company may be successfully carried out in your Colony, and that it may take its place prominently in the development of the industries and mineral resources of New South Wales.

The Secretary for Public Works.—H.P., 31/10/89. The Under Secretary for Public Works, B.C., 1/11/89.—C.W., Principal Under Secretary. B.C., Railways.—W.S., 4/11/89. The Under Secretary for Finance and Trade. Please see report to Minister herein.—H.McL., 7/11/89.

No. 3.

The Railway Commissioners to The Minister for Railways.

Proposal for Establishment in New South Wales of Works for the entire manufacture of Locomotives and Rolling Stock.

7 November, 1889.

WE have carefully considered this question, and we feel that if works for the construction of locomotives of the character described could be successfully carried on in the Colony, it would be a very material advantage to the Department, and would in all probability lead to the establishment, on a substantial basis, of a new industry of a most desirable character.

We could not advise the Government to agree to the proposal to give a monopoly for the supply of locomotives, carriages and waggons to the proposed company; but we consider it absolutely necessary that a guarantee of some kind should be given, and would advise an order being given for 100 locomotives to be supplied within a period of three years, if suitable terms could be arranged. As there are already several manufacturers of carriages and waggons in the Colony, the company should take its chance with those firms in securing orders for that class of stock.

The question of a free grant of land which is raised in the letter we feel that the Government will not require our advice upon.

We must without delay place orders for further supplies of locomotives, and it is therefore very necessary that a decision on this question should be arrived at as early as possible, as unless the new company be started and able to commence the manufacture of engines within twelve months we must place orders with the home makers; and, of course, to place a number of engines under order in this way would of necessity mean the reduction by a similar number of the total of 100 that we recommend should be guaranteed to the proposed company.

E. M. G. EDDY.
W. M. FEHON.
CHARLES OLIVER.

No. 4.

Cablegram from The Minister for Railways, Sydney, to The Agent-General for New South Wales, London.

19 November, 1889.

GREENWOOD, Leeds, have submitted proposal for locomotive works this Colony. Decided will advertise for tenders here and in London. Particulars by post of 19th November.

No. 5.

Cablegram from The Minister for Railways, Sydney, to Greenwood, Leeds, England.

19 November, 1889.

PROPOSED locomotive works. Public tenders to be invited Colony and England. Particulars sent Agent-General this mail.

No. 6.

The Minister for Railways to Messrs. Greenwood & Batley, Albion Works, Leeds.

Gentlemen,

The Treasury, New South Wales, Sydney, 19 November, 1889.

In reply to the proposal, dated the 15th August, addressed to the Honorable Sir Henry Parkes, Colonial Secretary, I have the honor to inform you that the subject of the establishment of locomotive works in the Colony has been under the consideration of my Government, and it has been deemed desirable to call for proposals, both in the Colonies and at Home, for the establishment of works of the nature described by you, and I have pleasure in enclosing heroin, for your information, a copy of the draft advertisement which the Agent-General has been requested to arrange to appear in the English papers.

I have, &c.,

W. McMILLAN,
Minister for Railways.

No. 7.

The Minister for Railways to The Agent-General.

Sir,

The Treasury, New South Wales, Sydney, 19 November, 1889.

Referring to my cablegram of this date, I have the honor to inform you that a proposal has been received by the Government from Messrs. Greenwood & Batley, Limited, Albion Works, Leeds, to establish works in the Colony for the manufacture of locomotives and railway rolling stock. The Government is anxious to see first-class locomotive works established in the Colony, and have decided to invite public tenders, both in the Colony and in England, and with that view forward herewith draft advertisement for insertion in the English newspapers which will in your opinion be the most suitable.

I shall feel obliged by your sending forward the communications you receive on the subject as early as possible, in order that the Government may consider the same in conjunction with similar proposals which may be received in the Colony.

I have, &c.,

W. McMILLAN,
Minister for Railways.

[Enclosure.]

(Advertisement inserted in Colonial papers).

Establishment of Locomotive Works in New South Wales.

THE Government of New South Wales are prepared to receive proposals for the establishment in the Colony of a first-class firm of locomotive builders, for which there exists a good opening—a large number of engines being required both for renewals and additions to the present stock of 431 locomotives.

The

The works must be fully equipped with the best modern machinery, and be capable of building locomotives equal in every respect to those made by the English makers. It is estimated that a capital of about £125,000 would be required.

The Managing Director or Manager must reside on the spot, and be a locomotive builder of known repute.

The firm may manufacture or repair any class of machinery or rolling stock, and, as regards Government contracts for this class of work, will be on the same footing as other builders in the Colonies.

The firm may, subject to any Customs duties which may be in force, import any parts, materials, or machinery for the manufacture of locomotives, which cannot be reasonably made in the Colony, such articles to be subject to the approval of the Railway Commissioners, and to be set forth in the proposal for establishing the works.

Proposals should be accompanied by satisfactory references as to financial standing, technical ability, and manufacturing experience.

Proposals should state the price per ton of engine and tender empty at which locomotives built in the Colony can be delivered complete in steam. If considered desirable, a sliding scale of prices may be named, based on the variations in the market prices of copper, spelter, best Yorkshire iron and steel boiler plates.

The Railway Commissioners are prepared to give any firm established under the above conditions an order for 100 locomotives, to be supplied within the next three years, provided the price quoted does not materially exceed the price of similar engines built by first-class firms in England and delivered in steam in Sydney.

The first engine must be delivered not later than 1st July, 1891.

Proposals will be received up to the 14th February, 1890.

Communications are invited through the Railway Commissioners, Sydney, New South Wales.

W. M'MILLAN,

Minister for Railways.

NOTE.—Although well advertised in the colonial papers, no local offer was received.

No. 8.

Sir Saul Samuel to The Minister for Railways.

Sir, 5, Westminster Chambers, Westminster, S.W., 14 February, 1890.

Referring to your letter of the 19th November last, No. R. 89-62, on the subject of the establishment in the Colony of a first-class locomotive works, I have the honor to enclose herewith copy of the advertisement which has been extensively circulated in the United Kingdom, inviting proposals for the establishment of the works in question; and I have now to report that only one tender, that of Messieurs D. Drummond, Arthur Greenwood, Henry Hudson, and J. E. Pepper (being "The Australasian Locomotive Engine Works, Limited"), has been received by me. I forward the same herewith, for your information.

I have, &c.,

SAUL SAMUEL.

The Secretary for Railways.—G.E.

The Treasury. B.C., 24/3/90.

[Enclosure.]

(Advertisement inserted in English papers).

Establishment of Locomotive Works in New South Wales.

THE Government of New South Wales are prepared to receive proposals for the establishment in the Colony of a first-class firm of locomotive builders, for which it is considered there exists a good opening—a large number of engines being required by the Government both for renewals and additions to the present stock of 431 locomotives. The works must be fully equipped with the best modern machinery, and be capable of building locomotives equal in every respect to those made by English makers. It is estimated that a capital of about £125,000 would be required. The Managing Director or Manager must reside on the spot, and be a locomotive builder of known repute. The firm may manufacture or repair any class of machinery or rolling stock, and, as regards Government contracts for this class of work, will be on the same footing as other builders in the Colonies. The firm may, subject to any Customs duties which may be in force, import any parts, materials, or machinery for the manufacture of locomotives which cannot be reasonably made in the Colony, such articles to be subject to the approval of the Railway Commissioners, and to be set forth in the proposal for establishing the works.

Proposals should be accompanied by satisfactory references as to financial standing, technical ability, and manufacturing experience. Proposals should state the price per ton of engine and tender empty at which locomotives built in the Colony can be delivered complete in steam. If considered desirable, a sliding scale of prices may be named, based on the variations in the market prices of copper, spelter, best Yorkshire iron, and steel boiler plates.

The Railway Commissioners are prepared to give any firm established under the above conditions an order for 100 locomotives, to be supplied within the next three years, provided the price quoted does not materially exceed the price of similar engines built by first-class firms in England and delivered in steam in Sydney. The first engine must be delivered not later than 1st July, 1891.

Proposals, accompanied by satisfactory references, should be sent on or before the 14th February, 1890, to the Agent-General for New South Wales, 9, Victoria-street, London, S.W.

6th January, 1890.

SAUL SAMUEL,
Agent-General for New South Wales.

TENDER.

16, Great George-street, London, S.W., 13 February, 1890.

To the Honorable Sir Saul Samuel, K.C.M.G..

Agent-General of the Colony of New South Wales, London,—

Dear Sir Saul,

We, the undersigned, are prepared to establish a Locomotive Building Factory in New South Wales, in terms of your advertisement of 19th November, 1889, fully equipped with the best modern machinery, and capable of building locomotives equal in every respect to those made by the leading English makers.

The general conditions we would submit for your acceptance are as follows:—

That our company shall be placed on the same footing as other builders in the Colony as regards Government contracts, and be at liberty to manufacture or repair all descriptions of railway or tramway rolling-stock for other Colonies or companies.

That, after the satisfactory completion of the one hundred (100) engines now specified, a further order of one hundred (100) engines be guaranteed on the terms of and in conformity with your advertisement dated 19th November, 1889, namely,—a sliding scale of prices, based on the variations in the market price ruling to-day of copper, spelter, best Yorkshire iron and steel boiler plates, and subject to the fiscal duties existing at the present time. This stipulation we consider reasonable, as the company established by us will be permanently and purely a colonial factory, having no connection with any English or foreign company,—the present number of locomotives offered being, of itself, wholly inadequate to induce a first-class firm of builders to expend their capital and settle in the Colony unless further substantial orders be received to keep their works employed.

We

We consider, from careful inquiry and practical knowledge, that three types of engines will suffice to meet the whole of the working requirements on your system of railways. Of these, the first or main-line engines which we recommend, are designed for working either passenger or goods trains; each engine to have all its parts interchangeable, or duplicates of each other, and be of the most modern design, and the materials and workmanship equal to the highest class of English manufacture. The second class are designed for local passenger traffic. The third class for shunting and working short-distance goods and mineral traffic, and are of the same quality of material and workmanship as the main-line engines.

These engines are the well-known types built for the North British, the Caledonian, and the London, Brighton, and South Coast Railway Companies. They are specially designed to work over heavy gradients and sharp curves, and are provided with copper fire-boxes, brass tubes, and brass axle-boxes. Their working steam pressure is 170 lbs. per square inch.

We are prepared to supply your Government with one hundred (100) engines of this type, and deliver them in steam on your line within two years and six months from date of order, for the sum of sixty-five pounds (£65) per ton for main-line tender engines, and seventy pounds (£70) per ton for tank engines; payments to be made within one month of the delivery of each engine in working order.

We may remark that the manufacturing cost of these engines in England at the present time is £60 per ton, while the cost per train mile for working and repairs is considerably less than that of any other engine running in this country.

Future prices to be based on a sliding scale, according to the variations in the market, as may be from time to time arranged, on the basis of our present tender.

That the Government afford every facility for the purchase by the company of suitable land to the extent of 10 acres or thereby, belonging to the Government, in the immediate vicinity of their railways that we may select for the purposes of the company, and at a reasonable price.

Our Managing Director, who is a well known locomotive builder and engineer of acknowledged skill and repute, and Member of the Institute of Civil Engineers and of the Institute of Mechanical Engineers, will reside on the spot.

For our financial standing, technical ability, and manufacturing experience, we refer you to—

W. L. Jackson, Esq., M.P., Financial Secretary to the Treasury.

Messrs. William Williams, Brown, & Co., Bankers, Leeds.

The Yorkshire Banking Company (Limited), Leeds.

Messrs. Williams, Deacon, Thoroton, & Co., Bankers, London.

We annex a statement of the machinery and parts or materials of engines which require to be imported, presuming that none of the articles named therein can at present be made or procured in the Colony.

We are, Sir,

Your obedient servants,

D. DRUMMOND,

Managing Director.

ARTHUR GREENWOOD,

HENRY HUDSON,

J. E. PEPPER.

(The signatories being the partners in the proposed The Australasian Locomotive Engine Works, Limited).

STATEMENT of parts and materials of engines to be imported:—

Frame and boiler plates—in the rough.
Copper fire-box plates—in the rough.
Brass, iron, and steel tubes.
Tyres—in the rough.
Crank axles—in the rough.
Cast-steel wheels—in the rough (wrought and cast iron wheels will be made in the Colonies.)
Spring steel.

MACHINERY to be imported:—

3 steam engines.	1 cupola.
2 steam boilers.	1 hydraulic engine and accumulator.
3 power overhead cranes.	1 paint grinding mill.
3 wheel lathes.	1 engine adjusting weighing machine.
4 slotting machines.	1 10-ton weighing machine.
1 frame slotting machine.	1 nut tapping machine (6 spindles).
12 drilling machines.	1 nut making machine.
27 lathes.	1 plate planing machine.
4 shaping machines.	1 plate bending machine.
1 horizontal boring machine.	50 bench vices.
1 cylinder boring machine.	2 large forge furnaces.
3 screwing machines.	1 punching and shearing machine.
1 quartering machine.	1 oliver.
1 slot drilling machine.	3 large grinding machines.
1 saw bench.	1 American turret lathe.
1 wood planing machine.	Complete plant of hydraulic riveting machinery.
1 hydraulic forging and flanging press.	Complete set of emery grinding machinery.
4 hydraulic riveting machines.	Complete equipment of brass and iron moulding machinery.
1 bolt and rivet machine.	Complete equipment of machines for spring making.
1 Roots' blower.	Complete equipment of machinery for making wheels and axles.
5 steam hammers.	
15 smiths' hearths.	
15 anvils.	
4 iron and brass moulding machines.	
1 pug mill.	

All the machinery to be specially designed, and with all the most modern improvements.

No. 9.

The Railway Commissioners to The Minister for Railways.

Proposed establishment of Locomotive Works in New South Wales.

Office of the Railway Commissioners of New South Wales,
Sydney, 27 March, 1890.

Sir,

We have carefully considered the enclosed proposal which has been made in response to the advertisements put out by the Agent-General on the subject, and consider that the offer is a most advantageous one—the advance upon the price of the engines made by English manufacturers being small as compared with the very material advantage that would be gained by the Department if the locomotives were constructed on the spot under the supervision of the officers of the Department, and the greatly accelerated delivery as compared with that we are now experiencing in obtaining engines from abroad. There are other and material advantages which will accrue to the Department by the establishment of such works which we need not now enumerate.

Attached hereto is a minute from the Locomotive Engineer, giving the prices at which engines have recently been built for the South Australian Government, delivered free on board in London and in steam in Adelaide, and also colonial prices for similar engines which were obtained after very keen competition. You will see that the figures of the "Australasian Locomotive Engine Works Company, Limited," are extremely favourable, looking at them in all ways.

We therefore strongly recommend the acceptance of the offer, and would be glad if the Minister will say if we may proceed with the matter under the powers given to us in clause 47 of the Government Railways Act, 1888.

We have, &c.,

E. M. G. EDDY, Chief Commissioner.

W. M. FEHON, Commissioner.

CHARLES OLIVER, Commissioner.

No. 10.

Memo. to The Railway Commissioners by Mr. Thow, Locomotive Engineer, New South Wales Government Railways, late Locomotive Engineer, South Australian Railways.

Locomotive Works.

CONSIDERING the several attempts made—without success—to establish the manufacture of locomotives in this Colony, as evidence of a desire to establish that industry here, I regard the offer of the Australasian Locomotive Engine Works Co. (Limited) as most favourable for that purpose. There cannot be a doubt entertained as to the convenience of having a well-equipped and well-managed locomotive factory in Sydney, assuming, of course, that the work would be executed at a fair advance on English prices. The prices asked by this new company are most reasonable. For purposes of comparison I give below the cost per ton of 5-3-gauge locomotives of the best types, but of ordinary simple designs, delivered by Messrs. Beyer, Peacock, & Co., and Messrs. Dübs & Co., to the South Australian Railways during the last five years; and in addition I give the prices obtained, after keen competition, by a colonial maker for fifty-two engines, exact duplicates in all respects of the English imported engines alluded to.

I consider the suggestion that a second order should be given for 100 engines, at corresponding or relative prices, a reasonable one, which may be safely entertained, because the probable increase of traffic and extension of lines in two and a half years will render that amount of increase in our locomotive stock desirable.

Suburban tank-engine, packed f.o.b., London	£77	per ton.
The same engine delivered in steam, Adelaide...	88	"
The same engine, colonial made, delivered in steam	115.28	"
Express passenger (inside cylinder) tender engine, packed f.o.b.,		
London	60.25	"
The same, delivered in steam, Adelaide...	69.9	"
The same, colonial made, and delivered in steam	90.37	"
Heavy slow passenger and goods (outside cylinder) tender engine,		
packed f.o.b., Glasgow	55.46	"
The same, delivered in steam, Adelaide...	63.86	"
The same, colonial made, and delivered in steam	82.9	"

Notwithstanding the seemingly high colonial rates, I do not believe any profit will be made.

26/3/90.

W. THOW.

No. 11.

Memo. to The Railway Commissioners by Mr. Neale, Mechanical Engineer.

Proposals—Colonial Locomotive Company.

Mechanical Engineer's Office, 44, Phillip-street, Sydney, 27 March, 1890.

I HAVE carefully examined the figures, &c., in the proposals to build locomotives in the Colony, and consider the terms fair and advantageous to the Colony.

As a locomotive engineer, Mr. Drummond's reputation for ability and energy stands very high, and he has achieved great success in rebuilding the rolling stock and repair shops of two great railways. He believes in using the best materials and workmanship in the first instance, and has proved that this pays in the consequent diminished repairs. Mr. Drummond's well-known determination to always have good work should ensure our colonial-built engines being built up to the mark.

Messrs.

Messrs. Greenwood & Pepper are also well known men, connected for many years with first-rate firms, engaged respectively in making all kinds of machinery which has been most successful in accomplishing difficult work, and in the manufacture of the best quality of iron made in Great Britain, known as "Best Yorkshire."

The suggestion of making only three classes of engines is, I think, a sound one under our circumstances. The same engine that takes a passenger train could then, if necessary, return with a goods without waiting for a passenger train, while the present four coupled Dübs express (of which we have forty-seven) could work light passenger trains or run on the easier parts of the line where the proposed main-line engines would be unnecessarily powerful. We do, however, undoubtedly badly want more powerful engines for the heavy parts of the line, and, as showing that one class of engine would do for both goods and passenger traffic, I give the following figures for the desirable standard trains on gradients of 1 in 40:—

PASSENGER TRAINS.		GOODS TRAINS.	
	tons.		tons.
2 Sleepers	50	25 Waggons at 8 tons (loaded) ...	200
1 Car 1st (lavatory)	23	1 B. van, Bogie	16
1 Car compo. (lavatory) ..	23	Engine and Tender	80
1 2nd	23		—
1 B.V. (lavatory)	21		296
<hr/>			
6 Vehicles (loaded) weighing ...	140		
Engine and Tender	80		
<hr/>			
Total	220		

The difference in weight, 76 tons, would be offset by the higher speed required with the passenger train.

I estimate that an engine as proposed by Mr. Drummond, with six coupled wheels, 170 lbs. boiler pressure, and a pony truck in front, would do this work if made with 42 tons adhesion weight, or 14 tons on each driving axle. The total weight of the engine would be about 50 tons, and the tender loaded 30 tons. The weights empty would be about 46 and 14½ tons respectively.

Engines of similar weights and dimensions are coming into favour on the Canadian Pacific Michigan Central, Erie, Chicago, Burlington, & Quincy, and other lines in the U.S.A. for passenger traffic

According to the terms of the offer, I estimate the cost of the different proposed classes as follows:—

	Weight loaded, E. only.	Weight, E. and T. empty.	Price per ton.	Cost, each.
	tons.	tons.	£	£
Main-line Engine.....	50	60½	65	3,933
Shunting Tank—Mineral	56	45	70	3,150
Suburban Tank	45	34	70	2,380

These prices, as regards the heavier engines, appear high, but the engines are far heavier and more powerful than any we now have, and would also be more durable.

Our best available engines haul a load of only 18 trucks up 1—40, which is practically the ruling grade on the most important parts of our main lines. The proposed engine would, I estimate, haul easily 25 loaded wagons. This would not only mean an increase of nearly 40 per cent. in the load for 37½ per cent. increase in the first cost of the engine, but would give a greater increase in the earnings without any appreciable increase in the cost of working, as shown by the following figures of the estimated annual earnings and expenses of a main line engine, on the basis of 25,000 train miles per annum.

PRESENT ENGINES.		PROPOSED ENGINE.	
Earnings—	£	Earnings—	£
Load of 18 wagons =	8,750	Load of 25 wagons =	12,150
<hr/>		<hr/>	
Expenses—		Expenses—	
Running and repairs ...	£1,100	Running and repairs ...	£1,100
Interest on cost of engine, 4 per cent. on £2,850...	114	Interest on cost of engine, 4 per cent. on £3,933...	157
Interest on proportion of cost of workshops and machinery	40	Interest on proportion of cost of workshops and machinery	40
<hr/>		<hr/>	
Total expenses	1,254	Total expenses	1,297
<hr/>		<hr/>	
Net earnings per annum ...	£7,496	Net earnings per annum ...	£10,853

While the extra charge for interest on the first cost of the more powerful engine is £13 per annum, the net earnings are over £3,300 per annum greater, figures that explain the great benefits obtained elsewhere from the use of more powerful engines, and fully justify the greater cost of the proposed main line engines.

Such engines would have the flexible wheel base, great tractive power, and consequent profitable earning capacity, which are the strong points of modern American engines, united with the economical consumption of fuel, careful design, and excellent materials and workmanship, which render English locomotives so durable, trustworthy, and economical.

The

The following table shows the cost of the most recent examples of various types of our existing engines, the actual price as paid to the various English makers being compared with the cost on the proposed scale. All American type engines have been excluded, because the extensive use of cast in place of wrought iron increases the weight and diminishes the cost and renders impossible any comparison on a price-per-ton basis. It is believed that the following is a fair comparison:—

Maker.	Class of engine.	Weight— L. & T. empty.	Cost— proposed scale	Actual price paid.	Date price quoted.
		tons cwt.	£	£	
Dubs	Express passenger.....	50 6	3,270	2,877	January, 1885.
Beyer	Goods (Mogul)	52 0	3,383	2,866	Latter part 1884.
"	"	52 0	3,383	2,860	August, 1889.
"	Suburban tank (351)	31 17	2,230	2,240	1885.
Vulcan	Shunting tank (285)	28 2	1,967	2,290	Latter part 1883.
	Average		2,847	2,627	
Beyer	Shunting Mineral tank	Weight not accurately known		2,780	August, 1889.

The proposed scale of prices is thus about 8·3 per cent. above the prices paid hitherto.

The difference in cost must be considered against the great delay in obtaining engines from England. Ten passenger engines were indented for October, 1888, but only five of these engines had arrived up to March, 1890. Thus five engines had been obtained in seventeen months after order, whereas the proposal offers 100 engines within thirty months after order.

Another batch of twenty-five goods engines were indented for in June, 1889, but, though urgently wanted, little progress had been made up to the following February, the English makers being full of orders.

D. H. NEALE,
Mechanical Engineer.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

PULLMAN CARS.

(CORRESPONDENCE RELATING TO USE OF, ON NEW SOUTH WALES LINES.)

Ordered by the Legislative Assembly to be printed, 3 July, 1890.

RETURN to an *Order* of the Legislative Assembly, That there be laid upon the Table of this House,—

“ All correspondence, minutes, documents, and writings in anywise relating
“ to the proposed use on our lines of the Pullman cars.”

(Mr. Crick.)

Memo. by The Secretary for Railways.

Re proposed use of Pullman cars in New South Wales.

WITH regard to the preliminary negotiations in this matter, it may be stated that, seeing it announced in the newspapers that Mr. William Pullman, of the firm of Pullman & Co., the well-known carriage-builders of America, had arrived in Melbourne, with the view of introducing the Pullman cars into Australia, the Railway Commissioners placed themselves in communication with Mr. Griffin, the United States Consul, with the desire of having an interview with Mr. Pullman so soon as he arrived in Sydney.

Mr. Pullman soon after arrived in Sydney, and was duly introduced, through Mr. Griffin, to the Commissioners. Several personal interviews took place, Mr. Pullman representing that he had power to negotiate on behalf of the Pullman Company for the introduction of the Pullman cars to the Australian railways, and at an interview on the 6th January, 1890, the heads of an agreement were drawn up, and, after subsequent meetings, the arrangements stood as shown in paper. Before the agreement was formally prepared it was necessary for Mr. Pullman to produce his authority from the Pullman Car Company to sign such an undertaking on their behalf, but, as some little time elapsed without Mr. Pullman again meeting the Commissioners, a cable was sent to the Pullman Company, with the result as shown in papers following.

H.M.L.

Office of the Railway Commissioners of New South Wales, Sydney, 6 January, 1890.

Notes of interview relative to introduction of Pullman Vestibule Trains into New South Wales.

Present:—

The Railway Commissioners.

Mr. William Pullman.

1. The general proposal of the Pullman Company to introduce their system of dining-car and vestibule train into New South Wales was discussed. The proposal of the Pullman Company to divide the railway traffic was considered, but it did not commend itself to the Commissioners, and, as an alternative, it was proposed to make a mileage allowance for the use of the carriages, as is the custom between railway companies generally, and to allow an extra fare to be charged for the additional comfort secured by these cars. It was ultimately proposed that 3d. per train mile should be allowed for the use of the carriages for a period of ten years, and after that 2d. per mile; and, in order to increase the traffic, the extra fare for the use of the vestibule cars, including sleeping-berths, to be limited to 8s. per passenger.

2. It was further stipulated that, in the event of better terms being made by any of the other Colonies for the running of the vestibule cars, the New South Wales Railway Commissioners shall have power to vary this agreement so as to make it as favourable to the New South Wales Government as that granted to such other Colonies. Further, that the Members of both Houses of Parliament, and such other holders of free passes as the Commissioners may decide, to be allowed to use the vestibule train free of extra charge except for refreshments.

373—A

3.

[882 copies—Approximate Cost of Printing (labour and material), £4 10s. 0d.]

3. The rates to be charged to passengers for refreshments to be subject to the approval of the Commissioners, and everything provided to be of the best character. The servants employed to be subject to the approval of the Commissioners.

4. Mr. Pullman to arrange that every comfort now given in the vehicles running on the lines of the United States shall be provided in the carriages sent to New South Wales, and that the total weight of the cars shall not exceed 20 tons, and the cars shall not exceed 60 feet in length. Should any cars become damaged through defective road or carelessness on the part of any servant of the Railway Commissioners, such damage to be made good by the Railway Commissioners.

5. Shelter-sheds to be provided by the Railway Commissioners at the respective termini.

6. It is proposed that the cars shall accommodate forty-six passengers for refreshments, each car to be capable of sleeping thirty-two passengers; three trains to be provided to make up the express service between Sydney and Albury (the present service being a train daily from Albury and Sydney, with the exception of Sunday and Saturday). The Pullman Company to supply three spare carriages (one dining-car and two drawing-room cars). The service to commence by 1st October, 1890. The extension of the system to the section between Sydney and Wallangarra to be the subject of further negotiations.

7. The allowance made to the Pullman Company shall cover all expenses in connection with the staff, &c., required for attendance upon the passengers in every form, and shall include the upkeep, washing, &c., of the rolling stock, and the keeping of it in first-class condition, and shall include the lighting of cars by the electric light. The Commissioners shall arrange to make the necessary examination of the train, and provide for the necessary oiling.

8. Should the public object to double sleeping-berths, Mr. Pullman undertook to withdraw the double berths, and substitute single ones.

9. Should wayside passengers travel in the Pullman cars, and not require sleeping-berths, an extra charge to be made of 2s. for the first 100 miles or part thereof, and 1s. for each 50 or part of 50 miles beyond that distance.

10. The Railway Commissioners shall have the right at any time during the currency of this agreement to purchase the cars at a price based on £6,000 for each dining-car and £4,000 for each drawing-room car, proper allowance being made for wear and tear; and should the Railway Commissioners and the Pullman Company not be able to agree as to the amount to be paid, the same to be determined by arbitration in the usual manner; and should the cars be purchased by the Commissioners, the name of Pullman to be removed.

11. It was agreed that the Commissioners shall bear half the cost of freight and insurance of the cars from San Francisco to Sydney.

Office of the Railway Commissioners of New South Wales, Sydney, 18 January, 1890.

Notes of interview relative to the introduction of the Pullman Vestibule Trains into New South Wales.

Present :—

Mr. Commissioner Fehon.

Mr. William Pullman.

In the absence of the Chief Commissioner, Mr. Pullman saw Mr. Fehon, who read to him the heads of agreement, as talked over previously by Mr. Pullman and all the Commissioners.

Mr. Pullman objected to the Commissioners taking power to purchase the cars during the currency of agreement at £6,000 per dining-car and £4,000 per drawing-room car, and stated he would require £2,000 per car as profit on above figures, which he stated was the actual cost.

At a subsequent interview, after a cablegram had been received from the Chief Commissioner, declining to pay £2,000 per car profit, Mr. Pullman agreed to reduce his proposition to £1,000 per car.

Cablegram from the Chief Commissioner, Ashburton, New Zealand, to W. M. Fehon, Sydney.

20 January, 1890.

PULLMAN. Our terms generally are liberal. Think suggested figures for taking cars over too high. Would have no objection to £1,000 being added to price.

Office of the Railway Commissioners of New South Wales, Sydney, 30 January, 1890.

Notes of further interviews relative to the introduction of Pullman Vestibule Trains into New South Wales.

Present :—

The Railway Commissioners

Mr. William Pullman.

12. With regard to clause 8 of the memorandum of interview on the 6th January, it was agreed that single sleeping-berths only should be provided from the commencement of the arrangement, and that provision should also be made for ladies, separate from the general passengers.

13. With reference to clause 10 of the memorandum of interview of 6th January, and Mr. Pullman's subsequent communication with the Railway Commissioners, it was ultimately agreed that the Railway Commissioners shall have the right at any time during the currency of this agreement, on giving three months' notice, to purchase the cars at the cost price, less depreciation, and should the Railway Commissioners and the Pullman Company fail to arrive at a mutual understanding as to the sum to be paid the matter shall be settled by arbitration in the usual manner. Should, however, the plant be purchased within five years of the date of the arrangement coming into force, it was agreed that a sum not exceeding £1,000 shall be added to the original value of each car, so as to indemnify the Pullman Company for the exceptional expenses which will be incurred in establishing and perfecting the new service.

If the arrangement is terminated after the Pullman Company have been running for a period of five years or more the actual first cost of the vehicles only, less depreciation, to be considered in agreeing upon the sum to be paid for the purchase of the cars.

14. If the cars are purchased at any time by the Railway Commissioners the name of the Pullman Company to be removed therefrom.

15. The Railway Commissioners intimated that their existing arrangements with the refreshment-room contractors would not terminate until the end of the present year, and should there be any difficulty in making arrangements with these contractors regarding the required alteration in the present system of providing refreshments in connection with the express trains the dining arrangement could not be brought into operation until the 1st January, 1891.

16. The Railway Commissioners undertook to use their best influence to obtain the necessary authority for the sale of liquors in the dining-cars *en route*.

17. The Railway Commissioners also intimated that should a uniform gauge be arranged between the various Colonies, and the cars are enabled to run through to Victoria, the rate to be agreed to be paid per mile would have to be reconsidered.

18. It was understood that the Westinghouse brake would have to be fitted to all the wheels of the cars, and that the leverage must be arranged according to the standard adopted by the Master Car-builders' Association; also that the wheels and axles must be in accordance with the New South Wales Government Railways specifications, and all details such as buffers, &c., to be agreed with the Locomotive Engineer of the New South Wales Government Railways.

J. Nobbs, Esq., M.P., to The Commissioners for Railways.

Gentlemen,

Granville, 24 January, 1890.

I beg most respectfully to lay before you a few facts in connection with a matter of the utmost importance to my electorate and other portions of the Colony in which industries are established similar to those which are the mainstay of portions of Central Cumberland.

It is currently reported that you are negotiating on behalf of the Government with Mr. Pullman, of the Pullman Car Company, of America, for the running by that company on the railway-lines of this Colony of saloon, dining, and sleeping cars, and that certain concessions are asked by Mr. Pullman which, in my humble opinion, are such as would, if granted, have an effect which could not but be extremely prejudicial to some of our already-established industries.

If I am correctly informed, Mr. Pullman is to be free to supply the rolling stock ready-made from his American works, and retain the right to charge for certain accommodation, and to the exclusive sale of refreshments *en route*. If the first be correct, permit me to say that to obtain ready-made carriages would be to strike a heavy blow at firms like that of Hudson Brothers (Limited), who are certainly able to turn out carriages fit to run on any line, and have expended a vast amount of capital in bringing their works to such perfection as enables them to do it. I merely mention them as a typical firm, and one in my own electorate. There are doubtless many other firms which, if competition were opened, would endeavour to secure the work, and would be able to supply all that is necessary. They will undoubtedly feel that they have been slighted and put to a disadvantage, as compared with a foreign competitor, by not being invited to compete for the work.

You will pardon my laying stress on the fact that at the works mentioned, and others at Granville, Auburn, and other places, many hundred men are employed, and any serious blow at such important industries would have the effect of throwing a large number of industrious citizens out of work.

Feeling sure that you are actuated only by a desire to secure the greatest benefit possible to the department, and through it to the Colony, I am assured that you will pardon my protesting respectfully, but strongly, in the name of a large number of my constituents, against the proposed arrangement, until, at all events, it has been conclusively proved that the manufacturers of New South Wales are unable or unwilling to similarly supply the rolling stock required, and on terms equally advantageous to the Colony, which is already indebted to your exertions for so many much-needed reforms.

I am, &c.,

JOHN NOBBS.

The Chairman, Hudson Brothers (Limited), to The Chairman, Railway Commissioners.

Dear Sir,

2, O'Connell-street, Sydney, 27 January, 1890.

We notice in this morning's papers paragraphs referring to certain letters which Mr. Nobbs, M.P., has addressed to the Railway Commissioners and the Minister for Works, protesting, on behalf of the alleged manufacturers, against the importation of the Pullman cars. We beg to say that, so far as this company is concerned, we know nothing of the matter, and must strongly object to be made a political stalking-horse for anyone.

We quite recognize the fact that the Messrs. Pullman, by their genius, have invented cars which give the height of comfort in railway travelling, and it is our desire to assist in the adoption of the latest and most improved facilities for travelling, rather than to protest against the introduction of improvements, and we shall be glad to assist Mr. Pullman all we can to make his scheme a success.

I may, perhaps, add, with regard to the introduction of improvements, that when in America some time ago I obtained particulars of a dining-car, and on my return impressed upon the Railway authorities the desirability of doing something to popularize railway travelling by the introduction of such cars, and at my risk built the dining-car which now belongs to the department.

We should feel very much pained if the Commissioners should think we had anything to do with any apparent reflection upon their splendid efforts to improve our railway travelling. We are too well impressed with the courtesy which has been extended to us by the Railway Commissioners, and beg to assure them that our best efforts are at their disposal.

I have, &c.,

ROBERT HUDSON,
Chairman, Hudson Brothers (Limited), Sydney.

The Secretary for Railways to J. Nobbs, Esq., M.P.

Sir,

Railway Commissioners' Office, Sydney, 7 February, 1890.

I am directed to state that the Commissioners are desirous of having, as far as possible, all rolling stock made in the Colony, and if it is determined to obtain any special stock from outside the Colony it will be for the reason that, owing to the making of certain vehicles being covered by patent rights, they will have to be obtained abroad.

I may add, the local builders are now practically full of orders, and, as a matter of fact, the Commissioners would be much pleased if the orders in hand could be turned out at a much faster rate than is now the case, so that tenders for further supplies of carriages could be called.

I have, &c.,

HUGH McLACHLAN,

Secretary.

J. Nobbs, Esq., M.P., to The Commissioners for Railways.

Gentlemen,

Granville, 26 February, 1890.

I am in receipt of yours of 7th instant, in answer to my former representations to you on the undesirability of arrangements being made with Mr. Pullman of an exclusive kind.

I am pleased to note that it is the intention of the Commissioners to obtain, if possible, all rolling stock in the Colony, and not to go outside the Colony unless the article is protected by patent rights within it; and, as I am informed by a competent authority that a careful search in the Patents Office shows no record of any patent as being granted to the Pullman Car Company, I presume the intention to introduce American cars will be abandoned, and that they will be manufactured in the Colony.

I am glad to hear that the Commissioners are in receipt of information to the effect that some local carriage-builders are full of orders, but regret that my inquiries do not tend to prove that this is at all general, at all events with the larger firms.

I am, &c.,

JOHN NOBBS.

Cable Message sent 6th March, 1890, from Eddy, Chief Commissioner, to George Pullman, Pullman City.

Negotiations with William Pullman. Are you preparing agreement?

Cable Message received 6th March, 1890, from George Pullman, Pullman City, to Eddy, Sydney.

Party unknown.

The Secretary, Pullman Palace Car Company, to Mr. Chief Commissioner Eddy.

Dear Sir,

Chicago, 6 March, 1890.

Your cable message was duly received this day, as follows:—

"To George Pullman, Pullman City. Negotiations with William Pullman. Are you preparing agreement."

"Eddy, Chief Commissioner."

This company has no foreign representative; except in London (England). Mr. Pullman does not know the party "William Pullman" referred to, and therefore directed me to briefly cable you, which has been done, and same is hereby confirmed.

"Eddy, Sydney. Party unknown."

We were called upon to pay the cable charges, \$13.20, which amount I will thank you to send me by early mail.

Very respectfully,

A. S. WEINSHEIMER,

Secretary.

The Chief Commissioner of Railways to G. Pullman, Esq., President of The Pullman Palace Car Company, Chicago, Ill., U.S.A.

Sir,

Railway Commissioners' Office, Sydney, 18 March, 1890.

I beg to confirm my cable of 6th instant, "Negotiations with Pullman. Are you preparing agreement," and have to thank you for your prompt reply. I may say in explanation of cable that a Mr. William Pullman (see card enclosed) came here with a recommendation from the United States Consul and represented he was acting on behalf of your firm to endeavour to introduce your palace sleeping and dining cars into this Colony, and negotiations were opened up for the supply of Pullman cars for the express train service between Sydney and Albury (for Melbourne). The agreement only wanted a final meeting to confirm, but as six weeks elapsed without hearing from him we thought it wise to cable you.

We are disposed to introduce your cars into this Colony, and shall be obliged if you will say on what terms you are prepared to supply eight sleeping-cars. The standard width and dimensions of the vehicles we would require are shown on the accompanying statement and drawing. The cars would probably be sent out in parts, and they could be put together in the railway workshops.

The sleeping-carriages we now have accommodate twenty passengers each, and it is necessary that separate berths should be provided for each sleeper.

Our

Our circumstances are as follows:—

We have a large sleeping-car traffic between Sydney and Melbourne, the cars running from Sydney to Albury (386 miles), where there is a break of gauge. The gradients are heavy throughout, grades of 130 feet per mile being frequent, while there are several miles of 176 feet per mile. Our sharpest curve is 528 feet radius, or nearly 11 degrees. At present we are running the 386 miles in 12 hours 35 minutes, including one stoppage of 25 minutes for supper, and two stoppages of 10 minutes each and two of 5 minutes each. Deducting all stoppages, the actual time in motion is about 11½ hours, and the average speed 33½ miles per hour, making no allowance for slackening speed at crossing-places on single line. Only a few miles are double track. Our present train consists of two second-class passenger day cars, a baggage and mail car, and two sleepers, the whole weight of the train, exclusive of engine, being about 200,000 lb. The present sleepers weigh empty 39,900 lb., and accommodate twenty passengers each. You will see from this that our present rolling stock is very light on account of our heavy grades.

This weight cannot be materially increased without greatly increasing the cost of running the trains, and, while we wish the accommodation improved, the question of speed is very material, and a reduction in time of one hour or more would be of great importance.

If you can provide a sleeping-car for twenty-eight passengers only weighing 56,000 lb. the weight per passenger will not be increased.

The accompanying brief specification will give you particulars of our requirements on points of detail, but we would also like a proposition from you for cars of the "Mann" type, which are now running with very satisfactory results in other parts of Australia. As you can readily understand, the "Mann" system of compartments is more congenial to English tastes (or prejudices) than the open American car. The Railway Commissioners of New South Wales are therefore prepared to entertain offers from the Pullman Car Company as follows:—

1. To provide eight Pullman sleeping-cars fitted with connecting passages, the arrangement for attaching and dividing the connecting gangway being of simple construction. The use of shops, and machinery, cranes, &c., for putting the cars together, being given free in the Commissioners' shops in Sydney; wheels and axles to be supplied by the Commissioners, but all other expenses being defrayed by the Pullman Company.
2. To build and equip in the United States and erect in Sydney eight similar cars on the "Mann" principle (these cars to be in lieu of those referred to in paragraph 1). A fold-up basin for washing to be provided in each compartment.

Should the offer of the Pullman Palace Company prove moderate and acceptable, the Commissioners may later on require additional vehicles for other services.

Payment will be made—75 per cent. on bill of lading being lodged with a San Francisco bank to be named by the Commissioners, and 25 per cent. one month after the cars have commenced running in New South Wales.

The insurance against sea risk to be dealt with by the Pullman Company.

If the cars, or any of them, could be placed on the line by October next it would be a great advantage, as a large traffic is conveyed to Melbourne for the races at the end of that month.

For the purpose of expediting the matter, I submit the following code for cabling:—

<i>Phrase</i>	<i>Code.</i>
We can supply eight "Mann" cars landed in Sydney and erected ready for running.	"Minutaglia"—pounds.
We can supply eight Pullman sleeping-cars landed in Sydney and erected ready for running.	"Miratrix"—pounds.
The weight of "Mann" cars will be tons of 2,240 lb.	"Mirrastes"—tons.
The weight of Pullman sleeping-cars will be tons of 2,240 lb.	"Mirtidane"—tons.
We will deliver vehicles in Sydney month of	"Misaltate"—month.
The number of berths in "Mann" car will be	"Miscadere"—number.
The number of berths in Pullman car will be	"Miscidate"—number.
We will accept your terms for Pullman cars.	"Miserodence."
We will accept your terms for "Mann" cars.	"Misericers."

Should you find occasion to add anything further you might make use of the A.B.C. code. I may say that "Eddy," Sydney, will be my cable address.

I have, &c.,
E. M. G. EDDY,
Chief Commissioner.

Cablegram from Pullman, Chicago, to Eddy, Sydney.

Time, 10:30 p.m.; 24 April, 1890.

Impossible to deliver this year.

Cable sent 28th April, 1890, from Eddy, Sydney, to Pullman, Chicago.

Cable prices—state earliest date delivery.

Cable Message received April 28th, 1890, from Chicago, to Eddy, Sydney.

Have written.

The President, Pullman Palace Car Company, to The Chief Commissioner for Railways.

Dear Sir, Pullman Palace Car Company, Office of the President, Chicago, 26 April, 1890.

I duly received your letter of March 19th, confirming your cable message of March 6th, and transmitting blue prints and specifications for eight Pullman sleeping-cars, and requesting terms upon which this company would be prepared to furnish the same.

The first intimation we had that anyone claiming to represent this company was in negotiation with your Commissioners in regard to the building by the Pullman Company of sleeping-cars, for service in New South Wales, came to us in associated press despatches. This was confirmed by your cable message of March 6th. As you know, we promptly replied to your despatch, and advised you that the person so claiming to act for this company was unknown to us.

I regret very much that your Commissioners were so imposed upon by one who had absolutely no authority to make any dealings on our behalf, and of whom this company had no knowledge whatever.

I have caused careful examination to be made of the blue prints and specifications submitted with your letter; and, as requested, have sent you a cable response to your communication, stating that it was impossible for us to make delivery of the cars referred to this year. Our works are now running to their fullest capacity, and the condition of orders now being filled, and of others under which delivery must be made during 1890, makes it impracticable for us to undertake to meet any further requirements of the character specified in your letter during this year.

If your Commission desire to adopt the Pullman system of sleeping-cars next year, it would be advisable for you to send to us an engineer, in order that he may become acquainted with the Pullman system of vestibule trains. His familiarity with your requirements, in conjunction with the practical knowledge of our people engaged in the operation of such trains, would, no doubt, result in simplicity and perfection of general plan, and ready adjustment of details.

We shall be glad to extend our field of usefulness into your country, and to confer fully and freely with your representative, when you may be pleased to send one to us.

Yours, &c.,
G. M. PULLMAN,
President.

1890.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAY FROM BYROCK TO BREWARRINA.

(CORRESPONDENCE IN CONNECTION WITH PROPOSED.)

Ordered by the Legislative Assembly to be printed, 6 May, 1890.

RETURN to an *Order* of the Legislative Assembly of New South Wales, dated 8th May, 1889, That there be laid upon the Table of this House,—

“Copies of all papers, &c., in connection with the proposed Railway from “Byrock to Brewarrina.”

(Mr. Willis.)

SCHEDULE.

NO.	PAGE.
1. R. Barton, Esq., M.P., forwarding petition from residents of Brewarrina, urging construction of railway from the Great Western Railway to Brewarrina. 7 September, 1881	2
2. Engineer-in-Chief for Railways to R. Barton, Esq., M.P. Instructions have been issued to make survey from Great Western Railway to Brewarrina. 12 November, 1881.....	2
3. R. Barton, Esq., M.P., to the Honorable the Minister for Works, that survey from Western line to Brewarrina, via Gongolgan, be proceeded with at once. 3 April, 1882	2
4. Engineer-in-Chief for Railways to R. Barton, Esq., M.P. Instructions have been issued to make survey. 25 April, 1882	3
5. Petition from residents of Brewarrina, urging construction of railway from Byrock to Brewarrina. March, 1883	3
6. Report of deputation which waited on Minister for Public Works, respecting railway from Brewarrina to Bourke. 21 December, 1883	3
7. Report of a deputation which waited on Minister for Public Works, respecting construction of a railway Byrock to Brewarrina; also, petition from residents setting forth advantages of line. 2 April, 1885.....	4
8. R. R. Macphatic, Esq., M.P., to Minister for Public Works. Telegram <i>re</i> meeting deputation on 28th August. 18 August, 1885	4
9. Minister for Public Works. Report of deputation which waited upon him <i>re</i> Byrock-Brewarrina line. 28 August, 1885	4
10. W. Sawers, Esq., M.P., to the Honorable the Minister for Works, urging construction of line. 7 December, 1885	5
11. Minister for Public Works. Report of a deputation which waited upon him <i>re</i> proposed line to Brewarrina, and statement presented by Mr. Sawers, M.P. 17 June, 1886	5
12. Under Secretary for Public Works to Thos. Waddell, Esq. Minister will receive deputation <i>re</i> proposed line. 13 April, 1889	6
13. Under Secretary for Public Works to Messrs. Willis and Davis, M's.P., that Minister will receive deputation. 13 April, 1889	6
14. Report of deputation which waited on Minister respecting construction of line. 18 April, 1889	7
15. Report of Railway Commissioners on proposed railway from Byrock to Brewarrina. 16 July, 1889	7
16. Thos. Waddell, Esq., M.P., to the Honorable the Minister for Works, to know estimated amount of traffic required to make the line pay. 23 July, 1889	8
17. Further report of Railway Commissioners <i>re</i> estimated annual cost of working line. 8 August, 1889.....	8
18. Under Secretary for Public Works to T. Waddell, Esq., and W. W. Davis, Esq., M's.P., acknowledging letter <i>re</i> information as to estimated traffic. 26 July, 1889.....	8

RAILWAY FROM BYROCK TO BREWARRINA.

No. 1.

The Chairman, Public Meeting, Brewarrina, to The Secretary for Public Works.

[Presented by Russell Barton, Esq., M.P.]

Railway Line from Brewarrina to line from Dubbo to Bourke.

The humble petition of the inhabitants of the town of Brewarrina and surrounding district,—

RESPECTFULLY SHOWETH:—

That at a public meeting of the inhabitants of Brewarrina and surrounding district, the following resolutions were unanimously adopted:—

That this meeting is unanimously of opinion that a branch line of railway to Brewarrina from the nearest point of the proposed main trunk line from Dubbo to Bourke is an urgent necessity.

That the said branch line would very greatly increase the export of wool and other pastoral produce from this district.

That Brewarrina being centrally situated with reference to some of the most extensive and best pastoral properties probably in the Colony, the said branch line would be kept employed at other seasons than the wool season in the conveyance of cattle and sheep to the Orange Freezing Company's works, and that the conveyance of merchandise in conjunction with these would keep the line occupied profitably during the year.

That the said branch line would divert into New South Wales the large and profitable trade now carried on with the neighbouring Colonies of Queensland, South Australia, and Victoria, by the River Darling, when navigable.

That a petition be forwarded to the Honorable the Minister for Works, conveying the sentiments of this meeting upon this subject.

In compliance with these resolutions, we, the inhabitants of Brewarrina and the surrounding districts, respectfully pray that a trial survey of such branch may be made as early as convenient to your honorable Government; and we would respectfully point out the necessity of expedition, as, from the state of the River Darling, one year's additional trade would be a considerable item in defraying cost of such trial survey.

THOS. THOMPSON,

Chairman of Public Meeting.

Brewarrina, 7 September, 1881.

Forward to Engineer-in-Chief.—C.H.A.G., B.C., 6/10/81. Mr. Palmer to see me on this subject, with plan of the district.—J.W., 14/10/81. Mr. Palmer. Saw Engineer-in-Chief.—H.P., 18/10/81. I see no objection to a trial survey being made if authorised by the Minister.—J.W., 21/10/81. Under Secretary.—P.W.O., B.C., 22/10/81. I think it might be desirable to have the information which a survey would give, with a view to future railway construction.—J.L., 3/11/81. Mr. Palmer to make arrangements to have this survey made as early as practicable.—J.W., 8/11/81. Mr. Palmer noted.—H.P., 10/11/81.

No. 2.

The Engineer-in-Chief for Railways to R. Barton, Esq., M.P.

Department of Public Works, Engineer-in-Chief's Office, Sydney, 12 November, 1881.

Sir,

I have the honor to inform you that instructions have been given for a railway trial survey, to be made as early as practicable, from the Dubbo to Bourke Extension of the Great Western Railway to Brewarrina.

I have, &c.,

W. H. QUODLING,

(For the Engineer-in-Chief).

No. 3.

R. Barton, Esq., M.P., to The Secretary for Public Works.

Sir,

Russell Lea, Five Dock, 3 April, 1882.

On behalf of the inhabitants of Brewarrina and surrounding districts, I have the honor to request that the trial survey for a railway from the Bourke line to Brewarrina *via* Gongolgon may be proceeded with at once. This is the more important, as the trade of this extensive and rich pastoral district is now being forced to Adelaide and Melbourne, from the fact that in times of drought or floods the roads for teams to the present terminus of the Great Western line of railway are impassable, many clips of last season's wool having been held over for the steamers that were only able to take it away in consequence of the late rains, thus causing very serious loss to the district.

Trusting you will give instructions to have this work pushed on with all possible despatch.

I have, &c.,

RUSSELL BARTON.

This survey having been authorised by the Minister, memo. 3rd November, 1881, a surveyor may be sent as early as practicable.—J.W., 18/4/82. Mr. Palmer. I have instructed Mr. Whitlock to carry out this survey, and to commence at Brewarrina.—H.P., 24/4/82.

No. 4.

3

No. 4.

The Engineer-in-Chief for Railways to R. Barton, Esq., M.P.

Sir,

Department of Public Works (Railway Construction Office), 25 April, 1882.

In reply to your letter on behalf of the inhabitants of Brewarrina and surrounding districts, dated 3rd instant, that the trial survey from the Bourke line to Brewarrina *via* Gongolgon should be proceeded with at once, I have the honor to inform you that a surveyor has received instructions to commence at Brewarrina.

I have, &c.,

W. H. QUODLING,

(For the Engineer-in-Chief).

No. 5.

Minute Paper.

RESIDENTS of Brewarrina (R. Barton, M.P.) urging construction of a branch line of railway from Brewarrina to the line from Dubbo to Bourke.

Surveys of this line have been made, but I am not aware of the intentions of the Government as to its construction.—J.W., 17/5/83. Resubmit in a month.—F.A.W., 5/6/83. Under Secretary, B.C. Resubmitted as requested by the Minister.—C.H.A.G., 9/7/83. These papers may be put away, as it is not my intention to recommend the construction of this line.—F.A.W., 28/7/84.

To the Honorable the Minister for Public Works.

The humble petition of the residents of the town and district of Brewarrina,—

RESPECTFULLY SHOWETH :—

1. That the main line of railway from Dubbo to Bourke is distant from here, at its nearest point, about 45 miles, from whence to Brewarrina a trial survey has been made.

2. That the construction of a branch line from the aforementioned point would be in fulfilment of the expressed policy of the Government, to construct feeders to all trunk lines where such branches are likely to become payable.

3. That during the past six months the settlers, and other inhabitants of the district, of which Brewarrina is the centre, have been highly inconvenienced, and in many cases suffered from the want of the common necessaries of life, owing to the difficulties and extreme rates of carriage of goods from Sydney, and the staple industry of the district has been paralyzed at the most critical time of the year, owing to the utter impossibility of obtaining the necessary requisites for shearing purposes.

4. That the wool produce of this district will amount this year to about 35,000 bales, and the quantity thereof is yearly increasing, owing to many of the stations substituting sheep for cattle.

5. That when the river is navigable, which is the case in two seasons out of three, the bulk of the traffic connected with the transport of the wool of the district to the seaboard will be lost to this Colony, inasmuch as the growers will prefer making one shipment thereof on board steamer, to having the same transhipped several times, as will be the case unless accommodation be established by rail between Brewarrina and the trunk line.

6. That we estimate the quantity of goods required for consumption in this district amounts to 15,000 tons annually, and that the certainty of rail carriage to the centre of the district will ensure the goods being obtained from Sydney, whereas the want of such certain means of transit as a railway, will throw the whole of the trade, during navigable seasons, into the hands of Victorian and South Australian traders to the serious detriment of the commerce of this Colony.

7. That we believe the construction of the branch line now sought, will tap the trade of a very large portion of South Queensland, which will not be effected by any line now in course of construction by this Colony.

And we, therefore, pray that you will place the before-mentioned branch line of railway from Byrock to Brewarrina in the next schedule of lines to be proposed to Parliament for construction.

And your petitioners, as in duty bound, will ever pray.

[Here follow 490 signatures.]

No. 6.

Report of Deputation.

Railway from Brewarrina to Bourke.

A DEPUTATION, comprising Messrs. Machattie, Ferguson, Coonan, and Abigail, M's.P., waited upon me to-day, to ask for a railway from Brewarrina to Bourke. It was pointed out that the line could be constructed cheaply, as the distance was not great and the country level. Brewarrina also received a large quantity of goods annually, and sent away a great deal of wool, and a large number of live stock. Petition presented in favour of line herewith. I informed the deputation that I could promise nothing definite in the matter further than that I would give their representations the fullest consideration. If the prospect of traffic indicated that the railway would pay I would be prepared to recommend it, but then such recommendation would have to be ratified by my colleagues, and finally approved of by Parliament. A comprehensive scheme of railway extensions would, as early as possible, be submitted to Parliament, but I was not in a position to say whether Brewarrina would be included in this scheme.

I had statistical and other information by me, and would give their application every consideration.

F.A.W., 21/12/83.

No. 7.

No. 7.

Report of Deputation.

Proposed Railway to Brewarrina.

A DEPUTATION, introduced by Mr. R. Barton, and accompanied by Messrs. Hammond, W. F. Ferguson, Machattie, Cass, and T. R. Smith waited upon me to-day, urging the construction of a railway from Byrock to Brewarrina. The petition enclosed was presented, setting forth the advantages that would be gained by the adoption of the proposed line, and giving fully the nature and extent of the traffic that the line would probably carry.

I informed the deputation that I could give them no further promise than that which I made when a previous deputation waited upon me on the same question, viz., "That when I submitted a scheme of branch railways to Cabinet a line to Brewarrina would be included in such scheme."

They were aware that the Government had recently submitted and carried a comprehensive list of railways, and it was not intended that anything further would be submitted this year by the present Government; in fact, all the available labour and capital that the Colony could raise would be utilised in making the railways already approved of for a few years to come, and it was not probable therefore that any railway scheme would be submitted for some time. I promised, however, that should I be in power I would not overlook their claims, and would adhere to what I had stated.

I took occasion to point out that they were in error in calculating the expense that would be incurred, as the line in place of being a cheap one would be, owing to the nature of the works that would have to be provided, a comparatively expensive one.

F. A. W., 2/4/85.

[Enclosure.]

To the Honorable the Minister for Public Works, Sydney.

The Petition of the Residents of the town and district of Brewarrina,—

HUMBLY SHOWETH:—

That your petitioners are strongly of the opinion that it is desirable to construct a branch line of railway from Byrock to Brewarrina, and in support of this claim would submit the following arguments in its favour:—

1. Brewarrina, situated on the Darling River, is about 500 miles distant from Sydney, and 100 miles from the Queensland border, and is the centre of one of the largest and most important pastoral districts in the Colony.

2. This pastoral district contains forty-four sheep stations, within an average distance of 72 miles, carrying over 3,500,000 sheep, and fifteen cattle stations, within an average distance of 61 miles, carrying over 130,000 head of cattle, the quantity of wool represented thereby being 36,000 bales annually, and from these stations 1,000,000 fat sheep would be available for export annually, besides 30,000 cattle, and a large number of horses.

3. From the Customs returns the revenue collected at Brewarrina during the past six months, in the face of a very severe season, has been at the rate of £6,879 18s. 10d. per annum, showing an increase of nearly 200 per cent. since 31st July, 1877, the date of the establishment of a Custom House here.

4. During the past five years a large trade has been developed between Brewarrina and the south-western districts of Queensland, which will be largely increased if the facilities now sought for be provided, Brewarrina being the natural outlet for the trade of that portion of Queensland.

5. We anticipate that the requirements of the district, together with that portion of Queensland of which it forms the centre, would amount to a trade of the extent of 28,000 tons of merchandise, required from the seaboard, the profit on which traffic alone would more than pay interest on the cost of the construction of the line, independent of the revenue derivable from the carriage of exports of wool, sheep, cattle, horses, hides, skins, &c.

6. That, owing to difficulties of land carriage, the bulk of the trade of the district in past years has been through Victoria and South Australia, both as to imports of merchandise and exports of wool, and, notwithstanding the railway extension to Bourke, a large portion thereof will still continue to drift in the same channels, especially during the periods the river is navigable, unless direct communication be established between Brewarrina and Sydney by means of the branch line now asked for by your petitioners.

7. The length of line now advocated is under 50 miles. A trial survey has been made, which shows that no engineering difficulties exist, and that the line proposed will, if constructed, be the cheapest line ever made in the Colony.

Your petitioners therefore pray that you will be pleased to take into favourable consideration the request now presented. And your petitioners, as in duty bound, will ever pray.

[Here follow signatures.]

No. 8.

Telegram from R. R. Machattie, Esq., M.P., to The Secretary for Public Works.
Brewarrina.

WOULD you kindly meet deputation, Brewarrina, Friday, 28th instant, re railway. Have been deputed by influential body to wait on you.

R. R. MACHATTIE, M.P.

No. 9.

Report of Deputation.

Deputation.—R. R. Machattie, M.P.—Railway, Byrock to Brewarrina.—11:30.

Department of Public Works, Sydney, 28th August, 1885.

THE deputation introduced by Mr. R. R. Machattie, and accompanied by Messrs. Barton, Olliffe, Murray, Hammond, and Targett, M's.P., waited upon me to-day to ask that the claims of the Byrock-Brewarrina railway might be considered. Their presence, they stated, was not due to any fear that the promise previously given concerning this line would not be kept, but rather to strengthen the hands of the Government, and give them greater justification for submitting this extension to Parliament. It was said that the line would prove easy and economical in constructing, as the country passed through was almost a dead level, and no expensive bridges or other works would be required. The Brewarrina district ranked second to none in the west, and its importance could at once be seen by looking at the business done at the local Lands Office, the residents appreciating the new Land Bill, and taking up a great area of land under the homestead leases. In fact, while there were nine Lands Offices in the west, and some of the districts were four times as large as Brewarrina, the business done at this place equalled almost one-fourth of the whole transactions in the western pastoral area. In

In regard to traffic, almost the whole of the fat cattle for the metropolitan market passed through Brewarrina, the stock coming from the cattle stations in Queensland, and they would pass over the extension if constructed, while in good seasons the district itself supported 2,000,000 of sheep, the clip from which would go to the line.

I informed them that I was fully alive to the importance of their district, and the value of the railway to it. I heard with great pleasure that the people of Brewarrina appreciated the Land Bill, and the provision made for homestead leases, which appeared to me one of its best clauses, and one which would produce great good.

With regard to the railway, I fully intended to carry out my promise that, should the Government submit a scheme for branch lines to Parliament, Brewarrina would be recommended by me as a place entitled to a branch line. During the coming Session the Government did not intend to submit any fresh railway scheme, although they would ask for approval for the Narrabri-Walgett and Dubbo-Coonamble lines, but these, I pointed out, were not fresh lines, but simply a modification of a Government proposal last Session, Parliament deciding by a large majority to have these lines in place of the one proposed by the Government, viz., from Mudgee to Walgett. They were aware that the Government had to withdraw the last loan, and as there were still some 14,000,000 already voted to be raised, the Government would not at present be justified in submitting further proposals for new railways. At the same time, I would renew my promise that, should the Government decide at any time while we remained in power to submit a scheme of branch lines to Parliament, I would recommend that the line to Brewarrina should be included; or if such a line were submitted at any time when I was a Member of the Legislature, I would give it my support.

F.A.W.

No. 10.

W. Sawers, Esq., M.P., to The Secretary for Public Works.

Sir,

Parliament House, 7 December, 1885.

I have the honor to direct your attention to the claims of Brewarrina and district to a branch line of railway. You may shortly be asking the consideration of your colleagues to fresh railway proposals for the approval of Parliament. Should such be the case, I beg that the well-known proposal to construct a branch line from Byrock to Brewarrina will not be overlooked. Many depositions have pleaded the claims of this line, and Mr. Wright, the late Minister for Works, became so satisfied of the necessity for this railway, that he pledged himself, should he remain in office, he would never submit a fresh scheme to Parliament without including the Byrock-Brewarrina line. The Department is doubtless in possession of ample evidence as to the probable paying character of this line, as also details as to nature of the country and estimated cost, but information can readily be produced. The survey has long been completed, and I believe estimated vote required made up. The distance is about 56 miles. I am sure the line could be completed at less than £150,000, and pay good interest on its cost. This line would draw much Queensland trade to Sydney, and tend to develop much valuable country. Brewarrina is the favourite Lands Office for homestead lease applications, and much settlement of this character is taking place.

I believe that more than one of your colleagues has expressed himself as favourable to the construction of this line. I submit, Sir, that should you bring down a railway proposal to Parliament, without including this line, it would be felt as a great hardship by a large section of my constituents. I am confident that if Parliament, in temper, to pass any railway proposals, the Brewarrina line would scarcely be questioned, as many Members favourable and the money vote so small. The Brewarrina people are anxious to send down a deputation, to wait upon you on this railway question, but refrain from doing so, at my request, as I desire to avoid such public action during present political crisis.

I have, &c.,

W. SAWERS.

My colleague Mr. Russell Barton is equally in favour of this line.

Place this with other papers on the subject and submit to Cabinet.—W.J.L., 8/12/85.

No. 11.

Report of Deputation.

Railway to Brewarrina.

Department of Public Works, Sydney, 17 June, 1886.

A DEPUTATION, introduced by Mr. Sawers, M.P., from Brewarrina, accompanied by Messrs. Abbott, W. Clarke, Dalton, Cass, Olliffe, O'Sullivan, Hungerford, Moore, Stephen, and D. A. Ferguson, M'sP., waited upon me to-day, with reference to the proposal for a railway from Byrock to Brewarrina. The statement enclosed was submitted by Mr. Sawers, showing the estimated traffic, and the probability that the line would prove a paying one from the commencement, while, as time went on, the traffic would increase as the district was developed, and it was said the line was promised by a previous Government. It was mentioned that Brewarrina was a very suitable place for an irrigation scheme to be initiated, and following such scheme a large population would settle on the Barwon. That without the railway the traffic would pass by the river from this Colony into Victoria and South Australia. That Brewarrina was already an important place, as was evidenced by the extent of land selection and the Customs revenue a greater increase in these particulars being shown at Brewarrina than in any other district. That the line would be easy of construction (no engineering difficulties being met with), and the cost would be small. In connection with this matter, Mr. Abbott remarked that it seemed to him the earthworks to Bourke were much more extensive than the requirements warranted, and that the traffic and wants of the district would be fully met by a train three times a week instead of daily, as at present, the reduction of the trains lessening the expenditure, and, consequently, making the lines more remunerative. They considered the Brewarrina line could be made for a sum not much exceeding £150,000.

I informed them that I looked upon this line as one that would come within the category of cheap lines, as proposed by Sir John Fowler in the report he submitted to me. I quite concurred in his opinion, that it was unwise to expend large sums in making expensive lines over the level plains of the interior; and

and, so long as I was in office, I would, whenever practicable, adopt the system of cheap railways, as by this means we would be able to construct railways to localities which otherwise would not obtain railway facilities. A principle was laid down in some recent railway proposals that where a railway went into a district, and enhanced the value of the local properties, the land actually required for the railway should be given free, and I trusted this principle would be observed in this case. It was pointed out that this line would pass almost wholly through Crown lands. I was under the impression that some proposal was to be made in connection with this line, that the Government, if they constructed the line, would be guaranteed against any loss, but no such proposal had been made. I had had an estimate prepared of the probable cost, and found it to be £247,000 or £4,500 per mile, but this seemed to me altogether too high an estimate for a branch line, such as the Byrock-Brewarrina Extension would be. Regarding irrigation, I mentioned that the Commission was fully aware of the importance of Brewarrina, and that a surveyor was now in the locality taking levels, &c. I stated finally I was not in a position to give any definite promise, but I would submit the matter to my colleagues and, personally, I was in favour of it, provided the line could be carried out cheaply and gave promise of a paying return. It would be a strong argument in favour of it if the people would guarantee the Department against loss.

W.J.L.

[Enclosure.]

Byrock to Brewarrina.

THE country between and surrounding both these places is entirely pastoral, and for the most part good. Both towns are small. Byrock has only had an existence since the extension from Dubbo was commenced. Brewarrina, though on all sides the land is good, has not advanced as it might have been expected it would. It is virtually the head of the navigation of the Darling, as, just above there, is a ledge of rocks forming part of the famed fisheries, over which vessels cannot get unless the river is very high.

The country about the proposed line being pastoral, the population is small and very scattered.

From Byrock to Brewarrina the country is practically level, and the engineering difficulties to overcome would be small.

The line, if constructed, would be a great boon to those who have now to send produce to or receive stores from Sydney by the present roads. These, in fine weather, are good, but a very little rain as the soil is heavy, sticky, and clogging, renders them impassable for wheeled vehicles.

A very close approximate idea of what the returns from this railway should be could be obtained from the Byrock books.

This line should attract some of the Queensland traffic, which now goes by other roads.

A matter for consideration with regard to this line is the competition which it would have to meet of the steamers on the Darling. But judging from what the extension to Bourke has already taught us, in the end the river unless locked would interfere very little with the railway.

Navigation is so uncertain (in my experience the Darling has only been open on an average for a period once in every three years), the chance of a steamer being caught in one of the bends when the river is falling so imminent, the danger when the river is low so great, that until matters be very much ameliorated, either by locking or some other means, a certain service by rail must prevail over the uncertain means of the river.

With regard to all extensions into the interior of the Colony, if they are to pay properly, a very different system of construction must be adopted in the future from what has prevailed in the past.

In the purely pastoral portions of New South Wales, the population is so small and so scattered, that in fixing a service, it may be neglected.

For the goods and the goods only should trains be run. To give an example of what I mean—I left Bourke not so long ago, and I believe I was the only passenger in the train. At that time a train for passengers and mails only ran right through to Bourke. It being conceded that the goods traffic only is to be considered (of course there would be accommodation for passengers on every train), a much less rate of speed than that at present attempted will suffice, and consequently a much cheaper line,—half ballasted, no fencing, sleepers on the sod—why in level country these are put on a bank not consolidated, while the earth is available and is consolidated, is, to the unprofessional mind, incomprehensible. No station buildings except sheds and residences which may be absolutely necessary, not as at present, erections which, in many cases, are more than equal to the traffic of fifty years hence—such is the line which, in my opinion, is suitable for our inland extensions. Let everything be good as far as it goes, and capable hereafter of being made equal to the present lines, which are undoubtedly excellent—but such excellency is not at present required.

The Under Secretary for Public Works to T. Waddell, Esq.

Sir,

Department of Public Works, Sydney, 13 April, 1889.

In compliance with your personal request, I have the honor to inform you that the Secretary for Public Works will receive a deputation, in reference to the construction of a line of railway from Byrock to Brewarrina, on Thursday, the 18th instant, at 11:30 o'clock a.m.

I am to add that Messrs. Willis and Davis, M's.P., have been apprised of the arrangement.

I have, &c.,

J. BARLING,

Under Secretary.

No. 14.

Report of Deputation.

Department of Public Works, Sydney, 18 April, 1889.

Deputation:—Construction of Railway from Byrock to Brewarrina.

TO-DAY a deputation, consisting of Messrs. Waddell, Davis, Lakeman, Hayes, and Gormly, M's.P., with other gentlemen, waited upon the Minister to urge the desirability of the construction of a light line of railway from Byrock to Brewarrina.

Mr. Waddell, M.P., who was the first speaker, said their object was to ask the Government to take into consideration the construction of this line. The matter, he said, had been under the attention of previous Governments, and Mr. Wright, when Secretary for Works, had expressed himself in favour of it, and had stated that it would be included in the first batch of lines submitted by his Government. He (Mr. Waddell) further pointed out that Brewarrina was the centre of a large pastoral district, the richest in the colony, and was certain to be a town of considerable importance in a few years. As a proof of the richness of the district he would refer to the large number of homestead leases there were in the district, which could be seen by a glance at the map. Further, there were no engineering difficulties in the way of the work, and on account of the level nature of the country a railway could be made at the cheapest possible rate, and that if the line were not constructed the Government would be compelled to make roads. He also stated that no district in the colony was more suitable for carrying out irrigation works. The Barwon runs close to the town, and there were other rivers in the locality; and when the irrigation works, proposed by the Government, were carried out, this district would be certain to be one of the first for their operation.

Mr. Davies, M.P., said he supported all that had been said in favour of the line by the previous speaker.

Mr. Rich said that as an old resident of the district he could strongly advocate the line. In wet weather traffic between the two places was greatly impeded owing to the boggy nature of the country. Traffic with Walgett would be served by the line, and it would also cause a considerable trade with the Queensland district.

Mr. Gormly, M.P., stated that it would cost more to construct and maintain a proper road in this district than it would for a railway, which could be made in the cheapest possible way; and he considered the fact of the saving of a large expenditure in road construction should be placed against the cost of the line. He further stated that there was a rocky bar in the river at Brewarrina which rendered it very suitable for the construction of dams for conserving water for irrigation purposes. He added that the line would have the effect of diverting traffic to Sydney which at present goes to Brisbane.

Mr. Hayes, M.P., said he was well acquainted with the level nature of the country, and he considered that a light line of railway would cost little more to construct than a proper road. He desired to refer the Minister to a report on the subject of light lines of railway which was made some time since by Sir John Fowler.

Mr. Lakeman, M.P., said a great deal of money had been thrown away in trying to make roads in country similar to this. A properly metalled road would cost £1,000 a mile more than a railway; and instead of spending money in roads, he considered light lines of railway should be built. He thought the estimate of the cost of the line by the Department was excessive, and he stated that a private company had estimated the cost at £1,800 per mile, exclusive of rails and rolling-stock.

Mr. Waddell said the Queensland Government were getting a line built from Normanton to Croydon, through similar country to that between Byrock and Brewarrina, only more swampy, and therefore worse, at the rate of £2,250 per mile.

Mr. Bruce Smith, in reply to the deputation, said he knew nothing of the country in question, except from the papers in the office. These he had had the advantage of perusing, and they extended back, he found, to the year 1885. Deputations had at different times waited upon Ministers, but he found they had always received the stereotyped answer, which pleased a deputation without committing the Government, viz., that they would look into the matter, and, if possible, recommend it for the consideration of the Cabinet. [The Minister then read to the deputation minute of 2nd December, 1887 (Railways, 87-21,810), and extracts from replies given to previous deputations by Mr. Wright and Mr. Lync.] He further said that not knowing the country he could only say he would look further into the matter and get together all the information on the subject and endeavour, with the assistance of the professional knowledge of the Department, to form such an opinion as would enable him to determine whether or not he could recommend the application to the Cabinet.

BRUCE SMITH.

Send on to Railway Commissioners.—B.S., B.C., 20/5/89. Railways.

No. 15.

Report of Railway Commissioners.

Office of the Railway Commissioners of New South Wales, Sydney, 15 July, 1889.

Proposed Railway from Byrock to Brewarrina—55½ miles.

IN compliance with the request of the Honorable the Secretary for Public Works (89-1115), we beg to report as under on the above proposal:—

This line traverses a purely pastoral country, with a very limited population.

With regard to the township of Brewarrina, there is no evidence of any advance having been made during the past five or ten years, and it is very doubtful whether the construction of a railway would give it any great impetus. During the past four years large areas of Crown lands have been taken up as homestead leases, and by this means the population of the district has been increased, but, even with this improvement, the whole population which would be served by the railway is limited, and the freights produced

produced by and required of it at present, and in the immediate future would fall far short of that necessary to bring a profitable revenue to a railway. There is, it was alleged by some of the residents of Brewarrina, a prospect of an extensive stock traffic arising north of this place, and extending some distance into Queensland, which would drift to Brewarrina. This may be so, but it is exceedingly doubtful, as it is unlikely that traffic now going to Bourke, where there is a railway, and to Moree, where there probably will be one, is likely to be diverted to Brewarrina. For these reasons the construction of a line cannot, upon commercial grounds, be recommended.

There is, however, another aspect of the case which is, perhaps, not altogether beyond our province, and may be mentioned in connection with the necessity for means of communication between Byrock and Brewarrina. At present there are practically none, and to make roads would be expensive, both the first cost and maintenance, and consequently the question as to whether an inexpensive railway both as regards construction and working, should be provided, may be worthy of consideration, not as a commercial undertaking, but as of affording a means of communication which the Government should provide.

We have not given the usual statement of estimated working expenses and traffic, as the figures cannot be laid down with any degree of certainty.

Estimated Cost.

The estimated cost of construction cannot be given, as no proper survey of the line has been made by the Engineer-in-Chief.

The Seal of the Railway Commissioners of New South Wales was affixed hereto this 16th day of July, 1889, in the presence of,—	}	E. M. G. EDDY, (L.S.) Chief Commissioner. W. M. FEHON, (L.S.) Commissioner. CHARLES OLIVER, (L.S.) Commissioner.
W. V. READ.		

No. 16.

T. Waddell, Esq., M.P., to The Secretary for Public Works.

Sir,

Legislative Assembly, 24 July, 1889.

On behalf of the people of Brewarrina, I would like to know the estimated amount of traffic that would be necessary to make the Byrock-Brewarrina railway pay; also, if the Government would accept a guarantee from a number of responsible people in the Brewarrina district that the line will return a fair interest on the outlay.

Yours, &c.,

T. WADDELL.

No. 17.

Further Report of Railway Commissioners.

Office of the Railway Commissioners of New South Wales, Sydney, 8 August, 1889.

Railway—Byrock to Brewarrina—56 miles.

WITH reference to the estimated annual cost of working the Byrock to Brewarrina line, the cost of the line is set down at £242,400; and the interest on this sum at $3\frac{1}{2}$ per cent. would amount to £8,484; the working expenses are estimated at an additional £9,500; making the value of traffic to be obtained, £17,984.

It may be pointed out that only the proportion of the revenue that would be earned for the traffic actually passing over the section must be given to it, and credit must not be taken for the total rate to be received for carriage from and to Sydney and Brewarrina.

No. 18.

The Under Secretary for Public Works to T. Waddell and W. W. Davis, Esqs., M's.P.

Sir,

Department of Public Works, Sydney, 26 July, 1889.

I am directed to acknowledge the receipt of your letter of the 24th July, on the subject of estimated amount of traffic required to make the Byrock-Brewarrina line pay, and to inform you that the same has been forwarded to the Railway Commissioners, and when the requisite information has been obtained, a further communication will be made to you.

I have, &c.,

J. BARLING,
Under Secretary.

1890.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(ALTERNATIVE ROUTES FOR RELIEVING CONGESTION OF TRAFFIC ON GREAT WESTERN LINE.)

Ordered by the Legislative Assembly to be printed, 5 November, 1890.

25th October, 1890.

The Under Secretary for Public Works,

Sir,

I have the honour to submit the following Report on the commercial and industrial aspects of the suggested loop-line from Blacktown to Blayney, and also of the proposed line from Richmond to Esk Bank.

Blacktown to Blayney.

To obtain a personal knowledge of the country traversed I accompanied Mr. Burge and Mr. Gipps over the line from the Warragamba valley to Blayney, and subsequently examined the country between the Nepean and Blacktown and Liverpool.

Liverpool connection.

The line originally suggested by Mr. Gipps would start from Blacktown, but Liverpool has since been proposed by various persons as a more suitable connection.

The distance from Sydney to the Nepean is the same by either route.

As regards engineering the Blacktown connection would probably be a little easier.

But on the other hand the line from Liverpool would open up a larger area of good land now deprived of railway communication; and, in the event of the Marrickville and Liverpool loop-line being constructed, would keep the traffic clear of the present suburban line.

Description of country.

By either route the line would pass through good agricultural land for 17 miles as far as the Nepean at Mulgoa.

From thence it runs for 14 miles up the narrow gorge of the Warragamba.

Here there is some good land along the slopes of the sandstone cliffs, but the strip is so narrow and steep that when the necessary land is taken for the railway there will be little left for cultivation.

The route then lies up the valley of the Cox for 5 miles. Here, and also in the neighbouring Wollindilly valley, some patches of very rich land occur, but they are only patches in comparison to the extent necessary to feed a railway.

The good land has long since been taken up, and the greater part is now under cultivation.

The line then leaves the Cox and winds up a ridge between Butcher's Creek and the Kowmung River. It follows this ridge for about 60 miles to where it joins the main range, near Shooter's Hill.

There are patches of good land along the ridge, and some nice flats and swamps at Colong and Bendock, but nothing of sufficient area to produce a traffic large enough to support a railway. In fact, the precipitous and broken character of the country precludes the idea of its being cultivated to any extent.

From Shooter's Hill to Blayney, a distance of about 60 miles, fully three-quarters of the land is good, much of it being of a superior volcanic nature suited for the growth of English cereals and fruit.

This district would produce in time a large traffic, though at present it is undeveloped, owing to want of railway communication.

Agricultural

Agricultural products.

As regards agricultural traffic, therefore, I consider that the first 17 and the last 60 miles would eventually yield a traffic of importance, but that over 70 miles of the central section would produce practically nothing.

Timber.

The timber along the route as far as Mount Werong, or for half the distance, consists principally of stringybark, ironbark, and gums. What grows on the ridges is generally of a poor quality.

In some of the ravines good timber is visible, and I was informed that large quantities of good ironbark are found higher up the River Cox.

Cedar is also said to still exist in the Kowmung valley.

Though we descended into several ravines I saw no really first-class timber of sufficient commercial value to become an item of traffic, except in one valley near Mount Werong. Here there was a good forest of blackbutt, stringybark, turpentine, and gum, but yet not to be compared with what grows on the North Coast.

The long railway carriage would prevent this timber from being sent to Sydney, but there would be a good market for it out west.

From Mount Werong to Blayney the timber is of no commercial value, being principally white gum and willow.

Timber products.

I have therefore come to the conclusion that, though sufficient timber could be got for construction purposes, the timber traffic would be small, and principally local and westwards.

Minerals.

Valuable coal seams occur on the Warragamba which cannot possibly be worked without a railway.

At Mount Werong is an extensive gold-field, which has been very little worked. Silver has also been found in the district.

It is probable that with railway communication this field would be developed—the present workings being only alluvial—and support a moderate population, and consequent traffic.

The Warragamba coal-mines are only 50 miles from Sydney; so a large traffic could be relied on, especially as the analysis shows the coal to be of good quality.

Population.

The country as far as the Nepean at Mulgoa supports a very small population. It is principally held under old grants, and is unimproved.

At Mulgoa a new settlement is springing up; and if Messrs. Chaffey Bros.' irrigation scheme is carried out it will rapidly increase.

All good land along the Warragamba and Cox has been taken up and supports about ten families.

From the Cox to Mount Werong is practically uninhabited, and is used as a cattle run.

Near Werong are half a dozen miners and two or three selectors. From thence to Blayney the land is held by several large owners and a few selectors.

There is, however, a considerable area of good land along this section still unalienated.

Probable traffic.

For the present I exclude the question of through traffic derived from the Western Line.

Goods.

With regard to goods it will be seen from the description of the country that over 70 miles of the line would be through country from which little or no agricultural traffic could be derived, and that the only mineral traffic of consequence would be in coal from the Warragamba, only 50 miles from Sydney.

The first 17 miles of the line would have a traffic in fruit and vegetables for Sydney markets of considerable importance.

The traffic from the last 60 miles would be principally grain, potatoes, and other root crops, as well as fruit.

Sheep are only kept west of Shooter's Hill, so the wool traffic would not be large.

Cattle and sheep, except fat stock, would seldom use the railway.

Pigs are now driven in considerable numbers to Camden, after being collected from the different selectors. These, if fat, would probably be trucked or else come as dead meat.

Passengers.

As far as the Nepean a considerable suburban passenger traffic might be expected in course of time, and probably a tourist traffic up the Warragamba and Cox, and to the Jenolan or Whombeyan Caves.

The line would pass within 12 miles of the Jenolan and 15 of the Whombeyan Caves.

It is also certain that settlement would immediately increase on the Warragamba with the opening of the coal mines.

Total traffic.

Making every allowance, therefore, for further development along the line, I am forced to the conclusion that at least 50 miles of this line would be devoid of wayside traffic.

Arguments

Arguments for and against.

Unless it can be shown that the loss sustained through constructing and working this 50 miles of most expensive line is compensated for in other ways, it should be sufficient to condemn the route.

It may be argued that the opening up of 17 miles of good land at the beginning, and 60 miles at the end, is sufficient compensation.

But this good land can be opened up at much less expense, and equally well, by the construction of a line as far as Mulgoa, and by extending the proposed branch from Perth to Rockley, a little further.

A private line from the Nepean would be sufficient to develop the coal mines. The Government can hardly be expected to construct a line for the sole benefit of a Mining Company.

Diversion of traffic.

The main contention, however, of the promoters of the Blacktown-Blayney loop is, that the relief it would afford to the present congestion of traffic on the Mountains, by the diversion of all the traffic to and from places west of Blayney over the new line, and the saving in working expenses effected by having to haul it over a 1 in 60 grade line, instead of over the existing railway with its ruling grade of 1 in 30, would not alone compensate for all disadvantages, but actually pay off the whole capital cost within a few years.

Pamphlets have been published professing to prove this. They are, however, entirely wrong in their premises, and therefore false in the conclusions arrived at.

Briefly, it is argued that because a line has a ruling grade of 1 in 60, it must have a larger traffic than one with a steeper grade. This is absurd!

The traffic depends not on the grade, but on the resources of the country passed through.

The working expenses alone will be reduced by having a flatter grade, and this in a much less degree than is commonly supposed.

"Figures," it is said, "are dangerous things," and "will prove anything;" in the case referred to they have proved an absurdity.

In order to be in a position to judge of the commercial value of the Blacktown-Blayney Line, as an alternative to the Western Line, it will be necessary to investigate these two questions of relief to congestion of traffic, and saving in working expenses.

Means of relieving traffic congestion.

There are four ways of relieving congestion of traffic—

1. Increasing the weight of locomotives. This can only be done to a limited extent.
2. Improving the grades and curves. The grades on the Western Line cannot be improved to any extent, except by cutting out the two Zig Zags. The curves are now being improved.
3. Constructing an alternative line.
4. Duplicating the track.

Comparison of an alternative with a duplicate line.

An alternative or loop line with similar grades, length, summit, level, and character, will simply double the capacity of the railway system affected.

But to duplicate the existing track would increase the capacity twelve-fold, as will be explained further on.

The Blacktown-Blayney Line, it is claimed, will have no grade steeper than 1 in 60. To obtain this, the length must be increased by 5 or 6 miles in one place alone.

The summit level will, I believe, be several hundred feet higher than the present line.

The line will therefore be longer, and rise to a greater elevation than the Western Line, but will be superior as to grades.

Steep grades involve reduced loads and increased working expenses.

The gross weight of a train varies directly with the grade, but the gross working expenses do not thus vary.

Capacity.

It will be shown later on that the capacity of the Blacktown-Blayney Line will be about double that of the present Western Line, so that by its construction the capacity of the Western system would be increased threefold.

As regards capacity, therefore, it would be four times as advantageous to duplicate the present track.

By capacity is meant the greatest amount which, under the most perfect arrangements and with improved appliances, can be carried over a line. In practice of course the amount would be much less.

Capacity depends upon two things:—(1) The number of trains it is possible to work; and (2) the weight of each train.

Single track capacity.

On a single line, with trains passing each other every 5 miles, and travelling at 15 miles per hour, allowing 10 minutes loss at each passing-place, it would be possible to run one train each way every hour = 48 trains per day.

An average "Consolidation" engine will draw (exclusive of its own weight) 196 tons up a 1 in 30 grade: $48 \times 196 = 9,408$ train tons per day. The same engine will draw 410 tons up a 1 in 60 grade: $48 \times 410 = 19,680$ train tons per day.

Double track capacity.

On a double track, with automatic block signals every mile, trains might safely follow each other a mile apart, or (say) at five-minute intervals = 12 each way every hour, or 288 trains per day. This on a 1 in 30 grade would amount to $288 \times 196 = 56,448$ train tons per day each way.

These figures are given for the purpose of showing that where the number of trains must be necessarily great, a duplicate track possesses enormous advantages over a single one, even though this single line has better grades, and provided that both are high grade lines.

Difficulties

Difficulties of working present traffic.

The goods traffic on the Western Line is now very large, and the congestion is severely felt between Penrith and Lithgow, owing to the single track and heavy grades. The grades necessitate the trains being broken up, so increasing the number of trains and train-crossings. If the track were double, this inconvenience would not be felt, as the trains would simply follow each other at short intervals.

The working capacity of a single track is limited, but with continuous brakes and a proper block system the capacity of a double track is almost unlimited, amounting to a constant stream both ways.

These remarks apply to slow goods traffic.

Fast passenger trains running over the same tracks will of course disorganise the procession of goods trains, so that sometimes it becomes necessary to quadruple the lines.

By the time it becomes necessary to quadruple the Western Line, the Colony will have become wealthy enough to construct half a dozen alternative railways.

Single track railways, where the tonnage carried per mile is small, are more economical than double tracks, especially when constructed through level country.

For instance, to duplicate the line from Junee to Hay, would add about 60 per cent. to the capital cost without reducing the working expenses at all.

Economy of double tracks for heavy traffic.

But when the grades are heavy, and the traffic is large and increasing, the proportion of the total working expenses chargeable to shunting and delays at passing places becomes so great, that it is a matter of economy to duplicate.

This time must soon arrive for the Mountain section of the Western Line.

It is claimed by the promoters of the Blacktown-Blayney Line that it would be better to construct their line than to spend any money on the improvement of the existing one. In fact, if their argument is pushed a little further it would be better to close the Western Line altogether.

Estimate of cost of duplication and improving.

Mr. Deane, Acting Engineer-in-Chief for Railways, has furnished me with the following rough estimate of the cost of duplicating the existing line the whole way between *Penrith* and *Blayney*. The line is already duplicate as far as Penrith:—

Permanent-way	per mile.	£2,000
Ordinary works		2,500
						£4,500
140 miles at	£4,500	£630,000
Tunnels		200,000
						£830,000

This includes the avoidance of the two Zig Zags.

For the expenditure of (say) £850,000 the carrying capacity would be increased fully twelfefold, delays avoided, and working expenses per ton reduced.

Branch Lines.

Add to this the cost of the Perth and Rockley branch—estimated at £196,000—with a further extension of about 10 miles, costing (say) altogether £260,000.

Also add the cost of a short branch from Liverpool towards Mulgoa, say 15 miles, at £6,000=£90,000, or a total extra sum of £350,000, which will be necessary to tap the traffic-producing areas of the Blacktown-Blayney Line, and the result is, that for the expenditure of £1,200,000, as much advantage will accrue to the country at large as if the Blacktown-Blayney Line were constructed.

Private Coal Line.

The few settlers on the Cox River and Warragamba would not be long without a railway in the event of a branch being made to Mulgoa—that is, if the coal seams are as good as the analysis would lead one to suppose.

Tourist traffic.

I have excluded the question of tourist traffic, as I believe the larger proportion would continue to visit the Caves by the present routes. Tourists like generally to visit Katoomba or Mount Victoria, and take in the Caves as one of their excursions. The shortening of the road journey to 12 miles would hardly compensate for the tamer scenery of the new route.

In any case, whatever traffic there was might be said to have been stolen from the present line.

It must be now seen whether the saving in working expenses on the Blacktown-Blayney Line would compensate for the additional expenditure it would involve in its construction to what would be required to duplicate the Western Line, and construct the two branches referred to.

Engineering—Cost of Blacktown-Blayney Line.

Mr. Burge, who has had large experience in railway construction in this and other countries, has gone into the engineering merits of the line.

He reports that, in his opinion, the 1 in 60 grade claimed can be got throughout, but only at great expense, and that he is very doubtful if 12-chain curves can be obtained.

He estimates the cost of construction at £2,193,000, and remarks that it might be much more, and is not likely to be less.

I fully concur with him, and consider that, if anything, he has underestimated the difficulties and cost.

It is, of course, impossible in a case like this for anyone to give more than a rough estimate of the probable cost previous to actual survey. Barometric levels will show whether a line is possible, but are useless in determining details, an estimate of which can only be formed from one's previous knowledge of railway construction.

Total

Total cost.

If the cost of survey is added to Mr. Burge's estimate, the total will amount to about £2,200,000, or £1,000,000 in excess of what it would take to duplicate the present line and construct the Perth and Rockley branch, and also the branch from Liverpool to the Nepean.

The question therefore resolves itself into this: Will the saving in working expenses pay 4 per cent. interest on £1,000,000? Otherwise, will the saving be £40,000 per annum?

Working expenses.

Comparing the Blacktown-Blayney Line with the Western: The summit level of the former will be higher than the present line. But allowing that they are equal; then the actual work done in foot-pounds in hauling a given gross load to the top will be the same in both instances.

If the traffic was light the working expenses would also be practically the same, although one may have a grade of 1 in 60 while the other has 1 in 30; that is to say, if one train per day each way would carry all the traffic.

It must be borne in mind that if one line has steeper gradients than another over similar country, it will also have more stretches of level or of low grade.

And it is quite possible to have a line with a ruling grade of 1 in 60 between two places which will be more expensive to work than another line with 1 in 30.

This would occur where the 1 in 60 was obtained at the expense of a great increase of length, or where the 1 in 60 grades were scattered, while the 1 in 30 was all in one place, and could be worked advantageously with an assistant engine.

Good location.

Many things have to be considered besides grades when laying out a line; for instance, first cost wayside traffic, bunching of grades, direction of traffic, length and cost of future maintenance.

If too much weight is attached to one of these to the neglect of others, the resulting line may prove a financial failure.

If the Western Line had still to be constructed, less weight would be attached to the question of first cost, which at the time must have seriously hampered the engineers.

Improvements to Western Line.

Several improvements had to be given up on account of the extra expense entailed.

For instance, the avoidance of both Zig Zags, the great Zig Zag especially, where the direction of the grade is against the heavy mineral traffic.

This can be avoided by a tunnel, the cost of which, as well as the doing away with the other Zig Zag, has been included in Mr. Deano's estimate.

All things being equal, a line with 1 in 60 grade must be much superior to a line with 1 in 30, so that if the western line were not already constructed, the Blacktown-Blayney should be certainly surveyed, even though it would leave out many important towns and districts; a true balance could then be struck.

The present line being constructed, the case is totally different.

It cannot be closed; the same staff of station-masters, porters, &c., must be maintained, as well as the additional staff required for the new line from Blayney to Blacktown.

So that the only saving in working expenses will be the amount represented by the cost of keeping that number of additional locomotives in steam which would be necessary to work the present goods traffic over a 1 in 33 grade instead of over a 1 in 60; and from this should be deducted the cost of the additional staff required for the new line—not to speak of the cost of maintaining so many more miles of works other than permanent-way.

To arrive at the number of additional locomotives required we must investigate the effects of grades upon haulage.

Effect of grades upon haulage.

The tractive power of an engine depends on—

- (1.) The weight on its driving wheels—constant for the same engine.
- (2.) Adhesion, or the proportion of that weight which can be turned into traction before the wheels slip. This varies from one-third to one-fifth, and depends on the state of the rails whether dry, or very wet, or moist and dirty. Average (say) one-fourth.
- (3.) Internal power of engine.—Constant for each engine, and supposed to be always greater than adhesion, and therefore can be disregarded except in calculation of speed.

Typical Locomotive.

The economy of using heavy locomotives has long been recognised, and the tendency is to increase the weight still more.

I have therefore taken as a standard the average consolidation type from Baldwin's catalogue:—

Average Consolidation Engine.	American— Tons (2000 lbs).	English— Tons (2,240 lbs).
Total weight of engine and tender in working order	75	66·75
Do do only do	51	45·4
Do on all driving wheels do	44	39·16
Total tractive power (one-fourth adhesion)	11	9·8

Rolling friction.

The rolling friction of a train moving at 15 miles per hour may be taken at about 8 lb. per ton. This has been determined by actual experiment by Sir Daniel Gooch and others.

Using American tons of 2,000 lb. so as to avoid complications.

The consolidation engine could haul $\frac{11 \times 2000}{8} = 75 = 2,675$ tons on the level.

On a grade, by the first principles of mechanics, the weight sustained by a given pull, is to the pull as the length of the grade is to its height, or $\frac{W}{P} = \frac{l}{h}$. This is when friction is so small that it may be disregarded.

In all except English countries grades are expressed by the number of feet risen in 100 feet. This simplifies calculations. Thus:—

1 in 60 = 1.66 per cent. grade.

1 in 40 = 2.5 " "

1 in 33 = 3 " "

1 in 30 = 3.33 " "

Then for a 1 in 60 grade $\frac{W}{P} = \frac{100}{1.66}$.

To move the load rolling friction must be overcome as well as grade resistance—8 lb. per 2,000 lb. = 0.4 per cent. grade.

Therefore, for a moving train up 1 in 60 $\frac{W}{P} = \frac{100}{1.66 + .4}$ $W = \frac{100 P}{2.06} = \frac{100 \times 11 \text{ tons}}{2.06} = 533$ tons gross.

Deducting weight of engine, tender, and (say) a 4-ton brake-van, in all 79 tons:—

534 - 79 = 455 = weight of loaded trucks.

Paying load.

If we allow the paying load of a goods train to average 60 per cent. of the total waggon weight, and calculating for other grades in the same manner, remembering that rolling friction is constant for a given speed and for all grades, and in fact varies hardly anything under any circumstances when once the train is started, we obtain the following table:—

Table showing effect of grade upon haulage.

Loads hauled by Average Consolidation Engine. Traction = 11 American tons.				Paying Load.	
Grade.	Grade. Per cent.	Gross Load. American tons.	Waggon Load. American tons.	American Tons (2,000 lbs.)	English Tons (2,240 lbs.)
Level	0	2,750	2,671	1,602	1,430
1 in 60	1.66	534	455	273	244
1 in 40	2.5	379	300	180	160
1 in 33	3	323	244	146	130
1 in 30	3.33	294	216	130	116

It will be seen that the paying load for 1 in 60 is a little less than twice the paying load of a 1 in 33, and a little more than twice that of 1 in 30.

Ruling grade.

Though the steepest incline on the Western Line is 1 in 30, only a short length ($1\frac{3}{4}$ miles) of this occurs, and all in the direction of the heaviest traffic— $16\frac{1}{2}$ miles of 1 in 33 grades occur; they also are, with one exception, in the right direction, so that properly speaking 1 in 40 is the grade which might be taken as the limiting grade; 1 in 40 would necessitate loads being about one third less than on 1 in 60.

If therefore I assume that the net paying loads on the Blacktown-Blayney Line would be twice as heavy as on the present line, it cannot be said that I have underrated the advantage of a 1 in 60 grade.

Expenses per mile.

It might be hastily assumed that because an engine could haul double the load over the Blacktown-Blayney Line its working expenses would be only half. This is not so.

If it were possible to use an engine twice as heavy on the present line the same net tonnage could be hauled for about 15 per cent. extra to what it would cost on the line with 1 in 60 grades.

I find that this result has been obtained on American lines.

Our typical engine could not be doubled in weight, therefore the number of trains must be double.

Then the total extra expense per train mile including interest on cost of additional Locomotives would be under 50 per cent. This means that supposing the working expenses of the Mountain section of the Western Line amount to three-quarters of a penny per ton per mile, then the working expenses of the Blacktown-Blayney Line would amount to one half-penny per ton per mile.

Unfortunately I cannot find what the working expense per ton per mile of the Mountain section is. It would be obviously unfair to take the working expenses of the whole line, and divide by the number of tons.

English railways.

The average working expenses on English railways with moderate traffic is about 3s. per train mile.

American

American Railways.

On American railways it amounts to about 1 dollar = 4s. 2d., per train mile.

Mr. A. M. Wellington, M. Inst. C.E., one of the greatest living authorities on Railway Economy, who has studied the subject for years, in the last edition of his work on Railway Location, gives many valuable tables.

The question of the extra cost of working steep grades is fully gone into by him.

The following table is based on his American experience and has been amended since the former edition of his work was published, though the totals remain the same :—

Estimated average cost per train mile of doubling the number of trains to haul a given traffic, or proportion of expenses which varies directly with the number of trains—the car tonnage remaining constant.

Item.	Cost per cent. or in cents.	Per cent. added by doubling number of trains.	Added cost—cents.
Fuel	7.6	67 per cent.	5.1
Oil, waste, and water	1.2	67 "	0.8
Engine repairs	5.6	75 "	4.2
Shunting engines	5.2	Unaffected.	
Train wages and supplies	15.4	100 per cent.	15.4
Car maintenance	12.0	10 per cent. less.	(-1.2)
Renewals—rails	2.0	100 per cent.	2.0
Adjusting track	6.0	100 "	6.0
Renewals—ties	3.0	100 "	3.0
Earthwork and ballast	4.0	100 "	4.0
Switches and sidings	2.5	100 "	2.5
Bridges and buildings	5.5	Unaffected.	
Station terminal and general... ..	30.0	20 per cent.	6.0
Total for operating items	100.0	47.8	47.8
Add for interest on cost of extra locomotives			1.7
Grand total cost per mile per cent. added			49.5

Thus if we double the number of trains to carry a given traffic—otherwise double the train miles—the cost per each additional train mile will be only 50 per cent. of the cost of the original train mile.

Relative cost per train mile.

Therefore the average cost *per train mile* for the two lines will be as :—

$$1 : \frac{1 + .50}{2} \quad \text{or as} \quad 1 : .75$$

New South Wales Railways.

The average cost *per train mile* for all the New South Wales Railways—as given in the Railway Commissioners' Report, was 49.91 pence for year ending June, 1890.

The items are given thus :—

Working Expenses, 1890.

Maintenance of way, works, and stations... ..	d.
Locomotive power	13.24
Carriages and waggons	15.95
Traffic expenses	4.75
Compensation	13.64
General expenses	0.32
	2.01
Total	49.91d.

It is curious that this should agree so exactly with the amount given by Mr. Wellington as the average of American Railways, viz 1 \$ = 50 pence.

The Blacktown-Blayney Line, with 1 in 60 ruling grades, and supposing 12 chain curves also to have been obtained, would be about an average line to work.

Assuming, therefore, that all the traffic in goods and stock to and from places west of Blayney, to and from places east of Blacktown passed over the line when constructed, we may fairly say it would be carried at 50d. *per train mile*.

Then, applying the result arrived at in a previous Table, we find that the same tonnage could be carried over the existing line for $\frac{2}{3}$ = 37.5d. *per train mile*.

This result may appear strange, but when it is recollected that a train mile on the Blacktown-Blayney line would mean 244 tons of paying load moved 1 mile, against 130 tons for the present line, it will not be wondered at, especially when it is remembered that locomotive power bears such a small proportion to total working expenses.

Relative

Relative cost of working a given traffic.

Grade.	Cost per Train mile.	Cost per Ton mile.
1 in 60.	50 pence.	·20 pence.
1 in 33.	37·5 „	·29 „

Traffic Returns.

I have had considerable difficulty in obtaining a return of the traffic that would be diverted from the existing line to the Blacktown-Blayney, owing principally to the press of work in the Traffic Department.

Where the return was incomplete I have extracted the information from the last Annual Report of the Railway Commissioners.

Traffic which would be diverted over the Blacktown-Blayney Alternative Line.

General goods	81,643 tons = 13,607 trucks.
Live stock	= 8,737 „
Wool	25,771 „ = 4,295 „
Total	26,639 „

Allowing average load for goods truck to be 6 tons, and average gross weight for all, 12 tons. This would be an average traffic of 86 trucks per day, allowing 310 working days per year.

To carry this traffic over present line would require 8 trains per day or 4 each way, and over Blacktown-Blayney Line 4 trains per day or 2 each way per day.

Relative working expenses.

Then giving the Blacktown-Blayney Line the benefit of supposing it to be as short as the present line—say 150 miles:—

$150 \times 8 \times 310 \times 37\cdot5d. = \text{£}58,125$ = Annual working expenses of that portion of traffic to be diverted.

$150 \times 4 \times 310 \times 50d. = \text{£}38,750$ = Future cost by new route.

To working expenses of new route must be added cost of maintenance of over 100 miles of additional line and annual cost of at least ten additional stations and platforms, to what would be required on the Rockley and Mulgoa branches.

By maintenance I mean wages of milesmen or track walking. Other items, such as wear of rails, have been allowed for in estimate of cost per train mile.

Maintenance men, at £25 per mile	2,500
Stations' wages, ten at £300	3,000
...	£5,500
Traffic working expenses	38,750
Blacktown-Blayney annual expenses	£44,250

Loss sustained by construction of Blacktown-Blayney Line.

The actual saving in working present traffic would be £13,875.

Or over £26,000 short of what is required to pay 4 per cent. interest on the excess of cost of the Blacktown-Blayney Line over the sum required to duplicate the present line from Penrith to Blayney, and construct the Perth-Rockley branch, and a branch from Liverpool to Mulgoa.

It would be necessary then for the present traffic to considerably more than double itself, in order for the saving in working expenses to justify the construction of the alternative line.

But as the traffic from places west of Blayney is not one-fourth of the whole traffic of the western system—the Lithgow Valley coal trade alone exceeding it—the relief afforded by the Blacktown-Blayney Line would be completely nullified by an increase of one-third in the whole of the western traffic.

The duplication of the western line across the mountains is, therefore, inevitable, and the sooner it is done the better, unless a really good alternative line can be got from the Lithgow Valley.

Richmond to Eskbank.*Description of route.*

This line would cross the Hawkesbury about half a mile above the road bridge at Richmond, and wind up the Kurrajong slopes, tunnelling through the summit unto the long ridge forming "Bell's Line," which extends to Mount Wilson, or Bell Siding. The length is about 42 miles.

Land.—For the first 12 miles the land is of the richest quality, and the high grounds are gradually becoming covered with fruit gardens.

About one mile of worthless sandstone then intervenes, after which Bell's Line is reached. The soil along this ridge, as far as Mount Tomah (about 28 miles from Richmond), is generally poor and sandy; some better patches, however, occur here and there.

Mount Tomah is covered with basaltic soil of the richest kind.

The remaining 12 miles are through worthless sandstone country.

Summary as to Soil.

It will be seen, therefore, that out of a total length of about 42 miles, 14 miles is through very rich soil, 10 miles through light soil of not much value, and extending only a short distance on either side, and 18 miles through absolutely worthless land.

Timber.—Hardwood of a good quality grows on the Bilpin Forest Reserve, and in the ravines, also near Mount Tomah.

There would be sufficient to construct the line and produce a small traffic. There are about 6 square miles of forest reserve in all.

Kurrajong.

Kurrajong.

Population.—The first 12 miles is pretty thickly populated. The Kurrajong is a favourite place for summer residence, and with railway communication established it would at once rival and probably surpass all other summer resorts.

The rise from the Hawkesbury is sudden yet not precipitous, so that magnificent building sites can be got at any elevation up to 2,000 feet, from which beautiful views can be obtained.

From what is locally known as "The Top," the Hawkesbury Plain and Richmond appear as on a map.

In its rich soil the Kurrajong possesses enormous advantages over Katoomba or Mount Victoria. It is also 30 miles nearer Sydney traffic.

The wayside traffic for the first 12 miles would consist principally of fruit, firewood, and probably milk.

Very good fruit could also be grown at Mount Tomah, but the area of good land is too small to produce a large traffic.

The passenger traffic with the Kurrajong during summer months would eventually prove very large.

Conclusion as to traffic.

The conclusion, therefore, I have arrived at is that the first 12 miles would pay for the construction of a *cheap line*, but the remaining portion would not earn any revenue.

Unfortunately the large bridge which is required across the Hawkesbury would so swell the cost of the short line required that a cheap line cannot be obtained at present.

At some future time the road bridge will require rebuilding, and the new bridge should be constructed to carry both road and railway.

Relief to traffic on Western Line.

The main question, however, is whether the line would relieve the traffic of the present Western line sufficiently to justify its construction. This depends on the grade obtained and the cost.

Engineering.

On the question of grade I find a difference of opinion among the surveyors who have been engaged on the trial survey.

Mr. Sharkey maintains that 1 in 50 can be obtained, while Messrs. Cumming and Lloyd say that 1 in 40 is the lowest ruling grade possible.

From my own inspection of the country I believe that 1 in 40 is the best grade that can be got on the 10-mile rise from the Hawkesbury, but that from there on 1 in 50 might be obtained at a greatly increased expense.

To get 1 in 40 heavy works will be required over 30 miles of line.

Tunnels, viaducts, and bridges, will prove a large item.

The bridge over the Hawkesbury will require an open approach nearly a mile long, while the bridge itself will be about 1,000 feet long and 60 feet high; costing, if made as cheaply as the Hawkesbury bridge, fully £100,000.

Rough estimate of new line.

A line with 1 in 40 grades would cost about £1,000,000 to construct as far as Bell Platform.

I do not include the cost of cutting out the great Zig Zag, as that portion of the project really belongs to the improvement of the Western line, and therefore for purposes of comparison may be excluded from the estimate.

Cost of duplication.

To duplicate and improve the present line as far as Bell would cost, according to Mr. Deane's rough estimate, about £300,000 or £700,000 less than what it would cost to construct the alternative line from Richmond.

Saving in working expenses

The saving in working expenses and wayside traffic should, therefore, produce £28,000 per annum before the line would pay interest on cost of construction.

Relative loads.

Referring to tables previously given.

	Tons.	Average Trucks.
Paying load on 1 in 40	= 160	= 26
" " 1 in 33	= 130	= 21
Difference...	30	5

or a 1 in 40 grade would increase the nett paying load a little less than one-fourth = 23 per cent actually.

Relative cost per mile of working.

Thus the reduction in engine mileage would be so small that the cost per train mile would be much the same as at present, or—

Grade.	Cost per Train Mile.	Cost per Ton Mile.
1 in 40	42 pence	0.26 pence.
1 in 33	37.5 "	0.29 "

Traffic to be diverted.

The traffic which could be diverted over this line amounted last year to about 60,000 trucks—allowing an average truck of 12 tons—equal to an average of 196 trucks per day or 18 trains on the present line.

A 1 in 40 grade would reduce the daily number of trains to 14.

Taking the distance as being the same by each route, then we obtain :—

Cost of working traffic West of Bell, over different routes from Bell to Blacktown.—Estimated cost of working per annum.

	miles.	days.	trains.	pence.	
Present line	60	310	18	37.5	= £52,312.
Via Richmond	60	310	14	42	= 45,570.
Difference					£6,742.

Wayside revenue.

The Kurrajong would eventually produce a nett revenue of £5,000 per annum, while the passenger traffic to Mount Tomah and Mount Wilson would pay for cost of stations and maintenance men.

Total revenue.

The net revenue from the line from all sources would therefore only amount to about £12,000 per annum, or £16,000 less than what is required.

A 1 in 50 grade would reduce the working expenses considerably; but I fear that, even if it were possible, this grade could only be obtained at such an enormous expense that 1 in 40 would show a better return for the money invested.

Concentration of grade.

It would, however, be worth spending a good deal of money to concentrate the 1 in 40 grade in one place, namely, the rise from the Hawkesbury to the top of the Kurrajong, and so derive the full benefit from an assistant engine.

Reward for survey and plans.

As Mr. Sharkey appears so confident that he can get a grade of 1 in 50 with 12-chain curves right through, would it not settle the matter if a suitable reward were offered for complete plans and sections showing this grade and curves, with line staked on the ground—cost of railway not to exceed (say) £25,000 per mile, or whatever amount it is considered might be spent in order to obtain a suitable line?

Conclusions.

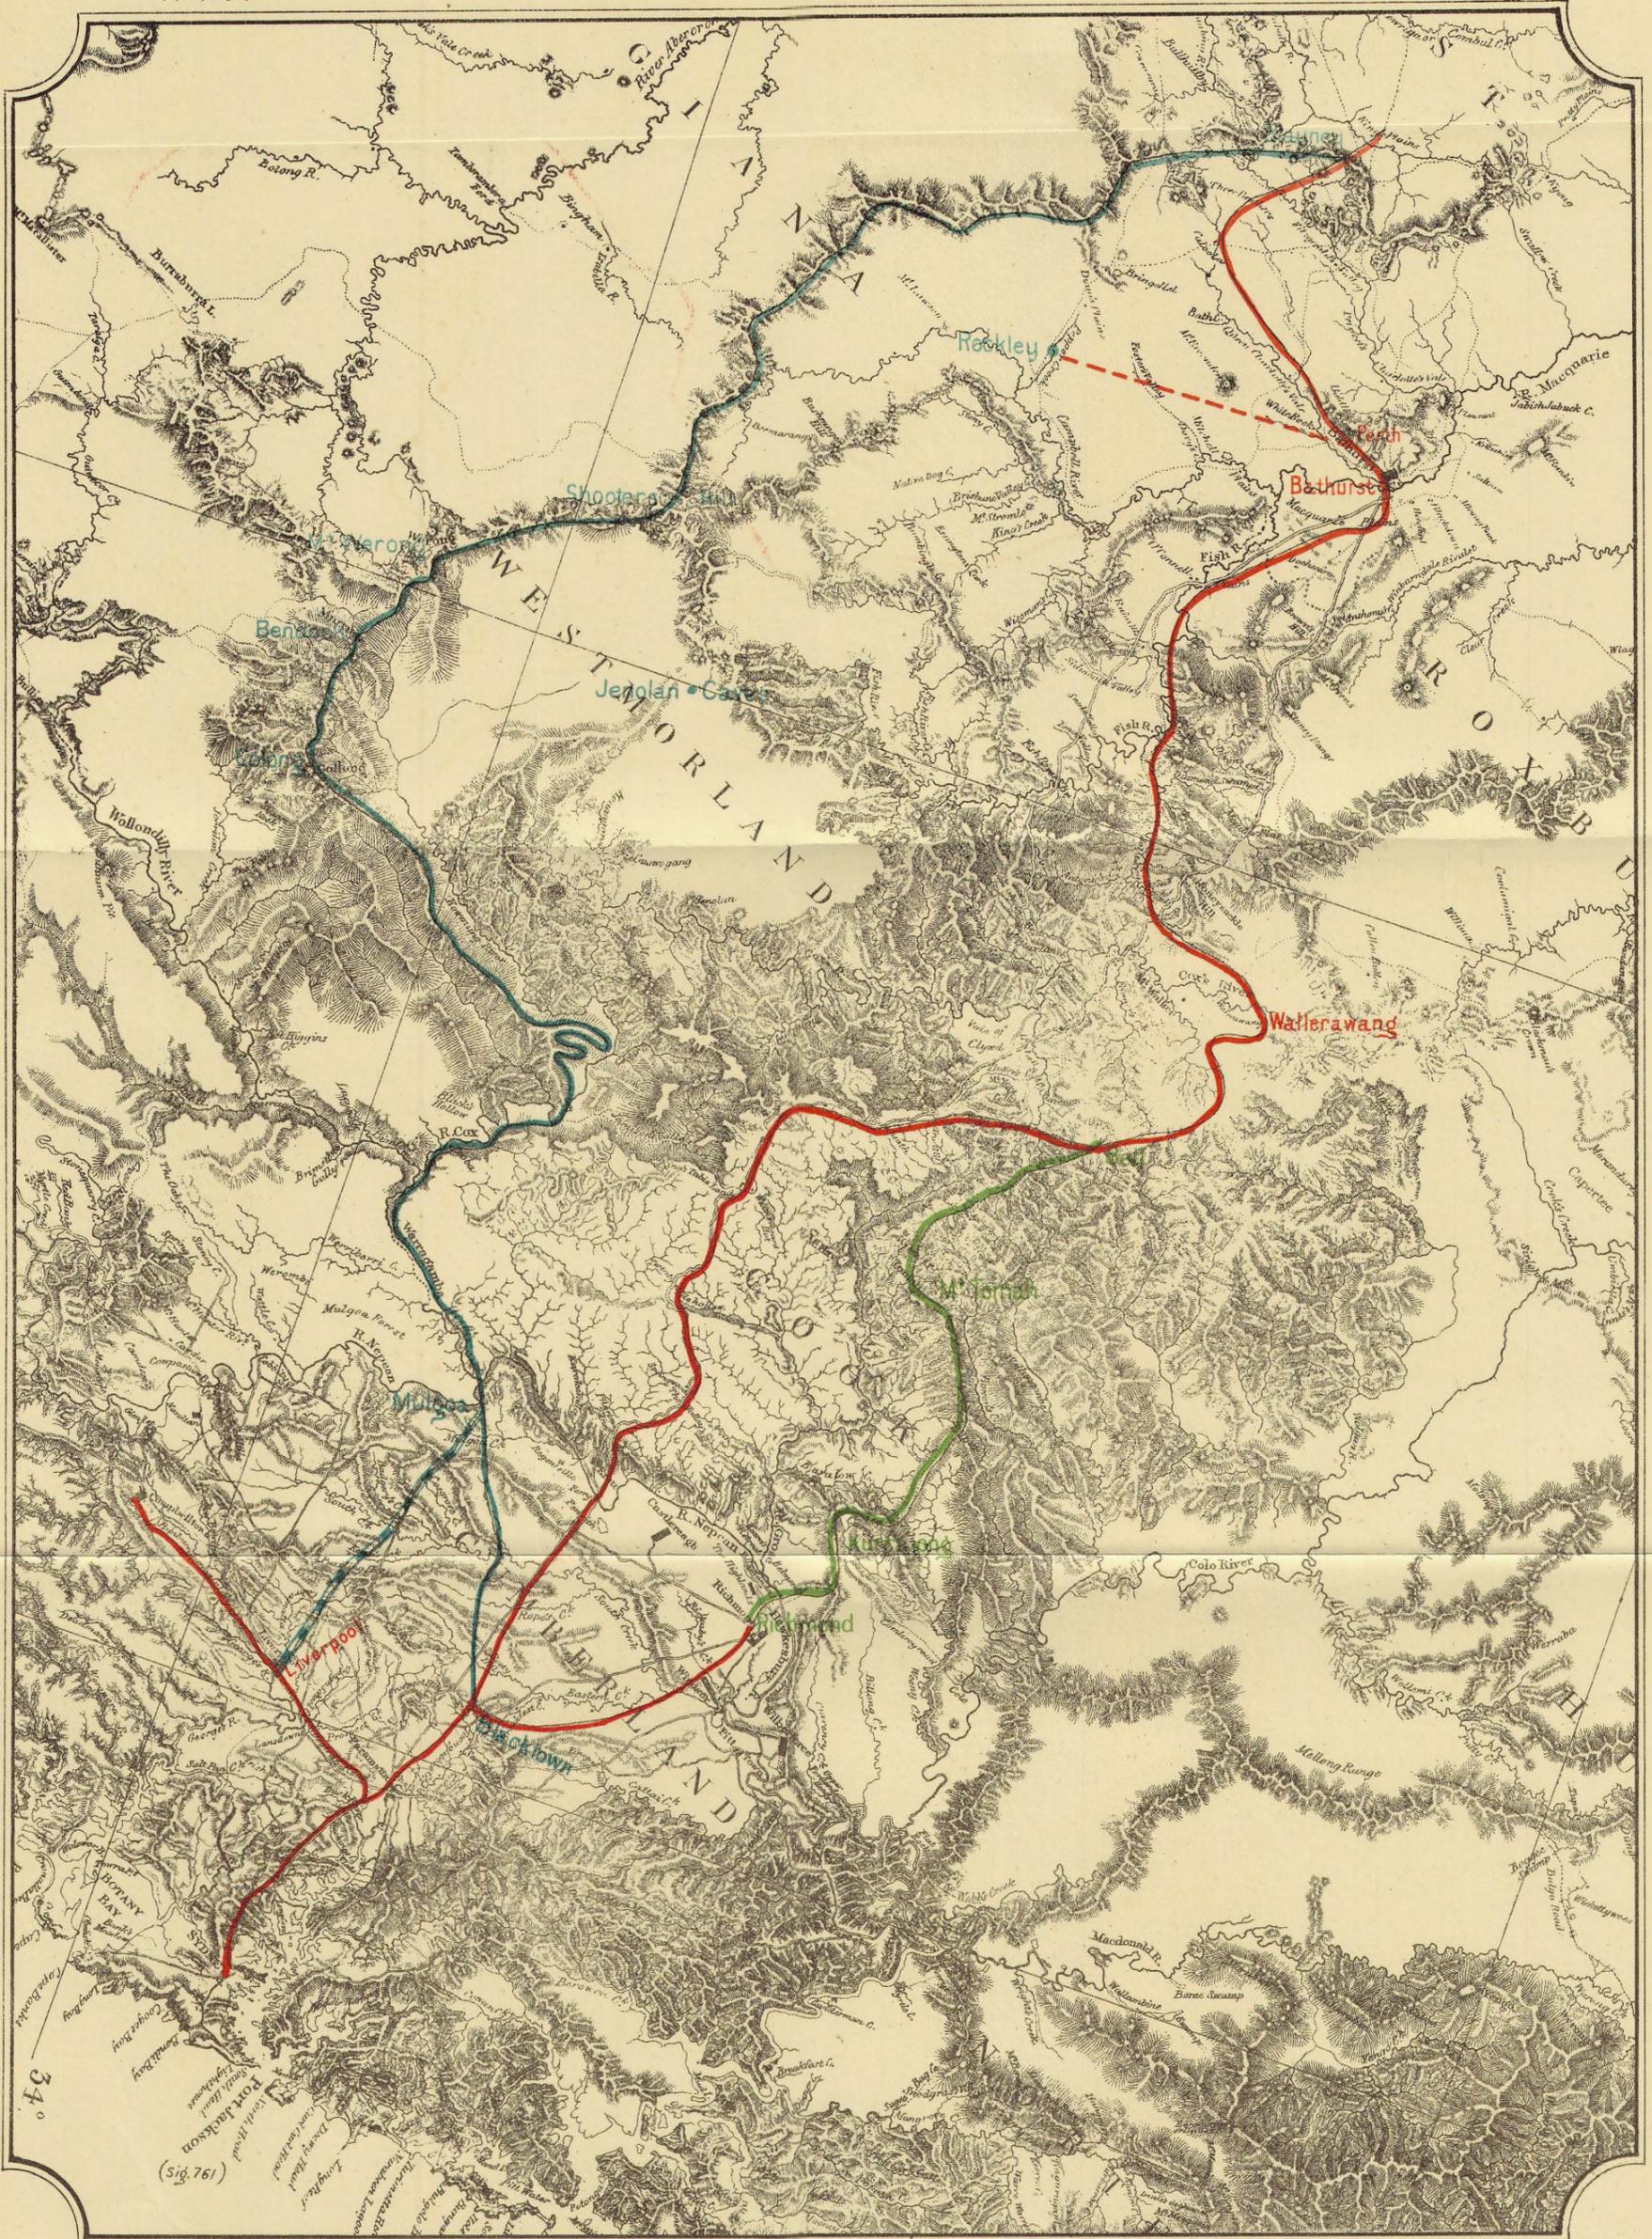

As the result of my investigations I have arrived at the following conclusions :—

- (1.) That it is necessary to take steps to relieve the congestion of traffic on the Mountain section of the Western Line.
- (2.) That the Blacktown-Blayney Line would not divert a sufficient proportion of the traffic to give permanent relief, or the saving in working expenses and wayside traffic be sufficient to justify its construction.
- (3.) That the traffic producing districts opened up by the Blacktown-Blayney Line could be more economically served by branches from the main line.
- (4.) That the line from Richmond to Eskbank would divert fully half the traffic of the whole Western system, and therefore its point of connection is geographically correct.
- (5.) That the ruling grade of the Richmond-Eskbank Line would be so little superior to that of the present line that the consequent working expenses would be little reduced.
- (6.) That the saving in working expenses on the Richmond-Eskbank Line, together with the wayside traffic would not pay interest on its cost of construction.
- (7.) That it would be more economical, and better serve the interests of the country, to duplicate the present track and construct branches than to make either the Blacktown-Blayney or Richmond-Eskbank alternative Line.
- (8.) That the construction of a branch from Liverpool to Mulgoa and from Perth to Rockley is well worthy of consideration.
- (9.) That the extension of the Richmond Line into the Kurrajong would eventually pay interest on the cost of the construction of a cheap railway, and, therefore, no permanent concessions should be granted to any private company.

I have, &c.,

EDWD. B. PRICE.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(ROYAL COMMISSION APPOINTED TO INQUIRE INTO PROPOSED EXTENSION INTO THE CITY.)

Ordered by the Legislative Assembly to be printed, 1 May, 1890.

[Laid upon the Table of the Legislative Assembly in accordance with a promise made by the Secretary for Public Works, in reply to Question No. 14 of the 1st May, 1890.]

VICTORIA, by the Grace of God, of the United Kingdom of Great Britain and Ireland, Queen,
Defender of the Faith, and so forth,—

To our trusty and well-beloved—

SYDNEY BURDEKIN, Esquire, M.P., Mayor of the City of Sydney, President,
The Honorable SAMUEL ARON JOSEPH, M.L.C.,
The Honorable JOHN MACINTOSH, M.L.C.,
The Honorable WILLIAM HILSON PIGOTT, M.L.C.,
HENRY CHRICILARD FRASER, Esquire,
JOHN HAY GOODLET, Esquire,
JAMES HAYES, Esquire, M.P.,
ALEXANDER KETHEL, Esquire,
JAMES MARTIN, Esquire, M.P.,
GEORGE MUNRO, Esquire,
JOHN MACPHERSON, Esquire,
CHARLES FREDERICK STOKES, Esquire,—

Greeting :

Know ye that we, reposing great trust and confidence in your ability, zeal, industry, discretion, and integrity, do, by these presents, authorize and appoint you, or any seven of you, as hereinafter mentioned, to make a diligent and thorough examination and investigation into the several proposals which have been made for extending Railway accommodation into the City of Sydney; to inquire into the whole subject for the information of the Government;—such inquiry to be primarily in view of the present circumstances of the Colony and the present wants of the City population; and secondly and independently in view of the progress of the Country, the extension of the metropolis and its suburbs, and the increase of the population within the next twenty years or other estimated period. Further, to include in such inquiry the expediency of bringing into existence such suburban lines as may be necessary in connection with the main Railway system, and also the expediency of connecting the North Shore by means of a Bridge not obstructing the harbour navigation: And we do, by these presents, grant to you, or any seven of you, at any meeting or meetings to which all of you shall have been duly summoned, full power and authority to call before you all such persons as you may judge necessary, by whom you may be better informed of the truth in the premises, and to require the production of all such books, papers, writings, and all other documents as you may deem expedient, and to visit and inspect the same at the offices or places where the same or any of them may be deposited, and to inquire of the premises by all lawful ways and means: And we do give you power at your discretion to procure such clerical and other assistance as you may deem necessary for enabling you duly to execute this our Commission: And our

further will and pleasure is that you do within three months after the date of this our Commission, certify to us, in the Office of our Colonial Secretary, under your or any seven of your hands and seals, what you shall find touching the premises: And we hereby command all Government Officers and other persons whomsoever within our said Colony, that they be assistant to you and each of you in the execution of these presents: And we appoint you the said Sydney Burdekin, Esquire, M.P., to be President of this our Commission, which said Commission we declare to be a Commission for all purposes of the Act 44 Victoriae No. 1, intituled, "An Act to regulate the taking of Evidence by Commissioners under the Great Seal."

In testimony whereof, we have caused these our Letters to be made Patent, and the Great Seal of our said Colony of New South Wales to be hereunto affixed.

Witness, our right trusty and well-beloved Councillor, CHARLES ROBERT, BARON CARRINGTON, Knight Grand Cross of our Most Distinguished Order of Saint Michael and Saint George, our Governor and Commander-in-Chief of our Colony of New South Wales and its Dependencies, at Government House, Sydney, in New South Wales aforesaid, this nineteenth day of March, in the fifty-third year of our Reign, and in the year of our Lord one thousand eight hundred and ninety.

(J.S.) CARRINGTON.

By His Excellency's Command,

BRUCE SMITH.

Entered on record by me, in Register of Patents, No. 13, pages 515-16, this nineteenth day of March, one thousand eight hundred and ninety.

For the Colonial Secretary and Registrar of Records,

CRITCHETT WALKER,

Principal Under Secretary.

1890.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(CONDITIONS, SPECIFICATIONS, &c., OF THE CONTRACTS FOR RELAYING AND DUPLICATING THE SOUTHERN LINE.)

Ordered by the Legislative Assembly to be printed, 19 December, 1890.

[*Laid upon the Table in reply to Question No. 1, 10 December, 1890.*]

Questions.

- (1.) **DUPLICATION OF SOUTHERN RAILWAY LINE:—**MR. McCOURT *asked* THE COLONIAL TREASURER,—
- (1.) Have the contractors for relaying or duplicating the Southern line any responsibility beyond employing and controlling the men?
 - (2.) What price per day are such contractors allowed for gangers, platelayers, and pick and shovel men?
 - (3.) What is the amount per day paid by such contractors to gangers, platelayers, and pick and shovel men?

Answers.**New South Wales Railways.—Duplication of Existing Lines.****SPECIFICATION.**

1. This Contract is for the completion of Duplications of the following lines:—
Hurstville to George's River,
Sutherland to Waterfall,
Campbelltown to Picton,
Strathfield to Ryde,
Teralba to Adamston,
and from Granville to Campbelltown.

2. The works for which tenders are invited, and to which this specification refers, comprise the providing of all materials (except such as hereafter specified to be otherwise provided), labour, scaffolding, tools, implements, and every other thing requisite and necessary for the full and proper completion of all the earthwork, brickwork, masonry, timberwork, fencing, and ballasting required in the construction of a single line of railway, in accordance with this specification, and to the entire satisfaction of the Commissioners for Railways.

3. The contractor shall state in his schedule prices per cubic yard at which he will execute all the excavation, brickwork, and masonry; the timberwork at per cubic foot; the ironwork in bolts, straps, and other similar ironwork at per lb.; the fencing per lineal yard; the ballasting at per cubic yard, at the thickness specified hereafter; and ironwork in the construction of iron bridges at per ton, finding all materials and labour, the work being paid for on the net measurements as executed.

Earthwork.

4. A ditch at least 3 feet wide at top, 1 foot wide at bottom, and 1 foot 6 inches deep, shall be made on the higher side of the ground to be occupied by the railway, and at a minimum distance of 12 feet from the top of cutting or foot of embankment. These drains are to be made to fall into the ditches or water-course at present existing for the drainage of the adjoining lands, or into the diverted channels, as the case may be; the side ditches are in all cases to be executed in advance of the cuttings and embankments.

5. The bottom of the cuttings is to have 5 inches rounding, unless otherwise ordered.

6. The cuttings to be sloped at such batters, as may be ordered during the progress of the work.

7.

7. The embankments throughout the contract to have slopes of $1\frac{1}{2}$ to 1 properly trimmed, and the width of formation to be as may be directed.

8. The formation of the cutting shall be trimmed to such level, and be of such width as may be directed during the progress of the works. No ballast shall be laid in cuttings or on embankments until the formation has been properly trimmed.

9. The excavations shall at all times be kept free from water, and so conducted as always to afford the utmost facilities for the escape of water, by casting and keeping properly cleaned out ditches (which shall in no case be deeper than the formation level) on each side of the excavation, and also by pumping if necessary.

10. No compensation will be paid for any damage or loss caused by slips, heavy rainfall, or floods. The actual excavation only will be paid for at schedule rates.

11. The contractor must deposit the material from the cuttings to such place, not exceeding a mile lead, that may be directed during the progress of the works, at the price stated in the schedule for "excavation from cuttings taken to embankments."

12. Any stone or gravel that may be found in the cuttings suitable for ballasting may be laid aside by the contractor, at his expense, instead of being taken to embankments; but any deficiency in the embankments caused by such appropriation of materials from the cuttings shall be supplied entirely at the expense of the contractor.

13. The price stated in the schedule for excavations from cuttings is to be the average price per cubic yard, whatever the nature of the material excavated may be, and the contractor must therefore satisfy himself as to the nature of the excavations in the different cuttings before sending in his tender.

14. The earthwork must be well punned for such distance as may be required on either side, and one yard in depth, over the top of all culverts, to ensure their safety during tipping, without any charge beyond the price stated in the schedule for earthwork.

15. In cuttings which have already been formed and embankments which have already been tipped, the formation of which has been interfered with by carting will have to be reformed by the contractor at a price per yard super.

16. On embankments, the stumps of trees, &c., must be cut off 2 feet below formation, or removed altogether, if necessary, before the earthwork is commenced. On the sites of bridges and waterways, when required, all stumps must be removed. This cost will not be paid for as a specific charge, but must be included in the price stated in the schedule for earthwork.

17. All embankments which have to be formed on side-lying ground must have benchings cut, so as to prevent the bank from slipping, and such benchings shall be done to the satisfaction of the superintending officer. The excavation for these benchings to be paid for at the price stated in the schedule for side cuttings.

18. During the progress of the works every protection shall be afforded to the public by the erection of proper fences alongside all excavations which join upon any public road; and when the road is crossed by the railway, temporary crossings or diversions shall be made at the expense of the contractor, and lights shall be kept burning between the hours of sunset and sunrise at all intersections or diversions of all public roads. (Temporary fencing must also be erected between the works in progress and the existing line.) The contractor will be held responsible for any accidents which may occur at any of these crossings during the progress of the works.

19. Four miles of rails or fastenings for a single line of railway will be lent to the contractor if necessary.

20. All rails and fastenings lent to the contractor for temporary purposes must be returned by him and stacked in the line where ordered, having been first straightened to the satisfaction of the Engineer. Any rails or fastenings cut, broken, lost, or so damaged by the contractor as to be rendered useless must be paid for by him at the price per ton at which similar articles are valued in the Colony. (No rail must be bent to suit sharper curves than 7 chains radius.)

21. Benchings not less than 2 feet on the base must in all cases be made on the slopes of original embankment where directed. These will be paid for at per chain. If necessary, all grass must be chipped off the slopes of original embankments, and the seats of new embankments, if considered necessary by the superintending officer. The cost of this work will not be paid for as a specific charge, but must be included in the price stated in the schedule for earthwork.

Bridges, Culverts, &c.

Brickwork and Masonry.

22. The brickwork and masonry in bridges, culverts, &c., is to be similar in every respect to that already built in the original line between Adamstown and Teralba, Ryde and Strathfield, and Dlawarra lines, unless otherwise directed by the engineer or superintending officer; but between Granville Junction and Picton new drawings will be made.

23. No masonry or brickwork shall be commenced without an order from the engineer or superintending officer; and when the excavation is ready to receive the brickwork or masonry, the contractor must give notice to the engineer or superintending officer to that effect, so that the foundations may be inspected before the work is commenced.

24. If any work shall sustain damage from carelessness on the part of the contractor in not sufficiently backing up the masonry or brickwork, the whole of such work will be condemned, and must be rebuilt at the expense of the contractor.

25. If earthenware pipes be used for drains they shall in all cases be sunk not less than their outside diameter below the surface of the ground, and the joints made with properly tempered clay.

Concrete.

26. When the foundations, in the opinion of the engineer, require it, the contractor shall provide cement concrete, composed of one part of Portland cement and six parts of stone and sand or of approved gravel, the stone to be broken to a 2-in. gauge and the sand to be in such proportion as the engineer may direct; the whole to be mixed with water and carefully filled into the foundation pits in layers not less than 1 ft. in thickness, every portion being carefully punned. The sand and stone to be measured separately to make up six parts.

Cement.

Cement.

27. The cement to be Portland cement of the best quality and of approved brand, gauged in the proportion of four of clean sharp sand to one of cement, or in such other proportions as may be ordered, and must be used fresh.

The contractor is to submit samples of every brand of cement used by him on the contract (as often as he may be required to do so) to the Department of Harbours and Rivers, for the purpose of being tested as to its tensile strength, weight, and fineness; and he must produce satisfactory certificates of the results of such tests, together with samples of the cement so tested, before any cement will be accepted for use in the works.

Timberwork.

28. The timberwork in viaducts, bridges, &c., is to be constructed in every respect similar to that already built in the original line, unless otherwise directed by the engineer or superintending officer; but *no round timber will be allowed.*

29. White gum timber shall not be used for any purpose in this contract.

30. The timber used in the viaducts and bridges must be free from sap, wane, knots, gum-veins, and all other defects, and must be sound and well-seasoned. All timber less than 12 in. x 12 in. scantling must be free from heart. Great care must be taken in forming the work and fitting the ironwork, which must be done with the greatest accuracy.

31. The girders, trusses, headstocks, sleepers, transoms, and corbels shall be of ironbark timber, perfectly square, and the walings, braces, planking, and sheeting shall be of sawn timber of any approved hardwood, straight and sound. All beds and joints of the timberwork to have a thick coat of red lead and oil previous to being fixed. The cost of this is to be included in the price stated in the schedule for timberwork.

32. When the piles are being driven every precaution must be taken to prevent splitting during the driving, as no split piles will be allowed to remain in the work.

33. Each pile must be driven with an iron ram, weighing not less than 25 cwt., and every pile shall be driven to such depth as may be required by the superintending officer.

34. The contractor must ascertain for himself the required length of each pile, as no scarfing to any of the piles will be permitted, and all piles pitched too short must be drawn and others substituted of the required length.

35. An allowance will be made to the contractors of 3 feet in each road pile beyond the net measurement (when cut off for the reception of the headstock) for waste in driving. No allowance will be made on wing piles or on trestles fixed on sills, as the length of these can be ascertained beforehand.

36. The whole of the bolts, nuts, straps, spikes, plates, washers, strap bolts, and pile shoes to be of wrought iron of the best quality, and of similar form and dimensions to those in the original bridges.

The whole of the ironwork, excepting pile shoes, to be heated and dipped in linseed oil before being taken on to the works.

37. The whole of the exposed timber work is to have three coats of lead and oil, two coats to be put on as the work is finished, the third coat to be put on just before the completion of the contract of approved colour. The wings to bridges, sheeting, and decking which will be covered, to have two coats of tar laid on hot. This work will be paid for at the price named in the schedule.

Permanent Way and Ballasting.

38. All iron work for the permanent way, rails, fishplates, bolts, nuts, spikes, and screws will be provided for the contractor. These permanent way materials will be delivered to him where required, free of cost.

39. The bottom ballast shall consist of broken stone of approved quality not larger than a 4-inch cube, to be laid to a thickness of 9 inches. (See clause 61.)

40. The ballasting, as described in clause 39, when laid complete, will be paid for at per cubic yard at the price stated in the schedule, and no allowance will be made for any loss by subsidence in embankment or otherwise.

41. The price per lineal yard for laying the permanent way includes laying down and fixing the line of rails to the sleepers and to lifting and boxing up with top ballast provided by the Commissioners in accordance with drawings that can be seen at the office of the Engineer for Existing Lines.

42. The sleepers will be provided by the Commissioners, and must be placed such distance apart as may be directed. The bed for rails to be machine planed by the contractor.

43. The rails must be fixed to the sleepers with screws and spikes, the holes for which must be bored in the sleepers to prevent their splitting when inserting the fastening.

44. The rails must be laid with the joints at nearly right angles with each other as the length of rail will permit, but in no case shall the joint of one line of rails have a lead or be in advance of the joint in the opposite rail of more than 3 inches.

45. All the sleepers must be laid as nearly as practicable at right angles to the centre line of railway; they must be well and thoroughly packed so as to cause the upper surface of the rails when finished to be at such level as may be directed; and the two lines of rails shall be laid uniformly parallel to the centre line throughout, and must be perfectly straight on all the straight portions, and on the curves they must be laid to a uniform specified curve.

Miscellaneous.

46. The contractor shall maintain all works which he may have executed under this contract in good order and repair for a period of six months after they have been certified by the engineer to have been satisfactorily completed.

47. The contractor shall pay all stamp and other duties which the Government may now or hereafter require to be paid on any document forming part of this contract.

48. The Government foremen, gangers, mechanics, and labourers at present employed on these duplication works must be employed in their present position by the contractor for a period of one calendar month after the contract is signed.

49. The plant at present in use on these duplications is to be taken by the contractor at a valuation.

50. Flagmen will have to be provided when necessary for protecting the line and trains, as in the case of blasting, &c. These men will be provided by the department, but must be paid by the contractor.

51. When cuttings are through rock the face must be dressed off to such batter as may be deemed necessary. This will be paid for at superficial yard.

52. The contractor must furnish a list with his tender showing the rate per day at which he will supply the different classes of labour.

53. Each person tendering must enclose with his tender a Treasury deposit receipt for £50, without which his tender will not be taken into consideration. Such deposit will be returned to the unsuccessful tenderers forthwith, but should the person whose tender has been accepted fail to find the necessary security within the time named in the general conditions, then the said sum of £50 shall be forfeited by him to the Commissioners.

Iron Bridges.

54. The whole of the cast and wrought iron work for these bridges must be provided and erected by the contractor, and must be of the same form and dimensions as shown on the sample drawings which may be seen at the office of the Engineer for Existing Lines, 58, Bridge-street.

55. The wrought-iron to sustain a tensile strain of 22 tons per square inch before fracture, and 10 tons per square inch before loss of elasticity, and the contraction of area of fracture to be not less than 12 per cent.

56. All edges and ends of plates in girders to be planed, and all rivet-holes to be drilled on the top and bottom flanges and in the angle irons.

57. The whole of the ironwork to be subject to such tests of its strength as may be deemed necessary by the engineer, and the contractor must be at the whole expense of executing such tests.

58. The whole of the wrought-iron work on this contract to receive one (1) coat of petroleum oil of the best quality, and the iron must be thoroughly cleaned from oxidation by steel-wire brushes before such application. Every portion of the ironwork to receive one (1) coat of red lead oil paint before leaving the works, and the second coat immediately after its permanent erection. Two more coats of paint must afterwards be put on of such colour, and at such time, as the engineer may direct. The paint must in all cases be of the best quality, and the entire cost of painting is to be included in the cost of ironwork.

59. The whole of the cast-iron which may be used in the construction of bridges, either in the form of girders or screw piles, will have to be of the best quality, and subject to such tests as may be ordered by the engineer. It must be free from air-blows, and to the sections shown in drawings. In the case of girders the castings will have to be made with the bottom flange down; in the case of screw piles they will have to be cast on end.

60. The whole of the timber used in these bridges must be of ironbark, excepting the deck planking, which may be of approved hardwood.

61. A portion of the bottom ballast is now being supplied by contract, and will be delivered on the line, and the contractor must furnish a price per yard (superficial) for spreading and levelling.

NEW SOUTH WALES RAILWAYS.—DUPLICATION OF EXISTING LINES.

FORM OF TENDER.

Date, 18 .

hereby propose to execute the whole of the works required for the duplication of the existing lines, as specified, in strict accordance with the plans and specifications, at the following prices, viz. :—

Description.	Amount.
Excavations from cuttings taken to embankments—average price	per cubic yd. 0 2 0
“ from benchings to embankments—rock	“ 0 0 9
“ from side cuttings taken to embankments—earthwork	“ 0 1 2
“ “ “ “ rock	“ 0 0 6
“ from side “ “ “ forming mound alongside of ditch—earthwork	“ 0 1 6
“ “ “ “ “ rock	“ 0 0 9
“ from inlet and outlet drains to bridges or culverts, taken to embankments not exceeding 66 yards lead—earthwork	“ 0 1 6
“ “ “ “ “ rock	“ 0 1 6
“ from diversions of water-courses taken to embankments, not exceeding one quarter mile lead—earthwork	“ 0 1 6
“ “ “ “ “ rock	“ 0 1 6
“ reforming present formation	per sup. yd. 0 0 6
“ dressing batters of rock cuttings	“ 0 1 6
“ benchings in slopes of existing banks	per chain 0 4 0
Masonry to culverts, bridges, &c., in Portland cement, 1 cement to 2 sand	per cubic yd. 3 8 0
“ “ “ “ “ 1 cement to 4 sand	“ 3 7 6
Portland cement concrete to foundations, 1 of cement to 6 of gravel or broken stone	“ 1 14 6
“ “ “ “ “ 1 of cement to 8 of gravel or broken stone	“ 1 12 6
Brickwork to culverts, bridges, &c., in Portland cement, 1 cement to 2 sand	“ 2 8 0
“ “ “ “ “ 1 cement to 4 sand	“ 2 5 0
Timber, ironbark, framed and fixed in superstructure of bridges and other works	per cubic ft. 0 4 3

If in cutting, to be not less than 3 feet below formation	“ 0 3 0

IRON

the matter in dispute shall stand referred to a sole arbitrator in default of the appointment by the other party, and such sole arbitrator shall die, the party by whom he was appointed shall appoint another sole arbitrator in his place; and every arbitrator so to be substituted in either of the cases aforesaid, shall have the same powers and authorities as were vested in the former arbitrator at the time of his death or disability.

6. If more than one arbitrator shall be appointed, such arbitrators shall, before they enter into the matter or question referred to them, nominate and appoint, by writing under their hands, an umpire to decide on the matter so referred; and if such umpire shall die or become incapable of acting, they shall forthwith, after such death or incapacity, appoint another umpire in his place, and the decision of every such umpire on the matters referred to him shall be final.

7. If, in either of the cases aforesaid, the said arbitrators shall refuse, or shall, for seven days after request of either party, neglect to appoint an umpire, a Judge of the Supreme Court, upon application made to him by either party, shall appoint an umpire whose decision shall be final.

8. If a single arbitrator shall be appointed, and he shall die or become incapable to act before he shall have made his award, the matters referred to him shall be determined by arbitrators appointed hereunder, as if the arbitrator so dying had not been appointed.

9. If more than one arbitrator be appointed, and either of them shall refuse or for seven days neglect to act, the person by whom such defaulting arbitrator was appointed shall, within seven days after notice in writing, proceed to appoint another arbitrator to act for the arbitrator so refusing or neglecting, or the other arbitrator may proceed *ex parte*; and the decision of such other arbitrator shall be as effectual as if he had been the single arbitrator appointed by both parties.

10. If more than one arbitrator shall be appointed, and neither of them shall refuse or neglect to act as aforesaid, then if such arbitrators shall fail to make their award within thirty days after the day on which the last of such arbitrators shall have been appointed, or within such further time as may be granted by a Judge of the Supreme Court on application by either party, the matters so referred to them shall be determined by the umpire appointed as aforesaid.

11. The arbitrators, or any two of them, shall have power to hear, receive, and examine evidence; and the witnesses on any reference herein may be examined on oath or affirmation. Neither of the parties hereto shall be at liberty to appear before the arbitrators by counsel or solicitor.

12. The award of the arbitrator or arbitrators or umpire shall be in writing, ready to be delivered to either party within the time appointed for making the said award. This submission may be made a rule of the Supreme Court. The amount of costs, umpire's and arbitrators' fees, shall be decided by the arbitrators, arbitrator, or umpire; the amount of costs, including arbitrators' and umpire's fees and witnesses' expenses, the items thereof, being shown in the account annexed to said award.

13. If upon an arbitration in respect of claims made by the contractor the sum awarded to the contractor shall be less than one-half of the amount of his said claim, all the costs, charges, and expenses of and incident to the said arbitration and award shall be borne and paid by the contractor; but if the amount awarded shall exceed one-half of the amount of the said claim, then each party shall pay his own costs and one-half of the arbitrators' and umpire's fees.

14. It is to be distinctly understood that all claims by the contractor or by the Minister to have any of the matters which under paragraph number 2 may be submitted to arbitration so dealt with, must be made upon the whole of the work being completed, and before payment to the contractor of the retention money or of the money deposited as security for the due performance of the contract, and that the acceptance by the contractor of payment of the retention money in case where a bond to secure the completion of the works has been given, and in other cases of the retention money or of any balance thereof, and of the money deposited as security for the due performance of the contract, shall be conclusive proof that the contractor has no such claim or claims.

Duplication of Existing Lines.—General Conditions.

Interpretation clause.

1. The words "Superintending Officer" in these conditions shall mean any person who may from time to time be appointed by the Engineer for Existing Lines of Railways to supervise the works or buildings, and the word "Engineer" shall mean the Engineer for Existing Lines of Railways for the time being of the Commissioners for Railways.

Dismissal of workmen, removal of improper materials, &c.

2. The engineer shall have the power of immediately dismissing any agent or workman employed by the contractor, and of having removed off the line of railway (or any land belonging to the Commissioners) any materials, plant, or implements which in his opinion are insufficient for the purpose intended, or at variance with the meaning and intention of this specification. The cost of the removal of any such plant, materials, or implements, to be paid by the contractor.

Instructions to be obeyed.

3. Should the contractor refuse or neglect to carry out the instructions of the engineer or the superintending officer, the engineer shall have the power of suspending the usual monthly certificate until such instructions have been complied with.

Extra works, omissions of works, &c.

4. If at any time whilst the works are in hand it shall be deemed expedient by the engineer to increase or diminish the dimensions of any works to be done under this contract, or to alter their situation, or to vary the materials or form or dimensions of any of the said works, or of any part thereof, he shall have full power to do so, and to order and direct any such increase, diminution, or alteration, which

which shall be executed by the contractor if of the class of works provided for in the schedule of prices; and no such increase, diminution, or alteration of works shall in any way annul or set aside this contract, or extend the time for the completion thereof, but such additions or alterations shall be measured and allowed and paid for, or such deductions credited to the Commissioners for Railways as the case may require, according to the schedule of prices; and if any portion of the works so ordered to be done shall not be of the class of works provided for in the schedule of prices, the same shall be executed by the contractor at such price as may be agreed for with the engineer; but if the contractor and the engineer cannot agree as to the works required to be done, which are of a class not provided for in the schedule of prices, the engineer may order and direct the same to be done by such person or persons as he may think fit.

Measurements.

5. The whole of the work to be executed as per instructions of the engineer, and to the dimensions given on the drawings.

Labour, materials, plant, &c.

6. The contractor shall provide, at his own costs and charges, all materials, labour, tools, plant, tackle, machinery, scaffolding, &c., for the proper completion of the works at the prices stated in his schedule.

Damages, &c., to be paid for by contractor.

7. The land inside the fences of the railway may be used for the purpose of carting the materials for the works on this contract, but all damage that may be done to any land not actually the property of the Commissioners must be paid for by the contractor, whether such damage be caused by the carting of materials, or the straying of cattle in consequence of the destruction by the contractor or his workmen of the original fences, or of the fences alongside the railway, or by any other cause connected with the construction of the works; and should such damage not be at once paid for, such an amount as shall appear reasonable to the Commissioners may be paid by him in compensation for the same, and deducted from any money that may be due to the contractor for work done under this contract.

Setting out works.

8. The works will be set out for the contractor, but he must satisfy himself of their accuracy, as no work incorrectly set out or improperly executed will be paid for by the Commissioners.

Contractor to be represented.

9. The contractor, at all times during the progress of the works, when he is not personally superintending them, must have a responsible agent or overseer stationed on them to receive instructions from the superintending officer or Engineer for Existing Lines of Railways, and to represent the contractor for all the purposes of this contract.

Progress of works.

10. Should the engineer be at any time dissatisfied with the mode of proceeding, or at the rate of progress of the works or any part thereof, the Commissioners shall have full power, without vacating this contract, to take the works wholly or in part out of the hands of the contractor, and to employ, procure, and make use of all labour or materials which they may deem necessary for completing the works, the cost of such labour and materials to be deducted from any money that may be then due, or may hereafter become due to the contractor; and if the money then due, or thereafter becoming due to the contractor, shall not be sufficient for that purpose, the balance remaining unpaid may be recovered in an action for damages for breach of contract, or as money paid for the use of the contractor.

Cancellation of contract.

11. The Commissioners shall have the option, and full power and authority, in lieu of proceeding under the last preceding clause of these conditions, if the contractor fail to proceed in the execution of, and to carry on the works in the manner and at the rate of progress required by the engineer, of cancelling this contract so far as relates to the works remaining to be done; and in such case the moneys which shall have been previously paid to the contractor on account of the works executed shall be taken by him as full payment for all works done under the contract; and upon notice in writing under the hand of Commissioners that they, under the authority of this condition, cancel the contract, being served upon the contractor, or left at his last-known place of abode, the contract shall be cancelled, and thereupon all sums of money that may be due or unpaid to the contractor, together with all implements in his possession, and all materials provided by him, upon the ground upon which the work is being carried on, or adjacent thereto, and all sums of money named as penalties for the non-fulfilment of the contract within the time specified, and the sum of four thousand pounds, which, under section 20 of these conditions, the contractor shall have deposited as security for the completion of the contract, shall also be forfeited and become payable to or receivable by the Commissioners, and the said implements and materials shall become and be the absolute property of the Commissioners, and with the moneys so forfeited and payable or receivable as aforesaid shall be considered as ascertained damages for breach of contract.

Time of completion.

12. The contractor shall complete the whole of the works comprised in this contract on or before the thirty-first day of May, one thousand eight hundred and ninety-one; and in the event of their non-completion at the specified time, should the Commissioners not have proceeded under clauses Nos. 10 and 11 of these conditions, or either of them, the contractor shall forfeit and pay fifty pounds sterling per week or every part of a week that shall elapse after such specified time until their completion, and which sum or sums may be deducted from any money payable to the contractor under this or any other contract or (as hereinafter provided) from the money deposited by the contractor as security for the due completion of the contract.

Delay

Delay by Commissioners, &c.

13. If the contractor shall not be able to obtain possession of any portion of the ground required for the formation of the railway, or of any of the works to be done in connection therewith, or if from the non-delivery, or any delay in the delivery to the contractor of any materials which under the contract the Commissioners for Railways are to supply, or from any cause whatever arising out of the acts or defaults of the Commissioners for Railways, or any officers or servants in their employment, or from any accident happening to the said works during their progress not arising from the neglect or default of the contractor or his servants or workmen, the contractor shall be delayed or impeded in the execution of his contract, the contractor may, from time to time, within seven days of the happening or occurring of such act, default, or accident, apply in writing, setting forth the cause of such application, to the Engineer for Existing Lines of Railways for an extension of time on account of such act, default, or accident, who shall, if he shall think the cause sufficient, but not otherwise, allow by writing under his hand such an extension of time as he shall in his uncontrolled discretion think adequate; and the penalties, sets-off, and deductions to which under the contract the contractor is liable shall not attach until the expiration of such extension of time, but shall attach and the contractor shall become liable to the same from the date of the expiration of such extended time or times. And unless the contractor shall make such application within the time and in manner aforesaid, and unless and until the Engineer for Existing Lines of Railways shall allow such extension or extensions of time as aforesaid, the contractor shall not, by reason of any delay arising from the cause or causes aforesaid, or any of them, be relieved in any way or to any extent of his liability to finish and complete the works within the time in this contract specified; and in default of his so doing to pay and be subject to the penalties, deductions and sets-off as in these conditions provided; nor shall the Commissioners for Railways be deprived in any way or to any extent of their right to deduct or recover penalties or liquidated damages, or to make deductions or sets-off which under the contract they are entitled to make, receive, deduct, set-off, or receive from the contractor for or by reason and on account of any delay in the completion of the work or any portion of the same, nor shall the rights, powers, and authorities, by these conditions given to or vested in them be in any way affected. And the Commissioners will not be responsible for any compensation for any delay that may be caused through the working of the ordinary traffic.

Copies of drawings, &c.

14. Copies of all drawings will be supplied to the contractor whose tender is accepted.

Free passes, &c.

15. No free passes on any of the Government Railways will be granted to the contractor or his agents, but the material and plant will be conveyed from Sydney and Newcastle and along the various sections free of charge.

Liability of contractor.

16. The care and maintenance of all works under this contract shall remain with the contractor until six months after their completion, and until the Engineer for Existing Lines of Railways shall, by notice in writing under his hand, inform the contractor that he has taken charge thereof; and until such notice shall have been given, the contractor shall be responsible for all accidents from whatever cause arising, and shall make good all damage thereto.

Contractor not to assign works or moneys.

17. The contractor shall not assign over this contract or assign all or any of the moneys payable or to become payable under the contract, or all or any part thereof, or any other benefit whatsoever arising, or which may arise under this contract, to any other person, without the consent in writing under the seal of the Commissioners for Railways first obtained. The contractor, for each and every breach of this condition, shall pay to the Commissioners for Railways the sum of five hundred pounds as and for liquidated damages; and the sum or sums payable as such damages may be deducted from any sum or sums due to the contractor under this or any other contract with the Commissioners for Railways. And any permission to assign over this contract shall not discharge the contractor from liability to see that the works so assigned are executed and completed in terms of this contract, unless on the assignment thereof the Commissioners expressly declare that the contractor is discharged from further liability.

Truck system not allowed.

18. The workmen, tradesmen, and labourers of every class employed on the works to which these conditions refer, shall be paid their wages, in full, in money, current coin of the Colony, at least once in every month, and no ticket or other system of payment by provisions, liquors, or goods, will on any pretence be allowed; nor shall the contractor, or any person or persons employed by him, or in any way connected with him, establish any shop for the supply of provisions, liquors, or goods; nor shall the contractor oblige his workmen to take provisions, liquors, or goods of any kind from any person in particular. The workmen of every class shall be paid on the works if it be possible, or in some building adjoining; and in no case shall they be paid at a public-house or other place where liquors or refreshments are sold.

Bankruptcy or insolvency.

19. If the contractor shall become insolvent, have his estate placed under sequestration, or shall make an assignment of his estate for the benefit of his creditors, it shall be lawful for the Commissioners, without previous notice to the contractor, or to the official or other assignee or assignees of his insolvent estate, or to the trustee or trustees under the assignment, to take the works out of the hands of the contractor and of the assignees or trustees of his estate, and to recontract with any other person or persons to proceed with and complete the same, upon such terms, stipulations, and conditions as shall be deemed expedient; and all the then remaining materials, implements, and plant aforesaid may be used in and applied for the purposes of the works; but on the final completion of the works, the surplus of such materials, implements, and plant shall cease to belong to the Commissioners, and shall become the property of the said assignees or trustees, without any allowance for or payment by the Commissioners, or on account of any loss or diminution, wear, tear, or injury they may have sustained in the meantime.

Security.

Security.

20. Within six days after notice of the acceptance of his tender shall have been given to the contractor or posted to the address of his last-known place of business or residence, the contractor shall deposit with the Commissioners or at the option of the Commissioners in some bank or banks in Sydney, upon fixed deposit in the name of the Commissioners the sum of four thousand pounds, to be held by the Commissioners as security for the due and proper performance and completion of the contract until the Engineer for Existing Lines of Railways has certified that the whole of the work in the said contract has been completed to his satisfaction, or until the contract has been cancelled by the Commissioners under the power given to them in that respect under clause 11 of these conditions—in which last-mentioned event happening the money so deposited will become forfeited. If however the contract shall not be declared to be cancelled under the said 11th clause, and if the works comprised in this contract are not completed within the time mentioned in clause 13 of these conditions, the weekly penalty which under the said last-mentioned clause will be payable to the Commissioners may be deducted and taken from the money so deposited.

Should the contractor fail to deposit the said sum of four thousand pounds as hereinbefore provided, within six days from the acceptance of the tender, or should the contractor fail to execute the contract for the due performance of the works mentioned in the said tender, the Commissioners will have the option of and full power and authority to declare such acceptance to be annulled.

No tenderer will be allowed to proceed with the work tendered for until he has made the deposit as aforesaid, and has executed the required contract for the due performance of the said works—it being hereby declared that for all or any work done or materials found and provided by the contractor before the due execution of the said contract, or the said money being deposited as aforesaid, he shall not have any right of action, claim, or demand against the Commissioners.

The contractor will be entitled to receive any interest that may be payable upon the fixed deposit of the money if the money shall be placed in a bank at fixed deposit as such interest becomes payable, but it is expressly declared that the Commissioners are not to be held liable or answerable in any way for any loss of the money so deposited by reason of the same having been deposited in a bank as fixed deposit, or for any loss of interest from the fixed deposit not being renewed.

Progress payment without prejudice, &c.

21. No certificate given to the contractor for the purpose of any progress payment shall prevent the Engineer for Existing Lines of Railways from at any future time before the termination of the contract rejecting all unsound materials and improper workmanship discovered subsequently to the giving of the last previous certificate; and notwithstanding the giving of any certificate that portions or the whole of the works have been satisfactorily performed, the Engineer for Existing Lines of Railways may require the contractor to remove and amend at any future time previously to the final payment on account of the construction or maintenance of the works, any work that may be found not to have been performed in accordance with the contract; and the contractor must remove and amend at his own cost all such work when so required, notwithstanding any approval made or given by the superintending officer; and the Commissioners shall have power, on the report of the Engineer for Existing Lines of Railways that the work approved of as aforesaid is not in accordance with the contract, to deduct from any moneys that may be due or that may become due to the contractor, the whole amount that has been paid on account of such work.

If, in the opinion of the Engineer for Existing Lines of Railways, further inquiry is necessary or desirable before any certificate is given, he shall have power to withhold such certificate for a period not exceeding one month from the date at which in the ordinary course the certificate would have been given.

None of the conditions of this contract shall be varied, waived, discharged, or released, either in law or in equity, unless by the express consent of the Commissioners testified in writing under their seal.

Payments.

22. Payments will be made once in every month, unless same shall become not payable by reason of anything contained in these conditions, on the engineer's certificate, as the work proceeds, in the proportion of 90 per cent. of the value of the work satisfactorily executed, and the remaining 10 per cent. will be paid in the proportion of 5 per cent. on the expiration of the contract, the remaining 5 per cent. to be paid at the expiration of the six months' maintenance.

23. Should any portion of the contract be opened in sections, the contractor's maintenance for such sections will commence on the dates of such openings, and his retention moneys will be dealt with in accordance with such openings.

New South Wales Government Railways, Office of Engineer for Existing Railways,
Sydney, , 188 .

New South Wales Government Railways.—Relaying, Reballasting, &c.—Southern Division.

SPECIFICATION to be observed in carrying out a contract for relaying, reballasting, draining, fencing, and other extra works in connection with the Permanent-way of the Southern Division of the New South Wales Railways.

Position and mileage of division.

	Miles.	yards.
From Picton to Goulburn	81	528
„ Goulburn to River Murray	252	66
„ Goulburn to Cooma	130	550
„ Cootamundra to Gundagai	33	1,144
„ Demondrille to Cowra	63	1,144
„ Junee to Hay	167	688
„ Narrandera to Jerilderie	65	220
Total length of line	793	760

Conditions of Contract.

Contractors' workmen.

The contractor will be required to provide men for carrying out the various works specified on any portion of the division, and at such times as may be determined. These men, when relaying, to consist of gangs with not less than thirty-six men and one ganger, and one leading man, who will have to work under instructions from the engineer for the division, and who will have the right to object and cause to be discharged any ganger, foreman, or workman whom he may consider incompetent, or who fails to carry out any order or instructions given by his inspector.

Machinery and tool repairs.

The contractor will also have to provide and keep in repair all and every kind of tools and machinery necessary for the due performance of such work, viz., bars, levers, beaters, picks, shovels, augers, hammers, spanners, portable and other drilling machines, adzing and boring machines, portable engines for driving same, and any other tool or tools found requisite for the due performance of the work, as also portable forge or forges for tool repairs.

Materials for relaying.

The Railway Commissioners will provide all the necessary materials for relaying, viz., rails, chairs, fishplates, fishbolts, screws, spikes, and sleepers, as also ballast, drain-pipes, and all fencing materials.

Loading and unloading materials.

The contractor will be required to load and unload all such materials at any place where directed on the division, and to distribute same on the ground in such a manner as to facilitate relaying and other operations.

Loading and unloading ballast.

The contractor will also be required to load and unload ballast required for relaying.

Traffic not to be obstructed.

It must be distinctly understood that under no circumstances will any delay, impediment, stoppage, interference, or obstruction of whatsoever kind to the traffic, either on the railway or public roads, be permitted in carrying out this contract, and the whole of the works under the same must be done in such manner and at such times as not in any way to interfere with such traffic. The contractor will be required to provide at his own expense, and at all times during the currency of the contract, all necessary means and provisions that may be required for the carrying on of the traffic as before described, without obstructions or delay; and he must carry out without delay any instructions, whether verbally or in writing, that may be given for this purpose by the engineer or the superintending officer. And it must further be understood that the contractor will be held strictly and exclusively responsible for all delays, accidents, or damage to property or persons, of whatever nature, that may occur through the carrying out of the work.

If the contractor refuse or fail to carry out immediately any instructions given by the engineer or the superintending officer during the currency of the contract, the said engineer shall have full power, without vacating this contract, to take the works wholly or in part out of the contractor's hands, and carry the same out by his own Department, at the expense of the contractor.

The contractor must make himself thoroughly conversant with the time-tables and the rules and regulations in force for working the traffic on the railways (copies of which will be furnished to him on application), and a responsible foreman or overseer, who must also be thoroughly acquainted with the said time-tables and regulations, shall be placed wherever directed while the works are in progress. The contractor must also comply with all usages of conducting the traffic on the public roads.

Passes.

The contractor will be provided with one first-class pass for himself, one second-class pass for one foreman, and second-class passes for gangers and workmen. The passes for the contractor and foreman will be made available from Sydney and over the division. The workmen's passes will be confined to the division only.

No portion of this work to be sublet by the contractor.

The contract to be let for a term of five years from date of signing contract.

Nature

Nature of Relaying.

Relaying.

The contractor will have to remove the old sleepers, rails, fishplates, spikes, and screws; also chairs where they exist. This old material to be loaded into ballast wagons, and unloaded at the various depôts arranged for old materials on the division. After unloading all sleepers, if any have chairs attached, the chairs must be unspiked and removed from the sleepers, as also all old spikes and screws, and each kind of material must be stacked in such a manner as will be directed by the Permanent-way Inspector for the district.

Description of bottom and top ballast.

On removal of the old permanent-way material, the ballast, if worn out, will have to be removed, and new bottom ballast substituted of a thickness not less than 9 inches. Such ballast will consist generally of broken sandstone or other similar stone, not less than 4-inch cubes. The top ballast will consist of hard broken stone, not less than 1½-inch cubes, or larger than 2-inch cubes. This ballast will have a thickness of 5 inches below the sleeper, and be boxed up level with the top of sleeper, or not more than 1 inch above same. (See drawing, Fig. 1.)

Lowering formation.—Variable widths of ballast.

It may be necessary in some cases to lower and remove the formation between station platforms and under overbridges, in order to maintain the rail level at their respective heights (or such heights as will be directed). In some cases the existing ballast may be found sufficiently good, not requiring the full depth of 9 in. of bottom ballast, or it may be found that only the top or hard ballast of 5 in. below the sleeper and to the top of the sleeper may be necessary, but all such depths and widths of bottom and top ballast will have to be carried out as may be directed.

Number and position of sleepers under 30-ft. rails.

After the ballast has been properly levelled for the reception of the sleepers, the latter must be placed at their respective distances, which in no case must exceed 2 ft. 8 in. from centre to centre; the position of joint sleepers to be so arranged as to allow the intermediate sleepers to be so spaced. Any alterations in this respect, viz., reducing the distance of 2 ft. 8 in. to a less distance, will be paid at a rate per extra sleeper or sleepers which reduces this distance. (See drawing, Fig. 2.)

Size of sleepers.

The sleepers will generally be of the following dimensions, viz., 9 ft. x 10 in. x 5 in., but cases will occur when sleepers of a less size, viz., 8 ft. x 9 in. x 4 in. to 4¾ or 5 inches will be used. In all such cases the space between the sleepers, more especially on sharp curves and soft formations, will be reduced in distance.

Adzing and boring sleepers.

The sleepers must be adzed by machinery to allow of the proper gauge, either in case of chairs or T rails, and also to give a true bed for the chair or T rail, and for the proper cant. All the holes for the spikes and screws must be bored to such a depth, and be of such a diameter as to allow of these being driven so as not to split the sleepers (the size of augers used in boring to be decided by the engineer), and if the contractor fails to carry out these conditions, and is found driving the screws and spikes without boring, he will have his contract cancelled.

This condition will be strictly enforced, and contractor must carefully consider same.

Gauge of line, and packing with ballast.

After the chairs (if chaired road be laid down) or T-headed rails have been properly secured to their respective gauges—for straight line and curves over 15 chains radius the gauge must not exceed 4 feet 8½ inches, and for curves between 8 chains and 15 chains must be laid to 4 feet 8¾ inches—the road must be properly packed and lifted, such packing to be stiffly done for a length of 12 inches from the centre of the rail on either side, the middle and extreme ends of the sleepers to be only slightly packed, and it would be advisable for the road to be thoroughly bedded before it is finally packed and straightened, preparatory to completing the boxing up. (See drawing, fig. 3.)

Expansion at joints.

The rails must be fished-up with the plates, and screw-bolts provided, and such expansion given as the engineer may direct, but not less expansion than one quarter of an inch must be given at each joint for 30-foot rails.

Fishplates and nuts.

The fishplates must be screwed up, and the nuts of each bolt left with the square or hexagon sides of same in one level, as shown in drawing. (See drawing, fig. 3.)

Rail joints.—Short rails for curves.

The rail joints must be placed opposite each other, and as square as can practically be done. The sleepers must also be equally spaced, and placed square to the rails. In going round sharp curves, great care must be used in keeping the joints square by putting in short rails (these short rails to be picked out by the men when laying out the rails preparatory to relaying).

Cant for curves.

The necessary cant will be decided by the engineer, and each curve must have its full cant at the tangent, and be run out on to the straight, if it is straight road, with a grade of not less than 50 feet for every inch of cant given. In the case of reverse curves with little or no straight intervening, the full cant cannot be given for some distance from the tangent, but such cases will be specially directed by the engineer.

Drainage

Drainage.

In some cases it will be found necessary to lay in socket drain-pipes at a depth of not less than 12 inches below formation level; and as the size of pipes will vary in diameter, the contractor must put in a price for laying pipes, as given in his schedule of prices. He will also have to load and unload same.

Fencing.

The contractor must state a price per lineal yard for removing old fencing, and loading and unloading and erecting new fencing, as per drawings Nos. 14 and 15, and for loading up the old material, and unloading and stacking same at the depôt.

Removal of earthwork, refuse material, and worn out ballast. Measurement for loading and unloading bottom and top ballast. Hopper ballast wagons and ploughs.

It may also be found necessary to load and unload earthwork from slips and cuttings where silting up of grips has taken place, as also worn out ballast and refuse earthwork generally, such material to be paid for by the cubic contents of the wagon—the wagons to be full in all cases. Bottom and top ballast will also be paid for in the same manner. As the sizes of the wagons may vary, the wagon numbers and sizes will be registered, and when the contractor returns his statement of wagons loaded and unloaded, he must specify the wagon No. Special wagons for ballast are being provided with hopper doors in the bottoms to drop the ballast into the 4-foot, and a brake van with a plough is also being provided for levelling down the top ballast. These wagons and ploughs will be introduced as early as possible.

As cases may occur where measurement cannot be arrived at, the contractor must give a schedule of day-work prices.

Laying in points and crossings.

The contractor will be required to use great care in laying in points, crossings, and diamonds to the drawings provided. In every case the points from the toe to heel of points will be laid on special-sized sawn timber; as also the entire crossing, which includes crossing, Vs, wings, and check rails. Diamonds in all cases to be placed on similar timbers, and they must be laid in long enough to allow of double slip points being put in, the timbers to extend from heel to heel of crossings, as shown on drawing. The leads between heel of points and heel of crossings, or between diamonds and junction leads may or may not be laid with sleepers or timbers, as directed.

Size of augers for boring timbers.

All holes in timber for securing chairs or rails must be bored with an auger of suitable size for either screws or spikes. The timbers for all points, crossings, and diamonds will have one sawn face.

Payment.

The contractor will be paid monthly for the whole of the work executed, no retention money being held.

The contractor will also have to deposit the sum of £100 on sending in his Tender, which amount will be retained until the expiration of the contract, and to find two responsible sureties for the due performance of the work.

Supply of materials.

In the event of the Commissioners being prevented from supplying any of the materials in connection with the above contract, by causes reasonably supposed by them to be beyond their control, thereby causing delay to the contractors in the carrying out of the works, or should delay arise from the exigencies of the working of the traffic of the railways, or from any other cause or causes whatever occasioned by the act or default of the Commissioners, which in their opinion could not be reasonably avoided, the contractor shall have no claim upon the Commissioners for compensation for such delay.

Terminating contract.

Provided also that the Railway Commissioners have the option of terminating this contract at any time by giving three months' notice in writing to the contractors, should the Commissioners at any time be dissatisfied with the progress of the works, or find in their opinion that the contract is interfering in any way with the working of the railways, and the contractor shall not, by reason of such termination of the contract, have any claim whatever against the Commissioners for such termination of contract.

It is also agreed that the contractor, on his part, may at any time terminate the contract by giving to the Commissioners three months' notice in writing of his intention so to do.

J. ANGUS.

SCHEDULE OF PRICES FOR RELAYING SINGLE LINE OF RAILWAY.

		Rate.	
		£	s. d.
Taking out old sleepers rails, fish-plates, spikes, screws, and unspiking chairs, loading same into wagons, and unloading and stacking at Depot, as specified		per lin. yd...	0 0 6
Loading and unloading new materials for relaying, viz., sleepers, chairs, rails, fish-plates, fish-bolts, keys, spikes, and screws		"	0 0 6

1890.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

LIGHT RAILWAYS.
(INFORMATION RESPECTING.)

Ordered by the Legislative Assembly to be printed, 26 August, 1890.

[Laid upon the Table in answer to Question No. 4, of 4 June, 1890.]

Questions.

(4.) LIGHT RAILWAYS:—MR. O'SULLIVAN asked THE SECRETARY FOR PUBLIC WORKS,—

- (1.) Is it a fact there has recently been adopted in France a system of light railways, which can be laid down for £1,200 per mile, on gradients of from 1 in 12 upwards, and with engines, carrying water and fuel, weighing only 12 tons?
- (2.) Is it a fact that these railways are now being sent from France to various portions of the world at the rate of 120 miles per month, and that one of them is now in operation in Melbourne in connection with the Metropolitan Gasworks?
- (3.) Will he lay upon the Table of this House all the information he may have respecting these railways, in order that it may be ascertained if they are suitable to the plain country of New South Wales?
- (4.) If he has no information respecting these light railways, will he have a report made upon the matter without delay?

Answers.

- (1.) The system referred to is probably Decauville's, or some other such system of portable railways, but the idea is by no means new. From the lightness of the engines and the steepness of the grade, it is evident that the system is only applicable when extremely small loads have to be drawn.
- (2.) I am unable to answer this question at present, but am seeking information on the point.
- (3 and 4.) I have already given orders that the necessary information be obtained, which shall, with pleasure, be placed at the disposal of Parliament.

Royle's Chambers, Bond-street, Sydney, 10 April, 1890.

Cheap Railways for Australia.

Sir,

The great success obtained by the Decauville system of narrow-gauge railways has long since been practically demonstrated in nearly every part of the world, and a splendid test of the carrying capacity, general utility, and adaptability of this famous railway was only recently afforded at the late International Exhibition at Paris.

Over the Company's line connecting the Concorde Station with the Champ de Mars an aggregate of no less than 6,000,000 passengers were conveyed without accident or impediment of any kind, the maximum for one day alone numbering 63,276. The line was of 2-feet gauge, with 19lb. steel rails riveted on steel-dished sleepers. The locomotives, on the compound system, weighed 12 tons in working order, and were able to run over curves of 65 feet radius, and to ascend 8% gradients.

The comparatively small cost of the plant, and the easy and speedy method of construction, would render this narrow-gauge system best adapted to parts of this country where a more extended means of railway communication would not be warranted by reason of the greatly-increased cost, and where probably no Government railway could be expected for many years to come.

The Decauville railway is fully capable of meeting all the requirements of a large passenger and freight traffic, and no system, it may be confidently asserted, would so adequately open up the country and assist in developing its many and varied resources.

I shall be prepared to afford all practical assistance by every possible means in furthering the construction of railways on this principle, where it can be sufficiently shown that an adequate return on the outlay can be obtained.

There is ample evidence as to the financial success of narrow-gauge railways wherever they have been tried, and there is no reason to believe that their success would be less in Australia.

I shall be gratified to afford any information on the subject which may be required.

To Hon. Bruce Smith, M.L.A.

I am, &c.,
CLEMENT VAN DE VELDE, C.E.

Department of Public Works, Railway Construction Branch,

Sir,

Sydney, 4 June, 1890.

Allusion having been made in the Legislative Assembly here to the light railway now in operation in Melbourne, in connection with the Metropolitan Gasworks, I have the honor to request that you will kindly furnish me with the fullest information in your power relative to the same.

I have, &c.,

HENRY DEANE

(*pro* A.R.M.),

Acting Engineer-in-Chief.

R. Watson, Esq., Engineer-in-Chief for Railways, Melbourne.

Sir,

Railway Department, Engineer-in-Chief's Office, Melbourne, 7 June, 1890.

In reply to your letter 90-252, dated 4th instant, I have the honor to inform you that, on inquiry, I find the Metropolitan Gas Co. have constructed a small Decauville railway from the wharf to their works.

It is about 18 or 20 feet above the level of the street which it crosses, and is used for conveying coals, &c., from the ships to the works. Its length is about 300 yards, and there are branches at both ends. The gauge is 2 feet 6 inches, and it is worked by a small Decauville locomotive engine. No doubt full particulars could be obtained by writing to the Secretary or Manager of the Company.

I have, &c.,

ROBERT WATSON,

Engineer-in-Chief.

H. Deane, Esq., Acting Engineer-in-Chief, Sydney.

Mr. Deane,—Please add your own remarks to this. Is it necessary to seek further information?—
J.B., 21/7/90.

I think little may be said. It is evident that the system is not capable of carrying a large amount of traffic, and quite unsuitable for adoption as a substitute for the present tramways or railways.—H.D.,
5/8/90.

1890.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(GROSS RETURNS OF THE COOMA LINE FROM DATE OF OPENING TO 31st MAY, 1890.)

Ordered by the Legislative Assembly to be printed, 27 August, 1890.

[Laid upon the Table in answer to Question No. 6, of 10th June, 1890.]

Question.

(6.) COOMA RAILWAY:—MR. STEVENSON (for MR. MILLER), *asked* THE SECRETARY FOR PUBLIC WORKS,—Will he inform the House of the gross returns of the Cooma Railway Line for the first twelve months?

Answer.

RETURN showing the Value of Inwards and Outwards Traffic at all Stations on the Cooma Line from date of opening to 31st May, 1890 (12 months).

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(RETURN OF COAL CONTRACTS FOR 1890.)

Ordered by the Legislative Assembly to be printed, 1 October, 1890.

[Laid upon the Table in answer to Question No. 8, of 1st October, 1890.]

Questions.

(8.) CONTRACTS FOR SUPPLY OF COAL TO RAILWAY DEPARTMENT:—MR. BARBOUR asked the COLONIAL TREASURER,—

- (1.) The names of the firms owning collieries (and the names of the collieries owned by them) which have entered into agreements to supply the Government Railways with coal during the current year?
- (2.) The total quantity of coal required for all the New South Wales Government Railways?
- (3.) How is this total amount subdivided among the various collieries; will he table a statement showing the subdivision of supply, if any?
- (4.) If more than one contract has been entered into for supply of coal for the Government Railways for the current year, will he, in addition to giving information as to subdivision of the whole quantity, table the price per ton quoted by either one or several contractors?

Answers.

(1.) Names of firms owning collieries, and names of collieries, contracting to supply coal during 1890.

Price per Ton.	Contractors' Names.	Names of Collieries.
s. d.		
7 0	Metropolitan Coal Co. (Gresley Lukin, Manager)	Helensburgh Mine
3 9	Thomas Wilton	Eskbank, Lithgow Valley, and Hermitage Coal Mines.
3 10		
4 1	Vale of Clwydd and Zigzag Coal Association (D. Chadwick, Secretary).	Vale of Clwydd and Zigzag Mines.
5 6	Mittagong Coal Co. (Thomson Moore, Secretary)	Mittagong Coal Mine.
4 6	Cullen Bullen Coal and Coke Co. (W. H. Chapman, Secretary).	Cullen Bullen Mine.
9 10	Waratah Coal Co.	Waratah Colliery.
7 3	Read and Longworth	Rix's Creek Colliery.
6 6	Centenary Coal and Coke Co. (J. Barnard, Secretary)	Curlewis Colliery.
8 9		

(2.) Total estimated quantity of coal during year 1890, 221,700 tons. Mittagong Coal Company's contract was cancelled in June, 1890, and the supplies were ordered from Mr. Wilton for the remainder of month.

(3.) How is it subdivided amongst contractors? Metropolitan Coal Co., 31,000 tons; Mittagong Coal Co., 19,100 tons; Thomas Wilton, 109,500 tons; Cullen Bullen Co., 1,800 tons; Vale of Clwydd and Zigzag Association, 13,800 tons; Waratah Co., 22,000 tons; Read and Longworth, 10,000 tons; Centenary Coal Co., 15,000 tons.

(4.) If contract has been entered into to supply from more than one colliery, how is it subdivided? Thomas Wilton's contract is for supply from three mines—Esk Bank, Lithgow Valley, and Hermitage. The Department has not specified particular quantities from any one of these mines; the distribution is therefore left to option of contractor, who has supplied to 31st August as under:—Esk Bank, 26,443 tons; Lithgow Valley, 32,490 tons; Hermitage, 26,656 tons.

1890.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(RATE FOR THE TRACTION OF COAL ON THE NEW SOUTH WALES.)

Ordered by the Legislative Assembly to be printed, 9 July, 1890.

[Laid upon the Table of the House, in accordance with a promise made by the Colonial Treasurer, in reply to Question No. 1, of the 9th July, 1890.]

Questions.

1. MR. BURNS asked THE COLONIAL TREASURER,—

- (1.) Is there any general rate for the traction of coal on the New South Wales Railways?
- (2.) The different traction rates for coal in the owners' waggons and in the Government waggons respectively?
- (3.) Has permission been given to any company to use its own locomotives on the Government Railways; and, if so, for what distance, and at what rate?
- (4.) The minimum rate charged for coal traction at Newcastle?
- (5.) The rate payable by the Commissioners to the contractors for shipping coal at Sydney, Wollongong, and Newcastle respectively?
- (6.) The difference in the rate per mile for traction in the Government and owners waggons in the Southern and Western districts?
- (7.) The like information in relation to the Northern districts?
- (8.) Are the Commissioners prepared to provide waggons for the Northern collieries on the same terms as they are provided for the Southern and Western?

Answers.

- (1.) Yes.
- (2.) On the Southern and Western lines the rate for coal in owners' waggons is 1d. per ton per mile, with a minimum charge of 2s. for the first 50 miles; for distances over 50 miles the rate is $\frac{3}{4}$ d. per ton per mile, plus the rate for 50 miles, with a terminal charge of 3d. per ton added. Minimum charge 4s. 3d. per ton.

On the Northern lines the rates in owners' trucks are as follows:—

	per ton. s. d.		per ton. s. d.
For distances not exceeding 1 mile.....	0 6	Over 20 miles and not exceeding 22 miles	1 6
Over 1 mile and not exceeding 7 miles	0 10	" 22 " " " 24 "	1 7
" 7 " " " 10 "	1 0	" 24 " " " 26 "	1 8
" 10 " " " 12 "	1 1	" 26 " " " 28 "	1 9
" 12 " " " 14 "	1 2	" 28 " " " 30 "	1 10
" 14 " " " 16 "	1 3	" 30 " " " 32 "	2 0
" 16 " " " 18 "	1 4	" 32 " " " 34 "	2 2
" 18 " " " 20 "	1 5	For distances exceeding 34 miles, $\frac{3}{4}$ d. per ton per mile.	

The rates for coal in Commissioners' trucks are the same on all lines, and are made up on the following basis:—

- For the first 15 or portion of 15 miles, 1s. 6d. per ton.
- For every mile exceeding 15, but not exceeding 35, $1\frac{1}{4}$ d. per ton per mile, plus the rate for 15 miles.
- For every mile exceeding 35, but not exceeding 55, 1d. per ton per mile, plus the rate for 35 miles.
- For every mile exceeding 55, but not exceeding 150, 1d. per ton per mile for the whole distance. Minimum, 5s. 3d. per ton.
- For every mile exceeding 150, but not exceeding 250, $\frac{3}{4}$ d. per ton per mile, plus the rate for 150 miles.
- For every mile exceeding 250, $\frac{1}{2}$ d. per ton per mile, plus the rate for 250 miles.

Modified rates are charged for coal when sent in truck-loads of not less than 6 tons, as follows:—

Rate per Truck.											
	£	s. d.									
120 miles	2	17 10	220 miles	4	3 10	320 miles	5	5 7	420 miles	6	4 3
125 "	2	19 2	225 "	4	5 0	325 "	5	6 7	425 "	6	5 2
130 "	3	0 6	230 "	4	6 4	330 "	5	7 7	430 "	6	6 0
135 "	3	1 9	235 "	4	7 8	335 "	5	8 7	435 "	6	6 11
140 "	3	3 0	240 "	4	8 11	340 "	5	9 7	440 "	6	7 10
145 "	3	4 4	245 "	4	10 2	345 "	5	10 8	445 "	6	8 9

180 "	3	13 6	280 "	4	17 6	380 "	5	17 0	480 "	6	15 0
185 "	3	14 10	285 "	4	18 6	385 "	5	17 11	485 "	6	15 11
190 "	3	16 1	290 "	4	19 6	390 "	5	18 10	490 "	6	16 10
195 "	3	17 4	295 "	5	0 6	395 "	5	19 9	495 "	6	17 9
200 "	3	18 8	300 "	5	1 6	400 "	6	0 8	500 "	6	18 8
205 "	4	0 0	305 "	5	2 6	405 "	6	1 7	505 "	6	19 8
210 "	4	1 3	310 "	5	3 6	410 "	6	2 5			
215 "	4	2 6	315 "	5	4 6	415 "	6	3 4			

(3.) Yes. The following Coal Companies have been granted permission to haul coal in their own wagons, and by their own locomotives, from their junctions with the main line to the Southern Coal Company's junction with the same:—

Mount Keira Coal Company, 3 miles, 2d. per ton.

Mount Pleasant Coal Company, 3 $\frac{1}{2}$ miles, 2 $\frac{1}{2}$ d. per ton.

Corrimal Coal Company, 6 $\frac{1}{2}$ miles, 3 $\frac{1}{2}$ d. per ton.

Bellambi Coal Company, 7 $\frac{1}{2}$ miles, 3 $\frac{1}{2}$ d. per ton.

Illawarra Coal Company, 11 $\frac{1}{2}$ miles, 6d. per ton.

as it is not convenient for the Department to provide locomotive power.

(4.) Sixpence per ton for distances not exceeding 1 mile.

(5.) The Commissioners do not undertake the shipping of coal at Sydney and Wollongong. They pay 1 $\frac{1}{2}$ d. for the service at Newcastle, in addition to providing cranes, &c.

(6.) This is shown fully in answer to question No. 2, but it may be mentioned that the Commissioners are not required to haul coal in owners' wagons on the Southern or Western Lines.

(7.) This information is contained in the answer to Question 2.

(8.) The Commissioners would be prepared to provide wagons for the Northern Line on the same terms as they are provided for the Southern and Western Lines.

NEW SOUTH WALES.

RAILWAYS.

(RETURN OF GOODS CARRIED TO GLEN INNES AND GUYRA RAILWAY STATIONS DURING YEAR 1889.)

Ordered by the Legislative Assembly to be printed, 8 May, 1890.

[Laid upon the Table of the Legislative Assembly, in accordance with a promise made in answer to Questions No. 7, of 8th May, 1890.]

Questions.

- (7.) GOODS TRAFFIC AT GLEN INNES AND GUYRA RAILWAY STATIONS:—MR. WRIGHT asked THE COLONIAL TREASURER,—
- (1.) The number of tons of goods carried by rail to Glen Innes for the year 1889?
 - (2.) The number of tons of goods (exclusive of wool) despatched by rail from Glen Innes for the year 1889?
 - (3.) The number of bales of wool (and weight of same) sent from Glen Innes during the year 1889?
 - (4.) The like information regarding Guyra station?

Answer.

New South Wales Government Railways.—Comparative Statement showing the Goods traffic at Glen Innes and Guyra Stations for the year 1889.

Description.	Glen Innes.	Guyra.
Number of tons of goods carried by rail	7,090 tons.	1,587 tons.
Number of tons of goods (exclusive of wool) despatched by rail.....	2,992 „	2,395 „
Number of bales of wool sent by rail	6,191 bales.	1,060 bales.
Weight of bales of wool sent by rail	1,288 tons.	225 tons.

(RETURN OF RECEIPTS ON DURING MONTH OF AUGUST.)

Ordered by the Legislative Assembly to be printed, 11 June, 1890.

[Laid upon the Table of the Legislative Assembly in accordance with a promise made by the Colonial Treasurer, in reply to Question No. 1, of 2nd October, 1889.]

Questions.

- (1.) RECEIPTS ON GOVERNMENT RAILWAYS FOR MONTH OF AUGUST:—*Mr. Hugh Taylor* (for Dr. Ross) asked the COLONIAL TREASURER,—
- (1.) The amount of receipts for first-class passengers, and the number carried, during the month ending 31st August, on the Government Railways?
 - (2.) The same for second-class passengers during the same period?
 - (3.) Amount received for parcels?
 - (4.) Amount received for mails?
 - (5.) Amount received for horses, cattle, sheep, pigs, and dogs, and numbers?
 - (6.) Amount received for goods?
 - (7.) Amount received for minerals?
 - (8.) The same information for the corresponding month of last year?
 - (9.) Total number of miles run for same period, and amount of expenses incurred for coal, wages, wear-and-tear, &c.?
 - (10.) Same information, corresponding number of miles, last year?

Answers.

	1888.	1889.
(1 & 2.) Number of passengers, 1st class	259,699	279,680
Number of passengers, 2nd class	517,192	581,156
Amount for passengers, 1st and 2nd	£56,210	£57,909
(3.) Amount for parcels	£5,191	£5,690
(4.) Amount for mails... ..	£4,574	£4,637
(5.) Amount for live stock traffic—		
Number of horses in horse-boxes	850	1,171
Dogs	1,526	1,853
Horses in cattle trucks... ..	626	980
Cattle	13,050	11,790

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(CORRESPONDENCE, &c., IN CONNECTION WITH DUPLICATION OF LINE FROM TERALBA TO ADAMSTOWN.)

Ordered by the Legislative Assembly to be printed, 1 May, 1890.

[Laid upon the Table of the Legislative Assembly, in accordance with a promise made by the Colonial Treasurer, in reply to Question No. 18, of the 18th December, 1889.]

Memo. to The Secretary for Railways.

Office of Engineer for Existing Lines, Sydney, 27 February, 1889.

EXTRACT from the minutes of the Railway Commissioners on their recent tour of inspection of the Great Northern Railway, viz. :—

“Cockle Creek—Engineer to submit plan for duplicating line, West Wallsend Company’s Junction to Newcastle.”

Plan herewith. The total estimated cost is £35,500, in which is included making all the duplicate bridges of iron on brick abutments and piers. The present timber bridges are very much attacked by the white ants, and consequently it would not be a wise policy to continue constructions in timber on this section. G.C.

Mr. Cowdery,—Please say what would be the cost of duplicating line from West Wallsend Company’s siding to Teralba.—H.M.L. (*pro* Secretary), 11/3/89. About £7,000.—G.C., 12/4/89. Secretary. Refer to Mr. Angus.—H.M.L., 13/4/89.

Memo. to Mr. Cowdery.

58, Bridge-street, 5 July, 1889.

Will you please furnish me with your estimate for duplicating the bridges between Teralba and Adamstown. J. ANGUS.

Detailed estimate herewith. Estimated cost between Teralba and West Wallsend Junction, £4,712; from West Wallsend crossing to Adamstown, £11,528.—M.T. (*pro* Engineer for Existing Lines), 9/7/89. Mr. Angus.

G.N.R.—Duplication of Bridges, Teralba to Adamstown—Approximate Bill of Estimated Quantities and Cost.

G.F., 9/7/89. M.T., 9/7/89.

Will you please furnish full details of your estimate for each bridge.—J.A., 17/7/89. Engineer for Existing Lines. No detailed estimates have as yet been made for these bridges, as the plans for the same are only just being prepared. The estimates submitted are merely approximate.—M.T. (*pro* Engineer for Existing Lines), 28/7/89. J. Angus, Esq. Recommended to be carried out in timber departmentally.—G.C. (*per* D.H.A.), 11/10/89.

Memo. to Secretary for Railways.

Office of Engineer for Existing Lines, Sydney, 25 July, 1889.
Will you please let me know whether plans are to be prepared in this office for the bridges, culverts, &c., in connection with the duplication of the line from Adamstown to Teralba.—G.C.

Yes, in your office.—H.M'L. (*pro* Secretary), 26/7/89. George Cowdery, Esq. Mr. Fischer to carry out.—G.C., 31/7/89.

Memo. to Mr. Cowdery.

58, Bridge-street, 4 September, 1889.
I WOULD like to see you early with reference to the bridges between Adamstown and Teralba. The progress of the work is being greatly retarded in consequence of the work of widening the structures not being carried out.

J. ANGUS,
(*per* G.L.)

Mr. Kendall as to plans.—G.C. (*per* D.H.A.), 5/9/89. Mr. Shaw. Robt. Kendall, 24/9/89.

To Engineer for Existing Lines.

MR. ANGUS intimates that the earth-works on the duplication, Teralba to Adamstown, is progressing rapidly.

The Commissioners will be glad if you will submit at once the plans of bridge works necessary.

H. M'L.,
(*pro* Secretary), 22/8/89.

I recommend that these bridges be carried out in timber in accordance with attached memo.—GEO. COWDERY (*per* R.K.), 11/10/89. Secretary.

Memo. to Engineer for Existing Lines.

Re widening bridges between Teralba and Adamstown.

THE existing timber bridges on this section are of recent construction and in very good order. I therefore suggest that the widening be also carried out in timber, and as this work will necessitate some alteration in the existing bridges, which, if carried out by contract, would require for the safety of the traffic a great deal of supervision, owing to the work being distributed. I therefore recommend the work be carried out departmentally.

The total estimated cost of widening the bridge and culverts is £6,000.

ROBT. KENDALL.

The Chairman verbally approved yesterday of these bridges being constructed by day labour. Have the work put in hand and completed without delay.—J. ANGUS, 29/10/89. Mr. Kendall. This work has now been let to Angus & Co.—J.A., 12/12/89.

Extracts.

EXTRACT from Draft List of Works submitted by Commissioners to the Honorable the Minister for Railways:—

Duplicating Railway Lines.—Teralba to Adamstown, £35,300.

E.M.G.E.,
W.M.F.,
C.O.,
27/8/89.

Amount passed, 10th October, 1889.

Tenders.

Department of Railways, Sydney, 13 November, 1889.

TENDERS will be received at the Railway Commissioners' Office until 12 o'clock on Monday, the 25th November, from persons willing to contract for the completion of the duplication of the following Railway Line:—Adamstown to Teralba.

Specification, form of Tender, and further particulars may be obtained at the office of the Acting Engineer for Existing Lines, 58, Bridge-street, on and after the 8th instant.

Tenders are to be endorsed "Tender for duplication of Railway Lines."

The Commissioners do not bind themselves to accept the lowest or any Tender.

By order of the Commissioners,
H. M'LACHLAN,
Secretary.

Twelve tenders received. Messrs. Angus & Co.'s accepted, as per attached schedule of prices.

LEGISLATIVE ASSEMBLY,
NEW SOUTH WALES.

RAILWAYS.

RETURN OF TRAVELLING ALLOWANCES TO OFFICERS ENGAGED IN ENGLAND FOR SERVICE IN THE COLONY.

Ordered by the Legislative Assembly to be printed, 11 June, 1890.

[Laid upon the Table in accordance with promise made in answer to Question 2, Votes 19, 10 June, 1890.]

Questions and Answers.

(1.)

The names of all the Officers engaged by the Commissioners from any place outside the Colony.	The positions and salaries for which they were so engaged.		The positions and salaries they now occupy and receive.		The amount paid for passage money and expenses to each of them.	The date on which their salaries commenced.
	Position.	Salary.	Position.	Salary.		
		£ per annum		£ per annum	£	
D. H. Neale	Mechanical Engineer.	550	Mechanical Engineer	550	47	1 December, 1888.
James Angus	Civil Engineer	600	Acting Engineer for Existing Lines.	900	63	1 January, 1889.
J. G. S. Carns	Traffic Officer	500	Traffic Officer (Acting District Supt.)	500	70	1 December, 1889.
Thomas Hall	Chief Accountant	1,000	Chief Accountant	1,000	70	1 January, 1890.
C. A. Hodgson	Traffic Officer	500	Traffic Officer	500	70	" "
W. T. Foxlee	Deputy Engineer	700	Deputy Engineer	700	£87 Ss.	" "
William Thow	Locomotive Engineer	1,200	Locomotive Engineer	1,200	Nil.	1 May, 1889.

(2.) Did any of such Officers receive passage money for other members of their families besides themselves? Yes.

(3.) If so, which—specify the relations and the amount in each case? Mrs. Angus and family, £153; Mrs. Hall and three sons, £230; Mrs. Neale, £47; Mrs. Foxlee and children (part of expenses), £170.

(4.) Did any of such Officers receive passage money for any servants? No.

(5.) If so, which, and how much in each case? Answered by Question No. 4.

1890.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(TIME OF ARRIVAL AT SYDNEY AND ALBURY OF SOUTHERN EXPRESS TRAINS, FROM 1st JANUARY TO 31st OCTOBER, 1890.)

Ordered by the Legislative Assembly to be printed, 14 November, 1890.

[Laid upon the Table in answer to Question No. 1, 7 November, 1890.]

Question.

- (1.) ALBURY EXPRESS TRAIN:—MR. LYNE *asked* THE COLONIAL TREASURER,—
How many times since 1st January last has the Albury express train run late, and how late on each occasion, both from and to Albury.

Answer.

RETURN showing the arrival at Sydney and Albury of the Southern Express Trains, from 1st January to 31st October, 1890.

Up Train.

Number of days arrived Sydney to time	8
Daily average number of minutes late	34½

Down Train.

Number of days arrived Albury to time	85
Daily average number of minutes late	16½

Owing to the defective state of the line, which has been reported upon to Parliament, and which has seriously increased by the exceptional rainfall experienced for so many months, it was necessary, in order to ensure the safety of the travelling public, to run the trains at reduced speed, varying from 4 to 25 miles per hour, over long sections of the line, during a large portion of the time referred to. The lines are now getting into better condition, and it is hoped ere long that punctual working will be obtained.

The more punctual working on the down journey arises in consequence of thirty-five minutes additional running time being allowed.

1890.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

RAILWAYS.

(PROPOSED PLATFORM AT OR NEAR OURIMBAH CREEK.)

Ordered by the Legislative Assembly to be printed, 19 August, 1890.

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated 26th June, 1890, That there be laid upon the Table of this House,—

“Copies of all petitions, letters, reports, minutes, and other documents relating to a proposed platform at or near Ourimbah Creek, on the Great Northern Railway Line.”

(*Mr. Crick, for Mr. Edmunds.*)

No. 1.

Memorial from certain residents of Wyong.

To the Honorable the Minister for Works,—

The Memorial of the undersigned residents of Wyong, in the district of Brisbane Water,—

HUMBLY SHOWETH,—

1. Lying between Wyong and Ourimbah Creeks, and the Gosford and Maitland Road and Tuggerah Lake, is a portion of country occupied by a large number of settlers.

2. The Homebush-Waratah railway now in course of construction passes through this land.

3. The railway stations or platforms as proposed are both on the opposite sides of the creeks named, and the residents of the locality referred to have no access to them but by travelling a distance of from 4 to 8 miles.

4. That though the distance between the stations or platforms referred to is probably not more than 4 miles, to give access to either of them from the land mentioned it would be requisite to build a very expensive bridge, and resume land along the route for the formation of a road.

5. That it will entail far less expense on the Government, and be more convenient for the inhabitants for a platform to be erected; that the best site for such platform is on the road nearest to Ourimbah Creek, leading from the Gosford and Maitland Road to the water reserve on the said creek, and thence to Tuggerah Lake; and that Michael Smith is prepared to give the Government half an acre of his land—lot No. 12—as a site for a platform.

6. Your Memorialists therefore ask that a platform be erected on the site indicated.

And your Memorialists, as in duty bound, will ever pray, &c.

[Here follow 32 signatures.]

I RECOMMEND the memorial to the favourable consideration of the Minister. It is probable that Mr. Allison will make a similar offer of land in order to get the platform erected on his private estate; but the site now submitted would be equally central, and far more available for the general public, as a road has, I am informed, just been opened to the spot named.

R. STEVENSON,
Member, Wollombi.

12/12/86.

No. 2.

Minute Paper.

Department of Public Works, Railway Branch, Engineer-in-Chief's Office.

MR. MANN for report.

W.H.Q., 3 January, 1887.

The position applied for for platform is near where surveyed road crosses line at 60 miles 51½ chains. This road leads from Tuggerah Lake to main road, between Gosford and Maitland, when there is a small settlement at the foot of Kangy Angy Mountain. This settlement is about 3½ miles north of Blue Gum Flat Station, 5 miles south of Wyong Station, and 2 miles from site of proposed platform. A platform at this place would accommodate the settlers on the western side of Tuggerah Lake, lying between Ourimbah and Wyong Creeks, for in order to get to Wyong or Blue Gum Flat Stations the traffic would have to go from 5 to 7 miles round by main road or means of crossing the creeks provided. The inhabitants of the district are small farmers and timber-getters, timber being the principal produce. About thirty families would use this platform: not the greater portion of the timber would probably go to Blue Gum Flat Station.—G.F.M., 6/1/87.

For the Minister's consideration.—J.W. *per* W.H.Q., 10/1/87. Railways, 12/1/87.—J.R. Submitted for Minister's decision.—CHAS.A.G., 15/1/87. For my successor.—W.J.L., 17/1/87. Better stand over for a time until experience shows what course the traffic will take.—J.S., 11/2/87.

No. 3.
Minute Paper.

PLEASE let me have papers about a siding applied for at Ourimbah Creek on the Hawkesbury Line. Wanted to-day.

D. C. M'L., 25/2/87.

Papers *re* platform herewith.—C.H., 25/2/87. Chief Clerk. Mr. Stevenson, M.P., is moving again in this matter and requests an answer.—D.V., 1/3/87. Commissioner. Inform in terms of Mr. Secretary Sutherland's Minute of 11/2/87.—CHAS. A.G., 1/3/87.

No. 4.

The Commissioner for Railways to R. Stevenson, Esq., M.P.

Sir,

Department of Railways, Sydney, 3 March, 1887.

Referring to your personal interview on the subject of the application made for a platform at Ourimbah Creek, on the Hawkesbury line, I have the honor to inform you that Mr. Secretary Sutherland has decided that the question of providing a platform at this place shall remain in abeyance until experience shows what course the traffic will take.

I have, &c.,

CHAS. A. GOODCHAP,

Commissioner for Railways.

(Per D.V.)

Mr. Stevenson says he would like to know whether Mr. Allison offered any land for the crection of a platform. Please search records, and inquire at Construction Branch.—CHAS. A.G., 14/3/87. I can find no record, either in this office or Engineer-in-Chief's, of the offer of land by Mr. Allison.—M.A.O.B., 14/3/87. Inform Mr. Stevenson, and in so doing refer to memorial he presented, and to his subsequent personal inquiry.—CHAS. A.G., 21/3/87.

No. 5.

The Commissioner for Railways to R. Stevenson, Esq., M.P.

Sir,

Department of Public Works, Railway Branch, Sydney, 21 March, 1887.

Referring to the memorial presented by you from residents of Wyong for a platform at Ourimbah Creek, on the Homebush-Waratah Railway, and to your subsequent personal inquiry as to whether Mr. Allison offered any land for the purpose, I have the honor to inform you that inquiry has been made in this matter, but no trace can be found, either in this office or the Engineer-in-Chief's Branch, of any such offer being made.

I have, &c.,

CHAS. A. GOODCHAP,

Commissioner for Railways.

(Per A.R.)

No. 6.

The Hon. John Davies, M.P., C.M.G., to The Commissioner for Railways.

Casual Labour Board, 82, Goulburn-street,

My dear Mr. Goodchap,

Sydney, 22 March, 1888.

The Secretary of the Board, Mr. T. C. Hinchcliffe, Captain Thompson, of the Marine Board, and a party of twelve gentlemen, friends of mine, are going to spend their Easter holidays at the Tuggerah Lakes, leaving Sydney on Thursday, 29th instant.

Their camp is on Messrs. Hinchcliffe and Thompson's land at Ourimbah Creek, 2 miles on the Sydney side of Wyong station. Would you kindly send me memo. to give the station-master at Gosford, or officer in charge of trains, to set them down at Ourimbah Creek, as it is late at night when they arrive at Wyong, and there is no made road to return. I may mention that there is a station called Ourimbah, situated at Blue Gum Flat, but this is about 6 miles from where the train crosses Ourimbah Creek. They inform me that where they wish to alight the line is perfectly level and straight, and they promise not to detain the train more than half a minute.

I am, &c.,

JOHN DAVIES.

P.S.—A petition was sent some time back to the local Member, Mr. Stevenson, M.P., for presentation to the Minister, asking for a platform at this particular spot.—J.D.

No. 7.

The Secretary for Railways to The Hon. John Davies, M.P., C.M.G.

Sir,

Railway Department, Sydney, 24 March, 1888.

With reference to your letter of the 22nd instant, asking that a party of your friends may be set down near Ourimbah Creek on Thursday night next, I have the honor, by directions of the Commissioner for Railways, to inform you that he has approved of this being done, and instructions have been given accordingly. It will be necessary, however, for your friends to speak to the station-master at Mullet Creek when they arrive there and advise him as to the exact spot where they wish to alight.

I have, &c.,

D. VERNON,

Secretary for Railways.

Traffic Manager.—A.R., 26/3/88. I take it that the party wants to get out at Wyong, from the distance they give. Please see them on arrival at Mullet Creek and arrange for the stoppage.—F. R. NELL, 28/3/88. Arranged. The place they wanted to get out was 2 miles this side of Wyong.—H.C., 29/3/88.

No. 8.

No. 8.

Extract from Letter from R. Stevenson, Esq., M.P., dated 17 April, 1888.

For erection of Railway siding at Ourimbah Creek.

In presenting the petition I recommend that the siding asked for at Ourimbah Creek be erected, for, as the Tuggerah Lakes become known, it will be a place of great resort for excursionists from Sydney and Newcastle, as well as the surrounding districts. At Easter last I am informed a large number visited the Lakes, which is a lovely spot, with plenty of fishing, shooting, and boating. All that is required is the erection of the siding, and the opening of the Government road, which does not exceed a mile from the site of the proposed siding, which has been wisely provided for in the construction of the line.

No. 9.

Memorial from certain residents of Tuggerah Lakes, and others.

[Presented with letter by R. Stevenson, Esq., M.P.]

To the Honorable the Minister for Works,—

Sir,

Kangy Angy, Brisbane Water.

We, the undersigned residents, landowners, and visitors to the Tuggerah Lakes, hereby humbly petition that you will be pleased to have a siding made at the public crossing leading through Michael Smith's, senior, property to the water reserve and Tuggerah Lake, on the Northern Line from Sydney to Newcastle.

There is a large settled population between the present stations, Ourimbah, situated at Blue Gum Flat, and Wyong, to which the siding would be a great public convenience; also to visitors to the Lake from Sydney and elsewhere it would be a great accommodation. Michael Smith, senior, will give 1 acre of ground free if required for siding.

By placing this siding here it will open up the surrounding country, and there will be dairy and agricultural produce and timber sent out by rail, which, at the present distance between the abovenamed stations, is not done.

And your Petitioners will ever pray.

[Here follow 52 signatures.]

No. 10.

Memorial from certain residents of Tuggerah Lakes, and others.

[Presented by the Honorable John Davies, C.M.G., M.L.C., in conjunction with a Petition presented by R. Stevenson, Esq., M.P., on the 7th May, for a siding on the northern side of Ourimbah Creek.]

To the Honorable the Minister for Works,—

Sir,

Ourimbah Creek, 29 March, 1888.

We, the undersigned residents, land-owners, and visitors, to the Tuggerah Lakes, hereby humbly petition that you will be pleased to have a platform erected at Ourimbah Creek, on the Northern railway line, from Sydney to Newcastle.

There is a large settled population between the present stations, Ourimbah (situated at Blue Gum Flat) and Wyong, to which the platform would be a great public convenience; to visitors to the lakes from Sydney and elsewhere it would also be a great accommodation, there being two Government roads from near the platform petitioned for, one on each side of Ourimbah Creek direct to the lakes, besides the waterway down the creek which is navigable for the largest boats.

A sufficient quantity of land to erect the platform, &c., will be handed over free to the Government at either side of the creek.

And your Petitioners will ever pray.

[Here follow 57 signatures.]

I should be glad to have a report on this matter.—J.S., 28/5/88. Traffic Manager, Newcastle.—
A.R., B.C., 29/5/88. Please furnish a report.—F. R. NIELD (*per* J. BURNS), 30/5/88. Mr. Willis.

No. 11.

Mr. T. Hinchcliffe to Mr. Lee.

Dear Mr. Lee,

103 and 105, Oxford-street, Sydney, 29 May, 1888.

In company with the Hon. John Davies, C.M.G., M.L.C., I waited upon the Minister for Works yesterday, and presented my petition for a platform at Ourimbah Creek. It seems that the petition presented some few weeks ago by Mr. Stevenson, asks for a siding at Ourimbah, not Ourimbah Creek. I told the record clerk that it was meant for Ourimbah Creek, and informed the Minister that the petition presented by Mr. Davies and myself was in conjunction with the one presented by Mr. Stevenson, and was intended to strengthen the hands of that gentleman in procuring the boon asked for. You will therefore see that it was very fortunate that I called on the Minister for Works, and got matters put straight. If there is anything required in the matter of roads I will be happy to assist at any time.

I am, &c.,

THOMAS HINCHCLIFFE.

5,

No. 12.

R. Stevenson, Esq., M.P., to The Commissioner for Railways.

Siding at Ourimbah Creek, Tuggerah Lakes.

Sir,

I am astonished to learn by the enclosed letter that the Railway Department has fallen into error in regard to the petition presented by me some few weeks back, and about which I have made frequent personal applications to know what was being done in the matter.

To the petition I attached a letter, pointing out not only the locality—which I am intimately acquainted with—but that provision was made by the department for the siding, which is absolutely necessary, as being about 1 mile, and the nearest point touched by the railway to the celebrated Tuggerah Lakes, which only requires the erection of the siding to make it a place of great resort for excursionists, not only from Sydney but Newcastle. Last Easter the train, by special request, was allowed to stop at this place, to enable visitors to alight who were bound for the Lakes, but apart from which, as the petition sets out, it is required for present public convenience.

Again asking that the matter may receive attention,

I am, &c.,

R. STEVENSON,

For report with other papers; please expedite.—H.M'L., 4/6/88.

Mr. Neild.

No. 13.

Report by Acting Traffic Manager, Mr. F. R. Neild.

15 June, 1888.

88-2477c asks for a siding at Ourimbah Creek, and 88-2841c makes a request for a platform at same place. The distance between Wyong and Ourimbah Stations is only 6 miles, and the erection of a platform or siding, or both, between these places, distant only $1\frac{1}{2}$ mile from Wyong, is not necessary for reasonable requirements. I think the department should pause for a long time to come, unless very great changes occur, before erecting any more platforms or sidings on this line. The Inspector's report enclosed, and I fully concur in it.

F. R. NEILD.

MEMO. by Acting Traffic Inspector Willis.

THE petition for a Siding at Ourimbah Creek is, I think, one and the same with another petition (herewith) for a platform at the same place. The place where these are required is about $1\frac{1}{2}$ mile on Sydney side of Wyong Station, and from such information as I can gather I do not think there is yet sufficient trade round here to warrant a siding being put in. There is only a distance of 6 miles between Wyong and Ourimbah Station, and I am of opinion that at present they are quite adequate to the requirements of the district.

No doubt a platform would be a convenience for visitors to Tuggerah Lakes; but as platforms mean extension of journey time, very good reasons should be shown for putting up such, which I think are wanting here.

I notice also, that in the petition for the platform, out of 57 names attached to it 17 are residents of Wyong, where there is already a station.

A. WILLIS,

Acting Traffic Inspector, 5/6/88.

Acting Traffic Manager, Newcastle.

I am sure there is no necessity for a platform at this place at present. I visited it on 6th September, 1888.—C.A.G., 7/9/88.

No. 14.

The Secretary for Railways to R. Stevenson, Esq., M.P.

Department of Public Works, Railways Branch,

Sydney, 19 June, 1888.

Sir,

Referring to your representations in favour of the construction of a siding at Ourimbah Creek, and for a platform at the same place, I am desired by the Commissioner to inform you that the matter has had full and careful consideration, and under the reports of the traffic officers he is not prepared to erect further accommodation on this line for the present.

I have, &c.,

D. VERNON,

Secretary for Railways.

No. 15.

R. Stevenson, Esq., M.P., to The Railway Commissioners.

Gentlemen,

5 August, 1889.

In presenting the enclosed petition, I would wish to point out that the land has been reserved for a siding at the spot indicated, and gates on either side of the line erected.

Before the Commissioners were appointed, petitions were presented, asking for the siding, and it was decided to leave the matter to be dealt with by them.

I would be very convenient for the residents of Tangy Angy, where there is a large centre of population, with a public school showing an enrolment of about 50 pupils; in addition to which it would be the nearest point for tourists bound for Tuggerah Lakes, which are largely resorted to in the summer months, as it is only about three-quarters of a mile distant, with a good Government road all the way. Under the circumstances, perhaps the Commissioners would have the previous papers looked up, as, in the season, the siding would be availed of by excursionists, apart from the regular trade it must develop.

I am, &c.,

R. STEVENSON.

Chief

Chief Traffic Manager to report.—W.M.F., 8/8/89.

Ourimbah is a little more than 56 miles distant from Sydney, and Wyong is about 62½ miles distant. The siding asked for at 60 miles 52 chains would be about 4½ miles from Ourimbah and 1½ mile from Wyong. I am informed that many of the persons who have signed the petition reside either at Wyong or Ourimbah. Most of the others are labouring men and bushmen. There is nothing at the place named to induce a population to settle there, and if the siding were constructed the traffic dealt with at it would be withdrawn from either Wyong or Ourimbah. At the two stations named there is plenty of accommodation for dealing with the traffic, and, under these circumstances, I cannot recommend that the request be complied with.—D.K., 28/8/89.

Reply accordingly.—W.M.F., 30/8/89.

No. 16.

The Secretary for Railways to R. Stevenson, Esq., M.P.

Sir,

2 September, 1889.

With reference to the memorial signed by Mr. George Fowler, Mr. David Goldie, and others, and presented by you, asking that a siding may be put in at 60 miles 52½ chains on the Great Northern Line, I am desired to inform you that the matter has had consideration, but the Commissioners regret they cannot see their way to comply with the request.

I have, &c.,

H. M'LACHLAN,

Secretary.

No. 17.

Memorial from certain Residents between Wyong and Ourimbah Creeks.

[Presented with letter by R. Stevenson, Esq., M.P.]

To the Honorable the Minister for Railways,—

Gentleman,

Rosebank, Tuggerah, Wyong, 29 July 1889.

We, the undersigned residents, chiefly freeholders on our homesteads, living between Wyong and Ourimbah Creeks, in the parish of Tuggerah, in a prayer, hereby humbly petition that your Honor will be pleased to cause steps to be taken to have a siding erected on the Great Northern Railway, distant 60 miles and 52½ chains from Sydney, at the crossing of public road leading from Maitland and Gosford Road to water reserve and Tuggerah Lakes, as public money is being now expended to put the said road in fair order, as it would be a great advantage to the district in getting a large quantity of timber and other produce away to market, and bringing a large quantity of good land into cultivation.

We are at the present time most of us from 5 to 8 miles from Ourimbah Station by road, and 5 to 10 miles from Wyong Station by road. Our families, to get anything to or from the above stations, have to go the above distance, or trespass on railway line; whereas if the said siding were erected the majority of us would be within 1 mile of it, and timber and produce could be got away to advantage, and finding employment for our families. We still pray.

Yours, &c.,

[Here follow 35 signatures.]

No. 18.

Extracts from Notes of Commissioners' visit to Newcastle.

Secretary's Office, Sydney, 2 December, 1889.

Memorial for a Platform and Siding at 60 miles 52½ chains, between Wyong and Ourimbah.

REPRESENTED that if a platform at this place were erected it would be most convenient for passengers visiting the Tuggerah Lakes, besides being the means of increasing the traffic. A siding was also much required to enable the farmers living in the neighbourhood to send their produce to market, &c. Mr. Angus instructed to have plan and estimate submitted at once. Work to be completed in time for taking away this season's produce.

J. Angus, Esq.,—Please submit plan and estimate as early as possible.—H.M'L., Secretary, 2/12/89.

Mr. Baxter to obtain the surveys relative to the proposed station at this place.—J.A.

No. 19.

Memo. by Mr. Commissioner Fehon.

Memo. for Mr. Angus.

MR. STEVENSON, M.L.A., called this morning to know what had been done about putting in a siding at Ourimbah Creek, or more properly Tuggerah Lake siding. He also asks that the District Engineer see the Station-master at Gosford about a few small matters required while the workmen are there, such as water at the urinals, a little fencing at Station-master's house, &c.

Engineer is preparing plan.—H.M'L.

W.M.F., 3/1/90.

No. 20.

The Secretary for Railways to Mr. Angus.

Memorial for a Platform and Siding at 60 miles 52½ chains, between Wyong and Ourimbah

Government Railways of New South Wales,

Secretary's Office, Sydney, 16 January, 1890.

REFERRING to the special inquiries which you were requested by the Commissioners to make hereon when they were on their northern tour on the 22nd November last, will you kindly let me know how the matter stands?

H. M'LACHLAN,
Secretary.

Herewith I forward tracing showing proposed platform, waiting-shed, and siding at 61 miles 10 chains, North Coast line. The estimated cost will be about £805.—J. ANGUS, 5/2/90. Secretary. If you concur, please initial plan and return to-day if possible.—H. M'LACHLAN (*per* J.J.S.), 6/2/90. Chief Traffic Manager. I have signed the tracing, but it appears to me that £805 is a large sum of money to spend at a place from which I fear we shall not get a great deal of traffic.—D.K., 8/2/90. Approved.—E.M.G.E., 11/2/90. C.O. J. Angus, please carry out early.—H.M'L. Mr. Halligan to carry out.—J. ANGUS, 13/2/90.

No. 21.

Mr. T. Smith to The Chief Commissioner for Railways.

Sir,

Tuggerah, Wyong, 30 January, 1890.

I hope you will excuse me for troubling about this platform. You may remember that you and other gentlemen came to see the place at about 60 miles 55 chains, and you saw me and another man at the crossing, when I told you about my crops that I wanted to send away by train. You said that the platform would be built so that I could get last year's crops away. It will be a big loss to me if I cannot do so. The old road is now blocked, so I cannot get away nohow. They say that it is not settled where it is to be put up. I might say the most suitable place would be anywhere near the main road (61 miles 10 chains crossing), it being the most central between the farmers, and would accommodate every one of us.

I am, &c.,
THOMAS SMITH

No. 22.

The Secretary for Railways to Mr. T. Smith.

Sir,

5 February, 1890.

I have the honor to acknowledge the receipt of your letter of the 30th January, received to-day, relative to the provision of a platform between Ourimbah and Wyong, and to inform you that plans have been prepared, and will be submitted to the Commissioners for approval to-day, and the work if approved will be at once proceeded with.

I have, &c.,
H. M'LACHLAN,
Secretary.

No. 23.

Memorial from certain Residents and others between Ourimbah and Wyong Creeks.

Sirs,

Ourimbah, 8 March, 1890.

We, the residents and landowners between Ourimbah and Wyong Creeks, beg most respectfully to ask that you will cause to be erected, as soon as practicable, the platform and siding on the main public crossing between the afore-mentioned creeks, which was promised by you some months ago.

We would point out that a large quantity of farm produce is now raised in close proximity to the proposed platform, which at present can only be sent to market at immense cost of money and time, thus rendering our labour as farmers wholly unprofitable. This platform would also open up new timber country, which timber, when cut and sent to market, would prove a source of revenue to the Department. Trusting you will give this matter your favourable consideration.

We have, &c.

[Here follow 40 signatures.]

No. 24.

The Secretary for Railways to Mr. W. Smith and others.

Gentlemen,

14 March, 1890.

In reply to your letter of 8th instant, requesting the erection of a platform and siding between Ourimbah and Wyong, I have the honor to inform you that the Commissioners have approved of the accommodation being provided at 60 miles 50½ chains, and the engineer has been instructed to expedite the work.

I have, &c.,
H. M'LACHLAN,
Secretary.

No. 25.

No. 25.

Office Memo.

Platform and Siding between Ourimbah and Wyong.

PLEASE return at once previous paper, with report.

Mr. Halligan.

J.A., 17/3/90.

Previous papers and tracing attached. You will see that all papers, and especially the one approved of, show the siding should go in at 60 miles 52½ chains. The plan sent to me to work to shows siding to go in at 61 miles 10 chains. Work is now delayed pending your instructions as to where siding is to go. Please expedite reply.—E.M.H., 21/3/90. Mr. Angus.

I am greatly surprised at the delay in carrying out this work. Please have the siding laid in at once at the mileage shown on plan (61.10). This must be completed within a fortnight. I have made other arrangements with reference to platform and waiting-shed.—J.A., 29/3/90. Mr. Halligan.

No. 26.

Mr. W. Smith to The Railway Commissioners.

Sir,

Ourimbah, 10 March, 1890.

I have the honor to forward the enclosed document for your information, and trust you will kindly excuse the liberty I thus take in addressing you.

I may also request you will let me know the result of the accompanying paper, as those who have signed it are very anxious to hear about it.

I have, &c.,

WILLIAM SMITH.

No. 27.

Mr. W. Smith and others to The Railway Commissioners.

Sir,

Ourimbah, 19 March, 1890.

In reply to yours of the 14th instant, we beg to inform you, most humbly, that a part of the material for the platform and siding was laid down to-day at 61 miles 10 chains, which we believe to be a mistake, as there is no access to that place at the present time whatever. The mileage in your letter is in every way convenient for the public,—60 miles 50½ chains.

Your, &c.,

WILLIAM SMITH, and others.

No. 28.

The Secretary for Railways to Mr. W. Smith.

Sir,

Department of Railways, 22 March, 1890.

I am directed by the Railway Commissioners to acknowledge the receipt of your letter of the 19th instant, relative to the site of the new platform between Wyong and Ourimbah, and beg to inform you that the matter is having attention, and a further reply will be sent to you in the course of a few days.

I have, &c.,

H. M'LACHLAN,

Secretary.

No. 29.

W. J. Chapman, Esq., J.P., to The Secretary for Railways.

Sir,

Wyong, 26 March, 1890.

As I understand an agitation exists for the erection of a siding between Wyong and Ourimbah Creeks, I think it my duty to point out a few facts that the Commissioners may not be aware of.

1. At the present time there are not more than eight families who would be immediately benefited by the proposed siding.

2. Those people are so divided as to the site to be determined on that each party declares its intention to make no use of the siding unless placed where it "ought to be."

3. The revenue derived at a siding in this locality could not pay interest on the capital expended for the next ten years.

4. The same amount of money required for the erection of this proposed platform would build a bridge across Wyong Creek; and now that the Government has granted a sum of £450 for the making of a road to the bank of the creek, all that is required to give the people between Wyong and Ourimbah Creeks access to Wyong Station is for a bridge to be erected across the creek, which would cost not more than £6,000.

5. This would be a much greater convenience to all parties concerned, and obviate any necessity for the expense and delay to trains which must attend an additional stopping-place.

6. I have no purpose to serve in thus placing this matter before the Commissioners, except to save a waste of the public money, and the creating additional inconvenience and delay to the travelling public.

7. I would most respectfully suggest that, to meet the requirements of the whole case, the Commissioners might urge upon the Department of Works the necessity of erecting a bridge across Wyong Creek, in close proximity to the railway line.

I have, &c.,

W. J. CHAPMAN, J.P.

Letter acknowledged.

No. 30.

No. 30.

Mr. T. Smith to The Railway Commissioners.

Sir,

Tuggerah, Wyong, 27 March, 1890.

I believe a dissatisfaction exists between a few as regards the site of siding between Wyong and Tuggerah Creeks. I wish to bring under your notice that there is a very steep hill at crossing 60·55, which will be a great drawback to us in getting our heavy timber and other produce away, should the above siding be erected at this place, and be a great inconvenience to the sporting public in getting to our lakes, as a glance at the parish map will show. I hope you will give this your earnest consideration before having the above siding removed from 61·10 miles, as it is the most convenient place between those two creeks, likewise avoiding a sharp curve in the line at 60·55½.

Yours, &c.,

THOMAS SMITH.

No. 31.

R. Stevenson, Esq., M.P., to The Railway Commissioners.

Sir,

When in my electorate on Saturday last I visited the site chosen for the siding now in course of erection at 61 miles 10 chains. I would respectfully suggest that the siding should have been put in the site petitioned for, and promised to the residents by letter from the Railway Department, viz., 60 miles 52½ chains, to which there is already good access by roads, with gates at the crossing alongside. To complete the siding where commenced would, in my opinion, be a huge mistake, and could not be used when erected. I know the surrounding country well, and without wishing to be considered in any way dictatory to the Commissioners, I would, after visiting the place on Saturday last, respectfully request the Commissioners to reconsider their decision, and erect the platform where petitioned for and promised, which I am informed is the spot where the Commissioners drew up their special train and met the residents. It would be a large saving of money to put the siding in at 60 miles 52½ chains, even now, than to continue present work, which is a waterhole, with holey ground all round it; while the siding, unless provision is made to carry off the water, will act as a dam and throw the water on to Mr. Smith's land, who informed me he had written to the Railway Department asking for a drain to be constructed.

The road at 60 miles 52 chains is the one always used to reach the lakes, upon which the Government has erected a large bridge and culverts where required, being the direct route from the Gosford and Maitland road to Tuggerah Lakes, and is extensively used by the fishermen; while for a very small outlay a short but pleasant walk could be provided for excursionists, who would use the platform, which, I trust, the Commissioners will, though rather late, yet see their way clear to remedy by placing the same at 60 miles 52½ chains, which, I am certain, the whole of the correspondence will prove is the correct site, the one frequently petitioned for, and, lastly, promised to my constituents by the Railway Commissioners. Hence I ask, with every confidence, that the matter may receive reconsideration.

I have, &c.,

R. STEVENSON.

Platform between Wyong and Ourimbah. Mr. Hodgson for report.—H.M'L., 28/4/90.

No. 32.

Mr. C. A. Hodgson to The Secretary for Railways.

Platform and Siding between Ourimbah and Wyong.

8 May, 1890.

I VISITED the site 61 miles 10 chains where the siding has been put down, on Saturday last, and met there a dozen or more of the inhabitants.

They all, with one exception, pointed out that the siding and platform had been asked for at 60·52½, where the Government road crosses the line, and they stated that the siding at 61·10 would be of no use to them, as there was no road formed leading to it, and also that the land between them and the siding was a swamp.

Plans of the district show a direct road leading past 61·10, to the shores of the lake, but the road is only in existence on paper, and I understand that if the road is ever made it will have to be logged for a greater part of the way, on account of the water lying there.

In your memo. of 16th January, 1890, to Mr. Angus, you give the site as 60·52½, but I now learn from the Engineer's Department that the site approved on the ground was at 61·10.

At the present time the siding has been laid in, and the front row of piles driven in for the platform, but no road of access to the siding has yet been made.

The people of the district ask for a loading-bank to be erected, for timber, if the siding is removed to 60·52½.

C. A. HODGSON.

No. 33.

Memorandum by Mr. J. Angus.

Railway Department, Office of Engineer for Existing Lines, Sydney, 8 May, 1890.

REFERRING to our conversation to-day, I herewith send you papers and plan, and shall be glad if you will have the matter looked up. It was decided for you to send an officer first to make inquiry from the two men whom we met on the ground, and, on receiving his report, we were to go ourselves and settle the matter. As this has been a long time on hand, I shall be glad to know when you can go, when, if possible, I will arrange to go with you.

I have, &c.,

J. ANGUS.

The Chief Traffic Manager.

8/5/90.

No. 34.

R. Stevenson, Esq., M.P., to The Railway Commissioners.

Gentlemen,

12 May, 1890.

This question is creating considerable attention at the present time, and, I am creditably informed, a petition has been sent in—not through the representative—signed, it is alleged, by those not directly interested, in favour of the present site. I know the place, but am content to leave the correspondence which was sent in—not to-day—which expresses the wishes of those interested, and should be ample to guide the Commissioners in arriving at a decision. I have received a private letter, from which I append an extract, as it puts the whole question very fairly:—

“If the platform were to remain where it is now being built, at 61 miles 10 chains, it would necessitate the roads approaching it being cleared and made in all directions, as there is not a track within 2 miles, excepting the present Government road, which crosses the railway at the other proposed site, 60 miles 52½ chains. This road work would be very expensive, but when done the platform would be very convenient for the Lakes, Maitland Road, near to Tangy Augy, and also some of the farms. On the other hand, if built at 60 miles 52½ chains, or, in other words, at foot of the hill on Government road, it would be very convenient for every resident in the vicinity, and for the fish-carts that come from the navigable waters of Ourimbah Creek, and cross the line at this place. I am informed that at times twelve carts a day go to and fro. This site, however, would make the distance to the Lakes a few chains further, but if the road was cleared it would be a very pleasant walk for excursionists, and there would be no difficulty in getting there. To open new roads to where the platform is now being placed, 61 miles 10 chains would be costly, owing to the boggy nature of the soil.”

I am, &c.,

R. STEVENSON.

No. 35.

Mr. G. Fowler to The Railway Commissioners.

[Presented by Mr. R. Stevenson, 12/5/90.]

Gentlemen,

Rosebank, Tuggerah, Wyong, 9 May, 1890.

I write to say we had the inspector to see the siding, and Mr. Hinchcliffe was up the same time. We called a good muster of people to meet him. All seemed in favour of it being removed, except Thomas Smith; he has got up a letter of protest, and got a few outsiders to sign it. It was sent on Monday last we understand, so you must oppose it strongly. Mr. Hinchcliffe spoke strongly in favour of it being removed; likewise stating that they had an interview with Mr. McFaden, the secretary to Fishermen's Union, who states that he is coming up with Mr. Stephen, Member for Redfern, to see about snagging Ourimbah Creek, and establishing a fishing station on the same. If you can see Mr. Hinchcliffe he will explain matters to you. Please let us know how things are going on, as there are about 100 people interested in this letter, and are anxious for a reply.

I am, &c.,

GEORGE FOWLER.

No. 36.

Mr. G. Fowler to The Secretary for Railways.

Dear Sir,

Rosebank, Tuggerah, Wyong, 12 May, 1890.

I write on behalf of the persons signing the petition for siding on Northern Railway, distance 60 miles 52½ chains, of which an officer was recently sent up to report on site. We understand that a petition has been sent by Thomas Smith, opposing the removal of materials to a better site, as his house fronts the materials laid down now; he has got a lot of outside persons to sign it which have no interest in the siding, and others that get their living by working on roads which they know would take an immense amount of money to make to the present site; therefore we ask that you will be kind enough to send us a copy of that petition and names of persons signing, so that we can point out the interests of those persons to the Railway Department.

Yours obediently,

(For the petitioners),

GEORGE FOWLER.

No. 37.

Memorial from certain inhabitants of Wyong and Tuggerah Lakes.

The Petition of the undersigned inhabitants of Wyong and Tuggerah Lakes being concerned in the erection of a Platform between Wyong and Ourimbah Creeks,—

RESPECTFULLY SHOWETH:—

1. We hear with regret of the probability of the platform in question being shifted from the site previously chosen, namely, 61 miles 10 chains to a position nearer Ourimbah Creek.

2. A glance at the parish map will show that in the near future, when the available land becomes occupied, the site at first determined on will be very much more central and more easy of access, being upon the only Government road in this locality leading from the Maitland Road to Tuggerah Lakes, and at a point at which the roads from Wyong Creek and Kangy Hill converge.

3. That the proposed site will be for all time unsuitable to the general public, and if erected at this point will serve the purpose of a few individuals only, there being no room round it for any increase of population, as Kangy Mountain is in such close proximity to the railway line at this point. This hill is so steep as to form an almost insuperable barrier to traffic leading to and from this proposed site.

4. Should there be any doubt in your minds as to the suitability of the previous site above the one now proposed we respectfully request that the matter be kept in abeyance until the population becomes more settled, when it will certainly be found that the original site is the proper one, and indeed the only one, that can ever possibly pay for the outlay.

And your Petitioners, as in duty bound, will ever pray.

[Here follow 21 signatures.]

11

No. 38.

Mr. J. Lees to The Secretary for Railways.

Dear Sir, Tuggerah Lake, 13 May, 1890.
 Having heard that a petition signed by forty or fifty local residents had been forwarded within the last few days against the platform being erected at 60 52½, I would feel obliged if you would supply me by return post with a copy of the name and address of the petitioners, as I feel sure, as an old resident, that there are not one quarter who have an interest in this matter.

Yours, &c.,
 JOSEPH LEES.

No. 39.

The Secretary for Railways to Mr. Lees.

Sir, 16 May, 1890.
 In reply to your letter of the 13th instant, I have the honor to inform you that the question of the site for the platform between Ourimbah and Wyong is now under consideration.

I have, &c.,
 H. M'LACHLAN,
 Secretary.

Office Memo.

Railway Department, Office of Engineer for Existing Lines, Sydney, 16 May, 1890.
 The Chief Traffic Manager,
 When arranging our visit to inspect the site for proposed station platform near Wyong, milcage 62.10 north, the Commissioners desire that you will request Mr. Joseph Rankin and Mr. Stephenson, M.P., to be present.

F. ANGUS.

No. 41.

Mr. H. Denny to The Secretary for Railways.

Dear Sir, Ourimbah, 15 May, 1890.
 Being informed, it was proposed to hold a meeting to consider which would be the most suitable place to have the platform and siding, and on account of being a land-owner near the proposed place, and have already laid out an orchard, I have an interest in giving my opinion as to the most suitable place. I am decidedly in favour of it being erected at 60 miles 50½ chains, and consider it the most central position for the benefit of the inhabitants.

I am, &c.,
 H. DENNY.

No. 42.

Mr. H. Foot to The Railway Commissioners.

Gentlemen, Ourimbah, 15 May, 1890.
 I understand there is a meeting to decide the interests of the people requiring the siding and platform, therefore I state that I am living on my mother-in-law's property, and we are continually going to Sydney and back on business, therefore the platform would be of far more benefit to us if it was at 60 miles 52½ chains.

Yours, &c.,
 HENRY FOOT.

No. 43.

Mr. J. Denny to The Secretary for Railways.

Kangy Angy, 15 May, 1890.
 J. DENNY, teamster, landowner, and resident within a short distance of the proposed platform and siding. I am in favour of it being erected at the public crossing, 60 miles 50½ chains.

JOSEPH DENNY.

No. 44.

Mr. D. J. Goldie to The Secretary for Railways.

Sir, Golden Point, 15 May, 1890.
 I am a landowner and teamster, and reside at Golden Point, near Kangy Angy. If the siding is put at 60 miles 52½ chains I could draw to it as soon as completed; if put at the place where the material is laid I could not draw to it at all as it is impossible to get to it with a team.

I have, &c.,
 DAVID J. GOLDIE.

No. 45.

No. 45.

Mr. F. Ebert to The Railway Commissioners.

[Letter from the Secretary of the Fishermen's Association, Tuggerah Lakes, to the Railway Commissioners. Forwarded per favour of Captain Thompson, 19/5/90.]

Sir,

WYONG, 16 May, 1890.

As the public of the parish of Tuggerah are advocating the removal of the siding between Wyong and Ourimbah Creeks, I, on behalf of the fishermen of Tuggerah Lakes, humbly sheweth that by placing the said platform as near as practicable to Ourimbah Creek it would be a great advantage to the fishing industry, as the distance from Wyong Station to the said lake is 4 miles, and the distance from Tuggerah bridge is only 2 miles; therefore the rowing daily of a heavy fishing boat 8 miles is a great consideration to an ill-treated industry. Another important feature is the enormous private carriage we have to pay before getting our fish to the railway. Praying that you will grant the said removal,

I have, &c.,

F. EBERT.

No. 46.

Mr. G. Fowler to The Railway Commissioners.

Gentlemen,

ROSEBANK, TUGGERAH, WYONG, 17 May, 1890.

I write on behalf of people signing petition for siding at 60 miles $52\frac{1}{2}$ chains. We now find out how our petition has been undermined by Thomas Smith and a few others. He told the Commissioners the day the train stopped at the place, when they asked him had he signed it he said he did, which he did not, as you will see his name is not there. A short time after those promised it he writes a letter to the department, pretending to be for the petitioners, unknown to them, asking them to put it at 61 miles 10 chains, fronting his own house. When your officers came up on 15 May to take names of people interested, he had several people on his side whose names are not on the petition, namely—Mr. Rankin, Wyong; Mr. Allison, Wyong; Mr. Walmsley, Ourimbah; and the latter told us all in the presence of officer, he did not care if there were no sidings for twenty years, so you can see the interest of these gentlemen.

I have, &c.,

GEORGE FOWLER.

No. 47.

Mr. C. Alison to The Railway Commissioners.

Gentlemen,

WYONG ESTATE, WYONG, 19 May, 1890.

I hear that there is at present an agitation by a small section of people here to have the proposed platform, now being erected, at 61 miles 10 chains on the Northern line, removed a mile or more further south. The arguments in favour of the present site are—

1. That it is on a surveyed main road to Tuggerah Lake, and would benefit greatly a large number of people living at Kangy Angy.
2. There is a public road about to be constructed from the present site to Wyong Creek.
3. It would benefit a larger number of even the immediate settlers than the proposed alteration.

The arguments in favour of the alteration I am unable to imagine, and I have an intimate knowledge of the country. If it were deemed advisable we could easily secure an overwhelming majority of names in a petition on the matter, as, so far as I can understand, the agitation is confined to a very small number (comparative) who would each like a platform at their door.

Hoping that the original site will be adhered to, and apologising for troubling you,

I have, &c.,

CHAS. ALISON.

No. 48.

Office Memo.

Memo. for Mr. W. B. Smith *re* siding at either 60 m. $52\frac{1}{2}$ ch. or 61 miles 10 chains.

WHEN the Commissioners went north about November last (Mr. Kirkcaldie thinks), two men met them there, also a surveyor, and they suggested that a siding should be put down at 61 m. 10 ch.; now a lot of people are saying that the siding ought to be at 60 m. $52\frac{1}{2}$ ch.

Mr. Kirkcaldie wants Mr. Smith to go down there on Monday next, and try and find out the people who saw the Commissioners, also the surveyor.

When this has been done, make inquiries of all the people in the neighbourhood, so as to find out which would be the most convenient place for the siding.

Mr. Kirkcaldie wishes Mr. Smith to be very careful respecting this matter.

E.B., 10/5/90.

Memo.—Attached is a report *re* siding at 60 m. $52\frac{1}{2}$ ch., and at 61 m. 10 ch.—E. COOLE, 19/5/90.
C.T. Manager.

No. 49.

Mr. E. Coole to The Chief Traffic Manager.

Siding at either mileage 60 m. $52\frac{1}{2}$ ch. or 61 m. 10 ch.

Sir,

19 May, 1890.

I went to these mileages on Northern line on Wednesday, the 14th, but was unable to see many of the petitioners concerned, as they were away from their homes. However I arranged for a meeting the next day at 12.30.

As arranged, I attended at this time and met a number of the petitioners, and on referring to this matter I made them aware that I was not there to decide this question, but to gather information for your guidance.

I may mention that those present in favour of site 61 m. 10 ch., where the siding is laid in, gave their names as follows, and, as far as I could learn, that, with one exception; they are directly interested:—Thos. Smith, Thomas Collins, R. Douglas, Jno. Thompson, Wm. Chaseling, and Thos. Douglas.

Those present in favour of site 60 m. 52½ ch. were:—M. Smith, sen., Geo. Smith, Wm. Smith, Robt. Smith, Geo. Fowler, Joseph Lees, F. Sard, E. Mead, Wm. Kellon, D. Thompson, T. Stump, Thos. Hawkins, Michl. Smith, jun., and Robert, David, and James Goldie.

I elicited from those present that in November last the Commissioners' train stopped at 60 m. 52½ ch., and that they were interviewed by Messrs. T. Smith and Wm. Smith, residents of the locality, and by Mr. W. Smith (road surveyor for that district). Wm. Smith says that on that occasion the Chief Commissioner was then in possession of a petition asking for a siding at 60 m. 52½ ch., and that he did not hear any other site referred to at that time. T. Smith, the petitioner in favour of site 61 m. 10 ch., says that Mr. Smith (roads surveyor) produced plans when conversing with the Chief Commissioner, and pointed out to him that the next crossing at 61 m. 10 ch. was on the main road, and that he recommended that the siding be laid in at this site, as he considered it the most suitable for present and future traffic requirements.

I was unable to meet Mr. W. Smith (surveyor), his head-quarters being at Newcastle, and, as far as I could learn, he was not in the district; but it was well known by those present that he advocated site 61 m. 10 ch.

The arguments advanced in favour of site 60 m. 52½ ch. were:—That the bulk of the inhabitants of that locality reside adjacent to this site; that they originally petitioned for a siding at this site; that at the present time this site, 60 m. 52½ ch., is only accessible to a Government road leading from the main Maitland Road; that the siding at 61 m. 10 ch. was not accessible to them, and therefore they could not make use of it; that should the siding be removed to 60 m. 52½ ch., as originally petitioned for, they would commence to clear their selections, and thereby open up a timber traffic similar to that at Wyong, and for the first year or so their outward traffic would consist principally of timber, but to what extent they were not prepared to say.

Thos. Smith, the principal mover and supporter of site 61 m. 10 ch., and who was present at the interview of the Commissioners, is without doubt a *bonâ fide* producer of farm and dairy produce, and which industries are supplemented by the hewing of felloes for the Sydney market.

He, with other petitioners mentioned, is in favour of present site at 61 miles 10 chains, and they contend that the siding is laid in at the most suitable site, and at the main road crossing, and that the opening up of new and accessible roads to this siding must follow as a matter of course, and it is only a question of a short time, and that, as a matter of fact, a sum of money is already granted for the opening up of a new road 66 feet wide, extending from the Maitland Road to crossing at 61 miles 10 chains, thence to Tuggerah Lakes.

It is contended that this road will be available and accessible to all the inhabitants of the locality, and that the same will extend a further development of traffic, and which must of necessity take place in that direction. The petitioners admit that until new roads are opened out a siding at 60 miles 52½ chains might at the commencement have some slight advantage in the way of an outward traffic, but certainly not ultimately.

I have set before you, as far as I am able, the views of the petitioners, *pro* and *con*; at the same time I would say that it was a most difficult matter to get a fair expression of opinion from some of them owing to family connections and other influences.

It was represented by the petitioners in favour of site 60 miles 52½ chains that opposition petitions had been signed by persons not interested in the locality. As far as I could see this charge cut both ways. However, I may say that all those who were present in favour of site 61 miles 10 chains on 15th instant, with one exception, satisfied me that they were interested. The exception referred to is a man named Douglas, who admitted that he was not a landowner, but he said he had already submitted an application to the Railway Department to place a saw-mill on the platform, and if such was granted he would commence work as soon as the platform was finished.

As the question of accessible roads to a railway station is of great importance, I travelled over the road leading from crossing 60 miles 52½ chains for some distance with the petitioners for the purpose of seeing its condition, as it is referred to in petition dated 6th instant. This road is represented as being well-nigh impassable with a heavy-loaded team owing to its gradient. As to its grade and condition the petitioners have not overstated facts. This road on leaving the crossing at 60 miles 52½ chains rises abruptly, and on reaching the crown of the hill it is very rocky and uneven. Of course there is this to be said, the grade of this road is favourable to teamsters coming in the direction of the railway station. This road, I am told, connects with the Maitland Road at about 2 miles from Ourimbah Station.

Mr. Hodgson's report shows that the only road to 61 miles exists on paper only, and which is quite true at the present time. But on referring to the parish map you will see the indication of a road running from the Maitland Road to railway crossing 61 miles 10 chains—thence to Tuggerah Lakes. In regard to this road, when at Wyong Post Office on 15th instant, I saw specifications calling for tenders for clearing and its formation, and the conditions were that the work was to be completed within two months; and further, that the amount sanctioned for this work was £470. I presume this is the book referred to by Mr. Hodgson.

The question of opening up of the new roads in that locality refers, and is as of much importance, to a siding at 60 miles 52 chains as at 61 miles, and certain roads which now exist on paper only, and which I have indicated on attached rough sketch, must of necessity be opened up to make a siding at either side of any use to the residents and payable to the Railway Department, so that the question of roads refers equally to either sites. As to the further development of traffic, I shall again refer you to parish maps, and you will see that the land on the eastern side of the railway and adjacent to site 60 miles 52½ chains has already been selected to the water reserve, so that further expansion can take place in that direction; and it is contended by the petitioners in favour of site 61 miles 10 chains that future developments of selections and population must take place in a northerly direction, and more adjacent to the site just mentioned; and in support of this contention Mr. Rankin, agent to Mr. Allison, produced plans showing that a syndicate floated in England had purchased 1,500 acres of land off Mr. Allison, skirting the selections facing the new road, and that this acreage had been subdivided into 40 and 50 acre lots, and that a sale was to take place shortly. The petitioners in favour of site 60 miles 52½ chains, in answer to this, say that

that the land referred to is unsaleable, and unfit for anyone to settle upon it, as it is low and swampy, and therefore the increase of population is improbable. You will see by the parish map that the site of siding at 61 miles 10 chains will, on completion of new road, for which tenders are called, be the nearest point and the most direct route to the Tuggerah Lakes—a holiday resort for excursionists. The Wyong Station-master told me that at one time the Tuggerah Lakes were much frequented at holiday times, and it seems to me that it would be so again with increased rail facilities. With the aid of the attached rough sketch I may personally be able to make my views clear to you

E. COOLE.

Telegram from Mr. T. Hinchcliffe to The Secretary for Railways.

Gosford Station.
Work going on at platform 61, 10 Local residents very indignant; talk of bringing matters before Parliament.

THOMAS C. HINCHCLIFFE.

Orders distinctly given for this to be stopped temporarily. Who is going on with work?—H.M.L. Wired instructions last Thursday to stop work. Wired also and asked for explanation. 27/5/90.

Wire from E. M. Halligan to J. Angus, re siding at 61 miles 10 chains:—Work was stopped immediately on receipt of your wire, and nothing has been done to it since.

No. 51.

The Secretary for Railways to W. H. Vivian, Esq., M.L.A.

Sir,

13 June, 1890.

I am directed by the Chief Commissioner to inform you that the Chief Traffic Manager and Engineer for Existing Lines will visit the site of the proposed siding between Wyong and Ourimbah, and will be on the ground shortly after 11 o'clock on the 21st instant (Saturday).

I have, &c.,

H. M'LACHLAN,
Secretary.

No. 52.

The Secretary for Railways to R. Stevenson, Esq., M.L.A.

Dear Sir,

13 June, 1890.

With reference to your many calls relative to the proposed siding between Wyong and Ourimbah, I beg to inform you that Messrs. Kirkcaldie and Angus have arranged to visit the locality in question on Saturday, 21st instant, and will be on the ground shortly after 11 a.m.

Yours faithfully,

H. M'LACHLAN,
Secretary.

No. 53.

Memo. from The Secretary for Railways.

I beg to confirm the arrangement made to-day, that the Chief Traffic Manager and the Engineer for Existing Lines shall visit the site of the proposed siding between Wyong and Ourimbah, on Saturday, 21st instant, leaving Sydney at 9:30 a.m.

H.M.L., 13/6/90.

Chief Traffic Manager and J. Angus, Esq., to note. This matter will, I understand, be dealt with by the Commissioners. The papers were handed to Mr. Angus in the special train which left here for Newcastle at 1:30 p.m.—D. KIRKCALDIE, per W.H.C., 18/6/90.

No. 54.

Memo. by The Railway Commissioners.

Siding 61 miles 10 chains, or 60 miles 52½ chains.

THE Commissioners inspected this section of the line again, and found that the accommodation was being provided at the spot they agreed to when on the ground, and from the further inquiries made it would appear to be the right spot, looking at all the surrounding circumstances. Decided that the work be completed as early as possible.

E.M.G.E., W.M.F., C.O., 19/6/90.

No. 55.

The Secretary for Railways to R. Stevenson, Esq., M.P.

Sir,

19 June, 1890.

With reference to my note to you of the 13th instant, intimating that officers of the Department would visit the locality between Wyong and Ourimbah, in connection with the proposed alternative site for siding at 61 miles 10 chains, or 60 miles 52 chains, I am now directed to inform you that, taking the opportunity of passing through the locality on Tuesday, the Commissioners looked into the question, and carefully considered it in all its bearings, and it appears to them that the best position is that originally selected, and where the works are now in course of construction. There is, therefore, no necessity for the officers to visit the ground, as proposed, on Saturday next.

I have, &c.,

H. M'LACHLAN,

Secretary.

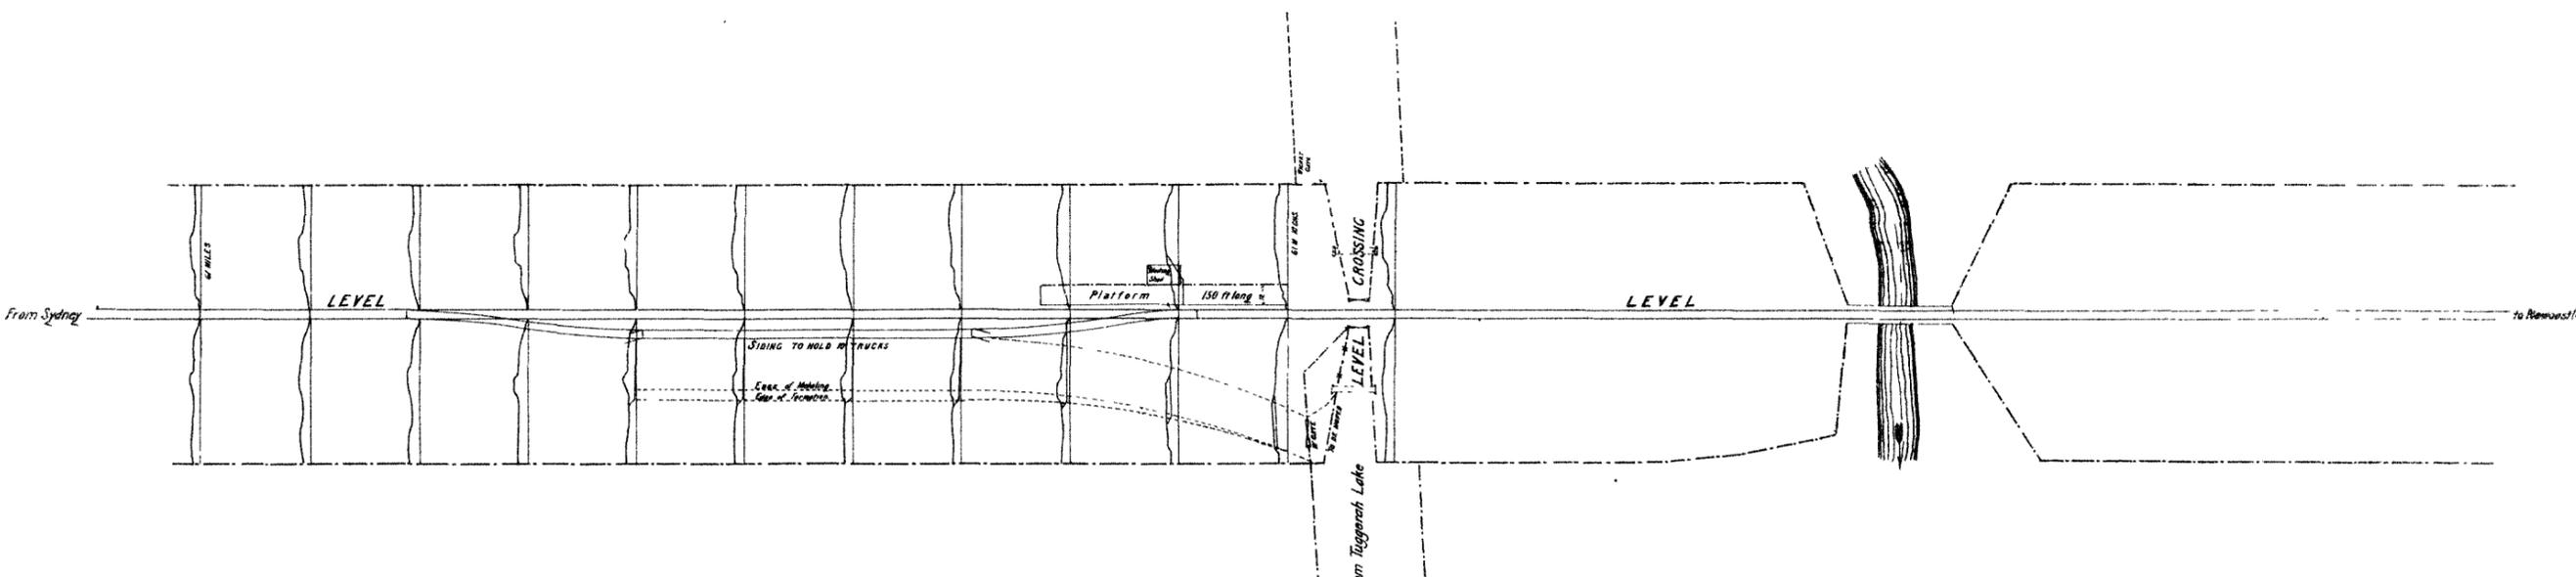

[Mr. Vivian, M.P., similarly informed.]

Acting Engineer for Existing Lines.—H. M'LACHLAN, per J. 19/3/90. Instructions have been issued.—J. ANGUS, Superintendent. 28/6/90.

RAILWAY EMPLOYEES PROVIDENT AND PENSION
FUND BILL.

(MESSAGE No. 40, RECOMMENDING.)

Ordered by the Legislative Assembly to be printed, 10 September, 1890.

CARRINGTON,

Message No. 40.

Governor.

In accordance with the provisions contained in the 54th clause of the Constitution Act, the Governor recommends for the consideration of the Legislative Assembly the expediency of making provision to meet the requisite expenses in connection with a Bill "To facilitate the establishment of a provident and pension fund for the relief and support in sickness, on retirement, and other contingencies of persons employed at weekly or daily wages on the New South Wales Government Railways and Tramways, and of their families; to authorize contributions by such persons and by the Railway Commissioners; to protect the interests of persons entitled to the benefits of the said fund; to regulate the administration of the fund; to make certain provisions affecting liabilities of and contributions to the Civil Service Superannuation Account; to allow contributions to the fund to stand instead of the life insurance required by the sixty-fourth section of the 'Government Railways Act of 1888'; to make further provision in connection with the said fund, and for other purposes."

RAILWAY FROM HORNSBY TO ST. LEONARDS.
(PETITION FROM RESIDENTS OF NORTH SHORE, &c, IN FAVOUR OF.)

Received by the Legislative Assembly, 6 May, 1890.

To the Honorable the Speaker and Members of the Legislative Assembly of New South Wales, in
Parliament assembled.

The humble Petition of the undersigned, residents and property owners of North Shore, North
Willoughby, Chatswood, North Sydney, Gordon, Hornsby, and Gosford,—

SHOWETH:—

(1.) That the extension of the North Shore Railway from its present terminus at Gore Hill to
Milson's Point having been referred to the Public Works Committee, was, notwithstanding that the
evidence was entirely in favour of such extension, not recommended by the Committee, for reasons
which, in the opinion of your Petitioners, are inadequate and invalid.

(2.) We therefore pray your Honorable House to take the premises into consideration, and affirm
the expediency of at once constructing the railway to Milson's Point.

And your Petitioners, as in duty bound, will ever pray.

[Here follow 2,118 signatures.]

1890.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

CLARENCE RAILWAY CONSTRUCTION AND
HARBOUR IMPROVEMENT.

(PETITION FROM RESIDENTS OF THE CLARENCE IN FAVOUR OF).

Received by the Legislative Assembly, 6 May, 1890.

To the Honorable Members of the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the Executive Committee of the Clarence Railway Construction and Harbour Improvement League, for and on behalf, and by direction of the Citizens of Grafton, and the people of the Clarence in Public Meeting assembled, on the 16th day of April, 1890, in the Theatre Royal, Grafton,—

HUMBLY SHOWETH:—

1. That your Petitioners in the month of November, 1888, presented their two several Petitions for the construction of Harbour Works at the Clarence River on the designs of Sir John Coode, and of lines of Railway from Grafton to The Tweed River, Grafton to Glen Innes, and Glen Innes to Inverell, and your Petitioners crave leave to refer to the said Petitions herewith.

2. That your Petitioners are impressed with a profound sense of the national importance and public expediency of the Harbour and Railway Works above referred to, and believe that the adverse recommendations of the Public Works Committee in respect thereof are due solely to their failure to grasp this view of the question.

3. That the Clarence is the principal sea-port on the north coast of this Colony which has not yet been developed up to her capabilities and deserts, and that the designs of Sir John Coode alone are adequate to doing so, and worthy to fit her for her rightful service.

4. That the proposal for the line of railway from Grafton to The Tweed River having been submitted to Parliament as the first instalment of a national coast line, inquiry should be made into the general merits of such a line before any isolated section of it is approved by your honorable House.

5. That your Petitioners, led by this reasoning, reiterate their desire for the execution of such works as national undertakings, and at the meeting abovementioned have unanimously adopted Resolutions in the following terms:—

(1st.) That this meeting protests against the recommendations of the Public Works Committee as regards the Clarence Harbour Works being only partially carried out, and would urge upon the Government the necessity of carrying out the works as designed by Sir John Coode in their entirety.

(2nd.) That this meeting also protests against the recommendations of the Public Works Committee that the Grafton-Tweed Railway should only be constructed from The Tweed to Lismore, and would urge upon the Government the necessity for constructing the whole line from Grafton to The Tweed as originally submitted by the Premier to Parliament as the first instalment of a north coast line.

Your Petitioners, therefore, humbly pray that your honorable House will take into your early and favourable consideration the execution of the aforementioned works, and afford such relief in respect of the same as to your wisdom may seem expedient in the general interests of the whole Colony.

And your Petitioners, as in duty bound, will ever pray.

[Here follow 14 signatures.]

1890.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAY FROM LISMORE TO THE TWEED.

(PETITION FROM MAYOR OF CASINO, URGING CONSTRUCTION OF.)

Received by the Legislative Assembly, 14 May, 1890.

To the Honorable the Speaker and the Honorable Members of the Legislative Assembly of the Colony of New South Wales.

The Petition of Members of the Railway League, Casino, Richmond River, in the Colony of New South Wales,—

HUMBLY SHOWETH:—

1. That the Public Works Committee having recommended the construction of a line of railway from Murwillumbah (Tweed River) to Lismore (Richmond River), your Petitioners would respectfully urge your Honorable House to adopt that recommendation, so as to enable the Government to provide for the immediate construction of the line in question and thus afford relief to thousands of settlers, who at the present time have no means of getting their produce conveyed to the principal markets of the Colony, except under crushing difficulties; and at the same time lead to the development of what is admittedly the richest Electorate—as regards agriculture, dairying, and pastoral pursuits—in the Colony, and one that is capable of sustaining a population of at least one million.

2. Your Petitioners would further urge the construction of the proposed railway from Murwillumbah to Lismore, in that it must inevitably prove to be the first section of a line that will connect these northern districts with the main Railway system of the Colony, at or near Tenterfield.

3. That your Petitioners feel this Electorate is justly and equitably entitled to the expenditure necessary for the construction of the proposed railway from Murwillumbah to Lismore, and ultimately to Tenterfield—apart altogether from the important factors that such a line will not only be a commercial success but also an undoubtedly national undertaking, especially in view of the almost assured early accomplishment of the federation proposals so wisely and ably promulgated by Sir Henry Parkes—in view of the fact that this northernmost portion of the Colony has not participated in the benefits directly and indirectly derived from the expenditure of over forty million pounds of loan votes, for which the residents in this Electorate have been and are paying a proportionate share of the interest payable on such loans.

4. Your Petitioners therefore pray that your Honorable House will take these premises into your earnest and favourable consideration; and with the view of assisting the residents of this Electorate, and promoting the welfare of the Colony, will so view the request of your Petitioners as to speedily grant the boon and relief they ask for.

And your Petitioners, as in duty bound, will ever pray.

Signed for and on behalf of the members of the Casino Railway League.

F. G. CROUCH,
Mayor, Chairman.

1890.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(PETITION FROM INHABITANTS OF CUDAL, PROTESTING AGAINST CONSTRUCTION OF—FROM
MOLONG TO PARKES AND FORBES.)

Received by the Legislative Assembly, 10 June, 1890.

To the Honorable the Legislative Assembly, in Parliament assembled.

The humble Petition of the undersigned, inhabitants of the farming settlements of Cudal and surrounding districts,—

RESPECTFULLY SHOWETH:—

That your Petitioners humbly yet most emphatically protest against the decision of the Parliamentary Standing Committee on Public Works *re* the Molong to Parkes and Forbes and the Borenore to Forbes Railway lines, as being contrary and opposed to the great bulk of evidence given thereon.

That your Petitioners view with surprise that the Borenore to Forbes line should have been dismissed from consideration by the Public Works Committee on account of the steep gradients thereon, whilst, according to the evidence given by Mr. Surveyor Kennedy at Molong before the Sectional Committee, there are no less than three portions of the line from Molong to Parkes with gradients quite as steep.

That your Petitioners would respectfully ask that a fresh survey be made on that portion of the line where the steep grade occurs, having no hesitation in saying that the gradient can be considerably reduced if a further survey were granted, such fresh surveys having already been carried out twice on the Molong to Parkes line for the same purpose.

That your Petitioners assert that a line from Borenore, *via* Cudal to Forbes, will pass through an agricultural district with a population of at least three to one over that of Molong to Parkes, which can be verified by reference to the Educational and Postal Departments, and is more centrally situated.

That your Petitioners further state that the line from Molong *via* Bocoble Gap to Parkes will not serve the district of Cudal, as the majority of the population are south of Cudal and of the Borenore-Forbes line, and that they would be at considerable loss if they had to cart their produce to the Parkes line, a distance in many instances of over 18 miles, the nearest point on the Parkes line from Cudal being not less than 8 miles by any charted road, besides having to pay for 26 miles haulage from there to Borenore, whereas the distance from Cudal to Borenore by road is only about 18 miles.

Your Petitioners also state that they have every reason to believe, from the nature of the country, that if a survey were made from Eugowra to Parkes it would be found that a line could be constructed from Borenore *via* Eugowra to Forbes, and from Eugowra to Parkes, at about the same cost as a line from Molong to Parkes and Forbes, and would thus give Forbes, Parkes, Eugowra, Murga, Toogong, Cargo, and a large district south of Cudal, railway communication with the Sydney market.

Your Petitioners would further point out to your Honorable House that the line from Borenore *via* Cudal to Forbes having been passed by three successive Parliaments with very large majorities, and the report of the Railway Commissioners showing that the construction of the Molong to Parkes and Forbes line would involve a loss to the Colony of £15,000 per year, your Petitioners are of the opinion that the Borenore to Forbes line should be constructed in preference to the Molong-Parkes Line.

Your humble Petitioners, considering the vital importance of obtaining direct railway communication with the metropolis, and being convinced that the Borenore to Forbes line will prove one of the best paying lines in the Colony, a fact of which your Honorable House "has long been convinced," now solicit your Honorable House to take such steps as will secure the adoption of that line.

And your humble Petitioners, as in duty bound, will ever pray.

[*Here follow 218 signatures.*]

1890.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(PETITION FROM CERTAIN RESIDENTS OF FORBES AGAINST CONSTRUCTION OF—FROM MOLONG TO PARKES AND FORBES.)

Received by the Legislative Assembly, 18 June, 1890.

To the Honorable Mr. Speaker and Members of the Legislative Assembly of New South Wales, in Parliament assembled.

May it please your Honorable House,—

The Petition of the residents of Forbes and surrounding districts,—

RESPECTFULLY SHOWETH:—

That at a public meeting held in the town of Forbes, New South Wales, on the twenty-eighth day of May last, and which meeting was duly convened by the Mayor of Forbes in response to a numerously signed requisition, the following resolutions were duly proposed and carried:—

- “1. That the report of the Sectional Committee, wherein they state that they have made careful and minute investigations concerning not only the proposed line (Molong to Parkes and Forbes), but also of the rival routes, Borenore to Forbes and Cowra to Forbes, is incorrect, inasmuch as a distance of 40 miles of the last-named route was not traversed by any Member of such Committee.”
- “2. That the recommendation of the Committee, as embodied in the final paragraph of their report, is contrary to evidence.”
- “3. That this meeting is of opinion that before the sanction of Parliament is obtained for the purpose of carrying out the Government proposal, petitions should be at once sent in from the residents of Cowra, Goolagong, Canowindra, Nyrang Creek, Eugowra, Forbes, Condobolin, and the residents on the Lachlan River generally, praying Parliament to withhold its sanction to any proposed line of railway to Forbes until a full and complete report has been obtained respecting railway extension from Cowra or Woodstock to Forbes.”

Your Petitioners, in support of the last-named resolution, respectfully beg to draw the attention of your Honorable House to the particulars of a debate which took place in the Legislative Council on the eighth day of October, one thousand eight hundred and eighty-six (*vide Hansard*), when the Honorable W. H. Suttor moved an amendment on the Government proposal to construct a railway from Borenore to Forbes, substituting a line from Mandurama or Lyndhurst or Wood's Flat to Forbes in lieu thereof, and which resulted in the original motion being lost, the Honorable John Lackey and the Honorable G. H. Cox both speaking in support of Mr. Suttor's amendment.

Your Petitioners respectfully submit that the arguments against the construction of a line of railway from Borenore to Forbes are equally applicable, and even in a greater degree to any extension from Molong to Forbes, and that a line from one of the points named on the Murrumburrah-Blayney line to Forbes would result as follows:—

- (a) A large number of people settled on the land would be benefited by its construction; (b) it would pass through first-class agricultural and well watered land the whole of the way; (c) it would be shorter and cheaper to construct than any other line; (d) the question of elevation and gradients is all in favour of the line traversing the Lachlan Valley as against any other.

On these grounds your Petitioners pray that you will give the third resolution embodied herein your most favourable consideration; and, as in duty bound, they will ever pray.

[*Here follow 277 signatures.*]

Similar Petition from certain residents of Eugowra received 18th June; 290 signatures.

1890.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(PETITION FROM CERTAIN RESIDENTS OF CANOWINDRA DISTRICT AGAINST CONSTRUCTION OF
MOLONG TO PARKES AND FORBES.)

Received by the Legislative Assembly, 10 June, 1890.

To the Honourable the Members of the Legislative Assembly of New South Wales.

The Petition of the undersigned residents of Canowindra District,—

HUMBLY SHOWETH,—

That your Petitioners respectfully protest against the proposed construction of the Molong to Parkes and Forbes Line of Railway, for the following reasons, viz.:—

Firstly: That the merits of the Cowra to Forbes route had not been sufficiently inquired into.

Secondly: That the Cowra to Forbes route, as proved officially, can be constructed for £200,000 less than the Molong route.

Thirdly: That this saving of £200,000, with an extra £60,000, would construct a railway from Forbes to Parkes, a distance of 20 miles, at £1,000 per mile, also a line from Forbes to Condobolin, a distance of 60 miles, at £3,000 per mile, when these three important towns would have railway communication.

Fourthly: That the Cowra route is shorter than the Molong route by several miles.

Fifthly: That by adopting the Cowra route in preference to the Molong-Parkes route, a distance of 70 miles would be saved by persons wishing to take advantage of the Southern Market.

Sixthly: That the difference in elevation between Cowra and Forbes is 200 feet, whereas the difference in elevation between Molong and Forbes is 1,800 feet.

Seventhly: That the Cowra-Forbes route had not been personally inspected by the Sectional Committee.

Eighthly: That the inhabitants of Condobolin, Forbes, Eugowra, Canowindra, Goolagong, Cargo, and Cowra, are opposed to the adoption of the Molong route.

Ninthly: That the valley of the Lachlan is the true grand line of railway that should be constructed from a national standpoint, being the great highway of traffic, having the greatest population, and must therefore benefit the greatest number of people.

We pray that your Honorable House will take into careful consideration our earnest protest.

And your Petitioners, as in duty bound, will ever pray, &c., &c.

[Here follow 41 signatures.]

1890.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

KIAMA TO NOWRA RAILWAY.

(PETITION FROM CERTAIN RESIDENTS OF NOWRA IN OPPOSITION TO.)

Received by the Legislative Assembly, 2 July, 1890.

To the Honorable the Speaker and Members of the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the undersigned Residents and Freeholders of Nowra, in the Electorate of Shoalhaven and its vicinity,—

HUMBLY SHOWETH :—

1. That your Petitioners and others, through their representatives in past Parliaments, requisitioned the Government to extend the South Coast Railway Line to Nowra.

2. That a trial survey was made by the Railway Department, and an estimate of cost made.

3. That on the day of 1883, your Honorable House voted £804,000, to construct a line of Railway from Kiama to Jervis Bay.

4. That on the 27th July, 1886, your Honorable House approved of the plans, sections, and books of reference of section 1 of the said then proposed line, and that the same was on the 11th day of August of the same year, laid on the table of the Legislative Council, which did not come to a vote on it in consequence of the dissolution of Parliament, and that the plans, sections, &c., of No. 2 section of the said line, including the town of Nowra, were laid upon the table of your Honorable House on the day of , 1886, and was not come to a vote upon in consequence presumably of the immediately subsequent dissolution of Parliament.

5. That the line designated "Kiama to Nowra," as introduced in 1889 by the Hon. Sir Henry Parkes, G.C.M.G., Premier, amongst the Government proposals included the town of Nowra.

6. That the proposed line was, subsequently, in accordance with section 13 of the Public Works Act, submitted to the Railway Commissioners for report, the estimated cost then being £538,663, including £100,000 for crossing the Shoalhaven River to Nowra.

7. That the Commissioners for Railways, viewing as large the excessive estimate of £100,000 for a bridge, recommended the omission of the said sum.

8. That in evidence on oath before the Parliamentary Standing Committee on Public Works (*vide* Report of Parliamentary Standing Committee of Public Works, page 4, questions 117 and 118) Henry Dean, Esq., Engineer-in-Chief for Railways, states that the line can be constructed into Nowra for £441,663, or £97,000 less than the estimate upon which the Railway Commissioners recommended the omission of Nowra from the line.

9. That the Sectional Committee of the Parliamentary Standing Committee on Public Works visited the district, made an extensive inquiry, and *inter alia* states in their report: "Your Committee also urge the necessity for taking the line into the town of Nowra, in order to secure the maximum amount of traffic. The speedy erection of a railway bridge would render unnecessary the proposed branch line from Bomaderry to the existing bridge over the Shoalhaven River."

10. That the line, as at present proposed to your Honorable House, is not a line "to Nowra," as designated, but a line to a point by the nearest practicable highway 141 chains from Nowra, on the Berry Estate, which the line enters 7 miles south of Kiama, and traverses the said estate alone for 15 miles, to the proposed terminus at a settlement called Bomaderry, on the said Berry Estate.

11. That, as the terminus with the expensive station buildings, &c., may remain at Bomaderry for an indefinite number of years, the effect will be detrimental to the interests of Nowra and the district south of the Shoalhaven River, and injurious to the monetary prospects of the line, inasmuch as the public steamer wharf is much nearer Nowra, and much more convenient to the residents of the said district for goods traffic than will be the proposed terminus.

12. That Nowra and the district immediately south of the Shoalhaven River of which it is the centre still contains much Crown Lands, is capable of considerable expansion and development as a centre for fruit-growing and other purposes; and that the effect of terminating the line at Bomaderry for any time will be to inflate the value of private land at the public expense, whilst the public estate south of it will be reduced in value.

In view of the foregoing facts,—

Your Petitioners humbly pray that your Honorable House may be pleased to cause such amendment to be made in the Bill for the railway designated "Kiama to Nowra" as shall avert the consequences foreshadowed by your Petitioners.

And your Petitioners, as in duty bound, will ever pray, &c.

[*Here follow 98 signatures.*]

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAY TO WALGETT.

(PETITION FROM PROGRESS COMMITTEE OF WALGETT, URGING THE CONSTRUCTION OF A LINE OF.)

Ordered by the Legislative Assembly to be printed, 26 August, 1890.

To the Honorable the Legislative Assembly of New South Wales in Parliament assembled.

The Petition of the undersigned members of the Progress Committee, of Walgett and surrounding districts acting for and on behalf of the residents thereof,

HUMBLY SHOWETH:—

That, at a public meeting of the residents of Walgett and the surrounding districts, held at the Walgett School of Arts on Wednesday evening, 2nd July, it was unanimously resolved:—

1. That, in the opinion of this meeting, it is most desirable that Walgett should have railway connection as early as possible.

2. That the resolution be most respectfully conveyed by Petition to your Honorable House by the local Progress Committee on behalf of the residents aforesaid.

3. That, in view of the importance and urgency of the matter and of the previous agitations in this behalf, and the constant promises of the different Governments in support of the very strong claims of the district of such extension, the matter be represented to the Government by Petition.

And your petitioners most respectfully pray that, after taking the premises into your most favourable consideration, you will be pleased to sanction the construction of a line of railway to Walgett as early as possible.

And your petitioners as in duty bound will ever pray, &c., &c.

[*Here follow 17 signatures.*]

1890.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(PETITION FROM CERTAIN SERVANTS, PRAYING THAT THE SERVICES OF EMPLOYEES, KNOWN AS
EXTRA HANDS, MIGHT BE RETAINED.)

Received by the Legislative Assembly, 18 September, 1890.

To the Honorable the Speaker and the Honorable Members of the Legislative Assembly of New South
Wales, in Parliament assembled.

The humble Petition of the undersigned,—

RESPECTFULLY SHOWETH:—

1. That your Petitioners are servants of the Railway Department of New South Wales.
2. That about the middle of July last nearly 600 of the Railway employees, known as extra hands, received a fortnight's notice that their services would be dispensed with.
3. That, although the carrying out of the notice has not yet taken effect, that your Petitioners verily believe that the same is to be carried out at the end of this present month of September.
4. That your Petitioners verily believe that there is much danger to public safety in giving the work which has previously been done by the men now under notice and other similar men over to public contract.
5. That your Petitioners verily believe that no saving can be effected in the cost of such works as carried out at present by such contracts as are proposed, except at the imminent and permanent risk of the travelling public.
6. Your Petitioners respectfully point out that many of the men under notice as hereinbefore described are old and faithful servants of the Railway Department, some having been in the service for periods varying from ten to twenty years. Some of them have also received special thanks from His Excellency the Governor of New South Wales for special services in preventing accident, &c.
7. Your Petitioners respectfully point out that a large number of entirely new hands have been permanently appointed to the Railway Service, while these old and faithful servants as aforesaid have been continually passed over, and that, consequently, their discharge is now a grievance and an injustice to them.

Wherefore, your Petitioners pray your Honorable House to make such inquiry as you may deem fitting into the premises, and thereafter to grant your Petitioners such relief as your Honorable House may deem befitting.

And your Petitioners, as in duty bound, will ever pray, &c.

[Here follow 442 signatures.]

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAY FROM NEW ENGLAND TO THE COAST.

(PETITION FROM CERTAIN RESIDENTS OF THE TABLELAND OF NEW ENGLAND AND DISTRICT WEST OF INVERELL).

Received by the Legislative Assembly, 13 November, 1890.

To the Honorable the Speaker and Members of the Legislative Assembly now assembled.

The Petition of the undersigned residents of the Tableland of New England and district west of Inverell,—

HUMBLY SHOWETH:—

That in the interests of the northern districts and the Colony generally a line of railway should be constructed at once from New England to the coast.

That the proposed line from Grafton to Guyra has been favourably reported upon by Messrs. Scarr and Price.

That from the facts contained in their reports has been shown the central position of Guyra station is half-way between Sydney and Brisbane. The nature of the country through which such a line would pass, and the cost of construction being estimated at £88,539, exclusive of the bridge, less than the cost of constructing a line from Glen Innes to Inverell, although the length of line from Guyra to Inverell is longer, and the probability of the line from the coast being connected with the Great Northern Railway at Guyra.

That the proposed line of railway to Inverell should have its starting point at Guyra, which would bring Inverell within easier distance of Sydney and the coast, and avoid the heavy traction ascending and descending Ben Lomond and Waterloo if the line were constructed from Glen Innes.

That in view of all these facts, and that the proposed lines, while being the most economical as regards cost of construction and maintenance, would also better serve the requirements of the northern districts than any other lines suggested, and encourage the settlement of population upon land that is capable of sustaining it, and benefit the Colony generally. Your Petitioners humbly pray that the proposed railway lines from Inverell to Guyra and Guyra to Grafton be referred to the Committee for Public Works for report and consideration at the same time as the Glen Innes and Inverell line is considered.

And your Petitioners will ever pray.

[Here follow 177 signatures.]

1890.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAY ROUTE FROM GUYRA TO INVERELL.

(PETITION FROM CERTAIN RESIDENTS OF OLLERA, WANDSWORTH, AND TENTERDEN, &c.)

Received by the Legislative Assembly, 2 December, 1890.

To the Honorable the Speaker and Members of the Legislative Assembly of New South Wales, in
Parliament assembled.

The humble Petition of the undersigned residents of Ollera, Wandsworth, Tenterden, and their
surroundings,—

RESPECTFULLY SHOWETH:—

That the railway route from Guyra to Inverell is the most desirable one, and, on its construction, the greater number will be benefited thereby, and will prove remunerative to the Colony at large.

Although your humble servants fairly agree with Messrs. Scarr and Price in their report of this route, yet we mention that the above-named gentlemen overlooked the commodity of timber, there being abundance of the finest quality and in close proximity to the line.

Your humble petitioners would draw your honorable attention to the ample supply of stone for ballast, as well as the suitable earth for bricks which already has been tested by buildings having been erected thereof.

We therefore pray that this route will be submitted for consideration to the Works Committee.

With the foregoing, and many other advantages, your petitioners most respectfully pray, that is your wisdom, your Honorable House will take such steps as will cause the speedy construction of this route.

And your petitioners, as in duty bound, will ever pray.

[Here follow 99 signatures.]

NEW SOUTH WALES.

PUBLIC WORKS ACT OF 1888.

(RESUMPTION OF LAND AT COMO FOR ADDITIONAL SIDING ACCOMMODATION.)

Presented to Parliament, pursuant to Act 44 Vic. No. 16.

NOTIFICATION OF RESUMPTION OF LAND UNDER
THE "PUBLIC WORKS ACT OF 1888."

NEW SOUTH WALES, } Proclamation by His Excellency The
to wit. } Right Honourable CHARLES ROBERT,
BARON CARRINGTON, a Member of Her
Majesty's Most Honourable Privy
Council, Knight Grand Cross of the
(L.S.) Most Distinguished Order of Saint
CARRINGTON, Michael and Saint George, Governor and
Governor. Commander-in-Chief of the Colony of
New South Wales and its Dependencies.

WHEREAS the Railway Commissioners of New South Wales are desirous of acquiring the land described at the foot hereof, which is adjacent to other land belonging to the said Railway Commissioners, for the purpose of erecting additional siding and other railway works and conveniences thereon, and it is estimated that the cost of carrying out the said works will not exceed the sum of two thousand pounds: And whereas under the provisions of the "Public Works Act of 1888," I, the Governor aforesaid, with the advice of the Executive Council, have in due form directed that the said work shall be carried out under the provisions of the said Act by the Railway Commissioners, who in respect of the said work I have declared, shall be deemed to be the constructing authority; and also, that the land required for carrying out the said works shall be acquired under the "Public Works Act of 1888": And whereas the land described at the foot hereof, is the land required for carrying out the said work: Now, therefore, I, CHARLES ROBERT, BARON CARRINGTON, the Governor aforesaid, with the advice of the Executive Council of the said Colony, in pursuance of the powers on this behalf given to or vested in me by the "Public Works Act of 1888," do, by this notification published in the Gazette and in a newspaper, that is to say, in the "Daily Telegraph" circulated in the Police District wherein the said land is situated, declare that the land hereinafter described, has been resumed for the purpose hereinafter mentioned, that is to say, for the purpose of constructing and erecting thereon additional siding and other railway works and conveniences, to the intent that upon the publication of this notification in the Gazette, the land hereinafter described, shall forthwith be vested in the Railway Commissioners, as the constructing authority on behalf of Her

Majesty for the purposes of the said Act, for an estate in fee simple, in possession, freed and discharged from all trusts, obligations, estates, interests, contracts, charges, rates, rights-of-way, or other easements whatsoever; and to the intent, that the legal estate therein, together with all powers incident thereto or conferred by the said Act, shall be vested in the said Railway Commissioners as such constructing authority as a trustee: And I declare that the following is the description of the land hereinbefore referred to, that is to say:—

All that piece or parcel of land situate in the parish of Sutherland, county of Cumberland and colony of New South Wales, being part of the Holt Sutherland Estate: Commencing at the junction of the north-eastern boundary of the railway from Sydney to Wollongong and Kiama with the south-eastern boundary of Railway Road; and bounded thence by the said boundary of Railway Road bearing north 51 degrees 24 minutes east 80 links; thence by a line bearing south 38 degrees 33 minutes east 3 chains $\frac{1}{2}$ link; thence by a line bearing south 61 degrees 4 minutes east 2 chains 31 $\frac{1}{2}$ links; thence by a line bearing north 56 degrees 2 minutes east 1 chain 25 $\frac{1}{2}$ links; thence by the south-western boundary of the Novara Parade bearing south 32 degrees 15 minutes east 1 chain 17 $\frac{1}{10}$ links, south 28 degrees 45 minutes east 1 chain 17 $\frac{1}{10}$ links, and south 25 degrees 30 minutes east 1 chain 17 $\frac{1}{10}$ links; thence by a line bearing south 66 degrees 6 minutes west 2 chains 99 links; thence by the eastern boundary of the aforesaid railway bearing north 25 degrees 27 minutes west 1 chain, north 29 degrees 20 minutes west 1 chain, north 32 degrees 17 minutes west 1 chain, north 35 degrees 44 minutes west 1 chain, north 38 degrees 21 minutes west 1 chain, and north 38 degrees 33 minutes west 3 chains $\frac{1}{2}$ link, to the point of commencement,—containing 1 acre 1 rood 35 $\frac{1}{2}$ perches, and said to be in the possession of the trustees of the late Thomas Holt.

Given under my Hand and the Seal of the said Colony, at Government House, Sydney, this nineteenth day of May, in the year of our Lord one thousand eight hundred and ninety, and in the fifty-third year of Her Majesty's Reign.

By His Excellency's Command,

W. MEMLIAN.

GOD SAVE THE QUEEN!

1890.

NEW SOUTH WALES.

PUBLIC WORKS ACT OF 1888.

(RESUMPTION OF LAND FOR WIDENING THE LINE OF RAILWAY FROM SYDNEY TO EVELEIGH,
PARISH OF ST. LAWRENCE.)

Presented to Parliament pursuant to Act 51 Vic. No. 37.

NEW SOUTH WALES, } Proclamation by His Excellency The
to wit. } Right Honourable CHARLES ROBERT,
BARON CARRINGTON, a Member of Her
Majesty's Most Honourable Privy
(L.S.) Council, Knight Grand Cross of the
CARRINGTON, Most Distinguished Order of Saint
Governor. Michael and Saint George, Governor and
Commander-in-Chief of the Colony of
New South Wales and its Dependencies.

WHEREAS it is expedient that the public work hereinafter mentioned shall be constructed, that is to say, the Widening of the Line of Railway from Sydney to Eveleigh and the erecting on the land required to be taken therefor of additional railway works and conveniences, the estimated cost of which public work will not exceed twenty thousand pounds: And whereas it is expedient that the said public work shall be carried out under the provisions of the "Public Works Act of 1888": Now, therefore, I, the Governor aforesaid, with the advice of the Executive Council of the said Colony, and under and by virtue of the powers and authority vested in me by the said Act, hereby direct that the said public work shall be carried out under the provisions of the said Act, and that the carrying out of the same shall devolve upon the Railway Commissioners, who shall in that behalf be deemed the Constructing Authority: And I hereby further direct that the land described in the Schedule hereto, being in my opinion required for the purpose

of the aforesaid public work, shall be acquired for the aforesaid purpose, under the provisions contained in Part III of the said Act.

SCHEDULE.

All that piece or parcel of land situate in the city of Sydney, parish of St. Laurence, county of Cumberland, and Colony of New South Wales: Commencing at a point bearing north 15 degrees 31 minutes east 186 feet 6½ inches from the intersection of the eastern building line of Regent-street with the northern building line of Clerland-street; and bounded on the west by a line bearing north 24 degrees 6 minutes east 121 feet; thence on the north by a line bearing north 89 degrees 45 minutes east 17 feet; thence on the east by a line bearing south 28 degrees 20 minutes west 128 feet 4 inches; and thence on the south by a line bearing north 65 degrees 54 minutes west 6 feet, to the point of commencement,—containing 4½ perches, and said to be in the possession of the Trustees of St. Paul's Church of England, Redfern.

Given under my Hand and Seal of the said Colony, at Government House, Sydney, this thirteenth day of September, in the year of our Lord one thousand eight hundred and ninety, and in the fifty-fourth year of Her Majesty's Reign.

By His Excellency's Command,

W. McMILLAN.

GOD SAVE THE QUEEN!

1890.

NEW SOUTH WALES.

PUBLIC WORKS ACT OF 1888.

(RESUMPTION OF LAND AT NEWTOWN IN CONNECTION WITH THE ERECTION OF ADDITIONAL RAILWAY WORKS)

Presented to Parliament pursuant to Act 51 Vic. No. 37.

NOTIFICATION OF RESUMPTION OF LAND UNDER THE "PUBLIC WORKS ACT OF 1888."

NEW SOUTH WALES, } Proclamation by His Excellency The
to wit. } Right Honourable CHARLES ROBERT,
BARON CARRINGTON, a Member of Her
Majesty's Most Honourable Privy
(L.S.) Council, Knight Grand Cross of the
CARRINGTON, Most Distinguished Order of Saint
Governor. Michael and Saint George, Governor and
Commander-in-Chief of the Colony of
New South Wales and its Dependencies.

WHEREAS it is expedient that the public work hereinafter mentioned shall be constructed, that is to say, for the purpose of erecting thereon additional railway works and conveniences, the estimated cost of which will not exceed twenty thousand pounds: And that the said public work shall be carried out under the provisions of the "Public Works Act of 1888": Now, therefore, I, the Governor, aforesaid, with the advice of the Executive Council of the said Colony, and under and by virtue of the powers and authority vested in me by the said Act, hereby direct that the said public work shall be carried out under the provisions of the said Act, and that the carrying out of the same shall devolve upon the Railway Commissioners of the said Colony, who shall in that behalf be deemed the Constructing Authority; and I hereby further direct

that the land described in the Schedule hereto, being in my opinion required for the purpose of the aforesaid public work, shall be acquired for the said purpose under the provisions of the said Act:—

SCHEDULE.

All that piece or parcel of land situate at Newtown, in the parish of Petersham, county of Cumberland, and Colony of New South Wales: Commencing at the junction of the eastern boundary of the Newtown Road with the southern boundary of the Great Southern Railway; and bounded thence by the said boundary of railway bearing north-easterly 2 chains 63 links; thence by part of the western boundary of the Mervale Estate bearing southerly 1 chain 94 links; thence by the northern boundary of the Newtown Markets bearing westerly 2 chains 70 links; thence by the aforesaid eastern boundary of the Newtown Road bearing northerly 95 links, to the point of commencement, and said to belong to the representatives of the late J. Donohoe.

Given under my Hand and Seal of the said Colony, at Government House, Sydney, this ninth day of September, in the year of our Lord one thousand eight hundred and ninety, and in the fifty-fourth year of Her Majesty's Reign.

By His Excellency's Command,

W. McMILLAN.

GOD SAVE THE QUEEN!

1890.

NEW SOUTH WALES.

PUBLIC WORKS ACT OF 1888.

(RESUMPTION OF LAND FOR TRAMWAY EXTENSION FROM LEICHHARDT TO FIVE DOCK.)

Presented to Parliament, pursuant to Act 51 Vic. No. 37.

NOTIFICATION OF RESUMPTION OF LAND UNDER
THE "PUBLIC WORKS ACT OF 1888."

NEW SOUTH WALES, } Proclamation by His Excellency The
to wit. } Right Honourable CHARLES ROBERT,
BARON CARRINGTON, a Member of Her
Majesty's Most Honourable Privy
Council, Knight Grand Cross of the
(L.S.) Most Distinguished Order of Saint
CARRINGTON, Michael and Saint George, Governor and
Governor. Commander-in-Chief of the Colony of
New South Wales and its Dependencies.

WHEREAS the Minister for Public Works of the Colony of New South Wales is desirous of acquiring the land described in the Schedule at the foot hereof for the purpose of erecting additional siding and other tramway works and conveniences thereon, and it is estimated that the cost of carrying out the said works will not exceed the sum of twenty thousand pounds: And whereas the land described in the said Schedule is the land required for carrying out the said works: Now, therefore, I, CHARLES ROBERT, BARON CARRINGTON, the Governor aforesaid, with the advice of the Executive Council, in pursuance of the provisions of the "Public Works Act of 1888," do hereby direct that the said works shall be carried out under the "Public Works Act of 1888," by the Minister for Public Works aforesaid, who, in respect of the said works, I hereby declare shall be deemed to be the Constructing Authority; and in further pursuance of the provisions of the said Act, I do hereby direct that the land described in the Schedule at the foot hereof may be acquired for the purpose of erecting thereon the

said additional siding and other tramway works and conveniences under the provisions contained in Part III of the said Act: And I hereby declare that the following is the description of the land hereinbefore referred to:—

SCHEDULE.

All that piece or parcel of land situate in the parish of Petersham, county of Cumberland, and Colony of New South Wales, being part of the land comprised in certificate of title vol. 804, folio 157: Commencing at the intersection of the south-western side of Norton-street with the southern side of Marion-street; and bounded thence by the said boundary of Marion-street bearing 256 degrees 34 minutes 95 feet and $\frac{1}{2}$ inch; thence by the north-eastern boundary of a right-of-way bearing 164 degrees 49 minutes 25 feet 4 inches; thence by a line bearing 75 degrees 9 minutes 95 feet; thence by the south-western side of Norton-street aforesaid bearing 344 degrees 54 minutes 22 feet 7 inches, to the point of commencement, containing 83 perches, numbered A over 1 on plan and book of reference, and said to be in the possession of Agnes Findlay.

In witness whereof, I have hereunto set my Hand, and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this sixth day of August, in the year of our Lord one thousand eight hundred and ninety, and in the fifty-fourth year of Her Majesty's Reign.

By His Excellency's Command,

BRUCE SMITH.

GOD SAVE THE QUEEN!

1890.

NEW SOUTH WALES.

PUBLIC WORKS ACT OF 1888.

(RESUMPTION OF LAND IN CONNECTION WITH THE EXTENSION OF THE TRAMWAY FROM CASTLEREAGH-STREET TO THE RANDWICK ROAD, PARISH OF ALEXANDRIA.)

Presented to Parliament, pursuant to Act 51 Vic. No. 37.

NOTIFICATION OF RESUMPTION OF LAND UNDER
THE "PUBLIC WORKS ACT OF 1888."

NEW SOUTH WALES, } Proclamation by His Excellency The
to wit. } Right Honourable CHARLES ROBERT,
BARON CARRINGTON, a Member of Her
Majesty's Most Honourable Privy
(L.S.) Council, Knight Grand Cross of the
CARRINGTON, Most Distinguished Order of Saint
Governor. Michael and Saint George, Governor and
Commander-in-Chief of the Colony of
New South Wales and its Dependencies.

WHEREAS it is expedient that the Public Work herein-after mentioned shall be constructed, that is to say, an extension of the Tramway from a point on the Botany tramway line, in Castlereagh-street, bearing northerly and distant 116 feet from the centre of Cleveland-street; thence along Cleveland-street to the Randwick Road; and thence along Moore Park to a point near the Association Ground, the estimated cost of which will not exceed £20,000, and that the said public work shall be carried out under the provisions of the "Public Works Act of 1888:" Now, therefore, I, the Governor aforesaid, with the advice of the Executive Council of the said Colony, and under and by virtue of the powers and authority vested in me by the said Act, hereby direct that the said public work shall be carried out under the provisions of the said Act, and that the carrying out of the same shall devolve upon the Minister for Public Works, who shall in that behalf be deemed the Con-

structing Authority; and I hereby further direct that the land described in the Schedule hereto, being in my opinion required for the purpose of the aforesaid public work, shall be acquired for the said purpose under the provisions of the said Act.

SCHEDULE.

All that piece or parcel of land situate in the parish of Alexandria, county of Cumberland, and Colony of New South Wales: Commencing at the junction of the northern boundary of Cleveland-street with the eastern boundary of Castlereagh-street; and bounded thence on the west by Castlereagh-street bearing northerly 45 feet; on the north by a line parallel with Cleveland-street bearing easterly 95 feet; on the east by the western boundary of Pembroke-street bearing southerly 45 feet; and on the south by the aforesaid northern boundary of Cleveland-street bearing westerly 95 feet, to the point of commencement,—containing 15½ perches, and said to be in the possession of Mrs. Watkin and occupation of Henry Lloyd.

Given under my Hand and the Seal of the said Colony, at Government House, Sydney, this twenty-seventh day of August, in the year of our Lord one thousand eight hundred and ninety, and in the fifty-fourth year of Her Majesty's Reign.

By His Excellency's Command,

BRUCE SMITH.

GOD SAVE THE QUEEN!

1890.

NEW SOUTH WALES.

PUBLIC WORKS ACT OF 1888.

(RESUMPTION OF LAND FOR CONSTRUCTION OF A LINE OF TRAMWAY FROM ASHFIELD RAILWAY STATION TO PORTLAND PLACE)

Presented to Parliament pursuant to Act 51 Vic. No. 37.

NEW SOUTH WALES, } Proclamation by His Excellency The
to wit. } Right Honourable CHARLES ROBERT,
BAYON CARRINGTON, a Member of Her
(L.S.) Majesty's Most Honourable Privy
CARRINGTON, } Council, Knight Grand Cross of the
Most Distinguished Order of Saint
Governor. } Michael and Saint George, Governor and
Commander-in-Chief of the Colony of
New South Wales and its Dependencies.

bearing north-westerly 3 chains 68 links and 1 chain 4 links ;
thence by the eastern boundary of the Burwood Road bearing
northerly 1 chain 2 links ; thence by a line bearing south-
easterly 4 chains 68 links ; thence by a curved line bearing
generally easterly 1 chain 70 links ; thence by the north-western
boundary of the George's River Road bearing south-westerly
1 chain 60 links, to the point of commencement,—containing 1
rood and 28 perches, numbered 5 on plan and book of reference,
and said to be in the possession of W. H. Wilkinson, and
occupation of John Jones.

WHEREAS it is expedient that the public work hereinafter
mentioned shall be constructed, that is to say, a Line of
Tramway from Ashfield Railway Station to Portland Place,
the estimated cost of which public work will not exceed
twenty thousand pounds : And whereas it is expedient that
the said public work shall be carried out under the provisions
of the "Public Works Act of 1888" : Now, therefore, I, the
Governor aforesaid, with the advice of the Executive Council
of the said Colony, and under and by virtue of the powers and
authority vested in me by the said Act, hereby direct that the said
public work shall be carried out under the provisions of the said
Act, and that the carrying out of the same shall devolve upon the
Minister for Public Works, who shall in that behalf be deemed
the Constructing Authority : And I hereby further direct that
the lands described in the Schedule hereto, being in my opinion
required for the purpose of the aforesaid public work, shall be
acquired for the aforesaid purpose, under the provisions con-
tained in Part III of the said Act.

2. All that piece or parcel of land situate in the parish,
county, and Colony aforesaid : Commencing on the western
boundary of the Burwood Road, at a point bearing northerly
and distant 4 chains 88 links from its junction with the north-
western boundary of the George's River Road ; and bounded
thence by a line bearing westerly 26 chains 35 ¹/₁₀ links ; thence
by the eastern boundary of Portland-street bearing northerly
75 ¹/₁₀ links ; thence by a line parallel to the first-described line
bearing easterly 26 chains 35 ⁵/₁₀ links ; thence by the aforesaid
western boundary of the Burwood Road bearing southerly 75 ¹/₁₀
links, to the point of commencement,—containing 1 acre 3 roods
and 35 perches, numbered 7, 8, and 9 on plan and book of
reference, and said to be in the possession of W. Foy, J. P.
Lannartz, and Frederick Hall.

SCHEDULE.

1st. All that piece or parcel of land situate in the parish of
Burwood, county of Cumberland, and Colony of New South
Wales : Commencing on the north-western boundary of the
George's River Road, at a point bearing south-easterly and
distant 4 chains 61 links from the junction with the eastern
boundary of the Burwood Road ; and bounded thence by a line

Given under my Hand and Seal of the said Colony, at
Government House, Sydney, this thirteenth day of
October, in the year of our Lord one thousand
eight hundred and ninety, and in the fifty-fourth
year of Her Majesty's Reign.

By His Excellency's Command,

BRUCE SMITH.

GOD SAVE THE QUEEN!
