Mining matters were anything but brisk during the year in this Division, and only 190 oz. of quartz gold were won, the result of a crushing of 256 tons, only about one-third the quantity won in 1894. The low average yield per ton may be accounted for by the fact that during the year several new reefs were found and tried, some of them giving very small yields, although a large percentage went over 1 oz. per ton. Matters will probably liven up somewhat during the coming year, as 40 acres of leases were applied for during the last two months of 1895, principally at Clyde Mallow, where a battery is in course of erection. Brimbamalla is considered a good field, but is languishing for capital, the miners being mostly poor men. There are several good properties there, which, if amalgamated, should pay handsomely, and they have the advantage of an abundant supply of water. The crushing plant erected by the Phoenix Company at Currowan has been removed, but Braithwaite and party are still doing fairly well by means of one stamper worked by hand. The same party are erecting a four-head battery, to be worked by horse-power, the tailings to be saved for special treatment. Another good property of 30 acres is being developed by White and party; but at present there is no battery in the vicinity to treat this stone. There is very little alluvial mining going on in this Division at the present time, and the quantity of gold got was only about 5 oz. from this source.

*Bateman's Bay Division.*

This is a new division of the Southern Mining District, and was formed in consequence of the growing importance of the mining operations being carried on on Big Hill, near Bateman's Bay. The returns show that 90 oz. of alluvial, and 204 oz. of quartz gold were won during the year, giving a total value of £1,041. Fullerton and party have sold their claim to a company who have purchased several adjoining claims, with a view of floating them on the London market. Fitzgerald Bros., had one crushing of 33 tons for 87 oz. Several other parties are at work on the Hill, prospecting, with promising indications, some of them in receipt of aid from the Prospecting Vote. At Sandy Creek, lying between Mogo and Bimbimbi, some good veins have recently been struck, and several parties are now at work in the locality. Coates and party had a trial crushing of 10 tons for 22 oz. of gold. Keating and party, at Bimbiubi, have erected two batteries, and have sold their claim for a good figure. Several other parties are at work, and are sanguine of striking something payable during the coming year.

*Moruya Division.*

Bateman's Bay, formerly part of this Division, having been proclaimed a separate division under the Mining Act, has reduced the returns materially, the quantity of gold won being 330 oz., valued at £1,195. At Turlinjah, Statham and party have leased part of the Italia Mine, but little work has been done since the lease was taken up. They are raising a little quartz from the 50-foot level, their deepest level being 130 feet. Several quartz claims are at work, on Donkey Hill, near Moruya, and although the stone has to be carted a long way for treatment, the miners appear satisfied with the result. Cleaver and party are in receipt of aid from the Prospecting Vote to sink a 100-foot shaft on their reef. About twenty men are fossicking among the old workings, but the scarcity of water has prevented them from earning more than a bare living.

*Nerrigundah Division.*

The returns from this Division show a satisfactory increase on the previous year, being 1,174 oz. valued at £5,127, the yield in 1894 being 889 oz. valued at £3,600. In quartz mining very little work has been done, and only 170 tons were crushed at the local battery, which gave 122 oz. of gold. Cram and party during the year discovered a new vein on Captain's Creek and their trial crushing of 29½ tons yielded 49½ oz. of gold. The Tin Pot Mine was abandoned during the last quarter of the year, but there is a probability of it being taken up again by an English company. There are several other quartz claims at work but they are only doing prospecting work. In alluvial mining about 160 men have been making a fair living during the year. A party of 20 chinamen on Cowdroy's private land have won a considerable quantity of gold, but the exact amount could not be ascertained.

*Wagonga Division.*

There were 652 oz. of gold won in this Division during the year as compared with 1,119 oz. in 1894. During the year Bailey and Miles sold their mine to the Mount Dromedary Gold-mining Company (Limited), and the two mines are now being worked under the one management. The returns from stone crushed during the year proved satisfactory, but the scarcity of water for the purpose retarded operations very much. The other mines on the mountain are in the same position—a large quantity of stone has been raised but cannot be treated for want of water. Considerable prospecting work has been done westerly from the old workings and several veins discovered, that give promise of yet becoming payable. A syndicate took up a 20-acre lease on old alluvial ground at Bermagui, on which they placed a patent gold-saving machine, but the result has not reached expectations. The Prospectors is the only claim at work on the Coolagalite Field, all the other leases having been cancelled.

*Cobargo Division.*

There is very little mining going on in this Division of any importance. There are still a few fossickers working the old alluvial ground who seem satisfied with their returns. A party of three are sinking on a reef at Brassknocker, but have not been successful in striking anything payable so far.

*Bega Division.*

The principal scene of mining operations in this Division is known as the Nelson Diggings, situated 10 miles north from Bega. Work is carried on in the various creeks and gullies that take their rise in the Doctor George Range of mountains. The country is mostly composed of slate, though the range is of granite formation. A belt of basalt crosses the creek at almost right angles immediately above where the gold is found and the general opinion of the more experienced of the men employed is that a lead of gold exists under the basalt. From one of the reefs outcropping in the locality 3 tons were raised from a depth of 30 feet, and on treatment at a Pambula Battery yielded 17 dwt. per ton. Prospecting work is being vigorously proceeded with and occasionally specimens much richer than the quartz treated at Pambula are found. At the foot of the ranges and a mile nearer to Bega, alluvial mining has been carried on for many years past where the gold is found fairly coarse in sinking from 10 to 18 feet. It is thought that a thorough prospecting of this Division would lead to important discoveries.

*Pambula Division.*

The value of the gold won in this Division during the year was £27,534, more than double the value of that won in 1894. A decided revival set in during the last few months of the year, on the Pambula gold-field, owing to the important fresh developments in the Falkner's mine. A great number of the cancelled leases have been retaken up, and work started, which has resulted in new finds being made on those portions. The Falkner's Gold-mining Company's shaft is now down 120 feet; but work has been carried on during the year, principally at the 90-foot level, and the quantity of stone raised was 2,051 tons, which yielded gold to the value of £21,546, the average number of men employed being sixteen. The Mount Gahan Gold-mining Company employs eighteen men, and during the year raised 1,465 tons of stone, which returned 466½ oz. of gold, and from 1,740 tons of tailings the same company saved by the cyanide process other 858½ oz. of gold, valued in all at £4,289. This company's shaft is 360 feet deep, at which level work is now being carried on. The Mount Lewisson Gold-mining Company raised 45 tons, which yielded gold to the value of £560. The Great Victory Company, 17 tons for 119½ oz., valued at £478; and the Hidden Treasure Company, 43 tons for 94½ oz., valued at £277. The Victory, the Diorite, and Great Southern Companies are still at work, but returns as to their yield during the year were not available. Gold-mining in the neighbourhood of Wyndham, was, during the early part of the year all but abandoned.

abandoned. Early in July, however, Donnelly and party reported having discovered payable gold on cancelled mineral lease portion 6, and that their trial crushing of 14 tons had yielded nearly 45 oz. of gold. This caused a large number of miners to start prospecting work, and ground was pegged out in all directions. Several syndicates have taken up land in this locality, and are making arrangements to give the ground a thorough trial. Messrs. R. Y. Medcalf and party, who hold 143 acres under mineral lease, have sent 30 tons of stone to Germany for special treatment, but the returns are not yet to hand. Robert Saddington and Co., of Sydney, have taken up several abandoned leases, and are erecting machinery to pump the water from the shafts. A few alluvial miners are at work about 15 miles north-east from Timbilica Post-office, which is situated a few miles from the Victorian border. The deposits so far found have not proved to be of any extent, but it is thought that fresh ground will be struck on the ranges to the north-east of the prospectors' claim.

#### *Bombala Division.*

There are seventy-eight men, including thirteen Chinese, employed in gold-mining in this Division, and the result of their labour was 545 oz. of alluvial gold, valued at £2,071, which is an increase of a little over 100 oz. on the previous year. Quartz-mining in this Division is confined to prospecting, and several parties are receiving Government assistance to prosecute that work.

#### *Yalwal Division.*

The returns from this Division could not be obtained, although the quantity of gold won must have been considerable. The Caledonian mine continues to yield good gold, and the lease adjoining is reported to be very rich. By the end of the year all the batteries, with the exception of a small one at Clyde Mallow, had to shut down through want of water. When the English companies formed to work the mines in this locality have completed their work for conserving water large returns may be expected from this district.

#### *Rye Park Division.*

There were about 100 men prospecting throughout this Division during the year, but no payable finds were reported. The alluvial ground tried was proved to be not payable, and the quantity of gold found, if any, could not be ascertained.

#### *Berrima Division.*

With the exception of the East Kangaloon Diamond-mining Company there is little mining work going on in this Division. The above-named company in connection with its diamond prospecting operations save a little gold. The company has erected a small steam puddling-machine, and constructed two small dams to conserve water. The hydraulic sluicing companies on the river, have, with one or two exceptions, ceased working principally through scarcity of water, but it is stated that an English company is making preparations to start work on a gravitation scheme for supplying water to work the deposits instead of pumping it. It is believed that by this means the extensive body of auriferous drifts on the river can be profitably worked.

#### *Yass Division.*

The only mining being carried on in this Division is on the Red Hill, about 14 miles from Yass, where several shafts have been sunk. A trial crushing of 6 tons was sent to Sydney for treatment, which was reported to have gone 6 oz. of gold per ton. Very little work has been done on the ground since, but it is the intention of the party to have another parcel of the stone tested in Sydney. Several claims have been pegged out in the vicinity of the prospectors' claim, but little work will be done till the result of the further test of the stone is known.

### THE HUNTER AND MACLEAY MINING DISTRICT.

#### *Copeland Division.*

The gold won in this Division during the year amounted to 454 oz., valued at £1,558, about £1,000 worth less than the quantity won in 1894. This district has suffered severely from the drought, and many of the batteries were unable to work. The Lady Belmore mine did not turn out so well as in past years; only one crushing of 70 tons was put through, which yielded 172 oz. of gold, a much poorer return than obtained from previous crushings. The party working the old Mountain Maid mine took out a small quantity of stone from the old stopes, which returned about 1½ oz. per ton. Carter, Fallon, and Seiman, who hold leases on the old Mountain Maid line of reef, are still driving their tunnel under aid from the Prospecting Vote, but have not yet struck the reef. The tributors of the Hidden Treasure took out a crushing which did not turn out payable. The machinery on the mine is now unable to cope with the heavy influx of water into this mine. Chubb and party are still working on the Centennial reef, but it does not show any gold at present. At Bowman mining is at a standstill owing to the scarcity of water, the batteries there being driven by water-wheels. At Cobark, Fitzgerald and party and Mitchell and party have raised small crushings, which have not paid wages. Anderson and party won about 32 oz. from their sluicing claim, and about 80 oz. of alluvial gold were got by the fossickers working in the creeks and gullies.

#### *Dungog Division.*

The returns from this Division have not come up to expectations, the total yield being only 137 oz., as against 205 oz. won during 1894. Several claims at Monkerai have stopped work owing chiefly to the want of capital. About the end of the year 20 acres of Church and School lands on Lawler's Creek were pegged out, whose splendid surface shows can be obtained. The prospectors are sanguine that they will strike something payable. The claim at Cherry Tree Hill, near Dungog, has been idle during the year. The quartz-claims at Whispering Gully, above Upper Wangat, are deserted, and the miners have turned their attention to the alluvial ground in the valley with good results, some beautiful nuggets being unearthed at Wangat. Four claims have had fair returns from their crushings, viz., the Brandon, Mountaineer, Welcome Stranger, and Wonga Wonga. Gardner and party at Redbank, near Lower Wangat, are steadily pushing in their tunnel, which is now in 171 feet. They are in receipt of aid from the Prospecting Vote.

#### *Kempsey Division.*

As far as could be ascertained only a few ounces of gold were won in this Division during the year. The Deep Creek gold lease was not worked. Some years ago this mine was purchased by Messrs. Cochrane and Gearey, and some difficulty arose which prevented the leases being transferred to their names. When this has been done it is the intention of the purchasers to fully develop the mine, which, if proved payable, would be of great benefit to the district. The plant and chlorination works on the mine are valued at £14,000.

#### *Taree Division.*

There are about forty-five men prospecting in this Division, principally at Twill Creek, situated about 60 miles from Taree, and it is stated that they are earning fair wages, although no information as to the quantity of gold won could be got. About twenty-five men are employed at Cells Creek, where some good stone is being obtained, which is crushed by a battery worked by water-power.

### PEEL AND URALLA MINING DISTRICT.

#### *Glen Innes Division.*

Owing to the partial or total cessation of work on many of the auriferous reefs, and the want of water for sluicing purposes, there has been a falling off in the production of gold in this Division during the year, which as near as can be ascertained was 661 oz., as compared with 1,848 oz. in 1894. The returns from Oban show an increase, mainly due to the settlement there of a number of the unemployed sent up from Sydney in the early part of the year. Work is still being carried on at Glen Elgin, but the production of gold from these mines has decreased considerably, and shows no present sign of recovering. The machinery employed for crushing and saving the gold is ample and costly, and the lodes not difficult to work, which average over 1 oz. per ton. Still no increase in the yield from this locality can be reported. A good deal of prospecting work is going on in this district, and although no new discoveries have been reported during the year, it is quite probable that important developments may take place at any time.

*Kookabookra*

*Kookabookra Division.*

The quantity of gold won in this Division during the year was about 635 oz., which is very little less than the previous year. Quartz-mining in this locality has been entirely in abeyance during the year, and is likely to remain so until a more economical and careful system of working and treating the stone obtains in lieu of the wasteful method formerly in vogue. The reefs here would pay the working miner if held under miner's right and the abundant water-power at hand in the Mitchell River utilised for driving the batteries, and so reducing the generally heavy cost of crushing to a minimum. The old Butcher's reef was worked for a couple of months during the latter part of the year by Cameron and Mourilyan, who erected a small 3-head stamper battery worked by water-power. They raised about 10 tons of stone, which is said to have yielded 2 oz. per ton. A large number of men are fossicking on the old Oban Field, Nowland's Creek, and the Mitchell River, and appear to be quite satisfied with the returns from their labour.

*Armidale Division.*

There were 854 oz. of alluvial gold won in this Division during the past year, being just about double the quantity won in 1894. Some good returns are being got at Puddledock, where a number of men are making fair wages. Work is still going on at Tilbuster, and the Great Britain mine is in course of being floated into a company, when operations will be extended. Rafferty and party, who received aid to further test the Zulu Reef in vicinity of Tilbuster, reported payable gold on the 15th January, 1896. The reef is situated three-quarters of a mile S.E. from the Tilbuster public school. The reef averages 9 inches wide, and 7 tons 17 cwt. taken from the 54-foot level yielded 9 oz. 17 dwt. of gold. Several parties are now at work prospecting for a continuation of the vein.

*Hillgrove Division.*

This Division ranks next to Orange as the largest gold-producing district in New South Wales, the output for the year being 21,617 oz., valued at £75,660, which is just 567 oz. of an increase on the yield for 1894. The Baker's Creek Gold-mining Company still holds the pride of place in this Division, and have been continuously crushing during the year, the quantity of stone put through being 13,753 tons, for a yield of 15,304 oz., valued at £55,095. Four dividends of 1s. per share were paid during the year, representing £20,000. The company has rapidly proceeded with the development of its property, and the depth of the main shaft is now 800 feet, and levels are opened out every 100 feet. The reefs in this property appear to be still going down, and according to present indications this mine will be a large employer of labour for many years to come, and promises to be prosperous and permanent. The past year has seen a great change in the Eleanora mine, the stone treated being 12,202 tons, for a yield of 4,907 oz., valued at £17,016. Under the new management the work of development has been pushed on, and the mine is now fairly well opened up. The depth of the main shaft is 615 feet, and the south shaft 250 feet. Ten additional 6 feet frue vanners have been erected and will start working in a few days. This mine furnishes an object lesson in concentration. Owing to the highly mineralised nature of the ore, it is very difficult to treat, but the company have erected the best concentrating plant procurable to overcome the difficulty, and only a trace of gold can now be got in the tailings. After the concentrates are collected from the frue vanners they are calcined in a reverberatory furnace, the antimony, sulphur and other volatile substances being driven off. The ore is then bagged and sent to Wallaroo, when the gold is extracted. Seventy thousand tons of tailings which have accumulated at this mine will be treated in due course, and this, with the fact that the reef appears to get richer with depth, should materially increase the returns from this Division during the coming year. This company's plant is valued at £29,000. The Garibaldi Gold-mining Company's mine has been worked by a few tributors only, who obtained 110 oz. of gold from 61 tons of stone. This mine is on the same line of reef as the Eleanora Company, and has just been floated on the London market for a large sum. The Baal Gammon lease has been worked on the surface only, and 50 oz. of gold, valued at £175, were got from 7 tons of stone. Capital is badly needed to develop this property. The Golden Gate Company has just completed the erection of a 10-head battery driven by electric power, and the construction of a dam capable of conserving a large quantity of water. The length of the main drive is now 400 feet along the course of the reef, and aid has been granted from the Prospecting Vote to continue it. Concentrating machinery is urgently required on this mine, as a large percentage of the gold is lost in the tailings. The stone put through was 107 tons, for 176 oz. of gold. Baker's Creek No. 1 Extended have obtained nine months' suspension, and the syndicate is trying to float the property on the London market. The Baker's Creek Proprietary Company has been at work during the year, but owing to the dry season has been unable to crush for more than a few weeks, but they obtained 341 oz. of gold. A trial crushing of 110 tons was put through, which went over 1 oz. per ton. It is expected that operations on a more extensive scale will be carried on during the coming year. Numerous other small parties have been at work in the vicinity of Hillgrove during the past 12 months, and in most instances have made good wages. The Rock Vale Freehold Company's mine at Rock Vale has lately been taken over by a Sydney syndicate, who propose treating the stone by concentrating, and with that view are erecting frue vanners. There are fourteen men employed on the mine at the present time raising stone and making alterations in the plant. Several parties are working on the Wollomombi River for alluvial gold with varying success. One party is sinking through the basalt at Surface Hill for a deep lead supposed to be there, but have not yet bottomed. Speaking generally of this Division, it is to be regretted that electricity as a motive power has not proved such a complete success as anticipated, due to the late excessively dry season, and before the system can be considered complete provision will have to be made for storing water in the Gara River to combat the effects of a future drought. It is also considered that if the other companies would erect proper concentrating plant that the returns from this field would show a marked difference in the future.

*Hillgrove West Division.*

The returns from this Division show that 7,588 oz. were won during the year, valued at £26,759, a decrease of 2,730 oz. on the return for 1894. This result is directly due to the drought, which lasted from February until October, when the principal mines had to be shut down the greater part of the year. The West Sunlight Reef Gold-mining Company suffered considerably from want of water, and could only crush 5,894 tons of stone, which yielded 2,262 oz. of gold, valued at £8,035. This mine is now in good working order; large additions have been made to the gold-saving machinery. The Sunlight Gold-mining Company worked under more favourable circumstances through the year, although it had to shut down at different times from want of water. The stone crushed by it was 10,668 tons, which yielded 4,839 oz., valued at £16,888. Additional gold-saving machinery has been erected by the above company, which is working well. Murgatroyd and party are still driving their tunnel to cut the reef worked by this company. A number of the old Earl of Hopetoun blocks have been satisfactorily worked by different parties on tribute, the quantity of stone crushed being 240 tons for 337 oz. The Starlight mine crushed 60 tons for 150 oz. The tributors work under a great disadvantage, as their stone has to be packed to the public battery on top of the falls.

*Uralla Division.*

The gold product of this Division was 2,220 oz. of alluvial gold, a decrease of 36 oz. on the previous year. During nine months of the year the alluvial mines on the Rocky River Gold-field could not be fully worked, and sluicing was out of the question, owing to the drought. Early in the year gold was struck by Nixon and party at the head of Sawpit Gully, after sinking through 150 feet of basalt. A small rush set in, and a large number of shafts were sunk without success, and the place is now almost abandoned. In many instances, however, the ground could not be thoroughly tested owing to the heavy influx of water. Gold is still being obtained by the prospectors. There is a revival in mining on the old Melrose Field, where several reefs have been struck; some of them carrying rich gold. A number of leases have been applied for, but little has yet been done by way of development. Several reefs have been discovered on private land during the year, the value of which is now being proved.

*Walcha Division.*

There were 1,069 oz. of gold won in this Division, as compared with 921 oz. in 1894. Healy and party, at Glen Morrison, raised about 30 tons of stone from their Brunga Park claim, which yielded 23 oz. 18 dwt., and from another quartz-claim at Wrandunby they obtained 17 oz., valued at £3 5s. per oz. About thirty men are employed in the vicinity of Nowendoc working the alluvial, and they average £1 per week per man. Prospecting work is still being carried on at Tia, where very promising indications are being obtained.

*Swamp Oak and Niangala Division.*

The Mining Registrar's Office at Niangala has been abolished and amalgamated with that at Swamp Oak. As far as could be ascertained, the gold won was 2,156 oz., valued at £6,830. There is no improvement to report in this Division, as the majority of the leases are idle; the only ones worthy of note working are the "Highland Mary," at Swamp Oak, and the "Jersey," at Niangala, both of which are putting out first-class stone, averaging 3 oz. per ton. These mines are both sinking, and the stone improves with depth: the "Highland Mary" shaft being down 110 feet, and the "Jersey" 130 feet. Capital is required to cope with the water and continue the shafts to a depth on this field, when it is thought that many of the reefs now idle would be found payable. The bulk of the claims at Paradise are idle.

*Tamworth Division.*

If there was any gold won in this Division during the year the amount could not be ascertained. A number of men are working up Spring Creek and around Moonbi, and although some of them reported small finds of gold, it is very difficult to obtain correct information as to the quantity of gold won by them. Marsh and party have taken up 8 acres of land at Moonbi under the Mining on Private Lands Act, and operations will be started at an early date.

*Nundle Division.*

The gold won in this Division was 4,856 oz., valued at £16,825, as compared with 3,616 oz. won in 1894, which is a very satisfactory increase considering the very dry weather experienced during nine months of the year. Isaacsohn and Thompson's claim has been sold to a London Company, and is now worked by the Tamworth Gold-mining Company. Under new management the mine is being thoroughly opened up and put in working order. A 10-head Frazer battery, with 800-lb. stamps, is being erected with self-feeding and concentrating tables, to be driven by a 48-inch Pelton wheel. Work is being pushed forward on the claims at the Rocks, but nothing payable has been struck so far. A patch of 25 oz. was struck in the Black Snake mine about Christmas time, and Deegan and party got some very rich quartz. Stringer and party, working at Hanging Rock, got a patch which yielded 200 oz. of gold. At Bowling Alley Point mining matters have been very quiet. The Peel River Proprietary Company did a lot of work during the first half of the year in blank country, but afterwards picked up the shoot of gold, and the subsequent crushings have proved payable, but its total returns for the year were not available. A few sluicing parties in this locality are making fair wages. A large number of men are still working on the banks of the Peel River, some of them it is said do well, while others only make a bare living.

*Bendemeer Division.*

There were 298 oz. of gold won in this Division, got principally on the McDonald River, where 60 Europeans and 6 Chinese find employment. Had a sufficient supply of water been available, the returns from this locality would have been much larger.

*Bingara Division.*

Returns from this Division state that 1,494 oz. of gold were won during last year, as against 1,393 oz., valued at £5,129, won in 1894. Numerous applications were made during the year for suspension owing to the scarcity of water, while other claim-holders left without applying for suspension. A Sydney syndicate has been vigorously carrying on prospecting work at Barrack Creek, and are so satisfied with their prospects that they have erected a battery. Attention is again being directed to the old Ballarat and Bendigo leads at Upper Bingara, and also the Black Reef, where a large area has been taken up under lease application. Several of the parties, notably Jones and company on Little Bendigo, and Messrs. Miller and party on the Black Reef, are obtaining good results. The old All Nations gold leases at Bingara township have been applied for again, but no work has been done so far. About 130 men are fossicking in this Division, some making more than wages, one man producing 1 oz. 18 dwt. for a week's work. A large number of the men are not the holders of a Miner's Right, but if they strike anything worth protecting they soon take steps to procure one.

*Barraba Division.*

The returns give the yield of this Division as 250 oz., but it is questionable if it includes all the gold won in the district. About seventy miners and their families are located at Wood's Reef, where a lot of prospecting work is being carried on; but the field is badly in want of machinery to develop it. There is a small battery on the ground, but it does not crush for the public. Geo. Allen and party have a good show of gold in their new find, and several other parties have very promising indications indeed. H. Goodman's water-wheel is at a standstill for want of water. At the Crow Mountains there are about six claims on good gold, and this locality, from all appearances, is the coming field within this Division. Watt and Davis have erected a crushing machine on this field for their own use, but when occasion permits they oblige the miners by putting a small lot through. The usual number of fossickers are still scattered throughout the district, getting sufficient gold for their immediate wants.

*Stewart's Brook Division.*

The gold won in this Division is set down at 1,210 oz., valued at £4,356. No new development has taken place on the field during the year. The Stewart's Brook Gold-mining Company has been formed to work the claim lately held by W. L. Adams and party, and Towns and Ninness, both on the Hidden Treasure line of reef. The works are progressing very favourably, and the prospects of the new company are promising. The New Royal Standard Company's mine is turning out good stone, and the shareholders are receiving dividends. The smaller claims are working away as usual; but under the disadvantages attending the want of capital to properly develop their claims, and erect the necessary plant required to make them highly payable. The Denison field is much in the same state, and will remain so till capital is brought in to put the claims on a good working basis.

## NEW ENGLAND MINING DISTRICT.

*Fairfield Division.*

There were 2,978 oz. from quartz, and 3,769 oz. from alluvial won in this Division during the year, valued at £23,614, an increase of £2,397 over the previous year. Notwithstanding the fact that the scarcity of water greatly retarded alluvial mining, it is highly gratifying to be in a position to report an increase in the yield. The increase in the yield from alluvial can be accounted for by the coming into force of "The Mining on Private Lands Act," which caused a large area of auriferous land on the Yulgilbar Estate to be thrown open to prospectors. The result of this is that over 100 men find profitable employment, who further speak well of the kindness and consideration shown them by the owner, Mr. Ogilvie. Mining in the vicinity of Yulgilbar and Lionsville is now assuming a more promising aspect and a large number of respectable men are collecting in this locality, a large amount of prospecting work is sure to be carried out during the coming year when further developments may be looked for. On the various old Diggings in this Division, a large number of men find employment, and are likely to do for many years to come. Some make fair wages, the others average about 20s. per week. During the past year several new developments have taken place notably in the basalt formation at Frasers' Gully, near Tooloom, but the unusual scarcity of water has prevented the miners from thoroughly prospecting the ground. The scene of the discovery referred to is on a high ridge of some extent. The depth of sinking varies from 12 to 28 feet, and in some places about 4 or 5 feet of hard basalt is pierced before the wash is met with, which is composed of river-sand and water-worn boulders on a very irregular slate bottom. There is every indication that this auriferous deposit is of some extent, and is the bed of an ancient river running at right-angles to the present course of the Clarence River. Several new discoveries have also been made in quartz mining during the year, and some rich patches of gold met with, but unfortunately they have not been of any great extent. The following list gives the names of the principal quartz mines in full work, at the present time, with the results from crushings put through by them during the last twelve months:—

Lady Jersey .....	1,091 tons, yielded 2,483 oz. of gold.
All Nations .....	400 " " 620 "
Adeline .....	506 " " 291 "
Parkers .....	64 " " 203 "
Hawkins .....	48 " " 117 "
Littles' .....	30 " " 55 "
	2,139                      3,769

The above mines are all considered payable and as development proceeds, the output of gold will be greatly increased. The total number of men employed gold-mining in this Division is 490; 72 of whom are Chinese. Several parties are in receipt of aid from the Prospecting Vote within this Division, the principal work of that nature being carried on is at Boonoo Boonoo, where a party is being assisted to sink a shaft to a depth 300 feet in search of the Buck Reef. The men are proceeding vigorously with the work.

*Penterfield*

*Tenterfield Division.*

There is very little of importance to report in connection with this Division, the number of men employed in gold-mining being thirty-nine, and the quantity of gold won, was 450 oz. of alluvial valued at £1,237 10s.

*Wilson's Downfall Division.*

The total quantity of gold won in this division was 161 oz. valued at £563 10s., all from alluvial, principally won from the Accacia Creek and the tributaries of the Clarence River. This is a slight increase on the yield of previous years, and with a favourable season, still better results may be looked for.

## CLARENCE AND RICHMOND MINING DISTRICT.

*Grafton Division.*

There are 127 gold miners scattered throughout this Division, and they won among them 1,347 oz. of alluvial and 345 oz. of quartz gold, valued in all at £5,931, a very substantial increase of the yield for 1894, which was only 427 oz. During the year new discoveries were made in the neighbourhood of Bucca Creek, but unfortunately the discoveries have not been followed up with any great energy, no doubt occasioned by the exceptional scarcity of water in these localities. The operations of the Sir Walter Scott Gold-mining Company have been much retarded from the same cause, and from accidents to the machinery. As repairs have now been effected, and it has a supply of water available, the company may be expected to add to the returns from this division very considerably. Should the coming year prove favourable, a large number of men will be at work prospecting throughout this Division.

*Nana Creek Division.*

There is a very satisfactory increase in the returns from this Division for the year, the yield being 1,554 oz. valued at £5,833; as compared with 427 oz. in 1894. The new finds at Coramba, have drawn attention to that locality, where a number of leases have been applied for. A trial crushing from the Coramba Queen Claim, of 158 tons, gave a return of 121 oz. The Coramba King, 76 tons for 41½ oz. The Evening Star Claim, 9 tons for 80 oz., and 17 tons for 23½ oz. of gold. Huxham and Rudder had a 5-ton crushing, which yielded close on 4 oz. per ton. Nicholson and Pollock crushed from their prospecting claim 15 tons for 70 oz., and Tyson and Cook, the owners of gold-lease 332, had five crushings of 68 tons in the aggregate which yielded the handsome return of 175 oz. of smelted gold. The above returns will show that some of the reefs at Coramba are highly payable, and as none on them have been proved to any great depth, the locality seems to be one worthy the attention of capitalists. Several parties are at work at Tallewadjah Creek raising good stone. Jarrett and party, the prospectors, had one crushing of 28 tons for 63 oz. Lachlan M'Kinnon, working the Homeward Bound Claim, 54 tons for 42½ oz., and Wm. Parker and party, crushed 12 tons for 17 oz. of gold. Prospecting is also being carried on by Goldspring, Tyson, and party at the West Branch, Upper Orara, where the indications are very promising.

*Dalmorton Division.*

Returns from all the mine-owners within this Division could not be obtained, but as far as can be ascertained the yield was 572 oz., valued at £2,144, as compared with £3,984; the value of the yield in 1894. Mining matters have been very dull in this Division for some time, with no immediate prospect of an improvement. Many of the old mines have been retried by different parties of men, but the result invariably proved unsatisfactory, and most of them are now abandoned. The Tower Hill Mine has been worked a little during the year, but the results have not proved satisfactory. The Mount Rea Mine has been purchased by an English Company, and is likely to prove a payable property; machinery is to be erected without delay. The Mount Remarkable Mine has been turning out payable stone during the last few months of the year, and may yet repay the outlay of the owners. The New Era Mine was again tried to the extent of a 20-ton crushing, but the result was only 5½ dwt. per ton, and it will probably be again abandoned. A party of two are raising a crushing from the Carbine, in the hope that it may pay to work. McDougall and party are putting in a tunnel at the head of Chandler's Creek, by means of aid from the Prospecting Vote; but the reef does not seem to improve as it goes in. The owners of the Hawk-eye claim have recently had a small crushing, which yielded 1 oz. 5 dwt. per ton, which will pay if systematically worked. All the other mines in this Division are shut down for an indefinite period. Several grants of aid from the Prospecting Vote were made to miners in this Division, but so far only one party have availed themselves of the assistance offered. The explanation seems to be, that unless the aid offered is sufficient to cover the full cost of the work, it is allowed to lapse. The Black Slate Mine is in course of being floated on the London market, and when arrangements have been completed, employment will be found for a large number of extra hands, the number employed at the present time being about 30. Fossickers are not meeting with much success in this locality, and can only make a bare living.

*Ballina Division.*

The quantity of gold won in this Division is set down at 2,345 oz., valued at £9,962, which is an increase of £6,512 on the yield for 1894. All the gold was won from the sand on the various sea-beaches and terraces, and it is estimated that 600 men now find profitable employment at this class of mining. A good payable lead was discovered during the year in the locality of the Esk River by M'Auley and party. The scene of the discovery is situated about three quarters of a mile inland in a direct line from the sea beach, and is known as M'Auley's Lead. Some of the claims on this lead have proved very rich, and have returned to the lucky owners as much as £10 per week per man for some months past. Prospecting work is being vigorously proceeded with on the various beaches and terraces on the coast lying between the Clarence River and the Brunswick Heads, more especially in the neighbourhood of Jerusalem, Bullock and Ghosty Creeks, Evans River, Woodburn, Broadwater, and Byron Bay.

NOTE.—Attention is directed to an exhaustive and valuable report by Mr. Geological Surveyor Carne, on pages 149 to 160 of this volume, who deals fully with the field and its prospects. It may be here stated that the Department has decided to assist the miners from the Prospecting Vote to further test these beaches in a systematic manner.

*Macleay Division.*

It is estimated that 455 oz. of gold were won in this Division during the year. As in the Ballina Division the mining is confined chiefly to the sea-beaches, and from the number of men engaged in purely prospecting work in the locality there is every probability of new leads being discovered.

## THE COBAR MINING DISTRICT.

*Cobar and Mount Drysdale Division.*

The returns of gold from this Division fall short of the yield for 1894, the amount being only 10,000 oz. as compared with 18,524 oz. the previous year. The large decrease can be accounted for by the fact that the Mount Drysdale and the New Eldorado Companies did not crush so much ore during the year as usual, a large number of the men being employed constructing dams and erecting machinery. The Mount Pleasant Company has also erected a 10-head battery, and the Young Australian Company has machinery on the ground ready to erect. The Fort Bourke Tunnel and several adjoining properties have been acquired by Messrs. Janin and party, who propose erecting a large cyanide plant on the mine. The following list gives returns from stone put through by several of the principal companies:—

Occidental	8,647 tons for.....	1,492 oz.
Cobar Mining Co.	1,761 " " .....	288 "
Mount Drysdale	150 " " .....	1,700 "
Mount Pleasant	469 " " .....	87 "
Great Western	870 " " .....	951 "
New Eldorado	350 " " .....	1,350 "

The rush to the new finds at Gilgunnia during the year caused a number of the Mount Drysdale miners to leave the district, the result being that numbers of claims have been abandoned, and are now lying idle. Prospecting work is being vigorously carried on in several localities in this Division, and aid from the Prospecting Vote has been granted in several instances. Since the passing of the "Mining on Private Lands Act," 48 permits were issued by the Warden, with the result that good gold was discovered at the Peak, near Cobar, and seventeen leases applied for. *Gilgunnia*

*Gilgunnia Division.*

This is a new Division formed during the year in consequence of the discoveries made near Gilgunnia in the month of April by an aboriginal. Since then a very satisfactory advancement has been made in the prospects of the field, there being now thirty-five claims on gold. The true value of each claim cannot be given, in the absence of machinery to treat the stone; but it is confidently anticipated that a large number of them will prove payable. The erection of crushing machinery is likely to be proceeded with at once, as a tender has been accepted for the construction of a battery tank. Among the principal claims are the Tarcombe Prospecting Claim, with a shaft down 100 feet, the reef at that level being 18 inches wide. At the 50-ft. level a drive was put in on the reef for a distance of 120 feet on good gold-bearing stone. About 100 tons of stone from this drive were sent away for treatment, and yielded at the rate of 2 oz. per ton. Nos. 1 and 2 claims have been amalgamated, and are now held by the Great Tarcombe Gold-mining Syndicate. The reef in No. 1 shaft, at the 150-ft. level, is 2 feet wide, showing good gold. No. 2 shaft is down 50 feet, and the reef is 12 inches wide at that level. The owners of the Eight-Hour Claim have a shaft down 70 feet on a 15-in. reef, showing good gold. About  $\frac{3}{4}$  of a mile west of the Tarcombe line of reef, Rubby and party are down 96 feet on a reef 20 inches wide, showing a little gold. This shaft has been connected by a drive at the 50-ft. level with No. 2 shaft. This party have 300 tons of stone broken down, which they estimate will go 3 oz. per ton. Fin and party, working the Her Dream Claim, have sunk two shafts. From No. 1 shaft they took 15 tons, which averaged 8 oz. 18 dwt. per ton. Altogether this party have treated 85 tons for 425 oz. Mullins and party's Rising Sun Claim joins Her Dream Claim on the north. This party sent 6 tons to Sydney for treatment, which yielded 27 oz. of smelted gold, and a total of 49 tons yielded 99 $\frac{1}{2}$  oz. This shaft is down 135 feet. What is known as the Four-mile diggings is situated 4 miles east of the main field. A large number of claims are being worked there on good-looking reefs, which are expected to prove payable. A large quantity of stone is at grass awaiting the erection of a local crushing plant, and a further supply of water, which wants have greatly affected the development of the field. About 185 men are employed in the various claims, and about sixty men are prospecting in the vicinity. It is expected that some further valuable discoveries will be made in this district.

*Nymagee Division.*

About the beginning of the year fair prospects were discovered in quartz-reef on Restdown Station. Several claims were taken up and worked for some time without anything payable being struck. On the Gilgunnia rush setting in, the ground was all but abandoned. Some very promising prospects have been met with at Hunter's Gutter on Overflow Station. Several shafts are being sunk to prove the value of the reefs. There is a large area of land on this station which experienced miners consider well worth testing, and it is not improbable that before the end of the year payable lodes will be found in this locality.

*Mount Hope Division.*

During the year 3,339 tons of stone were treated by the Mount Allen Gold-mining Company for a yield of 1,187 oz. which is given as the total yield from this Division. This company's mine is situated 12 miles from Mount Hope, and their operations have been much retarded through a scarcity of water. The gold occurs in an ironstone-slate formation, and the stone is now being raised from a depth of 150 feet. During the year thirty-five men, on an average, were employed in the mine on which plant to the value of about £4,000 has been erected. The Mount Dromedary Gold-mining Company in the same locality has not been working, and several other leases in the neighbourhood have also been idle through the scarcity of water.

*Euabalong Division.*

The principal mine in this Division is owned by The Errebenderry Gold-mining Company, which put through 637 tons of stone for a yield of 420 oz., valued at £1,650. Work is now being carried on at the 142-ft. level, where the reef averages from 1 to 5 feet wide bearing north-east and south-west. The company has a battery and pumping-gear on the ground, valued at about £700. Partial suspension was granted the company for six months to enable it to deepen the shaft, which work is now at a standstill owing to heavy water. A large amount of prospecting work has been done in this Division during the year without any new finds of importance being made. True, Knight, and party are searching for alluvial gold at Ilawong, 40 miles north-east from Cudgellico, where gold in small quantities was found. A little gold was also got at Tallabang, 14 miles south-east from Cudgellico, where 25 acres were applied for and other ground pegged out. Mining is going on at Wilga Mount, 15 miles from Euabalong, and the reef worked there is considered payable.

*Condobolin Division.*

The quantity of gold produced in this Division during the year under notice was 410 oz. valued at £1,591. In January, McClure and Linden reported that they had discovered payable gold at Cugong, when a small rush set in, and in a very short time twenty-five claims were pegged out along the line of reef, and a small township was formed about a quarter of a mile westerly from the line of reefs. The new find is situated about 6 miles from the Kiacatoo Station, and about 25 miles from Condobolin, the Lachlan River being about 4 miles from the township. The population has varied from 50 to 150 since March last, and at the present time about 75 men are on the field. The best returns so far have been obtained from No. 1 South, better known as the Yellow Streak Claim, from which 21 $\frac{1}{2}$  tons of stone were sent to the Clyde Works, Sydney, for treatment, giving the handsome return of 92 oz. of gold. There is 150 tons of stone lying at grass on this claim awaiting the erection of Mr. Pooler's battery, which is nearly completed. Many of the other claims are stacking stone which now amounts to over 500 tons awaiting treatment. The erection of this plant will greatly assist the development of the reefs in this locality, as the almost prohibitive cost of carriage to the nearest battery greatly retarded mining operations. Tough and party have taken up the abandoned gold-lease known as the "Surprise," in the Melrose Road, near Condobolin, and are sending a trial crushing to Sydney for treatment.

*Fifield Division.*

The exceptional scarcity of water completely paralyzed mining operations in this Division during the past year, reducing the returns to 249 oz. as compared with 875 oz. in 1894. At the end of the year, there were upwards of 6,000 loads of wash-dirt at grass, estimated to average all through 25s. per load, but which could not be dealt with till rain fell. Prospecting operations were at a complete standstill, the only water near being a small dam at Fifield which was reserved entirely for domestic purposes. Platinum is still being won in connection with the gold-mining operations, the yield during the year being 413 oz., worth 23s. per oz. At Fifield and Platina, which are about 3 miles apart, there are 250 miners, this number will be greatly increased should the coming year prove favourable.

## THE ALBERT MINING DISTRICT.

*Milparinka Division.*

The disastrous drought of the past year had the effect of reducing the quantity of gold won to 320 oz., as compared with 2,300 oz. won in 1894. The alluvial mines at Stringer's Hill, Four Mile, and Mount Browne, could not put their wash-dirt through, owing to the scarcity of water, and it is all stacked waiting rain. Kitto and party, working the Hard-Up Claim, struck a patch at the 112-ft. level, from which they washed 36 oz. of gold from seven loads of dirt. The gold continued to the 165-ft. level, and in all they won 102 oz. from the patch, including one nugget of solid gold weighing 25 oz. Kershaw and party's puddling-machines have been at work when water was available, and saved about 50 oz. of gold, and two dry blowing machines about 30 oz. Smith and party are down about 200 feet, and they saved about 60 oz., but the other mines made little more than wages, if that. The new find of reefs at Warratta and Bendigo was made in February, and ground has been pegged out in all directions. The first lease was applied for by Roberts, and Downs, who formed a syndicate of Melbourne residents to test the ground. A large amount of work has been done by them in sinking shafts and by open-cutting. During the progress of this work, various leaders or veins were cut, all carrying rich, free gold, the veins varying in width from half an inch to 9 inches, but no well defined reef of any size has yet been found. It may be worthy of mention, that it was on this lease that the rich specimens were discovered in 1874, and the supposition is that these specimens came from a rich reef in the vicinity. Very encouraging indications are being obtained at West Warratta, in several

several open cuttings put in, but insufficient work has been done as yet to prove its value. Work is being carried on steadily at Warratta East and Moffit's Gully, and stone is being raised from reefs varying from 18 inches to 3 feet wide. None of the stone has been tested in bulk so far, but good results are obtained by dollying. The old crushing machine that was originally erected at Old Warratta has been purchased and put into thorough repair. It completed two crushings during the year, one from Hause's Prospecting Claim at New Bendigo, of 25 tons which gave a return of 4 oz. 2 dwt. per ton, and the other from Mannix's lease, Evans' Gully, of 15 tons which yielded  $\frac{1}{2}$  oz. per ton, but this was only poor-surface stone. At New Bendigo seven claims, including the Prospectors', are on good stone showing free gold, but only one parcel has been crushed. It is believed that this would prove a payable field if capital were brought to bear on it. All the quartz-claims and leases are in the hands of poor men who have not the means to develop them. There are 130 men employed in gold-mining in this Division including ten Chinese.

*Tibooburra Division.*

The quantity of gold won in this Division is given as 1,325 oz., valued at £5,300, all taken from alluvial ground. The puddling machines have been unable to work during the greater part of the year through want of water. A good deal of prospecting work is being carried on throughout the Division, and some new finds might be expected if the men had an opportunity of getting steadily to work.

*White Cliffs Division.*

The only mining being carried on in this Division is on the White Cliff Opal Field, which will be dealt with on pages 68 and 69 of this report.

*Broken Hill Division.*

The Broken Hill Proprietary Silver-mining Company saved in connection with their silver-mining operations 4,650 oz. of gold, as compared with 4,079 oz. saved by them in 1894. There is still a little prospecting work for gold going on in this Division, but nothing of a payable nature has been met with so far.

*Wentworth Division.*

The only work being carried on in this Division is some prospecting by the Federal Prospecting Company at Poon-carrie. The company have been testing an ironstone lode by sinking shafts, and putting in a number of cuttings along the lode for a distance of over half a mile. This deposit trends away for miles, and outcrops can be traced running probably towards the Cobar country. The stone was found on assay to contain about 3 dwt. of gold per ton, with traces of silver. The company has, however, been compelled to stop work from want of funds.

I am indebted to J. MacDonald Cameron, Esq., F.I.C., the Deputy Master of the Royal Mint, for the following information:—

QUANTITIES of Gold, the produce of New South Wales, received into the Royal Mint, Sydney, during 1894 and 1895, compared.

Clarence and Richmond .....	842·02	1,543·51
New England .....	989·38	2,240·87
Mixed—Western, Northern, and Southern .....	62,459·88	42,682·38
Localities unknown .....	57,698·37	67,075·86
	222,988 17	202,317·03

From the above table it will be seen that the quantity of gold sent to the Mint in 1894 exceeded that sent during last year by 20,671 oz. The principal decrease is in the Armidale, and in mixed Northern, Western, and Southern Districts, but a large increase is shown in the return from the Orange District, due, no doubt, to the operations of the Companies working on the Wentworth Estate at Lucknow.

The following table is compiled from information kindly furnished by the Collector of Customs:—

## EXPORT OF GOLD, 1895.

Gold.		Quartz Tailings and Pyrites		Total.	
Quantity.	Value.	Quantity.	Value.	Quantity.	Value.
oz.	£		£	oz.	£
112,035	399,626	20,721 packages .....	189,057	162,450	588,683

The quantity of gold sent to the Royal Mint—plus the quantity exported in 1895—equals 361,767 oz., but of the 162,450 oz. exported we are informed that 4,601 oz. passed through the Mint, and is included in the returns furnished by the Master. The output of gold for the year may therefore be set down as 360,165 oz., an increase of 35,378 oz. as compared with 1894.

The Broken Hill Proprietary Silver-mining Company are still saving gold in connection with their silver-mining operations, the quantity so saved last year being 4,650 oz., valued at £18,600.

## RETURNS of Gold for 1895. from Mint and Mining Registrars compared.

District.	Mint.	Mining Registrars.	Excess.	Deficiency.

The returns from Mining Registrars exceed returns from Mint by .....				116,083·02

From the foregoing table it will be seen that the returns furnished by the Mining Registrars of gold won in their respective divisions exceeds the quantity sent to the Mint by 116,083 oz., but is less by 41,765 oz. than the year's production, as shown by the Mint and Customs returns. The Mining Registrars have in many instances a difficulty in obtaining full and complete information from mine owners and others,

others, occasioned either by neglect to keep a correct record of the yield of their mine or an unwillingness to disclose the information. With regard to the numerous fossickers throughout the Colony, who mostly dispose of their gold as it is won, a greater difficulty is experienced.

MINING Registrars' Returns of Gold for 1894 and 1895 compared.

District.	1894.	1895.	Increase.	Decrease.
	oz.	oz.	oz.	oz.
Bathurst .....	50,024	99,632	49,608	.....
Tambarooora and Turon .....	11,444	10,856	.....	588
Mudgee .....	28,439	32,343	3,904	.....

Clarence and Richmond .....	2,885	8,256	5,371	.....
New England .....	6,665	7,358	693	.....
Cobar .....	20,593	12,769	.....	7,824
<i>Less Decrease</i> .....	245,705	318,400	88,050	15,355
<i>Increase in yield for 1895</i> .....	.....	.....	72,695	.....

From the above table, comparing the return sent in by the Mining Registrars for the last two years, it will be seen that there is an increase in 1895 of 72,695 oz. As the Mint and Customs returns only show an increase during the year of 35,378, it is made abundantly clear that the information supplied to these officers is far from complete.

COMPARATIVE Statement of Average Yields from Alluvial Mines for 1894-95.

The foregoing table is intended to show the returns obtained from the treatment of parcels of alluvial wash in each district during the year, but the greatest difficulty is experienced in obtaining the information necessary to make it nearly complete. The miners rarely keep a record of wash-dirt put through, and in the case of Sluicing Companies, to obtain a correct data is nearly impossible. It can be readily seen from the table that there are immense quantities of wash-dirt treated of which no information is given, but which, if supplied, would be of interest to the public and a benefit to the miners themselves. It is, however, given as fully as possible under the circumstances.

	149,514	0 14 8	107,188 14 1		128,431	1 7 1	173,806 10 0

The foregoing statement shows the average yield of sundry parcels of quartz crushed in the several mining districts. Less difficulty is experienced in obtaining information as to yields from quartz crushings than returns from alluvial washings, as there is often a necessity to keep some record of the stone crushed.

Were it possible to obtain the complete information a very interesting table could be compiled, which would be of much service to the persons who might, but who do not, supply it. As will be observed, there is a large increase in the average yield for the year, due to the rich stone raised at Lucknow, in the Bathurst Mining District, and to the splendid returns from the Wyalong gold-field, in the Lachlan District. I take this opportunity to impress on the Mining Registrars and the miners the benefit complete information of this nature would be to the mining community, and hope they will conjointly use their best efforts to obtain the desired results.

The number of miners employed in gold-mining, more or less constantly during the year, was 21,434, an increase of 4,227 over the number employed during 1894. Of that number there were 10,498 Europeans and 833 Chinese(?) working on the alluvial fields, and 10,103 on quartz. The principal increase is in the number of alluvial miners employed, due to large numbers of unemployed men drafted to the old gold-fields as fossickers.

If the total quantity of gold won during the year, viz., 360,165 oz., is divided by the number of the men employed, it would appear that the average earnings of each man was 16 oz. 19 dwt. 5 gr., valued at about £63 12s. These figures can, however, only be taken as approximate as large numbers of the men must necessarily be employed in prospecting and preliminary works from which no returns have yet been obtained, but in the absence of more complete information this very rough system of computing the earnings cannot be improved upon. It might also be mentioned that a section of the men only engage in alluvial mining when a good supply of water is available for ground sluicing or treating their wash-dirt, and resort to other employments when this fails them.

During the year 4,327 samples were assayed for gold in the laboratory of the Geological Survey Branch of this Department:—

2,453 yielded nil.

COAL.

The output of coal for 1895, as compared with the previous year, shows an increase of 66,513 tons, but a decrease in the value of £60,246. The coal-mining industry of the Colony has during the year been in a most depressed state. No doubt the lamentable labour disputes which have unfortunately existed in this very important industry have materially helped to bring about this result. It is gratifying to notice, however, that our growing export trade, which received a severe check in 1890 from this cause, is improving. This Colony has now to face a strong competition from the mines being opened up in Japan, and it behoves both owners and men to use every effort to prevent a recurrence of strikes if the trade is to be preserved to the Colony. As will be seen from the following table the average total value of the whole output was only 5s. 10 3/4d. per ton, which is the lowest price recorded since the opening of our coal fields. The Sydney Collieries Company have not yet started operations to sink at Cremorne, near Sydney, negotiations for a suitable site for wharfage not having been completed by the Company. The total number of collieries under inspection throughout the Colony at the 31st December, 1895, was 99 coal and 7 shale mines, an increase on 1894 of 2 coal and 2 shale mines.

QUANTITY and Value of Coal raised from the opening of the Coal-seams to 1857, inclusive :—

The following statement shows that the output of coal in the Northern District was 26,079 tons in excess of 1894 although there is a decrease in value of £69,947. In the Western District there was a decrease of 9,005 tons in the output and of £5,202 in the value. The Southern and South-Western Districts, however, show an increase of 49,439 tons, but an increase of only £14,903 in the value.

COMPARATIVE Statement of Output of Coal in the Northern, Western, and Southern Districts.

\* This includes—1st class, 18,578 tons, valued at £37,156; 2nd class, 13,065 tons, valued at £3,266.

The number of men employed in and about the coal and shale mines of the Colony during 1895 were 9,376, which includes 354 men employed in shale-mines and 5 men employed sinking at the Dudley Mine not actually engaged in the raising of coal. The total number of men employed during 1894 was 9,428, so that there is only a decrease of 52 on the previous year. The total number of accidents in coal-mines recorded during the year were 10 fatal and 47 non-fatal. In the Northern district there were 9 fatal and 38 non-fatal accidents; in the Southern district, 1 fatal and 7 non-fatal; and in the Western district there were no fatal and only 2 non-fatal accidents. These figures unfortunately show an increase of 3 fatal and 7 non-fatal accidents, as compared with 1894.

The following table is intended to show that the safety of our mines can bear comparison with the coal-mines in the United Kingdom:—

SUMMARY of persons employed, number of fatal accidents (deaths), and ratios of the number of persons employed, and the number of fatal accidents in and about the "United Kingdom" and "New South Wales" Coal-mines, since 1874.

Year.	United Kingdom.				New South Wales.			
	Persons employ ed.	Lives lost by accident.	Persons employ ed per life lost.	Death-rate from accidents per 1,000 persons employ ed.	Persons employ ed.	Lives lost by accident.	Persons employ ed per life lost.	Death-rate from accidents per 1,000 persons employ ed.

\* Excessive number of falls of coal and Lithgow disaster caused this high death-rate.

† Bulli catastrophe and excessive falls of coal caused this high death-rate

‡ Hamilton pit crush, excessive falls of coal, and over-winding of four men at South Barwood sinking pit caused this high death rate.

During the year twenty-three analyses were made of coal in the laboratory of the Geological Survey Branch of this Department, sixteen of which resulted as follows:—

Official Number.	Locality—Stated by the finder to be.	Analysis in 100·00 parts.					Specific Gravity.	Remarks.
		Hygroscopic Moisture	Volatile Hydrocarbons, &c	Fixed Carbon.	Ash.	Sulphur.		
4359	Ashford seam .....	·90	21·55	67·50	10·05	·453	1·374	Coke, 77·55 per cent., fairly well swollen, hard and lustrous. 1 lb. of this coal will convert 13·86 lb. of water into steam. Ash—light gray in colour, granular.
4360	„ .....	·75	23·25	68·90	7·10	·357	1·349	Coke, 76·00 per cent., well swollen up, hard and lustrous. 1 lb. of this coal will convert 13·86 lb. of water into steam. Ash—light gray in colour, granular.
4361	„ .....	·55	24·65	67·80	7·00	·357	1·342	Coke, 74·80 per cent., fairly well swollen, firm and lustrous. 1 lb. of this coal will convert 14·08 lb. of water into steam. Ash—light gray in colour, granular.
4362	„ .....	·65	22·15	71·65	5·55	·480	1·328	Coke, 77·20 per cent., fairly well swollen, firm and lustrous. 1 lb. of this coal will convert 13·53 lb. of water into steam. Ash—light gray in colour, granular.
4559	Avondale .....	1·51	21·81	60·12	16·56	·521	1·468	Coke, brittle, dull lustre—not a good description of coke. 1 lb. of this coal will convert 11·88 lb. of water into steam. Ash—reddish tinge, flocculent.
3184	Bulli .....	1·87	22·60	64·08	11·45	·617	1·387	Coke, 75·53 per cent. 1 lb. of this coal will convert 13·1 lb. of water into steam. Ash—nearly white in colour, flocculent.
3185	„ .....	1·19	23·84	58·56	16·41	·56	1·433	Coke, 74·95 per cent. 1 lb. of this coal will convert 12·6 lb. of water into steam. Ash—nearly white in colour, flocculent.
3186	„ .....	1·31	23·38	62·70	12·61	·56	1·395	Coke, 75·31 per cent. 1 lb. of this coal will convert 13·1 lb. of water into steam. Ash—nearly white in colour, flocculent.
3669	Gunnedah .....	2·05	39·91	53·46	3·58	·412	1·291	Coke, 57·04 per cent., well swollen, lustrous and firm, excellent for metallurgical purposes. 1 lb. of this coal will convert 13·8 lb. of water into steam. Ash—gray and flocculent.
4586	„ (Gladstone C.M. Syndicate).	1·94	40·99	53·14	3·93	·535	1·295	Coke, 57·07 per cent., well swollen up, with cauliflower-like excrescences, firm and lustrous, excellent for metallurgical purposes. 1 lb. of this coal will convert 13·64 lb. of water into steam. Ash—nearly white in colour, granular.
4587	„ „ .....	1·68	30·71	61·48	6·13	·576	1·362	Coke, 67·61 per cent., not much swollen up, fairly firm, dull in lustre. 1 lb. of this coal will convert 13·09 lb. of water into steam. Ash—gray in colour, granular.
3803	Humewood .....	1·57	34·91	55·06	8·46	·562	1·320	Coke, 63·62 per cent., fairly firm and lustrous. 1 lb. of this coal will convert 13·4 lb. of water into steam. Ash—gray in colour, and flocculent.
379	Rossville, near Taralga	17·80	32·15	33·65	16·40	3·92	1·412	Ash—red and granular.
3047	South Clifton (coke)	·43	·15	87·04	12·13	·25	...	Ash—12·13 per cent. <i>Chemical composition</i> —Silica, 56·05; alumina, 33·98; ferric oxide, 5·64; manganous oxide, trace; lime, ·84; magnesia, ·59; potash, 1·07; soda, nil; phosphoric acid, ·69; sulphuric acid, ·34; total, 99·80. Coke—blackish-gray in colour, fairly bright, very dense; will readily stand handling without much breakage, and bear the weight of a heavy burden of ore or flux.
3693	„ „ .....	·65	·33	86·90	11·44	·50	1·836	Coke, very dense, firm, and of good lustre. The coke can be handled without much breakages, and is a good coke for metallurgical purposes. Ash—reddish tinge, flocculent.
2888	West Narrabri .....	3·25	46·50	40·75	9·50	·755	1·265	Coke, 50·25 per cent., not much swollen, hard and bright. 1 lb. of this coal will convert 11·45 lb. of water into steam. Ash—reddish, granular.

The foregoing table shows that the quantity of coke manufactured during the year was 4,551 tons less in quantity and £8,526 less in value than the previous year. In the Southern District the Australian Coke Company at Unanderra is still the principal makers, and the output for the year was 13,357 tons, valued at £10,017, and in the Northern District the Purified Coal and Coke Co. at Wallsend turned out 8,520 tons, valued at £10,650, and 1,050 tons of nut coal washed from slack, valued at £420. Continued efforts on the part of the manufacturers to produce a clean hard coke, which is necessary for the proper treatment of some of our silver-bearing ores, will no doubt ultimately put them in a position to successfully compete with the English article, large quantities of which are still imported by some of the Broken Hill Silver-mining companies.

The following table shows the quantity and value of Kerosene Shale produced during the years 1865 to 1895:—

Year.	Quantity.	Average price per ton.	Total Value.	Year.	Quantity.	Average price per ton.	Total Value.
	tons.	£ s. d.	£ s. d.		tons.	£ s. d.	£ s. d.

1881	27,894	1 9 2·59	40,748 0 0				

As will be seen from the foregoing table, there is a very satisfactory increase in the output of shale, otherwise known as Petroleum Oil Cannel Coal, or Boghead mineral. This mineral is worked at the present time principally in the Katoomba, Joadja, Hartley, and Capertee districts, and the number of men employed during the year was 354. A large quantity of the higher-grade shale is shipped to England, where it finds a ready market. The average price, however, was about 4s. 8½d. per ton lower than the average price for 1894, and lower than reached during any year since the opening of the mines, and would show that the depression which existed in the coal trade during the past year has extended to this industry.

During the year twenty-three analyses were made of kerosene shale in the laboratory of the Geological Survey Branch of this Department, nineteen of which resulted as follows:—

Official Number.	Locality— Stated by the finder to be.	Analysis in 100·00 parts.					Sulphur.	Specific Gravity.	Remarks.

## SILVER AND LEAD.

The following table shows a large decrease in the output of silver and silver-lead, the amount of the decrease being £634,526. It is, however, confidently anticipated that the coming year will see a very large increase in the returns. Owing to the success attending the efforts of the Broken Hill Companies to treat their low grade ores, some of the mines long shut down have been reopened, and expect, under the new system of treatment, to be able to work at a profit. Attention is also being directed to the silver lodes in the Northern District. When the large works now being erected on the shores of Lake Illawarra for the treatment of these ores are completed, it is hoped that these large lodes can be profitably worked. In other districts where silver-bearing lodes exist there are indications of a revival, when all hopes of such had virtually been abandoned.

\*Note.—In the Annual Report for 1888, 11,739 tons 7 cwt. of silver ore, valued at £164,620, was omitted from the table. The bulk of the silver is exported in the form of silver-lead.

The following information relating to the silver-mining industry within the Colony is taken from the reports sent in by the Wardens and Mining Registrars:—

## THE ALBERT MINING DISTRICT.

## Broken Hill Division.

About the beginning of the year mining matters were very depressed in this very important Division, but a revival is now apparent owing to the great advancement made in the efforts to profitably treat the large bodies of sulphide ore found in all the mines on the Barrier. The effect of this is that many of the mines which were compelled to shut down when their oxidised ore was exhausted are now in full work and able to make a small return to the shareholders. The companies have spent large sums in carrying out experiments to solve the difficulty, and it is impossible to over-estimate the benefits to the district from the successful result of their experiments. The supply of sulphide ore, of a payable character, is practically unlimited, and fresh developments of a similar grade are frequently taking place. The principal mine on the field is The Broken Hill Proprietary Company (Limited), which employed during the year, on an average, 2,409 men, and the value of their mining and metallurgical plant is about £200,000. The quantity of ore raised was 517,565 tons, and the company exported 24,625 tons of silver lead bullion, assaying on an average 276 oz. per ton, the total value of which is £363,294. They also sold ore assaying 26 oz. of silver and 14 per cent. of lead to the value of £189,900; 4,650 oz. of gold were also saved and 443 tons of copper in matte. The large reduction in the number of men employed as compared with 1894 is due to the disastrous fire in the mine, which threw a large number of men out of employment and cost the company a very large sum of money to extinguish it. A large number of the men who were temporarily thrown out of work left for other fields. The Companies at work on the lode are The North Broken Hill, The Broken Hill Junction North, The British Broken Hill Proprietary, The Broken Hill, Proprietary Block 10, Block 14, The Central, and Broken Hill South.

The total quantity and value of the minerals exported from the field during 1895 were as follows:—

		Value.
Silver lead bullion .....	29,684 tons	£959,562
Silver lead ore .....	189,133 „	587,255
Silver ingots (pure) .....	472,449 oz.	57,804
Copper ore .....	23 tons	112
Copper matte .....	1,004 „	21,230
Gold .....	4,650 oz.	18,600
		£1,644,563

As compared with 1894 there is a reduction of over £600,000 in the yield from this Division. In view of the success attending the experiments with the sulphide ore, combined with the fact that ground known to contain this ore is being pegged out with a view to being worked, a substantial increase in the yield may confidently be anticipated during the coming year. The number of men in and about the mines at the end of the year was 4,297. There is a difficulty in arriving at a correct estimate of the exact quantity of pure silver won from this field, as it is exported chiefly in the form of silver lead bullion and silver ore, but the amount may be put down approximately at not less than 8,669,012 oz.

## THE BATHURST MINING DISTRICT.

*Mitchell Division.*

The Sunny Corner Silver-mining Company's mine is still working on tribute, and during the year gave employment to 100 men on an average. The amount of ore treated was 14,941 tons, which yielded 355 tons of argentiferous and auriferous copper matte, valued at £21,300.

No work has been done during the year at the Mount Costigan and Cordillera Mines, but there is some prospect of the property being taken over by a syndicate during the forthcoming year.

## THE MUDGEE MINING DISTRICT.

*Denison Town Division.*

The Mount Stewart Silver-mine has been idle all the year, and there is no immediate prospect of the mine being reopened. The owners of the Mount Scott lease have, however, been doing a little work on their lode, which is a very nice gossan, assaying very fairly. Negotiations are being carried on with a Melbourne syndicate regarding the silver properties in this locality, but at the end of the year no arrangement had been arrived at.

## THE NEW ENGLAND MINING DISTRICT.

*Fairfield Division.*

There is every prospect of a revival in silver-mining in this Division during the incoming year. An English syndicate has acquired the White Rock property, and has also leased a large area of land at the old Boorook Silver-mine. It is believed to be the intention of the syndicate to work these properties in connection with the Illawarra Smelting Company. The Adeline Milling Co. has entered into an arrangement with the Mascotte Co. at Drake, and if the large parcel of ore sent for treatment proves profitable there is a probability that the Mascotte Mine will again be worked on a large scale.

*Emmaville Division.*

About 2,000 tons of ore were raised from Webb's Mine, and 211 tons of concentrates were sent by rail to Maryborough, Queensland, for treatment, and the value of the silver won was £3,899. Some activity was displayed during the close of the year by parties retaking various of the abandoned silver-bearing portions east and west of Emmaville, but the boom appears to have been almost entirely speculative in view of the proposed erection of smelting works at Illawarra, for the treatment of refractory ores. There is no doubt, however, that the successful establishment of those works will cause a revival of silver-mining in this district, as the argentiferous ores are abundant and easily accessible over good roads to the railway station.

*Wilson's Downfall Division.*

Silver-mining in this Division is at a very low ebb. The leases which are only partially at work are the Central Mine and Messrs. Reid and party. The Proprietary Company's works have been leased to Mr. Edgar Hall, the experiments in connection with the ore having fallen through. The mill has been at work at intervals only during the year, and is now closed owing to the want of ore to keep it going. The capacity of the crushing mill is 45 tons per day, and of the roasting plant 15 tons per day. The quantity of ore purchased from the mines and treated during the year was 280 tons, for which the sum of £1,640 was paid, equal to £5 17s. 2d. per ton. This ore was taken from 15 different claims. The present lessees have no intention of again starting the mill. A few parcels of picked ore were sent to the Queensland Company's works at Aldershot for treatment, the results averaging from 65 to 110 oz. of silver per ton. About 20 men are at work in the locality, and the total output for the year was 516 tons, valued at £2,184. The following report by Mr. Joseph Benjamin, a well-known mine manager, at Rivertree, will show some further light on the condition and prospects of silver-mining in the Rivertree district:—

"Rivertree Central Mine, Rivertree, 5 January, 1896.

"In furnishing you with the annual statement of the quantity of silver ore raised by me, and its value, from the Rivertree Central Mine for the year ending 31st December, 1895, with particulars and value of plant, I am desirous of pointing out to you many things in connection with this field which, while embarrassing the mining population that are here, causes their disabilities to be so great that where there should be working room for a large number of men, with their families, opening up a large and permanent industry, employing some thousands of hands, there is simply, from the want of change being made in the present condition of things, a few just struggling along, and kept alive by their uphill exertions, and as it is possible it may be in the power of the Department of Mines to make such inquiry as may lead to the alleviation of our existing troubles, I am desirous that this report may be forwarded on to the Under Secretary for Mines, together with the annual return.

"In explaining our difficulties, and in order that our position may be understood, it will be necessary to describe the Rivertree field, the character of the lodes, and the grades of the ore obtained from them; also the methods that have been attempted for their treatment, with the results of such attempts, with the cost of raising and treatment. This having been done, I think I can show that up to the present time, without any exception, all work has been carried on at a loss, and that until such method or process is introduced to treat our low-grade ores of from 30 oz. silver to the ton upwards at a reasonable cost, such working loss will continue.

"The Rivertree silver field is situated on the Clarence River, being portions of the parishes of Clarence, Reil, Strathspay, and Cataract, county of Builer, starting from (say) the junction of the Maryland and Boonoo Boonoo Rivers; thence running the Boonoo Boonoo River down to the junction with Koreelah Creek, at which point it becomes the Clarence; thence running the Clarence River down for about 3 miles, taking in upon the north about 4 miles back, and upon the south about 2 miles back, such country, mostly being included in the extended gold-field reserves of Tooloom and Boorook, the whole covering an area of about 35 square miles.

"The country on the northern side consists of altered and carboniferous slates, with Devonian and diorite belts running through, with granite intrusive. The lodes then, in running between slate and granite and slate and diorite walls, are clean, true, and defined.

"On the southern side the country is principally granite, the lodes, there running between granite, or granite and diorite walls, and, as in the north, are clean, true, and defined also, while some little greisen crops out, and more southerly the slate country comes in again, the deepest shafts being tested to a depth of 200 feet. The lodes are very numerous, in fact, portions of the country being traversed by networks of veins, their bearing being N. and S. from 15° to 20° west of south. They are in character lenticular, both in their course, and in going down and ranging in thickness from 1 inch to 18 inches or 2 feet, the ore going in value from a few to 200 and 300 oz. silver to the ton. The bulges of ore are uncertain both in size and value, while the blanks are often of greater extent, thus entailing a large amount of dead work before one can win any quantity of ore fit for treatment. The country generally appears much broken, the lodes at the east end underlying to the east, while those at the west end underly to the west. Of the ore itself, the gossans or oxides consist of arsenical iron gossans, containing carbonate of lead, with silver either in arsenical or chloride form; in some traces of antimony are met with, while in others the surface outcrops are chiefly quartz, containing iron (argentiferous). Upon sinking, when the sulphides are struck, which varies from 10 to 30 feet, the sulphides usually appear in one of the following forms:—Galena, mixed with pyrites and zinc blende, black ore, showing some galena and arsenic, arsenical pyrites, arsenical red silver, and Fahlerz. Most of the sulphide ores are base, and generally carry with them zinc blende. Throughout the lodes, is also about an equal amount of copper as there may be silver. The lodes are all silicious, the average in lead being about 8 or 9 per cent.

"The treatments that have been attempted have been smelting by the water-jacket furnace, leaching by the Russel process, using the White-Howel roasting furnace for chloridising, and in a smaller way raw-leaching. The first from the high silicious character of the ore, and having to import fluxes (ironstone and lime), as also coke, caused the result to be both expensive and unsatisfactory. With leaching, its high tariff of charges makes this also prohibitive, except for the treatment of the rich grade ores, leaving all the poorer ores useless, which in some cases have been stacked with a hope of future cheap means of treatment, while by many others it has either been thrown over the tip, or has been returned into the mine to fill up stopes. "In

" In the return of silver won from the Rivertree Central Mine you may notice that out of the 60 tons of ore only 37 tons were good enough to be sent for treatment, the remaining 23 tons being seconds of too low grade to bear expense of treatment, or the ore left from 37 tons after dressing, which was also too low. The charge for treatment at the works on the field is £3 per ton, together with 20 per cent. deducted of its value, thus making on the 37 tons of ore, of 166 oz. silver per ton, the value of which, at 2s. 6d. per oz.—£746—the following charges, viz. :—

37 tons treatment, at 60s. per ton .....	£111 0 0
20 per cent of silver (value of £746) deducted .....	149 5 0
	£260 5 0
Which, together with carriage of 37 tons to works.....	0 10 0 = £269 15 0

making the cost of treatment 36 per cent. of its entire value, and even this, it is stated by the mill-owner, to be under what it cost and to incur a loss. You will also notice that the labour, stores, and rent incurred during the twelve months to raise this 60 tons of ore, amounting to £647 4s., is entailing a loss, after everything is paid, of £170 19s. for the year's run. This clearly points to the fact that to make the Rivertree field a successful industry, and one that can be made so, and which by so doing opens up a field to support a large number of men and their families, other efforts will have to be made, either in addition or in lieu of these that have already been tried by those who have struggled to keep the field going to the present time.

" A large amount of money, something between £60,000 and £70,000, has already been laid out upon development and machinery, that spent upon the former being, to a great extent, surface work, and small portion only having been expended in deep mining, which at the greatest depth is now only a shade over 200 feet; while the money that has been sunk in machinery for treatment has nearly all been absorbed by the large leaching plant which has lately been running, but which, from the high tariff already referred to, has caused it to be a failure, by making it prohibitory to the miners, except for their high-grade ores, and which they can realise upon with almost equal results by sending to the Queensland Smelting Works, Aldershot, at which place they are paid for their lead, while here they are not, beyond the fact that the local works, even at their high tariff, are working at a loss.

" These facts in themselves prove that the method of treatment is not that which is required for the well-doing of the field, and that other process of treatment is necessary before the place can be worked with profit to those concerned. The raw-leaching that was tried on a small scale was so far as it went fairly successful and could be improved upon, but in this case oxide ores only were treated, and the difficulty of the sulphides still remains a vexed question. Amalgamation may possibly be a solution to the difficulty, more particularly if ore amalgamation could be used, there appearing to be a difficulty in any process by which the ore has to be chloridised by roasting with salt in consequence of the volatile character of the Rivertree ores.

" Under these circumstances we are naturally at a standstill to know what is best to be done. We have a large field, a quantity of ore, much of it rich, however much it may be scattered, and a larger quantity of lower grade; to get the rich ore we must mine the poor also, and our difficulty is to find a process by which we can, at a reasonable and remunerative cost, treat and realise with profit on high and low grade ores, treating in bulk without dressing. Numerous experts and metallurgists have ventilated schemes, but all have more or less proved faulty and unworkable; but we think it is possible that if the Department of Mines instructed the Government Metallurgist to visit the field, and by his carefully getting together all evidence, by examination of the character of the ore, by analysis, and by other data, he may be able to put forward such views as may lead to the solution of our present trouble as to the treatment of the ore.

" All the particulars I am writing I am sure, upon inquiry, will be endorsed by all the miners now working and raising ore on the field.

" To sum the matter up, it means we have a large and extensive field only half prospected; numerous lodes, carrying silver from a few to hundreds and more ounces to the ton; the lodes although numerous are small and patchy (that is, lenticular), having often long blanks of poor ore, and consequently the cost of raising becomes heavy.

" Up to the present time all methods of treatment, on the field, have either been impracticable from the character of the ore, or the cost of treatment has been so high as to prohibit any but rich ores of (say) 100 oz. and upwards, or ore dressed to that standard, being treated, leaving on the hands of the miner all ore from 40 oz. downwards, which, although in some cases it may have been stacked, in most has been thrown over the tip or returned to the mine. In order to make the field what its resources should make it, to carry a good and prosperous population, a process for treating our low-grade ores of from 30 oz. upwards is necessary. By so doing the ore which is now obliged to be dressed up to a certain standard to make it remunerative would then be treated in bulk, and the labour which is now lost in raising ore, which at the end is valueless, would in its turn become payable to the miner. This also means that (firstly) the output of the present number of miners would be increased at least three-fold, while the fact of the ore being of value in bulk would (secondly) bring on to the field a number of miners who are waiting the solution of this difficulty and anxious to come, and (lastly) the leaseholders who are working on a partial suspension of labour would, from force of circumstances, have to throw up their leases if their labour conditions were pressed, as being heavy losers now by the present hands they employ, this loss would only be made greater (*pro rata*) by the number they might further employ, while the reason of this state of things is simply the inability to realise on the low-grade ores won by such labour.

" I have, &c.,  
" JOSEPH BENJAMIN."

#### THE PEEL AND URALLA MINING DISTRICT.

##### *Hillgrove Division.*

Messrs. Wade, Baker, and Party are working a very promising silver lode on Mr. Finlayson's Points Field Estate, and so far are very well satisfied with the results obtained. They have bagged and sent away for treatment 100½ tons, valued at £3,756. This mine promises to be both permanent and profitable. There are several other parties opening up silver-bearing veins in the vicinity of the above, but so far nothing permanent has been discovered. At the Old Della Mine, Coakley and Party are bagging a trial lot, and appear satisfied with their prospects. There are undoubtedly rich silver veins in this locality, which careful prospecting would prove payable to small working parties.

##### *Inverell Division.*

Nothing has been done during the year in silver-mining in this Division owing to the low price of silver, but now that the treatment of refractory ores is in a fair way to being solved, anxious inquiries are being made about the best of the lodes taken up some years ago, but afterwards abandoned owing to the difficulty in treating the ores. There are several silver lodes in this district well worth developing, although the local miners take very little interest in the industry, devoting all their energies to tin-mining.

#### THE SOUTHERN MINING DISTRICT.

##### *Rye Park Division.*

The Walla-Walla Company's claim is situated about 18 miles south-east of Burrowa, near Rye Park. Very little work was done during the year, but it is stated that the mine is to be reopened shortly, when the lode will be thoroughly proved.

##### *Captain's Flat Division.*

The Lake George United Mining and Smelting Company employs 150 men, and raised during the year 18,563 tons of ore, which produced 1,104 tons of matte and lead bullion, containing 2,164 oz. of gold, 137,951 oz. of silver, 350 tons of copper, and 64 tons of lead, of a total value of £42,604. Since the recent important developments in this mine, the number of men employed has been greatly increased, and should the diamond drill bores now being put down equal expectations, the number will be added to.

*Moruya*

*Moruya Division.*

The only silver-mining operations being carried on in this Division are purely of a prospecting nature. Several shafts have been sunk, the deepest being 47 feet. From one of these shafts 10 tons of ore were raised, which assayed from 15 to 40 oz. of silver per ton, with a small percentage of gold. O'Neill and Party, working the adjoining ground, have been aided from the Prospecting Vote to continue their shaft to a total depth of 100 feet. Should the lode prove payable at that depth, extra employment will be found for a number of miners.

*Pambula Division.*

In the neighbourhood of Wyndham, there are about forty men prospecting for silver lodes, and some very good-looking gossan ore has been raised. Several parcels have been sent to Europe and elsewhere for treatment, and should the results prove satisfactory, development work will be vigorously proceeded with. All the old abandoned ground has been taken up, and new and heavier machinery is being erected on the old shafts to clear them of water.

During the year 4,285 samples were assayed for silver in the laboratory of the Geological Survey Branch of this Department.

2,261 yielded nil.

### TIN.

The following information relating to the Tin-mining industry during last year within the Colony is taken from the reports sent in by the Wardens and Mining Registrars:—

#### THE NORTHERN DISTRICT.

##### *Tingha and Inverell Divisions.*

There is a large decrease to report in the output of tin from the Tingha and Inverell Divisions, the quantity being 469 tons 15 cwt., valued at £15,498, or at the rate of about £33 per ton on the ground. The output during 1894 was 742 tons, valued at £27,454. The recent drought had a great effect in creating this large decrease, as the alluvial tin-miners could not treat their wash-dirt, and at the end of the year it was estimated that 20,000 loads were at grass awaiting water, the whole being valued at £7,600. Although the price has been low and the production small, the miners seem to be fairly well off, and can always make rations. There is nothing in particular to note this year in new finds, and it is becoming apparent that the shallow tin leads around Tingha are nearly worked out. Prospecting is still going on in the vicinity for the deep leads supposed to exist there, but as the water is troublesome capital is required to carry the work to a successful issue. The deep leads are being worked at Elsmore, and the wash-dirt stacked in anticipation of rain. At Aubury Vale a little work is being carried on, chiefly on private property. Wilton and party are said to be raising payable wash-dirt on Mr. Cooper's estate, but owing to the long and continuous drought they have been unable to wash. The same may be said of the localities of Gilgai, Ponds, Stannifer, Newstead, and Middle Creek, where stacks of wash-dirt are to be found awaiting water, some of it having been stacked for about twelve months. About 400 men, including 150 Chinese, are employed tin-mining in this Division.

##### *Glen Innes Division.*

There is a slight increase in the output of tin from this Division, the quantity being 165 tons, valued at £5,445. The Mann River, on whose banks the tin is mainly found, affords an abundant supply of water during all seasons. Many of the miners in this locality are also farmers, and they combine the two avocations with profit. It is thought that payable tin will ultimately be found under the basalt range bounding the course of the Mann River, and should such prove the case a large avenue for employment will be opened up. There were 41 Europeans and 18 Chinese tin-mining in this Division at the end of the year.

##### *Emmaville Division.*

This is the largest tin-producing mining Division in New South Wales, and during the year 350 Europeans and 260 Chinamen were employed in the work. The quantity won was 900 tons, valued at £29,700, which is a large decrease as compared with the output in 1894, which was 1,108½ tons, valued at £44,386. Of the year's yield 115 tons were won from the deep leads, 286 tons from the lode, and the balance, 499 tons, from the various shallow workings extending over the whole field. The Ottery tin-mine at Tent Hill is the only mine where systematic work on the lode is being carried on, and from this source 181 tons 6 cwt. of dressed ore were obtained. This Company employed 76 miners during the year, and has two batteries at work of ten and fifteen head of stamps respectively. The lode being worked varies from 3 to 25 feet wide, and carries about 3 per cent. of tin. But little development work has been done at the "Butler's" mine during the year, on account, it is alleged, of the low price of the ore. Small lots of lode tin, also came from various lodes and leaders at the Gulf, Torrington, the Table-land, and vicinity. Should the forthcoming season provide an ample supply of water, the returns from this Division will be largely increased.

##### *Deerwater Division.*

There were 200 tons of tin won in this Division during the past year, valued at £6,400, which is just about half the quantity produced the previous year. The Cliff Tin-mining Company's is the only mine of any note being worked for tin in this Division at the present time. This Company is working a lode, and there are a number of other parties working on the same line, who occasionally discover shoots of tin, which, however, cut out again in a few days. There are a great number of alluvial claims at work, but it is questionable if the men have been able to make more than rations, owing to the drought.

Wilson's

*Wilson's Downfall Division.*

There is a decrease of about 50 per cent. in the output of tin from this Division as compared with 1894, the quantity being 98 tons, valued at £3,234. This result may be partly due to the recent drought and to the fact that some of the old payable claims are now worked out. No fresh discoveries have been made during the year, and the work done has been more of a fossicking nature than otherwise.

*Kempsey Division.*

Work is still being carried on at the Gundle Tin Mine, but the returns for the year were not available. Prospecting work is still being carried on for payable tin lodes in this locality, and very promising indications are met with.

*Bendemeer Division.*

Murray and party are still working their stream tin deposit, and won during the year 11 tons 17 cwt., valued at £448, which is the total yield of this Division.

## SOUTHERN DISTRICT.

*Germanton Division.*

There are 20 men employed tin-mining in this Division, but the work carried out has been principally of a prospecting or developing nature, and the quantity won amounted only to a few tons. The Champion Company's operations have been at a standstill for want of water, and the work of the other parties in the locality has been carried on under great difficulties. The local miners are confident that payable wash-dirt will yet be struck in the neighbourhood of Spring Creek and other localities in the Upper Murray District.

*Wagga Wagga Division.*

Prospecting was very active for a time around Wagga Wagga, the result so far not being satisfactory. At Pullitop the tin lodes are not sufficiently developed to prove their value, and more capital is required for the work than can be got locally. The deposits of stream tin to be found near Pullitop would, it is thought, prove payable if sufficient water could be had for sluicing purposes, but at present it is difficult to see how the want is to be supplied. There is a large area on this field that would probably pay well if water could be got from some near source. There are a large number prospecting in this locality, and the coming year may see some fresh and important developments.

TABLE showing the quantity and value of Tin exported from, and the product of, the Colony of New South Wales, since the opening of the Tin-fields in 1872.

Year	Ingots.				Ore.				Total.			
	Quantity.		Value.		Quantity.		Value.		Quantity.		Value.	
	tons	cwt.	£	s. d.	tons	cwt.	£	s. d.	tons	cwt.	£	s. d.

4133	Esk River .....	Concentrates (See 4139 under "Gold.") .....	5.12
4269	" (McAuley's Lead).....	Concentrated beach sand, first treated with boiling washing soda and then passed over copper plates three times (See 4269 under "Gold.")	38.52
2258	Grenfell, north of .....	Alluvial tin. (See 2258 under "Gold.") .....	47.20
1049	Gulf, New England .....	Lode tin ore.....	48.4
1050	" " .....	Slaty material containing copper pyrites. (Silver 1 oz. 10 dwt. 11 gr., per ton.)	4.4
1051	" " .....	Pannings .....	62.70
1718	Inverell District .....	Stream tin .....	73.47
422	Pullitop, Parish of .....	Rubble, consisting chiefly of tinstone and quartz fragments. (Gold a trace, silver 12 dwt. 22 gr., per ton)	55.54
4327	Shellharbour .....	Concentrated beach sand (See 4327 under "Gold.") .....	49.10
370	Strathbogie .....	Ironstone .....	54.78
2892	Tumut District .....	Black sand (See 2892 under "Gold.")	7.34

#### COPPER.

The following table will show that the quantity of copper exported during the year was largely in excess of that in 1894—an increase of 1,715 tons, and £67,404 in value. The restarting of the Great Cobar Company's mine at Cobar is responsible for the increase, as that Company produced 1,703 tons of smelted copper, valued at £68,120, from 37,845 tons of ore raised. To further increase its production, the company has added another 60-ton water-jacket furnace, and now employs, on an average, 415 men. The Nymagee Copper Mine is being worked on tribute, and the ore raised was 5,845 tons, which produced 485 tons of smelted copper, valued at £21,825. About 150 men are employed in and about this mine. The New Mount Hope Copper Company at Mount Hope employs 38 men, and raised 858 tons of ore for 143½ tons of smelted copper, valued at £5,456. This company's shaft is now down 340 feet, and the ore is being raised from that level, the lode being about 58 feet wide. The Great Central Mine is at South Mount Hope, and employs over 40 men. The shaft is down 242 feet, but work is being carried on at the 192-ft. level, where the lode is 3 feet wide. The Company raised 900 tons of ore, which yielded 134 tons of copper, valued at £5,093. The Burruga Copper Mine, at Burruga, was worked all the year round with the exception of a couple of weeks in June last, when the lode ran out. It was, however, picked up again, but, unfortunately, did not prove so rich as the old lode. This fact, combined with a wages dispute with the men, helped to reduce the output, which was only 331 tons, valued at £14,895, from 3,311 tons of ore. Two furnaces are kept going, and the number of men employed is about 150. The May Field Copper Company have started work at Rye Park, situated about 17 miles south-east of Burrowa, and during the year raised 50 tons, which returned 9 tons of smelted copper, valued at £360. The lode is 2 ft. 6 in. wide, and the deepest shaft is now 125 feet. At Captain's Flat, the Lake George United Mining and Smelting Company obtained 350 tons of smelted copper. This company raised 18,563 tons of ore, and besides the copper given above, got 2,164 oz. of gold, 137,951 oz. of silver, and 64 tons of lead, the total yield being valued at £12,604. About 300 men are now employed in and about this mine, and should the diamond drill boring operations prove successful, the number is likely to be increased. A well-defined lode, carrying copper and silver, has been discovered by Thomas Coyle near the Cotter River in the Queanbeyan Division, from which 60 tons were raised, yielding copper to the value of £150 and silver £105. This lode is being further developed. At Broken Hill, the Proprietary Company saved in connection with their silver mining operations 23 tons of copper and 1,004 tons of copper matte, valued at £21,312.

TABLE

Official Number.	Locality—Stated by the finder to be.	Description.	Per cent. Metallic Copper.
31	Drake .....	Cavernous quartz, with blue carbonate of copper. (Silver, 5 oz. 2 dwt. 8 gr. per ton.)	17-51
137	" .....	Siliceous felspathic lodestuff, containing blue carbonate of copper and copper pyrites. (See No. 137 under gold.)	19-07
4072	" .....	Ferruginous friable quartz, with blue and green carbonates of copper. (See 4072 under silver.)	10-07
4073	" .....	Sulphide and carbonate of copper. (Gold, a trace; silver, 5 oz. 8 dwt. 21 gr. per ton.)	46-97
2795	Elsmore (Newstead Mine).....	Crushed sample, rich in sulphides, principally galena. (See 2795 under silver, lead, and zinc.)	7-15
2726	" .....	Crushed sample, rich in sulphides, principally galena. (See 2796 under sulphur and zinc.)	7-29
3531	Gulgong (about 3 miles from) .....	Very ferruginous copper ore. (Silver, 13 oz. 12 dwt. 4 gr. per ton.)	32-67
3532	" .....	Ferruginous copper ore. (See 3532 under gold and silver.)	25-05
564	Gundagai (12 miles from) .....	Green carbonate of copper.....	12-36
728	" (near) .....	Dark coloured stone, containing blue and green carbonates of copper. (Gold, a trace; silver, 2 oz. 3 dwt. 13 gr. per ton.)	17-71
1729	Kiandra .....	Copper gossan.....	36-70
2731	" .....	Mainly various sulphides of iron and copper. (Gold, a trace; silver, 8 dwt. 17 gr. per ton.)	13-36
2732	" .....	Similar to preceding. (Gold, a trace; silver, 10 dwt. 21 gr. per ton)	12-36
948	Liliwa, Cudgong .....	Sulphide of copper, somewhat oxidised. (See 948, under silver.)	31-16
2300	Macleay District .....	Blue and green carbonates of copper. (See 2300 under silver.)	11-81
941	Milburn Creek .....	Copper pyrites. (Gold, a trace; silver, 4 oz. 0 dwt. 13 gr. per ton)	8-89
2185	Millthorpe (18 miles from) .....	Copper glance. (See 2485 under gold)	13-32
120	Molong, Copper Hill .....	Copper ore. (Gold, 1 dwt. 15 gr.; silver, 8 dwt. 3 gr. per ton)	7-39
2672	" .....	Copper glance. (Gold, a trace; silver, 1 oz. 3 dwt. 22 gr. per ton)	62-80
3299	" .....	Quartz, with carbonate of copper. (See 3299 under gold)	6-66
2742	Mount Drysdale (30 miles from)....	Copper glance. ....	22-14
4078	Mount Hope .....	Carbonate of copper in white clay. (Gold, 3 dwt. 6 gr.; silver, 2 oz. 0 dwt. 6 gr. per ton.)	33-10
4812	Mount Stromboli (near).....	Broken up copper-stained ore .....	32-45
4813	" .....	" .....	21-23
1102	Mulloon (E. P. Scott Mine) .....	Copper pyrites, with zinc blende. (Gold, 4 dwt. 8 gr.; silver, 3 oz. 16 dwt. 5 gr. per ton.)	5-70
4163	Narrandera .....	Massive copper glance, superficially converted into oxide and green carbonate. (Gold, a trace; silver, 1 oz. 3 dwt. 22 gr. per ton.)	56-24
1782	Orange District .....	Crushed copper ore—carbonate. (See 1782 under silver)	33-61
1783	" .....	" .....	10-20
2275	Orange .....	Cupriferos gossan. (Silver, 1 oz. 1 dwt. 18 gr. per ton)	13-56
2276	" .....	" .....	14-96
4234	" (7 miles from) .....	Copper glance and copper pyrites. (Gold, a trace; silver, 2 oz. 12 dwt. 6 gr. per ton.)	23-78
278	Peak Hill .....	Copper glance and iron pyrites, with quartz, in a matrix consisting of silvery micaceous mineral. (Gold, 4 dwt. 8 gr.; silver, 1 oz. 3 dwt. 22 gr. per ton.)	45-68
608	Queanbeyan (about 2 miles N.E. of) .....	Lodestuff, containing blue and green carbonate of copper. (Silver, 3 oz. 0 dwt. 22 gr. per ton.)	5-98
3388	Rylstone (10 miles from) .....	Ferruginous copper ore—carbonate and sulphide. (Silver, 7 oz. 18 dwt. 22 gr. per ton.)	34-95
3389	" .....	Copper ore—bornite, partly superficially converted into carbonate. (See 3389 under silver.)	36-26
3865	Tingha .....	Copper gossan. (See 3265 under silver)	10-17
768	Tooloom .....	Ironstone, with a little red oxide and green carbonate of copper. (Silver, 1 oz. 6 dwt. 2 gr. per ton.)	19-31
503	Wandsworth.....	Quartz, with copper pyrites and a little calcareous material. (Gold, a trace; silver, 3 oz. 14 dwt. 1 gr. per ton.)	14-52
3634	Wee Jasper (20 miles from Yass)....	Copper pyrites and carbonates in a dark-coloured quartz.....	6-06
727	Willie Willie (Macleay River) .....	Copper ore, containing blue and green carbonates. (Gold, a trace; silver, 7 oz. 12 dwt. 10 gr. per ton)	26-17
1556	" .....	Copper ore—blue and green carbonates. (Gold, a trace; silver, 6 oz. 6 dwt. 3 gr. per ton)	18-12
1557	" .....	Copper ore—blue and green carbonates. (See 1557 under silver)	48-16
1560	" .....	" .....	40-09
1675	" .....	Copper gossan. (See 1675 under silver)	42-44
2642	" .....	White quartz, with clay, coloured green by carbonate of copper ..	5-78
2952	" .....	Copper gossan. (Gold, a trace; silver, 14 oz. 0 dwt. 21 gr. per ton.)	35-55
3758	" .....	Green carbonate of copper. (See 3758 under silver)	32-84
3801	" .....	Ferruginous carbonate of copper ore. (Silver, 5 oz. 17 dwt. 14 gr. per ton.)	27-80
4259	" .....	Ferruginous copper ore—sulphides with carbonates. (Gold, a trace; silver, 13 oz. 10 dwt per ton.)	22-28
4418	Wyalong .....	Quartz and chloritic schist, with iron and copper pyrites .....	9-02
2187	Wyangle, county of Buccleuch .....	Cupriferos ironstone.....	20-15

## IRON.

Several men were at work during the year prospecting for payable deposits of hematite ore on the Bulli Ranges, in the Wollongong District. Extensive deposits of clay-band ironstone have been found to exist in these ranges, and indications of the presence of hematite ore have been discovered. The men were being paid from the Prospecting Vote, and the leader of the party was Mr. Charles Morton, C.E., of Bulli, the work being carried out under the supervision of Mr. James Rowan, Inspector of Collieries for the district, who took sections of the seams and strata where the men were at work. The first opening was

was made at a point about half-a-mile north-west of Corrimal Colliery, 1,170 feet above sea-level, and 630 feet above the top seam of coal; and No. 2 opening about 2½ chains north from No. 1; No. 3 opening is situated between Mount Keira and Mount Pleasant; No. 4 opening at Garden Gully, Mount Keira. At this place large blocks of hematite were found cropping out, and small pieces scattered over a portion of the ground. This place was well tried by sinking and trenching, but failed to prove more than could be seen on the surface. On Stafford's farm, Mount Kembla, and near the Mount Kembla Colliery air-shaft, hematite could be seen outcropping, but no well-defined deposit could be traced. A large number of samples taken by Mr. Inspector Rowan were sent to this Department for examination and analysis. Mr. Pittman, the Government Geologist, on submitting the results of the analysis of the samples, stated that "a very large proportion of the specimens forwarded for analysis consisted of shales and tuffs, which were quite worthless as ores of iron." It will be seen from the foregoing that the existence of payable deposits of hematite ore in this district still remains to be proved, which for this district, as a whole, is unfortunate. The manufactory of finished iron castings and galvanised iron, from scrap-iron, is still being carried on at the Eskbank Iron and Steel Rolling Mills by Mr. W. Sandford. During the year the quantity of iron put through was 2,403 tons, the manufactured price of which is £15,620 8s. 9d. On an average Mr. Sandford employs 130 men and 40 boys, his establishment being of much benefit to the district generally.

During the year fifty-two assays were made for iron in the laboratory of the Geological Survey Branch of this Department, the best results being as follows:—

Official Number.	Locality—Stated by the finder to be.	Description.	Per cent Metallic Iron.
2146	Bathurst .....	Earthy red oxide of iron .....	53·15
2679	Bulli .....	Ironstone .....	12·18
2680	" .....	" .....	50·40
2963	" .....	" .....	50·86

4196	" .....	" .....	*51·53
4197	" .....	" .....	*41·58
4198	" .....	" .....	*38·86
4199	" .....	" .....	*53·70
4200	" .....	" .....	*53·53

\* A large number of samples of shales, tuffs, limonite, &c., &c. of which thirty-two (4171-4202) were subjected to analysis. Of these only fourteen contained less than 60 per cent. of gangue. The above yielded over 30 per cent. of metallic iron.

Gangue.—Insoluble in boiling muriatic acid, and consists of sand and silicates of alumina, also some organic matter.

#### ANTIMONY.

The bulk of the antimony won in New South Wales comes from the Hillgrove District, where it is won in conjunction with the extensive gold-mining operations carried on there. The low price for this class of ore prevailing during the past year has been the means of greatly reducing the output, which was only about 400 tons, valued at £1,000, as compared with 632 tons, valued at £9,480, the product of 1894. The Eleanora Gold-mining Company sent away 167 tons of the smelted metal, which is valued at £1,908, and the Hillgrove Freehold 20 tons, the balance coming from the other smaller mines in the Division. Very little work has been done during the year on the antimony lodes at Bowraville, the total quantity raised being 50 tons, valued at £500. Until the price of antimony increases there will be little done towards extending the output.

During

During the year twenty-four assays were made for antimony in the laboratory of the Geological Survey Branch of this Department, the following yielding over 40 per cent. :—

Official Number	Locality—Stated by the finder to be.	Description.	Per cent. Metallic Antimony.
4539	Bowra, 7 miles from—Nambucca Heads (Geo. Lowe's antimony mine.)	Stibnite.....	62.55
3024	Cobar, 40 miles from .....	Siliceous antimony ore—sulphide. (See 3024 under gold.)	59.98
2823	Golden Gate, 8 miles from Bingara .....	Sulphide of antimony ore, superficially oxidised, contains a large quantity of cervantite as well as some antimonite and metallic antimony.	72.86

#### BISMUTH.

The only place in this Colony where bismuth is being mined for at the present time is at the King's Gate mine, in the Glen Innes District. The output of this metal is controlled by the demand in the London market, which is very limited. In consequence, only 2 tons 9 cwt. were forwarded during the year, but the selling price could not be ascertained. Very promising indications of the existence of payable deposits of bismuth have been met with in the Nymagee District, but no steps have been taken to prove the deposits so far.

During the year ten assays were made for bismuth in the laboratory of the Geological Branch of this Department, the following giving the best results :—

Official Number.	Locality—Stated by the finder to be.	Description.	Per cent. Metallic Bismuth.
1019	Glen Innes .....	Quartz. (See 1019 under gold .....	7.87
1020	" .....	" " 1020 .....	13.17
1769	Mount Emily, near—south of Quambi...	Weathered granite containing bismuth ores. (Gold, 4 dwt. 8 gr.; silver, 2 oz. 1 dwt. 9 gr. per ton.)	6.39

#### PLATINUM.

The quantity of platinum won at Fifield and Platina has been greatly restricted owing to the very dry weather prevailing last year—the figures being 413 oz., valued at 23s. per oz., as compared with 1,000 oz. won in 1894. This metal is saved in connection with the alluvial gold-mining operations carried on, and at the end of the year it was estimated that there were 6,000 loads of wash-dirt at grass awaiting a supply of water. A little platinum is still being got on the beaches on the northern coast by the miners working the black sand for gold, but the exact quantity saved could not be ascertained.

During the year twenty-six assays were made for platinum in the laboratory of the Geological Survey Branch of this Department, the following yielding the most favourable results :—

Official Number.	Locality—Stated by the finder to be.	Description.	Platinum per ton.
2772	Cudgeon Creek and Richmond River Heads (between).	Beach sand. (See 2772 under gold and tin.) .....	oz. dwt. gr. 270 17 2
		Iridosmine..... =	79 1 13
		Other platinoid metals .....	4 4 22
4139	Esk River beach deposits.....	Concentrates—Iridosmine under 15 gr. per ton. (See 4139 under gold and tin.)	0 18 17
4269	Esk River (M'Auley's Lead) .....	Concentrated beach sand, first treated with boiling washing soda and then passed over copper plates three times. (See 4269 under gold and tin.)	2 18 3
		Iridosmine..... =	0 17 7
3213	Richmond River (12 miles north of) ..	Beach sand. (See 3213 under gold.) .....	23 3 20
		Iridosmine..... =	3 19 23
3515	" " .....	The small sample of sand contains a few ounces of platinum, also a very small amount of gold. There is a fair amount of osmiridium present, also a good percentage of tin.	
4327	Shellharbour .....	Concentrated beach sand. (See 4327 under gold and tin.)	30 10 18
1819	Tweed and Richmond Rivers (between)	Beach sand. (See 1819 under gold) .....	18 9 22
		Osmiridium .....	6 10 16

#### CHROMIUM.

Gundagai is the only district in the Colony that is producing chrome iron to any extent at the present time, the quantity raised during the year being 5,500 tons, valued at about £20,000. This is rapidly becoming a valuable industry for the district, looking at the large amount of labour employed, which averages over fifty men. Mr. Geological-Surveyor Carne reports fully on these deposits on pages 125-8 of this volume.

During the year 149 assays were made for chrome in the laboratory of the Geological Survey Branch of this Department, the following yielding over 40 per cent. :—

Official Number.	Locality—stated by the finder to be.	Description.	Chrome per cent.

## MANGANESE, NICKEL, AND COBALT.

No serious attempt has yet been made to mine for these minerals to any extent; and although small parcels have been brought to Sydney for treatment, and fairly satisfactory results obtained, the matter has ended there. Large deposits of manganese ore are to be found at Back Creek, in the Rockley District, and it is also reported to be abundant in the broken country east of Glen Innes; but none of the lodes have been worked to any great extent. The cobalt deposits in the Carcoar District have not been worked during the year.

DURING the year forty assays were made for manganese, four for nickel, eight for cobalt, in the laboratory of the Geological Survey Branch of this Department, the following yielding the best results:—

Official Number.	Locality—stated by the finder to be.	Description.	Per cent. Binoxide of Manganese.	Per cent. Metallic Manganese.

1559	Willie Willie, Upper Macleay River.	Black oxide of manganese.....	68.39	43.24

## TUNGSTEN.

Nothing has been done during the year with the lodes of wolfram in the Emuville Division, but should the season prove favourable there is a probability that they will be tried. Margoehis and party had aid from the Prospecting Vote to test a wolfram lode at Berridale, but the work has been abandoned without anything of importance being struck.

During the year fourteen assays were made for tungstic acid in the laboratory of the Geological Survey Branch of this Department, the following yielding over 50 per cent:—

Official Number.	Locality—stated by the finder to be.	Description.	Tungstic Acid. Per cent.
2354	Casino District .....	Scheelite .....	75.20
4001	Cobar .....	Wolfram in quartz .....	53.70

4058	„ „ .....	„ „ „ .....	0.58

## ZINC.

During the year eight assays were made for zinc in the laboratory of the Geological Survey Branch of this Department, the results being as follows:—

Official Number.	Locality—Stated by the finder to be.	Description.	Per cent. Metallic Zinc.
2327	Broken Hill.....	Sulphide ore. (See 2327 under iron) .....	29.73
2328	" .....	" (See 2328 under iron) .....	26.21
4321	Cudjagong (near) .....	Zinc blende.....	8.75
2795	Elsmore ("Newstead Mine") .....	Crushed sample, rich in sulphides, principally galena. (See 2795 under silver, copper, and lead.)	23.65
2796	" .....	Crushed sample, rich in sulphides, principally galena. (See 2796 under silver and copper.)	9.15

## DIAMONDS.

The diamond mining industry at Bingara has been very quiet during the year. Captain Rogers has lately sunk a new shaft to test the low-levels of the Monte Christo Mine. A very large area of land has been taken up by various syndicates for diamond mining purposes who seem prepared to give the ground a good trial, judging from the preparatory works started. A revival has taken place at the Boggy Camp Diamond Field, which is situated 16 miles west of Tingha, and about 12 miles south-west of Inverell. The diamondiferous land comprises some 300 acres, all of which is taken up. Eight different parties are working the ground, and at the end of the year three of the parties were raising payable wash-dirt. The total yield for the year from this field, as far as can be ascertained, was 4,100 diamonds, which weighed in the aggregate 1,313 carats, principally got from the claims worked by Daisey and Party and Foreman Bros. The former party, in six months ending 31st December, 1895, from 50 loads of wash-dirt obtained 3,000 diamonds, valued at £280, and the latter party, during three months ending the same period, got 1,100 diamonds, valued at £120, from 110 loads of wash. The gem-stones are found under the basalt hills, in wash underlying a strata of clay and sand. The stones are not large, going about three to the carat, but some larger ones are occasionally met with. One stone was found recently which weighed 2 carats, and was almost perfectly round. There is a large deposit of diamond bearing ground in this locality which could be profitably worked if capital was introduced to erect the necessary machinery and work the claims in a systematic manner.

Operations are still being carried on in the Mittagong District in search of diamonds. The Kangaloon Diamond Mining Company are in receipt of Government assistance to continue their shaft to a total distance of 100 ft. Diamonds have been picked up from time to time in this locality, but the drift or matrix has not yet been traced from which they came.

## OPALS.

The principal seat of opal-mining in this Colony is at White Cliffs, in the Wilcannia District, where over 300 men find constant employment. The most important development on the field during the year is the finding of good stone at a depth of 50 feet from the surface—a much greater depth than previously worked. At that depth the country shows no sign of changing, and it has yet to be proved at what depth payable stone can be found. It is also encouraging to learn that the patches of opal met with appear to improve in quality with depth and to become more regular and frequent than that met with in the higher levels. On Block 5 the shaft is down 50 feet in first-class country, and splendid opal is showing in the drives. On Block 7 a patch of stone was found which realised over £3,000, and good stone is still being got. In one of the shafts on this block there are three distinct veins of opal—one at 10 feet, another at 20 feet, and a third at the 30 feet level. The work done on Block 8 has proved very satisfactory, the quality of the opal obtained being very good. In a shaft on this block large pieces of petrified wood and opalised shells were obtained at a depth of 30 feet. Block 6 is on the brow of a hill, where the country is much harder and the opal-bearing veins dip into the hill. Some valuable patches of opal have been taken from this block. A large amount of work has been done on Block 1, and payable veins of opal have been opened up in several of the drives. From Grant's shaft on this block a patch of stone was taken about the end of the year which brought £1,200, and driving is still being done along the vein. The shallow shafts on Block 3 are being deepened with satisfactory results. The other blocks on the field have been worked well and profitably during the year, and show every sign of improving as depth is reached. From the above notes on the prospects of the field, this industry is showing signs of a permanency not considered probable a few years ago, and is likely to find employment for a larger number of men during the coming year. It is a very difficult matter to obtain from the miners the value of the opal won by them, owing to the very loose manner in which they keep their accounts, if any at all; but as far as could

be ascertained the value of the stone sold on the field during the past year was over £6,000, which is probably a very low estimate. It was, however, pretty clearly shown, from rough books kept by the owners of seven different blocks, that during the past three years they had sold stone to the value of £23,000. The price of the stone per ounce is by no means of a uniform character, some being sold as low as 10s. per oz., while some of the best quality brings as much as £42 per oz. The main market at present seems to be Germany, as the majority of the buyers come from that country direct, or are connected with firms there. There is a ready sale for opal, more especially for first-class gems.

#### EMERALDS.

The mines at the Glen, in the Emmaville District, still remain closed down in consequence of the difficulties of extraction, and the low price of the gems in the London market.

#### TURQUOISE.

Work was carried on during the year by means of aid from the Prospecting Vote to test the value of the discovery of turquoise made at Mount Lorigan, in the Wogonga Division. A lot of work was done, but although very promising indications of payable stone being met with were present, no fresh find of any importance was made.

#### TOPAZES.

These gems were got during the year, near Oban, in the Glen Innes Division, in considerable quantity, but the only sale that could be traced was one where a small parcel was bought for a sum of £20, at a very low rate per pound.

#### MARBLE.

A very fine collection of different varieties of marble has been made by the Government Architect, chiefly from the Bathurst and Orange Districts. The samples have been polished, and some of them are extremely attractive in appearance, and would compare favourably with the better varieties of imported ornamental marble. If the deposits from which these samples were taken should prove to be extensive, there is every reason to hope that the marble will be extensively used for ornamental work in the future.

#### LIMESTONE FLUX.

The quantity of limestone flux brought in from Tarrawingie to Broken Hill during the year was 104,194 tons, valued at £68,160. This is slightly less than the quantity used during the previous year, which is accounted for by the partial stoppage of work at the Proprietary Company's mine during the disastrous fire underground. With a revival of mining at Broken Hill, owing to the solution of the "sulphide ore" difficulty, the output from these quarries will be largely increased.

#### ALUNITE.

The Australian Alum Company are still raising stone at Bulladelah, and shipping it to England, the quantity so shipped during the year being 826 tons, valued at £826 at the mine. The Company's works at Bulladelah still remain closed, as it is found the stone can be treated in England at a cheaper rate. This is the only place in New South Wales where this mineral is worked. There is a very extensive deposit, and the stone can be taken out very cheaply.

#### PLUMBAGO.

A lease to mine for this mineral has been taken up by Messrs. Smith and Party in the Wilson's Downfall Division, and they have a shaft down on the deposit to a depth of 60 feet. About 20 tons of ore from this shaft, valued at about £80, which has been forwarded to various firms for trial. The adjoining land has been taken up, and prospecting operations are being carried on from the deposit being worked by the prospectors.

#### TRIPOLITE.

A lease has been taken up to work a deposit of this mineral, commonly known as "infusorial earth," at Wyrallah, in the Lismore District, and a quantity has been forwarded to Sydney for examination, and to be experimented upon. A quantity from even a larger deposit, in the same Division, has been sent on to Sydney and London for a like purpose. Although deposits of the mineral are to be found about 8 miles from Barraba, a few miles out from Cooma, and in the Warrambungle Ranges, 50 miles north from Mudgee, no serious attempt has been made, so far, to open up the deposits and find a market for it.

#### MISCELLANEOUS

## MISCELLANEOUS ANALYSES.

During the year 97 miscellaneous analyses were made in the laboratory of the Geological Survey Branch of this Department, of which the following are the most interesting :—

## LOCALITY—BARNEDMAN BATTERY.

(2314) Water.

The water gave a slight alkaline reaction to litmus paper, and a strong saline taste, somewhat resembling sea-water.

On evaporation it yielded :—

	Grains per gal.	In 1,000 parts.
Total solid matter .....	1660.736	23.7248
Chlorine in combination.....	854.840	12.212
Sulphuric acid .....	144.249	2.060
Magnesia .....	148.953	2.127
Lime.....	55.188	0.788

The total solid matter consists mainly of soda, magnesia, and lime, combined with chlorine, sulphuric acid, and carbonic acid. There is also present a small amount of potash, ferric oxide, alumina, silica, and phosphoric acid.

The sample may be described as a strong saline water, so concentrated that chemical treatment cannot be recommended as a means of rendering the water suitable for battery purposes, for which it is highly undesirable, on account of its high density, which would tend to cause loss of gold. For boiler purposes it is a most unsuitable water.

## LOCALITY—BERTHONG ESTATE, WALLENBERRN.

(3046) Rock, yielding :—

	per cent.
Moisture at 100° C. ....	2.87
Combined water.....	10.11
Silica .....	40.80
Alumina .....	2.54
Ferric oxide .....	6.20
Ferrous oxide.....	.48
Manganous oxide .....	trace.
Cobalt and nickel oxides .....	.25
Chromium sesquioxide .....	.20
Lime .....	absent.
Magnesia.....	35.82
Soda.....	.27
Potash.....	absent.
	99.63

Specific gravity, 2.521.

## LOCALITY—BROKEN HILL.

(304) Sulpho-carbonate of lead, yielding :—

	per cent.
Water .....	nil.
Oxide of lead .....	74.11
Sulphuric oxide .....	22.27
Carbonic oxide .....	3.32
	99.70

## LOCALITY—BROKEN HILL.

(645) Sulpho-carbonate of lead, yielding :—

	per cent.
Lead protoxide .....	74.11
Sulphuric oxide .....	25.00
Carbonic oxide .....	1.34
Water .....	nil.
	100.45

## LOCALITY—BROKEN HILL (ROCKWELL Paddock).

(1743) Micaceous mineral, yielding :—

	per cent.
Moisture and water of combination .....	4.30
Silica .....	45.90
Alumina and ferric oxide.....	36.70
Lime .....	absent.
Magnesia.....	2.77
Potash.....	10.41
Soda.....	nil.
	100.08

## LOCALITY—BRAIDWOOD (LITTLE RIVER, NEAR).

(1761) Pyromorphite, yielding :—

	per cent.
Lead oxide (PbO) .....	69.40
Metallic lead (Pb) .....	6.67
Phosphoric acid (P <sub>2</sub> O <sub>5</sub> ) .....	15.22
Vanadic oxide (V <sub>2</sub> O <sub>5</sub> ) .....	trace.
Chlorine (Cl) .....	2.26
Ferric oxide (Fe <sub>2</sub> O <sub>3</sub> ) .....	.62
Lime (CaO) .....	trace.
Insoluble in acids (sand) .....	4.67
Moisture .....	.86
	99.60

No gold or silver detected.

## LOCALITY—DERRAWANG, CONDOBOLIN.

(1003) Water, yielding :—

	Grs. per gal.	In 1,000 pts.
Total solid matter (dried at 200° F.)	410.358	5.8622
Soluble saline matter .....	372.538	5.3219
Insoluble mineral matter .....	37.816	.5403
	410.354	5.8622
Chlorine in combination .....	167.66	2.3951
Sulphuric acid combination .....	43.55	.6221

The soluble saline matter consists mainly of soda, magnesia, with lesser amounts of lime, potash, &c., combined with chlorine, sulphuric acid, and carbonic acid.

The insoluble matter consists of carbonate of magnesia, carbonate of lime, silica, and a trace of alumina, oxide of iron, &c.

A strong saline water unfit for man or beast. If used for irrigation purposes will in time destroy all useful vegetation.

## LOCALITY—DRYSDALE.

(1406) Residues after washing a small quantity of Drysdale auriferous slate, yielding :—

The portion soluble in acid (nitric) consisted chiefly of copper with a little silver, ferric oxide, and alumina, and traces of bismuth.

The portion insoluble in acid (nitric) consisted chiefly of silica and ferric oxide (present probably as silicate of iron), with a small quantity of antimony and traces of copper and manganese.

There is some sulphur present in combination, but not enough to combine with the copper, silver, and antimony found.

A few specks of gold present.

## LOCALITY—THIRTY MILES S. E. OF DUBBO.

(135) Kaolin, yielding :—

	per cent.
Moisture at 100° C. ....	1.09
Combined water.....	13.38
Silica (SiO <sub>2</sub> ) .....	46.27
Alumina (Al <sub>2</sub> O <sub>3</sub> ) .....	39.05
Ferric oxide (Fe <sub>2</sub> O <sub>3</sub> ) .....	1.08
Ferrous oxide (FeO) .....	nil.
Manganous oxide (MnO) .....	"
Lime (CaO).....	"
Magnesia (MgO) .....	.22
Potash (K <sub>2</sub> O) .....	.32
Soda (Na <sub>2</sub> O).....	nil.
Phosphoric acid (P <sub>2</sub> O <sub>5</sub> ) .....	minute trace.
Sulphuric acid (SO <sub>3</sub> ).....	nil.
Titanic acid (TiO <sub>2</sub> ) .....	strong trace.
	100.41

## LOCALITY—EDEN (WEST OF THE LIGHTHOUSE).

(2384) Weathered rock, yielding :—

	per cent.
Moisture at 100° C. ....	3.73
Combined water .....	9.92
Silica (SiO <sub>2</sub> ) .....	43.22
Alumina (Al <sub>2</sub> O <sub>3</sub> ) .....	28.16
Ferric oxide (Fe <sub>2</sub> O <sub>3</sub> ) .....	12.85
Ferrous oxide (FeO) .....	.42
Lime (CaO) .....	trace.
Magnesia (MgO) .....	.58
Potash (K <sub>2</sub> O) .....	.77
Soda (Na <sub>2</sub> O) .....	.20
Phosphoric anhydride (P <sub>2</sub> O <sub>5</sub> ) .....	.31
Sulphuric " (SO <sub>3</sub> ) .....	.25
	100.41

This mineral is decomposed by boiling hydrochloric acid.

## LOCALITY—FAIRFIELD (NEAR).

(3289) Graphite, yielding—proximate analysis :—

	per cent.
Moisture and combined water.....	6.61
Carbon .....	47.12
Ash .....	46.27
	100.00

Ash—reddish tinge, flocculent.

## LOCALITY—GALONG.

(945) Water, yielding :—  
Chemical composition.

	Grains per gallon.
Silica and silicates.....	1·624
Calcium chloride .....	3·429
Magnesium chloride .....	30·140
Sodium chloride.....	15·408
Carbonate of lime .....	7·000
Oxide of iron and trace of alumina.....	·756
Sodium sulphate .....	16·250
Potassium sulphate .....	3·170
Organic matter .....	2·105
	<hr/>
	79·882

Free ammonia, nil per one million parts.

Albuminoid ammonia, 1·80 parts per one million parts.

*Remarks.*—The large amount of albuminoid ammonia present shows the water to be seriously contaminated with organic matter, in fact it may be classed as diluted sewerage. On no account should the water be used for human consumption, nor in washing the various apparatus in every day use in a butter factory. It is not by any means a suitable water for steam purposes, and if other is obtainable I should strongly recommend its use to be discontinued. The magnesium chloride present will be decomposed at a high temperature into oxychloride and hydrochloric acid, the latter escaping with the steam, and thus acting on the steam-pipes, valves, &c.

## LOCALITY—GALONG.

(946) Sediment and solution taken from steam boiler.  
This sample consisted of a solution and a copious sediment, which occupied about one-fifth the space of the whole sample. The sediment consisted of carbonates of lime and magnesia, oxide of iron, silica, clayey matter, organic matter, &c. The solution consisted of the various salts present in the water in a highly concentrated form.

## LOCALITY—A BATTERY DAM AT GARANGULA.

(3071) Water, yielding :—  
Total solid matter (dried at 225° F.), 100·80 grains per gallon.

Chemical Composition.

	Grains per gallon.
Chloride of sodium.....	15·064
Chloride of potassium.....	5·184
Carbonate of potash .....	3·030
Carbonate of lime .....	2·800
Carbonate of magnesia .....	3·528
Alumina and ferric oxide .....	2·240
Silica and clay (very finely divided) .....	62·860
Organic matter .....	7·560
Manganous oxide .....	trace.
Sulphuric trioxide .....	trace.
	<hr/>
Total solid matter .....	102·266

Total matters held in suspension, 76·370 grains per gallon, consisting mainly of finely-divided clay and organic matter.

Water neutral to test paper.

No nitrates present.

The presence of so much finely-divided clay and organic matter would tend to cause "priming," and in its present state it is a very undesirable water for steam purposes. An addition of 1½ oz. of alum per 10,000 gallons of water is recommended. The alum should be finely powdered, and the proper quantity dissolved in water and added to the water, the whole being well stirred and allowed to settle, the clear water being drawn off for use. This will necessitate the use of settling-pits, and it is not recommended that the alum be added to the water in the storage dam, for a large amount of fine silt will be deposited which will frequently require removal.

## LOCALITY—GUY FAWKES (NEAR).

(480) Carbonaceous mineral, resembling jet, yielding :—  
Proximate analysis.

Hygroscopic moisture .....	17·55
Volatile hydrocarbons, &c. ....	44·70
Fixed carbon.....	31·80
Ash.....	5·95
	<hr/>
	100·00

Specific gravity .....

Sulphur .....

Ash—Buff colour, granular. No coke formed. A loose mass left after ignition.

## LOCALITY—HILLGROVE DISTRICT.

(2245) Plumbago disseminated through a soft rock. Proximate analysis :—

Moisture.....	per cent.
Carbonaceous matter.....	9·51
Ash.....	12·02
	<hr/>
	78·47
	<hr/>
	100·00

Ash—Reddish tinge.  
A carbonaceous earth of no commercial value.  
The above result was obtained from material which had been crushed coarse and washed.

## LOCALITY—HILLGROVE DISTRICT.

(2246) Plumbago disseminated through a soft rock. Proximate analysis :—

Moisture.....	per cent.
Carbonaceous matter.....	11·88
Ash.....	12·24
	<hr/>
	75·58
	<hr/>
	100·00

The above result was obtained from material which had been crushed fine and washed.

## LOCALITY—MOUNT ALLEN MINE, MOUNT ALLEN.

(3553) Water, yielding :—

	Grains per gallon.	In 1,000 parts.
Total solid matter (dried at 220° F) .....	216·440	3·092
Chlorine in combination .....	83·538	1·1934
Sulphuric oxide in combination .....	23·880	·3411
Free ammonia ..	nil per 100,000 parts.	
Albuminoid ammonia .....	·005	" "

The total solid matter consists mainly of soda and magnesia with lesser amounts of lime and potash, combined with chlorine, sulphuric, and carbonic acids. A trace of ferric oxide and a small quantity of silica present.

The large amount of total solid matter present in this water renders it a very unsuitable one for human consumption. The maximum amount present in a potable water should not exceed 40 to 50 grains per gallon.

## LOCALITY—MUDGE DISTRICT (LIMESTONE).

(1103) Alluvial gold, yielding :—

	In 1,000 parts.
Fine gold .....	932·08
" silver .....	58·12
Base metals.....	9·80
	<hr/>
	1000·00

Colour excellent.

The sample too small to permit of the determination of the base metals present, which, however, were in very small proportion.

## LOCALITY—NYNGAN (NEAR).

(2460) Magnesite, yielding :—

Carbonate of magnesia .....	per cent.
	98·70

## LOCALITY—PERA BOBE—NEAR.

(677) Soil, yielding :—

Soluble saline matter .....	per cent.
Re-action—slightly alkaline.	·888

A very small quantity of the alkali present exists as carbonate, the carbonic acid found being only ·05 per cent. The soluble saline matter consists largely of organic matter, sodium chloride, and a considerable amount of nitrates. The amount of saline matter present in this soil is small. The sample sent was insufficient for a more detailed analysis.

LOCALITY—SHOALHAVEN.

(3022) Alum, yielding —	per cent.
Moisture and water of combination (by difference)	42.37
Insoluble in acids (sand, &c.)	1.74
Alumina	10.91
Ferric oxide	.21
Lime	.30
Magnesia	4.68
Potash	1.06
Soda	trace.
Manganous oxide	.59
Copper, nickel, and cobalt oxides	traces.
Sulphuric tri-oxide	38.14
Chlorine	trace.
	<hr/> 100.00

LOCALITY—SILVERTON TO LAKE COBHAM ROAD. SANDY CREEK BORE.

(4378) Boiler incrustation:—	per cent.
Chemical composition.	
Moisture at 100° C.	.35
Combined water	2.44
Silica (SiO <sub>2</sub> )	5.10
Ferric oxide (Fe <sub>2</sub> O <sub>3</sub> )	3.30
Manganous oxide (MnO)	trace.
Alumina (Al <sub>2</sub> O <sub>3</sub> )	3.90
Calcic sulphate (CaSO <sub>4</sub> )	80.27
Potassium sulphate (K <sub>2</sub> SO <sub>4</sub> )	.27
Magnesia (MgO)	3.02
Potassium chloride	.78
Phosphoric acid	trace.
Organic matter, loss, etc.	.56
	<hr/> 100.00

LOCALITY—TALBRAGAR.

(1682) Finely stratified sedimentary material, yielding:—	per cent.
Combined water	1.04
Moisture at 100° C.	.40
Silica	97.01
Alumina and trace of ferric oxide	1.70
Magnesia	.18
Soda	trace.
	<hr/> 100.34

LOCALITY—WALLENDREEN.

(3133) Crystalline rock (unaltered), yielding:—	per cent.
Moisture at 100° C.	.26
Combined water	.79
Silica	49.30
Alumina	10.2
Ferric oxide	2.20
Ferrous oxide	3.83
Manganous oxide	nil.
Chromium sesquioxide	trace.
Nickel oxide	"
Lime	11.82
Magnesia	19.36
Potash	.50
Soda	1.14
	<hr/> 99.62

LOCALITY—WALLERAWANG.

(3469) Some small pieces of crystalline substance were subjected to a qualitative analysis, and proved to be magnesia sulphate (epsomite) of good quality.

LOCALITY—WALGETT, 12 MILES N. OF DUNGLEAR RUN.

(1179) Water, yielding —  
Total solid matter, 2609.60 grains per gallon, consisting of a large quantity of sodium chloride, with large quantities of lime and magnesia present as chlorides and sulphates. Small quantities of organic matter and ferrous sulphide present. Unfit for human consumption and stock purposes.

LOCALITY—WYRALLA, RICHMOND RIVER.

(368) Tripolite, yielding:—	per cent.
Moisture at 100° C.	2.69
Combined water	2.79
Silica	90.94
Alumina	2.38
Ferric oxide	.49
Ferrous oxide	.33
Manganous oxide	trace.
Magnesia	trace.
Sodium chloride	.32
	<hr/> 99.94

LOCALITY—WYRALLA, RICHMOND RIVER.

(2493) Tripolite, yielding:—	per cent.
Moisture, at 100° C.	6.02
Combined water	3.64
Silica	88.14
Alumina	1.42
Ferric oxide	.59
Potash soda	.43
Phosphoric anhydride	minute trace.
Organic matter	trace.
	<hr/> 100.23

LOCALITY—WYRALLA—GEO. DIXON'S PROPERTY, NORTH COBRINGTON, ABOUT 2½ MILES FROM—RICHMOND RIVER.

(4546) Tripolite, yielding:—	per cent.
Moisture at 100° C.	5.41
Combined water	4.42
Silica (SiO <sub>2</sub> )	67.71
Alumina (Al <sub>2</sub> O <sub>3</sub> )	15.47
Ferric oxide (Fe <sub>2</sub> O <sub>3</sub> )	2.31
Ferrous oxide (FeO)	trace.
Manganous oxide (MnO)	trace.
Lime (CaO)	.72
Magnesia (MgO)	.93
Potash (K <sub>2</sub> O)	2.52
Soda (Na <sub>2</sub> O)	.98
	<hr/> 100.47

LOCALITY—WYALONG.

(1824) Boiler incrustation, yielding:—	per cent.
Calcium carbonate	.18
Calcium sulphate	22.03
Magnesium oxide	2.91
Sodium chloride	49.89
Potassium chloride	6.35
Ferric oxide, alumina, and traces of calcium phosphate	2.54
Moisture at 100° C.	2.80
Organic matter and water given off over 100° C.	1.54
Insoluble matter (silica and clay)	11.76
	<hr/> 100.00

LOCALITY—WYALONG, PINE RIDGE.

(2986) Water:—  
Appearance in 2-foot tube—pale yellow; odour when heated to 100° F., metallic.  
Free ammonia, .012 parts per 100,000 parts.  
Albuminoid ammonia, .026 parts per 100,000 parts.  
Nitrogen as nitrates, minute trace, " "  
" nitrites, nil " "  
Oxygen absorbed in 15 minutes, .028 parts per 100,000 parts.  
" " 4 hours, .067 " "  
Phosphoric acid as phosphates, trace " "  
Poisonous metals, nil " "

Chemical composition of total solid matter:—	Grains per gallon.	In 1,000 parts.
Silica and silicates	5.264	.0752
Alumina and ferric oxide	.504	.0072
Carbonate of lime	8.749	.1249
" magnesia	14.597	.2085
" soda	10.980	.1568
Sulphate of potash	1.229	.0175
Chloride of sodium	10.220	.1460
Total solid matter	61.543	.7361

Matter in suspension, 4.928 grains per gallon.  
" " .0704 in 1,000 parts.  
The water gave an alkaline reaction to litmus paper, and contained a fair amount of suspended matter.  
The large amount of free and albuminoid ammonia found in the water proves it to be contaminated with organic impurities, rendering it a very suspicious water, not by any means suitable for human consumption.  
Should no other water be obtained, it is recommended that it be well boiled before use.

## LOCALITY—YULGILBAR.

	per cent.
(4651) Mercury ore, yielding :—	43.68
Metallic mercury .....	6.87
" copper .....	4.44
" antimony .....	trace.
" arsenic .....	.45
" iron .....	trace.
Alumina .....	1.26
Lime .....	.21
Magnesia .....	30.46
Gangue .....	11.46
Sulphur .....	.44
Carbonic acid .....	.25
Moisture at 100° C. ....	
	<hr/> 99.52

## LOCALITY—THE BOURKE LOCK AND WHIR, THE SITE OF.

	per cent.
(3266) Indurated black clay, yielding :—	4.01
Moisture at 100° C. ....	8.29
Combined water .....	52.52
Silica .....	25.79
Alumina .....	7.48
Ferric oxide .....	trace.
Manganous oxide .....	.68
Lime .....	.54
Magnesia .....	.58
Potash .....	nil.
Soda .....	minute trace.
Phosphoric acid .....	trace.
Organic matter .....	
	<hr/> 99.89

## LOCALITY—BALD HILLS, BATHURST.

(3942) Sandy clay.  
A brick was made from this clay and carefully dried. It was afterwards submitted to an intense heat in a coke assay furnace, with the result that fusion took place. It appears to be a very poor quality of clay, and is useless for the manufacture of fire-bricks.

## LOCALITY—CARLINGFORD.

	per cent.
(864) Pipe-clay, yielding :—	2.610
Moisture at 100° C. ....	10.660
Combined water .....	43.940
Silica .....	34.170
Alumina .....	.800
Ferric oxide .....	minute trace.
Lime .....	.341
Magnesia .....	1.360
Potash .....	.004
Soda .....	5.810
Titanic acid .....	trace.
Organic matter .....	
	<hr/> 99.695

## LOCALITY—DON DORRIGO.

(3613) White clay.  
A portion of the clay was moulded into the shape of a small brick, also a second brick was made with the addition of half its weight of sand. After careful drying they were placed in a covered crucible, and submitted to the highest heat obtainable in a coke assay furnace for some 4 hours. The bricks on cooling showed no fusion had taken place, the sharp edges and original shape being retained.

## LOCALITY—KING'S PLAINS, BLAYNEY.

	per cent.
(2385) Fine white clay, yielding —	.50
Moisture at 100° C. ....	3.56
Combined water .....	74.40
Silica .....	16.88
Alumina .....	1.11
Ferric oxide .....	.11
Ferrous " .....	trace.
Manganous oxide .....	nil.
Lime .....	.29
Magnesia .....	2.79
Potash .....	.03
Soda .....	trace.
Phosphoric acid .....	
	<hr/> 99.67

Free silica present in this sample.

24—K

## LOCALITY—MUDGER.

	per cent.
(3687) White clay, yielding :—	.34
Moisture at 100° C. ....	3.71
Combined water .....	73.28
Silica .....	18.00
Alumina .....	.54
Ferric oxide .....	.37
Lime .....	.33
Magnesia .....	.07
Potash .....	3.73
Soda .....	trace
Organic matter .....	
	<hr/> 100.37

From the analysis and freedom of the clay from ferric oxide it was thought that it would be a suitable one for the manufacture of porcelain.

Several small utensils were made from the clay, and carefully dried and burnt. These models, when taken from the furnace, were of a good colour, and resembled porcelain ware in appearance.

## LOCALITY—NORTH SHORE.

	per cent.
(3498) Clay, yielding :—	1.25
Moisture at 100° C. ....	5.47
Combined water .....	65.04
Silica .....	23.06
Alumina .....	1.48
Ferric oxide .....	.35
Lime .....	.65
Magnesia .....	2.14
Potash .....	.01
Soda .....	.04
Sulphuric oxide .....	trace
Phosphoric acid .....	.93
Organic matter .....	
	<hr/> 100.42

From experiments made as to the refractory nature of this clay, it does not appear that it is suitable for the manufacture of a high-class fire-brick.

## LOCALITY—ULLADULLA.

	per cent.
(856) White clay, yielding :—	1.42
Moisture at 100° C. ....	12.86
Combined water .....	43.86
Silica .....	33.77
Alumina .....	.74
Ferric oxide .....	.70
Lime .....	.14
Magnesia .....	.84
Potash .....	nil.

I have the honor to be,  
Sir,  
Your obedient Servant,

D. C. M'LACHLAN,

Department of Mines and Agriculture,  
March 14th, 1896.

Under Secretary for Mines and Agriculture.

## CHIEF INSPECTOR OF MINES' REPORT.

Sir,

In submitting my annual report for the year 1895 I do myself the honor to inform you that the following is a list of accidents reported on by Wardens, Coroners, Inspectors of Mines, and Mining Registrars, as having occurred in the year 1895 in the metalliferous mines of New South Wales:—

TABLE A.  
Fatal, Serious, and Minor Accidents, 1895.

No	Date.	Name of Mine.	Locality.	Person Killed.	Person seriously Injured.	Minor Accidents.	Occupation.	Nature and Cause of Injury or Death.
1	1 Jan.	Proprietary Block 12	Broken Hill	John Cotty		J. Veal	Trucker	Jammed by truck.
2	2 "	No name	Locksley				Miner	Both legs broken and skull fractured by fall of earth.
3	2 "	B.H. Proprietary	Broken Hill		Albert Smith		Furnace hand	Legs scalded removing water-jacket.
4	5 "	" Block 12	"			George Miller	Miner	Severe bruises on head caused by loose ore falling off timber.
5	11 "	"	"			Alfred Williams	Trucker	Small bone of leg broken—jammed between trucks.
6	11 "	B.H. South	"		Charles Kutchen		Miner	Leg broken by fall of rock.
7	17 "	Wright's Mine	Coolac	Wm. Cummins				Crushed by fall of rock.
8	24 "	No name	Wombat	Robt. Johnson				Internal injuries by fall of earth.
9	25 "	"	Bailow		Wm. Saddler			Head crushed by fall of earth.
10	27 "	B.H. Proprietary	Broken Hill			G. Williams	Labourer	Loss of a finger crushed by timber.
11	31 "	"	"	John McGuire			Quarryman	Crushed by fall of rock.
12	2 Feb.	Fort Bourke Tunnel	Cobar		— Cumberlin		Miner	Hand shattered   Drilling into unexploded dynamite.
13	2 "	"	"			— Brown		Bruises and cut   ploded dynamite.
14	2 "	B.H. Propy. Block 11	Broken Hill		Pat. Curry			Ribs broken by falling through stope.
15	4 "	No name	Oberon			James Moore		Leg broken by fall of earth.
16	8 "	B.H. Propy. Block 13	Broken Hill			Geo Taylor	Trucker	Jammed on truck.
17	13 "	Drysdale Proprietary	Mt. Drysdale			Tom Titus	Miner	Ribs broken by fall off ladder.
18	21 "	No name	Trunkey Creek	Jer. Sullivan				Smothered by fall of earth.
19	22 "	Junction Mine	Broken Hill		J. Stowebury		Foreman	Leg broken and spine injured by fall of derreck.
20	27 "	B.H. Proprietary	"	Robert Dins			Labourer	General injuries by runaway truck.
21	12 Mar.	No name	Springmount	J. E. Ryan			Quarryman	Suffocated by foul air.
22	15 "	B.H. Proprietary	Broken Hill		D. Campbell		Trucker	Internal injuries—run over by truck.
23	22 "	Peak Hill Proprietary	Peak Hill		Wm. P. Quigley		Miner	Leg and ribs broken by runaway cage.
24	30 "	Helvetia Mine	Gulgong	John Egan				Head smashed by fall of earth.
25	31 "	Baker's Creek Mine	Hillgrove	Michael O Neil			Timberman	Head crushed and arm fractured by fall off stage.
26	3 April	West Sunlight	"			G. L. Smith	Miner	Premature explosion.
27	7 "	B.H. Proprietary	Broken Hill		C. Hill			Leg broken by fall of rock.
28	7 "	"	"		W. Tripp		Trucker	Kneecap dislocated—jammed between trucks.
29	9 "	Tarrawingee Co.	Tarrawingee	Victor Cleal			Quarryman	Internal and spinal injuries by stone from blast.
30	16 "	B.H. Propy. Block 11	Broken Hill			W. Lee	Miner	Wrist broken by fall through stope.
31	20 "	" Block 12	"			J. Ward	Quarryman	Scalp wound by fall of rock.
32	22 "	No 1 Myall Mine	Tonungley			W. McGuire	Miner	Bruised on body by fall of rock.
33	26 "	B.H. Propy. Block 11	Broken Hill			J. Trezona	Trucker	Cut on arm, being jammed by truck.
34	3 May	" Block 13	"			J. Uren	Miner	Bruised and cut by fall off stage down shaft.
35	8 "	No name	Eugilbar	Wm. Kellick				Neck and legs broken by fall of earth.
36	14 "	Central Mine	Broken Hill		Ch. McElouchy			Internal injuries by fall of ore.
37	17 "	Peak Hill Proprietary	Peak Hill		John Townsend			Compound comminuted fracture of leg by explosion of shot.
38	23 "	Crown of Peak Hill	"		Gideon Treshewry			Leg broken by fall of pulley down shaft.
39	10 June	Central Mine	Broken Hill		— Adams			Severe cut thigh by explosion of shot.
40	11 "	Broken Hill South	"	Wm. Harris				Bodily injuries by fall through stope.
41	21 "	B.H. Proprietary	"		A. T. Franki		Labourer	Contused skull—struck by fly-wheel.
42	26 "	"	"		R. Reever		Quarryman	Cuts and bruises by fall down quarry.
43	4 July	Tarrawingee Flux Quarry	Tarrawingee	Pat. Garric				Fall over face of quarry by rope breaking, causing internal and external injuries.
44	5 "	B.H. Proprietary	Broken Hill			F. Barber	Miner	General shaking by fall off ladder.
45	5 "	Crown of Peak Hill	Peak Hill			J. Homan		Rib broken by fall off stage.
46	5 "	"	"			J. Luckwell		Bruised by fall off stage.
47	8 "	B.H. South Mine	Broken Hill			S. Vician		Cuts on arms and legs by fall of ore.
48	8 "	B.H. Proprietary	"			Wm. George		Cuts on head by fall off stage.
49	9 "	No name	Young		Hy. Gould			Skull fractured by collapse of windlass.
50	12 "	B.H. Proprietary	Broken Hill	W. Barrett			Labourer	Internal injuries—jammed in timber.
51	13 "	Great Cobar C. Mine	Cobar			Jos. Buckley	Miner	Fall down pass.
52	15 "	B.H. Proprietary	Broken Hill			Jes. Sharp	Labourer	Foot crushed by water-jacket.
53	18 "	South Mine	"	W. McLeish			Miner	
54	18 "	"	"	G. Holmes				
55	18 "	"	"	J. Lee				
56	18 "	"	"	B. Snell				External and internal injuries caused by their being hurled against the sides of the drive, by compressed air from fall of ground.
57	18 "	"	"	A. Trembath				
58	18 "	"	"	W. Arthur				
59	18 "	"	"	C. Ellison				
60	18 "	"	"	F. Pearse				
61	18 "	"	"	W. L. Panter				
62	18 "	"	"		R. Mortimer			
63	26 "	B.H. Proprietary	"		J. Carey			By rock from blast, head severely injured
64	27 "	B.H. Block 14	"			F. Kuidries	Labourer	Ankle dislocated by fall from brace.
65	27 "	"	"		W. Budd			Thigh broken by fall down stairs.
66	27 "	British Lion	Trunkey Creek		Josh. Glasson		Miner	Arm shattered drilling out missed shot.
67	2 Aug.	Hill Top Mine	Wyalong West	James Bevet				Back broken by fall of rock.
68	4 "	B.H. Block 14	Broken Hill			E. Crofton		Eyes injured drilling out missed shot.
69	8 "	" Proprietary	"		H. Francis		Quarryman	Leg fractured by rolling stone.
70	14 "	" Block 14	"		W. McCarthy		Miner	Injuries to arms and head by explosion of shot.
71	20 "	Great Cobar C. Mine	Cobar	James Calvi			Labourer	Killed by explosion of shot.
72	23 "	Tuttleby and Bruce	Araluen		J. N. Littrell		Miner	Leg broken in two places by fall of earth.
73	24 "	No name	Wee Jasper		W. Cashman			Badly bruised by fall of earth.
74	24 "	B.H. Proprietary	Broken Hill			P. McCann	Quarryman	Ankle injured by rock from shot.
75	6 Sept.	Excelsior Mine	Dalmorton		J. Graham		Miner	Leg broken by fall of rock.
76	7 "	North Central	Broken Hill	Josh. Brokenshire				Leg and back injured, lockjaw supervening, by fall down shaft.
77	10 "	B.H. Proprietary	"			R. Barnes		Bruises on back by fall of bucket down shaft.
78	11 "	"	"		J. Duesbury		Labourer	Concussion of brain, being struck by truck.
79	17 "	"	"	J. Voller			Shunter	Body crushed by truck.
80	23 "	"	"	W. R. Tonkin			Miner	Abdominal injuries by fall of rock.
81	4 Oct.	No name	Rockley	Albert Thomas				Spine injured by fall of earth.
82	7 "	Great Surprise	Wyalong West			John Todd		Ribs broken by fall off rope down shaft.
83	10 "	Lake George C. Mine	Captain's Flat			Wm. Lewis	Trucker	Scalp wound by fall off truck.
84	10 "	Ruby Mine	Broken Hill	James H. Martin			Miner	Burns by explosion of shot.
85	11 "	B.H. Propy. Block 11	"	Charles Heven			Quarryman	Killed by explosion of shot.
86	5 Dec.	"	"	Wm. Daly				Killed by explosion of shot.
87	11 "	Great Tarcome Mine	Gulgungia	Ch. Eason			Miner-owner	Neck broken by fall down shaft.
88	14 "	B.H. Block 10	Broken Hill	James Broadstock			Surface hand	Killed by fall of ore-dump.
89	20 "	Young Australia	Wyalong	M. J. Casack			Miner	Spinal injuries—struck by dummy.
90	20 "	Cotterill's Mine	Rockley	Josh. Fell				Internal injuries by fall of rock.
91	26 "	B.H. Proprietary	Broken Hill		John Langdon		Surface hand	Loss of toe by foot crushed in machinery.

## ABSTRACT.

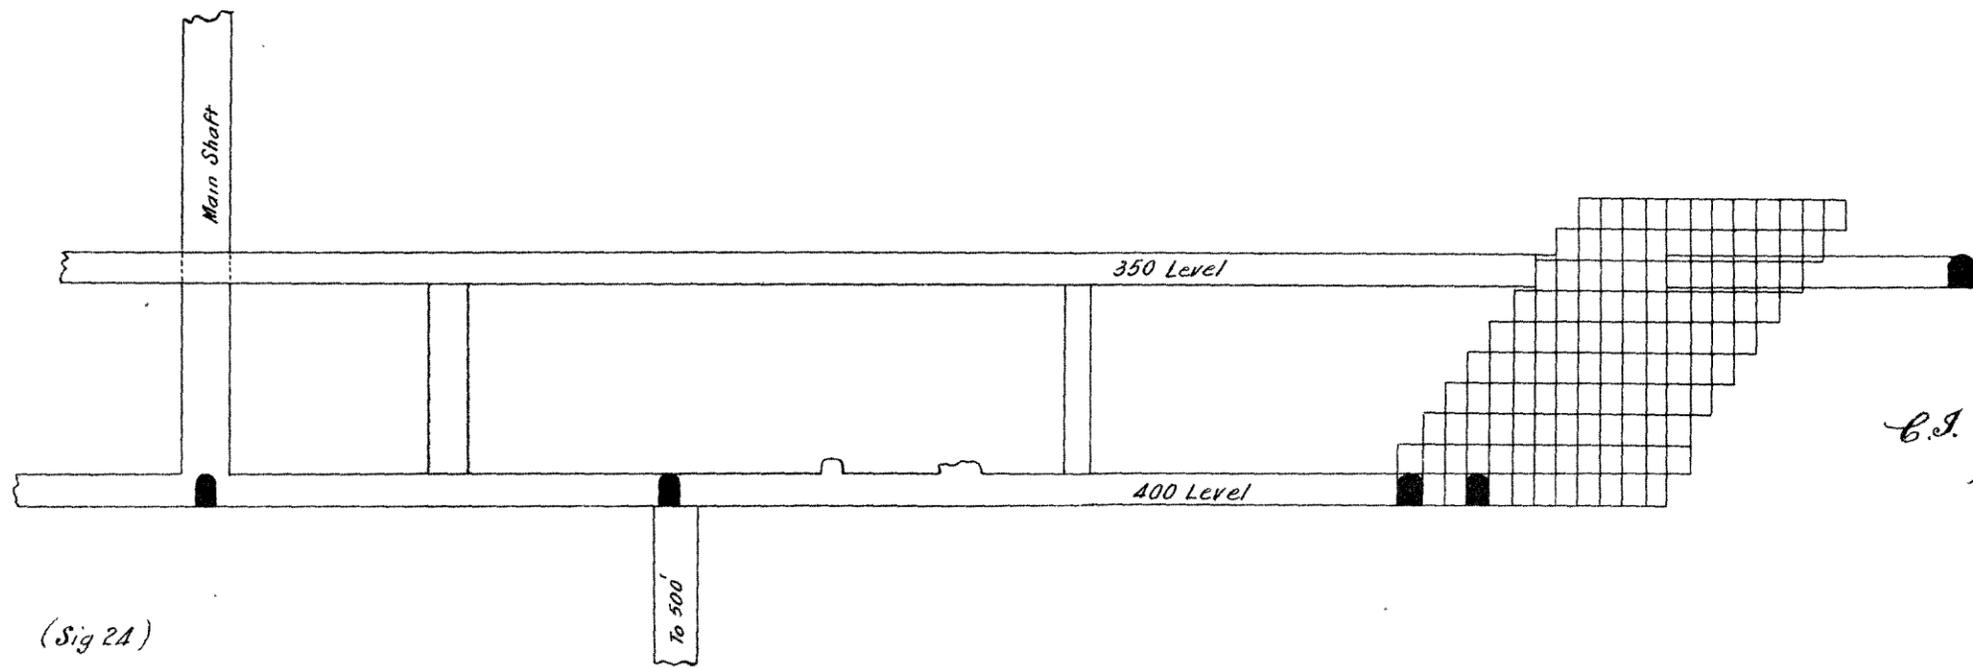

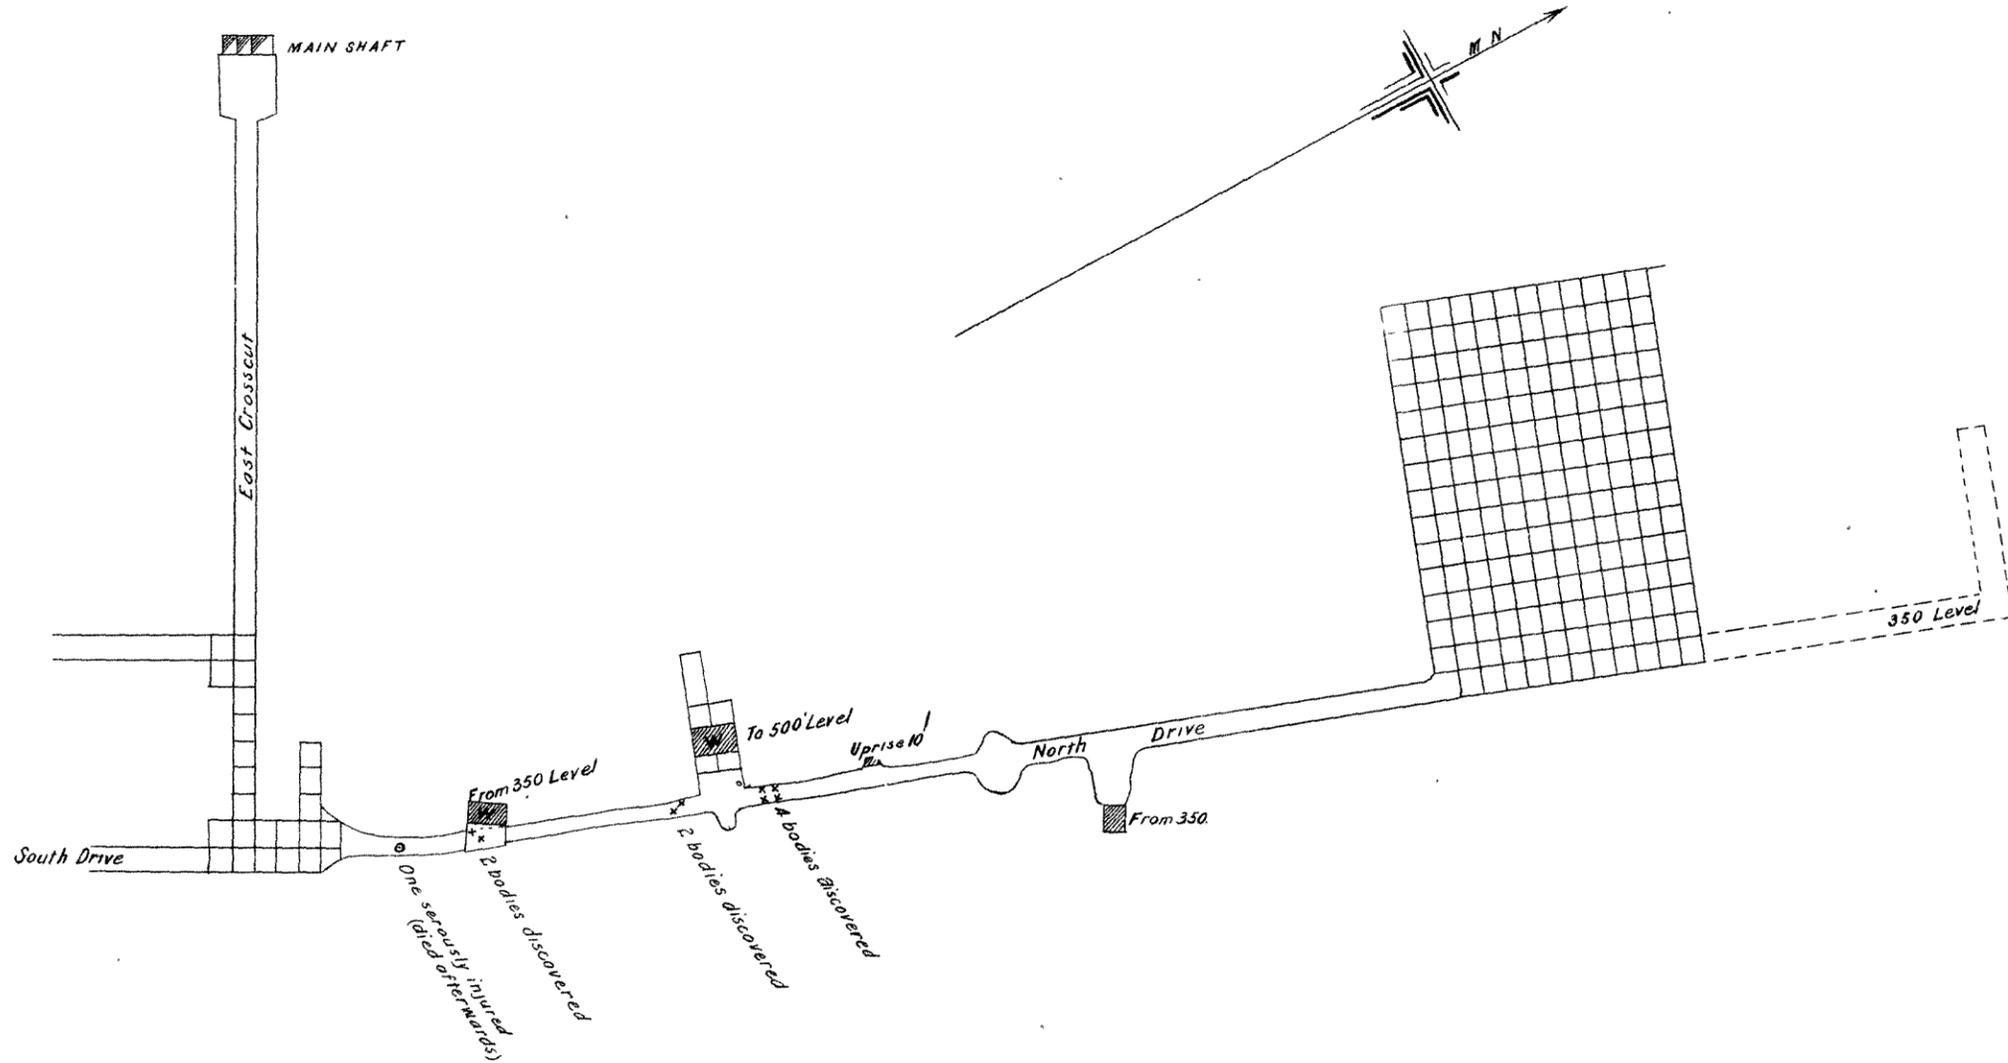

Fatal—5 gold quartz, 7 gold alluvial, 20 silver, 1 copper, 1 chrome, 2 limestone; total, 36. Serious—6 gold quartz, 5 gold alluvial, 17 silver; total, 28. Minor—5 gold quartz, 20 silver, 2 copper; total, 27. Grand total, 91.

Persons killed per 1,000 persons employed.	..62	..50	4.29	1.15	.....	.....	.....	5.32	1.25	.....	.....
Persons injured per 1,000 persons employed.	..44	..60	3.65	...	.....	.....	.....	...	..97	.....	.....

The minor accidents are not included in the above percentages.

Table A gives the number of accidents, date, name of mine or company, locality, persons killed or injured, occupation, and cause of death or injury.

Table B gives in addition to the percentage of persons killed, or injured, the number of persons employed, and the value of the machinery in, on, or in connection with the metalliferous mines of New South Wales.

Out of the total of 36 persons killed, 20 lost their lives in silver-mining, 5 in auriferous quartz-mining, 7 in alluvial gold-mining, 1 in copper-mining, 1 in chrome-mining, and 2 in limestone (flux) mining.

The large number of fatal accidents which occurred during the year in silver-mining is due to the calamity caused in the South Broken Hill Mine by a sudden fall of a large mass of lode-stuff on the 415-foot level, and the consequent concussion of air which rushed through a level connected with the shaft, throwing the men who were in the level off their feet, instantly killing 8, and another died from the injuries received a few days afterwards. [See my reports marked C and D.] The tracing herewith showing the site of the creep, and where the bodies and those seriously injured were discovered, in the 415-foot level, is the work of Mr. C. F. Valantine, surveyor, and was kindly presented to me for official use by Mr. J. B. Gluyas, the general manager of the South Broken Hill Mine.

## C.

REPORT by Mr. W. H. J. Slee, F.G.S., Chief Inspector of Mines, on the accident in the South Broken Hill Mine, whereby nine persons lost their lives on 18th July last.

Sir,

Broken Hill, 20 August, 1895.

I have the honor to inform you that I have inspected the scene of the accident in the South Broken Hill Mine, by which accident nine persons lost their lives on the 18th July last. Very little can be added by me to the evidence obtained at the inquest. It appears that ample time was given to the men to withdraw, and take away their tools. Altogether there were twenty men working in the stopes when Mr. S. Mayne, the under mining manager, ordered the whole of the men to leave the stopes, and take away their tools, as a creep was likely to take place. This was done at 3 p.m., and the creep took place at 3.50 p.m., or fifty minutes after the men were warned to get to a place of safety. Some of the men went to the cross-cut and others remained in the level, distant from 100 feet to 200 feet from where the fall took place, no doubt thinking that they were perfectly safe, and I have no doubt that up to that time any miner would be of the same opinion. The theory that noxious gases exploded through the sudden fall of earth I think is erroneous, there being no visible evidence of such an explosion: but there is substantial evidence that the immediate cause of the accident was the fall of earth causing concussion of compressed air, the latter forcing itself at a terrific rate along the 415-foot level through the only opening connected with the shaft. The men being in so confined a space were no doubt lifted off their feet like mere feathers, and thrown with terrific force against the top and sides of the levels, which caused instantaneous death. As the stopes were rather warm to work in, the men were probably afraid to go at once to the surface or enter the cross-cut into a sudden cold, either of which they had ample time to do. I have read works on mining accidents both in European and American mines, but have never seen one mentioned similar to that which occurred on the 18th July last in the South Broken Hill Mine, and in my forty years of mining experience I have never heard anything of the kind before. This is certainly one of those unpreventable accidents which may occur as long as extensive mining operations are carried on.

I have, &c.,

W. H. J. SLEE,

Chief Inspector of Mines.

The Under Secretary for Mines and Agriculture.

## D.

SUPPLEMENTARY Report by Mr. W. H. J. Slee, F.G.S., Chief Inspector of Mines, on the accident in the South Broken Hill Mine, whereby nine persons lost their lives on 18th July last.

Sir,

Broken Hill, 22 August, 1895.

I do myself the honor to furnish you with an additional report in connection with the accident which occurred in the South Broken Hill Mine on the 18th July last, and by which accident nine men lost their lives, and others were injured. This morning, in company with Mr. Inspector Hebbard, I again inspected the scene of accident, and went in the broken ground as high as possible, not without some considerable amount of risk, but could see nothing to throw further light on the subject. I could, however, see that the sets of timber had been secured by stays and angles, on the same principle as adopted in the principal Broken Hill mines. In fact, Inspector Hebbard and I inspected these very stopes in the

the last week of June and considered everything safe. The stopes rise from south to north, ten sets being the highest obtained, but in the vertical it would only be about five sets; the lower parts of the sets were filled in with mullock. Very probably the whole of the lode stuff slipped away from the overhanging wall, which is very greasy. Inquiries have also been made by me amongst a large number of persons, principally miners, and in no instance have I met one person who said otherwise than that the accident was unpreventable and no one was to blame. Three of the miners spoken to by me were working in the stopes (with those killed) at the time the underground manager, Mr. Samuel Mayne, instructed by the general manager, Mr. J. B. Gluyas, ordered the men out of the stopes to a place of safety. These three men escaped with slight injuries, and are again at work, whilst their comrades were killed by their side, and these men state that the underground manager gave them warning at 2 p.m. on the 18th July, and again at 3 p.m. ordered them from their work, against the whole of the men's wish, as they thought the manager stopped them from working without real cause. The creep took place fifty minutes after this, and as the men worked on contract they could have gone to the surface had they chosen to do so. But, as stated in my former report, all the men thought they were safe in the level when overtaken by concussion of air.

I have, &c.,

W. H. J. SLEE,

Chief Inspector of Mines.

The Under Secretary for Mines and Agriculture.

The reports of Inspectors Milne, Hebbard, and Godfrey are attached herewith. I may here state that the abovenamed Inspectors have given me every possible assistance, and I have good reason to think that they have given general satisfaction to all concerned.

The following districts have been visited by me in my capacity of Chief Inspector of Mines:—Cootamundra, Wyalong (Reefton, Barmedman, and Temora twice), Rye Park, Gundagai, Adelong, Bowning, Yass, Gunning, Yarrawa, Burrowa, Young, Grenfell, Bywong, Captain's Flat, Murrumburrah, Garangula, Albury (twice), Bulgandra, Bowna, Corowa, Marulan, Bungonia, Broken Hill (twice), Tarrawingi, Milparinka, Tibooburra, Mount Brown, Cobar, Mount Drysdale, Byrock, Coolabah, Bald Hills, Nymagee, Gilgunnia, Overflow, White Cliffs (Wilcannia), Tenterfield, Boono Boono, and Drake.

To accomplish this work I travelled by railway fully 12,000 miles, and by vehicle 2,328 miles.

Amongst a number of reports furnished by me to the Department, the following received the Honorable the Minister's approval for publication:—Report on Drake, Milparinka, White Cliffs, Bulgandra, Gilgunnia, Corowa, Cobar, Coolabah, Mount Drysdale, Bald Hills, Grenfell, and Temora.

The total numbers of letters written and registered in my branch during the year 1895 are as follows:—

	Letters written in 1895.	Papers registered in 1895.
Chief Inspector of Mines	3,311	4,551
Diamond drills	210	440

The above is irrespective of telegrams, circulars, and other documents not copied.

There are also a large number of papers received and dealt with in connection with the Prospecting Vote.

During the year I have lost the valuable services of Mr. M'Culloch, who was transferred to the Head Office, and Mr. M'Neil took his place as Clerk to the Chief Inspector of Mines. Both Messrs. J. S. M'Neil and J. S. Leigh have greatly assisted me in my office duties, which are greatly on the increase and accumulating.

I have, &c.,

W. H. J. SLEE, F.G.S.,

Chief Inspector of Mines.

REPORT by Mr. Slee, F.G.S., Chief Inspector of Mines, on the prospect of the Drake Gold-field.

Sir,

Drake, 7 March, 1895.

I do myself the honor to inform you that I have completed my official duties here. The yield of gold for the Drake Division for 1894 was 6,062 oz., a considerable increase of previous years. This increase in the yield of gold is principally due to the Prospecting Vote and new arrivals who have been assisted to come here from Sydney under the system adopted by the Mines Department.

Drake has quite a permanent appearance, owing to the fact that the miners are more satisfied to settle and search for gold than was the case in former years.

The principal yield obtained during the year has been from the Lady Jersey Mine, which, through the aid of the Prospecting Vote granted to Mr. George Rivers, part owner and manager, discovered rich auriferous veins in the felsite formation. With a small crushing plant, known as Patterson's Patent Elephant Stamp, or rather Arms, worked by spring, which crushes on an average of about 4 tons in twenty-four hours, the manager, Mr. G. Rivers, obtained for his Company during last year 1,851 oz. of gold. The Company now intend to erect a large crushing plant, when they expect larger returns than hitherto. The works of this mine are extensive, and the prospects of future prosperity are very encouraging.

The Adeline Mine crushed 544 tons, with a yield of 570 oz. 13 dwt., and also crushed for the public 573 tons, with a yield of 896 oz. 7 dwt. of gold. The All Nations (Hineman and party) and other mines are also yielding payable results.

Miners can be seen in gullies fossicking for gold which for years past were either considered worked out or too poor to be worth working; nevertheless, several persons are now making a living.

The White Rock Mine is again at work. Fifteen stamps are continually crushing, and Messrs. Rossiter and Harton feel confident that at last they have discovered the proper method by which to treat the White Rock ore on a payable basis, even at the present low price of silver. There is a large deposit of ore in the mine which could be cheaply worked on the quarry system; the trouble hitherto has been the great loss of silver in the treatment, but which trouble, by the consistent energy and perseverance of Mr. Rossiter, seems to have at last been overcome.

I have, &c.,

W. H. J. SLEE,

Chief Inspector of Mines.

The Under Secretary for Mines and Agriculture.

REPORT by Mr. W. H. J. See, F.G.S., Chief Inspector of Mines, on mining in the Milparinka District.

Sir,

Milparinka, 27 May, 1895.

I do myself the honor to inform you that I have, for the present, completed my official duties on the Albert Gold-field. Mining matters have been greatly improved since the new discoveries were made on Little Bendigo, a locality situated about 5 miles northerly of Milparinka. The reefs occur in the slate formation, in lenticular blocks, with a strike of 50° north of west, with an easterly underlay. A large

large number of claims have been taken up; the principal, so far, are House and party (prospectors), who have a reef averaging about 2 feet in thickness. The gold can be seen in the stone with the naked eye, and is well distributed through the quartz, which, by appearances, should yield from 2 oz. to 3 oz. per ton, and, at the time of my inspection, there were about 40 tons of stone at grass. Chambers and party, who are on a different line of reef, westerly from House and party's prospecting claim, have a reef several feet in thickness, and fine gold can be seen with the naked eye in some of the solid quartz. Kershaw and party, Lindberg and party, Bamuss and party, Sullivan and party, and others have also excellent indications. As stated above, these reefs occur in lenticular blocks, therefore, the quartz will, at times, pinch out, or even totally disappear; but miners should not be discouraged by such occurrences, they should sink and drive for new makes of quartz. Indications are not wanting to the observer to believe that numerous reefs of a payable nature may be discovered, provided the quartz-veins in the hills at Little Bendigo are thoroughly and systematically prospected. Up to the present very little actual work or thorough prospecting has been performed. There are about 100 men at Little Bendigo.

At Mount Browne, Geo. Smith and party, Jas. Kershaw and party, and others are still obtaining payable gold, and a few parties of miners are also working at the Four-mile. At Warratta, Mr. Sheridan has had some men at work for some months past to discover the quartz-vein from which the rich specimens were obtained. He has discovered some very narrow but rich veins, and is in great hopes that further rich discoveries will be made by him. The quartz reef at the Wamberriga Range has been reoccupied of late with a view to further developments. At Tibbooburra, a few prospectors are seeking for new discoveries of gold, but the scarcity of water has greatly retarded their progress; as, however, from 1 to 1½ inch of rain fell in the district during last week, numbers of fossickers will be able to make a living in the alluvial. I here beg to reiterate my opinion, expressed in my annual report of 1893 and former reports, that Mount Browne, Mount Poole, the reefs on Wamberriga Range, Good Friday, Nuggety, Easter Monday, The Granito (Tibbooburra) and Tipperary Gully (Two-mile), which are situated in a tract of country 50 miles in length by 10 miles in width, will, sooner or later, be closer united by leads or other gold workings, and that rich but narrow quartz-veins will be discovered. In fact, prospecting for payable auriferous quartz-veins has been greatly neglected on the whole Albert Gold-field. Scarcity of water is the greatest drawback, and is severely felt about Little Bendigo.

I have, &c.,

W. H. J. SLEE,

Chief Inspector of Mines.

The Under Secretary for Mines and Agriculture.

REPORT by Mr. W. H. J. Slee, F.G.S., Chief Inspector of Mines on the Opal Fields at White Cliff.

Sir,

White Cliffs, 16 June, 1895.

I have the honor to inform you that I have completed my inspection and other official work in connection with the White Cliff Opal Mines, and forward you herewith separate reports on each separate subject.

These opal mines are situated about 16 miles from Taralla Home Station, 60 miles from Wilcannia, 100 miles from Milparinka, and 160 miles from Broken Hill.

The opal is found in the Cretaceous formation, in small veins varying from a mere thread to 2 inches in thickness, at different shallow levels, the deepest so far obtained being about 50 feet, and the only guidance the miner has in mining for this opal is small veins of common opal known to opal miners as potch, and it is amongst this common opal or potch patches, valuable opal is frequently discovered. I was informed by opal buyers that some of the White Cliff opal is the finest in the world; as much as £20 per oz. has been paid on the field. Lately the output has diminished; but a patch of very fine opal was discovered during my visit, valued by the owners at £350, one piece alone being valued at £100. It is variously estimated that from £70,000 to £100,000 worth of opal has so far been discovered, and sold, from the White Cliff Opal Fields. At present the most valuable opal deposits seem to be held under mineral leases, which are worked on the tribute system; but there is still a large area of country totally unprospected either in depth or distance.

Fourteen (14) years ago, when I occupied the position as Warden of the Mount Browne Gold-fields, I forwarded several small pieces of fairly good opal found by me (associated with gypsum) near Milparinka, and which was pronounced by the late Mr. C. S. Wilkinson, Government Geologist, as good opal, showing a good red and green fire, and since my visit to the White Cliff Opal Fields I feel confident that not only will payable opal mines be discovered near Wilcannia, and in different localities between Wilcannia, Milparinka, and in that direction towards the Queensland Border. In fact, in the near future this hot and arid country, now mere sheep walks, will be settled on here and there by flourishing industrious mining communities.

White Cliff, which has a public school, post-office, two hotels, several stores and private dwellings, has a total population of about 400, which may be increased at any moment, should fresh opal discoveries be made.

\* \* \* \* \*

I have, &c.,

W. H. J. SLEE,

Chief Inspector of Mines.

REPORT on the Bulgundra Gold-field by the Chief Inspector of Mines, Mr. Slee, F.G.S.

Sir,

Bulgundra, 1 July, 1895.

Having, in accordance with your instructions, visited the Bulgundra Gold-fields and inquired into several matters in connection with same, I have the honor to inform you that I also inspected the underground workings of the principal mines, and am of opinion that there are no defined quartz reefs in the locality, but the gold occurs in small irregular quartz-veins, associated with felspathic dykes from a few inches to several feet in width. Numbers of claims are at work on several dykes, such as the Lone Hand, Pardos Nolan, Grey and party, whose greatest depth is 35 feet, and who crushed 38 tons yielding 103 oz. of gold; the average thickness of the vein being about 10 inches. Several claims both N.E. and S.W. of Nolan and party's are at work with various success.

At.

At the Goodwood dyke, Albert Bonting and party are 60 feet in depth, the width of crushing stuff being 2 ft. 6 in., and have crushed 110 tons with a yield of 62 oz. of gold; strike of dyke due west. Several claims are at work both east and west, some of which are also payable.

On the Show Day Line, Hewitt and party are down 86 feet, they had two crushings, one 60 tons yielding 2½ oz. per ton, and 17 tons yielding a total of 42 oz. 6 dwt.; thickness of vein from 4 to 8 in. On this line there are also several claims at work, some of which are payable.

On the Welcome Find line, Driscoll and party's deepest part is 70 feet, their crushing stuff in parts of the claim is fully 8 feet in width, and they crushed 74 tons with a yield of 70 oz. of gold.

Although, as I stated above, there are no defined quartz reefs so far discovered on the field, nevertheless, if the dykes are worked with a proper system and economy, they are likely to return payable results for years to come. As a rule the payable nature of small quartz-veins associated with dykes such as occur at Bulgandra do not carry payable gold to any great depth, say, over 200 feet, but, before that depth is reached many thousands of tons of crushing stuff may be treated with payable results, provided that instead of the primitive mode a better system of working be adopted throughout the field.

Independent of fresh discoveries in quartz there is a great probability that payable gold may be discovered in alluvial and there are several gullies well worth prospecting, especially one within half a mile of the Albury side of the township of Bulgandra.

A 10-stamp crushing machine of a good type is in full work. The population of the field numbers about from 150 to 200 (many having left temporarily to go shearing and are likely to return after the shearing season). There is a private school, stores, and the usual business premises, but so far no hotel.

The distance from Albury is 41 miles. A township has been surveyed on a reserve, and as soon as the latter is cancelled buildings of a more substantial character than those at present in use will be proceeded with.

I have, &c.,

W. H. J. SLEE,  
Chief Inspector of Mines.

The Under-Secretary for Mines and Agriculture.

REPORT by Mr. W. H. J. Slee, F.G.S., Chief Inspector of Mines on the Gilgunnia, Overflow, Rest Down, and Hermidale Mines.

Chief Inspector of Mines' Office, Department of Mines and Agriculture,  
Sydney, 29 July, 1895.

Sir,

In compliance with your instructions I have inspected the new gold discoveries at Gilgunnia, and do myself the honor to inform you that I have forwarded you separate reports on different subjects in connection with said discoveries. The latter are situated in the parishes of South Peak and Tarcombe, county of Blaxland. Some are on the travelling stock-road No. 2,361 from "Gilgunnia Hotel" to Eremeron.

Discoveries have also been made, and claims are at work on the disallowed conditional purchased land applied for by Henry Kruge.

So far, Gilgunnia is essentially a quartz-reefing district, consisting of a net-work of auriferous quartz-veins, from a mere thread to several feet in thickness, and with a strike of almost all points of the compass, the principal strike is about N.E.

The area in which the discoveries have so far been made is about 5 miles by 3 miles in extent.

The following are the principal mines at work:—

The Dream (Finn and party).—Depth, 50 feet; average thickness of quartz-vein, 6 inches; 5½ tons crushed at the Clyde Works, Granville, yielded a total of 35 oz. of gold. Six tons of quartz have also been dispatched to Park and Lacey's for treatment.

The same party have struck a reef south of No. 1 shaft, 3 feet in thickness, containing a little gold, which by further prospecting may become payable. This is a distinct reef from the one from which a payable crushing was obtained.

The Rising Sun (Mullins and party).—Depth, 54 feet; average thickness of vein from 6 to 8 inches. A crushing of 6 tons from this claim, treated at the Clyde Works, Granville, yielded 4½ oz. of gold per ton. The quartz was taken from the western leg of a saddle-reef, which saddle shows distinctly in the shaft near the surface.

The Tarcombe Claim (Eason and party).—Has lately been floated into a company of 10,000 shares of £1 each. Depth, 50 feet, with an average thickness of vein from 6 to 12 inches. I was informed that 2½ tons quartz treated yielded 3 oz. 17 dwt. 10 gr. of gold, and that No. 1 North had crushed 3 tons, yielding 1 oz. of gold per ton. There are several claims on this line.

At the Four-mile, that is about 4 miles easterly of Tarcombe reef, are several claims at work with various success.

The Prospecting Claim (Collins and party).—Depth, 40 feet; average thickness of reef, 14 inches. No crushing has so far been made, and gold could be seen with the naked eye in some of the quartz.

No. 1 East (Bray and party).—Depth, 40 feet, are on a reef about 1 foot in thickness in which gold can be seen.

The Keep-it-Dark (Scaton and party).—Depth, 30 feet; average thickness of quartz-vein, 18 inches, showing gold.

The Moonlight (Talbot and party) and others on the field, too numerous to mention for the purpose of this report, are more or less on gold of which some claims seem apparently payable.

The whole of the quartz-veins are associated with oxide of iron and pyrites, the quartz is easily crushed, and so far the ore is not refractory; they occur in lenticular shapes (pinching and bulging) in an altered sandstone formation intersected by (cross coarses) dykes of perhaps a volcanic origin, the rock being soft it is easily worked without explosives. Scarcity of water is the great drawback for immediate developments, although I have no doubt that by the time the depth of 150 feet to 200 feet is reached an ample supply of underground water fit for quartz-crushing, but not for domestic purposes, will be met with; hard rock and refractory ore may also be met with at the above said depth.

At the time of my inspection there were about 500 persons on the ground. A street had been formed by rows of tents, of which I am sorry I could not take advantage, owing to the fact that one side of said street was on the stock route, and some of the residence areas were in too close proximity of quartz claims. I settled several disputes in my capacity as Warden, and by request of the Progress Committee

Committee and the people present, I selected a township site, and marked off two sections on a street. The site chosen by me is perhaps not satisfactory to every person on the field, as there were no less than three or four rival sites; the one selected is the most eligible, considering all circumstances, and was approved of by the majority of the people present. It is midway between Tarcum line, and Finn and Mullin's line of reefs, clear of the stock route, and near, but not on, the principal gold discoveries.

In conclusion, I beg to state that the Gilgunnia gold-field, although perhaps not extensive, is likely to profitably employ a population of a few hundred persons for some time to come, as some of the quartz-veins are certain to yield more than payable returns; whereas, others require strict economy and systematic working before shareholders are compensated. As stated before, the great drawback is an immediate water supply, and machinery for the treatment of auriferous quartz.

In my reports published in 1880, 1883, 1884, 1887, and more recent dates, I drew attention to the country between Cobar and Mount Hope, Nymagee, and Cobar, Nyngan, Nymagee, and Girilambone, as being well worthy of prospecting for gold and other minerals, but I would strongly advise the public not to rush to Gilgunnia unless parties are prepared with ample means to prospect for at least six months in a hot dry country, such as the districts referred to. The population at Gilgunnia is greater than present circumstances warrant, work is not obtainable at any price, either for miners looking for wages, tradesmen or labourers.

Before my return to Sydney, I also inspected the Overflow, the Rest Down, and Hermidale mines.

At the Overflow, which is situated about 25 miles easterly of Nymagee, a lode has been discovered about 9 miles S.E. of the Overflow Home Station about 5 ft. in width, from which assays were made, yielding from 17½ per cent. of lead 8 oz. of silver and 3 dwt. of gold up to 58½ per cent. of lead, 26 oz. of silver and 13 dwt. of gold per ton. Unfortunately, instead of following the lode down, a vertical shaft of a rather large size for prospecting purposes has been sunk at the back of the lode 50 feet in depth which naturally proved nothing. The appearance of the locality is favourable for payable mineral deposits.

At the Rest Down, Goodwin and party are still prospecting, so far without payable results. The country a few miles nearer Nymagee has a more decided auriferous appearance than at Rest Down proper.

At Hermidale Messrs. Hennessey and Oldfield crushed 10 tons for the yield of 4 dwt. of gold per ton. This mine is worthy of being further prospected.

I have, &c.,

W. H. J. SLEE,

Chief Inspector of Mines.

The Under Secretary for Mines and Agriculture.

REPORT on the Corowa Gold Workings, by Mr. H. J. Slee, F.G.S., Chief Inspector of Mines.

Sir,

Corowa, 31 August, 1895.

Having inspected the mining operations in the Corowa district, I do myself the honor to inform you that sinking has not yet been commenced by the Corowa Deep Lead and Prospecting Company. The quantity of high quality gold shown to me by Mr. Chenhall, of Corowa, and testified by statutory declaration that it was obtained by the company from the bottom of four bore-holes, viz., 294 ft., 298 ft., 307 ft., and 310 ft., respectively, leaves little doubt, if any, that deep alluvial leads exist on the New South Wales side of the river Murray, in the vicinity of the town of Corowa. In fact, deep alluvial mining operations on a profitable and extensive scale are now carried on in the Rutherglen district, Victoria, and payable prospects have been obtained by boring on the Victorian side, near the banks of the river Murray, proving that the Rutherglen rich alluvial leads will be traced under the Murray into New South Wales.

The Hillside Quartz-mining Company's operations, about 8 miles N.E. of Corowa, and the Nulla Nulla or Redland alluvial rush, were also inspected by me. At the former a great deal of work has been done; the deepest shaft being 70 feet. An 8-stamp quartz battery has been erected within a short distance of the mine, and large quantities of quartz have been crushed; but so far, not with any success. The company, however, intend to test their quartz reef at a greater depth.

At Nulla Nulla, on Redland Rush, I found about forty men at work; the sinking varied from 15 ft. to 50 ft. in depth; thickness of wash from 6 to 12 in., yielding in a few instances sufficient to give wages, and in others barely tucker. The prospectors (Messrs. Tiplady and party), washed one load yielding 12 dwt. 17 gr. of gold. Fair prospects were also washed in my presence in McLennen's and other claims. There are quite sufficient miners on the ground, as far as the Redland Rush is concerned; the whole length only being about half a mile in length before it enters into freehold lands. If miners could make easy terms with the landowners, then there would be inducement for prospecting, and perhaps a payable lead may be discovered within a mile below the Redland Rush.

The whole locality has a decided auriferous appearance, but being principally freehold land prospecting cannot be carried on cheaply. Although the Corowa district is not likely to become famous in quartz-mining, there is a very great probability that in the near future Corowa will take its stand as a prosperous gold-field of New South Wales.

I have, &c.,

W. H. J. SLEE,

Chief Inspector of Mines.

The Under Secretary for Mines and Agriculture.

REPORT by the Chief Inspector of Mines (W. H. J. Slee, Esq., F.G.S., &c.), on the Mines at Coolabah, Byrock, Mount Drysdale, and Bald Hills.

Sir,

Cobar, 28 Oct., 1895.

I do myself the honor to inform you that I have completed my inspection of the Coolabah, Byrock, Mount Drysdale, and Bald Hill Mines.

Near Wilga Dam, Coolabah, a party of miners are now prospecting in a Tertiary formation, on a site known as the Verecani Riley Mount. Small quantities of alluvial gold have frequently been found in the locality, but so far not payable. The present party (Gilligan and Riley), intend to prospect systematically by sinking and driving across the deepest part of the channel. About 3 miles from Gilligan's a quartz reef has been discovered by Peacock and party, half a ton yielding 6 dwt. of gold. In my opinion the prospects of the said reef are not encouraging, and are not likely to yield payable returns.

Several

Several quartz reefs were examined by me, in the Byrock district, some of which are worthy of thorough prospecting.

At the Bald Hills, about 35 miles from Byrock, and 50 miles from Cobar, a few parties are prospecting—the principal of which is Redcliff and party, who had a narrow quartz vein near the surface, in which gold, with the naked eye, could be seen. But as the vein has faulted, they intend prospecting for it on a deeper level.

In my opinion, the country between Bald Hills and Byrock, and Bald Hills and the Government Tank near the Tindory Hotel, has a more pronounced auriferous appearance than in the immediate vicinity of the Bald Hills.

Mining matters at Drysdale are not very flourishing, as a large number of the claims are lying idle.

The Mount Drysdale Company's Mine, in which rich gold discoveries were made through the aid of the Prospecting Vote, has had some very rich crushings, and as the gold occurs in bunches in the country rock, new discoveries may be made at any time. The shaft and workings are in good order, and reflect great credit on Mr. S. J. Skewes, the Mining Manager, the deepest shaft on the mine being 300 feet, but the present workings are being carried on at the 80-ft. and 180-ft. levels.

The total number of miners on the field is now somewhat below 106.

The old C. S. A. Mine, about 8 miles from Cobar, has been retaken for further prospecting. Hitherto it has been prospected for copper deposits, but it has a more auriferous appearance, and there is a greater probability that payable gold, instead of copper, will be discovered in the C. S. A. Mine.

I have, &c.,

W. H. J. SLEE,

The Under Secretary for Mines and Agriculture.

Chief Inspector of Mines.

REPORT by W. H. J. Slee, Esq., F.G.S. &c., Chief Inspector of Mines, on mining matters in the Cobar District.

Sir,

Cobar, 30 October, 1895.

I do myself the honor to inform you that I have completed my inspection in the Cobar District.

Mining matters are on a more solid foundation than they were twelve months ago, when public excitement ran so high owing to the very rich finds in the Mount Drysdale Mine. The frenzy consequent upon the mining boom having disappeared, mine-owners and managers have now settled down to proceed with the genuine development of their respective mines.

The Great Cobar Copper Mine, which has been almost totally idle for some years, was restarted last year by five plucky enterprising gentlemen, who hailed from the neighbourhood of Singleton, and who deserve the utmost praise for endeavouring to make the mine pay (under the tribute system) at the then low price of copper. Many obstacles and difficulties presented themselves during the first year of the existence of the Great Cobar Mining Syndicate Company (the tributors), but through the energy and sound common sense-management of Mr. William Longworth, these difficulties are one by one disappearing, and it is to be hoped that the tributors' syndicate will receive their well-merited reward, as by their action a large number of men have obtained employment, and the prosperity of the Cobar district has been placed on a sounder foundation. Mr. W. Longworth is now raising ore from the 74 fathom, 88 fathom, and higher levels, and as will be seen below, the percentage of copper is very low, and very little, if any high grade ore can be obtained; nevertheless, fair profits are extracted, and the syndicate appear to be satisfied with their plucky undertakings. The tributating syndicate are now employing 415 persons, including boys. Their monthly consumption of firewood is 2,163 tons; of coke, 550 tons; and of coal, 91. The average amount paid monthly for freight is £1,151; wages, £4,036. Quantity of ore smelted (monthly), 3,859 tons. Average percentage of copper per ton of ore,  $\frac{1}{4}$  per cent. Number of water-jackets in use for smelting purposes—one 80 tons, and one 30 tons. The syndicate intend to extend their operations, and so obtain a still greater output in the future.

One of the most pleasing incidents in connection with the working of the Tributating Syndicate Mine is well worth noticing for the public good, and the publication of which may induce other mine-owners, tributors, or syndicates to follow the Cobar syndicate's noble example, namely, that although a large number of unemployed men offered themselves daily to Mr. William Longworth, one of the tributary syndicate, and manager, he, in face of the number of men daily seeking work at the rate of wages paid by the company, posted a notice in the mine that owing to the slight rise in the market value of copper, the syndicate had come to the conclusion that on and after a certain date the Company, or rather Syndicate, intended to raise the wages of the whole of their employes  $7\frac{1}{2}$  per cent. This came as an agreeable surprise to those employed. They have now enjoyed the increase for over a month, and during my inspection of the underground workings I could not help noticing the high spirit and contentment of the men, and how they vied with each other to work for the real interest of their employers.

The gold-mines within 3 miles of Cobar from the Fort Bourke to the Oriental are still working with varying success.

The Occidental still under the able management of Mr. G. Fawl, who is continually crushing with 15-stamp battery on a low quality quartzite lode. The Albion Mine which should certainly be payable is under suspension. The Chesney, Mr. J. P. Watson manager, is now bailing his deep shaft for the purpose of extensive and deeper mining operations than have hitherto been undertaken on that line of country.

The Mount Pleasant has just completed the erection of a 10-stamp battery, and the Young Australian, which so far has been a good mine, will also erect a 15-stamp battery with all the newest gold-saving appliances. The manager, Mr. G. T. Hunts, thinks his machinery will reach completion by about the end of this year.

At the Peak, about  $1\frac{1}{2}$  miles in a southerly direction from the Occidental, Connelly, Barass, and party have discovered a slate formation over 20 feet in width; they crushed samples at the Clyde Works, Granville, which gave highly payable results, and has caused quite a rush to the locality. I have no doubt that if this line of country is more thoroughly and systematically prospected other payable gold discoveries will be made.

At present there are quite sufficient men in the district for all purposes.

I have, &c.,

W. H. J. SLEE,

The Under Secretary for Mines and Agriculture.

Chief Inspector of Mines.

REPORT

REPORT by the Chief Inspector of Mines, W. H. J. SLEE, Esq., F.G.S. &c., on the Mitchell's Creek Freehold Estate Mine, Mitchell's Creek.

Sir,

Daviesville, 4 November, 1895.

Having completed my inspection of the Mitchell's Creek district, I do myself the honor to submit my report on the Mitchell's Creek Freehold Estate Mine. This mine which is now under the general management of Mr. J. M. Findlay, is being worked on sound commercial principles. The smallest details are not allowed to escape careful consideration, and it is only by such means that such and similar mining properties can be made to yield payable returns. I am indebted to Mr. Findlay for all the details and other valuable information which added to my own observations has prompted me to give the following interesting and instructive details:—

The property, which is a freehold and contains 600 acres, was bought by Messrs Dick, Davies, Dalveen, and Findlay, in the latter part of 1888. Operations started in June, 1889, by sinking a shaft known as No 1. At the 140-foot level water, which had accumulated in the old workings, was met with and overcome by the erection and use of a double barrel plunger pump working on the footwall of the underlay.

In June, 1890, a 15-stamp battery was erected by the Company which started crushing on quartz from the No. 1 shaft. The battery has crushed since its erection 21,600 tons of quartz yielding 17,228 oz. of gold.

In February of the present year the battery was increased to 25 head of stampers, and has since crushed 7,223 tons of quartz for a yield of 5,306 oz. of gold. The total number of tons of quartz crushed and yield of gold obtained up to the 19th October last, that is, in five years and four months, is 28,900 tons yielding 22,531 oz. 7 dwt. 8 gr. of gold, giving an average of 15 dwt. 14 gr. per ton. The value being £83,716 10s. 2d. The total number of persons employed in the mine, 98; and on the surface, including battery and chlorination works, 47, making a total of 145 persons directly employed.

The crushing and gold-saving appliances consist of a 25-stamp battery, each stamper when new being 6cwt.; the crushed stuff passes through screens 240 holes to the square inch, then over four copper plates in front of each battery of five stamps. The first 2 feet is plain copper, the second and third, together 5 feet, is electric silvered, followed by a mercury well, and then over the fourth plate, 2 feet electric silvered, into the tailing shoot. The electric silvering is done on the mine by the company's electrician. The tailing shoot connecting the battery with the vanners is 400 feet in length, and conveys the pulp from the battery tables to the concentration shed. This wooden shoot is cleaned up every four weeks as some of the finest amalgam stops in the crevices. At the clearing up on Saturday the 2nd inst., 19 oz. of amalgam were obtained out of said shoot; the latter discharges on a second set of amalgamating tables. There were 9 vanners in full work, and one thrown out of gear for repairs. The loss of quicksilver for a twelve months' run averages  $\frac{3}{4}$  oz. per ton of quartz crushed, and the tailings from the vanners concentrates have now been reduced by the treatment adopted by Mr. Janistky, the Company's able Metallurgist, to 1 dwt. 4 gr. per ton, being about 3 dwt. per ton less than when Mr. Janistky took charge of the chlorination works. I may here state that the ore is refractory containing gold, silver, copper, and other minerals, the gold being very fine, and although the yield per ton is 15 dwt. and over no gold can be seen in the stone. The Company also intend to make their own chloride of lime for which they have a plant on their mine.

The electric-light is used on all the surface works, but so far has not been introduced into the underground workings of the mine.

Although there is more quartz in sight than can be crushed for the next two to three years, the underground workings are steadily extending, and very probably the Company will ere long add an additional 25-stamp to their crushing power.

No. 1 shaft is down 680 feet in which six different levels have been opened, namely, at the 205 feet, 327 feet, 420 feet, 530 feet, 600 feet, 680 feet. At present there are not many men employed on these levels. The 327-foot level which had been idle for some time, and which is now in 370 feet, south from the shaft has lately been driven into a body of higher quality stone than has previously been obtained by the Company, the same class of stone has also been discovered in the 100-foot level in workings known as Snow's Tribute.

No. 2 shaft, which is at present the chief supplier of quartz, is 480 feet in depth. Five different levels are being worked, namely, 131 feet, 200 feet, 310 feet, 400 feet, and 480 feet; the last level is the shortest being 160 feet in length. The reef is in parts over 3 feet in width, averaging about 20 inches, well defined throughout, with smooth walls, a horse appearing at times, splitting the reef. But this only occurs at long distances apart, and for a short extent; the vein splitting, but never actually faulting. The output of this shaft averages about 100 trucks per day, or 400 tons of quartz per fortnight.

Snow's shaft, above mentioned, is a temporary working shaft, depth 76 feet; at a trial crushing of 10½ tons yielded 1 oz. of gold per ton, and at a lower level, 200 feet from surface, assays gave recently 3 oz. of gold per ton. These levels are now being extended with all speed to cut under this rich stone, and the 327-foot level has already intersected it, and is extending into the rich vein at the rate of 3 feet per day. The opening up of this part will add greatly to the gold-producing power of the mine; as hitherto this part of the mine has received very little attention.

As already stated, I have gone into details in this report, in the belief that it would not only be interesting but instructive to the mining community, as too much detailed information cannot be given to the public on such important mining operations. But on the contrary, such information may become a valuable guide for others in their endeavours to carry on economical systematic mining. The facts and figures given by me certainly prove beyond doubt that many gold and other mineral deposits which have been worked and abandoned in the Colony of New South Wales, may be made to pay, under a proper system, by men of energy, perseverance, and practical knowledge, such as the owners of the Mitchell's Creek Freehold Estate Company appear to be.

Through the working of this mine a township has sprung up, which has been named Daviesville, after Mr. Phillip Davies, one of the owners of the mine. This town contains a population of about 400, has a daily mail from Wellington, post office, school, and a number of business premises, including boarding-houses, but no hotel; the erection of an hotel is discouraged by the company.

I have, &c.,

W. H. J. SLEE,

The Under Secretary for Mines and Agriculture.

Chief Inspector of Mines.

REPORT

REPORT by W. H. J. Slee, Esq., F.G.S., &c., Chief Inspector of Mines, on Mining at Grenfell.

Sir,

Grenfell, 30 November, 1895.

Having for the present completed my official work in the Grenfell district, I do myself the honor to inform you that owing to the severe drought mining operations have been greatly retarded. Very little has been done in alluvial mining. At the quartz reefs, the Young O'Brien just completed a crushing of 840 tons of quartz, yielding 346 oz. 5 dwt. of gold. This yield, although not up to expectation, is nevertheless payable, the reef being several feet in thickness; the water for crushing purposes being very dirty, perhaps the concentrates will contain a higher yield of gold.

J. H. Dodd and party have struck the reef at the depth of 190 feet, on the south end of the Consols. It is surmised that this is the continuation of the old O'Brien reef, which was lost in Guliani's claim, about twenty-five years ago. The quartz looks promising, containing a fair percentage of pyrites, but, so far, no gold.

Southerly of Dodd and party's claim, and westerly of the old Outward-bound Reef, Messrs. Thomas Holsen and party have discovered a reef several feet in width, in which a little gold can be seen with the naked eye; but whether it is really payable cannot be ascertained for certain until a crushing has taken place. The Homeward-bound (Campbell and party) is still at work and sinking; a party of tributors have lately taken over the mine, and are sanguine of success.

O'Brien, Clarkson, and party (Lucknow Reef) have a well-timbered shaft down to the depth of 286 feet, at the bottom of which is a reef fully 10 feet in width, containing a little gold, but not payable. This party have sunk over 100 feet through the barren quartz, and at the time of my inspection it appeared to me that an improvement had taken place within the last few feet of sinking; as the latter is, however, very costly, the party intend opening on the 266-ft. level along the line of reef, in a southerly direction, to ascertain whether payable gold exists in said direction. The reef, although almost barren, still keeps in well-defined walls, and the indications are promising. The party is deserving of success for their plucky, persevering actions, and should they obtain payable gold, an impetus will be given in re-working or prospecting the Grenfell reefs at a lower level.

The Enterprise Reef, which has almost been continually worked and yielded payable returns since the opening of the Grenfell goldfield in 1866, is now being worked on the tribute system. The battery belonging to the mine is now the only one crushing for the public in the Grenfell district.

Several of the Tyagong reefs, which have been idle for years, have recently been retaken, with a view to development; very little can be done with them at present owing to the drought. The richness of the Grenfell quartz reefs is now a matter of history, several of which gave several thousands of pounds sterling to the working shareholders. In my opinion it only requires energy and perseverance, combined with an economical system of prospecting the deeper levels, to once more place Grenfell in the front rank of the quartz-reefing districts of New South Wales.

I have, &c.,

W. H. J. SLEE,

The Under Secretary for Mines and Agriculture.

Chief Inspector of Mines.

Report by Mr. W. H. J. Slee, F.G.S., Chief Inspector of Mines, &c., &c., on the New Alluvial Rush at Reefton.

Sir,

Temora, 21 December, 1895.

I do myself the honor to inform you that in connection with my recent official duties in the Temora district, I also inspected the new alluvial rush at Reefton. On my arrival at the rush I found about fifty miners on the ground. Mr. Slattery, the prospector, had washed a few loads yielding about 7 dwt. of gold per load, and as that ground is very shallow, with a good thickness of wash-dirt, the claim so far returns payable results, but unfortunately no other party has been successful in discovering payable gold. No. 3 Morris, Pain, and Party washed two loads of stuff during my visit yielding about 2 dwt. of gold per load—not payable. Shafts have been sunk from Slattery's prospecting claim to Nixen's selection for a distance of about half a mile in a well-defined east and west channel, but so far without any payable results; the deepest shaft being that of Smith and party's, which bottomed at 84 feet, with about 1 foot of wash and close to the boundary of Nixen's selection.

The wash in the shallower ground, near the quartz reefs, is angular, but at a greater distance from the quartz reefs it becomes waterworn, although as stated before, without any payable results, notwithstanding this, several parties are still driving across the channel in the hopes of striking something payable, of which there is still a probability.

But in my opinion the only hope for extensive alluvial discoveries in the Reefton district is the prospecting for, and discovery of, a deeper channel trending in an opposite direction from Slattery's channel, and which through several tributories has received the principal part of the denudation of the Reefton auriferous quartz reefs.

The present population at Reefton is ample for all purposes, and it would be worse than folly for anyone to come any distance to the Reefton alluvial rush. Several of the Reefton quartz reefs are still yielding payable returns, but the battery dam being dry, and water very scarce, parties have to stack their quartz waiting for rain.

A telegram was received by me to-day from Mr. Frederick Marshall, of Barmedman, to the effect that Roberts and party just crushed from a new discovered quartz reef situated about 7 miles on the Wyalong side from Barmedman 23 tons quartz, crushed at Barmedman, yielding 29 oz. 8 dwt. of smelted gold, the reef being 18 inches in thickness. This is highly payable, and proves beyond doubt my often-expressed opinion that payable gold would be discovered between Barmedman and Wyalong.

In fact, sooner or later, many of the still unprospected localities between Scrub Yards, Reefton, Barmedman, Wyalong, and Yalgogrin, will be able to profitably support an industrious mining population.

In different parts of the Scrub Yards, say from 10 to 14 miles from Temora, new gold discoveries (principally in quartz) have of late been made, the foremost of which is Hall and party who, during the last twelve months, crushed 286 tons yielding 1,782 oz. 12 dwt., or at the rate of 6 oz. 5 dwt. per ton.

The reef averages from 3 to 15 inches in thickness, has been worked in parts over 100 feet in depth, and traced fully 400 feet along the surface. But owing to the land being held under conditional lease, adjoining claims are unable to work until the matter *re* their application for permit has been settled.

A

A ten-stamp battery is now in course of erection, and will be able to start in February next, provided sufficient rain fall in the meantime for quartz crushing purposes.

Taking everything into consideration the prospects on the Scrub Yards Districts are encouraging, the only drawback is that most of the land is held under conditional purchase or conditional lease. Although where the gold discoveries have been made are on rugged ironbark ridges; unfit for agricultural or even pastoral purposes and with very little, if any, improvements.

I expect a large population to be settled on these parts as soon as satisfactory arrangements can be made with the conditional leases.

At Temora an effort has again been made to work the deep alluvial which was found in Parker's prospecting claim, and in Moran's, known as the Golden Gate, at a greater depth than in any other part of the Temora lead, as it is thought by some that a false but the main bottom has been worked, and while on this subject I may here state that the late Mr. C. S. Wilkinson, Government Geologist, frequently expressed his opinion both verbally and in his official reports (*see* annual report of Department of Mines, 1881) that the true bottom of the Temora Lead had not been discovered, and with that object in view he has frequently in my company urged miners to try in various parts of the old lead for the true bottom.

Unfortunately, however, large areas of land have been alienated on the course of the old lead which in itself will prevent further prospecting.

The Municipal Council of Temora through their able Mayor, Mr. M'Gregor, have brought the subject once more prominently before the public and are now urging for some aid out of the Prospecting Vote to solve the interesting problem, whether the pipe-clay on which the alluvial gold at Temora was obtained, was or was not the true bottom.

Power, Bray, and party, who are working in the old Golden Gate Claim, and on a lower level than that attained by the original party, are, and have been, on payable gold for some considerable time, and Todd, Irwin, and party who have taken up part of Parkers' old prospecting claim are working below the level originally worked by Parker and party, and are obtaining gold, but so far not payable.

In my opinion recent developments are proving these alluvial auriferous deposits to be mere caverns filled with clay (mere pug) and waterworn pebbles somewhat similar to those at the Happy Valley, and Canadian Lead, Gulgong, or the Cow Flat, Cargo, and not in a regular continuous lead.

As there is, however, a large area of similar formation to the Golden Gate, and Parker's Claims along the whole course of the lead it would, perhaps, be expedient to sink four or five shafts along the old lead which I would recommend.

I have, &c.,

W. H. J. SLEE,

Chief Inspector of Mines.

The Under Secretary for Mines and Agriculture.

#### INSPECTOR MILNE'S ANNUAL REPORT.

Sir,

Sydney, 3 January, 1895.

I have the honor to submit this, my Annual Report, of the inspection of mines in the following districts:—

Armidale, Barraba, Bingera, Bear Hill, Borah Creek, Crowe Mountain, Dungog, Elsmore, Glen Innes, Glen Elgin, Guy Fawkes, Hillgrove, Inverell, Kookarabookra, Moonan Brook, Monkerai, Mururundi, Narrabri, Niangala, Nundle, Stewart's Brook, Scone, Swamp Oak, Tamworth, Tia, Tilbuster, Tingha, Uralla, Walcha, Wangat, and Warraldi in the northern district.

Araluen, Braidwood, Bungonia, Bateman's Bay, Brimbramalla, Moruya, Mogo, Nelligen, Welcome Reefs, Nerriga, Shoalhaven River, Snowball, and Tarago in the southern district.

Capertee, Clear Creek, Caloola, Cobbrah, Dark Corner, Brown's Creek, Bathurst, Blayney, Burnt Yards, Box Ridge, Forest Reefs, Gratti, Hill End, Hargreaves, Leadville, Lucknow, Lewis Ponds, Long Creek, Mudgee, Mount McDonald, Molong, Macquarie River, Merindie, Newbridge, Ophir, Orange, Pyramul, Palmer's Oakey, Sunny Corner, Slattery's Creek, and Sofala in the western district.

The total number of working mines inspected during the year is 292, employing 1,768 men; several of the principal mining centres in the north and west have been inspected twice or more during the year.

In the larger and more extensively-worked mines the managers are careful, and every attention paid to the safe timbering and other precautions in and about the mines for the safety of those in their employ. The result of this is noticeable in the list of accidents, where it will be seen that comparatively few accidents occur in the larger mines from falls of ground.

In the smaller mines worked by the individual miners where no one is recognised as the manager, and are simply prospecting on barely making a living, some difficulty occurs in having their mines kept in a safe condition.

With these parties no doubt in a number of cases want of money is the principal cause of their neglect, and the loss of time in getting timber with which to secure their mines which is simply prospecting, and in some places expecting to leave the ground any day; they would sooner run the risk than get timber to secure it, saying it will last our time, knowing full well the danger they are running in their work.

With others again, want of knowledge when the mine is in an unsafe state; and again a number of cases gross carelessness in fitting the timber used for securing the ground.

Besides the above, I have, as a member of the Prospecting Board, inspected and reported on 230 applications for aid out of the Prospecting Vote.

The total number of mines inspected working or for aid is 522. In the execution of which I have travelled a distance of 3,678 miles.

I have, &c.,

DAVID MILNE,

Inspector of Mines.

The Chief Inspector of Mines, Sydney.

## INSPECTOR HEBBARD'S ANNUAL REPORT.

Sir,

Broken Hill, 5 February, 1895.

I have the honor to present my annual report for the year 1895, as follows:—

During the year I have visited all the outlying portions of the district, with the exception of Mount Browne.

The mining industry, which at the beginning of the year was in a very depressed condition, has received a fresh impetus owing to the profitable treatment of the low grade sulphide ore, and the discovery, in some of the mines, of bodies of ore rich enough to bear cost of shipment and realisation without a preliminary concentration. Practically, the "Sulphide problem" is solved, and mines are again on the dividend list which had returned no profit since the depletion of the oxidised ores.

The depression was added to by the occurrence of a fire in the Block 11 portion of the Broken Hill Proprietary Mine, which broke out on 21st July, 1895, and led to the throwing out of employment of a large number of men of various occupations; and incidentally, to a large exodus of men to Western Australia, as it was for some little time feared the fire would spread throughout the mine on the line of lode.

Fortunately, the persistent efforts made to cope with the flames by means of water, steam, and carbonic-acid gas, aided by the collapse of the ground, and the partial filling-up of the Block 11 quarry, checked the progress of the fire, and after a while allowed of the burning section being bulk-headed, and completely isolated.

The precautionary measures were the placing of solid bulk-heads in all unstoped passages leading to the fire; and this was done in every possible place in the Proprietary Mine, as also in Block 10 Mine, where the stopes connected with those of the Proprietary on the south end.

The collapse of the ground adjacent to Block 10 made huge fissures in the solid rock and ore, and led the fire into that mine, where, before it could be overcome, the stopes in the vicinity of Block 11, above the 240-ft. level, were completely gutted.

In reopening the mine every possible precaution was taken for the safety of the men in providing air and water and canvas linings to keep back the gas as the men progressed, but notwithstanding this the men were sometimes overcome. The gas, however, does not appear to have left any permanent effect on the affected men.

The opening of Drew and McGregor shafts has caused a very good and thorough ventilation, and apparently has completely driven the gas out of the mine.

The burning portion is secured by brick bulk-heads in the solid ground, and where this was not possible in stopes, the struts have been cut out, the height and width of the stope, the sides of the standing timber lined with plate-iron, and the intervening space filled with sand.

The burnt-out ground is also being filled with sand, and the timbered portion filled with fine sand run in with water.

There are now nearly 200 men working in the recovered portion of Block 11 under fairly satisfactory conditions.

The district is now almost entirely dependent on the sulphide ores, and the only company carrying on smelting operations locally is the Broken Hill Proprietary.

The opening up of the sulphide ores in the various mines has been very satisfactory, almost unlimited supplies having been developed, until it now seems as if there were more sulphide ores of a payable character in the mines than have been extracted of oxidised ores.

At White Cliffs the search for the gem is continuous, and attended with a fair amount of success. The search now extends to upwards of 50 feet in depth, and it is stated the stone obtained at that depth is, if anything, superior to that obtained nearer the surface.

At Thackaringa Pinnacles and Day-Dream the mines are being worked in a desultory fashion, though doubtless the demand for sulphide ore will lead to renewed activity.

The mines now at work on the Broken Hill lode are Broken Hill North, Broken Hill Junction-North, Broken Hill Junction, British, Block 14, Broken Hill Proprietary, Block 10, Central and South.

The Victoria Cross, has recently been repegged, and probably will soon be at work. During the year I have endeavoured to have the provisions of the Lead-poisoning Act carried into effect.

In some instances everything needful has been accomplished, but in others, particularly Block 10 and Central Mines, scarcely anything has been done in compliance with the Act. This is especially the case in regard to changing house, and washing and bathing accommodation, and I am of opinion that very strong measures will have to be taken before the companies named will comply with the Act in this particular.

Since the enforcement of Clause 3 of the Lead-poisoning Act, the names of 88 men have been recorded as having suffered from lead-poisoning from 1st May to 31st December.

In a great many instances the illness lasted only a day or a few days.

Of the 88 cases, 27 were uncertificated; of the cases recorded, 32 were miners; and the balance, 56, were employed on furnaces, 7 were over 50 years of age, 16 over 40, 31 over 30, and 30 over 20 years of age.

In my opinion the baths and other accommodation of this nature where provided are not made use of to the full extent by the men as they might be.

The accident list for the year is a very heavy one, comprising 21 fatal, 26 serious, and 21 accidents of a minor character. The fatal accidents include the victims of the lamentable South Mine disaster, which occurred on 18th July, 1895. As this has been very fully reported on, it is only necessary to state that the deaths were undoubtedly caused by the violent rush of air through the level in which the men were standing consequent on the collapse of the stope from which they had been withdrawn.

Of the remaining twelve fatal accidents, 1, Jas. Martin at Appolyn Valley was the result of the ignition of some powder in an open can which he was preparing to take up the shaft in a bucket; 2, Victor Cleal, at Tarrowingee, the result of being struck by a stone from a blast 200 yards away, and where he thought he was perfectly safe; 3, W. H. Tonkin, Broken Hill Proprietary Mine, the result of a fall of stone which he was attempting to bar down; 4, J. Voller, Broken Hill Proprietary Railway, being run over by a truck which he was helping to push; 5, J. Brokenshire, through stepping into Central Shaft, supposing the cage was the platform; 6, P. Guarre, at Tarrowingee, fall over face of quarry through breaking of a rope, to which a rock-drill was suspended; 7, J. McGuire, through the unexpected coming

coming away of some ground he was taking down in the open cut, Broken Hill Proprietary Mine; 8, R. Dias, Proprietary Mine, open cut, through a runaway truck on an incline the truck not having been chocked when it reached the top; 9, W. Barrett, Broken Hill Proprietary Mine, in stacking timber at saw-mill; 10, Jas. Broadstock, through a fall of a loose ore stored at surface of Block 10, which was being filled into railway trucks; 11 and 12, Charles Herreen and Wm. Daly, Broken Hill Proprietary open-cut, a mistake having been made as to whether a certain blast had been lit, these men had gone back to fire it.

These with the victims of the South disaster comprise the twenty-one fatal accidents for the year.

Of the serious and minor accidents, a large number cannot fairly be classed as mining accidents, as they have occurred in other operations than mining, and the same applies to some of the fatal accidents.

Numerous other casualties have been reported to me from time to time, of a trifling nature.

Work in the district is almost entirely confined to the Broken Hill line of lode. The tin-fields of Euriovie and Waukeroo are deserted.

A great number of claims are being pegged that are known to contain sulphide of lead, and there seems a prospect of some of them being worked in the near future.

The total number of men employed in the district exclusive of Mount Browne and White Cliffs, is 4,297; divided into men employed in mining and raising ore, 2,327; men employed in the reduction of ore and construction of plant, 1,970; total, 4,297. Allowing about 200 miners, &c., for White Cliffs and Mount Browne, the figures are practically the same as for 1894, when the number employed in the district was 4,500.

I have, &c.,

JAMES HEBBARD,

The Chief Inspector of Mines, Sydney.

Inspector of Mines.

#### ACTING INSPECTOR GODFREY'S ANNUAL REPORT.

Sir,

Sydney, 14 January, 1896.

I have the honor to forward you my annual report for the year 1895.

During the year I visited and inspected at the following places:—

Broken Hill, where I was stationed for the first three months of the year.

In the west—Barnedman, Newbridge, Reefton, Sebastopol, Tomora, including Possum Power and Combaning; Trunkey, Yalgogrin, including Mulyan and Nariah, Young, and Wyalong, where I remained for two and half months.

In the south—Adaminaby, Bywong, Bega, Bombala, Braidwood, including Major's Creek and Bell's Creek; Burrowa and Frogmore, Bateman's Bay, including Bimbimie and Big Hill, Brimbramalla, Bungonia, Burrier, Captain's Flat, Cooma, including Cowra Creek, Fiery Creek, Macanally, Myalla and Arable, Cootamundra, Candelo, Delegate, Gundaroo and Dairy Creek, Kiandra, Murrumburrah, Mount Dromedary, Marulan, Nerriga, including Mountainy and Tim's Gully; Nadgingomar, including Mantou Reef and Welcome Reefs; Nerrigundah, Pambula, Qeanbeyan, Tharwa, Wyndham, Wolunla, Wallendbeen Wogonga, and Yalwal.

During the time I was at Broken Hill three fatal accidents occurred, all of which were preventable; in each case the jury returned a verdict of accidental death, with which verdicts I concurred. One fatal accident occurred at Wyalong through a fall of ground, due to neglect in not putting in timber where it was urgently wanted.

I had no other fatal accidents to inquire into; but there is the usual long list of serious and minor accidents due to explosions. I have been very particular this year in trying to enforce the general rules regarding explosives, but I find that the rules are continually broken, and little or no care used in handling the explosives—cartridges and detonators are kept indiscriminately in the same box, without lid or covering; frozen dynamite is thawed in tins over the forge, or in front of a fire; scrapers are used for tamping even when proper sticks or bars are supplied, and it is a common occurrence for men to go back to a missed hole with in 5 to 10 minutes, and to unprick the charge, and to draw it. No amount of inspection can guard against such accidents, where the men break the rules laid down for their own safety, knowing the danger they run, and deliberately incurring the risk, and so long as men deliberately and knowingly handle explosives in a dangerous way, so long will blasting accidents occur. As a rule, the larger mines under the control of a responsible manager, are carefully worked, and the general rules for the inspection and regulation of mines other than coal and shale mines, were well complied with. But in the smaller mines owned by working parties, the mine is often very defective, and the class of work done very bad. Want of money may be partly the cause, but the more probable reason is, that there is no particular individual to take the responsibility,—each man is his own "boss," works in his own way, and does exactly what he likes, and consequently accidents occur. If one of the party were appointed manager, and had the sole responsibility, I think it would conduce to more efficient and safer work.

I served an unusually large number of written notices this year, most of them on mine-owners at Wyalong, where the ground is of a treacherous nature, and sufficient care not exerted. I trust that better work will be done for the future. In the discharge of my duties during the year I inspected 626 mines (some of these being inspected two or three times), employing about 6,000 men. I travelled 8,404 miles, namely, 1,849 on horseback, 1,022 by coach, 5,175 by train, and 358 on foot. I also reported on 120 applications for aid and under the Prospecting Vote.

I have, &c.,

J. R. GODFREY,

The Chief Inspector of Mines, Sydney.

Acting Inspector of Mines.

## SUPERINTENDENT OF DIAMOND DRILLS REPORT.

## The Superintendent of Diamond Drills to The Under Secretary for Mines and Agriculture.

Sir, Department of Mines, Diamond Drill Branch, Sydney.

In submitting my Annual Report on the working of the diamond drills for the year 1895, I do myself the honor to attach to said Report the following Appendices.

*Appendix A.*—Return showing the locality, strata, depth bored, percentage of core extracted, and rate per foot, exclusive of office salaries, store wages, and rent, also Superintendent of Drills travelling expenses.

*Appendix B.*—Summary of diamond drills, showing the number of feet bored, working cost to the Department, average cost at per foot, and the amount receivable for the year 1895.

*Appendix C.*—Balance-sheet of diamond drills.

*Appendix D.*—Diagram section of bore during the year 1895.

The total depth bored with the diamond drills in 1895 was 299 feet, or 258 feet less than in the year 1894. The field cost for boring, exclusive of office salaries, store wages, and rent, was equal to 15s. 2½d. per foot, or 1s. 6¾d. per foot less than during the year 1894.

The total amount paid into the Treasury during 1895 was £171 16s.

The percentage of core saved during the year was 87.60. This low percentage was due to the fact that the drills passed through an old level which had been worked, hence no core would be obtained.

The cost of wear and tear of diamonds during the year was 3s. 9½d., the extra cost of diamonds is due to the hard nature of the strata passed through.

Although part of the salaries has been added to the cost of boring, it is but fair to state that the clerks are fully occupied with clerical work in connection with Chief Inspector of Mines Office, several of the hand-borers and a Tiffen machine have been working in the field boring for minerals.

The Honorable the Minister for Mines and Agriculture, Mr. Sydney Smith, M.P., adopted a new departure by which the use of the diamond drills can be made available at almost a nominal cost in basaltic or other mineral country which has not been prospected, and which is either too hard, wet, or deep, and therefore too costly for sinking. On those terms a number of the diamond drills are likely to come in use during the next year.

I have, &c.,

W. H. J. SLEE,

Superintendent of Diamond Drills.

## APPENDIX A.

DIAMOND-DRILL work, showing average cost per foot for boring, exclusive of office salaries, store wages, rent, and Superintendent's travelling expenses, for year 1895.

No. of bores ... ..	1	Days occupied— <i>contd.</i>	
Locality ... ..	Captain's Flat	Repairing ... ..	12
Diameter of bores ... ..	4 in.	Delays ... ..	6
Strata ... ..	Porphyry	Holidays ... ..	5
Depths—		Total ... ..	86
Bored during year ... ..	299 ft.	Rate bored per hour ... ..	9.34 in.
Days occupied—		Percentage of core obtained ... ..	87.60
Moving ... ..	3	Cost—	
Erecting ... ..	12	Amount ... ..	£227 15 0
Boring ... ..	43	Per foot ... ..	0 15 2

J. S. McNEIL.

J. S. LEIGH.

W. H. J. SLEE,

Superintendent of Diamond Drills.

## APPENDIX B.

SUMMARY of Diamond-drill work, showing number of feet bored, total working cost to Department, average cost per foot, and amounts receivable for 1895.

Locality ... ..	Captain's Flat	£	s.	d.
Bored ... ..	299 ft.	21	1	4
	£ s. d.	0	2	9
Wages ... ..	110 5 4	149	9	7

## EXAMINER OF COAL-FIELDS' REPORT.

## Report of the Examiner of Coal-fields for the Colony of New South Wales for the year 1895.

In compliance with the provisions contained in the 26th section of the Coal Mines Regulation Act, 39 Vic. No. 31, I have the honor to submit the half-yearly reports of Messrs. Dixon, Bates, and Humble, Inspectors of Collieries for Coal Mines at work and opening out in the Counties of Northumberland, Durham, Gloucester, Buckland, and Pottinger, called the northern district; and of Mr. Rowan, Inspector of Collieries for Coal and Shale (Boghead Mineral) Mines at work and opening out in the Counties of Camden, Cook, and Roxburgh, in the Illawarra or southern district, the south-western and western districts.

The information I have the honor to submit with respect to the number of accidents above and below ground, quantity and value of coal gotten, number of persons employed on the surface and underground, coal exported and that used for home consumption, and notices received of new mines opening or in course of development, &c., &c., during the year 1895, is as follows :—

In 1895, the year under notice, there have been 10 fatal and 47 non-fatal accidents—5 of the fatal accidents occurred through falls of coal, 1 by skips, 1 by a descending cage in shaft, and 3 by falls of stone.

Ten of the non-fatal accidents occurred by skips; 25 by falls of coal; 1 by a falling prop; 1 by a coal truck; 2 by being scalded by steam above ground; 5 by falls of stone roof; 1 by falling off a trolley; and 1 by jumping off a train of skips.

In 1894 the fatal accidents were 7, and the non-fatal accidents 40. Two of the fatal accidents happened from falls of coal; 1 by explosion of a shot; 1 by falling down incline; 1 by falling on cage in incline; and 2 from falls of stone.

Five of the non-fatal accidents occurred by skips; 28 by falls of coal; 1 by fall of stone; 1 by the bursting of pin of machinery; 3 by ignition of powder; 1 by truck on surface; and one on engine plane.

In 1893 the fatal accidents were 13, and the non-fatal accidents 45. Ten of the fatal accidents happened from falls of coal; 1 from fall of stone; 1 from loaded waggon on surface; and 1 by descending cage at bottom of shaft.

Four of the non-fatal accidents occurred from an explosion of gas; 22 from falls of coal; 5 by skips; 5 by falls of stone; 2 by ignition of loose powder; 1 by waggon on surface; 1 on railway line; 1 falling down shaft on to cradle; 1 by explosion of a shot; 1 by crank shaft of engine when in motion; 1 by a piece of coal falling down shaft; and 1 by a falling prop.

RETURN

Returns showing the number of fatal and non-fatal accidents; those caused by "falls of coal," stone "roof"; and Lithgow, Ferndale, Bulli, A. A. Co.'s Hamilton Pit, and South Burwood Sinking Pit disasters, 1873 to 1894 inclusive.

\* Figures not available.

From this return it will be seen that the fatal accidents exceed those of 1894 by 3, and that the tons of coal raised per life lost are less than the previous year, but more than in 1893.

The returns of the collieries raising coal and shale (boghead mineral) which have been collected and forwarded to me by the Mining Department show the following figures for the year 1895:—

#### COAL RETURN.

	Northern District.	Southern and South-western Districts.	Western District.	Total.

From these returns we find that in the Northern District, in the year under notice, there has been a decrease of 300 persons employed in and about the collieries, and an increase of 26,078 tons of coal raised, and £69,947 in value.

In the South and South-western Districts there has been an increase of 194 persons employed in and about the collieries, and an increase of 49,439 tons of coal raised and of £14,903 in value.

In the Western District there has been a decrease of 5 persons employed above ground, and an increase of 2 persons employed under ground, and a decrease of 9,005 tons of coal raised and of £5,202 in value.

\* Excessive number of falls of coal and Lithgow disaster caused this high death-rate.

† Bulli catastrophe and excessive falls of coal caused this high death-rate.

‡ Hamilton pit crush, excessive falls of coal, and over-winding of four men at South Burwood sinking pit caused this high death-rate.

*Newcastle Harbour (the principal Coal Port of the Southern Hemisphere), and its Facilities for Shipment.*

Newcastle, in the county of Northumberland, the trade of which is second only to that of Sydney, owes its great commercial importance to the different coal-mines which have been opened out close to and within 32 miles of the harbour.

On the south or town side of the harbour there is a continuous line of wharf, 3,607 feet long, belonging to the Government, 2,130 feet of which is occupied for cargo berths for deep-draught vessels; 500 feet reserved for Sydney passenger steamers; and the remaining 977 feet is used as a general cargo wharf, including a lumber berth for loading vessels with timber. The whole length of this wharf is lit with gas.

At Bullock Island, on the western side of the harbour, a substantial timber Government wharf, 7,760 feet in length, and four ballast jetties, each 50 feet long and 200 feet apart, has been constructed along the face and round the south end of what was formerly known as the Ballast Dyke; at present 5,550 feet of this wharf is set apart chiefly for the shipment of coal. The loading is performed by hydraulic cranes, of which twelve are erected, capable of shipping 1,000 tons of coal each in twenty-four hours—six being 15-ton, four 9-ton, and two 25-ton cranes, the latter for discharging heavy machinery, &c., and three 15-ton steam cranes. The remainder of the wharf and the ballast jetties are used by vessels discharging ballast or waiting their turn to load. Ships of the largest class can load under the hydraulic cranes, and proceed direct to sea through deep-water channels recently dredged. It is proposed to spend immediately £150,000 to further increase the shipping facilities at Bullock Island. This wharf is now lit by electric light, which greatly facilitates the loading of coal at night, and is one of the finest systems of electric lighting in existence, consisting of fifty large arc lamps, each 5,000-candle power.

A branch double line of railway connects the wharf with the Great Northern railway, and along the back of the wharf is laid a very extensive system of sidings and standage room for working coal traffic.

A sand-dredge is reclaiming foreshore in front of the hydraulic engine-house, where 2,000 feet of wharf will be erected as a commencement of a 90-acre basin inside the present wharf, which basin it is intended to dredge to a depth of 25 feet, where vessels will be able to lie in slack water, and the whole will be lit up with the electric light.

At Stockton, on northern side of harbour, there is a Government wharf 600 feet long with a shoot capable of shipping 1,000 tons in twelve hours. A sand-dredge is also reclaiming foreshore at Stockton.

In addition to these Government cranes, the Australian Agricultural Company have three large private shoots capable of delivering 2,000 to 3,000 tons of coal per diem. Vessels loading from them can discharge their ballast on to the Company's ballast wharf, lying alongside at a draught of 18 ft. 6 in. and upwards. Vessels drawing 22 feet can load at the Company's shoots. The Waratah Company also have a shoot at Port Waratah capable of shipping about 50 tons per hour, and Messrs. J. and A. Brown have two shoots on the Hunter River, at Hexham, 10 miles from Newcastle, capable of shipping 100 tons per hour.

*Newcastle Facilities for Shipment of Coal.*

The present estimated capabilities for shipment of coal at the abovementioned places in Newcastle Harbour is about 24,000 tons per day by the Government hydraulic cranes, and about 4,800 tons per day from private shoots.

At Catherine Hill Bay, near Lake Macquarie, the Wallarah Coal Company have a jetty 1,060 feet in length, 30 feet above high-water, with two shoots capable of shipping 1,000 tons in eight hours.

*Coal shipped from Newcastle Harbour, the Principal Coal Port of the Southern Hemisphere.*

The quantity of coal shipped in 1895 to foreign and intercolonial ports was 1,920,378 tons, valued at £678,217; and the largest quantity of coal taken by a steamer (May 30, 1895) was 5,235 tons, by the "Port Stephens," and by sailing vessel, 4,558 tons, by ship "Royal Firth," on June 14, 1895.

*Collieries at Work, &c., in the Northern District, viz., Newcastle, Four-mile Creek, Maitland, Greta, East Greta, Singleton, Curlweiss, and Gunnedah.*

In 1895 there were sixty-nine collieries at work and opening out in the Northern district, which raised 2,631,221 tons of coal, valued at £813,227, and the number of men employed in and about the collieries was 6,777. The Borehole coal seam is the principal one worked at the Newcastle collieries, and it varies from 18 feet to 4 ft. 2 in. of marketable coal. It is very free from faults, and lies almost horizontal. It is a bright, bituminous, caking coal, of first-class quality for steam, smelting, household, and cooking purposes, and a good gas coal. The cost of hewing it is now 2s. 8d. to 3s. per ton, and the supposed selling price 7s. per ton delivered on board vessels at Newcastle Harbour. The cost of hewing the Burwood coal seam, proved to be the next best in quality at and near Newcastle, is 2s. 7d. per ton, and the selling price is about 1s. less than the Borehole coal. The cost of hewing the Greta coal, situated 35 miles by rail north-west of Newcastle, is about 2s. per ton.

The Newcastle-Wallsend Coal Company has the Government railway contract for furnaces at Eveleigh, at 6s. 6d. per ton; the New Anvil Creek Coal Company has the Murrurundi district contract, at 5s. 4d.; the East Greta Coal-mining Company has the Newcastle and Singleton district, at 5s. 6d. per ton; the Centenary Coal Company the Werris Creek, Narrabri, and Armidale districts, at 8s.; and Green and Curley, of Gunnedah, have also the latter contract, at 7s. 9d. per ton—this colliery being situated 29½ miles from Sydney.

*Illawarra District, and its Facilities for Shipment of Coal.*

The Wollongong Harbour and Basin is situated 45 miles south of Sydney Harbour, and at low tide there is a depth of 13 feet of water at its entrance and alongside the wharf, where there are three cranes capable of shipping 1,800 tons of coal per hour. The Belmore Basin has a depth of 17 feet of water at its eastern side, where there are four shoots, each capable of shipping 100 tons per hour; but as only two vessels can load there at the same time, the largest quantity of coal shipped by them is 200 tons per

per hour, or 2,000 tons per day. The largest steamship which has coaled at the harbour drew about 15½ feet of water, and carried about 900 tons of coal; and the largest sailing vessel has taken away about 700 tons of coal.

In addition to the Government appliances for shipment of coal at Wollongong, the Coal Cliff, North Illawarra, Bulli, Bellambi, South Bulli, and Mount Kembla Companies have jetties of their own, from which coal is sent by steam colliers, &c., to Port Jackson and elsewhere.

The Coal Cliff jetty has a depth of 18 feet of water at high tide, and 14 feet at low tide, and can ship 100 tons per hour.

The North Illawarra Coal Company, Bulli, Bellambi, South Bulli, and Mount Kembla jetties have a depth of about 26 feet of water at their shoots, and can ship about 120 tons per hour.

*Coal shipped at Wollongong Harbour, the Jetties, and sent by Rail, &c.*

The coal raised in the Illawarra and Southern districts in 1895 was 910,123 tons, valued at £239,035.

*Collieries at Work in the Illawarra or Southern District.*

In 1895 there were twelve collieries at work in the Illawarra district that raised 681,782 tons of coal, valued at £174,780, and the number of men employed in and about the collieries was 1,477, and one colliery (Metropolitan) in the Southern district, at Helensburg, adjacent to the Illawarra and South Coast railway, 27 miles from the Metropolis and 29 miles from Darling Harbour, Sydney, that raised 228,341 tons of coal, valued at £64,255, and employed 403 men in and about the mine. The coal seam worked at these twelve collieries is the uppermost one, or No. 1 of the upper coal measures. It is a semi-bituminous coal used for steam, smelting, household, blacksmith, and cooking purposes, and varies from 10 feet to 4 feet in thickness. With the exception of the Metropolitan and South Clifton collieries, the coal is principally wrought from adits driven into the seam in the high ranges fronting the Pacific Ocean at heights of from 20 to 750 feet. The coal seam is very free from faults, and lies almost horizontal.

The cost of hewing the coal is now 2s. per ton, and the selling price at the jetties and Wollongong Harbour is supposed to be about 6s. per ton.

The Metropolitan Coal Company have the Government railway contract for supply of coal to Southern district railway depôts at portion of Penrith railway requirements, at 5s. 4d. per ton, and for Metropolitan district at 5s. 10d.

*Collieries at Work in the South-western District.*

The South-western collieries (3) are situated at Joadja, Mittagong, and Moss Vale, near to the Great Southern railway. In 1895 they employed 69 men in and about the collieries, and raised 6,379 tons of coal, valued at £2,803.

*The Western Collieries, their Railway and Shipping Appliances.*

The Western Collieries are situated 91 to 158 miles from Sydney, and are adjacent to, or within a short distance of, the Great Western and Mudgee railway. Their coal meets with a ready sale for railway, manufacturing, household, and other purposes in all the suburban and inland towns, and large quantities of slack are there sold for brick and tile making.

*Collieries at Work in Western District.*

In 1895 there were 15 collieries at work, that raised 190,864 tons of coal, valued at £40,260; and the number of men employed in and about the collieries was 296. The coal seam worked is the lowest one in the upper coal measures. It is a splint coal, used for steam, smelting, household, and blacksmith purposes, and is 10 feet to 11 feet in thickness. About 5 ft. 8 in. of the lower portion of it is the portion wrought and sold. The coal seam is free from faults, and lies almost horizontal.

The cost of hewing the coal is now 1s. 8d. per ton, and the Lithgow Coal Association supply it to the Railway Department for their Penrith requirements at 5s., and the Cullen Bullen at 4s. 3d. per ton, delivered at colliery siding.

On 9th November, 1893, the Sydney Harbour Collieries Company bored through the Illawarra No. 1 coal at a depth of 2,917 feet, at Cremorne, adjacent to the Sydney Harbour, 10 ft. 3 in. in thickness, of splint and bituminous coal, which proves the correctness of the opinions expressed by myself and others that the metropolis is near the centre of our extensive coal basin, and that the Newcastle and Illawarra coal measures would be found there. The Company are in treaty for some land adjacent to their harbour leasehold, on which two shafts are to be sunk.

*Boghead Mineral and Petroleum Oil Cannel-coal Deposits.*

These deposits are very irregular in their area and are found in isolated patches, generally at a considerable distance apart, in the midst of the workable coal measures of New South Wales. Whilst the coal seams are very regular in their character (with the exception of their generally improving in quality, and thickening as they leave the edge of the coal basin), the boghead mineral (torbanite) is most irregular, and there is nothing to guide us in telling where the seam is likely to be, but by finding pieces of it at or below its outcrop. Near the edge of the deposits this rich mineral deteriorates, and gradually changes into indurated clay, bituminous and non-bituminous shale, coal, or ironstone.

There are four companies getting and selling the mineral, and two of them manufacture oil and other products therefrom. These mines are situated at Hartley Vale, Genowlan, Ruined Castle, and Nellie's Glen, in the Western district, and at Joadja in the Southern district; and prospecting is going on in the Capertee Valley, situated about 150 miles north-west of Sydney, and at Morrangaroo, near Bathgate and Wallerawang. The richest of the mineral yields about 100 to 130 gallons of crude oil per ton, and 17,000 to 18,000 cubic feet of 35 to 40 candle gas when gas only is extracted from it.

RETURN showing the quantity raised, price per ton, and value of the boghead mineral or petroleum oil (cannel coal), commonly called kerosene shale, from 1865 to 1895 inclusive.

THE following notices were received during the year of new mines opening out or in course of development, mines re-opened, sinking of pits, driving tunnels, change of ownership and names of collieries, also colliery management:—

On 3rd January Mr. Wm. Hunter notified that he was sinking a shaft for coal at Lithgow.

On 14th January Mr. J. Wall notified that he was prospecting for shale in the parish of Gindantherie (Glen Alice), near Rylstone.

On 18th January Mr. John Crompton notified having obtained permission from the owners of land at Woonoona (leased by J. Salisbury) to mine for coal, and was opening a small tunnel to work the coal for local purposes.

On 28th January Mr. Alfred Page notified that he was in charge as overman or underground manager of the Anvil Creek Colliery.

On 5th February Mr. Frank Croudace notified having started some men on the coal at Durham, to get coal for the engines.

On 19th February John Ferguson Brown notified having started to mine for coal on the Waratah Coal Company's land, near Lambton Heights, to be known as "Sunnyside."

On 1st March James Jackson notified having opened a colliery on portion 201, Newcastle Pasture Reserve, Lambton.

On 1st March Mr. Henry Harper notified that he was opening out a prospecting tunnel on Mr. Peter Howson's selection, north-east of the South Wallsend Junction.

On 1st April James Jackson notified that he had taken out a mineral license on seven blocks of land, Church-street, Lambton, Nos. 301, 309, 310, 303, 304, 313, and 314, and was going to start work at the new shaft which had been inspected.

On 9th April Joseph Farish notified having commenced to wind coal from his pit, "The Surprise Colliery," Newcastle Commonage.

On 2nd May Mr. J. E. G. Manning, on behalf of himself and others, notified having opened a colliery at Black Jack, near Gunnedah, and to be known as the "Gunnedah Colliery."

On 10th May Mr. Samuel Palmer notified that he intended to open up the mine known as "Erith Colliery," Bundanoon, which has been closed for some years.

On 9th June Mr. Ed. Charlton notified that he had no further connection with the "Bayley's Reward Colliery," having handed everything over to Mr. M. Elliott, of Lambton.

On 24th June Mr. Patrick Scaulon notified that he was prospecting for coal on Tulip's old lease, East Maitland.

On 19th July Mr. T. J. Evans notified having changed the name of the colliery known as "Bulli Pass" to "Bulli Steam Coal" Colliery.

On 5th August Mr. Robert Taylor notified that he had started a colliery on the Pasturage Reserve to be known as "Clickman Colliery."

On 5th August David Mason notified that he had commenced operations on the Newcastle Pasturage Reserve to mine for coal on lots 460, 462, 481, and 482, also streets and lanes adjoining same.

On 24th August Mr. R. Vernon Saddington, Secretary to the Australian Kerosene Oil and Mineral Company, notified that his company had taken over the Genowian Shale Company's property at Capertec, and also had started to work the mine situated on that property.

On 1st September Mr. M. Tulip notified having commenced to mine for coal on the Rathluba Estate, East Maitland.

On 10th September Mr. William Morgan notified the number of allotments applied for to work coal at Griffiths' Hill, Lambton, the name of the mine to be known as "Mountain Ash Colliery."

On

On 11th September James Meredith notified opening out a colliery on Lambton Heights called "Meredith Colliery."

On 28th December Mr. D. R. Harris notified having from above date taken charge of the "New Anvil Creek Mine" in lieu of Mr. Alfred Page.

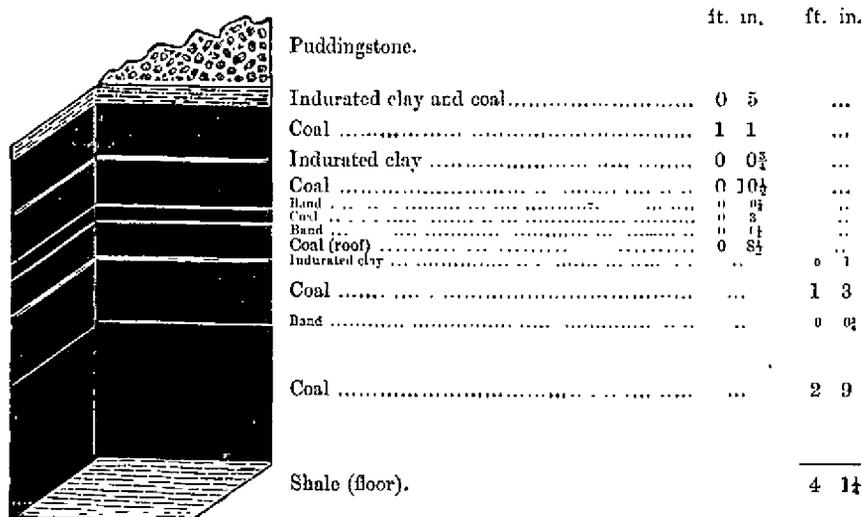

COAL-MINES ABANDONED, &c., DURING THE YEAR 1895.

On 10th January Mr. Thomas Henny notified that he had severed his connection with the "Electric Colliery," and that he would not be blamable after that date.

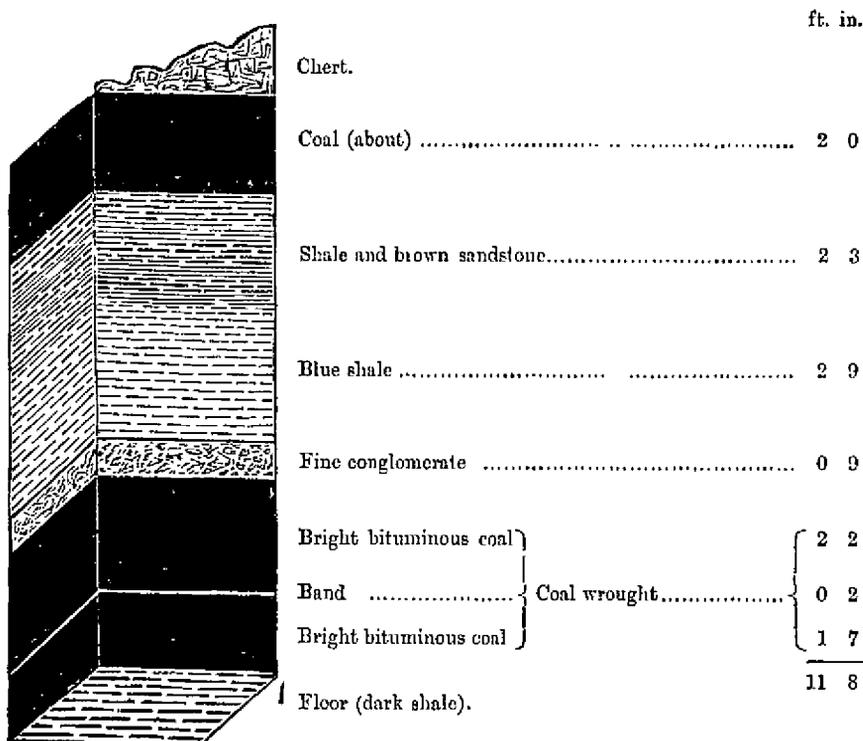

On 15th March, Mr. D. McGeachie for the Waratah Coal Company, notified that the "East Lambton Colliery" has now been abandoned and not likely to be again reopened.

On 12th December Sarah Robson notified that the "Bebside Colliery" had been stopped and the mine abandoned.

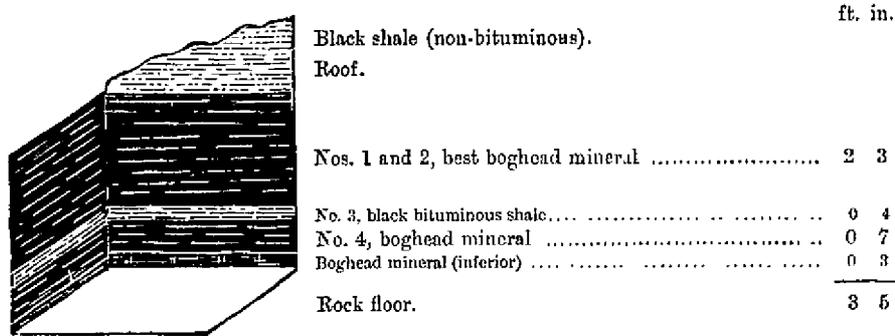

On 18th December, Hugh Snedden notified that his "Sunlight Colliery" had been closed since the last return was sent in, and has no intention of reopening it again.

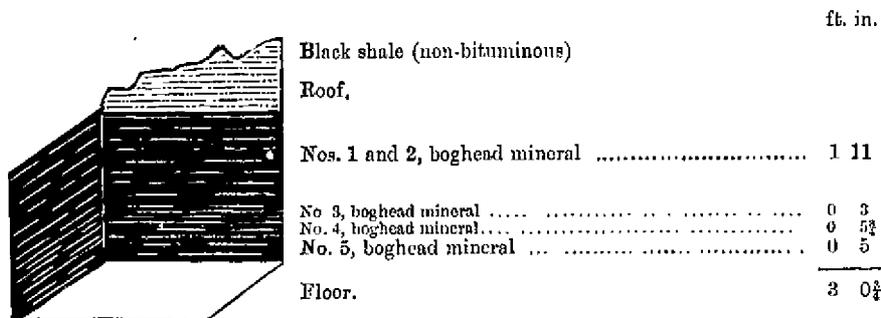

The above is a section of the seam of coal opened out on a Crown mineral lease by Mr. Bashforth, adjacent to the Mudgee main road, at Maddox's Finch, near Cox's River, in the county of Cook, and about 2 $\frac{1}{2}$  miles from the Wallerawang Railway Station.

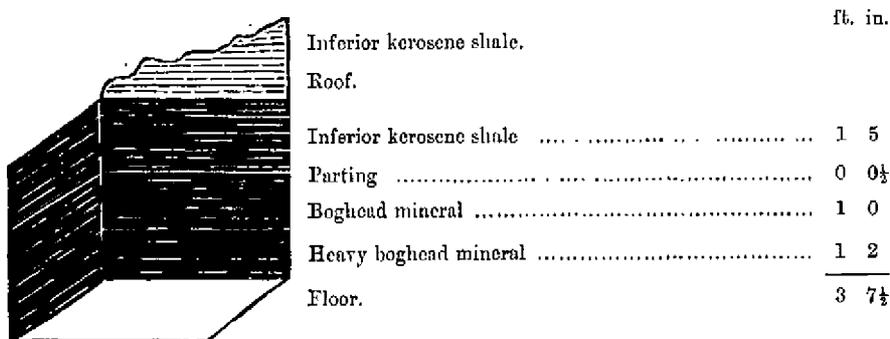

This is a section of a bright bituminous coal seam opened out by Mr. Wallace, adjacent to the Mudgee Road, at Blackman's Flat, in the county of Cook.

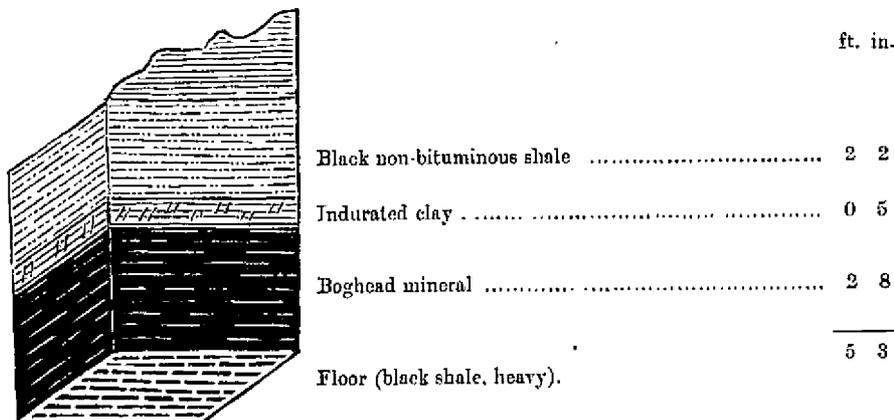

The above is a section of King's "Airley Shale Mine" (near Genowlan), near Capertee, in the county of Roxburgh, from where specimens were taken by me and Mr. Inspector Rowan for analysis. It is situated about  $8\frac{1}{2}$  miles by road from Capertee Railway Station, on the Mudgee line of railway.

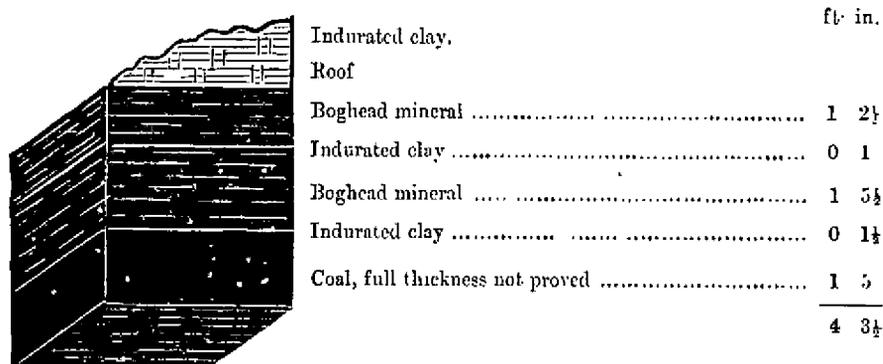

The above is a section of the Australian Kerosene Oil and Mineral Company's mine (late Genowlan), near Capertee, in the county of Roxburgh, from where specimens were taken by me and Mr. Inspector Rowan for analysis. It is situated about 8 miles by road from Capertee Railway Station, on the Mudgee line of railway.

The above is a section of the "Crown Ridge Boghead Mineral Mine," near Capertee and Mudgee line of railway, in the county of Roxburgh, opened out by Messrs. Hart and others, who have been unlawfully extracting boghead mineral therefrom.

The above is a section of the Capertee Shale Co.'s mine, near Glen Alice, in the county of Cook, taken by me and Inspector Rowan at a distance of 230 yards from the outcrop or mouth of adit, which adit is situated about 24 miles by road from Capertee Railway Station, on the Mudgee line of railway.

The above is a section of the Glen Alice Shale Co.'s mine, near Glen Alice, in the county of Cook, taken by me and Mr. Inspector Rowan, at a proving made by them. It is about 21 miles by road from Capertee railway station on the Mudjee line of railway.

#### PROSECUTIONS AND COMPLAINTS.

Proceedings, where necessary, have been taken to enforce the provisions of the Act, and reports furnished thereon and complaints of deficient ventilation and non-compliance with the "Coal Mines Regulation Act" have, as usual, been inquired into, and reports made thereon.

#### AUTHORITIES TO MINE AND MINERAL LEASES.

I have also visited numerous localities for the purpose of reporting upon applications to mine coal on Crown land, reserves, &c., work done thereon, and number of men employed; also checked and reported on royalties owing for coal gotten from Crown lands by different colliery companies.

In conclusion, I have only to add that there were 99 coal and 7 boghead mineral mines under inspection, and that notices have been received of 17 new mines opening out, or in course of development, re-opening, sinking, &c., and of 3 only having been abandoned, although there are several others abandoned of which no notice has been received. Also that the year's return shows an increase in the coal trade, for 1895, in the Newcastle district, of 26,078 tons of round and small coal raised, and a decrease in value of £69,948; in the south and south-western districts an increase of 49,438 tons of round and small coal raised, and £14,902 in value; and in the western district a decrease of 9,004 tons of round and small coal raised, and £5,202 in value.

I have, &c.,

JOHN MACKENZIE, F.G.S.,  
Examiner of Coal-fields.

### THE Half-yearly Report on the Collieries in the Northern District of New South Wales, and accidents investigated by the Inspectors of Collieries during the six months ending 31 December, 1895.

The Examiner of Coal-fields, Sydney.—

Sir,

Newcastle, 28 January, 1896.

Pursuant to the provisions of section 26 in the "Coal Mines Regulation Act 1876," we have the honor to transmit to you this our six monthly report on the state of the various collieries in the northern district for the half-year ending 31st December, 1895.

The total number of collieries under inspection in the northern district during the half-year is sixty-nine.

Three collieries have been added, viz., Meredith, Mason's, and Sunderland.

Two collieries have been abandoned, viz., East Lambton and Kensington.

No work has been done at the following fifteen collieries, viz.:—Awaba, Shamrock Hill, Young Wallsend, Swansea, Richmond Vale, Maitland, Stanford Greta, Summerhill, Leconfield, Fern Valley, Pioneer, West Burwood, Rotunda, Richmond Hill, and Nicholais Tunnel.

#### PRESENT STATE OF MINES.

*A. A. Co.'s No. 2 Colliery.*—There are about 120 men, &c., employed in this colliery during the morning shift and about an equal number on the afternoon shift, besides several men, &c., on the night shift. The whole of the work is now pillar extraction. There are five separate and distinct districts, and the total quantity of air circulating in the mine during the daytime is about 60,000 cubic feet per minute. The Act is complied with in every respect.

*A. A. Co.'s New Winning Colliery.*—At the present time about 60 men, &c., are employed in this colliery during the daytime. The total quantity of air circulating in the mine is about 50,000 cubic feet per minute. There are three separate and distinct districts. The provisions of the Act are fully carried out.

*Newcastle Wallsend Colliery.*—About 720 men, &c., are employed in this colliery during the day, and supplied with about 150,000 cubic feet of air per minute. The face workings are divided into twelve separate and distinct districts, none of which are overcrowded. The provisions of the Act are complied with.

Newcastle

*Newcastle Co.'s Colliery.*—About 500 men, &c., are employed in this colliery during the daytime and supplied with about 140,000 cubic feet of air per minute. The face workings are divided into ten separate and distinct districts, none of which are overcrowded. The Act in other respects also is fully carried out.

*Lambton Colliery.*—There are about 260 men, &c., employed in this mine during the day, and supplied with about 80,000 cubic feet of air per minute. The face workings are divided into ten separate and distinct districts, none of which are overcrowded. The provisions of the Act are complied with.

*Co-operative Colliery.*—About 220 men, &c., are employed in this mine, and supplied with 42,000 cubic feet of air per minute. The face workings are divided into five separate and distinct districts. The Act is complied with.

*Burwood Colliery.*—About 210 men, &c., are employed in this colliery during the daytime, and supplied with about 47,000 cubic feet of air per minute. There are three separate and distinct districts, none of which are overcrowded. The provisions of the Act are complied with in other respects also.

*Stockton Colliery.*—There are about 200 men, &c., employed in this mine, and supplied with about 28,000 cubic feet of air per minute. The face workings are divided into four separate and distinct districts. In September last the No. 3 sinking shaft was connected with the workings, and is at present acting as an intake air-shaft supplying two of the districts with fresh air. It being about 70 feet above the other shafts, affords an escape for men and boys in any case of emergency that may arise. The provisions of the Act are complied with.

*Wickham and Bullock Island Colliery.*—About 263 men, &c., are employed in this mine during the day, and supplied with about 34,000 cubic feet of air per minute. The face workings are divided into eight separate and distinct districts. The provisions of the Act are complied with.

*Hetton Colliery.*—There are about 300 men, &c., employed in this mine. The quantity of air circulating through the workings is about 53,000 cubic feet. There are nine separate and distinct districts, none of which are overcrowded. The Act is complied with.

*Brown's Colliery.*—About 270 men, &c., are employed in this mine during the day, and supplied with about 41,000 cubic feet of air per minute. The face workings are divided into six separate and distinct districts. The provisions of the Act are complied with.

*Duckenfield Colliery.*—There are about 260 men, &c., employed in this mine during the day. The quantity of air circulating through the workings is about 34,000 cubic feet per minute. There are six separate and distinct districts, none of which are overcrowded. The Act is complied with.

*South Waratah Colliery.*—About 180 men, &c., are employed in this mine during the day shift, and supplied with about 40,000 cubic feet of air per minute. There are five separate and distinct districts. The Act is complied with in every respect.

*New Lambton Colliery.*—Only 4 men, &c., are employed in this colliery at the present time, owing to slackness of trade. The whole of the workings are in good condition, and the ventilation is adequate to keep the workings free from noxious gases. The provisions of the Act are fully carried out.

*Ebbw Vale Colliery.*—There are 12 men, &c., employed in this mine during the daytime, and the total quantity of air in circulation is about 8,000 cubic feet per minute. The Act is complied with in every respect.

*Hillside Colliery, Merewether.*—There are 3 men, &c., employed in this mine. The ventilation is satisfactory, and the other provisions of the Act are also carried out.

*Surprise Colliery, Lambton.*—There are only 2 men employed in this mine. The Act is fully carried out.

*Sunnyside Colliery, Lambton.*—There are 3 men, &c., employed in this mine. Everything is in good order, and the Act complied with.

*Bayley's Reward Colliery, Lambton.*—There is no person employed in this mine at the present time, as all work in connection therewith is suspended.

*Ray's Colliery, Lambton.*—There are 2 men occasionally employed getting house-coal. Everything in good order. No cause for complaint.

*Meredith's Colliery, Lambton.*—This is a new mine which has lately been opened, but very little work has been done beyond opening out. There is no person employed at the present time. The Act is complied with.

*Rosehill Colliery, North Lambton.*—During the half-year 2 men have been employed in this mine, but at present all work is suspended. The workings are in good order. No cause for complaint.

*Beside Colliery, Grovestown.*—This small mine is now abandoned.

*Green's Colliery, Grovestown.*—This mine is now abandoned.

*Sunlight Colliery, Grovestown.*—This mine is also abandoned.

*Jackson's Colliery, Lambton.*—All work at this mine is at present suspended.

*Quarry Colliery, Waratah.*—There are 3 men, &c., employed in this mine. Everything in good order and condition.

*Mason's Colliery, Waratah.*—There are 2 men occasionally employed in this mine. Everything in good order. No cause for complaint.

*Rushton's Colliery, Waratah.*—During the six months 2 men have been employed in this mine, but at the present time all work is suspended.

*Liddle's Colliery, Waratah.*—There are 4 men, &c., employed in this mine. The ventilation is good, and the Act is complied with in other respects also.

*Side Colliery, Waratah.*—There are 3 men employed in this mine. The ventilation is good and the Act is complied with in other respects also.

*Bell's Colliery, Waratah.*—This mine is now finally abandoned.

*Wright's Colliery, Waratah.*—Only 2 men employed in this mine. Ventilation good and the Act complied with.

*Elmore Vale Colliery, Wallsend.*—There are about 16 men, &c., employed in this mine during the day and supplied with about 5,000 cubic feet of air per minute. The provisions of the Act are fully complied with.

*Maryland Colliery, Plattsburg.*—About 28 men, &c., are employed in this mine. The quantity of air circulating through the workings is 8,000 cubic feet per minute. There are two separate and distinct districts. The Act is complied with.

*Dudley Colliery, Charlestown.*—This mine is still practically closed. Two men usually employed in getting fuel for the engine and pumps. The provisions of the Act are complied with.

*Durham Colliery.*—At the present time there are only 2 men employed, keeping the mine free from water. The provisions of the Act are fully complied with.

*Burwood Extended Colliery.*—Only 2 men are at present employed in this colliery getting coal for the steam boilers, keeping the workings in repair, &c. The provisions of the Act are complied with.

*South Helton Colliery, Lake Macquarie.*—Only 1 man employed in this mine. The ventilation is good, and the Act complied with.

*Morrisett Colliery, Lake Macquarie.*—There are 6 men employed in this mine. The ventilation is satisfactory, and the provisions of the Act complied with.

*Wallarah Colliery, Catherine Hill Bay.*—There are about 109 men, &c., employed in this mine. The quantity of air circulating through the workings is 18,000 cubic feet per minute. The provisions of the Act are fully complied with.

*Northumberland Colliery, Fassifern.*—Only 2 men are occasionally employed in this mine. The ventilation is satisfactory, and the Act complied with.

*Pacific Colliery, Teralba.*—About 150 men, &c., are employed in this mine during the day-time, and supplied with about 40,000 cubic feet of air per minute. There are four separate and distinct districts. The provisions of the Act are complied with.

*Gartlee Colliery, Teralba.*—There are about 53 men, &c., employed in this mine. The quantity of air circulating through the workings is about 10,000 cubic feet per minute. The Act is complied with.

*South Wallsend Colliery, Cardiff.*—About 30 men, &c., are employed in this mine, and supplied with about 8,000 cubic feet of air per minute. The provisions of the Act are complied with.

*West Wallsend Colliery.*—There are about 220 men, &c., employed in this mine, and supplied with about 30,000 cubic feet of air per minute. The face workings are divided into five separate and distinct districts. The Act in other respects also is complied with.

*Seaham Colliery.*—Since 24th of August last the mine has been closed, and both shafts sealed off in consequence of an underground fire in the east side workings. At the time of stoppage about 170 men and boys were employed, and supplied with about 58,000 cubic feet of air per minute. There are four separate and distinct districts. The Act is complied with.

*Thornley Colliery, East Maitland.*—Four men are in this mine. The ventilation is satisfactory, and the Act complied with.

*Bloomfield Colliery, East Maitland.*—There are 8 men employed in this mine. The ventilation is good, and the Act complied with.

*Marshall's Colliery, East Maitland.*—One man usually employed in this mine. The ventilation is good, and the Act complied with.

*Louis Vale Colliery, East Maitland.*—Only 2 men employed in this mine. Ventilation satisfactory. No cause for complaint.

*Scanton's Colliery, East Maitland.*—Three men are employed in this mine. The ventilation is satisfactory, and the Act complied with.

*Sunderland Colliery, East Maitland.*—There are 4 men and boys employed in this mine. The ventilation is satisfactory. No cause for complaint.

*East Greta Colliery, West Maitland.*—There are about 150 men, &c., employed in this mine in the two shifts, and supplied with 25,000 cubic feet of air per minute. The provisions of the Act are complied with.

*Denton Park Colliery, Farley.*—About 22 men, &c., are employed in this mine, and supplied with about 4,000 cubic feet of air per minute. The Act is complied with.

*Font Hill Colliery, Farley.*—There are 12 men employed in this mine, and supplied with 3,000 cubic feet of air per minute. The provisions of the Act are complied with.

*New Anvil Creek Colliery, Greta.*—There are 18 men, &c., employed in this mine. The quantity of air circulating in the mine is 9,000 cubic feet. The Act is complied with.

*Greta Colliery, Greta.*—There are about 180 men, &c., employed in the mine, and supplied with about 50,000 cubic feet of air per minute. There are five separate and distinct districts, none of which are overcrowded. The provisions of the Act in other respects also are complied with.

*Ellesmere Colliery, Singleton.*—No coal has been drawn from this colliery during the half-year, but the mine is kept open and in a good state of repair ready for resumption of work at any time.

*New Park Colliery, Singleton.*—There are 23 men, &c., employed in this mine. The quantity of air circulating through the workings is about 8,000 cubic feet per minute. The provisions of the Act are complied with.

*Elliott's Colliery, Singleton.*—Only two men occasionally employed in this mine. The ventilation is satisfactory, and the Act complied with.

*Rosedale Colliery, Singleton.*—Five men are employed in this mine. The ventilation is good, and the Act complied with.

*Oakvale Colliery, Singleton.*—One man occasionally employed getting house coal. Ventilation satisfactory. No cause for complaint.

*Dulwich Colliery, Singleton.*—There are 7 men employed in this mine. The ventilation is satisfactory, and the Act complied with.

*Kayuga Colliery, Muswellbrook.*—There are 2 men employed in this colliery. The ventilation is good, and the Act complied with.

*Centenary Colliery, Curlewis.*—About 20 men, &c., are employed in this mine. The ventilation is good, and the other provisions of the Act are also carried out.

*Gunnedah Colliery, Gunnedah.*—About 11 men, &c., are employed in this mine. The ventilation is good, and the provisions of the Act carried out.

*Gladstone Colliery, Gunnedah.*—Only 1 person occasionally engaged at the present time getting a little house coal. The provisions of the Act are observed.

*Morley Colliery, Gunnedah.*—About 3 men, &c., are employed in this mine. Everything in good order, and the provisions of the Act fully carried out.

## ACCIDENTS IN MINES.

The accidents investigated by us in the Northern District, and fully reported upon during the six months ending December 31st, 1895, are 24 in number. We also investigated several other slight accidents, which are not embraced in this report.

Of the 24 accidents in the annexed tabulated list, 4 proved fatal—3 from falls of coal and 1 from fall of stone. Of the non-fatal accidents, 7 were caused by fall of coal, 4 by skips, 4 by fall of stone, 1 by fall of coal and stone, 1 by fall from timber trolley, and 1 from jumping from skip.

The first fatal accident occurred to a miner named Thomas Williams, by a fall of coal in the A. A. Co.'s No. 2 Pit, on July 3rd. The District Coroner, G. C. Martin, Esq., held an inquest on the body of deceased, at Adamstown, on July 4th. The inquest was attended by Inspector Dixon, who heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The second occurred to a miner named Jacob Gibson, by a fall of coal on July 10th, at Greta Colliery, terminating fatally on August 15th. The District Coroner, H. Pinchin, Esq., held an inquest on the body of deceased, at Greta, on August 16th. The inquest was attended by Inspector Bates, who heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The third occurred to a miner named James Lambert, by a fall of coal at Rose Hill Colliery, on August 23rd. The District Coroner, G. C. Martin, Esq., held an inquest on the body of deceased on August 24th, at North Lambton. The inquest was attended by Inspector Dixon, who heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The fourth occurred to a miner named Thos. Pascoc, at South Waratah Colliery, on December 18th, by a fall of stone, terminating fatally on December 23rd. The District Coroner, G. C. Martin, Esq., held an inquest on the body of deceased on December 24th, at Charlestown. The inquest was attended by Inspector Dixon, who heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The first of the non-fatal accidents occurred to a miner named John Hugo at Newcastle-Wallsend Colliery, on July 4th, resulting in fracture of leg by a fall of coal.

The second occurred to a miner named James Lever on July 4th, at Elermore Vale Colliery, by a fall of coal, resulting in severe internal injuries.

The third occurred to a driver named Henry Maddison, at Elermore Vale Colliery, on July 11th, resulting in fracture of leg by loaded skip.

The fourth occurred to a miner named Joseph Hart, on July 26th, at A. A. Co.'s No. 2 Pit, by a fall of coal and stone, resulting in fracture of foot and injury to back.

The fifth occurred to a miner named William Hogg in Newcastle Co.'s pit, on October 3rd, resulting in fracture of leg by fall of coal.

The sixth occurred to a shiftman named Elswald Baird, on October 7th, in Newcastle-Wallsend No. 2 Colliery, by fall of stone resulting in injury to hand and face.

The seventh occurred to a miner named Samuel Gibson, at Burwood Colliery, on October 7th, resulting in severe injury to lower part of body by fall of coal.

The eighth occurred to a miner named John Bothwell, on October 9th, at Duckenfield Colliery, by a fall of coal resulting in fracture of collar bone.

The ninth occurred to a driver named Henry Goodbun, at Co-operative Colliery, on October 29th, resulting in fracture of leg by skips.

The tenth occurred to a miner named William Dunlop, on October 30th, at Newcastle-Wallsend Colliery, by fall of coal resulting in injury to chest and shoulders.

The eleventh occurred to a miner named Jas. Hetherington, at Burwood Colliery, on November 2nd, resulting in fracture of leg by fall of stone roof.

The twelfth occurred to a driver named Alfred Anderson, on November 6th, at Co-operative Colliery, resulting in severe internal injuries by skips.

The thirteenth occurred to a wheeler named Wm. Ford, at Newcastle-Wallsend Colliery, on November 12th, by loaded skips resulting in severe injury to hand.

The fourteenth occurred to a shiftman named James Miller, Senr., on November 15th, at Newcastle-Wallsend Colliery, resulting in injury to back and chest by falling from timber trolley.

The fifteenth occurred to a miner named George Diggins, at Burwood Colliery, on November 25th, by fall of stone roof resulting in severe injury to head and shoulders.

The sixteenth occurred to a driver named Joseph Selway, at Newcastle-Wallsend Colliery, on December 5th, resulting in injury to head by fall of stone roof.

The seventeenth occurred to a water boiler named Robert Renfrew, on December 9th, at Brown's No. 4 Colliery, resulting in fracture of leg by jumping from train of skips.

The eighteenth occurred to a miner named John Johnson, at Burwood Colliery, on December 19th, by a fall of coal resulting in severe injury to lower part of body.

## ACCIDENTS ON SURFACE.

There were two non-fatal accidents on the surface at Burwood Extended Colliery, on October 3rd, which occurred to Wilson Rennie, Junr., the Manager, resulting in injury to body and legs by steam scalding and at the same time and place to Isaac Wyper, engine driver, resulting in injury to leg by steam scalding.

The tabulated list of accidents is hereto appended.

I have, &c.,

JOHN DIXON,  
THOS. L. BATES,  
WILLIAM HUMBLE,  
Inspectors of Collieries.

The Half-yearly Report on the Collieries in the Northern District of New South Wales and accidents investigated by the Inspectors of Collieries during the six months ending 30th June, 1895.

The Examiner of Coal-fields, Sydney.—

Sir,

Newcastle, 27 July, 1895.

Pursuant to the provisions of section 26 in the Coal Mines Regulation Act, 1876, we have the honor to transmit to you this our six-monthly report on the state of the various collieries in the Northern District for the half-year ending 30th June, 1895.

The total number of collieries under inspection in the Northern District during the half-year is 69. Seven collieries have been added, viz., Scanlon's, Jackson's, Bell's, Side, Sunnyside, Surprise, and Gunnedah.

Three collieries have been abandoned, viz., Ferndale, North Co-operative, and Electric.

No work has been done at the following fourteen collieries, viz., Awaba, Shamrock Hill, Young Wallsend, Swansea, Richmond Vale, Stanford (Greta), Maitland, Leconfield, Fern Valley, Pioneer, West Burwood, Rotunda, Richmond Hill, and Nicholai's Tunnel.

PRESENT STATE OF MINES.

*A. A. Co.'s No. 2 Colliery.*—There are about 170 men, &c, employed in this mine during the day and supplied with about 70,000 cubic feet of air per minute. The whole of the work at the present time is pillar coal extraction. There are four separate and distinct districts, none of which are overcrowded. The provisions of the Act are fully complied with.

*A. A. Co.'s New Winning Colliery.*—About 120 men, &c., are employed in this mine. There are four separate and distinct districts, and the total quantity of air circulating in the colliery is about 90,000 cubic feet per minute. None of the districts are overcrowded, and the provisions of the Act are fully complied with.

*Newcastle-Wallsend Colliery.*—About 705 men, &c., are employed in this mine during the day, and supplied with about 160,000 cubic feet of air per minute. The face workings are divided into thirteen separate and distinct districts, none of which are overcrowded. The Act in other respects also is complied with.

*Newcastle Co.'s Colliery.*—About 490 men, &c., are employed in this mine, and supplied with about 160,000 cubic feet of air per minute. The workings are divided into ten separate and distinct districts, and none of the districts are overcrowded. The provisions of the Act are also complied with in other respects.

*Lambton Colliery.*—About 350 men, &c., are employed in this mine during the day, and supplied with about 80,000 cubic feet of air per minute. The face workings are divided into six separate and distinct districts, none of which are overcrowded. The provisions of the Act are complied with.

*Co-operative*

*Co-operative Colliery.*—There are about 260 men, &c., employed in this mine, and supplied with about 45,000 cubic feet of air per minute. The workings are divided into four separate and distinct districts, none of which are overcrowded. The provisions of the Act are complied with.

*Burwood Colliery.*—There are about 200 men, &c., employed in this mine. The face workings are divided into four separate and distinct districts, and the total quantity of air circulating in the mine is about 50,000 cubic feet per minute. None of the districts are overcrowded, and the Act in other respects also is complied with.

*Stockton Colliery.*—About 220 men, &c., are employed in this mine, and supplied with about 26,000 cubic feet of air per minute. The workings are divided into three separate and distinct districts. The Act is complied with in regard to ventilation. The third shaft has been sunk to the lower portion of the Borehole seam; total depth of shaft, 290 feet. About 18 men, &c., are employed in connection with this shaft. The shaft is lined throughout with cylindrical tubing. A drive is now proceeding in the coal-seam to connect with the workings of the colliery. Such connection will probably be effected in September next.

*Wickham and Bullock Island Colliery.*—About 280 men, &c., are employed in this mine during the day. The quantity of air circulating through the workings is about 40,000 cubic feet. The workings are divided into nine separate and distinct districts. The provisions of the Act are complied with.

*Hellon Colliery.*—There are about 320 men, &c., employed in this mine, and supplied with about 55,000 cubic feet of air per minute. The face workings are divided into five separate and distinct districts, none of which are overcrowded. The Act, in other respects also, is complied with.

*Brown's Colliery.*—About 280 men, &c., are employed in this mine during the day. The quantity of air circulating through the workings is about 55,000 cubic feet per minute. The workings are divided into six separate and distinct districts. The provisions of the Act, in other respects also, is complied with.

*Duckenfield Colliery.*—There are about 280 men, &c., employed in this mine, and supplied with about 40,000 cubic feet of air per minute. The face workings are divided into five separate and distinct districts, none of which are overcrowded. The Act, in other respects also, is complied with.

*South Waratah Colliery.*—About 166 men, &c., are employed in this mine during the day-time, and supplied with about 50,000 cubic feet of air per minute. There are five separate and distinct districts, neither of which is overcrowded. The provisions of the Act are fully complied with in other respects also.

*New Lambton Colliery.*—About 120 men, &c., are employed in this mine, and supplied with about 26,000 cubic feet of air per minute. The mine is divided into two districts, neither of which is overcrowded. The other provisions of the Act are also carried out.

*Ebbw Vale Colliery.*—There are about 40 men, &c., employed in this mine during the day, and supplied with about 12,000 cubic feet of air per minute. The provisions of the Act in other respects also are carried out.

*East Lambton Colliery.*—This mine was under inspection for a short time during the half-year, but is now finally abandoned.

*Hillside Colliery, Merewether.*—There are 2 men and 1 boy employed in this colliery. The ventilation is good, and the Act complied with.

*Rosehill Colliery, North Lambton.*—Only 2 men employed at the present time. The ventilation is good, and the Act complied with.

*Bayley's Reward Colliery, Lambton.*—Only 2 men employed in this mine. The ventilation is good, and the Act complied with.

*Ray's Colliery, Lambton.*—Only 1 man occasionally employed getting a few loads of household coal. No cause for complaint.

*Quarry Colliery, Waratah.*—One man and one boy employed in this mine. Everything satisfactory.

*Wright's Colliery, Waratah.*—One man and one boy employed in this mine. No cause for complaint.

*Rushton's Colliery, Waratah.*—Only 2 men employed at this mine. The ventilation is satisfactory, and there is no cause for complaint.

*Liddle's Colliery, Waratah.*—Three men employed in this mine. The ventilation is good, and the Act complied with.

*Green's Colliery, Grovestown.*—Scarcely anything has been done in this mine during the past six months, and at present all work is suspended.

*Sunlight Colliery, Grovestown.*—Very little work has been done here during the half-year, and at present all work is suspended.

*Jackson's Colliery, Lambton.*—This mine was commenced during the past six months, but all operations are at present suspended.

*Bell's Colliery, Waratah.*—This mine has lately been commenced, and 2 men are employed extracting pillar coal. The Act is complied with.

*Surprise Colliery, Lambton.*—This mine has been very recently commenced. There are 3 men employed extracting pillar coal, and everything is in good working order. The Act is complied with.

*Side Colliery, Waratah.*—This is a new venture, and 1 man and a boy are employed in the extraction of some of the pillar coal left by the Waratah Company years ago. The ventilation is good, and the Act complied with.

*Sunnyside Colliery, Lambton.*—This mine has been commenced during the six months. The coal is reached by adit, and pillar coal is being extracted from the Waratah Company's old workings. The Act is fully complied with.

*Beaside Colliery, Grovestown.*—Only 1 man, occasionally employed getting house coal. No cause for complaint.

*Elmore Vale Colliery, Wallsend.*—There are about 16 men, &c., employed in this mine. The ventilation is satisfactory, and the Act complied with.

*Summerhill Colliery, Plattsburg.*—All work at this mine is temporarily suspended.

*Maryland Colliery, Plattsburg.*—There are 28 men, &c., employed in this mine, and supplied with about 5,000 cubic feet of air per minute in one current. The provisions of the Act are complied with.

*Dudley Colliery, Charlestown.*—All work at this mine is temporarily suspended.

*Durham Colliery.*—Only 2 men, at present employed keeping the mine free from water. Everything in connection with this colliery is in good working order, and the provisions of the Act are fully complied with.

*Burwood*

*Burwood Extended Colliery.*—Only 4 men employed at this colliery, keeping the workings in repair and free from water, and getting coal for the steam-engines. Everything is in good working order, and the provisions of the Act complied with.

*South Hetton Colliery, Lake Macquarie.*—Two men are employed in this mine. The ventilation is good, and the Act complied with.

*Morissett Colliery, Lake Macquarie.*—There are 6 men and 1 boy employed in this mine. The ventilation is good, and the Act complied with.

*Wallarah Colliery, Catherine Hill Bay.*—There are about 100 men, &c., employed in this mine, and supplied with about 30,000 cubic feet of air per minute. There are two separate and distinct districts. The provisions of the Act are fully complied with.

*Northumberland Colliery, Fassifern.*—About 8 men are employed in this mine. The ventilation is satisfactory, and the Act complied with.

*Pacific Colliery, Teralba.*—There are about 140 men, &c., employed in this mine during the day, and supplied with about 40,000 cubic feet of air per minute. The workings are divided into six separate and distinct districts. The provisions of the Act are complied with.

*Gartlee Colliery, Teralba.*—There are about 44 men, &c., employed in this mine, and supplied with about 9,000 cubic feet of air per minute. The Act is complied with.

*South Wallsend Colliery.*—About 55 men, &c., are employed in this mine, and supplied with about 8,000 cubic feet of air per minute. The provisions of the Act are complied with.

*West Wallsend Colliery.*—There are about 160 men, &c., employed in this mine, and supplied with about 70,000 cubic feet of air per minute. The workings are divided into six separate and distinct districts. The Act is complied with.

*Seaham Colliery.*—About 250 men, &c., are employed in this mine, and supplied with about 70,000 cubic feet of air per minute. The workings are divided into four separate and distinct districts. The provisions of the Act are complied with.

*Thornley Colliery, East Maitland.*—Four men are employed in this mine. The ventilation is good, and the Act complied with.

*Bloomfield Colliery, East Maitland.*—There are 8 men employed in this mine. The ventilation is good, and the Act complied with.

*Marshall's Colliery, East Maitland.*—Only 1 man employed in this mine. The ventilation is satisfactory, and the Act complied with.

*Louis Vale Colliery, East Maitland.*—There are 3 men employed in this mine. The ventilation is good, and the Act complied with.

*Scanlon's Colliery, East Maitland.*—One man and a boy are employed in this mine. The ventilation is satisfactory, and the Act complied with.

*Kensington Colliery, East Maitland.*—This colliery has been under inspection during a portion of the half-year, but is now abandoned.

*East Greta Colliery, West Maitland.*—About 160 men, &c., are employed in this mine in the two shifts. The ventilation is satisfactory, and the Act complied with.

*Font Hill Colliery, Farley.*—There are 9 men employed in this mine. The ventilation is good, and the provisions of the Act complied with.

*Denton Park Colliery, Farley.*—There are 20 men, &c., employed in this mine. The ventilation is satisfactory, and the Act complied with.

*Greta Colliery, Greta.*—There are about 240 men, &c., employed in this mine, and supplied with about 50,000 cubic feet of air per minute. The workings are divided into five separate and distinct districts. The provisions of the Act are complied with.

*New Anvil Creek Colliery, Greta.*—About 22 men, &c., are employed in this mine, and supplied with about 9,000 cubic feet of air per minute in one current. The provisions of the Act are complied with.

*Ellesmere Colliery, Singleton.*—No coal has been drawn from this colliery during the half-year, but the mine is kept open and in a good state of repair, ready for resumption of work at any time.

*New Park Colliery, Singleton.*—About 23 men, &c., are employed in this mine, and supplied with about 8,000 cubic feet of air per minute. The Act is complied with.

*Elliott's Colliery, Singleton.*—Two men occasionally employed in this mine. The ventilation is satisfactory, and the Act complied with.

*Rosedale Colliery, Singleton.*—There are 3 men employed in this mine. The ventilation is good, and the Act complied with.

*Dulwich Colliery, Singleton.*—There are 9 men employed in this mine. The ventilation is satisfactory, and the Act complied with.

*Oakvale Colliery, Singleton.*—There are 2 men employed in this mine. The ventilation is good, and the provisions of the Act complied with.

*Knyuga Colliery, Muswellbrook.*—Two men are employed in this mine. The ventilation is good, and the Act fully complied with.

*Centenary Colliery, Curlewis.*—About 21 men are employed in this mine, and supplied with about 11,000 cubic feet of air per minute in one current. The mine is in good order, and the Act fully complied with.

*Gladstone Colliery, Gunnedah.*—There are 8 men, &c., employed in this mine, and supplied with about 3,000 cubic feet of air per minute in one current. The Act is complied with in other respects also.

*Morley Colliery, Gunnedah.*—Three men are employed in this mine, and a current of about 6,000 cubic feet of air per minute is circulating in the workings. The Act in every other respect is also complied with.

*Gunnedah Colliery, Gunnedah.*—This mine has only lately been commenced in the Black Jack Mountain, near Gunnedah. Two adits have been driven to the coal-seam, which is the same as that wrought in the Gladstone Colliery. There are 4 men employed in the mine. The ventilation is satisfactory, and the other provisions of the Act are also complied with.

## ACCIDENTS IN MINES.

The accidents investigated by us in the Northern District during the six months ending June 30th, 1895, are 41 in number. Of this number, 23 were fully reported upon at the time, and 18 were found to be of a minor character, and full reports were not written thereon.

Of the 23 accidents in the annexed tabulated list, 5 proved fatal; 2 from falls of coal, 1 from injury by skip, 1 from injury in shaft, and 1 from fall of stone. Of the non-fatal accidents, 13 were caused by fall of coal, 4 by skips, and 1 by prop.

The first fatal accident occurred to a miner named Thomas Watson, by a fall of coal in the Newcastle Co.'s B Pit, on January 31st. The District Coroner, G. C. Martin, Esq., held an inquest on the body of deceased at Merewether on February 1st and 6th. The inquest was attended by Inspector Bates, who heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The second occurred to a miner named Robert Maxwell by a fall of coal at Greta Colliery, on March 20th. The District Coroner, J. N. Brooks, Esq., P.M., held an inquest on the body of deceased at Greta on March 20th and 21st. The inquest was attended by Inspector Bates, who heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The third occurred to a deputy named John Gilbert by a train of empty skips at Newcastle, Wallsend Colliery, on March 29th. The District Coroner, G. C. Martin, Esq., held an inquest on the body of deceased at Wallsend on March 30th. The inquest was attended by Inspector Bates, who heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The fourth occurred to a miner named John James by injury in shaft at New Lambton Colliery, on May 7th. The District Coroner, G. C. Martin, Esq., held an inquest on the body of deceased at Lambton on May 7th. The inquest was attended by Inspector Dixon, who heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The fifth occurred to a deputy named William Mc'Ghee by a fall of stone at A.A. Co.'s New Winning on June 4th, terminating fatally on June 5th. The District Coroner, G. C. Martin, Esq., held an inquest on the body of deceased at Merewether on June 6th. The inquest was attended by Inspector Humble, who heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The first of the non-fatal accidents occurred to a miner named James Hailstone, at Duckenfield Colliery, on January 15th, resulting in fracture of ribs by train of skips.

The second occurred to a miner named James Dunn, at Burwood Colliery, on January 16th, by a fall of coal, resulting in fracture of leg.

The third occurred to a miner named John Dent, at Lambton Colliery, on February 5th, resulting in fracture of leg by fall of coal.

The fourth occurred to a wheeler named George Steavenson, at Brown's No. 4 Colliery, on February 5th, resulting in fracture of arm by skip.

The fifth occurred to a wheeler named William Desreux, at Pacific Colliery, on February 28th, by empty skips, resulting in fracture of thigh.

The sixth occurred to a miner named Robert Carnichael, at Hetton Colliery, on March 26th, resulting in fracture of leg by fall of coal.

The seventh occurred to a miner named William Teasdale, at Hetton Colliery, on April 5th, by a fall of coal, resulting in fracture of collar-bone.

The eighth occurred to a driver named William Etherington, at Hetton Colliery, on April 6th, resulting in fracture of thigh by skip.

The ninth occurred to a miner named Henry Leary, at Brown's No. 4 Colliery, on April 6th, by fall of coal, resulting in fracture of ribs.

The tenth occurred to a miner named John Thompson, at A. A. Co.'s No. 2 Pit, on April 19th, resulting in fracture of collar-bone by fall of coal.

The eleventh occurred to a miner named John Phillips, at Hetton Colliery, on April 25th, resulting in fracture of leg by falling prop.

The twelfth occurred to a miner named Herman Fink, at Stockton Colliery, on May 15th, by a fall of coal, resulting in fracture of thigh.

The thirteenth occurred to a miner named David Gwynne, at Hetton Colliery, on May 16th, resulting in fracture of leg by fall of coal.

The fourteenth occurred to a miner named James Brown, at Brown's No. 4 Colliery, on June 5th, by a fall of coal, resulting in fracture of thigh.

The fifteenth occurred to a miner named Joseph Allanson, at Newcastle Co.'s Colliery, on June 12th, resulting in fracture of leg by fall of coal.

The sixteenth occurred to a miner named Thomas Godfrey, at Wallarah Colliery, on June 15th, by fall of coal, resulting in severe injury to back.

The seventeenth occurred to a miner named John Anderson, at Lambton Colliery, resulting in fracture of leg by fall of coal on June 18th.

The eighteenth occurred to a miner named Alan Wilde, at Roschill Colliery, on June 24th, by a fall of coal, resulting in fracture of leg.

There were no accidents on the surface.

The tabulated list of accidents is hereto appended.

We have, &c.,

HALF-YEARLY Report of the Inspector of Collieries on the state of the various Collieries in the Southern and Western Districts of the Colony of New South Wales, and Accidents therein, for the half-year ending 30th June, 1895.

Sir,

In compliance with the requirements of clause 26 in the Coal Mines Regulation Act, 1876, I have the honor to transmit to you this my six-monthly report on the state of the various collieries, for the half-year ending 30th June, 1895.

The total number of collieries under inspection in the Southern and Western Districts during the last six months is 34.

Western District	...	...	...	15 coal-mines and 5 shale-mines.
Southern	...	...	...	13 "
Berrima	...	...	...	2 " 1 "
				30 " 6 " = 36 collieries.

PRESENT STATE OF MINES.

*Metropolitan Colliery.*—About 300 men and horses are employed underground. The total quantity of air circulating in the mine is about 450,000 cubic feet per minute. The workings are divided into six separate districts. Each district is well ventilated. The wheelers and miners work with locked safety-lamps, and great care is exercised by the management in order to ensure safety. The Act in all matters complied with.

*Coal Cliff Colliery.*—About 28 men are employed underground, and served with 16,000 cubic feet of air per minute. The Act in all matters complied with.

*South Clifton Colliery.*—About 140 men are employed underground, and served with about 45,000 cubic feet of air per minute in two separate splits. The Act in all respects complied with.

*North Illawarra Colliery.*—About 84 men and horses are employed underground, and served with 26,000 cubic feet of air per minute. The Act in all matters complied with.

*Bulli Pass Colliery.*—About 15 men are employed underground, and served with 3,000 cubic feet of air per minute. The Act in other respects complied with.

*Bulli Colliery.*—During the last six months only a few miners at work, getting slack from the workings and doing repairs in the haulage roads.

*Hillend Colliery.*—Only 2 men at work, and served with 1,000 cubic feet of air per minute. The Act in all matters complied with.

*Bellambi Colliery.*—Work at this mine has been suspended during the last six months on account of slackness of trade; only 3 men are at work doing repairs in the main dip heading.

*South Bulli Colliery.*—About 150 men and horses are employed underground, and served with about 42,000 cubic feet of air per minute in four separate splits. The Act in every respect complied with.

*Corrimal Colliery.*—About 90 men are employed underground, and served with about 22,000 cubic feet of air per minute. The Act in all other matters complied with.

*Mount Pleasant Colliery.*—About 120 men are employed underground, and served with about 28,000 cubic feet of air per minute in two separate splits. The Act in all matters complied with.

*Osborne Wallsend Colliery.*—About 150 men are employed underground. The ventilation is good, and the Act in every respect complied with.

*Mount Kembla Colliery.*—About 220 men are employed underground, and served with about 56,000 cubic feet of air per minute. The provisions of the Act are fully carried out in all matters.

WESTERN

## WESTERN DISTRICT.

*Capertee Shale Mine.*—This is a new shale mine, about 25 miles from Capertee Railway Station N.E. Twelve men are engaged driving a tunnel in order to prove the thickness and extent of the shale. The Act complied with.

*Rawden Colliery.*—Two men employed underground at this mine. The ventilation is good, and the Act complied with.

*Cullen Bullen Colliery.*—About 16 men are employed underground. The ventilation is good, and the Act in all matters complied with.

*Genowlan Shale Mine.*—About 20 men are employed underground, and served with 12,000 cubic feet of air per minute. This mine is being worked on the long-wall system, and the places are well built, with pack walls. The Act in other matters complied with.

*Ivanhoe Colliery.*—Twelve men employed at this colliery, and served with 6,000 cubic feet of air per minute. The Act in other matters complied with.

*Irondale Colliery.*—Six men are employed, and served with 5,000 cubic feet of air per minute. The Act in all other matters complied with.

*Lithgow Valley Colliery.*—About 28 men are employed underground, and served with about 20,000 cubic feet of air per minute. The Act in all matters complied with.

*Hermitage Colliery.*—About 24 men are employed underground, and served with 19,000 cubic feet of air per minute. The Act in every respect complied with.

*Eskbank Pit.*—About 30 men and horses are employed underground, and served with 20,000 cubic feet of air per minute. The Act in all other respects complied with.

*Old Tunnel (Eskbank).*—Six men employed underground, and served with 5,000 cubic feet of air per minute.

*Vale of Clwydd Colliery.*—Thirty-two men and horses employed underground, and served with 17,000 cubic feet of air per minute. The Act in all other respects complied with.

*Zig Zag Colliery.*—About 28 men and horses employed underground, and served with 12,000 cubic feet of air per minute. The Act in other matters complied with.

*The Vale Colliery.*—About 30 men are employed underground. The ventilation is very good throughout the mine, and the Act complied with.

*Oakey Park Colliery.*—Twenty-eight men and horses are employed underground, and served with about 15,000 cubic feet of air per minute. The Act in all matters complied with.

*Cooverwall Mine.*—Two men employed. The Act complied with.

*Maddix's Mine.*—Two men employed. The Act complied with.

*New South Wales Shale Mines (Hartley).*—About 65 men are employed underground, and served with about 16,000 cubic feet of air per minute. During the last six months a large number of the men have been working on pillar work; great care has been taken by the manager and men to ensure safety. The Act in all respects complied with.

*Coal Tunnel.*—Five men working, and served with 6,000.

*The Australian Kerosene Oil and Mineral Company (Katoomba), Ruined Castle.*—About 60 men are employed, and served with 12,000 cubic feet of air per minute. The Act complied with.

*Mort's Shale Mine (Katoomba).*—About 50 men are employed, and served with 10,000 cubic feet of air per minute. The Act complied with.

## BERRIMA DISTRICT.

*The Australian Kerosene Oil Coy. (Joadja).*—About 60 men are employed underground, and served with 12,500 cubic feet of air per minute. The Act in all respects complied with.

*Box Vale Colliery (Mittagong).*—Three men employed, and served with 3,000 cubic feet of air per minute. The Act in other matters complied with.

*Great Southern Colliery (Berrima).*—Six men are employed underground. The ventilation good, and the Act in other matters complied with.

## ACCIDENTS IN MINES.

During the last six months ending 30th June, 1895, I have investigated four separate accidents included in this list. I have also examined a few other accidents which were not of a serious nature, and are not included in this list.

The first non-fatal accident occurred to a miner named Lewis Palmer, at the Metropolitan Colliery, on March 26th, who had his leg broken by a fall of stone at his working-face.

The second happened to a miner named Andrew Crystel, at the Metropolitan Colliery, on April 11th, who was hurt about the back by a fall of coal at the face of his bord.

The third was to a wheeler named Richard Gibson, at Corrimal Colliery, who had his arm broken by a full skip at the "flat" where he was working on May 31st.

The fourth occurred to a miner named William Glover, at the Vale of Clwydd Colliery, who was hurt about the back and legs by a fall of top coal at his working-face.

The tabulated list of accidents is hereto appended.

I have, &c.,

John Mackenzie, Esq.,

Examiner of Coal-fields,

Mines Department, Sydney.

JAMES ROWAN,

Inspector of Collieries.

THE Half-yearly Report of the Inspector of Collicries on the state of the various Collicries in the Southern and Western Districts of the Colony of New South Wales, and Accidents therein, for the half-year ending 31st December, 1895.

The Examiner of Coal-fields,—

Wollongong, 5 February, 1896.

Sir,

In compliance with the requirements of clause 26 in the Coal Mines Regulation Act, 1876, I have the honor to transmit to you this my six-monthly report on the state of the various collicries for the half-year ending 31st December, 1895.

The total number of collicries under inspection in the Southern and Western Districts is:—

Western District	...	...	...	...	15 coal-mines, and 6 shale-mines.
Berrima	„	...	...	...	2 „ 1 shale-mine.
Southern	„	...	...	...	13 „
				30	7 shale-mines.
				= 37.	

PRESENT STATE OF MINES.

*Metropolitan Colliery.*—About 300 men are employed underground. The total quantity of air circulating in the mine is about 400,000 cubic feet per minute. The workings are divided into eight separate splits. All the bords and headings in the colliery are bratticed up to within a few feet of the working-faces. All the miners and wheelers in this colliery work with locked safety-lamps, and great care is exercised by the manager to ensure safety. The Act in every respect complied with.

*Coal Cliff Colliery.*—During the last half-year an average of 25 men have been employed underground, and served with about 20,000 cubic feet of air per minute. The Act in other respects complied with.

*South Clifton Colliery.*—About 100 men employed underground, and served with about 80,000 cubic feet of air per minute. The colliery is well ventilated throughout, and the Act in all other matters complied with.

*North Illawarra Colliery.*—An average of about 50 men are employed underground, and served with 18,000 cubic feet of air per minute. During the last six months work at this mine has been very slack, on account of dull sales for the coal. The Act complied with.

*Bulli Steam Coal Colliery.*—During the last six months this mine has only worked a few weeks, on account of no sale for the coal. When the pit was at work an average of about 15 men were employed, and served with about 3,000 cubic feet of air per minute.

*Bulli Colliery.*—During the last two months of the half-year ending this colliery has been re-opened, and about 20 men are employed underground, and served with about 20,000 cubic feet of air per minute. The Act in other matters complied with.

*Hillend Colliery.*—Two men employed underground, and served with about 1,000 cubic feet of air per minute. The 2 men supply coal for local purposes, and only work about half-time.

*Bellambi Colliery.*—During the last six months work has been suspended at this colliery. Only a few men are at work doing general repairs in the main heading and airways.

*South Bulli Colliery.*—About 200 men are employed underground, and served with about 48,000 cubic feet of air per minute in six separate splits. The Act in all other respects complied with.

*Corrimal Colliery.*—About 123 men are employed underground, and served with 32,000 cubic feet of air per minute. The face-workings are divided into four separate and distinct districts. The Act in all other matters complied with.

*Mount Pleasant Colliery.*—About 130 men are employed underground, and served with about 30,000 cubic feet of air per minute. During the last six months an air-shaft has been sunk on the north side of the main tunnel. Preparations are being made for a furnace being built at the bottom of the air-shaft. All is expected to be finished in about three months. The same will greatly increase the ventilating currents throughout the colliery. The Act complied with.

*Osborne Wallsend Colliery.*—About 180 men are employed underground, and served with about 35,000 cubic feet of air per minute. The Act and all other matters complied with.

*Mount Kembla Colliery.*—About 185 men are employed underground, and served with about 60,000 cubic feet of air per minute. During the last six months several of the airways have been shortened, which has increased the ventilation round a portion of the workings. The Act complied with.

BERRIMA DISTRICT.

*Australian Kerosene Oil Company's Shale Mines, Joadja.*—During the last six months an average of 50 men have been employed underground, and served with about 9,000 cubic feet of air per minute. The colliery is worked on the longwall system, and the ventilating currents brought in straight line with the working-faces. The Act in all other matters complied with.

*Great Southern Colliery, late Berrima.*—Six men are employed underground and served with 8,000 cubic feet of air per minute. The Act complied with.

*Box Vale Colliery.*—Two men employed underground, and served with about 2,000 cubic feet of air per minute. The Act in other respects complied with.

WESTERN DISTRICT.

*Australian Kerosene Oil Company, Katoomba.—Mort's Tunnels.*—An average of about 40 men have been employed during the last six months, and served with about 5,000 cubic feet of air per minute. *Ruined Castle.*—An average of 50 men are employed, and served with about 7,000 cubic feet of air per minute. The above tunnels are worked on the longwall system, and built with substantial packwalls. The Act in all matters complied with.

*New South Wales Shale Mines, Hartley.*—An average of about 50 men have been employed underground during the last half-year, and supplied with about 14,000 cubic feet of air per minute. *Coal Tunnel.*—Five men are employed getting coal for the retorts. The above tunnels are worked on the longwall system, and the bords built with substantial jack-walls. The Act in all matters complied with.

Oakey

*Oakey Park Colliery.*—About 30 men and horses employed underground, and served with 18,000 cubic feet of air per minute. The Act in all other matters complied with.

*Vale Colliery.*—About 26 men are employed underground, and served with 12,000 cubic feet of air per minute. The Act in other matters complied with.

*Zig Zag Colliery.*—Twenty-seven men are employed underground, and served with 15,000 cubic feet of air per minute. The Act complied with.

*Vale of Clwydd Colliery.*—Twenty-eight men are employed underground, and served with 15,000 cubic feet of air per minute. The Act complied with.

*Esk Bank Pit.*—Twenty-six men employed underground, and served with 18,000 cubic feet of air per minute. Old tunnel, 6 men employed, and served with 5,000 cubic feet of air per minute. The Act in all other matters complied with.

*Lithgow Valley Colliery.*—258 men are employed underground, and served with 20,000 cubic feet of air per minute.

*Hermitage.*—Twenty-two men employed underground, and served with 18,000 cubic feet of air per minute. The Act complied with.

*Cooverwill Mine.*—Two men are employed getting coal for the tweed factory. The Act complied with.

*Irondale Colliery.*—Five men are employed underground, and served with 5,000 cubic feet of air per minute. The Act in all other matters complied with.

*Ivanhoe Colliery.*—Eight men are employed underground, and served with 6,000 cubic feet of air per minute. The Act complied with.

*Cullen Bullen Colliery.*—About 46 men are employed underground, and served with about 15,000 cubic feet of air per minute. The Act in other matters complied with.

*Rawden Colliery.*—Two men employed, getting a few tons of coal weekly for local purposes. The Act complied with.

*Maddox's Folly Mine.*—One man employed. Act complied with.

*Genowan Shale Mine.*—About 30 men employed underground, and served with 12,000 cubic feet of air per minute. This mine is worked on the longwall system, and the air brought in straight line with the working-faces. The Act in all matters complied with.

*King's Shale Mine.*—About 10 men are employed underground, and served with about 3,000 cubic feet of air per minute. The Act in other matters complied with.

*Capertee Shale Mine* (near Glen Alice).—About 4 men have been employed during the last half-year driving a heading into the mountain to prove the extent and quality of shale; are supplied with about 500 cubic feet of air per minute. The Act complied with.

#### ACCIDENTS IN MINES.

During the last six months I have investigated 6 separate accidents, 1 of which was fatal, and 5 non-fatal. The first non-fatal happened a labourer named J. Lang, on 24th July, employed at the Vale Colliery, who had his back bruised by a loaded truck on the surface siding. The second non-fatal happened to a carpenter named J. Reid, at Corrimal Colliery, on 28th August, who had his foot crushed by a set of empty skips on the underground incline.

The third was a fatal accident which happened a miner named Edward Evans, at Coal Cliff Colliery, on 9th September, by a fall of roof, by which he was instantaneously killed. On the day following, 10th September, the District Coroner held an inquest on the body of deceased at Clifton, which inquest I attended, and fully agree with the verdict of "accidental death" as returned by the jury.

The fourth was non-fatal, and happened a lad named George Bell, on the 19th October, at Osborne Wallsend Colliery, who had his hand crushed by a skip underground.

The fifth was non-fatal, and happened a miner named John Miller, at the Metropolitan Colliery, on 25th October, who had his nose broken by a fall of coal.

The sixth was non-fatal, and happened a miner named Matthew Kean, who had his foot badly crushed by a fall of stone from the roof at his working-face. He was removed to Prince Alfred Hospital, where it was found necessary to amputate the foot above the ankle.

I have also examined a few other accidents which were not of a serious nature, and are not included in this report.

The usual tabulated list of accidents is hereto appended.

John Mackenzie, Esq.,  
Examiner of Coal-fields, Newcastle.

I have, &c.,  
JAMES ROWAN,  
Inspector of Collieries.

## GEOLOGICAL SURVEY OF NEW SOUTH WALES.

## Progress Report for 1895 by the Government Geologist.

Sir,

I have the honor to submit the following Progress Report of the Geological Survey Branch for the year 1895:—

As usual my time has been divided between practical work in the field and the supervision in the office of the general work of the Branch under my control.

From the 18th to the 22nd February I was engaged in an inspection of the then recently-discovered Bulgandra (or Walbundry) reefs near Culcairn, in the Albury District. A report on this field was subsequently submitted, and forms Appendix 1 to this report.

On the 2nd April I paid a second visit to the Garangula Gold-field, and furnished you with a report dealing with the suggested resumption by the Government of the land on which the gold-field is situated (*vide* Appendix 2). On the 11th April I proceeded to the Talbragar River, north of Gulgong, and, in conjunction with Professor David, made a geological survey of what are known as the Talbragar Fish Beds. The results of that survey have been published during the year as an Introduction to Memoir No. 9 (of the Geological Survey of New South Wales) on "The Fossil Fishes of the Talbragar Beds," by Mr. A. S. Woodward, F.L.S., of the British Museum. This work is of special importance as establishing the occurrence of rocks of Jurassic age in New South Wales.

From the Talbragar I proceeded to Capertee, and inspected a site in connection with which an application had been made for aid out of the Prospecting Vote.

On 2nd May I again visited Mudgee, and made an inspection of the Apple Tree Flat Gold-field in connection with a complaint that part of the Gold-field Reserve which had recently been cancelled contained auriferous deposits occasionally worked by the miners.

On the 7th June I visited Wyalong, and inspected a number of areas which the Lands Department proposed to alienate.

From the 29th August to the 10th September I was engaged on a geological examination of the country to the east of the road between Narrabri and Moree. The information gained during this examination was of considerable importance, and in a subsequent report (*vide* Appendix 3) I had the honor to lay before you evidence proving that the Moree and Coonamble Bores, from which large supplies of artesian water of excellent quality had been obtained, were not, as previously supposed, in the Lower Cretaceous rocks but in sandstones and shales of the same age as the Clarence River Coal Measures and the Ipswich Coal Measures of Queensland. In view of this discovery it is evident that the area of our artesian water-bearing country is much larger than was previously supposed, as these Ipswich (? Triassic) Coal Measures extend a considerable distance to the eastward of the eastern boundary of the Lower Cretaceous basin as shown on the Geological Map of the Colony.

On the 15th October I furnished a report on the probability of obtaining artesian water at Grafton, on the Clarence River. This report forms Appendix 4 hereto.

On the 15th October I proceeded to Queensland, where I made an examination of the Ipswich Coal Measures in the type district. I also visited Roma and Texas for the purpose of examining the Blythesdale Braystones, or "intake beds," of the Lower Cretaceous basin; and I was engaged until the 23rd November in examining the country north and north-west of Inverell, and in mapping the eastern boundary of the Ipswich Coal Measures in that district, with a view of defining the limits of the newly discovered artesian basin. In a paper read (by permission of the Minister) before the Royal Society of New South Wales, on December 4th (and subsequently published in the Records of the Geological Survey of New South Wales, Vol. v, Pt. 1), I detailed the results of my observations in Queensland, and suggested the possibility of the Ipswich Coal Measures being continuous (under the Lower Cretaceous rocks) between Eastern Australia and Leigh's Creek, in South Australia. While in the Northern District I made a geological examination of the Ashford Coal-field, the results of which were published in Vol. v, Pt. 1, of the Records of the Geological Survey of New South Wales. The Ashford Coal-field is very limited in width, and the seam is inclined at a high angle; nevertheless, in view of the great thickness of the seam (about 27 feet), and the excellent character of the coal for steam or smelting purposes, there is no doubt that the deposit will be a valuable one in the future. The seam is of special interest, as being the most northerly occurrence of the Permo-Carboniferous Coal Measures in the Colony. It is an isolated deposit, and extends to within a few miles of the northern boundary of the Colony, near Bonshaw.

While in this district I also made an examination of the new discovery of diamantiferous drift near Boggy Camp, about 17 miles south-west of Inverell. The drift occurs under a high basalt hill, the underlying rock being granite. The diamonds are about equal in size and quality to those found on the Bingara Field. At the time of my visit forty-two loads of drift had been washed for a total yield of 600 carats, and the wash-dirt also yielded at the rate of about 13 lb. of tin ore per load. One load of wash-dirt gave the extraordinary yield of 515 diamonds, weighing in the aggregate 184 carats. There still appears to be a difficulty in obtaining a satisfactory market for diamonds of the small size found in New South Wales; and in view of the length of time which has elapsed since these quartz-pebble drifts were first prospected, there is reason for assuming that if diamonds of large size existed in them, some of them would have been discovered before this. The area of country covered by river drifts containing small diamonds is extensive, and I cannot help thinking that their source will ultimately be traced to volcanic pipes, analogous to those found at Kimberley in South Africa. Bearing in mind the positions and trend of the diamantiferous river-drifts of the Northern District, I am inclined to think that the belt of country lying to the east and south-east of Inverell, and between that town and the Northern Railway Line, is the most likely one in which to prospect for the source of the diamonds; but, unfortunately for the prospector, this area is covered to a considerable extent by basalt flows, which would effectually hide the volcanic pipes if they existed there.

On

On the 16th December I inspected a deposit of kerosene shale in the banks of Bundanoon Creek, near Exeter, and, with a view of enabling the deposit to be thoroughly prospected, I recommended the proclamation of a reserve covering it. On the 18th December I made a third inspection of the Garangula Gold-field in connection with the question of the resumption of the land by the Government. My report forms Appendix 5 hereto.

The following maps and publications have been issued from this Branch during the year:—

Geological Map showing the Stanniferous Leads in the Tingha and Elsmore Districts.  
 Sketch-plan of the Jenolan Caves.  
*Records of the Geological Survey*, Vol. IV, Parts 3 and 4.  
*Palaeontological Memoirs*, No. VIII, Part 3, and No. IX.

During the year a considerable portion of the Geological Surveyors' time has been devoted to inspecting and reporting upon land for which aid from the Prospecting Vote had been sought. The details of the other work performed by them, including reports on mineral areas in various parts of the Colony, will be found appended hereto.

In September last Mr. G. A. Stonier resigned his position of Geological Surveyor, after ten years' service in the Department.

The reports of the Curator, Inspector of Caves, Assistant Palaeontologist and Librarian are submitted herewith.

Eighteen Institutions have been supplied with mineral collections during the year, and no less than 4,816 specimens have been assayed or analysed.

I have, &c.,

EDWARD F. PITTMAN,  
 Government Geologist.

#### APPENDIX I.

##### Report on the Walbundrie Reefs.

Geological Survey Office, Department of Mines and Agriculture, Sydney, 23 February, 1895.

Sir,

I have the honor to report that I have inspected the auriferous reefs lately discovered in the Albury District, and known as the Walbundrie reefs.

##### *Situation.*

They are situated in the Parish of Bulgandra, County of Hume, about 40 miles north-west of Albury, on the road to Urana. The greater part of the land in the district has been alienated, and the first reef discovered in this instance was situated upon Portion 120, the property of Mr. Fagan.

##### *Geological Formation.*

The reefs occur in some low hills on the northern side of Billabong Creek. These little hills consist for the most part of micaceous schists and slates of probably Upper Silurian age, more or less impregnated with iron oxide, while in places, especially in proximity to the reefs, dykes of granite and felspar porphyry occur. The country on the southern side of Billabong Creek consists of level plains which have been formed of the silt deposited from the flood waters.

##### *Depth of Made Ground.*

The depth of this made ground is probably very considerable in places, and I was informed that a bore put down for water on Bulgandra Run penetrated to a depth of about 250 feet without reaching bed rock.

##### *Probable existence of Deep Leads.*

It is very probable that deep leads, fed by gold derived from the reefs in this locality, may exist below the surface of the plains, and it behoves the miners, therefore, to prospect carefully for the heads of such leads in the shallow ground, so that their course may be followed into the deeper country.

##### *Names of Principal Reefs.*

The five principal reefs inspected by me are known respectively as (1) the Goodwood reef, (2) the Lone Hand reef, (3) the Show Day reef, (4) the Welcome Find, and (5) Coonerty and Murphy's reef.

##### *Goodwood Reef.*

The Goodwood Reef was the first discovered, and more work has been done upon it than upon any of the others. It bears east and west, is nearly vertical (having a very slight southerly underlay) and varies in width from 18 inches to 5 feet. The upper part of this reef contains a considerable amount of slate which has, doubtless, fallen into the vein fissure from the walls, and it is also very much impregnated with iron oxide in places. It is probable that as greater depths are reached the reef will be found to consist of quartz with pyrites, and possibly other sulphides. Fairly coarse gold is visible in places in the workings along the reef. There are at present seven claims at work on the Goodwood Reef, and a depth of about 40 feet has been attained. The claims are held under Section 33 of the Mining on Private Lands Act of 1894, the miners having made their own terms with the landowner.

##### *Results of Crushings from Goodwood Reef.*

I was informed that the following results had been obtained from crushings:—From the Prospectors' Claim (Wade & Crawley), 4 tons yielded  $\frac{1}{2}$  oz. per ton; 1 ton yielded 2 oz. 11 dwt.; and 4 tons yielded 15 dwt. per ton. In Fagan's Claim (No. 1 East), 6 cwt. of stone yielded 1 oz. 6 dwt. of gold. In Gibbon's (Doncaster Claim, No. 3 west of Prospectors) 4 tons yielded  $\frac{1}{2}$  oz. per ton. From Voltien's (No. 4 West) 1 ton gave 5 oz., and 10 tons gave 2 $\frac{1}{2}$  oz. per ton. Total result of trial crushings, 24 tons 6 cwt. yielded 40 oz. 17 dwt.

*The*

*The Lone Hand Reef.*

The Lone Hand Reef is situated about 200 yards south of the Goodwood, and is also within the limits of Portion 120, Parish of Bulgandra. This reef strikes about north-east, and dips to the north-west at an angle of about 70 degrees. At the time of my visit it had been opened to a depth of 4 or 5 feet for a distance of about 30 feet. In this opening the reef was about 1 foot wide, and fairly coarse gold could be seen through the stone. Four tons were despatched to the battery on the day of my visit, and I have seen a statement in the newspaper since that the yield was at the rate of 8 oz. per ton.

*The Show Day Reef.*

The Show Day Reef is situated upon Portion 21, Parish of Bulgandra, also the property of Mr. Fagan. This reef bears north-east, is nearly vertical, and varies in width from 6 to 18 inches. It occurs along the line of contact between slate and a very decomposed rock—probably a decomposed felspar porphyry. Dykes of hard felspar porphyry also occur in proximity to the reef. Hewitt Bros. and Party are the prospectors, and I was informed that 35 tons of stone from their claim yielded 95 oz. of gold. There are five other claims sinking on this reef. In No. 1 South-west (Neal and Party) the reef is about 9 in. wide. In No. 2 North-east (Young and Son's claim) the reef is about 1 ft. wide, and I was informed that 5 tons had been crushed for a yield of 2 oz. 2 dwt. per ton. Noble and Party in No. 3 North-east claim have not found the reef as yet, but in No. 4 (Davis and Party) the reef has a width of 9 in.

*The Welcome Find Reef.*

The Welcome Find Reef is situated on Portion 8, Parish of Bulgandra, which is also private property. Driscoll, Strachan, and Party are the prospectors, and there is only one claim on this reef. The reef strikes North 10 degrees West, and dips West at about 50 degrees. It is situated in slate country, and its width varies from 9 in. to 4 ft. The shaft is down about 45 ft. Rather fine gold can be seen in the stone here and there, and very good prospects can be obtained by dollying, but no bulk crushing had been tried at the date of my visit.

*Coonerty and Murphy's Reef.*

Coonerty and Murphy's Reef is situated on Water Reserve 321, just to the south of the Lone Hand. Very little work has as yet been done on this reef, which bears about North-east, and has a dip to the North-west at about 80 degrees. The width of the reef varies from 2 in. up to 1 ft., and colours of gold can be seen here and there in the stone.

*Machinery.*

I believe that crushing machinery was conveyed to the ground a day or two after my visit, so that in a very short time a reliable test of the reefs will be made, it being estimated that there are 300 tons of stone at grass awaiting crushing. A good site for a battery can be found on Billabong Creek, in proximity to the reefs.

*Summary.*

In conclusion I have to report that present appearances are decidedly favourable, and although it is too early to speak confidently of the permanence of the field, there is fair reason to hope that as the workings progress in depth, the auriferous nature of the reefs will be maintained. As already stated, there is a reasonable probability that auriferous deep leads may exist in the neighbourhood.

At the date of my visit it was estimated that there were about 200 men on the field.

I have recommended the proclamation of a Gold-field Reserve in lieu of the reserves for water, travelling stock, etc., now in existence.

I have, &c.,

B. F. PITTMAN,

Government Geologist.

## APPENDIX 2.

## Second Report on the Garangula Gold-field.

Geological Survey Branch, Department of Mines and Agriculture,

Sydney, 10 April, 1895.

IN accordance with the Minister's instructions, I have made a second inspection of the Garangula Gold-field with the object of inquiring into the question of the resumption of the land for mining purposes, and I have the honour to report as follows:—

The auriferous deposits are situated upon Portions 200 and 202, Parish of Cunningham, County of Harden. The owner of the portions (Mr. Macansh) originally made applications for permits to remove the gold under Section 7 of the Crown Lands Act of 1884, but after the passing of the Mining on Private Lands Act of 1894, the permits could not be issued, and Mr. Macansh accordingly applied to convert the applications for permits into special leases under Section 23 of the Mining on Private Lands Act of 1894. There are two areas for which special leases have been applied, viz., Portions 200 and 202, of 640 acres each. Up to the present the leases have not been granted, but Mr. Macansh has made private agreements from month to month with the miners, whereby they are to pay him rent at the rate of 10s. per month per man after striking gold-bearing wash.

I understand that these rents have not been systematically enforced (although active gold-mining operations have been carried on for about ten months), but that it is the intention of Mr. Macansh to enforce them at an early date, and to demand a deposit or payment in advance, unless the Government decide to resume the land, his reason being the difficulty of compelling the miners to fill up the shafts after they have been abandoned.

The following statements were made to me by the miners with the object of showing why the auriferous land should be resumed by the Government:—

1. The alluvial deposits have not been thoroughly prospected, and new deposits may therefore be found.
2. Many of the reefs are likely to be permanent.
3. Much of the alluvial ground already worked would still give a small return, but the yield from such would not be sufficient to justify the rent demanded by the owner of the land.
4. If the land were resumed by the Crown many of the miners would keep a cow or a horse, but under present circumstances they are prevented from doing so by reason of the expense.
5. Only one battery of five head of stamps is allowed on the field by the land-owner. It has crushed 92 tons of stone, and it required four weeks and four days to do so. This is not sufficient for the requirements of the field.

6. Heads of families would erect houses if they could obtain a miner's right title for the residence purposes. At present they are compelled to live in tents and cannot keep their wives and families in comfort.
7. A school is wanted, and would probably be erected if Crown Lands were available.
8. Water is at present very scarce on the field. If the land were resumed dams could be built for conserving water, but there is no encouragement to do so now, as rent would be charged and the improvements would revert to the land-owner.
9. There is only one store on the field, and this is the property of Mr. Macanah. If the land were resumed other stores would be erected, and business generally would prosper.
10. There are many old miners on the field who have for years past helped by their labours to increase the revenue of the Colony, and these consider themselves entitled to the consideration asked for.
11. The miners consider that the gold-field offers a good position for a permanent village. The surroundings are favourable. The nearest village (Jugiong) is about 8 miles distant, while the town of Murrumburrah is 17 miles distant. The field, they state, is in the same auriferous belt as Parkes, Grenfell, Wambat, &c., and would form a good centre or depôt for miners' families.
12. The amount of rent demanded is objectionable; each miner is asked to pay £6 5s. per annum. Other charges increase the cost of living, they state, to £15 per year per man more than it would cost elsewhere.
13. Resumptions are made by the Department in the interests of agriculture, and it is only fair that something of the same kind should be done in the interests of mining.
14. Payable gold has been found here, and a large meeting of miners has carried a resolution in favour of the resumption of the land.
15. Mr. Macanah's land has been damaged by the mining operations, and it is only fair, the miners state, that the Government should recoup him by resuming it.
16. The reefs on the field are, according to the miners, important, and there are at the present time between sixty and seventy men at work upon them.
17. During the past ten months the field has supported, and is still supporting 400 men.
18. Fully 200 men have left the field since the enforcement of the rent has been threatened. If the rent be enforced, it is said that many men will return to Sydney to increase the ranks of the unemployed, whereas if the land were resumed a large increase of population would result."

The payable alluvial deposits hitherto worked may be said to be confined to two principal gullies, known respectively as Main Gully and Strawstack Gully. Each of these gullies has several short gullies or branches in which the alluvium has been worked, but the total length of the payable auriferous deposits on either gully has not exceeded three-quarters of a mile. It is clear, therefore, that the gold has not travelled far, and that the alluvial deposits hitherto discovered cannot be said to be extensive, notwithstanding the fact that during the past ten months there has been on the field a population of at least 400, and occasionally as many as 800 or 1,000, busily engaged in prospecting.

I have inspected the principal reefs which occur on the ridges between the two auriferous gullies already referred to as Strawstack Gully and Main Gully. These reefs have undoubtedly formed the source whence the alluvial gold was derived. The following particulars will serve to convey some idea of their extent and prospects.

*Manley's Reef.*—Average width, 5 inches. Three shafts have been sunk, their depths being 63, 67, and 42 feet respectively. Twenty-seven tons of stone were raised by two men in five weeks. Ten tons crushed at the Clyde Works yielded 1 oz. 4 dwt. 16 gr. per ton, and 16 tons crushed at the local battery gave 1 oz. 6 dwt. 14 gr. per ton.

The country rock consists of decomposed granite down to the bottom of the present workings. There are several other parallel reefs in Manley's Claim, the widest being about 1 foot, but the reef at present being worked gave the best prospects.

*Hell and Party's Reef.*—Two shafts, 63 and 75 feet in depth respectively. In the first shaft the reef shows from 1 to 5 inches in width; in the second it averages 2 feet. Fifty tons of stone have been despatched to Cunnigar, and are expected (by the owners) to yield from 15 to 18 dwt. per ton. In the deeper shaft the rock is becoming harder.

*Cousin Jack's Claim.*—Morris and Party. Shaft 80 feet in depth and several drives. Reef averages 10 inches in width. Sixty tons of stone have been raised and are now being crushed at the local battery. The country is getting hard at the bottom, but no blasting has as yet been necessary.

*Perseverance Claim.*—Morris and Party. This is probably on the same line of reef as the last. One shaft 70 feet deep, and drive 70 feet long. Average width of reef, 10 inches. No stone crushed as yet, but 50 tons at present at grass are estimated by the owners to yield at the rate of 12 dwt. per ton. The decomposed granite is beginning to give place to hard granite at the bottom of the shaft, but no blasting has yet been necessary.

*The Conundrum Claim.*—Adams and Party. Three shafts, 82, 90, and 51 feet deep respectively. The first was sunk on a reef dipping slightly eastwards, and having an average width of 10 inches. Thirty-seven tons from this reef were crushed at the local battery, and yielded 19 dwt. per ton.

The second shaft was sunk on a parallel reef a few feet east of the first and dipping westward, so that it is probable that the two will junction at a depth. This reef has an average width of 18 inches. The third shaft is on the same reef, but is situated further to the south. In all, 92 tons of stone have been raised from the three shafts and crushed at the local battery; the yield was at the rate of 16 dwt. per ton. There are two other small parallel reefs in this claim. The country rock at the lowest level is still decomposed granite.

*Lady*

*Lady Duff Claim.*—English and Party.—Two shafts, 60 and 40 feet deep respectively, with drives. Reef averages about 12 inches in width. Country decomposed granite. Thirty tons of stone from this claim was crushed at the local battery, and yielded an average of 5 dwt. per ton.

*Monte Christo Claim.*—Emery and party.—Three shafts, 95, 80, and 40 feet deep respectively, also drives. Average width of reef, 9 to 10 inches. Twelve tons of stone were treated at the Clyde Works, and yielded at the rate of 1 oz. 9 dwt. 16 gr. per ton. There are at present about 50 tons at grass, estimated (by the owners) to contain over 1 oz. per ton. The decomposed granite appears to be giving place to hard granite in the lowest workings.

*Jeffray and Party.*—Four shafts, 45, 44, 32, and 14 feet deep respectively. There are five gold-bearing reefs in this claim, the largest of them averaging about 6 inches in width. Hard granite has been met in one shaft at a depth of 38 feet, and blasting had to be resorted to. No stone from this claim has been crushed as yet, and there are only about 3 tons at grass.

*Constellation Claim.*—Dubois and Party.—There are said to be twelve gold-bearing reefs in this claim, but it is probable that some of them will be found to junction. The largest of these has an average width not exceeding 9 inches, while the average width of the others is about 6 inches. No less than eight shafts have been commenced, the two deepest being about 50 feet each. Fifty tons have been despatched to the Cunnigar battery, and are estimated (by Mr. Dubois) to contain at the rate of 1 oz. 10 dwt. per ton.

The reefs are all very variable in width, occasionally thinning out to a mere thread and again increasing in width as they are followed horizontally or in depth, in other words they are lens shaped, thus  in horizontal as well as in vertical section. The reefs contain a little galena as well as pyrites. As already stated the country rock in which the excavations have hitherto been made consists of decomposed granite, which is easily worked and requires no blasting. Circumstances are therefore at present very favourable for economic mining, and the average yield of gold hitherto obtained by the batteries will pay, notwithstanding the narrowness of the reefs, so long as the character of the country rock continues the same. Indications are not wanting, however, that the favourable nature of the rock will not continue much deeper, and when the workings have extended to perhaps 100 feet or a little more the reefs will be found to occur in hard granite. In addition to this water will be met with, and the pyrites will be found to increase in quantity, rendering the gold more difficult of extraction. The conditions of mining will thus be materially changed, and it is questionable in my opinion whether the reefs will continue to be payable unless they increase in width or richness. Meanwhile there is no reason for assuming that any such increase will take place.

Section 40 of the Mining on Private Lands Act gives the Minister power to resume land where alluvial deposits containing gold of a payable character occur, but the Act contains no provision for the resumption of land on account of auriferous reefs. In the case of the Garangula Gold-field I am of opinion that the greater part of the alluvial gold, within the areas applied for as special leases by Mr. Macansh, has been extracted, and it is probable that by the end of twelve months from the present date, provided mining is carried on as at present, the alluvial gullies referred to will only afford employment for a few fossickers.

As already stated it is, in my opinion, doubtful whether the reefs will continue payable after the workings have penetrated the hard granite which is certain to be met with at a certain depth.

If it be considered, therefore, that resumption of the land should not be carried out unless there is good reason for believing that the Gold-field will be a permanently productive one, I do not think that the expenditure of such a sum as would be necessary to resume 1,280 acres of good agricultural land would be justifiable in this instance.

EDWARD F. PITTMAN,  
Government Geologist.

The Under Secretary for Mines and Agriculture.

#### APPENDIX 3.

##### Report on the Country between Narrabri and Moree.

Geological Survey Branch, Department of Mines and Agriculture,  
Sydney, 26 September, 1895.

Sir,

I have the honor to report that I have visited the Moree Bore, and have made a geological inspection of the country between Narrabri and Moree, and in the ranges to the east of the road between those two places.

##### *Geological features, Narrabri to Moree.*

The road from Narrabri to Moree passes over black soil plains, there being only one hill, a small basalt rise, where any outcrop of rock can be seen between the two towns. It will be understood therefore that the geological formation is very much hidden, and as these plains extend, with very little interruption, far to the westward, it has been a matter of considerable difficulty in the past to locate the eastern boundary of the Cretaceous basin—the evidence which would be afforded by the rocks being hidden by the level covering of Pleistocene and Recent soils. The basalt hill, already alluded to, and known as the Bald Hill, is situated close to the Galathera Tank, and from here to the Boggy Creek Hotel (a distance of 8 or 10 miles) the basalt occurs within a few feet of the surface, as proved by wells which have been sunk in a few places.

##### *Woolabrar and Dobikin.*

I was requested to report upon the probability of obtaining artesian water at Woolabrar, about 12 miles to the east of Boggy Creek Hotel, as the Railway Commissioners propose—in the event of the prospects being favourable—to have a bore put down there for supplying water for the railway from  
Narrabri

Narrabri to Moree. Accordingly, in company with Mr. P. J. Makinson, Inspector of Public Watering Places, I drove to Dobikin Station, and thence to the railway (now in course of construction) at Woolabrar.

The road was still over black soil plains, but at Dobikin the plains are strewn with various coloured pebbles, consisting of agate, chalcedony, jasper, carnelian, lydian stone, &c. These have probably been scattered by flood waters, and have evidently been derived from a deposit of well-rounded pebble drift—probably of Pliocene age—which occurs at Woolabrar. The railway line runs in a northerly direction for about 5 miles through this deposit, which probably extends in an east and west direction for about the same distance.

#### *Evidence of Wells on Dobikin Run.*

There have been several wells sunk on Dobikin Run for the purpose of obtaining water. One of these is on Portion 26, Parish of Dobikin, and its position is shown by the letter "A" on the accompanying plan. The well has a bore at the bottom, the total depth reached being 350 feet without finding water. It was impossible to get down this well, but I made an examination of the spoil heap, and found that the rocks consisted of white and greyish sandstones, bluish-grey sandy shales, brownish clays, and nodules of clay ironstone; there were also thin seams of coal. Most of the rocks have crumbled or disintegrated readily on exposure to the atmosphere (owing no doubt to the quantity of moisture in them), and this I found to be a characteristic feature of the rocks as seen on the spoil heaps of all the wells in the district. By turning over the heap, however, I obtained fragments of solid rock in which were to be seen numerous impressions of *Taeniopteris Daintreei*, as well as another fossil plant, which has since been identified by Mr. W. S. Dun, as *Baiera*. *Taeniopteris Daintreei* occurs in the Clarence River Coal Measures, in the Ipswich Coal Measures of Queensland, and in the Mesozoic Coal Measures of Victoria. The presence of this fossil plant at Dobikin shows that the rocks there are the equivalents in age of the Clarence River and of the Ipswich Coal Measures.

#### *Eastern Limit of Plains.*

The plains extend to the eastward of Woolabrar for about 5 or 6 miles when they are succeeded by ranges of sandstone. These sandstones probably belong to the same series as the coal-bearing rocks underlying the plains.

There are two other wells on Dobikin Run, viz., at Woolabrar, on the eastern side of the railway line. I did not see these wells, but Mr. Taylor, the owner of Dobikin, informed me that they were sunk through similar rocks to those of the well last described, and that water was reached in them at depths of 90 and 130 feet respectively.

#### *Moloney's Well, 14 miles E. of Moree.*

I visited another well, known as "Moloney's Well," 14 miles east of Moree. The position of this well is shown by the letter "B" on the accompanying plan. Here again I found in the spoil heap similar rocks to those observed at the well "A" on Dobikin Run. They showed the same tendency to disintegrate on exposure to the atmosphere, and here again I obtained specimens of *Taeniopteris Daintreei*.

#### *Well west of Terry-Hie-Hie Homestead.*

At another well,  $2\frac{1}{2}$  miles west of Terry-Hie-Hie Homestead, and marked "C" on plan, rocks similar in lithological characters and exhibiting the same tendency to disintegrate on exposure were seen, and in these I saw several indistinct specimens of what I believe to be *Taeniopteris Daintreei*, though they were too imperfect to warrant their being definitely named. Terry-Hie-Hie Homestead is by barometric measurement about 420 feet higher than Moree, but the ascent is so gradual as to be scarcely noticeable on the road.

#### *Rocky Creek Carboniferous Rocks.*

Near Rocky Creek Homestead (which is about 500 feet higher than Terry-Hie-Hie, or 920 feet above Moree) are seen beds of sandstone and blue limestone containing marine fossils, which have been determined by Messrs. Robert Etheridge, jun., and W. S. Dun, as of true Carboniferous age. Mr. G. A. Stonier, Geological Surveyor, was the first to collect *Orthis australis* and *Spirifera* from this locality, and I have now collected, in addition, *Productus*, *Rhynchonella*, *Bellerophon*, *Loxonema*, *Euomphalus*, crinoid stems, &c.

The rocks overlying these Carboniferous marine beds, and forming the mountain ranges around Rocky Creek, have all the appearance, when viewed from a distance, of the Hawkesbury sandstones, and those of the Clarence basin. I propose, however, to make a closer examination of these rocks at an early date.

#### *Rocky Creek to Narrabri.*

Apparently similar rocks are to be seen along the road between Rocky Creek and Narrabri. At about 27 miles from Narrabri this road passes over a gap in the range at an altitude of 1,550 feet above Moree. The zigzag road over the mountain is cut through a thick sheet of olivine dolerite, but on each side of this the mountains appear to be composed of the same (Mesozoic?) sandstone.

#### *Well near Turrawan.*

The same formation appears to extend for some distance to the south-east of Narrabri, and about 4 miles west of Turrawan Railway Station the owners of Tibbereena Run have put down a well to a depth of 50 feet in greyish-white sandstone (which crumbles readily on exposure) and brownish-clayey shales. No water was struck, but at the bottom of the well a seam of good bituminous coal, 7 inches thick, was penetrated. The position of this well is shown by the letter "D" on the accompanying plan. I could find no recognisable plant-impressions in the rocks from this well, but from their lithological characters it is probable that they may belong to the same series as those already described, though, on the other hand, they may be an extension northwards of the Permo-Carboniferous rocks of Gunnedah.

*Age of Rocks in Moree Bore.*

Judging from the very great lithological resemblance between such fragments of the rocks and coal from the Moree Bore as were available, and the rocks (containing *Taniopteris Daintreei*) and coal from Moloney's Well and the well on Dobikin Run, and bearing in mind the great depth of the bore, and the comparatively short distance which the two wells are to the eastward of the bore, it appeared to me that the evidence all pointed to the probability of the artesian water supply at Moree occurring, not in the Cretaceous formation, but in rocks which are the equivalents of the Clarence and also of the Ipswich Coal Measures, and which may be regarded as of Triassic, or at any rate not newer than Jurassic age.

*Proof of the existence of an Artesian Water-bearing Basin of Triassic or Jurassic Age.*

On my return to Sydney I made a careful examination of the drillings from the Moree Bore, which were collected by the Officers of the Works Department, under whose supervision the bore was commenced, and here I had the satisfaction of obtaining confirmation of the opinion previously formed, for in a sample of shale which was labelled as having been drilled from a depth of 810 feet I recognised several undoubted specimens of *Taniopteris Daintreei*.

The importance of this palæontological evidence is unquestionable, as it proves the existence of large supplies of artesian water in Triassic or Jurassic rocks, whereas we had no previous definite knowledge of the occurrence of artesian water in any other than the Cretaceous formation in New South Wales.

*Proof of Similar Age of Rocks from Coonamble Bore.*

A paragraph appeared in the *Daily Telegraph* of January 20th, 1894, stated that the Rev. J. M. Curran had reported to the Minister for Works that, in his opinion, the strata pierced by the Coonamble Bore were Triassic and not Cretaceous. I have made enquires at the Works Department, and am informed that there is no record of any written report to that effect having been received. I understand from Professor David, who spoke to Mr. Curran on the subject, that the latter gentleman stated that he had not obtained any definite palæontological evidence of the age of the rocks, and that his opinion was based on their lithological resemblance, and that of the indeterminable plant fragments to those of the Dubbo rocks, with which he was familiar. The Coonamble Bore was begun and completed by the Works Department, and I have not until recently had an opportunity of inspecting the samples of drillings which were collected from it. I have now carefully examined them, however, and am glad to be able to confirm, by palæontological evidence the opinion previously formed on lithological grounds by Mr. Curran. In a piece of shale from a depth of 327 feet in the Coonamble Bore I found several specimens of *Taniopteris*, while in a fragment of greyish-white sandstone from a depth of 1,211 feet I found a fairly distinct impression of *Thinnfeldia*, a fern characteristic of the Hawkesbury Series, and of the Dubbo Beds, which are regarded as of Triassic age, and which are also thought to be the equivalent of the Clarence series.

*Gil Gil and Dolgelly Bores.*

An examination of the drillings from the Gil Gil and Dolgelly Bores (north of Moree), shows that the rocks pierced there are, in their lithological character, very similar to those of the Coonamble and Moree Bores, and it is therefore highly probable that they are of the same formation.

*Nyngan Bore.—Terabile Creek, near Castlereagh River.*

In 1891, Mr. Robert Etheridge, junior, identified a specimen of the *Taniopteris Daintreei* in shale from the Nyngan Bore, and a few months ago another specimen of the same fossil plant was identified by Mr. W. S. Dun, in some rocks forwarded by Mr. W. L. R. Gipps, from Terabile Creek, 4½ miles from the Castlereagh River. The position of this find is marked by the letter "E" on the accompanying plan.

*Gilgandra and Bourbah Bores.*

The drillings from the Gilgandra and Bourbah Bores (the latter of which has a yield of over 1,100,000 gallons of water per day), also closely resemble in their lithological character the rocks which I have been describing.

*Probable extent of Triassic or Jurassic Water-bearing area.*

It is evident, therefore, that this Mesozoic Coal-field is of very considerable extent, and the Coonamble and Moree Bores, and probably also the Bourbah, Gil Gil, and Dolgelly Bores, are proofs of the fact that the area of our Cretaceous artesian water-bearing country is supplemented by a considerable area of water-bearing rocks of Triassic or Jurassic age, not previously known to exist.

*Coal in the Triassic or Jurassic rocks.*

It is open to question whether these Triassic (or Jurassic) rocks contain any *workable* seams of coal, for while in Queensland good workable seams are found in the Ipswich Coal measures, none that could be profitably worked are known in the Clarence carboniferous basin in our own Colony.

*Extension of water-bearing rocks east of Moree.*

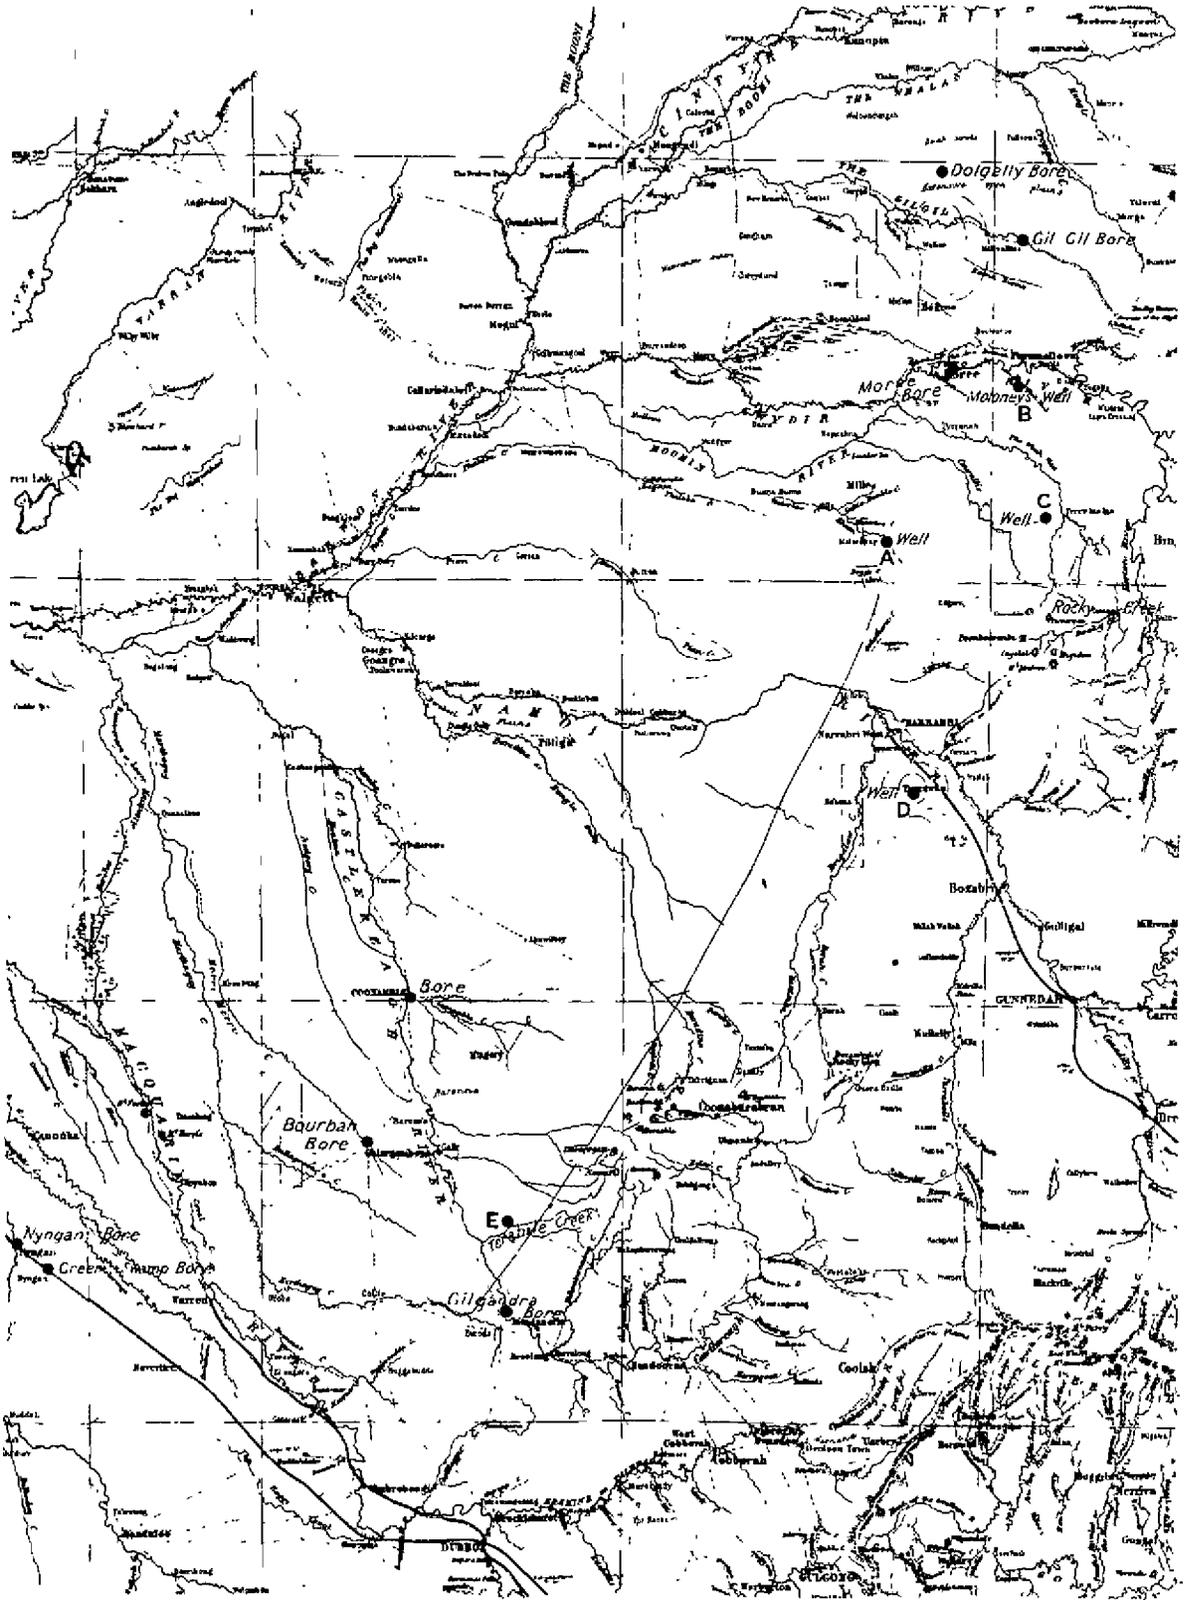

It is probable that bores for artesian water would be successful for at least 15 miles east of Moree, and I am of opinion that the bore which the Railway Commissioners suggest at Woolabrar, should have a fair prospect of success.

*Desirability of obtaining a solid core with a drill.*

It would be a very great advantage from a geological point of view, if in the next bore put down in this district a solid core could be obtained. This could probably be best effected by means of the recently introduced Calyx Drill. I understand that splendid work has been done by this drill in the Coal Measures of Victoria, and at a cost very much below that of the ordinary percussive drill. I have had the advantage of seeing a number of the cores obtained by the Calyx Drill in Victoria, and am of opinion that the rocks in the Moree District would be eminently suited to its action, while the geological information which would result from the production of a solid core would be of enormous importance in enabling us to more thoroughly understand the nature and limits of our underground water supply. In addition to this the question as to whether this newly recognised coal basin contains any workable seams of coal would be definitely settled.

# PLAN

TO ACCOMPANY REPORT BY E.F. PITTMAN, A.R.S.M., GOVERNMENT GEOLOGIST,  
on the country between Narrabri and Moree

*Water in Ipswich Coal Measures.*

The Ipswich Coal Measures in Queensland are water-bearing, the water having risen to near the surface in several instances, but it appears that only in one locality (*viz.* at Brisbane Racecourse or Eagle Farm), was true artesian water obtained, and in that instance the maximum supply was only about 8,000 gallons per diem, and the water was unfit for domestic use (*vide* "The Geology and Palæontology of Queensland" Jack and Etheridge, p. 322.)

*Probability of water in the Clarence River Series.*

The fact that the rocks in which the Moree Bore was put down, are the equivalents in age of the Clarence River Series, renders it probable that artesian water might also be obtained by boring in the Clarence basin. Fifteen years ago, in a report addressed to the late Mr. C. S. Wilkinson, I suggested the putting down of a bore near Grafton, with the double object of ascertaining whether workable seams of coal occur there, and of testing for artesian water (*vide* Annual Report of the Department of Mines for 1880, page 244.)

*Summary.*

The discovery of the fossil plant *Teniopteris Daintreei* in the Moree Bore (in which an artesian supply of over 3,000,000 gallons of very good water has been obtained from a depth of over 2,600 feet), proves that this bore is not in the Cretaceous formation, but in carboniferous rocks of Triassic or Jurassic age—the equivalents of the Ipswich Coal Measures and the Clarence River Series. The same fossil was found in the Coonamble Bore (which has a supply of artesian water amounting to over 1,800,000 gallons per day), in the Nyngan Bore, and at Terabilo Creek, on the Castlereagh River. The lithological characters of the drillings from the Gil Gil Bore (which has yielded a supply of about 100,000 gallons of water per day); from the Dolgelly Bore (from which a supply of 300,000 gallons per day has been obtained); from the Bourbah bore (which has a yield of over 1,100,000 gallons per day), and from the Gilgandra Bore, lead me to believe that they all belong to the same formation.

It is evident, therefore, that not only has a new source of artesian water been discovered in New South Wales, but that the area from which the supply will be available is of very considerable extent.

In conclusion, I would invite attention to the excellent quality of the water from the Moree Bore. An analysis by Mr. J. C. H. Mingaye, shows that it contains 49.16 grains of solid matter per gallon, and that over 40 grains of this consists of carbonates of soda and potash. The water has a distinct alkaline reaction, and its temperature as it issues from the bore is about 113 degrees Fah.

It appears to me, therefore, that it has qualities which render it peculiarly adapted for wool scouring, and in a district so remote from Sydney as Moree, the saving which could be effected in the cost of carriage of wool if it were first scoured, would probably be a matter of some importance.

I have, &c.,

EDWARD F. PITTMAN,  
Government Geologist.

The Under Secretary for Mines and Agriculture.

## APPENDIX 4.

## Report on the probable occurrence of Artesian Water in the Clarence Coal Measures.

Geological Survey Branch, Department of Mines and Agriculture,

Sydney, 15 October, 1895.

Sir,

I understand that a request is being made from Grafton that a report be furnished as to the probability of artesian water occurring in the Coal Measures of the Clarence basin, and as I am about starting on a trip which may occupy some time, I venture to submit the following remarks in anticipation of the request referred to.

About fifteen years ago I made an examination of the Clarence and Richmond River basin, and suggested the putting down of a bore with the twofold object of testing the country for payable coal seams and for artesian water (*vide* Ann. Rept. Dept. Mines for 1880, p. 244). Subsequent examinations of this coal-field were made by the late Mr. C. S. Wilkinson, in company with Mr. W. H. J. Slee (Ann. Rept. Dept. of Mines, 1889, p. 202), and by Mr. (now Professor) T. W. E. David (Ann. Rept. Dept. Mines for 1891, p. 220).

The Clarence River coal-bearing series are considered on palæontological grounds to be the equivalents in age of the Hawkesbury Series of New South Wales, of the Ipswich Measures of Queensland, and of the Coal Measures of Victoria. No artesian water has ever been obtained from either the Hawkesbury Series of New South Wales, or the Coal Measures of Victoria, although a number of bores have been put down through both these formations in search of coal. In the Ipswich Coal Measures of Queensland several bores have been put down, but only in one locality (near the Brisbane Racecourse) has artesian water been met with, and in that instance the supply was only about 8,000 gallons per day, and the water was unfit for domestic use, by reason of the amount of soluble salts contained in it.

Quite recently however (*vide* papers 95/18091) I had the honor to report having found proof, of a palæontological nature, that the Moree and Coonamble Bores (in both of which large supplies of artesian water of excellent quality have been obtained) have pierced rocks which are the equivalents in age of the Clarence Series.

The fact, therefore, that good supplies of artesian water have been found in these Triassic or Jurassic rocks at Moree and Coonamble renders it reasonable to hope that similar supplies may be obtained in the lower sandstones of the Clarence Series—especially as the latter appear to occur in a complete basin—notwithstanding the absence of artesian water supplies in the Hawkesbury Series and the Victorian Coal Measures and the very poor supply obtained in one instance in the Ipswich Coal Measures.

The problem can of course only be solved in a practical way, *viz.*, by putting down a test bore, but in the meantime it may be stated that there is sufficient geological evidence to justify such a test, which, it need hardly be said, would be of very great interest.

I have, &c.,

EDWARD F. PITTMAN,  
Government Geologist.

The Under Secretary for Mines and Agriculture.

## APPENDIX 5.

## Third Report on the Garangula Gold-field.

Geological Survey Branch, Department of Mines and Agriculture,

Sydney, 20 December, 1895.

Sir,

I have the honor to report that I have paid a third visit to the Garangula Gold-field, and, in company with Constable Wilson, the Mining Registrar, have inspected the chief workings on the field.

Not one of the alluvial claims on which it was stated that payable gold had recently been reported can, in my opinion, be regarded as a new discovery. They are all situated either in the midst of or adjoining old workings, and consist of small runs of auriferous wash in the form of feeders to the already worked main gullies, or patches which have been overlooked by previous workers. All the alluvial work now going on upon Macansh's private land is more or less in the nature of fossicking, and cannot, under any circumstances, be regarded as of a permanent nature. I see no reason for modifying the remarks on this subject made in my report of the 5th April last.

Adams Reef is the most important of the lode deposits on the field. It has averaged 16 or 18 inches in width (maximum width, 3 feet), and has been found rich in places. Adams and Party have crushed 241 tons in all for a total of 322 oz. of gold, and a parcel of 58 tons had just been put through the battery at the time of my visit. "Cleaning up" had not been completed, but Mr. Adams expected the yield to be at the rate of 25 dwt. per ton. The main shaft is now about 95 feet deep, or only 5 feet deeper than it was eight months ago on the occasion of my last visit. The party has been mainly engaged in stopping out the auriferous stone up to the surface. The sinking is now in hard granite.

Another reef has been discovered by T. Mott since my last visit to the field. It is situated between the Lady Duff and Manley's Reef, and has a width of from 10 to 16 inches in the workings at a depth of 100 feet from the surface. Sixty-five tons have been crushed from this reef for a yield of 75 oz. of gold.

I have, &amp;c.,

EDWARD F. PITTMAN,

Government Geologist.

The Under Secretary for Mines and Agriculture.

## APPENDIX 6.

## Rumoured Discovery of Gold at Parramatta.

Geological Survey Branch, Department of Mines and Agriculture,

Sydney, 12 August, 1895.

At rather frequent intervals there have been rumours of the finding of payable auriferous deposits in the rocks of the Hawkesbury Series, thus a report of this nature caused a rush at Parramatta about a year ago, and there have been similar reports in reference to the occurrence of gold-bearing reefs at Springwood, Gosford, and Kiama within the last three or four years. All these rumours, however, proved upon investigation to be unfounded, and I have no hesitation in expressing my opinion that the present rumour in regard to the occurrence of a gold-bearing reef at Parramatta will not be substantiated.

The sandstones and conglomerates of the Hawkesbury Series are known to contain gold in small quantity, as was first pointed out by the late Rev. W. B. Clarke in 1860. Professor Liversidge also read a paper before the Royal Society last year giving the results of a number of assays of Hawkesbury sandstone, showing that much of it contained a trace of gold. This gold, however, exists in fine particles disseminated through the sandstones and conglomerates, and not in the form of concentrated deposits, such as auriferous reefs intersecting them.

Mr. Mingaye, Analyst and Assayer to the Department, who lives at Parramatta, informs me that he inspected the locality of the rumoured find yesterday, and he has handed me a specimen of the rock, which consists of grey micaceous sandstone of the Hawkesbury Series. He informs me that no reefs were visible, and that the exact spot where the gold is said to occur is kept a secret by the prospectors.

In conclusion I may state that from my observations of the Hawkesbury rocks generally I do not think it probable that they will be found to contain payable auriferous deposits, and, in any case, if an auriferous reef existed in the neighbourhood of Parramatta, it is extremely improbable that it could have remained undiscovered for so many years in such a populous neighbourhood.

E. F. PITTMAN,

Government Geologist.

The Under Secretary for Mines and Agriculture.

## Progress Report of Mr. J. E. Carne, F.G.S., Geological Surveyor.

Sir, Geological Survey Branch, Department of Mines and Agriculture, 29 January, 1896.

I have the honor to hand you the following brief summary of work performed during 1895:—

In January I was engaged in writing reports on the Toolong and Bogong Gold-fields, and a second report on the chrome deposits of the Gundagai and Tumut districts.

In February I inspected and reported on the Bywong Gold-field.

In March I reported on Messrs. Harrison and Timmis' mine at Batlow, near Adelong, and examined prospecting sites at Queanbeyan, Foxlow, and Captain's Flat.

In April I inspected prospecting sites in the Gundaroo, Braidwood, Snowball, Yalwal, Bateman's Bay, and Brimbramalla districts; and land alienation area at Mogo.

In May I inspected Waldron's Swamp, near Moruya; Turquoise Mine, near Bodalla; and prospecting sites at Pankalla, and Mount Dromedary; supposed deep ground near Bermagui; and prospecting site in the Parish of Murrumbidgee, near Bermagui; examined country round Eden, and continued examination and mapping of the Pambula Gold-field.

In June I was occupied with reports and office work.

In July I was absent on leave.

In August I inspected the Tallawang Gold-field Reserve, and recommended curtailment of portions only. Inspected prospecting sites near Mudgee, Parkes, Forbes, Burrage, and Mount Werong. Examined land for alienation at Parkes, and Cheshire Creek, near Bathurst. Inspected supposed false bottom in the alluvial workings of Mount Werong. In

In September I assisted in running a section line across the Greta Coal Measures, and examined a large special area for alienation near Lake Cowal.

In October I examined prospecting sites at Dalmorton, Chandler's Creek, Mann River, Chambigne, and Coramba. Examined the recently discovered reefs at Coramba, Bucca, and Tallawndjah Creek, Orara River district, also a newly discovered cinnabar deposit on Yulgilbar Station, Clarence River. Began inspection of the Esk River and Jerusalem Creek auriferous sand leads between the Clarence and Richmond Rivers.

In November continued the above examination. Examined tripolite deposit at Wyrallah, near Lismore; the neighbourhood of Byron Bay and Ballina. Examined the Gundry Tin lodes at Rowlands' Plains, Wilson River; and Willi Willi Copper Mine, Upper Macleay. Inspected prospecting sites at Yankee Creek, near Mullumbimby, Bowraville, Nambucca River, Smith's Flat, Upper Macleay River, Port Macquarie, Coolongolook, and Paddy's Creek, near Bungwall.

In December I inspected prospecting sites at Copeland, Cobark, and Upper Gloucester River, the rest of the month being occupied in writing reports, &c.

At various times during the year I attended meetings of the Prospecting Board.

The following reports were handed you relative to work performed or completed during the year:—

Further report on the chrome deposits of the Gundagai and Tumut districts.

Report on the Toolong and Bogong Gold-fields.

Report on the Bywong Gold-field.

Report on an auriferous deposit at Batlow, near Adelong.

Report on the Big Hill reefs near Bateman's Bay.

Report on a deposit of cinnabar near Lionsville.

Report on the Coramba and Bucca Creek reefs.

Report on the auriferous beach sands of the Esk River and Jerusalem Creek, Clarence and Richmond Districts.

I have, &c.,

JOSEPH E. CARNE, F.G.S.,

Geological Surveyor.

The Government Geologist.

#### APPENDIX 7.

##### Further Report on the Chrome Deposits of the Gundagai and Tumut Districts.

Sir, Geological Survey Branch, Department of Mines and Agriculture, 12 March, 1895.

I have the honor to report that, in accordance with your instructions, I have examined the deposits of chromite in the Gundagai and Tumut districts which have been discovered since my previous inspection in 1892.\*

Since that date the chrome mining industry has been inaugurated and developed into fairly large proportions. The export of chromite began in 1894, and during the year reached 3,034 tons valued at £12,336.

The first attempt to export this ore was in 1882, when the deposits at Bowling Alley Point, near Nundle, were opened up by Messrs. Blackall, Hunt, and others, of Tamworth. Mr. E. C. Hunt informs me that they shipped in the aggregate about 100 tons to Melbourne, Liverpool, and London; the highest price realised being 70s. per ton, which was not sufficient at that date to afford a profitable return on the outlay.

In the Gundagai-Tumut District chromite has now been found at intervals in the serpentine country, for a distance of about 24 miles southerly from the first deposit opened near Coolac, the most southern operations being within 8 miles of Tumut. Permits to mine extend to even a greater distance. There is no doubt that other deposits will be discovered from time to time in the belt of serpentine country which extends both north and south from the points mentioned, as well as in the area already partly explored. But the present workableness of discoveries in the southern extension—apart from quality—will depend entirely upon the distance from rail. In this direction also the country becomes more rugged and broken.

The most recently discovered deposits towards Tumut, such as the Emu, Mt. Miller, Keefe's, and McNerny's, do not at present afford indications of being equal in extent to the deposits nearer the Murrumbidgee River and Coolac, such as the Kangaroo, Carroll and Gillespie's, Quilter's, and Vulcan Mines, but as little more than preliminary prospecting has yet been begun, more extended work may belie the surface features.

##### *Vulcan Mine.*

The first mine opened in the chrome district was the Vulcan, formerly known as Wright's, and described under that name in my previous report.

About 1,200 tons of chromite has been raised from this mine, chiefly by an open cut of a most dangerous character, which is now being filled in preparatory to the adoption of a safer and more systematic method of extraction.

From the appearance of the remaining portions of the ore-bodies I am of opinion that my previous estimate of ore available in the then known bunches, viz., 2,250 tons, will not be exceeded, though it is quite possible that prospecting may discover other deposits in the vicinity.

Between the Vulcan and Quilter's Mount Helena Mine, a distance of about 5 miles, several bunches have been discovered, but chiefly of minimum grade at surface. No ore has yet been extracted from them.

##### *Quilter's Mine.*

Of the six deposits of chromite on Mr. John Quilter's property at Mount Lightning, described in my first report, three have since been opened, and 1,100 tons of ore despatched, mainly from bunches described under letters B and C.

Both these deposits when first seen presented very small surface outcrops from under the soil and loose slipped rocks, which had not been removed, hence an attempt to give a roughly approximate estimate of quantity based upon measurements of only partly exposed outcrops has proved altogether futile.

At B the ore has been extracted by means of an open cut about 50 feet in length and 20 feet deep, from the bottom of which a shaft was carried down 30 feet. An inspection of the lowest level attained—50 feet—was not possible as the shaft had been filled up in view of a safer method of extraction than that previously adopted.

It

It is reported, however, that the ore-body—which shows solid and thick in the open cut—gradually thins towards the bottom of the shaft.

At C a solid vein from 1 ft. 6 in. to 2 feet thick, appears to be going down. A little ore has been extracted from bunch A, where a face above ground is now exposed measuring about 14 feet high, and 12 to 15 feet wide. Bunch E near the summit of Mount Lightning, is not being worked. The two latter deposits—A and E—are of considerable extent, especially E, but unfortunately the grade is low, being below the minimum standard.

The ore from the working deposits is conveyed by gravity to a stage across the Murrumbidgee River, by means of a single wire cable, 1,300 yards long, the bags of ore being suspended to the cable by hooks with running blocks.

It would, therefore, appear advantageous—if the grade of the richer ore bunches will allow, and I am informed by Mr. Quilter that four consignments aggregating 80½ tons yielding from 49·8 to 56·5 per cent. of sesquioxide of chromium—that a grading floor should be laid down at the landing stage and the ore from the different deposits carefully blended to a uniform average grade (say) of 50 per cent. The direct return would naturally shrink in proportion to the fall in grade, but the shrinkage would be more than compensated by the larger amount of ore rendered available. Uniformity of quality would no doubt also be appreciated by users abroad.

#### *Mount Mary Mine.*

On the south side of Mount Lightning close to the Adjungbilly Creek, Messrs. Carroll and Gillespie are working the Mount Mary Mine on tribute from Mr. Quilter, in whose property it occurs. About 400 tons have been dispatched to Sydney averaging, according to the tributors, from 48 to 49 per cent.

The main bunch, which underlays to the west, has been worked hitherto in a most dangerous open cut, about 45 to 50 feet long, and from 20 to 30 feet deep. The ore-body under foot is solid and about 7 feet thick; whilst a wedge of ore remains in the upper workings 12 feet high and 10 feet broad. Evidently a considerable amount of ore is still available when a proper system of extraction is adopted.

Several smaller bunches have been more or less exposed by open cuts and shallow shafts higher up the slope of the mountain. In one instance a thickness of about 1 ft. 6 in. is exposed in a shallow shaft.

The most important of the new finds, however, has been found near the top of the ridge, where the soil has been removed for a small space, partly exposing an outcrop of solid ore for about 10 feet by 4 feet. Fifty feet south another small bunch occurs which may prove to be connected with the former; but no attempt has been made to uncover the entire outcrop, notwithstanding that a considerable expenditure has been decided upon, in the construction of a tramway to convey the ore from this deposit to the northern foot of Mount Lightning, a distance of about 50 chains. Sufficient fall is stated to be obtainable through a gap to enable the loaded trucks to run by gravity to the foot of the ridge, from whence the ore will have to be carted to the river, and conveyed across by cable or other means. The empty trucks will be returned by horse-traction. The impetus received in the descent of the ridge should, however, be sufficient to carry the loaded trucks to the river side, as the falling ground continues to within a very short distance of it.

The grade of the ore is stated to be good, but the statement appears to be based upon an assay of a sample only from the outcrop. To insure certainty from disappointment a more adequate test is desirable.

There is evidence of a very considerable quantity of chromite being available on Mr. Quilter's properties, especially if blending of the various grades be adopted.

#### *Welch's Mine.*

On the west side of the continuation of the serpentine ridge south of Adjungbilly Creek, in Portion 173, Messrs. Welch and Party extracted 220 tons from a deposit, which, unfortunately, appears to have pinched out entirely in the bottom of the open workings.

On Mr. Robert Owen's property, in addition to the Kangaroo Mine, Messrs. Givney and Thornycroft are engaged prospecting on behalf of Mr. Joseph Edwards, of Katoomba. So far twelve deposits have been opened which yielded 1,800 bags of ore, about 75 tons. The grade in several instances is stated to have been very close to the minimum. Four known bunches have yet to be proved. The largest yet found by the prospectors yielded about 21 tons.

#### *Kangaroo Mine.*

The Kangaroo Mine is situated in Portion 128, Parish Wagara, County Buecleugh. The proprietor, Mr. M. Constable, holds two leases of 80 and 40 acres, subject to terms agreed upon with the owner of the land.

About 1,230 tons of ore have been despatched to date (February 8th, 1895); the output of late being at the rate of 100 tons per week.

The ore-body has been proved horizontally for about 200 feet by two open cuts—following the irregularities of its contour—and by two shafts between the open excavations. Vertically it has been proved to the 30-ft. level. The main opening is about 75 feet long, 25 feet broad, and 30 feet deep.

The strike is a little west of north, and the underlay west. Since the new year the dangerous method of working by open cut, without timbering, has been abandoned; and under the new Manager, Mr. T. Coke-Hill, stulls have been put in and the ground made secure. Drives are now being extended both north and south; and preparation is being made for sinking a main shaft to test the deposit in a systematic manner.

The ore-body was originally narrow at surface (so I am informed), but opened to about 18 feet in widest part in sinking. At the present lowest stope, at the north end, about 6 feet of solid ore is exposed; and at the south end (of main opening) about 5 feet is showing, without reaching the hanging wall, which at this point is undercut by the swelling of the ore-body.

In the bottom there is a length of 54 feet by an average width of about 4 feet of solid ore.

At the surface, at the extreme south end of the main opening, the ore bunch seems to be divided by a block of country. About 45 feet from this point a shaft has been sunk 25 feet into the deposit. Thirty feet further south another shaft has been sunk 30 feet in ore rather mixed with country; 10 feet from this is the second open cut, about 15 feet long and 12 feet deep, in which about 5 feet of ore is showing at both ends, but rather mixed with country.

The quality of the ore in the Kangaroo Mine has so far proved consistently good, as may be judged from Mr. Constable's statement that, as regards the 1,230 tons despatched, the lowest average in the account sales of any consignment was 53 per cent., and the highest 57 per cent. Thirty-one men are at present employed on the mine.

Between the Kangaroo and Emu Mines, near Mr. P. Kiley's Homestead, the serpentine belt, so far as examined, appears to attain its maximum width, and in places forms level or gently undulating downs. The frequent presence of small chromite rubble in rain gutters in the surface soil attests the proximity of deposits which future prospecting will doubtless reveal. Several outcrops have already been discovered on the estate, and from one of them, known as the Zigzag Mine, about 100 tons of ore were extracted. It is, however, reported that the ore pinched out, which is borne out by the fact that the mine was abandoned about a month prior to my visit. I did not see the site, as it was, unfortunately, overlooked by the person guiding me, evidently owing to its having been abandoned.

#### *Emu Mine.*

The Emu Mine is held as a Mineral Lease of 20 acres, on Brungle Creek, Parish Wyangle. Operations were begun on this property about a fortnight prior to inspection, and considerable progress had been made, under the supervision of the owner, Mr. M. Constable, in preparing roadways, shoots, &c., and uncovering the two known ore deposits. Unfortunately the largest outcrop—on the south side of a low spur—soon proved only a surface skin, which yielded not more than about 15 tons of ore. Timbering was being prepared for driving alongside a joint in which a little ore was still showing; but the prospect of the ore-body going down under-foot with a southerly dip seems brighter than the inducement offered for driving the tunnel into the hill, where the rock was becoming excessively hard and tough.

The second bunch of chromite occurs a few feet above Brungle Creek, and close alongside the Tumut-Tomorrowmak road. Here an opening has been made in the north-western side of the above-mentioned spur, in which about 6 feet by 3 feet of solid chromite has been exposed under-foot, the longest axis having a north and south direction, which corresponds pretty closely with the side of the ridge from this point. Hence a shaft will be necessary instead of a tunnel as first contemplated. Until the ore-body has been further exposed it would not be safe to venture an opinion as to its probable extent.\*

The Emu Mine offers the advantages of accessibility, a good Government road, and permanent water. If the deposits prove extensive, advantage could perhaps be taken of the latter for dressing the snalls up to market grade, and thus save at small cost a present loss in working, equal to about one-sixth of the output in some cases.

The distance from the mine to the nearest railway station—Gundagai—is about 19 miles; and the cost of carriage is to be 10s. per ton, the lower rate in this case being due to the superior road.

At the time of inspection, fourteen hands were employed, and this number will be increased if the developments warrant it.

#### *Mount Miller Mine.*

This mine is situated on the south side of Brungle Creek, close to the Emu Mine. It is held as a 20-acre Mineral Lease by Messrs. Griffiths, Kelly, and Party.

The only bunch of ore yet discovered occurs at an elevation of about 200 feet above the Tumut-Tomorrowmak road, near where it crosses Brungle Creek. An open-face working has exposed an ore-body about 2 feet 6 inches thick in the widest part, which appears to be going down, but considerably mixed with the country on the top and on the east side. About 8 feet of the deposit has been extracted, as the face was carried forward horizontally. Operations so far can only be regarded as preliminary prospecting, and not sufficiently advanced to justify any prediction as to permanency of deposit.

A sample from the outcrop yielded 48.13 per cent. of chromium sesquioxide at the Departmental Laboratory; others are reported up to 51 per cent.

#### *Keefe's Mine.*

Between Brungle and Bumboleec Creeks chromite has been discovered on Mr. Keefe's property, but little has yet been done to prove it, and no work was in progress at the time of inspection, because—so Mr. Keefe informed me—the mine was under offer to an investor. At this site a chromite bunch is represented by broken blocks at the surface for about 6 feet by 2 feet 6 inches, but no attempt has yet been made to ascertain its actual longitudinal extent by removal of the soil. On the west side of the outcrop is a small opening about 5 feet deep, but the appearance of the ore at this level could not be seen because of the presence of about 4 feet of water in the hole.

About 3 feet from the bunch on the east side a shaft has been sunk about 16 feet deep; a little ore was at surface which had been extracted from it, and more was showing in the side of the shaft, but it appeared to be too much mixed with country to be of a marketable grade. The ore in the surface outcrop, however, is of good quality.

Mr. Keefe informed me that he had other "shows" but that no attempt had yet been made to prove them.

#### *M'Inerny's Mine.*

Close to Bumboleec Creek on the south side, at about 8 miles from Tumut, Mr. James M'Inerny has several men employed prospecting on the side of an old Mineral Lease, about 150 yards north of the south-west corner of Portion 351 in the Parish of Mundongo.

The outcrop of a small bunch was discovered at this site by W. Piper in September last on a low spur falling into Bumboleec Creek. Attention was first directed to a bunch on the west side, but only a small quantity of low-grade ore was obtained when it pinched out. At the time of inspection a little better prospect was being developed on the eastern fall, where a bunch 7 feet long, with an average thickness of from 12 to 15 inches has been uncovered for a depth of about 5 feet. The ore-body is very irregular, and apparently of minimum grade; the southern end is broken and mixed with country. If a payable deposit of chromite should be discovered in this locality, the carriage to rail would be from 23 to 30 miles. In winning and dressing the ore day-labour has been found most advantageous where the chief aim has been to maintain a high average grade. In one mine contract labour was employed for a time but has since been abandoned in favour of day-labour with efficient supervision. At the Kangaroo Mine

The

\* I have since been informed by Mr. Constable (March 8th) that a shaft has been sunk 16 feet at this site, in which there is 4 feet of ore going down; the bunch had also been proved for 16 feet horizontally, and was still showing in each end.

the following method of preparing the ore for market is adopted. The ore, as it comes to the dressing floors from the mine, is divided into "firsts" (clean ore) and "seconds" (mixed ore and country). The "firsts" ore is broken into pieces about 3 inches in diameter, and filled into bags direct. The "seconds" ore and country is broken by hand and picked, the residue being screened and again picked. The filled bags average about 24 to the ton. At least one-sixth of the ore raised is lost as smalls, a loss which it might pay to obviate where water is plentiful, by use of coarse jiggs, or possibly by box-head sluices. A trial with one of the latter set at a high angle would prove whether the fragments of serpentine rock could be removed by sluicing—the specific gravities of chromite and serpentine being 4.3.5 and 2.5.7 respectively. I am indebted to Mr. M. Constable for the following statement of price obtainable for chromite delivered in Sydney, viz., 70s. per ton for 50 per cent., and 2s. 6d. per unit over that percentage. It is difficult to ascertain the lowest saleable grade, as buyers "fight shy" of ore yielding less than 48 per cent. of sesquioxide of chromium, and much prefer not to deal with ore carrying less than 50 per cent. The fall in value per unit below 50 per cent. is very rapid. The cost of carriage by team in the Gundagai District has, so far, averaged from 10d. to 1s. per ton per mile. Railway freight depends upon the extent of the consignments, the following being the ruling rates:—

Ore in 120 tons, Gundagai to Sydney,	13s. per ton	} Minimum rate.
„ next 60 „	12s. „	
„ over 180 „	11s. „	

The shipping rates do not come into consideration, as the price quoted is for delivery in Sydney, where the chief buyers are Messrs. Dalgety & Co. and Gibbs, Bright, & Co.

The following figures represent the approximate yields from the different mines to date, February 10th, 1895:—

	Tons.
Kangaroo Mine ..	1,230
Vulcan „ ..	1,200
Quilter's „ ..	1,100
Mt. Mary „ ..	600
Welch's „ ..	220
Zig Zag „ ..	100
J. Edwards' „ ..	75
Total ...	4,525

According to the literature of the subject, the chief chrome supply of the world appears to be drawn from Asia Minor. America obtains about half her requirements from the State of California, where, according to the State Mineralogist,\*—"Ores producing less than 50 per cent. cannot be handled and shipped to compete with those from the Mediterranean. Owing to the 'pockety' nature of the deposits it is difficult to determine anything about their extent except by actual work, and the deposits or pockets are usually soon exhausted." \* \* \* \* \* The bunches and connecting stringers are arranged in such an exceedingly irregular manner that no rule can be laid down for tracing the ore bodies."

In connection with the chrome industry in the Gundagai and Tumut Districts, the feeling of uncertainty which now prevails as to the permanency of the deposits, consequent upon the rapid exhaustion of several promising-looking bunches, is aggravated by the method of mining, viz., open cut—which reveals nothing until the bottom drops out of the mine. Where the bunches are small, such a system is the only one necessary and possible, but when the deposits afford indications of extent, systematic prospecting by shafts and drives should be adopted at the outset to determine the vertical and horizontal extent in each case. The prosecution of such necessary testing would not only set at rest any uncertainty on the score of extent but also afford an immediate supply of ore for despatch, and enable further operations to be regulated strictly in accordance with the amount available.

Chrome mining in the districts in question has now been advanced to a stage which enables a fairly clear opinion to be formed of the nature and mode of occurrence of the deposits, and the experience of the past year teaches that they in no way differ from those of other countries which have been described as "pockety" and "bunchy," irregular and uncertain. Therefore, it seems imperative if the chrome industry is to be advanced and maintained as a profitable commercial undertaking that systematic prospecting must be kept well ahead, not only of actual winning, but also of actual discovery, so that new finds may be made available as the old give out, and thus prevent frequent cessation of work.

With resolute grasping of the fact of comparatively small but numerous and wide-spread deposits, coupled with systematic prospecting and proving, careful blending of ores and uniformity of grade, and by saving and concentration of smalls where practicable, there can be no doubt that the chrome industry of the Colony will be maintained on a vigorous and profitable scale.

In addition to the localities mentioned in my first report, chrome deposits have been found in the serpentine country lying between Attunga and Manilla, and are probably connected with those nearer Barraba. Samples from several deposits have, however, proved of low grade. A chrome bunch was also opened by Mr. C. S. M'Glew, on a M.L. of 40 acres, about 3 miles south-east of Moonbi railway station, but it soon gave out.

I have, &c.,

JOSEPH E. CARNE, F.G.S.,  
Geological Surveyor.

The Government Geologist.

#### APPENDIX 8.

#### Report on the Toolong and Bogong Goldfields.

Geological Survey Branch, Department of Mines and Agriculture,

Sydney, 18 March, 1895.

Sir,

I have the honor to hand you the following brief report upon the Toolong and Bogong diggings and their immediate surroundings, together with a sketch plan showing the principal physical and geological features, tracks, &c., believing that such may prove of service in drawing attention to this comparatively little known tract of country, the possibilities of which, I believe, are considerable from a mining view.

The

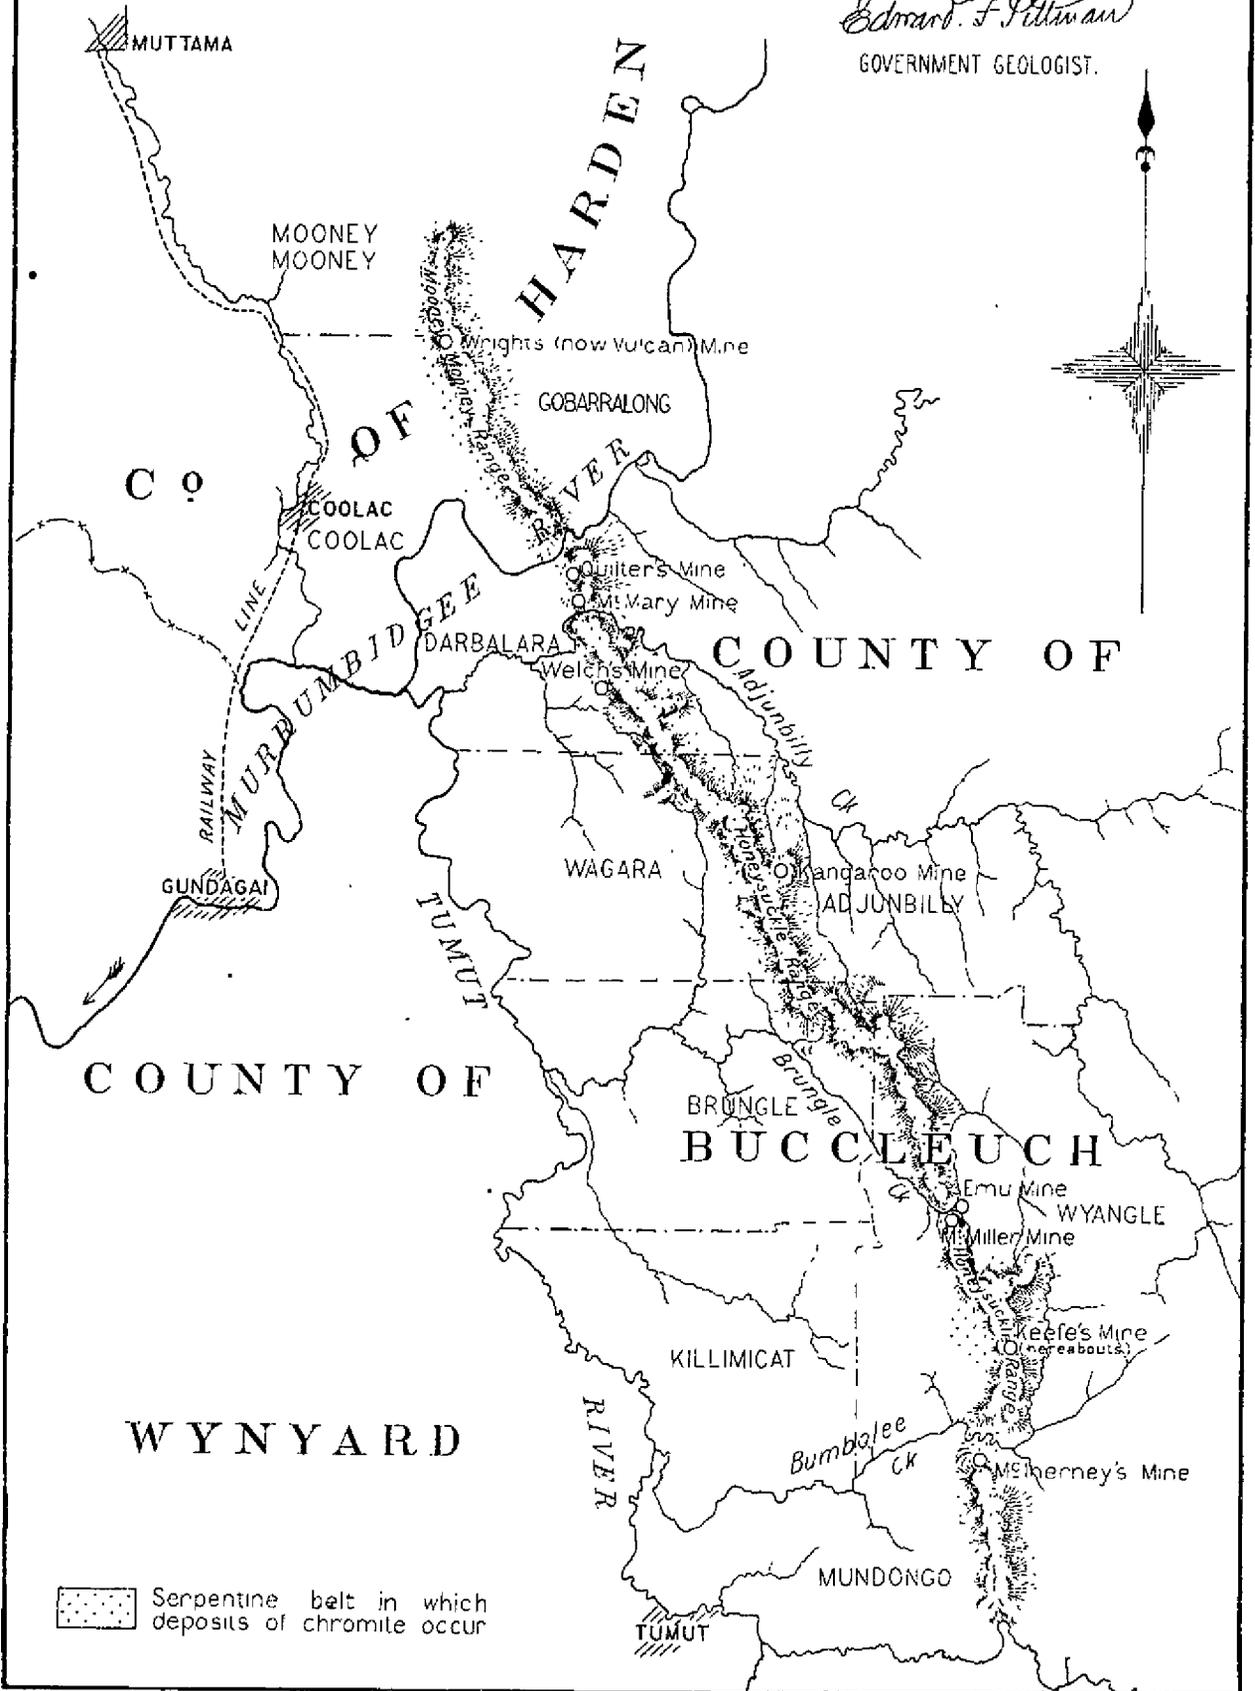

# PLAN

TO ACCOMPANY SECOND REPORT BY  
J. E. CARNE, F.G.S., Geological Surveyor.

on the deposits of Chromite in the Gundagai and Tumut Districts

Scale in Miles  
0 1 2 3 4 5

*Edward F. Pittman*  
GOVERNMENT GEOLOGIST.

 Serpentine belt in which deposits of chromite occur

(Sig 24)

The Rev. W. B. Clarke, in his *Southern Goldfields*, 1860, describes generally portions of the area under consideration, and alludes to the occurrence of coarse gold in the heads of the Tumut River, which have their source within it.

Dr. R. Von Lendenfeld and Mr. J. Stirling, F.G.S., have also mentioned certain localities in the neighbourhood, but only in connection with evidences of glacial action.

#### *Situation.*

Toolong Diggings are situated in the bed of Dargals Creek, a short tributary of the Tooma River, one of the affluents of the Murray, which it joins near Weleragang.

The nearest settlement is the village of Tooma, on Tumberumba Creek, about 25 miles west-north-west. Tumberumba is distant 40 miles *via* Tooma, whilst Kiandra on the north-north-east is distant about 30 miles; Corryong, in Victoria, is about 40 miles from Toolong—these are the chief points of approach. The nearest railway station is Gundagai, distant *via* Adelong about 100 miles. A good Government road extends from Gundagai to Tooma; from the latter to Toolong the track is very rough and steep for a considerable portion of the way, but bullock teams are now taking loading to the diggings.

Toolong Diggings have an elevation of about 3,300 feet above the village of Tooma, and are themselves about 1,300 feet lower than Big Dargal Mountain, on the east of which it is situated. The gold lead is located in a semicircular valley, formed by a bend in the range extending from the Big Dargal, near the Tooma River, southerly to the Inkbottle Mountain, and thence north-easterly to the river again.

#### *Bogong Diggings.*

The Bogong diggings are situated about 15 miles south-easterly from Toolong, on and alongside a low foot-hill between Smith's Lookout and Grey Mare's Bogong, about 15 miles in a direct line north from Kosciusko.

#### *Physical Features.*

Between Toolong and Bogong the country forms part of the extensive elevated tablelands of the Snowy Mountains region. Above the general level of the area in question low ranges rise with occasional prominent peaks, such as Big Bogong, Grey Mare's Bogong, Round Mountain, Mangar, Big Dargals, and others.

The tablelands consist of open undulating country, well grassed and watered; peaty swamps are of frequent occurrence. The most elevated areas are densely covered with a dwarf eucalypt of the malee species; frequent fires have, however, destroyed large patches of it. Lower down mountain ash grows into splendid proportions suitable for building and other purposes.

The drainage system of this elevated tract naturally becomes abruptly precipitous as the fall to the north and west is approached. The Tumut River, which has its source near the Big Bogong, rapidly falls into a narrow gorge from 1,500 to 1,600 feet deep, quite inaccessible in places. Its main heads, known as the Gulf and Doubtful Creeks, of which there are four, have equally precipitous channels; nor does the main stream become more approachable until it nears Tumut.

The Tooma River also rises in the Muniung Range near Big Bogong. This stream has a rocky precipitous fall from near Toolong to Possum Point, where it gradually enters rich alluvial flats in the low country.

#### *Geological Features.*

The geological features are distinctly plutonic, granite and gneiss rocks predominating; the latter is most typical in its characteristics, the banded arrangements of the quartz grains in some instances having the appearance of rubbly quartz veins.

Intermediate igneous rocks occur as occasional dykes of diorite as at Toolong and Bogong; two typical specimens were determined by Mr. Card, A.R.S.M., as pyroxene-hornblende diorite.

Volcanic rocks are represented by a wide basalt plateau between the Round Mountain and the 15-mile, on the Tumut River, and by cappings on Round Mountain, Bald Mountain, and two other locations north-west and south-west of Round Mountain. These isolated patches of basalt no doubt once formed part of an extensive sheet extending to the country round Kiandra, where other outcrops occur, and from which they were subsequently separated by the erosion of the Tumut River and its tributaries.

Sedimentary rocks are represented by slates and schists along the Tumut River, and extending to Kiandra. Narrow belts also occur near Toolong and Big Bogong, and at Yellow Boy Creek. No fossils have yet been found in these rocks so far as I am aware, but from the occurrence of a thin intercalated bed of limestone (containing fossils of an Upper Silurian facies), outcropping in a most marked rampart-like manner on the slopes of the slate ridges on the east side of the Tumut River, south of Lobb's Hole, they may be classed as Silurian.

Pliocene drifts occur under the basalt cover, near the 15-mile, and elsewhere. The present working drift at Toolong probably belongs to the later Pleistocene and Recent.

#### *Discovery.*

Gold has been mined in the bed of the river at Toolong each summer since 1887, when it was first discovered by Messrs. J. and D. Caholan. Conflicting statements, however, are extant as to the actual discoverer of the Dargal's Creek Lead. Messrs. Caholan claim the credit, which is disputed by F. Allen. However, in 1893, as a result of the latter's prospecting, a syndicate was formed to take up a 5-acre lease in the western branch of the creek, about half a mile from the river. This lease was granted. The syndicate, however, began operations at the creek mouth by the commencement of a tail-race through a granite bar which occurs at that point. Soon after a second lease was applied for by Lublin and Party, just below the junction of the creek branches, but the discovery becoming known it was opposed at the Warden's Court at Kiandra, and refused, whereupon miners pegged out the whole of the creek bed as claims, with the exception of the first lease, and thus defeated the object of the discoverers, viz., to work the whole lead by ground sluicing. Mining began practically in December, 1893, and was carried on until winter began to set in, when most of those engaged obtained exemption on account of the rigorous nature of the climate. A few claim-holders (about 30), however, erected winter quarters and made use of the snow-water. Some portions of the lead are reported to have been covered 7 feet deep in snow.

The

The return of summer was impatiently awaited by a large number of miners who had been attracted by the reports which appeared from time to time, but who were prevented from reaching the locality until a portion of the snow on the ascent from Possum Point had melted. About October several hundred men had arrived; of these, about 300 found an opening at Toolong, whilst others settled on the river. At the time of my visit on the 29th January, about 250 men were on the different workings.

As the Dargal's Lead is very limited, not being more than about three-quarters of a mile long by 1 chain wide, it will be nearly if not quite worked out before the ensuing winter.

The stripping varies from 3 to 7 feet, including from 1 to 3 feet of surface peaty matter, which has to be cut with hay knives.

The wash is from 2 to 5 feet thick, patchy, and of varying width; a little gold occurs through the whole thickness, but generally only the bottom foot is worked. Boulders and large pebbles, well water worn, of fine siliceous schist, gneiss, and granite form a large proportion of the wash.

The richest portion of the lead occurs about the middle of its length, which is opposed to the general rule; usually the heaviest gold, especially when coarse, lies nearest the source at the head of the lead. The present exception may possibly be due to the torrent-like force of a stream, fed by melting snow on a steep slope, which transported the coarse gold, and almost entirely carried the finer particles into the river. The "scour" produced by the same force would also account for the absence of gold in the "pot-holes." The well-worn surfaces of the boulders and pebbles would also hardly have been produced in so short a transit from the parent rock to present site unless under exceptional circumstances of wear and tear.

The bed-rock (gneiss) becomes very jointed and uneven as the lead approaches the river, rendering it very difficult to scrape the bottom; frequently blasting has to be resorted to to enable the joints to be cleaned out.

Box-head sluices are in universal use, the water supply being drawn from the creek itself.

The gold is coarse; nuggets, 3, 5, 8, and 11 oz. have been found. In outward appearance the nuggets are solid and of good quality, but the appearance is deceptive, for nearly all coarse pieces have been found to contain drusy cavities filled with dross, most probably resulting from decomposition of pyrites. The average Mint Returns of Tooma gold prove it to be worth about £3 14s. per oz. in its natural condition; after melting, in which the loss is somewhat heavy, it is worth about £3 18s. per oz.

The western branch of Dargal's Creek contains little payable gold. A little tinstone has been found in the wash at this point.

That portion of the range in which Dargal's Creek rises, lying directly at the head of the lead, consists of a very fine-grained metamorphic rock, in which mica is so largely developed as to produce a foliated or schistose structure; on the east, close to the head of the west branch, typical gneiss occurs. Pyritous quartz veins occur at the foot of the range between the two branches, in which tourmaline is abundant, but no gold can be obtained from them. Close to the head of the main lead—or eastern branch—a thin leader has, however, been discovered, in which gold is freely visible. A sample taken from a small quantity obtained from a shallow shaft yielded at the rate of 11 oz. 14 dwt. 11 gr. of gold per ton. The thickness of the lead varies from a quarter to one inch.

Close by, on the east of Dargal's Creek, is another short creek and flat known as Broadway Flat, draining from the same area as the former, and presenting exactly similar features, excepting that it opens into a fairly broad low flat at and near its mouth. It is reported that nothing more than colour of gold can be obtained from it, but even a most cursory examination renders it at once apparent that sufficient prospecting has not taken place to justify this verdict. A few pot-holes have been put down at rare intervals. The experience of the Dargal's Creek miners is that several "duffer" holes were afterwards included in payable paddocks in that lead. The gold of the locality being coarse and scattered is easily missed in random holes. To properly test this or any similar flats in the neighbourhood, trenches or paddocks—where not too deep—or lines of shafts at short intervals, connected by drives, is absolutely necessary. The difficulty of working Broadway Flat, if proved payable, will be the absence of sufficient fall to the river; the widest part of the flat is but a few feet above the river level.

On the opposite side of the Tooma River a small lead near the Toolong Station Homestead is affording work for a few men. Still further north-easterly towards Round Mountain other parties are at work in small creeks near Ogilvie's Creek. In all the drainage channels in this locality gold can be obtained, and no doubt from time to time payable patches will be discovered. Close by the workings the highest point still retains a small cap of basalt; water-worn boulders and pebbles on the slopes of the hill remain as evidence of the drift which once was preserved under a wide extension of the basalt flow; and which, most probably, was the immediate source of the gold in the more recent and present drainage channels.

Between Round Mountain and the 15-mile, on the Tamut River, an extensive sheet of basalt occurs overlying drift. The highest point of the plateau is about 1,750 feet above the river bed. On the eastern fall, about one mile from the 15-mile crossing, sluicing operations were carried on some time ago by the Golden Crown Sluicing Company. At the present time, two parties are at work further South, in what is called the Gulf, whilst in the beds of the main tributaries, as well as in the bed or banks of the river itself, a considerable number of men find a living. The difficulty presented by the drift outcrop from under the wide basalt sheets is essentially the great elevation, making the necessary water supply almost impossible, or at least a costly undertaking. A scheme to procure water from the Tooma River was projected by one of the sluicing companies on the eastern margin of the basalt area, but it was little more than initiated before abandonment, it is understood for want of funds.

Still, even under present conditions, it is reasonable to surmise that profitable employment will be afforded for a considerable number of men at lower levels on the falls from the basalt areas into the river and the tributaries at its head, particularly the Gulf Creeks. Here water is procurable for ground or box-sluicing purposes during the better part of the year, if not continuously.

On the eastern side of the river, between the 15-mile and Kiandra, schist and slate rocks predominate. The most characteristic feature of these formations is the occurrence in them of conspicuous outcrops of quartz reefs, many of huge proportions; and though leads have been worked in several places in which quartz boulders and rubble form the major part of the wash, little attention appears to have yet been paid to the reefs.

## ON THE TOOLONG AND BOGONG DIGGINGS, COUNTY OF SELWYN

Scale in Miles

*Edmund F. Pittman*  
GOVERNMENT GEOLOGIST.

- REFERENCE
-  Silurian
  -  Basalt.
  -  Granite.
  -  Tracks

Leaving Toolong for the Bogong Diggings, the track follows the river for about 2 miles. Most promising-looking flats occur about this point, and continue as the river takes a sharp turn to the south through what is known as Pretty Plain. At the turn the Bogong track crosses the river. Here a change of country is encountered; the gneiss gives place to a belt of slate about  $\frac{1}{2}$  a mile wide, with a north and south strike. The slate in places is fissile, in others, compact and siliceous. Quartz veins are numerous; one crossing the river at an angle with the strike of the slate carried pyrites, but yielded only a trace of gold.

Near Big Bogong another belt of slate, or, more correctly, schist, with quartz veins occurs, striking north and south. Both these beds of sedimentary rock are well worth prospecting for reefs, especially near the junction with the gneiss.

Grey Mare's Bogong is situated about 4 miles south of Big Bogong, and the diggings are located on the side of a low spur or foothill on the east side of the mountain, and between it and Smith's Lookout. Alluvial gold was discovered at this site by W. Williams and party in January, 1894, just at the junction of the gneiss and the schist. The same party, by following up indications in the surfacing from the lead, discovered a very promising reef in the adjacent gneiss-spur. This reef has undoubtedly been the source of the gold in the lead.

The elevation of the lead is about 5,250 feet above sea-level. The general level is here gradually rising to its maximum as Kosciusko is approached.

The Bogong Lead is very short and narrow, affording only six claims, which originally employed about thirty miners. At the time of inspection, however, the three unexhausted claims provided work for only nine men. The claim at the head of the lead, embracing the unworked ground between it and the reef, will afford work for some considerable time yet. Scarcity of water was retarding operations at the time mentioned, but provision was being made for utilising the next snow-water on a more extended scale.

In the face opposed to the head of the lead about 5 feet of wash is resting on agneissic bottom, and overlying the wash is about 7 feet of alluvium. The "channel" of the lead is heading direct for the reef. The wash rubble consists of gneiss and quartz, with occasional boulders of diorite.

The top claim has so far yielded 111 oz. of gold, the next below 27 oz., and the rest of the claims about 30 oz. a total of 168 oz. to February, 1895.

Prospectors were at work near Big Bogong and Kosciusko; near the former a little gold was obtained by a solitary miner a couple of years back.

#### *Bogong Reef.*

Messrs. Williams and Party's Bogong reef strikes N. 12° W. in typical gneiss, and dips west at an angle of 44° from the horizontal. It varies in width from 1 to 10 feet in the course of about 150 yards from south to north. The Prospectors' Claim consists of 8 acres (lease applied for); outside of this area the reef has not been found northerly, though three parties have been engaged prospecting for it; to the south, in Harnett and Party's ground, it becomes very thin and broken, and mixed with the country. Several small openings have been made exposing the reef, and a shaft was started to catch it on the underlay at about 40 feet; at 34 feet water made rather freely, and the contractors abandoned the work without any genuine attempt to bail the water out; about 9 feet was standing in the shaft when inspected.

The sinking was in soft, rotten gneiss, the banding or foliation of the latter being on so large and distinctive a scale as to impart a parallel vein-like appearance to the quartz layers.

The reef-stone has been tested by two large samples—each 6 lb. weight—in the departmental laboratory with the following results:—

1. 3 oz. 14 dwt. 1 grain per ton.
2. 4 „ 13 „ 21 „ „

Dolly tests from the reef and rubble also show very fair prospects. In a portion of the stone arsenical pyrites is present in some quantity, which will necessitate concentrating appliances.

Altogether the Bogong reef, in Williams and Party's Claim, presents a very promising aspect, and is well worthy of systematic testing, and if proved payable will give an impetus to reef-prospecting in the district.

#### *Climate.*

The climate of the area under consideration has so far prevented continuous work being carried on during winter months, but judging from the greater elevation and more vigorous climate of numerous mining camps in the United States, where operations are continuous, there is no reason why Australian miners should not become acclimatised to such conditions as prevail in the Snowy Mountains of this Colony; and, in fact, as before stated, some thirty or more have already wintered at their claims. It need hardly be added that during summer and autumn the climate is most bracing and delicious.

The presence of gold has already been proved in numerous places over a wide-spread area, and, though possibly comparatively poor and patchy in occurrence, yet there is every reason to believe that it will be found in sufficient quantities in the most favourable localities to maintain a fair mining population. For able and energetic prospectors, I believe this locality offers a field of fair promise, especially if the testing be thorough, as indicated in the description of Broadway Flat.

Through the courtesy of the Manager of the Bank of Australasia at Curryong (Vic.), Mr. A. I. Lukins, of Tooma, and Mr. S. Ramsay, of Tumbarumba, I am enabled to state very closely the amount of gold obtained from Toolong, Bogong, and immediate surroundings, viz., 900 oz., up to the beginning of February of this year, the value of which, in its natural condition, would be £3,330.

I have, &c.,

JOSEPH E CARNE, F.G.S.,  
Geological Surveyor.

The Government Geologist.

## APPENDIX 9.

## Report on the Bywong Gold-field.

Geological Survey Branch, Department of Mines and Agriculture,

Sir,

28 February, 1895.

I have the honor to report that in accordance with your instructions of the 13th instant, I visited Bywong, near Bungendore, and inspected the recently discovered reefs, to which a rush was just setting in owing to the publication of a rich return obtained from a small parcel of stone from Messrs. Lowe and Party's Claim.

In my report, which I have the honor to hand you herewith, the different claims have been chiefly described as they occur from South to North, without regard to their relative importance, and only those have been mentioned in which at least a moderate amount of work has been performed.

A sketch plan is attached showing the geological formation of the locality, and the approximate position of the most important reefs. A statement has also been prepared, showing the amount of stone crushed to date, with yields, &c.

The recently discovered reefs extend over an area of about 3 miles by 1 mile, bearing N.N.E. from Mac's Reef, in the Parish of Bywong, County of Murray, about 10 miles from Bungendore.

Considerable interest attaches to Bywong because of the expressed belief of the late Rev. W. B. Clarke, in a report dated 1st June, 1852, "that gold in profitable quantities will hereafter be found in some part of the district of which Bywong Hill is the centre."\*

Though Mac's Reef, about 3 miles S.S.E. of Bywong Hill, yielded some small rich shoots of gold when first opened up some twenty-nine years ago, and Brook's Creek, several miles to the north-east, a fair amount of alluvial gold, it can hardly be said that Mr. Clarke's prediction has yet been fulfilled, hence the interest attaching to the present find.

For some time past the neighbourhood of Bywong Hill has been receiving considerable attention at the hands of prospectors, several of whom have been aided from the Prospecting Vote, but their efforts were not crowned with success until Messrs. Robins and Cartwright struck gold in their present claim in April last. Following this discovery a number of claims were pegged out and prospected more or less persistently for a time; most of them, however, were abandoned prior to Messrs. Lowe and Party's discovery of the present rich shoot in their second shaft about the middle of December last. The publication of the yield from a small quantity of rich stone treated about the beginning of the month, caused the present rush, which was not justified by the circumstances.

*Physical Geography.*

The reefs chiefly occur in gently undulating country on the eastern fall of the ridge which trends between Mac's Reef and Bywong Hill. At Mac's Reef the country is more rugged. This ridge forms the water parting between the Yass River on the west and its tributary (Brook's Creek) on the east. Its elevation is from 500 to 700 feet above the former.

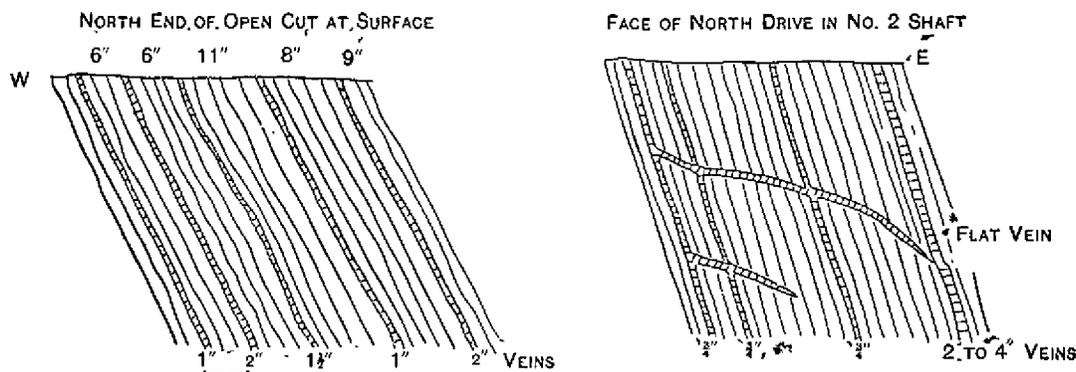

*Geology.*

From the sketch map it will be seen that the reefs occur in the Silurian formation, which is here represented by fissile, metamorphic, and sandy slates, and schist. On the west, near the Yass River, a mass of intrusive granite occurs.

*Gundaroo Syndicate, G.L. 14, 5 acres.—Little Wonder Reef.*

Gold was discovered in this reef about twelve months ago by Messrs. Cartwright and Smith, who sold to the present holders.

The gold-bearing formation consists of a number of thin parallel quartz leaders, occurring in the cleavage of slate country, and separated by varying thicknesses of the latter, as shown in the accompanying sections to scale.

The strike of the veins is about north and south, and the dip at an angle of 65° from the horizontal.

The prospectors sank a shaft 48 feet deep—30 feet following the reef on the underlay—and drove south 60 feet along its course.

From

\* Vide Southern Gold-fields, 1860, p. 233.

From this shaft, and an open cut alongside, 14 tons of picked stone were extracted, which yielded as follows:—

9 tons, treated at the Clyde Works	...	...	...	3 oz. gold per ton.
5 " " Captain's Flat	...	...	...	15 dwt. "

Since obtaining possession the Gundaroo Syndicate sank a vertical shaft (No. 2) about 80 feet south of No. 1, and at 45 feet struck the reef in a crosscut 22 feet west. In sinking this shaft a cross vein from 2 to 3 inches thick was discovered, and followed to its junction with the main meridional veins. So far as traced it has not only proved barren itself, but apparently cuts off the gold in the main line. At the junction the country and veins turn from about 20° E. of N. to 20° W. A drive is now being put in north to meet the south drive in No. 1 shaft; a section of the present face is shown above. At the time of inspection the syndicate had just completed a crushing at their three-head stamp battery, made up as follows:—

5½ tons picked stone from No. 1 shaft	...	...	} Yield—16 dwt. per ton.
4½ " " " No. 2 "	...	...	
15 " " mixed stone and rubble, No. 1	...	...	

In mining, the quartz leaders, being rubbly, break into small fragments; and by discarding the larger pieces of country, about 1 ton in 4 is available for the battery. Picking and dressing could, perhaps, be done by boys at moderate cost; but it remains a question for actual test whether such a small proportion of payable stone can be profitably extracted in country which, though not actually hard, yet requires drilling and blasting.

#### *Williams' Reef.*

This reef is situated about 6 chains south-west of Mac's Reef, and takes its name from the original prospectors—Messrs. Williams and Party—who held it for about twelve months before abandonment. During this period a little gold is stated to have been obtained by cradling the fine material and dollying specimens. The site is now held by the Gundaroo Syndicate as four men's claim in abandoned ground.

Ten tons of stone from the reef used by the Syndicate to charge their battery plates is estimated to have yielded about 5 dwt. per ton. An average sample from lowest level, selected by myself, yielded only a trace of gold on assay. At the present time the reef is being reprospected on tribute. The shaft is down 24 feet, with a drive 10 feet north from that level. In the face of the latter a bunchy quartz vein, from 6 to 12 inches thick, is showing; but there is no appearance of it in the south end of the shaft. The course of the reef is about N. 30° W.

#### *Mac's Reef.*

This well-known reef was originally opened about the middle of 1866, and worked in claims for some distance along its course to a reported depth of from 70 to 80 feet. At intervals since its first abandonment attempts have been made to work different portions, but apparently unsuccessfully, the latest being by means of a tunnel at the north end, near Portion 49, which was driven nearly 400 feet for about 60 feet of backs. Very little actual proving appears to have been achieved by this costly undertaking.

Mac's is a well-defined reef, from 2 ft. 6 in. to 3 feet thick, striking about N. 20° W., and dipping easterly at an angle of 63° from the horizontal. It affords evidence of extension to considerable depths.

J. M'C. Brady holds the northern end, including tunnel, as a registered claim, and Messrs. Pringle, Lawler and Party 1,200 feet along the line of the principal old workings.

The latter party are at present opening a payable "shoot," which was discovered timbered up in a shaft (known as "Noakes'"), about 30 feet from surface. This shoot dips south at an angle of about 45°, and is but a few feet thick. A parcel of about 40 tons is now being put through the Gundaroo Syndicate's battery.

Noake's Shaft, 110 feet deep, is the latest and deepest on the reef; but no driving has been done at that level, where the reef is about 2 ft. 6 in. thick, between well-defined walls. It is the intention of the present holders to test the reef by driving to catch the payable "shoots" which were worked nearer the surface, if they should go down or make again with depth. From such a large, well-defined body of stone as that exposed in Noake's Shaft and Brady's Tunnel a yield of only a very few pennyweights of gold per ton should be remunerative if worked on a sufficiently large scale. It is therefore very desirable that whilst driving for the anticipated "shoots," practical test should be made, by means of the local battery, of the body of the reef passed through in the proposed drive for the purpose of ascertaining whether it contains sufficient disseminated gold to render it more advantageous to treat it as a whole for a small yield than to pick out the shoots for a larger return.

#### *T. Cartwright and J. Hurley's Claim.*

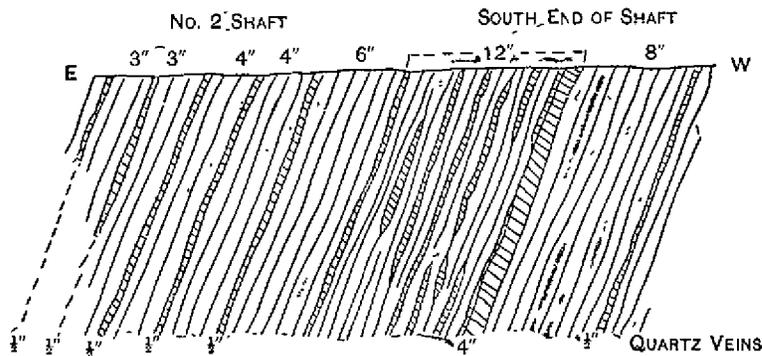

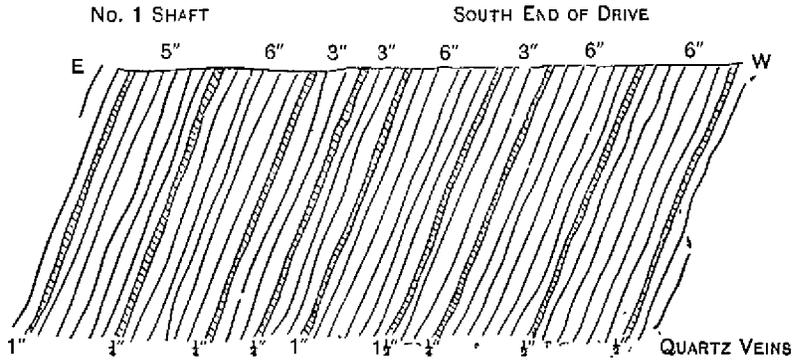

About 7 chains north-east from Noake's shaft Messrs. Cartwright and Hurley are sinking on two small quartz leaders, from 2 to 3 inches thick. In the cleavage of the slate casing of the veins, fine "paint" gold is occasionally seen. Nothing, however, has yet been struck of importance.

#### *"Lone Hand Mine."*

About 10 chains north-easterly from Mac's Reef is M'Cabe and Party's Lone Hand Claim of six men's ground. The strike of the auriferous leaders is about N. 35° W. in sandy slate, and the dip easterly. No. 1 shaft has been sunk 25 feet, and driven south 5 feet; the veins thin perceptibly as they go down. No. 2 shaft has just been started about 60 feet south; in it a larger rubbly vein is exposed, which strikes to the west of No. 1 shaft.

From

From No. 1 shaft, and an open trench extending south 21 feet, 8 tons of picked stone were crushed at the local battery for a yield of 17 dwt. per ton. The following sections will fully illustrate the thickness and mode of occurrence of the auriferous leaders in this claim:—

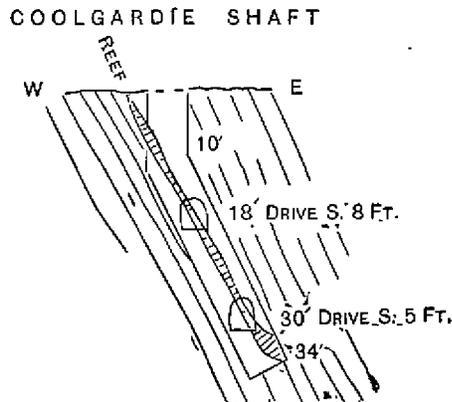

*Coolgardie Mine.*

About 70 chains north of the Lone Hand Claim is Messrs. Giles and Party's Coolgardie Claim of four men's ground, at present held as a prospecting protection area.

Gold was discovered in December last in the loose rubble on surface, and traced to the outcrop of a reef about 4 inches thick, having a strike of N. 15° E, and an underlay to the east of 65° from the horizontal.

In sinking the vein continued thin and rubbly down to 25 feet, where it thickened to 12 inches. At the present lowest level, 34 feet, a bunch of quartz is showing in the north end of shaft about 2 feet 6 inches thick, but is pinching rapidly both vertically and horizontally to the south. At 18-ft. and 30-ft. drives of 8 feet and 4 feet respectively were put in south. At the 34-ft. level there is an appearance of a hanging wall, but none of the footwall. The best stone hugs the hanging wall.

The prospectors have supported themselves since the discovery by dollying specimens. About 4 tons of picked stone have been bagged to date, but no crushing has yet taken place. A crosscut west would most probably cut other auriferous leaders.

*Butt and Party.*

Butt and party are sinking about 200 yards south of the Coolgardie shaft, in the direction of the strike of the vein in the latter, and though down 29 feet have not yet cut the reef; they will shortly crosscut in search of it.

*J. F. Cox and Party.*

Adjoining the Coolgardie and Butt's claim on the west, J. F. Cox and Party have just begun opening on a broken rubbly vein, striking about N. 20° W., and dipping east. The thickness varies from 6 to 12 inches, but so far prospects are only obtainable from the loose rubble, and not from the actual reef.

*Clancy and East.—*

About 5½ chains north-easterly from the Coolgardie Mine Messrs. Clancy and East have applied for a 2-acre lease on Portion 215. At the time of inspection no work was in progress, and a little water was in the shaft. I was, however, informed by Mr. East that the shaft was started last September on a rubbly quartz reef, averaging about 5 inches in thickness. The gold found at surface was lost at 12 feet, but picked up again in the drive 15 feet from bottom of shaft.

A shallow gully close by on the south of shaft has been prospected for a short distance for alluvial gold. One report is to the effect that 4 oz. of gold were won from it, but Mr. East states that nothing beyond prospects were obtained.

North of Portion 215 is a block of Crown land, about 63½ acres in extent; in this, at about 20 chains north of Clancy and East's Shaft, Lowe and Party's and Erenshaw and Party's claims occur. Between Clancy and East's and the latter claims a good deal of prospecting was originally done by Giles and Party, who abandoned the ground prior to Lowe and Party's discovery of payable gold. The intervening ground is now held as claims by Messrs. Cadogan, Murphy, Whalan, Boswell, M'Alister and Parties.

In Cadogan and Party's claim, in south-west corner of the Crown land, two shallow holes show a rubbly quartz vein striking about north and south.

Boswell and Party's claim embraces Giles and Party's abandoned prospecting shafts, 10 and 17 feet deep. In a new shaft started close by a quartz leader, from 2 to 3 inches thick, has been followed down 6 feet.

In the claims held by the other parties mentioned, surface prospecting for reefs was in progress.

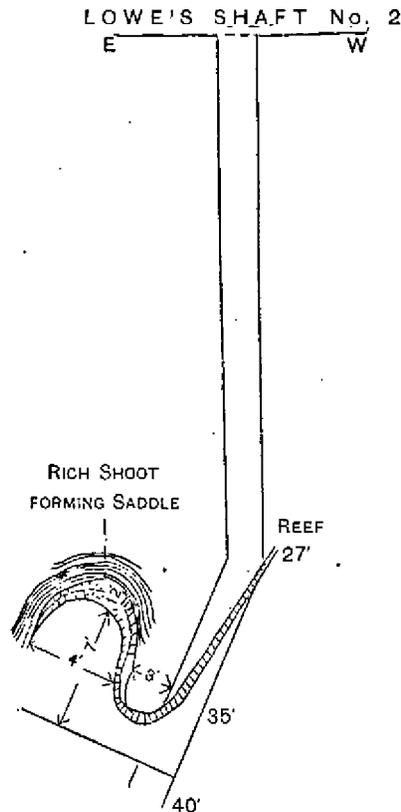

*Lowe and Party.*

The rich gold recently obtained from Messrs. Lowe and Party's claim was the cause of the present rush. This claim consists of a gold lease (G.L. 13) of 4 acres. The reef strikes north and south, and underlays east.

In the first shaft, sunk in July last, on the underlay, Mr. Lowe states that the reef was 2 feet thick at the surface, but pinched to 1 or 2 inches at 27 feet, at which level this shaft was abandoned. Six tons of stone raised during sinking yielded 8 dwt. per ton at the Clyde Works.

The present working shaft was started 75 feet north of No. 1 shaft, and the rich "shoot" struck it at the 30-ft. level. The reef was struck at 27 feet and followed on the underlay to 40 feet. Sinking was not being continued, as the reef had passed into the hanging wall at 35 feet.

In the shaft the reef when first struck was rubbly and broken; at 35 feet it passed on to the hanging wall, formed a synclinal trough about 3 feet across, and then rose rapidly about 4 feet and formed an anticlinal fold or saddle about 4 feet wide and 12 inches thick—as shown in the following section to scale—and pinching out to a thread at the eastern flap of the saddle.

The anticlinal fold dips to the north, and if the south face, from which the rich stone is being obtained, continues to rise at its present rate, the gold-bearing saddle will probably reach the surface in the party's ground.

The

The south drive following the saddle has been extended about 18 feet. Gold was showing freely in the face at the time of inspection. Five tons from the tunnel have yielded 59 ozs. 8 dwts. of gold, and about 8 or 10 tons were at grass.

The reefs at Bywong all occur in the cleavage of the country, and hence follow with it the puckering and folding of the latter. In connection with Lowe's Reef an interesting feature is presented in the folding of the country, and the production on a mimic scale of a "saddle reef," a feature which at once gives rise to a conjecture that repetitions may occur at lower levels, as in the case of the famed Bendigo reefs. If not, then the reef stone in Lowe's shaft, in all probability, terminates vertically at the end of the eastern flap of saddle.

As the folding is on a small scale a few feet of sinking should suffice to test the interesting question raised, and the possibility of a recurrence of the above features renders further sinking very desirable and interesting.

*Erenshaw, Whalan, and Party.*

This party hold a mining tenement of 2 acres adjoining Lowe and Party on the south, in which two parallel veins occur about two chains apart. No. 1 vein, on the east, strikes N. 10° W., and No. 2, on the west, N. 10° E.; both underlay to the east. Work was begun on the claim in April, 1894, on the east vein, and a shaft sunk 42 feet on the underlay. The reef was very jumbled and broken, with a 1 to 3-inch leader carrying gold; 5 tons 15 cwt. crushed at the Clyde Works yielded about 5½ dwt. per ton, and 6 tons at the local Huntingdon Mill yielded 6 dwts. per ton. One hundred feet south, on the same line, Giles and Party sank 24 feet and drove 20 feet without result. A considerable amount of trenching was also done in the direction of strike, but to no purpose.

No. 2 shaft, on the west reef, is 20 feet deep on the underlay, the latter being 55° from the horizontal. The reef is from 6 to 8 inches thick at surface, and thickens to nearly 3 feet at the 20-foot level, though it is here a little mixed with country. A crosscut has been driven 8 feet to the west, and two thin quartz leaders cut. No bulk tests have yet been made of the stone in this reef.

Brewer, Turner, and Party hold six men's ground adjoining Lowe and Party's claim on the north. Three shafts, from 14 to 35 feet deep, have been sunk, and a fair amount of surface trenching, but so far no gold bearing reef has been cut, though barren ones occur.

East, Johnson, and Party have applied for a 4-acre lease adjoining Lowe and party on the east, and have just commenced work on a parallel reef 6 chains east from Lowe's shaft. This reef strikes N. 10° E., and is 15 inches thick at 5 feet deep.

J. Murphy and Party hold the adjoining claim on the north, and have sunk 6 feet on the same reef, which here is from 6 to 15 inches thick. The underlay is east at about 69°.

*Robbins, Cartwright, and Party.*

This claim consists of a 10-acre gold lease (G.L. 1) on Portion 213. Messrs. Robbins and Cartwright are the original prospectors of the locality; indeed a number of abandoned shafts in the neighbourhood attest their perseverance, as others do that of Messrs. Giles and Party.

Gold was discovered in this claim in April last, since which two shafts have been sunk 50 and 25 feet deep, at about 30 feet apart, on a reef which is of a bunchy character, the largest bunch being at surface between the shafts, where a thickness of 5 feet is attained. The reef strikes N. 15° W., and underlays east at an angle of about 56° from the horizontal. At the bottom of the 50-foot shaft the reef is 2 ft. 3 in. thick in the north end, but pinches to almost nothing at the south end, as might be expected in a reef of this character.

The 25-foot shaft is being struck vertically to strike the reef on the underlay; at the present time a crosscut is being put in at the 25-foot level to catch the reef. Thirty tons of stone raised from the 50 feet shaft, and from the surface bunch, treated at the local Huntingdon Mill, yielded 8 dwt. 13 gr. of gold per ton; and six tons of similar stone treated at the Clyde Works yielded 19 dwt. 19 gr. per ton.

A little arsenical pyrites occurs in the stone, which will probably increase in quantity with depth. Several specimens of quartz containing it were roasted by Mr. Cartwright, with the result that beads of gold were liberated wherever the pyrites occurred. The concentrates from this reef are, therefore, likely to be of considerable value.

Adjoining the above claim, Donnelly and Party have a 10-acre lease, embracing a 15-foot shaft sunk by a previous prospector on a north and south vein. In the south end of the abandoned shaft a quartz block 2 feet deep and 18 inches thick pinches to a rubbly vein 6 inches thick in about 6 feet of sinking.

In Portion 212 the same party hold another 10-acre lease, in which two shafts have been sunk 17 and 26 feet respectively. In the 17-foot shaft gold was carried down in a rubbly vein for about 9 feet, when it broke away to the east, and was found in a drive 6 feet east from the bottom of shaft. Five tons of stone from it yielded 6 dwt. per ton at the local mill.

*Bywong Reef.*

This reef (perhaps better known locally as Johnston's Reef) is being worked by the Bywong Gold-mining Syndicate, which began operations a little over two years ago. The reef, machine, and dam sites are held as G.Ls. 4 and 5, of 13 acres and 5 acres respectively. The reef crosses a surveyed road along the north boundary of Portion 52, but the necessary permission to mine under it has been obtained.

Two shafts have been sunk about 40 feet apart; the southernmost, 73 feet deep, is not now used, as the stone became poor in that direction. The main working shaft is 65 feet deep, but the lower 5 feet has been filled up. Connection between the two shafts has been established at the 40-foot level. The course of the reef between them is about N.W. and S.E., but at the main shaft an elbow is formed, and the course alters to 13° north of west at the 40-foot level, and to due west at the 60-foot level. The reef has been followed about 38 feet in the latter direction. In the drive at the 40-foot level stopes have been carried up about 16 feet, but several feet of stone yet remain to be stripped, as the reef is here from 10 feet to 14 feet thick. Towards the south, however, it narrows to about 3 feet, and becomes poor, not yielding more than 2 or 3 dwt. per ton. Rich shoots are stated to occur in certain parts of the reef, but the average yield from all the stone raised to date, about 370 tons, has been 6½ dwt. per ton.

Arsenical pyrites is present in the veinstone close to surface, and is saved in the blanketings, but, so far, no quantity of it has been treated. Excellent results are, however, obtainable by roasting and amalgamation of test samples.

The cap of the reef has been traced south for about 100 feet by small trenches. At about 35 feet west of the main shaft an outcrop of large irregular blocks and jumbled veins of quartz occurs, which is being removed by an open cut. At this point, and at the 60-foot level, there is some indication of a turn in the reef to its normal north-west course.

In October last a 5-foot Huntingdon Mill was erected on the claim by Mr. Johnston, the present Manager, chiefly in connection with the mine, though also available for public use.

About 50 chains north-west of the Bywong shaft, in Portion 133, Johnston and Party hold a prospecting license, and are engaged extracting a trial crushing from a series of thin parallel veins by means of trenches. The veins, which occur a few inches apart, strike about N. and S., and dip rather flatly to the east.

About 40 chains south of the Bywong mine 5 tons of stone were raised from a 14-foot shaft by Messrs. Byrne and Turner, which yielded 5 dwt. per ton at the local mill—a return not regarded by them sufficiently encouraging to continue operations; this ground has, however, lately been repegged.

M. Millyn and Party and J. H. Millyn and Party each have claims close to the south-west corner of Portion 53, on a reef which has just been exposed in a few shallow openings. The strike is N. 10° W., and the dip east. The thickness varies from 6 to 12 inches. Colours of gold are obtainable from the rubble.

About 6 chains south from J. H. Millyn and Party's claim, the discovery of rich alluvial gold was reported in most exaggerated terms; a subsequent visit elicited the fact that a few colours only were obtained while trenching for the southern continuation of the above reef.

#### *Crushing Plants.*

As before stated, a 5-foot Huntingdon mill at the Bywong Reef is available for public use, the terms being as follows:—

Small parcels under 10 tons, as per arrangement.
10 tons to 20 tons, 22s. 6d. per ton.
20    "   30    "   20s.       "
30 tons and upwards, 15s.       "

Near Mac's Reef the Gundaroo Syndicate has erected a small testing plant of three stamps, which I believe will also be available for testing reefs other than those in which the Syndicate is directly interested.

If the re-prospecting of Mac's Reef proves satisfactory, it is the intention of the present holders to erect a large crushing plant.

#### *Water and Fuel.*

Permanent water (Yass River) occurs 2 miles west of Mac's Reef; an adequate supply could perhaps be obtained at Donnelly's Creek at about 1½ mile. For the north end of the field, near Lowe's Claim, a supply for domestic purposes is obtainable from tributaries of Brook's Creek, known as Gum Creeks, which head close to the claims. Here also a larger supply could easily be conserved.

Timber for ordinary mining purposes and for fuel is abundant.

#### SUMMARY.

From the attached statement it will be seen that, leaving out the Bywong (Johnston's) Reef returns, the quantity of stone crushed from the most recently discovered reefs during the past ten months has only amounted to 175½ tons, which yielded 142 oz. 2 dwt. 18 gr. of gold, and of this amount 59 oz. 8 dwt. were obtained from 5 tons of stone.

The total average yield from the whole field during the past two years was 9 dwt. 19 gr. per ton.

At the time of inspection not more than 100 tons, if as many, were at grass on the entire field, including Mac's Reef.

Payable stone, so far as at present proved, is confined to six claims, and in at least two of these it has yet to be verified whether it exists in sufficient quantity to pay for extraction.

Prospects are obtainable in numerous leaders in a number of other claims on the field, but sufficient exploratory work has not yet been performed to justify any prediction as to their richness.

The largest bodies of stone occur in Mac's, Johnston's, and Robbins' and Cartwright's Reefs. The richest in Low and Party's Reef.

From a careful examination of the locality I am of opinion that the conditions which prevail in the majority of instances, viz., thin rubbly veins separated more or less by country, are not promising for permanency; also, that the winning of the available stone in these affords more legitimate scope for small parties of miners than for the more extended and systematic exploitation of companies.

I am also of opinion that other similar veins will be discovered in the vicinity.

Both north and west of the present claims very large reefs outcrop at surface, which do not appear to have received the attention they deserve. Instead of napping surface blocks or opening small holes in such bodies, cross-cutting at intervals is recommended, with special care of prospects from the walls or junction with the country, for frequently payable leaders occur alongside otherwise barren bodies of stone.

*Alluvial.*—In perhaps nearly all the shallows, flats, and narrow channels in the neighbourhood of the reefs colours of gold are obtainable, but the prospect of payable leads of any importance seems remote within the area in question.

In conclusion, it is to be hoped that the outcome of the rush will be the systematic prospecting of a more extended area radiating from Bywong Hill. At the present time operations appear to be too closely confined to the immediate vicinity of the lately discovered reefs.

I have, &c.,

JOSEPH E. CARNE, F.G.S.,  
Geological Surveyor.

The Government Geologist.

Total quantity, 545½ tons. Total yield, 237 oz. 7 dwt. 18 gr. Average yield per ton, 9 dwt. 19 gr. Total value at £4 per oz., £1,069 11s. Average yield, exclusive of Lowe and Party's five tons of rich stone, 7 dwt. 16 gr. per ton. Total quantity crushed from new claims (exclusive of Bywong Reef) since April, 1894—175½ tons, yielding 142 oz. 2 dwt. 18 gr. (including 59 oz. 8 dwt. from five tons of Lowe and Party's rich "shoot").

## APPENDIX 10.

## Report on an Auriferous Deposit at Batlow.

Geological Survey Branch, Department of Mines and Agriculture,

Sydney, 25 March, 1895.

Sir,

I have the honor to state that in accordance with your instructions I inspected the auriferous deposit worked by Messrs. Harrison & Timmis, near Batlow, in Portion 113, Parish of Hindmarsh, County of Wynyard.

Batlow is situated on the Adelong-Tumberumba Road, about 18 miles from the former and 22 miles from the latter. It is, perhaps, better known locally as Reedy Flat, after the auriferous lead which was discovered here many years ago.

The geological formation of the district is chiefly gneiss, though less foliated masses approach the ordinary granite type. Included in the above are patches of chlorite and micaceous schist and slate. The gneissic and chlorite rocks are very similar to those enclosing the well known Adelong reefs.

Southerly, near Bago, basalt occurs covering auriferous drift. Patches of rich soil on some of the ridges near Batlow afford evidence of the decomposition of a similar cover.

Messrs. Harrison & Timmis' mine is situate about one mile west of Batlow, and about 400 yards east of Adelong Creek. Being on alienated land it was originally held under permit, but since the abolition of the latter title, the whole portion has been converted into a lease by the owner, Mr. Harrison. Locally the mine is known as "Walsh's Dyke," after the discoverer, P. Walsh.

From the mine a small gully, known as Fine-gold Gully, trends north-westerly to Adelong Creek, a distance of about 400 yards. The bed of the gully, from the creek up to the mine site, has been worked and reworked repeatedly since the first discovery of gold in the district.

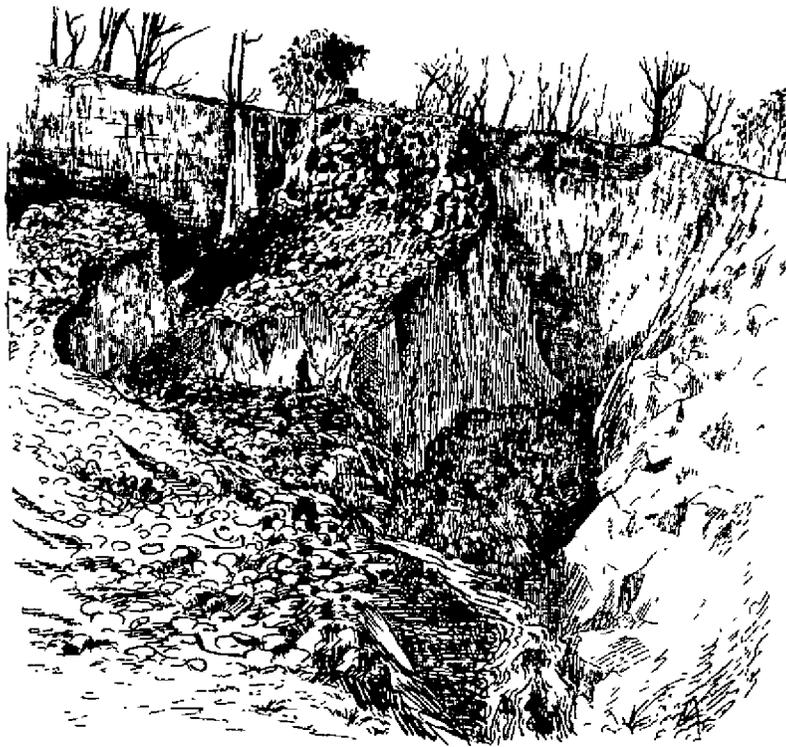

About ten years ago a tunnel was driven from the head of the gully southerly into the ridge, for a stated distance of 300 feet. The end of the drive is estimated by the owners to be about 110 feet below the face of the present open workings. Subsequent operations have partly filled and partly covered the tunnel; but judging from a portion of the tip material still remaining in situ, the rocks passed through near the face were unaltered gneiss and slate with unoxidised pyrites. The resemblance to the enclosing rocks at Adelong is very marked. Mr. Timmis informed me that a trial of 5 or 6 tons of stone from the tunnel level yielded 4 or 5 dwt. per ton, a result which was evidently not sufficiently encouraging to induce further prospecting.

Some years later P. Walsh obtained fair prospects in the surfacing above the present workings, and a ground sluice trial was made on a small scale which resulted in a few dwt. of gold only. Walsh, however, began a shaft at the site of his first prospect, and in a few feet succeeded in striking a thin leader or shoot, from which he eventually obtained about 1,000 oz. of gold before it pinched out about two years later. The remains of his shaft and drives are still visible in the beds of the present workings.

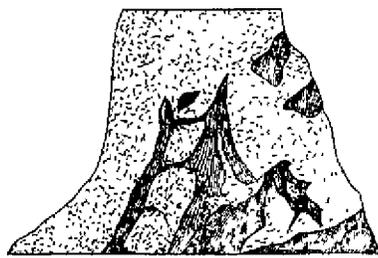

Three years ago Messrs. Harrison and Timmis began operations by bringing a water race from Gilmore Creek, and commencing sluicing operations near the mouth of the tunnel at the head of the gully. Under such a method naturally only the surface soil and the softer portions of the auriferous material have been removed; the harder being forked into heaps awaiting further treatment if found payable. Owing to the extent of the weathering, and the deposition which has taken place at this point, the softer portion has, so far, proved a not inconsiderable part of the whole.

The auriferous material consists of the country rock—gneiss—at and near contact with irregular patches of schist, which occur as enclosures in the gneiss. All gradations can be seen from true gneiss to true schist, and in places an inextricable mixture of both gives the mass a brecciated appearance. Where much brecciated, the isolated blocks of gneiss are so decomposed and soft as to crumble readily between the fingers. Such masses also have a spotted appearance from the decomposition of disseminated pyrites; in washing a prospect cubes of limonite (after pyrites) are obtained in some quantity with the free gold. An assay of a sample of the cubes thus obtained yielded at the rate of 2 oz. 18 dwt. 18 gr. of gold per ton in the Departmental Laboratory.

In other parts of the mine similar rock occurs, but not in a sufficiently advanced state of decomposition to yield its gold contents under sluicing power; it, however, afforded the best results during a crushing test of the different classes of material available in the mine. The

WALSH'S DYKE NEAR BATLOW.  
*(South face of open workings)*

 Gneiss

 Schist

*Diagram, illustrating occurrence of schist enclosures*

The schist is mostly so decomposed as to be readily worked by the sluice; cubes of limonite also occur in this rock, as indeed they do throughout the whole mass under consideration.

Associated with the above rocks, are more siliceous masses in which quartz occur in patches, and strings both in the gneiss and schist. The quartz is generally honeycombed owing to the decomposition of the originally included pyrites, in these cavities gold is occasionally seen. Through this class of stone cellular gossany kernels and thin veins occur without quartz. (A sample of the above from the present working face yielded 3 oz. 5 dwt. 8 gr. of gold per ton.)

If hand specimens are readily obtainable in which all the characteristic features of the deposit are represented.

In two places the schist in the face has the appearance of an intrusive dyke; in another, a mass of greenish-gray fine grained gneiss, which possesses tolerable hardness, adds to the deceptive dyke-like appearance. A closer inspection, however, of these rocks reveals their true origin.

The auriferous portion of the mine is estimated to be about 120 feet in the widest part, the height of the face is about 60 feet from the bed of the sluice.

The gold appears to be confined to that portion of the country containing schist masses, and the various gradations between the two.

As the hard unaltered material obtained from the tunnel (110 feet), yielded but 4 or 5 dwt. of gold per ton, it can hardly be taken into consideration in view of the greater cost of mining. The question then which presents itself, is what depth of comparatively soft weathered material may be expected. As the present face is about 60 feet, half of the distance between it and the tunnel may be safely assumed, which would give a depth of 85 feet, by a width of from 50 to 100 feet for the virgin ground. In addition to this would be the remaining 25 feet under the present sluice bed, and the large quantity of broken material forked from the sluice. How far south the auriferous material extends is a matter of conjecture only as no prospecting has yet been done to prove it. There is no doubt, however, that there is already exposed a considerable body of low grade material, which will probably pay to work if treated on a large scale with cheap and efficient motive-power and crushing appliances. In September, 1892, the Chief Inspector of Mines, Mr. W. H. J. Slee, F.G.S., recommended that a test of 5 tons of stone from the mine, should be made under the auspices of the Prospecting Board at the Clyde Smelting and Chlorination Works. The result of the test made in a Huntingdon Mill at the above works, was 4 dwt. 24 gr. of free gold per ton; and 51 lb. of concentrates equal to 387—assaying at the rate of 1 oz. 13 dwt. 23 gr. per ton. Owing to the nature of the material a large proportion passed away as slimes in the sludge—only about 2 tons of tailings resulting, which assayed at the rate of 3 dwt. per ton. No test appears to have been made of the slimes.

The total gold contents may be stated pretty closely as follows:—

Free gold .....	dwt. gr.	
	4 24	per ton.
In concentrates .....	36	"
In tailings .....	1 10	"
	6 dwt. 16 gr.	

At the local battery three other parcels were subsequently treated, in all aggregating 40 tons; the results being  $3\frac{1}{2}$ ,  $4\frac{1}{2}$ ,  $7\frac{1}{2}$  dwt. per ton, the latter from the soft spotted rock before alluded to. A general average of the 45 tons treated would be about 5 dwt. of free gold per ton.

Though gold is occasionally seen in the quartz, yet there is abundant evidence of the major portion of it having been liberated from the disseminated pyrites by decomposition or oxidation. As before stated, a sample of solid cubes of limonite obtained from the softer portion of the deposit yielded gold at the rate of 3 oz. 5 dwt. 8 gr. per ton.

There is nothing in the stone in its present condition to prevent amalgamation; the chief cause for special care will be the fineness of the gold particles. Ample plate surface at a low angle and good lengths of blanketings will be requisite. The latter would probably also save a good proportion of the uncrushed limonite cubes.

The method of working by sluice at present adopted, however cheap, is neither effective nor satisfactory; and the soft material only being attacked, and the loss owing to the fineness of the gold aggravated by the force of the water necessary and the steepness of the fall. The latter could and should at once be remedied under any conditions, as the gold is being carried down the tail-race even into Adelong Creek. At intervals the bed of the gully itself is cleaned up, 160 oz. of gold being obtained on the last occasion. Dish prospects, almost equal to the sluice itself, are obtainable at the present time from the tail-race below the boxes. The results obtained in a Huntingdon Mill at the Clyde Works, and in the local stamp battery, appear to demonstrate the fitness of either for treating this class of material; the chief care, as before stated, being the plates and blanketings. In the latter respect the local battery could be considerably improved. The chief desideratum is cheap motive power, and this is already provided by the water-race. At the present time—end of summer—the water supply is equal to two sluice-heads (12 inches x 2 inches), but Messrs. Harrison & Timmis state that for at least nine months of the year five sluice-heads are available at a pressure of from 300 to 500 feet. With this supply the local water-wheel might, if necessary, be utilized, but a greater percentage of power would be secured in a turbine wheel.

Light stamps, if adopted, would only be required, as none of the material is actually hard.

Before any large expenditure is incurred in the erection of necessary machinery, I would recommend that an efficient bulk test be made at the local battery of the different grades of stone in the mine, which are readily distinguishable, with special care of plates and blanketings; and if the results thus obtained bear out the previous average of 5 dwt. of free gold per ton, I see no reason, under the conditions which prevail, why this mine should not be made a profitable concern for a number of years to come, if advantage be taken of the full extent of available motive power to work on a large scale.

I would also recommend that a little prospecting, by trenching, be carried out at the south end to prove the extension of the auriferous material in that direction.

Attached is a sketch by Mr. P. P. Hammond of the mine made from a photograph and a diagram illustrating the occurrence of the schist enclosures.

I have, &c.,

JOSEPH E. CARNE, F.G.S.,  
Geological Surveyor.

The Government Geologist.

## APPENDIX II.

## Report on Big Hill Reefs near Bateman's Bay.

Geological Survey Office, Department of Mines and Agriculture,

Sydney, 7 August, 1895.

Sir,

I have the honor to report that in April last I paid a brief visit to the above locality, in connection with applications for aid from the Prospecting Vote.

The reefs are situated in the Parish of Goba, County of St. Vincent, about 3 miles south-west of the village of Bateman. They occur low down the western slopes of Big Hill which I believe corresponds with Sugarloaf Hill of the County Map.

The surrounding country consists of stony ridges, more or less covered with loose shingle and scrub, and with abundant timber of excellent quality for mining and other purposes.

The geological formations consists of slates and sandstones probably of Silurian age. Northerly these rocks disappear under the Carboniferous formation between Bateman's Bay and Ulladulla. Southerly they form the prevailing rocks through the Coast districts, being broken in a few places only by intrusions of granite, as at Moruya, Mount Dromedary, Bega, &c. Westerly they give place to the auriferous granites of Braidwood and Araluen.

At Mogo, about 5 miles south of Big Hill, basalt occurs in elevated isolated patches which mark the course of an old Tertiary lead. Alluvial gold was profitably mined in this locality years ago, in the recent drainage channels through which the Tertiary drift had been naturally ground-sluiced and its auriferous contents concentrated, as weathering and denudation removed the basalt cover.

Within a radius of about 30 miles from Bateman's Bay quartz reefs have been opened from time to time, as near Moruya, Bimbibi near Mogo, and close to the present reef, where the site of an old stamp battery is still visible, though now overgrown with young timber. The Brimbramalla reefs, about 30 miles north-easterly, occur in the same formation. At each of the places mentioned gold has been obtained in fairly rich but very limited patches. The rough and scrubby nature of the intervening country renders systematic prospecting naturally a slow and tedious process; and the difficulties have been intensified by the want of confidence engendered by repeated failure of discovered reefs to realise anticipations based upon yields from small rich shoots.

The principal reef at Big Hill is known as Fullerton's, after the discoverer and owner, who had been prospecting single-handed for a considerable time prior to his discovery of payable stone, about two years ago. The announcement of the result of his first crushing caused a rush to the locality, and the discovery of a number of other reefs in the immediate vicinity. The outcome, however, has so far been very disappointing. Fullerton's main reef has not been profitably opened outside of his claim, which is of limited extent, viz., 1 acre 2 roods 22 perches.

Several of the reefs appear large and well-defined at surface but pinch rapidly both horizontally and vertically; and so far as tested the larger bodies of quartz have proved unworkable, the bulk of the stone being barren, whilst the thin streaks, generally near one or the other of the walls, are not sufficiently rich for extraction alone. Aid from the Prospecting Vote has been granted for testing three of the most promising reefs at a depth.

Fullerton's, Fitzgerald Brothers, and Batt's are the only reefs on the field from which stone of a payable quality has been raised.

Fullerton's main reef has an average thickness of from 4 to 5 feet down to 90 feet; which is the depth of the shaft. It strikes N 60 degrees E, and underlays south-easterly. I was informed by Mr. Fullerton that drives along the course of the reef had been put in from the lowest level for distances of 12 feet and 45 feet respectively, but I was unable to inspect below 60 feet on account of water. Work in this shaft had ceased about two months prior to my visit; the reason given by the Owner being the troublesomeness of the surface water. From the reef 347 tons of stone were crushed for a yield of 520 oz. of gold, exclusive of the blanketings which I understood were then being treated in Sydney. Some stone from the lowest level, which was lying at the surface, was highly charged with ordinary iron pyrites, some of which was in massive bunches.

About 70 feet south-east of the main shaft a second shaft had just been started on a small parallel reef near the boundary of the claim. At 20 feet its thickness varies from 3 to 6 inches. Gold was freely visible in ferruginous cavities caused by decomposition of pyrites.

Batt and Party had sunk on the last-mentioned reef just outside Fullerton's boundary, to a depth of 65 feet and had stoped from the 55-foot level to the surface for a short distance along the reef, which in this claim, varies in thickness from 4 to 6 inches. Thirty tons of stone thus obtained yielded 1 oz. 5 dwt. of gold per ton at the local battery. The reef was still showing in the bottom of the shaft, but as the country was hardening the owners did not regard further operations as really payable.

On the west of Fullerton's claim several shafts have been sunk without payable results. On the east J. Bishop holds a claim—of six men's ground—and has sunk 65 feet on a reef striking about north-east. Its thickness varies up to about 18 inches. Fourteen tons of stone from the 45-foot level yielded 15 dwt. of gold per ton; a second crushing, however, yielded about 4 or 5 dwt. per ton. The best indications are in the north-east end of the drive from the above level, but as the reef at this point is pitching steeply in its course, water is very troublesome.

Close by, on the north-east of Fullerton's Mine, George Green holds a claim which was originally prospected by Duffy Bros., who sank two shafts 50 feet and 30 feet deep respectively, and crushed 10 tons of stone for a yield of 7 dwt. per ton. The reef strikes about north-east, and is from 12 to 14 inches in thickness, but swells and pinches at intervals. Other reefs occur in the end of the small spur forming the claim; one of them of fair size, but quite barren. Green had started a tunnel from a small gully about 300 feet distant, on the east, for the purpose of cutting the main reef at about 80 feet from the surface, which would be only a few feet lower than the present shaft workings. This attempt, however, was abandoned in favour of testing at a depth from the main shaft, assisted by the Prospecting Board. At the end of July a depth of 70 feet was attained, and the reef was reported to have pinched out, but sinking was being continued alongside a well-defined wall or joint.

Fitzgerald Bros.' reef, before-mentioned, lies north of Fullerton's. It strikes N. 30 degrees E., and dips easterly. Its thickness varies up to 6 or 8 inches to a depth of 60 feet. At this level drives have been extended about 80 feet along the course of the reef, and stopes carried up about 25 feet; 130 tons of stone extracted and crushed to the end of April yielded about 2 oz. of gold per ton.

A few chains south of the above mine is Messrs. Dickson and Laughton's reef. Between the two claims is a narrow saddle-reef, but the reefs are distinct. Dickson and Laughton's reef strikes N. 15 degrees

degrees E., and is vertical, or nearly so. In this claim a tunnel was carried in about 10 feet on the southern slope of the ridge, exposing a solid quartz reef 4 feet thick. At this point a shaft was sunk 40 feet, from the bottom of which a north drive has since been commenced under aid from the Prospecting Vote. If a payable shoot should be struck, this drive will give about 80 feet of backs under the top of the ridge. At 20 feet in the drive 3 feet of quartz was showing in July, the date of the last report. So far, the best results obtained from this claim have been 2½ dwt. of gold, per ton, from 8 tons of stone crushed. The reef is large and well-defined, and well situated for economic working by tunnel, under which circumstances a very few dwt. per ton would yield remunerative returns.

About 200 yards south-east of the above claim is Messrs. Fitzgerald, Guy, and Thomas' Reef, which strikes about N. 20 degrees E. Two shafts have been sunk, about 100 feet apart, to depths of 75 and 40 feet respectively. I was unable to descend the former, owing to water and the absence of ladder-ways, but the Owners reported the reef to be from 7 to 9 inches thick, but very broken and uncertain. From the bottom of the shaft a drive was put in, north, 21 feet. One hundred tons of stone raised during operations yielded from 4 to 5 dwt. of gold per ton.

No. 2 shaft (40 feet) was sunk about ten months ago, and driven, south, 13 feet, and 10 tons of stone raised yielded from 3 to 4 dwt. per ton. As an instance of the abruptness of the pinching in some of the Big Hill reefs, the appearances at the bottom of this shaft may be mentioned. In the south end of the shaft and the 13-foot drive from it, about 3 ft. 6 in. of solid white quartz is showing, whilst at the north end no trace of quartz is seen in the solid slate country.

North of Fitzgerald Bros.' Mine another party was at work, but the time available did not permit of an inspection.

On the east side of the Bateman and Moruya Road, about three-quarters of a mile south-east of Big Hill reefs, Messrs. Duffy and Christensen were down 18 feet on a 3-foot reef, striking N. 15 degrees E. This reef also affords a good instance of pinching; in the north end of the shaft it is about 3 feet thick from the surface down, whilst in the south end the vein-stone was only just showing on the east wall at 18 feet deep. This vein is curiously cross-jointed horizontally with thin fillings of soft flucan between the blocks. Colours of gold were seen in several specimens at grass, and fine specks were also detected in a small dolly test. The stone nearest the walls prospected fairly well, but an average sample was poor. Numerous other claims were originally held adjoining or close by those described, and a certain amount of prospecting was done upon them; but attention was only given, during the limited time at my disposal, to those which were at work at that date.

Judging from the uniform general characteristics of the reefs already opened in the district, it does not appear hopeful that any sensational finds will be made of an extensive or permanent character; but the indications are sufficiently good to justify a confident prediction that many reefs similar to those already discovered will be found in the intervening country as prospecting extends—as it should—from the already fairly-tryed centres.

I have, &c.

JOSEPH E. CARNE,  
Geological Surveyor.

#### APPENDIX 12.

##### Report on a Deposit of Cinnabar near Lionsville.

Sir, Geological Survey Branch, Department of Mines and Agriculture, 3 January, 1896.

I have the honor to report that, in accordance with your instructions, I have inspected the recent discovery of cinnabar on Yulgilbar Station, Clarence River.

The deposit occurs about 5 chains from the south-west corner of Portion 15, Parish Ewengar, County Drake, and about three-quarters of a mile west of the Clarence River.

The nearest settlement is Lionsville, distant about 7 miles in a south-west direction.

The discovery was made by Laurence Fox about twelve months ago through picking up a loose surface specimen of the matrix containing cinnabar. Actual prospecting began in February last.

A previous discovery was recorded in this district in 1891 at Horseshoe Bend, about 16 miles lower down the course of the river, and about 3½ miles south-east of Lionsville. This site has been surveyed as M.L. 5, of 40 acres, in the Parish of Carnham. Mr. Geological-Surveyor David reported on this deposit about March of the same year, and recommended aid from the Prospecting Vote for proving it. The occurrence is briefly described as\* "a dyke, 12 feet wide, of felspathic rock, allied to serpentine containing cinnabar, distributed irregularly in spots and minute veins. This dyke has intersected the granite of the district at this locality, and is likely, I think, to be permanent to a considerable depth."

The present report will be limited to a brief description of the country rocks, nature and apparent mode of occurrence of the Mercury ore, present and suggested future prospecting, &c.

To attempt an estimate of the richness of the deposit or of the quantity of ore likely to be available at the present initial stage of exploration would be unfair, even if not altogether impossible. Sufficient data, however, will be adduced to justify the opinion that the prospects are decidedly encouraging, and far superior to those afforded by any previous discovery recorded in the Colony.

##### Previous Discoveries and Mention.

The localities of previous discoveries with reference to reports thereon may be briefly summarised as follows:—

Locality.	Authority.
Near Rylstone, Cudgegong River, county Roxburgh .....	Rev. W. B. Clarke, Min. Statistics N.S.W., 1875, p. 201.
Mookerawa, and Great Waterhole of Ophir, County Westmoreland...	Prof. Liversidge, Min. of N.S.W., p. 52.
† Clifton Mine, Boorook, County Buller .....	" "
Wingona, County Dampier.....	" "
Moruya, County Dampier.....	" "
Calton Hill, Dungog, County Durham .....	" "
Grove Creek, Abercrombie Mountain, County Georgiana.....	" "
Near Scone, County Brisbane .....	Mr. Dickson.
Spring Creek, near Bingara, County Murchison .....	T. W. E. David, Ann. Rept. Dept. Mines, N.S.W., 1891, p. 234.
Horseshoe Bend, Clarence River, County Drake .....	T. W. E. David, Pros. Board Papers, 91-279.

Whilst writing this report a sample of galena and zinc blende with cinnabar has been brought to the Geological Survey Office for assay with a statement that it was obtained from Sunny Corner, Mitchell, County Roxburgh. General

† These occurrences are evidently based on verbal or non-published reports; hence the references are non-committal. —J. E. C.

*General Geological Features.*

The country at the cinnabar deposit consists of hornblende, granite, felsite and augite-diorite, whilst in the immediate neighbourhood serpentine is largely developed.

The sedimentary rock of the district consists of altered slate, which has been referred to the Devonian formation by the late Government Geologist, Mr. C. S. Wilkinson.\* The gold reefs of Lionsville occur in the latter where it has been intruded by granite dykes.

The special feature of the most important mercury mines of the world, viz., association of igneous rocks with sedimentary strata is absent in the present case. So far as yet proved the mercury ore is confined to the igneous rocks.

*Prospecting Operations.*

At the time of inspection in October last prospecting operations had just been resumed after a short respite. Two shafts have been sunk 20 feet and 50 feet respectively about  $3\frac{1}{2}$  chains apart on a line bearing W. 15 degrees E. and S. 15 degrees W. These shafts are on distinct veins, which have an east and west trend.(?)

From the 50 feet shaft a line of shallow surface-openings has been extended for about 29 chains in a direction 25 degrees north of east. These openings have been made wherever any of the characteristic fine-grained felsitic and chalcedonic matrix appeared at surface. In some instances the openings have been on loose and isolated boulders; in others, however, there is evidence of veins *in situ*, but not sufficiently pronounced to allow of a definite strike being determined for the complete line. It appears more likely that these veins are numerous. Traces of cinnabar were detected in most of these openings; but nothing approaching payable ore.

A second line of shallow openings has been made along a well-defined outcrop of similar rock. This line bears E. 5° S. from a point 80 links south of the 50 feet shaft. The openings extend for about 16 chains east from the shaft; the outcrop, however, can be traced at least twice that distance to the Clarence River, near the west bank of which it forms a bunch or "blow." Some years ago this bunch was prospected for gold. Cinnabar could not be detected here, though numerous freshly broken specimens were examined. I was informed, however, by Mr. T. Bassetti, one of the shareholders of the Cinnabar Mine, that that mineral could be identified upon crushing and washing the samples of the rock.

At the spot marked (C) on plan an opening 7 feet deep has been made in the outcrop referred to, and from that level a small opening or drive has been put in about 4 feet south. At the extreme north and south limits of the opening and drive hornblende granite is exposed, the intervening rock being felsite, both being much weathered and decomposed. The peculiar feature here represented is the horizontal banding or marking of the rotten felsite by finely divided particles of cinnabar. The decomposed felsite is about 7 feet thick, and carries a small percentage of mercury—about one half per cent.—throughout that thickness. This site is one of the most favourable for prospecting.

*Detail of prospecting and appearance of ore in the workings.*

The main 50 feet shaft being timbered for about 20 feet from surface an examination of the appearance of the ore-veins near the surface could not be made for the purpose of comparison with those presented in the shallow openings above described. Below the timbering the discoloration obscured all traces, if any existed, of the ore to within a few feet of the bottom. In the south-eastern end of the shaft, thin veins of cinnabar traverse irregularly about 1 foot of felsite country. In the north-western end a little cinnabar was just beginning to show at the bottom of the shaft.

Specimens of cinnabar were taken out at the upper levels several inches thick; the individual veins, however, at the 50-feet level have narrowed to about 1 inch at thickest. Little importance attaches to this pinching or thinning, because of the capricious occurrence of the cinnabar. Bunches of greater thickness are certain to be met with at intervals where vughs or cavities have been formed in the country.

From the 50 foot level a start has just been made to cross-cut southerly in the direction of the 20-feet shaft. The first shot had broken off a thin skelp from the side of the shaft, which revealed thin veins and faint impregnations of cinnabar traversing and colouring the felsite country. The actual thickness of the ore-body at this point cannot, therefore, be determined until the drive has been extended. A cross-cut in the opposite direction would also, perhaps, reveal an extension of the cinnabar in the country.

At the 20-feet shaft, the cinnabar, quartz, and calcite form the filling of a contact fissure between an intrusion of augite-diorite and the felsite. The cinnabar in the best specimens averages, perhaps, 1 inch in thickness in this vein.

The appearance of the ore in the small opening marked (c) has already been described. In the shallow openings, as has been mentioned, traces only of cinnabar have as yet been exposed.

*Probable Mode of Occurrence of the Cinnabar.*

As far as the limited amount of prospecting will allow of an opinion being formed, it appears probable that three or more parallel bands of felsite occur, containing veins and impregnations of cinnabar.

The ore-band on the 50-feet shaft is evidently distinct from that in the main line of outcrop, which strikes about 52 feet south of the shaft, because the felsite in that outcrop, as exposed at the opening marked (e) is but 7 feet thick, between well-defined hornblende granite walls.

A third band is represented at the 20-feet shaft, and possibly a fourth in the most northern line of openings.

*Nature of the Country or Enclosing Rocks.*

Characteristic specimens of the country rock were selected and forwarded to the Geological Survey Office for petrographical examination and determination. The following notes upon them have been kindly supplied by the Curator and Mineralogist, Mr. Card, A.R.S.M. :—

"Three types of rocks are comprised—

- "(a) Fine grained felsite of a greenish colour, weathering brown when fresh. This is the principal cinnabar-bearing rock, the ore occurring in veins and spots closely associated with quartz, and, to a less extent, calcite. These three minerals—cinnabar, quartz, and calcite—are of secondary origin; they do not occur in fresh, unaltered felsite, but their presence is always correlated with a general alteration of that rock. Pyrites is very generally present, but does not appear to possess any significance with regard to the origin of the cinnabar ore. " (b)

\* Ann. Rept. Dept. Mines N.S.W. for 1889, p. 202.

- "(b) A holocrystalline rock-marked "country." This consists of quartz, felspar, orthoclase, and much oligoclase (?) hornblende and a little magnetite, may be classed as hornblende-granite. A much altered form of this rock is of great interest, in that the alteration has been accompanied by an introduction of cinnabar, which occurs in small particles within the decomposed felspar, and more abundantly along the divisional planes of the hornblende.
- "(c) Two specimens of fine grained augite-diorite from No. 2 shaft."

Mr. Card's opinion as to the secondary nature of the cinnabar and associated minerals in the felsite and hornblende-granite, derived from microscopic examination of selected specimens is entirely confirmatory of the decision I arrived at in the field.

Though the cinnabar is mainly confined to the felsite bands, yet evidence is not wanting, macroscopic as well as microscopic, of a certain amount of impregnations of the granite itself.

The calcite and quartz occur in veins as well as impregnating the mass of the altered felsite. Small vugs occur which are lined with crystal faces of the calcite. It is noticeable that when the cinnabar occurs as a vein, no matter how thin, it is entirely associated with the quartz, and separate from the calcite. In no instance in the vein-specimens collected could cinnabar be detected in the calcite. The quartz filling the veins has a translucent appearance passing almost into clear glassy transparency near the metallic vein minerals. Its outer surfaces form a series of mammillary curves covered with free terminating crystals. On these the calcite has been deposited. Part of the calcite is dark greenish-black, the colouring matter may be due to chlorite from decomposition of hornblende.

The felsite in its normal condition is very fine-grained and greenish in colour, breaking with a cherty conchoidal fracture. Pyrites is fairly abundant in it. Where decomposition has been set up the texture of the rock has become more coarsely crystalline in appearance owing to the replacement of portion of the fine felspathic material by crystalline calcite. The extent of the replacement may be judged from the following determination of the lime in an average specimen of the felsite from the bottom of the 50 feet shaft=Lime (CaO) 11.70% equal to carbonate of lime 20.89%.

*Nature of the Ore.*

Associated with the cinnabar is an almost tin-white material, weathering bronze, containing copper, antimony, and sulphur. The copper carbonates, which occur in small quantity in the upper levels, have resulted from the oxidation of this mineral. The association of the latter with the cinnabar is too intimate to allow of the perfect separation necessary for adequate test for mercury in it. A complete analysis, however, of the mixed ore has been made by the Analyst to the Department, Mr. J. C. H. Mingaye, F.C.S. with the following results:—

*Chemical Composition.*

						99.52

Fine silver at the rate of 9 oz. 6 dwt. 4 gr. per ton } No tellurium or  
 Fine gold a trace (under 2 dwt) } selenium detected.

\* Chiefly silica

The copper-bearing mineral penetrates the vein quartz in wedge or cone shape forms. Mr. Card, who examined all the selected specimens prior to my return, suggests that it may be a mercurial fahlerz; further exploration may furnish sufficiently pure specimens for actual determination.

The first specimen of cinnabar from the Yulgilbar deposit assayed in the Departmental Laboratory yielded:—

- Metallic mercury, 60.70 %.
- Silver, 6 oz. 10 dwt. 15 gr. per ton.
- Gold, a trace (under 2 dwt. per ton).

This sample represented the highest grade ore in the principal vein near the surface of the main 50-foot shaft. The following samples were selected by myself from a band of decomposed felsite about 7 feet thick, in the small opening at the spot marked (c) on plan.

[4057] "Picked." Decomposed felsitic material forming horizontal pink layers from 1 to 2 inches thick in a vertical section of about 3 ft. 6 in.:—

- Metallic mercury, .48 %.
- Copper, a minute trace.
- Neither gold or silver.

[4058] "Average." Decomposed felsitic material being an average sample selected from the full thickness in the above section:—

- Metallic mercury, .50 %.
- Copper, a minute trace.
- Neither gold or silver.

From the pink colour of the horizontal layers a much higher yield would have been anticipated from the "picked" sample than from the average of the whole thickness.

The

The cinnabar in the soft decomposed felsite must be in a very fine state of division, for its presence is only detected by the faint pinkish tinge imparted to the matrix. Possibly portion of the cinnabar may have been removed during the decomposition and weathering, as a sample of undecomposed felsite, having a pink tinge from included cinnabar from No. 2 shaft, yielded as follows:—

[4056] "Lump."

Metallic mercury, 1.58%.  
Copper, a minute trace.  
Neither gold nor silver.

Hence it is reasonable to expect a higher yield from the undecomposed felsite at a depth at the spot marked (C) on plan.

#### *Origin of the Cinnabar.*

Field observation and microscopic examination alike agree as to the deposition of the cinnabar from solution in siliceo-calcareous waters which percolated through definite cracks or fissures, and soaked laterally into the country as the corroding solutions attacked its more soluble constituents, and replaced them chiefly from the calcium or lime salts in solution.

It would, however, be premature to offer an opinion as to whether the mercury salts had a deep seated extraneous source or were originally leached in minute quantities from the contiguous or underlying granite and redeposited in the way described.

#### *Ore at Grass.*

Some of the richest patches of ore have been bagged, but little care has been taken with the bulk of the stone raised from the shafts, hence any estimate of quantity of workable ore—fixing 5 per cent. as the maximum in this case—would be very approximate only. It is certain, however, that a fair proportion of the above grade ore could still be culled from the waste.

#### *Further Prospecting.*

The crucial question at the present moment however, is, what quantity of workable ore is likely to be available in the mine; a question which requires a practical answer such as systematic prospecting alone can give.

The sites most likely to afford a solution to the query would be the present shafts (A and B) and the site marked (C) on the accompanying plan. The prospecting should be in the direction of deepening the above shafts (including C), driving along the course of the veins, and crosscutting to ascertain the thickness of ore-bearing country.

#### *Conclusion.*

I am of opinion from the mode of occurrence that the cinnabar is likely to continue to great depths, but whether in sufficiently concentrated form to pay for extraction prospecting alone can prove.

The conditions of occurrence differ from those of the very few paying mercury mines of the World, yet the prospect of developing a paying deposit of moderate extent is decidedly encouraging and certainly superior to any yet obtained in the Colony.

As the existence of a mercury mine in Australia would be of first importance in such a gold-bearing country, I am of opinion that a share of the cost of proving comes well within the scope of the Prospecting Vote.

I have, &c.,

JOSEPH E. CARNE, F.G.S.,

Geological Surveyor.

The Government Geologist.

#### APPENDIX 13.

#### Report on the Coramba, Bucca Creek, and adjacent Reefs.

Geological Survey Branch, Department of Mines and Agriculture,

31 December, 1895.

Sir,

I have the honor to hand you the following report on the lately discovered reefs in the vicinity of Coramba Mountain, County of Fitzroy.

The discoveries are in the Parishes of Moonee and Comlaroi, in the southern portion of the Orara Gold-field East Extension, which was proclaimed on the 28th October, 1881.

Taking the bearings from the Coramba King mine, the Warden's Office at Nana Creek Reefs lies about 4 miles north-west; Woolgoolga, about 14 miles north-east; and Coff's Harbour, 9 miles south-south-east. The two latter being on the seaboard.

#### *General Geological Features.*

Proceeding from Grafton—which lies about 40 miles a little north of west from Coramba—the formation consists of Clarence (Triassic) Coal Measures as far as Bagawa. Very characteristic mural escarpments of the middle beds (Hawkesbury Series) form the most conspicuous physical features of the country passed through.

Near Bagawa the basal rocks of the district appear; these have been described in connection with the Nana Creek reefs, by the late Government Geologist as Devonian slates and sandstones.\* This classification I believe was based on stratigraphical and lithological grounds, as no fossils, as far as I am aware, have been found in these rocks in the district.

Intruding the Devonian formation at Coramba is a mass of granite, in which some of the principal reefs occur.

The following note by Mr. Card, A.R.S.M., Curator of the Mining and Geological Museum, on the petrographical examination of specimens of the country at the Coramba King, Lady Elsie, and Evening Star Mines is of interest:—

"The igneous rocks intruding the country rock consist of granite and (perhaps) porphyry. Evidence of crushing is very pronounced in one or two, as for instance [740], in which the twin lamellæ of the felspars are seen to be faulted. The rock from Coramba King [738] contains a little brown hornblende, stretched and bent by the crushing forces. With this exception minerals of the ferromagnesian group are absent."

The Bucca Creek and Tallawudjah Creek reefs occur in the Devonian formation. A sample of the hardened country in Sharpe and Morrow's No. 2 claim, at Tallawudjah Creek, is thus described by Mr. Card, after microscopic examination:—"This is a compact rock of sedimentary origin, and consists essentially of angular fragments of quartz and felspar." The

\* Ann. Rept. Dept. Mines for 1889, p. 203.

*Coramba.*

The first discovery at Coramba was made about eighteen months ago by some selectors in the vicinity, whose attention had been drawn to the probable proximity of reefs by the occurrence of numerous specimens of gold-bearing quartz in the rich alluvial flats, which they were cultivating on the bank of the Orara River, into which the Coramba Mountain channels drain on the west. Though M.T. 1 was the original prospecting claim on the field, the Coramba King Claim was the first to reward their efforts, and as regards thickness and length of outcrops it is the most important of the immediate group, though, perhaps, surpassed in average richness by some of the smaller reefs.

At least three parallel reefs occur in close proximity on the western slope of the Coramba Mountain, and between the Coramba King and the Lady Elsie reefs is another which has not yet been proved. This middle line passes through the Coramba King and adjoining leases.

*Coramba King Reef.*

The main (Coramba King) reef strikes about N. 38 E.; and underlays south-easterly at an angle of from 43 to 45 from the horizontal. At the 55-foot level the underlay suddenly alters to 57°.

The thickness varies from 2 feet to 6 feet along its crop. At the 55-foot level, where the dip suddenly becomes steeper, the thickness increased to 8 feet. At the surface of this shaft the reef was but 10 inches, but rapidly thickened in a few feet.

Along its southern strike the outcrop of the reef has been traced from the Coramba King (G.L. 9), through the G.Ls. 6 and 7, M.T. 1, G.L. 8, and into G.L. 11, a distance of about 30 chains.

The middle reef strikes N. 30° E, and underlays south-easterly at an angle of 43° from the horizontal.

The Lady Elsie reef strikes N. 30° E, and underlays south-easterly at an angle of 78° from the horizontal. In thickness it varies from 3 to 14 inches.

Between the outcrop of this reef and the Coramba King line there is a distance of about 5 chains, and a gradual ascent of about 150 feet to the latter.

Northerly from the Coramba King main shaft a break in the reef has apparently occurred, for notwithstanding a considerable amount of labour expended by the discoverers in sinking and driving across the line of strike, at a point where several large blocks of loose quartz were discovered in the soil, the channel of the reef has not been cut. The failure of the efforts to pick up the reefs in the crosscut drives has given rise to a belief that a fault at this point has thrown it out of its course, the surface evidence of this displacement being obliterated by the accumulated debris of soil and slipped shingle from the higher levels.

As the outcrop of the reef undoubtedly occurs about midway between the main shaft and the prospecting works referred to, the surest and most economical method of tracing the reef, and proving the existence or otherwise of a fault, is to sink at this point into settled country, and then follow the reef on its northerly course.

In the adjoining lease on the north-east (G.L. 14), at a distance of about 10 or 12 chains from the outcrop mentioned above, a reef has been exposed in several shallow openings, which, through having a slightly different strike (N. 35° E), is very probably the continuation of either the main or middle reef. The reef in G.L. 14 has a thickness of about 1 ft. 3 in., and underlays south-easterly at an angle of about 50° from the horizontal.

Between this outcrop and the most northerly Coramba King workings loose blocks of kindly-looking banded quartz are to be seen in and near a small creek. It is therefore more than probable that the main reefs will shortly be traced continuously through the intervening space.

From the large loose blocks of quartz lying just below the point where the trouble occurs in the Coramba King Claim the richest returns have been obtained. The largest of these blocks must have weighed several tons.

The output from the Coramba King Mine to the date of my visit, in October, was as follows:—

	oz.	dwt.	gr.	
2 tons "from loose, slipped blocks," treated at Parke and Lacey's .....	8	15	0	per ton.
3 tons from reef, .....	2	6	0	"
76 tons from reef, treated in local battery .....	0	10	21 <sup>3</sup> / <sub>4</sub>	"
4 tons from main shaft (picked from 6 tons), Parke and Lacey's .....	10	0	0	"
6 tons from surface, treated at Parke and Lacey's .....	1	12	0	"

The reinstein is a free milling ore, comparatively non-pyritiferous down to the lowest level mentioned (55 feet) in the main shaft; in the adjoining claims, however, arsenical pyrites is more abundant at the surface. On the whole line there is evidence that below the water-level, if not before, the proportion of contained pyrites will be sufficiently appreciable to render special care of the concentrates a matter of importance.

The Coramba King Mine is at present held in conjunction with G.Ls. 6 and 7 on the same line and G.L. 17, which adjoins the above mine on the north-west, and contains a parallel—middle—reef (?), which has yet to be proved. The total area of the above lease is 18 acres.

Timber for all purposes is abundant, and permanent water—the Orara River—is within 1 mile. The main shaft has an elevation of about 475 feet above the river-bed; the falling ground between will render transport easy and expeditious, either by horse or steam traction.

In the adjoining claim (G.L. 7) on the main line two shallow shafts and two open cuts have exposed the reef, which here has a thickness of 5 feet. 120 tons of stone from these workings are reported to have yielded 53 oz. of gold, equal to 8 dwt 2 gr. per ton. Taking this yield in conjunction with the bulk test from the adjoining Coramba King Claim, viz., 76 tons for 41 oz. 7 dwt. of gold, a return equal to 9 dwt. 16<sup>2</sup>/<sub>3</sub> gr. per ton of quartz has been obtained from 196 tons, which should be a fair test of the average value of the stone near the surface.

On G.L. 6, which adjoins G.L. 7, little proving has yet been done, and no crushings have taken place. One shaft, 30 feet deep, has been sunk on the reef, about 20 feet from the north boundary.

Adjoining G.L. 6 is M.T. 1 of 4 acres 1 rood 24 perches, which is now being tested by means of a tunnel under aid from the Prospecting Vote. As before stated, this is the original prospecting claim of the locality, and so far the owners have reaped no benefit from their labours, for after starting two shafts the tunnel test was adopted.

One of the shafts was started to cut the reef on the underlay, but had not reached it when the tunnel was begun. The other shaft follows the reef on the underlay for about 28 feet, and exposes about 2 feet of quartz. Between the two shafts an outcrop exposes 3 feet of quartz. The crosscut prospecting tunnel, which starts from the south-west corner of G.L. 6, will give from 150 to 160 feet of backs when the reef is struck, besides cutting the parallel middle reef, which outcrops west of the main reef.

No test has yet been made of the stone raised from the underlay shaft or open cuts.

Adjoining M.T. 1 on the south is G.L. 8 of 4 acres. An opening on the reef at the boundary of the two claims reveals a thickness of about 6 feet of quartz. Practically little or no real prospecting has been done in this claim, though the outcrop of the main reef is well defined all through it. Excellent tunnel sites, which would afford a large amount of backs, are available in these southern claims.

G.L. 11 of 10 acres, which joins the last-mentioned lease, has its southern boundary against the east line of C.Ps. 62 and 63. A little trenching has been done on this claim, exposing loose blocks of quartz; the presence of a good deal of slipped rock and soil, however, covers the outcrop of the reef.

There is evidence of earlier prospecting in this area; a shallow vertical shaft has been sunk upon a reef striking N. 17° E., and having a thickness of from 12 to 18 inches. This shaft is just at the boundary of Portion 62.

#### *The Lady Elsie Reef.*

The Lady Elsie Mine consists of G.Ls. 10 and 25, the workings being in G.L. 10.

The reef strikes N. 30° E., and underlays south-easterly at 78° from the horizontal below the 46-foot level, down to which it is nearly vertical. It averages from 3 to 14 inches in thickness in hard country. The maximum thickness was showing at the lowest level attained, viz., 63 feet. Two drives either way along the reef from the 43-foot level had been extended 36 and 52 feet respectively. In the face of the south drive the reef had pinched out, but the hanging wall was well-defined. As the quartz occurs in lens-shaped blocks the reef is sure to widen and pinch at intervals, and even to leave blank spaces like that described. A tunnel was being driven to connect with the south drive for ventilation.

The Lady Elsie stone contains a fair amount of pyrites and occasional crystals of zincblende; due care should be paid to the blanketing or other method adopted for saving the concentrates, as they are likely to be of considerable value.

The following parcels of stone from the reef had been treated prior to my visit:—

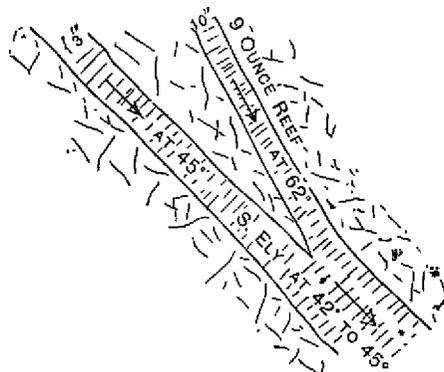

8½ tons	yielded	2½ oz.	per ton	} Equal to a fraction over 2 oz. 13 dwt. 13 gr. per ton.
17½ "	"	2½ "	"	
13½ "	"	3 oz. 7 dwt.	per ton	
7 "	"	2 oz.	"	

#### *Goldspring Reef.*

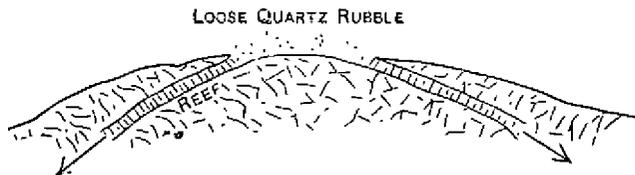

Near the Orara River, on Portion 59, a small reef named the Goldspring has been opened by two shafts 20 and 26 feet deep respectively, and 26 tons of stone raised from them yielded 13 oz. 5 dwt. of gold at the local battery. The reef varies up to 9 inches in thickness, but is very irregular in occurrence.

#### *Evening Star Reef.*

At the south-west corner of Portion 15, Parish of Comlaroi, on the west of the Orara River, is the Evening Star Mine, G.L. 24, of 6 acres. Two reefs junction in this lease, and one of the points of contact exposed in the workings, where a rich 9-oz. shoot joins the main reef, is shown in the following rough sketch section. The former was the first reef discovered in the mine; its thickness is about 10 inches. The main reef being about 15 inches thick. These reefs strike about N. 65° E., and underlay after junctioning south-easterly at 42° to 45° from the horizontal. The thickness at this point is 3 feet:—

On the south-western strike, a short distance from the furthest shaft in that direction, denudation has exposed the top of an anticlinal fold or "roll" in the reef, after the manner depicted in the following rough sketch section:—

On the surface between the two outcrops was a quantity of loose quartz rubble, a portion of which is said to have yielded payable returns at the Battery. The

For a distance of over 300 feet along the outcrop, gold can be readily detected with the unassisted eye, on breaking specimens from the reef. The surface openings are shallow—not exceeding 10 feet—but they serve to expose a solid reef for over 200 feet, and smaller openings reveal its extension for about 330 feet. About 100 feet northerly from the main reef the cap of a parallel vein had just been discovered about 18 inches below the surface. Gold was visible in specimens, but sufficient soil had not been removed to allow of the thickness, strike, and dip being determined with a reasonable amount of accuracy.

From 8 tons of rubble and casing from the different surface openings in Tayler's Reward Reef, 23 oz. of free gold were obtained by washing. The washed stone, with the addition of 7 tons from the reef direct, were sent to Mort's Dock for treatment, with the result that 14 tons 7 cwt. yielded 98 oz. 10 dwt. 19 gr. of smelted gold, in addition to the 23 oz. mentioned above.

Estimating the original quantity at 15 tons, the yield would be equal to 8 oz. 2 dwt. 1 gr. per ton, irrespective of the concentrates, which are reported to have yielded at the rate of 10 oz. of gold per ton at Climo's Works, but the proportion is not known. This reef certainly offers one of the best surface shows I have seen, and there is every reason to predict a successful development.

#### *Perseverance Reef.*

Close by the Reward claim is the Perseverance Mine, G. L. 33, of 6 acres, which embraces a very flat reef discovered in June last. This claim has been opened by tunnels in a very erratic manner following the reef on the underlay. In the main tunnel the underlay steepened suddenly, and at the time of my visit the face was covered with water, which prevented a proper inspection. The reef so far as seen, appeared very broken and rubbly, though larger blocks of quartz which had been taken from the face testified to greater solidity. The vein appeared to vary in thickness from a few inches up to about a foot. Gold was freely visible in specimens. The owner was putting a quantity of the rubble and flucan through a most primitive sluice made from a cabbage palm stem. About 15 tons had yielded in this simple treatment about 1 oz. of gold per ton. 14 tons 7 cwt. of the washed stone was then awaiting crushing at Mort's Dock, the result of which I am now informed was 89 oz. 14 dwt. of smelted gold.

#### *Gold Lease 36.*

In G. L. 36, adjoining the Reward claim on the west, several flat leaders were exposed in the bank of the creek, ranging from 2 to 6 inches in thickness. One ounce of gold is stated to have been washed from less than a dish of the rubbly stone in these veins, and 70 lb. of stone from a leader in a 9-foot shaft close by yielded 7 dwt. of gold. Leases have been pegged out adjoining each of the above claims, and prospecting was proceeding, but at that early date nothing special had been discovered outside the mines mentioned. There is every reason, however, to expect other finds in the vicinity.

#### *Tallawudjah Creek.*

I also visited some recently-discovered gold-bearing reefs on the west side of Tallawudjah Creek, in the Parish of Bagawa, County Fitzroy, about 4 miles west from Nana Glen Post-office.

#### *Sharpe and Morrow's Reef No. 1.*

The prospectors of this particular locality are Messrs. Sharpe and Morrow, who have applied for two leases. In the claim nearest the creek a 6-inch reef has been opened to a depth of about 30 feet in claystone country. This reef strikes about north-east and south-west, and underlays south-easterly at an angle of 53 degrees from the horizontal. Another 6-inch vein occurs in the same claim, having a strike of north 5 degrees east, but the crop only has been exposed.

#### *Sharpe and Morrow's Reef No. 2.*

In the Prospectors' No. 2 Claim, a short distance to the west, another reef is being opened by means of a tunnel, which, however, was only in a few feet at the time of my visit. The reef strikes north 25 degrees east, and is nearly vertical. The thickness varies from 6 to 9 inches. If it should prove payable the tunnel will give about 95 feet of backs at the back boundary of the claim. A parallel reef occurs close by on the east, about 12 inches thick, but no work had been done upon it.

#### *Currajong Reef.*

South of the above claim is Messrs. Seghors and Party's Currajong Reef, which strikes north 20 degrees west, and averages about 5 inches in thickness. The veinstone prospects well, but the country is hard, consisting of highly-altered sedimentary rock. Two shafts have been sunk 15 and 20 feet respectively at a distance of 12 feet apart. In one of these two veins are showing in one end about 10 inches apart, one about 2 inches thick, and the other 6 inches.

A parallel vein has been exposed in two small openings about 3 chains west of the above, having a strike north 30 degrees east and a thickness of about 1 ft. 5 in.

#### *Fairy Queen Reef.*

Jarrett and Pick's Fairy Queen reef has been opened to a depth of about 10 feet, exposing a thickness of from 5 to 8 inches of quartz. It strikes north and south, and underlays east at an angle of 42 degrees from the horizontal. Gold was seen in numerous specimens from this vein.

Between the Fairy Queen and Currajong reefs numerous small leaders occur, from which fair prospects can be obtained, and several parties were engaged prospecting in the vicinity. So far no bulk tests have been made from these reefs. Dolly tests, however, in most instances give encouraging results.

#### *Conclusion.*

I am of opinion that the Coramba District, radiating from the mountain of that name, offers considerable inducement to prospectors, though their preliminary efforts are liable to be trammelled and retarded by the dense undergrowth and vines and the great depth of soil in many parts. Still, evidence is not wanting in road cuttings and rocky creek channels of numerous quartz veins and leaders, some of which may prove auriferous.

*Alluvial.*

*Alluvial.*

Though the locality mentioned is a promising one as regards reefing, yet the chances of payable alluvial leads are not so bright. The most likely spot which came under my observation, for the occurrence of payable alluvial, is the small channel and alluvial flat which drains from the Evening Star Mine to the Orara River. This ground would be bouldery and wet and is undoubtedly worthy of a test. The site is on conditionally purchased land. Taking all the facts into consideration, there is every reason to hope for a successful future for the gold-mining industry at Coramba. It cannot be denied, however, that there is a very prevalent feeling of distrust in the permanency of any reefs in the north-coast country, mainly owing to the short vertical lengths of the gold shoots in the Nana Creek Gold-field. It is, however, difficult to imagine a sudden termination, vertically, to such horizontally lengthy shoots as are already exposed in the Taylor's Reward and Coramba King reefs. Nor can the depths to which the Nana Creek reefs have been tested be accepted as conclusive evidence of complete impoverishment with depths. The system, or rather want of system, adopted in working payable shoots in New South Wales, is a feature which expresses itself more and more upon the attention of those whose duty it is to examine mines for which aid is asked from the Prospecting Vote. With a very few worthy exceptions, when a paying shoot is being worked, a hand-to-mouth policy is adopted, with no thought of the morrow. Not a single foot beyond the daily crushing requirements are the shafts and levels extended, until, suddenly the "bottom drops out of the mine;" in other words, the paying shoot ends, and then the reaction from good dividends and high expectation to frequent calls and deadening despondency, closes the mine before the blank, unproductive, spaces have been pierced; and so, perhaps, later on others reap where they have not sown over much.

In legitimate mining one of the first and most vital principles is systematic prospecting, concurrently with actual winning of pay stone. The shafts and levels should be kept persistently ahead of actual stoping. The cessation of prospecting directly pay stone is struck, is, undoubtedly, the most prolific cause of sudden collapse and disappointment in mining. It is satisfactory to know that in several of the Coramba reefs systematic prospecting is in progress, which it is earnestly to be hoped will not end with the striking or proving of *one* pay shoot, but continue with, and in advance of, the actual stoping.

At Bucca Creek where systematic mining has not yet been begun, and practical experience is wanting, a splendid chance awaits skilful management, which should be secured at the outset.

*Crushing Plants.*

A public battery, working ten head of stamps, has been erected on Portion 62 on the Orara River, and, judging from remarks current on the field, has given general satisfaction to all parties. This battery is a great boon to the owners of the small reefs and to the proprietors of the larger ones, as it enables them to properly test their claims before incurring the expense of crushing plants. If, however, the gold in the Coramba King line of reef is proved to maintain the average (or even a couple of dwts. less) obtained from 196 tons from the surface, viz., 9 dwt. 16 gr. per ton, down to reasonable depths, it is manifest that rapid treatment on a large scale will yield the best results from such a large body of stone.

As regards the requirements of Bucca Creek, a ten-head battery at the present time would be of equally great advantage to the small holders and prospectors, whilst enabling the owners of main reefs to adequately prove their properties before deciding on the extent of the requisite crushing plant.

Though within about  $3\frac{1}{2}$  miles in a direct line from the Coramba Battery, the country between it and the Bucca reefs is of such a nature as to offer considerable difficulties to transport. The nearest point of the Orara River lies about  $2\frac{1}{2}$  miles south-west from the reefs, but numerous tributaries approach much closer in that direction.

The branch of the Bucca Creek on which the reefs occur, or the main channel can be readily made to serve all purposes of water supply by means of storage dams.

I hope shortly, through the courtesy of the Warden's Clerk at Nana Creek, to submit as an addenda to this report, a complete return of the results of crushings from the various reefs from the time of the discovery to the end of the year.

I have, &c.,

JOSEPH E. CARNE, F.G.S.,  
Geological Surveyor.

## APPENDIX 14.

Report on the Auriferous Beach Sands of the Esk River and Jerusalem Creek, in the Parish of Esk, County Richmond.

Geological Survey Branch, Department of Mines and Agriculture,

29 January, 1896.

Sir,

I have the honor to hand you the following report on the auriferous sand "leads" in the vicinity of the Esk River and Jerusalem Creek, in the Parish of Esk, County Richmond, together with general notes on the nature, extent, and probable source of the auriferous beach sands of New South Wales, and the methods of working adopted.

*Previous mention.*

Mr. Geological-Surveyor Stonier, F.G.S., reported on the auriferous sands near the Evans River, about 8 miles north of Jerusalem Creek, and briefly alluded to the locality now under consideration.\*

Mr. E. F. Pittman, A.R.S.M., examined the auriferous beach sands between the Richmond and Tweed Rivers.†

Mr. C. S. Wilkinson, F.G.S., F.L.S. (late Government Geologist), described those near the Richmond River heads, as well as the auriferous basalt of the same locality.‡

Mr. J. C. H. Mingaye, F.C.S., M.A.L.M.E. (Analyst to the Department of Mines), read a paper on the occurrence of gold, platinum, and tin in the beach sands of the Richmond River District.§

The most accessible approach to the Esk and Jerusalem Creek mines is *via* the Half-way House, on the Chatsworth-Woodburn road; whilst the auriferous areas north of Jerusalem Creek are more readily reached from Woodburn *via* Evans or Little River.

§ Jour. Roy. Soc. N.S.W. for 1892, Vol. XXVI, p. 363-70.

‡ Ann. Rept. Dept. of

From the Half-way House, about 12 miles from Chatsworth, a track has been partially cleared to M'Auley's "lead," a distance of about 7 miles east. Several coaches pass the Half-way daily, to and fro between Chatsworth, on the Clarence River, and Woodburn on the Richmond; hence, communication with the beach diggings is readily accessible. A bi-weekly mail from the Esk Post Office, Half-way House, runs along the "leads" as far north as Jerusalem Creek Heads, collecting as well as distributing mail matter.

#### *Physical Geography.*

The Parish of Esk, with the exception of its north-west corner, where the dividing range between the Clarence and Richmond coast waters crosses it, consists of a tract of level forest land merging gradually into broad, marshy, almost treeless flats along the sea coast which forms its eastern border. It is difficult to define the boundary between the sea and land-made deposits, because the loose sand derived from the weathering of the massive sandstones of the adjacent high lands on the west, is mingled with the sea-worn sand which has been drifted inland by the action of the wind. It is clear, however, that numerous shallow inlets of the sea penetrated at one time well inland towards the Dividing Range. But there is not sufficient ground for the belief entertained by some of the miners, that the foot of the present range represents the original shoreline prior to the deposition of the auriferous sands.

Between the range and the coast (a distance of about 9 miles due west from M'Auley's Lead), the sandstone bed-rock can be seen *in situ* on the low ridges and in road cuttings. The most eastern outcrop noticed being about 3 miles east of the Half-way House.

The coast country between the Clarence River and Jerusalem Creek Heads is enclosed on the west in semi-circular form by the Dividing Range as far south as Tobbimoble, and thence easterly by high lands to the Clarence Heads. The bay-like appearance of this low area partially enclosed by a rim of high land, doubtless gave rise to the belief above stated as to its marine origin.

#### *Geological Features.*

The geological formation represented in the coast country between the Clarence and Richmond Rivers consist almost entirely of Clarence (Triassic) Coal Measures. Mr. Stonier describes a small outlier of slate at Bullock Creek, between Jerusalem Creek and the Evans River, as probably of Lower Carboniferous age, but this classification is based solely on stratigraphical position.

About half-a-mile south of Evans River Heads, the coast section exposes a massive escarpment of sandstone with conspicuous current bedding, overlying sandy shales containing an inferior coal-seam, about 1 foot thick, just above high-water mark. The high downs of this locality are formed of the above sandstone, large bosses of which are seen outcropping at intervals. The highest beds of the Dividing Range west of the Esk River, also consist of the same massive sandstone; these form the middle beds of the Clarence Coal Measures, and are regarded as the geological equivalents of the Hawksbury Series.

Igneous rocks are represented by a felsitic dyke which intrudes the Coal Measures just south of the Evans River. From the strike of this dyke it is extremely probable that the reef on which the ill-fated S.S. "Cahors" was wrecked (about 2 miles south-easterly), is a hard boss of the same rock which has resisted the wearing action of the sea more successfully than the enclosing shales and sandstones.

On the Dividing Range at Tobbimoble and near Doubleduke Peak, south-west of the Esk River, two small isolated patches of basalt have so far been recorded. These are of special interest as they indicate a considerable southern extension of the volcanic flow so largely represented north of the Richmond River.

#### *Discovery of Gold in the Beach Sands.*

According to Mr. D. Munro, of Ballina—who is well-known as a most observant and careful recorder of geological and other phenomena—gold in payable quantity was first discovered in beach sand in New South Wales, at Shaw's Bay, near the north head of the Richmond River, by John Sinclair, in March, 1875, who obtained 12 oz. of gold in a fortnight.\* The publication of this return caused a rush, and drew New Zealand beach miners to the spot with the appliances which experience had proved most suitable under similar conditions on the west coast of the South Island of that Colony. Though thirty years have elapsed since the commencement of beach mining in New Zealand, blanket, carpet, or cocoanut matting covered tables have not been superseded. Dredges have been tried on the beaches unsuccessfully. In the *Papers and Reports relating to Mining in New Zealand*, 1893, p. 120, little hope of success with dredges is expected until the principle adopted by the miners is used in connection therewith.

From the date of Sinclair's discovery to the present time the beaches of the north coast have given employment to many. Periodically large numbers find remunerative work for several months in the year. Mining on the present beaches will, however, always be of an intermittent character, because of its dependence upon the occurrence of south-easterly gales to break up fresh portions of the terrace of black sand rock, which is exposed for miles along the coast just beneath the loose sand-dunes, and to concentrate the heavier particles on the surface of the beaches into what are locally called "sniggers." The lower portions of the loose white sand-dunes fringing the coast also contain particles of previously liberated gold, which help to enrich the concentrates accumulated in workable form during stormy conditions.

Mr. Munro states that the richest patches recorded in the early workings were found on the southern side of the headlands, which is in conformity with the greater force exerted at such points by the prevailing winds, viz., south-east. The localities recorded by the same authority as being specially distinguished by their original richness are Tallow Beach, south of Byron Bay, Seven-mile Beach, south of Broken Head, Black Rock Beach, and south of Evans Head. From these sums up to £800 per man were obtained in periods ranging from six to nine months.

For a considerable time past little actual beach mining has been done, owing to the absence of any gales of consequence. North of Jerusalem Creek auriferous deposits have been worked some distance back from the beach on areas of some elevation above sea-level. As the occurrence of the auriferous sands under such conditions in this locality has formed the subject of a special report by Mr. Stonier (already quoted), the present detail description will be restricted to the more recent discoveries in the flat lands further south.

In

\* Mr. Munro has since informed me that Sinclair's discovery was in 1870.

*M'Auley's "Lead."\**

In March, 1895, Messrs. Alexander and Angus M'Auley discovered the lead which bears their name; and to them belongs the credit of the first discovery of payable gold in the "black rock" at a distance from the present beach, but not, as is frequently stated, for the first discovery of gold inland from the sea-line.

For several months they had been prospecting the low-lying ground between the sea-beach, Jerusalem Creek, and the site of their find. Mr. Alex. M'Auley states that colours of gold were found almost anywhere in the locality mentioned. The ground was tested by means of a sludger—a tool presently to be described,—the holes being put down at short intervals to depths not exceeding 20 feet.

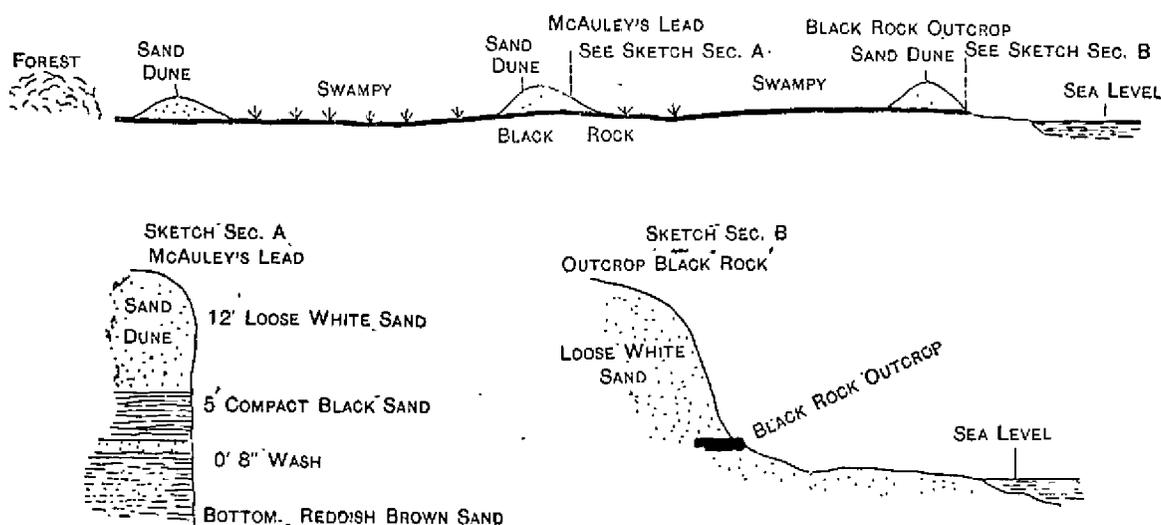

The lead occurs on the east face of a low, narrow, sand-dune, which trends parallel with the coast-line for several miles. For a long distance the lead keeps uniformly on the eastern face, but near the north end it underlies it. Its trend so far as traced is about north and south, and the distance from the coast about three-quarters of a mile.

The sand-dunes—several of which occur between the coast and the Esk River—are about 300 feet wide, and from 10 to 15 feet above the general level. Locally they are known as "terraces"; this term, however, has a local significance, differing from the ordinarily accepted meaning of the term in mining. About M'Auley's Lead and Jerusalem Creek it simply denotes long, narrow, windrows of loose white sand parallel to each other and the coast; and separated by areas of low marshy ground covered with stunted vegetation, chiefly spear-grass.

The "black rock" cropping out along the present coast-line on a uniformly level horizon indicates a prior extension of the swampy conditions seawards, and a subsequent encroachment of the sea. But whether the slight elevation of the surface of the black rock represents an elevation of the land or depression of the sea-bed, or simply an accumulation of sand thrown up by stormy conditions, sufficient data is not yet to hand to enable a determination being arrived at.

The following rough section of the country between the sea-coast and the edge of the forest land west of M'Auley's Lead will give a fair idea of the so-called terraces, and possibly suggest a mode of formation. If the most western dune or terrace be regarded as approximately the position of an earlier shore-line of a broad, shallow estuary, the middle terrace may be regarded as the probable site of a sand-bar which gradually shut off the sea-water; the land drainage and rainfall into the intervening area would gradually tend to render the impounded shallow sea-water brackish, and subsequently fresh; whilst the suspended matter would form nutriment for swamp vegetation, the decay of which has coloured all the underlying beds, so far as tested, to a more or less degree of blackness.

A repetition of similar conditions would account for any number of dunes or "bars" to suit the circumstances.

One of the small sections represents the outcrop of the "black rock" on the coast, along which it forms a most marked feature; and the other the nature of the sinking at M'Auley's prospecting claim; the latter being to scale. At this point, however, the overburden of loose white sand is exceptionally heavy, as the lead here is under the terrace.

A short distance north from M'Auley's the terrace takes a turn to the eastward, and swampy conditions prevail in the direct line of strike. At this point the lead has been lost, and a considerable distance intervenes between its north end and the next nearest workings which are known as Coolgardie.

The connected line of claims which form M'Auley's Lead proper, extends for a distance of about 2 miles. Since M'Auley's discovery the terraces have been followed as guides in prospecting, but it is doubtful whether their present positions can always be regarded as having been permanent since the first accumulation of the loose sand forming them; for the prevailing wind must tend to move them forward in the direction of its course. This objection applies only to the loose sand above the compact or swampy conditions, in which the inequalities would be permanent. The bend to the eastward, north of M'Auley's Claim, may be due to the protection afforded by the higher sand-dunes on the shore line opposite, and a little south of this point, which intercept, and modify the force of the wind, whilst the unprotected terrace further south would tend to move bodily in a more or less straight line. Hence

\* The term "lead" is adopted in this report because of its local use; the auriferous wash, however, has been deposited by the action of the sea on an earlier shore-line, and not by a fluvial stream.

Hence there is every reason to expect to find in the level swampy areas between the terraces, other old shore-lines from which the loose surface sand accumulations have been removed by the transporting power of the wind. This explanation has in fact already been realised near Jerusalem Creek, where the leads occur chiefly in the swampy ground west of the terrace.

M'Auley's Lead itself affords evidence of movement of the terraces, for where the coast dunes are low or wanting, as opposite the southern portion of the lead, it is uniformly on the east side of the terrace, but directly the protective influence of higher coast dunes has come into play, as above stated, the lead passes under the terrace. From this it would appear that the natural inequality in the underlying compact sand layers forming the old shore-line (the present lead)—which rise to the west, and dip seawards—acted as a dam to arrest the wind-borne sand particles, which however, were shifted to leeward of the arresting medium where exposed to the full force of the prevailing wind.

The direction of the latter is rendered remarkably evident on the small plain a little north of M'Auley's Lead, by the inclination of the trees which are canted north-westerly at an angle of nearly 45 degrees from the vertical.

#### *Detail description of M'Auley's Lead.*

A full description of one or two of the most important claims on this lead will serve for the whole, the only variations being in the amount of stripping, thickness of wash, and yield of gold.

M'Auley's Claim, consisting of six mens' ground, is situated near the north end of the lead; and as before stated, is on the terrace instead of east of it. The overburden or stripping of loose sand is, therefore, exceptionally heavy, being upwards of 12 feet deep. At this level the compact black sand—locally identified as the "black rock"—is met with, and 5 feet below its surface the auriferous layer is reached. Underlying the wash is a layer of reddish-brown sand which is regarded as bottom. At the west side, or back of the lead, the auriferous layer forms but a thin streak, which thickens gradually on the underlay seawards. Its richness decreases proportionately with the thickening, and the overburden becomes correspondingly heavier. Hence the width of the workings represents the payable limit of the wash following the underlay. This fact holds good for the whole lead; the workable width of which, under present conditions, varies from about 14 to 30 feet.

The richest portion of the wash lies well up on the sloping bottom of the lead, just as do the "sniggers" of the present beaches after south-easterly gales. The gradual cessation of the gales, and recession of the waves, tend to draw off the lighter particles down the sloping surface of the beach, leaving the heavier stranded beyond the reach of normal waves, nature thus performing on a gigantic scale the panning of the miner.

In a number of claims—Williams and Party's for instance—two layers of auriferous sand occur, separated by about 3 inches of barren sand; the auriferous layers in this instance being 6 and 10 inches thick. The intervening barren sand increases in thickness in some claims—as at Kcats and Party's—to about 2 feet.

About 12 inches above the top of the black sand is a layer of varying thickness known as the "blue seam," which carries colours of gold, the colour of the layer being due to the distribution of black sand particles through the pure white. The "seam" represents, very probably, æolian concentration on the surface of the compact black rock. The concentrating action of the wind, by removal of the lighter particles of quartz sand, is seen to advantage any windy day on the sea-beaches; at a distance the wind-born particles have the appearance of dust. In this way large areas of beach surface, covered with a thin superficial layer of the heavy black sand-grains, have been completely sifted of the lighter quartz particles which were left entangled by the waves.

In the black rock above the wash very black thin bands occur at intervals, one very characteristic one, about 1 inch thick, just above the wash. These are exceedingly hard, most likely owing to the precipitation of an iron salt by organic matter.

In October last, there were but four claims at work north of M'Auley's Lead. In the most northern—Wilson and Bourke's—the stripping is very heavy; about 16 inches of wash is said to underlie it.

As before stated, north of this point a break in the lead occurs, extending for at least a mile. Up to this point the "terrace" has run a true course nearly north and south, here it takes an easterly bend. If, as there is reason to believe, the lead represents an earlier shore-line, a sinuous bend partly round a projection seawards, or following an inshore encroachment, may naturally be expected, which may account for the loss of the lead at the north end of M'Auley's, irrespective of the contour of the terrace; on the other hand the lead may yet be found on its course under the swampy land, and ultimately connect with the Coolgardie Lead which lies in the same general direction.

South from M'Auley's Claim the lead with few exceptions is being worked in a continuous line of claims for about one mile and a half. The richest portion, however, lies north towards the Prospecting Claim.

Prospecting has been extended for a considerable distance south of the most southern workings but without success; gold being obtainable, but not in payable proportion. In this direction the wash shows a considerable thickening, accompanied by a corresponding depreciation in richness. In M'Auley Bros. Claim at the extreme south end, the auriferous layer is 3 ft. 6 in. thick, and the approximate width 20 feet. An attempt was being made to work about 2 feet of this wash.

#### *Coolgardie Lead.*

This lead is situated on the west side of Jerusalem Creek. Three claims only were at work, but active prospecting was proceeding between it and the mouth of the creek. A number of claims have already been worked out north of the above lead.

The most interesting feature about the Jerusalem Creek Mines, and one of hopeful import to the field, is that several distinct runs of gold-bearing sand have been proved, in the swampy flats as well as in the terrace. In the swampy ground the sinking is from 9 to 12 feet. The runs of wash vary in thickness from 1 to 2 feet, by a width of about 12 feet. Water stands within about 3 feet from the surface.

Close to the head of Jerusalem Creek, the gold is obtained from about 2 feet of white sand just above the black rock; the best yield being from a seam about 3 inches thick directly above the latter. The underlying black rock has been tested to a depth of 12 feet, but nothing beyond colours was obtained; this, however, appears to have been a single test.

North from Jerusalem Creek the coast country loses its level character, and changes from marshy land traversed by low parallel sand dunes, to very undulating country covered with high dunes irregularly disposed.

Between

Between the sand-hills fresh water channels trend from the adjacent high lands on the west. At intervals large basin-shaped depressions occur also filled with fresh water. Along the shore-line high narrow sand dunes extend, the leeward of which affords capital camping ground for the itinerant miners who periodically visit the locality after stormy weather to work the "smiggers" or concentrates formed by the action of the high waves. In October, however, this locality was practically deserted owing to the superior attractions of M'Auley's Lead, and the absence of gales.

All the workings on the high levels back from the beach in this neighbourhood have been in the loose white sand.

#### *Method of Working.*

With few exceptions the whole of the stripping is done by manual labour, with shovel and barrow. The exceptions being a derrick and scoop worked by horse-power, and a few tip-drays.

The loose white sand is first removed in large benches or paddocks until a sufficiently large opening is obtained, then a bench of the compact black sand is taken out to the wash-level. In some instances the auriferous layer is beaten with large wooden mallets or rammers before removal, in others it is first raised and then broken on floors. The worked benches are then used in progressive order, partly for stowage of the overburden of black rock in succeeding benches, and partly as a sump or well-hole for drainage of the water. The loose white terrace sand is, however, always removed out of slipping reach of the workings.

The natural level of the soakage water is a little above the wash-level, but it can be kept down by jigger pumps, which are used in connection with the washing of the pay sand. Once a claim is properly opened, raising and treating the wash is concurrent and continuous, and pumping and washing readily and naturally combined.

Since the discovery of the lead, the conditions for cheap and expeditious working have been most favourable. The long-continued drought, so disastrous in its effects in most parts, has been an unmixed good in this locality. The water in the claims, though highly coloured by vegetable organic matter both in solution and suspension, is fresh and potable, and abundant for all requirements. (If preferred, clear fresh water is procurable near the Esk River for domestic purposes.) Judging from the surrounding swampy conditions and the porous nature of the sand-beds, it is extremely doubtful whether many—if, indeed, any—of the present claimholders could contend against a heavy and continuous downfall of rain. Much of the surface between the terraces is evidently periodically covered with water.

#### *Treatment of the Gold-bearing Sand.*

The method of treatment adopted for the auriferous black sand is uniformly the same along the lead, the only differences noticeable being in its more or less systematic application. One of the best regulated plants is that of Messrs. Hammond, Dowling and Party, whose claim adjoins the prospector's, a description of which will serve to illustrate the treatment.

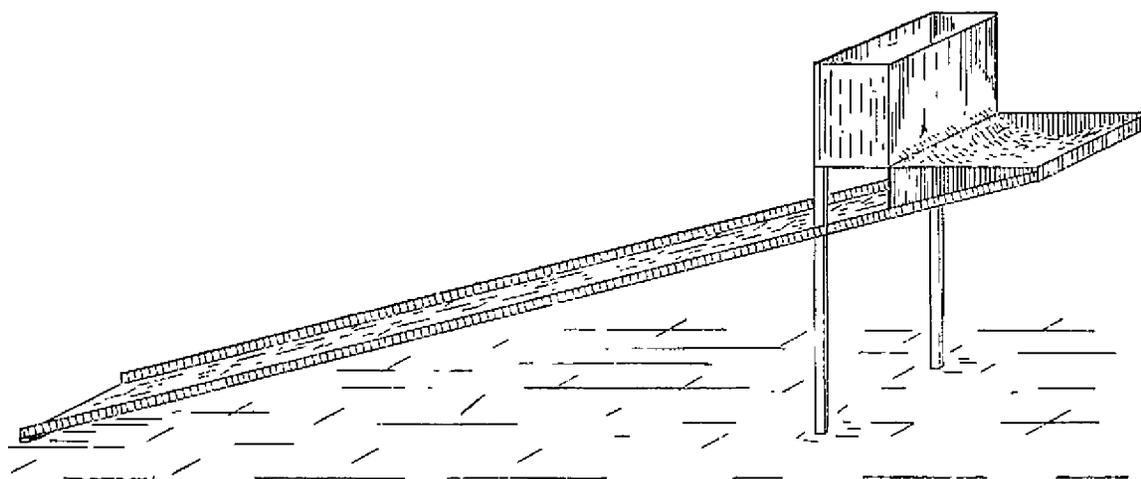

The auriferous sand is beaten *in situ* with wooden mallets, then wheeled on to a floor 12 ft. square, formed of tongued and grooved boards. Here it is screened through an ordinary plasterer's quarter-inch screen. The rejected portion is raked evenly over the floor, and rolled with a small iron garden roller and again screened. This operation is repeated until all the material passes through the screen. One man attends to this portion of the work as well as clearing the tailing pit.

The screened material is then fed slowly into a perforated zinc-lined hopper affixed over the upper end of the table. The water supply is raised from the mine workings by a jigger pump, and conveyed to the machine by canvas hosing; the distributing medium being an ordinary wooden box with a line of perforations just above the bottom on the hopper side.

The small indurated pellets of compacted sand grains too large to pass through the perforated lining of the hopper are scraped out by hand. These, after thorough dessication either by sun or artificial heat, are rolled and again passed into the hopper.

The table in use—14 ft. long and 2 ft. 3 in. wide—is set at an angle of about 13 degrees from the horizontal. Its width appears to be regulated chiefly by the breadth of an ordinary strip of carpet with which it is lined. A rectangular iron box, fitted with lock and key, is used for storing and securing the concentrates which from time to time are washed from the carpet. The concentrates consist of the heavier particles of the wash and the associated tinstone, gold, platinum, and platinoid metals which are caught on the rough surface or pile of the carpet.

The following sketch will give an idea of the table in use on the field.

The concentrates, at intervals varying according to the immediate wants of the owners of the different claims, but generally from three to four weeks, are washed in a solution of ordinary washing-soda with a little caustic soda, to which in some cases is added caustic potash. The strength of the solution varies. At the plant under description about 3 lb. of washing-soda is added to an ordinary oil-drum of water—about 5 gallons; the proportion of caustic soda being about 4 oz.

The duration of the treatment is dependent entirely upon the discretion of the manipulator, some preferring vigorous stirring and short immersion; others a more or less protracted subjection to the action of the alkalies; others, again, a double washing. The effect of this process, if efficiently conducted, is to remove the organic colouring which coats the individual particles of the sand, and doubtless to a large extent the metallic contents; and according to the completeness of the chemical reaction do the particles assume their natural colours. Hence the chemically-washed concentrates are much lighter coloured than the untreated material.

On completion of the cleansing process the carpet is removed from the table and amalgamated copper plates substituted. The prepared concentrates are then passed slowly over them, frequently as often as three times; and finally are bagged or preserved in separate heaps, as they have proved by assay to be of considerable value, on account of the escaped amalgam, free gold, platinum, and tinstone which they contain.

The above description of the method of treatment holds good for the whole lead, the only difference being in the detail. For instance, in some claims the wash is far more indurated than in others, and fire is used to render it thoroughly dry and friable, the sun-drying process being too slow and less efficient. Whilst saturated with water the wash possesses toughness in addition to its ordinary hardness. Complete expulsion of the moisture, however, renders it friable, excepting in such instances as already recorded, where hardness is due to cementation caused by precipitation of oxide of iron by organic matter, arising from the decomposition of vegetation on the swampy surfaces.

Where the loose white sand alone is worked, as near the head of Jerusalem Creek and the high-level claims further north, carpeting is not always used, the wash being passed directly over the copper plates.

#### *Loss in Treatment.*

Very diverse opinions are extant on the field as to the amount of gold lost in the tailings and concentrates, estimates varying from 30 to 70 per cent. of the actual contents.

During inspection small quantities were selected from the tailings' heaps of at least two-thirds of the claims on McAuley's Lead, for the purpose of obtaining by assay a general idea of the loss in the first part of the treatment. In like manner small quantities of the concentrates after amalgamation were secured. From the general average of these samples the following results were obtained under the supervision of Mr. J. C. H. Mingaye, F.C.S., Analyst and Assayer to the Department:—

(4138). Mixed tailings from about two-thirds of McAuley's Lead claims:—

	dwt. gr.
Gold .....	2 14 per ton.
Silver .....	1 7 „
Metallic tin .....	0·05 per cent.

No platinum or platinoid metals detected.

(4139). Concentrates from McAuley's Lead claims after amalgamation:—

	oz. dwt. gr.
Gold .....	2 19 3 per ton.
Platinum .....	0 18 17 „
Iridosmine.....	under 15 „
Metallic tin .....	5·12 per cent.

(4270). Tailings from Hammond, Dowling, and Party's Claim:—

	dwt. gr.
Gold .....	3 19 per ton.
Silver .....	3 19 „

No platinum or platinoid metals detected.

(4269). Concentrates from Hammond, Dowling, and Party's Claim, after passing three times over amalgam plates.

	oz. dwt. gr.
*Gold .....	15 1 12 per ton.
Platinum .....	2 18 3 „
Iridosmine.....	0 17 7 „
Metallic tin .....	28·52 per cent.

\*Chiefly from amalgam which escaped from the plates.

The following assay results, obtained in the Departmental Laboratory,† are quoted to show the extent to which concentration on a small scale has been carried on as regards the metals, other than gold, and the tin oxide. Unfortunately these returns afford no data of value, as particulars are not available as to the quantities of wash operated on.

With the exception of No. 1,251, these samples were presumably concentrated in the ordinary manner by frequent passage over carpet-covered tables. The exception was the result of manipulation in a small experimental machine constructed by a Mr. R. Young, but nothing is known of the principle.

(245). Concentrated beach-sand from Ballina:—

	oz. dwt. gr.
Platinum .....	428 9 4 per ton.
Iridium .....	26 16 16 „
Osmiridium .....	161 13 20 „
Other platinoid metals .....	2 16 11 „
Gold .....	2 19 12 „

(1251.)

† Ann. Rept., Dept. Mines, for 1894, p. 57.

(1251.) Beach sand from the Richmond River district, concentrated by Mr. R. Young :-

	oz.	dwt.	gr.	
*Gold .....	70	4	16	per ton.
Platinum .....	36	5	4	"
Iridium ..	8	6	14	"
Iridosmine.....	6	0	18	"
Other platinoid metals .....	4	8	2	"
Metallic tin .....	25.7			per cent.

\* In this case it is known that none of the gold contents had been removed by amalgamation before concentration.

(2690). Concentrated beach sand (containing some amalgam) from the Richmond River district :-

	oz.	dwt.	gr.	
Gold .....	100	18	7	per ton.
Platinum .....	68	0	4	"
Osmiridium ..	8	18	23	"
Iridium and other platinoid metals.....	2	1	19	"
Metallic tin ..	28.96			per cent.

(2879). Concentrates from J. Ware's claim, Richmond River District :-

	oz.	dwt.	gr.	
Platinum.....	129	9	16	per ton.
Osmiridium.....	58	0	7	"
Iridium and other platinoid metals .....	5	0	7	"
Gold.....	0	9	11	"

(3499). Concentrated beach-sand from between Richmond River Heads and Byron Bay :-

	oz.	dwt.	gr.	
Platinum.. ..	7	13	22	per ton.
Osmiridium ..	1	6	0	"
Other platinoid metals.....	0	3	6	"
Gold.....	0	9	18	"
Metallic tin .....	15.82			per cent.

When the concentrates after amalgamation yield an abnormally high return of gold, it may be taken for granted that most of it is from amalgam which escaped from the plates.

The gold returns in the four samples Nos. 2879, 3499, 4139, and 245, which may, perhaps, be regarded as comparatively free from amalgam, equalled 9 dwt. 11 gr., 9 dwt. 18 gr., 2 oz. 19 dwt. 3 gr., and 2 oz. 19 dwt. 12 gr. respectively.

It is probable that concentrates which have been treated with due care contain under 3 oz. of gold per ton. This estimate, however, refers only to the amount of gold which is prevented amalgamating by coating of the particles, enclosure in hardened pellets, or other causes; for there can be little doubt that the average value of the concentrates in gold is considerably higher owing to the presence of escaped amalgam. The loss in this way is due (perhaps chiefly) to limited plate areas in the first place, and in the second to the rasping effect of repeated passage of such heavy material over the plates.

A careful examination of the above-quoted amalgamated samples, revealed the presence of a certain amount of free clean gold, the escape of which, in the total absence of slimes, must be attributed chiefly to the short length of the plates, and partly to the floating capacity of the gold particles, the surfaces of which are large in proportion to their gravity.

As regards the tailings from the carpet-covered tables, there is reason to believe that the supposed loss of gold is greatly exaggerated. The average sample made up of small quantities taken from about two-thirds of the claims on M'Auley's Lead, gave a return of 2 dwt. 14 gr. of gold per ton; and a sample from Hammond, Dowling, and Party's Claim, selected by themselves, yielded 3 dwt. 19 gr. per ton.

These returns, however, cannot be regarded as sufficient indication of the true average value of the tailings, which have in many cases been unduly enriched by defective manipulation, chiefly through insufficient crushing of the indurated portions of the wash. It is impossible to secure satisfactory average samples without bulk sampling, for as the wet tailings on the surface of the heaps rapidly dry, a large proportion of the small indurated pellets formed of compact sand grains (which probably contain the major portion of the lost gold) roll down the sides, and become more or less covered. Such, however, as remain exposed to the sun and wind disintegrate, and thus liberate the enclosed metallic particles, which, with those previously held in the wet tailings by suction from their great gravity, tend to sink as the drying surfaces of the heaps are rendered lively by the wind or the continuous slipping of the loose dry grains to their angle of rest. In this way the heavy metallic particles get beyond the reach of surface sampling.

As the wash is practically free from any shining substances, whatever loss occurs in the first process is confined to the tailings.

As the quantity of tailings on the lead is very large, a proper bulk sampling test to ascertain the true average value would be a boon to all concerned, and one well within the scope of the proposed Metallurgical Works.

It is highly probable that after exposure for a time to the influence of wind and weather, these tailings may even be remuneratively reworked under the present system, if previous roasting, or boiling in caustic solutions be adopted, and a large plate surface be used on the tables. At the same time a question well worthy practical demonstration in the Government Metallurgical Works, is the suitability of the Cyanide Extraction Process for recovery of the gold in the tailings; it appears highly probable that such a process would be most suitable.

As further evidence of the value of the tailings I have been informed by Mr. S. Dowling, of Hammond, Dowling, and Party, since the rough draft of this report was completed, that the following bulk test had lately been made by Allen and Party, of the Derrick Claim, M'Auley's Lead. A load of the natural wash was passed over the carpet in the usual way; the concentrates on treatment by caustic solution and amalgamation yielded about 4 dwt. of gold. The tailings from the carpet were then treated with caustic solution and afterwards amalgamated, the yield being 5½ dwt. of gold. The result of this test has induced others on a larger scale. Hammond, Dowling, and Party intend to put through a large parcel of their wash, discarding carpet concentration, and adopting the caustic solution treatment for the whole before amalgamation with larger plate surface than formerly used. The result of this experiment will be awaited with interest.

Composition

*Composition and Characteristics of the Wash.*

High specific gravity, fineness of component particles and colour, are the physical characteristics which immediately arrest attention.

The gravity of a sample of the wash from M'Auley's Claim carefully determined by Mr. Mingaye was 4.42. That of the average concentrates of the lead after amalgamation 4.22.

An attempt was made to estimate the proportion of quartz sand in the natural wash by means of a gravity solution, viz., borotungstate of cadmium, which has a density of 3.28. With the exception of a few grains which remained in suspension, the whole of the sample settled at the bottom of the tube, from which it may be inferred that the proportion of quartz is very slight, as indicated by the high specific gravity (4.42).

On warming a little of the wash with distilled water the solution gave an acid reaction with litmus paper. On roasting at a low heat in the open the organic matter and colouring were readily burnt off, which opens up the question as to the relative advantages of roasting and solution. To effect thorough combustion of the organic matter by roasting, open hearths or plates, lightly spread charges, and frequent raking will be necessary. The two processes are equally effective as far as cleansing the sand grains is concerned; roasting, however, removes the peaty particles which would remain practically untouched in the solution; this does not, however, affect the equal value of the solution process, as the peaty fragments would not interfere with amalgamation. The question therefore resolves itself entirely into one of relative cost.

After roasting in the open it was found that the major portion of the titanite iron could be removed by magnetic separation.

Briefly stated the wash is composed chiefly of small zirconous—mostly uncoloured—ilmenite (titanic iron), quartz, garnets, and tinstone, and varying proportions of gold, platinum, and platinoid metals.

The hardness (7.5) and highly crystalline character of the zircon sand suggests the possibility of its utilization for the preparation of an improved variety of sandpaper.

The fineness of the component particles of the wash will be easiest comprehended from the results achieved in sizing tests, which are given in the following abstract:—

SIZING TESTS.

Locality.	Nature of Material.	Weight of Sample.	No. 1 Screen	No. 2 Screen	No. 3 Screen	Passed through No. 3 Screen.	Remarks.

*Further concentration of Carpet Concentrates.*

To effect a further reduction of the waste material in the concentrates from the carpets, sizing will first be necessary to ensure full efficiency of any form of gravity separation; without it larger particles of lighter substances will surely follow small fragments of heavier. Hence trials with Bruce Vanner's (departmental test), Wick's, and Farquar's Machines were unsuccessful. The latter machine embraced the principle of gravity *versus* upward hydraulic pressure regulated to overcome the gravity of descending lighter particles of the sand.

Judging from the results of the small experiments already quoted, it appears that sizing will also concentrate to a certain extent. For instance, the tinstone particles will readily pass through a screen of 8,100 holes to the square inch. The quartz grains rarely pass through a screen of 3,600 holes to the inch.

It was also found that the bulk of the titanite iron could be removed by magnetic separation after roasting in the open, the weak native magnetism being increased thereby.

*Platinum Concentrates.*

A great deal of dissatisfaction exists as to the local prices offered for platinum, which a few miners have endeavoured to concentrate. The few transactions or offers which have taken place appear to have been almost entirely based on haphazard estimates of value. An idea of the present price of crude platinum may be gained from the local selling price at the Fifield Mines, viz., 24s. per ounce for 75 per cent. metal. The platinum particles from the latter field are comparatively coarse, and therefore easily concentrated and cleaned, whereas those of the beach sands are excessively fine (in one instance a 74-grain sample

sample practically all passed through a screen of 8,100 holes to the square inch), which renders complete separation a difficult and lengthy process. The platinum concentrates of the beach mines generally consist of parcels of the heavier sand grains and tinstone, with varying quantities of platinum, which is reckoned by the yield per ton instead of percentage proportion.

The chief difficulty in connection with the realisation of the market value of the contained platinum is the smallness of the separate parcels and the cost of assay. A way out of the difficulty would be the pooling of the parcels and proportional division of proceeds obtained through one average assay. The process of concentration being uniform in pooling, it would only be necessary to ensure that each parcel had been carried to the same degree of fineness. Considering all the circumstances, however, the wisdom of attempting to separate the platinum is not apparent. Sale of the mixed concentrates on bulk assay (after amalgamation) appears to offer greater advantage to the individual vendors.

*Payable Leads beneath those at present worked.*

So far as could be ascertained very few attempts have been made to test the sand-beds beneath the present wash-level. In some of the very few test-holes below the bottom of the leads colours of gold have been found. It appears very probable that deeper leads exist, but the possibility of working below a stripping level is not very bright unless the yield is high. The presence of permanent water with impossible drainage, and porous and treacherous ground, requiring powerful pumping machinery, and close timbering or boxing, would render working very costly.

*Prospecting.*

Prospecting in the sand-beds is nearly all done by sludgers or sand-pumps, which are at once cheap and efficient; indeed, they can be readily extemporised. The better quality consists of a short steel barrel, about 2 feet long, and from 1½ to 2 inches in diameter, fitted with an air-tube and spring dump, or a ball or clack-valve. The sludger is affixed to the end of a light pine rod from 16 to 18 feet long.

The extemporised sludgers simply consist of a section of ordinary gaspipe, tempered and fitted with two rectangular opposite openings near the upper end, and a perforated wooden plug-valve and metal dump. Lining-tubes for the sludger-holes consist of two lengths of gaspipe or ordinary galvanised spouting of a slightly larger diameter than the sludger-barrel. To these tools it would be advantageous to add a chisel-shaped cutter (which could be affixed to the upper end of the sludger-rod), for the purpose of cutting through the hard bars in the "black rock."

Through the kindness of Mr. S. Dowling a section is given of an improved sludger, designed by Mr. R. W. Laidley, Consulting Engineer, 56, Pitt-street, and constructed at Mort's Dock. The original sludger designed by Mr. Laidley has been successfully used between the Esk and Evans Rivers for a period of about eighteen months. The latest design embodies all the improvements which practical tests have suggested, not the least being the sectional, jointed sludger-rod, which screws together on the principle of a fishing-rod.

The locally extemporised sludger, from a section of tempered gaspipe, is also illustrated in section, from a sketch of one in use at Jerusalem Creek.

In prospecting with a sludger a hole is sunk about 3 feet deep, sufficiently large to enable a man to stand in it and hold the lining-tube, which he gradually presses down with a semi-rotary motion as the sludger-hole deepens. The sludger is worked like a jumping-rod, the best results being obtained when the force of the impact is regulated chiefly by the gravity of the falling tool, and is followed by a semi-rotary boring motion before raising. As the wash-level is approached prospects are panned off on a shovel, on to which a little water is poured at short intervals. The miners become very expert at this form of vanning.

When two lengths of lining-tube are used, the shorter is first put down to the level of the 3-foot hole, and then withdrawn and the longer inserted. In this way it is possible to work the sludger-rod at the top of the lining-tube without a raised platform. The tubes are readily withdrawn by means of a short rope.

The test-holes are generally put down at short intervals, the distance varying according to the prospects obtained.

*Applications for Prospecting Aid.*

A number of applications have been received by the Prospecting Board for aid to prospect in the Parish of Esk, but a single visit to the locality is sufficiently convincing of the inutility of erratic individual effort. The conditions of the field are such as require systematic prospecting under efficient control, and concentrated effort on definite lines at right angles from the coast across the sea-made areas. The correctness of this view has been readily conceded by the applicants.

The following areas are well worthy systematic proving in the way indicated:—Between the Esk River and Jerusalem Creek and the coast; north of Evans River towards Broadwater; and about ¼ of a mile north-west of Byron Bay township.

*Derivation of the Gem Sand and Associated Metals and Metallic Minerals.*

As might be expected considerable diversity of opinion exists as to the source of the precious metals in the sands of the North-coast beaches. Some regard the adjacent coast ranges as the original repository; others surmise the existence of auriferous reefs beneath the sea parallel with the coast line; whilst others, regardless alike of distance and opposing currents, look even so far the West Coast of New Zealand, where similar auriferous sands occur. Precipitation from sea water is also not without advocates.

For the sake of comparison it is interesting to note Dr. Julius von Haast's description of the alluvial workings on the West Coast of New Zealand:—"The earliest found and most elevated of the drifts rest on terraces composed of marine Tertiary strata, where they have escaped denudation by the streams descending from the mountains. The second group of gold diggings are those in the beds and alluvial terraces of streams which intersect the first-mentioned leads. Third—The beach terraces, which extend to an altitude of 220 feet, and mark several changes in the level of the shore line within a comparatively recent geological period. In this group also must be classed the gold deposits formed on the present coast line by the action of the surf and currents, which distribute along the shore the gold brought down by the streams."\*

As

\* N. Zealand Mining Statements and Gold-field Reports (H. Authority), Vol. 3, 1893, p. 150.

As detail geological survey proceeds, the interesting problem of origin presented by the North Coast auriferous beaches will doubtless receive practical demonstration, in the meantime the following possible sources may be discussed :—

- (a) The underlying Siluro-Devonian rocks.
- (b) The Clarence Coal Measures, particularly the basal and middle beds of the Series.
- (c) Early drainage channels, represented by drifts under basalt.
- (d) The auriferous (?) basalt at the Richmond River Heads.
- (e) Present drainage channels from the eastern margin of the auriferous and stanniferous rocks of New England.

In considering the above suggested sources it is essential that the enormous spread of the auriferous sands along the coast should be kept prominently in view. From near the Queensland Border to Port Macquarie, at least, these sands have been worked; and even as far south as Shellharbour, south of Wollongong, similar sands occur, and have received a little attention. The distance between the extreme points mentioned is about 500 miles. In considering the probability of any restricted source, such as the Ballina basalt, it must also be remembered that the trend of the coast current is southerly.

The break in the continuity of the auriferous sands along the coast between the most southern (Shellharbour) and the nearest northern (Port Macquarie) will, perhaps, eventually be accounted for by the difference between the geological formations of the watershed between these points and those opposite the auriferous beaches.

(a) *The underlying Siluro-Devonian rocks* developed on the North Coast, between Broken Bay, near Ballina, and Sutherland Point, near the Tweed River Heads, contain numerous quartz reefs. In a few instances assays up to several dwts. of gold per ton have been obtained from the most favourable; but the average results have not exceeded 2 dwts. per ton. Mr. E. F. Pittman, after examination of the auriferous beaches between the Richmond and Tweed Rivers, came to the conclusion, in the year 1880, that the black sand and gold evidently came from a drift (underneath the basalt) derived from the underlying older rocks (Siluro-Devonian).\*

The basalt referred to touches the coast about Ballina at the Richmond Heads, where it overlies the Clarence Coal Measures, hence any drifts directly underlying it having the above derivation, must have been transported from the Siluro-Devonian area on the north.

The drift becomes additionally important if instead of restricting its source to the underlying rocks, we regard it as evidence of extensive channels which, prior to the basalt outflow, drained from the high auriferous and stanniferous areas of the West. This extension of the source of the drift would account for the large proportion of gem sand and the tinstone, which are invariably associated with the gold and platinum metals in the beach sands, neither of which could be reasonably assigned wholly to the Siluro-Devonian sedimentary rocks.

(b) *The Clarence Coal Measures* form the surface rocks along the coast from a little north of Ballina to nearly opposite Solitary Island, a distance of about 80 miles south. The auriferous character of these measures is based upon the discovery of gold in minute specks in the Hawkesbury Sandstone (which is regarded as the equivalent of the middle beds of the above measures), at North Shore, and Govett's Leap, by the Revd. W. B. Clarke, M.A., F.R.S., &c.† and recently by Professor Liversidge in the same beds at Pyrmont, and in the overlying Wianamatta Shales in the University grounds, Sydney.‡

The basal conglomerate of the Clarence Measures, so far as is known has not been tested. This bed has an extensive outcrop along the western margin of the coal basin, where a thickness of several hundred feet rests directly on the auriferous Siluro-Devonian slates and sandstones of the eastern falls of the New England Tableland.

Where exposed in creek sections the conglomerate and intercalated coarse grits are generally very friable. Frequently quartz pebbles are abundant, the bulk, however, being slate and granite.

Considering the nearness of the Dalmorton, Mann River, and Solferino reefs, and the junction of the stanniferous granite, it is reasonable to expect to find at least traces of gold, tin, and gem stones in a conglomerate formed from the wearing down of such rocks. Through the kindness of Mr. W. J. Mulligan, of O.B.X. Creek, about 20 miles from Grafton, I have been able to test, by panning off, about 50 lb. of this conglomerate; but, contrary to expectation, none of the abovementioned minerals were detected. The test, however, can only be regarded as a superficial one.

Though gold has been determined in the Hawkesbury Series, there is no record of platinum ever having been detached.

The basal beds of the Clarence Measures have an additional interest, inasmuch as beds of similar age and geological horizon have recently been identified by Mr. E. F. Pittman, Government Geologist, as containing artesian water at Moree.

(c) *Drifts under Basalt.*—This possible source has already been alluded to under section (a). Basalt is extensively developed as a surface rock between Ballina and Casino; thence north-westerly up the channel of the Richmond River to Rosebery Station, and from there north-easterly to the coast at Point Danger.

Another outcrop trends north from Casino to Fairy Mount, and from there north-east to the valley of the Tweed, where it joins the first mentioned.

The isolated patches of basalt at Tobbinoble, and near Doubleduke Peak, on the dividing range of the Clarence and Richmond coast waters, afford indisputable evidence of a southern extension of the Richmond basalt sheet, or of a similar flow now almost entirely removed.

Under the Tobbinoble basalt patch, which is now but 10 to 15 feet thick, resting on Hawkesbury Sandstone, quartz pebbles and granular drift occurs, which has been prospected by three or more shafts, a little gold being obtained.

From selected samples, fine colours of gold and a little of the characteristic gem-sand of the beach-wash were obtained. Tobbinoble lies about 10 miles south-west of M'Auley's Lead.

The extensive basalt flows of the Richmond and Tweed Districts in all probability filled up the pre-existing drainage system from the western table-lands; and this would, as before stated, account for the composition of the beach sands, formed from denudation of the old channel débris.

(d) *Basalt as a Source of the Gold.*—According to Mr. Munro, gold was first reported in decomposed basalt at Black Head, near the town of Ballina, in February, 1888. The only other record of the occurrence of gold in basalt ascertainable is that recently announced by Mr. J. Collett Moulden, A.R.S.M., from Kangaroo Island, off the south coast of South Australia.\*

Professor Tate, in an editorial note, states that the basalt referred to occurs as an intrusion in mica schist. The specimen microscopically examined by Mr. Moulden contained a small speck of gold embedded in it, which might have been caught up from a reef in the intruded schist.

The late Government Geologist, Mr. C. S. Wilkinson, describes the Ballina occurrence in the following terms:—"The town of Ballina, which is immediately within the river entrance from the ocean, is situated on the flat; but the north head of the entrance consists of a small hill of dense black basalt and blown sand. About half a mile further north is the Black Rock (Head), a perpendicular cliff 30 feet high, facing the ocean, and composed at the base of hard dense basalt, then a bed 4 to 10 feet thick of scoriaceous volcanic agglomerate, overlaid by 15 to 20 feet of hard dense columnar basalt; above this is about 30 feet of soft decomposed laminated basalt.

Mr. Munro informed me that from the lower agglomerate bed several parcels had been treated in Sydney—one of over 3 tons yielding at the rate of 2 dwt. 10 grs. of gold per ton, and another of 19 cwt. yielding 18 dwt. 11 grs. of gold per ton, a total of about 7 tons 17 cwt. treated gave an average yield of 12 dwt. per ton. These beds have a slight dip inland and could be easily worked. There is no doubt that the gold and platinum in the sand and gravel on the beach, which has for years past been worked to the north and south of Black Rock, have been derived from the denudation of the basalt; the rippling action of the ocean surf tending to throw back the gold with the black sand and shingle drift about high water level.†

Mr. Wilkinson personally selected samples from the 4-foot bed in Jones' shaft, from the top 1-foot layer of the lower 8-foot bed, from top bed 30 feet thick, and from lower 7-foot level, all at Black Rock. In only one of these samples was the Departmental Analyst, Mr. Mingaye, able to detect even a trace of gold.

Mr. Wilkinson also selected samples from the same basalt sheet near Lismore, in none, however, was gold detected.

Whilst recently at Ballina I also selected a sample from the agglomerate, and later on Mr. Munro forwarded a larger sample. In both instances care was taken to break away the sea-worn face and to take only the freshly exposed material. Large duplicate assays and panning tests failed to detect the presence of gold in either sample.

The value of the discovery is greatly discounted by the conflict between the numerous fire assay results and those obtained by mechanical treatment from bulk parcels, a statement of which, through the kindness of Mr. Munro, is here given.

*Statement of Crushing of Basalt from Black Rock, Ballina.*

Where treated.	Tons cwt. qrs. lbs.	Yield per ton.		Remarks.
		Oz.	dwt. gr.	
Sydney Mint ...	0 17 1 16	0 15	6	From sea face, lower seam.
Parke and Lacey ...	3 8 0 10	0 2	12	Do.
Do. ...	1 18 3 15	0 12	13	From drive in lower seam.
Do. ...	0 19 1 3	0 18	11	From drive in lower seam, 20-30 feet.
Do. ...	0 14 1 16	0 9	18	From top or surface seam.

The above parcels were dispatched in three lots at different dates in 1888.

Were it not for the yields from the two parcels obtained from drives in the lower seam (one of which is stated to have been from 20 to 30 feet in length), the discrepancy between the assay and bulk crushing results might be accounted for by the accidental occurrence of gold in the exposed scoriaceous agglomerate face at the foot of the Black Rock, the vesicular cavities of which would act as small rille holes as the auriferous sand of the coast is dashed against it by the wash of the waves which continuously reach it save at low tide. That gold sands have been perpetually dashed against this bed is undoubted, because of the occurrence of one of the richest patches of beach sand just on the north side of the Black Rock.

The presence of gold in the decomposed basalt forming the soil on the top of the cliff just below the Lighthouse (where the discovery was first made) does not weaken the above solution of the question, because the windblown sand mentioned by Mr. Wilkinson has at one time extended over the top of the basalt at this point, a little of it even now remains. As it was drifted away by the wind a few fine gold particles would remain on the surface of the decomposing basalt, and would slip into sun-cracks and joints, and thus account for the surface prospects obtained.

It is unaccountable why such favourable prospects, obtained from bulk samples, have not been followed up.

The value or worthlessness of this basalt as a source of gold is a question well worthy of thorough demonstration when the Government Metallurgical Works are in operation, pending which inquiry as to whether the contained gold is indigenous or accidental may well remain in abeyance.

The gem sand and tin stone, which are such uniformly persistent associates of the gold and platinum of the beach sands, can hardly have been derived from the basalt even if the gold was. A quantity of the crushed basalt was carefully panned, but no trace of any enclosed gem stones could be seen under the microscope. Even if such had been present in quantity their presence would, perhaps, be best accounted for by accidental engulfment in a basalt overflow.

(e) *Present drainage channels from the eastern margin of the auriferous and stanniferous rocks of the New England Tableland.*—These channels have a precipitous watershed from the above formations, and short courses to the ocean. They are very subject to flooding in rainy seasons, the currents at such times being swift and powerful. The lower stretches of these rivers have little fall, and here the heavier burdens from the precipitous upper reaches are dropped, whilst only the finest particles are swept on to the sea.

Where the watershed is formed of rocks, differing from those mentioned above (as west of Sydney, where the Hawkesbury Series, and the Permo-Carboniferous Measures form the high lands), the characteristic auriferous sand is absent from the coast beaches.

Taking

\* Trans. R. Soc. S. A., 1895, XIX, Pt. 1, pp. 71, 72.

† Ann. Rept. Dept. Mines N. S. Wales for 1889, p. 203.

Taking all the facts into consideration, it seems most probable that the earlier drainage channels (represented by the drifts under the basalt flows) and the present surface streams have been, and are, the feeders of the auriferous beaches.

The early drainage channels probably first began the work of transporting the sand to the sea, which is now being carried on by the present drainage system. Owing to the extreme fineness of the particles, the powerful currents of these old torrential rivers, like the present, were able to overcome the high gravity of the component minerals and sweep them on to the ocean, where they encountered an opposing current and the shoreward sweep of the waves.

Since the basalt flow filled up these early rivers, and turned the waters into new channels, atmospheric denudation has been steadily wearing away the volcanic cover and bringing the imprisoned drifts again within the transporting influence of rain and stream to the further enrichment of the beaches.

#### Conclusion.

In concluding this report I desire to point out that for upwards of twenty-five years the auriferous beaches of the North Coast, particularly those between the Clarence and Tweed Rivers, have provided employment for a large number of men. Notwithstanding that the work has been intermittent, and the yields irregular, it is estimated by residents, competent to judge, that the average annual earnings have not been less than £1 per week per man. Many of the small settlers of the districts mentioned work the beaches when farming operations are slack, and, on the other hand, many of the regular miners avail themselves of the employment offered during the sugar-cane crushing season. Though the beaches have been robbed of nearly all the original rich accumulations, yet occasional highly payable patches are discovered, whilst the repeatedly worked areas are continually renewed whenever south-easterly gales occur. Taking all these facts into consideration, conjointly with the possibilities awakened by M'Auley Bros.' discovery in the "black rock" back from the sea-line, the auriferous sand areas must be regarded as amongst the most important fields for the absorption of labour. This field offers the additional advantages of small and inexpensive equipments, easy access, and extremely cheap living. About 300 men were profitably employed on the leads between the Esk and Evans Rivers; in October last this number was daily being added to, and it was confidently expected that the return of the regular beach miners, at the close of the cane crushing, would largely augment the total.

In view of the fact that the present known leads will shortly be worked out, it is recommended that special tests—under the aid and control of the Prospecting Board—be made, in the localities already mentioned, to discover other leads.

I have, &c.,

JOSEPH E. CARNE, F.G.S.,  
Geological Surveyor.

The Government Geologist.

#### APPENDIX 15.

##### Geological Report upon the Slaughter-house Creek District.

Sir,

Glen Innes, 11 January, 1895.

In accordance with your attached instructions, I have the honor to furnish the following report upon the formations supposed to be gold-bearing at Slaughter-house Creek in the Moree District:—

Moree is situated on an ana-branch of the Gwydir or Big River (an important stream in the western fall of the Colony), the country around the township for several miles to the east and many miles in a northerly, southerly, and westerly direction consisting of the Tertiary alluvial plains which occupy a large area in the north-western portion of New South Wales. Slaughter-house Creek takes its rise in the ranges in the Parish of Singapoora, County Burnett, and flowing northerly through the Parish of Monsoon, joins the Gwydir 22 miles from Moree in a direction a few points south of east.

The area examined borders on the Bingera district described in my report of July, 1894, and consists of gently undulating open forest land with hills of circumdenudation rising abruptly from the surrounding surface, and long ridges whose tops are covered in part with open forest and in places with thick scrub.

My visit included a hurried trip through the country which lies immediately west of the range in which Slaughter-house Creek takes its rise. The highest peak in this range is known as the "Sugar-loaf," and from its summit an exceptionally good view can be obtained, although it is perhaps eclipsed by the magnificent sight from the top of the "Cap and Bonnett" (a hill about 2½ miles south-westerly from the Sugarloaf) from which can be distinguished Gravesend Mt. in the direction of Warialda, the Nandewar Range towards Narrabri, and a large extent of the western plains around Moree, with the remarkable hills known as the Fort, &c., standing out in bold relief from the general landscape.

The formations developed about Slaughter-house Creek are as follows:—

1. Recent.
2. Pleistocene and other Tertiary systems including basalt.
3. Middle Clarence Series.
4. Carboniferous.
5. Carboniferous mudstones, &c.
6. Porphyrite.
7. Granite.

#### 1. Recent.

Under this heading are included deposits of varying width and thickness found along the banks of the streams now running; at Yugabi, and in Jong and Lowe's gullies (tributaries of Slaughter-house Creek), they have been found to contain gold, but the work has been only of the nature of gully raking, as the precious metal has not been traced into the wider and deeper deposits of alluvium, which are fairly numerous but practically unprospected. Gold was discovered in Lowe's Gully in the year 1874, and from it and Long Gully some 40 ounces in all are said to have been won; most of the gold obtained was fine with a fair number of coarse waterworn specks—the largest weighed 6 dwt. 12 gr.—and judging by the sample which has been kept by Mr. Maiden, the major portion would appear to have travelled a considerable distance. As the western plain country is approached the recent alluvium spreads out into wide areas and consists of the familiar black soil painfully known in wet seasons to travellers across the plain districts.

Along

2. *Pleistocene, &c.*

Along the banks of the Gwydir, and at heights varying up to 10 feet above the river flood-level, are patches of loose gravel of different thicknesses, and covering a mediumly large area; at Yugabi, (2 miles above the junction of Slaughter-house Creek with the Gwydir) the gravel carries gold, but there is not sufficient present to pay the expenses of working. As the series is followed westerly it thickens and widens, but is covered in part by more recent deposits; there can be little doubt, I think, that considering the amount of denudation which the country about Bingera has been subjected to, a certain quantity of gold must be concealed under the western plains, but, as has been pointed out\* the Cretaceous sea would leave deposits which would be likely to be less concentrated than river-drift. It is possible, of course, for well-defined channels to occur in the wide Pleistocene drifts (although I have seen no evidence of elevation in the beds), but the farther west they are tried the farther is the known source of the gold left to the east, and consequently there is less likelihood of payable gold being struck. The deep round along the Gwydir, even at Bingera, where the prospects of striking payable wash are good, has never been tried, and to prove the existence of channels or basins such as are referred to above it would be necessary to undertake systematic and expensive prospecting operations which would not be warranted by present knowledge of the subject; it should also be borne in mind that to merely discover gold is a simple matter, the difficulty is to find the precious metal in sufficient quantity to pay the cost of its extraction.

At the bore at Moree Township, 1,450 feet deep (1/1.95), the Pleistocene beds have a thickness of 310 feet, and at the 36-foot level Mr. Skeet, who visited the bore and washed samples daily, obtained a speck of gold from a handful of gravel, and from the 50 to 300 feet levels a little black sand from a number of different samples. The speck of gold has not been kept. A piece of quartz collected from the recent gravels along the Gwydir was supposed to show gold, but the mineral appears to me to be iron pyrites and not gold.

Near Mr. Solling's house, 4 miles E.N.E. from Moree, a deposit of gravel has been opened out and shows a thickness of 10 feet of drift, consisting of well waterworn white quartz, red jasper, altered mudstone, and subangular and waterworn pieces of siliceous breccia up to 2 inches in diameter, with several occasional pebbles 5 inches in diameter, and several gems, such as sapphire, topaz, and zircon, of small size.

Underneath the Pleistocene are the Cretaceous (water-bearing) beds† which latter have been struck in both the Dolgelly and Moree bores. It is not known how far the series extends easterly.

Basalt occurs in several places, and in the range at the head of Slaughter-house Creek covers an outlier of the sandy pipeclay, &c., which are largely developed on the Bingera diamond field. It is probable that the gold found in Long Gully has been chiefly derived from an old river channel which is, or was at one time, covered by basalt, and with a view of testing the formation below the basalt a tunnel has been driven for about 40 feet (good prospects of gold and a few diamonds are said to have been obtained from a fine quartz drift in this tunnel) and several shafts, one of which is 40 feet deep, have been sunk. To prospect the formation is no easy task, because at Bingera the payable gravel is found to occur at various levels resting on pipeclay and not on the mudstones, which are the true bed-rock for the Bingera leads; hence at Slaughter-house Creek it will be necessary to prospect the whole thickness of the pipeclay and not merely the wash, which rests on the bed-rock. Then, too, the recognition of the bed-rock will not always be a simple matter, for to the south of Jerrybong Mountain the carboniferous mudstones, &c., are overlaid by sandstones and conglomerates, which latter will be bed-rock in the portion of the district referred to, and it may not be easy in some cases to distinguish the carboniferous sandstones, &c., from the siliceous sandstones of the leads. It is possible that the carboniferous sandstones, &c., may themselves contain gold. They are referred to under a subsequent heading.

A mile to the east of Jerrybong Mountain, and also again at 6 miles to the east of Moree, patches of basalt occur, the former of Tertiary age and the latter probably belonging to the same era. The "Cap and Bonnett" (already referred to) is capped by an outlier of rudely columnar basalt, about 60 feet thick, which is dipping to the north-east at about 20°, and resting upon a bed of volcanic breccia, 50 feet in thickness, containing angular fragments of a basic lava averaging about ½ inch, with a number of large pieces up to 1 foot in diameter.

3. *Middle Clarence Series.*

The rocks included in this division occur as outliers bounded on every side by mural precipices and capping the hills to the west of the Sugarloaf, known as the Fort, &c. They consist of whitish and reddish brown glistening sandstones and quartz-pebble conglomerates with thin layers of sandy ironstone, the beds being of variable thickness, and a number of them showing false-bedding, which dips E. 20° N. at 20°, the whole series having perhaps a slight westerly dip. At the Fort the underlying rocks consists of clayey sandstones dipping E 30° N. at 35° and are clearly unconformable to the false-bedded sandstones—the actual junction-line can be traced without difficulty.‡ No evidence was observed which would indicate the existence of the Lower Clarence Coal Series developed about Warialda, but it is possible that in a westerly direction the Carboniferous rocks may be found to have been extensively denuded and the intervening strata, between them and the Middle Clarence rocks, to consist of coal-bearing beds of either Permian or Lower Clarence age. This would appear to be the case, for in a well sunk by Mr. Moloney, 14 miles in an easterly direction from Moree, a seam of coal, said to be 3½ feet thick, was struck at a depth of 70 feet. I visited the site, but was unable to descend the shaft, although specimens of the coal which had been raised to the surface were collected and forwarded to you.§ A sample sent to the Mines Department by Mr. Joseph, in 1892, was analysed with the following result, and it will be observed that the mineral does not possess the composition of a true coal:—

Assay No. 1232/92.	Hygroscopic moisture .....	10 25
	Volatile hydrocarbons .....	32 3 0
	Carbon .....	36 55
	Ash .....	20 90
	No coke formed.	100 00

It is only reasonable, I think, to conclude that better coal and thicker seams have been found in the series, although the extent of the field, and its value for the production of coal, remain yet to be proved, for the measures are concealed by alluvium, and consequently do not outcrop over a large area. 4.

\* T. W. E. David, Peak Hill, Ann. Rept. Dept. Mines, 1889, p. 216.

† I have since found *Tamnopteria Daintreei* in these beds, thus proving them to belong to the Clarence or Ipswich measures and not to the Cretaceous formation.—E.F.P. ‡ I have since found marine fossils of true Carboniferous age in these beds.—E.F.P. § *Tamnopteria Daintreei* was subsequently found by me in the spoil-heap from this well.—E.F.P.

## 4. Carboniferous (a).

The rocks which are seen from the Fort, for a couple of miles in a northerly direction, consist of sandstones and coarse conglomerates, probably of Carboniferous age, and clearly unconformable to the Middle Clarence Series. Judging by the occurrence of *Orthis australis*, determined by Mr. R. Etheridge, junr., Honorary Consulting Palæontologist, Geological Survey, N.S. Wales, and considered by him to be essentially Carboniferous, at Rocky Creek (20 miles south from the Sugarloaf), and plant remains 3 miles west of Derra Derra Homestead (13 miles south of Sugarloaf Mountain), the rocks would be divisible into a fresh-water and marine series, but no evidence was obtained at Slaughter-house Creek to assist in unravelling the problem. The beds occupy a large area, and are traversed occasionally by thin felspathic veins; the lower beds are likely to contain gold, as they have been formed from the disintegration of gold-bearing formations, but so far as could be learned no attempt has been made to prospect them.

## 5, 6, and 7, Carboniferous (b) Porphyrite and Granite.

The Carboniferous rocks come to the surface at Yugabi, and extend uninterruptedly to the head of Slaughter-house Creek. They consist of thin-bedded mudstones, sandstones, and limestones dipping, as far as was observed, to the east at angles varying from 30° to 70°, and traversed occasionally by thin felspathic and quartz veins. The limestone beds are numerous, some of them from a foot to 18 inches in thickness, being composed almost wholly of encrinites, and others containing shells and corals of Carboniferous type in profusion. The following genera have been determined by Mr. W. S. Dun:—

- |  |                                 |
|--|---------------------------------|
| 2. <i>Spirifera</i> , cf. ( <i>convoluta</i> ) (?) | 3. <i>Diphyphyllum</i> (f), sp. |
| "    sp.   | <i>Syringopora</i> , sp.        |
| <i>Strophomena</i>                                 | <i>Cyathophyllum</i> , sp.      |
| <i>Penestella</i> , sp.                            | <i>Zaphrentis</i>               |
| Crinoid stems                                      |                                 |

with the remark that *Diphyphyllum* and *Syringopora* are new to Australian Carboniferous rocks. It is satisfactory to have this palæontological confirmatory evidence, but without it there would be no difficulty in correlating the beds with the rocks developed from Pallal towards Cobbadah.

Porphyrite is found 2 miles to the north of Yugabi, and although its occurrence at Bingera as an interbedded lava is fairly clear, the junction line at Yugabi has somewhat the appearance of being intrusive. The rock is traversed by a number of lenticular veins of quartz, which were tried to a depth of 40 feet without payable gold being met—the bulk of the quartz which was raised to the surface does not show gold. Near the shaft just referred to a well defined quartz vein, from a foot to 18 inches in width, of white dull opaque quartz and capel, and bearing W. 10° N., with an underlay to the south of 5° traverses the sediments, but has not been tried to a greater depth than 4 feet.

Granite is noted on the late Rev. W. B. Clarke's map as occurring near Torry-hic-hie.

From the foregoing report it will be seen—

1. That the district around Slaughter-house Creek has not received much attention from prospectors.
2. A small amount of gold, which appears to have been chiefly derived from an old river-channel, has been won by gully-raking in two tributaries of Slaughter-house Creek close to a basaltic range.
3. This basaltic range may contain part of an old river-channel carrying payable gold with some diamonds, and should be prospected by experienced miners.
4. The river Gwydir has brought a certain quantity of gold into the western plains, but there is no evidence to show that there are other than patches of auriferous wash concealed by the surface alluvium.
5. Very few veins have been observed, and none have been tested to a greater depth than 30 feet. One vein is well defined, but has not been proved to carry payable gold. The Carboniferous Series is the most likely to carry auriferous veins.
6. Coal may be expected to occur between Slaughter-house Creek and Moree, but the thickness of the seams, and value of the coal, remain to be ascertained by systematic prospecting.

In conclusion, I beg to acknowledge the kind help afforded me by Messrs. Conroy, Skoot, and Joseph during my examination of the district.

I have, &c.,

GEO. A. STONIER,  
Geological Surveyor.

The Government Geologist.

## APPENDIX 16.

## Report on the Uralla Gold-field.

Geological Survey Branch, Department of Mines and Agriculture,

26 March, 1895.

Sir,

In accordance with your instructions attached, I have the honor to furnish the following report upon a recent inspection of the Gold-field immediately around the Township of Uralla, County Sandon:—

The field has been mentioned in various reports by the late Rev. W. B. Clarke, and was fully reported upon by Professor (then Geological Surveyor) David,\* so that my remarks will deal more particularly with recent discoveries, and are chiefly supplementary to the Professor's paper, which will be referred to in this report as A, and his maps as A1.

## I. GEOLOGY.

For a considerable distance around Uralla the formation consists of hornblendic granite, mediumly coarse, and making in places a fairly strong outcrop, but, as a general rule, showing above the surface of the ground as occasional boulders in gently undulating country, the soil of which is several feet in thickness in places. The rock is intersected by felsitic, earitic, quartz porphyry and basaltic (?) dykes of variable thickness up to 8 feet, and by a number of quartz veins, one of which has been proved to be auriferous. About 3½ miles south-east and 5 miles west of the township the granite intrudes (there is no local

\* Ann. Rept. Dept. Mines for 1886, p. 153.

local evidence of the age of the intrusion, but it probably took place during early Permo-Carboniferous times), and is replaced by a series of granitoid rocks, claystones, conglomerates, &c., the age of which, in the absence of palaeontological evidence, is doubtful, and was considered by Professor David to be Siluro-Devonian (?). A very large area was at one time covered by basalt and laterite of Tertiary age, but, as a result of denudation, the volcanic rocks are now represented by outliers such as Mount Beef and patches of various size, the largest including Doherty's Hill, Mount John, &c., and running in a northerly direction for several miles, with a width of more than a mile. The basalt conceals several auriferous deep leads, representing old river-channels, some of which are exceptionally wide, and in places appear to have been partly of lacustrine origin. The deep lead deposits consist of gravels, sands, and clays, up to 11½ feet in thickness, and containing leaf-impressions, which have not been thoroughly examined, so that the exact age of the formation cannot be stated. It should, however, be remembered that the older leads at Vegetable Creek (Geological Survey, N.S. Wales, Pal. 2, pp. 78 and 188; Geological Survey, N.S. Wales, Geol. 1, p. 24) have been determined to be of Eocene age, that the late C. S. Wilkinson considered that the Newstead (Elsmore, New England) ironstones were not younger than Lower Miocene, and Professor Bittingshausen (Geological Survey, N.S. Wales, Pal. 2, p. 78, *et seq.*) classified the fossils submitted to him from Elsmore as Eocene, so that, although the relation of the Uralla to the Vegetable Creek (Eumaville) and Newstead leads is not known, there is a possibility that the Uralla leads may be partly of Eocene age. It is quite clear that a considerable time has elapsed since the deposition of the leads, for valleys have been excavated to a depth of 500 feet. A number of patches of "billy" (quartzite) are associated with the drifts, and are found not only on the outside edges of the basalt, but also covering payable wash, and hence the occurrence of the rock is not invariably an indication of the depth of the ground. The leads are at least of two ages, and are all more or less auriferous. One of them has been worked from the western side of Mount Jones, through Sydney Flat, to Doherty's Hill (a distance of 1 mile 30 chains), with a fall in the bed-rock in the direction stated. Miners who have worked in the lead say that judging by its occurrence (the underground workings are not open to inspection at the present time) the wash would appear to have come from the reverse direction; but both aneroid levels and the varying depths of water in the old shafts show clearly that the present fall in the direction named, and, as there is no evidence of local subsidence, it is only reasonable to conclude that the old watercourse ran in the direction of the present main stream, *i.e.*, roughly, meridionally. The other leads, including one older and found at a higher level than the Sydney Flat lead, have been proved for short lengths; their extension is of importance from a mining standpoint. Besides the earlier Tertiary several newer and shallower leads not covered by basalt, such as the Freethinker, &c., have been developed and have been worked for gold, but have not extended for any great distance. Finally, there are the recent deposits along the present watercourses, and they are all more or less auriferous, and of a thickness up to 20 feet, with areas of surfacing of fair size, and containing more or less gold.

## 2. MINING.

### (a) *Recent, &c., Alluvial.*

These deposits, all more or less auriferous, have been fairly well developed, and have yielded a large amount of gold, and to those who are acquainted with and settled on the field there is a living to be obtained for a number of years to come. The more likely and easily-worked places have been tried, and at the present time even the old mullock heaps of the Sydney Flat, &c., leads are being carted and washed for the sake of the gold which was not considered worth the labour of extraction in the old days. The drawback is the want of water, and to provide a good supply would entail the expenditure of a large sum of money, while it is open to question whether the results would justify the expenditure of the necessary capital. The subject is specially referred to in Report A. The field has a peculiar elasticity, for although the alluvials were considered to be worked out ten years ago, they have given and still are affording employment to a number of men.

### (b) *Deep Leads (chiefly covered by Basalt).*

As already stated, a lead has been worked from Mt. Jones to Doherty's Hill. At the last-named place the lead split, and although a large sum of money has been expended and a wide body of drift has been proved to exist in a northerly direction from Doherty's Hill, patches only of payable wash have been struck. A line of shafts known as the "Bullion" were sunk in the position shown on plan A1; but no attempt has been made to test the formation further to the north. Of the shafts sunk between Doherty's Hill and the Bullion Shafts prior to 1886, a detail account is given in Report A, and since that time a considerable sum of money has been spent in trying to prove the same stretch of country. The Rocky River Company have driven for 429 feet in an easterly direction from the bottom of the "Old Rock" shaft (No. 13 (?) plan A1), which was continued to the 120-ft level. Browning and Party have recently sunk a shaft on M.L. 2, Parish Arding (Co. Sandon), a couple of chains south of the long drive just referred to. The shaft is 126 feet deep (110 feet to bed-rock), and has been driven 182 feet in an easterly direction, 8 feet northerly, and 32 feet southerly. In consequence of the pump being out of order, I could not descend the shaft and examine the workings, but the drift is said to vary from 3 ft. 6 in. to 11 feet in thickness, and the wash from 6 inches to 1 foot in thickness, and to contain 5 dwt. of gold to the load, while the southerly drive is approaching ground which was worked by — Bullen to the water-level, and yielded handsome returns. The Phoenix Shaft (No. 10, plan A1) has been driven for 100 feet in a W.N.W. direction in black pipeclay without any sign of wash or bed-rock, and a short drive was put in a southerly direction. It is to be regretted that the southerly drive was not continued. Rice and Party are not now at work, but have recently won a fair amount of wash from a claim immediately south of No. 19 (plan A1). I was unable to ascertain details of the work done.

From the foregoing particulars it will be seen that, although there have not been either specially important developments within the last ten years, or the discovery of a payable run of wash, the expenditure of the capital has demonstrated the fact that between Doherty's Hill and the Bullion Shafts a lead exists which is auriferous and wide, although, on account of the expense attendant on dealing with a large body of water, the wash, as a whole, is not payable; it is, however, a matter well worthy of investigation, whether a deep-level tunnel could not be constructed from Tipperary or an adjoining gully, which would drain off the water.

Of much more immediate promise, however, is the basalt country north of the Bullion Shafts, for, as pointed out by Professor David, between Portions 23 and 244, Parish Arding, the basalt narrows to a width of three-quarters of a mile, and as this is the narrowest part of the area it is well worth a trial. One shaft (or bore) would not, however, be sufficient to test the ground, and as there will be a large body of water to be dealt with, it is useless for any attempt to be made unless the party is prepared to properly complete the work. A shaft was commenced some years ago in the position referred to, but was abandoned before reaching bed-rock.

The Sydney Flat Lead, which has been just described, is not the only one in the vicinity, for the basalt is wide, and has been proved to cover more than one run of wash. At the head of the Sawpit Gully a short lead of payable gold has been worked, and a few chains north of the lead Rixon and Party are sinking a shaft now 120 + feet deep, and within a few feet of the bed-rock; should they strike payable gold, the lead may have a great length. On Mount Copeland (east of Sydney Flat) auriferous wash has been proved in several shafts, and between Mount Copeland and Doherty's Hill a shaft known as the Government prospecting shaft, which was sunk to a depth of 79 feet, and driven for 60 feet in a westerly direction, is well worthy of further attention.

At Mount Jones Mr. French has done an immense amount of work in testing an upper drift, and although he has failed to strike payable wash, he is confident that a tunnel driven on the southern side of the hill would give good results. If, however, the existence of a rich patch of auriferous wash be proved, the work will not establish his contention that a main lead runs from east to west, consisting of a number of saucer-like depressions with payable wash on the eastern portion of the basin and without any drift connecting the basins, for, although the occurrence of depressions in the bed-rock is common in the Vegetable Creek leads, there is generally a trace of wash to indicate the lead, and their development in the Uralla district remains yet to be proved. In connection with this subject the work now in progress at Mount Beef is of special interest; Dr. Woods and Mr. Krippner are having a low-level tunnel driven (now 260 feet in the granite), believing that the bed-rock will dip into the hill, which is capped by basalt, but has not been proved to contain an outcrop of wash, although a little gold can be obtained from the surface on the eastern side of the hill. That the junction-line between the basalt and the granite does dip in places is proved by Carroll's old tunnel, a couple of hundred feet south-west of Dr. Woods' tunnel; the former is 176 feet in length, and for the last 28 feet dips 1 in 4, while at the end of the tunnel the junction between the basalt and granite is almost vertical. Whether the dip will continue and wash be found between the two formations as the junction is followed into the hill can only be solved by actual prospecting work, but it should be remembered that dykes of basalt may be struck, and in that case the junction-lines will be vertical; if, however, wash is discovered it is likely to carry gold. The work is of importance, because, as a rule, no attempt is made to prospect a hill capped by basalt, unless there be an outcrop of wash, so that if Mount Beef be found to contain payable gold a number of basalt hills will be tried which hitherto have been looked upon as valueless from a mining standpoint.

About a mile to the east of Uralla there is a stretch of basalt, including Bourke's Nob, which covers drift containing gold, and has been but little prospected; also at the Digger's Ridge, 5 miles easterly from the township, gold has been obtained in a drift, and is well worthy of further attention.

#### (c) Veins.

The granite is traversed by a number of veins of quartz, felsite, &c., and some of the latter are said to carry gold, but until very recently reefs of any description have not been considered to be of much importance, for the alluvial gold is very fine and has seldom been found attached to quartz; recently, however, a patch of alluvial was worked on the western side of Mount Mutton, and Mr. Roberts assures me that a number of specimens were obtained. Most of the gold won from the alluvials was probably derived from the granite, and as that granite is intrusive it is only reasonable to expect that auriferous veins were formed near the junction of the granite with the adjacent rocks, and it is in this geological position that recent prospecting operations have revealed the occurrence of gold-bearing veins.

Six miles north-west of Uralla, on Portion 93, Parish Devon, Sney and Party have discovered a vein by tracing the gold gradually from the alluvial, and have tried it to a depth of 91 feet. The vein bears E. 40° N. with an underlay of 2° to the north occurs, in granite, and consists of a dyke of felsite (?) with quartz up to 10 inches in thickness developed on both walls, but mostly on the foot-wall; the walls are from 9 inches to 3 ft. 3 in. apart, and are slicken-sided and striated, the striae dipping to the north at 53°. At the 40-foot level a bunch of sulphide of antimony of high grade, with a maximum height of 5 feet, a thickness of 15 inches, and dipping to the south, was struck, and was driven on for 10 feet; at the bottom level there is also a thin vein of sulphide of antimony on the foot-wall. A crushing of 4 tons 2 cwt. gave 8 oz. 14 dwt. 18 gr., *i.e.*, 2 oz. 2 dwt. 14 gr. per ton, but cannot be taken as an average of the vein as the gold is patchy, and a well-marked auriferous shoot has not yet been struck. There can be but little doubt that the vein will continue to a considerable depth, and it is purely a matter for systematic sinking and driving to determine the dimensions of the auriferous shoots. The antimony will occur in bunches, but may prove to be a valuable adjunct to the precious metal.

At Balala, on Portion 150, Parish Devon, 2½ miles southerly from Sney's Claim, M'Alister and Party have discovered several mullocky veins which traverse quartzites near the junction of the granite. An underlay shaft (Prospectors' Shaft) at the southern end of the portion has been sunk to a depth of 60 feet on a vein which bears N. 23° E., with an underlay of 6° to the west, and averages 6 inches; the hanging wall is badly defined, but the foot-wall has been continuous throughout. The vein has been traced for several chains in length, although its outcrop is difficult to follow, and appears to have been faulted at the shaft. Two crushings have been sent to Hillgrove, the first of 5 tons giving 23 dwt. per ton, and the second of 5 tons yielding 8 dwt. per ton. Near the northern boundary of the portion two shafts have been sunk, the deeper of which is 25 feet, and have proved a vein 4 to 5 inches in thickness, which bears N. 10° E. with an underlay slightly to the east. Encouraging assays have been obtained, and the claim-holders propose to send away a parcel of stone for battery treatment. I would suggest that the tailings be assayed, as gold may occur in the form of auriferous mispickel, and it would not be saved by the ordinary treatment.

Immediately to the south of the Prospectors' Shaft, Crotty and Collins (No. 1 South) have sunk a shaft to a depth of 69 feet on a vein which bears N. 13° E. with an underlay of 9° to the east, averages 6 inches, and is up to 2 feet in thickness. Gold is present, but only as occasional colours and fine prospects. To the west of the underlay shaft a well-defined quartz vein 9 inches thick, and bearing N. 23° E.

E. with an underlay to the east of  $4^{\circ}$ , has been discovered, and tried to a depth of 15 feet without a colour of gold being detected, but as the vein is fairly well defined its outcrop might be traced and tested in various places in order to ascertain if it contains a shoot of gold which comes to the surface. The country between Suey's claim and Balala, both of which have been referred to, is well worth prospecting, and although the veins do not make a bold outcrop and are not easy to follow, some of them are likely to continue to a depth, and should carry payable gold. It is, however, necessary that the vein, and if possible the shoot of gold, should be followed, for if the walls are once left there may be difficulty in finding them in a crosscut, as the country is traversed by a number of joints, and it will be impossible to know on which side of the drive the shoot of gold lies. A small battery erected in a position convenient to both places would be a help to the field, but sufficient work has not been done to justify at present the erection of a complete plant.

Four miles to the south-east of Uralla, on Portion 504, Parish Uralla, a number of badly defined veins have been discovered, and are now being tried by Mr. P. Shanahan, who has sunk three shafts, the deepest of which is 49 feet, and has struck a couple of flat veins, and in a drive northerly from the bottom level a fairly defined reef of quartz up to 15 inches wide and bearing N.  $25^{\circ}$  W. with an underlay to the west. Thirty-two feet northerly a shaft 12 feet deep has touched a vein 8 inches wide bearing E.  $12^{\circ}$  S. with an underlay to the south at  $45^{\circ}$ , and a cross-vein 4 inches wide bearing N.  $15^{\circ}$  W. with an underlay to the west. There are several tons of quartz at grass, and although an assay gave 7 dwt. of gold no crushing has yet been made, so that it is impossible at present to state the average yield of the quartz. A number of veins have been formed, but it remains yet to be proved that there is a vein which will extend to a depth. In testing the veins it will be found advisable to prospect the surface of the ground for the outcrop of auriferous shoots, and then to follow the shoot wherever it may lead; certainly for ultimate working it may be desirable to sink a vertical shaft in a carefully selected spot, but work of that character may well stand over until it has been demonstrated that the erection of a battery is justifiable, and at present that stage has not been reached.

#### Summary.

From the foregoing report it will be observed—

1. A very large amount of gold has been won from Recent, &c., alluvial, and the field should yield a living to a certain number of residents for years to come.
2. A considerable amount of gold has been obtained from several leads under basalt, and there is a large area which may conceal the extension of these leads and their tributaries, besides outliers which have been but little tried. On account of the body of water to be overcome and the width of basalt to be prospected, it appears improbable that in some cases the leads will be proved, except by their being traced from one claim into the adjoining property.
3. The recent discovery of auriferous veins is of importance, and is a new feature in the mining industry of the district. In each case they have been found near the junction of a large mass of granite with the adjacent rocks. They vary up to 2 feet in thickness, and crushings of several tons have proved a yield of gold up to 2 oz. 3 dwt. per ton; but none of them have been tried to a depth exceeding 91 feet. One vein has well-defined and striated walls, and the remainder, although not so well defined, carry richer gold. The country at the junction of the granite with the adjacent rocks is worth the attention of prospectors.

In conclusion, I beg to acknowledge the kind help afforded me by Dr. Woods, Messrs. Cleghorn, Roberts, Glendenning, French, and a number of others, who did all in their power to assist my examination of the field.

I have, &c.,

GEO. A. STONIER,  
Geological Surveyor.

#### APPENDIX 17.

##### Report on Alluvial Tin at Shannon Vale.

Sir,

Inverell, 4 February, 1895.

In accordance with the attached instructions I have the honor to furnish the following report upon the recent discovery of alluvial tin at Shannon Vale, in the New England District, 8 miles from the township of Glen Innes, in a direction a few points north of east:—

#### 1. Situation.

Shannon Vale is a settlement in the Parishes of Beardy Plains, Rusden, and Boyd, County Gough, and along the Mann or Mitchell River, which latter is an eastern water rising near Glencoe and flowing in a northerly direction until it is joined by Skeleton Creek, when the river changes its course and flows easterly for a considerable distance, ultimately entering into the Clarence River. I traversed the Mann River at intervals for a distance of 7 miles above the junction of Skeleton Creek, and find that it is bar-bound in a number of places (the bars bearing generally east and west), with patches of alluvial on either side of the river, and occasional bluffs of rock falling away into open forest country. As a rule, the fall into the river on both sides is not steep, and the soil between the outcrops of rocks, which are numerous, is of a fair thickness, and supports good herbage.

#### 2. Recent Alluvium.

Alluvial tin has been worked for the past twenty years at various places in the bed and along the banks of the Mann River, but the work has been of a desultory character, as it could only be attempted in dry seasons; in all, some 200 to 300 tons of ore are supposed to have been mined. There are, however, parts of the river-bed which are unworked, and several wide flats, such as Lobb's Farm (Portion 214, Parish Beardy Plains), which are untested; and as there is evidence that the watercourse has changed its position by encroaching on the eastern bank, and has continually received material resulting from the degradation of tin-bearing rocks, it is only reasonable to expect that tin-bearing deposits are concealed under some of the wide flats. It would, however, be useless to commence work unless ample provision be made for dealing with the water, which is troublesome, except in very dry seasons. Colours of gold are constantly associated with the tin; opposite Portion 17, Parish Beardy Plains, a piece weighing  $\frac{1}{2}$  dwt. is said to have been obtained.

## 3. "New Find."

The "New Find" is situated on Portion 155, Parish Rusden, near the School-house, and consists of an outlier of drift and sand having a thickness (so far as has been proved) varying from 2 to 6 feet, and occurring 50 feet above the river-level; it probably represents portion of an old watercourse, but the small size of the pebbles and the quantity of sand present raise a doubt whether it may not represent a flood deposit rather than a portion of the main channel. There can, however, be no doubt that at the time of deposition of this stanniferous outlier the river-bed was at a higher level than it is at the present time, but having generally the same course and flowing in the same direction as the present stream. The Boden Bros., who discovered the tin, have opened a paddock about a chain square and having an average thickness of about 3 ft. 6 in. of sand and wash, the pebbles in which are up to 4 inches in diameter and consist of subangular and well waterworn, and a few angular fragments of quartz, quartzite, quartz-porphry, and altered mudstone. The paddock has yielded 3½ tons of tin. Several shafts have been sunk about a chain to the north-east of the paddock, and prospects of tin have been obtained, but the deposit itself cannot extend across the river in a northerly direction into Lobb's Farm (already alluded to), and no work has yet been done to prove its existence south of Portion 190. It is, however, unlikely that this one outlier is all that remains to denote the existence of an old river-bed, and I would urge that the country on each side of the river be carefully prospected for some distance in a southerly direction for high-level deposits similar to that which has been discovered by the Messrs. Boden. The old channel probably had the same general direction, so that the outliers, which have escaped denudation, may be found half a mile one side or the other of the present watercourse. The tin is fine, and consists chiefly of waterworn grains, which appear to have travelled for some distance. Part may have been derived from the basalt range which occurs to the west of the river, but the bulk of the mineral must have come down the river for some distance, even supposing that a fair percentage of it was derived in the first instance (primarily, of course, from veins) from an old river channel partly denuded and partly still concealed by the basalt sheet just referred to.

## 4. Surfacing.

Besides the alluvial close to the river, deposits have been mined in two or three places half a mile back from, and at a considerable elevation above, the watercourse. On Portion 22, Parish Rusden, 2 miles south of Boden's Claim, a party of Chinese, who are still in possession of the ground, have worked a patch 8 chains in length, in one place 2½ chains in width and from 2 to 6 feet in thickness, consisting partly of alluvium accumulated in a gully from the disintegration of the rocks in the immediate vicinity, and passing at the sides into ordinary surfacing. The tin is fine and has probably been derived locally from narrow veins in the surrounding granite, which is also traversed by a number of felsite veins up to 10 inches in thickness, running in various directions, and having a little quartz occasionally on either wall carrying tinstone in small crystals. The claim is said to have yielded 18 tons for the last eighteen months' work.

On Portion 331, Parish Beardy Plains, a mile to the north of Boden's Claim, three small strips of surfacing, the largest of which is a couple of chains in length, by rather less than a chain in width and about a foot in thickness, have been worked; they occur about 30 chains westerly from the river, and at a considerable elevation (some 70 feet) above its bed. The tin won was coarse, specimens up to an inch in their longest measurement being of frequent occurrence, and, from their angular condition, had evidently not travelled.

## 5. Veins.

Within the last couple of months Williams and Party have discovered two veins traversing the granite on portion 331, where the surfacing has been worked; one of them consists of oxide of tin an eighth of an inch in thickness, and has been tried to a depth of 9 feet, while the other vein, which bears W. 30° S. has been tested in two shafts, 10 and 22 feet deep, and found to be 10 inches and an eighth of an inch respectively in thickness. In the latter case the vein consists of oxide of tin, and has maintained its thickness from the surface to the bottom level, although heaved in one place for about 7 inches. The shaft is of particular interest, because it shows that the tin-vein was formed subsequent to the development, but before the consolidation, of a felsite vein which crosses the shaft.

## 6. Basalt Range.

About 15 chains to the west of the workings referred to under the previous heading a dip tunnel has been driven under the basalt on Portion 337, Parish Beardy Plains, bearing W. 12° N. for a distance of a hundred feet, and following a fine and patchy drift resting on the bed-rock (*i.e.*, granite). At the end of the tunnel the bed-rock is still dipping into the hill, and the work has been stopped at a time when its continuation has become a matter of some importance. The drift forms part of a Tertiary deposit of whitish and reddish-brown sandy clays, &c., which are at least 40 feet thick and contain an upper quartz-pebble drift composed of waterworn fragments up to an inch in diameter of quartz, some of which carry tinstone, and others have the dark tint considered to be favourable for the occurrence of tin in the Vegetable Creek District. This upper drift does not appear to have been prospected, and for future work it should be borne in mind that, although the wash resting on bed-rock (*i.e.*, granite in this particular part of the district) should be carefully tested, it is of importance that the drift which occurs at a higher level should not be neglected, as there are instances (*e.g.*, at Tin, near Walcha) where the richest mineral does not occur in the deepest part of the channel.

The basalt occupies a large area on the western side of the Mann River, and has been observed for the distance shown on the accompanying plan.

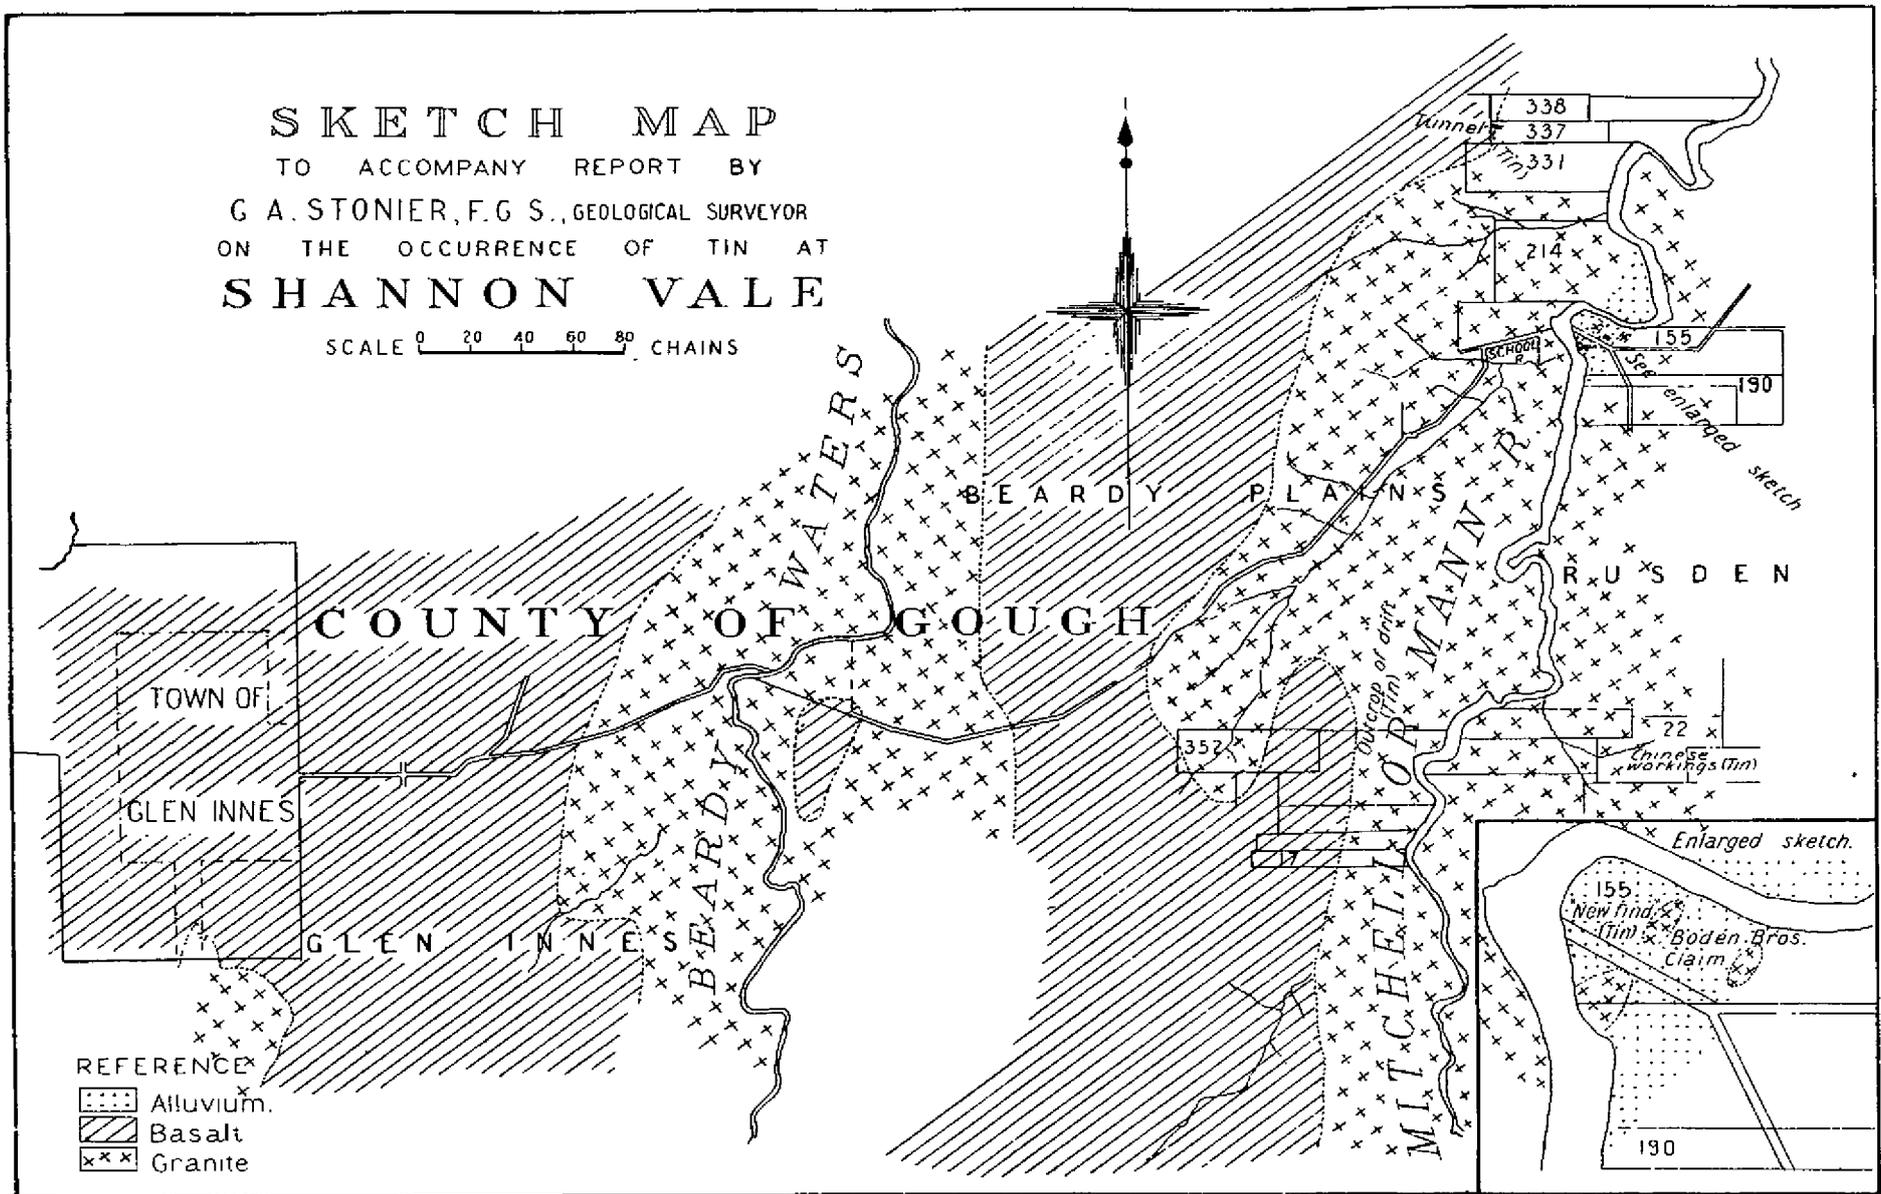

A few chains to the west of Portion 352, Parish Beardy Plains, Mr. Osborne has discovered an outcrop of drift which carries tin, and is worthy of further attention.

## 7. Granite.

With the exception of the basalt area the country consists entirely of granite as far as examined, of which two types can be recognised, although their exact relation is by no means clear. The one is a granite (possibly a granitite), consisting of felspar with quartz, hornblende, and biotite; it makes a bold outcrop, and occasionally forms bluffs, resembling in its occurrence a rock developed about Emmaville, which is, as a rule, non-metalliferous. The other type consists of a granite containing quartz, felspar, and

 ON THE OCCURRENCE OF TIN AT  
**SHANNON VALE**

SCALE 0 20 40 60 80 CHAINS

(Sig 271)

a little biotite, and is traversed by a number of veins of felsite running in various directions, and up to 10 inches in thickness, and thin felspathic quartz and tinstone veins. The stanniferous veins already discovered are very thin, but as some of them consist almost entirely of tinstone they should pay, while in soft granite which may be expected to extend to about the 80-foot level (there is one instance where the soft granite extended in New England to the 160-foot level, but the occurrence is exceptional). There is no evidence available that the veins will increase materially in thickness as depth is attained, but if several of these thin veins could be discovered, separated only by a small thickness of rock, they might pay to work even in the hard country. No well-defined vein has however been discovered, and it is possible that prospecting operations will demonstrate that the tin is associated with felspathic rather than with quartz veins. Numerous pebbles of quartz-porphry are found in the river-wash, but the rock has not been yet observed *in situ*.

#### 8. Summary.

From the foregoing report it will be observed—

1. A certain amount of tin has been worked from recent deposits along the Mann River, and from surfacing in two places above the river-level.
2. The discovery of alluvial tin on Portion 155, Parish Rusden, proves that an old watercourse deposited tin at a higher level than the present river-bed.
3. There is a fair area along the bed of the Mann River still untested, and a considerable area where portions of an old river-channel, at a higher level than the present watercourses, may be expected to occur, as well as a larger amount of surfacing and shallow alluvial which has not been touched, but is worth a trial. (The difficulty in the first case will be to overcome water, and in the last-named to provide water.)
4. The drift discovered under the basalt, which forms the divide between the eastern and western waters (*i.e.*, the Mann and Beardy Rivers), is worth prospecting.
5. The veins hitherto discovered are thin, but carry rich tin in places. The formation in which they occur should be prospected for larger lodes.

In conclusion, I am glad to have an opportunity of acknowledging the unvarying courtesy which has been extended to me, both on the late and previous visits, by those interested in the mining industry of the Glen Innes District.

I have, &c.,

GEO. A. STONIER,  
Geological Surveyor.

The Government Geologist.

#### APPENDIX 18.

##### Geological Report on Crow Mountain.

Sir,

Bingera, 16 May, 1895.

I have the honor, in accordance with your instructions attached, to furnish the following report upon the recent discoveries of auriferous veins at Crow Mt., the reported yields of gold having caused some excitement in the Barraba district:—

Crow Mountain is situated in the Parish of Eumur, County Darling, and within the watershed of the Manilla River, a tributary of the Namoi in the western fall of the Colony. It is distant 12 miles from the township of Barraba in a direction about east 30 degrees south, 18 miles northerly from the township of Manilla, and 40 miles, a few degrees west of north from Tamworth, a town on the Great Northern Railway.

The Annual Report of the Department of Mines contain various references to the mining and geological characteristics of the country north of Barraba, and some of the features of the latter are described in Mr. Geological Surveyor Anderson's report.\*

#### 1. General, Physical, and Geological Features.

The country around Crow Mt. is mountainous, open forest land, and consists partly of hills of circumdenudation, rising to a height of several hundred feet above the main creek-beds, with spurs in places, rocky and fairly steep, and running in various directions, occasionally opening out into gently undulating ridges with shallow and narrow alluvial flats between them. The timber is chiefly white box and apple-tree, with ironbark over a limited area and cherry-tree on the ridges.

The formations developed consist of—

- (a) Recent and other Tertiary Alluvials.
- (b) Serpentine, granite, and felsite (?).
- (c) Carboniferous rocks.

(a) *Recent and other Tertiary Alluvials.*—The Recent alluvials do not occupy a large area, but are found chiefly as narrow and shallow patches along the various watercourses, such as Crow Mt. Creek, &c. The older Tertiary alluvials occur at various elevations, up to 100 feet above the Recent flats, and have a thickness in places of at least 80 feet; they consist of clays (containing concretionary magnesite), sands, and conglomerates containing angular, sub-angular, and well-rounded pebbles averaging about 1½ inches and up to a foot in diameter, and composed largely of red and other jasperoid rocks, quartz, and occasionally felsite, in places cemented together into a hard, compact, ferruginous rock. The formation has been observed by me at intervals for a length of 6 miles and a considerable width; it occurs on the tops of various ridges, and at one time must have covered a large area, but has been subjected to continued denudation, so that it is now found frequently as outliers. The material of which the rocks are formed was probably deposited after the intrusion of the serpentine into the Carboniferous rocks, for a number of pebbles of the Carboniferous jasperoid rocks are present in the conglomerates, but the exact age cannot at present be stated, although judging by the height at which the formation is found above the present drainage channels a considerable time must have elapsed since its consolidation. A striking feature is the presence of a number of angular fragments; their form, taken in conjunction with the width of the deposit, raises a doubt whether the conditions may not have been partly lacustrine.

(b)

\* Ann. Rept. Dept. Mines for 1888-1889, p. 179.

(b) *Serpentine, granite, and felsite* (?).—The serpentine occurs in the district as a well-marked belt having a nor-nor-westerly trend and extending almost without a break from Manilla to Bingera, a distance of 50 miles. At Crow Mt. its width varies from 3 to 14 chains with a fairly direct western but an irregular eastern boundary. Divisional planes bearing N. 20° E. are well developed in places, and the terms of the formation are marked by so-called "gossan" (possibly peridotite) bars of variable thickness; on the west the rock is continuous but cannot be traced on the eastern side for about half a mile north of Crow Mt. Creek, although about 25 chains to the east of this spot a peridotite (?) dyke about a chain and a half in width outcrops for three-quarters of a mile in length and trends in a nor-nor-westerly direction. There can be little doubt that the serpentine is intrusive, and as the intruded are jasperoid and probably of Carboniferous age, and jasper conglomerates are found in Permo-Carboniferous rocks, the intrusion may have taken place at the close of the Carboniferous period. A number of thin, sometimes auriferous veins of quartz, calcite, &c., and bunches of chromite, have been observed. Near Bingera an intrusive diorite has been noted by Mr. Anderson.\*

The granite, which occupies an extended area in New England and intrudes rocks of Carboniferous (?) age, comes within 6 miles to the east of Crow Mt., and it is interesting to observe that its junction line with the sediments is in the same general direction as the serpentine, although the distance between them is lessened in a southerly direction; the relation of the serpentine to the granite has not been determined. A quartz-felsite (?), probably intrusive, occurs in small areas south of Crow Mt., and is traversed by thin quartz veins.

(c) *Carboniferous rocks*.—The beds which extend from Barraba to Crow Mt. probably form part of one system, and consist of a well-developed tuffaceous series with interbedded felsite (?), occasional conglomerates, sandstones, and thin-bedded mudstones (containing *Lepidodendron australe* at Barraba Township, and cleaved in lines coincident with the bedding planes close to the serpentine), with argillaceous interbedded limestones. The rocks have been altered, apparently, by the intrusion of the serpentine—Professor David, however, suggests that the red jaspers may be abyssal deposits—into quartzite, jaspers, and jasperoid rocks, the latter occurring at Crow Mt., chiefly on the eastern side of the serpentine. The limestones in Crow Mt. Creek on Portion 14, Ph. Eumur, are richly fossiliferous, and contain the following forms, which have been determined by Mr. W. S. Dun:—

Crinoid stems.  
Fenestella.  
Polypora, or Phyllopora.  
Rhombopora (?).  
Phillipsia, sp.  
Spirifera.  
*Syringothyris cf. cuspidata, Martin.*  
*Strophomena cf. rhomboidalis, var. analoga, Phill.*  
*Orthis resupinata, Martin (?).*  
Orthotetes (?).  
Productus, several species.

Mr. Grey, a local resident, states that fossil shells have been collected at Jenny's Creek, 4 miles south from Crow Mt. Creek, and has shown me specimens of encrinital limestone. In 1893, I collected *Lepidodendron australe* on Portion 2, Parish Borindie, County Darling, 10 miles south-west from Barraba, and found that, 3 miles further in the same direction and a few chains south-west from Portion 106, the fossil was associated with marine shells in an oolitic and encrinital limestone. It is remarkable that where *Lepidodendron australe* has been collected in the Barraba District the beds have generally only a slight dip, and hence it has been suggested that those measures which have a steep dip are unconformable to the horizontal rocks; and such, at first sight, would appear to be the case at Burindi (Borindie), but a detail survey would probably result in the apparent unconformity being proved to be due to rolls and faults.

## II. Mining.

Alluvial gold with platinum (?) has been mined in the recent alluvial along middle Jerry's Creek, &c., but there has not been a large amount of the precious metal won, although specimens up to 42 oz. (containing only 1½ oz. of quartz) have been obtained. Surface Gully has been worked for three-quarters of a mile, and has yielded wages, pieces up to 15 dwt. being of common occurrence; there are also a number of gullies which are untested, but are worth a trial. The Older Tertiaries contain colors of gold throughout some thickness of the beds, but they have not been proved to carry payable gold.

Auriferous quartz and calcite veins, traversing the Carboniferous rocks, were discovered about the year 1868, and worked by Fletcher and others, who are said to have made as much as £1,000 for three years work on one claim, and £4,000 for twelve months' work on two other claims; but for a long time the ground has been unoccupied, and it was not until the end of 1893 that Watt and Party commenced work on the old Try Again block, and ultimately proved payable gold. Their operations did not, however, attract much attention until the beginning of the present year, and when about the end of February Mr. Kenzie and Party struck rich gold-bearing quartz at a depth of 15 feet, claim pegging began in earnest. The number of men on the field fluctuates daily, and although at one time it is said to have reached 200, it is doubtful if there are more than 80 men at the present time actively engaged in mining operations.

Most of the claims which are being worked are close to and on the eastern side of the serpentine, the most northerly being:—

(1.) Chalmers and Party, who hold Portion of an old gold lease, No. 18, Parish Eumur, at Crow Mount. A shaft has been sunk to a depth of 50 feet, and at the 26-ft. (?) level driven south for 23 feet, and at the 10-ft. level northerly for a few feet. Two shoots of auriferous quartz have been proved, and one of them stopped to the 26-ft. level for a length of 8 feet and an average of about 15 inches (up to 2 feet); with a steep dip in the shoot to the north, the vein being 8° E., with an underlay to the west at 10°. The second shoot was worked to the 50-ft. level, and had a length of 6 feet, but was only

\* Ann. Rept. Dept. Mines for 1888 (1889), p. 181.

only taken for a thickness of 2 feet, leaving quartz 3 feet thick still unstoped, and which is stated to contain  $\frac{1}{2}$  oz. of gold to the ton. Several parcels have been crushed at Ironbarks (local battery) with the following results:—

4 tons	.....	20 oz. of gold.
8 "	.....	7 $\frac{1}{2}$ "
13 $\frac{1}{2}$ "	.....	19 "
6 "	.....	5 $\frac{3}{4}$ "
<u>31<math>\frac{1}{2}</math> "</u>		<u>52<math>\frac{1}{4}</math> "</u>
		4 dollied.
		<u>56<math>\frac{1}{4}</math> oz. obtained.</u>

A crushing of 40 tons is now being carted to Ironbarks (expenses cartage 12s., and crushing 10s. per ton), and is expected to yield about 6 dwt. to the ton, making the total quantity, which has been taken out of the claim, to average an ounce to the ton. Several other veins have been discovered, but have not been opened out.

(2.) Dyson and Party's Claim adjoins the preceding property on the east, and includes the Old Red Flag and O'Donnell's shafts. The former are 20 to 28 feet deep, and the veinstone won yielded  $\frac{1}{4}$  of an ounce to the ton. O'Donnell's shaft was sunk about the year 1882; it is 92 feet deep, and at the bottom was worked for a length of 15 feet, and two veins, one a foot thick on the hanging-wall, and the other comprising 15 inches of quartz on the foot-wall, were stoped to veins bearing E. 12° N. with an underlay to the north of 45°. Dyson's shaft is a few yards to the east of the workings just referred to, and is 23 feet deep, with a drive 16 feet west, on a shoot 6 feet long, and about 14 inches wide, dipping west, and expected to yield 4 ounces of gold to the ton.

(3.) The "Princess" has been held by several parties, and is now in the hands of Condran and Party, who have a lease (Gold Lease 2) of the land which is south of (2). A vein of quartz, with a strike, varying from N. 20° E. to N. 10° W., and underlying to the west, has been traced for some distance, and two shafts have been sunk 35 feet apart, one of which has proved a shoot, about 6 feet long and 10 inches in width, to a depth of 87 feet, dipping N. at 50° with a fairly defined foot-wall. The first crushing was completed in April, 1893; and the following are the results of several parcels of stone treated in the district:—

17 tons	.....	15 oz.
8 "	.....	2 $\frac{1}{2}$ " per ton.
50 "	.....	14 dwt. "
8 "	.....	13 " "
15 "	.....	about an ounce to the ton.
<u>98 "</u>		

A drive has been commenced at about the 40-foot level, so as to test the reef in a southerly direction.

The three claims, which have been referred to, are all situated on Crow Mt., and following the serpentine in a southerly direction. On Conditional Purchase 16, on the southern side of Crow Mt. Creek, is (4) a claim held by Janson and Gardiner, who have sunk to a depth of 18 feet, following a vein which gives fair prospects of gold, is 8 inches wide, and bears N.W. underlying to the east at 19°.

(5.) Adjoining the preceding, and on its southern side, Ryan and Party have done a considerable amount of work in sinking through the Tertiary alluvial without striking bed rock, but have also sunk a couple of shafts 4 feet deep, and discovered auriferous quartz, but sufficient work has not been done for the size and direction of the veins to be determined.

(6.) Hill and Skews hold the ground adjoining Ryan on the south, and have sunk a shaft to a depth of 17 feet on a vein from 6 to 16 inches in thickness, bearing N. 20° E. and underlying to the east at 10°. Good prospects have been obtained by hand-crushing—the vein is worth proving. A shaft has also been sunk to a depth of 37 feet on a vein of quartz from 4 inches in thickness.

(7.) To the east of (6) is M'Kenzie and M'Nair's claim which was known at one time as "Crowley's" reef, and now as the "Dodger." A shaft has been sunk to a depth of 18 feet on a vein bearing N. 30° E. underlying to the west at 9° and consisting of quartz which averages 13 inches where it is gold bearing. At 13 feet level gold was struck, and has continued to the bottom of the shaft, the shoot dipping apparently at a long angle to the north, and containing very coarse specks and pieces of gold. In all 4 $\frac{1}{2}$  tons have been won, and of this quantity 3 tons of quartz have yielded 33 oz. to the ton (a number of rich specimens have not been yet crushed—had they been included the yield would have been about 57 oz. to the ton), 70 oz. have been dollied, and there are a number of rich specimens still uncrushed.

(8.) Adjoins the "Dodger" on the south-east, and is held by Geddes, Leslie, and Reay. A shaft 41 feet deep discloses a foot of quartz on the hanging-wall, and 4 inches on the foot-wall of a vein bearing N. 35° E. with a slight underlay to the west, and giving prospects of gold. In another portion of the ground 7 tons were raised by Williams and Party, previous holders of the claim, and the parcel is said to have yielded 3 $\frac{1}{2}$  oz. of gold to the ton.

(9.) Smith and Party, a couple of chains south-east of (8), are 8 feet deep and testing a body of quartz said to contain gold, and situated probably at the junction of several veins.

(10.) Fletcher's claim, G.L. 54, was taken up in 1875, and is said to have yielded £7,000 to a small party of miners working for three years. Several shafts have been sunk, one of them to the 60-ft. level; the vein bears W. 10° N., and the shoot dips to the west; 40 tons of quartz are said to have yielded 23 oz. to the ton. A lease of the ground has been applied for and work will be shortly commenced to further test the veins.

(11.) Adjoining (10) on the east, Johnson and Party have sunk a shaft to a depth of 13 feet on a mullocky vein, bearing W. 10° S., underlying to the north at 40°, and varying in thickness from 5 to 12 inches. A second shaft is 6 feet deep on a vein bearing N. 30° E., having a slight westerly underlay, and consisting of quartz and fluean, 3in. to 5in. thick, said to carry gold.

(12.) Is on G.L. 109 and half a mile south-east from the preceding claim. It is known as the "Try Again" and was worked in 1868, yielding to a small party of miners £4,000 for twelve months work. The lease is now held by Wall, Davis, and Hayes, who have sunk a shaft to a depth of 75 feet, and stoped

all the quartz from the surface to the 65-foot level for a length of 60 feet. It was impossible to examine the stoped ground, but the average thickness of the quartz ore is said to have been about 18 inches with the shoot dipping rapidly to the north—the vein bears N. 10° E. with an underlay of S° to the west. A three-head battery has been erected by the party at Crow Mt. Creek, distant 2 miles from the claim. The following are the results of crushings to date:—

50 tons.....	100 oz. (about)
5 " .....	42 "
15 " .....	35 "
12 " .....	30 " expected yield, stone not crushed.
<hr/>	<hr/>
82 tons.	207 oz.
	76 " dollied.
	<hr/>
	283 oz. total yield.

The party are sinking below the 65-foot level a shaft 30 feet north of the deep shaft, and its progress is of importance to the field as the work already done is thorough, and the party have their own battery for treatment of the veinstone won.

(13.) Immediately to the south of the "Try Again," T. Guy has sunk a shaft 20 feet deep, and driven from the bottom level northerly for 15 feet, proving a vertical vein 18 inches wide, bearing N. 45° W., and a cross-vein bearing N. 15° W., and having a thickness of 15 to 18 inches of quartz and mullock, which is said to contain colours of gold.

(14.) Fifteen or twenty chains S.-E. of (13), Janson and Gardiner are trenching a vein of quartz and brown iron ore 1 foot in width, and giving fair prospects of gold; it strikes N. 15° E., and has an underlay to the W. of 25°.

(15.) Is known as the "New Find"; it adjoins the preceding claim, and was taken up in the latter end of April by Faddy and Johnson, who have sunk a number of eastening trenches, and have discovered several veins, most of them carrying gold; from one of them a pound weight of gold was obtained in a dish of dirt. The work has not proceeded far enough for an idea yet to be formed of the value of the veins, which are, however, well worth attention.

(16.) About 15 chains east from (4), Williams is driving a tunnel in a direction W. 12° S., now 38 feet in length, and expects to strike a vein in a few feet. The vein outcrops about 20 yards south of the tunnel, strikes E. 30° S., with an underlay to the east of about 50°, and has a thickness of 5 inches. A load went 1½ oz., and several dishes gave 3 to 5 dwt. per dish.

The sixteen claims which have been referred to are all to the east, but within 20 chains of the eastern boundary of the serpentine, and are included in a length of 3¼ miles. As already stated, however, about 25 chains east of the main mass of serpentine, *i.e.*, on Jones's Selection and Leases Nos. 26 and 28, a dyke of the same rock occurs, and within 24 chains to the east of its eastern edge veins have been partly worked. At the present time there are three claims held. Floyd and Party (17) have sunk a shaft to a depth of 7 feet on a vein bearing E. 15° N., with an underlay to the north of 10°, having a thickness of 8 to 12 inches, and outcropping for nearly 5 chains. The quartz is said to carry colours of gold. Jones and party (18) are commencing work on a thin vein, bearing E. 10° N., with a slight underlay to the south, and composed largely of calcite; the shoot dips east. Several other veins up to 1 foot in thickness, and consisting chiefly of quartz, have been discovered, and will doubtless be tested. Handsome returns were obtained some years ago from working a vein in "Flanagan's" old shaft, and Phillips and party (15) have started a shaft on the same (?) line of reef, and have sunk it to a depth of 18 feet, following a thin leader, bearing W. 10° N., with an underlay of 4° to the north.

A mile and a half south-east from (15), Geddes and Party (20) are commencing work on G.L. 110 (?), Parish of Welsh, known as the old Fig Tree Claim. The vein bears W. 22° N., with a slight northerly underlay, has been tried to the 63-foot level and stoped for 40 feet in length to a depth of 25 feet from the surface for a thickness of 7 to 8 inches. The hanging-wall is fairly well defined, but the foot-wall is broken. Mr. Jones has kindly supplied the following particulars of the crushings which were taken out of the claim when previously worked:—

tons.	oz. dwt gr.
2½ .....	7 1 12
13 .....	1 10 0 per ton.
4 .....	1 11 0 "
4 .....	0 13 14 "
<hr/>	<hr/>
23½	

A few chains south of (10) Finkernagel and Party have commenced to test a number of thin veins which occur in the serpentine. The claim is of interest, because it is the only one now being worked which is situated on the serpentine.

### III. Summary.

Alluvial gold has been worked in the neighbourhood of Crow Mt. and at the present time is giving a living to a few men, but the immediate cause of the rush now taking place is the discovery of rich gold-bearing quartz, &c., in veins.

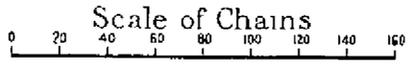

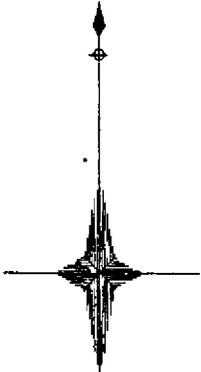

The occurrence of auriferous veins is not however new to the field, for work was commenced in the year 1868, and it is said that some of the parties of miners obtained as much as £4,000 for twelve months work, while there is every reason to believe that a crushing of 40 tons yielded 23 oz. of gold to the ton.

Most of the old deep shafts are not open to inspection, but Mr. Dyson states that one of them has reached the 150-foot level. Of the later work, *i.e.* performed during the last eighteen months, the deepest shaft is 72 feet, and payable gold has been worked to the 60-foot level. At the present time there are about eighty men on the field, the number varying daily and at one time reaching 200.

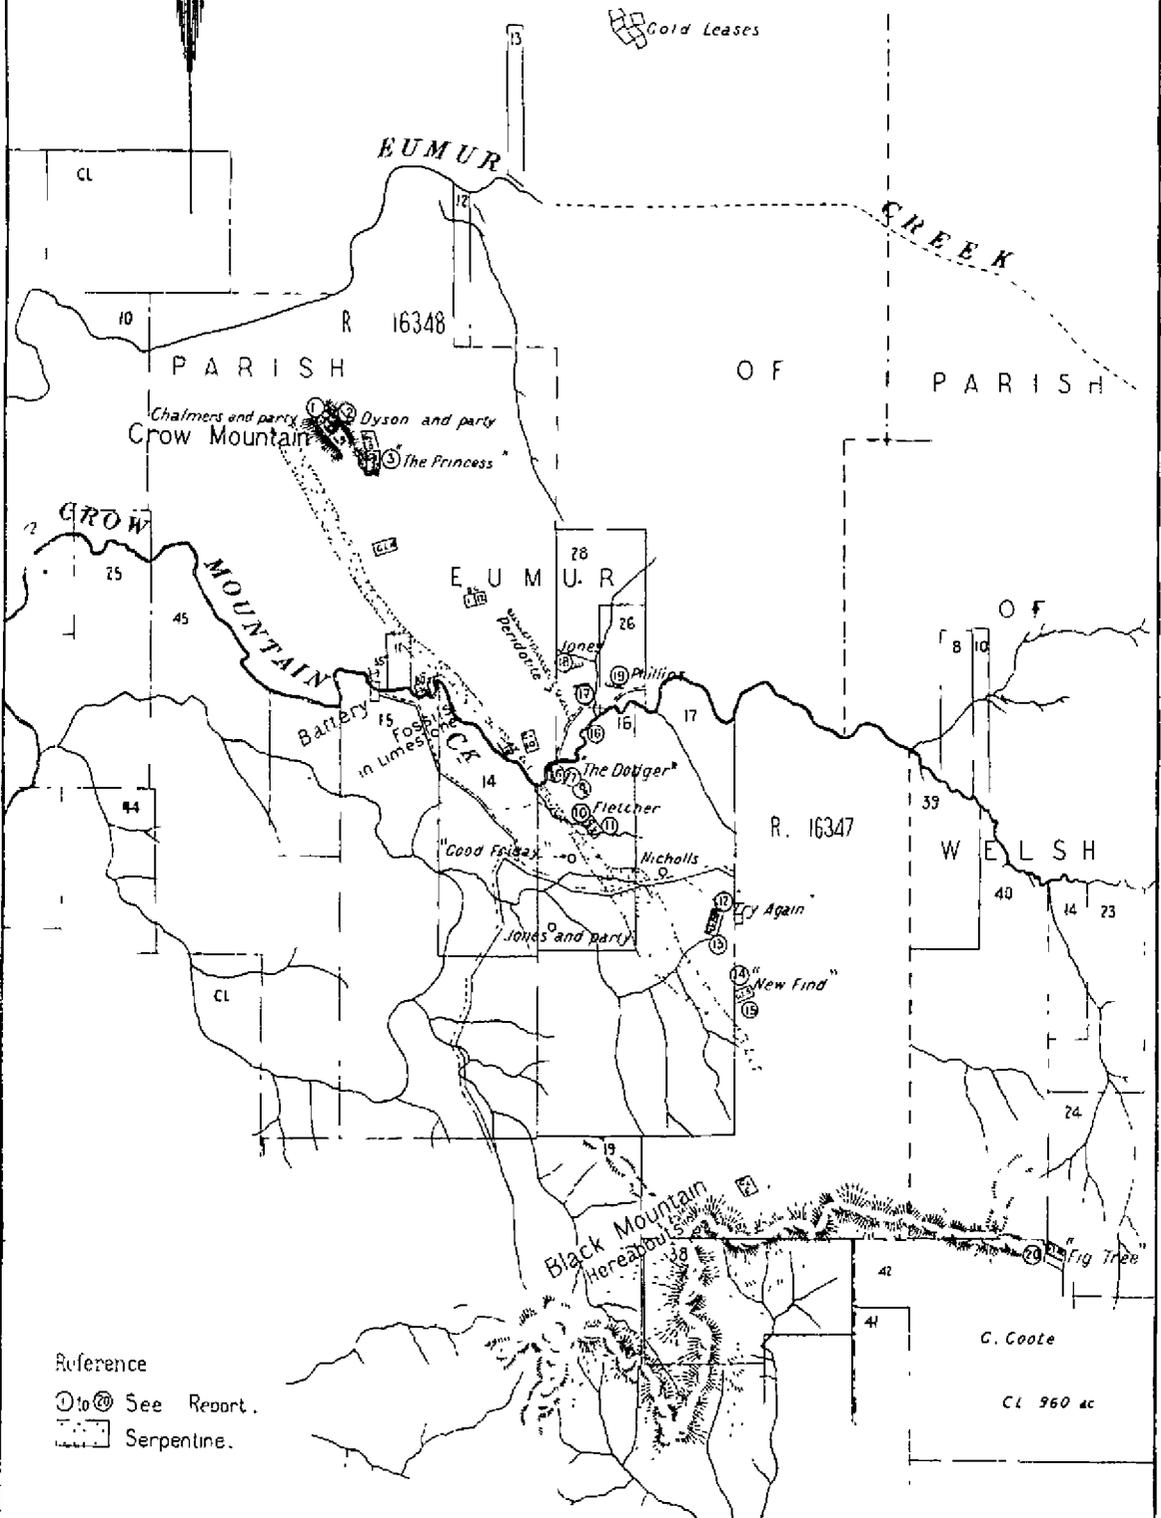

Three distinct areas of auriferous country have been proved to exist, one has a length of 3¼ miles with a width of about 28 chains, a second is three quarters of a mile long by about 24 chains, and the third has not been proved beyond a very limited area; if however the three areas be considered to form one auriferous belt, it will have a length of 5½ miles by 7 mile in width. The auriferous land abuts on to the eastern side of a well-marked belt of serpentine striking in a nor'-nor'-westerly direction, and the veins consist chiefly of

 COUNTY OF DARLING

*Edward F. Pittman*  
 GOVERNMENT GEOLOGIST.

(Sig 24)

quartz and occasionally of calcite, &c., running in two general directions, N. 8° to 30° E. and W., 15° S. to W., 22° N.—the gold does not appear to favour one series rather than the other—and varying in thickness, taking four of the principal claims, from 10 to 18 inches. As a rule the shoots outcrop and do not exceed 6 or 7 feet in length, but are separated by a variable, at times almost feather-edged amount of barren veinstone; one reef has been stoped for a length of 60 feet with payable results, but the gold may have occurred in more than one shoot. Sufficient work has not been done for a definite statement to be made as to the direction in the dip of the shoots, but it appears to be northerly in the meridional reefs and westerly in those at right angles to them, the amount of dip being variable. The gold has a Mint value of £4 1s. per ounce and occurs as coarse specks, probably deposited before the consolidation of the quartz, and pieces partly coated with oxide of iron, but although there is some fine gold present and occasionally a little pyrites, there has been no difficulty up to the present in saving the precious metal by the ordinary methods. As the gold is coarse it is not a matter of surprise that the yields vary and small parcels have given high returns. Of the quartz recently crushed one parcel of 50 tons has yielded about 100 oz. *i.e.* 2 oz. per ton, and a recent crushing of 3 tons gave a return equal to 57 oz. per ton (the actual yield was 33 oz. to the ton, but the parcel did not include a number of rich specimens now being dollied). Within the last twelve months 320 oz. of gold have been despatched to the the Mint, but the amount does not include all the gold which has been won.

The richer veins have not been traced outside the particular ground in which they are being worked, and their walls are not well-defined. Some few are unquestionably lenticular, but others are much promising for continuation to a depth, and one has been proved to the 150-foot level (recent work to 72 feet), while another vein outcrops for a distance of 5 chains.

A three-head stamper-battery, with copper plates and blankets, has been erected within 2 miles of the main portion of the field, and at Ironbarks (8 miles distant) there are two stamper-batteries, one of eight-head, with copper plates, and the other of ten-head, with cement tables and Watson and Denny pans. Owing to the scarcity of water there are not many sites convenient to the field, and suitable for the erection of batteries.

For future work it appears to me to be of importance that the country to the west of the serpentine should not be neglected, and as at Bingera auriferous dykes traverse the serpentine, the latter formation at Crow Mt. should be prospected. Moreover, gold is not the only mineral known to occur, and lodes may yet be found containing payable shoots of antimony or copper. The serpentine extends for more than 50 miles in an almost unbroken line, and gold has been obtained in various places at its junction with the adjacent rocks, but the intervening country has been but little prospected, so that there is a good opening for miners who are prepared to work without expecting immediate returns. The shoots are small, and it therefore takes time to prospect a small area of country; but, on the other hand, they are rich, so that there is in some cases a handsome return for the labour expended.

In conclusion, I desire to acknowledge the kind assistance afforded me by Mr. Warden Lawson and Messrs. Watt, Guy, and Dyson.

I have, &c.

GEO. A. STONIER,  
Geological Surveyor.

The Government Geologist.

#### APPENDIX 19.

#### Report on Country between Moree and Warialda.

Glen Innes, 10 July, 1895.

In accordance with the attached instructions, I have the honor to furnish the following geological report upon the road from Moree to the Whalan, Bogabilla, and Warialda. The specimens of rock met with have been already forwarded to you:—

From Moree to Bogabilla there is not an outcrop of rock to be seen, the whole distance being over tertiary plain country, and, so far as could be learned from inquiries, none of the wells or bores (Moree, 1,450 deep, and Dolgelly, 1,660 feet deep) have touched any rocks other than the water-bearing (Cretaceous) strata.

At the Whalan, a fairly large inlier of rock occurs, showing a thickness of 12 feet, and consisting of compact greyish-white sandy clays, passing into marl, with beds of fairly coarse clayey sandstone, enclosing, occasionally, well rounded pebbles up to 2 inches in diameter, composed chiefly of siliceous mudstone, the whole section containing numerous concretions of sandy or siliceous ironstone. To the west of the Rocky Crossings, thin beds of ferruginous quartzite also occur, the whole formation being overlaid by dark grey finely-divided sand. The dip could not be determined accurately, but is, apparently, a little south of west, at about 20°. There is no conclusive evidence of their geological age; but judging from the lithological character of the beds, I consider them to belong to the Cretaceous period, and to form part of the Rolling Downs Formation of Queensland. It was impossible, however, to decide whether they are in the upper or lower portion of the Cretaceous beds, and it depends solely on their position in the series whether a bore would strike water which would rise to the surface. In order to throw any light on the question, it would be necessary to go into Queensland, and follow, to the New South Wales border, the junction of the Cretaceous beds with the underlying rocks, and by devoting about three weeks to a journey of this kind, some useful information would be gathered, even supposing that conclusive evidence were not obtained. I understand that Mr. Jack, the Queensland Government Geologist, has lately discovered a thick porous bed of Cretaceous sandstone, which is probably the inlet of the water, and if this sandstone bed could be traced for some few miles, and the fall of its outcrop ascertained, some idea might then be formed whether a bore at Bogabilla or the Whalan would have any chance of success. At both places there is, however, practically permanent water, and there are several sites between the Whalan and Moree where the chances (judging by available evidence) of obtaining water are better, and where the water is said to be more urgently needed. If, however, it be decided to bore either at Bogabilla or the Whalan, I would venture to respectfully suggest, (1) that the bore should not be commenced until the Dolgelly and Gil Gil Bores have been completed; (2) in order to obtain as much information as possible, that samples be carefully kept of the strata passed through at Dolgelly, Gil Gil, and Moree Bores.

The Tertiary plain country continues from Moree for 6 miles, when an outcrop of basalt, probably of Tertiary age, and occupying at least a square mile of country, is met. At Yugabi the Carboniferous rocks outcrop, and towards Warialda are covered by a series of sandstones, &c., capped by basalt, the latter being of Tertiary age. At Warialda itself there is no chance of striking the Cretaceous series by boring,

boring, for the Carboniferous come to within a mile and a half of the Township to the west, and three miles to the south. Although there is no confirmatory palæontological evidence I do not feel any hesitation in correlating them with the Carboniferous beds of Bingera, where they are largely developed, and extend to Tamworth.

Above the carboniferous mudstones, &c., there is a thin unconformable series of fresh-water beds, in which I discovered fossils determined by Mr. W. S. Dun to be "*Alethopteris sp.*, *Phyllopteris sp.*, and *Brachyphyllum*, and to indicate the presence of beds of the Clarence Series." The discovery of these fossils is of importance, because they tend to prove that the measures are of Mesozoic and not of Palæozoic age, as previously considered; and to confirm my observations of the geology of the Coonabarabran District. Above this fresh-water series there is a large development of falsely-bedded sandstone, with beds of sandy ironstone, in all about 100 feet thick, and lithologically resembling the Middle Clarence Series (considered by the late C. S. Wilkinson to be homotaxial with the Hawkesbury Sandstone). The falsely-bedded sandstones appear to me to be slightly unconformable to the fresh-water beds. About 4 miles to the east of Warialda a bed of conglomerate occurs, dipping to the west, and in an easterly direction is succeeded by a coarse ternary granite. Whether the conglomerate is interbedded with the Clarence Measures, or is a small inlier of Permo-Carboniferous rocks, has yet to be ascertained.

I have, &c.,

GEO. A. STONIER,  
Geological Surveyor.

The Government Geologist.

#### APPENDIX 20.

##### Report on the Lismore District.

Geological Survey Branch, Department of Mines and Agriculture,

Sir,

Sydney, 25 July, 1895.

In accordance with your instructions attached I have the honor to forward the following report upon a recent visit to the Lismore District.

Lismore is a township on the Richmond River in the north-eastern (*i.e.*, the coastal) portion of the Colony, and is well known as the centre of a fine agricultural district.

Most of the more important geological features have been already noted in official reports of which the following will be found of interest:—

- (1) E. F. Pittman, 1880, p. 244.
- (2) C. S. Wilkinson, 1889, p. 202.
- (3) T. W. E. David, 1891, p. 220.

##### 1. *Geology and Physical Geography.*

The country around Lismore consists of gently undulating ridges with small plateaux, having fairly steep sides in places, and clothed with a dense brush which makes clearing operations a work of magnitude, but is a speaking witness to the fertility of the soil. Between Lismore and Murwillumbah (a township on the Tweed), the hills attain a considerable height, and in places are rocky and rough. The "Nimbin Rocks" are two remarkable hills of circumdenudation, having a small base, and rising abruptly from the surrounding country; when seen from a distance they resemble the outliers of Hawkesbury sandstone common on the famous Blue Mountains, near Sydney. From the summits of the range which divides the Tweed from the Richmond, fine views of the surrounding country can be obtained, and an idea formed of the extent of land which is being cultivated. In past years the sugar-cane industry was confined to the rich alluvial flats fronting the river, but the energy of the residents is being directed to the clearing of the ridges, and the destructive effects of frost are being met by the cultivation of the higher land.

The geological formations are—

- (1) Recent and Pleistocene.
- (2) Tertiary lavas, pipe-clays, &c.
- (3) Lower Middle and Upper Clarence series.
- (4) Granite and other acidic intrusive (?) rocks.
- (5) Devonian (?) sandstones, &c.

(1) Recent and Pleistocene.—The Richmond and Tweed Rivers with their tributaries are flanked by rich alluvial deposits, proved to be 40 (+) feet in thickness in places. Along the beach are wide areas of blown sand, and to the south of Richmond Heads the existence of a "back-terrace" has been demonstrated.\* At Ballina the sand is consolidated into a sandstone having a steep dip inland, at the base of which is a conglomerate of late Tertiary age and of marine origin. Along North Creek kitchen-middens have been formed, flanking the stream in one case nearly 25 chains, and having a thickness of 6 to 13 feet. They contain a number of stone tomahawks, clips of quartzite, rounded pebbles, and occasionally basalt boulders, the latter showing clearly that the deposits are of later age than the basalt flow. B. J. Statham, Esq., Assoc. Inst. C.E., published a paper giving details of these shell heaps,† and a description of the shells discovered is given in Mr. Etheridge's report.‡

(2) The Tertiary lavas occupy an immense area, for the most part consisting of basalt which is at least of three distinct sheets and variable composition, and showing well in section in a number of places. The acidic lavas occur to the north and north-west of Lismore in the vicinity of the Nightcap Range where they are more largely developed than in any other part of New South Wales, except perhaps the Coonabarabran District. In the Parish of Tunstall they attain a thickness of several hundred feet, and occupy a fair area, many of the rocks showing beautiful fluxion structure, and passing into pitchstone. The pipe-clays, &c., have been observed chiefly to the south of Lismore, where a deposit of tripolite has been discovered, varying in thickness up to 4 feet 6 inches, but there has not been sufficient work done to enable any idea to be formed of the extent of the deposit—doubtless prospecting operations will reveal its occurrence in other parts of the district.

(3) These Measures outcrop in a number of places from beneath the basalt, and although their outcrop does not occupy a large area, the system has been widely developed, and will be found under the basalt in many parts of the district.

Professor

\* Ann. Rept. Dept. Mines for 1894 [1895], p. 120.

† Proc. R. Soc., N.S.W. for 1892, p. 304.

‡ Ann. Rept. Dept. Mines for 1891, p. 268.

Professor David has given a detailed account of the coal at Coraki, and notes the occurrence of the three coal-seams, one of which with bands is 10 feet in thickness, but as the average percentage of ash in the average sample was high, it is evident that the coal would not be profitably exported. West of the township of Wardell, several outcrops have been observed, but none of them are of importance. North of Lismore a number of outcrops are known, and from Parish Tunstall ("Nimbin"), a couple of tons were brought into Lismore and tried at the local Gasworks. The coal is friable, and has only been found in thin beds, and even were it more favourably situated, the seams are too thin to be worked; there is, however, a large area yet to be prospected, and the creeks could be carefully traversed in order to ascertain if larger outcrops containing coal of better quality exist. In view, however, of the distance of the field from market, even a first-class coal would be handicapped.

(4 and 5.) Granite has been observed near Mount Warning, and at Mullimbimby, felsites make their appearance. The sandstones, &c., in the absence of palæontological evidence, might be considered to be of Devonian age. They come to the surface in small areas, and a strip of the rocks runs from Cape Byron in a southerly direction, 6 miles to the west of Ballina.

## (2.) Mining.

Immediately to the north of Black Head, Ballina, beach-combers have found a considerable amount of profitable employment. Some miners assert that during rough weather, gold is brought up by the action of the waves and deposited on the beach, but it is questionable whether the process is not one of concentration of the mineral already present, rather than the transportation of mineral from a distance. As to the source of the gold, platinum, and tin which are found along the beach, there can be little doubt that they have been originally derived from veins, &c., in the Devonian sandstones, &c., and it is a suggestion well worthy of consideration whether the minerals may not have been concentrated into the conglomerates, &c., of the Clarence Series from which they are being daily freed and deposited ultimately along the beach. The conglomerates referred to are worthy of a little more attention than what has already been devoted to them. The late Mr. Wilkinson, in his report already referred to, states that the basalt at Black Head is auriferous. The deposit has received some attention, but the returns of gold have varied considerably. Independent of the present beach, there is a fair stretch of flat country back from the shore-line, where a back-terrace may be concealed; it is impossible to sink shafts in some cases, so that recourse must be had to boring, and as the beach may not be wide, the ground will need to be systematically prospected before it can be definitely asserted that a back-terrace does not occur.

Unless the Clarence Measures contain gold in the form just alluded to, they are not likely to be valuable to the gold-miner. Of much more promise, however, are the Devonian sandstones, &c., for they are traversed by quartz-veins which carry gold. At Alstonville (between Lismore and Ballina), several veins have been discovered, one of which is a foot in thickness, and a crushing of a ton gave 15 dwt. to the ton. On Tonkeo Creek, two quartz-veins have been discovered, and are well worth prospecting. There is a fair stretch of country worth attention, but as it is partly covered by a dense brush the work takes a considerable time, and prevents a party from making much headway.

In conclusion, I desire to acknowledge the kind courtesy extended to me by Messrs. Coleman (the Mayor of Lismore), Stewart (Mayor of Ballina) and Morton, and in particular to Mr. Munro, of Ballina, whose intimate acquaintance with the district and geological notes and plans proved of great service to me.

I have, &c.,

GEO. A. STONIER,  
Geological Surveyor.

## Progress Report by Mr. J. B. Jaquet, Geological Surveyor.

Geological Survey Branch, Department of Mines and Agriculture,

Sydney, 22 January, 1896.

Sir,

I have the honor to inform you that during the past year I was engaged as follows:—

From 1st to 22nd January I was absent on leave. On the 23rd I left for Condobolin, and spent a week making a geological examination of the country around Melrose, about 35 miles north of this town. (*Vide Appendix 25.*) I afterwards reported upon proposed alterations of gold-field reserves, and applications for aid from the Prospecting Vote in the following localities:—Alectown, Peak Hill, Cadia, Canowindra, Watle Flat, Avisford, Windeyer, and Oberon. I returned to Sydney upon the 28th February.

Having prepared various reports, I left for Mount Drysdale upon the 18th March, and made an inspection of the Drysdale and Billagoe Gold-fields. My report upon the same forms Appendix 26. I also examined a newly-discovered deposit of auriferous ironstone upon the Cobar-Louth Road, and the Restdown and Hermidale Gold-fields.

Returning to Sydney upon the 4th April, I left again upon the 25th, and was engaged until the 9th May in making a joint inspection with Mr. District Surveyor Sheaffe, of Cooma, of various gold-fields upon the upper portion of the Shoalhaven River, with a view of reporting as to how their boundaries might be altered and simplified. From Braidwood I proceeded to Nerrigundah, Moruya, and Bateman's Bay, and reported upon applications for aid from the Prospecting Vote and proposed alterations of gold-field reserves in these localities.

I arrived back in Sydney upon the 21st May, and left again for Dubbo upon the 29th. From Dubbo I journeyed to near Ballimore, and made an examination of the auriferous drifts upon the Talbragar River (*Vide Appendix 27.*) After leaving Ballimore I journeyed to Stuart Town, Orange, Sunny Corner, Palmer's Oakley, Newbridge, Trunkey, Tucua, Crookwell, Young, Cowra, Junee, The Rock, and Picton. In each of these localities I either reported upon applications for aid from the Prospecting Vote or inspected portions of land which it was proposed should be withdrawn from various gold-field reserves. I also inspected the Amos (Lucky Hit) Mine and the Golden Dyke Mine at Tucua, the deposits of chrome ore at Berthong and the Cumberoona Gold-field, near Albury. (*Vide Appendices 28 and 5.*) I returned to Sydney at the end of July.

Upon the 27th August I left Sydney for Mandurama, Woodstock, and Mount Macdonald, in connection with applications for aid from the Prospecting Vote. I also reported upon a newly-discovered auriferous reef near Woodstock. (*Vide Appendix 30.*)

Towards the end of September I left Sydney and journeyed to Tarcutta, Adelong, Bullenbong, Junee Reefs, Harden, Burrowa, Yass, Gunning, Wyalong, Lake Cudgellico, Yalgogrin, Euabalong, Cujong, Condobolin, Forbes, and Parkes. In the vicinity of each of these towns I inspected mines in connection

connection with applications for aid from the Prospecting Vote. I also reported upon the Yalgogrin Gold-field and the platinum deposits at Fifield. (*Vide* Appendices 31 and 32.) Returning to Sydney upon the 23rd November, I left again upon the 27th for Lewis Ponds, and inspected some M.L.'s which had been applied for, and which were supposed to cover payable auriferous deposits.

From Lewis Ponds I proceeded to Binni Creek, near Cowra. Upon the slope of a low hill which overlooks the Binni Creek lead some exceedingly rich specimens of auriferous quartz have been from time to time found. I examined the locality with a view of determining whence these specimens had been derived. Having regard to all the circumstances, I am of opinion that they have not been shed from a well-defined reef, but from a series of small quartz-pockets. One patch of auriferous quartz has already been discovered, and found to pinch out altogether a few feet below the surface. These pockets can be best discovered by trenching; and I am of opinion that it is useless to continue sinking in the country rock where no indication of a vein is to be seen, in the hope that a reef will be struck at a depth.

I journeyed from Binni Creek to Oberon, and inspected a portion of the Swatchfield G.F. Reserve from C.P., with a view of reporting as to whether such portion might be cancelled.

During the year I have contributed four papers to the Records of the Geological Survey, as follows:—  
Notes on the Geology of the Auriferous Gravels occurring in the upper portion of the Shoalhaven River.  
Petrological Notes on two Andesites associated with Auriferous Deposits in N.S.W.

The Intrusive and Metamorphic Rocks of Berthong, with especial reference to the occurrence of Serpentine after Amphibolite.

The Occurrence of Platinum in New South Wales.

I have, &c.,

JOHN B. JAQUET,

Geological Surveyor.

The Government Geologist.

APPENDIX 21.

Report on Gold Reefs at Cumberoona and Wyndham.

Geological Survey Branch, Department of Mines and Agriculture,

Sydney, 17 August, 1895.

Sir,

I have the honor to report that, in accordance with your instructions, I have inspected the gold reefs which have recently been discovered about 15 miles north-east of Albury in the Parishes of Cumberoona and Wyndham, County Goulburn.

The reefs occur in granite. They vary in width from a few inches to 2 feet, and are composed of highly ferruginous quartz.

Picked samples of quartz have yielded when assayed by this Department up to 2 oz. of gold per ton, but at the period of my inspection no crushings which would enable me to form an idea of the general yield had been made. The gold would seem to occur in a finely divided state; at a short distance below the surface it will probably be associated with pyrites and be difficult of extraction.

On Portion 29, Parish of Wyndham, Plunkett and Party have traced a reef in trenches for a distance of 9 chains. A shaft has been sunk to a depth of 30 feet. Near the surface in this shaft the vein is 2 feet wide and well defined, but it has split up into a number of small veins below.

On Portion 85, Parish of Cumberoona, Macpherson, Gibson and Party have sunk a shaft to a depth of 40 feet. I was not able to inspect the shaft owing to the absence of the proprietors, but I learned from the inspection of the ore recently raised that arsenical pyrites had been met with below. Several shallow shafts have also been sunk upon Portions 119 and 116, Parish Cumberoona, by Messrs. Auhl, Cotterell and Party, and Cobman and Party.

Both as regards the stone they yield and the mode of its occurrence, all the reefs I examined closely resembled one another, and I have but little doubt that further prospecting will result in other similar reefs being found.

There are at the present time twenty men working upon the field. Most of these own farms in the district, and I do not think many of them could earn a living by mining alone.

Some reefs have already been found to give out but a few feet below the surface, and I think very few of them will continue downwards; while any ore obtained below the zone of oxidation will probably be refractory. I would advise the miners to devote their attention to exploring and raising the gossanous ore near the surface, rather than in sinking deep shafts in the hope of meeting with better ore below.

I have, &c.,

JOHN B. JAQUET,

Geological Surveyor.

The Government Geologist.

APPENDIX 22.

Report on Specimen Hill, Binni Creek.

Geological Survey Branch, Department of Mines and Agriculture,

Sydney, 15 February, 1896.

Sir,

I have the honor to report that according to your instructions I have made an examination of "Specimen Hill," Binni Creek, near Cowra.

Specimen Hill overlooks the Binni Creek Lead from the west. It is composed of quartz-felsite. The bedrock is, however, for the most part hidden by a loam deposit which is from 2 to 12 feet deep. Underneath the loam, resting upon the bedrock, exceedingly rich specimens of auriferous quartz have, from time to time, been discovered. Altogether specimens worth several hundred pounds have been obtained, some of them were more than half gold. They were but little waterworn, and this is evidence that they had not travelled far from their source.

Having regard to all the circumstances I am of opinion that the specimens have not been shed from a well defined reef, but from a series of small quartz pockets. One patch of auriferous quartz has, I was informed, been already discovered and found to pinch out altogether a few feet below the surface.

There is no evidence to show that any golden pockets still remain *in situ*. They may, with the exception of the one already found, have been denuded away and scattered over the hillside and flat below. The pockets could be best discovered by systematic trenching upon the hill top, and I am of opinion that it is useless to continue sinking in the country rock where no indication of a vein is to be seen, in the hope that a payable reef will be struck at a depth.

I have, &c.,

JOHN B. JAQUET,

Geological Surveyor.

The Government Geologist.

APPENDIX 23.

## APPENDIX 23.

Report on Metalliferous Deposits at Restdown, Amphitheatre, Hermidale, and Bee Mountain.

Geological Survey Branch, Department of Mines and Agriculture,

Sir,

Sydney, 24 April, 1895.

I have the honor to report that, in accordance with your instructions, I made an examination of the metalliferous deposits at Restdown, Amphitheatre, Hermidale, and Bee Mountain, in the Cobar and Nyngan districts.

*Restdown.*

Gold has been discovered in the outcrop of a reef about a mile and a-half west of the Restdown Hotel. On the find becoming known, about six months ago, a number of men flocked to the field, and a considerable amount of prospecting has been done upon it. At one time there were thirty men working in the claims, but only nine of these now remain.

The reefs are composed, near the surface, of ferruginous quartz, and below, of quartz with arsenical pyrites. Only traces of gold have been found in them, and having regard to the large quantity of arsenical pyrites present the treatment of any ore, other than that raised from the outcrop, would be a costly operation.

I am of opinion that the district around is well worth prospecting, but that little good is likely to result from the exploration of the reefs now being worked.

*Amphitheatre.*

The auriferous deposit is situated about 9 miles west of Cobar, upon the Cobar-Louth road.

It consists of an irregular mass of hæmatite, occurring in argillaceous sandstones. I was informed by Mr. W. J. Hogan, of Cobar, who accompanied me during my inspection, that 10 tons of the ironstone yielded, when treated in Cobar, gold at the rate of 16 dwt. per ton.

*Hermidale.*

Several years ago gold was discovered in hæmatite about 4 miles west of Hermidale, and after several shafts had been sunk the workings were abandoned. Attention has recently been again directed to these deposits.

The gold occurs not only in the iron ore but also in the slates which are more or less impregnated with iron oxide. The ore hitherto obtained has only yielded traces of gold—less than 2 dwt. per ton.

The deposits resembles that one which is being worked at Mount Allen, near Mount Hope. They deserve, I think, to be further prospected.

*Bee Mountain.*

A large quartz reef carrying galena and mispickel has been discovered upon the flat to the east of Bee Mountain. Samples of this reef, when assayed, yielded but small quantities of silver and lead, and no gold, hence I am of opinion that the lode is not worth prospecting.

I have, &c.,

JOHN B. JAQUET.

The Government Geologist.

## APPENDIX 24.

First Report on the Cujong Gold-field.

Geological Survey Branch, Department of Mines and Agriculture,

Sydney, 4 February, 1895.

A VERY promising gold reef was discovered near Condobolin by Messrs. Linten and M'Clure during the latter portion of last week, and, before leaving the district, I made an examination of the same.

The site of the discovery is distant about 30 miles in a westerly direction from Condobolin, and about 8 miles from Kiacatoo Homestead.

The country rock is altered slate, which is for the most part covered with a loose rubble.

The outcrop of the reef, which is about 2 feet wide, has been exposed for about 5 feet along its course. I saw coarse particles of fine gold occurring in situ, and several hundred-weight of rich specimens have already been raised.

Prospecting is now being carried out in the immediate vicinity of the discovery, and, having regard to the fact that numerous boulders of quartz, which resemble the stone raised from the prospector's claim, have been found in the trenches, I am of opinion that other reefs may be discovered shortly.

I have, &c.,

JOHN B. JAQUET.

## APPENDIX 25.

Report on Auriferous Deposits in the Condobolin, Melrose, and Cujong Districts.

Geological Survey Branch, Department of Mines and Agriculture,

13 March, 1895.

Sir,

I have the honor to report that, in accordance with your instructions, I have made an examination of the auriferous deposits occurring in the neighbourhood of Condobolin, Melrose, and Cujong.

The formations around Melrose were geologically examined by the late Mr. Lamont Young in 1879,\* and afterwards in greater detail by Mr. P. T. Hammond in 1892.†

*Condobolin.*

The country is made up of low ranges of hills which are widely separated from one another by spacious flats. The hills are composed of altered silurian slates and sandstones. The flats are covered, for the most part to a great depth, with recent and pleistocene sediments. It is upon the ranges and at those places where, the recent deposits being shallow, the bedrocks can without much difficulty be examined that reefs have been found, and prospecting is now in progress. About

\* Ann. Rept. Dept. Mines for 1880, p. 259.

† Ann. Rept. Dept. Mines and Agric. for 1892, p. 167.

About 3 miles north of Condobolin, on the Condobolin-Melrose road, numerous auriferous reefs have been discovered, and several shafts sunk upon them.

The reefs conform with the bedding planes of the country and when followed either in a vertical or horizontal direction are found to frequently "pinch out" altogether. The gold near the surface is associated with quartz, cerussite, and oxides of iron, and below the zone of oxidation with pyrites, mispickel and galena. The shoots of payable stone hitherto discovered were of small dimensions; and having regard to the general character of the reefs I think there is but little chance of any of them yielding a large quantity of ore.

#### *Melrose.*

I spent several days examining the country in the vicinity of Melrose.

The physical features of the district are similar to those which obtain around Condobolin. The formations consist of much altered Silurian slates which are intruded by bosses of granite and quartz felsite. Outliers of Devonian sandstones and conglomerates occur in places.

In places quartz reefs are very numerous, I did not see any which carried gold; however, having regard to the geological formations, and the fact that a little alluvial gold has been found in the creeks, I think the district deserves to be well prospected. It is possible that ore-deposits consisting of altered slates impregnated with gold similar to those which occur elsewhere in the Western District may be present; the intending prospector would do well to bear such deposits in mind.

On Mount Tinda, which is composed of granite, numerous thin veins of argentiferous galena occur. Several shafts were sunk upon these lodes a few years ago, but at the present time, with one exception, the workings are all abandoned. The galena contains from 20 to 40 oz. of silver per ton. The small lodes hitherto discovered would not, in my opinion, yield a profit if worked.

Several shafts have been sunk in various places upon the flats with a view of discovering deep auriferous leads on the bottom. In no instance have such efforts been successful. It is possible that such leads do exist in places, but the Pleistocene sediments are very thick and of vast extent, while there is nothing on the surface to indicate the position of ancient gutters below, and these circumstances enormously increase the difficulties of the prospector.

I am of opinion that it would be better for the searcher after alluvial gold to confine his attention to the drifts which accompany the present watercourses.

#### *Cujong.*

For some months past prospecting has been in progress in this locality at a spot distant 8 miles in a north-westerly direction from the homestead on Kiacatoo Run. The country here consists of much altered slates which are covered to a depth of from 2 to 6 feet with a recent deposit of loam and rubble.

A few days previous to my visit, the outcrop of a promising looking reef had been discovered by Messrs. Maclure and Linden. It was 2 feet wide, had an approximately vertical dip, and appeared to trend nearly east and west. Several bags of rich ore, a considerable portion of which was richly studded with gold, had been raised.

Upon the surface of the ground for a considerable distance around boulders of quartz, some of which have been found on crushing to contain gold, are to be seen; and I am of opinion that further prospecting will result in other reefs being found.

I have, &c.,

JOHN B. JAQUET,

Geological Surveyor.

The Government Geologist.

#### APPENDIX 26.

#### Second Report on Mount Drysdale.

Sir, Geological Branch, Department of Mines and Agriculture, Sydney, 23 April, 1895.

I have the honor to report that, in accordance with your instructions, I have made a further examination of the Drysdale Gold-fields.

#### *Mount Drysdale Mine.—No. 1 Shaft.*

This shaft has now been sunk to a depth of 190 feet. The rich ore thinned out and terminated at a depth of 160 feet. Below this point the country is charged with finely disseminated arsenical pyrites. I obtained samples of the pyritous rock from the bottom of the shaft and these on assay yielded neither gold nor silver.

#### *No. 2 Shaft.*

The sinking of this shaft has been discontinued. A winze has been sunk from the 50-foot level to the stopes at the back of the 100-foot level upon the ore-shoot. I was unable to examine the winze, but from the back of the stopes I obtained samples of rock, and these on being assayed yielded at the rate of 8 dwt. of gold and 3 dwt. of silver per ton.

A winze has also been sunk below the 100-foot level to a depth of 50 feet. No ore would seem to have been met with in this winze, and some samples which I took from the bottom contained neither gold nor silver.

The 100-foot level has now been connected with the 80-foot level of No. 1 shaft, and a testing of the stone has shown that the ore-bodies accompanying No. 1 and No. 2 shafts respectively, are distinct from one another.

The gold yielded by the last 100 tons of ore sent away from the mine to Queensland—16 dwt. per ton—was not sufficient to pay for the cost of carriage and treatment.

#### *Eldorado Mine.*

The shaft has now been sunk to a depth of 150 feet, and preparations were being made to drive south and explore the ore-body previously worked in the underhand stopes from the 100-foot level. It was from these stopes that the bulk of the ore sent away from the mine was obtained. I was unable to examine them for the entrance is boarded over and covered with heavy rocks.

A little ore is now being raised from the walls and "backs" of the 50- and 100-foot levels.

#### *Mulum in Parvo.*

The shaft has been sunk to a depth of 140 feet without meeting with any payable stone. In view of this fact we may be warranted in assuming that there is no connection between the Drysdale and Eldorado ore-bodies.

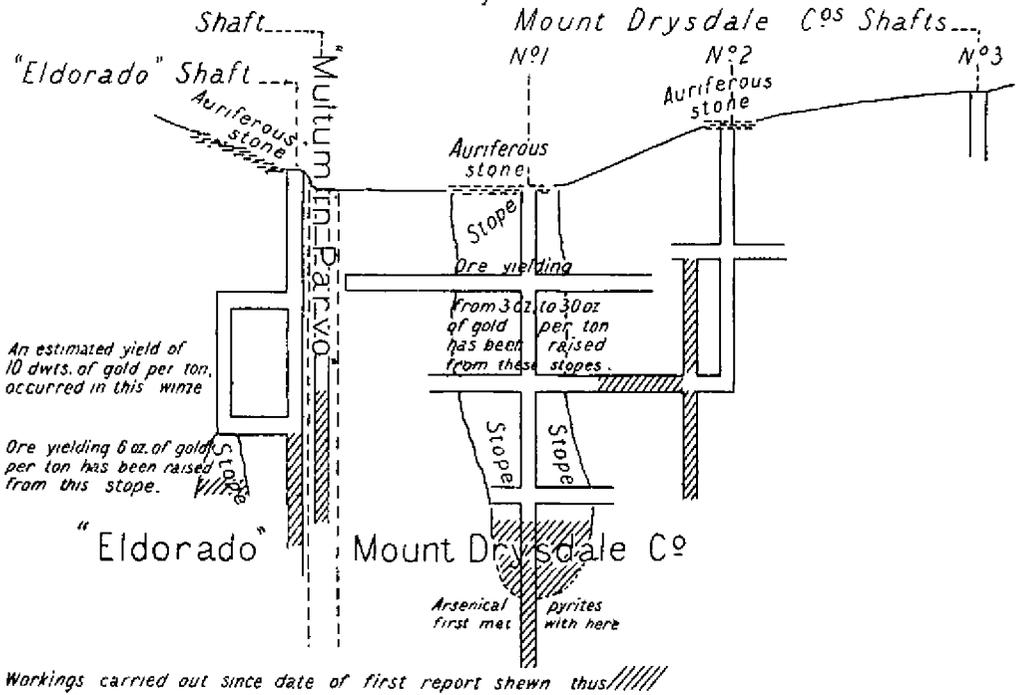

*Drysdale*

Section through shafts.

Mount Billagoe Mine

(Sig 24)

*Drysdale Proprietary Mine.*

The company owning this mine is exploring the ground adjoining the Mount Drysdale Block upon the west. Two shafts have been sunk near the boundary of the mines, one of which has reached a depth of 110 feet, and the other 50 feet.

*General Remarks concerning the Drysdale Mines.*

After my previous inspection I stated that the Drysdale and Eldorado Mines were not sufficiently developed to enable me to express any definite opinion as to the extent of the ore-bodies. Since that inspection, however, fresh exploratory work has been carried out and several important facts made clear. The chief among these are as follows:—

1. The rich ore occurred in three distinct shoots, which are separated from one another by masses of barren rock, or rock containing but traces of gold and silver. One of these is situated a little south of the Eldorado Shaft, and the others accompany the No. 1 and No. 2 Drysdale Shafts respectively.

2. At a depth of 160 feet in the Drysdale Mine the country is highly charged with iron pyrites and mispickel. These minerals not only accompany the ore-bodies, but are more or less distributed through all the rocks below the zone of oxidation. It may be that the gold was originally associated in small quantities with the pyrites, and has been concentrated on the oxidation of this mineral by a process of segregation in the decomposed and porous portions of the country rock.

3. The ore-shoot accompanying the Drysdale No. 1 Shaft, hitherto by far the most productive of the three, has given out at a depth of 160 feet, when the soft bleached slates, &c., pass into a compact blue pyritous rock, and has not been met with between this depth and the bottom of the shaft. It is important to note that several breaks occurred in the shoot while it was being followed from the surface to 160 feet, and this circumstance suggests that it may be found again lower down. However, it yet remains to be seen what effect the change in country will have.

I would recommend that drives and cross-cuts be driven from the bottom of the shaft, for it is possible, in the event of the shoot making again, that it may dip either to one side or the other, when it would never be encountered in a vertical shaft.

Should ore be met with beneath the zone of oxidation, it will probably contain less gold and be more difficult to treat.

At the time of my inspection only six miners were employed in the Drysdale Mine, and these were engaged in sinking No. 1 Shaft and the winze near No. 2 Shaft. No attempt was being made to explore the upper portions of the mine.

I would suggest, having regard to the irregular character of the ore-bodies, that the most efficient and profitable method of searching for them would be by means of a series of vertical and horizontal diamond-drill bores. Such bore-holes were successfully substituted for exploratory cross-cuts at the South Broken Hill Mine, and, I believe, they have also been used in the Wentworth Gold-mine at Lucknow.

I am of opinion that further prospecting may result in patches of rich ore being found in the Drysdale and Eldorado Mines, but that the ore-bodies are too small and scattered to permit of these mines yielding for a lengthy period large supplies of gold. There is a considerable quantity of low-grade ore in sight, which might be profitably treated when a battery is erected upon the field.

*Billagoe Mine.*

This mine is distant about 2 miles in a south-westerly direction. The ore-body exploited by it consists of silicified slates, argillaceous sandstones, breccias and lenticular patches of quartz, impregnated with chlorobromide and iodide of silver and gold. In the lower levels of the mine patches of ore are to be seen in which the silver is present wholly as native metal. A specimen of this ore which I obtained yielded at the rate of 3 oz. of gold and 130 oz. of silver per ton.

The sketch sections which accompany this report show the relative positions of the mine workings and ore-shoots.

The main ore-shoot is about 30 feet long. It is 3 feet thick in the centre, and tapers towards each end. The ore raised from it contained from 5 to 20 oz. of gold and from 40 to 300 oz. of silver per ton. No ore was obtained in the underlay shaft between the surface and a depth of 50 feet, and the shoot has been lost sight of in the floor of the 120-foot level. It yet remains to be proved whether a break occurs in the ore-body at this level or whether it ceases there altogether. It is significant to note in connection with this question that the western cross-cut at 160 feet has been driven a distance of 22 feet without meeting with any ore.

Some very rich ore is now being raised from the bottom of the underlay shaft (stopes "A"), but a glance at the plan will show that the amount of ore remaining here unworked is not very great.

A second ore-shoot has been discovered in the 70-foot level, about 40 feet in a north-easterly direction from the underlay shaft. It is about 30 feet long and 10 inches wide, and I was informed by the Manager that it contained from 1 to 2 oz. of gold and from 20 to 30 oz. of silver per ton. This shoot has disappeared in the floor of the 70-foot level.

I have, &c.

JOHN B. JAQUET,  
Geological Surveyor.

The Government Geologist.

## APPENDIX 27.

## Report on Auriferous Drifts on the Talbragar River.

Sir, Geological Survey Branch, Department of Mines, New South Wales, 6 August, 1895.

I have the honor to report that I have made a geological examination of the auriferous drifts in the vicinity of Talbragar River, in the Parish of Erskine, distant about 20 miles in a westerly direction from Dubbo.

The drifts are probably of Tertiary age. They are superimposed upon the Hawkesbury Sandstone and Coal Measures, and have been for the most part covered by a flow of basalt. In so far as they only occur in the vicinity of the Talbragar River, we are, perhaps, justified in assuming that they represent detritus brought down by this river during Tertiary times.

All the circumstances point, I think, to the gold having been derived from a far distant source. The component pebbles of the drifts are water-worn, and are nearly all composed of white quartz. No quartz-reefs occur in the underlying sandstones, nor has quartz *in situ*, nor auriferous rock, been found within a radius of several miles from the deposits.

The precious metal occurs in very minute scaly particles. It is, indeed, so fine that in the absence of special precautions a considerable proportion would be lost during the washing of the drift.

Some of the pebbles, more particularly those which rest immediately upon the bottom, are tightly cemented together by an infiltration of oxide of iron. The gold in these cements can only be won by treating the stone as reef-quartz and crushing it in a battery.

Upon Portion 13, Parish of Erskine, Dr. Fitzpatrick and partners have driven a tunnel upon the drift, which is here from 1 foot to 3 feet thick, for a distance of 100 feet. They have also erected a five-stamp battery for crushing the cement.

On the hill above the tunnel several shafts have been sunk through the basalt and "bottomed," at depths varying from 20 to 43 feet. From one of these shafts May, Hogan, and Party recently obtained fourteen loads of dirt, which yielded, I was informed, on washing, 2 oz. 5 dwt. of gold.

There seemed to be some doubt in the minds of the miners working on the field as to whether all the work hitherto carried out had not been upon a "false bottom." Acting upon this assumption, one shaft has been continued for a distance of 20 feet into the Hawkesbury Sandstone, without, it is scarcely necessary to add, meeting with any drift. In all sections examined by me there was but one distinct bed of gravel resting immediately upon the bed-rock. I would advise all miners to cease sinking after meeting with a compact bed of sandstone. On the whole, I do not think these drifts can be profitably worked on a large scale.

The gold is for the most part patchy as regards its mode of occurrence, and the exploitation of the rich patches is not likely to yield a profit equal in amount to the money expended in preliminary exploratory work. Again, the bottom is very uneven, and this makes the driving of levels upon the drift a costly and difficult operation.

A few miners may, perhaps, make a living by quarrying the drifts where they are exposed upon the river cliffs.

I have, &c.,

JOHN B. JAQUET,

Geological Surveyor.

The Government Geologist.

#### APPENDIX 28.

#### Report upon the Amos and Golden Dyke Mines, Tucua.

Geological Survey Branch, Department of Mines and Agriculture,

Sydney, 13 August, 1895.

Sir,

I have the honor to report that, in accordance with your instructions, I have inspected the "Amos" and "Golden Dyke" Mines, which are situated in the Parish of Meglo, County Georgiana, about 3 miles south of Tucua, upon the Tucua-Binda road.

The "Amos" Mine has been worked intermittently for a large number of years. It was formerly known as the "Lucky Hit" Mine. The formations in which the auriferous deposits occur consist of altered slates and chlorite-schists.

The gold is found in thin lenticular veins, which strike across the cleavage planes of the slates, and are seldom more than a few feet in length. The greater portion of the old workings were filled with water, and I was, in consequence, prevented from making an examination of the veins far from the surface; but I was informed by Mr. Mills, Mine Manager, that some of them had been followed downwards to a considerable depth.

The veins are composed, in the slates, of quartz, and, in the chlorite-schists of calcite, with an admixture of quartz.

The gold occurs for the most part in a massive form. It is concentrated in certain portions of the pipe-veins, and outside of the auriferous nests the stone is of little or no value. From the golden portions of the veins small quantities of exceedingly rich stone have from time to time been raised; indeed, some of the specimens contained as much gold as gangue.

The veins have been followed down to a depth of 265 feet by an underlay shaft, and from this shaft numerous levels have been driven across them. A shaft has recently been sunk upon the hillside at a point distant 260 feet in a westerly direction from the underlay shaft. From this shaft, at a depth of 203 feet, a cross-cut has been driven easterly for a distance of 75 feet. In this cross-cut chlorite-schist occurs, and ramifying through it are barren, segregated veins of calcite.

The position of the various workings is shown upon the sections accompanying this report, which is plotted from data principally supplied by Mr. H. M. Mills, Manager of the mine.

It has been suggested to me that the pipe-like veins would probably run together and form a well-defined reef below, but I am unable to concur in this opinion.

I have already stated that the vein-stone varies with the country rock, and that it consists almost entirely of calcite in the chlorite-schists. Veins of calcite are frequent concomitants of chloritic rocks, more particularly when the chlorite has been derived from amphibole or pyroxene, and I attach no special importance to the occurrence of the lime-mineral in this case.

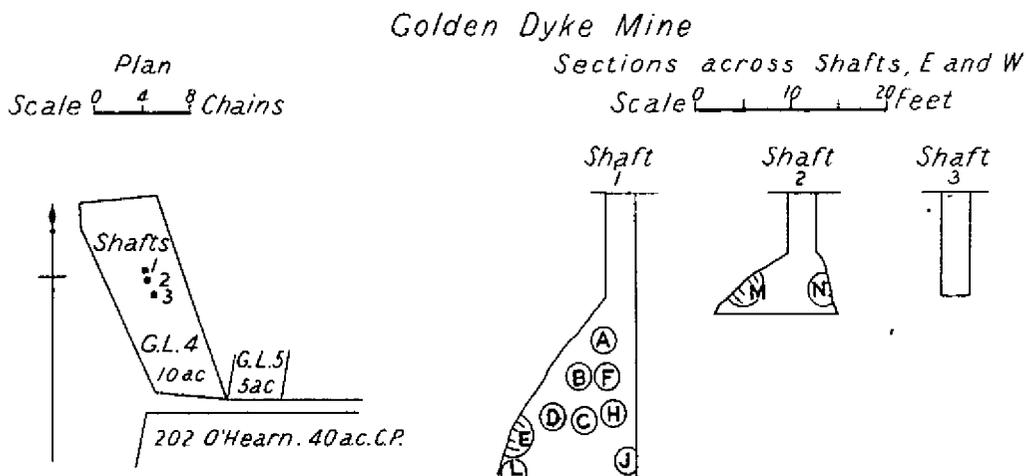

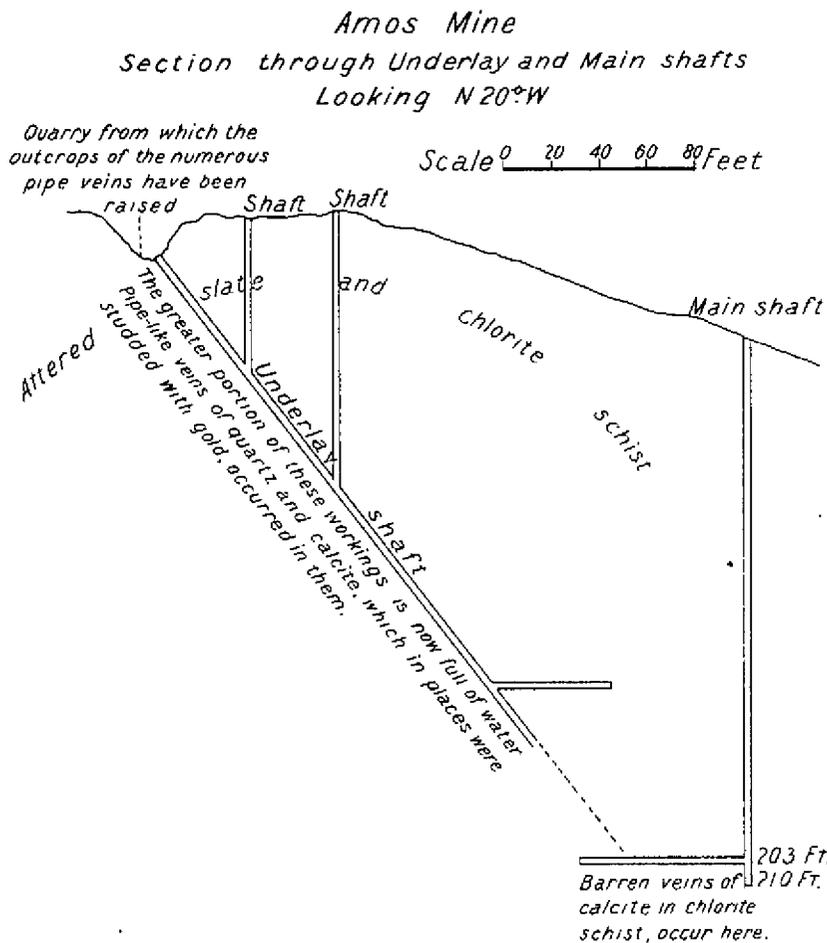

I saw but little oxide of iron in the veins, and the rich pockets of gold would seem to have been directly segregated from the country-rock, and not have resulted from a secondary segregation accompanying the oxidation of pyritous ore. In view of these facts, I see no reason why, in the event of the veins continuing downwards, they should not, as they have done near the surface, contain patches of very rich ore. On the other hand I have no reason to believe that the yield of gold will be more regular at a depth, or that the patches of auriferous stone will be richer; and it is scarcely necessary for me to add that the cost of working will continue to increase as a greater depth from the surface is reached. At the present time there would seem to be no ore exposed and available for exploitation in the mine.

The auriferous deposit known as the Golden Dyke is situated upon G.L. 4, Parish of Meglo, three-quarters of a mile from the Amos Mine in a north-westerly direction.

The formation in which the gold is found consist of slates and chlorite schist, and are identical with those found at the Amos Mine. The mode of occurrence of the gold is, however, quite different.

The

Sections  
 TO ACCOMPANY REPORT BY  
 J. B. JAQUET, A.R.S.M., F.G.S., GEOLOGICAL SURVEYOR,  
 on the Amos and Golden Dyke Mines, s.s.e. of Tuena.  
 PARISH OF MEGLO COUNTY OF GEORGIANA.

The gold-bearing stone consists of silicified slates impregnated with iron oxide. Thin veins of quartz and calcite ramify through the slate. The boundaries of the ore deposit are most irregular.

Two shafts 28 feet and 12 feet deep respectively have been sunk at a distance of 42 feet from one another, and payable gold-bearing stone has been obtained from each of them. A shaft has been started at a point distant 90 feet from No. 2 shaft, but would appear to have not yet encountered any gold-bearing stone.

From No. 1 and No. 2 shafts I took several samples and these on my return were assayed by Mr. J. C. H. Mingaye, Assayer and Analyst to the Mines Department. The sketch sections which accompany this report show approximately the place from which each sample was taken. The results of the assays were as follows:—

A.	Gold, 2 oz. 14 dwt. 10 gr. per ton.
	Silver, 6 " 12 " "
B.	Gold, 7 " 14 " "
	Silver, 3 " 6 " "
C.	} From various parts of face below A. and B.—Neither gold nor silver.

These assays show how irregular is the distribution of gold in the deposit.

In prospecting the ground it will be necessary for the stone encountered to be continually tested, for it is not always possible for the eye to distinguish barren rock from rich ore, and there are no walls to guide one.

It will be noticed that very little work has yet been done to prove the extent of the deposit. Several tons of ore await crushing upon the surface, and payable stone has been raised from both No. 1 and No. 2 shafts.

In so far as the auriferous rock has numerous pseudomorphs of limonite after pyrites scattered through it, the gold will probably be found associated with the latter mineral below. The pyritic ore will probably contain less gold than that raised near the surface, and it certainly will be more costly to treat.

I have, &c.,

JOHN B. JAQUET,

Geological Surveyor.

The Government Geologist.

#### APPENDIX 29.

##### Geological Report on the Berthong Estate, near Wallendbeen.

Sir, Geological Survey Branch, Department of Mines, Sydney, 22 August, 1895.

I have the honor to report that, in accordance with your instructions, I have made a geological inspection of the Berthong Estate, near Wallendbeen.

The dominant formations are Silurian slates and quartzites and granitite. The latter rock has had an intrusive origin; wherever examined it shows evidence of having been crushed, and in places it passes by insensible gradations into a granitoid gneiss. Near the head of Berthong Creek a large area of hornblende rocks occur, which over wide areas have undergone a serpentinous change. Masses of hornblende rocks are also found apparently intruding the slates.

A dyke of felsite has been intruded along the western line of junction between the hornblende and granitite.

The distribution of the various rocks is shown upon the geological sketch map accompanying this report, and I propose contributing a paper to the Records of this Survey which will contain an account of their petrological character, and the relation which they bear to one another.

##### Gold Deposits.

The drifts found along the banks of Berthong Creek and its tributaries contain small and not payable quantities of alluvial gold.

About twenty years ago a selector named Dwyer found some very rich specimens in a small water-course about a mile S.E. of Berthong Homestead, and subsequent prospecting led to the discovery of quartz *in situ*. Several shafts, the deepest of which is 60 feet, were sunk. The reefs exposed in these shafts are ill-defined, and some of them can be seen pinching out at a few feet below the surface.

I was shown by Mr. Dwyer a very rich specimen which he obtained several years ago from one of the veins; however the quartz now exposed in the shafts and lying upon the surface was of a barren character, and contained little or no gold. I am of opinion that the unproductive character of the veins has already been sufficiently proved, and that the circumstances do not warrant further prospecting.

Upon the western portion of the run Prothero and Party are being aided by the Government to put down a series of shafts for the purpose of proving whether an auriferous lead exists beneath some deep Post-tertiary deposits. Several deep shafts have already been bottomed but no river drift has been met with in them.

##### Chrome Iron Ore.

Chromite has recently been discovered upon Berthong Run, but nothing has yet been done in the way of proving the extent of the deposits. In the bed of Berthong Creek, at the spot indicated upon the accompanying map, a shallow trench 5 feet long and 2 feet broad has been cut through a mass of this mineral. Chrome ore has also been found in a shallow trench put down upon the banks of a tributary of Berthong Creek. In the vicinity of the discoveries, and over a large portion of the serpentine zone, the bed-rock is hidden by a shallow alluvial deposit, and it will be necessary for prospectors to trench in order to find the ore below.

Chromite

Two miles N.E. of Woodstock.

Sketch section shewing workings.  
(NOT TO SCALE.)

(Sig 24)

About 4 miles south of Yalgogrin township a lode of siliceous gossan has been proved to a depth of 90 feet by means of an inclined shaft. The ore when tested was found to contain a little gold, but no crushings in bulk have been made. A little arsenical pyrites can be seen in the stone, and it will without doubt pass into a very refractory ore at a depth.

Near the township altogether about thirty shafts have been sunk to a depth of from 30 to 100 feet. All the reefs which I examined here were closely analogous to one another. They varied in width from 3 inches to 2 feet, and are on the whole well defined. The ore in the upper levels consists of ferruginous quartz, with a little iron and arsenical pyrites; as a greater depth from the surface is reached the pyrites increases in quantity. Galena is present in some of the stone. As regards their general character the reefs closely resemble those being worked at Wyalong.

During last year 335 tons of ore were raised upon the field, which yielded on crushing 377 oz. of gold. Small parcels of stone have yielded between 2 and 3 oz. of gold per ton.

A crushing plant (Otis Mill) has been placed upon the field, and at the time of my visit it was reported that a battery was going to be erected.

I see no reason why these reefs should pinch out when followed downward, but after a certain distance from the surface has been reached (say 100 feet) the ore met with will certainly be of a most refractory character and require a special mode of treatment. I believe, in fact, that the oxidised ores now being treated in the ordinary way contain a considerable quantity of gold which will not readily amalgamate.

To the north of Yalgogrin the country consists of iron-stained Silurian slates. These slates are likely to contain both quartz reefs and deposits of auriferous ironstone, and deserve to be well prospected. Near Blairgowrie Homestead, about 30 miles north of Yalgogrin, I inspected a reef from which some very rich specimens have been obtained. It would seem, however, as seen in a shallow shaft, to have pinched out altogether at a few feet below the surface.

Upon the Monument Flats Pastoral Holding I found outliers of a horizontally bedded, vitreous-looking sandstone, which would seem to closely resemble, lithologically, some of the arenaceous rocks of the Upper Cretaceous series. Mr. Minter, of Gorman's Hill West, kindly procured for me a specimen of sandstone traversed by a vein of common opal. Further investigations may show that several outliers of cretaceous rock occur in this locality.

As one travels northward, the leucite basalt, which has been described and provisionally mapped by my late Colleague, Mr. G. A. Stonier,\* is first met with a little beyond Monument Flats, where it forms a low range of hills.

Between Monument Flats and Bygaloree, I examined a section which was exposed on the banks of a creek, where the vitreous sandstones could be seen resting unconformably upon Silurian slates, while at the same time they were capped by a basalt flow.

It has been suggested by Mr. Edward Caudish and others that an auriferous lead may run under the basalt. I carefully examined the exposed edges, but in no instance did I find any evidence of ancient drift beds. It is true that old river channels, which may or may not carry gold, have been perhaps covered up and preserved by the consolidated lava; but having regard to the large area covered by the rock, and its great thickness, I think there is but little chance of success following any prospecting operations, and there are no data available which would enable one to indicate sites for shafts.

I have, &c.,

JOHN B. JAQUET,  
Geological Surveyor.

The Government Geologist

#### APPENDIX 32.

##### Report on the occurrence of Platinum at Fifield

Sir, Geological Survey Branch, Department of Mines, 18 December, 1895.

I have the honor to report that I have made a geological examination of the platinum deposits at Fifield and Platina, about 26 miles N.E. of Condobolin and 54 miles N.W. of Parkes.

##### *Platinum elsewhere in N.S.W.*

Grains of platinum have not infrequently been met with in some of the auriferous drifts in the Colony. Professor Liversidge mentions a nugget weighing 268 grains as having been obtained from the bed of Wiseman's Creek, near Oberon.† It is also found associated with gold and gemstones in the sea beaches between the Richmond and Clarence Rivers,‡ and occasionally small parcels have been saved by the miners working in this locality for gold. From a scientific point of view, perhaps the most interesting occurrence is near Broken Hill. Here the metal is found in ironstone and decomposed gneiss.§ No platinum can be seen in the ore. Experiments made to determine the condition in which it is present have resulted in failure, while attempts at concentration have only been partially successful. Until the opening of the Fifield-Platina Lead, however, there had been no production of platinum upon a commercial scale in the Colony.

##### *History of discovery at Fifield.*

For the last two decades it would appear that the country around Fifield has been intermittently prospected for alluvial gold, and a little platinum must from time to time have been obtained, though there is no record of this metal being discovered previous to 1887.

In this year Mr. J. F. Connelly, who received aid from the Government to prospect the district, reported having discovered alluvial platinum and presented a sample to the Geological Museum. Nothing appears to have been done in the way of further developing the field until 1893, when Messrs. Fifield, Rand, and Party discovered rich alluvial gold near the site of the present township of Fifield.|| Upon news of the discovery becoming known a rush set in to the district, and the lead which is now being worked was found soon afterwards.

*General*

\* Records Geol. Survey, N.S. Wales, 1893, III, Pl. 3, p. 71.

† Minerals of N.S. Wales, p. 52.

‡ Records Geol. Survey, N.S. Wales, IV., Pt. 1, p. 25.

§ Ann. Rpt. Dep. Mines and Agric., N.S. Wales, for 1892, p. 142

|| A. Jbid., for 1893, p. 63.

*General Geology of district.*

The sedimentary formations represented are slates of Silurian age, and fossiliferous sandstones and limestones of either Devonian or Siluro-Devonian age. Mr. W. S. Dun, Assistant Palæontologist, has identified the following forms as occurring in specimens of the latter beds which I collected and those which were given to me by Mr. C. J. Metcalfe of Fifield:—

<i>Sandstones.</i> —Rhynchonella, sp. indet.	<i>Limestone.</i> —Multiculporoid corals, 2 genera.
"          allied to R. cuboides.	Rhynchonella, 2 species.
Spirifera.	Tentaculites.
Athyris.	Pleurodictyum.
Cyclonema.	
Orthoceras.	

The Silurian slates are intruded by diorite. A thin section of this rock which I examined under the microscope consisted essentially of grains of hornblende and triclinic felspar with some accessory sphene and quartz.

Near Melrose Plains homestead an auriferous reef has been discovered in the diorite and a little exploratory work carried out upon it.

*The Platiniferous Lead.*

The Fifield-Platina Lead runs in a north and south direction for a little over a mile. It is from 60 to 150 feet wide. The drift containing the precious metal is overlain by from 60 to 70 feet of loam with occasional bands of barren quartz drift. The platinum and gold occur in small well-waterworn grains, and are practically confined to the crevices in the bed-rock and the dirt within a few inches of the bottom. Occasional nuggets have been obtained which have weighed from a few grains up to 5 dwt.

*The treatment of the Washdirt.*

The washdirt is first of all puddled in machines worked by horses. During this process the soft layer of bed-rock which is broken down with the drift is pulverised and any metal which may be attached to it set free. The clean gravel is afterwards washed in ordinary sluice boxes and the gold and platinum obtained. The gold is extracted by amalgamation with mercury and crude platinum left behind. The latter realises at the present time upon the field 24s. per oz. It contains about 75 per cent. of platinum, the balance being chiefly platinoid metals and iron.

*Analysis of crude platinum.*

An analysis by Mr. J. C. H. Mingaye, Analyst and Assayer to the Mines Department, was as follows:—

Platinum.....	75 90 per cent.
Iridium .....	1 30 "
Rhodium .....	1 30 "
Palladium .....	traces.
Osmiridium.....	9 30 "
Iron .....	10 15 "
Copper .....	41 "
Gold .....	nil.
Lead .....	traces.
Siliceous matter.....	1 12 "
	99 48 "

" 14 " .....	4	2 13 6	0 11 12	5 " 1	1 6 3

Mr. C. J. Metcalfe has kindly furnished me with the above returns, obtained on treating parcels of dirt from various claims upon the lead.

It will be seen that the quantity of platinum per load varies from 5 to 12 dwt., and the quantity of gold from 1 to 3 dwt., while the total value of the precious metals per load varies from 9s. to 37s.

Amongst the returns will be noticed several trial lots of two loads each from large dumps of dirt, which have yet to be treated. These lots were, in most instances, probably picked samples, and have given a yield in excess of that which will be obtained from the dumps as a whole.

*Origin*

*Origin of the Platinum.*

Only three well-authenticated instances of platinum, occurring *in situ*, would seem to be on record. At Sunbury, in Canada, it occurs chemically combined with arsenic.\* At Broken Hill, as I have previously mentioned, finely disseminated through ironstone and decomposed gneiss; and Brazil, in veins (?) associated with gold.†

In Russia, where alluvial platinum deposits of enormous extent are to be found, the source of the metal has never been discovered, and is still a matter for conjecture; so a considerable amount of scientific interest is attached to the genesis of platinum in all newly-discovered deposits.

In the vicinity of Fifield and Platina, at an elevation of at least 100 feet above the lead which is now being exploited, outliers from a series of horizontally bedded conglomerates or cemented drifts and shales occur. The conglomerates are composed of rounded or sub-angular quartz pebbles, tightly cemented together by an infiltration of iron oxides. The shales are highly ferruginous and much indurated.

In the absence of fossils, I am unable to speak definitely as to the geological age of these beds; however, having regard to their general character, and the amount of denudation that has taken place since their deposition, I am inclined to think that they are of Tertiary age, or even older.

Upon the top of Jack's Look-out, a low hill which is distant about 2 miles from Fifield in a south-easterly direction, a good section of the beds is to be seen. Here they have been found to contain water-worn grains of gold and platinum, and some prospecting work has been carried out upon them. As is generally the case with widely distributed auriferous drifts, the precious metals occurred in patches, and not in defined "runs." This fact, and the great expense of treating the hard cement, discouraged the miners, and all work has now been abandoned in this locality.

I obtained from the Fifield-Platina lead, boulders of cement which were indistinguishable, lithologically, from portions of the beds upon Jack's Look-out, and I am of opinion that the precious metals in the lead were originally contained in those portions of the conglomerate and shale beds which have been denuded away. I am suggesting, in fact, that the older beds, with their scattered patches of platinum and gold, have been disintegrated and ground-slucied by Nature, and that the deposit now being worked represents the resultant concentrates. If we admit this hypothesis, then the ultimate source of the metals is still an open question. It is possible that the components of the Tertiary (?) beds may have been derived from a source far removed from Fifield.

It was suggested to me that the platinum might have been derived from a reef or reefs in the vicinity of the field. A consideration of the general mode of occurrence of platinum would perhaps cause one to discredit such a theory, and the ascertained facts seem to me to disprove it altogether. The dividing line of the Bogan and Lachlan River watersheds passes through Fifield, and the platinum deposits have been followed up one side of the ridge and down the other; so one or more of the supposititious reefs should be located upon the highest ground; yet, notwithstanding all the sinking and driving that has been carried out, no reefs had been found—moreover, the grains of metal appear to be uniformly waterworn.

*General Remarks.*

Dry seasons have prevailed since the discovery of the field, and its development has been much retarded in consequence. The washing of dirt has often been completely suspended for many months at a time on account of the shortage of water. At the present time 7,000 loads of washdirt are dumped around the various shafts awaiting treatment.

About 1,200 oz. of crude platinum have already been sent away from the field, and, including the deposits in the immediate vicinity of Fifield, and outside the Fifield-Platina Lead proper, the gold won has totalled about 1,800 oz.

A few of the parties have already worked out all the "pay-dirt" from their claims, while others have a year or eighteen months' work in sight.

A consideration of the circumstances connected with the origin of the platinum, and the fact that it has been found in small quantities over a wide area of country, has made me of opinion that other platiniferous leads are to be found in places under the flats in the district. Prospecting for such leads, however, is a very tedious operation, since the flats are for the most part of great extent, and there is nothing upon the surface to indicate the path of the gutters below.

Small quantities of drift yielding a payable quantity of platinum, associated with gold and tin (cassiterite), have been mined about 10 miles north-east of Fifield, near the village of Burra Burra.

It is possible, though scarcely probable, that there may be a considerable rise in the price of platinum. The price of the refined metal per oz. has during recent years fluctuated from a minimum of 25s. to a maximum of 60s. The latter price was probably due to the market having been controlled for a time by "a ring." I have, however, reasons to believe that the deposits remaining unworked in Russia—the country which produces more than three-fourths of the World's annual supply—are of enormous extent, and that the output could be largely increased if the necessary demand for the commodity arose.

Though no very rich ground has been found at Fifield yet employment has been found for from 150 to 200 men at a time when a field for their labour was sorely needed. Moreover, with the opening up of the field a new industry has been created, and an addition made to the long and varied list of mineral products exported from New South Wales.

I have, &c.,

JOHN B. JAQUET,  
Geological Surveyor.

† Geol. and Phys. Geog. of Brazil, Prof. Hart.

## Progress Report of the Curator and Mineralogist.

Sir,

Mining and Geological Museum, 15 February, 1896.

I have the honor to submit the following report of work done during the past year:—

The number of minerals and ores submitted for examination has been very large. Of these, 4,816 were sent on to the Assayer to be assayed or analysed, as compared with 3,806 last year, representing an increase of 26½ per cent. This total has only once been exceeded (1888), and then but slightly. The removal to Pitt-street, although beneficial as regards suitability for carrying on the office work, has rendered it more difficult to superintend the Museum, as the distance between the two buildings is nearly a mile, and has also been followed by a distinct falling off in the number of miners and others calling personally for information.

Among the specimens of possible commercial importance received have been cinnabar ore from the Clarence River district, and massive antimonial and arsenical silver ores from near Armidale.

Very many inquiries have been made as to the occurrence and uses of tripolite (*kiesolguhr*), and it is now being introduced for use as an insulator for refrigerating chambers, boiler covering, &c.

The occurrence in New South Wales of antimonial silver ores in quantity, and of interesting igneous rocks, such as norites and peridotites, has been referred to in the Records of the Geological Survey, to which four papers have been contributed during the year.

Early in the year a burglary took place at the Museum. Nothing has been heard of the missing specimens, many of which were of considerable value. The specimens displayed in the show-cases are being relabelled and supplied with suitable headings as rapidly as the pressure of routine duties permits.

There are now on view some 9,000 separate exhibits, and a considerable number of rock and other specimens are arranged for ready reference in the stores. The collection of New South Wales gold ores alone numbers about 600 specimens. The collections are arranged so as to afford as much information as possible, and the assistants and caretaker are assiduous in their endeavours to assist visitors. During the year donations were received from seventy-six persons, and much valuable help rendered by the geological surveyors and other officers of the Department. In the course of another year or so, the work of relabelling will perhaps be sufficiently advanced to justify the preparation of a handbook that shall serve as a guide to the Museum and, it is hoped, be also of educational value.

During the year the section cutter, Mr. Murton, has prepared some hundreds of fossils and rocks for microscopical examination. Mr. Giding, the lapidary, has been occupied more particularly in polishing coral-marbles. He reported very favourably on a white marble from Mudgee. Mr. Harper's aid is invaluable in the Museum; upon him the work of preparing collections of minerals for various institutions has mainly fallen. The very responsible clerical work connected with the assay returns has been most efficiently performed, as heretofore, by Mr. Morrison, who also undertakes some of the blow-pipe tests of samples submitted. Mr. Dobson has continued to devote himself energetically to both office and museum work as required.

As Appendices will be found a list of the persons to whom the Museum is indebted for donations, and of the institutions to which collections have been sent during the year.

I have, &amp;c.,

GEORGE W. CARD.

The Government Geologist.

Progress Report by Mr. J. C. H. Mingayc, F.C.S., Analyst and Assayer.

Sir, Department of Mines, Geological Survey Branch, Laboratory, Sydney, 18 February, 1896.

I have the honor to furnish you with the following progress report of work performed in the Chemical Laboratory during the year 1895:—4,826 numbered samples were received for assay and analysis; 145 quantitative and qualitative analyses made, and a large number of reports given of various examinations of artesian, mine waters, boiler incrustations, retorted amalgam, &c. The total number of assays, exclusive of those made for gold and silver, are 676.

The following figures show the large increase of work received in the laboratory since the year 1883:—

Year 1883 .....	242 samples.	Year 1890 .....	3,323 samples.
" 1884 .....	664 "	" 1891 .....	4,082 "
" 1885 .....	1,428 "	" 1892 .....	3,570 "
" 1886 .....	1,807 "	" 1893 .....	3,015 "
" 1887 .....	2,222 "	" 1894 .....	3,816 "
" 1888 .....	5,245 "	" 1895 .....	4,826 "
" 1889 .....	3,287 "		

The following are some of the assays made:—

Antimony .....	24	Mercury .....	23
Bismuth .....	10	Nickel .....	4
Chrome .....	148	Iron .....	20
Cobalt .....	8	Platinum .....	24
Copper .....	137	Tin .....	85
Lead .....	32	Tungstic Acid .....	14
Manganese .....	40	Zinc .....	8

The following analyses were made of waters :—

(1.)	Water from Pera artesian bore.
(2.)	" Dolmorecé Well bore, No. 1.
(3.)	" " " No. 2.
(4.)	" " " No. 3.
(5.)	" " " No. 4.
(6.)	" " " No. 5.
(7.)	" Boatman's artesian bore.
(8.)	" Poisson Point bore.
(9.)	" Dingle Ridge bore.
(10.)	" Gaylong Butter Factory.
(11.)	" Bancryan bore.
(12.)	" Dungulen Run, 12 miles N. of Walgett, No. 1.
(13.)	" " " " " No. 2.
(14.)	" well at Condobolin.
(15.)	" Wagden's artesian bore
(16.)	" Gidgea Camp bore.
(17.)	" Clifton artesian bore.
(18.)	" Barmedman Battery, near Temora.
(19.)	" a shaft at Wynlong.
(20.)	" Moree artesian bore.
(21.)	" dam at Garangula.
(22.)	" shaft at 150-feet level, Mt. Allen Gold Mine.
(23.)	" Osaca artesian bore.
(24.)	" Currabulla artesian bore.
(25.)	" Mulgarry "
(26.)	" Wanaaring "

Several analyses were made of boiler incrustations and mine waters, with a view of chemical treatment as a means of rendering their action less corrosive on the boilers and tubes.

Eight analyses were made for the Government Printing Office of samples of stereotype metals, also two analyses of a powder, marked "Dr. Letterby's Disinfecting Powder," and a pink fluid, marked "Sanitary Disinfecting and Purifying Fluid," and reports given as to their value for that purpose.

A sample of concentrated beach sand from Shellharbour, on the South Coast, on examination was found to be rich in tin, platinum, and platinoid metals. On assay the concentrates yielded:—

Metallic tin .....	49 10 per cent.
Fine gold .....	1 oz. 15 dwt. 22 gr. per ton of concentrates.
Platinum .....	30 " 10 " 18 " " " "

A few ounces of iridosmine and other platinoid metals are present.

The gold had been extracted by amalgamation.

The retorted amalgam yielded :—

In 1,000 parts.	
Gold .....	691.4
Silver .....	43.4
Base metals .....	265.2
	<hr/>
	1000.0

The base metals consisted largely of copper and a very small amount of lead. Mixed with the metal is a fair amount of heavy concentrates.

The occurrence of gold, tin, and platinum in the beach sands of Shellharbour is interesting, and suggests the possibility of the beach sands from the Queensland border to the Victorian boundary containing these metals in small quantities. This is, I believe, the first recorded instance of these metals being found so near Sydney in the beach sands. Professor Iversidge reports platinum to occur with gold in the Shoalhaven River, county Dampier. The occurrence is recorded of the presence of cobalt in a sample of arsenical pyrites from the Shoalhaven district. The sample on assay yielded :—

Metallic cobalt .....	9.15 per cent.
" nickel .....	66 " "

The mineral is very similar in appearance to that obtained from Careoar.

A large number of fire-clays, shales, &c., were examined and practical tests made, with a view of ascertaining their suitability for the manufacture of fire-bricks, porcelains, cement, &c. Owing to the large deposits of chrome iron ore being found at Gundagai and other districts, some 148 samples were received for assay.

The work received this year has been exceptionally heavy, and to perform it in a satisfactory and business-like manner has taxed the capabilities of the staff to their utmost.

It is with regret that I record the decease of the late Mr. C. Hildebrant, junior assistant, who had been connected with the laboratory since it started in 1887. Mr. Hildebrant had qualified himself so as to be able to undertake a large amount of the wet assay work and part of the analyses in hand, the bulk of which since his decease now falls on the assistant and myself. Mr. E. J. Dolan was appointed to the vacant position, the previous office held by him not being filled up at present.

In concluding my report I have to thank the assistant analyst (Mr. H. P. White), also Messrs. Neilson, Fletcher, and others, for the satisfactory and efficient manner in which they have carried out the work entrusted to them during the year.

I have, &c.,

JOHN C. H. MINGAYE,  
Analyst and Assayer.

The Government Geologist.

Progress Report by W. S. Leigh, Superintendent of Caves, for the year 1895.

Sir, Department of Mines and Agriculture, Geological Survey Branch, 11 February, 1896.

I have the honor to submit the following progress report on the Caves for the year 1895:—

During the year all the caves, with the exception of Bendithera, have been inspected in connection with their general supervision and improvement works.

With the exception of one or two small openings in the Slattery Cave at Jenolan, and the Wollondilly Cave at Wombeyan, which, when made accessible, may be found to lead to extensive chambers, no new discoveries of importance have been made.

It was intended to explore the southern portion of the limestone on the Rosebrook Estate, near Cooma, the general opinion being that on enlarging and exploring some of the crevices in same, good caves would be met with. The carrying out of this, however, has been held over pending a transfer of the land, the Government having the option of acquiring same by an exchange.

The total amount collected for the use of the magnesium light was £161 19s. 8d., and the expenditure in connection therewith as follows:—Purchase of magnesium wire, £119 7s. 6d.; repairs to lamps, &c., £2 2s. 6d.; total, £121 10s.—leaving a profit for the year of £40 9s. 8d.

The total number of visitors who signed the books at the different caves, inclusive of those to the Kanangra walls, near Jenolan, was 5,115.

Following are particulars showing number of visitors, improvements, &c., at each of the caves for the year 1895:—

*Jenolan Caves.*

Number of visitors, 988. A number of visitors who did not take quarters at "Cave House," omitted to sign the register, and are not included in this return. In March last, as previously reported, the whole of the old accommodation house, including the first and second class dining-rooms, sitting-room, billiard room and table, twelve bed-rooms, kitchen, pantry, &c., the property of Mr. J. Wilson, keeper, were completely destroyed by fire. Visitors were somewhat inconvenienced thereby, but not to such an extent as might have been expected. Quarters in the new building, usually reserved for visitors alone, had to be set apart for Mr. Wilson's family and servants. Fortunately, there is another place of accommodation (Wallace's) within easy distance, which was taken advantage of by a number of visitors, and, consequently, it has been well patronised since the fire. I may mention that Mr. Wilson and family suffered to a large extent, owing to the loss of all their personal effects. The buildings, but not the contents, were insured. It has been decided to resume the remaining buildings, and erect a new dining-room, kitchen, &c., and let the whole by tender on a ten years' lease.

The Department of Public Works has commenced operations in connection with the extension of the Mount Victoria Road through the Grand Arch. (See Appendix 1.)

The necessary ironwork having been forwarded, two men have been engaged temporarily to further proceed with the work of improving and opening up the Slattery Cave, good progress in which was made last year; but operations had then to be suspended on account of the shortness of funds.

*Wombeyan Caves.*

Number of visitors, 308. Two men have been engaged temporarily to carry out certain necessary improvements in the Wollondilly and Figtree Caves. This work should be completed in about four weeks. The accommodation buildings have been repainted and otherwise improved inside and out.

*Yarrangobilly Caves.*

Number of visitors, 458. It is with regret that I have to record the death of the late keeper, Mr. J. Murray, the result of an accident met with on the 18th October. Mr. Murray had been in the Service about eight years, and always took great pride in his work, especially so in regard to the proper preservation of the caves under his charge, and cleanliness as regards the accommodation house. The keepership, thus rendered vacant, was first offered to two of the senior guides at Jenolan in turn, but was declined by each. It was then offered to, and accepted by, Mr. H. Bradley, the acting keeper, whose appointment dates from the 1st of January, 1896.

*Wellington Caves.*

Number of visitors, 1,850. The necessary ironwork has been forwarded for fencing in the "Altar" in the main cave, and the erection of a handrail down the steps at entrance of cave. Several cases of fossil bones, unearthed by the keeper, have been received by the Department.

*Abercrombie Caves and Waterfall.*

Number of visitors, 1,070. Tracks have been cut, and handrails, &c., erected at certain dangerous places in the main cave. The Department of Public Works has improved the branch road to the caves, which was previously in rather a dangerous state.

*Bungonia Caves.*

Number of visitors, 302. No further improvements were carried out here, but it has been decided to build a shelter-shed for the use of visitors.

*Bendithera Caves.*

Number of visitors, 79.

I have, &c.,

W. S. LEIGH,

Superintendent of Caves.

## APPENDIX I.

Sir,

Geological Survey Branch, 4 December, 1895.

I have the honor to report that operations in connection with the opening of a road through the Grand Arch, Jenolan Caves, to connect the Mount Victoria and Oberon Roads, will be commenced by the Department of Public Works within a fortnight.

The undertaking, for which a special vote of £1,500 was granted, has been entrusted to Mr. Brownrigg, Resident Engineer, Lithgow, whom I accompanied in laying out the work. Commencing at the "Turntable," the present terminus, as far as vehicular traffic is concerned, of the Mount Victoria Road, the new road will follow the course of the existing bridle-track for a distance of 9 chains, which section will be 16 feet wide and fenced on the creek side. From this point, M'Ewan's and Cave Creeks, which form a junction here, will be spanned by a bridge, which, including approaches, will be over 80 feet in length, thus bringing the road to the mouth of the Grand Arch, eastern end. Thence the present track will be followed for a distance of about 250 feet under the archway, beyond which, on account of the confined space, it will be necessary to follow the course of the creek for about 200 feet, the road being carried 3 feet above the bed of same by iron girders and buckled plates in the form of a long culvert. In order to obtain the necessary width on the latter section a considerable amount of overhanging rock will have to be dislodged.

From this point, *i.e.*, the end of the culvert, the road will rejoin the present track, and, emerging from the archway at the western end, connect with the Oberon Road opposite the plantation, 150 feet beyond the culvert. The natural features of the archway and surroundings will be interfered with as little as possible, and it has been arranged to carry out that portion of the work under the arch without the use of powder. When this work is completed visitors from the mountains will be landed at the accommodation house, and thus not put to the inconvenience of having to walk a quarter of a mile to and from the coach as at present. It will also prove a great boon to the district people.

I have, &amp;c.,

W. S. LETGII,

Superintendent of Caves.

## Annual Report of the Assistant Palæontologist and Librarian for the Year 1895.

Sir,

Geological Survey, Department of Mines and Agriculture, 6 January, 1896.

I have the honor to submit to you the following summary of the Palæontological work and work connected with the Library performed by myself during the past year:—

*Records and Memoirs.*—Volume IV, Parts 3 and 4 of the Records have been published, and Vol. 5 Part 1, is almost ready for the Press. Of the Memoirs, Palæontology, VIII, Part 3, "Contributions to a Catalogue of Works, Reports, and Papers on the Anthropology, Ethnology, and Geological History of the Australian and Tasmanian Aborigines, Part 3," by Mr. R. Etheridge, Junr., Honorary Consulting Palæontologist; and Palæontology No. IX, "The Fossil Fishes of the Talbragar Beds (Jurassic?)" by Mr. A. Smith Woodward, F.L.S., &c. of the British Museum, have been published.

*Miscellaneous Determinations.*—The number of fossils submitted for determination has not been very great, but some which are of most interest are here given. I have to acknowledge the courtesy of Mr. R. Etheridge, Honorary Consulting Palæontologist, in giving me advice in many of the determinations:—

1. Siluro-Devonian Fossils from Wellington Caves, collected by Mr. J. Sibbald, Keeper of the Caves, including *Heliolites*, *Syringopora*, *Favosites* (2 species), *Pachypora*, *Tryplasma wellingtonensis*, Eth. fil.; Dendroid Stromatoporoid, allied to *Stromatopora* or *Idiostroma*; Crinoid Stems. *Rhynchonella Wilsoni*, Sby.; *Rhynchonella*, sp.; *Atrypa*, *Cyclonema*, *Worthenia*, *Loxonema*, *Bellerophon et convolutus*, De Kon.
2. Lower Mesozoic Plants from half a mile west of Warialda, collected by Mr. Geological Surveyor Stonier:—*Phyllopteris*, *Alethopteris australis*, Morr.; *Alethopteris* sp.; *Brachyphyllum*.
3. Carboniferous Fossils from three miles south-east of Slaughter-house Creek Homestead, collected by Mr. Geological Surveyor Stonier:—*Spirifera convoluta* (?); *Spirifera*, *Strophomena*, *Fenestella*, Crinoid stems. From 2 miles south of Slaughter-house Creek Homestead, comprising *Diphyphyllum*, *Syringopora*, *Cyathophyllum*, *Zaphrentis*. This lot of fossils is of interest, as, together with the stratigraphical relations of the beds yielding these two lots of fossils as determined by Mr. Stonier, it indicates the occurrence of *Diphyphyllum* and *Syringopora* in Australian Carboniferous rocks.
4. Post-Tertiary Bones from Bearbung, Gilgandra, submitted by Mr. W. L. R. Gipps, comprising:—*Diprotodon australis*, Owen; molar tooth, portion of left upper incisor, and right lower third molar.
5. Jurassic (?) Plants, collected by yourself at Boyce's Selection, Talbragar River:—*Taniopteris Daintreei*, M'Coy; *Thinnfeldia odontopteroides*, Morris; *Thinnfeldia*, sp., *Podozamites lanccolatus*, Lindl. and Hutton; *Uxites cf. planus*, Feistm.
6. From a lenticular mass of red shale in Hawkesbury Sandstone, 3 miles south-east of Cookabutta Mountain, Talbragar River:—*Taniopteris* (?), *Alethopteris australis*, Morr.; *Thinnfeldia odontopteroides*, Morr.; *Thinnfeldia*, sp., *Phyllopteris Keistmanteli*, Eth. fil. (?); *Sphenopteris*, *Baicra*, or allied Coniferous plant.
7. Permo-Carboniferous Fossils, submitted for determination by the Technological Museum:—From (a) Jamberoo—*Martiniopsis subradiata*, G. Sby., and var.; *Spirifera vesperitilio* G. Sby.; *Productus brachythærus*, G. Sby.; *Spirifera duodecimcostata*, M'Coy, var.; *Spirifera Clarkei*, De Kon. (b) From Bundanoon—Crinoid fragments, distorted calyx of *Phialocrinus*, *Fenestella*, *Protoretocera ampla*, Lonsd.; *Dielasma saccula*, Mart.; *Productus brachythærus*, G. Sby.; *Productus*, sp., *Spirifera duodecimcostata*, M'Coy; *Spirifera vesperitilio*, G. Sby.; *Spirifera*, sp., *Aviculopecten*, two species; *Chanomya* (?) *Maonia carinata*, Morris; *Maonia*, sp., *Platyschisma*.

8. Carboniferous Fossils, from Parish Eumur, County Darling, collected by Mr. Geological Surveyor Stonier. The fossils are badly preserved and distorted, but serve to prove that the containing beds are Carboniferous:—Crinoid stems, *Fenestella*, *Polypora* or *Phyllopora*, *Rhombopora* (?), *Phillipsia* (pygidium of a new Australian species), *Spirifera*, *Syringothyris*, cf. *cuspidata*, Martin; *Strophomena* (*Leptana*) cf. *analoga*, Phill.; *Orthis resupinata*, Martin; *Productus*, several species.
9. *Taniopteris Daintreei*, M'Coy, from Terabile Creek, submitted by Mr. W. L. R. Gipps.
10. Upper Devonian Fossils, from Currowan Creek, Braidwood district, collected by Mr. Galway, Warden's Clerk, and submitted by Mr. Geological Surveyor Jaquet:—*Rhynchonella pleurodon*, Phill.; *Spirifera disjuncta*, Sby.
11. Carboniferous Fossils from Rocky Creek, County Murchison, collected by yourself:—*Productus*, *Spirifera*, *Orthis australis*, M'Coy; *Rhynchonella*, *Bellerophon*, *Macrocheilus* (?) *Loxonema*, *Enomphalus*, Pteropod crinoid stems.
12. Lower Mesozoic Plants, from a well sunk 8 miles east of Boggy Creek, Narrabri to Moree Road, collected by yourself.—*Taniopteris Daintreei*, M'Coy, *T.* (*Oleandridium*) *Carruthersi*, Ten. Woods, *Baiera*.
13. Carboniferous Fossils, from Gresford, forwarded for determination by Mr. H. G. Rienits:—*Lepidodendron*, *Zaphrentis Culleni*, Eth. fil.; *Zaphrentis*, sp., crinoid stems, crinoid, probably one of the Actinocrinidae, *Griffithides*; *Phillipsia* (probably a new Australian species), *Fenestella*, *Orbiculoidea* (*Discina*) *nitida*, Phill.; *Orthis resupinata*, Mart.; *Athyris*, showing lamellar fringe, *Orthoteles crenistria*, Phill.; *Aviculopecten*, various undetermined Pelecypoda.
14. Permo-Carboniferous Fossils in limestone and silicified, from Parish Panton, County Dudley, collected by Mr. Geological Surveyor Carne:—Crinoid stems and plates, *Fenestella internata*, Lonsd.; *Protorectopora ampla*, Lonsd.; *Spirifera vespertilio*, G. Sby.; *Spirifera tasmaniensis*, Morr.; *Martiniopsis subradiata*, G. Sby.; *Productus*, *Deltopecten illawarrensis*, Morr.
15. Fossils from the Fifield district, submitted by Mr. Geological Surveyor Jaquet (*vide p.*):—(a) Siluro-Devonian Limestone, from 12 miles from Fifield, on Fifield to Trundle Road—*Rhynchonella*, allied to *R. cuboides*, Sby.; *Rhynchonella*, sp., *Spirifera*, *Athyris* (?), *Cyclonema* (?), *Orthoceras*. (b) From 9 miles from Fifield, on the same road, consisting of very indistinct casts—Monticuliporoid Corals, *Pleurodictyum*, *Tentaculites*.
16. Fossils from Yarrangobilly, submitted by Mr. W. S. Leigh:—*Pentamerus Knightii*, Sby.; *Cyclonema*, *Pleurotomaria*.
17. Upper Devonian Fossils, from 10 miles north of Cobar, collected by Mr. Geological Surveyor Jaquet:—*Rhynchonella pleurodon*, Phill.; *Rhynchonella*, allied to *R. primipilaris*, V. Buch.
18. Eocene Leaf (*Cinnamomum Leichhardti*, Ett.), from Warrumbungle Mountains, presented by Professor T. W. E. David.
19. Siluro-Devonian Fossils, from the limestone at Bungonia Caves, collected by Mr. W. S. Leigh:—*Heliolites*, *Favosites* (two species), *Stromatopora*, *Pentamerus Knightii*, Sby.; *Pentamerus*, sp.
20. Post-Tertiary Fern, from Myall Creek, collected by Mr. G. A. Stonier:—Variety of *Pteris aquilina*, Linn.

Mr. E. C. Whittel, when in Tasmania in connection with the Hobart Exhibition, made a collection of Permo-Carboniferous Fossils from various localities around Hobart, which forms a very welcome addition to our small collection of Tasmanian fossils.

Collections of fossils were prepared for the following:—

- Albury Free Industrial Museum.
- Wanganui Public Museum.
- Wesleyan Sunday School, Bourke-street, Sydney.
- Mr. P. F. Adams, small collection.

In connection with the rearrangement of the Museum Collection of Australian Fossils, a great deal of preliminary work in sorting and determination has been done. The whole of the New South Wales Palaeozoic Formations (with the exception of some forms kept out for detailed examination) are now represented by as characteristic a set of fossils as the museum resources will allow of. The Mesozoic Fossils are now being tabletted, and it is hoped that these, together with the New South Wales Tertiary Fossils will be on view by the middle of the year.

In accordance with instructions, I visited the Bantry Bay rock-carvings, and made a short report (published in *Records*, IV, Pt. 4) on those newly exposed.

A large number of microscopic slides of Australian diatomaceous earths have been prepared for examination during the year, chiefly in response to enquiries made by the Australian Drug Company, and other parties. Mr. Card is making a detailed report on the earths, as regards their physical properties and economic value, and it has been thought advisable to prepare a short account of the more characteristic forms of diatoms occurring in the different earths.

During the year the following papers by myself have been published in the *Records*:—

- (a) Notes on the Occurrence of Monotreme Remains in the Pliocene of New South Wales; with plates 11 and 12. *Records*, IV, Pt. 3, pp. 118-126.
- (b) On Additional Aboriginal Rock-carving on the French's Forest Road, near Bantry Bay. Plates 23 and 24. *Records*, IV, Pt. 4, pp. 167, 168.
- (c) Index, &c., to *Records*, Vol. IV (*in litt*).

The Australian Geological Record for the Year 1894, with Addenda for 1891 to 1893. *Records*, IV, Pt. 4, pp. 168-198.

In conjunction with Mr. R. Etheridge, Jun.

II. *Library.*

During the past year 1,455 publications have been registered and placed in the Library, consisting of Societies' Transactions, Reports of State Departments, and separate works and pamphlets. This total is made up of 1,207 volumes, parts of volumes, and pamphlets that have been presented or sent in exchange for departmental publications, and 248 volumes and parts of volumes that have been purchased.

The Library is now in correspondence with 174 institutions and State departments, from which exchanges are regularly received, and there are also numerous personal exchanges.

All donations have been regularly acknowledged.

The principal additions to the Library during the past year have been:—(1.) A large number of Natural History and Physical Science pamphlets, from the Royal University of Upsala; (2.) Geological and Palaeontological pamphlets and memoirs, from the Stockholm Academy of Science; (3.) A complete set of the Transactions of the Federated Institute of Mining Engineers, and (4.) A large number of Geological Quarter Sheets and Mining Maps, from the Victorian Department of Mines.

The Library slip catalogue, for author's names, serial and societies' publications, has been kept up to date, and now contains over 3,000 slips, many of which carry several titles.

During the year the following departmental publications were distributed through the medium of the Library:—

- (1.) Records of the Geological Survey, Vol. IV, pt. 3.
- (2.) do do do Vol. IV, pt. 4.
- (3.) Palaeontology, Memoir, No. 8, pt. 3.
- (4.) do do No. 9.
- (5.) Annual Report of the Department for 1894. (To societies and State departments.)
- (6.) Numerous miscellaneous lots to institutions and individuals.

The general register and other books connected with the Library have been kept up to date.

I have, &c.,

W. S. DUN,

Assistant Palaeontologist and Librarian.

The Government Geologist.

## LIST of Fossils registered during 1895.

Name.	Locality.	Donor or Collector.
<b>SILURIAN AND SILURO-DEVONIAN.</b>

## Commission.

VICTORIA, by the Grace of God, of the United Kingdom of Great Britain and Ireland, Queen,  
Defender of the Faith, and so forth.

To our trusty and well-beloved

FRANCIS EDWARD ROGERS, Esquire, one of our Counsel learned in the Law ;  
JAMES CURLEY, Esquire ; and  
JESSE GREGSON, Esquire,—

Greeting:—

KNOW YE, that we, reposing great trust and confidence in your ability, zeal, industry, discretion, and integrity, do, by these presents, authorise and appoint you or any two of you, as hereinafter mentioned, to make a diligent and full inquiry into the questions which arise upon the provisions of the Coal Mining Regulation Bill, which was introduced into the Legislative Assembly of our Colony of New South Wales on the fifth day of September, one thousand eight hundred and ninety-four ; and into all questions which arise upon such amendments proposed in the said Bill as were not agreed to, in order that the Bill may be again submitted to the Parliament of our said Colony, containing such provisions as will in your opinion fully secure the objects of the measure without unnecessary interference with the working of the collieries, or the rights of the proprietors thereof : And we do, by these presents, grant to you, or any two of you, at any meeting or meetings to which all of you shall have been duly summoned, full power and authority to call before you all such persons as you may judge necessary, by whom you may be better informed of the truth in the premises, and to require the production of all such books, papers, writings, and all other documents as you may deem expedient, and to visit and inspect the same at the offices or places where the same or any of them may be deposited, and to inquire of the premises by all lawful ways and means : And we do give you power at your discretion to procure such clerical and other assistance as you may deem necessary for enabling you duly to execute this our Commission : And our further will and pleasure is that you do, within three months after the date of this our Commission, certify to us, in the office of our Colonial Secretary, under your or any two of your hands and seals, what you shall find touching the premises : And we hereby command all Government officers and other persons whomsoever within our said Colony that they be assistant to you and each of you in the execution of these presents : And we appoint you, the said Francis Edward Rogers, to be President of this our Commission, which said Commission we declare to be a Commission for all purposes of the Act 41 Victoria No. 1, intituled "*An Act to regulate the taking of Evidence by Commissioners under the Great Seal.*"

In testimony whereof, we have caused these our letters to be made patent, and the Great Seal of our said Colony of New South Wales to be hereunto affixed.

Witness our Trusty and Well-beloved Councillor, The Honourable SIR FREDERICK MATTHEW DARLEY, Knight, our Lieutenant-Governor of our Colony of New South Wales and its Dependencies, at Government House, Sydney, in New South Wales aforesaid, this fifteenth day of August, in the fifty-ninth year of Our Reign, and in the year of our Lord one thousand eight hundred and ninety-five.

FREDK. M. DARLEY.

By His Excellency's Command,  
(Signed) JAMES N. BRUNKER.

Entered on record by me, in Register of Patents, No. 17, page 75, this fifteenth day of August, one thousand eight hundred and ninety-five.

For the Colonial Secretary and Registrar of Records,

(Signed) CRITCHETT WALKER,  
Principal Under Secretary.

## LETTERS OF INSTRUCTION.

Sir,

Chief Secretary's Office, Sydney, 15 August, 1895.

I am directed by the Chief Secretary to transmit herewith a Commission under the Great Seal of the Colony, appointing you, in conjunction with the other gentlemen named therein, to be a Royal Commission, to make a diligent and full inquiry into the questions which arise upon the provisions of the Coal-mining Regulation Bill, which was introduced into the Legislative Assembly on the 5th September, 1894; and into all questions which arise upon such amendments proposed in the said Bill as were not agreed to, in order that the Bill may be again submitted to Parliament, containing such provisions as will, in your opinion, fully secure the objects of the measure without unnecessary interference with the working of the collieries or the rights of the proprietors thereof.

2. I am desired to add that the Lieutenant-Governor-in-Council has also been pleased to appoint you to be President of the Commission.

3. You will be provided with such clerical and other assistance as may be deemed necessary for enabling you to execute the Commission.

I have, &amp;c.,

CRITCHETT WALKER,  
Principal Under Secretary.

Francis Edward Rogers, Esq., Q.C., &amp;c., &amp;c., &amp;c.

Sir,

Chief Secretary's Office, Sydney, 15 August, 1895.

I am directed by the Chief Secretary to inform you that His Excellency the Lieutenant-Governor, with the advice of the Executive Council, has been pleased to appoint you, in conjunction with the other gentlemen named in the margin, to be a Royal Commission, to make a diligent and full inquiry into the questions which arise upon the provisions of the Coal-mining Regulation Bill, which was introduced into the Legislative Assembly on the 5th September, 1894; and into all questions which arise upon such amendments proposed in the said Bill as were not agreed to, in order that the Bill may be again submitted to Parliament containing such provisions as will, in your opinion, fully secure the objects of the measure without unnecessary interference with the working of the collieries or the rights of the proprietors thereof.

2. I am desired to add that the Commission appointing you has been duly forwarded to Mr. Rogers, the President.

I have, &amp;c.,

CRITCHETT WALKER,  
Principal Under Secretary.

James Curley, Esq.

Francis Edward  
Rogers, Esq.,  
Q.C., President.Jesse Gregson,  
Esq.

Sir,

Chief Secretary's Office, Sydney, 15 August, 1895.

I am directed by the Chief Secretary to inform you that His Excellency the Lieutenant-Governor, with the advice of the Executive Council, has been pleased to appoint you, in conjunction with the other gentlemen named in the margin, to be a Royal Commission, to make a diligent and full inquiry into the questions which arise upon the provisions of the Coal-mining Regulation Bill, which was introduced into the Legislative Assembly on the 5th September, 1894; and into all questions which arise upon such amendments proposed in the said Bill as were not agreed to, in order that the Bill may be again submitted to Parliament containing such provisions as will, in your opinion, fully secure the objects of the measure without unnecessary interference with the working of the collieries or the rights of the proprietors thereof.

2. I am desired to add that the Commission appointing you has been duly forwarded to Mr. Rogers, the President.

I have, &amp;c.,

CRITCHETT WALKER,  
Principal Under Secretary.

Jesse Gregson, Esq.

Francis Edward  
Rogers, Esq.,  
Q.C., President.James Curley,  
Esq.

Sir,

Chief Secretary's Office, Sydney, 23 August, 1895.

With reference to your letter of the 16th instant, I am directed to inform you that the Chief Secretary approves of the employment of Mr. F. W. Carnow as Secretary and Shorthand Writer to the Royal Commission on the Coal-mining Regulation Bill, with remuneration at the rate of £2 2s. per sitting and 9d. a folio for transcribing evidence.

2. I am desired to add that Mr. Brunner also approves of Mr. May, Mining Lecturer in connection with the Technical College at Newcastle, being engaged to assist generally in carrying out the duties in relation to the Commission, on condition that the Minister of Public Instruction concurs in this arrangement.

I have, &amp;c.,

CRITCHETT WALKER,  
Principal Under Secretary.

F. E. Rogers, Esq., Q.C., &amp;c., &amp;c., &amp;c.

Sir,

Chief Secretary's Office, Sydney, 11 October, 1895.

I am directed to inform you that the Chief Secretary has approved of the payment of the undermentioned fees to the President and members of the Royal Commission on the Coal-mining Regulation Bill, viz.:—President, £12 12s. per sitting; members, £7 7s. per sitting; the amount to be defrayed from the proposed vote of £2,000 for expenses in connection with the Royal Commission on Coal-mining on the Estimates of 1895-6.

I have, &amp;c.,

CRITCHETT WALKER,  
Principal Under Secretary.

The Secretary to the Royal Commission, &amp;c., &amp;c., &amp;c.

## EXTENSION OF COMMISSION.

## ROYAL COMMISSION ON THE COAL-MINING REGULATION BILL.

WHEREAS it is necessary to extend the time within which the Commissioners are to make their report in the above matter: Now, therefore, I do hereby, with the advice of the Executive Council, extend the time within which the said Commissioners are to make such report for a period of one month—to take effect from the 15th instant.

Given under my hand, at Government House, this 20th day of November, 1895.

FREDK. M. DARLEY,  
Lieutenant-Governor.

By His Excellency's Command,  
JAMES N. BRUNKER.

---

## ROYAL COMMISSION ON COAL-MINING REGULATION BILL.

### MINUTES OF MEETINGS.

APPENDED are the minutes of the meetings of the Royal Commission, appointed on the fifteenth day of August, one thousand eight hundred and ninety-five, "to make a diligent and full inquiry into the questions which arise upon the provisions of the Coal Mining Regulation Bill, which was introduced into the Legislative Assembly of our Colony of New South Wales on the fifth day of September, one thousand eight hundred and ninety-four; and into all questions which arise upon such amendments proposed in the said Bill as were not agreed to, in order that the Bill may be again submitted to the Parliament of our said Colony, containing such provisions as will in your opinion fully secure the objects of the measure without unnecessary interference with the working of the collieries, or the rights of the proprietors thereof."

MONDAY, 19 AUGUST, 1895.

AFTERNOON SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 3 p.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.  
James Curley, Esq. | Jesse Gregson, Esq.

The Commission was read by the Secretary.

The PRESIDENT, in opening the proceedings, said that the subject entrusted to the Commission was an important one, affecting both employers and employed, and he hoped that his colleagues representing these two interests would have no difficulty in arriving at some unanimity in regard to the subject entrusted to their care. They were called upon to inquire into the questions arising out of the provisions of the Coal Mines Regulation Bill introduced into the Legislative Assembly in September 1894, and to consider the amendments proposed in this Bill that were not agreed to, with a view to the Bill being again submitted to Parliament. The first thing he thought would be to decide upon the method of procedure. No provision had been made as to how the inquiry should be conducted, and as he had, what might be termed, only an elementary knowledge of coal-mining through having had a case or two, he would suggest that Mr. Curley and Mr. Gregson should name any witnesses they may deem it necessary to examine, when the necessary subpoenas for their attendance would be issued by the Secretary.

Mr. GREGSON wished to know whether the scope of the Commission allowed of their inquiring into any legislation at all.

PRESIDENT: We have to deal with the Bill and the amendments in connection with it, and to suggest any other provisions. In that way the inquiry is limited to the Bill.

The PRESIDENT laid on the table a copy of the Bill. He thought that the more important questions were (1) the ventilation; (2) the weighing; (3) the vexed eight hours question; (4) the sizes of pillars under ocean and tidal waters; and (5) the powers of inspectors.

Mr. CURLEY thought these were some of the points, but there were others that had not been touched upon; the Bill had been referred to and reported upon by several Select Committees, and he would like to introduce these reports. He thought these reports would be essential to the inquiry. He would also think it necessary to call additional witnesses.

Mr. GREGSON thought that there was enough literature on the subject to enable the Commission to come to a conclusion without calling any witnesses. The witnesses, he thought, who had given evidence will not have altered their minds, and unless something additional, or anybody could be found to say something new, fresh evidence could not further the object they had in view.

PRESIDENT: For the purpose of arriving at a conclusion we can consult the evidence in point, but I think it would be advisable perhaps to call some of the leading people as witnesses.

Mr. GREGSON: The matter has been under consideration for five or six years, and evidence of a voluminous character has been given touching the state of things in the trade, which are in the same state now as they were then. Witnesses had suggestions to offer then, and they are in no better position to-day than they were six years ago. There was a Commission of inquiry into the coal trade some years ago, and there have been two or three Select Committees from the Legislative Council and one from the Legislative Assembly, but I have no objection to witnesses being called if Mr. Curley wishes.

Mr. CURLEY was of opinion that Mr. Gregson took a negative view.

Mr. GREGSON: Because it is easier to prove.

Mr. CURLEY thought it was Mr. Gregson's duty to prove that these Bills should not become law.

PRESIDENT: I think we should decide to-day how often we shall meet, and after that is done Mr. Curley will no doubt name one or two witnesses he would like to call.

#### *Dates of Meeting.*

It was decided to meet on Mondays, at 2:30 p.m., and on Tuesdays and Wednesdays from 10 a.m. till 5 p.m. The next meeting to be held on Monday, the 26th instant.

Mr.

Mr. CURLEY handed in the names of J. L. Fegan, Esq., M.L.A.; Adam Cook, Esq., Chairman, Amalgamated Miners' Association; J. B. Nicholson, Esq., M.L.A.; and Joseph Cook, Esq., M.L.A., Postmaster-General, to be called as witnesses.

The Secretary was requested to procure copies of all Bills, Reports of Select Committees and Royal Commissions bearing upon the subject, also copies of the Reports of the Department of Mines for the previous ten years.

The meeting then adjourned till the 26th instant.

---

*MONDAY, 26 AUGUST, 1895.*

AFTERNOON SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 2 p.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.  
James Curley, Esq. | Jesse Gregson, Esq.

The Secretary laid on the table copies of Bills, Reports of Royal Commissions, and Select Committees of both Houses of Parliament, and the Reports of the Department of Mines asked for at a former meeting. The following witness was sworn and examined:—John Lionel Fegan, Esq., M.L.A.

---

*TUESDAY, 27 AUGUST, 1895.*

MORNING SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.  
James Curley, Esq. | Jesse Gregson, Esq.

The following witness was sworn and examined:—Adam Cook, Esq. (President, Amalgamated Miners' Association).

---

*TUESDAY, 27 AUGUST, 1895.*

AFTERNOON SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 2 p.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.  
James Curley, Esq. | Jesse Gregson, Esq.

The following witnesses were re-examined:—Adam Cook, Esq. (concluded), John Lionel Fegan, M.L.A. (examination continued).

---

*WEDNESDAY, 28 AUGUST, 1895.*

MORNING SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.  
James Curley, Esq. | Jesse Gregson, Esq.

The following witness was re-examined:—John Lionel Fegan, M.L.A. (examination continued).

---

*WEDNESDAY, 28 AUGUST, 1895.*

AFTERNOON SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 2 p.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.  
James Curley, Esq. | Jesse Gregson, Esq.

The following witness was re-examined:—John Lionel Fegan, M.L.A. (examination continued).

---

*MONDAY, 2 SEPTEMBER, 1895.*

AFTERNOON SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 2 p.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.  
James Curley, Esq. | Jesse Gregson, Esq.

The following witness was re-examined:—John Lionel Fegan, M.L.A. (examination concluded).

Mr. Curley requested that the Report of the Select Committee of the Legislative Assembly, of which Mr. Fegan was Chairman, should be embodied in the Appendix to the Report of the Commission.  
—Agreed to.

---

*TUESDAY,*

*TUESDAY, 3 SEPTEMBER, 1895.*

MORNING SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.  
James Curley, Esq. | Jesse Gregson, Esq.

The following witness was sworn and examined:—George Henderson, Esq. (Secretary to Illawarra Miners).

Upon the request of Mr. Curley it was agreed that the correspondence and reports on the ventilation of coal mines between himself and Mr. Mackenzie, Examiner of Coal-fields, should be embodied in the Appendix to the Report of the Commission.

*TUESDAY, 3 SEPTEMBER, 1895.*

AFTERNOON SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 2 p.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.  
James Curley, Esq. | Jesse Gregson, Esq.

The following witness was re-examined:—George Henderson (examination continued).

Mr. Curley requested that the letters of the inspectors in connection with the Stockton Colliery, to be found in the Appendix to the final Report of Mr. Fegan's Select Committee, should be embodied in the Appendix to the Report of this Commission.—Agreed to.

*WEDNESDAY, 4 SEPTEMBER, 1895.*

MORNING SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.  
James Curley, Esq. | Jesse Gregson, Esq.

The following witness was re-examined:—George Henderson (examination continued).

*WEDNESDAY, 4 SEPTEMBER, 1895.*

AFTERNOON SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 2 p.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.  
James Curley, Esq. | Jesse Gregson, Esq.

The following witness was re-examined:—George Henderson (examination continued).

*MONDAY, 16 SEPTEMBER, 1895.*

AFTERNOON SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 2 p.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.  
James Curley, Esq. | Jesse Gregson, Esq.

The following witness was re-examined:—George Henderson (examination continued).

On the motion of Mr. Curley, it was agreed that the agreement between the Associated Masters and the District Officers of the Miners' Association of the Hunter River District and the delegates should be embodied in the Appendix to the Report of the Commission.

*TUESDAY, 17 SEPTEMBER, 1895.*

MORNING SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.  
James Curley, Esq. | Jesse Gregson, Esq.

Mr. Gregson: I would suggest that the evidence taken before the Select Committee of the Legislative Council, on the 5th October, 1893, be put in as evidence and be included in the Appendix to the Report of this Commission.—Agreed to.

The following witnesses were examined:—George Henderson (examination concluded), James Thompson, Esq., M.L.A. (sworn and examined).

*TUESDAY, 17 SEPTEMBER, 1895.*

AFTERNOON SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 2 p.m.

PRESENT :—

Francis Edward Rogers, Esq., Q.C., President.  
James Curley, Esq. | Jesse Gregson, Esq.

The following witnesses were examined :—James Thompson, Esq., M.L.A. (examination concluded)  
Treharne Evans (sworn and examined).

Francis Edward Rogers, Esq., Q.C., President.  
James Curley, Esq. | Jesse Gregson, Esq.

The following witnesses were examined :—John Wilson (examination concluded), Joseph Brown Barclay, Thomas Arthur Lloyd (sworn and examined).

*TUESDAY,*

*TUESDAY, 15 OCTOBER, 1895.*

MORNING SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.

James Curley, Esq. | Jesse Gregson, Esq.

The depositions in connection with the Coroner's inquiry into the death of James Hodson were laid on the table.

A letter received by Mr. Gregson from Mr. Andrew Sneddon desiring to give evidence before the Commission was read. The Secretary was instructed to subpoena Mr. Sneddon for the 22nd instant.

The following witnesses were sworn and examined:—John Owen, Daniel M'Auliffe, James Barnes Nicholson, Esq., M.L.A.

*TUESDAY, 15 OCTOBER, 1895.*

AFTERNOON SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 2 p.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.

James Curley, Esq. | Jesse Gregson, Esq.

The following witnesses were examined:—James Barnes Nicholson, Esq., M.L.A. (examination concluded), Frank Croudace, David Watkins, Esq., M.L.A. (sworn and examined).

*WEDNESDAY, 16 OCTOBER, 1895.*

MORNING SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.

James Curley, Esq. | Jesse Gregson, Esq.

The following witness was sworn and examined:—John Dixon, Senior Inspector of Collieries.

*WEDNESDAY, 16 OCTOBER, 1895.*

AFTERNOON SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 2 p.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.

James Curley, Esq. | Jesse Gregson, Esq.

The following witnesses were examined:—John Dixon, Senior Inspector of Collieries (examination concluded), William Humble, Inspector of Collieries (sworn and examined).

*MONDAY, 21 OCTOBER, 1895.*

MORNING SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.

James Curley, Esq. | Jesse Gregson, Esq.

A letter was read from Mr. Michael Yates, stating that he was desirous of being called to give evidence before the Commission. The Secretary was instructed to subpoena Mr. Yates for the 23rd instant.

The following witnesses were examined:—William Humble, Inspector of Collieries (examination concluded), Wilson Rennie (sworn and examined).

*MONDAY, 21 OCTOBER, 1895.*

AFTERNOON SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 2 p.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.

James Curley, Esq. | Jesse Gregson, Esq.

Mr. Gregson handed in a letter received by him from Dr. Robertson, intimating that Mr. J. C. Jones, Manager of the South Bulli Colliery, desired to give evidence before the Commission. The Secretary was instructed to subpoena Mr. Jones for the 22nd instant.

The following witnesses were sworn and examined:—James Jackson, Samuel Rees, Thomas Lionel Bates (Inspector of Collieries).

*TUESDAY,*

*TUESDAY, 22 OCTOBER, 1895.*

MORNING SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.

James Curley, Esq. | Jesse Gregson, Esq.

The following witnesses were sworn and examined:—Thomas Parton, Andrew Sneddon, Richard Thomas.

*TUESDAY, 22 OCTOBER, 1895.*

AFTERNOON SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 2 p.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.

James Curley, Esq. | Jesse Gregson, Esq.

The following witnesses were examined:—Richard Thomas (examination concluded), Jacob Carlos Jones (sworn and examined).

*WEDNESDAY, 23 OCTOBER, 1895.*

MORNING SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.

James Curley, Esq. | Jesse Gregson, Esq.

The following witnesses were sworn and examined:—Harrie Wood (Under Secretary for Mines), Jacob Carlos Jones (re-examined), Thomas Ellis, Michael Yates.

*WEDNESDAY, 23 OCTOBER, 1895.*

AFTERNOON SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 2 p.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.

James Curley, Esq. | Jesse Gregson, Esq.

The following witnesses were sworn and examined:—Henry George Pullin, Jonathan May, Daniel Alexander Wilberforce Robertson (recalled).

*MONDAY, 4 NOVEMBER, 1895.*

MORNING SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.

James Curley, Esq. | Jesse Gregson, Esq.

Letters were read by the Secretary from the Stockton Coal Company asking that their Colliery Manager, Mr. M'Auliffe, should be re-examined by the Commission, and from Thomas Croudace, Esq., General Manager, Scottish Australian Mining Company, and Robert James Jury, asking to be permitted to give evidence before the Commission.

The Commission decided against recalling Mr. M'Auliffe, and instructed the Secretary to call Messrs. Croudace and Jury for Tuesday the 5th instant, at 2 p.m.

Business—Consideration of Evidence and Bill with a view to Report.

*MONDAY, 4 NOVEMBER, 1895.*

AFTERNOON SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 2 p.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.

James Curley, Esq. | Jesse Gregson, Esq.

Business—Consideration of Evidence and Bill with a view to Report.

*TUESDAY,*

*TUESDAY, 5 NOVEMBER, 1895.*

MORNING SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.

James Curley, Esq. | Jesse Gregson, Esq.

Business—Consideration of Evidence and Bill with a view to Report.

*TUESDAY, 5 NOVEMBER, 1895.*

AFTERNOON SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 2 p.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.

James Curley, Esq. | Jesse Gregson, Esq.

The following witness was sworn and examined:—Thomas Croudace, Esq., General Manager  
Scottish Australian Mining Company.

Business—Consideration of Evidence and Bill with a view to Report.

*WEDNESDAY, 6 NOVEMBER, 1895.*

MORNING SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.

James Curley, Esq. | Jesse Gregson, Esq.

Business—Consideration of Evidence and Bill with a view to Report.

*WEDNESDAY, 6 NOVEMBER, 1895.*

AFTERNOON SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 2 p.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.

James Curley, Esq. | Jesse Gregson, Esq.

The following witness was sworn and examined:—Robert James Jury.

Business—Consideration of Evidence and Bill with a view to Report.

*MONDAY, 11 NOVEMBER, 1895.*

AFTERNOON SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 2 p.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.

James Curley, Esq. | Jesse Gregson, Esq.

Business—

Consideration of Draft Report submitted by the President.

Further consideration of evidence and Bill.

Mr. Curley took exception to the inclusion in the Draft Report of an extract from Dr. Ogle's letter to the Registrar-General of Births, Deaths, and Marriages in England, on the grounds that it had never been before the Commission in any shape or form until to-day; and that after examining it he was of opinion that it dealt with a matter that to some extent appeared to him to be foreign to the subject they had in hand, and virtually opened up a new question. The original book from which the letter had been taken had not been before the Commission, and therefore he had had no opportunity to test its accuracy. If admitted at all, he thought it should only appear in the Appendix to the Report of the Commission.

Mr. Gregson explained that an opportunity had not presented itself before to-day to place the figures given by Dr. Ogle before the Commission, and that it was a mere extract, open to anybody to test its accuracy.

Mr. Curley, in reply, considered that the extract raised a question on which not a particle of evidence had been taken, and that he should have seen the document earlier. He thought he had good reasons for objecting to the extract being embodied in the Report.

President ruled that the extract from Dr. Ogle's letter should be embodied in the Report, and that the whole of the parts of the letter referring to coal-mining should be embodied in the Appendix to the Report of the Commission.

*TUESDAY,*

*TUESDAY, 12 NOVEMBER, 1895.*

MORNING SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.

James Curley, Esq.

Jesse Gregson, Esq.

Business:—Consideration of Report and Draft Bills.

---

*TUESDAY, 12 NOVEMBER, 1895.*

AFTERNOON SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 2 p.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.

James Curley, Esq.

Jesse Gregson, Esq.

Business:—Consideration of Report and Draft Bills.

---

*WEDNESDAY, 13 NOVEMBER, 1895.*

MORNING SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.

James Curley, Esq.

Jesse Gregson, Esq.

Business:—Consideration of Report and Draft Bills.

---

*WEDNESDAY, 13 NOVEMBER, 1895.*

AFTERNOON SITTING.

The Commission met in the Board Room, Chief Secretary's Office, at 2 p.m.

PRESENT:—

Francis Edward Rogers, Esq., Q.C., President.

James Curley, Esq.

Jesse Gregson, Esq.

Business:—Consideration and Completion of Report and Bills.

Mr. Curley desired to bring under the notice of the Commission a letter from a correspondent in Vancouver. In the letter there was a statement to the following effect:—"There is one good thing here, however, that is the eight hours from bank to bank." The correspondent then went on to say that it has been stated by people that the miners there worked ten hours. He gives that statement a denial, and says that they have not done so for the past five years.

On the suggestion of Mr. Gregson, the Commission decided to embody extracts from the Fifth and Final Report of the Royal Commission on Labour in England on the eight-hours question in the Appendix to the Report of the Commission.

Mr. Curley wished included in the Appendix an extract from Mr. Nelson Boyd's book "Coal Pits and Pitmen," pages 223-229,—Agreed to. (*See Appendix F 1.*)

---

## ROYAL COMMISSION ON COAL-MINING REGULATION BILL.

## MINUTES OF EVIDENCE.

MONDAY, 26 AUGUST, 1895.

[The Commission met in the Board Room, Chief Secretary's Office, at 2:30 p.m.]

Present:—

FRANCIS EDWARD ROGERS, Esq., Q.C. (PRESIDENT).

JAMES CURLEY, Esq.

JESSE GREGSON, Esq.

John Lionel Fegan, Esq., M.L.A., sworn and examined:—

1. *President.*] I believe, Mr. Fegan, you are a Member of the Legislative Assembly of this Colony? Yes. J. L. Fegan, Esq., M.L.A.
2. For what constituency? For Wickham.
3. *Mr. Curley.*] Previous to your becoming a Member of the Legislative Assembly, what occupation did you follow? I was a miner. 26 Aug., 1895.
4. Have you done practical coal-mining? Yes.
5. How long have you been engaged in that occupation? For some years.
6. What age did you start at—when did you enter a mine? I first worked in a mine when I was 16 years of age. That was in England, and I have been in mines out here for five or six years.
7. What collieries have you worked in here? In the Wickham and Bullock Island Colliery, and collieries in England.
8. What collieries in England? The Seven-Foot and Main Delf.
9. In what district? In Lancashire.
10. Any others? No.
11. What other collieries have you worked in out here? At Anvil Creek, Stockton, Linwood, and Wickham and Bullock Island.
12. Have you held any positions in connection with check inspection, or anything like that? I acted as check inspector for four or five years at the Wickham and Bullock Island Colliery.
13. On the part of the miners? Yes.
14. What duties did you carry out in connection with that office? I went round the mine and measured the air, saw that the men were supplied with props or timber, and took notice of any grievances regarding ventilation and reported to the men and to the manager.
15. Do you know the provisions of the present Act known as the Coal-mines Regulation Act of 1876? Pretty well.
16. What does that Act say regarding the provisions for ventilation? Clause 12, sub-sections 2, 3, and 4 say:—
- (2) An adequate amount of ventilation shall be constantly produced in every mine to dilute and render harmless noxious gases to such an extent that the working-places of the shafts, levels, stables, and workings of such mine, and the travelling roads to and from such working-places, shall be in a fit state for working and passing therein.
- (3) An adequate amount of ventilation shall mean not less (as a minimum) than one hundred cubic feet of pure air per minute for each man, boy, and horse, which shall sweep undiminished along the airway past each working-place.
- (4) Within six months after the commencement of this Act every mine shall be divided into districts or splits of not more than seventy men, and each district shall be supplied with a separate current of fresh air. All intake air shall travel free from all stagnant water, stables, and old workings, and no place shall be driven more than thirty-five yards before the current of air without a cut-through put through or bratticed up within three yards of the face of such working-place.
17. Do you consider that the provisions in the Act meet with the requirements of the different mines of the Colony to-day? No, I do not.
18. What is the date of that Act? 1876. Eleven years before the passing of the English Act in 1887.
19. Four years after the Act of 1872? Yes.
20. How do you arrive at the conclusion that the provisions of the present Act are not adequate to meet the requirements of to-day;—have any accidents taken place? As far as accidents are concerned, men have been slowly poisoned through the inadequacy of the ventilation, and these matters are not reported to the Mines Department in any shape or form.
21. *President.*] That shows the necessity for some Act now? Yes.
22. *Mr. Curley.*] When you say that men have been slowly poisoned, you mean, I suppose, that the air becomes too stagnant and too impure, and that the ventilation is not there in sufficient quantity or purity? Yes; that is what I mean by that statement; and then the latest experts on the subject give a far greater amount of air in non-gaseous seams than the Act of 1876 allows.
23. *President.*] The Act of 1876 prescribed an exact amount? Yes; it prescribed a minimum. Practical men, like Mr. W. Hopton, M.E., for instance, and no one will disparage what he says, says in a supposed conversation with his son in his book "Conversation on Mines," 9th edition.
- Son:* How much air per minute does a man inhale?
- Father:* He requires 100 cubic feet. A candle requires about the same quantity, and a horse 1,000 cubic feet, or ten times that of a man.
- Son:* But if a mine gives off much explosive gas, or black damp, how much air per man is required per minute?
- Father:* Each workman should have about 500 or 600 cubic feet.
- Son:* Then in one district of a mine where ten men are at work, they should be supplied with about 5,000 cubic feet of air per minute?
- Father:* Yes; with about that quantity.

J. L. Fegan, Esq., M.L.A.  
26 Aug., 1895.

Mr. Hopton was in one of the most gaseous seams in England. He first proved the practicability of supplying the air in divisional splits as a colliery manager, and after being a colliery manager for years he is now honoured by Her Majesty by being placed in the Civil Service list. We ask 150 cubic feet of air per man, and 200 cubic feet of air per horse. Another authority, Mr. W. Fairley, F.G.S., &c., an eminent colliery manager, in his work, "The Colliery Manager's Catechism," page 22, says:—

## CHAPTER 3RD—VENTILATION.

129. What rule is allowed in practice by inquirers as to the quantity of air necessary for ventilating a coal-mine where men and horses are employed? By some it is allowed that 100 cubic feet of air per man and 600 cubic feet per horse will keep the mine in a good sanitary condition.

130. In a mine employing 250 men and twelve horses, what ventilation would be considered necessary?  $250 \times 100 + 12 \times 600 = 32,200$ . Answer: 32,200 ft. per minute.

131. Are the quantities given in questions 129 and 130 to be considered all that is necessary in fiery mines? No; mines which yield much fire-damp will not be considered efficiently ventilated unless provided with 200 to 600 cubic feet per man per minute.

24. *Mr. Curley.*] Have you seen a later work published by Fairley, "Ventilation made easy;" the date of the edition is 1892, and the one you have just quoted from 1888;—will you just look at page 3, paragraphs 15 and 17:—

15. The quantity of air required in a mine should not be reckoned at less than 150 cubic feet per man per minute, and for each horse five times as much as for a man. In answer to question 12, in Chapter V, 250 feet per man per minute has been reckoned.

17. The air of a mine may be considered good when it is found to exist in nearly the same state as pure atmospheric air, but it becomes noxious as the oxygen is consumed, and as carbonic acid and water are added to it, which takes place by the breathing of animals and burning of lights.

The gases issuing from the rocks likewise renders it more unfit for respiration and more dangerous. It is on this account necessary that a constant stream of fresh air should be made to enter the mine and flow through it, to dilute and render harmless all the noxious emanations, and carry them away as fast as they are engendered.

25. You have stated what the proposed Bill provides. Yes; 150 cubic feet per man, and 200 cubic feet per horse.

26. *President.*] What I do not understand is that five times 150 is 750? We are not asking all that we should.

27. My trouble is that you want a minimum of 150 cubic feet, and that would not be nearly enough where there is gas? Certainly not.

28. You may put in a minimum, and say an adequate amount should be provided not less than 150 cubic feet per man, per minute, and even then you must leave it in mines where there are gases to the inspector? Yes; to the manager.

29. Why do you limit him;—you say 150 cubic feet would not be enough for a man, and then you have to leave it to the manager? For this reason: Where we have no gas there is not the same necessity for ventilation. Where there is gas the manager will be forced to give more than 150 cubic feet of air per minute. Where there is no gas there is nothing to force him. Then it becomes a question between the man and the manager. The manager comes to a man's place, and says there is sufficient ventilation, but there is not sufficient at the face.

30. How do you know there is gas? You notice the gas by a small blue top on the light, and by the smell. Where there is no gas generating there is nothing to force the manager if this minimum quantity is not stipulated in the Bill. If the man says there is not sufficient air, the manager may say there is, and if you do not like it you can take your tools out. There are instances where men have made a report to the manager, and have been sacked for doing so, or some other excuses have been made for discharging the men. We want to have a stipulation in the Bill to be proved by the anemometer, whether the quantity of air goes in or not.

31. In places where there is gas you are quite ready to trust the manager? I will trust him then, because he will see there is sufficient ventilation, otherwise there would be an explosion through insufficient ventilation.

32. Why would there be an explosion? In the majority of collieries we work with the naked light. At the Metropolitan Colliery, Helensburgh, they work with safety lamps. Two hundred and fifty men work there at the present time. The manager supplies them with 350,000 cubic feet of air, or taking the number of men, 350,000 divided by 250 would give over 1,000 cubic feet of air per minute per man. That is why we want a minimum quantity in the Bill. The manager will see if there is any gas, and if there is any he will shift it.

33. *Mr. Curley.*] With regard to this question of a minimum, do you not regard that as an imperative necessity? I would not give threepence for the Bill if it was not in. It is useless to the miners if it is not in.

34. Is it not useless to the miners of any district? As a practical man, yes.

35. You think that for sanitary purposes alone, and in order that the miner may have a proper atmosphere to work in, that there should be a stipulated quantity of air? I do; and that it should not be less than 150 cubic feet of air per minute per man.

36. That in no way interferes with the quantity of air required to deal with noxious gases? Certainly not, because the Bill gives full scope to a manager, who must not have less than a certain quantity. In the Metropolitan Colliery, to show that this does not hinder the manager, or impede him working the colliery as he would like, they send 350,000 cubic feet of air per minute.

37. And why? To render the gases harmless there, and because it is absolutely necessary to do it.

38. Do you think we have been troubled much by gas in the collieries in this Colony;—look at the Report of the Mines Department for 1889, and state what the nature of the accidents have been? The Examiner of Coal-fields reports the number of accidents in 1887, 1888, and 1889 as follows:—

In 1887 there were ninety-four fatal and forty-five non-fatal accidents; eighty-one of the fatal accidents occurring through the Bulli disaster.

In 1888 fifteen fatal and forty-three non-fatal accidents.

In 1889, the year under notice, there have been forty-one fatal and fifty-seven non-fatal accidents. Eleven of the fatal ones happened from falls of coal; 12th to 22nd inclusive, from a crush at the A. A. Company's Hamilton Pit; 23rd to 26th inclusive, from over-winding and falling down the South Burwood sinking shaft; 27th and 28th, from falls of stone from roof of mine; 29th and 30th, from a stone falling and striking sinkers in sinking shafts; 31st and 32nd, through being jammed by skips; 33rd, through being thrown from a trolley; 34th, through being thrown amongst skips; 35th, from falling down a sinking shaft; 36th, through being knocked down by a locomotive; 37th, from an explosion of powder; 38th, through being crushed between trucks; 39th, from being injured by a fly-wheel; 40th, from a fall of timber and clay; and 41st, from an explosion of fire-damp at Monkwearmouth Colliery. Twenty-four

Twenty-four of the non-fatal accidents occurred from falls of coal; 25th to 29th inclusive, from a stone falling and striking sinkers whilst sinking shafts; 30th to 34th inclusive, by injuries received from loaded skips; 35th to 38th inclusive, by explosions of fire-damp at the Durham and Monkwearmouth Collieries; 39th and 40th, inclusive, from explosion of a shot; 41st to 43rd inclusive, from powder explosions; 44th and 45th, through falling from pit-top; 46th, through being knocked down by a truck; 47th, being knocked down by a trolley; 48th, by a loaded waggon; 49th from a fall of stone; 50th, through a blow from a hauling rope; 51st, through falling from pit top; 52nd, from a fall of top-band coal; 53rd, from a fall of stone roof; 54th, from a hauling chain; 55th, by a blow from a prop; 56th, through falling off a skip; and 57th, by a steel drill.

J. L. Fegan,  
Esq., M.L.A.  
26 Aug., 1895.

39. You see that apart from the Bulli explosion there are two or three more references to explosions? Yes, four.
40. At different collieries? Yes.
41. Apart from the question of stagnation that you have referred to, and the provisions of the Bill that was introduced into the Assembly and passed, you think that the quantity of air should be raised higher—that the standard should be raised beyond what is in the present Act? I do.
42. That is more than 100 cubic feet of air per man per minute? Yes. The miners in the Northern district had this question before them in 1889, and by a unanimous vote of the men believed it only fair to the men working in the mines that the quantity of air per man per minute should be raised from 100 to 150 cubic feet.
43. There is a stipulation too with regard to the distance that places should be driven before the air in connection with cut-throughs? The provision in the Act of 1876 is 35 yards, exclusive of cut-throughs, which, in some instances, are 10 yards over.
44. The 10-yard cut-through is exceptional? Yes; some men have had to work 47 yards before the air.
45. *President.*] When they are making it? Before they complete the cut-through. First they work 35 yards, and then in some cases two more yards to have their bords cut out. Then they work 10 yards where the pillar is 10 yards, to get the air through.
46. That is when they are making it? Yes. In some instances pillars have been known not to be 2 yards thick. They have not been driven straight. Through not driving the bords straight they have worked the pillar out without knowing it. If the pillar is on to the left they have gone through before they got 35 yards, through not driving by the instrument.
47. *Mr. Curley.*] The Bill stipulates that that provision is to be altered? Certainly.
48. What is the provision in the proposed Bill for the air? We propose that no place should be driven more than 25 yards without a cut-through being put through.
49. Do you consider that it will materially improve the ventilation of a colliery by having this limit—bords at shorter distances, and cut-throughs at a less distance than under the present Act? Certainly.
50. That would relieve many a serious cause of complaint? Yes; many.
51. And place the miner in a much more healthy atmosphere? Certainly. Of course, brattice is even more preferable, because we do not know what thickness the pillar may be. It is 20 yards thick in some mines, and according to the reading of the present Act it could be 20 yards, 35 yards, or 55 yards before the air. It all depends on the thickness of the pillar whether this 25 yards will be sufficient or not.
52. You think that it is absolutely necessary to have the limited distance with regard to bords and the provision for cut-throughs? Yes, I do.
53. There is also a provision in this Bill, as it went to the Legislative Council, with regard to the size of bords and the minimum width of a pillar? Yes.
- Rule 42.* Where the thickness of cover over the coal seam does not exceed eight hundred feet. In the case of working coal by the pillar and stall system under river or tidal or ocean waters the workings shall be laid off systematically and carefully, and the size of the pillars shall be such as will afford ample support, after exposure to the crumbling effect of the air over many years, and shall not be less than twice the width of the bords or coal wrought out between such pillars. The bords on one side of the headings, levels, or cross-cuts shall, unless prevented by rolls or faults, be driven opposite the bord pillars on the other side of the heading, level, or cross-cut. The minimum width of the pillars of coal shall be eight yards, and the maximum width of the bords or stalls six yards. And in no case shall the pillars under ocean or tidal waters be removed.
- Rule 43.* Every underground main road in a mine, which road is used for the purpose of haulage or for persons travelling therein, shall not exceed sixteen feet in width. And on each side of such road, other than a cross-drift or headway driven across bords in direction of the cleat or on the end, a barrier of coal or stone shall be left of not less than fourteen yards wide. No heading or bord through the barrier of coal shall exceed three yards wide, and such heading or bord shall not, without the express sanction as aforesaid, be less than ten yards apart: Provided that if any cross-drift or headway as aforesaid, or any heading on each side of which no barrier of coal shall have been left be at any time converted into or used as a main road, sufficient support shall forthwith be constructed on each side thereof.
- Rule 45.* Boreholes for the purpose of proving the thickness of the alluvial deposit shall be put down by the owner or manager on all lands fronting the ocean, tidal waters, or rivers where the thickness of the strata and deposits which overlie the coal worked or about to be worked is less than two hundred feet. Such boreholes, at distances not exceeding one hundred yards apart, shall be put down from the surface through the alluvial deposit to the rock, and to the rise of the coal seam worked. An account of the strata and deposits so bored through shall be furnished by the owner or manager to the Inspector when the boring has reached the rock.
- Rule 46.* In mines not under river or ocean or tidal waters worked on the pillar and stall system, where it is intended to remove the pillars, the stalls or bords shall not exceed in width eight yards, and the pillars shall not be less than eight yards wide. Where it is not proposed to remove the pillars they shall be of such dimensions as shall be necessary to support the roof. In mines worked on the long-wall system substantial supports shall be erected sufficient to protect the workmen. In mines worked on the Welsh bords or double-stall systems good, substantial, and sufficient pack walls shall be built, and a sufficient number of props set on each side of the pack walls.
54. Do you think that it is necessary for this stipulation with regard to these pillars? I am certain it is.
55. Do you know of any place where a mine has tumbled down in consequence of the weakness of pillars? I do.
56. *President.*] With people in it? Yes; the A. A. Company's mine.
57. *Mr. Curley.*] Will you kindly explain how pillars are extracted—explain the general system? The usual system worked is the pillar and bord system. To work to the boundary, and then either split your pillars or take them out. Where they are split, a remnant is left, and as a whole it does not support the roof as it ought to.
58. You have read the particulars of those accidents in the report of the Examiner of Coal-fields for 1889? Yes.
59. Some of those accidents are from falls, and reference is made to the crush in the A. A. Company's mine? Yes.
60. What do you know about the crush in the A. A. Company's mine? I only know the evidence that came out at the inquest, and I have seen the fall myself.
61. Were you down the mine? Yes.

- J. J. Fegan, Esq., M.L.A.  
26 Aug., 1895.
62. What year was that in? In 1889.
63. Were there a number of men entombed there? Yes; I think there were nine.
64. Were there not eighteen? I think there were eighteen entombed, but nine lives lost.
65. Did not seven men make their escape? Some men made their escape.
66. Did not eleven men lose their lives? I know of nine myself. It might have been more.
67. A whole body of men? Yes, a whole body.
68. *President.*] Is there any provision in the present Act about pillars? None whatever. There is a provision in the English Act for places being examined before men go to work. There is no provision in the present Act, but there is a provision in the Bill before the Commission now. A place may be crumbling in, and there is no one to give instructions to the men as far as the law is concerned, *i.e.*, as far as the Act is concerned.
69. Look at Clause 3 of the proposed Bill:—
3. (1) In every mine required by this Act to be under the control of a certificated manager, daily personal supervision shall be exercised either by the manager or by a duly qualified under-manager, in accordance with the provisions of this Act, nominated in writing by the owner or agent of the mine.
- Is there no provision in the present Act for supervision of that kind? I do not think there is.
70. Assuming a manager to be a competent person, would not he see that all these things were carried out properly, knowing how they endanger life? There is no clause in the present Act recognising a competent manager. The 3rd clause does in the proposed Bill, and also the 34th clause in the English Act.
71. The rules you have read, 42 to 46 inclusive, are not in the English Act at all? No, sir.
72. Do not the same dangers exist in England as here? It is because they have had power so long. Colliery owners have been sent wholesale into the Parliament of the country, and the miners at the present time cannot send their men because they would have to keep them. That is one reason.
73. The English Act is the outcome of very careful consideration by the best body of men in England? Yes, and the miners have had to concede many points that they think to be right.
74. I want to know why there should be all this necessity for this detail in the Bill;—if there is a proper manager surely he would see in removing pillars that too much was not removed to render the place dangerous? These clauses have been inserted in the proposed Bill from the report of the Royal Commission on the Ferndale Colliery, where one or two lives were lost. This Commission was composed of Dr. Robertson, Mr. Nielson, Mr. Curley, and other persons, and the report of that Commission is almost the same as the clauses you find here.
75. *Mr. Curley.*] Was there a lengthened coroner's inquiry held in connection with that disaster that took place at the A.A. Company's mine? I believe there was.
76. Do you recollect the verdict of the jury (*see Appendix*)? I do not think I do.
77. Did you hear of a subsidence at the Stockton Colliery about this particular time? It was reported, but I did not see it myself.
78. What about later on? Later on a subsidence took place there, and it was so serious that the colliery manager, Mr. Macaullife, had the men taken out of the mine. I went to Stockton myself, and I found in Fullerton-street something like 40 yards of a subsidence on one side, and in Maitland-street about 30 yards. Some of the houses you could put your arm in between the bricks, and in William-street the plaster of the houses was broken very materially. It made me think that the whole square of streets was settling upon the pillars. The consequence was that I brought the matter up in the House. There was a stipulation in the Act that these men could not go back to the mine until the inspector certified that the mine was safe, but the men went back with the colliery manager's permission. While other men are taken up for breaking the law, these men were allowed to go on working. Up to the present time a certificate has not been given that the mine is safe. Several subsidences have taken place at Stockton through falls in the mine.
79. Do you know the locality of the Stockton mine? Yes.
80. Is it far from the Hunter River and the ocean? It is alongside of the water. Fullerton-street and Maitland-street are about 40 yards from the water.
81. Do you know the depth of that mine? It is 300 and odd feet, I believe.
82. Seeing the proximity of that mine to the ocean waters, do you think it is anything like good management to work with the limited pillars as they did in that colliery when opening it out? I do not wish to say anything against the management of that colliery, because there have been so many managers there. What do I understand by management?
83. The working of the colliery;—has it been worked as it should have been worked? No; it has not.
84. Do you think if pillars had been left of sufficient size a fall would have come to the surface at such a distance? No; a fall would never have occurred if proper pillars had been left.
85. *President.*] Supposing the case of a man who is competent to manage a mine—that he has shown he is by examination and so forth;—would he not be able to know what thickness of pillars should be left, and be able to tell just as well by examination as by legislating for it? It just depends whether he has somebody else over him. In England they had some consulting viewers who wanted to make a dividend. The consequence is, that coal must be got from somewhere to show that it was a good speculation, and in some instances the pit has been proved unfit to work in afterwards. The manager would be able to work it if he was a practical man, and left free to act. That is the reason why there is a clause in the present Bill, that if a consulting viewer orders anything to be done it must be put in a book in order to free the manager from any responsibility.
86. Will you look at the 17th section of the Bill as it went from the Legislative Assembly?
17. In any mine where a consulting engineer, viewer, managing director, or other person has power to give directions as to the mode of conducting the works of a mine either above or below ground, he shall enter such directions in detail in a book to be kept at the mine for that purpose, but, unless required to be produced in a Court of law such book shall not be open to inspection by any person other than the Chief Inspector or an Inspector.
- That is the clause in which we do not think the manager should be interfered with.
87. You agree to that clause being struck out? No. If this clause is left in, and the manager does change his method of working, the right man will suffer the penalty.
88. If the manager is left free and anything wrong is done, would he not be the person to suffer the penalty? That is what I mean: but managers are not allowed to be free.
89. Who interferes with the colliery manager? The colliery owners. The pit is spoiled up at Stockton.
90. *Mr. Curley.*] You think it is just possible that while limited pillars might be left at Stockton Colliery the manager might not be responsible;—he might have been told to work according to a Board of Directors? Yes.

J. L. Fegan,  
Esq., M.L.A.  
26 Aug., 1895.

91. *President.*] Why could not the viewers be got at too? They ought to be got at.
92. If one man is likely to be corrupted, why not another; the manager, you say, is not left free;—why does the viewer make the mine any more safe? The viewer is looked to by the Board of Directors, and the manager is looked to to carry out instructions.
93. I, as a manager, regard the value of lives; if I am dishonest, I risk these lives for the benefit of a Company, or whoever it may be;—why is not a viewer liable if he is competent to give directions? When orders are given to a manager they should be left in a book. I want the person who gives the orders to be responsible. If orders are given by directors or viewers they should be put in a book, and this would absolve the managers.
94. *Mr. Curley.*] In a case of that description there might be no corrupt motive whatever, but serious mistaken mining judgment? Yes; that would result in loss of life.
95. That is what you want to guard against by a provision of this character? Yes; at present the manager has to carry out these instructions or else leave the place, and he is not always ready to leave the place.
96. There is nothing imperious in a provision of that character? Nothing wrong whatever in it.
97. Do you not think that the opposition arising from this is rather that the principle is an innovation than anything else? I can say that it does not interfere with the management as far as the miners are concerned, because they do not see the books, and it is only in case of accident these books will be produced.
98. *President.*] You are assuming that the manager does something that he knows to be wrong? Certainly.
99. That because it is his bread and butter he dare not leave his position; therefore he must carry it out? That is the position.
100. Supposing that the inspector or anybody else gives the directions, how does that help the matter? The inspector has no right to interfere with the management.
101. If the manager is competent he knows the directions are wrong and still he carries them out;—how are the men safe by that? Under the clause we are discussing it comes home to those who give these written instructions.
102. If there is an accident in which men are maimed or killed, what satisfaction is there in bringing it home? We want to prevent accidents. Surely the law should deal with those who have been the means of bringing on those accidents, as in case of felony or murder or any other offence of that description. That would mean that in future the responsible parties would be more careful. Now they get off and lives are sacrificed, but if it came home once or twice they would be very careful in seeing that it did not occur again.
103. Supposing I am a director of a mine, and I say "Take out those pillars" or only leave them such and such thickness, and these are not thick enough to support the mine, and that the manager knows that what he is doing will have the effect of risking the lives under him, I do not see how he can be absolved? He is in an awkward position if he has to leave his work rather than do it.
104. Then, with a viewer or managing director, the manager would be punished for knowing it was wrong? Yes; the point is that the manager is not working the mine really. The manager, according to the proposed Bill, would be manager; but the over-seeer, who is above him at present, gives instructions, and he has to carry them out or leave his place. The other man is free. The other man should pay the penalty, and not the manager.
105. *Mr. Curley.*] Is it not a question of discipline? Yes; as far as the manager is concerned.
106. He has the law laid down by his superior officer, who has control of the colliery and simply issues an order, and the manager has to carry out that order in an executive way? Yes; either that or leave it.
107. Or he becomes insubordinate, and must leave under any circumstances? Certainly.
108. In a case of that description, could not the manager object to the order? Yes; he could do that.
109. And if there was a Board of Directors he could appeal to them? Yes.
110. Would not that, then, originate a good deal of unpleasantness between the subordinate and chief manager? Yes; it would be a case of the survival of the fittest. It would depend on who was of the greater value to the Company. The man with the position generally has the best of it.
111. You think that, in the light of past experience in mining, as carried out in this country, that the provision in the Bill that we have been discussing is absolutely necessary? I do; absolutely necessary.
112. Before we came to this matter we were on the question of ventilation. There is something stated in the Bill about carrying the air to within 15 yards of the face. Will you look at page 23, clause 49-16, sub-clause III.
- Within six months after the commencement of this Act, every mine, unless worked on the long-wall system, shall be divided into districts or splits of not more than sixty men exclusive of wheelers and horses; and each district shall be supplied with a separate current of fresh air, which shall be taken to within fifteen yards of each working face by brattice or otherwise where gas does not exist, and to within three yards of the working face where gas does exist.
- ? Yes; the Legislative Council have struck that clause out.
113. Do you believe in that provision, Mr. Fegan? I do.
114. Do you think that provision is necessary in the Bill? I do, for reasons I have before stated. We do not know what thickness pillars are, and this provision will surmount the difficulty by having air carried 15 yards from the face.
115. There is something with regard to return airways, to the effect that they shall not be used as travelling roads. This is struck out as well by the Legislative Council. Will you look at the latter part of clause 41, Rule 1, page 24:
- And in single headings, or where gas is known to be generated, it shall be bratticed up to within three yards of the face of such working place. And no return airways shall be used as travelling roads. In the case of mines required by this Act to be under the control of a certificated manager, the quantity of air in the respective splits or currents shall at least once in every month be measured and entered in a book to be kept for the purpose at the mine.
- Do you think that is also necessary in the Bill? I think it is perfectly right there.
116. What is the effect of the air on men with regard to travelling roads? The return airway is where the vitiated air is from the stables and horses, and the air is sufficient to poison men at times. It is unhealthy.
117. In the great bulk of mines they are not used as a rule? No; I do not think so.
118. This is a provision in the Bill, so that they cannot be made use of? Yes.
119. *President.*] In properly conducted mines these roads are not used? No; they are not used.

J. L. Fegan, Esq., M.L.A. 120. Do you think it is necessary to legislate for this;—there is no use legislating for what is unnecessary? If there is no legislation managers can make their travelling road their return air-way. There is not much love lost between managers and men at present. Every advantage is taken by managers as things are at present.

26 Aug., 1893.

121. Is not that unfortunate? Yes; I have said that all along. There are exceptions, I must admit.

122. In any decently conducted mine do you think there is any need for apprehension that the return airways will be made travelling roads; do you think it is serious enough for the Legislature to interfere;—is it a matter of such moment? I think, that while we are legislating for ventilation, we ought to provide that men should not be forced to go into these roads. When I was check inspector, I used to be laid up at times when I went to these roads to examine them. It was really unhealthy to go through there.

123. Were you obliged to go through there? Yes; to see that the return airways were free, and I found that they were not the most healthy to travel in.

124. Is it a matter of sufficient importance to legislate upon;—is it a real practical grievance? They have done many things in the northern district, and I want to stop them forcing men into these positions.

125. *Mr. Curley.*] Do you recollect that an Executive Committee sat to draw up amendments? Yes; an Executive Committee of the Miner's Association. I was a member of that Committee in 1887.

126. One of the provisions, I think, had reference to not travelling in return air-ways? Yes; and it was one of the suggestions before the conference with the employers, and the men would not give way in any shape or form. I had the honour to preside over it.

127. The men considered this a very important provision? Oh, yes. Another reason why we do not want this is that when men have finished hewing coal and are coming to the shaft to ascend, they will be put in the return airway, in order that coal may be wound. We know that air, after it has been travelling through fifty or sixty men is not healthy to inhale. There is a lot of carbonic acid gas.

128. This matter brings us back to the competency of managers, and so on;—do you think it is absolutely necessary that mines should be under the control of efficient managers? I do.

129. *President.*] The miners, I presume, are satisfied with the Bill as it went from the Legislative Assembly? Yes, perfectly.

130. The matters in dispute are the amendments made by the Legislative Council? Yes, certainly.

131. *Mr. Curley.*] Would you be willing to agree with the amendment as suggested by the Council on page 2, Rule 3—

(i) In every mine required by this Act to be under the control of a certificated manager, daily personal supervision shall be exercised either by the manager, or by an under-manager, nominated in writing by the owner or agent of the mine.

—? I do not think there is much in this. There is something in Rule 4, "a contractor while so contracting."

132. *President.*] That means a contractor for getting minerals? ———

133. *Mr. Curley.*] With regard to Rule 5, on the same page, there is only the alteration of two words, "of competency"? Some men will receive certificates of competency on account of their examination; others will receive certificates for service. There are some men who are as good managers as can be found who could not pass the usual examination. I think that sub-section 2 of Rule 5—

(ii) For the purpose of ascertaining the persons to receive certificates of competency for the purposes of this Act, examiners shall be appointed by a Board consisting of—

should remain as it is proposed, because some men, from service, would be managers, who are not competent to pass an examination. When the English Act of 1872 was passed, certificates of service were granted to colliery managers, and some of these managers were superior to men who had passed their examinations, or quite as qualified.

134. *President.*] What sort of examination have they to pass;—what would the examination be in? The examinations would be theoretical and practical. First, on the Coal Mines Bill; then, on the theory of ventilation, &c.—written or oral.

135. Is that hard to understand? Some of us have not learnt the matter yet, although we have studied it for years.

136. Is that a thing that they would not practically know? Perhaps so; but if you gave them pen and paper they might not be able to write what they know. Part of the examination would be geometry, geology, mathematics, and surveying. Some men understand how to do these things, but could not describe them.

137. Look at page 37 of MacSweeney's book on the English Act, reference 3:—"Each Board shall make, from time to time, to a Secretary of State, a report of their proceedings; and of such other matters as a Secretary of State may from time to time require"? The '72 Act only gives certificates of service to managers. Then fifteen years elapsed to the passing of the '87 Act, when all managers were supposed to be competent, or to have this certificate of service. In the 1887 Act, they only granted certificates of service to under managers. In the Act, to managers and under managers certificates of service are to be given.

138. *Mr. Curley.*] Your reason for adhering to the clause in the Bill as it went from the Assembly is that many competent men, who have had long service, may be thoroughly competent, and yet could not go through an examination? Yes; it would be an injustice, and I for one do not want to see it done.

139. *President.*] Do you not think it is a good thing in future for all men to be examined; it saves all the present people? It provides for five years' experience.

140. Do you not think that future men should pass this examination? Yes; I believe in that. The Assembly had it "for the purpose of granting certificates of competency and service, the Board of Examiners shall be appointed, consisting of, &c."

141. That must be read with sub-section 8, which saves everything? I am not in favour of the Board granting certificates of service.

142. *Mr. Gregson.*] There is an agreement as to the constitution of the Board? Yes; the Board in England is under the direct control of the Home Secretary. They have 648,000 miners and others about collieries. Here we have 12,000 miners—perhaps less than that. In England there are so many different interests. There are only three miners on the Board here. The consequence in some cases has been that men are allowed certificates as far as the examination is concerned, while with others—working miners—who have no influence at court, the examination is made as strict as it possibly can be. We want fair play. The owners have no more right of representation any more than the miners. In an examination both parties ought to be represented by an equal number. Where there is a Board of nine, and only three of that

that

that Board representatives of the miners, the majority will appoint men who will look after their own interests. In the Board, as proposed to be constituted, there are six votes to three, and if you are Mr. <sup>J. L. Fegan,</sup> so and so's son you will get through. <sup>Esq., M.L.A.</sup>

143. It is for the examiners to say who gets through? Yes; but there are six against three, when certain names are proposed to receive certificates of competency. Six against three. <sup>26 Aug., 1895.</sup>

144. What do you suppose their interest would be? To get the most competent men, not men with silver spoons in their mouths.

145. Would anybody on that Board have a different interest to that? I could not say until I see the names.

146. *President.*] You seem to think that examiners will be appointed who will favour their own party? Yes.

147. *Mr. Gregson.*] In what way could they do that? There are several names proposed, and you know how far their sympathies go with a certain class.

148. Say for example that their sympathies are with the mine-owners. In what way will that effect the competency of the Board of Examiners? Say that when this Board is appointed it is composed of six men who are in close compact with the colliery owners. As a man who takes a prominent part in Union organisations I come before the Board; through its compositions I am put through a far severer test than the son or nephew of one of these men sitting on the Board!

149. Is not that rather a good thing? I do not object provided the test is the same all through. If it is a friend he may be allowed to sit near to two of these examiners and be put through an oral examination. Something like this:—The next; your name is So and So. Oh, yes! How is your father? Fairly well thank you! A few questions are put, and he is allowed to go out of the door.

150. Do you know that that man is not as competent as the man who has had to go through the severe examination? I want him to go through the same ordeal as the other man, and by having three on each side you will be able to get competent men who will show no favour in any shape or form. It is a fact to-day that the granting of certificates has become almost exclusive to families of engineers. I hope that state of affairs will never come to New South Wales!

151. *President.*] Is that in England? Yes, in England. I want the class I belong to to improve too.

152. *Mr. Gregson.*] Should the composition of the Board be ten or seven? Having respect for the lives of the people I represent, I say that this Board is too large by three, and not fairly representative to appoint these examiners. In my opinion to get a properly representative Board the owners and managers and employees will do.

153. *Mr. Curley.*] You mean to say that the proposition laid down in the Bill so far as the Assembly is concerned, that gives both owners and workmen an equal opportunity with regard to the granting of certificates meets with your approval? I do; I am in favour of the Bill as sent from the lower House.

154. Will you kindly look at Rule 6 on page 4, sub-section 1, "Certificates of Service in case of Under-managers."

6. (1) A certificate of service shall be granted by the Minister to every person who satisfies the examiners either that before the passing of this Act he was exercising, and has since that date exercised, or that he has at any time within five years before the passing of this Act, for a period of not less than twelve months, exercised functions substantially corresponding to those of a manager or an under-manager in a mine?

That Rule has been agreed to by accepting the Councils amendments—the new Clause.

155. Will you look at rule 8, on page 3, "Qualification and attendance of engine man":—

8. Subject to the provisions of section nine of this Act in any mine which is usually entered by means of machinery, or where any shaft, plane, or level is used for the purpose of communication from one part to another part of a mine, and persons are taken up or down or along such shaft, plane, or level, by means of any engine, windlass, or gin, driven or worked by steam or any mechanical power, a competent male person not less than twenty years of age, and being the holder of a certificate of competency or certificate of service, shall be appointed for the purpose of working the machinery which is employed in lowering and raising persons therein, and shall attend for that purpose during the whole time that any person is below ground in the mine, and such person shall have charge of all ropes, chains, or tackle connected with such machinery. Where any windlass, gin, or machine used for any of the purposes aforesaid, is worked by an animal or by manual labour, the person in charge of such engine, windlass, or gin, or of any part of the machinery, ropes, chains, or tackle connected therewith, must be a competent male person not less than eighteen years of age. Where the machinery is worked by an animal, the person under whose direction the driver of the animal acts, shall for the purposes of this rule be deemed to be the person in charge of the machinery.

*Dr. Robertson* in his evidence before the Committee which I had the honor to be chairman of, conceded that point.

156. *Mr. Gregson.*] Where was that evidence given? It was given before my Committee on 4th April, 1894:—

1378. *Chairman.*] I suppose you desire that the most competent men should take charge of your machinery as engine winder? Yes; I am very particular about engine-drivers.

1379. You believe that they ought to thoroughly understand their work? Yes.

1380. Do you think it is sufficient for a man to know that he has enough steam, or is it better that he should thoroughly understand all about the pressure and so forth? He would be no worse for that knowledge, but an ordinary engine-driver has nothing to do with that. You can get boilers guaranteed for a certain amount of pressure, and you work with about half that. Every body who has expensive machinery would desire to put it under the charge of the most competent man?

1381. You have said that you were in favour of managers having certificates? Yes.

1382. Do you think that the underground managers ought to have certificates? Yes; but as a rule underground managers are taken from the coal face, and you must not expect in them the same amount of education that would be possessed by a trained manager.

1383. Do you know that such is not required even under the English Act? When I left England underground managers had not certificates; but underground managers do get certificates under the present Act.

1384. There is a clause which stipulates that underground managers shall have second-class certificates? Yes; I should be the first to agree to that, if you could prove that no injustice would be done to a deserving class of men. You take underground managers from the best men in the mine, and you must give them time for education, and see that no injustice is done to them. In that respect I have very little to add to the recommendation which I made in one of those reports of the Commission of which I was President, namely, that the examination to a large extent should be oral.

1385. Do you believe that an examination ought to be passed by a deputy? Yes; but all the examinations should be made as practical and as fair as possible.

1385½. You believe that a man who takes charge of £10,000 or £12,000 worth of machinery ought to be a competent man? Yes.

1388. And that he ought to pass an examination? Yes; to a certain extent only.

That does not bear out your statement? Perhaps not altogether.

J. L. Fegan, Esq., M.L.A. 157. *Mr. Curley.*] Do you know whether that is the law in any other Colony? I believe it is the law in Victoria. The engineman has sometimes to let down as many as 600 men, and we want a man who thoroughly understands his work. Where there are so many lives in jeopardy he ought to be a man who thoroughly understands his work. During the Broken Hill strike a man was examined as to his competency, and he knew so much that he pulled men over the guard. Two or three men were killed through his incompetency in managing his engine.

26 Aug., 1895.

158. Rule 8, on page 3, "Qualification and attendance of engineman" (*see Appendix A*). I understood you to say that the Assembly had agreed to that clause? No; the new clause. As the Bill left the Assembly that part of it should be retained. The Assembly have agreed to the new clause 8, on page 4; but not with reference to engine-drivers. We still adhere to the old clause 8.

159. This new clause 8, on page 4, with regard to the granting of certificates;—have the Assembly agreed to that? The old clause 8 we have not agreed to; but the new clause 8 was agreed to—"Granting of certificates of service to existing managers."

160. Rule 9, sub-sections 1, 2, and 3, on pages 4 and 5, the Assembly want to re-insert:—

9. (i) A certificate of service shall be granted by the Minister to every person who satisfies the examiners either that before the passing of this Act he was exercising, and has since that date exercised, or that he has at any time within five years before the passing of this Act, for a period of not less than twelve months, exercised functions substantially corresponding to those of an engine-driver.

(ii) Every such certificate of service shall contain particulars of the name, place, and time of birth, and the length and nature of the previous service of the person to whom the same is delivered; and a certificate of service may be refused to any person who fails to give a full and satisfactory account of the particulars aforesaid, or to pay such registration fee as the Minister may direct not exceeding that mentioned in the First Schedule to this Act.

(iii) The Minister may from time to time appoint a Board to examine candidates for certificates of competency, and may by regulations prescribe the mode of conducting such examinations and granting such certificates, and the conditions under which such certificates or certificates of service shall be held, or may be suspended or cancelled; and may from time to time make, alter, and revoke such regulations as aforesaid.

? Yes.

161. Rule 10, sub-section 1, on page 5:—

10. If at any time representation is made to the Minister by an inspector or otherwise that any manager or under-manager holding a certificate under this Act or under any Imperial Act is by reason of incompetency or gross negligence, unfit to discharge his duties, or has been convicted of an offence against this Act, the Minister may, if he think fit, cause inquiry to be made into the conduct of the manager or under-manager, and with respect to every such inquiry the following provisions shall have effect:—

(i) The inquiry shall be public, and shall be held at such place as the Minister may appoint by such District Court Judge, Police Magistrate, or Stipendiary Magistrate, or other person or persons, as may be directed by the Minister, and either alone or with the assistance of any assessor or assessors named by the Minister.

What have you done with that; has the Assembly agreed to that? No; that is a very important matter. For this reason:—Appoint a District Court Judge, Police Magistrate, or Stipendiary Magistrate, &c., with all respect to the ability of the gentlemen sitting as referees on questions affecting miners, they do not seem to get hold of them. I have great respect for Mr. Oliver, and Mr. Barton; but they do not seem to get hold of the technicalities of mining. Mr. Brunker seemed to get hold of them, and the field should be open for as good a man as we can possibly get.

162. You think that some outside persons could be got who would understand the technicalities of mining better? Yes; a retired colliery manager or inspector, or others. The field should be wide and open. It should not be limited.

163. Sub-section 5, of Rule 10, page 5:—

(v) The person or persons appointed to hold the inquiry in this Act section and in section eleven referred to as the court, shall, on the conclusion of the inquiry, send to the Minister a report containing a full statement of the case, and the opinion of the court thereon, and such report of, or extracts from the evidence, as the court may think fit.

What do you think of that? I think there is nothing in that. I think it is all right.

[Witness withdrew to be recalled later on.]

TUESDAY, 27 AUGUST, 1895.

[The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.]

Present:—

FRANCIS EDWARD ROGERS, Esq., Q.C. (PRESIDENT).

JAMES CURLEY, Esq.

JESSE GREGSON, Esq.

Adam Cook, Esq., President, Amalgamated Miners' Association of the Northern District, sworn and examined:—

A. Cook, Esq. 164. *Mr. Curley.*] What occupation do you follow? Coal-mining.

165. How long have you been identified with mines? About thirty-two years.

166. You went into a mine at a pretty early age? Yes; at 11 years of age.

167. Was that in the United Kingdom? Yes; in Scotland.

168. How many mines did you work in there? In about half-a-dozen, I suppose.

169. Can you give us the names of them? I worked in the Town Hill Coal-mine, and in the Logally Ironworks Company's Mine, and one or two others.

170. Have you worked in mines in this Colony? Yes.

171. How long have you been out in the Colony? About sixteen years.

172. And what mines have you worked in out here? I have worked at Joadja Creek and Hartley Vale Shale-mines, and Coal-mines in the Northern District.

173. What coal-mines have you worked at in the Northern District? In the Co-operative Mine, Hetton, and in the Newcastle Wallsend Colliery.

174. You are President of the Amalgamated Miners' Association? Yes.

175. How long have you held that position? For about four years.

176. Have you held any prominent positions in connection with the miners' lodges? Yes; all of the offices in connection with the miners' lodge: all positions with the exception of treasurer. 177.

27 Aug., 1895.

A. Cook, Esq.

27 Aug., 1895.

177. You have held the position of secretary, I presume? Yes.
178. And the position of delegate? Yes.
179. And the position of chairman? Yes.
180. And of check inspector? No; I have never acted as check inspector.
181. Have you given evidence before in connection with the Coal Mines Regulation Bill? Yes; on two different occasions.
182. Before Select Committees? Yes.
183. What Select Committees have you given evidence before? At one appointed by the Upper House, and one by the Legislative Assembly.
184. Upon the last occasion what Select Committee did you give evidence before? The Committee of which Mr. Fegan was Chairman.
185. Is that a copy of the evidence taken before that Committee (*handing witness evidence*)? Yes; I see my name here, and I was supplied with a copy something similar to this, and the evidence is correct.
186. You have looked over the evidence? Yes.
187. Have you also read over the Bill that passed the Assembly some time ago? Yes; I have read that Bill.
188. You have read the latest Bill? Yes.
189. Is there any material point in connection with the evidence that you have given that you would like to refer to again? Well, I do not know that there is very much. I think I explained myself as clearly as I could on the last occasion, but there is one point in connection with the ventilation. On that occasion I said I was a thorough believer in the 150 feet per man minimum. I made the following statement:—

The first matter that I should like to touch upon, and which I think most important as affecting the health and comfort of the men, is the question of ventilation. A majority of the miners in the district I belong to would be perfectly satisfied with the alteration provided for in the Bill recently before the Legislative Assembly. I am a thorough believer in the 150 foot per minute per man minimum. I think that is the least quantity of air that ought to be guaranteed for sanitary purposes. I believe there is considerable difference of opinion about bratticing and short pillars. I am a believer in short pillars. I think it would be a great deal better, and it would be satisfactory to the majority of the miners, if cut-throughs were made not more than 20 or 25 yards apart at the utmost. Some people say that that would entail extra expense to the proprietors, but I think that would be counterbalanced by other benefits. In most of the collieries they have a system of taking out the pillars. In several of the collieries in the district which I belong to it is the custom when taking out the pillars to have extra cut-throughs cut across the centre of the pillar, and take one-half of the pillar down and leave the other half of the pillar up. But I maintain that these extra cut-throughs would not be necessary if the pillars were shortened. I think it would be a great advantage both to the miners and to the proprietors. If the 150 feet of air was always confined to the headings near the working-places, it follows, as a matter of course, the working-places would be kept free of powder smoke and impurities. There are great complaints in the northern district about miners filling dirty coal, and in several of our seams in the northern district there is a considerable number of bands and other refuse. There are the twopenny bands, and brass and kerosene, and other refuse in the seam, and the coal, as a general rule, is very difficult to get. In fact, you can scarcely get any coal without using a considerable amount of powder, and the place is always pretty well filled with smoke. If the air was kept sweeping along the heading nearest the working-places they would be kept free of powder smoke, and you could get clean coal. Men are sometimes punished severely for sending up small quantities of dirt in the coal. As regards the question of bratticing, it is not a question of expense altogether, though of course this has to be taken into consideration. It is not altogether what we should like, but what we can get. That is the most important consideration with me. I think it would be difficult to take the bratticing up the bord where there is a very soft roof. The roof would be coming down and interfering with the bratticing, and the air would be escaping. Some of our seams are between 8 and 9 feet high. I am most decidedly in favour of shortening the pillars. It is absolutely necessary that they should not be more than 25 yards apart, because in my experience I have seen men working at least 45 yards in front of the current of air. Under the present system the cut-throughs are supposed to be 35 yards apart. But after driving that distance, I have seen where another 2 yards had to be taken out for the width of the cut-through, and then drive 8 or 9 yards through the pillar, making a distance of 46 yards, before a fresh current of air could be got. As regards the ventilation question, there is no matter which has been talked about more freely amongst the miners for a number of years than the miners being allowed to travel on the return air-way. That is a thing which ought to be absolutely prohibited. I believe it is the custom in some collieries for men to be allowed to travel in return air-ways, but we know that the powder smoke and other impurities go into that air-way, and it is bound to be injurious to men travelling in it after a hard day's work.

I see no reason to alter my opinion since. There is a lot said about this air being taken into the working places, about bratticing and shorter cut-throughs. I am in favour of the 25-yard cut-throughs instead of bratticing each bord up. There is no necessity for that unless there are signs of gas. A bit of bratticing at the end of each bord so as to catch the air to go into the bord would be a very great improvement indeed, and keep the places clear of powder smoke. I should like to see 3 yards of bratticing in each bord at the entrance to the bord.

190. Do you think that would be an item of any serious cost to the colliery? No; I do not see where the cost would come in. It would be a mere trifle. If the place was kept free of powder smoke the proprietors would get cleaner coal. The brattice would have to protrude on to the heading in order to accomplish this.

191. The question of cleaning the coal is a matter you have given evidence upon already? Yes, and I have nothing to add to that.

192. In your previous evidence, have you referred to the number of men in a split? I do not think there was much said about that. I was satisfied with the alterations made in the Legislative Assembly.

193. I presume that you know from what has come under your notice that numbers of the mines in the northern district contain fire-damp? Yes, judging from what has taken place at some of the collieries, and by the reports in the newspapers, also by the complaints made to the Miners' Association.

194. Have you seen the correspondence that passed between Mr. Mackenzie, Examiner of Coal-fields, and myself some time ago [*see Appendix G*]? Yes.

195. It deals principally with ventilation, gas explosions, and general matters pertaining to the regulation of the mines? Yes.

196. Does it not bring under the notice of the Examiner of Coal-fields all these matters in a very pertinent way? Yes.

197. Do you know, Mr. Cook, the year in which the last Coal Mines Act came into operation? In 1876, I believe.

198. We have had no amended mining legislation since then that has actually become law? No.

199. Measures have passed the Assembly on former occasions? Yes; several have, and that is all the length they have got.

200. Do you think, from your past experience, that it is time that amended legislation should take place? Yes, I do.

201. And that that legislation should be of an effectual character? Yes, certainly.

A. Cook, Esq. 202. Have you given any evidence with regard to the minimum size of pillars? I do not think I said very much about that, because I think that will have to depend on the nature of the coal and the nature of the strata above. It might be possible to have a minimum, say 6 yard pillars, in width.

27 Aug., 1895.

203. Do you know that the Bill stipulates for a minimum of 8 yards? I take it that is under tidal waters.

204. Will you look at page 32 of the Bill:—

*Rule 46.* In mines not under river or ocean or tidal waters worked on the pillar and stall system, where it is intended to remove the pillars, the stall or bords shall not exceed in width 8 yards, and the pillars shall not be less than 8 yards wide. Where it is not proposed to remove the pillars, they shall be of such dimensions as shall be necessary to support the roof. In mines worked on the long-wall system substantial supports shall be erected sufficient to protect the workmen. In mines worked on the Welsh bords or double-stall systems good, substantial, and sufficient pack-walls shall be built, and a sufficient number of props set on each side of the pack-walls.

I was under the impression that the minimum laid down was 6 yards and 8 yards under tidal waters. This must of necessity depend on the nature of the roof, and the nature of the coal.

205. Is it not better to be on the safe side? Most decidedly.

206. Do you think there is any serious harm done if the minimum is stipulated for 8 yards? Of course there are several things to be taken into consideration. If the roof is good, it would be a waste of mineral to allow that extra 2 yards to be taken in.

207. The pillars are removed later on? Yes; but there is a probability of losing pillars, because there is not sufficient to begin with.

208. Is not that a substantial reason why they should be 8 yards? Yes.

209. What has been the usual custom in the collieries you have worked in;—what size pillars have been left? Where I am working now the pillars are 8 yards in width.

210. Where is that? At the Newcastle-Wallsend Colliery. Afterwards these pillars are taken out.

211. Sometime they put their supports in packs timber and refuse? Yes. I have not had much experience in the Wallsend Colliery, but I was eleven years in the Co-operative Colliery, and they were not particular there. The miners sometimes could have walked through the pillar.

212. Was that not under circumstances where the management had the whole business in their own hands? Most decidedly. It was the overman's duty to see the pillars were kept safe.

213. Under that system have you ever known any serious fall to take place in the Co-operative Colliery? Yes; I remember one about eight or nine years ago. A very large fall it was, too.

214. What was the effect of that fall; did it travel over those weak pillars? Yes; it closed up a considerable portion of the mine, threw men out of employment, and put the management to serious expense. Men had to go idle, and caviel three or four men in one bord. As a general rule two men only work in one bord. The men had to be double-banked. This place had to be won out again, and that was a lot of expense to the management.

215. That meant the internal demoralisation of the mine for a time? Yes; to a very great extent.

216. With regard to the weak pillars in that instance, would the great bulk of them be lost forever? Yes; completely lost.

217. Would that not be a loss to the owner of the coal for the time being? Undoubtedly.

218. A loss to the Company? Yes.

219. And would it not be a national loss as well? Yes; there is no question about it, because the coal was of first-class quality, and through the disaster it was an impossibility to get that coal at any future time.

220. If pillars had been left there of a sufficient size to have supported that roof, and if they did come away, would not the great bulk of that coal have been got afterwards? If the pillars had been sufficient the fall would not have taken place at all.

221. In the working out of pillars, a strong roof will stand for a considerable time, will it not? Yes.

222. It will stand until you have worked out a large sectional area with pillars in it, and after you have taken them out it will still stand? Yes.

223. When that occurs, is there not a tremendous amount of pressure when that roof makes a break? Yes, because there is such a wide area.

224. Will it not then require a good substantial pillar? Yes, it would.

225. Is not that a reason why sufficient pillars should be left? Most decidedly; but I am not able to say what is sufficient. It would depend on the nature of the coal and the nature of the strata. I should say not less than 6 yards.

226. With regard to the strata, where a large area like that is left, would not a 6-yard pillar sometimes be too weak for to break that off when it came to be an extensive area of heavy weight? In many cases it would.

227. Even where the strata is thin, but you have a strong roof, with a great pressure all at once you must have some substantial power to break it off when it falls? Yes; pillars should be strong enough to prevent that taking place.

228. Have you heard of other collieries in the district where falls have taken place in a similar way with similar results, and even worse results? I have heard of one with worse results.

229. Where was that? At the A.A. Company's mine, but I have no knowledge of it except by report and what I have read in the papers; still it is quite enough to arrive at the conclusion that if sufficient pillars had been left the fall would not have taken place.

230. In the working out of pillars, the men rely on the main roads as their outlet to get away? Yes.

231. Is there not great danger to life when these pillars are left weak and a big fall takes place;—is it not liable to shut up the main way and prevent the men getting out? Yes, it is more liable with weak pillars.

232. Have you heard tell of falls in any other collieries;—have you heard of any creeps at Stockton? Yes, I remember something happening there about two or three years ago.

233. Have you heard of anything happening at Burwood? Yes.

234. Have you heard of any extensive fall at Wallsend? Yes.

235. Do you know whether the men have been thrown out of work at Stockton in consequence of a similar fall taking place there? Yes; the whole of the men at Stockton were thrown out in consequence of a threatened fall.

236. You mean as distinguished from a creep? Yes.

237. I would like to direct your attention now to this provision in the Bill with regard to working under tidal waters. You will find it on page 31, rule 42:—

In the case of working coal by the pillar and stall system under river, or tidal, or ocean waters, the workings shall be laid off systematically and carefully, and the size of the pillars shall be such as will afford ample support, after exposure

to the crumbling effect of the air over many years, and shall not be less than twice the width of the bords or coal wrought out between such pillars. The bords on one side of the headings, levels, or cross-cuts, shall, unless prevented by rolls or faults, be driven opposite the bord pillars on the other side of the heading, level, or cross-cut. The minimum width of the pillars of coal shall be 8 yards, and the maximum width of the bords or stalls 6 yards. And in no case shall the pillars under ocean or tidal waters be removed. A. Cook, Esq.  
27 Aug., 1895.

I think that is a very wise and reasonable provision, because I do not think proprietors can be too careful when working under tidal waters. There is a double danger to people working below; they run the risk of being crushed and also of being drowned.

238. Supposing you heard that any colliery, situated under tidal waters, had pillars left 1 and 2 yards in thickness, and bords a width of 10 yards in some cases—that is, bords had been worked a width of 10 yards, and pillars in some cases 2 yards, would you consider that colliery had been worked in anything like a careful way? Certainly not.

239. How would you describe the management of that mine? No punishment too severe could be inflicted on any one that allowed such a thing to be done.

240. If a reference to something of that kind can be found in one of the Colliery Commission's Reports, referring to a colliery where that has been done, do you not think that is the best proof that a time has come for a change in that respect? I should think fresh legislation is very necessary if that is correct.

241. Any manager of a colliery would be unfit for his position where that is done? Yes.

242. Can you conceive that a manager may be forced to get out in the early stages of a colliery quantities of coal, irrespective of how the coal is worked? I suppose the colliery manager is under the control of a Board of Directors, but it is the duty of the manager to see that the mine is worked properly. I cannot think of a manager being compelled to do anything of that kind.

243. Is it not possible that the directors might be anxious to get out coal, and that the manager might have to do this to keep his position? Probably that might be the case, but I do not think that any level-headed manager would do a thing of that kind.

244. *President.*] A manager like that would be a sort of criminal, would he not? Yes; I should think he would rather give up his position, but there are managers who would do that, or anything else the directors told them.

245. You have already given us an instance of where pillars have been left too thin, and in consequence large quantities of coal have been lost;—I think you mentioned the Co-operative Colliery? Yes.

246. Put aside the question of safety;—was that not a big commercial loss to the company? It must have been. There is no question about that, I should think.

247. In the case of a colliery that is working under tidal waters, would not the directors have an opportunity of knowing this? I should think so.

248. Would they not have an opportunity of inspecting the mine and inquiring the width of the bords and working of the mine? Yes, they could get to know; but that shows the necessity for being extremely careful in driving the bords under the tidal waters. The bords should be driven by sights. The deputy gives you the line to go by that insures a uniform size.

249. That is absolutely necessary, is it not? Yes.

250. That would be a wise regulation in other cases, even on dry land, that they should be the width they are expected to be? Yes; in turning off a bord you may get 6 or 8 yards, but you do not get a uniform width, and you should get a uniform width as near as possible.

251. That would be bad management, would it not? Yes; certainly, sir.

252. *Mr. Curley.*] Have you heard of accusations being brought against miners being anxious to rob the pillars? Yes; but no case has come under my own particular notice. I have never seen miners rob pillars myself.

253. *Mr. Gregson.*] Who does rob them, then? Of course, if the pillars are robbed, the miner must do it.

254. *President.*] Have the miners any right to touch these pillars? No.

255. *Mr. Curley.*] Is this not a fact,—that the manager can come in at any time if he thinks the bord is going too wide, and put a mark on and say that the miner has to leave so much on in order to get the pillar a certain size? Yes, that is done.

256. And it is the miner's duty to follow that out? Yes; and if he does not do it he is liable to be dismissed.

257. Have you referred to the working hours? Yes; I did very particularly.

258. And you still are of the same opinion as regards the working hours? Yes; I believe there is a greater necessity now than ever.

259. *President.*] For what? For legalising the eight hours in connection with coal-mining.

260. What do you mean by legalising the eight hours;—do you mean to make it an offence to work longer? Yes; unless there is a creep or a fire, or other case of extreme urgency.

261. No one can compel a miner to work more now unless he chooses? No; not to my knowledge.

262. And yet you wish to take that choice from them? Most decidedly. When the liberty of the subject affects others I think his liberty should be taken away from him at once. We are supposed to work eight hours, but I question whether they do now, simply through the conditions imposed by the proprietors during the last year or two. Eight hours is quite enough to work underground, and if a man cannot obtain a living in this time it is time for him to give it up. There has been no trouble with the proprietors in connection with this matter.

263. *Mr. Curley.*] Do you know that there was a provision on this subject in one of the agreements between the proprietors and mine owners; I have the agreement here;—will you kindly look at clause 7, and tell me what it says (*see Appendix H*)? The daily hours for drawing coal shall be eight.

264. Was that obtained in a mutual way? Yes.

265. Is it not very difficult to control matters with regard to the uniform working of hours in consequence of tunnels at some of the collieries, and a few men being disposed to work any hours? Yes; it is a very difficult thing to control anything like that.

266. Is not that liable to lead to very serious danger in some cases? Yes; running in here and there any time they have a mind to. At the Hetton Colliery the system works first-class, and without any friction with the manager. There are two shifts, a front shift and a back shift. The front shift men are not let down before 6 o'clock and come back at 2, and the back shift is let down at 8 o'clock, and they come back again at 4 o'clock. At the Colliery I am working at now it is different, some of the men go

A. Cook, Esq. in at any time they like. This gives these men an opportunity to work ten or twelve hours a day to make a little more money, and the management, when any trouble comes, point out what these men are earning, which has an effect upon the others, and God knows where it might end.

27 Aug., 1895.

267. What is the rule with regard to a man coming to his work in the morning—is he supposed to see some mark to indicate that his place has been examined? I believe that is done at Hetton, but I am not aware that it is done at Old Wallsend.

268. Have you ever noticed any mark? No.

269. Have you been on the front shift? Yes; but I would not swear that it has not been done.

270. You have not observed any mark yourself? No.

271. Do you think that is a very necessary precaution to take? Yes; where there is the slightest appearance of gas it is very necessary. In tunnels where there is no sign of gas I do not think I would be anxious upon a provision of that kind, but where there are any signs of gas the places should be inspected before the men start work.

272. Even where gas is not given off, is it not possible it might be given off at any time? I would not like to say what is possible and what is not possible. It would be rather strange if there was gas where it was never heard of before.

273. You have heard tell of the gas explosion at Wallsend? I have. I believe two or three men have been burnt at that colliery.

274. *President.*] Does gas come so suddenly that you would not know anything about it? Gas may accumulate in the night, and the place may be standing full of gas in the morning. A miner going in with a naked light would cause an explosion, whereas the man going through before him would find out the existence of gas.

275. If the man does his duty the other man would not be allowed to go? Just so.

276. How many men are there employed in the Wallsend mine? Close upon 600 miners, I should think.

277. *Mr. Curley.*] Where this system prevails of men entering a mine as they please, and where gas is known to exist at these collieries, is that not a reason of itself why there should not be more firm discipline with regard to working hours? Yes; because where there is gas the man would not be allowed to pass a certain point until the deputy had reported.

278. *President.*] Why do you want to legalise the eight hours? Because it would be injurious to others in the district, if individuals are allowed to do as they please.

279. *Mr. Curley.*] Would a uniform starting point be made mutual with the men and the manager of the colliery? Yes.

280. Could not the management insist upon men coming to the mine in regulation fashion? Yes.

281. They could do so at present if they chose? Yes.

282. There is some reference in this Bill in connection with plans being submitted to some officer of the municipality. Will you look at Rule 28 of the Bill, section 5, on page 14.

(v.) Every copy or tracing as aforesaid, shall be deposited in the principle office of the Department of Mines and Agriculture, and, except as evidence in a Court, no copy or tracing thereof shall be furnished, nor information in relation thereto given, nor shall such plans or tracings be open to inspection unless the Minister shall order that any owner or lessee of the land or of the surface thereof, or the officer of any municipality whose rights or interests may be affected by the working of the mine be permitted to see such portion of any plan or tracing as affects the right or interest of such owner, lessee, or municipality.

I do not think that goes far enough to suit me. This simply looking at the plan would not be an advantage at all. I have some knowledge as far as the municipalities are concerned, and think that the officers of the municipality should have the right to make a periodical inspection, to see that the roads are left in a safe condition. That right is not here. An amount of damage has been done in the municipality that I live in through undermining streets, and completely ruining them in many instances. If the officer of the municipality could have inspected these places a great saving of damage would have been made.

283. With regard to the boundary of any abandoned mine, do you consider that an absolute necessity;—will you look at clause 3, of rule 28, on page 14:—

(iii) The plan of the workings shall have delineated on it the position of all shafts and boreholes sunk within the colliery surface boundary, with the depth to and thickness of the coal-seam passed through written alongside any shaft or bore-hole; and in addition to the plan hereinbefore provided for, there shall also be so provided, if required, a surface plan on the same scale, showing thereon all streets, roads, buildings, creeks, rivers, bays, swamps, navigable waters, and limits of any tidal waters within the said boundary.

I see nothing wrong with that as it stands.

284. You think that that subsection should be embodied in the Bill? Yes, decidedly.

285. The reference here to the Crown having lost revenue, is it not necessary to have a clear definition of boundaries upon plans? I think so.

286. May not a man who is working close to the boundary of an abandoned mine come upon a lodgment of gas through having exceeded the boundary;—if the boundaries are not on the plan, would it not be possible for the colliery to work into that? Yes.

287. Supposing it were standing full of water or a flooded mine, would there not be danger from that source as well? Yes; if they thought it was all solid coal there might be a danger from that source.

288. With regard to the eight-hour business, have you noticed anywhere where the Council has given reasons to this effect, that the miners were contractors, and could almost leave the mine when they pleased? I believe statements something similar to that have been made.

289. Can a miner leave a mine when he pleases in the way that is intended to be conveyed? I do not think he could without running the risk of being discharged.

290. If the miners were to act in that way, and the output of the colliery was interfered with, what would take place? A lot of them would be discharged from the colliery.

291. Then, you say they cannot do anything of the kind? No; in very few of the collieries in the district, if at all. In Hetton a man cannot get up the pit until certain stated times fixed by the manager.

292. With regard to the coming out of the mine, is it not absolutely necessary that the time should be stated when men should come out? I think it better to have a stated time, not two or three now and two or three at another time. I am a thorough believer in the eight hours. It is quite long enough for men to work. I go for legalising it because it is quite long enough for any man to work. If the proprietors were to take a stand and say that the men should work nine or ten hours, probably the men would have to do it.

293-4. *President.*] I do not think that is likely? No, perhaps not; but they would have the power to.

295. *Mr. Curley.*] Will you look at the reasons given by the Council with regard to clause 21 of the Bill, and the remarks upon the Stockton Mine, to be found in the Minutes of the Proceedings of the Legislative Council, 13th June, 1895, page 224—

A. Cook, Esq.  
27 Aug., 1895.

Insists upon its omission of clause 21, and the insertion of a new clause in lieu thereof,—because the new clause, which is an exact copy of section 41 of the British Act of 1857, provides all that is necessary to enable an Inspector to do his duty if he understands his work, whilst, on the contrary, if clause 21 were retained, it would hand over in an arbitrary way the whole of the mining operations of this Colony to the whim and caprice of, it might be, an incompetent Inspector, and would give him too absolute a power, which is undesirable. The power he possesses now under the present Coal-fields Regulation Act is quite sufficient, if not too extensive as it is, whilst the substitution of section 21 in lieu of the law as it now stands would endow the Inspector with such substantial power that, at his will, he could ruin any mining company if he thought fit. All he would require to do, without rhyme or reason, would be to announce to the colliery manager that it was his wish the men should be withdrawn from the mine, in which case 400 or 500 men would be thrown out of employment, and a repetition of what occurred at the Stockton Mine possibly be the result. In that case the mining authorities declared the pit unsafe, ordered the men to be withdrawn, and the men themselves, after some enforced idleness, petitioned the manager to be allowed to go back to work, as the mine was safe, notwithstanding the opinion expressed to the contrary by the mining authorities. The men went back to work, and have been at work for the last two years, in the face of the order that they should be withdrawn, and the fact that a prosecution was instituted against the manager for not complying with the mining authorities orders, the manager being fined for working, what was then alleged, a property which was unsafe, but which, as has already been stated, has been at work for two years since, and is at the present moment in operation.

Do you think that the powers of inspectors should be pretty well defined, and that they should have substantial authority? Yes, under certain conditions, but not to interfere materially with the management of the mine. The inspector should have power to order the withdrawal of the men. I believe that in the present Act he has the power to request the manager to withdraw the men.

296. Will you look at section 21 and subsections 1 to 5, on page 8 of the Bill, "Powers of inspectors, &c.," and Rule 7, on page 25, "Withdrawal of workmen in case of danger,"—

21. An inspector under this Act shall have power to do all or any of the following things, namely:—
- (i) To make at least once in each month such examination and inquiry as may be necessary to ascertain whether the provisions of this Act relating to matters above ground or below ground are complied with in the case of any mine.
  - (ii) To enter, inspect, and examine any mine, and every part thereof, at all reasonable times by day and night, but so as not to impede or obstruct the working of the mine except when absolutely necessary.
  - (iii) To examine into and make inquiries respecting the state and condition of any mine or any part thereof, and the ventilation of the mine, and the sufficiency of the special rules for the time being in force in the mine, and all matters and things connected with or relating to the safety of the persons employed in or about the mine or any mine contiguous thereto, or the care and treatment of the horses and other animals used in the mine.
  - (iv) To exercise such other powers as may be necessary for carrying this Act into effect, and shall enter in a book to be provided by the owner or manager a report of any defect, or anything in or about the mine tending to endanger the safety or health of the miners employed therein.
  - (v) To require the manager to withdraw the men from the mine if at any time he finds that, by reason of inflammable gases prevailing in any mine or part thereof, or of any cause whatever, the mine or the said part is dangerous; and no person shall, except so far as is necessary for exploration or inquiry into the cause of danger or the removal thereof, be readmitted into the mine or such part thereof as was found dangerous, until the same is stated by the Inspector to be safe.

Every person who willfully obstructs an Inspector in the execution of his duty under this Act, and every owner, agent, and manager of a mine who refuses or neglects to furnish to the inspector the means necessary for making any entry, inspection, examination, or inquiry under this Act, in relation to the mine, shall be guilty of an offence against this Act.

Rule 7. If at any time it is found by the person for the time being in charge of the mine, or any part thereof, that by reason of inflammable gases prevailing in the mine, or that part thereof, or of any cause whatever, the mine or that part is dangerous, every workman shall be by such person withdrawn from the mine or part so found dangerous, and a competent person appointed for the purpose shall inspect the mine or part so found dangerous, and if the danger arises from inflammable gas, shall inspect the mine or part with a locked safety lamp; and in every case shall make a true report of the condition of the mine or part; and a workman shall not, except in so far as is necessary for inquiring into the cause of danger or for the removal thereof, or for exploration, be readmitted into the mine, or part so found dangerous, until the same is stated by the person appointed as aforesaid not to be dangerous. Every such report shall be recorded in a book which shall be kept accessible to workmen at the mine for the purpose, and shall be signed by the person who made the inspection.

Do you think that is a satisfactory reason for the Council to assign with reference to the Stockton Colliery? No, I do not. I think that is a power that ought to be vested in the Government. I do not think an inspector would do anything detrimental to the proprietors or the miners. Where life is concerned the position is an urgent one, and inspectors ought to have the power to order the men out of the mine.

297. Will you look at the letter on the Stockton Colliery, dated 8th February, 1894, being a report from Mr. John Dixon and Mr. William Humble, Inspectors of Collieries, to Mr. John Mackenzie, Examiner of Coal-fields, to be found in the Appendix to final report of the Select Committee, presided over by Mr. Fegan (*see Appendix I*); also look at the 7th clause of the letter from Mr. John Mackenzie, Examiner of Coal-fields, to the Under Secretary for Mines and Agriculture, dated 21st February, 1893, to be found on page 43 of the Appendix to the same report:—

7. In conclusion, I beg to state that I have seen Messrs. Dixon and Humble's report of 18th instant on the innsh of water, &c., which I fully agree with and forward you herewith. The men having been withdrawn by the manager, work cannot be lawfully resumed until I or an Inspector state that the mine is safe, which we cannot at present say.

I have, &c.,

JOHN MACKENZIE,  
Examiner of Coal-fields.

The Under Secretary for Mines and Agriculture.

Do you think the men were withdrawn there without rhyme or reason? No; I do not think so.

298. It was a grave and serious matter? Yes.

299. The manager withdrew the men in the first place? Yes; because the danger was of such a glaring character that he could not get away from it.

300. And the inspector stated that the men were not to resume work until the mine was safe? Yes.

301. Look at the letter dated 8th February, 1894, the report in connection with Stockton Colliery from Mr. Dixon and Mr. Humble. What do they say with regard to the subsidence there. Read the 6th clause:—

6. Since our previous inspection, a portion of the old workings in the No. 3 District, amounting to an area of about 7 acres, has fallen and caused a subsidence of the surface at the junction of Maitland-street and Fullerton Cove Road.

We travelled the outskirts of a considerable portion of this fallen ground, and did not hear anything indicative of further disturbance, neither did we see any sign of water coming from the fallen ground.

To-day we walked over the surface where the subsidence has taken place. The greatest depression appears to be at the junction of the two streets, many of the kerbstones being split and disjointed, and in several places the asphalt guttering

A. Cook, Esq. guttering was fractured. The retaining-walls, stone steps, and fences of several houses in both streets bore evidence of disarrangement, the two former being fractured, and the latter thrown from their original upright position.

27 Aug., 1895. —? It shows there must have been some queer work going on below.

302. Also look at, and read, the 7th clause of the same report?—

7. Before leaving the colliery to-day, we entered the following report in a book at the colliery :—

Stockton Colliery, 8 February, 1894.

Our inspection of the above colliery on Tuesday and Wednesday, the 6th and 7th instant, has revealed nothing that would justify us in altering the opinion expressed by us, and entered in this book on the 13th February, 1893, and referred to by us on the 14th December, 1893.

—? It only shows that they were not in a position to report that the mine was safe, and still the men had resumed work.

303. *President.*] Were the men made to do so, or did they do so of their own accord? It was at the men's own request. There was a general inspection made, the employers and men being both represented, and they decided to resume work.

304. *Mr. Curley.*] Has there been a subsidence there since? Yes; a creep.

305. It has actually come to the surface? Yes.

306. You think that the powers of inspectors should be pretty definite? Inspectors should have absolute power in cases of that kind. Nobody should be in a position to question it at all.

307. Have you known of any serious collapse of a shaft when the men were at work and in the pit at the time? Yes; at South Waratah a couple of years ago.

308. Do you know whether that took place on the 28th April, 1893? I cannot say the date.

309. You know that it did take place? Yes.

310. As an executive officer of the Miners' Association that came under your notice by a communication from the local secretary of the colliery? Yes; and we communicated with the Mines Department.

311. Do you know how long some men were in the pit before they got up that day? The greater part of the following night—a considerable time after the accident happened. They had to be drawn up the air-shaft.

312. Do you know, in connection with that communication, whether any reference was made to a creep bordering upon the furnace shaft where the men had to come out? Yes; that was brought under our notice as well.

313. These two matters were brought under the notice of the Examiner of Coal-fields at the time? Yes.

314. Do you know whether the collapse of that shaft prevented the men from working? Yes; the men were about three or four months out of work.

315. Are you sure that is the correct time? I think it was about that time.

316. With regard to this alleged creep near this furnace shaft, do you not think that shafts should always be well secured by a substantial pillar of coal between them? Most decidedly. Of course the shaft is the outlet for the whole of the coal got by the miners. It is good management to see that this is done.

317. Do you know whether circumstances of that character ever arose in connection with the Newcastle Company's colliery? I have no knowledge of it.

318. *President.*] A good manager would know his duties in this respect? Yes; he ought to.

319. There would be no object gained by his putting the shaft in any dangerous place? It is only after the shaft has been sunk and they are taking out coal that they do not leave sufficient support near the shaft, and it threatens to collapse until it collapses altogether. We assume that that was the cause of the collapse of that shaft.

320. *Mr. Curley.*] It might have been liable to have closed in the furnace-shaft altogether. It might have been.

321. Will you look at the provisions in the Bill for shafts in section 43 on page 21.

43. (1) After the commencement of this Act, the owner, agent, or manager of a mine shall not employ any person in the mine, or permit any person to be in the mine for the purpose of employment therein, unless the following conditions respecting shafts or outlets are complied with, that is to say :—

- (a) There must be at least two shafts or outlets, with which every seam for the time being at work in the mine shall have a communication, so that such shafts or outlets shall afford separate means of ingress and egress available to the persons employed in every such seam, whether the shafts or outlets belong to the same mine or to more than one mine.
- (b) Such shafts or outlets must not at any point be nearer to one another than fifteen yards, [and there shall be between such two shafts or outlets a communication not less than four feet wide and six feet high, and in the case of communications made after the commencement of this Act between shafts or outlets, not less than six feet high.
- (c) Proper apparatus for raising and lowering persons at each such shaft or outlet shall be kept on the works belonging to the mine, and such apparatus if not in actual use at the shafts or outlets shall be constantly available for use.

The Bill provides 50 yards, the Council amended it to 15 yards, and the Assembly put it at 30 yards as a compromise :—do you think that is anything like a reasonable distance? I prefer the 50 yards myself.

322. A colliery like the Metropolitan Colliery at Helensburg is a great depth? Yes.

323. Would it require a substantial pillar in a case of that kind? Yes.

324. And if we are to have collieries like that proposed at Cremorne, it will require a great deal more? Yes; a great deal more than 15 yards. In the event of a creep affecting one shaft, I think that under ordinary circumstances it might be expected to find its way across 15 yards of a pillar and affect the other shaft; whereas, if 50 yards were left, it would be an absolute impossibility for the other shaft to be affected, and so nothing of that kind could take place.

325. Have you had any knowledge of taking out pillars in England or Scotland? No.

326. With regard to the question of check-weighing, have you given evidence on this subject? Yes; I have.

327. Do you still consider that the appointment of a check-weighman should entirely be in the hands of the men, as provided for in this Bill? Yes, I do. The men pay the check-weighman, and they should have the right to make the selection. I do not see that the proprietors have anything to fear from anything of that kind, because his duties are defined by law, and they can remove him at any time if he violated the law.

328. With regard to the check-weighman being selected under the present system from the employes of the colliery, have you known any instance where that was done and the colliery stopped work for a few weeks, and upon work being resumed the check-weighman was again objected to as not being an employe of the colliery? Yes; not very long ago at the Lambton Colliery in Newcastle.

329.

329. Did the Lodge Secretary communicate it in any way? Yes; he did.

330. Have you the communication with you? Yes.

331. Will you please read it? Yes.

A. Cook, Esq.

27 Aug., 1895.

Mr. James Curley, Miners' General Secretary,—

Now Lambton, 17 May, 1895.

Dear Sir,

I am directed by my lodge to forward to you a motion passed by the Lambton miners, on 15th May instant:—  
 "That the district officers use every endeavour in their power to have a clause inserted in the new Coal-mining Act, whereby the employees of any colliery may have the power to appoint any man to fill the position of check weighman, whether he be an employee or not of the same colliery."

The reason of this motion is in consequence of the action of the management of the Lambton colliery in the case of Treharne Evans, after the stoppage of the colliery for five weeks, the management did not consider him (T. Evans) an employee of the colliery, and refused to recognise him as one to be nominated for the position of check-weighman.

My lodge consider it a great injustice to anyone who may be appointed to such position to be cut off without any redress.

Yours, &c.,

DAVID PATERSON,  
 Secretary.

332. That communication is from the Lambton Lodge Secretary? Yes.

333. Do you think it is also necessary that each of the parties in the mine should contribute their share of the payment to the check weighman? Most decidedly.

334. Are there not some cases where miners are paid for large and small coal filling away together? Yes; at Wallarah and at the New Lambton tunnel.

335. Do you think that the men should also have the right to be paid by weight? Yes, of course.

336. Do you think that the operation of this Act should not apply (say) to a limited number of men. The Assembly says twenty men, and Council amend that to thirty men. Sub-section (iv), of rule 38, says:—

(iv) Where it is proved to the satisfaction of the Minister, in the case of any mine or class of mines employing not more than twenty persons under ground, to be expedient that the persons employed therein should, upon the joint representation of the owner or owners of any such mine or class of mines and the said persons, be paid by any method other than that provided by this Act, such Minister may, if he think fit, by order allow the same either without conditions or during the time and on the conditions specified in the order.

—? I think every miner ought to be paid by weight.

337. Do you know of a colliery where a demand was made to be paid by weight? Yes; at the Northern Extended Colliery, or Gartice.

338. Was the manager approached on the subject by the men? Yes.

339. Was there a document sent requesting this to be done? Yes; I believe so.

340. And the manager declined to do it? Yes, he declined.

341. And the matter has been referred to the Minister? Yes.

342. What was his reply later on? I have a copy of his reply.

343. Will you please read it?

Sir,

Department of Mines and Agriculture, Sydney, 20 August, 1895.

Adverting to my letter of the 3rd ultimo, in reference to the mode of payment at the Gartice Colliery, I have the honor, by direction of the Secretary for Mines and Agriculture, to inform you that in view of the opinion of the Attorney-General there appears to be no power to compel the owners of this colliery to pay by weight unless they choose to agree with the miners to pay them according to the weight of the mineral gotten.

I have, &c.,

HARRIE WOOD,

Under Secretary

(per P.H.O.)

James Curley, Esq., Secretary, Amalgamated Miners' Association, Newcastle.

344. It appears that under the present Act there is no power to pay by weight? Apparently not.

345. The general custom throughout the district is, as a rule, to pay by weight? Yes; that is the general custom of the district at the present time.

346. Has not this same proprietor been appealed to on former occasions? Yes, repeatedly to my own knowledge. I have interviewed him some years ago with the other district officers.

347. Do you know what was done in connection with the latest request;—do you know of any men being discharged? Yes, one in particular. There might have been more.

348. Do you remember there were four? I know of one; probably there were four.

349. Do you know of a man named Bradley? Yes, well.

350. Do you know that he and his mate were discharged? Yes, now I come to think about it.

351. Do you know whether his mate was reinstated? Yes, I believe so; but not Bradley.

352. Do you know a party by the name of Taylor, who was delegate for that colliery? Yes; I think I remember that gentleman.

353. Do you know whether Taylor and his mate were discharged as well? I cannot bring it to my recollection just now.

354. Do you know that Taylor was a delegate? Yes.

355. Might he not have been discharged without your knowledge? I think it would have been brought under my notice as an Executive Officer, but I forget the names just at present. I know that he was delegate.

356. Mr. Gregson.] You have had sixteen year's experience in coal-mining in Scotland, Mr. Cook? Yes.

357. In what part of Scotland was that? In Fifeshire.

358. What was about the thickness of the seam there? The seams vary very much. They range from 3 feet thick up to 6 and 7 feet.

359. What was the thickness of the seam you were working in? About 5 feet thick, but it was worked on the longwall system.

360. All longwall? Yes; most of the pits there were worked on the longwall system.

361. Have you ever worked bord and pillars there? Only as a boy.

362. What was the depth of the shaft? About 300 feet.

363. Do you think from your experience in New South Wales that there is any material difference in the conditions of working here and the parts of England you know? Of course my experience in the old country was confined to the long-wall system, and I have not seen any of that in this country.

364. In that respect there is a difference? Yes; there is a considerable difference there.

365. Is there any other difference you can call to mind? It appears to me that miners take a great deal more out of themselves in this country than they do in the old country.

366. Do they work harder? They appear to me to do so. I never saw men in the old country without a shirt of some kind on, but here they work without anything on in the shape of a shirt.

367.

- A. Cook, Esq. 367. What would be the temperature of the workings at home? That I cannot say. There was always a good circulation of air where I worked in the long-wall. There is very little difficulty in ventilating a mine under the long-wall system.  
 27 Aug., 1895.
368. I wish to know about the temperature;—what would be the average temperature there? I cannot tell you.
369. It is very much colder there? Yes.
370. Would not that explain the difference in the clothing you have referred to? No. So far as the temperature is concerned I do not think there is very much difference between the old country and this country.
371. What is the average temperature here below ground? I suppose it is between 66 and 70 degrees.
372. Is not that summer heat in the old country, where you come from? Pretty close up to it.
373. Do you think that a man's stamina is as good here as in the old country;—that he is capable of doing hard work here as well as in the old country? I think so.
374. That he does work here as well as in the old country? Yes; he ought to do as good a day's work.
375. There is nothing to prevent him doing so here—climatic conditions or otherwise? On top a man might not be able to do as good a day's work here, but I do not think that has much to do with the work below; that depends on the fans and furnaces.
376. If the temperature is naturally cooler in England than here, would it not make a difference down below? I do not think it would make very much difference. Of course the further you go down the warmer it gets. The temperature on the top will have very little to do with the air below.
377. You cannot cool the air after it gets into the mine;—you seem to think the temperature would be reduced? I cannot speak from a scientific point of view, but I do not think there is any difference.
378. A miner here is under no worse conditions than in England? I do not think so.
379. That being the case, do you think that the provisions in the Coal Mines Regulation Act as obtaining in England are inapplicable here? I think a few of the conditions could be improved upon.
380. You do not think on the face of it that it is wrong? I would be prepared to accept the English Act with a few improvements.
381. Are there any conditions in the Act that would make it unworkable in this country? I suppose it could be made workable even as it stands at present.
382. Are there any reasons in your knowledge that would prevent the present Coal Mines Act of Great Britain being worked here? I do not know of anything to prevent it being carried out here.
383. There are no conditions whatever, as far as you know? I do not see anything in the conditions of climate or other things to prevent the Act working here.
384. You would rather remain under the present Act than have the English Act? Yes; rather than have the English Act in its entirety working here.
385. With regard to the provisions in the proposed Bill for ventilation—that will include the minimum, and the distance of the cut-throughs, and the bratticing, and all the different arrangements the Bill seeks to provide for giving miners ventilation? Yes.
386. You have, I suppose, read the English Coal Mines Act? Yes, but not very carefully.
387. Does that Act contain any of these provisions? I know it does not provide for a minimum.
388. And nothing about cut-throughs? Yes.
389. And nothing about bratticing? I believe that is correct.
390. What does the English Act provide? An adequate amount.
391. What do you understand by the word "adequate"? Sufficient.
392. I will read rule 1 of section 49 on page 76 of MacSwiney's work on the English Act:—

## VENTILATION OF MINE.

*Rule 1.*—An adequate amount of ventilation shall be constantly produced in every mine, to dilute and render harmless noxious gases to such an extent that the working-places of the shafts, levels, stables, and workings of the mine, and the travelling roads to and from those working-places shall be in a fit state for working and passing therein.

In the case of mines required by this Act to be under the control of a certificated manager, the quantity of air in the respective splits or currents shall at least once in every month be measured and entered in a book to be kept for the purpose at the mine.

- Do not you think that that clause does away with the necessity for all these provisions? No; not in my opinion; because who is to be the judge of what an adequate amount of ventilation is?
393. That is the question I was going to ask you;—what are the powers of the inspectors? To see that the Act is carried out.
394. And the Act requires that an adequate amount of air is to go not to one place only, but everywhere? I have always held the idea that the working miner should have a certain amount of air, and that a minimum should be fixed. I think that 150 feet is a fair amount to fix the minimum at. I do not think the English Act deals with that at all, and that is one of the principal reasons I have for objecting to it.
395. You were working for sixteen years as a miner in Scotland? Yes.
396. Were you on the coal all the time? Yes.
397. Did you occupy the position of deputy? No.
398. You were only a working miner? Yes.
399. Subject to all the inconveniences at that time? Yes.
400. The Act you worked under was the 1872 Act? Yes.
401. The clause in the 1872 Act about ventilation is the same as in the Act of 1887? Yes.
402. Did you suffer in any way in your experience? The most of my experience in the old country was in long wall work, and it is easier to ventilate in long wall work than in bord or pillar.
403. Wherever you were working did you have an adequate account of ventilation? There are any amount of occasions where men have had to stop working for the want of ventilation. Men could not get into the working places because they were full of black damp.
404. That might be, no matter what quantity of air was passing? No; that goes to show that there was not a sufficient quantity of air going through.
405. The inconvenience then was the loss of work? Yes.
406. No inconvenience in the nature of the work itself;—it did not consist in personal inconvenience during the time they were at work? Where there was a sufficient amount of ventilation it could not inconvenience them, but in many cases the miners could scarcely get their lamps to burn, and I have known men to be completely done at 40 years of age through bad ventilation.
407. Do you look upon mining in the old country as being an unhealthy occupation? Yes. 408.

408. You mean as compared with other occupations? Yes.
409. Would you be surprised to learn that it stands very high up in the occupations from the standpoint of health? I would be a little bit surprised.
410. As regards this country, under the Act you have been working giving a minimum quantity of 100 cubic feet of air, and then in England, where only an adequate quantity is provided, has the minimum provided up to now put you in a better position than you were in the old country? I should not like to say there was very much alteration.
411. You do not think there was very much difference? I have seen in the Co-operative Mine, where they could get the amount of air required by the Act with the anemometer, but the air in the headings, through the powder smoke and other impurities, was very unhealthy.
412. Are the conditions with this 100 cubic feet minimum quantity better for you than the provisions in the old country? No; they are not. It will take the other 50 feet to bring the conditions up to as good as at home.
413. There is an old saying that "enough is as good as a feast";—if you have an adequate quantity of air, does it matter if you call it 100 feet or 150 feet? The miners may be placed at a disadvantage by the manager saying there is an adequate amount of air, and yet it might be an impossibility for the miner to work there. If there was 150 feet it would make things much more comfortable for the miners.
414. The person who decides whether the quantity is adequate is the inspector? Yes; he is supposed to be.
415. You are quite clear that the manager would have nothing to do with it? I suppose if the inspector said there was not enough air the manager would have to give it.
416. The decision with regard to the adequacy or inadequacy of the air is in the hands of the inspector? I would give the inspector the very same power.
417. Your objection to the provisions of the English Act is that you cannot confine this power to the inspector? I do not wish to say that I would not have confidence in the inspector, but I think there should be a minimum.
418. Supposing there was 150 feet of air, and the inspector said it was inadequate? Then the inspector should have the power to cause the manager to supply more ventilation.
419. Do you not think it more to the advantage of the miner that there should be no question of what the quantity of air should be? But there will be no question.
420. Generally, you are dissatisfied with the provisions of the English Act, because you do not think that the miner would be as safe in the hands of the inspector as he would be if a minimum were stated? I believe in a minimum of 150 feet.
421. Supposing the miner got his 150 feet, do you think it is necessary to make any provisions about cut-throughs or about bratticing? I think it would be just as well to express an opinion how these matters should be done.
422. Assuming that a miner has his 150 cubic feet of air, you do not want to bother about cut-throughs and bratticing? That is a matter of supreme indifference to the miner so long as he is supplied with 150 feet of pure air.
423. Supposing the proposed Bill said what the English Act says, with the addition of 150 cubic feet of air per minute, would you be willing to give way cut-throughs and bratticing altogether? I might be prepared to grant it if it can be done consistent with the safety and well being of the miners.
424. Does it matter much how you get it? No, not much, so long as each miner gets 150 feet. The system of the shorter cuts-through would be a reasonable way of getting much better ventilation.
425. In the inquiry in England, made by the foremost men in the world, they had under consideration all these matters, and they did not think it was necessary to tie the manager hand and foot as to the distance of his cut-throughs or as to bratticing; is not that a reasonable argument for following the English practice; do you set up your judgment in opposition to theirs? I am only concerned in seeing that the miner gets his 150 cubic feet of air at his working place. There is only one way of bringing it to the working face, and that is by bratticing.

[Witness withdrew.]

TUESDAY, 27 AUGUST, 1895.

[The Commission met in the Board Room, Chief Secretary's Office, at 2 o'clock p.m.]

Present:—

FRANCIS EDWARD ROGERS, Esq., Q.C. (PRESIDENT).

JAMES CURLEY, Esq.

JESSE GREGSON, Esq.

Adam Cook, President of Amalgamated Miners' Association:—

426. *Mr. Gregson.*] Mr. Curley asked you some questions regarding the size of pillars? Yes.
427. I think you are in favour of the limitations as to size that are provided for in the Bill? Yes.
428. Whether under the land or under the sea? I am most decidedly with the Bill as far as tidal waters are concerned.
429. You gave your limitation as 6 yards under the land, and 8 yards under the sea? Yes.
430. Has it struck you that there are circumstances under which the 8-yard pillar would be quite as insufficient under the land as the 4-yard pillar? No; I have not seen any places with such a difference as that.
431. Has it occurred to you that such a thing might be; you must provide against all reasonable contingencies; if you are providing for a minimum you must provide it large enough or small enough;—you still think that the minimum size provided in the Bill meets the case? I think the 8 yards would be sufficient under ordinary circumstances, but a good deal will depend on the strata.
432. Do you know enough of the English Act to say that there is no provision of such a kind there? No.
433. You would not think it a sufficient reason, that if they did not think it necessary in England it is not necessary here? We have to take the surroundings into consideration here, and if the English Act can be improved upon we have to do it for the safety of the miners.
434. In what way do you refer to for the safety of the miners? It might have a tendency to prevent those creeps and other things that have been mentioned to-day. In the colliery I referred to the fall would not have taken place.

A. Cook, Esq.

27 Aug., 1895.

- A. Cook, Esq. 435. Other folks might hold a different opinion to that? Yes; but I have come here to express my opinion.  
 436. Do you think any Act of Parliament will avoid accidents? No; but it might reduce them.  
 27 Aug., 1895. 437. Do you think that every accident that occurs should be taken as a fresh occasion for legislation? Of course you have to take the cause of the accident, but measures ought to be adopted to reduce accidents.  
 438. If you leave pillars larger than is requisite, does that not cause a loss of coal to the community? But that may be for the safety of the men who are working there.  
 439. In places under the land is it not the case that there are areas where coal is worked without any intention of coming back to the pillars? There may be cases.  
 440. You are aware that there are areas in which there is no intention to come back to the pillars? I cannot say that I am. I believe there may be, but I cannot say.  
 441. How do you come to give your opinion about a Bill of this kind? My opinion was asked about the reasonable size to leave pillars under tidal waters and places where they were not troubled with water at all, and I am not aware of any place where coal is left without any intention of taking it out at all unless under tidal waters.  
 442. Suppose I put it to you that there are such areas? I do not see that my opinion wants reconsideration at all. I think that a fair minimum is 8 yards, and that the pillars should be of greater size, if required, and under no circumstances less.  
 443. Upon whom should rest the responsibility of the proper size of pillars? I suppose the Commission will have to take the responsibility, to be embodied in an Act of Parliament.  
 444. With whom should rest the responsibility of deciding what is the size of pillars, supposing more than 8 yards is required? I suppose the Government inspector.  
 445. Would it not be the manager? Of course, we cannot overlook the manager. If the manager took a stand and said it was not necessary to leave larger pillars and the inspector said it was, I think the larger pillars should be left, independent of the manager.  
 446. Has not the inspector power to say that under the present Act? No; I do not think he has. He might point out a danger, and suggest to the manager to make an alteration, but he has no defined powers.  
 447. With regard to the Stockton accident, what was it the inspector dealt with in that mine? So far as the inspectors were concerned in the Stockton accident their opinions were thrown to the winds altogether. The management has not recognised the inspector at all.  
 448. Was not that for want of some further power under the present Act and now proposed in the Bill;—it was not for want of judgment on the part of the inspector? The deadlock was brought about by the inspector refusing to certify that the mine was safe.  
 449. The failure of the Government was not because they had not inspectors, but because, under the Act, the inspectors had not sufficient power? Yes; and we want to give the inspectors more power.  
 450. That is proposed in the Bill? Yes.  
 451. Do you know enough of the English Act to say whether it is in that Act? No; I do not.  
 452. Do you think that all mining managers and all owners of mining property ignore the canons of proper management, or do you think they try to do things according to the best of their lights? I think that they try to do things according to the best of their lights.  
 453. They may make mistakes? Oh, yes; I think in some cases a manager may allow his scientific knowledge to be set aside to better the position of the Company in getting more coal out of a limited space, and limiting the size of pillars—that is, in his desire to increase the output in a limited area. I think ventilation and the size of pillars ought to be regulated by the Government inspectors, and that they ought to have power to deal with the matter.  
 454. In the interests of the miner? In the interests of everybody concerned.  
 455. Do you not think it would be worth while for the mine-owner to consider his own interest? But the mine-owners are none the worse for the assistance of the Government expert.  
 456. In the interest of the miners you are anxious to avoid accidents? Yes; as far as possible.  
 457. Have you seen the report of the Department of Mines for last year, Mr. Cook? I do not think I have.  
 458. Will you look at the list of accidents that have taken place since 1873?

RETURN showing the number of fatal and non-fatal accidents; those caused by "falls of coal," stone "roof"; and Lithgow, Ferndale, Bulli, A. A. Co.'s Hamilton Pit, and South Burwood Sinking Pit disasters, 1873 to 1894 inclusive.

Year.	Fatal accidents.	Remarks on fatal accidents.	Non-fatal accidents.	Remarks on non-fatal accidents.	Men above and below ground.	Tons of coal raised.	Tons of coal raised per life lost.
1873...	13	9 by falls of coal	10	4 by falls of coal, 1 by stone roof	*.....	1,192,862	91,758
1874...	5	3 by falls of coal, 2 by stone roof	13	6 by falls of coal, 4 by stone roof	*.....	1,304,612	260,922
1875...	8	4 by falls of coal, 3 by stone roof	10	6 by falls of coal	3,308	1,329,729	166,216
1876...	4	2 by falls of coal, 1 by stone roof	8	4 by falls of coal	4,084	1,319,918	329,979
1877...	7	4 by falls of coal, 1 by stone roof	21	16 by falls of coal	4,657	1,444,271	206,324
1878...	8	2 by falls of coal, 1 by stone roof	15	12 by falls of coal, 1 by stone roof	4,792	1,575,497	196,937
1879...	5	2 by falls of coal, 2 by stone roof	19	10 by falls of coal	5,036	1,583,381	316,676
1880...	8	4 by falls of coal, 1 by stone roof	19	8 by falls of coal	4,676	1,466,180	183,272
1881...	2	2 by falls of coal	33	25 by falls of coal	4,098	1,769,597	884,798
1882...	12	10 by falls of coal	33	23 by falls of coal	4,487	2,109,282	175,773
1883...	15	8 by falls of coal, 1 by stone roof	34	15 by falls of coal, 4 by stone roof	5,481	2,521,457	168,096
1884...	14	6 by falls of coal, 2 by stone roof	34	14 by falls of coal, 6 by stone roof	6,227	2,749,109	196,364
1885...	11	7 by falls of coal, 2 by stone roof	40	13 by falls of coal	7,097	2,873,863	261,714
1886...	29	10 by falls of coal, 1 by stone roof, 8 by Lithgow disaster, 1 by Ferndale flooding.	43	15 by falls of coal, 2 by fall of roof	7,847	2,830,175	97,592
1887...	94	81 killed by Bulli catastrophe, 5 by falls of coal, 2 by falls of stone roof.	45	22 by falls of coal, 5 by fall of stone roof.	7,998	2,922,497	31,090
1888...	15	5 by falls of roof	43	12 by falls of coal, 4 by stone roof	9,301	3,203,443	213,562
1889...	41	11 by crush at Hamilton Pit, 11 by falls of coal, 4 by over-winding at South Burwood.	57	24 by falls of coal	10,277	3,655,632	89,161
1890...	13	4 by falls of coal, 1 by fall of roof	36	17 by falls of coal, 3 by stone roof	10,315	3,060,876	236,145
1891...	21	7 by falls of coal, 3 by fall of roof	54	27 by falls of coal, 6 by stone roof	10,820	4,037,929	192,282
1892...	8	4 by falls of coal, 3 by fall of roof	77	38 by falls of coal, 10 by stone roof	10,514	3,780,967	472,620
1893...	13	10 by falls of coal, 1 by fall of stone	45	22 by falls of coal, 5 by fall stone	9,971	3,278,327	252,179
1894...	7	2 by falls of coal, 2 by fall of stone	40	28 by falls of coal, 1 by fall stone	9,126	3,672,076	624,582

\* Figures not available.

I do not think that table represents the accidents that have taken place in the mines of this Colony during that period. That table only relates to accidents of a serious nature. Hundreds of accidents take place that prevent men being able to attend to their work for a month or a couple of months.

A. Cook, Esq.  
27 Aug., 1895.

459. *President.*] What kind of accidents do you refer to? A man may hurt his foot, or break his finger, and that sort of accident would not be reported here.

460. That would not be through any fault in the mine? These accidents in the report are looked upon by the manager as serious, but there are several other accidents that are not serious that are not recorded because they are not reported to the inspector.

461. *Mr. Gregson.*] You observe the headings on that return—the first column gives the year, the second column fatal accidents, the third remarks on fatal accidents, and the fourth non-fatal accidents, and remarks on non-fatal accidents—so that the return does take into account non-fatal accidents? Yes; that is where men are not exactly killed. There are a number of cases, as I have said, where men are paid out of the accident fund which are not reported at all.

462. Do you propose to legislate for accidents of that kind—to alter the size of pillars, &c., to provide against a man hurting his fingers? I simply mention these things to show that accidents of this kind are not recorded at all.

463. May we not take it that all accidents that are non-fatal are reported here? No.

464. And that all the fatal accidents are reported also? Yes.

465. Look through the return, and see if it does not give a very favourable account in connection with the management of the mines in this Colony. Just consider the number of accidents that are there. I make 161 accidents from falls of roof and sides. Supposing the number of accidents recorded here are 161 from falls of roof and sides, do you look upon that as a serious matter? If the return were correct, I would say it is not; but I say it is not correct, because only the accidents that are fatal are recorded here.

466. But I am speaking of fatal accidents? I believe that all the fatal accidents are recorded.

467. Assuming that the number of fatal accidents from falls of roof and sides should be found to be 161 in number, you would not look upon that as being a very serious business—I am referring to the return for the years from 1873 to 1894? I think it is a pretty fair amount when the number of miners is taken into consideration. We have very few miners here compared to the old country.

468. Is it your experience that the fatal accidents from the falls of roof or sides very seldom happen to the experienced miners? I have had very little experience in that particular instance. It is quite reasonable for anybody to conclude that the accidents referred to have happened to men who lacked experience.

469. You must know that the majority of men who meet with these accidents are old experienced miners, who have suffered? Two or three men have been killed in my neighbourhood, and all those that came under my notice were experienced miners.

470. Probably the most experienced miners in the pit? Yes.

471. Is there any provision in the Bill that would prevent such accidents in the future;—I am including that unfortunate accident in the Hamilton pit? So far as the miners' ordinary work is concerned, that is at the face, and I do not think you could legislate to keep him safe there, because there may be faults that are not visible to the most experienced men, but so far as keeping up the roof is concerned, that might be accounted for by too small pillars, and pillars of a proper size might have prevented some of those accidents.

472. You will admit that, no matter how you legislate as to the size of pillars, accidents will occur? I suppose they will.

473. Assuming that amongst the total number of accidents spoken of in this return is included the eighty-one men killed by the Bulli catastrophe in 1887, do you think the rest form a very satisfactory record;—they are, I think 353; that is 353 accidents of a fatal character? It is serious enough, and if we think that the number can be reduced by legislation in the future it is our duty to do it. So far as the Bulli business is concerned, that might have been prevented with ordinary caution.

474. Which clause in this Bill, supposing it became law, would have prevented the Bulli accident? The clause about ventilation might have. It is supposed by many that it was a gas explosion.

475. Are you acquainted with the report upon that accident? I am not.

476. Were you in the country at the time? Yes, and I have read a lot about it.

477. What conclusion did you form about it? That it was an explosion.

478. Do you think that anyone was to blame? Yes; the management of the colliery, by not having the mine sufficiently ventilated. The manager should have seen to that, and the explosion could never have taken place. The ventilation clause in the Bill would, I think, have prevented the explosion.

479. Were there not coal-mining inspectors at the time? Yes.

480. Did they fail in their duty do you think? An inspector may make a mistake in his duty.

481. Do you think that if the Bill now proposed became law that would avoid a similar accident in future? I think it would reduce accidents of that kind taking place very materially.

482. You think that the limitation as to pillars would reduce accidents, and that the provisions of the Bill should be insisted upon? Yes.

483. With regard to payment, are you satisfied with the way the amount of wages due to the men is ascertained? At several of the collieries I should say not; that is, at any colliery where the standard weight exists. The men desire to see the standard weight abolished.

484. Is the method of standard weight the only principle in the district that you object to? There is the other system of averaging, where every skip is not weighed.

485. What is standard weight? In some collieries the standard weight is said to be 12 cwt., and if the miner puts 14 cwt. into his skip he only receives payment for the 12 cwt. We think that is a gross injustice.

486. That is, supposing he overloaded the skip? I believe in the standard bar—that is, to fill up to a certain height, instead of weight, and that would protect the skips and machinery.

487. Have you any objection to the system by which the average weight is taken where the standard bar is used? There is only one thing that strikes me—that is, that there are not a sufficient number of skips weighed. It would be better if a greater proportion of the skips were weighed.

488. Does that often happen? Yes; pretty frequently. The miner would be fairly satisfied if there were more skips weighed.

489. What you mean is, that there should be two weigh-screens instead of one? That would give more satisfaction.

- A. Cook, Esq. 490. Would the miners go to the expense of paying an additional check-weighman? They might do so if they saw it would be to their own advantage.
- 27 Aug., 1895. 491. Some of them go in for having all the skips weighed? Yes.
492. In what way could the skips be checked? I have been told that in some of the large collieries in England every skip is weighed; and if that is the case there, I do not see why we could not do it here. Of course, I do not know anything about it from personal experience.
493. There is no very great discontent in the Newcastle district in the way in which the weight is ascertained? The miners object to the standard weight, but they are fairly well satisfied as far as I can see.
494. Do you know the practice that is carried on in the Western districts? I only worked at shale mines in the Western district.
495. Do you know the practice carried on in the south? No.
496. You do not know whether it varies materially from the practice in vogue in England? No; I cannot say.
497. *Mr. Curley.*] Will you just look at section 31, now 29, on page 15 of the Bill. You see that the section there was originally drafted with the omission of the word "serious." That would take in a number of those accidents you have just now referred to, if that word "serious" were out. Do you not think that it is necessary that these accidents should be reported? I know of many accidents that compel men to cease work, but these accidents are not recognised as serious.
498. Do you consider that that word "serious" should be left out? Yes.
499. Have you known of any serious accident that has taken place, that has not been reported? I know of one where a man nearly lost his left arm, and lost two or three of his fingers, and it was not reported. It was not looked upon in the light of a serious injury. He was badly cut about the head, but it was not reported, because the manager of the colliery did not recognise it as a serious injury.
500. What colliery did that happen in? The Lambton Colliery.
501. By the word "serious" being inserted, does not the manager take up this position, that although the accident may be of a serious nature, he may consider it not serious? Most decidedly; if a man lost a couple of his legs, the manager might think it serious, but not serious if he only lost one.
502. An accident of a serious nature not having been reported, you think it should have been reported? Yes; and then you will get a correct statement of the number of accidents. It is a serious matter to a man to lose two or three weeks' work.
503. With regard to colliery rules for instance, you would think a manager ought to know his own colliery rules? Yes.
504. Have you known where quite recently a breach of these colliery rules took place at one of the collieries in the district. Do you know of such a case at the New Lambton Colliery? Yes; by report, where a young man was killed in the shaft, it appeared to be a clear breach of the rules.
505. Does not that rule stipulate that no person shall come up the shaft with a trolley? Yes.
506. On this particular occasion did a person come up with the trolley? Yes.
507. Did it come right up to the top of the bank? No; it came up level with the surface.
508. Do you know what that trolley was called? Yes; a timber trolley.
509. Was the onsetter prosecuted for allowing that to take place? I believe he was.
510. And did he not plead guilty. Are you aware of that? Yes.
511. Do you also know that when the cage got to the bottom, that in the descending cage the man was found to be dead? Yes; unfortunately for him. There was one man going up the shaft with a timber trolley, and another man going down the shaft to work. The ascending cage did not come to the top, and the young man was apparently under the impression that the cage he was in had reached the bottom. The cage went away from under him, and he broke his neck.
512. With regard to the number of accidents that have occurred, which Mr. Gregson referred you to, in the Report of the Department of Mines, I think it would be better for us to take the figures from the year 1875. Do you notice that in connection with the years 1873, on page 184 of that report, you see besides the years mentioned, thirteen fatal accidents (*see* Question 458)? Yes.
513. Do you see there any statement with regard to the number of men above and below ground? No; there is a blank there.
514. Turn now to the year 1874 as well, and what are the number of fatal accidents there? Five.
515. Is there any statement there? No; a blank.
516. Can you give us, if you please, two statements for two decennial periods, taking the year 1875, the year before the Act came into operation, down to the year 1884 inclusive, and also for the years from 1885 down to 1894 inclusive, showing the loss of life, and the number of men according to the number of tons raised, taking a general average of the accidents. Will you kindly send us those decennial statements upon the lines I have suggested (*see* Appendix K)? Yes.
517. Now we come to this Bulli explosion;—do you know whether there was any deputy engaged at that place at the time of this accident? I do not think there was, but I cannot say. I would rather not go into anything that I am not sure about.
518. Assuming that a gas explosion took place the night before the explosion—a limited gas explosion, that was never reported, and to which no attention was given—does that show anything like discipline? No; the official in charge should have been brought up for murder.
519. Will you please look at the reports by Inspector Rowan, given with the report of the Bulli Colliery Explosion Commission to be found on page 189 (*see* Appendix L);—does Mr. Rowan make reference, in his reports, to gas being given off in the mine? He says the miners in this division are working with safety-lamps, &c. From that I would conclude that there must have been fire-damp there.
520. Look at the two next reports (*see* Appendix L), and see what Mr. Rowan states there with regard to the return air-ways? That the return air-ways were in a very bad condition.
521. What is the date of that report? Twenty-fifth of February, 1886.
522. What is said there? [*Witness reads report—see Appendix L.*]
523. Will you please refer to the other report as well, a little lower down. (*See Appendix L*)? It is dated 22nd December, 1886.
524. Is there any reference there with regard to the return air-ways again? It says:—

Sir,

Wollongong, 2 March, 1887

For your information, I have the honor to inform you that I inspected Bulli Colliery on the 17th instant.

*Hill End District*:—Fifty men employed, four of them working in narrow headings with safety-lamps, owing to the coal giving off a small per cent. of fire-damp. I carefully examined this division of workings, and found the ventilation good

good in every bord, 12,000 cubic feet of air being brought up to within 20 yards of the furthest in working face. On *A. Cook, Esq.* examining the return air-way I found that heavy falls of roof had taken place. The falls were so heavy I could not make a passage through. I drew the manager's attention to this matter. He stated that he had three shifts of men working, making a new air-course, and the same would be kept working until a proper recognised air-way was made from the working faces to the ventilating furnace. As I have formerly reported, a number of these falls took place during the recent strike. 27 Aug., 1895.

Harris's heading, where forty men were employed previous to the strike, is so completely crushed, caused by the bottoms heaving, in this district. The boards will require to be cut out anew, with a pair of headings.

I have, &c.,

JAMES ROWAN,  
Inspector of Collieries.

The Examiner of Coal-fields.

525. That is previous to the explosion? Yes.

526. It is only two or three months before the explosion occurred? Yes; that makes it much worse.

527. There has been a question or two put to you about the standard weight;—anything over the average of that standard is not weighed to the miner at all? No.

528. And if during the same day another skip was brought up and weighed that happened to be below that standard the miner would not get the standard? No; only what was in the skip in that case.

529. So that the miner would not really get the true average weight of what he had raised in the day? No, he would not.

530. Is it not your experience that a man may not overload the skip and yet his coal may vary in weight, according to the condition of the workings? Certainly. The difference in the density of the coal may sometimes account for that. The most experienced miner in the world may not get within 1 cwt. or 1½ cwt. of what he intended to put into the skip.

531. You think that this system of standard weight should be put on one side? Yes, most decidedly.

532. Does the system obtain in many collieries? No, in about four or five.

533. Some of the proprietors in a mutual way have conceded the matter? Yes.

534. Without any trouble? Yes.

535. *President.*] How do they weigh? By the standard bar. If the skip is too high the miner loses the whole skip. The skip is handed to the Miners' Accident Fund at some collieries. The miner loses it, but the whole of the miners gain.

536. How much does a skip generally hold? About 10½ cwt. is a fair average for the Wallsend Colliery. Of course the miner does not get paid for slack.

537. *Mr. Curley.*] Is there anything else, Mr. Cook, that you would like to refer to? I do not think so.

538. *President.*] Do you know a book called "Coal-pits and Pitmen"? I have heard about it.

[Witness withdrew.]

John Lionel Fegan, Esq., M.L.A. (re-examined):—

539. *Mr. Curley.*] What were the items we touched upon with you yesterday, Mr. Fegan? The ventilation, the size of the pillars, certificates of competency and service, the supplying of the air, and the com- J. L. Fegan,  
Esq., M.L.A.

position of the Board to appoint examiners. 27 Aug., 1895.

540. I suppose that in that report that has been drawn up by the Committee over which you had the honor to preside, almost every phase of the question has been touched upon there by witnesses that were examined before that Select Committee? Yes, I believe every point. I was going to say with the exception of the pillar question.

541. Will you please hand that report in (*see Appendix M*)? Yes.

542. Will you look at the Report you have made in connection with the sittings of this Select Committee, and give us what you consider necessary in connection with the Bill;—do you want to alter or add to your report in any way? With reference to the pillars, I want to add to the proposed Bill Rules 42, 43, 44, 45, and 46, on page 31 of the Bill. These are not in the English Act. I would like to call attention to clause 9 of the Report of my Committee.

In conclusion, your Committee beg to recommend the adoption of the English Coal-mines Regulation Act of 1887 (50 and 51 Vic., cap. 58), with the amendments suggested in this Report, believing it to be for the better protection of the miners health and life, the owner's property, and the welfare of the community in general.

543. *Mr. Gregson.*] Does that report give your own individual views? Yes; after the evidence that was given before that Committee.

544. *Mr. Curley.*] I think we touched yesterday on the size of pillars? Yes.

545. What have you to say about persons not to be employed on the coal without experience? That is a copy of the English Act with the exception of the word ironstone. It will be found in MacSwiney's book on the English Act, page 105.

#### PERIODICAL INSPECTION ON BEHALF OF WORKMEN.

Rule 39. No person not now employed as a coal or ironstone getter, shall be allowed to work alone as a coal or ironstone getter in the face of the workings until he has had two years experience of such work under the supervision of skilled workmen, or unless he shall have been previously employed for two years in or about the face of the workings of a mine.

546. *President.*] Where does your report embrace this clause?

[Rule 41. No person not now employed as a coal getter shall be allowed to work alone as a coal getter in the face of the workings until he has had two years' experience of such work under the supervision of skilled workmen, or unless he shall have been previously employed for two years in or about the face of the workings of a mine.]

The Upper House have left out this rule? Yes.

547. *Mr. Curley.*] Is there anything else you think of, Mr. Fegan? Yes; the standard weight.

548. *President.*] What is the reason that the coal getter should not be employed before he has had two years' experience? It is not for himself, but because he may endanger the lives of all the men in the pit. Where it is a gaseous seam, like the Seaham colliery, and we have had gas at Anvil Creek, Greta, and Bulli, an inexperienced man playing with a safety-lamp may endanger the lives of his fellows. That is the reason.

549. That is the reason? Yes, and in the propping of the roof an inexperienced man may cause the death of a boy through the bad propping of timber. A boy is not responsible for the propping of timber. There is also the necessary warning in case of firing a shot.

550. Are there any other reasons besides gas, the setting of timber, and the warning about shot-firing? Yes; there are scores of reasons, but I am giving you the principal reasons. I have seen a man myself, who was not careful, get hold of an iron-bar and ignite a spark which blew his head off, at all events it killed

J. L. Fegan,  
Esq., M.L.A.  
27 Aug., 1895.

killed him. A man before he calls himself a miner should serve some time for the benefit of the property and the miner's lives. The employers stand to lose as much as the men. As a rule, two men work together in a colliery, and a new hand is not allowed to work alone.

551. I can understand about the gas and the timbering? Yes, it is in timbering, and that means a big loss to all concerned. Mr. Curley can point out a case in one of the collieries in the Northern District, where in firing a shot a man was nearly killed through not giving the necessary warning.

552. *Mr. Curley.*] Is there anything else you would like to refer to? Yes; the standard weight is a question that affects the interests of the men very materially. Every other section of the community can get paid at the rate of 20 cwt. to the ton, and can demand the weighing of the material they produce. In the Northern District some of the employers have not the standard weight, and some men take advantage in every respect of that. Mr. Edden, M.L.A., produced a paper that went to prove that in three years one colliery got 1,700 tons of coal for which they did not pay a farthing. This was for all-round coal produced by the men.

553. What is the standard weight;—will you please explain what is meant by this? A skip is supposed to hold, say, 12 cwt. of coal, and if you send 13 cwt., or 1 cwt. over, you lose that 1 cwt. If a miner sends three or four skips, one weighing 16 cwt. and another 11 cwt., instead of averaging those two skips, 4 cwt. is taken off the 16-cwt. skip, and the miner gets 11½ cwt., although he has sent up 27 cwt. of coal. The specific gravity of coal varies materially, and this accounts for the difference in weight of the two skips.

554. *Mr. Gregson.*] Your figures are supposititious, are they not? Yes.

555. Have you ever known such a thing as 16 cwt. of coal being sent up in a 12-cwt. skip? Yes; more than that.

556. You have known such a case as that? Yes; I have been told about it by men who have had it done.

557. Perhaps you can produce an instance? I have a paper here from Mr. Edden where the men have lost £5 17s. 7d. from this cause in one pay. It was produced before the Select Committee, and the House was adjourned to bring the matter under their notice. The case also came before Judge Backhouse, and he could not take any steps in the matter.

558. What case was that? I believe it was in connection with the Hetton Colliery.

559. Was it an action brought by the miners? Yes.

560. *President.*] And they could not recover? No, not according to the reading of the Act.

561. *Mr. Curley.*] Has this matter been the subject of reference at any of the proprietors' conferences? The very fact of a conference meeting and refusing to accept other than the provisions of the Bill was sufficient.

562. Do you recollect the conference of 1888, when we were negotiating with the proprietors about this standard weight? I do.

563. Do you know that the proprietors would not then agree with it? I do.

564. *President.*] Will you look at sub-section 3, of clause [41], 38, on page 19 of the Bill, the latter part of the clause starting with "But nothing herein contained"

(iii) [That] Nothing in this Act shall be held to authorise or give any power to any owner or manager of a mine to pay miners by the method known as the standard weight system, and from and after the [passing] commencement of this Act that system shall be and is hereby abolished. *But nothing herein contained shall be held to affect the power of any owner or manager of a mine to pay miners by the method known as the standard bar system?*

Yes; they are getting rid of one thing and putting another in.

565. *Mr. Gregson.*] Is not the standard bar the prevailing custom in the district? It may be.

566. What system are some of the owners paying over? Every pound of coal is paid for.

567. Is there no limit to the height to which the skip was to be filled? In the Wickham and Bullock Island Colliery there was no standard bar. They can put 20 cwt. on if they wish, and it is not taken away from them.

568. Do you object to the standard bar? I prefer the wording of the English Act.

569. What does the English Act say? That the miners shall get paid for what they send up. The reference may be found in clause 12, on pages 12 and 13 of M'Swinney's book on the English Act.

PAYMENT OF PERSONS EMPLOYED IN MINES BY WEIGHT.

(By R. F. M'Swinney, M.A.)

PAGES 12-13. 12. (1.) Where the amount of wages paid to any of the persons employed in a mine depends on the amount of mineral gotten by them, those persons shall be paid according to the actual weight gotten by them of the mineral contracted to be gotten, and the mineral gotten by them shall be truly weighed at a place as near to the pit mouth as is reasonably practicable.

Provided that nothing in this section shall preclude the owner, agent, or manager of the mine from agreeing with the persons employed in the mine that deductions shall be made in respect of stones or substances other than the mineral contracted to be gotten which shall be sent out of the mine with the mineral contracted to be gotten, or in respect of any tubs, baskets, or hutches being improperly filled in those cases where they are filled by the getter of the mineral or his drawer, or by the person immediately employed by him, such deductions being determined in such special mode as may be agreed upon between the owner, agent, or manager of the mine on the one hand, and the persons employed in the mine on the other, or by some person appointed in that behalf by the owner, agent, or manager, or (if any check-weigher is stationed for this purpose as hereinafter mentioned), by such person and such check-weigher, or in case of difference by a third person to be mutually agreed on by the owner, agent, or manager of the mine on the one hand, and the persons employed in the mine on the other, or in default of agreement appointed by a Chairman of a Court of Quarter Sessions within the jurisdiction of which any shaft of the mine is situate.

570. *Mr. Curley.*] Do you know whether this standard bar is in operation at any other than one colliery in the district? I do not know.

571. Do you know this, that the prevailing custom in the district as a whole is principally to pay the men by weight? Yes.

572. Without a standard weight? Yes.

573. Or without a standard bar? Yes.

574. *President.*] The standard weight appears to be agreed to by both Houses? Yes; that is agreed to.

575. What you object to is the latter part of clause 3 on page 19 of the Bill, "but nothing herein contained shall be held to affect the power of any owner or manager of a mine to pay miners by the method known as the standard bar system"? Yes; when the English Act did not serve their purposes, the Council went away from it.

576. Surely the Council do not care anything about coal-mining? That is the unfortunate position.

577. They have no interest? There are several coal-owners there.

578. The sole interest of the whole House would not lead them to do anything wrong? My opinion is that they have expressly done wrong. This measure was before the country in 1887, and we are now in 1895.

J. L. Fegan,  
Esq., M.L.A.  
27 Aug., 1895.

579. *Mr. Curley.*] You object to this standard bar *in toto*? I do.

580. Is there anything else you would like to refer to? Yes; the appointment of check-weighmen.

581. Will you look at page 19 of the Bill, section 40 [43].

[43.] 40. (1) The persons who are employed in a mine, and are paid according to the weight of the [mineral] *large coal or shale* gotten by them, may, at their own cost, station a person *who shall be an employee of the colliery* (in this Act referred to as a "check-weigher") at each place appointed for weighing the *large coal or shale*, and at each place appointed for determining the deductions, in order that he may, on behalf of the persons by whom he is so stationed, take a correct account of the weight of the [mineral] *large coal or shale*, or determine correctly the deductions, as the case may be.

? I want this clause left according to clause 13 of the English Act. The words "who shall be an employec of the colliery" ought to be anybody that is chosen. At the present time if a man does his duty he runs the risk of being discharged—that is, if he stands by the interests of those he is paid to look after.

582. You mean the men? Yes. All that a manager has to do if he cannot get hold of him, is to stop his pit for a day, and discharge all hands, and, according to the 1876 Act, he can start with other men, and the man whom he objects to, not then being an employec, he can prevent him taking his place again. I have a letter in my hand about Treharne Evans.

583. You had better tell us who he is? He is a man who was living in Lambton.

584. What position did he occupy? He was a miner, and was appointed by the men to be check-weighman at the Lambton Colliery.

585. What has taken place in connection with his position? A manager closed his mine for a short time recently, and on reopening his mine, he would not allow this man to come back to work, giving as his reason that he was not an employec of the colliery. I saw the manager personally myself, and he said he was a very good man—Mr. Evans, as he called him—a good honest man, but he said the wording of the Act precluded him from employing Mr. Evans; that is the 1876 Act.

586. Evidently he was sorry? No; it does not preclude any man.

587. *President.*] The manager is right. If you look at the 20th section of the Act of 1876 on page 7:—

20. The persons who are employed in a mine to which this Act applies, and are paid according to the weight of the mineral gotten by them, may, at their own cost, station a person (in this Act referred to as "a check-weigher"), being a person employed at the said mine, or any mine belonging to the same company or proprietor, at the place appointed for the weighing of such mineral, in order to take an account of the weight thereof, and if in any mine reasonable facilities are not afforded to him for taking such account, the owner and agent of such mine shall each be guilty of an offence against this Act. The check-weigher shall not be authorised in any way to impede or interrupt the working of the mine, or to interfere with the weighing, but shall be authorised only to take such account as aforesaid, and his absence shall not be a reason for interrupting or delaying such weighing. If a check-weigher shall impede or interrupt the working of the mine, or interfere with the weighing, or otherwise misconduct himself, such owner or agent may complain to the nearest Court of Petty Sessions, which, if it shall think fit, may call upon the check-weigher to show cause against his removal. Such Court shall hear the parties, and if it think that sufficient ground is shown to justify the removal of the check-weigher, make a summary order for his removal, and he shall thereupon be removed. The Court may in every case make such order as to the cost of the proceedings as it thinks just.

—? Yes; but how he could have got over it was by allowing the man to cavil with the other men, to give him the opportunity of a place with the rest of the men.

588. *Mr. Curley.*] Could he not have recognised him as an employec at once? Mr. Gregson has never taken umbrage at a check-weighman.

589. *President.*] You do not think the proprietors, as a general rule, take advantage of these things? I should be sorry to think so, but it has been done in this instance. I remember an agitation in England on this very clause. As a rule the check-weighmen are secretaries of their lodges, and at the first strike or dispute that takes place, these men are men who are put off, and prior to the passing of the 1887 Act, they were walking about and could not get a livelihood, and it was pointed out to the Home Secretary that whilst the workmen paid these men they ought to have the same privileges as employers in getting the best men they could. The employers do not contribute one cent to the wages of a check-weighman.

590. *Mr. Curley.*] We want to hear what you have to say about anything else? At a colliery up north the manager, to get rid of a man who had done his best to represent the men, thought the easiest way to go about it would be to stop his colliery for a short time. This man is walking about, with seven children to feed, and not a penny coming in from anywhere, through the action of a certain colliery manager in the northern district not permitting him to go to work on a unanimous vote of the men to be their check-weighman. On account of the provisions contained in the Coal Mines Act of 1876, the 20th section of that Act, the manager would not permit him to return to his work, though he was appointed by the men, on account of him not being an employec of the colliery, although admitted by the manager to be the most competent man for the position of check-weighman.

591. Is there anything else? Yes; I would like to refer to clause 41 [38] on page 18, of the proposed Bill:—

[41.] 38. (1) Where the amount of wages paid to any of the persons employed in a mine depends on the amount of [mineral] *large coal or shale* gotten by them, those persons shall be paid according to the actual weight of such *large coal or shale* gotten by them, [of the mineral contracted to be gotten, and unless otherwise mutually agreed upon all the mineral gotten by them] *such weight being ascertained in such manner as may be agreed upon by the owner, agent, or manager of the mine on the one part, and the persons so employed on the other part, and in the absence of such agreement such coal or shale shall be truly weighed either at the bottom of the screen or at a place as near to the pit mouth as is reasonably practicable: Provided that nothing in this section shall preclude the owner, agent, or manager of the mine from agreeing with the persons employed in the mine that deductions shall be made in respect of small coal, stones, or substances [other than the mineral contracted to be gotten,] which shall be sent out of the mine with [the mineral contracted to be gotten,] such *large coal or shale*, or in respect of any tubs being improperly filled in those cases where they are filled by the getter of the *large coal or shale*, or his drawer, or by the person immediately employed by him, such deductions being determined in such special mode as may be agreed upon between the owner, agent, or manager of the mine on the one hand, and the persons employed in the mine on the other; or by some person appointed in that behalf by the owner, agent, or manager, or (if any check-weigher is stationed for this purpose as hereinafter mentioned) by such person and such check-weigher, or in case of difference by a third person to be mutually agreed on by the owner, agent, or manager of the mine on the one hand, and the persons employed in the mine on the other, or in default of agreement appointed by a Chairman of a Court of Quarter Sessions within the jurisdiction of which any shaft of the mine is situate.*

And clause 12 of the English Act, the weighing clause. There are some words struck out; I would like to refer to the striking out of these words. There is a colliery in the northern district, and because of the

J. L. Fegan, Esq., M.L.A.  
27 Aug., 1895.

the wording of the present Act the manager or owner refused the men the right to appoint a check-weighman. Four of the men requested the manager to put in a weighbridge so that their coal might be weighed, and for this they got their ticket of leave from the colliery, or they were discharged. I saw the Minister for Mines, and asked him what was the reason he could not see that a weighbridge was placed there, and I received the following letter:—

Sir,

Department of Mines and Agriculture, Sydney, 20 August, 1895.  
Adverting to my letter of the 3rd ultimo, in reference to the mode of payment at the Gartlee Colliery, I have the honor, by direction of the Secretary for Mines and Agriculture, to inform you that, in view of the opinion of the Attorney-General, there appears to be no power to compel the owners of this colliery to pay by weight, unless they choose to agree with the miners to pay them according to the weight of the mineral gotten.

I have, &c.,

HARRIE WOOD,

Under Secretary.

J. L. Fegan, Esq.

There is no stipulation in the English Act, I think. They recognise that the English law should extend to miners just as well as to other classes of tradesmen.

592. *Mr. Gregson.*] What do you want? I want men, when their coal has to be weighed, to have it weighed, and that the manager or owner shall not have power to say it must not be weighed. In other words, I want the wording of the English Act.

593. I do not know what your objection is;—what is the complaint at the colliery you mentioned? That the men made a request to be paid by weight, because they were being paid by skip, and this could not be granted.

594. What were the terms between the employers and the men at that colliery? At so much per skip.

595. Then what happened? The majority of the men wished to be paid by weight.

596. And the proprietors said "No?" Yes.

597. The case was brought before the Minister, and he took the opinion of the Attorney-General, and he said it could not be altered? Yes.

598. *Mr. Curley.*] Has not some compromise been made on this matter;—was it not suggested that the Bill should be applicable to a mine employing so many persons? Yes.

599. What was the number of persons? I think the Bill stated ten, the Council amended it to thirty, and the Assembly to twenty.

600. Will you turn to the clause in the Bill, to be found on page 19, subsection 4, of rule [41] 38? Yes.

(iv) Where it is proved to the satisfaction of the Minister, in the case [of any mine or class of mines employing not more than [twenty] *thirty* persons under ground, to be expedient that the persons employed therein should, upon the joint representation of the owner or owners of any such mine or class of mines and the said persons, be paid by any method other than that provided by this Act, such Minister may, if he think fit, by order allow the same, either without conditions or during the time and on the conditions specified in the order.

601. In certain mines are not men paid for large and small coal together? Yes; but that proviso is knocked out.

602. In what way? If the employees of any colliery wish to continue the system we have now.

603. Where are the words knocked out? In section [41] 38 on page 1E. "All the mineral gotten by them" is struck out.

604. Would it not meet your objection if these words were put in? At the present time the men are only paid for large coal. I think that a proviso might be inserted for sending the whole of the coal away together. Say, they shall be paid for round and small coal.

605. You think the clause as amended by the Council requires such a proviso were we able to agree to work in that way? Yes.

606. What have you to say upon the eight-hour question? Up to recently the collieries in the north have been working eight hours. There has been a general agreement for some years, but the position is materially altered to-day. Some of the managers are demanding longer hours from the men, and not very long since it nearly caused a strike in one colliery where the manager wished the men to work till 5 o'clock in the evenings. The men said they were willing to work eight hours, and that it was rather hard for the principle to be taken from them. A notice was put up at a pit-head only on Saturday last, to the effect that the men must work another half-hour longer. I had a letter from the Secretary before coming here, stating that the manager demanded that the men should stay in the face until 4 o'clock. It has been the custom for a score of years that the men should be ready to go up at 4 o'clock. The manager has taken the position of forcing the men to work at the face till 4 o'clock, which in some cases will mean half-an-hour to these men. It has been agitated for some years to make eight hours a legal day's work, and as long as the organisations were intact they worked comfortably on. Hard times have come, and they are forcing the men to work longer hours. Then the position of boys, whilst the Council in its speeches recognised that eight hours was long enough for anyone to be down in a coal-mine, they ignored the right of legislation for eight hours, but inserted a clause that boys can be allowed to work for ten hours in the mine.

607. *President.*] How long does the English Act allow? Ten hours, I think, for five days in the week.

608. How long do boys work now? Nine hours and forty-five minutes in some places.

609. They are not working all that time? They are in the mine all that time. In Russia, where their form of government is not so liberal as ours, boys of 15 years of age are not permitted to work more than eight hours in a factory, much less than in a coal-mine. It goes to show that we have to go to Russia to teach us what should be done for the protection of boys. The Board of Trade returns from England point out that boys of 15 in Russia are not allowed to work longer than eight hours in a factory. The Council want to legalise ten hours for children of tender years. Perhaps I may be asked, how do I know that the miners up there want eight hours? I may say, being a member of the Miners' Organisation, that every lodge in the district sends representatives to the Eight-hours Demonstration Committee, and that one of their objects is to legalise eight hours.

WEDNESDAY, 28 AUGUST, 1895.

*[The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.]*

Present:—

FRANCIS EDWARD ROGERS, Esq., Q.C. (PRESIDENT).

JAMES CURLEY, Esq.

JESSE GREGSON, Esq.

John Lionel Fegan, Esq., M.L.A., re-examined:—

610. *Mr. Curley.*] Have you ever looked up any statistics in connection with the number of accidents that have taken place in this Colony? I have.

611. Have you compared them with the number of accidents that have taken place in Great Britain? Yes; and I have made a statement in the Legislative Assembly upon the subject.

612. Have you drawn out any statistics that you can place before the Commission? No; but you can get them from Mr. Coghlan's book, "The Wealth and Progress of New South Wales." I have some of the statistics here. (*See Appendix N.*)

613. Where do they go down to? To the year 1891.

614. What are they? Up to the year 1891 there were 648,450 people employed in and about mines in Great Britain, and the lives lost during the year 1891 were 979.

615. Will you please refer to the latest years—give us the figures for ten years if you can? I can give you the figures for ten years if you wish.

616. Will you kindly prepare a statement, to be handed in to the Secretary later on? With pleasure. (*See Appendix N.*)

617. Are the decennial periods taken in the book you are referring to? They are taken from 1873 to 1891 *seriatim*—for nearly twenty years. Before the passing of the English Act of 1887 in one year alone 1,413 deaths took place—that is, fatal accidents; and in the year 1880 1,380 deaths took place. The number of deaths has gradually decreased since then, with the exception of one year. From the year 1887 up to the present time there has been a general decrease of fatal accidents.

618. *President.*] That is since the passing of the Act? Yes.

619. *Mr. Curley.*] Will you look at this book of Mr. Nelson Boyd's and tell us what he says;—you will find the reference on page 225, of his work "Coal Pits and Pitmen"?

"According to the Parliamentary summaries, the death-rate per 1,000 persons employed have been as follows:—

1851 death-rate per 1,000 persons employed	4.56
1861 " " "	3.38
1871 " " "	2.89
1881 " " "	1.92
1889 " " "	1.85

620. Will you turn now to the Bill and look at sub-section 4 of rule 10, on page 26;—do you see the clause there that reads:—

(iv) A person shall not have in his possession any lucifer match or apparatus of any kind for striking a light except within a completely closed chamber attached to the fuse of the shot.

Do you agree with that provision? I would like to know what it means. It is past my comprehension, and I had an opportunity of hearing the debate on the clause. There were several coal-owners prompting the Council, and the only reason the Council gave was because it was in the English Act. Any further explanation I did not hear.

621. *Mr. Gregson.*] What is your difficulty? The words, "except within a completely closed chamber attached to the fuse of the shot."

622. There is no difficulty, I think? To me there is. I cannot understand it. These words have been placed in by the Legislative Council.

623. Following the English Act? Yes; but there are many English Acts and legislation they do not believe in.

624. How does the miner fire his shot? By a wire. He takes the top off his lamp and puts a snuffing wire into the lamp gauze, and when it is red hot it ignites the powder attached to the fuse. There is no match used where gas exists in any shape or form. There is no flame; the pin touches a speck of powder and ignites the fuse. I never could understand this clause, and I have asked several people about it.

625. Is it not a provision for greater safety? I cannot see it.

626. Perhaps if you will read the report of the Royal Commission in England on accidents in mines, you may glean something? I have done so.

627. Are there no cartridges that may be fired without a red-hot pin? Yes; there are some that are fired by electricity with a small battery. That being the case, this clause compels that every shot shall be fired by a small battery.

628. What they are prohibiting is that no person shall have any lucifer match, or apparatus of any kind for striking a light, in his possession? The wording of this clause, as it stands, would prohibit a man carrying a pick. There is also the old flint box.

629. You are prohibited by this clause from having that? You can be dealt with for having a lucifer match without the part I have mentioned being attached to the clause. Where powder is used there must be a certain amount of flame.

630. *President.*] Can you point out how this clause does the miners any harm? I cannot give an opinion upon what I know nothing about.

631. *Mr. Gregson.*] The gentlemen who constituted the Royal Commission in England came to the conclusion that this was a very proper thing to make provision for;—is there any reason for cavilling about what they have done? I am not cavilling. I am just giving my knowledge as far as it goes. Am I forced to say I believe in a thing unless I understand it?

632. *President.*] No. Is there anything in this clause that can do anybody any harm? The representatives of the miners have been charged with putting too much detail in this Bill, and I hold that this rule is a matter of detail.

633.

J. L. Fegan,  
Esq., M.L.A.  
28 Aug., 1895.

J. L. Fegan,  
Esq., M.L.A.  
28 Aug., 1895.

633. You might say that other things are detail as well, but these things connected with fire are looked upon as matters of importance that need legislation? If the wording of this clause was, "that no shot shall be fired without a battery," that might get over the objection.

634. *Mr. Gregson.*] The Commissioners in England perhaps did not care to specify a battery—something else might come up—science might be able to invent something better? But it may not be in an enclosed chamber.

635. The Bill prohibits anything else? May I ask what does it really mean?

636. I understand you are not to have in your possession any lucifer match, or anything for striking a light, except it be attached to the fuse of the shot that you are going to use? But what is the meaning of it.

637. You have an apparatus attached to the fuse of your shot; say you fire by electricity, and that it is in a cylinder; there may be some other means for doing the same thing, but it must be in a completely closed cylinder to secure the safety of firing the shot? I want to point out that by an interference of this kind you are going to make a law that it is unnecessary to use candles.

638. Here is a provision that applies to the industry all through England, and we are told that it has worked successfully? To a certain extent perhaps successfully. To-day we have a large number of collieries which work altogether with naked lights. If this law were in force you would be made a laughing-stock of. You would be firing within a completely closed chamber apparatus when you have a candle in your hand.

639. Would you kindly read the first section of rule 10—

(i) A competent person appointed by the owner, agent, or manager for the purpose shall, either at the surface or at the appointed lamp station, examine every safety lamp immediately before it is taken into the workings for use, and ascertain it to be in safe working order and securely locked; and such lamps shall not be used until they have been so examined and found in safe working order and securely locked.

?—Yes.

640. You have no candle there? No.

641. You are quite satisfied on that point? Yes, certainly.

642. *Mr. Curley.*] Are you satisfied that this clause applies exclusively to where safety lamps are used? Perfectly.

643. Is the clause free from any ambiguity? No; if this clause were so constructed as to read that no shot shall be fired without a battery, or some other apparatus, it might be.

644. Without the amendment how would this clause read? "A person shall not have in his possession any lucifer match or apparatus of any kind for striking a light."

645. *President.*] Will you look at McSwiney's book on the English Act, page 83—"Use of safety lamps in certain places?" Yes.

Rule 8. No lamp or light other than a locked safety lamp should be allowed or used—

(a) In any place in a mine in which there is likely to be any such quantity of inflammable gas as to render the use of naked lights dangerous; or,

(b) In any working approaching near a place in which there is likely to be an accumulation of inflammable gas.

And when it is necessary to work the coal in any part of a ventilating district with safety lamps it shall not be allowable to work the coal with naked lights in another part of the same ventilating district situated between the place where such lamps are being used and the return air-way.

646. *Mr. Curley.*] Look at sub-section 2 of rule 10 of the Bill.

(ii) A safety lamp shall not be unlocked except either at the appointed lamp station or for the purpose of firing a shot, in conformity with the provisions hereinafter contained.

This clause gives the miner permission to fire a shot with his lamp if necessary, but it does not speak of any other apparatus? I hold that if it is not safe to fire with an open light it is not safe at all.

647. *President.*] Look at the English Act (McSwiney's work), pages 85 and 87;—do you see that the miner cannot unlock his safety-lamp except in the presence of a competent person? Yes; there are men appointed in the mines to fire shots.

648. This is a greater safeguard for the miners? Yes.

649. Will you look at the English Act again on page 88?

(i) Unless a competent person, appointed as aforesaid, has examined the place where gas has been so reported to be present, and has found that such gas has been cleared away, and that there is not at or near such place sufficient gas issuing or accumulated to render it unsafe to fire the shot.

All these things are for the safety of the miner? I am admitting that.

650. The thing you are objecting to? Is something I do not understand.

651. Still it is something for greater safety; they must not have any apparatus for striking a light "except within a completely closed chamber";—it is quite plain that is put in for greater safety? If it were a battery I could understand it.

652. The igniting thing must be within a closed chamber;—that cannot do the men any harm, can it? Perhaps not. The clause may have been inserted for stopping men from smoking.

653. *Mr. Gregson.*] A good thing too? Yes.

654. If that is what the clause is for, you can have no objection? I have not, but I cannot understand the section.

655. *Mr. Curley.*] You confess you cannot understand the section? I confess I do not. I can understand the former part of the section up to the word "light." I had the privilege of listening to the debate, and although prompted by some of the prominent colliery managers in the Colony the Council were only guided by the English Act.

656. *Mr. Gregson.*] May we not trust the gentlemen who formed the English Royal Commission so far, that whatever they have done has been done for good reasons? I hardly agree with that. To me this clause does not seem complete.

657. *Mr. Curley.*] How would you make it complete? By the addition of the words "that such apparatus shall be used for firing shots only."

658. *Mr. Gregson.*] I will read you an extract from the Final Report of Her Majesty's Commissioners in England (page 62):—

Your Commissioners are of opinion that the provision of some simple combination of chemical and mechanical devices, by which the fuse may be ignited without external application of flame or a red hot body, at any desired time within narrow

narrow limits, after it is set into action, should not be attended with any great practical difficulties; the employment of such an arrangement, which may also be made the means for preventing any lateral escape of fire from the short projecting end of fuse, and of delaying the explosion of the charge for a definite period after ignition has been effected, would greatly reduce the risk of accident attending the use of the ordinary mining fuze.\*

\* They may add that this point is now receiving the active attention of one of them.

J. L. Fegan,  
Esq., M.L.A.  
28 Aug., 1895.

You will see from this that they anticipate something which they think they ought to make provision for. May not that be so? Yes.

659. *Mr. Curley.*] Do you consider that the clause as it stands meets the case it is assumed to meet? The clause is to me very ambiguous. The first part of the clause speaks of a lucifer match, or apparatus of any kind for striking a light, but with the latter part reads as if you are allowed to carry a lucifer match in a completely closed chamber. That is how I read the wording of the clause.

660. *President.*] That is to say that some means of striking a light in a completely closed chamber is anticipated?

661. *Mr. Gregson.*] Would you not rule Mr. President, that the words, after the word "except" in the clause under consideration do not apply to a lucifer match?

662. *President.*] Yes; I think so. It must be in a completely closed chamber attached to the fuse of the shot. It would seem that they are anticipating some means of firing a shot, and that the thing to ignite the shot must be within a completely closed chamber.

663. *Mr. Curley.*] Your opinion is Mr. Fegan that this sub-clause might be simplified by putting it in another form? Yes; that is what I think.

664. With regard to rule 12, sub-section (D) on page 26, and the latter part of the section "nor shall coal or coal-dust be used for tamping." Have you anything to say with regard to that matter? At the present time, a very great majority of the holes which are bored for shooting coal, are charged with coal-dust, and the coal-dust is damped. For safety I would go a great way, but something else must be found if you debar the miner from using coal-dust. In the Northern collieries now, the dust is slaked with water to make it as near clay as possible.

665. *Mr. Gregson.*] Is there not a risk of firing gas if it was present? I know from the last Royal Commission that sat on coal-dust it was proved that many of our explosions have been made more fearful through coal-dust being used.

666. *Mr. Curley.*] They have been aggravated? Yes; considerably aggravated. Do you think in connection with a clause of that character that if the coal-dust for tamping was made damp it could be used without any danger? I do.

667. *President.*] What is tamping? Ramming. It is similar to using a rod in a gun. If the mine is very fiery it would be better for the miners to have something else to tamp with.

668. *Mr. Gregson.*] How will this meet your objection: "Nor in mines where safety lamps are used shall coal or coal-dust be used for tamping"? I think that will meet my objection.

669. *Mr. Curley.*] With regard to the words in this section, "Nor shall coal or coal-dust be used for tamping," your suggestion is that dry coal-dust shall not be used—you think that if the tamping was made damp that would meet the case? Yes; but where there are gaseous mines I would have no objection to let the clause go as it is.

670. *President.*] Your opinion is that the clause should read, "Nor shall coal or coal-dust be used for tamping in mines where safety lamps are required by this Act"? Yes; I agree to that.

671. *Mr. Curley.*] That is, where safety lamps are used? Yes.

672. *President.*] I would like to understand why coal-dust is dangerous? Because it increases or conveys the flame from the explosion, and may inflame itself. It will flare up at once if not properly tamped.

673. *Mr. Curley.*] Will you now turn your attention to sub-section E of the same rule, the latter part of the sub-section:—

Provided that no person shall return to a place where such charge has missed fire until a period of eight hours has elapsed from the lighting of the fuse attached to such charge.

That has been erased? Yes.

674. Do you think that portion of the sub-section should remain in the Bill? That would entirely depend on sub-clause 4 of rule 10. If a shot has missed fire and a battery has been used, there is no danger in going back to the shot. The latter portion of sub-clause 4 of rule 10 was placed there by the Legislative Council while this sub-clause E of rule 12 was placed by the Legislative Assembly. It has altered the clause altogether.

675. *President.*] You agree with the latter portion of sub-clause E of rule 12 being struck out, if the provision we have just considered is left in? Yes.

676. How long have you known shots to hold fire? For as long as twelve hours, caused sometimes through knots being in the fuse.

677. Is this fuse you speak of out of sight? Say a hole is bored about 4 ft. 6 in. in length, only 4 in. of the fuse will be seen. It may light up to a given point and then, through the tamping being so tight, may take a long time to go through, and a knot or two would make it much longer. The cavity in the fuse may also be defective. If the provision that no shot shall be fired except within a completely closed chamber is to remain it would get rid of the need for the latter provision of this sub-clause E, because when a battery is used, if the shot misses fire, you can go to your shot immediately.

678. *Mr. Gregson.*] It simply applies to the use of fuse? Yes.

679-80. *President.*] Will you look at Dr. Robertson's evidence, given on the 6th June, 1893, before Mr. Pigott's Select Committee, question 500, on page 30:—

What do you wish to refer to next? To the provision with regard to explosives, page 32, sub-section (l) says, referring to a shot that has missed fire:—

Provided that no person shall return to a place where such charge has missed fire until a period of eight hours has elapsed from the lighting of the fuse attached to such charge.

That is making a farce of mining. Half-an-hour would be quite sufficient. That provision would simply ruin the miners. I suggest that it be made half-an-hour instead of eight hours. If a miner does return to the place within half-an-hour he ought to be liable to a fine for infringing the Act. What I complain of is that our present Act is worked in an invidious way. Managers are punished very severely often for the acts of men, and the men escape. What is said there as to ruining the miners?

I do not think that has consideration with me. The miners will not go to the shot.

J. L. Fegan, Esq., M.L.A. 681. You object to the limitation of the eight-hours in clause E of rule 12? Yes, I think that should be there.

28 Aug., 1895. 682. *Mr. Curley.*] You think that should stand? Yes, without doubt.

683. *President.*] They can go and work somewhere else if they like? Yes, if the Manager will permit them.

684. *Mr. Curley.*] Will you turn to rule 15, on page 28 of the Bill.

Rule 15. Every road on which persons travel underground where the load is drawn by a horse or other animal shall be provided, at intervals of not more than fifty yards, with sufficient man-holes, or places of refuge, and every such place of refuge shall be [six feet high, three feet wide, and four feet deep] of sufficient length, and at least three feet in width between the waggons running on the road and the side of such road. There shall be at least two proper travelling ways into every steam-engine room and boiler gallery.

Do you think that stipulation there, with regard to the size of man-holes in travelling roads, should remain as originally drafted? Yes, for these reasons. In England I know very well that there are some collieries working where the coal is in some cases less than three feet. There are places where they work what is called the yard-seam, but in this Colony, as a rule, we have high seams, and it pays the managers or owners to make the man-holes of sufficient size where they have seven or eight feet of coal. At the same time I have seen men trying to escape from the hauling-engine's load, and in doing so, nearly meeting with an accident through the man-holes not being of sufficient depth for them to get in.

685. You have often seen a number of men travelling along these roads at one time? Yes, as many as twenty. Perhaps there are fifteen or sixteen skips which the hauling-engine is pulling at a high rate of speed, and these men have to use these man-holes to get out of danger. If they are made small there is not the same opportunity for them to get out of danger.

686. *President.*] How many men should a man-hole hold? It is limited to 6 feet high, 3 feet wide, and 4 feet deep.

687. You say that the size of these man-holes ought to be specified, while the English Act says that they are to be of sufficient length? Yes; in the English Act, the expense was the consideration on account of the height of the seam, but here we have high seams that will pay by the coal got from them.

688. *Mr. Curley.*] From your experience have you noticed that these man-holes have been made of nothing like huge capacity? They have not, but quite the reverse. As long as there is a hole of any kind, they are perfectly satisfied, and sometimes they have been found to be filled with debris. In one place in the north, a man was nearly killed through a man-hole being filled with debris.

689. *Mr. Gregson.*] Have not managers in England been summoned for not keeping these man-holes clear? So they have been here.

690. *Mr. Curley.*] Don't you think these man-holes ought to be a stipulated size? I do.

691. Will you now look at rule 19, on page 28, "Trolley over pit mouth."

Rule 19. [Every shaft in course of sinking shall be provided with a trolley to run over the pit's mouth and receive the load when brought to the surface. Such trolley to be large enough to cover the opening at the pit top.]

Do you think that a provision of this character is necessary? Yes; very necessary indeed. I know of a case where in the course of sinking one of these shafts, a bucket came down on account of no top being over the shaft.

692. Where did this happen? In the northern district. I know of another case where two or three men were over wound, where if there had been a trolley their lives would have been saved.

693. You think this rule as drafted ought to be part of the Bill? Yes, I think it ought to stand. It would be very little expense, and the means of great safety.

694. With regard to safety-hooks, have you seen anything of that kind? I have seen several experiments.

695. Do you think any provision of that kind is necessary in a Coal Mines Bill? I do.

696. Is it provided for in this Bill? Yes.

697. *President.*] Look at rule 20, 19. Is there any objection to that rule? There is no objection to that rule whatever, we want that retained.

698. *Mr. Curley.*] We will now go to rule 21, 20:—

Rule [21.] 20. Where the natural strata are not safe, every working or pumping shaft shall be securely cased, lined or otherwise made secure. [Every shaft in course of sinking shall be kept clear of all noxious gases by a fan or some other appliance.]

should the words that are struck out in that rule be retained? I think that clause should be retained as originally drafted.

699. *President.*] Is that clause in the English Act? The rule dealing with shafts in that act is No. 20. The latter portion of the clause, "every shaft in course of sinking shall be kept clear of all noxious gases, by a fan or some other appliance," is not in the English Act.

700. Why would they not have it in England. If it is necessary here, why is it not necessary there? There is a little expense at first.

701. Is it a serious expense? No, because a fan would be useful at any other time.

702. *Mr. Curley.*] With regard to rule 25, on page 29 of the Bill:—

Rule 25. [The coal shall not be wrought under any proclaimed or made road without the sanction, in writing, of the Minister, but headings may be driven under any such road for the purpose of connecting the workings, or of working the coal on either side thereof, but all such headings shall be in such positions, of such dimensions, and so supported as the Inspector shall, by writing under his hand, direct.]

Do you think that is a necessary provision in the Bill? I do.

703. *President.*] What has that got to do with the miners? It has got to do with the country, and the miners, as part of the taxpayers of the country, have to pay when these roads come down. The gentlemen who knocked this out in the Council wished this matter to be left in the hands of the coal-owners instead of the Minister.

704. *Mr. Curley.*] Is this not a matter that has sometimes a very serious effect upon the cost of a Municipality? Certainly; look at Waratah, and see the properties that are spoiled out there. At Wickham, roads and everything else have been let down through getting this coal out. It has been argued that there is no such stipulation in the English Act. That is because landowners have been representatives there, and the people have had to pay.

705. And may not another reason be that numbers of the mines in England are much deeper? Yes; some of the mines there are 2,400 feet deep. Here we only work top-seams. I have been down a mine in England that was 800 yards deep.

706. *President.*] What is the deepest mine we have in this Colony? I think about 600 feet.

707. *Mr. Curley.*] With regard to the provisions in rule 24 on page 29 of the Bill:—

Rule 24. In any mine which is usually entered by means of machinery a competent male person not less than twenty-two years of age shall be appointed for the purpose of working the machinery which is employed in lowering and raising persons therein, and shall attend for that purpose during the whole time that any person is below ground in the mine. Where any shaft, plane, or level is used for the purpose of communication from one part to another part of a mine, and persons are taken up or down or along such shaft, plane, or level by means of any engine, windlass, or gin driven or worked by steam or any mechanical power, or by an animal, or by manual labour, the person in charge of such engine, windlass, or gin, or of any part of the machinery, ropes, chairs, or tackle connected therewith, must be a competent male person not less than eighteen years of age. When the machinery is worked by an animal, the person under whose direction the driver of the animal acts shall for the purpose of this rule be deemed to be the person in charge of the machinery.

? This rule is exactly the same as the English rule.

708. Do you approve of that rule? There may be an objection to the age of the engine-man. The Bill states 22 years, when a person is supposed to be a man at 21. I do not think I object to 22 being there.

709. Have you any objection to the next subsection in connection with that rule? No, I do not think so; it is just the one rule. I have no objection whatever to that.

710. Have you any objection to the remaining portion? No.

711. Will you now look at rule [27] 26 on the same page, "overwinding";—have you any objection to that? No.

712. Now look at rule 34 on page 30 of the Bill:—

[Rule 34. At any mine where a boiler is used for generating steam, the owner or manager shall at least once in every six months cause every such boiler to be thoroughly examined and tested by a competent person, who shall, immediately after the completion of such examination and test, enter in a book to be kept at the mine for that purpose a full and true report of the result of such examination and test, and of the state of every boiler so examined and tested, and every such report shall be signed by the person making it, and shall bear date of the day of the entry, and a copy of such report shall be forthwith sent to the Inspector.]

Do you consider that is a necessary provision in the Bill? I think that the boilers ought to be examined where there are so many lives in jeopardy of an explosion. We have had an explosion at the Lambton Colliery. In England there is a Steam-owners Association, and they take out a policy of insurance on their boilers; and the insurance office sends an inspector to examine the boilers for their own safety.

713. *Mr. Gregson.*] Was not the objection raised in the Council that if boilers in a colliery should be examined so should boilers in any other industry be examined, too? But they are continually knocking out the examination of land boilers. This question has been before the country for five years. They have objected three successive times to the Land Boilers Bill, and we have been supported by Mr. See, who represents a firm that has interests where the Bill would be operative. They would not pass the first clause of the Bill, but threw it out. I believe marine boilers are examined periodically, and whilst they have that privilege for the safety of workmen and passengers, I think that where in some of the collieries there are sixty or seventy men working about the colliery they should have the same consideration. Perhaps a boiler might go when a cage full of men is coming up, with the result that these men might be killed, as well as the engine-driver. It is for the benefit of the owners, as well as for the men, that boilers should be periodically examined.

714. *Mr. Curley.*] Will you turn to rule [39] 37 on page 30 of the Bill:—

Rule [39] 37. The books mentioned in these rules shall be provided by the owner, agent, or manager, and the books, or a correct copy thereof, shall be kept at the office at the mine, and any inspector under this Act, and any person employed in the mine [or any one having the written authority of any inspector or person so employed] may at all reasonable times inspect and take copies of and extracts from any such books; but nothing in these rules shall be construed to impose the obligation of keeping any such book or a copy thereof for more than twelve months after the book has ceased to be used for entries therein under this Act. Any report by this Act required to be recorded in a book may be partly in print (including lithograph) and partly in writing.

Have you anything to say about this rule? This is an exact copy of rule 37 of section 49 of the English Act, with the exception of the words erased by the Council.

715. *President.*] You think the rule ought to be retained as it left the Assembly? Yes; I think the part struck out ought to be retained.

716. Why? There are some men who dare not speak of danger in a mine, or if they do so there is no more work for them. Mr. Curley, as representative of the miners, if forty men were killed, would not be allowed to go down and see the place where the accident occurred. Mr. Burt was not allowed that privilege in England. He would not be permitted to go into a colliery office to look at any reports to support any case he might have before a coroner. There might be bad ventilation, but men dare not give a report. There are some collieries where they have no check inspectors, knowing the consequence if they gave a report. There are no check inspectors, because if they gave a report to the inspector about the manager they would run the risk of being discharged. Being intimate with a number of men, I might ask for information as to whether a certain mine was safe, but at the present time I could not use that information through not knowing whether it was reliable. Under the wording of this rule they might give me a note to see what I require to enable me to point out an injustice. I think the wording of this rule would make managers look more carefully after the men.

717. *Mr. Curley.*] You appear to think that the inclusion of these words would lead to a more effective supervision of the mine? Certainly.

718. With regard to rule [40] 38:—

Rule [40] 38. The persons employed in a mine may from time to time appoint two of their number or any two persons not being mining engineers who are practical working miners to inspect the mine at their own cost, and the persons so appointed shall be allowed once at least in every month, accompanied, if the owner, agent, or manager of the mine thinks fit, by himself or one or more officers of the mine, to go to every part of the mine, and to inspect the shafts, levels, planes, working-places, return air-ways, ventilating apparatus, old workings, and machinery. Every facility shall be afforded by the owner, agent, and manager, and all persons in the mine for the purpose of the inspection, and the persons appointed shall forthwith make a true report of the result of the inspection, and that report shall be recorded in a book to be kept at the mine for the purpose, and shall be signed by the persons who made the inspection, and if the report states the existence or apprehended existence of any danger, the owner, agent, or manager shall forthwith cause a true copy of the report to be sent to the Inspector of the district.

Here you will see that there are some words inserted by the Council, "not being mining engineers who are practical working miners"? That is monstrous. Here are facilities given by our technical education classes, and a proposition in this Bill to give certificates to men who pass certain examinations, yet as

soon

J. L. Fegan,  
Esq., M.L.A.  
28 Aug., 1895.

J. L. Fegan,  
Esq., M.L.A.

28 Aug., 1895.

soon as they get a certificate of competency to manage a colliery they are debarred from using that intelligence on behalf of the men whom they are working with. The same wording is to be found in the English Act. The reason, to my mind, is simply that they might know too much.

719. The very words you wish inserted are in the English Act? No.

720. This is a copy of the English Act, but you object to the additional words? Yes, undoubtedly I do. Some miners give their time to study to go up for examination, and by that examination a certificate is conferred upon them. Why should they be debarred from using their intelligence on behalf of the men who send them to the mine?

721. I think you have dealt with most of the general rules on pages 31 and 32 of the Bill, from rule 41 to rule 51 inclusive;—do you see anything you have not touched upon? No; I think I have referred to the whole of those rules.

722. Did you refer to rule [52] 48 on the same page, to the latter part of the rule starting with "provided that nothing contained in the general rules in regard to barriers of coal," &c.? No; I do not think so.

723. *President.*] That remains provided the rules preceding it, from rule 41 to 51, remain also; it is a necessary corollary to those rules? Yes.

724. *Mr. Curley.*] Will you please turn your attention now to rule [54] 50, on page 33, the words in brackets, "where no special rules are in force," are struck out? I agree to that rule.

725. Turn next to rule 59, on page 34 of the Bill:—

[59. The Governor, with the advice of the Executive Council, may make and publish in the *Gazette* a set or sets of special rules, and thereafter the rules so made and published shall be deemed the special rules of every mine to which this Act applies and in respect of which no special rules shall be in force: Provided that upon special rules being established for any mine, the special rules made by the Governor as aforesaid shall cease to apply to such mine.]?

I think there is another clause forcing special rules,

726. Do you see that that rule is struck out by the Council;—what are your views on this matter? It is necessary to have special rules, but in clause [56] 52 there is a reference to framing and submitting rules for the approval of the Minister. I cannot see that the rule under consideration does much harm or good in being in.

727. *President.*] You will see that in the discussions in the Assembly on the amendments of the Council in rule 59, that the Assembly disagrees to the amendment omitting this clause, and gives as a reason "because in the interest of both the owners and the miners it would be wise not to strike out this clause, as there may occur a period during which no special rules made by the owner can be in force when the special rules made by the Governor would supply the deficiency;"—do you think that that rule ought to remain in? Yes, I do.

728. *Mr. Curley.*] Now with regard to rule [62] 57, on page 35, you will see that the word "wilfully" is erased? I think that ought to be left in.

729. Don't you see that the word "wilfully" is absolutely useless there;—if a person defaces a thing he must do it wilfully? But he may not intend to do it wilfully.

730. Is the word "wilfully" in the English Act? No; it is not in the English Act.

*President.*] You may take it from me that it will do no harm there. I do not see the necessity of it. We will, however, consider that.

731. *Mr. Curley.*] Will you turn to rule [63] 58, on the same page, subsection 2. The wording is altered from £5 to £1? I think £1 is useless there. A colliery manager was lately taken before a magistrate and fined £20, and afterwards £1 per day, and it will in the majority of instances pay to work a colliery at £1 per day.

732. *President.*] What was the nature of the offence? At a certain colliery in the north, a colliery manager thinking the colliery dangerous pulled his men out. The Act points out that, after the men have been drawn out of a colliery, the men must not go back again until the inspector has certified that the mine is safe. In the face of the Act, and without an inspector's certificate of safety, the manager permitted the men to return to work. The Inspector of Collieries summoned the colliery manager, and he was fined £20. The week following he was fined £1, and has since continued to work on without anything having been done. The department evidently thought that they would be persecuting the man by further prosecuting him.

733. *Mr. Gregson.*] It would have been a good deal better to have given him three months' imprisonment—that is what is provided in the English Act? If it had been the miner they would have given him gaol.

734. *President.*] Will you look at section [64] 59, on the same page:—

[64] 59. Where a person who is an owner, agent, manager, or under manager of, or a person employed in or about a mine is guilty of any offence against this Act which, in the opinion of the court that tries the case, is one which was reasonably calculated to endanger the safety of the persons employed in or about the mine, or to cause serious personal injury to any of such persons, or to cause a dangerous accident, and was committed wilfully by the personal act, personal default, or personal negligence of the person accused, such person shall be liable, if the court is of opinion that a fine will not meet the circumstances of the case, to imprisonment with or without hard labour for a period not exceeding three months.

Would not that section meet the case? What I have referred to was wilfully done.

735-6. Was this clause in the old Act? No.

737. *Mr. Gregson.*] There was no power under the old Act? The clause in the 1876 Act, dealing with this matter, is number 31, on page 10, which does not provide for a matter of this kind.

738-9. *President.*] The proposed Bill gives the necessary power? I think three months will meet the case.

740. Will you look at section [69] 64, on page 36, "no prosecution, &c."? They want this to read as near as possible to the English Act. I think the same law should apply to the miner as to a certificated manager.

741. Do you understand the English Act to be directed against the miner? I only know that a certain Earl in England has turned 2,000 people out of their homes because the men would not accept his terms.

742. *Mr. Gregson.*] Perhaps he wanted the houses for something else? I do not know what he wanted the houses for, I am only pointing out his humanity.

743. *President.*] We will look into this matter. We now go to rule [72] 67:—

[72.] 67. A person who is the owner, agent, or manager of any mine, or a miner or miner's agent, or the father, son, or brother, or father-in-law, son-in-law, or brother-in-law, of such owner, agent, or manager, or of a miner or miner's agent, or who is a director of a company being the owner of a mine, shall not, *except with the consent in writing of both parties, to the case, sit in Petty Sessions or adjudicate in respect of any offence under this Act.*

The words added there are "except with the consent in writing of both parties to the case"? I do not think out of delicacy an owner, agent, or manager, would sit on a case.

744. This clause gives the option to do so;—is there any objection to the words “except with the consent in writing of both parties to the case”? It would depend how the consent is got at times. Out of decency I think none of the parties mentioned should sit on a case. J. L. Fegan,  
Esq., M.L.A.

745. *Mr. Curley.*] What do you think of the additional words in this section? I think they would be better out of it. It would not then give the opportunity of casting a slur on the administration of justice which we should be very careful to shield from anything like that.

746. We will now go to section [78] 72, on page 38 of the Bill: “Large coal means all coal passing over a three quarter inch screen;”—what have you to say to this? I have given my evidence on this matter. I am against that entirely. The miners should have the right of their coal being weighed both for round and small.

747. *President.*] Is there not more paid to the miner for large coal? Yes, but they are taking it off. Large and small coal are nearly the same price.

748. Do you think that this clause ought to come out? Yes, I do.

749. *Mr. Curley.*] With regard to line forty of the same rule, “inspector,” you will see that the words “section 4 hereof” are erased;—do you approve of that? The Council have taken a greater portion of the powers proposed from an inspector, and necessarily have altered the duties relating to inspectors. In part 2 the Council have erased a number of clauses.

750. Will you give us your opinions on the powers of inspectors to be found on page 8, rule 21? The important part is rule [19] 17 on page 7 of the Bill with its sub-sections. My reason for amending this clause would be that whilst making provision for persons holding positions as managers, inspectors should come under the same heading by giving them a certificate for service, but for the future they should hold a certificate of competency by passing an examination.

751. *President.*] I think the Council are right in having amended the clause in that way? Yes if the provision is made elsewhere. I do not think provision is made to give inspectors a certificate of service. Having made provision for inspectors I do not think it is fair to those men as inspectors to be put out in the cold to please one or two gentlemen.

752. *Mr. Gregson.*] I think it is to save the possibility of that rather than to enable it to be done?—

753. *Mr. Curley.*] You say that there is no provision in the Bill? I cannot see any provision. There is no provision in the Bill to acknowledge inspectors who have been inspectors in the Colony for years.

754. *President.*] Will you look at rule [18] 16 on page 7 of the Bill:—

[18.] 16. The persons who at the commencement of this Act are acting as inspectors under the Act hereby repealed shall continue to act in the same manner, and generally to be in the same position, as if they had been respectively appointed under this Act.

That rule does not give an inspector a certificate, but it lets him be an inspector? Yes.

755. Would it not be better to insert in the Bill that a certificate of service would be a certificate of competency to those men? Men do not make friends at all times for doing their duty, and these men should be put in the same position as colliery managers or under-managers. I have in my mind at present a gentleman who has not a certificate, but who is quite as good as those who have certificates. I think all the evidence taken before Select Committees was in favour of dealing fairly with the inspectors as well as others.

756. *Mr. Gregson.*] Does not rule 8, on page 4 of the Bill meet your case? It provides that they shall “exercise such powers as may be necessary for carrying this Act into effect.” I think that in fairness to the position an inspector holds he ought to have a certificate. He is, as a rule, doing work which it takes a practical and experienced man to perform.

757. *President.*] Look at sub-section 3, of rule [19] 17, on page 7, of the Bill:—

Every Inspector appointed under this Act shall, after the [passing] commencement of this Act hold a *first-class* certificate of competency [or service] as [hereinbefore provided in regard to] Managers, [but for the purposes of this Act service as an inspector of collieries will be equivalent to service as manager of a mine].

?—An Inspector in England can have no higher certificate than that given by the Secretary of State as a manager's certificate. It is the highest certificate that is given to colliery experts. A colliery manager who gets his certificate of service may be put off from one colliery, and with his certificate can go to another, but if an inspector was put away from the Government Service he would have to pass an examination before he could qualify himself as a manager.

758. Look at rule [18] 16 of the Bill, on page 7:—

The persons who at the commencement of this Act are acting as inspectors under the Act hereby repealed shall continue to act in the same manner, and generally to be in the same position, as if they had been respectively appointed under this Act.

?—Yes; but it does not give them any certificate. A question may at any time be brought before Parliament, and affect the position of these gentlemen.

759. What is an inspector;—does he go indiscriminately to different mines, or does he visit only one mine? There are districts to be allotted to inspectors, and an inspector goes wherever he is told, but generally districts are allotted to them. Inspectors ought to be dealt with justly. Say that some case came up against an inspector and that he is discharged, he may have been acting as an inspector for twenty years, but when he leaves he is without any certificate to qualify him for another position. While we are giving certificates to colliery managers, I think we ought to give them to inspectors to qualify them for the position of manager.

760. *Mr. Gregson.*] I think that is only fair? It is just.

761. If an inspector is discharged by the Government I should think it would be for some very grave offence? He might resign without a certificate of any description. He ought to hold a first-class certificate of service, which would be equal to a certificate of competency after the passing of this Bill.

762. You want the whole of the words in the latter part of rule [19] 17, sub-section 3, left in the Bill—“but for the purposes of this Act, service as an inspector of collieries will be equivalent to service as manager of a mine”? Yes, I think that is only fair and just to those gentlemen.

763. *Mr. Curley.*] Have you anything else that you wish to bring under the notice of the Commission? There is one point, and I think an important point. I refer to the section in the Bill dealing with accidents.

764. What section is that? You will find it on page 15 of the Bill, section [31] 29. I want the word “serious” struck out. My reason is that it is unnecessary in the English Act, because in the majority of the mining centres they have a permanent relief fund, and according to the law governing Friendly Societies they have to keep a register of accidents, slight or otherwise. The employers contribute 25 per cent.

J. L. Fegan, Esq., M.L.A.  
28 Aug., 1895.

cent. to that fund and the men 75 per cent. Every accident at the various collieries must be reported, and a register kept to come within the scope of the Friendly Societies Act. In the New Zealand Act they have made a provision to meet all cases of accidents, by the employers contributing so much towards a permanent relief fund for the support of widows and orphans of miners who have been killed, or to those who have been disabled in the mines. The provision I refer to will be found in the 59th section of the New Zealand Coal-mines Bill (*see Appendix O.*) The date of the Coal-mines Act in New Zealand is 1891. They are working eight hours in many mines there. They have also a provision for a minimum quantity of air. The ventilation clause in that Act reads as follows:—

An adequate amount of ventilation shall be constantly produced in every mine, to such an extent that the shafts, winzes, sumps, levels, underground stables, and working-places of such mine, and the travelling roads to and from such working-places, shall be in a fit state for working and passing therein.

An adequate amount of ventilation shall mean not less than 100 cubic feet of pure air per minute for each man and youth, and horse, pony, donkey, or mule, which shall sweep undiminished along the airway through each working-place.

I may say, further, that according to the latest return, Mr. Coghlan in his statistics on coal mines only gives seven persons killed and seventy-six persons injured in New South Wales in 1892. Last year no less than 520 persons were injured in six months in the Newcastle district, and these persons had to be kept out of the scanty earnings of the employees. I do not think the mine owners contributed more than £5 altogether. These persons had to be kept by men who, in the condition of trade then, were working only two or three days a week, and several accidents not considered serious have never been mentioned.

765. *President.*] To my mind there is a difficulty in stating what constitutes a personal injury; the term is very broad; a case came under my notice only a short time ago, in which a person was injured by the firing of a shot without due notice being given to him; his arm was injured so that he could not use it for some time; the doctor said it was a simple injury, and considered that the person was making too much of it—putting on side about it; it is a personal injury if I knock the skin off my hand, or if something drops on my feet;—who decides whether the accident is sufficient to put a man on the fund? The committee of the lodge. He must have a certificate pointing out the nature of the accident and how it was caused, then the lodge deals with it. It does not seem much to a person just reading about it, but those who understand the many accidents that happen, and know of the little sympathy that is expressed towards them, will, I think, agree with me in what I am stating. If these accidents had only come to the front, we would have had legislation twenty years ago.

766. In what way could you legislate to prevent these accidents? By having them reported.

767. Will you give an instance of what you mean? Under the English Coal Mines Act the roads are seen to be secure before men enter the pit. An examiner sees that the roof is all right. He comes out and tells the men that everything is all right; but, under our Act, there is nobody to see that these things are secure, and the consequence is that when men are going along the road many of them are hurt by falls of roof, through want of proper supervision.

768. If some provision of this kind was made, you think there would not be these dangers? No; but like the sea captain, the manager prides himself when speaking about his term of service by saying that since he has been on the bridge no lives have been lost. If this word "serious" was taken out of the clause in question it would make colliery managers more careful—that is, if every accident was reported.

769. *Mr. Gregson.*] You are anxious that such cases as you have mentioned should be reported? Yes.

770. We say that under this Bill this will be corrected? Yes.

771. Let us deal with something that is not provided for? I understand that this Bill is not piecemeal, but whole.

772. I am speaking of the Bill as it came from the Legislative Council; you say that there are these large number of accidents that are not reported, and point out the necessity for legislation, and produce one instance which is provided for in the Bill; can you tell us of something else? As it has been seen necessary, in New Zealand, to legislate for the support of men who have met with these accidents to prevent their being thrown upon public charity, or upon their fellow men, I think that it should also be provided for by legislation here, and that the owners should take part of the responsibility of accidents in mines.

773. *President.*] That is outside the scope of this Commission (*scope of Commission read*)? My evidence is given with a view to future legislation. We may be able to ask the Government to do something to mitigate the poverty that ensues from these accidents under our present system. Seventy-six accidents amongst 12,000 men is small; but where it comes to 520 in six months of a year, or 1,040 for the year, it becomes appalling, and the Government might be asked for some measure to provide for the coal owners taking some share in these accidents.

774. Here is legislation to prevent a lot of these accidents? But omitting this word "serious" in my opinion would prevent more accidents.

775. *Mr. Curley.*] Do not you think that the word "forthwith" should be left in this clause? Yes; forthwith means at once, giving the limit not later than twenty-four hours.

776. Did you give us the whole of the statistics with regard to the accidents you have mentioned? They are to be found in Mr. Coghlan's book the "Wealth and Progress of New South Wales" on page 77. He says:—

There were seven persons killed and seventy-six persons injured in New South Wales coal mines during 1892, making a total of eighty-three accidents—the number of fatal accidents being smaller, and that of non-fatal accidents larger than in any of the previous ten years. For the ten years ending with 1892, the average annual loss of life in the British coal mines was 1·8 per thousand, or at the rate of 179,696 tons of coal raised for every fatal accident. In the New South Wales collieries, for the same period, the rate was 3·0 fatal accidents per thousand miners employed, and only 121,657 tons of coal were raised for every life lost.

777. *Mr. Gregson.*] I can give you very different figures to those (*see Appendix J*)? I am quoting from Coghlan. I am not making them.

778. I saw the same statement made by Mr Sydney Smith, but I did not know where he got the figures? They are here in Coghlan.

*Witness:* I made a mistake yesterday when speaking about the working day in Russia. I said children of thirteen years must not be employed more than eight hours; it should be fifteen years, and not more than six hours per day without a break.

779. *President.*] You have made no objection to the employment of boys? I object to them working for ten hours. J. L. Fegan,  
Esq., M.L.A.
780. *Mr. Gregson.*] You have been engaged in coal-mining from the time you were 16 years old? Part of the time, but I have not been coal-mining all the time. Part  
28 Aug., 1895.
781. How long have you been in this country? For eight years.
782. How long were you coal-mining before you came to this country? For something like five years.
783. Did you begin as a lad? Yes, when I was 16 years of age.
784. What were you doing? Working with skips.
785. Driving? No; I was drawing by hand, without a pony.
786. From that you went to other things? Yes; through all up to getting coal, timber, setting, &c.
787. How long were you on the coal? For about two and a half years; but there were intervals between the time I was 16 and the time I left for this Colony.
788. You were not the whole of your time employed in the mine? No, I was not.
789. You were living more or less in a coal-mining district? Yes, amongst coal-miners.
790. Since you have been in this country what has been your occupation? Mining.
791. In what capacity? I was underground manager at Anvil Creek. I was employed first as a coal-miner, and after that as underground manager.
792. From Anvil Creek where did you go to? I was working at Bullock Island.
793. What were you doing at Bullock Island? I was getting coal all the time until I got a seat in Parliament.
794. Were you not check inspector at the Wickham and Bullock Island Colliery? Yes.
795. During the time you were check inspector at the Wickham and Bullock Island Colliery you got paid by the men? Yes.
796. Do you think from your experience of mining in Lancashire you are able to form an opinion of the conditions of the industry there? I think so.
797. What was the height of the seams there? Seven feet and 22 feet.
798. Is that the ordinary run of the seams there? There are some seams only a yard and some only 4 feet.
799. Did you work in these seams? No; I knew men who were working there.
800. Would you think that men working on those seams worked under as favourable conditions as men in the 7-ft. seams? That would depend upon the ventilation. In the latter seams they had a volume of ventilation enough to blow your cap off. The seam was called the Little Delph seam.
801. A man who works in a small seam has not the same advantages as the man who works in a larger seam? A 6-ft. man cannot feel as much at home in a 3-ft. seam as he can in a large seam. He is more comfortable in a high seam than in a low seam.
802. Are not some of the seams in this country high seams? Yes.
803. Do you think from your experience that a miner is working under more favourable circumstances here? No, not by a long way. The ventilation here is a disgrace to the Colony.
804. You mean to say that the ventilation is less here? The ventilation in some parts of England is worse than here, and in one sense better. There is so much gas to dilute and push before the air that even where there is a large volume of air the ventilation is not as good as it might be.
805. These gases are all deleterious to health? Yes.
806. In New South Wales where there is less of this gas to contend with, is the miner under less or more favourable circumstances than in Great Britain? In some instances he is under worse conditions.
807. Will you kindly tell us how he is under worse conditions? Because there is such a small volume of air. Indeed on account of the absence of these gases the real quantity of air is not given, whilst in England, the air sweeps the face of the workings according to the Act. Here it is only allowed to sweep along the air ways of the workings, and not into the workings.
808. This is as regards some of the cases? Yes.
809. In other cases men are working under more favourable circumstances in this Colony than in Great Britain? Yes, when men are starting their bords away.
810. You do not limit it to collieries, but to different parts of the workings? Yes.
811. You mean to say that there are good and bad places in each pit? Yes.
812. Speaking of the average, a man here takes his chance as to what place he gets. Do you think that mining is conducted in this Colony under more or less favourable circumstances than in Lancashire, averaging the case as between the bad places and the good places in the pit. Does a man here work under more or less favourable circumstances than in England? He works under more favourable circumstances in England.
813. You think then that mining is conducted here under less favourable circumstances than in Great Britain? I do certainly. The statistics I have given will prove that.
814. As regards the climatic conditions of the country, do you think that there are any drawbacks here? I think this is a far superior country.
815. Is a man able to do as much work in this Colony as in Lancashire? In the summer time he cannot be. Although he gets as much coal he is an old man sooner.
816. You think he does get as much coal? Yes, because he has to work like a horse here on account of employment not being so regular here as in England.
817. What is the average quantity of coal a man can get in a day here? I can hardly give you that. It depends very much upon the place he is working in. Two men in one place cannot make as much as two men in another place.
818. How many skips of coal can they get? In bottoms, from six to eight skips.
819. What is the average weight? 12 cwt.—5 tons for two men or 2½ tons per man.
820. Is that a good rate? That was a fair rate at one time, but it is a starvation rate at present. You of course know that tops and bottoms vary considerably.
821. You put it that there are different places in the mine, some good and some bad? Yes.
822. That is provided for by a system of cavilling? Yes; cavilling is the best system.
823. Amongst a body of men, each one has an equal chance of getting a good place or a bad place? Yes.
824. In the bad place some men can get 2½ tons per day? Yes.
825. What would two men in a good place get—how many skips would two men get in tops? Sixteen.

- J. L. Fegan,  
Esq., M.L.A.  
28 Aug., 1895.
826. Sixteen times twelve will give 9 tons 12 cwt. ? Yes ; but cases like this are in the minority.
827. What do the miners get paid per ton ? There are two men to get this quantity of coal, and I think the rate per ton is 2s. 8d., while in some collieries they are reducing the rate to 2s. 6d. per ton.
828. These men get five tons between them ? Yes ; in the top coal they get threepence or fourpence less, and in some instances as much as eightpence less than in bottoms.
829. Do you think there is anything in the conditions of mining here that would make the English Act inapplicable in its general features or policy ? It has been admitted that the English Coal Mines Act can be amended upon. A bill was only introduced on the 16th of April this year to amend certain parts of the English Act.
830. Have you seen a copy of that Bill ? No ; but I have seen a notice of it.
831. Do you know in what respect that Bill amends the Act of 1887 ? I have not got the particulars.
832. Is there anything in the conditions of mining in New South Wales that in your opinion would make the English Act inapplicable to this Colony in its general features or policy ? Yes ; with reference to the ventilation clause.
833. I am not dealing so much with that clause ;—I mean with regard to the working of the coal ? Yes.
834. The policy of allowing the inspector to go into the pit ? I think we have a right to get this amended.
835. Do you think these things are inapplicable to New South Wales ? I do ; the English Act is not sufficient to protect life and limb.
836. Do you disapprove of giving an inspector power to come in and say that this or that is not correct, and you must make it right ? I entirely disapprove of that, because the roof is coming down while the arbitration is going on.
837. In respect of the powers it gives to the manager, apart from the inspector's control—that is, for the manager to carry on the mine in his way—is that a good system ? As an inspector represents the Government, and the Government represents the people, I think the people's lives ought to be secure, and that power ought to be given to the inspector to order the men out in case of danger.
838. That is a special provision ? Yes.
839. Assuming that the English Act was altered as you would like to see it altered would you be quite willing to have it here ? Yes ; if it is altered in the way of giving the inspector greater powers.
840. And in other respects ? I do not know what you mean.
841. Does the report of your Select Committee convey your own impression as to what you would like ? I said before, "Yes," with the exception that I wanted to make an addition.
842. With the addition you made yesterday, altering the Act to suit your views, and in your opinion the views of the miners generally ? Yes.
843. With regard to ventilation, the English Act provides, as you are aware, an adequate quantity of air in all parts of the mine ? Yes.
844. Don't you think that that is sufficient provision to make ? No, I do not.
845. Why not ? If you will bring the same circumstances here as in England, I am prepared to accept the wording of the English Act.
846. What is the meaning of the word "adequate" ? Sufficient.
847. If you have sufficient air in all parts of the pit, what more do you want ? Who is to say what sufficiency is ?—I am not going to leave it to a manager.
848. Under the Bill, do you not know that it is not a manager, but an inspector ? No, I do not.
849. Well, that is so ? If that is so, you have read the Act differently to what I have read it.
850. Will you kindly read the 19th section of the Bill on page 8, "Powers of inspectors" :—

19. An inspector under this Act shall have power to do all or any of the following things, namely :—

- (i) To make such examination and inquiry as may be necessary to ascertain whether the provisions of this Act relating to matters above ground or below ground are complied with in the case of any mine.
- (ii) To enter, inspect, and examine any mine, and every part thereof, at all reasonable times by day and night, but so as not to impede or obstruct the working of the mine.
- (iii) To examine into and make inquiry respecting the state and condition of any mine or any part thereof, and the ventilation of the mine, and the sufficiency of the special rules for the time being in force in the mine, and all matters and things connected with or relating to the safety of the persons employed in or about the mine or any mine contiguous thereto, or the care and treatment of the horses and other animals used in the mine.
- (iv) To exercise such other powers as may be necessary for carrying this Act into effect ?

You cannot have an inspector down the mine every day, unless you are going to have one inspector for every mine, which is entirely impracticable ; you have an inspector now for a certain number of collieries, and it is impossible for him to give the supervision necessary to have proper ventilation in the mine. My answer is, that it ought not to be left to the inspector, but that a minimum quantity of air should be inserted in the Bill, and that the anemometer should prove the sufficiency of air was there. I may point out that I have a report of a certain colliery in the Northern district where leaving it to the manager he has only given 35 cubic feet of air to man, boy, and horse in that district. (*See Appendix P.*)

851. Referring to that case, and supposing it to be true, what does a man do who is prejudiced by that sort of thing—what remedy has he ? The remedy of appealing to the inspector at once.
852. And what does the inspector do ? If time permits him, he has to go and see the place ; but the man who writes to the inspector is a marked man, and has to be shifted by some means or other.
853. When the inspector goes to see this place, what is to hinder the man pointing out any irregularity ;—do not people know when the inspector comes ? No, not always.
854. I am speaking of the remedy the man has ; does he not complain to the inspector ? He may, if he chooses.
855. Is that not his remedy ? Yes, but every man cannot take it.
856. Is it his only remedy ? No ; he can pack up his tools, and go and starve. I mean leave the pit.
857. He complains to the inspector and the inspector comes ;—the mine manager would not know when the inspector was coming ? At times he would not. He might give the manager certain notice.
858. Is that so ? In some cases he does.
859. Is it his duty to give notice to the manager ? No ; it is not his duty to do so.
860. He may make a surprise visit ? Certainly.
861. If in this surprise visit he finds the man's story to be true, he can proceed against the manager ? Yes.
862. Cannot the inspector make a surprise visit without any complaint at all ? Yes.

863. These difficulties are not peculiar to New South Wales;—do they not obtain in Great Britain? In Great Britain, almost as a rule, there is gas to force the manager to give good ventilation. J. L. Fagan,  
Esq., M.L.A.  
28 Aug., 1896.

864. Are there not other respects in which the miner can complain to the inspector;—if an inspector can make surprise visits, is he not likely to find out if anything wrong is going on? Yes, by observation.

865. Is the inspector not as likely to do his duty here as in Great Britain? Yes, but in the matter of ventilation gas is there to prove that the place is not ventilated, here you must have your instrument or a complaint from some of the men.

866. Will you look again at sub-clause 2 of that part of the Bill dealing with the powers of inspectors;—you will see that the inspector has power to enter, inspect, and examine any mine, and every part thereof, at all reasonable times by day and night, but so as not to impede or obstruct the working of the mine? May I ask your attention to rule 20 of the Bill, sub-clause 2:—

(11) If the owner, agent, or manager of the mine objects to remedy the matter complained of in the notice he may, within ten days after receipt of the notice, send his objection in writing, stating the grounds thereof to the Minister, and thereupon the matter shall be determined by arbitration in manner provided by this Act, and the date of the receipt of the objection shall be deemed to be the date of the reference.

The manager may, within ten days, state his objection to the Minister, and thereupon the matter shall be determined by arbitration. While this arbitration is going on the men are being slowly poisoned.

867. In some mines you say that the minimum quantity of air would not be enough? No, it would not be.

868. In the Metropolitan mine for instance? Yes.

869. In that case what would be done? The manager will not work without a proper quantity of air, because if he did he would be minus the colliery and the men's lives.

870. You attach great weight to the minimum quantity of air? I do.

871. Will you try and explain to me in what better position the inspector or the miner would be if you have that minimum quantity of air in the Bill and it is not provided in the mine? When check-inspectors go round they have an anemometer, which is an instrument to register the air with, and they are satisfied when they come to a certain point that a certain number of cubic feet of air is provided in accordance with the Act, and the consequence is that it satisfies the men and all concerned. In the other way, when no minimum is provided, if the inspectors happen to be a little pig-headed they may say that the quantity of air is not sufficient and a report is given to the men, and they say that they will have a sufficient quantity there. This may cause a dispute, and the result will be a strike because the ventilation is bad. To protect ourselves, therefore, against a manager who does not care for the lives under him we ask that a minimum quantity of air shall be put there for the welfare of all.

872. In what better position would the inspector or the miner be with regard to the sufficiency of air by having a minimum recorded;—say there is not the quantity of air, what remedy is there, supposing that there is not 100 feet of air in the place? The miners can report to the inspector, and the inspector can report to the Minister.

873. In what respect is the miner or the inspector in a better position by having the minimum quantity of air provided for in the Act? If the inspector finds that there is not a sufficient quantity of air it is his duty to report the matter to the Minister.

874. I think you will find it is his duty to communicate it to the manager? But if the manager will not provide the necessary quantity of air, what happens. The inspector draws the attention of the manager to the fact that there is not the minimum quantity of air fixed by the Act. Then it is the manager's word against the inspector's word.

875. No, surely not that. The inspector has simply to say that there is an insufficient quantity of air and then the matter goes to arbitration? No; I do not think so. If the manager will not supply the requisite quantity of air he writes to the Minister, and ultimately the matter goes to arbitration.

876. But arbitration does not come on the word of the inspector or the manager? No; if the manager objects to remedy the matter he can write to the Minister, and the question is to be settled by arbitration.

877. You will notice that although the minimum is fixed at 150 cubic feet there is more air given? Yes, but not for the workmen. It is passing down the shaft, but never gets to the workmen.

878. Suppose an inspector acting under the English Act comes into a working-place and says that there is not a sufficient quantity of air there, is not that better for the miner? No, it is not; inasmuch as there is a war of words between the inspector and the manager.

879. *President.*] If the inspector says that there is not sufficient air, would not the manager have to provide sufficient? A manager may say that he would do his best, and his best, in some instances, is very little.

880. Cannot the inspector compel the manager to do what he wishes to be done? It has to go through the avenues of red-tapeism before he can get it.

881. If, when the inspector finds something wrong, he communicates it to the manager, should not the manager try and put it right? Certainly he should.

882. It is only where this red-tape arbitration business is called in that you see some difficulty? Yes; and rightly so.

883. If the inspector is a man clothed with authority, this is sufficient to put it right, and the manager will put it right? Yes; that is so.

884. Notwithstanding that, you think that it is still necessary to have a minimum provided in the Bill? Yes, for the reasons I have given.

885. Supposing there is a minimum provided in the Bill and that minimum is not supplied, and the inspector says to the manager,—You are not supplying the minimum amount of air. How does that make the miner a marked man? If a man complains to the inspector you say that he is a marked man, then supposing that the Act provides a minimum and that that minimum is not given is he still a marked man? Certainly.

886. Cannot the inspector decide whether there is an adequate amount of air, and if he so decides, is his word not absolute? No the inspectors word is not absolute.

887. I thought we just agreed that it was? Oh no.

888. In ordinary cases the manager is told by the inspector that something is wrong, and when told so he puts it right? Yes, in some cases.

889. Is not the inspector, then, practically the boss of the whole situation? No.

890. What is the loop-hole, then? This arbitration business.

891. *Mr. Gregson.*] Are there not plenty of places in a mine so high and so large that the current of air may be there without the anemometer measuring it? Not in the sections of a mine. Where there is a district of sixty men I could not find a place.

J. L. Fegan, Esq., M.L.A. 892. Does not the Bill provide that there shall be an adequate amount of air in all parts? The Bill says that the mine shall be divided into districts or splits.

893. I do not think so—Will you look at section [49] 46 of the Bill, on page 23, and read the first clause?

*G. Division of Mine into [Splits] Parts.*

[49.] 46. (i) Where two or more parts of a mine are worked separately, the owner, agent, or manager of the mine shall give notice in writing to that effect to the inspector of the district, and thereupon each such part shall, for all purposes of this Act, be deemed to be a separate mine.

(ii) If the Minister is of opinion that the division of a mine in pursuance of this section tends to lead to evasion of the provisions of this Act, or otherwise to prevent the carrying of this Act into effect, he may object to the division by notice served on the owner, agent, or manager of the mine; and the owner, agent, or manager, if he declines to acquiesce in such objection, may, within twenty days after receipt of the notice, send a notice to the inspector of the district, stating that he declines so to acquiesce, and thereupon the matter shall be determined by arbitration in manner provided by this Act; and the date of the receipt of the last-mentioned notice shall be deemed to be the date of the reference.

Yes, I acknowledge I have mis-read the Bill, if you read it like that, but that is as the Legislative Council amended it; it was objected to by the Legislative Assembly.

894. Can you conceive of any part of a mine that the words in the ventilation clause of the Bill, section [50] 47, on pages 23 and 24, will not cover? Without a minimum quantity of air a mine without gas would not be properly ventilated.

895. We have heard something about the necessity for providing a minimum also with regard to the sizes of pillars under the land and under the sea. Do I understand you to say that the report of the Commission on Collieries adjacent to Ferndale made some suggestions with reference to this matter? Some suggestions were made with reference to collieries working under tidal waters. (*See Appendix Q.*)

896. But not with reference to collieries working under land? No, under land it would depend on the strata.

897. You approve of a certain width of pillar? Yes, nothing less than 8 yards.

898. Does that cover all conditions for the future? If you have broken strata you must have larger pillars. If you have a good thickness of rock your pillars do not need to be so thick.

899. Can you conceive of any circumstances where an 8-yard pillar would be insufficient? Yes I can.

900. Then why don't you provide for it in the Bill? There was a Bill brought before the House which made stricter provisions than those embodied in this Bill.

901. Is it not the case that the minimum now proposed may be insufficient in some cases? Yes. If I was working a mine myself I would work larger pillars. It depends on the strata as to what thickness of pillars should be left behind.

902. I have asked you whether you can conceive of any circumstances under which the minimum provided in this Bill is insufficient? Yes, I should say so.

903. Has such a case happened in which the minimum is insufficient? Yes; where a crush has come on, and about the shaft, or on the hauling road, I think that there ought to be more than 8-yard pillars.

904. I am not talking about main travelling roads, but of ordinary working pillars in the ordinary sense? I do not see that it is necessary to have more than 8-yards pillars in such places. I have not seen places where 8-yard pillars would not have been sufficient.

905. Suppose such a circumstance happened, as you have spoken about, where would your minimum be? If it happened it has an effect we cannot dispute.

906. Then what is the good of your minimum? We should have to draw on our imagination.

907. Would it not be better to leave out any specified size and trust to the inspector, and take the responsibility off the managers shoulders? Oh, no.

908. Would it not be better to leave it to the inspector to say that the pillars left by the manager are insufficient, and if anything should happen the manager should be free? No; the responsibility would rest with the manager. If you put an inspector in that position he could be harsh to some managers and not harsh to others.

909. Will not the inspector do his duty? We have always had those men. I think I asked some questions bearing upon this subject to Dr. Robertson, which will be found in his evidence with the progress report of my select committee of the 19th April, 1894. I will read them with your permission—

1229. Are you not aware that the inspectors get word at times as to the condition of the mine? I do not know anything about it. Any word that they get in that way ought to be communicated to the manager, to give him an opportunity to defend himself. If you make suggestions to a man in the way that that inspector did, you can get some men to say anything you please. The inspector is not there to raise dissension and strife between miners and over-men. The effect of the proceedings was that that over-man knew, without a word being said, that that man had been writing anonymous letters to the inspector, and he had his eyes upon him. I spoke to the man, and I said, "If you have any fault to find with anything, I am always accessible to you; but I do not want to put you in such an invidious position. The chances are that you will be discharged if you do not have care. If you are short of props why not tell the manager; why go to the trouble to write to the inspector?" The man said he did not do it; but I said, "The inference was that he did." I said, "You are putting yourself in a very invidious position. I will protect you so far, but do not do it again."

1230. Then it appears that the inspector was written to? I only inferred that he was, but I object to the way in which the inspection was carried out. The inspector ought to have been perfectly frank about it, or he ought not to have let the over-man go into the place with him.

1231. Did the inspector ever find in one of the mines a pillar a foot less than was stipulated? Yes; it was with very great difficulty that the manager was saved from prosecution over that.

1232. Who was the inspector? The inspector was Mr. Rowan. It was in the south. I suppose he was acting up to the letter of the law, but inspection is a farce if administered in this way, you must act according to the spirit. But I have no fault to find with the inspector for doing that.

1233. You think that he was overstepping the bounds? I do; and I explained it to the Minister. The over-man was a particularly careful man, and he went into a place where they were driving and marked it off, and put a stamp on with a pick and said, "When you have driven other 2 feet you turn off to make the cut through." The coal was working well and there were a pair of good men in the place; but when they got through the other 2 feet they came to a stone rising out of the floor. They went on, being still within the 35 yards, and the manager being away they took it upon themselves to go beyond the 35 yards, and they cut their end where the coal was high. The inspector came through on the following Tuesday, and the first words of the over-man were, "Did you hear my orders about going 2 feet beyond that stamp?" The answer was, "Yes; but we saw the stone was about to run out, and we broke away to the end." Although the men admitted they were in fault, and although the stamp and check were on the wall the inspector was bound to report it, and there was a great deal of trouble to prevent the manager from being prosecuted. This is acting according to the letter of the law. They will never get things done right if they do not show a more becoming spirit in the exercise of their duty.

1234. You think that the managers and inspectors should show a conciliatory spirit? Certainly. Here was a case in which the men admitted that they were in fault, and there was proof of it on the wall, yet the inspector was obliged to report that they had gone 18 inches over the 35 yards. That is one of the unfortunate provisions of the existing Act. I hold that these provisions should not be in the Act at all. If you take the English Act, there is no such provision out of which a prosecution could arise.

MONDAY, 2 SEPTEMBER, 1895.

[The Commission met in the Board Room, Chief Secretary's Office, at 2:30 p.m.]

Present:—

FRANCIS EDWARD ROGERS, Esq., Q.C. (PRESIDENT).

JAMES CURLEY, Esq.

JESSE GREGSON, Esq.

John Lionel Fegan, Esq., M.L.A., re-examined:—

910. *Mr. Gregson.*] I think when you were last examined we were on the subject of pillars? Yes, Mr. *J. L. Fegan, Esq., M.L.A.*  
 911. Can you give me any idea of the district custom in Newcastle with regard to pillars? I think it is 6-yard pillars and 6-yard bords. *2 Sept., 1895.*  
 912. Where are they working in that way? In the Wickham and Bullock Island and Hetton collieries, and they work the same way at Stockton.  
 913. Do they work by the mark? I do not know how they mark.  
 914. Do they drive the bords by the line, or is any precaution taken as to the miner widening his bord? I have known them to cut through the pillar before they have gone the distance.  
 915. Do they run their bords by marks in any of the collieries you have mentioned? In Hetton, yes.  
 916. Do they do so at Wickham? During the last five years they have been more careful there.  
 917. What is the custom with regard to other collieries further inland? I believe it is 8-yard pillars and 8-yard bords. I believe some of them commence on the long-wall system, or what we term narrow work.  
 918. How long has it been the fashion to leave 8-yard pillars and 8-yard bords in the more inland collieries about Newcastle? I think it has been the general custom.  
 919. Is that what you understand by the district custom? Yes. There are exceptions, of course, where men have gone through the pillar without the manager or anyone else knowing anything about it.  
 920. Do you know whether they have 8-yard pillars at Waratah? I do not know.  
 921. Do you know whether they have 8-yard pillars at the Co-operative Colliery? No; I have never worked there.  
 922. Have you ever made any inquiries? No; only in the matter of talk, and I would not give that as evidence.  
 923. Are you aware of the cover over some of these collieries—the different thicknesses of strata? Well, no—not by heart.  
 924. What would you say, generally speaking? Do you mean the distance of the shaft?  
 925. No, the overlying strata? There is in some instances red sandstone.  
 926. I am speaking of the thickness of the strata? There are some 300 feet, some less, and some more. There are some as much as 500 feet.  
 927. *President.*] Is that in the inland collieries or in collieries working under tidal waters? In the inland collieries.  
 928. *Mr. Gregson.*] Have you any knowledge of the thickness of cover at other collieries—say, at Singleton? Up at Singleton I think they are less. Some of the collieries there have a tunnel.  
 929. Have you any idea of the thickness of the cover? I cannot say from memory.  
 930. Have you any idea of the width of the pillar they leave there? No, I have not.  
 931. I suppose you will say that there is not an improbability of coal-mines being worked from 50 to 100 or 150 feet? I know they have been worked.  
 932. And may be again? Yes.  
 933. Would you not think it a waste of coal to leave pillars of that size with that cover? No; I should be afraid of working it less.  
 934. You would not think that anything less would support the strata? I would not work it less. The width of the pillar depends on the strata.  
 935. Is it your opinion that the thickness of the strata has nothing to do with the thickness of the pillar? Oh yes, it has.  
 936. Would a cover of 50 feet require as much strength as a cover of 500 feet? That depends on whether the ground is broken or not.  
 937. I want you to put that on one side and consider the thickness of the cover? I have tried to answer as plainly as I can.  
 938. Can you not say whether the thickness of cover has anything at all to do with the thickness of pillar? That will depend on the thickness of the strata.  
 939. A pillar that is sufficient for 50 feet would not be sufficient for 500 feet? It will depend on the thickness of the strata as to what pillars should be left in for support.  
 940. You cannot answer that plain question? I have answered the question as I think in a proper way.  
 941. *President.*] It varies under different circumstances;—it must be a certain thickness in one place, and the same thickness may not be required in another place? It varies according to the depth you go, and the ground that is gone through.  
 942. You decline to say that thickness of cover should of itself be a consideration? It all depends on the ground that is gone through, and upon the depth that is gone through.  
 943. This is surely a thing not difficult to comprehend;—we will all admit that there are circumstances that have to be taken into account, but they do not affect the consideration of the thickness or weight? I differ from that. If you are going through sand for a certain distance much stronger pillars will be needed than if you are going through rock. There is a certain holding capacity in rock, while under sand it would need a greater thickness of pillar than with what we call a place with a sound top over it.  
 944. *Mr. Gregson.*] Suppose you had 50 feet of sand for a cover, would you require as strong a pillar under that as you would with 500 feet of sand? It just depends whether you could work it. You could not work it.  
 945. *President.*] What Mr. Gregson wishes to know is whether, supposing all the conditions to be the same, if you are working at a depth of 50 feet, you will require the same size of pillar as if you were working at a depth of 500 feet? If all the conditions were equal, certainly not.  
 946. *Mr. Gregson.*] If you provide pillars that are sufficient for working at a depth of 500 feet, would it not be a waste of coal to have these pillars under circumstances where the cover is less? Not necessarily.

- J. L. Fegan, Esq., M.L.A.  
2 Sept., 1896.
947. Will you tell me why? Because where you have large pillars behind there is a better opportunity of getting them out than small pillars. With small pillars, as soon as you commence to work into them, the top comes over you. Where there is a solid pillar there is no crush. There is no crush until the coal is got out, or very little, where there is a strong pillar; but with a weak pillar there is a great deal of crushing.
948. Are you aware that in some places people have to work coal under the necessity of keeping up the roof to avoid all subsidence—in such a way as to avoid any chance of disturbing the surface? They do in the collieries under tidal waters.
949. Are there any other places that you know of? Yes; there is Sneddon's Colliery, at Wallsend.
950. I am asking you in general terms? Yes.
951. Such as what? In Sneddon's Colliery they are taking out some of the old pillars left by the Co-operative Colliery.
952. Are you aware that in some places the coal-owner has to work his coal so as to avoid any chance of disturbing the surface? I know of the Linwood Colliery and the Maryville Colliery.
953. At the Linwood Colliery did they start on the policy that they were not to disturb the pillars? I do not know what assumption they started on.
954. Do you know of any cases in which the surface value is greater than the underlying coal value? That would largely depend on the amount of money the person has got to sue with for damage done.
955. *President.*] Supposing no damage is done at all? In city sites I suppose the surface would be more valuable.
956. *Mr. Gregson.*] In city sites the coal-owner has to work without any intention of drawing pillars;—if the surface value is greater than the underlying coal value, is it not reasonable to suppose that he would work it without any intention of drawing pillars? That is his look out. It largely depends on the amount of money a person has got to sue a company with.
957. Am I to assume that you are above all these considerations, that they are only idle talk, that these matters should be settled without any regard to surface value or underground value? Whilst you may think that the answers I give are evasive, it is on account of the experience I have had. I still say that it depends on those who are living there as to whether they are in a position to sue a company or not whether pillars are left or taken out; upon whether they have the money to sue.
958. *President.*] Do you mean to say that the surface is let down without any regard for the men? The unfortunate position is that some of these men are working for the company. I know of some places that have been almost dragged in two, and the company has simply placed some cinders about them. I know of a case that was being taken to the Court where the difference was settled by the payment of £100 without further proceedings.
959. *Mr. Gregson.*] The object I have in asking you these questions is to get your idea of the circumstances; you are advocating certain conditions in the Bill, and I want to have your reasons for advocating them; I am asking you to explain the position you are taking up with regard to the Bill;—do you think that these provisions should be made without regard to the matters I have brought under your notice? Certainly not. There ought to be no consideration of that description. The greatest consideration should be the men's lives.
960. You think the provision in the Bill with reference to pillars should stand without regard to surface value or anything else? Yes, I do, for the protection of life. I provide a thickness on the side of caution. I prefer to have the size of pillars stated for the protection of life rather than any consideration of values.
961. Now with regard to the floor;—is the floor not stronger in some places than in others? I do not think there is much difference in the northern district.
962. Do you know of some cases where the floor has been proved to be rotten? There is just a thin sheet of rock in some mines that is not to be found in others.
963. I asked you if you knew of any instances where the floor is proved to be rotten? No.
964. You do not know of any instances? No; not where the bottoms are rotten.
965. Would you be surprised to find that there are some such instances? I should.
966. You would? I should.
967. It is not an impossibility? Oh, no; I am not going to say that.
968. Where you have got a rotten floor; would you still think it necessary to provide the same thickness of pillar as where the floor is strong, other circumstances of course being equal? If there is no foundation one must be got from somewhere. If the bottom is rotten some precaution must be taken for the roof.
969. Then the minimum pillar would not be safe for the men? I think the minimum provided in the Bill is sufficient to cover all these disabilities.
970. *President.*] Would there not be creeps with a bad floor like that? I do not think any harm would come under the stipulation in the Bill.
971. *Mr. Gregson.*] That is with regard to so many feet of cover, you mean? Yes; if it was sand it would not be as safe as in other cases, but that could be found out with a borehole.
972. Would it not be well to make some provision for that in the Bill? As a miner, I am perfectly satisfied with the wording as it is in the Bill.
973. You think the Bill makes sufficient provision for all circumstances? I am satisfied with the wording of the Bill.
974. I ask you whether you are content with the provisions of the Bill under all circumstances with regard to pillar-working? I am satisfied with the provisions of the Bill.
975. You are satisfied with the provisions of the Bill under all circumstances? Yes, certainly.
976. I ask you to turn to clause 51 on page 32 of the proposed Bill:—

51. If any owner or manager object to any of the following general rules, namely, general rule numbers forty-two, forty-three, forty-four, forty-five, and forty-six, being enforced or applied to a coal mine or colliery, he may give notice thereof to the Minister setting out his objections and the reasons therefor, and upon receipt of such notice the Minister may allow or disallow such objections or any of them. If the Minister allow such objections or any of them, he may order that the coal mine or colliery be exempt from the operation of any such rule or rules, or he may order that, so far as such coal mine or colliery is concerned, the provisions of any such general rule may be modified or varied. If the Minister disallow the objections, and the owner or manager do not withdraw such objections, the matter shall be referred to arbitration, and the arbitrators may make any order which under this section the Minister could make.

You will see that if the coal-owner objects to any of the rules referred to he may give notice to the Minister; you are providing hard and fast rules, and leave the power of enforcing those rules to the Minister.

Minister. Do you think it is a wise thing for the Minister to have the power of allowing or disallowing objections? I do; because circumstances may arise which would warrant his interference.

977. *President.*] You substitute the judgment of the Minister for that of the manager? The inspector would have to do with a matter like this as well as the Minister. When such an objection is made the inspector would have to report.

977½. *Mr. Gregson* thinks this is detailed legislation, and the English Act says leave these things to the manager, with an inspector, who may come in at any moment on a sort of surprise visit. You say let us have the hard and fast rules, but if any of them are objected to by the manager he may ask the Minister to do away with these rules? The inspectors would be the Minister's advisers in such a case, and they are practical men, and of as high qualification as the manager. Whilst the manager has the interests of the owners the inspector has the interests of the Government, and, of course, the Government represents the people.

978. *Mr. Gregson.*] You would not be afraid that politics would enter into that question? No, I would not.

979. You do not see any disadvantage in allowing the Minister to interfere with the precise rules provided in the Bill? I believe this is a matter which could go to arbitration, and I believe it would. I believe this would come under the heading of where a mine is not supposed to be safe, where the inspector ordered something to be done which the manager refused to do, and it would be dealt with by the arbitrators appointed under the Bill.

980. I only ask you what your opinion is with regard to the working of the clause—whether there is any disadvantage in leaving it to the Minister to annul or disannul the workings of the Bill? I do not see any disadvantage whatever.

981. Notwithstanding the fact that the Minister may know nothing of mining, and that the inspector is under the control of the Minister, subject to dismissal at any moment? I have not the slightest fear, and I believe that any inspector would do his duty.

982. Will you now turn to the "Powers of inspectors," on page 8 of the Bill;—do you understand that clause 21, with its sub-clauses (i) to (v), as it left the Assembly, puts the control of the manager wholly in the hands of the inspector in the first instance? No.

983. What do you understand as regards the powers of inspection? There is not much difference in this Bill and the Act we are working under now.

984. It is this Bill we are considering;—this Bill gives the inspector large powers? Yes.

984½. Do you object to his having those powers? I do not.

985. Do you think the miners, as a rule, would object? No; I do not.

986. Do you generally approve of the principle of leaving these matters in the hands of the inspectors? Yes.

987. You look upon the inspector as being the safeguard for the miners' safety? I look upon him as the representative of the Government, whose functions are to protect life. I may point out that when this clause was under consideration Mr. McMillan spoke strongly on the subject of increasing the powers of inspectors, and he had the Bill in hand for the coal-owners.

988. *President.*] What further power did Mr. McMillan want to give the inspectors? He said that too much power could not be given to inspectors to provide against serious loss of life.

989. I think they have very large powers under this clause? Yes; under the twenty-first section.

990. *Mr. Gregson.*] I suppose we may judge that in Great Britain it is only the inspector that the men have to depend upon? Yes; with the check inspectors. If you notice the report of the English Royal Commission you will find that they laid great stress on the powers of the men's inspectors. Mr. Nelson Boyd, in his work "Coal-pits and Pitmen," on page 211, says, "In concluding the report, they reiterate the opinion of many, or indeed, most practical men, for they 'attach much importance to systematic inspection by workmen under rule 30 of the Coal-mines Act of 1872.'"

Rule 30 of the English Coal-mines Act of 10th August, 1872—Inspection of mine on behalf of Workmen:—

The persons employed in a mine may from time to time appoint two of their number to inspect the mine at their own cost, and the persons so appointed shall be allowed, once at least in every month, accompanied, if the owner, agent, or manager of the mine thinks fit, by himself or one or more officers of the mine, to go to every part of the mine, and to inspect the shafts, levels, planes, working places, return airways, ventilating apparatus, old workings, and machinery, and shall be afforded by the owner, agent, or manager, and all persons in the mine every facility for the purpose of such inspection, and shall make a true report of the result of such inspection, and such report shall be recorded in a book to be kept at the mine for the purpose, and shall be signed by the persons who made the same.

990½. *President.*] Is that rule in the English Coal-mines Act of 1887? Yes. Rule 38 of English Coal-mines Act of 16th September, 1887, says:—

#### PERIODICAL INSPECTION ON BEHALF OF WORKMEN.

The persons employed in a mine may from time to time appoint two of their number, or any two persons, not being mining engineers, who are practical working miners, to inspect the mine at their own cost, and the persons so appointed shall be allowed once at least in every month, accompanied, if the owner, agent, or manager of the mine thinks fit, by himself, or one or more officers of the mine, to go to every part of the mine, and to inspect the shafts, levels, planes, working places, return airways, ventilating apparatus, old workings, and machinery. *Every facility shall be afforded by the owner, agent, or manager, and all the persons in the mine for the purpose of the inspection, and the persons appointed, shall forthwith make a true report of the result of the inspection, and that report shall be recorded in a book to be kept at the mine for the purpose, and shall be signed by the persons who made the inspection; and if the report state the existence or apprehended existence of any danger, the owner, agent, or manager, shall forthwith cause a true copy of the report to be sent to the inspector of the district.*

(NOTE.—Larger type denotes additions; italics, alterations in wording between 1872 and 1887 English Coal mines Acts.)

991. Have the powers of inspectors been altered since the passing of the English Coal-mines Act of 1872, that is, comparing the Acts of 1872 and 1887? I do not think there is very much difference. A greater number of inspectors have been appointed.

#### ENGLISH COAL-MINES ACT, 10TH AUGUST, 1872.

##### *Powers of Inspectors.*

(45.) An inspector under this Act shall have power to do all or any of the following things, namely:—

- (1.) To make such examination and inquiry as may be necessary to ascertain whether the provisions of this Act relating to matters above ground or below ground, are complied with in the case of any mine to which this Act applies.
- (2.) To enter, inspect, and examine any mine to which this Act applies, and every part thereof, at all reasonable times by day and night, but so as not to impede or obstruct the working of the said mine.
- (3.)

J. L. Fegan,  
Esq., M.L.A.

2 Sept., 1895.

- (3.) To examine into and make inquiry respecting the state and condition of any mine to which this Act applies, or any part thereof, and the ventilation of the mine, and the sufficiency of the special rules for the time being in force in the mine, and all matters or things connected with or relating to the safety of the persons employed in or about the mine, or any mine contiguous thereto.
- (4.) To exercise such other powers as may be necessary for carrying this Act into effect.

Every person who wilfully obstructs any inspector in the execution of his duty under this Act, and every owner, agent, and manager of a mine who refuses or neglects to furnish to the inspector the means necessary for making any entry, inspection, examination, or inquiry under this Act, in relation to such mine, shall be guilty of an offence against this Act.

ENGLISH COAL-MINES ACT, 16TH SEPTEMBER, 1887.

*Powers of Inspectors.*

41. An inspector under this Act shall have power to do all or any of the following things, namely:—

- (1.) To make such examination and inquiry as may be necessary to ascertain whether the provisions of this Act relating to matter above ground or below ground are complied with in the case of any man.
- (2.) To enter, inspect, and examine any mine, and every part thereof, at all reasonable times by day and night, but so as not to impede or obstruct the working of the mine.
- (3.) To examine into and make inquiry respecting the state and condition of any mine, or any part thereof, and the ventilation of the mine, and the sufficiency of the special rules, for the time being, in force in the mine, and all matters and things connected with or relating to the safety of the persons employed in or about the mine or any mine contiguous thereto, or the care and treatment of the horses and other animals used in the mine.
- (4.) To exercise such other powers as may be necessary for carrying this Act into effect.

Every person who wilfully obstructs any inspector in the execution of his duty under this Act, and every owner, agent, and manager of a mine who refuses or neglects to furnish to the inspector the means necessary for making any entry, inspection, examination, or inquiry under this Act, in relation to the mine, shall be guilty of an offence against this Act.

992. *Mr. Gregson.*] In spite of the favourable report of the English Royal Commission? Yes.

993. What reason would you give for the insertion of sub-clause v in the proposed Bill? That mining has made great progress since then. We are now in 1895. A Bill was introduced into the British Parliament last April, providing that the roads must be inspected, and that is left out in the principal Act. The Bill I refer to provides that greater provision should be made for examining roads.

994. I am speaking of the powers of the inspector. Can you give me any reasons why sub-clause (v) should be provided in the New South Wales Bill.

[v] To require the manager to withdraw the men from the mine if at any time he finds that, by reason of inflammable gases prevailing in any mine or any part thereof, or of any cause whatever, the mine or the said part is dangerous; and no person shall, except so far as is necessary for exploration or inquiry into the cause of danger or the removal thereof, be readmitted into the mine or such part thereof as was found dangerous, until the same is stated by the Inspector to be safe.

Every person who wilfully obstructs any inspector in the execution of his duty under this Act, and every owner, agent, and manager of a mine who refuses or neglects to furnish to the inspector the means necessary for making any entry, inspection, examination, or inquiry under this Act, in relation to the mine, shall be guilty of an offence against this Act.]

?—Because we have seen cases where the inspector has not had power to withdraw men, and the consequence has been loss of life, or, if not, that men have not worked with the same confidence as they should have done.

994½. Are there not similar dangers in Great Britain? Yes, and with great loss of life, and if the inspectors had more power there would be less loss of life.

995. *Mr. Asquith*, in his Bill to amend the English Coal-mines Act of 1887, ordered to be printed by the House of Commons, on 4th April, 1895, does not make any provision in this direction (*see Appendix D*)? No.

996. In Great Britain where there is more risk of human lives, it is not found necessary to legislate in this particular? At the same time they have not got all in the English Act they ought to have. Very few Governments ride for a fall. It is rather a risky thing to interfere with legislation where so many interests are at stake.

997. You think the reason is not that it is not wanted, but because it is not expedient? Yes; the Ministry you have mentioned had only a majority of twelve.

998. You base your reason for the necessity of this clause upon the fact that there has been loss of life, or the chance of loss of life for the want of this power? Yes; for the want of greater powers for inspectors.

999. We will go now to the clause dealing with payment by weight, section 41, 38, on page 18 of the Bill. I have been looking at your evidence given before *Mr. Pigott's* Select Committee on 11th May, 1893, and I see that you were in favour of paying for every skip. Is that the general wish of the miners? I do not know of the general wish of the miners. It is a question of what ought to be.

1000. What are the feelings of the miners with regard to this matter? The time has come when they consider that they ought to be paid for what they send.

1001. What do you think the opinions of the men are generally? I believe they want every skip to be weighed. In weighing the skips, the skip to be weighed is let down as gently as possible. The screen is at the top, and the contents of the skip go down a screen with a three quarter of an inch mesh, and the coal is shaken up and down to take all the small coal out, but when the skips are tipped for putting into waggons, the skip is thrust down as quickly as possible. For the men it is well sifted before going into the weighbridge, but when going into their own waggons it is thrust down at lightning speed. When weighing for the miners, a scraper is run down the screen, and a large portion goes through the screen, but when not weighing coal, this is not done. A great deal of coal is taken from the men in this way.

1002. From whom? From the men. The owners have a great deal of the better end of the bargain.

1003. What does it matter to the miners as to what is done with the coal that is not weighed? If the miner's coal was treated in the same manner as the other coal, a greater amount of coal would go to their scale and get weighed.

1004. Might not that be an argument for having every skip weighed? Perhaps so.

1005. Is the method adopted agreeable to the bulk of the men? I believe the provision in the Bill before it was amended by the Legislative Council is. The Bill provides that "they shall be paid on the amount of mineral gotten by them, and according to the actual weight gotten by them."

1006. Are the miners content with the present system of weighing, or do they want every skip to be weighed? They want every skip to be weighed. They believe that the same law should apply to them as to any other class of men.

1007. The miners would not be contented, then, with any arrangement at all, but they must have every skip weighed; I want to get at the views of the miners generally? They believe that the fairest way is to weigh every skip. J. L. Fegan,  
Esq., M.L.A.  
2 Sept., 1895.
1008. Are they discontented with the present method of getting at the weights? A large number are.
1009. Are they discontented with the standard weight or with the standard bar? Both.
1010. Do you consider the two terms synonymous? No.
1011. Do you draw a distinction between the standard weight and the standard bar? Personally, I draw very little distinction.
1012. What is your opinion with regard to the views of the men generally? That they are discontented with both systems, but the greatest objection is to the standard weight.
1013. At the Wickham and Bullock Island Colliery are the miners not paid for all that they fill? They are paid for all that is weighed.
1014. Do they not weigh every skip at that colliery? No; it is an average.
1015. Can you say how the average is taken at that colliery? It is very seldom that they weigh twice in one day there. Say a miner sends two skips up, one 13 cwt. and one 15 cwt., the average there is 14 cwt.
- 1016-17. How do you arrive at the average? If one skip is 13 cwt. and another is 15 cwt., the average of the two is 14 cwt. If only one skip is weighed, and it goes 14 cwt., that is the average the miner gets that day. If he has a high weight he may get weighed sooner than with a lighter weight.
1018. In what way? The miners have what they call tokens, and they are known by their numbers, better than by their names. There are first, second, third, and fourth left-hand flats, and the weighman knows perfectly well the miners in those flats. As a rule, the men keep their turns, and the wheeler goes to No. 1 first, and so on according to their turn. We will say that Nos. 1, 2, and 3 are working ordinarily, but No. 4 is getting very high, the weighman will watch that No. 4 is weighed oftener, in order that he may pull him down. If he gets No. 4 at a low weight he will not ask for him to be weighed for some time.
1019. Surely it will not be to his advantage to get the light skip weighed? Yes; if he can get No. 4 on a light weight he will take good care not to get him again for some time.
1020. How many weigh-screens have you at the Wickham and Bullock Island Colliery? One weigh-screen.
1021. How many screens have you altogether? I think four or five, but I am not sure.
1022. What I want to know is where the unfairness of this system lies;—is the weigh-screen at Bullock Island kept going all day? I do not know.
1023. Is it not reasonable to suppose that it is kept going all day;—the weighman and check weighman are there all day, are they not? If the average of the colliery is low it does not pay them to weigh many skips. It is the master's weighman that calls for these skips, and he says, "I will have the second skip," if the cage holds two skips, knowing the side shift these skips come from.
1024. *Mr. Curley.*] Is there not an understanding at the colliery that the first skip that comes out of the cage is weighed one day and the last skip next day? To my knowledge there is not. I have heard the men talk of how long they can be kept on short weight. In some of the southern collieries they have only weighed eight skips a day.
1025. What for? Because of the low average. They run the risk of a bigger weight if they weigh more.
1026. *Mr. Gregson.*] Does that apply to collieries generally? It applies to some, but I would not say generally. I do not believe the owners and managers are all rogues.
1027. Do you not think if what you are pointing out obtained we should hear about it from the men—that the colliery manager would hear something about it? Objections have been made to colliery managers about it. There was a matter in connection with the Glebe Colliery at one time.
1028. *Mr. Curley.*] Was not that in reference to standard weight? Yes, and weighing altogether; and I know there has been a deputation from the men there.
1029. About the weigh-screens not being kept going? Yes; and in the southern districts there have been more complaints than one.
1030. *Mr. Gregson.*] You think the miners want every skip to be weighed? A large number of the miners want every skip to be weighed, and I believe it to be the fairest way.
1031. You also object to this standard bar? I object to anything that will take weight off men who send their coal up, with the exception of the agreement that is made with regard to stones or any refuse.
1032. Did you say during your examination that at the Wickham and Bullock Island Colliery the miners are allowed to fill to any weight? Yes; some of them send as much as 18 cwt., and some 10, 11, and 12 cwt.
1033. In the same skips? Yes; in the same skips.
1034. What height would a skip with 18 cwt. be? About 18 inches over.
1035. Suppose the miners were to fill 2 feet higher, and put 20 cwt. into a skip instead of 18 cwt., what would be the result? I believe 20 cwt. has gone in.
1036. Is there no limitation as to height? At that colliery there is no limitation as to height.
1037. With regard to the height, do you think it is unfair that there should be any limitation as to height? I think a reasonable height ought to be allowed to men, if they are so foolish as to fill skips like that.
1038. What is a reasonable height? The height of the roadways.
1039. What about other circumstances? The manager knows what his machinery will pull.
1040. Is it unfair for the manager to say what the height shall be? I think if every skip was weighed it would get over that difficulty very much.
1041. I am asking you with regard to the standard bar? Under the present system every skip is filled, believing it to be the one to be weighed, but if every skip was weighed it would take a great deal of this piling up away.
1042. You think it is unfair for the manager to limit the height that a skip should be filled to, or that the miners should fill the skip? No; I do not think it is unfair as long as the manager knows what his skips will carry, and here is a proof that there is no limitation at the Wickham and Bullock Island Colliery.
1043. Is all the coal there lifted through the shaft? Yes.
1044. And run into the cage? Yes; the cage is the limitation, but that is not reckoned upon. There is no bar at the top.

- J. L. Fegan,  
Esq., M.L.A.  
2 Sept., 1895.
1045. How is the cage built;—is there no horizontal bar at the top? It is so long since I have been there that I do not remember.
1046. Where are the cage fastenings? They are on the side, I think, but I am not sure.
1047. Are you aware that in some cages they have these fastenings from a horizontal bar at the top? Yes.
1048. You do not think it is necessary that there should be a horizontal bar? It may be necessary.
1049. What would a miner do if the manager told him not to fill the skips so full again;—would he lose the skip if he continued to fill high? No.
1050. Not if it happened frequently? No; he would not.
1051. At some of the collieries I think it is the fashion to take that skip from the miner? Yes; where the standard weight is.
1052. But where the standard bar is? Yes.
1053. And the miner loses that skip? Yes.
1054. Does the mine-owner get the benefit of that skip? In some cases yes, and in some cases no.
1055. What is done at Wallsend in that respect? It is put into an Accident Fund, to pay for any accidents that may take place at the colliery.
1056. That fund is under the control of the miners, is it not? Yes; it is under the control of the miners.
1057. Do you know any colliery where the skip of coal is in such a case as that not given to the accident fund nor to the lodge? Yes; at Lambton.
1058. Do you know of any other colliery? No; I do not, from my own personal knowledge.
1059. At Lambton, you say the colliery only gets the benefit of that skip of coal? In some instances.
1060. But not generally? No; not generally.
1061. Is there any rule at that colliery? There is standard weight there.
1062. What I want to know is, is there any objection to the system of having a standard bar? There is an objection to anything that is wrong.
1063. Is this wrong? I believe it is wrong. It is not fair that coal should be taken from the miner.
1064. You think that the miner should be allowed to fill coal to any height he likes;—is that fair? The question then would come as to what height he should fill. I think every skip should be weighed.
1065. Should it be for the miner to say what is reasonable or unreasonable? He should have some say in it.
1066. The discretion of the manager applies more to the weight of the skip, and the strength of his hauling gear, or do you think the miner should have a voice in that? The manager knows what his skips will carry, and what his ropes and chains will bear. The miner knows nothing about it.
1067. The discretion of the mine-owner should only apply to the weight to be drawn, not to the height of the skip? Height is weight. A certain height with a certain specific gravity is a certain weight.
1068. You apparently want the miner to have some say in these matters? If you are fixing a bar, the miners should have some say in it.
1069. Is it unfair to the miner for the manager to say I am putting a bar there, which is to be the limit of the height of the coal in the skip. I want to know whether you think that the discretion should be with the manager, or with the miner in regard to both these matters? I think the miner should have a say in both these matters.
1070. Will you turn to your evidence given before Mr. Pigott's Select Committee on the 16th May, 1893, and see what you say there at page 16 on this subject (*see Appendix R*)? Since the passing of the English Coal Mines Act of 1887, there has been another Act passed, making the Act much stricter with regard to the weighing question. It is called the Coal Mines Check Weigher's Act. It was passed in 1894. (*See Appendix E.*)
1071. Can you say what the provisions of that Act are? Provision is made to stop the manager from making a threat or a bribe, and for giving the check-weighman every facility to weigh coal, and for holding meetings for the appointment of a check-weighman.
1072. With regard to the coal-weighing, have you any recollection whether it applies to a mine where the weigh-screen is standing idle;—would it enable the check-weighman to say we must have another skip of coal? I believe it would.
1073. Will you turn again to your evidence given before Mr. Pigott's Select Committee, and look at question 195; in reply to Mr. Combes' question, your answer is: "What we know by the standard weight is this bar. We want to have that knocked off, and a man to get paid for what he sends up on the average. What is called the bar is the standard weight." In reply to Mr. Vickery you also say that the bar is the standard; your answer is ambiguous, and I should like to know your real opinion;—you did not understand the standard weight to be the standard bar? In my answer to question 209 I said: "Whilst the men are paid by the ton every skip should be weighed."
1074. You say that what is called the bar is the standard weight;—did you intend to say that? There is what is called the standard bar and the standard weight, and I tried to point out the difference.
1075. But that is not given in your evidence;—it reads as if these things were one and the same? Question 208 is ambiguous also.
1076. What we want to get at is, what is justice? Yes; justice is weighing every skip that comes out of the mine.
1077. You think there is an objection to the standard bar? Yes; unless the men have some say. Unless there is some agreement between the owners and the men.
1078. *President.*] Why do you object to this section [41] 38 of the Bill as the Council have sent it down; there are two things that are provided for;—they can have their coal weighed or make an agreement? The unfortunate position is that the agreement is all on one side.
1079. *Mr. Gregson.*] And which side is that? The owners side.
1080. I thought it was the other way? Unfortunately not. I wish it was.
1081. Will you look at subsection 3 of Rule [41] 38, on page 19:—"But nothing herein contained shall be held to affect the power of any owner or manager of a mine to pay miners by the method known as the standard bar system;"—you have a standard bar to prevent the skip being over filled? Yes; some of the collieries have a bar upon their weigh-screen, and when the skip goes on the kick-up, all the coal that will not pass under this bar is knocked off, although it has passed all the running gear, chains, and everything else in connection with the colliery. All the coal that will not go under the bar, is the owner's coal.

coal. Though the skip has passed all the tests I have mentioned, the pulley, the cage, the horse, the incline plane, and everything else, yet, when it comes to the bar, all the coal that goes under the bar is the miners', and the rest the owners'.

J. L. Fegan,  
Esq., M.L.A.  
2 Sept., 1895.

1082. That is the standard height, and the miner knows it is of no use to fill coal above that standard height? That is the regulation height of the colliery.

1083. In some cases the miners lose the whole skip? In some instances, yes, and in some instances, no.

1084. *President.*] You will agree that the terms in the Bill are wrong, that there is no such thing as paying by the standard bar? You are only paid for whatever will go under that bar.

1085. That is what is meant to be expressed in the Bill in the words, "By the method known as the standard bar system"? Perhaps so.

1086. *Mr. Gregson.*] As long as there is a height that the men know they can fill up to, and this bar is fixed as the height to which they should fill, do you think there is anything unfair about that;—do you object to it? That would depend upon the height the bar is put at.

1087. Suppose the men have agreed to a height? If the men have agreed, there is nothing unfair about it.

1088. In that case it does not matter whether the standard bar is on the kick-up or elsewhere;—do you see any difficulty in a mine filling to a certain height? I do not see any very great difficulty.

1089. Does the coal shake down very much? Considerably at times.

1090. It depends more or less on experience? Yes.

1091. Is there any difficulty in filling to a certain height? No; there is not very much difficulty.

1092. You are aware that in some cases there is a good deal of over-filling? Yes; in a good many cases.

1093. *President.*] Is not this standard bar a fair thing to prevent over-loading? As long as the men know of it.

1094. Surely they would not have a standard bar without the men knowing it? Sometimes they might, Mr. *President.*

1095. Would they not know of it after their first day's work? Oh, yes.

1096. *Mr. Gregson.*] But they are for filling over it? Yes; they are filling to keep their weight up.

1097. *President.*] Why do they lose the coal that will not go under the bar? Because there is a rule to that effect.

1098. What would be their object in filling the skips high? It is only a game of chance as to whether they get weighed or not, and every skip increases the probability. The miner thinks that the high skip might be the very one to get weighed.

1099. *Mr. Gregson.*] I think you expressed an opinion about the provision in rule 25 on page 29 of the Bill for preventing mine-owners from working under roads;—you said, I think, there had been cases in which roads had tumbled down to the peril of passengers? Yes.

1100. Do you know anything of the circumstances as to the ownership of the coal;—do you know whether the workings had been driven before the road was formed? The road was formed first.

1101. In such cases would the road be dedicated? It was in a municipality.

1102. With, of course, the right to support? Yes.

1103. In that case, who is responsible for affording that necessary support? In what way do you mean?

1104. In the case of any subsidence occurring? I should think myself the owners.

1105. The mine-owner first of all, is he not? Yes.

1106. And next to him the owner of the coal, supposing he is working under a royalty? Yes.

1107. It is in view only of exceptional cases then that this rule is inserted in the Bill? Yes; but it may become general.

1108. You have always the parties to come upon in case of damage? Yes; but when you have won your case you get very little out of it.

1109. A passenger would get very good compensation if he can show a good claim? In the case of tumbling through and breaking his neck.

1110. Has that happened? Yes, the road has gone in.

1111. Is the case you speak of a public road—a publicly proclaimed road? Yes.

1112. You understand the distinction? Yes; it is one of the main streets.

1113. Have you looked into this matter very closely? No.

1114. You think the public should be protected? Yes.

1115. In that I think everybody will agree with you? I hope so.

1116. *President.*] Assuming that opinions may vary upon whether eight hours should be a matter for legislation, do you not think that it would be more proper for the eight hours legislation to be embodied in a general Bill than to be embodied in a Bill like this. Here you are legislating for a certain class? No; I am not in favour of having this in a general Bill. I believe that the miners occupation is more dangerous than any other occupation, and where I would support it in coal-mining I would not support it in some other kinds of mining. Coal-mining is more unhealthy than other kinds of mining, perhaps with the exception of silver mining.

1117. *Mr. Gregson.*] Is coal-mining more unhealthy than gold-mining? Yes; you will never find gold-miners in a coal-mine if they can get anything else to do.

1118. *President.*] There would be no gas to contend with in a gold-mine? No.

1119. *Mr. Curley.*] With regard to cavilling, do you know of any collieries where no cavilling takes place? There is no cavilling at Greta.

1120. Do you know of any other colliery? No; I do not know of any other.

1121. Do you know of any place where the system is adopted that the miners cavil for a place, and that place is to be worked out until it is finished? No; I must say I do not.

1122. Assuming that you did know of a case of that kind;—there was some reference made during your examination with regard to tops and bottoms;—if a miner had to work out a middle section the whole length of his bord, and that was worse than the other two sections, the tops or the bottoms, is it just possible he might never obtain either tops or bottoms? Yes.

1123. He might fall sick, die, or have to remove? Yes.

1124. Would not tops and bottoms in such a case be like the payment of a promissory note? Yes, never to be paid.

1125. Is it the practice for miners to set their own timber? Yes.

1126. And to lay their own rails? Yes.

1127.

- J. L. Fegar, Esq., M.L.A. 1127. Does the Company provide them with anything like free houses? Not to my knowledge.
- 2 Sept., 1895. 1128. Does the Company erect houses for them? The Company sells them some land at ten times its value, and they have to go to the building societies, and get fastened.
1129. Have you seen some Companies declare high dividends? Yes.
1130. For an extended number of years? Yes.
1131. I understood Mr. Gregson to put a question to you with reference to working coal under a proclaimed road where you said that you would make the person working in the mine responsible, and the owner of the coal afterwards? No; the mine-owner and the owner of the coal.
1132. There may be a person that might have the coal leased? He would come under the heading of mine-owner.
1133. Had not the Linwood colliery a lease from the Wickham and Bullock Island colliery? Yes; but Wickham and Bullock Island were responsible, and had to pay the compensation.
1134. Were they held responsible in the last case that came before the Quarter Sessions some time ago;—it was a case where a persons house was injured? Yes.
1135. Do you recollect anything about that last case that came on? The case I know of was Goodchild's case.
1136. Do you think, with regard to the undermining of roads, streets, or property, or anything of this kind, that the owners of the coal should be made responsible for any damage that may be done—that the owner of the coal should be the individual that should be held responsible for any irregular working? In justice I cannot say that. If I take a lease of coal, and there are conditions attached to that lease, it is not the coal-owner's fault if I go outside those conditions.
1137. Should the coal-owner have an inspector to see that the mine is worked in such a way that no injury shall take place? I believe that provision should be made for the security of public property, but how to get at it I do not know.
1138. Would you hold both parties responsible? Yes.
1139. With regard to pillars, something has been said during your examination about a waste of coal;—is it not your experience that the larger the pillar the less waste of coal? Certainly.
1140. Even where you had left coal for the protection of property, with a view to keeping the surface up, could you not later on, if you wished to extract a portion of that pillar, do it with much more safety? Yes, and economy.
1141. And less injury? Yes; to the men hewing it.
1142. What has been the system of working in the northern district? Eight-yard bords and 8-yard pillars, apart from tidal waters.
1143. Has not the system been an 8-yard bord and 4-yard pillar? I have not seen them.
1144. Have you worked at any place to see them? No.
1145. You are not speaking from your own personal knowledge? No; I might have been mistaken.
1146. With regard to the question of weighing, is it not the rule at most of the collieries to call one skip one particular day and another the day following? Not to my particular knowledge.
1147. Can you let the Commission have a copy of the Check-weighers' Act you referred to? The Act is the Coal Mines (Check-weigher) Act, 25th August, 1894, chapter 52. (*See Appendix E.*)
1148. With regard to inspectors, do you think that any chief inspector, or any inspector, should hold any interest in the coal-mines of the Colony? Certainly not.
1149. Is there anything in our present Act (the Act of 1876) about inspectors holding any interest in coal-mines? Yes; in the twenty-seventh section, and there is something in the English Act too. (*See Appendix C.*)

[Witness withdrew.]

TUESDAY, 3 SEPTEMBER, 1895.

[The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.]

Present:—

FRANCIS EDWARD ROGERS, Esq., Q.C. (PRESIDENT).

JAMES CURLEY, Esq. | JESSE GREGSON, Esq.

Mr. George Henderson, Secretary for Illawarra Miners, sworn and examined:—

- Mr. G. Henderson, 1150. *Mr. Curley.*] What are you by occupation, Mr. Henderson? I am at the present time Secretary for the Illawarra miners.
- 3 Sept., 1895. 1151. Previous to your becoming Secretary for the Illawarra miners, what were you? Previous to that I was a coal-miner.
1152. How long have you been out in the Colony? For about ten years.
1153. Did you work in any coal-mines previous to coming to this Colony? Yes.
1154. Where did you work? In the North of England.
1155. In what county? In the counties of Durham and Northumberland, but in Durham more particularly.
1156. Can you give us the names of the mines you have worked in? In the county of Northumberland I was employed in the Wallbottle and Scotswood Mines, and in the county of Durham I was employed in the Urpeth, Ouston, Springwell, and Addison Collieries. I came from the Addison colliery to this country.
1157. At what age did you go into the mine? I was nearly 10 years of age when I went into a mine first.
1158. Have you been mostly coal-mining, or have you had other occupations in connection with mining? I have been in other occupations.
1159. How long were you coal-mining in England? I suppose something like about seven years getting coal.

Mr. G.  
Henderson.  
3 Sept., 1895.

1160. And what was the other work in connection with the mines you were engaged at? I have done everything that a boy would do in the North of England, such as keeping doors, preparing timber, and wheeling up, to getting coal.

1161. You have never been a deputy? Yes, I have in this country.

1162. You have never been a deputy in England? No.

1163. Was there any gas in any of the mines that you have worked in in England? Oh, yes; in nearly all of them.

1164. What was the general method of working in the collieries there? The general methods in the collieries I worked in were bord and heading, or bord and stall, and pillar working—extracting pillars.

1165. Do you know the width of the bords they worked there? I do.

1166. What colliery are you speaking about? I can give you the whole four. In the case of Urpeth, the bords were worked 6 yards wide.

1167. Can you tell us the width of the pillar in Urpeth? Yes; 20 yards.

1168. Do you know the depth of the Urpeth mine? I cannot say for a fact, but it is something over 100 fathoms (600 feet).

1169. Now, the next mine? The next colliery is Ouston.

1170. What is the system worked there? The system there is 4-yard bords, with a 20-yard pillar. The reason is that in these collieries they extract the pillars. They work their bords 4 yards wide, consequently the headways are each 20 yards apart, and so are the bords. Then, in bringing back the pillars, they leave 10 yards to the right and 10 yards to the left of each heading, with the consequence that they are able to take the whole of the coal out. It is a very safe system of working, and I presume that is why it is adopted.

1171. *President.*] That system is adopted by the management? Yes, adopted by the management.

1172. Do you know the depth of the Ouston mine? Somewhere about 240 feet.

1173. Feet or fathoms? Feet; it is a very shallow mine.

1174. *Mr. Curley.*] About what date would that be? About 1880.

1175. Now, about these other collieries? The Springwell Colliery is worked on the principle of 4-yard bords, but the pillars are not so thick. I think 16 yards was about the thickness of the pillars in Springwell. Up to the time I left I could not really say that they had really commenced extracting pillars to any extent.

1176. Do you know the depth of the Springwell mine? It is 175 fathoms deep (1,050 feet).

1177. Now about the Addison Colliery;—what was the width of the bords there? They worked there 4-yard bords, with 20-yard pillars, and the pillars were extracted in the same manner as I have previously mentioned—10 yards to the right and left of each heading.

1178. Do you know the length these bords were driven? Yes; they were 20 yards in length. There was 20 yards from bord to bord, and 20 yards from head to head.

1179. Was the 20-yard system the system there? Yes; that was pretty well the system in the North of England.

1180. That was in the county of Durham? Yes. In the county of Northumberland I did not get any coal. I was simply doing boy's work. I cannot speak about the mines there, because I was a boy at the time.

1181. How is the air conducted into these places;—take the first colliery? In every instance that I have mentioned the air is conducted by brattice into the face of each working place.

1182. What kind of brattice was used—cloth, or any other kind? In the case of Urpeth and Ouston, it was cloth brattice, and in the case of Springwell, it was tube brattice.

1183. *President.*] What is tube brattice? It is some sort of light iron composition. It is simply a plain iron tube, and one tube fits into the other like a water or gas pipe.

1184. *Mr. Gregson.*] What was the diameter? Two feet, or 2 ft. 6 in.

1185. *Mr. Curley.*] This tubing is put up to the roof? Yes; standing up upon any kind of trestles or trees placed horizontally close up to the roof, but in many cases they actually filled the seam from bottom to roof, owing to the seam being very thin. In the case of the Addison Colliery, we had there a system of cloth brattice, and to this  $\frac{1}{2}$ -inch tongued and grooved lining boards, and these were made pretty well the full depth of the seam, and then attached to the inside props.

1186. Fastening up against the props? Yes; and in the case of course of (say) the bratticing being back, owing to the length of this wide brattice—I cannot say for certain what that length was, but it was from 8 to 10 feet—and in order to provide against deficiency of air, each man who did use this wide brattice, had the piece of cloth brattice hanging always to the end of the wide brattice that had been erected. The deputy would tuck up this cloth brattice until there was sufficient room to erect another length of wide brattice.

1187. Was this brattice conducted from the end of the bord right up to the face? Yes.

1188. To what distance? When the front-shift man went to work at 4 o'clock in the morning, he found it within 9 feet of the face. It did not matter, whether in bords or in headings, the same thing obtained.

1189. What kind of system had you with regard to your work there in the morning;—what sort of system of inspection was there? We had to see the deputy at his station. The deputy went down the shaft to each section of the pit. There were a number of deputies—one deputy for each section—who went down the pit at 2 o'clock in the morning, and examined the places, and left their initials in the face of each place. Then the miners coming down at 4 o'clock had to wait at these particular stations until the deputy returned to give them sanction to enter the working-places.

1190. Did you work with safety-lamps there? In some cases we did.

1191. But whether you worked with safety-lamps or not, you had to see the deputy before you went to your place? Yes; no matter what you worked with you had to remain at the station till the deputy gave his consent to enter the working place.

1192. When the men entered the mine did they all go down uniformly? Yes; the front shift went down at 4 o'clock, and then the back shift at 10 o'clock.

1193. When did the front shift come out? As soon as the back shift men liberated them in the face.

1194. At what hour did the back shift men relieve them? The back shift men went down at 10 o'clock, and places in closer proximity to the shaft would be relieved more speedily than others. I should say that the farthest off of the men would be relieved, at the latest, by 10:30 o'clock.

1195. Were all these seams thin seams? Some of them rose to about 5 feet, but that was the greatest height in any of those mines I have mentioned, and many of them were as thin as 20 inches. 1196.

Mr. G.  
Henderson.  
3. Sept., 1895.

1196. What did these deputies do—what was their work apart from inspecting the colliery in the morning? Of course they had to meet every shift, after inspecting the colliery in the morning. The front shift deputy, after meeting his shift, may be erecting brattice or setting timber. That was really the make-up of their duties, except when the pillar had been extracted sufficiently for to admit of the timber being drawn, then the deputy, in company with the men who were working in this particular place would repair to the drawing of this timber. These were really the main duties of the deputy—seeing to the ventilation and the timber.
1197. With regard to the setting of that timber you have referred to. In the drawing out of those trees later on, the men would be paid some compensation for taking them out? Decidedly; the men were paid over and above their tonnage rates; they were paid really according to time. On some occasions the deputy and a man might be able to take the timber out of a pillar in (say) half an hour, but in other cases I have known it to be an hour and a half, and, of course, we were paid according to the time it took us to extract the timber.
1198. *Mr. Gregson.*] You set the timber? Oh no—the deputy.
1199. *Mr. Curley.*] Also the brattice? Yes, the deputy set the brattice. We set timber in this respect. Suppose the deputy was away, we had timber there left by the deputy, cut into exact lengths, and lids or slabs ready, as the case might be, and in the event of coming into contact with a little piece of dangerous roof the miner would, simply for the sake of protecting himself, erect the timber.
1200. *Mr. Gregson.*] Were you paid for doing that? Oh, no; that was a chance matter. Some days you might set a number, some days only two, and some days none at all.
1201. *Mr. Curley.*] The deputy was supposed to set all timber? Yes.
1202. Did the deputy put the roadway down? Yes; the deputy put the roadway down.
1203. In what mines have you worked in out here? I have worked more particularly in Mount Keira, and I have been working in Mount Pleasant, but I cannot say that I really worked at Mount Pleasant, because I was not sufficiently long there.
1204. Have you worked in any other colliery out here? Those are the only two collieries that I have worked in, in the Colony of New South Wales.
1205. That is at Mount Keira and at Mount Pleasant? Yes.
1206. What was the system of working at Mount Keira—the width of the bords? I have known them to be from 8 yards to 16 yards wide. They were any width and every width.
1207. There was no regularity in the widths? No; they were all turned away on the principle of 6 feet. You turned them away off the heading 6 feet wide. They were driven narrow for 6 feet, and then you commenced cutting your bord out, and in the case of some bords, they might go 8 or 10 yards wide, while others might be 12 yards, and up to 16 yards wide.
1208. What was the width of the pillar? I think some of them were very thin indeed. The same logic applies to the pillar that I have expressed with regard to the bord. In some cases the pillar might be fairly thick, whilst in other cases, it was so thin that several bords holed into each other, that is met each other on the rib side.
1209. Does the same thing apply to Mount Pleasant? I was not there very long.
1210. How long were you at Mount Keira? I was at Mount Keira from February, 1886, until July, 1891—five years.
1211. *President.*] With reference to what you say about these bords working into each other, is that a dangerous thing? I certainly consider it to be a dangerous thing.
1212. You consider it to be a very bad mining—not good management? That is about the only thing we can attribute it to.
1213. *Mr. Curley.*] In a case of that character, where a bord is cut too wide or too narrow, is it usual for the manager or the deputy to give instructions to leave some on, or take some off? That is the usual practice in all well regulated mines, and strictly adhered to.
1214. What would be the depth of Mount Keira—the depth of the cover? I should not like to commit myself to that answer; simply because I have never really heard the exact depth.
1215. You go in by a tunnel at Mount Keira, do you not? Yes, the cover there is all right.
1216. You cannot tell what the covering would be? No; I cannot say.
1217. You are a good way up the mountain when you go into the mine? Yes; but the mountain is very high.
1218. From what you have seen of mining in England, were the pillars in England kept to a uniform width? Oh, yes.
1219. And the bords were similarly kept? Yes; everything was operated upon as methodically as a piece of machinery.
1220. They were driven by line? Yes.
1221. From what you have seen out here at Mount Keira, would you consider that rather a loose system of mining? Certainly I would. I believe the mine is better now than it was in early times. I am speaking of my experience from 1886 to 1891.
1222. *President.*] Did things go on as badly there up to 1891? A change took place there with a change of management.
1223. Was the manager there a man who had passed any examination? I cannot say.
1224. *Mr. Curley.*] Were you in the Illawarra district when the Bulli explosion took place? Yes; that was in March, I think.
1225. Can you say anything about it? I was never in the Bulli mine.
1226. Have you read over the report? Do you refer to the report of the Royal Commission?
1227. Yes; has anything struck you in connection with the report of that Commission? Yes; several things have struck me very forcibly with regard to that report.
1228. What are they? I was very forcibly struck, from the report itself, with the very loose management that obtained at that colliery, also with the indifference displayed by the managerial staff in particular, in the presence of what they knew to be an explosive gas. I think that matter must strike any one who reads that report.
1229. *Mr. Gregson.*] I think everybody will agree with you, Mr. Henderson? I think so.
1230. *Mr. Curley.*] With regard to the ventilation of a mine, is not one of the principal conditions to have a good return? Yes; one of the principal conditions is to have a good return, and a very capacious one, too.

Mr. G.  
Henderson.  
3 Sept., 1895.

1231. Have you seen Inspector Rowan's reports with regard to the state of the return there (*see Appendix R*)? I have.

1232. About the end of the year 1886? Yes; you refer to where he reported the return to be literally blocked, and that he was unable to traverse the return on account of falls, and so forth.

1233. With a return in that condition, and knowing there was gas in the mine, what in your opinion should have been done under those circumstances;—was it wise to allow the men to continue to work on? Certainly it was not wise to allow the men to work on, knowing that this return was practically inaccessible, and knowing that there was fire-damp there.

1234. *President.*] Is the Bulli Colliery managed differently now? The Bulli Colliery has been managed vastly different since the explosion occurred. For about two years more or less, the colliery was not worked at all. It has been practically closed up till now. They are just now commencing operations with a view to re-opening the same mine again.

1235. It closed up for some commercial reason did it not? Yes; I suppose so.

1236. *Mr. Curley.*] In the case of the Bulli mine, do you think an inspector should be clothed with powers of definite authority? I certainly do. In that case, or in a case similar, an inspector who was clothed with the authority to stop that mine, would at least have saved the human lives from being lost, and have saved destruction of property likewise.

1237. Will you look at this work of Mr. W. Hopton's "Conversation on Mines," and see the reference there to the powers of an inspector—

In the year 1886 I took charge of the St. Helens Colliery, belonging to Messrs. Pilkington Brothers. The ventilation of the colliery was very bad. Only 19,000 feet of air per minute passed through the workings, and the mine gave off much explosive gas. The lamps in several parts were unsafe to work with, and the inspector found it necessary to stop some part of the mine. Gas came out of the workings now and then, and filled the safety-lamps hundreds of yards along the main pony roads. As soon as possible, however, I changed the up-cast shaft, and split the ventilating current into parts; this increased the air from 19,000 to 40,000 feet per minute. The men then found themselves more safe, and when I left the colliery over 500 miners presented me with a gold watch, chain, &c.

Do you agree with what is said there? Yes.

1238. That was in the year 1866? Yes.

1239. Before the passing of the English Coal Mines Act of 1872? Yes.

1240. Do you think, that in connection with the working of collieries, that for the safety of workmen, and for the safety of the mine itself, apart from any consideration of the workmen, that it is necessary that an inspector should have some definite powers or authority? I do certainly think so. I think that an inspector ought to have such power as will enable him in the presence of what he sees to be danger, to say we will stop it at once. It seems to me rather a ridiculous thing to imagine that a man in the position of an inspector should first of all discover the danger, and then have to report the same to the colliery manager, and possibly to the Mines Department also, and during the whole of this course of procedure that lives and property may be in danger. I certainly think that it is altogether rather an erroneous position.

1241. Do you know that there are other gases spoken of as being injurious to the men in mines? Yes, other than explosive gas.

1242. Such as carbonic oxide? Yes.

1243. And sulphurated hydrogen? Yes.

1244. And also carbonic acid gas? Yes.

1245. Do you think it requires a vigorous current of ventilation to keep a mine clear of these gases? Yes; apart altogether from the explosive element. Those gases are very deadly, and it requires good ventilation to keep up the sanitary conditions of a mine.

1246. Is it not a fact that lights will burn in the presence of some of these gases? Yes. I suppose lights will burn in all of them except black-damp—that is carbonic acid.

1247. *President.*] How is the presence of these gases found out;—do they have a noticeable effect at once? Some of these gases are found out by their smell.

1248. *Mr. Curley.*] Do you know whether this sulphurated hydrogen that is described by Mr. Atkinson has an odour of rotten eggs;—have you noticed that at all? Not particularly. Whilst not noticing it myself, I have known it perfectly well from the expressions of those who have come into contact with it. It was actually there, although it was not in the same portion of the mine that I was working in.

1249. Have you noticed heavy bodies of moisture in a mine that would wet your pick-handle? Oh yes; spots on your shirt like dewdrops.

1250. Wherever you had experience of that kind, did you consider the ventilation bad? Certainly.

1251. And very injurious to health? Yes, injurious to health also.

1252. We will now go to the Bill;—will you look at sub-clause III, on page 2, in the first part of the Bill—you will see there that the words "ten pounds" have been altered to "five pounds," as the amount of fine the owner or agent of a mine is liable to pay for every day during which the mine is worked without a manager? Yes.

1253. You will see what the intention of that clause is? I do.

1254. Do you consider that £5 meets the case? I certainly do not.

1255. *President.*] Would you leave it at £10? Yes.

1256. It is £10 in the English Act? Yes; I think £10 is quite a small enough fine. I do not think myself that such a violation ought to be tolerated in any shape or form.

1257. Murder ought not to be tolerated, but you can only punish the man who commits it? Yes; certainly.

1258. *Mr. Curley.*] With regard to the latter portion of that clause, in sub-clause C:—"A mine in which not more than ten persons are employed below ground shall be exempt from the provisions of this section, unless the inspector of the district, by notice in writing, served on the owner or agent of the mine, requires that it be under the control of a manager;" you will notice that the word "ten" has been struck out and the word "thirty" substituted for the number of persons;—what are your views on that matter? My views are that where ten men are working, they are as valuable proportionately as the thirty, and those ten men ought to be equally cared for as any larger number.

1259. *President.*] Is not the reason this, that where it was thirty persons, it would be a very small undertaking, and that there would not be the same danger as if there were more men employed? I do not know whether that is the reason or not; but I presume there is something of that kind about it.

- Mr. G. Henderson.  
3 Sept., 1895.
1260. In the English Act they say thirty persons? Yes; but still English Acts, as well as other Acts, sometimes are inadequate to meet certain cases, and we have the experience, of course, of English Acts and English doings, and we may take it for granted that we are becoming more enlightened over it, and on those grounds, when we think there is an inadequacy in any provision, we ought to supply it with an adequate provision.
1261. The reason is that thirty persons employed would be a very small number, and represent only the commencement of the mine, and if the mine is to be any good, more men would be put on under the control of a proper manager? I grant you that; but here is the matter of fact of it. A mine may be kept working for a considerable length of time with only twenty-nine persons.
1262. Exactly; then if that was so, would not the inspector require the mine to be under the control of a manager;—does not the whole of this provision simply refer to pioneering work? It is one of the most remote things to see a mine prospected with thirty men. In sinking a shaft there might be thirty men, but as soon as the ground is opened up you can depend upon it they can see what they are going to do. In the case of ten men, a man might start a little mine of his own, and work it with twelve, fourteen, or sixteen men, and possibly be a dairy farmer, and know more about milking a cow than keeping a coal mine right. Consequently, omitting the provision of ten, and inserting that of thirty, gives the man, no matter what his experience may be, an opportunity to go on drawing coal with this quantity of men. It may be all that he requires.
- 1263-4. If he was found to be regularly working the mine, the inspector would give notice and require a proper manager? Providing that the number thirty was left out, and the number ten left in, I think that would meet the provision, and prevent the possibility of that occurring.
1265. *Mr. Curley*] It would limit the danger to which you have referred? Yes.
1266. You think that the words "ten persons" should remain in the Bill for the reasons you have stated? I do.
1267. We will now go to sub-clause II, of section 5, of the Bill, on page 2 (*see Appendix A*);—there is an addition made to this clause, or at least recommended to be made, that makes the clause read altogether different to when it was originally drafted. You will notice that the words "three persons being owners or agents of mines in the Colony of New South Wales" have been put in, and you see the other persons mentioned in the sub-section to act as a board of examiners? I see no real necessity for the three persons who are to be owners or agents of mines in the Colony remaining in the Bill. I think the necessity lies in that portion being removed. I do not see why there should be any grounds to depart from the original composition of that board, but I see many reasons why the clause should not be altered.
1268. *President*.] You want a board of seven, instead of a board of ten? Quite so.
1269. *Mr. Curley*.] Do you think the interests of the owners would be as sufficiently looked after with a board composed of seven, as it would be with a board composed of ten? I certainly do.
1270. With regard to section 8, on page 3, of the Bill—"Qualification, and attendance of engine-man" (*see Appendix A*);—do you consider that that section is requisite? I certainly do. Of course, I do not profess to be in any shape or form an engineer; yet at the same time, as a practical man, my common sense leads me to conclude that this is an essential in a Coal-mines Bill.
1271. You know that an engineman holds a very responsible position? Yes; a very responsible position.
1272. There should be no doubt about his qualification? No; the lives of others are entrusted to him, and the property of the owners also.
1273. Have you known of many accidents in your district from overwinding? No; in our district there are only two mines where such an accident could occur, owing to the fact that all the other mines are entered by a tunnel on the mountain side. Only in the case of the Metropolitan and South Clifton mines have we winding engines and shafts, and only in the case of the Metropolitan Colliery could an accident against which this is a provision occur, simply because at South Clifton the men do not descend or ascend the shaft where coal is drawn, but go down to a travelling road which is entered by the side of the cliff to the coal-seam. That is the travelling road there for men and horses. In the case of the Metropolitan mine it is quite different. In other collieries I have known accidents caused by the cages being drawn up too far.
1274. *President*.] Would not the same dangers apply to England, as far as the engineman is concerned? They do exist, and have actually taken place.
1275. You refer to injuries through the engineman not being competent? The fact of accidents having happened in the hands of a competent man is sufficient to prove, conclusively, that no man other than a competent man should take hold of the handles, because I certainly contend that an accident happening in the case of a man who is thoroughly proficient, becomes more liable in the hands of a man who is incompetent. Winding a cage in a coal-shaft is a responsible thing, because every soul in a colliery is twice a day more or less under the sole control and in the hands of that individual.
1276. *Mr. Curley*.] You are aware that some of those engines are very sensitive;—that the most of the machinery about a colliery is sensitive? I have heard those men—who know what engines are—speak, themselves, of the difference of the machinery in that respect.
1277. You know also that the tendency at the present time is not simply to put the machinery that will answer the purpose altogether, but to put even more powerful machinery so as to make it effective and active? Yes, that is the tendency.
1278. *President*.] How many people in England go up and down these colliery shafts per day? In one of the collieries I worked in there were 900.
1279. Was that colliery worked by an engine? Yes.
1280. Was it a competent person who was in charge of that engine? Yes.
1281. Will not the mine-owners for the safety of the men and for their own safety have competent enginemen, but to make the engineman have a certificate of competency or service limits their choice. Are there not plenty of competent men that do not hold certificates? I do not know that, but I am inclined to think it is a sort of playing fast and loose to admit of men being competent that have no certificates. They may be competent, but I know that there are a vast number of men without certificates that are incompetent.
1282. Do you think that anybody would dream of putting a man in charge of a steam engine who was not competent? Here is a matter of fact staring us in the face. We know that the thing is tangible, and that it is essential to have a competent man there; then why not have a provision that will warrant his competency.
- 1283.

1283. At present it seems to me that the mine-owners would certainly see that the man was actually competent, although he has not a certificate. If their choice is limited they may have to get a man who is less competent than the men who have been in their mine. Mr. Gregson draws my attention to the part of the report of the English Royal Commission dealing with shaft accidents, which says:—

Mr. G.  
Hendonon.  
3 Sept., 1895.

There is no one of the dangers incidental to mining operations which has been so successfully dealt with of late years as that connected with the shafts. Collisions, breakage of ropes and chains, and falling of materials and of men from the surface, or from part way down, combine to make the list of casualties thirty years ago a very serious one. In the British collieries and ironstone mines the average of the ten years from 1851 to 1860 shows that one death resulted from these causes among 1,161 persons occupied. Between 1861 and 1870 the number of persons employed for one death was increased to 2,121. The years from 1871 to 1880 gave an average of one life lost for 3,557 persons, and the average of the last three years shows the notable improvement of only one death to 4,718 people employed.

There being no provision in the English Act, where they would have much more range of choice, it seems to me that it is a somewhat dangerous thing to put that provision in this Bill. If the mine-owners have to get a man with a certificate of competency and service, their chance would be limited? Practically, then, there is very little necessity for a man serving his time as an engineer, unless there is some provision made in order that that man can display his competency.

1284. After all, he is only an engine-driver? Yes. The report of the English Commission you have just quoted from is good, and we can all appreciate the fact it gives birth to. At the same time, I cannot for the life of me see that it destroys the contention that we put forward in this provision of the Bill.

1285. Will you look at Rule 24, on page 29 of the Bill?—

#### ATTENDANCE OF ENGINEMAN.

*Rule 24. In any mine which is usually entered by means of machinery a competent male person, not less than twenty-two years of age, shall be appointed for the purpose of working the machinery which is employed in lowering and raising persons therein, and shall attend for that purpose during the whole time that any person is below ground in the mine.*

By what possible standard is a man's competency to be judged? Are we to go by what his uncle Harry says?

1286. The mine-owners would, I suppose, advertise for a man with a certificate of competency or service, and know nothing about him, while they, for their own sakes, would not employ anyone but a competent person to lower and bring the men up—that is, for their own safety? I do not see how that would injure the case in the least. If a man is competent to drive an engine, he is competent to hold a certificate.

1287. As a matter of fact, he may not be;—he may have to pass some examinations, and there may be practical men in a mine who could not pass an examination;—I should not like to pass an examination now, but I have done so, and yet I may be competent;—surely the mine-owners would not put an incompetent person on to drive an engine? It does not do the man any harm to pass an examination.

1288. Suppose he cannot—that he is one of the old employees in a mine? That is one position above all others where, having the lives of men under his control, or, rather, in his hand, he ought to, at least, hold a certificate of competency; he ought to make himself acquainted with all the facts before him.

1289. *Mr. Curley.*] He can hold a certificate of service under this clause? Quite so. You see how it would operate against a man, who may be a thoroughly competent man, and a man who deserves a certificate of service; but, as the thing is not in operation, he does not happen to hold one, and goes along to a mine where an engine-man is required, and sets forth his application, but they do not know the man, and there is nothing to know him by. He is a good engine-man, but he has nothing to show that he is.

1290. *Mr. Gregson.*] You mean to say where a man has been employed, and left a mine. Does he not get a kind of certificate in the same way that a certificate is given now? He may do so, or he may not.

1291. Would they not always give him a certificate? If they chose they would, but if they did not choose, they would not.

1292. Do you know of any case where a man who is a competent man has been refused? I have known several strange things in my lifetime, but I would not say in the particular case of an engine-driver that I do know.

1293. You think that this clause 8, and also the original clause 9 on page 4 of the Bill should be retained? Yes; certainly.

1294. *Mr. Curley.*] Will you now look at sub-sections 2 and 3 of clauses 9 of the Bill on page 5 (*see Appendix A*). Do you consider that the whole of those sub-sections should go in the Bill? Yes.

1295. *Mr. Gregson.*] If now clause 8 on page 4 of the Bill will do you, you do not want old clause 9 with its sub-sections? I do not think that they both refer to the same parties.

1296. *Mr. Curley.*] One has reference to the certificate of a manager, and the other has reference to the certificate of an under-manager? Yes; clause 8 has reference to the certificate of an engine-driver, whilst the other clauses have reference to the certificates of a colliery manager and under-manager.

1297. *Mr. Gregson.*] Clauses 8 and 9 of the Bill, as originally drafted, are contingent on one another? Yes.

1298. *Mr. Curley.*] There is some reference to registration in sub-section 2 of clause 15.14 on page 6 of the Bill (*see Appendix A*);—as there is no provision in the schedule for registration fees, what is the use for inserting these words?—

1299. *Mr. Gregson.*] We need not, I think, keep the witness for this; we can consider this matter ourselves again.

1300. *Mr. Curley.*] Will you now turn to clause 17 on page 17 of the Bill, "Directions as to mode of conducting works to be entered in a book" (*see Appendix A*)? Yes.

1301. Do you consider that is a section of any utility in the Bill? I consider it is of very great utility. Certainly it takes a most comprehensive view of matters, but at the same time I do not know that we can show any stronger argument for its retention than by simply referring to the evidence of the manager and his officials given in connection with the Bulli Colliery Explosion Commission. It is quite evident from the report of that Commission, after taking their evidence, that the manager and his officials give conflicting evidence as to shot-firing and so forth; and on those grounds such a clause as this being carried into effect would afterwards leave reliable evidence in such a case as the one I have referred to.

1302. Where any important instructions have been given with regard to any mine, this would be a substantial regulation to be referred to? Quite so.

1303. Is the provision not necessary for two reasons—first, in consequence of the action of the consulting engineer in the position he occupies? Certainly it is.

Mr. G.  
Henderson.  
3 Sept., 1895.

1304. And also for the reason, secondly, that it would be some kind of distinct order to the manager under him? Quite so. That certainly is a very strong reason why the provision ought to be retained in the Bill. That reason is embodied in the reason that I have just given in connection with the Bulli explosion case. One man, being in a position higher than another, says, "I said so and so," and the other says something else; but if the matter was kept in a book they would not be able to get away from what has been said.

1305. *President.*] The Council say, in insisting upon the omission of this clause, that—

Apart from its impossibilities, some of the company's consulting engineers are not resident in the Colony, and whilst possessing an exceedingly competent manager at a high salary, here questions connected with the general character of operations at the mine are submitted for the consulting engineer's judgment, though he is resident in England, and it would be impossible for such a person to conform to this section. The same contention may be raised regarding a managing director or the Board governing a company; besides, no good object could possibly be obtained by such a record. If orders were given to the manager, his proper business—provided he did not agree with the instructions given him—would be to at once record in writing for conveyance to the authorities above him his objections.

If a consulting engineer is out of the Colony, how can he comply with that section of the Bill? If a consulting engineer was out of the Colony he would not be in a position to give orders for the *modus operandi* of the mine. He might from the plan say what sections ought to be worked, but other than that he would not be able to give definite instructions.

1306. *Mr. Curley.*] I suppose you can pretty well conceive that a manager under a consulting engineer has frequently very important work to carry out in connection with the working of a mine? I can readily conceive that it is an undesirable fact that such is the case, and upon those grounds there are strong reasons for the retention of the clause under consideration.

1307. *President.*] I would like to understand what the practical good of this provision in the Bill is;—how would it operate? Supposing I was the manager of a mine, and the consulting engineer told me to do certain things that I disapproved of; I suppose he would give those directions in writing, but whether or not, I should be always able to say that I all along differed from the consulting engineer in this, that he ordered me to do it and I carried it out.

1307½. I do not see the strong reasons for putting these instructions into a book; it is a bothersome thing to note all these things in a book, which is only to be open to inspection by an inspector or a Court;—how can this section be of any good to the men? There might be a difference of opinion, and the consulting engineer might say he said nothing of the kind. I do not think it will benefit the men, but it simply seems to be a thorough mine regulation.

1308. What is the use of legislation relieving the manager from responsibility? That clause would not relieve the manager from responsibility. The mere fact of putting a thing into a book would not relieve a manager from his responsibility between the employers and workmen. The mere inserting it in a book would never relieve him, provided that the accident was caused through negligence, but in the case of the accident being caused through orders from some party outside of the manager, then the effect of this order being inserted would certainly save the manager from having to bear the brunt of other people's mismanagement. In the case of a consulting engineer giving definite orders to carry out some regulation in that mine, and the manager not being of the same opinion as the consulting engineer, refusing to do so, but carrying the matter out solely upon his own responsibility, then the effect of the consulting engineer's writing would remove the responsibility of the accident from the engineer and on to the shoulders of the proper party.

1309. If the manager carried out the work wrongly, or badly,—although according to his judgment,—in opposition to the views of the consulting engineer, I do not see it would be stronger against him in any way. Would he not be liable;—why put any more responsibility on him? As in previous matters, when mistakes have occurred accidents have been the result of the mistakes, and Royal Commissions or some other method of investigation has been the result of the accident. When these things are brought to bear on the real accident there would be documentary evidence to show that certain things had been ordered, and it would not be a question of obliging an inquirer to get certain witnesses to refute other witnesses, but the facts of the case would be there for whatever tribunal might be appointed. They would have the facts of the case.

1310. *Mr. Curley.*] Do you see any reason why a competent consulting engineer, a man that is well able to look after this kind of work, should have the least hesitation to place on record any orders he might issue? No; not the slightest reason.

1311. *President.*] Is there any necessity to legislate about it, because the more detail you leave to be done assuming you give responsibility, the better? Yes, quite true; I certainly as a practical miner have always regarded the mines regulations of New South Wales as leaving altogether too much detail, hence the necessity for this amended provision. Matters that rule ought to be embodied in the Act, if the Act is to be complete. There are quite sufficient details left out in the matter of mining that must be attended to.

1312. To a certain extent you look upon the English Act of 1887 as a very good Act I suppose? Yes, but I do not say that it could not be improved upon.

1313. You are aware that they have not got this section in that Act? I notice that the objection raised to this section, with regard to consulting engineers living out of the colony, will never apply in England?

1314. If the consulting engineer does live out of the colony how could he enter such directions in the book? He has no right to be out of the colony if he has to conduct the mine. A man cannot conduct a mine if he does not see it.

1315. *Mr. Curley.*] In that case, where a consulting engineer was out of the colony, the manager for the time being would have to rely upon his own judgment, unless the consulting engineer had left certain directions? Just so. That is the consequence arising from the fact that in the Bill the more details that are left for other people to take the responsibility of, the better. In the case of a coal mine there are certainly a thousand and one details that never come within the four corners of the plan, and must be directed by the man on the spot.

1316. Will you now look at section [19] 17, sub-clause 3, on page 7, of the Bill—"Inspectors to hold certificates" (*see Appendix A*). Will you read the clause as originally drafted, and then as it has been amended by the Council? I certainly cannot see any reasonable grounds for the alterations made by the Council. I think it is quite fair.

1317. *President.*] Don't you think that an inspector should hold a first-class certificate of competency? Yes, and as good as it possibly can be in the case of an inspector.

1318. You would make it a first-class certificate? Certainly.

1319.

Mr. G.  
Henderson.  
3 Sept., 1895.

1319. You said that you saw no reason for the alteration of the section. When you included the words "first-class," you did not interfere with the section? I certainly intend that my evidence shall mean that every inspector under this Act shall, after the passing of this Act, hold a certificate of competency or service as hereinbefore provided to managers.

1320. Would you allow the holding of a second-class certificate of competency. Just turn to page 5, on page 2 of the Bill, "certificate of competency to managers and under-managers, commencing with, "There shall be two descriptions of certificates of competency under this Act" (*see Appendix A*)? Yes; but in the case of an inspector I regard the fact that we can only have one class of inspectors. There cannot be a first and second class for inspectors.

1321. Would you be satisfied with the inspector holding a second-class certificate? I would be satisfied with a certificate of competency. He is actually a man by himself.

1322. The certificate he is to hold is a second-class certificate—that is, of fitness to be an under-manager; the difficulty is that some of the men who make good inspectors would not be able to pass an examination; would it not be safer to say, "Every inspector shall hold a certificate of competency, or a certificate of service as herein provided with regard to managers?" But you see the placing of the word "first-class." I should like to see him be a thoroughly competent man as an inspector; but in the case of an inspector, a man who may have served well and a man who has been a thoroughly competent inspector in every respect, I think that man should have a certificate to enable him to retain the position that he holds.

1323. Then let him have either a first-class certificate of competency, or a certificate of competency for service; I am afraid we are getting into difficulty, for if you look at section 6 of the Bill, on page 3 you will see that a certificate shall be granted by the Minister to every person who satisfies the examiners? We want our inspectors as highly qualified as we can get them.

1324. So the Legislative Council have thought in dealing with this matter? Yes.

1325. A man might be fully competent and yet not be able to pass an examination for a certificate of competency. You think you might have a first rate man who could not pass this examination, and you want to qualify that man by some certificate of service? Yes; but in the case of new appointments, we want the very highest qualifications we can obtain in the case of a colliery inspector.

1326. *Mr. Curley.*] You would not object to an inspector who has practised for a considerable time having a certificate of competency? Certainly not.

1327. *President.*] How long would you have a man acting as inspector to qualify him for a certificate of service. Will you look at section 5, on page 2, sub-section 1, of the Bill "certificates of competency to managers and under-managers." Do you think an inspector should have a certificate after five years service? Yes.

1328. Then what do you say to this:—

Every inspector appointed under this Act shall, after the commencement of this Act, hold a first-class certificate of competency as manager, or shall satisfy the Board appointed under sub-section 5 of this Act that he has exercised the duties of an inspector for at least five years, whereupon a certificate of service as inspector shall be granted by the Minister, which shall qualify the holder thereof to be appointed an inspector under this section.

Does that satisfy you, Mr. Henderson? Yes, that is quite plain to me.

1329. *Mr. Curley.*] Now we come to section 21, with its five sub-sections, on page 8 of the Bill—"Powers of inspectors" (*see Appendix A*);—is there anything you see objectionable in that section? I see nothing in section 21 that is objectionable.

1330. You will notice in sub-section 3 that there are some words introduced into the latter part of the clause that were not in the previous Act;—I mean with regard to the care and treatment of the horses and other animals used in the mine;—don't you think that is a very humane provision? I certainly do.

1331. *Mr. Gregson.*] It follows the English Act? Yes.

1332. You will see that sub-section 5, of the clause under consideration, is not in the English Act? Is there nothing in the English Act with regard to the withdrawal of the men.

1333. If you will look on page 62, of MacSwiney's book on the English Coal Mines Regulation Act, section 42, you will see the provision made in that Act (*see Appendix C*)? Still I cannot, for the life of me, conceive why such a provision should not be embodied in that Act, as is here embodied.

1334. To require the manager to withdraw the men? Certainly; if an inspector happened to go into a coal-mine, and saw things whereby the lives of men through some circumstance or other were endangered, surely it would be,—I do not know what kind of an Act to term it—wrong for that man to simply go and look, and write to the department, and write to the manager, and things go on for a fortnight; and during that time the whole pit, and everything about it, may be closed up. Certainly there is no harm in giving an inspector power to require the manager to withdraw the men.

1335. *Mr. Curley.*] That would not necessarily mean the closing of the mine? Not at all; simply the withdrawal of the men from the mine, in order that whatever disabilities existed there in the opinion of the inspector might be at once remedied; and if the company or the manager thought that the inspector was wrong, well, I think they have the same power or tribunal as the inspector has if he thinks the manager is wrong, namely, the power of arbitration.

1336. You will notice in the latter part of the fifth sub-section that—

No person shall, except so far as is necessary for exploration, or inquiry into the cause of danger, or the removal thereof, be readmitted into the mine, or such part thereof as was found dangerous, until the same is stated by the inspector to be safe.

Yes; the inspector is certainly the proper party to examine collieries that might be found in a dangerous condition.

1337. Do you think that inspectors, as a rule, exercise their office in any imperious way? No; I have never seen anything like that.

1338. Would you now look at clause 22, 20, sub-section 1, on page 9 of the Bill (*see Appendix A*)? Yes; you will see that just simply strengthens the objection that I have already made to the idea of this provision being excluded from the Bill. Here are the words, practically, that I used, or the same sense. An inspector is a person who is interested in nothing else but his duty. It does not matter to him if one thousand tons or one ton of coal goes out of the pit; whether they are drawing or not drawing coal at all. He only has one duty, and that is to see that life and property, in so far as the regulations of this Bill are concerned, are preserved. He goes into a mine and says, "Here is something dangerous here," and the manager takes no notice. The inspector says, "I will see to getting that matter remedied"; and, possibly, there

Mr. G. Henderson. there is a rush of trade, and the manager inclines to the belief that the inspector sees things through a different pair of eyes to what he sees, and consequently goes on to provide for his rush of trade, and in doing so he is simply caught in the midst of an accident, because the inspector had to sit down and write, and lay the matter before the Minister of Mines, after telling the manager. The inspector saw the danger, but had no power whatever to prevent the accident.

3 Sept., 1895.

1339. *Mr. Gregson.*] What sort of a position do you think the manager would find himself in after the inspector had warned him of the danger? Within the provisions of this Bill?

1340. Far worse than that? He might find himself in rather a bad position.

1341. Do you think that any reasonable manager would do such a thing after being cautioned by an inspector? A manager is a creature of circumstances like most of us. He sees what is before him, and he knows what work he has to perform, and he is endeavouring to perform this in the case of the output of coal, and may reasonably conclude to himself that the inspector's opinion may be biassed, or that the inspector is altogether taking an exaggerated view of things. The manager may do it as reasonable under the circumstances in which he is placed, as reasonably as a man could do anything. That is why I think that this provision ought to remain. The inspector has only one duty; it does not matter to him what coal goes out, or what stress of work there is. An inspector having a duty goes to perform it, but a manager has many duties, and often it is his duty to get every shovelful of coal out of the pit. If not above all, this is one of the paramount ideas in his mind.

1342. Don't you think a manager knows his mine better than any inspector can possibly know it? I would not object to that fact.

1343. He would say the inspector thinks there is danger; I had better take some precaution, otherwise evil will follow? He might possibly do so, and at the same time see an order standing for five or six thousand tons of coal.

1344. He would never allow that to weigh with him in the face of the danger? He might not consider the order for coal as a matter of itself in the face of the danger.

1345. *Mr. Curley.*] For instance, Mr. Henderson, cannot you well understand this, that if an inspector sees anything that is particularly apprehensive with regard to danger, from any cause whatever, he is likely to draw the manager's attention to it? Decidedly so.

1346. And ask him if there is any possibility of getting this danger remedied? Yes.

1347. And don't you think he would do it? Decidedly.

1348. It would be the last thing an inspector would do, to issue any order to a manager for the withdrawal of the men? Yes, I think so.

1349. You know the very serious conditions under which some of the mines of this Colony are working? Yes.

1350. You know that gas exists in the Helensburgh mine? I do.

1351. You know that from hearsay? Yes, I know that from hearsay.

1352. You know from hearsay that several mines in the Northern district work under ocean and tidal waters? I do.

1353. Knowing these things, don't you think that circumstances may arise in connection with these mines, or in connection with any mine, where it may be absolutely necessary for the manager, or the inspector to order the manager, to withdraw the men? Quite so. I am under the impression that such circumstances might occur. In one or two cases I have been under the necessity, in coming into contact with apparent danger, of drawing the men at once.

1354. Was that as deputy? It was my duty to do it, and I performed it, and I made the matter square before allowing them to proceed with their work.

1355. *Mr. Gregson.*] You do not assume that an inspector must necessarily be a more experienced man than a manager? I assume nothing of the sort.

1356. He has got his experience, and derives his ideas from the teaching of experience? Quite so.

1357. So that each might be equally competent to pass an opinion, but have a different opinion? Yes.

1358. You do not look upon an inspector as a heaven-born legislator? Oh, no. I look upon him as a man, with simply one duty before him.

1359. *President.*] Supposing there was a case of doubt, you would not withdraw the men except in imminent danger? It is a matter of thinking there is danger.

1360. Suppose a manager thought there was danger in his mine, but the inspector came round, and, clothed with this power, said nothing through inexperience, don't you think that there would be a deal of harm done, risk run, and perhaps accident, through the manager feeling that this man is supposed to be a man of experience—"I will not withdraw the men as he has said nothing about it";—don't you think the men would run greater risk in such a case as that;—is it not better to give the manager all the responsibility you can;—under this Bill we are going to work under a new order of things;—take the case of an inspector with a tenth of the experience of a manager, and the inspector says, "I think it is safe enough," and there is an accident? We are not attempting to take the responsibility from the manager.

1361. But would it not? I fail to see now if in the opinion of the manager this man, passing by what he thought a danger, would justify his carrying on operations in the presence of the danger, and the accident happening. That would make it serious for the men who might be victims to the accident, but I do not see how that could occur, even if you gave the inspector power to withdraw the men in the presence of danger that would not warrant the manager keeping those men working when he saw the necessity for withdrawing them.

1362. *Mr. Gregson.*] Because when the accident has happened, he shelters himself under the inspector although having the power to withdraw the men? I do not see it. If you refer to the Bulli Commission, you will see that there is just the possibility that if the inspector had more power than what he had at that time, the accident might not have happened.

1363. The result of that accident goes to show want of proper discipline? Yes, that is the whole thing.

1364. *President.*] I am supposing that the Manager has a misgiving himself, that on his own responsibility, he would withdraw the men, but that the inspector comes and says nothing, or, "it is right enough;" then the manager goes on and an accident happens. Don't you think that it is far better to leave it with the manager? You are actually placing the inspector in a false position. It is not intended that the manager shall consult the inspector, nor that the inspector will in any respect advise the managers

on those matters. All that the inspector will do is to go round the mine, see what he can, and then draft his report. If, in the event of his going round, he comes into contact with some danger, the Bill aims at giving him the power to withdraw the men.

Mr. G.  
Henderson.  
3 Sept., 1895.

1365. I want to get at—suppose that a manager has a misgiving, and, left to himself, he would withdraw the men, but the inspector comes round, and the manager has a certain amount of doubt; the inspector does not withdraw the men, and the manager thinks his misgiving wrong, and, therefore, does not withdraw the men, and an accident happens? I see the point, but fail to see any difference in the manager's position in the case you cite, or in the manager's position when this becomes actual fact.

1366. Suppose an accident happened, and the manager to be tried for manslaughter, don't you think it would be the strongest thing in his defence that the inspector came round and gave no orders;—would it not be one of the first things to be brought out by counsel, and the inspector be called to say, "Did you give any orders to withdraw the men";—don't you think that would exonerate the manager? I do not say so.

1367. This provision is meant to prevent the loss of life? Just so. It would take a great deal to prove the man was negligent.

1368. Suppose some of the people in the mine say, undoubtedly, he ought to have ordered the men out, the circumstances warranted it, and these deaths could not have taken place;—don't you think the first thing in the man's defence would be that the inspector was round yesterday;—would not that be strong evidence in the man's favour? Certainly it would be strong evidence, but I do not see that it should go in his favour. Whilst the inspector had power if he saw the danger, this Act does not intend he shall have power to make the other man see the danger.

1369. Suppose you are the manager of a mine, and I come round as an inspector, and you know all, and I know nothing, I know comparatively little to you, and you have some doubt as to whether you should withdraw the men, you wait till I come round, and I may say nothing about withdrawing the men, would not that fortify your opinion about withdrawing the men;—don't you think the fact of my going round would make you inclined to think there was no need to withdraw them? It is a very fine point. It might incline me a little, yet it would not in any way take the responsibility of my action.

1370. *Mr. Gregson.*] What about the position of the unfortunate men? Very bad.

1371. *President.*] Would it not be a great deal worse if the manager, thinking the thing to be dangerous, allowed these men to be inside, by saying to himself—If this inspector had not come I should have had these men out? Yes; he has to think for himself. It is human to err, and he might err on the other side. He might be biassed with circumstances, and the silence of the inspector, or want of observation, or a difference of opinion; but still it does not relieve the manager from responsibility.

1372. Is it not good policy to throw all the responsibility on the manager, rather than to relieve him of any responsibility. He has control of the men. Is it good policy therefore to relieve him of any responsibility? Certainly not.

1373. Well, it does relieve him of responsibility to a certain extent. If no accident happens, well and good, but if an accident happens, it is a strong answer to be able to say, as I did not tell the men, neither did the inspector who came round and saw the same condition of things as I saw. Are you therefore going to say I was negligent? Don't you think that relieves the manager of a great deal of responsibility? I see the trouble, but it does not remove the necessity of giving this power to the inspector.

1374. In the case you put of a vessel loading a cargo of coal and wanting it in a hurry, you think if some danger arose the manager in his anxiety to do the best for his owners would be apt to underrate whatever danger might exist, to get out the requisite quantity of coal? Yes; that is so.

1375. Then, if an inspector comes round who has not the power you seek to give, and sees danger, do you think if the inspector said that the mine was in a dangerous condition, the manager would, no matter for what quantity of coal, dare to keep the mine on? He would dare providing this condition in the Bill was omitted or erased. I don't like to have it put in such hard language. I want to put it that in the face of that fact the manager might do it.

1376. Do you think he might venture to do it? I think that he might venture to do it.

1377. You think he might chance it? He might chance everything in order to get the quantity of coal he wanted out by a certain time, being biassed by the circumstances around him.

1378. I am putting it that the inspector has told him that the mine is dangerous;—do you think he would venture to keep the men in after that? Perhaps he might, on the strength of his own opinion.

1379. Then he would be a wicked man? I don't think so. You know there are different circumstances by which a man is surrounded in life, and especially at these particular times, that makes him do many things that he does not do out of wickedness. Inwardly he does not think they are wrong.

1380. *Mr. Gregson.*] The object of the Bill is to try and save life;—the question is whether the responsibility must be left with the manager, with the inspector to overlook him, or whether the inspector is to be given co-equal powers with the manager? I do not like that way of putting the matter. Whilst we are endeavouring to save life by increasing the responsibility of the inspector we are in no way attempting in any way to reduce the responsibilities of the manager; and, in fact, I don't think it would happen.

1381. *President.*] You must, however, look at the effect of it? I suppose we have all opinions that sometimes differ. We look upon inspectors and managers as being of equal knowledge in mining matters; consequently, neither one has a right to look upon the other as being his superior in these matters.

1382. You look upon an inspector as a man of equal knowledge and experience? Quite so.

1383. Take it in this way:—I, as a manager, am causing men to work at a place in the mine that I have doubts about being safe;—I am very anxious to get coal out for one of the reasons you have put, and, being an inspector, you go round and say nothing about that place being dangerous—don't you think that fortifies me in the view I am taking that there is no danger? I may be a colliery manager and say, "Well, now, this chap is an inspector, but I know just about as much as he does." The managers may take that into consideration, and for the reason alone that they do not look upon the inspector as being superior to them, they should put no reliance upon that fact. The manager looks upon the inspector as not being equal in knowledge to himself, and, therefore, they risk the contingencies.

1384. *Mr. Gregson.*] You will see from that Commission of Inquiry that sat in England that there is no suggestion that this added power should be given to the inspector;—they said a good many things, but this is not amongst them? Perhaps not.

1385.

Mr. G. Henderson. 1385. What do you think of the reasons given by the Legislative Council for objecting to this clause? They say:—

3 Sept., 1895.

Because the new clause, which is an exact copy of section 41 of the English Act of 1887, provides all that is necessary to enable an inspector to do his duty if he understands his work, whilst, on the contrary, if clause 21 was retained, it would hand over in an arbitrary way the whole of the mining operations of this Colony to the whim and caprice of, it might be, an incompetent inspector, and would give him too absolute a power, which is undesirable. The power he possesses now under the present Coal-fields Regulation Act is quite sufficient, if not too extensive; as it is, whilst the substitution of section 21 in lieu of the law as it now stands would endow the inspector with such substantial power that, a his will, he could ruin any mining company if he thought fit.

All he would require to do, without rhyme or reason, would be to announce to the colliery manager that it was his wish the men should be withdrawn from the mine, in which case 400 or 500 men would be thrown out of employment, and a repetition of what occurred at the Stockton Mine possibly be the result. In that case the mining authorities declared the pit unsafe, ordered the men to be withdrawn, and the men themselves, after some enforced idleness, petitioned the manager to be allowed to go back to work, as the mine was safe, notwithstanding the opinion expressed to the contrary by the mining authorities. The men went back to work, and have been at work for the last two years, in the face of the order that they should be withdrawn, and the fact that a prosecution was instituted against the manager for not complying with the mining authorities orders, the manager being fined for working, what was then alleged, a property which was unsafe, but which as has already been stated has been at work for two years since, and is at the present moment in operation.

That is a very strong reason.

1386. An arbitrary power which, if an inspector was a bad man, could ruin a company either by wickedness or mistake? I regard coal-mining as an industry that employs a large number of people, and a large number of others depend upon the employment of those immediately engaged. I contend that no such thing as an incompetent inspector should continue on the rolls of inspectorship.

1387. Mr. Curley.] With regard to that Stockton business, are you aware that there is a very large surface subsidence that has taken place since this report? I am not very well up in the facts of that Stockton mine.

1388. Suppose that you knew that the men were 300 feet down there below ocean or tidal waters, and that you had heard tell of a surface subsidence where the curb-stones, supports under dwellings, steps up to houses, &c., had fallen in, would you not regard that as a serious matter? I certainly would. I would have regarded that mine as no place for human souls to be in.

1389. Assume that the inspectors gave a report against the mine that they had been sent for by the manager, and that the men had been withdrawn and they would not enter the mine until it was safe, would that mean that the inspectors wanted to close the colliery? I would regard that as a stoppage of work for the time being only until the danger had passed away.

1390. Will you look at the report of the inspectors on the Stockton Colliery, to be found in the Appendix to Final Report of Mr. Fegan's Select Committee, page 45 (*see Appendix J*)? Assuming this to be true, I would say that the inspectors, in withdrawing the men, were doing what any sensible men ought to do. When the top was going, there was what we call a creep, and in the face of this mine being under tidal waters.

1391. The subsidence was under the streets, not under tidal waters? Whilst apparently it was not under tidal waters, no one was prepared to say whether it was under or not. I think it was a poor reference on the part of the Legislative Council. This matter ought not to have been referred to.

1392. Was it not tantamount to this, that unless you get a big sacrifice of human life, there is no reason that an inspector should have power to withdraw men? I think so. If you had taken all the colliery managers of New South Wales, they would have arrived at the same conclusion as the inspectors. Why experience goes to show that inspectors are generally very good men.

### WEDNESDAY, 4 SEPTEMBER, 1895.

[The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.]

Present:—

FRANCIS EDWARD ROGERS, Esq., Q.C., (PRESIDENT).

JAMES CURLEY, Esq.

JESSE GREGSON, Esq.

George Henderson, Secretary for Illawarra Miners, re-examined:—

Mr. G. Henderson. 1393. Mr. Curley.] Have you given this section of the Bill, relating to the powers of inspectors, and particularly the sub-section 5, upon which you were examined when we adjourned yesterday, any further consideration? Yes; at least I have considered the matter during the interval, but I have arrived at no other conclusion.

4 Sept., 1895.

1394. And that conclusion is that you think the section ought to remain in the Bill as originally drafted? Yes; I think the section ought to remain in the Bill.

1395. President.] Do you want all the short amendments in the sub-sections that are beyond the English Act;—in sub-section 1, for instance, there are a lot of words that are not in the English Act? The English Act does not mean any other than what this Bill means, nor does this Bill amount really to more than the English Act. It may be more definite. Under the English Act an inspector can go and inspect a mine when he chooses, but here it stipulates that he should make at least once in each month such examination. That is simply because it was necessary for the inspectors to look more frequently into the mines than what they have been doing.

1396.

1396. Do not you think that when proper inspectors are appointed, and they see what their duties are, that it is legislating too much in detail to direct all these things? Don't you think they would do this themselves without specifying it as in sub-section 1? Why is it necessary to tell them when they should visit a mine? Might it not be an objection that they would know when to look for them? Would it not be better that they should be on the lookout for them? Mr. G.  
Henderson.  
4 Sept., 1895.

1397. But not once a quarter or once a month? They have no knowledge of the day, consequently they might be looking for them on the first day of the month, and every day till the last day of the month.

1398. If you legislate to bind inspectors down to visit once every month, may they not get into the habit of parcelling out their work and be expected at certain times. That is my trouble. I am ready to give every power that an inspector ought to have, but it does no good to legislate in detail? We may admit of the truth of the evil, but sometimes it is better to legislate in that method with the intention and for the obtaining of the greatest good. We find at the present time that our colliery inspectors have very large areas to inspect, and they do not very frequently visit the collieries, may be it is absolutely impossible for them to do so. It certainly would be better provided that legislation of such a character was passed to ensure more frequent visits from the inspectors to the collieries even if in anticipation of keeping everyone concerned looking for the inspector coming. That would be a great benefit.

1399. *Mr. Gregson.*] How many inspectors have you in the South? One.

1400. And how many collieries? Eleven.

1401. And what is the greatest distance from one colliery to the other? Thirty miles covers the whole district.

1402. What are the duties of the inspectors in England, the number of collieries, and the distances they have to travel? They have a considerable number of collieries in England.

1403. Much more than thirty miles? Yes, in fact our own southern inspector is the inspector for the western district.

1404. How many inspectors are there connected with the Mines Department altogether? Four: Inspectors Rowan, Dixon, Humble, and Bates.

1405. Where is Mr. Bates? In the northern district.

1406. *President.*] There is only one inspector for the Southern district? Yes, only one; Mr. Rowan.

1407. Have they no inspector in the Western district? No; our inspector officiates in that capacity in the west right up as far as Cullen Bullen.

1408. How many coal-mines are there in the Colony? Sixty-eight in the Northern district, thirty-two in the Western and South-Western districts, and twelve in the Southern district.

1409. *Mr. Gregson.*] If your proposal is to hold good to that sub-clause as it stands, an inspector would be the whole of the month going his regular rounds in your district? He could not do it, and when we come to consider matters calmly, I think he has altogether too much work.

1410. You think, therefore, that there should be a larger staff? Certainly; when you consider the number of collieries in the South and in the West, and the amount of travelling, it seems as if he had altogether too much work to perform.

1411. Anyway, your opinion is that sub-clause 5 of Rule 21 on page 8 of the Bill should stand? My opinion is that it should stand as it is.

1412. *Mr. Curley.*] With regard to the discipline at the Helensburgh mine, do you consider that the standard of discipline at that colliery is of a high character? Yes, I certainly do, and I must say that I never in my experience knew of a colliery where better discipline existed than at Helensburgh.

1413. *Mr. Gregson.*] Is it daily inspection? Oh, yes; daily inspection.

1414. More than once a day? Oh, yes; more than once a day.

1415. How many times a day? I cannot say the number of times.

1416. Front and back shift? The miners all come up together. There are always deputies in the pit at all times.

1417. *Mr. Curley.*] Have they ever approached faults of any description in that mine? I think they have had one or two faults, but I am only speaking of what I have heard, although I have been in the mine. I have had the pleasure of going all round and having a look at it for myself.

1418. Have you heard of any large blower of gas being given off in approaching these faults? No; not of any large blast.

1419. Have you heard of any small blower? I have certainly heard that naturally she generates or gives off a quantity of gas pretty well at all times.

1420. Do you know how the fan is situated at the upcast shaft? I know it is situated there, and I have had the pleasure of looking at the fan at the top of the upcast shaft.

1421. Is the fan away from the shaft top? Oh, yes; a respectable distance.

1422. How far away? I cannot give the exact distance. This I do know, that I have comfortably located myself between the fan and the shaft, standing and looking into the upcast shaft.

1423. It is some yards away? Oh, yes.

1424. *Mr. Gregson.*] A matter of 50 or 100 yards? Oh, no. You mean from the coal shaft.

1425. *Mr. Curley.*] From either shaft? The fan is fully 100 yards away from the coal shaft.

1426. It is the other one I am referring to? In close proximity to the up-cast shaft. The whole arrangement is under the cover of the one building. They have a very powerful fan there—I suppose one of the most modern.

1427. *Mr. Gregson.*] A quick runner—a Schiele? I think it is a Schiele, but I would not be certain on that point.

1428. *Mr. Curley.*] It is not a Cappel? No, not a Cappel.

1429. *Mr. Gregson.*] Is the fan run outside the building? No, inside the building.

1430. What diameter is the fan—2 or 3 feet? The fan would not run in this room. I believe it is 32 feet.

1431. *Mr. Curley.*] Does every man in the mine work with a safety lamp? Yes.

1432. There are no naked lights? No.

1433. Are the lights all examined at the pit top or at the bottom of the pit? I think they are examined both at the top and at the bottom of the pit.

1434. Do you know the class of safety-lamps they use at that mine;—is it the Muoseler or the Meredith? I do not know which of the makers it is. Of course it is the new safety-lamp.

1435. One of the latest? Yes; one of the latest.

Mr. G.  
Henderson.  
4. Sept., 1895.

1436. Do you know of any mines in your district where there is no mechanical ventilation of any description, where there is what is known as natural ventilation without mechanical power at all? No; we have no mines of that class. We have two mines that are ventilated with fans, and the remaining mines are ventilated by furnaces.

1437. Are there any other mines in your district that give off explosive gas or fire-damp? We have a mine that gas has been frequently observed in—namely, the South Bulli mine. We had a fatal accident in that mine through gas.

1438. What time in the day did the accident take place there? I cannot speak with certainty, but I am under the impression that the explosion of gas took place sometime between the hours of half-past two and half-past four in the afternoon.

1439. Do you know any of the circumstances in connection with that accident;—how it occurred? Yes; I pretty well know the whole of the circumstances. It occurred something like this:—A man or two men were working in a bord, the innermost bord in a certain heading. On this occasion, when their empty skips were sent in they were put past the turn, and in order to pull the full ones out they had occasion to go out of this bord and proceed a distance into the heading, in order that they might draw their empty skips back. This heading had a little dip from the turn to the bord, down to the face, and the empty skips had no doubt been put past the turn by the wheeler, and had gone in towards the face. When this man came out of the bord to seek his empty skips—no man being in the heading at the time, the heading man having gone home two hours previously—the gas exploded and burnt the man, and death was the result. Of course it was all naked lights. Those, briefly, are the circumstances.

1440. Do you know if there was any bratticing in that heading? There was no bratticing.

1441. Do you know whether the men work with any safety-lamps in that mine? At this particular time, when the explosion occurred, I do not think there were any safety-lamps used in the mine.

1442. Do you know anything about the method of inspection there? No, I do not.

1443. Will you now look at section [22] 20, on page 9 of the Bill—"Notice by inspector of causes of danger not expressly provided against" (*see Appendix A*). Will you look through the section. You will see that the words "and enter such report in a book at the mine" are struck out? I take the view that those words should not be erased; I think that that is an absolute necessity. Once an inspector has made an examination, and finds certain things that are not satisfactory, having inserted the same in a book at the mine, no one can dispute the fact of the inspector having made the observation.

1444. *President.*] Do you think that all these things are required of the inspector;—if you go back to section 21 you will see in subsection 4 these words, "and shall enter in a book to be provided by the owner or manager a report of any defect, or anything in or about the mine tending to endanger the safety or health of the miners employed therein;" then in this section [22] 20 that we are at, "and shall state in the notice the particulars in which he considers the mine, or any part thereof, or any matter, thing, or practice to be dangerous or defective"? I think that is simply repetition.

1445. If you require inspectors to make all these writings how will they have time to do other work? But that is one essential part of their work. What is the use of having an inspector if, after having made an inspection, you have no record of the work done?

1446. The object of his inspection is to require any defect to be remedied, and report to the Minister if he sees anything wrong? At the same time we must admit that, having officiated in a very important capacity, it is necessary that he shall leave some trace behind him. He may simply make an inspection and say to the manager so-and-so is the case. The manager possibly misunderstands or misinterprets what is said. I am not prepared to say wilfully neglects the observations made by the inspector, but through some force of circumstances he simply does not put into practice what has been ordered by the inspector, and he actually says he did not understand the inspector to mean what he said.

1447. *Mr. Curley.*] Is there not a qualifying circumstance in the section that we are now at. The report is only an after question, provided the manager takes up some obstinate position? Quite so.

1448. *Mr. Gregson.*] There is no such thing in the English Act, and there are no complaints before the Royal Commission on labour. The whole policy of the English Act is different to what is attempted to be provided here. The English Act assumes that a man is going to do his duty, but you want a heap of things that they do not dream of asking. They expect a man to do his duty;—you want them entered in a book besides? Having an English experience I tell you that the difference between English and Australian mining is almost incredible to any man. Having an experience in both countries as a miner, I must tell you that the whole of the mining arrangements in very many of the collieries in New South Wales seems to a man who has gone through English mines a tin-pot arrangement that is almost intolerable. That is the only way I can describe it.

1449. That itself might be removed when the inspector has the large powers that both the proprietors and the miners think he should have; hitherto he has not had quick power, but if he has the power to say this or that is to be done he can see it is done? Undoubtedly it would do, and it is the intention, and will remove a great deal of the disabilities we see around about us. Yet provided that this matter remained in the section, this provision of entering such report in a book, is there any particular injury that would be brought to bear against or upon any individual by such course of action? I certainly believe any of the work entailed would not be so great as we imagine. It is only a matter of a few minutes. Look at our deputies that go round and inspect the mines in the mornings. They come out of the mines and there is a report-book placed before them, and they go into the office and insert their daily inspection in this report-book. It is a matter of only ten minutes. Having done that, there is a record of their inspection, lying open to the manager and every other official about the concern, and procurable if necessity requires it.

1450. I am coming to the necessity of the position of a deputy, or the pillar inspection, to have it recorded that so-and-so is there, but in the case of the Government Inspector is there not a difference? He comes two or three times in a month, or two or three times in six months, and as long as he sees everything straight what necessity is there for him to record it? He has to make his reports to the Minister. As far as the safety of the mine is concerned, what difference does it make about him entering his report in the book? One man is a private servant, while the other is a public servant.

1451. It is part of the discipline of the pit? Ought not that discipline to apply to the public?

1452. *Mr. Curley.*] Have you seen the section in the English Act on this matter to make a comparison between the two methods;—the section is number 42, sub-section 1 (*see Appendix C, section 42, sub-section 1, of English Coal Mines Regulation Act of 1887*)? Yes.

1453.

1453. You think that the clause we are discussing should remain in the Bill as originally drafted? Yes.

1454. Will you now look at section [27] 25, sub-section 18, of the Bill, on page 12 (*see Appendix A*); there is a proposal I think to embody something else in connection with that clause to meet the words "a Police or Stipendiary Magistrate, or a Barrister-at-law"; the proposition is, "or other person agreed to by the arbitrators," so as to make the position as wide as possible;—would you look at the amendment proposed by the Legislative Assembly in the Minutes of the Proceedings of the Legislative Council, 1st May, 1895:—

Mr. G.  
Henderson.  
4 Sept., 1895.

The Assembly agrees to the amendments in clause 27, but proposes to amend that on page 11, line 1, by omitting therefrom the words "a Police or Stipendiary Magistrate, or a Barrister-at-law," and inserting the words "or other person agreed to by the arbitrators," instead thereof.

? So far as the District Court Judge is concerned, I certainly believe it is the proper course to take, but I have never been favourable to Police, or Stipendiary Magistrates having anything to do with these matters whatever. I do not know that it would be to the best interests of either parties that they should have, and I certainly favour the idea of omitting a Police or Stipendiary Magistrate, or a Barrister-at-law, with a view to inserting the words "or other person agreed to by the arbitrators." Of course, if those persons choose to agree upon a Police or Stipendiary Magistrate, or a Barrister-at-law, I have not the slightest objection.

1455. Might they not agree to some gentleman that might not have any legal connection at all? Quite so. We have done so in cases in our own district.

1456. *Mr. Gregson.*] Suppose these words were all taken out, and it was agreed that any person appointed by the arbitrators should be an umpire; but if the arbitrators failed to agree, the Minister must appoint a District Court Judge? I think a District Court Judge is better than a Stipendiary Magistrate or Barrister-at-law. We had an experience of that in the county of Durham. I rather like to have an agreement between the arbitrators if possible; but if not possible, next in preference comes the District Court Judge.

1457. *President.*] What do you wish to say, then? And any person may be appointed as an umpire under this section; but, in the event of the arbitrators failing to agree, the Minister shall appoint a District Court Judge to be the umpire.

1458. *Mr. Curley.*] Will you now look at section [30] 28, sub-section 1, on page 14 of the Bill—"Plan of the workings of the mine" (*see Appendix A*);—what do you say to that provision? In giving you an individual opinion, it is one of those provisions against which there should not be any objection, because all colliery managers keep a plan of their workings.

1459. *Mr. Gregson.*] Not made up to date? In most of the cases the plan never gets very far behind.

1460. What is the provision in the English Act in this respect? I think three months.

1461. Your view is that it should be as speedy as possible? Yes.

1462. *Mr. Curley.*] Will you look at sub-section 3 of clause [30] 28 (*see Appendix A*);—you will see that this section is crossed out? I think if a plan is to be kept at all that it may as well be a plan. This section is, in my opinion, simply the carrying out of sub-section 1 that we have just passed.

1463. *President.*] But do you see the detail it goes into? The view I take is that it would not be a plan if these things in this sub-section were not there.

1464. What is the good of legislating for what this plan is to contain; the section is not in the English Act, and they are very careful in regard to these matters;—there is such a tremendous amount of detail? Yes; there seems to be so.

1465. *Mr. Curley.*] Is it not possible that an inspector may inspect a colliery and look at the plan, but that there might be a creek on that estate on the surface workings of which he knew nothing;—he might look at the plan of the internal workings, but that plan would not indicate it. It might be a lagoon of which he would have no knowledge? Quite so.

1466. Is there any undermining down in your district—the undermining of streets, roads, or districts? I know something about it, but up to date we are not troubled with that kind of work. We are penetrating the mountain side.

1467. But do you not think it is a very desirable thing? I certainly think so. Our municipalities are down below the coal; but I certainly think that, in view of the fact that collieries are working under houses, roads, bridges, rivers, and so on, that this provision is really a necessary provision under such circumstances.

1468. It is necessary in the interests of the general public? Decidedly.

1469. *President.*] Would not this answer your purpose, Mr. Henderson, to add on to sub-section 1 the latter part of sub-section 3—"and in addition to the plan hereinbefore provided for there shall also be so provided, if required, a surface plan on the same scale showing thereon all streets, roads, buildings, creeks, rivers, bays, swamps, navigable waters, and limits of any tidal waters within the said boundary"? Having provided for a complete plan, that can only mean that the shaft and everything connected with the workings of the colliery must be shown on some plan or plans.

1470. *Mr. Curley.*] With the knowledge that we have that some of our mines are working under tidal waters, do you not think that it is almost absolutely necessary to know the kind of strata gone through, and that the inspector should be fully informed of all these matters? Yes, I do.

1471. So that he should always know of the possibility of any danger? Yes, certainly.

1472. *Mr. Gregson.*] The objection is putting too much information on one sheet? I am not satisfied to leave anything out where it is believed there is public good to be derived, especially as in the latter part of sub-section 3.

1473. Do you not think that the latter part of sub-section 3 might be added to sub-section 1, and the first part of sub-section 3, down to the words "or bore-hole," be struck out? Yes.

1474. *Mr. Curley.*] You believe that there should be a surface plan? Yes.

1475. And that that plan should indicate the bore-holes? Yes; I do not make it imperative which plan should indicate the bore-holes. I do not think it matters much on which of the plans they are shown.

1476. But they should be shown? Yes; certainly they should be shown.

1477. Will you now look at sub-section 5, of Rule [30] 28, on page 14 of the Bill [*see Appendix A*]. You will see that the words "or tracing" are erased in that sub-section? I do not see any necessity at all for the words "or tracing." It is quite evident that all that is wanted is comprehended within the meaning of sub-section 5, without the words "or tracing."

Mr. G.  
Henderson.  
4 Sept., 1895.

1478. *Mr. Curley.*] Perhaps the Commissioners will deal with this matter later on? It does seem as though it was an entirely new departure when coming to the words "nor shall such plans." Plans should, perhaps, read "copies," be open to inspection, &c.

1479. We now come to section [31] 29, sub-section 1, on page 15 of the Bill (*see Appendix A*). You will see that the word "serious" is inserted; that is a new word inserted that is in the English Act; Mr. Fegan and Mr. Cook do not want this word left in? Whilst the English Act has the word "serious," it may really mean exactly what we want to mean by leaving the word serious out, because you can depend upon it that reports of all accidents in England, no matter what they are, are always made.

1480. *President.*] The clause in the English Act is No. 35, sub-section 1, and reads (*see Appendix C*). The argument, so far, is that this word "serious" should be left out of the sub-section? I cannot, for the life of me, see why the word "serious" should be inserted at all, because, as a rule, we look on some kinds of accidents as being very small accidents indeed which ultimately turn out to be grievous and serious.

1481. Supposing a man got his hand slightly scalded or his finger hurt, this would necessitate sending in this to the Minister; whatever slight accident happened would have to be reported; do you not see that this is tremendous detailed legislation; surely no humane man would, if there was an explosion which caused personal injury, be likely to say it was not serious personal injury; I think it is well to follow what we have here in the English Act; there are a thousand and one different accidents that may happen: one man may throw a piece of coal on another man's toe, and is that to be reported; if you say "any personal injury," that would have to be reported; the object of the section is, where personal injury occurs through a serious thing, such as a gas explosion or the explosion of a boiler, the injury is to be reported; but in other cases you do not report it unless the injury is serious; in the case of an explosion, no matter what the injury is, it does not matter how slight, it must be reported, but you need not do it in other cases unless the injury is serious? But, Mr. President, I do not think that these slight matters that you have referred to really come under the heading of an accident at all.

1482. It is personal injury? Here is a matter of fact: We will depart from theory for the present. Say that there are two men loading a skip, for instance; one man happens by accident to knock a piece of coal on to his mate's foot. The accident or injury is one of those momentary things that will cause an amount of pain for a day or two, but it will not prevent the man from following his occupation, and so long as it does not do that it is never considered a personal injury. So soon as an accident or injury occurs that is calculated to throw a man out of employment—we never have any knowledge of what the nature of it will be, and especially if the man may have a little bruise—it ought to be reported. I have in my mind a man whom I know, a fine fellow, who fell on the side of a skip—that, of course, would never come under the heading of a serious accident, simply because the man stumbled—however, he finished his day's work and came out of the pit, mingled with his fellows, and came back to his work the next day. He followed out his work next day under some little disability, through pain in his ribs. That night he came home and felt his injury very much more serious, and it happened that nine or ten months lapsed before that man was able to put his feet to the ground, all traceable to that little personal injury.

1483. *Mr. Gregson.*] What would have been the good if that accident had been reported? I do not know.

1484. It was not discovered at the time to be a serious personal injury? I am giving an illustration of what may possibly occur in other cases.

1485. What would be the good of reporting an accident of that character? We know it is better in all cases to have records of injuries, and how they take place.

1486. A mere accident of stumbling? Oh, no! Here, in this sub-section, we have it plainly, that this only means that it shall be reported within the twenty-four hours. If the injury is such as of course would not be felt within the twenty-four hours, then the necessity of reporting it, or the possibility of reporting it in the twenty-four hours, goes away.

1487. *Mr. Curley.*] Do you think that one-half of the non-fatal accidents are reported? I do not think they are.

1488. *President.*] In the 28th section of the 1876 Act they have mixed these accidents up; but in the present Bill they have separated them? In the present Bill they have followed the English Act, and the framers have carefully considered this.

1489. *Mr. Curley.*] Do you know, Mr. Henderson, yourself, of any accidents that have turned out to be serious that have never been reported in your district? I cannot say I know of any other accidents.

1490. *President.*] The accident you have mentioned no one would have thought of reporting;—if you had this Bill you would not have reported that accident;—the man was able to go to his work next day? Yes; I have pointed that out.

1491. *Mr. Curley.*] If a man was knocked down by a train of skips on the engine plane, and some of those skips passed over him, and he had to have some of his fingers amputated, would that be a serious personal injury? Certainly it would; and that accident or injury ought to be reported. Taking the Report of the Department of Mines for 1894, the injuries that have taken place in the southern district correspond with those we have ourselves taken; so that all accidents that we really know of have been reported up to date, and I certainly think they should continue to do so, but in the case mentioned by Mr. Curley there was great neglect of duty somewhere.

1492. *President.*] That is no argument about this section; this section of the Bill provides that, if hurt by accident, it must be reported? As a matter of fact, those words that are inserted here in this sub-section with certain managers bear such wonderful construction; and whilst I think that the case mentioned by Mr. Curley was a strict dereliction of duty, if we had the person who ought to have reported it, he might think it was not sufficiently serious to come within the terms of the Act.

1493. *Mr. Gregson.*] My experience is, that on the chance of accidents being serious they are reported.

1494. *President.*] Is the inspector of the district, if you put in any personal injury, to have a report sent to him if a man has a bit of skin knocked off his hand, or if a piece of coal falls on his toe: is that to be reported;—is that to be reported unless it occurs by reason of an explosion? That is all right, but I will have you to understand this, that here in connection, say, with the Southern District Report of the Department of Mines, page 100 (*see Appendix L*), when this report was drafted, Mr. Rowan was very careful in considering the matters reported to him, knowing that in the future he has a report to submit to his Department, and that it is just possible that that report might come into the hands of Mr. Henderson, or any man placed in the same position as myself, and he would investigate that report, and if Mr. Rowan's report is what Mr. Henderson could prove to be incorrect there is a possibility of things becoming

becoming very unpleasant for the inspector. In that sense they would not dare to depart from their duty because of the smaller accidents that come in. There is no possible chance of injuries such as bits of skin coming in. They cannot know that they have actually taken place, and you cannot by law force a man to know.

Mr. G.  
Henderson.  
4 Sept., 1895.

1495. The injured workmen will never complain? No. Why we object to the word "serious," if you can call it an objection, is because, as Mr. Curley has pointed out, we sometimes come across matters that ought certainly to be reported and that are actually neglected.

1496. Do you think this matter of sufficient moment, when you see the distinctions drawn between these accidents, to have care about whether this word "serious" should be in the sub-section the way it is put here;—in one case accidents must be reported, but in other cases they must only be serious? I do not consider it myself of very vital importance.

1497. *Mr. Curley.*] I know at the time it was pointed out, that in a matter not being reported at a certain time, that if you had to bring a notice against a company that had to be given at a given time? Yes.

1498. *Mr. Gregson.*] There is no complaint about this word in the English Royal Commission of Investigation? It is a well-known fact by the number of accidents that are reported, and the circumstances, that they are pretty well all reported, save and except those that we have been conversing about—little bits of an injury that a man would not take the slightest notice of—but all other injuries are fairly well reported.

1499. *President.*] Would you make them any more reported by leaving out the word "serious";—take the case put by Mr. Curley, would that accident have been reported any more under this section? A man, with the word "serious" left out, may say "it is a part of my duty—this is a personal injury," and might have reported it.

1500. *Mr. Curley.*] In the section we have been considering there are the words "forthwith, but not later than within twenty-four hours"; even with the word "serious" the Council still objects to having these words in? What is the difference?

1501. I want your opinion about this? My opinion is that there is not sufficient difference between the wording "forthwith but not later than" and "within twenty-four hours." There is not sufficient difference in the construction to cause any comment.

1502. You are satisfied with the wording "within twenty-four hours"? Quite satisfied.

1503. We come now to section [32] 30, sub-section 4, on page 15 (*see Appendix A*). You will see that we come to the same word again in this sub-section; but on this occasion it is not in connection with twenty-four hours, but one month. Will you give us your views on this alteration?—

1503. *President.*] The wording in the English Act is "within two months"? I do not think the words "one month," ought to be in this sub-section at all. I think the word "forthwith" is really the most applicable to the circumstances. Why should there be a month intervening between the time of commencing a mine, or of shutting-up a mine—between the time of doing so, and the inspector being informed of it. I certainly think the words "within one month" are entirely out of place.

1504. It leaves it a question as to what "forthwith" means? Yes. I think it really ought to be within a much less period than one month, because I do not see any necessity for one month to intervene. The object is simply to inform the inspector that the mine has been abandoned; that some part of the mine is going to be commenced; or that a mine having been abandoned is going to be re-started; and this provision, seeing that the Coal Mines Regulation Act applies to coal-mines, is really an essential that must be carried out; and I see no reason why one month's grace should be given for any such act, because if a colliery was to be started, or they wanted to start it, a manager, or some one for the head manager, in some respects, could notify the inspector, surely, within seven days, anyhow.

1505. What is the object of their having notice in such a violent hurry? The object in commencing new seams is, that the inspector may at once proceed to the scene before this work is commenced. That ought to be the method of inspection in that case.

1506. Would they get very far in a month? It all depends on circumstances. It might be that a large section of a pit, for instance, had been standing for a number of years, and all at once they intend commencing, or re-commencing, this section. Whilst they would not get very far within a month, they could pop in forty or fifty men in that section. Hence the inspector, knowing all about it, as speedily as possible goes there in order to be acquainted with the system of ventilation necessary for that section, and all other matters appertaining to mining.

1507. Practically, the manager or owner has to give notice; but it does not say how? No; but it has to be done within one month, and I take it that this word "forthwith" was inserted, whatever we may construe it to mean, to provide that the thing should be done at once.

1508. Suppose we make the wording "fourteen days," instead of "forthwith," making it so that you can bind him down to it;—is fourteen days enough?—

1509. *Mr. Gregson.*] In the English Act it says, within two months. My only reason for adhering to those words is that unless some reason is shown why the system followed in England should not be adopted, we ought to follow it here? I do not think it really matters much.

1510. *Mr. Curley.*] We will now go to section 36, on page 17, of the Bill, "Hours of employment" (*see Appendix A*). You will notice that this section has been erased by the Council; do you consider that this section should be erased? Certainly not; I consider the section ought to remain as at first proposed, for very good reasons too.

1511. What are the reasons? Some of them are that really I am of opinion—and I think we all agree to the fact—that almost nature herself so designed it, that a man should work eight hours a day. It seems to be quite the natural thing for us to do so, and we find that in endeavouring to get this, which seems to be a very natural provision, we are blocked on every hand, and instead of being called upon to work the reasonable eight hours' shift, we have coal-miners, whose occupation we know is very far from being a pleasant one, called upon actually to go into the pit, and the manager of the pit will say to them, "now you stop there till I send for you to come out again."

1512. What are the circumstances in your district—the time of working at the different mines in your district? I am sorry to say that we have no real general custom. For instance, at Helensburgh we work one shift about eight hours and three-quarters, or nine hours per day—getting on to nine hours.

1513. What time do the men come in? At 8 o'clock, or half-past 7—from half-past 7 to 8 o'clock, and they come out again at 4:30 at night.

1514.

- Mr. G. Henderson. 1514. That is nine hours? Yes.
- 4 Sept., 1895. 1515. *Mr. Gregson.*] Is that from bank to bank? Yes; it may extend a little longer than nine hours from bank to bank. There are other mines where no hours of labour practically are recognised at all, but it is a question of blowing the whistle, which is to inform men that they are wanted at the pit, and it is not a miraculous thing for a man to go into the pit, and be told by the manager that he is to stop there until he is sent for.
1516. Until he is sent for? Yes; until he is sent for.
1517. *Mr. Curley.*] For how many hours is that? In some cases sixteen hours, and in this period of the nineteenth century.
1518. *Mr. Gregson.*] At the face? Yes, at the face. I have known a man, after he has been about fifteen or sixteen hours at the face, to be allowed by the manager to go home and get a little bit of tucker, and to be told to get back straight to the pit again, and do another eight or nine hours work. The manager has allowed him to come out, but compelled him to go back.
1519. *Mr. Curley.*] Under what circumstances was this done;—were there any special circumstances? The only circumstances that I can imagine or conceive of are these. There is not very much rolling-stock, and it is a question of making rolling-stock of flesh and blood. A steamer comes, and a quantity of coal is required to load that steamer. The mine may have been idle, but a steamer comes into the jetty, and the quantity of coal that is standing in the waggons is placed on board the steamer; then it is a question of getting the men to work, and keeping them there until that steamer has received the whole of her cargo, or the quantity she came for. The men are, practically, the rolling-stock.
1520. *Mr. Gregson.*] Then you do not have a steamer every day;—you get a long spell? We do not have a steamer every day.
1521. *Mr. Curley.*] Can you give us the prevailing general custom in your district? The general custom is that the collieries shall draw coal from 7 o'clock in the morning until 5 o'clock at night—ten hours per day. That is the general system.
1522. *President.*] In all of the collieries? In all of them, save and except Helensburgh, and that colliery works on the conditions that I have stated, but the other collieries are supposed to draw coal from 7 o'clock until 5 o'clock—ten hours a day. They draw coal often a good deal longer than that.
1523. *Mr. Curley.*] They exceed that time occasionally? Yes; in fact, there are one or two collieries who seem to never for one moment come within the limits of general custom. Almost every day they work outside the limits of general custom. They start at 6 o'clock in the morning, and work till 7 o'clock at night, and never seem to come within the limits of general custom.
1524. *Mr. Gregson.*] Are there any young people under the age of 18 years, employed for this number of hours? I am inclined to think there are.
1525. If so, it is an infringement of the Act? I am inclined to think the Act is infringed.
1526. Well, you know there is a remedy? Yes, I know; if you can get at them.
1527. *Mr. Curley.*] If a man or boy refuses to work what is the alternative? The alternative is to clear away, there is another man or boy for your job. That is why the hours of labour are in such a complicated state in the Southern district.
1528. *President.*] Do you know of any other place to which that applies? Well, I know several places where they have tried, but where we have up to date succeeded by organization in preventing them from bringing such exacting conditions upon us. I will give you an example. Here is a notice posted up on one of the mines in the Illawarra district, on the 15th day of June, 1895.

## MOUNT KEMBLA COLLIERY.

15th June, 1895.

FOURTEEN days from this date miners and other workmen employed at this colliery will be required to work on Pay Saturdays for such number of hours as the exigencies of trade demand, and to start work at any time up to 9 a.m., as on other days when required, and employment will be subject to acquiescence in this rule.

J. H. RONALDSON,  
Manager.

This only applies to Pay Saturday in regard to that particular colliery. We have not worked under the exacting conditions that are here set forth, but it came to a question of this, that we were driven actually to the verge of a strike, and it was only by the calmest and the greatest amount of consideration that a strike could actually be prevented. We see here that one is necessary to prevent such conditions of slavery as are within the conditions of that notice. It only applies to Pay Saturday. Up to that date we had not been working on Pay Saturdays at all, and for some reason or other they wanted us to work on these Saturdays, and put up a notice that that limitation to Saturday was actually from 9 o'clock in the morning until 12 o'clock on the Saturday night. We, of course, were very nearly driven to a strike, but ultimately we compromised by incessant representations. We wrote those who intended to enforce the conditions, and we interviewed them by deputations, until at last we arrived at an agreement that allows our men to come out of the pit at 1 o'clock on Pay Saturday.

1529. And what time do the men work from? Any hours between 6 in the morning and 1 o'clock. But you see the struggle we have to battle against; that is continually being fought in order to prevent the most serious conditions that may be imposed on men. I can understand that kind of thing in Siberia, but I really cannot understand it here.

1530. *Mr. Curley.*] They work eight hours in Siberia? Well, they are better off than we are.

1531. What is the practice of the hours in that particular colliery you name? It is that the miners work two shifts, front and back, of eight hours each. The miners work eight hours. This the miners have struggled to maintain, and as you know we have come through a number of years of very serious depression, and it has affected us down there, as well as other people. We have consequently been weakened in our stand, and whilst we have this provision for the men to work eight-hour shifts, only quite recently an employer or the manager ordered both shifts to go in at one time.

1532. Where was this? At Mount Kembla, and to come out at one time, for two or three days or something like this, and the consequences of course we know to a man who refuses any of these impositions—he is turned *holus-bolus* from the colliery.

1532½. Were the shifts kept for more than the eight hours? The manager had intended they should be kept ten or eleven hours, and did it on the first day, because the men had no opportunity of getting themselves together, but I know that after the first day's work, the men called a meeting and they unanimously decided that rather than submit to those conditions they would stop at home altogether. The result was that  
the

the men went to work in their usual shifts, and fortunately no notice was taken of them. They were permitted to go on, and no strictures were brought against them for having met and remonstrated.

Mr. G.  
Henderson.  
4 Sept., 1895.

1533. *President.*] What time does the first shift go in? At 6 o'clock in the morning, and they leave the face at 2 o'clock in the afternoon—eight hours. The second shift goes in at 9 o'clock and leaves the face at 5 o'clock in the afternoon—eight hours.

1534. When you were asked to work longer, until that time had you only been working the eight hours? Yes.

1535. And they tried to put on some more hours? They are continually trying.

1536. And you have resisted? Yes.

1537. And successfully? Yes, so far, at that particular colliery.

1538. *Mr. Curley.*] What time do they draw coal at Mount Kembla? For ten hours.

1539. Have you given us a statement with regard to most of the collieries in your district? I think so.

1540. Does that statement cover the whole of the collieries? Yes, concerning the working of ten hours. Of course, as I have said, there are some of the collieries that depart from that rule as to drawing coal, and not infrequently either. One of the collieries, in particular, during the last month. I do not think I would exaggerate matters by saying that one colliery has drawn coal on an average eleven and a half hours for half the time she has worked during the month.

1541. *Mr. Gregson.*] Are the men underground? Yes; working the whole of the time.

1542. I want to know with regard to Mount Kembla;—is it in the case of Mount Kembla that they are required to work sixteen hours? No, it is not.

1543. At other collieries than Mount Kembla? Yes, at others.

1544. *Mr. Curley.*] Will you give us the name of the colliery? At Clifton they have been working sixteen hours.

1545. *Mr. Gregson.*] Eleven and a-half hours a day for half the time they have been at work? Yes.

1546. Can you give the names of those collieries? Clifton and Corrimal are two that very frequently transgress the order of the ten hours.

1547. Clifton was the colliery where the miners have to remain at the face for sixteen hours? Yes; that is the Clifton Colliery.

1548. What about Mount Keira? Mount Keira draws coal for ten hours per day, and she does occasionally depart from that order of work. I have known her, by reputation, to work from 7 o'clock until 7 o'clock—twelve hours—drawing coal all the time. The miners were working the whole of that time, viz., twelve hours per day. At the same time I would like to impress this fact, that this order of things is altogether contrary to the wish and the desire of the men who are working these hours. It is not any free will of their own by which it is done.

1549. *Mr. Curley.*] You mean to say that they are ordered, or requested, to do this? They are requested to do it, and we know what that means, provided that there is a refusal.

1550. Do you think there is a need for anything like such irregularities in connection with this work? I certainly do not think so.

1551. *Mr. Gregson.*] Perhaps you cannot form an opinion? I am speaking from observation.

1552. *Mr. Ourley.*] Do the men work anything like full time all round? No; very far from full time.

1553. *President.*] What is full time? Eleven days per fortnight at some collieries would be full time.

1554. *Mr. Gregson.*] How long have you not been working full time? I think during the last three years we have not had many collieries in our district that have done full time for more than half a dozen fortnights in the three years. Even those collieries that work the long hours, putting the long hours into reasonable shifts—ten hour shifts—that would then bring them up only from nine to ten days per fortnight.

1555. Just consider this: you have to do the trade when it comes to you;—do you not think you would be in a predicament if the eight hours were fixed by law? I do not think so.

1556. Do you not think that you would often lose an order? I do not think so.

1557. Do not hide that possibility? We are not hiding that possibility at all. As a matter of fact, we are almost prepared to say that we know differently. We do not think that it would make any difference in that respect.

1558. Your trade is conducted on certain economic considerations;—there are so many steamers coming at certain times, and you get a certain amount of work in a certain way, and if you could get it in another way no doubt it would be more to your comfort? We have taken notice of all these things. We have known a pit to work for twelve hours one day, and not do a turn the next day.

1559. If you did not work twelve hours to-day you would not have got the trade? In cases I have mentioned the steamer was not there at all.

1560. *Mr. Ourley.*] Do the companies keep a fair amount of rolling-stock—skips and waggons? Mostly all of them have a fair amount of rolling-stock. Some of them have very insufficient rolling-stock.

1561. *Mr. Gregson.*] What do you call a fair amount of rolling-stock? Five or 6 tons to every man that is getting coal.

1562. That means two days' work? Yes; we have not that, but that is what I would call a fair amount.

1563. Some of the collieries have considerably less than that? Yes, some of them have considerably less than that. Some of them will fill everything up in a day.

1564. *Mr. Ourley.*] Do you not think if they have a day's work standing ahead in the trucks, or the skips, that that is a very fair supply to start with? I do; consequently that is one of the grounds why I consider that the matter of these long hours is a questionable method of working; and, apart altogether from that fact, it is injurious to coal-miners to remain in the bowels of the earth in the presence of the several injurious gases for that number of hours.

1565. *Mr. Gregson.*] But supposing you had this option, you have got to remain in the bowels of the earth for so many hours or be without your work; there comes the difficulty? I am telling you candidly, Mr. Gregson, that is not my opinion at all, because I am a very great believer in the fact that if one colliery does not get the trade the other will.

1566. The trade might go to the north? I do not care where it goes to so long as men are worked like reasonable human beings.

1567. If the necessity was so great, you would rather see the trade go from Illawarra than work the hours you are doing? I would rather see the trade out of the road than to enforce inhuman conditions. I have had

Mr. G.  
Henderson.  
4 Sept., 1895.

- had a fair experience in working six-hour shifts, and I have tasted the working of the long hours in the Illawarra district, and I was a much better man at the six hours than I was at the long hours.
1568. *Mr. Curley.*] Where did you work the six-hours shift? In the county of Durham.
1569. Did a man feel more vigorous for his work there? I should think so.
1570. He always went into the pit a man? Yes; prepared to do his work, and could do it.
1571. *Mr. Gregson.*] I see the average number of hours at Durham is given at 5:37? That is six hours to all intents and purposes. How the decimal comes in is, that the front shift-man goes to work at 4 o'clock in the morning, and he is relieved by the man who goes down at 10 o'clock, so that he actually works six hours at the face; but the man who relieves him at 10 o'clock has to be back at the shaft at 4 o'clock at night, consequently he cannot remain at the face six hours. That is how the decimal under the six hours is found.
1572. They do not draw after 4 o'clock? No; from 6 o'clock in the morning until 4 o'clock in the afternoon.
1573. *Mr. Curley.*] Did you notice that everything was carried out on uniform lines there? Oh, yes; everything is as regular as a piece of machinery—everything is worked methodically. The men are all there to go down at one time, and to come up at one time.
1574. Have the tunnels in this Colony something to do with this business of irregularity—the tunnels being favourable to get into the pit at any time? I think in some cases, but they are very exceptional ones. It is in exceptional cases where I know of men to desire to get in at an early hour of the morning. We are not much troubled with that in our district, unless they are ordered to be there.
1575. *Mr. Gregson.*] What hours do these men make or go when they make these sixteen hours? They are called at all times, in that colliery in particular, to go in. One of our collieries, Corrimal, for instance, only quite recently blew the whistle for the front shift men to go to work at 7 o'clock in the morning. When the front shift men went to work at the pit everything was filled—waggons and skips—and there was nothing for them to do. They went to the pit, and found there was nothing to do. A few of them wended their way back home again, and whilst the management knew there was nothing to do, they blew the whistle for the back shift men to come up; that is, two lots of men were brought up for nothing to do. The men finding things useless, sat down for an hour, and then wended their way back to their homes, and at 12 o'clock the whistle went again for the third time, and demanded the men to come back to work.
1576. Was there any friction between the men and the managers? No, not the slightest. The reason we assigned to ourselves for this was, that it was merely caprice on the part of the management to show that they could do practically with the men as they chose to.
- 1577-8. Can you give me the date when this was done;—were you there yourself at this time? No; I was told this by people I can credit. At the same colliery they have a system of sometimes filling slack—no round coal at all; and when they do this, the management says we will only want twenty men to fill the slack, but we will blow the whistle, and the consequence is that every man, probably 100 men, must go 4 miles from their homes up to the pit, and when they get there they will see on a paper at the pit top the twenty names that are required, and the other eighty or 100 men whose names are not on that paper must turn about and walk all that distance home again. If they do not come at the call of the whistle, and they are known not to come, it is simply a question of, "You can take your tools out."
1579. *Mr. Curley.*] I presume that numbers of these men, apart from their work, have pieces of land that they might profitably work in their own time? Yes; some of them have.
1580. Do you think that a manager should encroach on men's time in that way? I certainly do not, and I have complained very bitterly about it. I have gone so far as to interview the manager about this matter, and ask him to make such regulations as were really decent in the management of a colliery, but he went on in his own way.
1581. *Mr. Gregson.*] Did he give you any satisfaction? No, not the slightest. I think the words that he used were that he was most acquainted with his own business, and that it was no concern of mine.
1582. You were not working at the pit? No.
1583. Did any of the workmen, as far as you know, remonstrate with him? Yes; the men have many a time, but still he will not make any other arrangement.
1584. How many men are there employed there? Somewhere between 130 and 140—say 130 in round numbers.
1585. *Mr. Curley.*] With regard to this question of hours, Mr. Henderson, that you are now referring to; is there a general feeling on the part of the men to have the hours limited to a uniform time? It is so general that I went to the trouble some time ago of drafting a petition, in order that I might ascertain the real feeling of the men who were getting coal in the Illawarra district on this question. We had 1,450 coal getters at that particular time, and there were over 1,240 of these men who signed that petition in favour of the eight hours becoming a legalised enactment. The remaining number might have been at home, as you know you cannot always catch the men at the pit.
1586. Do you think the men fully realise the import of that business? I think they are as fully alive to the position as we are here to day, and that they have recognised the gravity of every position that may be conceived on this matter.
1587. *Mr. Gregson.*] Although they may lose trade? They have thought of that, to arrive at the conclusion emphatically, that it will make no difference to them.
1588. *Mr. Curley.*] Where you have referred to the short hours in England, at any part of your time in connection with those mines, do you remember the hours being longer than at the time you speak of? Yes; I remember when I was a boy, going into the pit, that I used to get away to the pit, and get down about half-past 5 in the morning, and my mother used to meet me at the bottom of the gangway, and bring me away from the pit at 7 o'clock at night, sometimes later, and it was a case of wash me and put me to bed till next day. That went on till the passing of that Act that stated the times a boy should work. I was three days at school and three days at work.
1589. *Mr. Gregson.*] Before you were eighteen years of age? Yes; before I was fourteen.
1590. *Mr. Curley.*] Do you think the alteration in the hours of working has led to any diminution in the output of coal? I certainly think it has done no such thing.
1591. Has it interfered with the profits of the colliery proprietors, as far as you know? As far as I know it has not.

Mr. G.  
Henderson.

4 Sept., 1895.

1592. Has it interfered to any material extent with the earnings of the workmen? No, it certainly has not. It has not made their earnings any less.

1593. Taking the condition of matters all round—the condition of the mines as a whole, the condition of the miners and colliery owners—as far as you know, do you believe that matters are better under the limited hours than they were prior to that? I believe the conditions all round are infinitely better. So far as I can see, I do not see anything of an injurious character, and I certainly believe that the proprietors must be in a better position than when the miners were working longer. We know that previous to the hours being shortened the people were practically steeped in the depth of ignorance, but since the shortening of hours there has been wonderful progress in various stages of life, and certainly in the intellectual stage.

1594. *Mr. Gregson.*] The hours have been shortened, but they have been shortened voluntarily? They have been shortened, I believe, if we speak correctly, by force. Whilst we may look upon it as voluntary if we choose, nevertheless public sentiment expressed itself in favour of it, and trades organisations combined for it, and obtained it.

1595. *Mr. Curley.*] When you say force, you mean moral force? Decidedly; not physical force.

1596. With regard to the shortening of the hours for boys, was not that obtained by legislative enactment? Decidedly it was, hence my having to go for three days to school. When the hours for boys were shortened it became a matter of great inconvenience to the employers at the particular time, but only for a very brief period. It came down all at once, and for a brief period boys had to go to work in order that the pit should draw coal, at a certain age, in two shifts. They were allowed to go into the pit at 6 o'clock, and come out at 5 o'clock at night. That was their limit per day. Part of the boys would go down at 6 o'clock in the morning, and come out a couple of hours before the pit knocked off. Another part would go down two hours later, and work the pit up to the evening. The difficulty was got over in a very brief period of time.

1597. Would that mean the employment of additional boys? Possibly in a mine where a large number of men were employed there might be an increase of two or three boys. In one colliery I know there was no increase in the boys at all. The employers shortened the hours of drawing coal in order to meet this inconvenience that was brought upon them, and the shortening of the hours proved for itself that the output of the mines was none the less, proving that the shortening of the hours was a benefit to those who received the shorter hours, and was of no detriment to the employers themselves.

1598. You are aware that with all these changes mechanical appliances have changed as well? Yes; wonderful progress has been made in that line, and is made every day.

1599. As far as you have thought upon the question, and as far as you express the views of others, do you think any opposition to the change arises more from the idea of innovation than anything else? I really think that is the groundwork.

1600. Simply because it is a change? Maybe. There are one or two mines that have machinery that should have been thrown away thirty-five years ago, and in this case they might think it was because of their modes of getting their coal out.

1601. *Mr. Gregson.*] Do your trains of skips come out of the mine all hours of the day? Yes.

1602. What number of skips do you draw? Some of the mines draw twenty skips upon a train, whilst others draw sixty. Mount Keira, for instance, draws sixty skips on a train, and Mount Kembla draws about thirty, or between thirty and forty, and South Bulli run from twenty to thirty. The mines vary very much in that respect.

1603. *Mr. Curley.*] How many screens have they at these different collieries? Some of them have four, some five, but the most of the collieries have four screens.

1604. How many men work at a screen? One man generally does the whole shift.

1605. Does one man attend to all the screens? Yes, with the exception of the weigh-screen, where there are two men.

1606. *Mr. Gregson.*] Is there any band or dirt in the coal? No; it is simply a question of rushing it into the waggons.

1607. *Mr. Curley.*] If you have your waggons under the screens, and you are running skips from the bank top, one man could not get that coal out of the screens? I do not think he could, but none of the collieries in our district use more than one screen, with the exception of the weigh screen. When they require unscreened coal they may use two screens at the one time. I have been brought out of the pit at Mount Keira to do work outside as weighman—sometimes one thing, sometimes another. I have once or twice had the job of screen-man, and I have put 700 tons of coal over one screen in one day, so you will see that there was not much cleaning.

1608. Was that coal all screened? Yes; it all went over the screen.

1609. Was there a waggon underneath the screen to take the slack? Yes.

1610. With regard to the question of putting coal into waggons;—there is no serious expense there with the limited number of hands? Oh, no; there is no expense at all.

1611. Are there many deputies in a mine? That varies. I cannot give you the exact number at Helensburgh, but certainly Helensburgh has the largest staff of deputies. I suppose there are half a dozen deputies there.

1612. How many deputies are there in the other mines? None of the other mines will exceed three, and some of them not more than two. The most of the mines have two.

1613. You think that section 36, on page 17, dealing with the hours of employment, should be retained in the Bill? I certainly do.

1614. *President.*] When these men work such long hours as in the cases you have put, are they paid anything for overtime;—how are they paid? They are paid by the ton.

1615. They are not paid at so much a day? Only daymen are paid by the day, such as men who are assisting to get the coal away. Screen-men and others are paid by the day, and some of those men may get all their time.

1616. Will you now look at section [41] 38, sub-sections [1] 4, on page 18 of the Bill: "Payment of persons employed in mines by weight" (*see Appendix A*). Please read that section, and tell us what is the system adopted with regard to the weighing in your district;—how is the weighing carried out? In the Illawarra district it is about the most irregular system that can be conceived of by any man. Sometimes they take it into their heads to weigh one skip one day at some of the collieries, and may be they will

Mr. G.  
Henderson.  
4 Sept., 1895.

will miss the next two days entirely, weighing no coal at all. The next day they will weigh five or six skips.

1617. Do you mean to say one skip for the whole colliery? Yes, at the colliery I referred to in connection with the hours—Corrimal.

1618. Is there a check-weighman there? Yes; there is a check-weighman at all of the collieries. At that particular colliery I speak of they have weighed during one fortnight eight skips per thousand. During another fortnight they have weighed twelve skips per thousand, and during another fortnight they have weighed twenty skips per thousand. At another colliery we have had as low as three skips per thousand.

1619. What colliery do you refer to? South Clifton. There we have so low an average as three skips per thousand. At other collieries we have at the rate of fifty skips per thousand, but I do not think that we really come over that at any of our collieries. It is a most unsatisfactory system of weighing (*see Appendix S*).

1620. How many skips would that amount to in a day—the days the men were working? Some days the highest number of skips that are weighed at any of the collieries in one day will run to about forty-five; occasionally it may be fifty skips. Other days they will work the whole day and possibly draw out 500 or 600 tons of coal, and weigh three skips, or, in other words, 30 cwt. or 2 tons of the 600 tons will be weighed.

1621. Have you such a thing as standard weight at any of the collieries in your district? We have standard weight at South Bulli.

1622. Have you standard weight at any of the other collieries? Yes, at Clifton. Clifton and South Bulli are two collieries where the standard weight is. At the Mount Pleasant Colliery there is also a standard weight of 20 feet.

1623. Do you know if the men have lost much weight by the standard weight being established? Yes; they have lost a good deal of weight. We cannot ascertain the exact amount lost, for the simple fact that the weighing-machine stands at the standard weight.

1624. The weighing-machine does not record anything more than the standard weight? No.

1625. What is the standard weight at the collieries you have mentioned? In South Bulli, for bords and headings, it is 15 cwt. It used to be 14 cwt. for pillars, and 15 cwt. for bords and headings, but now it is the same all round. At Clifton the standard weight is only 13½ cwt.

1626. Are the skips at those collieries about the same size? Yes.

1627. Is the quality of the coal much the same? Oh, yes; there is no difference in that respect.

1628. *Mr. Gregson.*] Do you say that at Clifton the weighbridge will not record over 13½ cwt.? At Clifton the weighbridge just stands at the standard weight. It will not go above 13½ cwt. It will not record a ton, simply because the bridge is placed at 13½ cwt. The bridge stands there in order that the check-weighman may not see the extra coal that may be on the skip.

1629. What do you mean by that—the bridge stands at this weight? Nothing more than that the bridge, as in the case of South Bulli, is placed there so that when the coal goes into the box and the beam goes up at the 15 cwt., she goes away. Provided that there is 13 cwt., the Company's weighman draws it along from the 15 cwt. to the 13 cwt., or to whatever other weight it is below the 15 cwt. which he wishes to ascertain. After he has done that he will place his balance back on the 15 cwt., and if the next skip takes the beam right up he tilts it up at once into the waggon. The weighman for the men has, therefore, no opportunity of finding out whether that skip has 17, 18, 19, or 20 cwt.

1630. *Mr. Curley.*] Is not that a great injustice to the men? I think the whole system of standard weight is an abominable disgrace.

1631. Have you in your district anything like the standard-bar regulation to prevent overloading? No; we have no such thing as standard bar.

1632. *Mr. Gregson.*] Can you fill up to any height? Oh, yes.

1633. Without any objection? We have skips coming out of Mount Pleasant running from 15 cwt. to 24 cwt.

1634. There is no limit as to height? The men are instructed not to fill up their coal so as to destroy the property.

1635. Is there any kick-up or tumbling tommy? Yes; the skip goes into the tumble tom, and Tom, if the coal is sufficiently high, would knock it off.

1636. Does the miner get the benefit of that coal? I think the miner would lose it.

1637. Do you look upon that as unfair? I do not look upon that as being wrong. The man knows the height, and as long as that is not tampered with I do not think that is a great detriment at all, but with the standard weight it is quite different altogether.

1638. *Mr. Curley.*] Will you look at the words in subsection 1 of this section "large coal or shale" (*see Appendix A*). Are there any collieries in your district where the miners fill large and small coal away together? We are not paid very much for filling anything. There is one colliery where we do fill everything away, and receive pay for it.

1639. What colliery is that? Austinmer.

1640. Would the drafting of that clause interfere with that method of working? We want this very particularly to remain as a clause with the elimination of those words "large coal or shale." I think we have the most sufficient grounds for our contention too. One fact is undeniable. We have an annual output in round numbers of 1,000,000 tons in our district, taking round and small coal together. A little over one-third of that 1,000,000 tons is what we term slack, or small coal. The miner has the getting of that small coal, and the filling of it, and it goes into the market making one-third of his 1,000,000 tons, but he receives no consideration for it.

1641. *Mr. Gregson.*] Assuming the proportion to be two-thirds large coal, and one-third small, what are you getting for your coal? 1s. 10d. in pillars, and 2s. in bords.

1642. *Mr. Curley.*] That is in a pure, clean seam? Yes.

1643. You are paid for round coal? Well, I suppose yes.

1644. *Mr. Gregson.*] You think this clause in the Bill is unfair? This alteration in the clause will certainly interfere with collieries that are filling all away together.

1645. Could that not be met by putting in words to meet the case;—the wording will not apply to the colliery that is filling round and small together, and you have only one colliery? Yes, Austinmer is the only one at the present time, but nearly all the collieries send away unscreened coal.

1646.

1646. *Mr. Curley.*] The proprietors can send away unscreened coal without interfering with the men's wages;—they are just paid as at present? Yes.

1647. Is it the wish of the men with regard to this weighing business that every skip should be weighed, or are they satisfied with a fair average;—say there is a fairly liberal number of skips weighed, what number would meet the case? I will tell really what the opinion of myself and the southern miners is. We know for a fact that we are being unjustly dealt with. I cannot put it in any milder language than that, and we want a law that will give us what we really produce, and render it nearly impossible to rob us. That is just the plainest way of putting it.

1648. How do you propose to do that? By making a provision for weighing every skip that comes out of the pit.

1649. *President.*] Could that possibly be done, and still let the colliery proprietor carry on? Oh, yes, Mr. President.

1650. *Mr. Gregson.*] Would it cost anything more? It might cost the erection of a new weighing machine in some cases, and that would not be very much. I am even prepared, from my own knowledge of things, to advocate a certain amount of expense being incurred in order that men may have their just due. I think it is fair when men come to think that 130 or 140 of them are producing 103 to 200 tons of coal a fortnight for which they get no pay.

1651. You would not favour any arrangement for averaging the skips? I think that every skip ought to be weighed; that the matter ought to be definitely fixed.

1652. *Mr. Curley.*] With regard to the choice of skips, does not the check-weighman have any choice about skips? None whatever. He just stands by to see that they do certain things fair, after they have done everything else unfair, but so far as anything else is concerned, he is simply a figure-head.

1653. *Mr. Gregson.*] Supposing there is this defect in the weight of the men, why could they not get over it by filling to the skip level, and contenting themselves with that? There is no law to prevent them from doing this; but suppose they did it, and the manager saw that those skips were being badly filled, and he went into the pit and told the men to take their tools out that filled these small skips.

1654. You think that might be done? I have good reasons for thinking it would.

1655. In the case of the two collieries where the standard weight obtains—that is, South Bulli and Clifton—is there any possibility of insuring that they shall be within the limit of what the scale shall weigh? There is no possibility there. It is a matter of mere judgment. There is no record to show when they are over their weight.

1656. Could the check-weighman not give them any idea about that? I do not know whether he could do that or not when the balance of the machine is chock up. He has no real knowledge as to whether there is 16 cwt. or 17 cwt. in that skip.

1657. Supposing he saw a skip that just went the limit, or a little under the limit, he would take notice how that skip was filled, and say, "Now always fill up to that height, and we will see what comes of it?" He could do that, but it is quite possible for a man, owing to the variation in the nature of the coal, to fill a skip a foot higher than the skip tipped to-day, that would go 16 cwt. to-morrow. A skip filled of similar size might go 1 cwt. or 1½ cwt. less owing to the density of the coal.

1658. Within a certain margin a man could have an idea of when he was likely to exceed the standard or otherwise? Well, he could approximate matters.

1659. *Mr. Curley.*] As a rule, does not he fill for weight? He wants to get as near as he possibly can to the standard.

1660. Do you think that the men are utterly opposed to any system of average? Decidedly; they are absolutely opposed to it.

1661. *Mr. Gregson.*] You think the men feel that way? I know it for a fact. It is quite a matter of unanimity with the miners on that point.

1662. *Mr. Curley.*] Does the coal vary very much in the workings of your district? Yes; the coal varies—it is harder in some parts, and softer in others.

1663. Is that the reason why you wish every skip to be weighed? That is certainly one of the strong reasons, inasmuch as we have had quite a multitude of men in our district who have been standing at possibly a low weight for as long as from three to four months at a stretch, never having one skip placed on the weighing-machine to their credit.

1664. Was work suspended during that time? No; work was going on—that is to say, the ordinary course of mining work. The same thing is obtaining in fact at this present moment. While we are discussing the matter, we could go and take out of a check-weighman's book records of a similar character.

1665. Can these check-weighman's books be obtained? Yes; but I am afraid you will want a check-weighman along with them.

1666. *President.*] Cannot a man insist on having his coal weighed;—cannot he say, "I want so many skips weighed to-day"? He can ask it, but he cannot get it done. He would be told that if he was not satisfied he knows what he can do—take his tools down the hill.

1667. *Mr. Gregson.*] Have you ever known such a case;—have you ever known such a request to be made? I have known the request to be made, not once but scores of times, that a man should be weighed, and they have been refused. I am not going to say that they have received their quietus, but there is a reign of terror with the men in those positions that makes men almost afraid to look over their shoulders. I have myself interviewed the manager on the men's behalf to show the reasonableness of weighing forty or fifty skips, and I have been quietly told that it was inconvenient for them to do so. I have pointed out that there were only certain skips weighed, and asked the manager to see to it. They say, "Oh, yes!" but it is never done, although you go from time to time.

Mr. G.  
Henderson.  
4 Sept., 1896.

MONDAY, 16 SEPTEMBER, 1895.

[The Commission met in the Board Room, Chief Secretary's Office, at 2:30 p.m.]

Present:—

FRANCIS EDWARD ROGERS, ESQ., Q.C. (PRESIDENT).

JAMES CURLLEY, Esq.

JESSE GREGSON, Esq.

Mr. George Henderson, Secretary for Illawarra Minors, re-examined:—

Mr. G.  
Henderson.  
16 Sept., 1895.

1668. *Mr. Curley.*] Have you any further evidence to tender on section [41] 38 of the Bill—"Payment of persons employed in mines by weight"? I would like to give the matter a little more definite shape with regard to the number of skips that are weighed than I have done. I have taken the precaution to furnish myself with exact details upon this matter since I was last examined. The figures I would like to put before the Commission have been taken from check-weighmen's books during the interim. In the Helensburgh, or Metropolitan Colliery, as the colliery is commonly known, there are something like 232 men getting coal daily. During the period extending from the 8th July to the 31st August—about seven weeks—there were 31,549 skips of coal raised from this pit. Of this aggregate number of skips, there were only 477 weighed. There are 230 or more men getting coal in that mine, and out of a total of 31,549 skips only 477 were weighed, leaving 31,072 skips of coal that were not weighed. In the case of the Coal Cliff Colliery, or Old Clifton, there are several men who have been weighed at periods varying from one month to three months, and whilst there has only been from twenty-seven down to as low as twenty-four men getting coal, there are actually four men who have never been weighed within the three months at all. In the case of the South Clifton Colliery there are seventy miners getting coal there, and during the last three months the average number of skips weighed, per thousand skips raised, has been something like four skips per 1,000, or, in other words, there have been twelve men during the three months who have never been weighed at all, thirty-two men who have never been weighed for over two months, and fifty-eight men who have never been weighed for over one month. The result is that only fifty-three skips have been weighed during the three months for the whole quantity of coal that has been raised from the pit. There are seventy men, and they have been averaging thirty-six skips per week during that time (*see Appendix B*).

1669. *Mr. Gregson.*] How many skips do they get out in a day at that colliery? The skips there run about 12 cwt. each, and the men calculate doing about 4 tons daily, so that it would be about eight skips per man.

1670. That is at the South Clifton Colliery? Yes. I want to say in regard to this matter, that there are occasions when actually there has never been a skip weighed for a whole week.

1671. What colliery are you speaking of? I am referring to the South Clifton Colliery, and there are other collieries that I will mention by-and-by.

1672. Is the weighman at that colliery standing by, ready? Yes; he is there upon the weigh-screen, waiting from early morning till the pit knocks off. He is there ready to weigh, but for a whole week—I would not exaggerate if I say that for two consecutive weeks there were no skips weighed there. It arises from this, that at nearly the whole of the southern collieries, although they have a weighman, his duties are not exclusively confined to those of weighing coal. The miners' coal seems to be the last consideration, because the weighman is called here and called there, with the result that there are for a week, or possibly longer, no skips weighed at all.

1673. *Mr. Curley.*] Are there any other collieries in your district where such things as you have described take place? Yes; Mount Pleasant Colliery also goes for a week without weighing, and just the same thing obtains at all of the collieries.

1674. *Mr. Gregson.*] At Mount Keira or Mount Kembla, are there any complaints of this kind? At every other colliery in our district, with the exception of Mount Keira, there are complaints of the same description. There may be complaints at Mount Keira, but I cannot speak of them, because I am not aware of them. So far as the collieries I have mentioned are concerned, deputation after deputation has interviewed the whole of the colliery managers, and brought under their notice the necessity for weighing the coal the men were getting in the pit. These deputations have always received a promise that the matter would be looked into, but it was never carried out.

1675. *Mr. Curley.*] With regard to the appointment of a check-weigher, will you look at section [43] 40, subsection (i), on page 19 of the Bill (*see Appendix A*);—please read the clause as it was originally drafted, and then as amended by the Legislative Council? Yes.

1676. Do you think that the miners should have liberty to select a check-weigher from whom they please? I certainly do. I think that the miners should have the right to appoint any man they choose, that, having to pay him after he is appointed, they have a perfect right to select their own servant.

1677. *President.*] What is the reason for their wanting to have a man outside of those connected with the mine;—are there not plenty of men in the mine who would be fit for that particular position? There are plenty of men in the mine, as far as numbers are concerned. There are quite a number of men that are capable, and, if not interfered with, men could be got from the employees of any particular mine.

1678. Is the reason then for wanting a man from outside of the employees for fear of his being interfered with? That is not the only reason. The main reason is that the men have a man they wish to employ, and, having a servant to employ, they simply think it rather absurd that the employer should say, "Here are a number of men, and only out of this number of men will we allow you to employ that servant."

1679. Supposing there is absolute freedom of choice given to the men to choose from out of their number one of the men working in the mine, would not that meet everything? Yes, I think so.

1680. In England, since the passing of the Act of 1887, they have passed an Act making regulations for the appointment of a check-weigher;—have you seen that Act? I have only seen references to that provision.

1681. I will read you the Act I refer to (*see Appendix B*);—would that provision in the English Act meet all you want? I do not think so. I do not think that would remove the provision that is made in this Bill.

1682. The provision there is that you can appoint a check-weighman outside of the men altogether;—cannot you get lots of men in a mine if you have absolute freedom of choice? We could, but there is

no

no absolute freedom of choice. Say there are forty-five men in a mine, and that you are left the choice of choosing from those forty-five men, may be the very man who is chosen may be sent adrift before you do choose him, and that has practically been tried on.

Mr. G.  
Henderson.  
16 Sept., 1895.

1683. The miners may choose some very objectionable person if they go outside the mine altogether;—surely they could get from the number of persons in a mine a man whom they can rely upon as a check-weighman? Possibly they might do so, but they might see a man outside the mine, who, to their minds, is a far better man for the position, but as he is not an employee of the colliery, they are prevented from selecting him.

1684. They might select some undesirable man, in a case where they did not care for their manager;—they might seek some one who would be objectionable to the manager? But, when we clearly understand the position of a check-weighman, it does not matter who he is, so far as the employers are concerned. He can only be objectionable by appearance, because he has duties to perform which he cannot go outside of, and in performing those duties he cannot interfere with the management of the men, or with any regulations whatever about the mine, and, consequently, only the appearance of any man could be objectionable; certainly nothing he could do.

1685. You want the words in the section we are considering, "who shall be an employee of the colliery" struck out? Yes; we want the section to read as it was originally drafted.

1686. Do you know of any objection in England to a man being an employee of the colliery? No; I do not know of any case in the old country, but I know that there are cases out here that have certainly inspired this provision being made in the Bill—that have set forth its necessity.

1687. What cases do you refer to—can you instance what you mean to convey? Only a very short time ago we had the case of a check-weighman who was acting at a colliery, and I suppose he became what is commonly termed an objectionable man to the management. The same man, known as he is amongst the people of the southern district, is one of the most respected men in that district, but either on account of his words, or his deeds, he became objectionable to the manager of the colliery. The check-weighman objected to the overman going into the pit, and then coming back and acting as weighman, because it was supposed that his reasons for going into the pit were to pass the heavy skips, and get a number of the lighter skips weighed. As soon as this check-weighman objected to this course, the overman said to the men, that they would have to stop paying to that man, otherwise their names would be "Walker." He gave them to understand that the best thing they could do would be to stop paying to that man, and that by-and-bye they would see what could be done. The course taken by that overman was successful, as under a reign of terror the men were actually afraid to let this overman know they were paying this check-weighman wages. The overman had in view another man, and told the men that they could put him on, thinking by this means to get the weighing in their own hands, and they made that one of the things at that colliery.

1688. Would not this Check-weigher's Act in England (*see Appendix E*) meet a case like that? It might; but I hardly think it would.

1689. *Mr. Curley.*] You notice that in this same section the Legislative Council has also inserted again the words "large coal or shale"? Yes.

1690. Would not that section have to be re-modelled according to the circumstances of the different collieries where they are filling large and small coal away together. In a case like that, would you not have to weigh the whole of the mineral? Certainly.

1691. *President.*] When they weigh coal at the different collieries, is the skip put on to the weighbridge? In some cases, yes. In the generality of cases it is turned over the tumbling-tom into a screen, with a mesh of three-quarters of an inch between the bars. The coal goes down that screen for a certain distance into an iron box, or pan, at the bottom of the screen, and this box, or pan, is really the weighing machine. The register for the weight stands by the side of the pan, and after the small coal has been taken out, the coal goes into that box or pan, and is weighed. What we want is that all mineral shall be weighed, both round and small coal. We consider the present system is very unfair. For instance, nearly all our collieries have a different elevation for the weigh-screen to the screen they sell from. The coal goes flying down the screen that they sell from, but the screen that they buy from, or weigh the miners' coal from, is generally a very flat screen, and at one of our collieries it is almost impossible to get it into the pan or box, unless the weighman gets up on to the screen to shove it in, and by this means destroying a quantity of the miners' coal, through it passing through the screen as small coal.

1692. The coal is tipped first of all on to a screen, and that gets rid of the slack? Yes.

1693. Then the best of the coal goes into this pan, or box, and is weighed? Yes.

1694. Then suppose a lot of the coal is knocked into small coal is not all that put into the pan? No; it passes through the screen.

1695. *Mr. Curley.*] You will notice that there are several clauses in this section where large coal or shale is again mentioned? Yes.

1696. What you have said with regard to those words in what I have drawn your attention to will apply to them in the connections they appear in in other parts of the section? Quite so.

1697. *President.*] Would it be possible, or practicable, in the conduct of a mine, to weigh every skip of coal? Oh, yes; quite practicable. I have worked at a colliery that has weighed every skip of coal, and that colliery actually draws as much coal out of the pit as any four of our collieries do.

1698. Under the conditions we have in this Colony, would it be practicable to weigh every skip of coal. It is my wish to deal with all fairness to the men? With the apparatus that some of the collieries have, it would certainly not be practicable to weigh every skip, but we hope to see this very soon abolished.

1699. If you close a mine you must not forget that there will be so much less employment for labour? The expense would not be very much. A man, only a short time ago, offered, through the daily press, to erect a machine at the whole of these collieries at the cost of a very few pounds. I am not certain what the cost was, but it was so small that, in my opinion, it need not have caused five minutes thought, for the mere sake of doing justice.

1700. Would not a great many alterations have to be made? Certainly there would have to be some alterations, because, as I have pointed out, they have appliances that are not of modern invention. Very many of them have been out of date for forty or fifty years.

1701. The colliery owners now pay higher wages because they only pay for round coal; if, therefore, they weighed all the coal that is got, would not the wages come down? We do not admit of that at all.

- Mr. G. Henderson.  
16 Sept., 1895.
1702. Would they not of necessity come down;—if the colliery owners paid the miners for both round and small coal, would not the wages come down? No; I do not think so.
1703. If the mine owners tell the truth and say they can only afford to pay a certain amount of wages now, must they not of necessity have to pay less wages if they pay for both round and small coal? Yes; but we believe that they can afford to pay higher wages than they do pay at the present time. We think that the men do not receive nearly sufficient remuneration for the work done, and we think that labour ought always to have consideration.
1704. *Mr. Gregson.*] How long has the state of things you have been referring to with regard to the weighing obtained in the south? Ever since I came into the Southern District—ten years ago.
1705. When you were giving your evidence before the Select Committee, why did you not lay stress on these things? Because I had not the opportunity.
1706. Your questions and answers before that Select Committee are comprised in a very few paragraphs? Yes; simply because I had certain questions put to me, and I was put off with those questions. My evidence before that Select Committee did not occupy more than thirty-five minutes.
1707. Is it not probable that if you had mentioned to the gentlemen who sat upon that Committee that you had something to say further, they would have listened to you? I think I said two or three things of a similar character to what I have stated before this Commission.
1708. If so, they have not been reported? We did not get on very well. I was very much dissatisfied with the way things were conducted.
1709. You did not get the same opportunity before that Select Committee as you have had here? Certainly I did not. There were some seven or eight gentlemen, and I know perfectly well that the questions that were put to me were shot from one part of the table to the other. The whole course of the examination lasted only about thirty-five minutes, and I was given my quietus, and I was passed out, and was no more called. Still I can assure you that the grievances I speak of existed then, and are becoming more intensified every day.
1710. *Mr. Curley.*] Will you now turn to section [46] 43, on page 21 of the Bill, "Single shafts" (*see Appendix A*); the whole point in that section is the distance between the shafts;—what, in your opinion, is a reasonable distance between shafts? My opinion is that there should not be less than 50 or 60 yards between the shafts.
1711. *Mr. Gregson.*] Are you not only working tunnels in the south? Yes.
1712. Have you any experience of shafts? Yes, in the old country.
1713. *Mr. Curley.*] Do you know the distance between the shafts in the old country? Yes; they are from 120 to 200 yards.
1714. Have you anything further to say about this section? I do not think that it is really necessary to say more, because I do not profess to be a geologist.
1715. *President.*] In England, the most competent people they could obtain considered this question, and yet the English Act provides only 15 yards;—do you know the general distance of the shafts in England? The distance varies; but I have not, to my knowledge, seen a pair of shafts within less than 100 yards of each other. Of course, I am not saying that there are none nearer.
1716. The Bill says that they must not be nearer than 15 yards? I think, the idea of having two shafts, apart from the matter of ventilation, is for an escape in the case of something occurring that may block one road up, and there are many things that might occur, more particularly in the case of an upheaval. One would think that in the case of two shafts within 15 yards of each other, an upheaval affecting one would almost certainly affect the other.
1717. Surely, the people working a mine would know the kind of ground they are working into; would not they know what the probability was, and if necessary have these shafts further apart;—would not they judge of any probability such as you have mentioned, in the shape of an upheaval, or something like that? No doubt they would have a knowledge of what they go through, but they might be deceived in that respect.
1718. I cannot understand why in England, where they have so much experience in these matters, they put the distance down at 15 yards, and yet you think this is not sufficient; you say 50 or 60 yards, and the Legislative Assembly say 30 yards, and they have some people who understand such matters;—why is 30 yards no better than 15 yards? Well, it is a little better, but very little—that little, that there is little difference.
1719. What do you say the minimum distance ought to be? I certainly think it should not be less than 50 or 60 yards between the shafts. When reference is made to the English Act, and whilst it provides for 15 yards, we have to look at that as they work under the English Act. It seems, in England, to be the idea of all managers and mining engineers, to do all that is in the Act, and a little better if possible; but in Australia it seems to be the rule to do as little as you can, and to get out of as much as you can.
1720. Would not people, for their own sakes as well as for economy in working, have shafts as far distant as possible;—is it not to the managers and mine owners interest to have these shafts as far away as possible? I cannot see that it is to their interests to have them close. I certainly think the greater distance is more to the interest of the mine owner.
1721. If you make a minimum of 50 yards, that is a good long distance? It is not much when you are down in the bowels of the earth.
1722. What is about the smallest area that is ever worked for coal—the surface area; how much ground would a man take up as a coal lease;—what would the smallest size of ground be? They sink a pit sometimes on one allotment of ground. There is no provision that I know of to prevent them doing so.
1723. But there is a provision here, because at least there must be two shafts or outlets; if shafts are to be sunk 40 or 50 yards apart, this would shut up any little people with one allotment;—you think however that the distance should be 40 or 50 yards? Yes; I think so.
1724. *Mr. Curley.*] We will now turn to section [49] 46 on page 23 of the Bill, "Division of mine into splits" (*see Appendix A*); the Legislative Council has erased the word "splits," and substituted in its stead the word "parts";—do you think that the word "splits" should be retained in the Bill? I think somebody who does not know very much about mining must have made that alteration. All people connected with mining understand the meaning of the term "split."
1725. *President.*] The English people ought to know a lot about it, and they say "parts"? It does not make the slightest difference, as far as the English Act is concerned, because both words have the same significance.

1726. *Mr. Ourley.*] Will you look at the reasons assigned by the Legislative Assembly when dealing with this section. The Assembly "disagrees to the amendment in clause 49—which omits subsection (III)—because if the provision as to splits be omitted there may be some difficulty about enforcing a separate current of air for each district;" will you also read now the third subsection of the Bill, which you will see has been erased by the Legislative Council;—do you know that splits are in operation at the present time, under the present Act, and do you believe in them still being in operation under the Bill we are considering? I do. The system of splits is the best.

Mr. G.  
Henderson.  
16 Sept., 1895.

1727. *President.*] Ought it not to be left to the manager when he is dealing with his ventilation? I have no doubt that is the idea.

1728. Therefore, inasmuch as it is for the manager to look after the proper ventilation of his mine, do we not hamper him by legislating in this detailed way as in subsection (III); he is bound to ventilate his mine—to have an adequate amount of air, and how he is to do it is a matter for him to decide; the question is, whether he should be hampered by being told by the Legislature how to do it? I think it is very much better for it to be placed in the Bill.

1729. *Mr. Ourley.*] Have you known this to happen, that in one part of a mine there may be a very vigorous current of ventilation, and in another part the ventilation may be very still and stagnant through the district not getting its proper quantity of air? Yes.

1730. And when the Inspector takes the return air at the return, he finds the requisite quantity for the mine, and yet one district may not get its portion of the air that is going? Yes.

1731. Are not the men the sufferers by this? They are.

1732. *President.*] Is it wise to hamper this matter by legislating for it;—the miner is bound to have the air? As a matter of fact, it is generally acknowledged that this system is the best system of ventilation. When it is acknowledged to be so, we want to see it complied with, and there is no assurance of its being complied with unless it becomes a legislative enactment, or part of a legislative enactment.

1733. If a manager is bound to give an adequate amount of air, is it not better left to him, and if splitting is best, we still will have these splits, but why limit him to all this minuteness? Because we think the provisions are essential to the welfare of the miners, and for the better sanitary conditions of the mine we want this fixed in the Act to assure us that this will be a provision in the future. This has not been so in the past, and we have never been assured of good sanitary conditions.

1734. *Mr. Ourley.*] Will you please read what is said in the Annual Report of the Department of Mines for the year 1878, in connection with the Vale of Clwydd Colliery. See what is said there on page 147 about ventilation: "Ventilation still very defective, notwithstanding repeated complaints made by myself to the manager on the matter. The fire-damp having lately been removed from under the up-cast shaft, there was no artificial means used for creating ventilation, when I visited the mine in December last. The miners are not yet paid by weight for the coal they get?" Yes.

1735. You have stated your opinion in connection with this section [49] 46; from what you have heard of the provisions of the English Act, do you feel inclined to modify your opinion? I do not.

1736. Do you think that subsection (III), of section [49] 46 should remain in the Bill as originally drafted? I think that subsection (III) is really the foundation of it.

1737. We will now pass on to the second part of the Bill, section [50] 47, "General Rules" (*see Appendix A*). The first rule you will notice deals with the ventilation of mines. Several amendments have been made in this rule by the Legislative Council, and I want to know whether you believe in the rule as it was originally drafted, or as it is with the amendments suggested by the Legislative Council? I believe in the rule as originally drafted in the former part; and I may tell you that I am not opposed to the amendments made by the Legislative Council in the latter part.

1738. How far do you go with the former part of the rule? I approve of the clause as originally drafted down to the word "therein" in line 50.

1739. What have you to say to the substitution of the words "35 yards," for the words "25 yards"? With regard to the substitution of 35 for 25, I am favourable to 25 yards being retained, but I would not oppose the matter of 35 yards, provided the system of bratticing was properly adhered to.

1740. What do you mean by the system of bratticing? I mean, provided that brattice was used to convey the air to the face of the working place. I would not make any strong objection to the bord being driven 35 yards.

1741. What about the cut-through in addition to that 35 yards? It has to go the 35 yards. The cut-through, in my opinion, ought never to be more than 10 yards thick, and then the brattice ought to convey the air into the face of the cut-through, as it did into the face of the bord.

1742. Do you mean to convey that bratticing ought to be placed in every bord to conduct the air to the working face? Certainly I do. I believe in the system of bratticing in its entirety.

1743. Do you consider that there should always be a stipulated minimum quantity of air? I consider there ought to be a minimum quantity of air.

1744. Do you know that the English Act provides for an adequate quantity? I am alive to that.

1745. Do you know the arguments that have been put forward about the word "adequate"—that its meaning is sufficient, &c.? I do.

1746. In full view of this argument, do you still adhere to a minimum quantity of air being provided for the miners? Yes; I still adhere to that idea.

1747. Would you state your reasons for agreeing to the latter portion of the rule starting with the words, on line 50, "And no place shall be driven," &c.? I simply say that I see no strong objection to the substitution of the words "35 yards" for the words "25 yards," provided that brattice conveyed the air to the face of the working place, and also conveyed the air to the face of the cut-through, but I certainly think that when a bord has been driven 35 yards that the cut-through ought not to be more than 10 yards thick.

1748. *President.*] What size are these cut-throughs generally? It depends upon the system adopted; they vary in different systems.

1749. *Mr. Ourley.*] Do you see any reason why the latter part of that Rule I should be objected to; you will see that two or three lines have been erased by the Legislative Council; the wording of the clause originally read, "or where gas is known to be generated, it shall be bratticed up to within 3 yards of the face of such working place, and no return air-ways shall be used as travelling roads"? I cannot for the life of me see any reason for an objection to that provision.

- Mr. G. Henderson. 1750. Does not the present Act we are working under provide that where gas is generated brattice shall be used? Yes; I think that will be found in subsection (iv), on page 4 of the Act of 1876. [*See Appendix B.*]
- 16 Sept., 1895. 1751. Seeing that this is the case, can you understand why these words were objected to? No; I certainly cannot.
1752. Is not the erasure of these words inconsistent with the conclusion arrived at by the Royal Commission that investigated the Bulli explosion? Certainly it is.
1753. Was not the manager of that colliery censured for not providing brattice? Yes; it was believed that a few yards of brattice would have saved the terrible loss of life that took place there.
1754. Would you in any way recommend the alteration of the words in the latter part of the rule as originally drafted? I can only recommend the stroke being withdrawn from the words again. I think they are an absolute necessity.
1755. You consider that the words should stand in the rule as originally drafted? I do.
1756. We come now to rule 4 on the same page, subsection (i). (*See Appendix A.*) You will notice that the words erased refer to a miner having not less than two years' experience in a coal mine;—do you consider that a necessary provision in the Bill? Yes, I certainly do. I look upon that as a very very important matter indeed.
1757. Do you think it is necessary for every working place to be examined in the morning? Yes, before a man is allowed to go to it.
1758. Do you think that a man who has the important duty entrusted to him to examine collieries in the morning should have some tangible experience in a mine? Certainly I do, and I think that two years is sufficiently limited, because we all know that a man must have experience, and a good long experience to carry out this work efficiently. He has in many cases, first of all, to search for fire-damp, and then to ascertain that the mine is safe concerning other matters—that it is safe in every respect for men to go to work.
1759. With regard to subsection (ii) of the same rule (*see Appendix A*);—do you think that report is necessary whether danger exists or not? I certainly think that there ought to be something in the Bill with regard to these reports. When writing out my report of my morning's examination, I used to place in the margin "I also examined, so and so, during such and such a time, before leaving the pit."
1760. At what colliery was this done? In Mount Keira.
1761. Was that when you acted as deputy there? Yes.
1762. Would that be a very onerous task to perform? Oh, no.
1763. How many minutes would it take you to go through it? About ten minutes.
1764. You wish a report to be made whether danger is found to exist or not? Yes.
1765. Do you think that the words erased should be retained in this subsection of the rule? Yes, certainly the words should be retained.
1766. Now we come to the rule dealing with the withdrawal of workmen in case of danger; that is rule 7 on page 25 of the Bill (*see Appendix A*);—do you consider that the words, "by such person" should stand in the rule? I am not particular about that matter. It does not look to be a matter of very great importance. I think the first person is implied whether it is left out or not. It ought to rest on the person who found out it was dangerous.
1767. Will you now look at rule 10, subsection (iv) (*see Appendix A*);—did you work under the Act of 1897 in England? No, I did not.
1768. How do you understand that subsection? I am under the impression that the meaning of it is that there is some sort of a chamber round about the cap. The idea is, I think, in connection with firing with a cap and fuse.
1769. We come now to subsection (v) of rule 12:—"Nor shall coal or coal-dust be used for tamping" (*see Appendix A*); the Legislative Assembly suggests dry coal-dust—"nor shall dry coal or coal-dust be used for tamping";—do you think that it will meet the case if the word "dry" is inserted? I think it would. We know it would be a very awkward thing for the miner to have to seek for anything else to tamp with.
1770. Will you please read this short extract from Fairley's book, "Ventilation made easy"? "A Royal Commission has been appointed to inquire into this question of coal-dust and colliery explosions, and the members have already taken evidence from several practical and scientific men on the subject, some of whom have expressed their doubts as to the explosibility of coal-dust, without the presence of, at any rate, a small proportion of inflammable gas. The writer cannot call to mind any colliery explosion having taken place from coal-dust during his forty years' experience in coal-mining operations in different districts."
1771. Do you agree with what is said there? Yes.
1772. Now, with regard to subsection (e) of rule 12 (*see Appendix A*);—do you notice the latter portion of that clause has been erased? I do.
1773. Do you know that it is a dangerous business to go back to a shot after it has missed fire? I do not understand why the Legislative Council should be careful in regard to the clause about tamping, and then expunge the latter portion of this clause.
1774. What do you think is a reasonable time to allow for coming back to a shot that has missed fire? I think that a place should always stand for a night, if possible, before a man goes back to a shot that has missed fire. If not for that length of time, I am certain that no man should go back to a shot inside of eight hours. I think we have had a shot go off in our district after it had been standing fully eight hours.
1775. *President.*] Don't you think that eight hours is too long;—would not you know what was likely to take place in less time than that? If they were shooting with fuse they certainly would not. If they were firing with straws, as they do in the old country, they would very soon know. There is a great deal of difference in fuse; some fuse is found to be much more trustworthy than other fuse.
1776. Do you think that an amendment to the effect "where fuse has been used" would meet the case? So far as I am concerned it would.
1777. What are the different ways of firing a shot? By squib or straw, and fuse; and of course there are electric batteries.
1778. Would the words "where a fuse is used" meet the case? Yes; I think so.

TUESDAY, 17 SEPTEMBER, 1895.

[The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.]

Present:—

FRANCIS EDWARD ROGERS, ESQ., Q.C. (PRESIDENT).

JAMES CURLEY, Esq. | JESSE GREGSON, Esq.

Mr. George Henderson, Secretary for Illawarra miners, re-examined:—

*Mr. Gregson.*] I would suggest that the evidence taken before the Select Committee of the Legislative Council appointed on the 5th October, 1893, be put in as evidence, and be added to the Appendix to the Report of this Commission.—*Agreed to.*

Mr. G.  
Henderson.  
17 Sept., 1895.

1779. *Mr. Curley.*] I think when you were last examined we were considering sub-clause (x) of rule 12, on page 26 of the Bill (*see Appendix A*)? Yes.

1780. I think you were of opinion that that clause should stand as it was originally drafted; that in no case, where fuse is used, should a person go to a charge that has missed fire within a period of eight hours? Yes.

1781. *President.*] You were of opinion that where a squib or straw is used the miners could use their own judgment? They would know in the course of two or three seconds in such a case whether a shot was likely to go off or not. There could be no danger, because when the squib is lighted they would know within a few seconds whether the shot was likely to go off.

1782. In other cases you think that eight hours is not too long before a person should return to a place where a shot has missed fire? No, I think not. I think that there is a possibility, if the fuse is cramped in the hole, or if it was to get coiled, of it being dangerous. Being of cotton texture, the cotton may smoulder for a time, and some considerable time may elapse before it reaches the shot.

1783. How long would this fuse be? If you had a 5-foot hole the fuse would be 5 feet or 5 ft. 6 in. long. I do not think many holes would be bored more than 5 feet.

1784. *Mr. Curley.*] Will you look at rule 15, on page 28 of the Bill (*see Appendix A*), "Man-holes for travelling roads";—do you think that is a necessary provision? I certainly think that refugo holes are a necessity.

1785. Do you think that man-holes, 6 feet high, 3 feet wide, and 4 feet deep, are too large? I certainly do not. I would advocate 6-foot holes, because in most of the places they are compelled to make their roads 6 feet high.

1786. The Legislative Council say that these holes should be of sufficient height, and at least 3 feet in width;—would not the height vary according to the seam? I think the amendment made by the Council is the most workable provision.

1787. That is, that these man-holes should be of sufficient length? Yes; the engine plane might be 5 feet or 5 ft. 6 in. high, and to have to cut through the bottom to get the height, might make it dangerous for the men.

1788. We now come to rule 19, "Trolley over pit-mouth" (*see Appendix A*);—do you think that that rule should stand as originally drafted? I agree with that rule as originally drafted.

1789. We now come to rule 25 on page 29 of the Bill, with regard to the working of coal under roads (*see Appendix A*);—do you consider that is a necessary provision? Yes, I think it is; I cannot conceive of any reason why it is struck out.

1790. We come now to rule 34 on page 30 of the Bill, "Examination of boilers" (*see Appendix A*);—do you approve of that rule? I certainly think it would be better to have something in the Bill with regard to the inspection of boilers; I think that these examinations should be made.

1791. We now come to rule [39] 37, "Books and copies thereof" (*see Appendix A*);—do you think that any person employed in a mine, or anyone having the written authority of any inspector or person so employed, should have the right of examination of these books? Certainly I do.

1792. With regard to rule [40] 38, "Periodical inspection on behalf of workmen" (*see Appendix A*), you will see that an alteration has been made in this rule by the Council;—do you approve of the clause as originally drafted, or the clause with the substitution of the words, "not being mining engineers who are practical working miners," placed by the Council? I do not quite comprehend the drift of those words. I agree with the clause without the insertion of those words; but I might believe in those words provided I comprehended their drift. It says, "persons not being mining engineers, who are practical working miners." In the event of a man being a practical mining engineer, and being a miner at the time,—would this provision exclude him from becoming one of the representatives of the men in this inspection?

1793. It appears to be so? Well, I certainly think it is wrong.

1794. Now, with regard to rule 41, "Persons not to be employed in coal-getting without experience" (*see Appendix A*), and also the rules 42-51, dealing with the working of coal under tidal waters, and the size of pillars, and so on;—do you approve of these rules being embodied in a Coal-mines Bill? I do. I think they are necessary provisions in the Bill.

1795. Have you read the Bill through very carefully? I have read the Bill several times very carefully.

1796. Do you believe in the latter portion of the Bill, taking the whole of the clauses as they were originally drafted, or as they have been amended by the Council? I believe in the Bill in its original form.

1797. With regard to special rules, do you think that there should be some kind of uniformity with regard to special rules, that they should be put, as far as it is possible, in some uniform way at the different collieries? I certainly think they ought to adopt a uniform principle as near as it is possible for them to do so.

1798. Will you look at the Annual Report of the Department of Mines for the year 1894, and take the number of fatal accidents that have happened in this Colony from the year 1875 down to the year 1884 (inclusive); that is for ten years—will you add up the number of fatal accidents for those ten years and say what the number is? Eighty-three fatal accidents.

1799. Will you now take the figures from the year 1885 down to the year 1891, including both these years; that is, for another ten years, and give us the number of fatal accidents during those ten years? Two hundred and fifty-two fatal accidents.

1800.

- Mr. G. Henderson,  
17 Sept., 1895.
1800. That is, there are eighty-three fatal accidents for the first ten years, starting from the year 1875 down to the year 1884, and for the next ten years, that is, from 1885 down to 1894, there is a record of 252 fatal accidents? Yes.
1801. Do you think that those figures reveal a rather unsatisfactory state of affairs? I certainly think they reveal an important increase of fatal accidents.
1802. *President.*] When you were speaking of the working hours, and the weighing question, did you say that the managers of the different collieries in your district know of the irregularities you have pointed out? Complaints innumerable have been made to the managers with regard to the weighing question.
1803. And they have not been attended to? No; we have always had a promise that things would be made better, but they seem to be growing worse.
1804. Do you say that they are growing worse? I think that is the indication from the statements I gave yesterday.
1805. *Mr. Curley.*] Those statements are certified to by the check-weighers? Yes (*see Appendix E*).
- [Witness withdrew.]

James Thomson, Esq., M.L.A., sworn and examined:—

- J. Thomson, Esq., M.L.A.,  
17 Sept., 1895.
1806. *Mr. Curley.*] What are you, Mr. Thomson? I am a Member of the Legislative Assembly for Newcastle West.
1807. Have you followed the occupation of a coal-miner? I have.
1808. For how long have you followed that occupation? For about twenty-eight years.
1809. Have you been connected with any of the coal-mines in Great Britain? Yes.
1810. What mines have you been connected with in Great Britain? The earliest mining I did in Great Britain was in mines in Fifeshire. I have also been working in Lanarkshire, but I forget the particular designation of the companies.
1811. Were you getting coal there, or did you do any other work in connection with the mine? I was chiefly getting coal.
1812. What was the system of working there? In Fifeshire it was chiefly long-wall, and in Lanarkshire chiefly bord and stall, or pillar and bord system.
1813. Do you remember the width of the bords? They were chiefly 12 feet in Lanarkshire.
1814. Can you mention the size of the pillars? Well, the pillars I can think of were generally a chain square.
1815. What mines have you worked at in this Colony? I have worked pretty well all over the Northern District.
1816. Will you mention the names of the mines? I was a good deal of my time in the A. A. Company's mine, Brown's Miami, Wallsend, Stockton, and a little of my time in Burwood. I think I have spent most of my time in the Borehole as far as mining is concerned in the Northern District.
1817. Have you held any official position in connection with the miner's lodges? I have occupied all the various positions at different times.
1818. Have you acted as check inspector? I have.
1819. I believe you were at one time President of the Miner's Association? I was.
1820. In connection with your business as check inspector, had you ever occasion to point out any deficiencies in connection with the ventilation? Yes; I had.
1821. In what respect;—can you recollect what these deficiencies were at the time? Insufficiency was the chief point I observed. The air was not conducted in sufficient quantities to the men.
1822. Do you mean to convey that the air was not taken up to the working face? Certainly.
1823. Did you ever discover any less quantity of air than was stipulated by the Act? Certainly, very frequently.
1824. *President.*] Where? Chiefly in the Bore-hole mine; that was the only mine where I acted as check inspector.
1825. *Mr. Curley.*] What pit was that in? Chiefly in the old pit that is working now—number two.
1826. Was not that a great many years ago? From between 1885 and 1887, I suppose.
1827. Where you have spoken of the insufficiency of the ventilation, that is, where the air was under the stipulated quantity, was not that mostly where you heard complaints from the men? Invariably that was so. We generally found that where the men complained there was an insufficiency of air.
1828. Did you ever notice, in attempts to measure the air current, that the anemometer would not work? Yes. We have tried various places, and found we could not obtain a measurement.
1829. Do you look upon efficient ventilation as one of the principal items in connection with mining? It is most important, unquestionably, the most important.
1830. Have you ever met with any fire-damp in the A. A. Company's mine? No.
1831. Have you ever met with any carbonic-acid gas or stythe? Yes, I have seen it occasionally, immediately after a big fall, but as a rule the Bore-hole has been fairly free from that.
1832. *President.*] What company does the Bore-hole Mine belong to? The A. A. Company.
1833. *Mr. Curley.*] From the official positions that you have held, were you in a position to hear complaints occasionally from some of the collieries in connection with defective ventilation? Yes, I was.
1834. Do you recollect an agitation many years ago being set on foot for getting an amended Coal Mining Bill? I do.
1835. Was that because it was very generally considered that the present Act was somewhat defective? Undoubtedly.
1836. Where were you working in the year 1889? I was working in the Wallsend Colliery during a portion of the year 1889.
1837. Was that in the former part of the year? Yes, in the former part of the year.
1838. Do you recollect what is known as the Hamilton Pit disaster? I do.
1839. Do you know the names of the men who lost their lives on that occasion? Yes, I remember them; do you wish me to mention their names?
1840. Yes, if you can recollect them. There was Peate, and Peate junior, Proctor, Hodson, Banfield, Meadows, Grant, and Beaumont.
1841. Do you know how many men lost their lives on that occasion? Eleven men.

J. Thomson,  
Esq., M.L.A.

17 Sept., 1895.

1842. Do you know whether a number of men had a very narrow escape? Yes; on that occasion all the men in the pit had a very narrow escape.

1843. *President.*] What did that accident arise from? A fall of roof.

1844. *Mr. Curley.*] Do you recollect some seven of the men that had a very narrow escape? Yes; six or seven of the men had an exceedingly narrow escape.

1845. Was there not a man named Petit? Yes; that is one of the names I forgot to mention.

1846. Were you down the mine on that occasion? Yes; a few days after the fall, on the following Wednesday.

1847. Did you see the fall? Yes.

1848. Where was it? In the cross-cut.

1849. Was that a main road? Yes; the main outlet, and the only outlet as far as I could see.

1850. Was that road blocked when you were down the mine? Yes.

1851. Was the fall a fall of stone from the roof? Yes, stone.

1852. Were you at the inquiry in connection with this matter at any time? Yes; I was at the Coroner's inquiry.

1853. Do you know the conclusion the jury came to in connection with this matter? I think it was a somewhat indefinite conclusion, if I remember rightly, but I cannot say with any degree of certainty what the wording of the verdict was.

1854. Was any reference made to the weakness of the pillars? Yes; I remember that a reference was made to the insufficiency of the pillars left.

1855. Do you recollect the work being abandoned after being prosecuted for a certain distance? I do.

1856. Upon the representation of the officers of the Miners' Association at that time, did the Government decide to carry the work on? Yes, they did.

1857. Did the A. A. Company consent to that being done? Yes.

1858. After an interview? Quite right.

1859. Was the work that was carried on undertaken with a view to rescuing the bodies of the workmen supposed to be entombed or killed? I suppose that was the chief object.

1860. Was the work successful? Yes; very successful.

1861. Did you see any of the men that were found in Murphy's heading on that occasion? I did.

1862. Did you see them after they had been got out? Yes; Meadows, Beaumont, Hodson, and Grant.

1863. Do you think these men had been killed by a fall of roof? No; I do not think so.

1864. You do not think the four men you have mentioned met with their deaths from this cause? No.

1865. Do you think that these men had been entombed? Yes; I think they were starved to death.

1866. Do you recollect that while the company was prosecuting the work they came across a live pony? I do.

1867. Did the company's manager assist the rescue party as far as possible? Oh, yes.

1868. He gave every attention to the business in conjunction with the manager who was appointed by the Miners' Association? Yes; I always found the manager ready to lend any assistance in his power.

1869. From your experience as a miner, what conclusion did you come to in your own mind as to what was the cause of that accident? The only conclusion I can come to is that the pillars were not sufficient to bear the strain that was brought upon them by the excavation behind. The pillars had been taken out and a big gob left, and of course the weight is supposed to come gradually; but in this case I think it came very suddenly, and when the weight came suddenly on the pillars they were not sufficient to bear the strain, and, instead of having a clear way out, the men were caught in a trap through the roof having fallen behind as well as in front of them.

1870. What was the system of working at that colliery? The bords were supposed to be 8 yards, and the pillars 4 yards.

1871. Do you think that the roof in that particular case had been a very strong roof? I am inclined to think so.

1872. Do you think that the roof had held up for a considerable time? Yes; it must have held up for a considerable time.

1873. In consequence of the strong roof standing for such a considerable time, when it made a breakaway, was that the reason why it came over these thin pillars? No doubt that was part of the reason. If the pillars had been thicker they would have checked it. Some of the pillars were very thin; I am afraid they were even under 4 yards.

1874. Have you known them to be less when you have been working yourself? Yes, I have.

1875. From a sad experience of that character, would you conclude that there should be no doubt about substantial pillars being left in the working of coal mines? I certainly should say that it was a safe mode of working, both for the company, as well as the men.

1876. From a commercial point of view, that is, in making the most of your coal, and getting the largest quantity out, don't you think that, as a rule, you would get the most coal out by leaving the large pillar? Yes, I should imagine you would; that is the reason why it would be an advantage to the proprietary, as, by that means, they would get all the pillars out, get better coal, and run no risk of losing property through the extraction of the pillars.

1877. With that particular exception, I suppose the mine we are speaking of was, as a whole, pretty free from accidents of any thing like a general character, or of that description? Oh, yes; fairly free from accidents. Of course there have been accidents, such as a man losing his life; but they would occur generally at the working face.

1878. The accidents you refer to would be individual accidents? Yes.

1879. These accidents still keep occurring? Yes; and will be occurring as long as coal-mining is carried on, because all men are not equally careful.

1880. Do you not know that some of the most careful men have sometimes lost their lives? Yes; these are recognised as pure accidents—some of them, at least.

1881. Do not a number of these isolated single accidents occur from unseen dangers, such as slips or sooty backs? Yes; these are accidents so far as the individual is concerned.

1882. Have you ever worked in the Newcastle Company's colliery? No, I have not.

1883. Do you recollect, some years ago, about some danger that was apprehended there? Yes.

1884. Were you living in the locality? Yes.

- J. Thomson,  
Esq., M.L.A.  
17 Sept., 1895.
1885. Did you hear anything about the danger in that mine? Yes; I remember they were creeping on pretty close to their shafts—that is, the A pit.
1886. Was there not only the A pit at that time? Yes, what was called the A pit.
1887. Did you hear the general current of conversation that was passing at the time? Yes; I had occasionally to converse with some of the men who were working there prior to the creep, and also during the creep. I refer to the men who were working there to prevent the roof from coming down.
1888. Were the men stopped for some time? Yes.
1889. Do you know whether a considerable amount of energy and extra effort had to be made to secure the mine from collapsing? Yes, and an extra amount of timber, and that was more useful than the energy.
1890. Would you conclude from that that the pillars in that particular locality had been left too thin? Certainly, that was the cause of it. It was supposed to be over anxiety to obtain a dividend.
1891. Was that in the early history of the mine? Yes; it caused them to turn away the workings close to their shafts, and leave small pillars.
1892. Have you ever heard tell of other collieries in the Northern district being affected in a similar way? Yes; I have heard of Wallsend; that is an extensive mine, and they are always taking out pillars. I have known, where a big stretch of goaf has been left, two or three pillars to have been lost entirely.
1893. Did that occur at Wallsend when you were working there? Yes.
1894. Do you know the district where that occurred? I cannot localise it; but it was in what was called Willis' tunnel.
1895. Did that not happen a good few years ago? It was in the beginning of the year 1889.
1896. Did you hear tell of anything similar to this occurring at Stockton about the same time? Yes; I heard of some of the movements in Stockton.
1897. Did you hear tell of the men being stopped there for a while as well? Yes.
1898. I suppose you have given some attention to the proposed Coal-mines Regulation Bill that has been before both Houses of Parliament? Well, I have. Of course I took a very lively interest in the Coal-mines Bill that was introduced in 1889 and 1890; but I have not devoted very close attention to the matter since.
1899. Have you a copy of the proposed Bill? Yes.
1900. Do you know of a provision in the proposed Bill dealing with the hours of employment? Yes; I believe there is a clause dealing with the eight hours.
1901. You will find that the section is No. 36, on page 17 of the Bill (*see Appendix A*); just look at that provision;—have you given any thought to the provision that is there embodied in the Bill? Yes; I have given it a little thought from a general standpoint, but I have not examined this clause very closely.
1902. Are you in favour of the clause as it stands in the Bill being embodied in a mining Bill in that form? Oh, yes; I do not see anything objectionable.
1903. Do you think it is necessary for that clause to be in the Bill? Yes; I think so. I am strongly of opinion that there should be such a clause as that in any mining Bill.
1904. What is the position without a provision like that? Well, at the present time, of course, a man, through force of circumstances, is compelled to work any hours that may be required of him.
1905. There is no uniformity? No uniformity.
1906. Do you think that the hours of employment can be regulated in a voluntary way between the men and the managers? No; not under present conditions; certainly not. I do not think myself that that would ever succeed very well.
1907. Do you think that a provision of that character would add materially to the cost of working the collieries? I do not think so. I cannot see how it would add to the cost of working.
1908. There is practically no limit to the supply of coal in connection with the collieries? No; the supply seems to be very much in excess of the demand.
1909. What has been the experience of the men during recent years;—have a number of the collieries shut down now and again? Yes; a great many of them are shut down half their time.
1910. Have some of the collieries cavilled out a number of their men? They have.
1911. Have the men had to shift the best way they could? Yes, or to starve.
1912. Do you think it was an absolute necessity in some cases that that should be done? I think not. The chief object was to throw men out of employment.
1913. Have you noticed the regular dividends that have been declared by some of the collieries under these circumstances? Well, yes; they have declared dividends.
1914. Have you noticed the Wallsend Company declaring their dividend half-yearly? Yes; I have seen very frequently an account of their dividends.
1915. Have you seen the same thing in connection with the Wickham and Bullock Island Collieries? I have.
1916. Do you think that eight hours is sufficiently long for a miner to be employed in the mines? I think it is too long.
1917. Do you think that the miner out in this Colony is exposed to lots of climatic influences that affect his general health, that he would not experience in a colder climate? Yes; I believe he suffers here more than in a colder or more settled climate.
1918. Do you know that in connection with numbers of the mines here, at present, that occasionally there is fire-damp given off? Yes.
1919. Do you not think it is necessary there should be some kind of uniformity, for starting work, and leaving off work in the mine? I think it is an absolute necessity in the cases you have mentioned.
1920. Have you considered the clauses in the Bill with regard to ventilation? Well, generally speaking I have.
1921. Would you look at section 50 [47] of the Bill on page 23 (*see Appendix A*)? I see that some of the clauses in that section have been altered materially.
1922. Will you look at the provision in the section as it was originally drafted? Yes; I see that there is, a minimum of 150 feet of air provided, and that bords are not to be driven more than 25 yards.
1923. Do you approve of that section as it was originally drafted? Yes, I certainly do.
1924. You would not prefer the amendments suggested by the Legislative Council? I certainly would not prefer the amendments.

1925. Do you think the minimum quantity of air provided in that section is absolutely necessary in a Coal-mines Bill? I do. J. Thomson,  
Esq., M.L.A.
1926. Do you think that there should be any doubt about a miner having a stipulated quantity of air? There should not be the least room for doubt. 17 Sept., 1895.
1927. Can you understand why there should be any objection to a limited quantity of air? No, I cannot. The proprietors profess to be quite willing to ventilate the mines efficiently, but they all object to a minimum quantity being fixed, and I cannot see the reason for their objection at all. I hold that the fact of a minimum will not prevent them from sending as much air as they like.
1928. Are you aware that in mines where there is much gas that that minimum quantity would not meet the case? In some cases it would not.
1929. Would it meet the case of a mine like the Helensburgh Mine in the Southern district? It does not interfere with a case like the Helensburgh Mine at all, because if 150 feet of air was not adequate, they could put 300 feet.
1930. You think they would have as much air as would sweep out the gas, or the place could not be worked? Certainly. If all the mines were troubled with gas there would be less need for a minimum quantity.
1931. Do you think that if no minimum quantity was stated, that in some instances the management would not be as active as they might otherwise be? I am quite satisfied that some—I will not say all—but some of the managers would be as indifferent as they possibly could be. They would not care if there was ventilation or not. They would tell the men, "If you say there is not sufficient ventilation I say there is, and I am the judge."
1932. Would not the manager say in such a case as that, "I am the manager of the mine"? Of course he would.
1933. Might not that seriously interfere with the health of the miner? Most assuredly; nothing more so.
1934. Do you believe in the provision in the Bill for splits in connection with ventilation? Yes, I do.
1935. Have you given any attention to that matter? Yes, I have.
1936. Will you look at the section [49] 46 on page 23 of the Bill (*see Appendix A*);—do you notice that subsection (III) has been crossed out by the Legislative Council? I do.
1937. Do you think that that subsection should be embodied in the Bill? It would certainly be all the better if it was, but a part of it does not seem quite clear to me.
1938. What part do you refer to? The part that refers to where gas does not exist.
1939. Do you think that brattice is an absolute necessity where gas does exist? Most unquestionably.
1940. And where no gas exists? I think bratticing would not be necessary where the distance between the cut-throughs was considerably shortened below 35 yards. I would be prepared to have cut-throughs 20 yards apart in preference to the brattice.
1941. Do you think brattice is required if the cut-throughs are not shortened? Undoubtedly; 35 yards is much too great a distance between cut-throughs.
1942. Do you think the clauses in the Bill providing for the working of bords and pillars under ocean or tidal waters should stand as they were originally drafted in the Bill? I do.
1943. Will you look at rules 41-51, on pages 31 and 32 of the Bill (*see Appendix A*);—do you approve of the 1st rule, rule 41, that deals with a person not to be employed as a coal-getter until he has had two years' experience? I do.
1944. Do you approve of a regulation width for pillars under ocean or tidal waters? I am strongly inclined to think that these pillars are none too big. I think that provision ought to be good enough. If it is not, it is hardly possible to work it.
1945. In cases of danger do you believe that inspectors should have power to withdraw the men? I do.
1946. With regard to a check-weigher, do you think that the men should have the right to select their check-weighman? Most assuredly.
1947. Do you think they should have the right to select him from whom they please, whether he be an employee of the mine or otherwise? Certainly.

[Witness withdrew.]

Treharne Evans sworn and examined:—

1948. *Mr. Curley.*] What are you, Mr. Evans? A miner.
1949. Where are you employed at the present time? At the South Waratah Colliery.
1950. Have you been employed at the Lambton Colliery as a miner? Yes.
1951. For what number of years have you been employed as a miner? I have been somewhere about eight years working as a miner, and three years, all but two months, as check-weighman.
1952. Were you appointed to the position of check-weighman by the men? Yes.
1953. Do you recollect the suspension of work at the Lambton Colliery some time ago? I do.
1954. Were the men given notice in connection with the matter? Yes.
1955. Were the whole of the men dismissed from the colliery? Yes, with the exception of myself, but I believe that some of the men outside did not receive notice. Through not being an employé of the Company I did not receive notice.
1956. For how many weeks did the colliery stop work. For about five weeks.
1957. When work was resumed again, did the great bulk of the men get taken back to the colliery again? Yes.
1958. Were the men, after they were taken on again, willing to still allow you to follow on at your old occupation as check-weighman? Yes. The check-weighman at the Lambton Colliery is appointed half-yearly, and I had another six weeks to go before the term of my six months expired. The chairman of the miner's lodge, through something he had heard, advised me to make an application to the manager of the colliery for re-employment.
1959. Did you do so? I did. I did not ask him to employ me as an employé of the colliery alone, but, after a short conversation, I asked him to be good enough to withdraw his objection to me, and allow me to take my old position as check-weighman, and this he refused to do.
1960. Could he not have permitted you to have gone back and have taken up your position? Yes.
1961. He could have kept his objection back? Yes. During the eleven years I was employed in and at that colliery, there had been three strikes previous to this. The check-weighman, after one strike that lasted

Mr. T. Evans.  
17 Sept., 1895.

- Mr. T. Evans. lasted for nine months, was not re-appointed by the men, but the check-weighman has never been known to ask the manager to reinstate him.
- 17 Sept., 1895. 1962. Was there ever any objection to you? No; I believe I would be appointed to-morrow by the same lodge.
1963. Were you out of employment for the time being? I was out of employment for five months.
1964. Do you consider that the miners as a body at the different collieries should have the right to select their check-weighman? I do.
1965. *President.*] From anywhere they like? Yes, as long as the men pay him.
1966. *Mr. Curley.*] Do you understand that the present Act states that he must be an employé of the mine? I was an employé of the mine when I was appointed.
1967. Had any objection been taken to you in connection with the performance of your duties? No; I intended to see the general manager, when the young man, his son, objected, and I could not see him; but I saw him afterwards, and asked him if he knew of anything I had done detrimental to the Company or to the men, and he said, "No, Treharne; I do not." I then asked him had he anything against me during the time I was employed under him at the pit, and he said, "No; I have nothing against you. I believe you are as good a man as any man we employ at the present time."

[Witness withdrew.]

WEDNESDAY, 18 SEPTEMBER, 1895.

[The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.]

Present:—

FRANCIS EDWARD ROGERS, Esq., Q.C. (PRESIDENT).

JAMES CURLEY, Esq. | JESSE GREGSON, Esq.

The Honorable Joseph Cook, Postmaster-General, sworn and examined:—

- The Hon. Joseph Cook. 1968. *Mr. Curley.*] You are at the present time, I believe, Mr. Cook, Postmaster-General? I am.
1969. And you are one of the Members of the Legislative Assembly? Yes.
- 18 Sept., 1895. 1970. Previous to your entering the Legislative Assembly, what occupation did you follow? I was for four years check-weighman in one of the collieries at Lithgow.
1971. What were you before you were check-weighman? I was a miner.
1972. How long have you been out in the colonies? For about eleven years.
1973. Have you worked in coal-mines in England? I have; in fact, I have been engaged in coal-mines since I was a little boy about 9 or 10 years old.
1974. At what mines in England were you employed? I was employed in North Staffordshire, where the system of mining is in many respects peculiar.
1975. What were the names of the mines you were engaged in in England? The Sheriff Mine was one, and another was called the Holywood; both mines were at Silverdale.
1976. Were those the only two mines you worked in in England? Oh, no; I worked in a number of mines, but I specialise the Sheriff Mine because I worked in it longer than the rest; I never worked in any other district. That is the only coal-mine I worked in; the other mines were ironstone seams.
1977. Were the coal seams thick seams or thin seams? There were a large number of seams.
1978. I refer to the seams you worked in? In the one mine there were nine or ten different seams of coal, worked from the one shaft, and varying in thickness from 10 or 11 feet down to 2 feet.
1979. Were they working all these seams? Yes.
1980. Simultaneously? Yes; you might say each one was really a separate mine. They dipped at very sharp angles, but the one shaft would pierce all the seams.
1981. What was the thickness of the seam you worked in? About 7 feet. As a matter of fact, there were two seams separated by about 2 feet of mullock. One seam was 7 feet thick, and the other seam about 5 feet thick. We wrought both seams from the one bord. We took out the lower seams first, and treated the top seam as tops, but there were two separate seams.
1982. Did the miner deal with the whole of that mullock as well as the coal-getting? Yes, it was soft mullock.
1983. It was not a hard material? It was nothing like your bands in the Northern district.
1984. What method of working was pursued in the mine? Pillar and stall. The method of working was peculiar. You went first of all to the boundary, and brought it out in 10-yard pillars. No other plan was possible, owing to the nature of the roof.
1985. When you drive to the boundary like that, would you drive parallel drives in order to cut one on to the other? You drive on to the boundary.
1986. Would you call it a heading? No, a self-acting plane. We used to call it a gig dip.
1987. Would it be a main road? No, you drive your main road to the boundary, but these rises are equidistant. Where it is flat, you can adopt the long-wall system.
1988. What was the width of the places you put across? The rises would be about 10 feet wide, and the headings driven along to fetch the 10-yard pillars back would be about 5 feet in width. The width was really never a given quantity, and if the coal is soft going a bit wider, but about 5 feet as a rule.
1989. Were the pillars of substantial size;—what size were they? There were no pillars; you kept bringing back the pillars. It is quite a different method to what we work here. You go to your boundary first, and there is no need for pillars.
1990. There would be sectional blocks? Yes; when a 10-yard section is taken out you bring down your gig dip, drive your heading, and bring out another block.
1991. What was the method of ventilation in connection with a colliery of that description? Bratticing and pipes.
1992. *President.*] Was it a gassy mine? Oh, yes; and being nearly perpendicular, the gas rested on the top, and it was almost impossible to drive it out. Explosions of gas were a usual thing. They were so located

located that they did not wreck a mine, as they sometimes do the large mines. I should imagine they would be the most dangerous mines in England, owing to the fact that they are nearly perpendicular, and it is difficult to drive the gas out.

The Hon.  
Joseph Cook.  
18 Sept., 1895.

1993. *Mr. Curley.*] There would not be much complaint about ventilation in such a mine as that? Well, self-interest would lead them there to ventilate sufficiently. That would be one of the cases in which protection to property and life were coincidental, and the motive in each case would be nearly equal. They had to have the very latest appliances to keep the property safe, because gas was always a trouble.

1994. Were the other mines similar to that? Oh, yes; they were all similar in that district.

1995. Now, coming to this Colony; what collieries have you worked at in the Lithgow district? At the Vale of Clwydd, and the New Vale Collieries.

1996. Did you work in these collieries as a coal-miner? Yes, as a coal-miner.

1997. What was the method of working pursued at the Vale of Clwydd Colliery? The ordinary bord and pillar system.

1998. Do you know anything about how the ventilation is conducted at that colliery;—was it by furnace, fan, or what? By furnace, and quite sufficient too, I should say, if properly looked after. They are only small collieries, and the conditions are the simplest.

1999. Were there many men employed when you were there? The number of men employed varies according to the condition of the trade—sometimes 100 men, sometimes twenty. At the present time there would not be more than twenty-five men in any of the mines.

2000. How many men were employed when you were working yourself? As high as 100, and at one particular time as many as 200. It all depended on the condition of the trade.

2001. What kind of stoppings were erected on the main roads? I think they varied in the collieries I worked in—chiefly slack.

2002. Was that in the main intake road? Yes, occasionally there would be a brick stopping.

2003. Was that mine fairly well ventilated when you were there? Yes, on the whole it was fairly well looked after. Of course, there were occasions when it was defective, like most other places.

2004. Did they work out the pillars in that colliery? No.

2005. Did they leave any pillars? They did not leave any pillars, that could be called pillars. It is only fair to say that the roof was of such a nature that hardly any inconvenience was caused by the roof.

2006. What was the size of the pillar left? It would vary from 4 to 5 yards. The mine was intersected with faults, which formed a very substantial support to the roof.

2007. Did these faults come through the seam? Yes; it was not like an ordinary fault or dyke, because it did not interfere with the level of the seam, never more than a few inches. The faults up there are peculiar to the district.

2008. Was it what is termed a stone-dyke? I do not know that I have seen anything like it before. It was a sort of conglomerate, sometimes hard, and sometimes soft, but peculiar to the district.

2009. What thickness was it? The thickness varied. The seam sometimes would not run entirely out, sometimes it might be a few inches, sometimes a foot, sometimes 3 inches, sometimes it would run out altogether. You could never depend on what one of them would be like.

2010. Did they go right through the ramification of the mine? They go about all ways; you scarcely knew when you were going to hit them. Some of them ran fairly regular, but they formed a substantial support to the roof.

2011. Have you to go through them? Oh, yes; and the miner does not like the job.

2012. No matter what it is, don't you think there is a danger of it tumbling down;—have you really nothing underneath it? Hardly anything. It has all grown together, naturally, and you have to make your own parting. There is hardly any danger about a fault there. The fault is peculiar to the district.

2013. No matter how you deal with a quantity of rock of that description, do you mean to say that there is never any danger of that tumbling down? There is a danger if it is soft enough, but the danger is at a minimum there. The entrance through them is very narrow, and there is no natural parting, therefore there is very little danger.

2014. Did they work out the pillars there—the pillars they could work out? They did not leave very much pillar there. I would not say that there is a very great deal of danger for the reasons I have mentioned. The faults themselves are substantial supports to the roof. I believe at the present time they do leave more substantial pillars in some of the mines.

2015. Have you ever known there any very large sectional area to be worked completely out, in the way of pillars, and all the coal to be got? No; not in that particular mine. I believe they are working under those conditions in one of the mines now.

2016. Do you know the width of the bords? I think they are about 7 yards wide. I am only speaking from what I hear in the district.

2017. At the particular time you were working there, what was the width of the bords? About 8 yards.

2018. What was the name of the other mine you worked in in that district? The New Vale.

2019. What was the method of mining pursued there? The method was practically the same as in the Vale of Clwydd Colliery.

2020. Did you meet with the same faults in the New Vale Colliery? Yes; but considerably more than in the Vale of Clwydd Colliery.

2021. What kind of stoppings were put up there in connection with the main intakes? Slack, or brick stoppings, according to the nature of the workings.

2022. Did you ever meet with black damp or anything of that kind while working there? No.

2023. There was no such thing as gas in any of these mines? No, never.

2024. What was the system of ventilating at the New Vale Colliery? Practically the same as the Vale of Clwydd—furnace.

2025. *President.*] Was there always fair ventilation there? I would not like to say that, because it varies considerably—if everything was going right, yes. It all depends on the system; you may have 100,000 feet of air at the bottom of the pit, but a place a mile away may be suffocating—it all depends on the system adopted.

2026. On the whole, was the mine fairly-well ventilated? Yes, on the whole, fairly-well ventilated.

2027. *Mr. Curley.*] Had you occasionally to make complaints with regard to the ventilation? Occasionally we used to send round our check inspector.

- The Hon. Joseph Cook.  
18 Sept., 1895.
2028. *President.*] Does not that arise in nearly every colliery; that does not show bad management? It all depends, it may or may not. As a rule, bad ventilation means defective management. Some places may be very badly ventilated at times that may ordinarily be well ventilated.
2029. May there not be accidental cases? Yes; want of sufficient ventilation for a time.
2030. *Mr. Curley.*] Is not that a serious matter for the man that has to work there? I rather think it is.
2031. It is not an accident for him? I think it is not.
2032. Is it not a case of slow poisoning every day that he works there? It is very bad.
2033. Do you think with regard to matters of that description that, with a little sharper supervision, numbers of these cases could be improved? I am sure of that.
2034. More particularly with a good current of air flowing through the mine;—is it not a matter of conducting the air? Yes; it is a matter of good internal arrangements.
2035. That can be done, I suppose, with proper management? It could. It is sometimes a little expense.
2036. Do you think that expense sometimes stands in the way of accomplishing this? I think so.
2037. You think that the miner may be punished in that particular way for the sake of economy? No doubt.
2038. Do you think that the miner has a right to be punished in that way? No, I do not.
2039. Are those the only two mines you have worked in in the Western district? Yes, those are the only two mines—the Vale of Clwydd, and the New Vale.
2040. Do you know anything about the method of ventilation in any of the other mines? It is generally the same—furnace ventilation.
2041. Are there any mines in the western district where you have no furnace ventilation;—have you any mines with artificial ventilation, or ventilation without mechanical power? We have one mine, I believe, where there is no furnace.
2042. How is that mine ventilated? I cannot say.
2043. Is it what is termed natural ventilation? I suppose so, but I do not know.
2044. Do you think that a mine should be left to ventilate itself in that fashion, if it is a fact? I do not.
2045. What is the name of the mine you refer to? The mine I refer to is the Oakey Park mine; that mine has no furnace, and it is the last mine that has been put down.
2046. Do you know the number of men that are employed in that mine? I should not think there would be more than twenty-five.
2047. *President.*] How can the mine ventilate itself? Well, it does; I suppose the same kind of ventilation goes on in a modified way as that that goes on in the atmosphere around us.
2048. That kind of natural ventilation would almost be in any mine? Oh, yes; I do not think you could thoroughly systematise it in any way.
2049. Could you not systematise it by saying that it was ventilation looking after itself? I suppose that would be the correct way to describe it.
2050. Are there a number of men employed in that mine? I should say there were about twenty-five miners. I suppose there would be more, including wheelers and shift-men—say, thirty-two or thirty-three.
2051. *Mr. Curley.*] Do you enter most of these mines by a tunnel? Only two of the mines have tunnels, that is, on the west side where the outcrop is. The coal dips east as you come towards Sydney, and the seam gets deeper.
2052. What is the depth of the shafts in the other mines? They vary, of course, as they go east. The first shaft, which is close to the railway station, I should not think was more than 50 or 60 feet, and the one nearest to Sydney, the Oakey Park Mine, would be over 300 feet.
2053. That is the mine where there is no mechanical ventilation that you are aware of? Yes.
2054. *President.*] I cannot understand why the manager of that mine has not been brought to book under the present Act—the Act of 1876? He cannot be brought to book if he has 100 cubic feet of air for every man employed—that is, if the mine ventilates itself to that extent you cannot compel him. The Act says nothing about a system. When the inspector goes to measure the air I suppose he finds it adequate according to the Act.
2055. *Mr. Curley.*] Take the case of a mine that generated gas;—if the minimum quantity stipulated in the Act was not sufficient to cope with that gas, would not an adequate supply of air have to be provided in order to meet the case? First of all there would be an argument entered into about it. There is no provision in the Act to deal with a case like that. The Act says that an adequate amount of air, not less than 100 cubic feet, shall be provided.
2056. Would not a manager have to do it for the safety of the mine? He might do it if he thought it was necessary.
2057. If the manager had a person at that colliery whose duty it was to inspect the working places in the morning, and he found there was gas in the mine, and there was not sufficient air to drive it out, would not the manager have to provide sufficient air;—if he did not, would not the gas explode? The protection of the property might make him drive the gas out, but there is nothing in the Act to compel him to give more than 100 cubic feet of air. A man might be working in a place in a state of suffocation, and yet the quantity of air stipulated in the Act may be passing along the airway, but it never reaches that man. The Act provides that the air “shall sweep undiminished along the airway,” but, “past each working place.”
2058. *President.*] Subsection (I) of the Act of 1876 says: “An adequate amount of ventilation shall be constantly produced in every mine to dilute and render harmless noxious gases to such an extent that the working places of the shafts, levels, stables, and workings of such mine, and the travelling roads to and from such working places, shall be in a fit state for working and passing therein”? Yes, and subsection (II) says how that is to be done,—“An adequate amount of ventilation shall mean not less (as a minimum) than one hundred cubic feet of pure air per minute for each man, boy, and horse which shall sweep undiminished along the airway past each working place.”
2059. The Act says that they must dilute these noxious gases? Yes, with 100 cubic feet of air, which shall pass undiminished along the airway past each working place.
2060. How are you going to remedy that;—if you get a bad manager or a bad inspector, in what way can you regulate that by Act of Parliament? I should say it would be a bad job.
2061. *Mr. Curley.*] In spite of all the conditions, will not circumstances make men complain? They have to do so ultimately. They have to take secret means of making their wants known.

2062. *President.*] Have you any cases in your mind, or are you speaking only of what might happen in cases where insufficient air is supplied, and the men are frightened to complain? I have cases in my mind.

2063. In the Western district? Yes.

2064. *Mr. Curley.*] You know that has occurred in the Western district? Oh, yes.

2065. Do you know whether any anonymous communications have ever been sent to the inspector? I do not know.

2066. Could not that be done? Yes, readily.

2067. Do you know that the Secretary of State in England has recommended the inspectors to take notice of these things? No, I did not know that. I have had anonymous letters myself.

2068. *President.*] About weighing? No, about ventilation.

2069. Anonymous letters asking you to do something? Yes, and I am not much in love with anonymity.

2070. *Mr. Curley.*] Will you please read what is said here in Mr. Nelson Boyd's book, "Coal-pits and Pitmen," on this subject:—"The Home Secretary, in reviewing the debate, repeated the statement that accidents had greatly diminished since the passing of the Act. He looked on the certificate of colliery managers as quite as important as those granted to masters of vessels, and had always given instructions to prosecute managers when there was sufficient cause for doing so; but, for safety, it was necessary to depend mainly on the responsibility of employers and employed. He repudiated the view that inspectors were not to visit a mine unless an accident had occurred, and he had issued 'consolidated instructions' to the inspectors on that subject. These instructions enjoined on the inspectors to examine a mine on invitation or complaint; to pay attention to anonymous complaints without divulging the source of their information; not to send notice of intended visits to mines, unless advisable to do so; and to examine mines as frequently as possible without announcing their intention, as the liability to an official inspection without previous warning might be a most effective prevention of abuse." Lastly, "That a record should be kept of the inspections and the results obtained."

2071. Do you approve of what is said there? I do, certainly. A weak point in the Act of 1876, the Act we are now working under, is that the air shall sweep undiminished along the airway past each working place, but the Bill we have now under consideration proposes to carry the air into each working place, and makes provision for doing so. The sections I refer to in the Act of 1876 are subsections (II) and (III) of section 12 (*see Appendix B*). You are told in subsection (II) what to do, and in subsection (III) how to do it.

2072. *President.*] Supposing the Bill we are considering does not pass the Legislature. I think it will be a grave thing for that interpretation of the Act to go forth to the world as the proper interpretation. I think that would be a very bad thing. It is my opinion that the inspector can take action under the present Act, and compel the minimum of air to be provided in each working place. Has such a case ever been tested? I do not think so.

2073. My reading at present of these two subsections is, that a manager is bound to supply the minimum quantity of air to the men at the working face, but I would like to give the matter further consideration.

2074. *Mr. Cook.*] I should like to say that in England where a mine is very dangerous, self-interest drives them to observe strict conditions. They could not drive 35 yards before the air. In the principal mine I wrought in, they never drove more than 10 yards, and even then they had to carry the current to the face by pipes, or brattice. Self-interest drove them to do this.

2075. *President.*] Are there any mines in England without gas? Oh, yes.

2076. *Mr. Curley.*] The Bill we have before us says this air must be carried into the working face by means of brattice. If it is generally done, why do the managers rebel so fiercely?

2077. *Mr. Gregson.*] The managers do not object.

2078. *Mr. Curley.*] The managers object to any steps being taken to force the air by means of brattice.

2079. *Mr. Gregson.*] The managers recommend the English Act of 1887. If the Bill said what the English Act of 1887 says they would be content with the Bill.

2080. *Mr. Curley.*] You have looked at the provisions in the proposed Bill sections [50] 47, on pages 23 and 24, "Ventilation of Mines" (*see Appendix A*). You notice the amendments made by the Legislative Council in the rule, the alteration of the words "twenty-five" to "thirty-five," and also the erasures further on in the clause? Yes.

2081. Do you consider that the section should stand as it was originally drafted, or do you believe in the amendments made by the Legislative Council? I think the clause should stand as originally drafted.

2082. *President.*] Will you look at the provisions in the English Act, section 49 (*see Appendix C*)? I do not agree with the English Act in all cases; it is not stringent enough in some things.

2083. Why? I have worked in places in England myself where it was almost impossible to work owing to the black damp, and have suffered long periods of sickness through it. I have seen places where the light would not burn at all, and where, when you had to run your skip out, you had to leave your light at both ends, and run the skip through the dark. The English Act is not necessarily a perfect Act any more than our Act is perfect.

2084. It seems to me to be well drawn? The gassy mines in England are the main care of the owners there, and those conditions dominated their ideas in framing an Act, but in the non-fiery mines there is no possibility of doing anything to make the conditions more sanitary. In the case of a very fiery mine self-interest comes in, and the inspector in England has very much larger powers than he has here.

2085. In what way? If an inspector finds that an accident is due to defective management he can move the Secretary of State, and put the manager on his trial. He has a penal power there.

2086. Is not that proposed here in this Bill? Yes, it is. Only a little while before I left England I knew of a case where an accident occurred owing to a fire in the goaf. The manager concentrated his attention on saving the lives of the people in the mine, but the owners and the inspectors thought he had not done his duty. He was a man who had risen from the ranks, and the experts moved the Secretary of State, and succeeded in getting the case tried before a County Court Judge. The judge who tried the case commended the manager for considering the safety of the lives under him rather than the property. That could not occur out here.

2087. Why? It could under the proposed new Bill.

2088. But you must take the two things together? I am willing to do so, but people in England are living lingering deaths by this black damp.

The Hon.  
Joseph Cook.  
18 Sept., 1895.

- The Hon. Joseph Cook. 2089. Do you mean to say they are doing so to-day? Yes; I do not see anything in the Act to make it different.
- 18 Sept., 1895. 2090. They cannot be giving an adequate amount of ventilation? They give what is thought adequate.
2091. *Mr. Gregson.*] The latest statistics do not bear out what you say? I am speaking from my experience.
2092. *Mr. Curley.*] Your opinion is, Mr. Cook, that there should be a stipulated minimum quantity of air fixed in any Act that may be passed in this Colony? Yes; as a matter of interpretation as to the least amount that can be called adequate.
2093. Do you look upon the provision in the Bill [49] 46, on page 23, "Division of mine into splits," (*see Appendix A*), as an essential part of the whole question? Oh, yes.
2094. With regard to the provision in the Bill for giving additional powers to inspectors, section 21, page 8 (*see Appendix A*);—do you believe in that provision? I do.
2095. Do you consider that an inspector should have power to call men out if he notices there is any danger? I do.
2096. *President.*] Suppose an inspector says to the manager, "This mine is dangerous, you ought to take the men out"; do you think any manager would keep on after that. Suppose the roof is dangerous, perhaps it is working, and the inspector says, "You must take the men out at once," leaving the provision as it is in the English Act—do you think a manager would dare to keep on working after that? Yes, under our present Act he might.
2097. Suppose a case in which the inspector is a man who is prejudiced, could he not ruin an owner by suddenly withdrawing the men from the mine for an insufficient cause? Yes, that is so. A bad inspector must always do mischief, and a bad judge might do the same, or a bad Governor, but you must have a final authority.
2098. *Mr. Gregson.*] Do you think that three months' imprisonment would be an assistance in making a manager careful? Yes, I suppose they would not care to go to gaol. We meet a defect of that sort in the proposed Bill.
2099. And it is willingly accepted? As to the power of the inspector to withdraw the men?
2100. No, that is another matter? No, it is the same matter.
2101. We are considering a case in which the inspector tells the manager that he thinks a mine is dangerous, and that the men should be withdrawn, and that the manager differs from the inspector, and they go to arbitration, and if the manager is wrong and he has not withdrawn his men he gets three months' imprisonment. He is committed for the offence. Will you look at the supplementary part of the Bill, section [64] 59, on page 35, "Imprisonment for wilful neglect, endangering life or limb" (*see Appendix A*)? With the other provision in the Bill as to arbitration, how extremely difficult it would be to prove that anything was done wilfully. Suppose a manager says it was my honest opinion that the inspector was wrong.
2102. Now, take the case at Stockton, which is one in point. There the provisions of the present Act have not been carried out, which provides they should go to arbitration, but nobody has done that. In such a case as Stockton, under the proposed Bill, the manager gets three months? Yes, after the arbitration. In Stockton the water might have got away, and the mine might have been flooded while the arbitration was going on.
2103. Here are the guardians of the miners who do not know their duty. Why does not the inspector force arbitration, or why does not the Minister? I am sure I do not know.
2104. *Mr. Curley.*] Is it your opinion, Mr. Cook, that this subsection (v), of section 21, should be embodied in the Bill as originally drafted? Yes.
2105. Now, with regard to the weighing question, as it affects the Lithgow district, can you give us any information as to the system adopted there? It is the system of averaging, the same as obtains elsewhere.
2106. Were you only employed in one mine as a check-weighman? Yes, that is all; but the same system obtains at other mines.
2107. Are the men in your district anything like satisfied with the system of averaging? They want more skips weighed in order to get at a truer average.
2108. Have the miners in your district been contending for having every skip weighed? No.
2109. They are satisfied with an average weight? Yes, if they can get a fair average, but they want to have some say in the system of weighing, and not to leave it to the caprice of the manager.
2110. Have you standard weight in your district? No.
2111. It does not obtain? No; our trouble is that we do not get enough skips weighed.
2112. What number of skips do you weigh daily? We go weeks together without a single skip being weighed.
2113. Is that at any particular mine, or do you refer to all the mines? Mostly all the mines. The weighing is absolutely at the caprice of the manager.
2114. *Mr. Gregson.*] Is the check-weighman standing by always? They used to, but now at most of the mines they have no check-weighman.
2115. When you were there were you always standing by? Yes, but I did not weigh, because the manager did not choose.
2116. Had you power to choose? I had no power.
2117. Did you request the manager to weigh coal? It was a source of constant friction; one of the most prolific sources of friction when a man goes six or seven months without being weighed.
2118. Can you give us any idea as to the proportion of the skips that were weighed? I do not know that I could.
2119. Have you any books that would supply this information? I think I could get them, but I know the proportion is extremely small. The system of weighing coal is more unsatisfactory than anything else.
2120. *President.*] Can you give the Commission this information? I will try and get the information for the Commission (*see evidence given by Mr. Coates, minutes of evidence, pages 129-130*).
2121. *Mr. Curley.*] Say the number of skips that have been weighed within a given time, the number of skips that have come out of the mine, and what the skips carry? Yes. I should not think the percentage is one per cent. at many of the mines.
2122. Do you think the same kind of thing obtains now? Yes, it is entirely at the caprice of the management.
- 2123.

The Hon.  
Joseph Cook.  
18 Sept., 1895.

2123. *Mr. Gregson.*] May not that tell against the management? No; the manager knows the average weight of the mine. He knows the skips that come out. All that he has to do is to get the weight from the railway station, and when he gets the weights he knows whether he is losing or gaining. If he is gaining, he lets the weighing alone.

2124. The protection to the mine-owners is railway weight; the manager can see if he is over-paying and if so, gets more skips weighed? He weighs just as he likes; just as it suits him.

2125. What would you suggest to meet the difficulty? I would suggest a very reasonable course, provided in the Bill as it was originally drafted. The section in the Bill dealing with weighing is [41] 38, on page 18 (*see Appendix A*). In England, in some of the collieries, they weigh every ounce of coal that comes out of the mine, and, while admitting that it might be an inconvenience to weigh all the skips here, the men, I think, although that is their right, because there is no other way by which they can be paid absolutely, do not ask for anything of the kind. They say, "we do not want to insist on this method if you will allow us to make a mutual arrangement with the management as to what proportion of skips shall be weighed." I refer to the words in the Bill as originally drafted, "and, unless otherwise mutually agreed upon, all the mineral gotten by them shall be truly weighed, &c."

2126. Will not the alterations suggested by the Legislative Council meet your views? No; there are no penal powers by which the men can enforce their rights.

2127. What would you suggest? The retention of the words "and, unless otherwise mutually agreed upon, all the mineral gotten by them shall be truly weighed, &c."

2128. Might I suggest to you a difficulty that may arise there; if the wording you suggest is put into the agreement a strike or lockout might be the result;—suppose a mine-owner does not care to agree, and the men insist on having every skip raised weighed, it might mean a block? Then the men say this man has shut his mine hoping to put us to inconvenience. It is an infringement of the Act.

2129. *President.*] Suppose the mine-owner finds that it would not pay him to have every skip weighed; the men, you know, sometimes get rapacious in their demands, and they may ask the extreme of their rights, and if they did do so the mine-owner might say, I cannot afford to work my mine, therefore I must shut it up;—would that be an offence? It ought to be no argument. A contract is entered into, and a basis of payment agreed upon to weigh all the mineral gotten, &c. I think that if a mine-owner cannot work his mine according to the Act he had better not work it at all. If he said, I have got to weigh all this coal, therefore I will shut the mine up, he does so in a penal way.

2130. *Mr. Curley.*] Do you think, Mr. Cook, that as a matter of right that every skip should be weighed in connection with a colliery? Yes, as a matter of right, by that I mean fairness.

2131. Do you consider the men would have any objection to an average provided that a fair number of skips were weighed each day at the collieries? They would be glad to get it; very glad indeed.

2132. Do you believe that all standard weight should be abolished? Yes, I think that whatever a man puts in a skip should be weighed.

2133. *Mr. Gregson.*] Have you any objection to the standard bar? As a matter of right I do not see how the standard bar can be objected to.

2134. *Mr. Curley.*] Will you leave that as a matter of mutual arrangement? I think it is far better to leave it out altogether from the Bill, although if a manager thought a bar was necessary for the protection of his working he has the right to say so.

2135. Have you looked into the question of certificates of service for managers, and under-managers, and inspectors? Yes; I quite agree that there should be certificates for service.

2136. Do you think that the provision in the Bill, as originally drafted, is a fair one? I do.

2137. *President.*] You believe in the Bill exactly as originally drafted? I do.

2138. And in nothing else? Yes.

2139. *Mr. Curley.*] Have you looked into the provision in the Bill with regard to sinking shafts; will you look at Rule 19 on page 28, "Trolley over pit mouth" (*see Appendix A*);—do you agree with that provision? I quite agree with that.

2140. Are you aware that men are frequently liable to things falling down the pit shaft? Yes; I stood by one shaft and saw a tub go down the sinking pit.

2141. Where was that? At the New Vale Colliery, when they were putting down the shaft.

2142. Did that occur after the tub had come to the surface? Yes.

2143. Was there any trolley at that particular shaft? There was, but it had not been run in. I think the man did not hook the tub properly. It was not the fault of the trolley. It was more of an accident than anything else, and, strange to say, it did not hurt anybody.

2144. From the experience you have had in connection with mines out here, do you think it would cost anything like 6d. or 8d. per ton extra to comply with the provisions of this Bill? Certainly not.

2145. Do you think that the miners should accept the onus whatever it was? I do not see that they should. Why should they pay for making things safe. The men under our present commercial system must work for the employer or starve. The employer has no right to say they shall work under any conditions he chooses unless they like to pay for it.

2146. Is there anything else you would like to refer to, Mr. Cook? I do not think there is anything else at present.

2147. Do the miners set their own timber in your district? Yes.

2148. Do the miners lay all their own roads? Yes; and they do a good many other things additional since the union got weak. I suppose surplus labour and the combination of capital has largely brought about the present state of things.

2149. *Mr. Gregson.*] Does the same unsatisfactory method of weighing that obtained while you were working in the Western District still obtain? Similar conditions to those I have mentioned still obtain, principally with regard to weighing, at other mines in the district, although some are not so bad as others.

2150. What would you put the proportion of skips at that the best of the collieries weigh? I cannot say; it is not as bad at some of the collieries as at others.

2151. Is this a matter of common talk amongst the miners themselves? It has always been a bone of contention.

[Witness withdrew.]

Alfred Edden, Esq., M.L.A., sworn and examined:—

A. Edden,  
Esq., M.L.A.  
18 Sept., 1895.

2152. *Mr. Curley.*] You are, I believe, Mr. Edden, at the present time a member of the Legislative Assembly? I am.
2153. You represent the constituency of Kahibah? I do.
2154. What occupation did you follow previous to entering the Legislative Assembly? Mining.
2155. Have you been engaged in mining pursuits for any considerable time? I never did anything else in my life. I have had thirty-two years experience in mining. I entered the mines when I was ten years of age.
2156. Have you worked in any mines in England? Yes.
2157. What districts have you worked in in England? In Staffordshire, Warwickshire, Derbyshire, and Nottinghamshire.
2158. Have you worked in these mines as a coal-miner? Yes.
2159. Take the first place you mentioned;—what was the name of the colliery you worked in in Staffordshire? Pennings and Harrison's.
2160. What was the system of working followed out in that colliery? It was longwall work there.
2161. What was the system of working followed out in the other places you mentioned? It was all longwall work. I never worked under any other system till I came to this Colony.
2162. Did you find the ventilation fairly good in those mines? When I first started to work in the mines the ventilation was not so good as it was years afterwards, when things were altered by Acts of Parliament and other matters. When I left home the last mine I worked in was in Nottinghamshire; it was over 600 yards deep, and we never worked with our shirts off, only in the straight work—headings.
2163. Did the men do their own timbering in these mines, or did they have deputies? We used to do our own timbering there.
2164. What mines have you worked in out in this Colony? I have worked in the Newcastle Coal-mining Company's mine for nine years, and in the Waratah Company's mine; also with the Lambton Company the Scottish Australian Mining Company, and at West Wallsend.
2165. Were you working continuously at the Newcastle Company's mine for nine years? I had a break of twelve months; that was all.
2166. What was the system of mining pursued in that mine? Bord and pillar work.
2167. Do you recollect the width of the bords at that colliery? Some 8 yards, some 6 yards, and some 4 yards; but the general practice was 8 yards—what we call narrow bords.
2168. The 4-yard bord was what you called a narrow bord? Yes.
2169. What was the size of the pillar in that colliery? Four yards.
2170. Was that the system throughout the mine? It was. I believe during the latter portion of the time I worked there they increased the size of the pillars; that was after the fall came on, but I am not certain.
2171. Did you have opportunities of seeing different parts of the mine during that time? I worked for four years as a shiftman, doing different work in different parts of the mine.
2172. With regard to the creep you have referred to, where did that take place? In what was known as the No. 1 heading—the main heading from the shaft.
2173. Was it far from the bottom of the shaft? No, not a great distance. I should think 100 yards at the outside, no more.
2174. Were the men in the mine at the time that creep came on? It came on the night previously. I was working in the night shift, and we perceived the creep coming on. The roof fell in the night-time, after the pit had knocked off. It shut off one part of the workings altogether for some time.
2175. Did the roof come down on to the roadway? Yes, right up to the surface.
2176. Do you know the extent to which it blocked the roadway? It was a terrible distance; I should think fully 100 yards in length. It took some months to get through it to get ready for work again.
2177. If that fall had occurred in the day-time, and the men had been at work could they have got out of the mine? It would have been a risky affair, because even in the return airway, that is the No. 2 heading, a portion of that heading fell. Fortunately it happened to break before it got to the cut-through that led into the return airway, otherwise the men would have been entombed. There was another road they could have come out of, called the No. 6 heading, but this was practically closed through the coal bulging from the sides. There may have been other ways of getting out.
2178. Do you know whether that fall crushed the pillars, or came over them? It came straight over all the pillars till it got to the main road. In the main road the bords were broken off between the main road and the airway. There was a 12-yard pillar, and had it not been for that 12-yard pillar the mine would have been closed. The 12-yard pillar broke it. If that pillar had been 6 yards or 4 yards, like some of the others, it would have resulted in the collapse of that part of the mine. The 12-yard pillar saved it.
2179. What would be the number of men employed in that particular district at that time? They employed about 300 men at that time, and in that district there would be upwards of 100 men.
2180. *President.*] Do you say that 8-yard pillars would not have saved the mine? It is very doubtful whether they would have saved that part of the mine.
2181. Is that a sort of thing that is very unusual? It is a common occurrence here.
2182. *Mr. Curley.*] Did that impress you at the time with the idea that this matter of small pillars was a mistake in mining? It did, because I ran a very narrow escape at that time, and also a friend of mine who was with me. We might have both been smothered. We could see the fall coming, and we put in chocks—in fact, we stopped longer than we ought to have stopped. We were thrown down on our faces when it happened to fall, and it was with an effort that some of us who were there got clear of it.
2183. How far was that away from the bottom of the shaft? From the first end of it—at the furthest 100 or 150 yards.
2184. Was that portion of the mine stopped for some considerable time? It was some months before they got the road ready for working.
2185. Did you ever notice the ventilation of that colliery in any way defective? I did, and in every colliery that I have worked at in the district; not that colliery more than others.
2186. Was there plenty of air on the headings? Yes.
2187. What was the difficulty then? There was not proper means for having it where the men were working.

working. All the reports of the check-inspectors, and everybody else that measured the air, go to show that there was always plenty of air on the main roads, and if conveyed to where the men were working there would never have been bother about it.

A. Edden,  
Esq., M.L.A.  
18 Sept., 1895.

2188. Could the air have been conveyed to the working places? Yes, it could.

2189. Do you know of any reason why it could not be conveyed? Only one reason, and that is a matter—a small matter—when it is considered that health is at stake, and that is probably the expense, which is a trifling matter.

2190. Do you think that provisions for better ventilation to carry the air into the working faces would cost anything like 4d., 6d., or 8d. per ton? I do not. On a subject such as this I would suggest that you do not take my evidence at all, but evidence of men who are not in the position I am in, and who can give the practical and theoretical side, such men as Mr. Humble, or Jonathan May, who can show by figures what the expense would be. Mr. Humble says that it ought not to cost 1½d. per ton, assuming that the brattice would have to be renewed at every bord. Others put it down at one half-penny per ton. A colliery manager, in my hearing, John Turnbull, told us that he managed it for one half-penny per ton, that that was what it cost him for labour and everything. I think there is a mistaken idea about the cost of this bratticing. In the old country I worked where it was used, and it has a longer life than some give to it, and the expense to put it up is a mere trifle.

2191. Would not the expense vary according to the size of the seams at the different collieries? Yes.

2192. One seam might be thinner than another. Do you think, taking into consideration the variation of the seams, the cost would come to what has been stated by some of the colliery managers? No, it is impossible for it to come to that. I was the mover of the amendment in the Legislative Assembly that the air should be taken to within 15 yards of each working face by brattice where gas does not exist, and to 3 yards of the working face where gas does exist. A bord would be worked 15 yards before brattice was to be put up and according to the Bill it should be worked only 22 yards more before the brattice could be taken down again, so that the brattice would not have to be up very long at all. It would be up till the cut-through was put through. In our mode of ventilation we have no means of carrying the air to the men where they are working. I have seen places with only a narrow way for the skip and horse to get along through the refuse that is thrown on each side, and when the shots have been fired first thing in the morning the place has never been clear of smoke all day. I have a book with me, written by J. T. Beard, called "Ventilation of Mines." In chapter I, on page 1, under the heading of "Ventilation," he says:—

First, we understand by the term "Ventilation," as applied to mines, the removing of the air contaminated and laden with the poisonous gases of the pit, and supplying in its place fresh air from the outside. To do this requires the maintaining of a constant current of air through the pit, and conducting such current by means of doors, stoppings, over-casts, &c., around the entire pit and particularly to the working faces, where it is most needed.

My argument has always been, how can air go unless it is taken. I know I may be met probably with this question:—How is it that these things have not been argued for before, and my answer is, that they have been argued for before, and that in this Colony, and especially in the northern district the working of our mines and seams have altered so much that it is absolutely necessary for an alteration in the mode of ventilation. We know there are mines to-day where the seam ranges from 8 to 9 feet thick. Several years ago the men used to be allowed to work that seam all before them, taking it in a body. Now the managers and masters have managed to get an agreement, which we agitated for, making 5 feet a minimum height. Where there is over 5 feet they can compel the men to split this seam into two sections, and there is one pit where they work the seam in three sections. In working these different sections their work is so much harder, because they have to do twice the amount of holing to get out the same coal as before, and nearly double the shooting, and they work to make what little wages they do at the present time. The thickness of the seam also makes it necessary for an alteration in ventilation for the sake of the health of the men. I know how circumstances stand with men to-day. It would not do for me to give men's names for the sake of their bread and butter. Through the ventilation men cannot work, they have to struggle on the best way they can.

2193. Your opinion is, Mr. Edden, that if the ventilation was carried up to the working faces it would remedy numbers of these complaints? I have no doubt about it whatever.

2194. Do you think it should be put beyond a question of doubt whether that should be done or not? There can be no doubt about it at all; it should be done. I know there are a lot of mining authorities that can be quoted upon this matter. The majority of mining experts have had experience in the old country, and they cannot gainsay the fact that they take a pride in ventilating a mine in England. They are forced to do so, because if they did not in some cases they would not have any mine.

2195. Did you ever see any other fall in the Newcastle Company's mine? No, not of any consequence; only what might be expected by the taking out of pillars, which is necessary.

2196. With regard to the taking out of pillars;—do you think that it is more economical to leave the larger pillar and work it out afterwards? I believe there would be more coal saved if larger pillars were left.

2197. Would it be safe for the Company? Yes, and safer for the miner. I have seen pillars taken out in mines in this Colony that have surprised me. The way it was done makes one think there is no care about one's safety. A bord worked on each side, and falling in on each side. They would start on the main road to take out the pillar, so that in case of danger they would have no place of safety. The pillar has been worked off the main heading—that is, when they are thin.

2198. When a man is going in like that with his pillar, he has the width of the bord on each side? Yes.

2199. Does not that form a big vacuum? Yes—at the least 20 yards wide.

2200. I think you referred to having worked in the Waratah Company's Mine. Did you notice anything unusual while you were working there? No; when I worked there I left the Newcastle Company's Mine to put in a drive to find the bore-hole seam.

2201. Was that a stone drive? It was a mixture of coal and shale, and bands of all descriptions. While we were driving that heading it let off a large amount of gas. I have heard it explode after we had gone out.

2202. That is, when you went back to your work again? Yes. That drive was a mile and a quarter through, and all driven by bratticing. The air was carried by bratticing.

2203. Do you mean, when you say explode, an actual explosion? No; light up, but there was no explosion. We were not away long enough for it to accumulate; but it is an evident fact that it would have exploded.

2204.

- A. Edden,  
Esq., M.L.A.  
18 Sept., 1895.
2204. Had you any opportunities while working in that drive to see the system of working throughout the mine? The mine was not opened up till we put the drive through.
2205. Did you leave after you put that drive through? I was not there long after.
2206. While you were there, was the work on which you were engaged on the 8-yard bord system? Yes, 8-yard bords and 4-yard pillars.
2207. Have you any idea what the depth of that mine would be? I think it was about 500 feet deep.
2208. You said you have worked at West Wallsend? Yes, for a short time.
2209. What was the system of working there? Bord and pillar.
2210. What was the width of the bord? 8 yards.
2211. What was the width of the pillar? The pillars were 4 yards and 6 yards wide—6 yards chiefly.
2212. Do you know the depth of that mine? About 600 feet.
2213. Where you have worked, with regard to the pillars—take the Newcastle Company's mine for instance—were the pillars kept to a uniform width; were they driven by any line? No.
2214. Would they sometime be less than 4 yards wide? Oh, yes; sometimes less than 4 yards, through the men encroaching on the pillar.
2215. When you were working in these bords, if the manager or deputy wished you to leave a portion on, would he put a mark on the coal? Yes, I have seen that done.
2216. Had that mark to be left on? Yes.
2217. Was he the only man that gave authority? Yes.
2218. Had his authority to be respected? Yes, sometimes.
2219. Could he enforce it? No, he had no power that I know of to enforce it, except to send you out of the mine.
2220. Could he not give an imperative order, and see that that order was respected? Oh, yes; he could do that. As far as I was concerned I always respected such orders.
2221. With regard to the other mines, are you aware whether the bords were driven by any line at West Wallsend? When I worked there they were not.
2222. Do you think that a regulation of that kind should be adopted? I think it would be a big improvement. Unless the bord is driven by a line, it is impossible to keep it, as it ought to be, without eating into the pillars.
2223. What is intended to be kept as a pillar you think should be left? Yes, it would not be much trouble. I do not think there would be much expense in connection with that.
2224. What system have you noticed adopted in these mines with regard to entering the mine in the morning. Was there any mark on the face showing there had been an inspection? I never saw that carried out specially to my knowledge. I have never seen it done in this Colony. It was always done at home in the old country. A mark was always put up on a board at a certain point.
2225. Do you think that that should be done in this Colony? Yes, I do, because many of our mines now are not what they used to be. A lot of them are letting off gas in larger quantities than they ever did before, and it is absolutely necessary that these places should be visited before men enter them.
2226. Do you know whether there is any uniformity with regard to men entering the mine. Do all the men go down at the same time? I think there may be uniformity at some mines, but not at all of them. It is not the management that keeps up that uniformity, it is a rule with the men. I am told there are some places where the men are going in at all hours, and stopping all hours.
2227. Will that apply more to where there are tunnels to enter the mine by? Yes, it chiefly applies to such cases.
2228. Do you think it would be more advantageous if some uniform system was adopted for entering a mine? I think there ought to be a uniform system adopted. I do not think that men ought to have discriminating powers to enter a mine or come out of it when they think fit.
2229. Do you know the provision in the Bill with regard to the working hours. Will you look at section 36 in the Bill, on page 17 (*see Appendix A*). Have you thought this matter over? Yes, I have.
2230. What are your views? I believe it ought to be enforced, that some provision ought to be made for limiting the hours for working in mines, and everybody is of the same opinion. We do not find anybody of a different opinion. I have never heard anybody yet say, but that that is quite long enough for men to work. The fact, however, remains that encroachments are made, and that it is getting from eight to eight and a half, and nine hours, and so on. Only a short time ago I had a letter from one of the collieries in the North stating that a manager had told the men that if they dared to leave the face until a certain time they could take their tools out, and we know what that means at the present time. Everybody says we are favourable to it, but we believe the men should get it by the power of their unions. I think that is a wrong position to take up. If the men are to have it why not legislate for it—legalise it. I do not think it should be left to the Unions, as that course might result in the old barbarous methods of settling what one says is right and the other says is wrong.
2231. Have you heard what has been said about it ontailing more expense? I remember Dr. Robertson stating that in his opinion it would come to 3d. or 4d. per ton extra, but he never showed us how.
2232. Can you conceive how it would come to anything like that? I cannot. We put the question to men whose evidence on such a subject would have more weight than mine, because I am looked upon as a kind of partisan, and they said that it could not increase the cost more than 1d. per ton. Take the men I have already referred to, and they can have no object in view but the truth; they are practical men with technical knowledge also, men who have been in mines from their youth, and who now hold high positions under the Crown, and they state that the increase in cost could not be more than 1d. per ton.
2233. What men do you refer to? Mr. Humble and Jonathan May. I remember putting the question to Mr. Humble:—What would he think if a mining expert said it would cost so much per ton? and he said, "I should think the mining expert had never considered the question." I think there is something else we want to consider, and that is the health of the men to some extent. The very laws in our statute books tell the tale, and yet in this Colony where men have to work in an impure atmosphere, we are told that the Legislature cannot interfere in this matter because it is interfering with the liberty of the subject. I think the thing is absurd.
2234. Do you think a provision like that would ruin the industry? How could it. It would be an impossibility.
2235. Do you think that 3d. or 4d. per ton in some cases would cover the whole underground account in a colliery with regard to the payment of wheelers and other men employed? I am hardly in a position to

to answer that question, but I should say that it would. From what I have known in England, at the price men used to take the getting of the coal, and pay men underground, I should assume that 3d. or 4d. per ton would cover it. A. Edden,  
Esq., M.L.A.  
18 Sept., 1895.

2236. In the event of a few more hands having to be employed in a limited way would that come to anything like 3d. or 4d. per ton? No, it would not.

2237. Do you think that the managers as a whole object to the men working eight hours at the present time? I cannot say. I know of no cases only the one I referred to where a manager politely told the men they must not leave the face until a certain time.

2238. Is it not one of their contentions that they have no objection to the men working eight hours? Undoubtedly.

2239. Should that be kept up in a mutual way? Yes; if they are in favour of it.

2240. Without legislation? Yes, without legislation. I never saw a man yet but deems that it is long enough for men to work.

2241. You consider that while that contention is put forward, in some cases the employers do not give very much assistance to see it carried out? If a man felt disposed to work twelve hours, in many cases they would do it. It is, however, a mistaken idea, and it is of no benefit to the company.

2242. Is the contention that is put forward by some of the proprietors, that the men, being contractors, can come out of the mine any time they like, correct? No; it is not correct. I was told that at the Lambton Colliery, where there is a tunnel, a man could leave his work when he liked, but now I am told there is a man stationed at the entrance to the tunnel to put the names of the men down and the times they go in, and the times they come out.

2243. If the men were to come out in anything like any numbers at any time they pleased, what would be the result as far as their occupation was concerned? They would get their walking-order—they would have to go. Another thing, I go as far as to say that I do not think men ought to come out after they have worked two or three hours if they are going to stop the mine. If there are two men in a bord, and they have plenty of coal, and by mutual arrangement one of these men comes out, I do not think anybody has anything to do with it.

2244. In such a case as that, would that man get up where there is a shaft? He could not get up without the consent of the manager.

2245. Unless he came out through sickness, or accident, or something of that kind? Exactly.

2246. Have you thought over the clause in the Bill that provides for a minimum quantity of air—the section in the Bill is [50] 47, on page 23 (see Appendix A)? Yes; I have. The Bill as it left the Legislative Assembly provides for a minimum quantity of air, to be not less than 150 cubic feet, and I look upon that as a wise provision. I know that in the English Act the word “adequate” is used, and, if our mines were like the English mines, no doubt the same provision would do here; but they are different. When I went to Victoria a short time ago, I had a conversation with some men in connection with gold-mining that impressed me very much. The Victorian Act contains these very words, “an adequate amount of ventilation,” &c. I asked how this provision in the Act worked, and they contended that it was one of the worst provisions in the Act. Who is to define what is an adequate amount of ventilation? One authority says one thing, and another authority says another. There is nobody to define what should be an adequate amount. None of the authorities say under 100 feet where there is no gas, some of them put it as high as 500 feet, and some 250 feet, but they are all above 100 cubic feet. The question is, who is to define what is an adequate amount of air, if it is to be in the Act in that way.

2247. Do you believe in a minimum quantity being stipulated? I do.

2248. *President.*] Under the proposed Bill, suppose that you put in an adequate amount of ventilation to be not less than 150 cubic feet, would they not have to give enough air? That could only occur in my opinion in a mine where gas was accumulating, and if the inspector found there was 150 feet in a heading where there was gas, and this was not enough air, they would be compelled to get more air to drive the gas away.

2249. Would 150 cubic feet of air be enough in a mine where there were no gases? Yes, I should say so. We have in the present Act 100 cubic feet.

2250. It has been said that the reading of the present Act is, that if 100 feet of air passes along the airway, the inspector's hands are tied? Yes, that is the trouble, but I do not know whether the inspector's hands are tied. We have, I think, a precedent to go by. I believe an inspector went into a colliery and found that there was not sufficient ventilation, that gas was accumulating. The inspector took the manager to court, and the result was that he had to supply more air. The manager was fined. The question is, what amount of ventilation is necessary for a man to breathe, and be, as he ought to be, at his work. I think that we ought to take the best authorities on the subject, and frame a Bill on what they think. I would be sorry for a Bill to be framed on what I say. The question to decide in the present Bill is, whether the air should pass each working place, or be taken into the working face.

2251. It appears to me that the meaning of the present Act is, that the air should be taken to where the men are working? I believe that was the intention of the framers of the Act, but still the fact remains that the men do not get the air.

2252. The Act does not say that the minimum is not to be taken to the working places? I was working in a mine, and where the heading rose, the ventilation followed us up till it got to the cut-through, and went into the cut-through and down the return. I said to the manager, “If you send me a few chaff-bags, I will soon alter this”; but he said that would never do, the Act does not specify it, and if you are allowed to do this we will have to allow it to be done all over the pit.” I think the framers of the Act meant that the air was to go into the working place, but the worst of it is that the air sweeps by the working place, and cannot get into it unless it is taken there.

2253. If you provide that there is to be an adequate amount of air in the working place, it must get there, and that is a matter for the manager;—Will you look at section 12, sub-sections 2 and 3, of the present Act (see Appendix B)? I believe that was the meaning of the Act, but the trouble is that we cannot get it.

2254. If it is a fact that men have been deprived of the necessary quantity of air because of the construction put on the Act, I think a case should have been tried, because, looking at the Act, as I read it, the interpretation does not seem to me to be correct? I hope it is not.

2255. *Mr. Curley.*] In that particular case you cited, did you point out to the manager that that was seriously

A. Elden, seriously affecting you as a miner? I did; I left the place—I would not work in it. I absolutely refused to work there. I was breaking a bord away just past the cut-through, and I would not stop it out.

Esq., M.L.A.

18 Sept., 1895.

2256. Did the manager find you another place? Yes, he did.

2257. Do you think that the section in the Bill dealing with the ventilation of mines should stand as it was originally drafted? I do.

2258. *President.*] No one wants to do anything that is not right; therefore, if there is a proper manager and a clause in the Bill which says that an adequate amount of ventilation shall be given to the miners working in the face, is it not better to have it that way than to bind a manager down by any hard and fast rules; is it not better to say you have to provide an adequate amount of ventilation, never mind how you do it, of course, with the powers of inspectors under this new Bill? I thoroughly believe in a minimum quantity being stated, and that would not debar a manager from giving more if necessary. In the amendment I moved in the Legislative Assembly, I put it that an adequate amount of ventilation shall be carried to within 15 yards of each working face where gas does not exist, and to within 3 yards of each working face where gas does exist, by brattice or otherwise. He can take it by brattice, or anything else he likes.

2259. Suppose you have an adequate amount of ventilation, being not less in any case than 150 cubic feet of pure air per minute, would it not be well to leave it to the manager as to how he shall get it to the working face;—is not the less you tie him down the better? I think sub-section 3 of section [49] 46 in the Bill, which I put in, is the best way of putting it.

2260. What do you want that section for if you have the next section [50] 47. If you have it that a man is to be supplied with an adequate amount of ventilation you do not want the section that you have referred to that you moved? In my opinion the Bill requires that section because it distinctly says where the air shall be taken to. At the present time, as long as they can get the measurement, it is all right, and they never measure the air where the men are working.

2261. That is not so in England because in England they read the Act properly. The words in the English Act of 1872 are exactly the same as the words in our present Act, sub-sections 2 and 3 of section 12? I admit that an adequate amount is mentioned there, and that is the stumbling-block. Mining authorities state what amount of air is sufficient, and what should be there; and if our managers know what is required, what objection can there be to fix a minimum amount. Although the English Act is good, that does not say that it is perfect.

2262. The objection to put in a minimum is for fear that they should give it some narrow construction? I think that all the trouble is the 50 extra feet.

2263. The fear is that these inspectors, if you put in a minimum, may still be saying he has got his minimum—the anemometer shows he has it—and that is enough? That is what the managers say. They seem troubled in their hearts that they would not be able to give more if this minimum was fixed. I am sorry to have to state what I know to be a fact, that in this Colony the biggest interest is not in men's health, but in dividends. That is what the manager bothers his head about, and the men's health is quite a secondary matter. If companies cannot pay 7, 8, or 10 per cent. they are not satisfied, while at home, in the old country, they are satisfied with 2 or 3 per cent. Their objection here is of really no value, because, as an experienced man, I have had to leave my work and come out to get a little bit of fresh air. I know that in many cases this is so, and there is not that care and anxiety to see to the ventilation in this Colony that there is in England.

2264. If you put it that an adequate supply of air is to be given, does it not put the inspector on the alert, and make him see that the air is given? The same question was put to Mr. Humble, and I look upon him as a clever man, and he is in favour of the minimum quantity. He says there is no impediment, and he considers that 150 feet is quite little enough, and that it does not prevent them from providing more.

2265. Is there no fear that they may be satisfied with only giving 150 feet, while, with an adequate supply, there ought to be more? I do not think so. I think the minimum should be fixed, because it is best to define what is an adequate amount. Take a man like Mr. Croudace, or Mr. Alexander Ross, or any other man who is looked upon as an authority, and suppose that Mr. Humble says, I went in so and so, and found there was not an adequate amount of ventilation, and the case goes to Court. Mr. Croudace gets into the box and says, "I consider there was an adequate amount of ventilation," who is to decide between those two, or what standard are they going to have. It is simply one man's word against the other.

2266. *Mr. Gregson.*] In that case, suppose the inspector says there is not an adequate quantity, and the manager says there is, how is that to be settled? You see there the difficulty about the word adequate.

2267. By the Bill, it is to be settled by arbitration? Exactly; but looking at it from a practical standpoint, it is straining at things. I think the minimum provides for it all.

2268. You seem to look upon the inspector as being a man without any authority? Undoubtedly he is to-day.

2269. But the Bill alters that, and gives him authority, and what is wanted is that the inspector shall say whether the thing is right or wrong. If an authority, call him an inspector, is to say whether there is an adequate quantity of ventilation in the pit, what more do you want? A minimum quantity.

2270. But why? Because you may get some men before this Commission who might say that 50 feet is enough.

2271. But it is for the inspector to say what is adequate or inadequate. The inspector says this is not adequate? Yes; then the manager says it is adequate, and he reports it, and we go to arbitration, which may take weeks.

2272. Will you look at section [22] 20 on page 9 of the Bill, "Notice by inspector of causes of danger," &c. (*see Appendix A*)? Yes, but this is a very round-about way.

2273. *Mr. Curley.*] If a man has to work in the same position as you have instanced, would this mode of procedure meet such circumstances? No, certainly not; a man has to go home and wait this arbitration.

2274. *President.*] Suppose you make 150 cubic feet the minimum, and the inspector says there ought to be more, and the manager says I do not think so, would they not still have to go to arbitration? Yes. If there is not gas to be seen to fire, or black damp, I think that amount of air is sufficient.

2275. Suppose there was black damp? I should say the manager would know it was there, and would shift it.

2276.

2276. But he has got his 150 cubic feet, and that is sufficient? Do you think he would stick at that?

2277. I am asking you to think? If he would stick at that, it is necessary for something else to be done.

2278. I want to do all I can for the men, but my belief is, that there might be some narrow construction put upon this Bill, such as has been put on the present Act. The Act says that an adequate amount of air, not less than 100 feet, shall sweep undiminished past the working place. I cannot understand men who are not getting this air putting up with it under this Act? It is because the theory has always been that the air should measure on the heading, not where the men are working. The inspectors come with their anemometer and fix it 100 yards from where the men are working, and get the measurement there, but where the men are working they may not be able to breathe. If I had the power to-morrow, to take you down to some of our mines, and say, we tumble in at 10 o'clock in the morning, I have not the slightest doubt you would be astonished at what you would find out. After a bord gets turned off the heading, 10 or 12 yards away, in nine cases out of ten, the men are without air.

2279. *Mr. Curley.*] Do you feel disposed to alter your opinion with regard to the minimum quantity of air? No, I do not.

2280. Do you approve of the question of splits in a mine? Yes, I do, and all scientific men are in favour of splits.

2281. Do you think that sub-section 3, of section [49] 46, should be retained in the Bill (*see Appendix A*)? I do.

2282. Do you see that in the heading of that section the word "parts" is substituted for the word "splits"? Yes, but I think the word "splits" is better understood—it is a mining term. Let us take a case, in one of our mines in the Northern district, say the A. A. Company. In that mine they have 300 or 400 men, a large number of horses, powder-smoke, and the heat from lamps, and such like. A current of air goes in, and sweeps all round that mine, it goes to the first, to the second, and so on, carrying with it all the noxious gases till it gets to the last lot of men.

2283. *Mr. Gregson.*] What is the cure for that? Splits.

2284. You are aware that the provision for the division of a mine into splits is not in the English Act. A mine is divided into splits here, but the objection is to tying the manager's hands hard and fast. In the English Act there is a rule, section 49 (*see Appendix C*) relating to these splits? The point for us to consider, or anybody else, is, are we to take any notice of men who have made this matter a study, and if we are to take notice of them, they say that this is the way a mine should be worked in case of fire, or in case of water, ventilation, and so forth; and believing these men to be right, I think the provision should be inserted in the Bill for the more efficient working of our collieries.

2285. *President.*] In England they do without putting this into their Act? Perhaps they may bring in another Act later on.

2286. Will not this be done under good management? The same argument will apply to the whole of the Bill. Why do we want a Bill at all. Why not leave everything to the managers?

2287. In the first place, a manager is to have his mine in proper order, and the inspector will see that it is, and that the men get their proper quantity of air? Mining experts say that this is the way a mine ought to be worked. If a manager sets himself higher than these authorities, and says they are wrong, then the question comes to this, has he a right to say, "I will not have the thing done in this way."

2288. *Mr. Curley.*] Do you feel disposed to alter your opinion on this matter? I have seen no reasons for altering my opinion. If we say that this is to be left to the inspector or the manager, I say I would not leave it to the inspector or the manager.

2289. *Mr. Gregson.*] Do you doubt the inspectors? This Bill is to guide them in their duties as to what they should do.

2290. This matter is left to the inspectors in England? They have different management in England to what we have here.

2291. *Mr. Curley.*] Do you know the clause in the Bill referring to the weighing, section [41] 38, on page 18 of the Bill (*see Appendix A*)? Yes.

2292. Was the standard weight in existence at the Newcastle Company's Colliery when you were there? Yes, and it is in existence there now.

2293. Do you consider that you lose much weight under that system? Yes, I believe so, but not at that colliery, as much as at others, I have seen 13 cwt. or 13 cwt. 2 qr. marked up on the board when you know that the miner was only to be paid for 12 cwt.

2294. *Mr. Fegan* during his evidence referred to some statement that had been handed to you by a check-weighman. Can you give us any information on this subject? I moved the adjournment of the House on the weighing question. One statement was in connection with the New Lambton Colliery. I think it was that 1,970 tons, or more, of coal had gone over the machine in four years that the men had not received payment for. The New Lambton Colliery does not work half-time on the average, and that was the amount of coal that went over that machine that the men never received a penny for. I showed the statement to Sir George Dibbs. The number of tons I have mentioned was the excess the men had got, and not been paid for. There was another paper also from the Hetton Colliery.

2295. What was the result of the Hetton business? The result was that I moved the adjournment of the House. Mr. Slattery was then Minister, and agreed that the Act made provision for the men to be paid. There were two men with a little more courage than the rest who were bested out of £1 8s. in one fortnight. One little fellow said, "I am not going to suffer this," and demanded the money. He summoned the Company to the Court, and the case was tried before Judge Backhouse, he, however, decided against the men. The manager of the colliery admitted the coal had gone over the screen, and although this was admitted, the case was given against the men, because it was the rule.

2296. With regard to the weighing, do you think the men are satisfied with an average, or do they want every skip weighed? I have heard some of the men ask for every skip to be weighed, but not many. I think the men would be satisfied with the average, provided the standard weight was abolished.

2297. That is if a fair number of skips was weighed every day? I think there ought to be a certain number of skips weighed every day. There are collieries in the Colony in the south, and in the west, that suffer more than they do up north. I think so many skips should be weighed.

2298. Do you think that if a fair number of skips was weighed, there would be any complaint about the average? If it was so that every skip could be weighed, I think they ought to be weighed.

2299. Would that increase the cost of the coal? I do not think that it would. Two men in England do

it

A. Edden,  
Esq., M.L.A.  
18 Sept., 1895.

A. Edden,  
Esq., M.L.A.  
18 Sept., 1895.

it with a larger output than they have in the collieries here. At a mine I worked in, they put out from 1,400 to 1,600 tons a day, four skips at a time coming up the shaft, each skip weighed not more than 9 cwt., and every skip was weighed. As far as the north is concerned, I do not think there would be any trouble with the averaging system, as long as the standard weight is knocked in the head.

2300. You think that the standard weight ought to be abolished? I think it is nothing but a piece of robbery.

2301. *President.*] What proportion of skips do you think ought to be weighed? It would be rather difficult to fix the quantity.

2302. Suppose the check-weighman was given power to ask for a skip to be weighed when he thought fit? I think it would be better to get the opinion of somebody who is in the habit of weighing the coal. I went up to Lithgow several years ago and had a look at a colliery. I saw the skips come out of the tunnel and go right away into the waggon. I said, "Where is the weighman," they said "He is here," I said "Where," and they said "Over there, banking off." I said to him "When do you weigh," and he said, "When the manager tells me." That is a nice state of things, is it not. The manager might weigh a light skip, but if it is a heavy one let it go.

2303. *Mr. Gregson.*] Did you see this? I did with my own eyes.

2304. Were they pleased with that system? No, they were not. The fact of the matter is that when there are about three men looking for one man's job advantages are taken by some people. Up our way to-day, where the seat of unionism was, a man dare not say his life is his own to-day, in nine cases out of ten, for the sake of his bread and butter.

2305. *Mr. Curley.*] With regard to the powers of inspectors in this Bill;—do you think that the inspectors should have power to withdraw the men in case of danger? I certainly think they should. An inspector goes into a mine and sees men in a dangerous position, and yet he has to report on it, and then the case is to be referred to arbitration.

2306. *President.*] Do you think any manager would oppose an inspector's judgment? Managers are queer people, and do queer things.

2307. If anything happened would not that manager be practically ruined? I should think he would, but I do not think an inspector would wilfully stop a mine.

2308. Don't you see the tremendous power you are giving an inspector; if he had power to withdraw the men it could be made an engine of great harm; if an inspector was not a good man, and wanted to ruin a mine, don't you think he could? I do not think he could. We are taking extreme cases. Take the Stockton case. The inspectors to-day still hold that that mine is not safe. The manager would not take the responsibility of the mine, but made the men sign an agreement to take the responsibility off his shoulders.

2309. Under this Bill he would be liable to three months' imprisonment? He ought to be liable to three years. Those are the knotty questions.

2310. Will you look at sub-section 5, of section 21, on page 8 of the Bill, "Withdrawal of men in case of danger" (*see Appendix A*). Will you kindly read that section? Yes; but I really do not see anything in that section but what is right.

2311. An inspector could arbitrarily for some cause or other withdraw the men and ruin people by that. Don't you think you should legislate for practical things? I agree with you, but I do not see any danger of that kind, and I have never heard any arguments to show that there really is.

2312. Do you suppose that a manager would in any case resist an inspector who asked him to withdraw the men? We might have a bad manager, as well as a bad inspector.

2313. Then he would be liable to three months' imprisonment? Yes, but we would have to prove it. I cannot conceive of an inspector trying to ruin a mine, nor the manager allowing the men to work on if the mine was dangerous.

2314. *Mr. Gregson.*] What is your idea of the relations between inspectors and managers? I think they get on pretty well.

2315. Don't you think that they are always likely to do so? If so, there is no need for us to trouble about this Bill.

2316. Don't you think if the inspector is the man he ought to be, that a manager is likely to look up to him? I should say he would.

2317. Is that likely to be the case? I don't know all the managers.

2318. *Witness.*] I wish to point out that in the Northern District bratticing is used at Seaham, West Wallsend, Durham, Burwood Extended, Dudley, and part of Brown's Colliery at Minmi.

2319. *Mr. Curley.*] We have considered the question with regard to the powers of inspectors. Do you think that they should have the power to withdraw the men in case of danger? I do.

2320. With regard to the size of pillars, the minimum fixed under tidal waters, and not under tidal waters; do you believe in the provisions in the Bill as originally drafted, Rules 42-46, on pages 31 and 32 of the Bill (*see Appendix A*)? I do.

2321. Do you consider that managers and inspectors should have certificates for service as provided for in the Bill, that is, certificates for having served as either managers or inspectors. The section I refer to is [19] 17, on page 7 of the Bill (*see Appendix A*)? With reference to managers I think it would be rather hard for them to pass an examination at the present juncture. I think the clause was all right as it left the Assembly.

2322. Do you think the clause with regard to certificates for managers should be retained in the Bill as originally drafted? I do.

2323. *President.*] Would you be in favour of an alteration of this kind:—"Every inspector appointed under this Act shall, after the commencement of this Act, hold a first-class certificate of competency, or shall satisfy the Board appointed under section 5 of this Act, that he has exercised the duties of an inspector for at least five years, whereupon a certificate of service as inspector shall be granted by the Minister which shall qualify the holder thereof to be appointed an inspector under this section." Would you rather he should satisfy the Minister? No; the Board.

2324. Say we put it then "shall satisfy the Board" instead of the Minister? Yes; I think that will do.

[Witness withdrew.]

MONDAY, 23 SEPTEMBER, 1895.

[The Commission met in the Board Room, Chief Secretary's Office, at 2'30 p.m.]

Present:—

FRANCIS EDWARD ROGERS, Esq., Q.C. (PRESIDENT).

JAMES CURLEY, Esq.

JESSE GREGSON, Esq.

William Wilson sworn and examined:—

2325. *Mr. Curley*] What is your occupation, Mr. Wilson? I am a colliery manager.
2326. What is the name of the colliery you manage? The South Clifton Colliery, in the Illawarra district.
2327. Have you had very much experience in the management of mines? I have had twenty-two years' experience.
2328. What are the names of the collieries you have been connected with? I have managed the Vale of Clwydd and Zig-Zag Collieries at Lithgow, in the Western district, and the South Bulli, and the South Clifton Collieries in the Illawarra district, and the Ringwood Colliery in the south-west.
2329. I suppose you have given attention to almost every phase of mining? Yes, fairly well.
2330. Have you worked as a practical miner? No.
2331. How many years have elapsed from the time you started to manage these collieries up to the present time? Twenty-two years. I started in 1873. I was working in mines before I was manager.
2332. Have you any proprietary interest in the colliery you are now managing? No.
2333. What is the system of work pursued at the South Clifton Colliery? Bord and stall work.
2334. What is the width of your bords at that colliery? Some eight yards wide, some six yards, but eight yards generally.
2335. What is the width of your pillars? As a rule they are six yards, but some are 100 yards. The blocks that we have left in are 100 yards.
2336. Do you go in by a tunnel to your mine? We work the mine by a shaft. Some of the men may enter the mine by the shaft, but mostly all of them enter by the tunnel.
2337. What is the depth of the shaft at that colliery? 150 feet.
2338. Are your workings far from the shaft? They might be three quarters of a mile now.
2339. Have you much cover over head? We have, say an average of 100 or 120 feet outside of the mountain, but under the mountain we have about 1,000 feet.
2340. Are there any of the rolls in your colliery that are to be found in other mines in the district? No.
2341. Are you free from these rolls? Yes.
2342. Do they not sometimes come up on the floor about 15 or 18 inches? Yes.
2343. Are you entirely free from these rolls? Yes.
2344. Do you know what the composition of the rock is? It is a conglomerate rock.
2345. Is it proposed to carry your workings in there to any distance? Yes, at least a mile or a mile and a half.
2346. Do you take the pillars out afterwards? Yes.
2347. How will you work your pillars out? After we get to the boundary.
2348. In the event of your going under that thousand feet of conglomerate rock, do you propose to enlarge your pillars? No, I think it will be stronger there than where we are at present.
2349. Do you think that that rock will stand for ever, after that coal is taken away? The rock, as a rule, blocks itself before it gets to the surface.
2350. Do you not think that that cover will require some substantial pillar? Pillars are generally left. We do not take everything away.
2351. Do you think a 6 yard pillar would be quite ample under such circumstances? Oh, yes; because if it does break away it saves itself.
2352. What kind of stoppings have you on your intake? Stone stoppings.
2353. Is that in your main intake? We have stone stoppings in all cases, unless it may be in temporary stoppings.
2354. Is that stone for these stoppings found in the mine? Yes, when we brush off the roof there is about 18 inches of it.
2355. What is the height of your seam? From 4 ft. 6 in. to 6 feet high.
2356. Do you plaster these stoppings? No; we pack them up with small coal.
2357. Do you notice that the stoppings occasionally shrink? Yes, sometimes; but you have to keep them full, and in some cases to plaster them up with mullock. We do not use lime, except in the bottom of the shaft.
2358. How many yards of slack do you put behind these stoppings? About 6 or 7 yards. We use these places for stowing small coal.
2359. Do you pay particular attention to the stoppings in the intake? Oh, yes; we must do so to keep the air tight.
2360. Is your mine fairly well ventilated? Yes; very well ventilated. We have a fan, which averages about 60,000 cubic feet of air.
2361. Have you ever had any complaints about ventilation? None whatever.
2362. How are the men paid at that colliery? At so much per ton.
2363. Have you a weighman at the colliery on behalf of the company? Yes.
2364. What are the duties of this weighman? To weigh the coal for the miners, when it suits him.
2365. Has he any other duties? Yes.
2366. What are his other duties? He weighs all the coal that goes away in the trucks.
2367. Where is the weighbridge for that situated? On the mine.
2368. Whereabouts is the weighbridge situated that weighs the miners coal? Underneath the screens at the top of the pit. The weighbridge for the coal in waggons is on the railway line.
2369. Is that weighbridge far away from the pit? It might be 60 or 70 yards away, perhaps 100 yards.
2370. Do you weigh very many skips at that colliery? We do not weigh an extraordinary number.
2371. What do you call an extraordinary number? We weigh when we think it suits us to weigh.

W. Wilson,  
Esq.  
23 Sept., 1895.

- W. Wilson, Esq.  
23 Sept., 1895.
2372. You weigh when you think it suits you? Yes.
2373. Do you give instructions to the weighman, how to weigh, or when to weigh? No, I tell him to use his own discretion. There is a check weighman there.
2374. Has the check weighman anything to do with the number of skips to be weighed? No.
2375. Has he any power to dictate to the company's weighman on that matter? No.
2376. Have you ever had any complaints from the miners about not weighing a sufficient number of skips? We have had complaints sometimes.
2377. What do you do when these complaints are made? We generally weigh.
2378. *President.*] How many skips do you weigh on an average? Sometimes six, sometimes twelve a day; sometimes not a dozen in the fortnight. It just depends whether we think it is necessary to weigh. Sometimes it stops the pit to weigh coal when we are busy.
2379. How many skips come out of the mine in a day? If we are working a whole day, I suppose we would send about 300 or 400 skips in all.
2380. And out of that number of skips would the most number you would weigh be twelve? Yes.
2381. *Mr. Curley.*] How many men have you employed at the South Clifton Colliery? About 100.
2382. Have you 100 men there getting coal? About that number.
2383. If you only weigh that number of skips in a day, is it not possible that some men may go for a very long time between the periods of weighing without being weighed? Oh, yes, some time elapses.
2384. How is a man going to get anything like a fair average of his weight if you proceed in that way? He is bound to get a fair average, because we do not get anything from them.
2385. Does he get anything from you? He gets his weight.
2386. In this periodic fashion that you adopt for weighing, would it not be difficult for a man to get a fair weight? I think they all get a fair average; in fact I am sure they do.
2387. *President.*] Do you really think that is a fair average? I think so. The way it works, they all get their weight, and they are satisfied. If a man fills a light weight, he gets his average on that weight; every skip he fills is counted the same weight.
2388. If a light skip is the only skip weighed, do you mean to say that he gets his average? He may have half-a-dozen light skips one day and half-a-dozen heavy ones next day. He gets his average for the fortnight. He gets the average of his eight or ten skips every fortnight.
2389. *Mr. Curley.*] With this limited number of skips that you weigh, is it not possible that a man might go for a matter of months without being weighed? Yes; they do.
2390. Don't you think it is a serious matter to a man with a light weight to carry that weight so long? Oh, yes; but they are not supposed to fill light skips. The man that fills the heaviest weight is the man we want.
2391. Does not coal vary in weight, and might not a man do his best and still suffer through light coal? Oh, yes; but the coal does not vary in one particular pit, to make this noticeable.
2392. Take it in your pit? I do not think it does.
2393. Do not some portions of your pit vary when you get on tender coal? It is in the screening where the weight comes off; more screenings come out of this coal, and therefore it weighs lighter.
2394. Do you think that one skip in a hundred is enough to be weighed? I think so.
2395. *President.*] Do you know what the custom is in Newcastle? I think they have one screen for the purpose there. We send very little coal away—about 150 tons a day, an an average. I do not think we average more than 1,000 tons a fortnight—it might be, perhaps, 1,100 tons.
2396. *Mr. Curley.*] Did this system of weighing prevail at other collieries that you have been managing? Yes, it is the same system as at Newcastle.
2397. It may be the same system, but is the system of ascertaining the average as efficacious? There may be a few more skips weighed in Newcastle, because they do more work.
2398. What other collieries has this system been carried out in, where you have been managing? At South Bulli.
2399. Did they weigh there in that proportion? I think they weighed more than we do at South Clifton.
2400. How much more would they weigh than you do? They had a man doing nothing else.
2401. Was this man under your instructions? Yes.
2402. Did you limit him in any way with regard to the weighing? No; but I expect the weighman to look after the interest of the colliery.
2403. If there were any complaints, would he complain to you about the matter? Oh, yes.
2404. Do you think this number of skips is quite sufficient to meet the case? Yes; as long as you can get a fair average.
2405. How can you get a fair average? You can always tell how the skips are running, whether they are running light or not.
2406. How is a man to get a fair average? He should not fill light weight.
2407. Has he not a right to be paid for the weight that he does fill? So he is. We do not get any of his weight.
2408. *President.*] You say that you weigh about four skips in every hundred? Yes; but sometimes a great many more.
2409. Take it at four skips in a hundred;—does that four skips give a fair average of the hundred? Yes; we do not pick them; the weighman lets him know.
2410. Not the check weighman? Yes; the check weighman.
2411. Can the check weighman weigh any skip he likes? Yes.
2412. Does the weighman see the skip? They are both on the machine, but they do not see the skip.
2413. Is there any number on the skip? There is a token hanging on the inside of the skip, and you cannot get the token until the skip is empty. Nobody can see whose skip it is.
2414. *Mr. Curley.*] Have the men ever represented to you that they would like a higher average of skips weighed each day? Oh, yes; they have said they would like more skips weighed than I did weigh, and I have done it; but it does not make much difference. If they asked me to do it on the same day as they made the request, I would not, because they might start filling full, and I might lose weight. I believe they think what I do is fair.
2415. *President.*] Don't you think it would be better to have it, so that one skip in every twenty should be weighed? I do not think so. We lose sometimes, and gain sometimes, and when we see we are losing we weigh.

W. Wilson,  
Esq.  
23 Sept., 1895.

2416. *Mr. Curley.*] How do you weigh the coal that you send away? We weigh every waggon.
2417. Why do you do that? Because we have to send the weight to the customers.
2418. Do you think that is the true way to get at the exact weight? Yes.
2419. That is, to weigh every waggon? Yes.
2420. Don't you think that the miner would get his due if every skip was weighed? Yes; but it would be a great deal of expense to the company, and a stoppage of work besides. It would be a large expense to the company.
2421. Have you not a weigh-bridge there? Yes.
2422. You have not, therefore, that expense to provide for? No.
2423. Is it not only a matter of running a few more skips there? Yes.
2424. How would that unduly increase the expense? It stops the pit while we are weighing coal, and when we are turning out 500 tons of coal a day we cannot afford to stop long.
2425. Is that any reason why the men should not have an opportunity of getting a sufficient number of skips weighed? If they want more skips weighed they can get them weighed.
2426. If they were to ask you to have a certain number of skips weighed every day, would you agree to it? No, I would not; it might not suit me to weigh every day, and I do not think it would be any benefit to them.
2427. Do you think that you are complying with the 20th section of the Act of 1876 (*see Appendix B*). Do you give the check-weigher there an opportunity to take a record of the weight if you will not weigh the skips? I weigh when it is necessary.
2428. *President.*] When it suits you? Yes; I do not trouble about that, because if it suits them, they can get weighed at any time. If they were to ask me to weigh twelve skips to-morrow I would do so, but not if the men underground were to know that I was going to weigh.
2429. *Mr. Curley.*] Have you looked at section 19 of the Act of 1876 (*see Appendix B*)? Yes; I have read the whole of that Act.
2430. Do you see there that they are to be paid according to the weight of the mineral gotten by them? Yes; but to do that you would have to weigh every skip of coal.
2431. Could not you weigh a reasonable number of skips? If they want me to weigh more, I will do so.
2432. Did you not say just now, that you will weigh as you please? I do not say I will weigh when they like. If they ask me to weigh to-day, I may not do so, but I will weigh later on, but they must know nothing about it.
2433. *Mr. Gregson.*] You say that complaints have been made to you about weighing? Yes.
2434. What answer have you made to these complaints? I always weigh.
2435. Do you go on weighing? No; because we have not the time always.
2436. Do you think it is any use to weigh for a day, and then go back to the old practice again? It keeps them up to the mark. If they were weighed every day, they might be worse off sometimes than they are now, and so might we ourselves.
2437. Does it matter who is worse off, as long as justice is done? It is only the trouble and the expense. In a big colliery, they can weigh one skip out of every truck, and that is what they do at South Bulli. As often as they could weigh, they did weigh. I think we are just as even as most of them up there, taking the average of the work we do.
2438. *Mr. Curley.*] Do you think that your method of weighing carries out the intention of the section of the Act I have drawn your attention to? I do not think that that section means that you are to weigh every skip, but that you shall take an average weight.
2439. The Act says that they shall be paid according to the weight of the mineral gotten by them? Then, if that is the case, every skip would have to be weighed.
2440. How many screens have you at the South Clifton Colliery altogether? Three.
2441. That is two besides the weigh-screen? Yes.
2442. What is the cost of the erection of a screen similar to the ones you have now in operation in your colliery? About £100.
2443. Do you think it would cost as much as £100 to put an additional screen up? Very nearly that amount. You would require kick-ups, and everything else with it to make it complete.
2444. How long would such a screen last? About twenty years, I suppose.
2445. Don't you think it would be better to erect another screen, in order that you might have the weigh-screen operating as a weigh-screen proper only? We have a weigh-screen.
2446. Did not you say that you could not afford to weigh a larger number of skips, because you would lose time? It is not the screen, it is the man who has to be there.
2447. Is it then only the expense of the man? We do not work more than three or four quarters during the week, and we could not afford to keep a man there constantly.
2448. What quantity do your skips hold? 10, 11, or 12 cwt.
2449. How large is your output? If we work all day we can turn out 500 or 600 tons.
2450. Do you only weigh four skips a day? If we start we may weigh half-a-dozen; we may weigh three or four in the morning, and three or four in the afternoon, but we do not weigh every day.
2451. You do not attempt to weigh every day? Sometimes we do, but we do not make it a rule.
2452. I suppose when you do not weigh the weighman will have instructions not to go to the weigh-bridge that day? No; he is on the top all the time, but we never tell their weighman.
2453. Does the weighman hold a dual position at your colliery? Yes.
2454. How many offices does he fill? He goes away on the trucks or waggons, and weighs that coal, also the miners' coal, and anything else that requires doing; he also does all the clerical work.
2455. Is your seam a clean seam? Yes, very clean.
2456. When the coal is tipped, does it require much cleaning? It requires no cleaning at all.
2457. It can soon be got rid of? Yes, with only just the screening.
2458. Is that not a reason why a certain number of skips should be weighed—I refer to the rapid way in which you can get rid of your coal? It can be done quickly enough. All that it has to do is to go over the screen.
2459. Have you seen the clause with regard to weighing in the proposed Bill;—it is clause [41] 38, on page 18 of the Bill (*see Appendix A*);—what is your opinion of that provision in the Bill? I do not see anything wrong with it. It is something similar to the provision in the present Act.

- W. Wilson, Esq.  
23 Sept., 1895.
2460. Only a little different;—have you looked at it very carefully? I was up at Lithgow when I received the subpoena to attend here to-day, and I have had very little time to look at it carefully.
2461. Have you anything to do with any of the collieries up at Lithgow? Yes.
2462. What colliery have you to do with in the Western district? The Zig-zag Colliery.
2463. Is the method of weighing at that colliery carried out in a similar way to what you have described? Yes.
2464. Does the weighman for the company there hold a dual position? We allow the miners' weighman to weigh the coal there himself. Sometimes the manager may see the weights now and again.
2465. How do you arrange about the selection of the number of skips there? It is left solely to the weighman to call for skips when he likes. There are, however, only twenty-three miners employed in that pit.
2466. Who is the manager of that colliery? Mr. John Wilson, a son of mine.
2467. In the event of your wanting a certain quantity of coal away that day, do you bother the weigh-screen at all? I do not know how they weigh there. I cannot speak definitely of the system there.
2468. Have you been managing there yourself? Yes.
2469. What was the method of weighing when you were there? I used to see the coal weighed myself.
2470. Did you weigh many skips in a fortnight? Just the same number as I do now at South Clifton. If they wanted coal weighed they got it weighed. It is a heavy coal there, and does not vary very much. There is not much slack in it.
2471. Are you sure you have looked at the clause in the proposed Bill about weighing? Well, I cannot say that I have looked at it particularly.
2472. Well, just look at the new clause [41] 38, on page 18 of the Bill (*see Appendix A*). I will read the section as it was originally drawn, and passed by the Assembly, and then as it has been amended by the Legislative Council. Do you believe in that section as it left the Legislative Assembly? No, I do not.
2473. What do you suggest? Under that section you would have to weigh all the coal of course.
2474. Seeing that you weigh all the coal you send away to market, don't you think the miner should have a similar advantage? Yes, but the trouble is in doing it. It would be more expensive to work a mine, and it is expensive enough now.
2475. Is it not a matter of competition rather than a matter of expense? Competition brings it down, no doubt. It has also brought the miners' wages down, and the profits of the mine-owners.
2476. Are you aware that there are differences of opinion as to the cause of this competition, and the origin of it? Yes, and there always will be.
2477. Is not this a very big question? Yes.
2478. In the event of that clause being amended in any shape or form, would you be favourable to having a fair number of skips weighed at every mine every day? That can be done.
2479. Do you think that is reasonable? I do not think it is unreasonable; but I do not see why it should be forced to be done, because I do not think the miner wants it any more than the manager. They are satisfied, as far as I can see.
2480. Don't you think that an arrangement like that would give more satisfaction? It might give more satisfaction. They were satisfied in Newcastle when I was there.
2481. Have you managed any mines in Newcastle? No.
2482. How do you come to speak about Newcastle? I have been working there.
2483. At what colliery did you work there? At the Lambton Colliery.
2484. What were you doing at the Lambton Colliery? I was carpenter and engineer there. I took Mr. Shott's place when he went to England.
2485. How long were you at the Lambton Colliery? I was there for eight or nine years.
2486. What was the method of weighing there? The weighman was there all day. He had to look after the screen. They were filling five or six waggons at a time, and he was in charge of the screens, as well as looking after the weighing. He weighed perhaps half of the day.
2487. Are you sure he did not weigh the whole of the day? I am sure he did not.
2488. Would you be surprised to hear that the weighman has to weigh the whole of the day? I believe they do now. The quantity they send away now requires that.
2489. Do you know that they have a foreman that looks after the screenmen? Yes; I suppose so. The average is not more than I am doing now when you compare the quantities that come out.
2490. *Mr. Gregson.*] Have you the standard weight system in force at your colliery? No.
2491. Do you know of any colliery in your district where this is in force? I do not know of any. I never had the standard weight. They have it at Newcastle, I believe, at some places.
2492. Have you any bar to regulate the height to which a skip can be filled? No.
2493. Can the men fill the skip to any height they like? Yes; to any height they like. Some of the skips weigh 15 cwt. We sometimes offer a prize for sending heavy skips.
2494. Do the miners generally fill to the same height? Yes; we have an endless rope at our colliery, and they fill to clear that rope.
2495. *Mr. Curley.*] What weight will your weigh-bridge register? A ton, I think.
2496. You say you have no standard weight? No; I can give you a plan of the mine, and also the colliery rules, if you think they will be of any use to you.
2497. Probably they might give some information to the Commission. Will you please send your plan and the colliery rules? I will.
2498. *Mr. Gregson.*] Have you looked through the proposed Bill? I only got it this morning.
2499. You know very little of its provisions then? Very little.
2500. Have you heard the Bill spoken about? Yes.
2501. Have you heard that it is proposed to make an alteration in the ventilation clause? Yes, the provisions are rather strict.
2502. In what respect? I understand they want more than 100 cubic feet of air, and I think that 100 cubic feet is enough. I think that there are plenty of mines that can do without brick stoppings, and in that Bill I believe they will be forced.
2503. Do you consider that your mine is sufficiently ventilated? Yes.
2504. Do the men ever complain to you about ventilation? No, they never have.

2505. Did you ever know of any case where they have suffered from want of air without complaining? No, not in our place. We have any amount of air. We could give them double the quantity if they wanted it.

W. Wilson,  
Esq.  
23 Sept., 1895.

2506. How do you ventilate your pit? By a fan.

2507. Have you ever heard of the men being anxious that more air should be given to them? Never.

2508. Have you read enough of the Bill to see that it ties the manager down to hard and fast lines in many respects? Yes.

2509. What is your general opinion about that? That it is too stringent.

2510. Do you think that more discretion should be left to the manager? I think so. I think the Bill adds a great deal to the expense of the mine as well. I think that inspectors of coal-mines have had it in their power to say what is to be done, and it has been done.

2511. You think that an inspector has sufficient power under the present Act? Yes.

2512. In carrying out his duties, does he do all that is necessary in the interests of the men? I think so.

2513. Does the inspector in your district visit you frequently? Yes.

2514. Does he give you any notice of his visits? No.

2515. Have you heard of his being there, without your knowing that he was there? Yes.

2516. Has he ever been called there to your knowledge by an anonymous letter from one of the miners? No, not to my knowledge.

2517. Have you ever heard him mention that there have been any complaints made to him at all? He has never mentioned such a thing as complaints to me.

2518. Generally speaking, according to your experience, do you look upon the provisions of this Bill, as being altogether beyond what is necessary? I think so.

2519. Have you any remarks you would like to make about any part of the Bill in particular? I consider that the section dealing with the weighing of coal is very strict.

2520. Do you consider that the alterations made by the Legislative Council are in any way objectionable? No, I do not think so.

2521. Would you be quite content with that section as the Legislative Council has left it? Yes.

2522. How many splits have you in your mine? Only one.

2523. Have you any signs of gas? No.

2524. Did you ever hear of gas in your colliery? No; and we examine every place every morning.

2525. Have you ever heard of gas having been seen? No, never.

2526. *Mr. Curley.*] What is the name of the makers of the fan you have at your colliery? Guibal; it is a Walker's.

2527. What is the diameter of the fan? 20 feet.

2528. Do you know what was the cost of this fan? It cost £1,500.

2529. Was that for the fan itself alone? No, with the fixing of it as well—the whole erection of it. With the fixing up, I should think it cost nearly £2,000 altogether, shaft, bricking, and everything else.

2530. Do you think that the air should be conveyed up to the working face? I do not think that is necessary.

2531. Where would you convey it then? I think 35 yards is near enough.

2532. Do you think that that is sufficient? I think so. I have never seen it fail as long as the cut-throughs were a proper distance.

2533. Does not the air get rather sluggish when the workman gets that far in advance of it? No, I think it is more comfortable.

2534. Is there any shot-firing in your colliery? No.

2535. Can they get coal without shooting? Yes; we only do shooting when brushing the roof.

2536. Have you been in the mine when a shot has been fired? Yes.

2537. Have you noticed the smoke hang? No, not for long. We only do brushing where the air is travelling.

2538. If a man had to get his coal with shots 35 yards up the bord, would not the smoke hang a good deal? If the places were close together, it might hang a little, but not for long.

2539. Don't you think, therefore, on that account, there should be some provision for ventilation? I have never seen it done. I have driven a place 100 yards before the air, where there was water, with a V drain of water going backwards.

2540. Where was this water coming from? From the roof. A large vein of water until you got into this place where the break was in the roof.

2541. Where was that? At Lithgow.

2542. Was there any brattice in this place? No, only this drain of water.

2543. What colliery was that in? In the Vale of Clwydd Colliery.

2544. Do you know the year when that occurred? I think it was about 1873 or 1874.

2545. Who was the manager of that colliery at that time? I was.

2546. Were you the manager of that colliery in 1878? Yes, I think I was.

2547. Did the inspector ever complain to you about deficient ventilation? I do not think so.

2548. If it is to be found in his report, would you believe he did? Yes, of course.

2549. Would you look at the report of the Department of Mines for the year 1878, and see what the inspector says there about the Vale of Clwydd Colliery, on page 147. What does he say? "Ventilation still very defective, notwithstanding repeated complaints made by myself to the manager of the matter. The fire-lamp having lately been removed from under the upcast shaft, there was no artificial means used for creating ventilation when I visited the mine in December last. The miners are not yet paid by weight for the coal they get."

2550. Are you satisfied that the inspector did complain at that time? Yes; but I do not know whether I was there then.

2551. Do you notice that the inspector points out that he had repeatedly drawn attention to this matter? Yes; but I do not think I was there then. I do not remember the circumstance.

2552. With regard to the provision in the Bill for splits (*see Appendix A*), did you say that you have only one split in your colliery? Yes.

2553. How many men have you in your mine? 100 men.

2554. Does not the Act say that not more than seventy-five men shall be in each split? Well, I have only fifty in each split. We have two districts, but only one split.

2555.

- W. Wilson, Esq.  
23 Sept., 1895.
2555. Do you consider that efficient ventilation in a mine is one of the prime objects to have in view? Yes, I do.
2556. That should be aimed at in every instance? Yes.
2557. Do you believe in the splitting of the air? I do; dividing it into splits.
2558. What do you think your fan is capable of producing? 300,000 cubic feet of air; and we work it up to 60,000.
2559. What time do you start work in the morning? 7 o'clock.
2560. What time do you knock off work at night? 5 o'clock.
2561. Do you ever ask the men to work any longer hours? I may have asked them, when busy, to stop a quarter extra to complete the shipping.
2562. Do you make a practice of doing this? No, we do not require it I am sorry to say.
2563. Do you ever call the men when there is no work? No.
2564. *President.*] Do you ever call them needlessly? No. One lot of men go in at 7 o'clock and come out at 2 o'clock, and another lot of men go in at 9 o'clock and come out at 5 o'clock.
2565. Have you ever known of any case in which the men have been underground sixteen hours? I do not think the miners would stop underground sixteen hours. There may be daymen who might work that number of hours at a job they have to get done.
2566. I am referring to miners getting coal, and working that number of hours? None of the miners work more than eight hours. I do not believe there is a miner in the country works more than eight hours, and some of them only work six hours.
2567. *Mr. Curley.*] How long would the miners be in that day that you wished them to stop an extra quarter? That would be the back shift, and it would not be really more than eight hours.
2568. *President.*] Do you know Mr. Henderson? Yes.
2569. Do you know anything about the Helensburgh Mine? No; I do not know much about the Helensburgh Mine.
2570. Is it true that the prevailing custom in your district is that the colliery shall draw coal from 7 o'clock in the morning until 5 o'clock at night? Yes; when they work all day.
2571. Does that mean two shifts? Yes.
2572. *Mr. Curley.*] Have you ever made an average of the number of skips you weigh, say for three or six months in each day? I have never made such an average.
2573. Can you tell us what the average would be? No; I cannot.
2574. *President.*] Are the Clifton and South Clifton Collieries two distinct collieries? Yes.
2575. Do you know how long the men work at the Clifton Colliery? I cannot say.
2576. How far is the Clifton Colliery from the South Clifton Colliery? About a mile. I think they work at the Clifton Colliery somewhat similar to us.
2577. Have they ever been working, to your knowledge, sixteen hours at the Clifton Colliery? Not to my knowledge.
2578. *Mr. Gregson.*] Have you ever heard of men being informed that if they did not remain in the face all that time they would be discharged? No.
2579. *Mr. Curley.*] Assuming that you had a very busy day, or were busy for a day, that you had a lot of orders to fill up, would you like to see the back shift come out without completing their day's work? No; I would like them to keep in their full time; but a remedy for that is to put more men on.
2580. Can the men do that in any pit? No.
2581. Would you allow that to go on as a manager? No; two, or three, or half-a-dozen men coming out would not make any difference.
2582. Is it a usual practice for men to do this? No, it is not. They are anxious to get all the work they can.

[Witness withdrew.]

Elias Arthur Jones sworn and examined:—

- E. A. Jones, Esq.  
23 Sept., 1895.
2583. *Mr. Curley.*] What is your occupation, Mr. Jones? I am the Manager of the Corrimal Colliery.
2584. What is the name of the company that the colliery belongs to? The Southern Coal Company.
2585. How long have you been manager at that colliery? Three years next February.
2586. Have you managed any other collieries? Yes; I was at Woonona.
2587. How long did you manage at Woonona? For about two years and three months.
2588. Have you been connected with any other colliery? Yes; I was underground manager at Austinmer.
2589. Have you been connected with collieries for any lengthened period of years? Yes; since I was 13 years of age.
2590. Is Corrimal situated south of the Bulli Colliery? Yes.
2591. Do you enter the mine by a shaft, or do you enter by a tunnel? The entrance to the pit is in the mountain side.
2592. What distance is your mine in underground? I think we are in a little over three-quarters of a mile.
2593. What is your system of working? Pillar and stall.
2594. What is the width of your bords? Some are 8 yards, and some less.
2595. What is the width of your pillars? The pillars vary considerably. We work according to the rolls. We generally take out as much as we can between the rolls.
2596. Do you not leave a pillar of some description? The rolls constitute the pillar, but where there are no rolls pillars of coal are left.
2597. Do the rolls in that colliery go up to the roof? They go from 2 feet right up to the roof.
2598. Do they go right through the seam? Yes.
2599. Do they become a stone dyke? No; in many cases they cut the seam clean out.
2600. Are the rolls in your colliery similar to the rolls in some of the other collieries in your district? Yes; they run just about the same in South Bulli, Mount Pleasant, and Mount Keira.
2601. Are you sure these rolls appear in the Mount Keira Mine? Yes; I have seen them there myself.
2602. Have you seen them in Mount Keira lately? No; before I came to Corrimal.
2603. What are the sizes of the pillars? They vary considerably. I can hardly give the size. I have a plan here on which they are shown [*plan produced.*]

2604. Can you say what the sizes of the pillars are? From 3 yards up to 13 yards, and some of them larger where there are these big rolls. E. A. Jones,  
Esq.
2605. They vary? Yes. 23 Sept., 1895.
2606. What system of ventilation have you? Furnace ventilation.
2607. Is your mine divided into splits? Yes; we have three splits.
2608. What number of men have you in the mine? About 140 miners. That was the number at the last caving.
2609. What are the hours of working at your mine? From 7 o'clock until 5 o'clock. Those are the recognised hours we work.
2610. Have you two shifts of men? Yes; a front shift and a back shift. The front shift starts work at 7 o'clock in the morning, and the back shift at 9 o'clock.
2611. Have you good ventilation at that colliery? Yes.
2612. Have you ever known the men to complain of the ventilation? No.
2613. Have you ever known the inspector of collieries to complain about not having the required quantity of air? No; every time he has been there he has said that things were in good order, and well secured as far as timber was concerned.
2614. Do you use much timber? Yes.
2615. Is it a bad roof? It is a shaley roof.
2616. Do the men set their own timber? Yes.
2617. Does the company provide the timber? Yes; we put it on the spot.
2618. Do you cut the timbers to the proper lengths? Yes.
2619. Do you find the miners with suitable lids? Yes.
2620. What kind of timber do you use? Flat and round timber mixed. Of course they set a lot of slabs—cap-pieces, in the headings especially, and we pay for these.
2621. What do you pay for this timber? One shilling, and 1s. 6d. a set for the 7-foot lengths, but we pay 4s. for the long sets.
2622. What do you call long sets? Eleven-foot lengths. We drive our main heading 11 feet wide.
2623. Do you always keep your return airway in a satisfactory condition? Yes.
2624. Do you always keep your return clear? Yes.
2625. What is the method of weighing at your colliery;—have you standard weight? No; we have an average.
2626. Do you pay the men by the average weight? Yes; by the weight they get. A miner may be weighed two or three times during a fortnight, and he is paid by the average weight he gets during that fortnight. A man may get weighed two or three times in a week, or two or three times in a month.
2627. Have you a weighman stationed at the screens on behalf of the company? Yes.
2628. What are that weighman's duties? To look after the waggons, put them under the screen, and to weigh coal. He also looks after the people at the screen to see that they do their duty.
2629. Is he foreman of the men? Yes; foreman of the screenmen.
2630. Does he do anything else besides what you have stated? No; that is all.
2631. He cannot be at the weighbridge all the time, then? No.
2632. How many skips do you put out in a day when you are working full time? About 900 or 1,000—something like that.
2633. Out of that number of skips, how many do you weigh? According to the check-weighman's account, posted up at the pit's mouth, the average lately has been about one in sixty or seventy.
2634. Is that number of skips satisfactory to the men? I have heard some of them complaining, and saying they would like to be weighed oftener. I have noticed that they complain when they stand at a low weight, but when they stand at a high weight there is no complaint at all.
2635. Do you think that the sixtieth or seventieth part of the weighing of the production of a miner is anything like a reasonable quantity to weigh? Yes, I do. If a man fills his coal honestly he need not be afraid to be weighed at any time.
2636. *President.*] Suppose he has the luck to have a light weight;—has not the manager the right] to weigh when he likes? Yes.
2637. What is to prevent his weighing whenever the miner likes;—I suppose a man can ask to be weighed whenever he likes? There are such a lot of skips with big pieces of stuff knocked off, and if a skip is broken the miners say that you have no right to weigh that skip. I am sure that there are many of the skips broken before they leave the bord so that they shall not be weighed, and that lumps are pulled off for that very purpose. We have found that out time after time. When they are rushed with skips, as fast as they can fill them, they pull one lump off the corner and say they will not weigh that skip, thinking to get the same average for that as the big skips before. If the skip does not come packed properly it will not be weighed, so that if they pull a lump off it will not be weighed.
2638. *Mr. Curley.*] Is it not the practice to mark a skip with chalk when it is broken? Yes; that is supposed to be the practice.
2639. Has the wheeler who has to do with it to chalk it? Yes; but the excuse is very often that he has not a bit of chalk.
2640. Cannot you supply the wheeler with chalk? I am afraid it would take a lot of chalk.
2641. Is chalk a costly matter? No; but they would not do it.
2642. Are they supposed to do it? Certainly; but they do not do it nevertheless.
2643. Whose look-out is it that they do not do it;—who has the discipline of the mine? You cannot have some one watching every wheeler.
2644. Have you taxed them with this breach of discipline? Yes; and I have discharged one or two men for the same thing.
2645. When was this? About five or six months ago.
2646. You say you have been manager of that colliery for three years? Yes; next February.
2647. How many men have you discharged for that sort of thing during that time? Two wheelers.
2648. Have you discharged any miners? No.
2649. Why did you discharge these wheelers? Because they did not mark the skips. The deputy on one occasion caught one of them coming out of the bord with the front of the skip all out.
2650. Did the deputy not stop him? It was coming out of the heading.
2651. Did he follow him out with the skip? He reported the matter to me. 2652.

- E. A. Jones, Esq.  
23 Sept., 1895.
2652. Is this a very frequent occurrence? I know that when the skips are coming down the incline you cannot sit at the office door without seeing some of the coal falling off the front of the skip on account of bad packing.
2653. Do you not insist on weighing for your own protection? No; I tell the weighman to be very careful, and to weigh as often as he gets a chance.
2654. What is the system of weighing;—how many hours a day do you weigh? The weighman has to look after the placing of the waggons. When the locomotive comes up with the empty waggons, he has to look after the shunting, and when he has the opportunity after doing that, he is supposed to weigh.
2655. How long will it take the weighman to look after the waggons? About three-quarters of an hour each time they shunt.
2656. Are there any days on which you never weigh any skips at all? No certain days.
2657. Are there certain days when there is no coal weighed at all? I cannot tell you.
2658. Does not the weighman give his book into you? There are fortnightly weights.
2659. If the weighman missed weighing one day, would you have any knowledge about it? No.
2660. They might weigh, or they might not weigh? Just so.
2661. How many skips does the weighman weigh in a day? I cannot tell you without looking over the books, but from thirty to fifty, or sixty to seventy, is a rough estimate.
2662. You state that the average is one in about sixty or seventy? The check-weighman places it up one in sixty or seventy.
2663. How many skips a day will you draw out of the mine? Between 900 and 1,000.
2664. Do you think it would be a better plan to weigh more skips? I did not know they were not satisfied. Occasionally I have heard one of them say that he has a low weight, and he has wished me to weigh him when he got into a good place. He may ask then to be weighed.
2665. Have you looked into the present Coal Mines Act of 1876? Yes.
2666. Will you look at the 19th section of that Act, on page 7 (*see Appendix B*). Do you think you are complying with that section of the Act, by weighing one skip in every sixty or seventy? Yes, I do. The miner is paid by the weight he gets of the mineral gotten.
2667. How can he be paid for the weight of the mineral gotten if you do not weigh it for him? He is weighed and paid according to the average.
2668. Do you weigh you waggons before you send them away? They are all weighed at the Wollongong railway station.
2669. Do you take the Government record? Yes.
2670. Do the Government weigh every waggon? They are supposed to weigh every waggon.
2671. Do you think they do weigh every waggon? I think they do.
2672. Have you the total weight at the colliery, represented by the weighman, *i.e.*, the weight paid for on the part of the miners? Yes.
2673. Do you know the weight of the miners' production? Yes.
2674. Do you know the quantity that goes over the Government weighbridge;—is that weight returned to you? No.
2675. Can you get it when you want it? Yes.
2676. Do you not want it now and again—occasionally? I only want it to work out the costs.
2677. Do you ever check the weight that has gone away with the average weight taken at the colliery? It is only occasionally that I get the weight of the coal in waggons.
2678. How often do you get it? Every two or three pays.
2679. Would you get it every six weeks or two months? Yes.
2680. Have you ever noticed any discrepancy between the Government weight, and the weight of the coal that the miners have been paid for;—if you had a given weight for your waggons, and a given weight from your weighman, would you not put the two together to see if there was any discrepancy;—have you done that? Yes.
2681. Which side was the discrepancy on? On the side of the mine. There has been a discrepancy of 80 to 100 tons.
2682. In favour of whom? In favour of the company.
2683. *Mr. Gregson.*] In what time was that? I could not tell you what time. It may be in a fortnight's pay.
2684. Would it be 80 or 100 tons to the good? Yes; I have noticed it from 60 to 70 tons.
2685. What is your idea of the general results of the year's working;—does the colliery gain, or the men gain? I think the colliery gains a little.
2686. Have you any idea how much? I cannot tell you how much? It fluctuates backwards and forwards. There is nothing to speak of.
2687. *Mr. Curley.*] Do you think the men should have something like justice and fair play in this weighing business? I think they have.
2688. Do you think you are carrying out the provisions of the present Act in the way you are weighing? I do.
2689. If the men were to appeal to you to-morrow, or any day hence, and ask you to weigh a certain number of skips each day, would you do it? The only thing that would prevent us is the cost; the man is too busy with other work.
2690. What is that work? Shunting, and giving a general hand at the screens.
2691. Should that be any reason for the men not getting weighed? The check-weighman would not allow us.
2692. Do you mean to say it is the cost of keeping a man at the weighbridge that prevents you from weighing more skips? Yes; we would have to get another man if we had to do this.
2693. Have you any standard weight at your colliery? No.
2694. Do the men get all they fill? Yes.
2695. Is the only contention about the number of skips that are weighed? I have heard no contention.
2696. Have the men ever made any complaints? No; only when a man gets on to good coal, he says, now is the time you ought to weigh me.
2697. *President.*] Would it not be better for both parties if coal was weighed more often? I suppose so.
2698. *Mr. Curley.*] Have you the sole control of the weighman? Yes.
2699. Could you order him to weigh more coal? Yes; but, as I have pointed out, there are so many skips coming down with the tops off, that they cannot be weighed.

E. A. Jones,  
Esq.  
23 Sept., 1895.

2700. Where is your weighbridge situated? At the screens, at the foot of the incline.
2701. How far are they away from the pit? They are 37 chains down from the pit. It is an endless rope, and they come straight from the mine to the screens.
2702. Do you weigh the skips before they are tipped? They come down the screen into the weigh-box.
2703. Who gets the benefit of that coal that tumbles off the skips when going down the incline? The company has to pay for cleaning that up.
2704. Do you get the benefit of that coal? Yes; we pay twice for it. We pay the miner first, and then the shiftmen for filling it up again.
2705. Have you ever worked the colliery for more than the usual hours? Yes.
2706. When have you done this? During this last week.
2707. What hours did you work? We started at half-past 10 and half-past 11 at night to run the incline to get enough skips for the men to work in the pit at night.
2708. Do you work a night-shift? Half a shift for outside hands, six; full shift for miners.
2709. Who are the men that work the half shift at night;—are they the men that have been at work in the daytime? Yes, when they chose. They simply ask to go.
2710. Do you request them to go? I simply ask them if they would like to go. They work from 11 o'clock at night till 3 o'clock in the morning.
2711. Do they then go to work on the following day, if there is work to do? Yes.
2712. *Mr. Gregson.*] Is this done by the men voluntarily? Yes.
2713. If the men did not come back to work the next day, would you dismiss them? Oh, no; there are several men only too glad to come back. The night-shift of miners come on every night at 8 o'clock, and they complain they do not get enough skips to keep them going, and it is on this account that we try to run the incline at night to keep them supplied with skips. There are about thirty-five or forty miners in the headings, and some of them are in the bords.
2714. Are the miners paid by the ton? Yes, by the ton, and yardage.
2715. Have you three shifts of men? No, only two shifts—a back shift and a front shift. One man goes in at 7 o'clock, and stops till 3 o'clock, and his mate goes on at 9 o'clock, and knocks off at 5 o'clock.
2716. Have the men who go on at 8 o'clock been employed during the day? It is a separate shift.
2717. How many men have you at work in the day time? One hundred and forty men.
2718. Have you thirty or forty additional men employed at night? Yes.
2719. *Mr. Curley.*] Are these thirty-five or forty men on the night shift part and parcel of the men who go back to work in the day time? No; they are a distinct lot of men.
2720. How many men go back at night that are working in the day time? Six.
2721. Are these the men working the incline? Yes; not miners.
2722. Do the miners occasionally come home and go back to work at night again? The miners are always willing to come back at night to do the work these six men are doing. If these men do not want to come back we can always get miners to do the work.
2723. If you have these men specially engaged in this particular work what need have you for miners? These six men are working in the day time.
2724. What are these men doing in the day time? Screening, and tipping; working outside the mine.
2725. Do you think that men can sustain that kind of thing for any length of time? That is not for me to judge.
2726. Is not that putting in sixteen hours of the twenty-four hours in some cases? No.
2727. How many hours is it? From thirteen to fourteen hours.
2728. Have you ever requested the whole body of men to come back and work at night? No.
2729. You have not worked the full colliery at night? No; we have asked them to work later, or start an hour earlier in the morning, but never an hour over the eight hours.
2730. Do you make that a practice? No; if they start at 6 o'clock in the morning they knock off an hour earlier. If they start at 6 o'clock they knock off at 2 o'clock.
2731. If you do not work on both shifts you do not work at all? Sometimes both shifts go in together.
2732. In this case do you request them to work longer? No.
2733. Have you looked over the proposed Bill? Yes; but I have not paid much attention to it. I have just glanced over it.
2734. Do you wish to say anything about any of the provisions in the Bill? No.
2735. *President.*] Do you agree with all its provisions as it left the Legislative Assembly? I have not looked over the Bill enough to say that.
2736. You think you will have to know it when it becomes an Act, but you do not care about it as a Bill? Yes.
2737. *Mr. Curley.*] Is your colliery a very dry colliery? No; very wet.
2738. Does the water come into the face of the workings occasionally? Yes.
2739. Have you to bail water? Yes.
2740. Are the men occasionally troubled with water? They are.
2741. Do you consider that it is pleasant to work in water? No; we keep water-bailers on constantly.
2742. Would it not still be uncomfortable for the men? I know it is wet in the face.
2743. Is that mostly the case throughout the mine? No; only in the dip workings.
2744. Do you propose to go far in under the mountain with your workings? Yes.
2745. With regard to pillar working, have you that matter fully in view—have you in view the additional weight your mine will have to carry? Yes.
2746. Have you had any gas at all to contend with? No; not the slightest trace of gas.
2747. Do you say that you have had no complaints about ventilation? None whatever.
2748. Has the inspector over drawn your attention to anything in that respect? He has said that the mine is excellently well timbered, and well provided for in other respects.
2749. *President.*] Have the men ever complained about ventilation? No, sir.
2750. How is your mine ventilated? By furnace.
2751. Do you use any brattice? Yes; we use it occasionally when we put up a stenton or cut-through across. When we get up to the 35 yards we brattice the heading up to that distance. We brattice while we are putting the cut-throughs across.
2752. *Mr. Curley.*] Are some of your cut-throughs very thick? From 12 to 14 yards.

- E. A. Jones, Esq.**  
23 Sept., 1895.
2753. Would you have to brattice your heading to get your bord in? Yes, occasionally.  
2754. Would you have to carry the brattice up into the stenton? Yes, if necessary.  
2755. What is the length of your bords? The bords run from 35 yards to 70 yards, but it is in the headings when we use the brattice.  
2756. Do you put your stentons through before you go the 35 yards? Yes.  
2757. *President.*] What for? To keep the ventilation up.  
2758. How far do you go at the most? Seldom more than 32 yards.  
2759. Do you then put your cut-through over? Yes.  
2760. Do you go 30 yards and then a little further to put your cut-through through? You go on till where you have a solid pillar, and then go across.  
2761. How wide is your cut-through? From 7 feet to 12 feet. This is done for cheapness more than anything else.  
2762. *Mr. Curley.*] What kind of brattice do you use? Cloth brattice.  
2763. Do you find that it lasts fairly well? It does not last very well with us. On account of the water and skips we have to get it renewed very often.  
2764. What width do you drive your cut-throughs? Heading cut-throughs 7 feet, and 7 ft. 6 in.  
2765. Have you the usual code of special rules at your colliery? Yes.  
2766. Will you kindly send a copy of yours to the Commission? Yes; I can.
- [Witness withdrew.]

TUESDAY, 24 SEPTEMBER, 1895.

[The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.]

Present:—

FRANCIS EDWARD ROGERS, Esq., Q.C. (PRESIDENT).

JAMES CURLEY, Esq. | JESSE GREGSON, Esq.

Daniel Alexander Wilberforce Robertson sworn and examined:—

- D. A. W. Robertson, Esq.**  
24 Sept., 1895.
2767. *President.*] Have you given evidence before, Mr. Robertson, on the proposed Coal Mines Regulation Bill? I have.  
2768. What Committee did you give your evidence before? A Select Committee appointed by the Legislative Council, of which Dr. Creed, M.L.C., was chairman.  
2769. *Mr. Curley.*] What is your profession, Mr. Robertson? I am a mining manager.  
2770. What mine are you the manager of? The Metropolitan Colliery.  
2771. That mine is situated at Helensburgh is it not? Yes.  
2772. Have you managed any other collieries in this Colony? Yes.  
2773. What other collieries have you managed? The Greta Colliery.  
2774. Have you managed any other collieries anywhere else? Yes; the Carron Iron Company's mines in Scotland, and the Brymbo Iron Companies' Collieries in North Wales.  
2775. Have you been connected with collieries for a considerable number of years? Yes; since boyhood.  
2776. Are you acquainted with the various systems of mining? I am.  
2777. Both the long wall, and pillar and stall systems? Yes.  
2778. What was the system of mining pursued in the mines you have referred to in England? There were practically only two systems, long wall, and pillar and stall.  
2779. Will you give us your experience of the method pursued in the first mine with which you were identified? Briefly speaking it was long wall, and pillar and stall, with, of course, modifications of each system.  
2780. Take first pillar and stall;—what was the length of the bord? The bords varied very much in size, from 8 feet to 20 yards.  
2781. Was 20 yards the usual distance? The usual distance was about 18 or 20 yards in North Wales.  
2782. What was the distance of the bords in Scotland? The system of working pillar and stall was not the same as in North Wales. It was more in the nature of headings than bords there. It might be anything from 8 or 9 feet, to 5 or 6 yards.  
2783. Are you speaking of the headings? We used to call them headings there.  
2784. What length did the headings run;—were they similar to what we call bords here;—there is a certain stipulated distance that we call the length? They would vary according to the rise of the seam. In a flat seam they would run very long distances. In other cases the cross levels would be longer, it might be from 50 yards up to 300 yards.  
2785. Would they not go across before they would be driven anything like 300 yards? Certainly.  
2786. How far would they go without putting a cross drive over? I should say about 40 or 50 yards. That would depend upon the strength of the ventilation, or a dip, or rising place.  
2787. How did you conduct the ventilation? Sometimes by brattice, cloth brattice or boards, and sometimes with bricks, but that was in a stone heading.  
2788. Did you use much brattice in these mines? Yes.  
2789. What was the height of the seams? From 10 inches up to 12 feet.  
2790. Did you work the 10-inch seams? Oh, yes.  
2791. How did you manage to work those seams? The working face was not more than 14 or 15 inches, but of course that is quite exceptional.  
2792. What was the usual height of the seam apart from those thin seams? You found 2 feet seams and 8 feet seams in the same district.  
2793. Was the same method of working pursued in each district where the seams were thick and thin? In the thin seams the only practicable method was longwall.  
2794. Where you have referred to bratticing, was that in the thin or thick seams? In the thicker seams.  
2795. Were there gases in any of these mines? Yes.  
2796. Was there any fire-damp? Yes.  
2797. Would the same thing apply to the seams in North Wales? Yes.
- 2798.

D. A. W.  
Robertson,  
Esq.

24 Sept., 1895.

2798. Had you any accidents of a serious character during the time you managed at these mines? Only the usual accidents from falls of roof and coal, but I am happy to say I have never had anybody injured by an explosion.

2799. Where you worked the bord and stall system what was the width of the pillar that you usually left? That depended very much on the conditions—upon the depth from the surface. According to the depth, anything from perhaps one dozen yards up to large blocks.

2800. Were the mines very deep? I have worked them up to 1,200 and 1,300 feet deep.

2801. What depth were the shallowest mines you have worked? Nearly on the surface.

2802. Did you ever work a mine ranging from 200 or 300 to 400 feet deep? Yes.

2803. What pillars did you leave in that mine? They would probably be about 40 or 50 per cent. of the coal.

2804. Would 40 or 50 per cent. of the coal be left as pillars? Yes; something like that.

2805. When you worked up to the boundary would you bring your pillars back? Sometimes in their reverse order pillaring would be going on in the interior part of the workings. We did not always wait till we got to the boundary.

2806. After you worked these pillars out in the interior part of the mine, had you to put packs up to prevent the roof from coming down? The main roads were always maintained; sufficient pillars were always left there.

2807. You might take some of the back pillars out? Exactly so.

2808. What were the sizes of the pillars you left near your main roads? That would depend on the depth.

2809. Were your main-road pillars left larger than your ordinary pillars as a rule? Yes; as a rule—certainly.

2810. Did you always have substantial pillars near your roadway? Undoubtedly.

2811. In the extraction of pillars, in the event of a large fall coming away, do the men not always look to the main road as a place of safety to flee for refuge? If a danger was apprehended, they would look for the nearest road to the pit.

2812. Should not that always be maintained? Yes.

2813. There should be no doubt about its security? The main roads ought to be above suspicion.

2814. Should they not be above suspicion at all times? I think so.

2815. In your practice of mining has not this been always one of the ideal things? Well, it was.

2816. What is the depth of the Helensburgh Colliery? The shaft is 1,100 feet deep, but we are working about 1,500 feet deep, speaking roughly. The shaft is sunk in a valley, and we are working under the hills.

2817. In your estimate, with regard to your working under the hills, do you consider the depth of your pit much deeper than where the shaft is? I do.

2818. Do you consider it about 400 or 500 feet more? About that.

2819. Do you work bord and stall system? Yes; we work what we call the Welsh bord system, 10-yard places with two roads, and the *debris* thrown in the middle. All throughout I am now leaving 50-yard pillars between the bords.

2820. Does your mine dip or rise very much? It undulates very much from flat, to one in seven.

2821. Have you much area where the dip working is? Yes, a considerable area.

2822. Do you work to the dip, or from the dip to the rise? The dip varies so much in different directions that it would be hard to answer that question. Generally speaking we get to the dip, and work upwards, but that has to be modified according to the varying circumstances.

2823. Have you extracted any pillars yet? Yes, a considerable area.

2824. Is that area in the dip section of your workings? It is all over the pit.

2825. Have you reached the boundary in some places? Yes; but it happens that the boundary is very near to the pit. We can go 13 miles in another direction and not reach our boundary.

2826. Have you had any falls where you have worked these pillars out? Yes; the roof has all caved in, of course.

2827. Is fire-damp given off in your colliery? Yes.

2828. Is it given off in quantities? Yes; there is a considerable quantity given off, but not in such large volumes, perhaps, as in some of the homo mines.

2829. In the places where you have extracted the pillars, and you have had falls, do you find much gas coming from these districts, *i.e.*, escaping from the old workings? I may mention that all the districts where we have extracted pillars are supplied with abundance of air. I do not bottle up the old workings. Some believe in bottling them up; they do not leave them open and supply them with air, but that is my system. I believe in leaving them open and supplying them with air as far as practicable.

2830. Is that the best way to keep the gas out—to sweep it clear? I think so; but of course you require an enormous amount of ventilation at your disposal. Under circumstances where a manager had not command of large ventilation the other system might be adopted with advantage.

2831. Is there not a danger if the other system was adopted of some imperceptible leak happening and forcing gas out of the goaf into the main ways? I think so, and that is the main reason why I leave them open.

2832. Is that not more particularly so where they are dip-workings, because you know that gas will go to the rise if it is forced out by any contingencies such as a fall? Certainly.

2833. Have you read of instances where that has taken place in connection with a colliery explosion? Yes, there are instances I believe.

2834. In your workings, at the present time, where do you discover this fire-damp giving off most? At the working faces.

2835. *President.*] Are the working faces the same as the working places? Yes; places and faces are synonymous terms.

2836. *Mr. Ourley.*] Does this fire-damp come from the coal, from the floor, or from the roof. Where does it come from? From the coal.

2837. Has it ever been noticed to come from the floor, or from the roof? I have never noticed it.

2838. Have you had instances where there has been a large fall in your mine at any particular time? Yes, in pillar working, where we have been extracting pillars, and the roof not breaking. When we start a district first the roof will not break very readily, and there is a considerable area left on props.

- D. A. W. Robertson, Esq.  
24 Sept., 1896.
2839. At such times as these have you made a special inspection to find out whether any gas was given off more than in the usual way from these waste places? Yes, we are constantly inspecting.
2840. Have you come across any faults of any consequence in the working of your colliery? It is rather a faulty field.
2841. Do you notice any unusual quantity of gas when you approach these faults? Yes, but it is not a regular thing. It is not certain that we will find gas when we find a fault. At present we have a fault giving off a considerable quantity of gas with a peculiar odour.
2842. Is it a large blower, or a small blower? We have not large blowers in the ordinary acceptation of the term. The coal is very open jointed, and you can scarcely tell where the gas is coming from.
2843. Has this fire-damp been peculiar to the colliery since the opening of it? Yes, since the first.
2844. What kind of gas would you term that? At the first opening we had a most peculiar gas, having all the properties of fire-damp, and yet lying on the floor. It has been proved beyond a doubt that such was the case. That only refers to the immediate neighbourhood of the shaft, but since we have got out from the shaft we get the ordinary fire-damp. The gas at first consisted of fire-damp (carburetted hydrogen), carbonic acid, and carbonic oxide. Carbonic oxide is supposed to have never been given off in a mine, but it was given off here.
2845. Have you read Atkinson's work;—does he not refer to it? I think he does; but carbonic oxide is not known to be given off in a free condition. If it is, it is a rare occurrence.
2846. Is carbonic oxide an inflammable gas? Yes.
2847. Do you think that carbonic oxide is as deleterious to health as it is said by scientific men to be? Not quite as much. You can breathe a great deal more of it than scientific men assert.
2848. Do you regard it as a dangerous gas seeing that it is inflammable and deleterious to the health of the men? I regard it in the same light as fire-damp—that is, that all possible precautions must be taken to render it harmless. As far as we are concerned that only refers to the past. We have nothing but fire-damp now.
2849. Seeing that you have had this other gas, is it not possible that you may meet with it again? Quite possible.
2850. What is the height of your seam? From 11 to 12 feet; but we only work practically about 7 feet.
2851. Do you leave the other 4 or 5 feet? Yes; in some of the main roads we lift the lower part of the seam.
2852. Do you leave this part down in the seam, or as tops? We leave it down in the bottom.
2853. What is the length of your bords;—what length do you drive your bords? Various lengths. I have had some driven nearly 300 yards.
2854. In the ordinary way how far do you drive them? Perhaps 100 or 150 yards.
2855. What distance do you drive them before you put a cut-through over? We seldom drive over 100 yards without a cut-through. I refer to the bords, not to the headings.
2856. I am speaking of the ordinary working bords—the 10-yard bords that you have spoken about? Through having the partition in the middle, they are ventilated up to the end.
2857. Do you build that wall solid up to the roof? In some places it is not a wall; it is the slack and *débris*, thrown together as a pyramid.
2858. Do you build it up to the roof? Yes.
2859. Do you use any bratticing? In some places we put a little on the top of the slack.
2860. You utilise the refuse, which acts partly as a conductor for the air? Quite so.
2861. Have you a door on the heading to force the air into these places? We have an ordinary flying screen, and occasionally a door.
2862. Do you mean a canvas screen? Yes.
2863. One part of the bord acts as an intake, and the other acts as a return? Exactly. We could not go these long distances with our bords except through having such a command of ventilation. By having this great ventilation, we can do things which could not be done at other collieries. We are far in excess of what is required for safety, and we have, I think, double the ventilation of the ten mines down below us.
2864. What kind of a fan have you there? The Schiele type.
2865. What is the diameter of your fan? 20 feet. A Schiele fan of 20 feet is equivalent to a Guibal of 60 feet.
2866. Did it cost you much to erect the fan you have? Yes; our ventilation plant must have cost at least £10,000.
2867. That is the erection of it—to put it in an effective condition? Yes, I think it cost every penny of that sum, not to speak of the underground arrangements in connection with it. You cannot get a large ventilation by a fan alone; your arrangements underground must be on a correspondingly large scale. You cannot get ventilation by a fan alone except your arrangements underground are of a corresponding size.
2868. Have you any splits in your mine? Yes.
2869. How many splits have you in your mine? Five main splits, but these are again subdivided (*a plan showing the number of splits in the Helensburgh colliery was produced by Mr. Robertson, and explained to the Commission, and the plan ordered to be embodied in the Appendix to Commission's report. See Appendix S*).
2870. What is the number of men you employ in your colliery? About 300 altogether underground.
2871. Can you send the Commission a copy of your special rules? Yes, certainly.
2872. What is your system of inspection at this colliery in the morning before the men resume work? The deputies go down the mine about half-past 4 o'clock in the morning.
2873. How many deputies have you? We have four deputies in the day shift, and one at night. These men are kept simply for inspection, and are not troubled with any other work.
2874. Will you please detail their duties? They go round the mine and examine the different places as regards the condition of the roof, the sides, the ventilation, and gas. They make take up brattice cloth, or some other little thing, but generally speaking they are simply inspectors. In addition to the deputies we have men under them—roadsmen and bratticemen.
2875. How many roadsmen have you? Each deputy has at least one roadsman under him, sometimes two.
2876. That would make about twelve or fourteen men, for both night and day? Yes, I think there would be that number.
- 2877.

2877. Do you work with safety-lamps at that colliery? Yes, entirely with safety-lamps throughout the whole of the mine.

2878. What safety-lamps do you use? The Thomas Griffith shielded lamp.

2879. Is that one of the latest lamps? Yes, they have lead locks. The old type of lock, a man could undo, but they cannot do it with a lead lock, because detection is certain. We place on each lead lock a small stamp with the Company's name on it, and they must cut that to get at the light, and if they do that detection would be certain.

2880. Do you regard these lamps yourself as of a very high type? Undoubtedly; we would not have them unless they were the best. I always like to have a lamp that I can put into the hands of a fool.

2881. Have you a rule that if a lamp receives any damage the matter is to be reported to you? Yes; that is the rule. No matter what the extent of the damage is, the man in such a case must appear before me.

2882. Where are these lamps examined? They are handed to the miners at pit-top, and they take them to the deputies down below, where they are examined a second time, and after this examination the men are allowed to pass into their places.

2883. Who cleans these lamps? The company's men. They are brought up at night to be cleaned.

2884. Have you a man appointed on the pit-top specially to look after these lamps? We have our lamp staff; a lamp-man and his assistants.

2885. Is your lamp-man a man with much experience in mines? Yes, they are all experienced men; but a man does not need to be experienced in a mine to be a good lamp inspector. In the matter of lamps we are extremely strict, and it takes some time before the men take kindly to the discipline in that respect. Besides this, we search the men regularly for matches.

2886. Is it one of your rules to allow no matches or pipes in the mine? Not if I know it. The men are regularly searched, and if they are found with matches it means a visit to the court.

2887. Have you any rules to that effect in your special rules? Yes; I have occasionally found a few matches, or a single match, but I have a great deal less trouble with the men in this Colony. I do not think that any man would take down a box of matches, or a single match, knowingly.

2888. Do the men go down the mine at a uniform time? We have several shifts. The winding shift, starts to go down at 8 o'clock in the morning, and come up about half past 4 o'clock in the afternoon.

2889. When do the miners go down the pit? At half past 7 o'clock in the morning.

2890. And when do they come out of the pit again? They start to come up again at half past 4 o'clock in the afternoon.

2891. Are the men allowed to go into their places in the mine before they see the deputy? No; none of them are allowed to go to their places before they see the deputy.

2892. Is it one of your rules that they must see the deputy? Yes.

2893. Does the deputy see them all come out? No; the deputies do not see them all coming out.

2894. How do you know they have all left the mine? By the number of lamps that are in the cabin.

2895. How are the miners advised about knocking off time? They are usually out before knocking off time. There is no trouble about that.

2896. Can the men come out of the mine when they like? No; they are not allowed to ascend the shaft before the usual time without an order.

2897. Throughout the day can they come when they like? No; not without an order.

2898. Would you look upon it as a breach of discipline if they did so? I would.

2899. Could they do it? No, they could not.

2900. Would a man be allowed to come out in case of sickness, or suppose he met with an accident? If they have any reasonable excuse we never refuse.

2901. Do men meet with many accidents in your mine? At one time we had a considerable number of broken legs; but lately we have been very free from accidents, I am glad to say.

2902. How did these accidents occur? Simply through the coal tumbling over. They are mostly confined to broken limbs at the face. The coal is very jointed, and, with the gas, rolls over on their feet; but in most cases the men are greatly to blame.

2903. Do you know anything of an accident that happened at your colliery in 1893, when a piece of coal fell down the shaft;—how did that accident occur, and what was the character of it? A piece of coal fell off one of the skips when the cage was going up the shaft. We have the pit bottom arched, and a safety scaffold over the onsetter's head. This piece of coal went away like a bullet, and the unfortunate fellow happened to be looking up at the time, and it caught him.

2904. Do you say that this piece of coal went through the protection board? Yes.

2905. Is the protection board you have there made of wood? It is iron with wood planking. It was never meant to prevent a bullet coming down. You can imagine the velocity with which a heavy lump of coal would go down 1,000 feet. There is nothing in the Act to compel me to put up a safety scaffold, and an accident like this might not occur in thirty years again. After that accident I put a steel plate under the wood, and we have a quantity of debris to cushion the blow.

2906. What is the thickness of the wood? Two-inch hardwood.

2907. Do you work a night shift at your colliery? We do not wind a night shift, but we have men working in special places.

2908. Do you ever ask the men to work longer than the times you have referred to? We managed to get them once to do it as a special favour, but I have never succeeded in doing it again.

2909. Would you like the men to work these longer hours? Yes, I would like to see the men take a little interest in the trade. I think if the men have only been working three or four days, and we have a ship to load, that it is hard that we cannot get them to work a little extra to finish that ship. If they were working ten or twelve days a fortnight, I should not ask them to do such a thing, but I would like them to work to meet the exigencies of the trade.

2910. When you have nothing for them to do, do you consider a man's time is his own, and that he should utilise it to his own advantage? Certainly.

2911. Do not some of the men utilise their time when they are not mining? I am sorry to say not many of them.

2912. What do they generally do? We keep two very large public-houses, and the proprietors of them are making fortunes there. The men might make their conditions very much more comfortable if they chose.

D. A. W.  
Robertson,  
Esq.

24 Sept., 1895.

- D. A. W. Robertson, Esq.  
24 Sept., 1895.
2913. Do you suppose that the miners keep these public-houses? There are no other persons there that I know of. It is entirely a mining community.
2914. In a mining community do you not have other people besides miners? Not many.
2915. Do you mean to say that the miners are the only people who sustain these hotels? They are the only people who come before me when I am on the bench.
2916. Do you think the miners lose much work through this? Yes, a good deal, I think.
2917. Have you any regulations in connection with such matters? Yes, we are not supposed to sanction that sort of thing. We sometimes caution them, and at other times discharge them. They wander about the country and come back again in rags, and we have pity on them and take them on again.
2918. Have they any advantages for securing pieces of land in the locality? Yes.
2919. Who can they secure this land from? The Government. They can buy allotments of land very cheap there, as low as from four to five pounds.
2920. Is your mine a very dry mine? Yes, a very dry mine.
2921. Would it be known as a dusty mine? Yes.
2922. Do you attach any importance to the coal dust theory? Undoubtedly I do.
2923. You attach importance to the theory of its being an explosive? Yes.
2924. Do you think it is explosive to any serious extent? I am not prepared to say that it would not explode of itself with a light. I have made experiments with our own dust, and I have not been able to explode it by any means I have tried.
2925. Do you think that coal dust might aggravate an explosion? Yes.
2926. Do the men set their own timber in your colliery? Yes.
2927. Do they lay their own roads? Yes.
2928. Do they wheel? No.
2929. Have you wheelers at your colliery? Yes.
2930. Do you weigh the coal? Yes.
2931. Do you pay the miners by weight? Yes, by weight.
2932. How are the miners paid;—do you weigh every skip? No; we pay on an average weight.
2933. What is your method of weighing? We have our own weighmen and the miners have their own weighmen, and when they have finished weighing one skip they ring a bell, and the banksman takes off the first skip that comes up the shaft.
2934. Has your weighman any other duties besides weighing the coal? He has the examining of the ropes, but you can hardly say that he has anything else to do but look after the weighing.
2935. How many skips do you weigh, on an average, per day? About twenty-five skips a day.
2936. *President.*] How many skips come out of the mine in a day? About 1,000 skips.
2937. *Mr. Curley.*] Do you think that gives anything like a fair average for the miners? I think any number of skips is a fair average, so long as it is the same system for both sides. We have a weighman, and they have a weighman.
2938. Have you ever made a calculation to show whether the weighing is in favour of the mine or the men? That is hardly a fair question to ask me. There is one weigh-screen for the miners, and another weigh-screen for the customers, and the miners' weigh-screen may have a different width between the bars, and be a different length. You cannot, therefore, argue on one side or the other, that either side is suffering an injury.
2939. Do you not pay for a certain quantity of weight each fortnight, and are not the miners supposed to be paid according to weight? Yes.
2940. Do you not send a certain amount of weight away every day for which the company is paid? Yes.
2941. Do you not know, from your own experience, whether that weight is against or in favour of the company? I do not think that is a fair question to ask me. It is on a wrong basis altogether. You assume that the employers may make a gain—that the railway weight may be more than the pit weight.
2942. *President.*] Can you give us any idea whether the system of average weight, as it obtains at your mine, is more in favour of the men or the mine-owner? I cannot answer that question, because the conditions are not the same.
2943. Can you give us any idea of these weights? I would be inclined to say that the railway weight was more than the miners' weight.
2944. That is, that it is in favour of the management? We sell a great deal of unscreened coal, and the weight of unscreened coal would be more than the weight of the screened coal, therefore the difference is in favour of the proprietors.
2945. Making all allowance for these things, which side do you think benefits by the present system of weighing? I do not think there is any difference at all. If your screen is the same mesh and the same length there cannot be any difference at all.
2946. Do you think that weighing a larger amount of coal would give the miner better results? I do not think so. It is a knife with two edges, that cuts both ways.
2947. *Mr. Curley.*] Do you think that one skip in forty is a fair average? Yes.
2948. Or one skip in sixty, or one skip in 100? Yes; as long as you get anything to represent a fair average.
2949. *Mr. Gregson.*] Is the weigh-screen kept going all day when weighing twenty-five skips? It is.
2950. Is that all they can manage to weigh in one day? Yes, they might weigh more; but I cannot get the miners' check-weighman, to work eight hours? It takes him, roughly speaking, an hour to make up his weights at the end of the day, and that time is calculated in the day's work. They start to knock off weighing at half-past 3 in the afternoon, but the mine stops at half-past 4, and I cannot get them to keep on weighing till half-past 4.
2951. *Mr. Curley.*] Would you like to insist on a man working longer than his usual hours;—has not the weighman the right to stop working as well as anybody else? Certainly, if they would go on till the pit knocks off; but the weighman objects to weigh after half-past 3, and so do the miners, because that would cause their check-weighman to work nine hours instead of eight hours.
2952. If you weighed up to half-past 4, would not your weighman and check-weighman have to tally their work after that? Certainly.
2953. Would not that be increasing the hours of employment? Yes.
2954. Cannot you weigh more skips within the time that is stipulated? No.

2955. What do your skips carry? The weight of coal would be about 22, 23, or 25 cwt. gross. Our skip is an exceptionally large skip.

2956. Is that coal run down the screen and then into the box? Yes.

2957. Is your seam a clean seam? It is a fairly clean seam, but we have rather a bad roof, and that is why they cannot weigh so many skips on account of having to take the dirt out.

2958. *Mr. Gregson.*] Have any complaints been made to you about sufficient skips not being weighed? Yes; and my answer is, "Why don't you weigh until half-past 4?"

2959. How many screens have you? One screen for weighing, one for the ordinary customers, and another for unscreened coal.

2960. Are your screens the ordinary sloped screens? Yes, the ordinary sloped screens.

2961. *Mr. Curley.*] Do you keep a record of the skips that are tipped with unscreened coal? No.

2962. You mentioned a difficulty with regard to screened and unscreened coal in the matter of weighing—is it not within your province to keep a tally of the unscreened coal? It is all unscreened coal before it is tipped.

2963. Do you not keep a record of that coal, to give you some idea of what has gone away? We have that information in our record of the railway weights.

2964. Can you always separate the large coal from the unscreened coal that has gone away? Yes.

2965. So that there is no trouble in getting a distinct calculation upon the quantities. You referred to that as a difficulty just now? No. I said that the conditions of the two screens are not alike, I say that if the screen to the customers is shorter than the other screen, necessarily the customers, to a certain extent, will get unscreened coal.

2966. Cannot you always gauge the quantity of unscreened coal distinct from the other coal, for this reason that you weigh it as unscreened coal? Yes.

2967. You have stated that the average of skips that are weighed at your colliery is about one in forty? Yes.

2968. Would you be surprised to know that from the 8th of July to the 31st of August of this year, that the average number of skips weighed at your colliery, has been one in sixty-six? That might be the case. We draw coal sometimes after half-past 4, but we cannot get that coal weighed. We draw coal off the roads, but the miners will not weigh it.

2969. Do you think that the limited number of skips you weigh complies with the 19th section of the Act of 1876. It says in that section of the Act, that the miners shall be paid according to the weight of the mineral gotten by them? To do that, you would have to weigh every skip.

2970. Do you not think that weighing more skips would give more satisfaction? I do not think that it would. The principal is just the same, whether you weigh twenty, fifty, or one hundred skips.

2971. Where a man gets a light weight, is that not a serious matter for him? Would that not cut both ways, supposing he gets a heavy weight.

2972. May not a man get a succession of light weights? He may also get a succession of heavy weights, and we know he does. So long as we have no control of the weighing the weight must be fair.

2973. *Mr. Gregson.*] Have the weighmen any choice of skips whatever. Can either of the weighmen, choose or see the skips to be weighed? No, they have no choice whatever.

2974. *Mr. Curley.*] Is the banksman supposed to take a skip to the weighman when the bell is rung? Yes. The first skip that comes out of the cage.

2975. Is your cage what is known as a double-decker? It is a single cage, with two skips coming up at the one time.

2976. Do the weighmen take the front skip one day, and the back skip another day? No. They take the front skip always, but of course they settle that between themselves. There is no objection to their doing it in the way you have mentioned if they like.

2977. Have you heard that the men want more skips weighed? Yes, I have.

2978. Have you had any trouble with the check-weighman? I have not had very much trouble, but occasionally there is a little friction between us. He is a little peppery and so am I, but on the whole we get on very well together.

2979. What was the cause of the friction you have mentioned? It was generally on trivial matters, but there may have been disputes that I know nothing about.

2980. Do you not leave the weighmen to settle these disputes themselves? I am only referring to the disputes that have been referred to me.

2981. Do you believe the men should have the right to select their check-weighmen from where they please? No; I do not believe in that.

2982. Do you say that he must be an employee of your mine? I think it would be an objectionable thing to employ outsiders.

2983. *President.*] Do you know that under the English Act the miners can select who they like as check-weighman? No, I did not know that; but I am willing to take the English Act as it stands, with all its deficiencies.

2984. What do you call its deficiencies? That, I think, is one.

2985. What are the others? The employment of any persons is unnecessarily elaborate; but there are not many deficiencies in the Act.

2986. On the whole do you consider it is a very good Act? On the whole I should be quite willing to take it as it stands.

2987. *Mr. Curley.*] Have you heard any complaints about the selection of these check-weighmen since the Act came into operation in England? No; I do not think I have.

2988. Have you heard of any objection on the part of the proprietors in England? No, I have not heard of any objection; but I am not in the way of hearing.

2989. Do not opinions travel very quickly now-a-days? No; I do not think so. I must say that I am not aware of any objection on the part of the proprietors. I think that nothing should be done to increase the friction that must always arise between an employer and an employee. I think that would be one way of causing trouble.

2990. Why should it be a reason? I resent the interference of outsiders.

2991. *President.*] Would a check-weighman know much about your business? Yes; he is in the way of obtaining a good deal of information.

D. A. W.  
Robertson,  
Esq.

24 Sept., 1895.

D. A. W.  
Robertson,  
Esq.  
24 Sept., 1895.

2992. *Mr. Gregson.*] Do you know that under the English Act of 1872 the check-weighman was to be an employee of the mine. The clause in the English Act I refer to is number 18? During my experience check-weighmen have always been employed from the men in the mine.
2993. *Mr. Curley.*] Don't you know that a man may be deprived of his occupation if he is an employee of the mine, that when he is a check-weighman you do not look upon him as an employee of the colliery, but as in the employ of the men? Yes.
2994. In the event of another man being placed in the position of check-weighman, is it not optional with the colliery manager whether he shall put him back to work again? I have no knowledge of such a case.
2995. Could you not object to him if you thought fit? Yes, I could; but I do not think it would make any difference to the man, because if he was objected to in one colliery he might not be objected to in others.
2996. Is not that the reason why he should be an independent man? No, I do not think it is; I do not see any difference whether he is selected from the employees of the mine or outside, if he is going to be objected to by the managers of the district, he will be all the same.
2997. Have you ever objected to any check-weighman being re-employed after he has left the office of check-weighman? No; I never have, although I have felt inclined to.
2998. What did you want to get rid of him for? A man may be particularly offensive, and stir up strife without any particular occasion to do so, and in some cases I might feel disposed not to re-employ him.
2999. Might not a manager have a mistaken view of the circumstances as well as the check-weighman;—might not he be in error as well as the check-weighman? Certainly.
3000. Would you like to see the men thrust a man away from the colliery because he was a little foolish? I do not think the men have ever had to complain of me in this particular.
3001. *President.*] Do you know of any recent legislation in England on the subject of check-weighmen? No; I do not.
3002. You are not aware that there was an Act passed last year? No; I was not aware of that.
3003. I have the Check-weighman's Act passed in England here (*see Appendix E*), and it looks as if the matter of the check-weighman had been a good deal canvassed in England;—will you kindly read the Act and tell me what you think of it? That is pretty hot, I must say.
3004. *Mr. Gregson.*] Is there anything in that Act that you object to? I think the whole thing is rather an insult, if you ask me.
3005. *President.*] Do you mean to say that this Act is an insult? Yes; that particular Act. I look upon it as an insult.
3006. *Mr. Curley.*] In conservative England? I do not think that in an occasional case where a manager has used his influence against the employment of some person, that it is right to throw legislation in the face of others.
3007. Do you not think that there may have been some necessity when that Act was passed? I do not think there was, and I know the trade in England very well. I think the Act is an insult.
3008. If you knew that a check-weighman had been objected to out here, in this Colony, that he had originally been employed by the men, and they still wished to keep him there, but he was objected to by the manager, how would you describe an act of that kind? Without knowing the circumstances, I could not answer the question.
3009. Assuming you had stopped your colliery, and the present check-weighman was on, that you gave the men notice of your suspension, and that you then took them back again, but after you resumed work you objected to take the check-weighman, on the part of the men, back, what would you say to such a case as that? I would want to know what was the objection to the check-weighman.
3010. In that case, suppose that you knew no more about the check-weighman than when he was at your colliery, that you had not objected to him, but that you objected to him when work was resumed again, what position would you consider that to take? Under those circumstances, I should say there would be very little sense in it.
3011. Assuming that the men wished to hold a meeting amongst themselves for the election of a check-weighman, and that the manager interfered and discharged a number of the men because they went to such a meeting, how would you look upon that? I would like to know the circumstances first.
3012. Would you think that an Act similar to the Act that has been passed in England was necessary under those circumstances? No; I would not. I do not think it necessary to legislate for the whole body of men because of the default of a few.
3013. Are you not aware that there might have been a species of intimidation that might have existed? I have been a long while in the old country managing mines, and I have no knowledge of it.
3014. Would you do such a thing yourself? No; I do not think so, although I have felt that I would be obliged to a man if he would go somewhere else.
3015. Have you ever discharged an official of the men? No; I do not know that I have.
3016. Do you know the president the men had down in your district some time ago—I think he was working in your colliery? They had a president, I know, named Coulson.
3017. Was he working at your colliery? He was.
3018. Do you know the circumstances that led to his dismissal? I did not dismiss him. He was not dismissed.
3019. Did he not get permission through the overman to leave the colliery for a certain time, and when he came back did you not object to him? No; he went away to the gold-fields, and when he came back I would not re-employ him.
3020. Did he meet you and tell you that the overman had given him permission to go away? I am not aware that he told me anything of the kind. He thought he had a good claim, and I understood that he had left the colliery, and when he came back I was not disposed to re-employ him.
3021. Do you get on well with the Union? I have always managed to get on amicably with the officers of the Miners' Union—as amicably as people can get on having divergent opinions.
3022. Do you have many visits from the Inspector of Collieries to your mine? Yes.
3023. How do you get on with the inspector;—do you find him act in anything like an officious way? I have never had occasion to find fault with any of the inspectors.
3024. Have you had a visit from all of them? I have had a visit from them all, I believe, except Mr. Humble.

D. A. W.  
Robertson,  
Esq.

24 Sept., 1895.

3025. Has Mr. Mackenzie, the Examiner of Coal-fields, paid you any visits? Yes.
3026. Has the Inspector ever drawn your attention to anything he thought required looking after at any time? I do not know that he has. I always reckon to have my place above criticism; and if he has it has been something trifling.
3027. If he was to do so would you pay heed to what he said, or would you regard it as an interference? It would depend on what he recommended, and on the man.
3028. I am speaking of the present inspector? I think he is a practical man, and knows what practical mining is, and he has had the responsibilities of office, and I would be very pleased to carry out any reasonable recommendation he might make.
3029. Do you think that he is an inspector that would attempt to do anything unreasonable? I do not think so.
3030. Have you noticed the proposed Bill with regard to the section dealing with the limitation of the hours of working—section 36 on page 17 of the Bill (*see Appendix A*);—do you approve of that provision in the Bill? No; I do not.
3031. Why do you not approve of it? Because it is entirely unnecessary, in my opinion, and it would add to the cost of producing the coal enormously.
3032. Do you not think that eight hours is long enough for a man to be in a mine (say) from bank to bank? I would be quite satisfied with eight hours for a miner, but we do not get it.
3033. Have you any objection to a provision in an Act of Parliament that the miners should work eight hours? Yes, I have. I object to anything of the sort going into an Act of Parliament.
3034. Do you agree, in a mutual way, that the men should work eight hours now? Yes, by established custom, but as a matter of fact, they do not work eight hours.
3035. Then what is your objection to embodying it in an Act of Parliament? I object to legislation for a grown up person. I do not see there is any necessity for it if the miners can secure a reasonable day's work.
3036. Can you not imagine a position in which a manager may require men to work longer hours; is it not possible that a manager might compel men to do that? He might; but I have yet to learn how to compel my men.
3037. Have you brought all the pressure you could to endeavour to get them to do so, as far as moral suasion is concerned? I have. I have asked them on one or two occasions to work an hour or two extra, but after a while they would not agree.
3038. Do you not think that it would be better to have a uniform system at all the collieries about this eight-hour business? I do not think so, although I am aware at some of the collieries the men do occasionally work longer, at least I am told so. I do not want to see any compulsory eight hours.
3039. Do you not know that when one colliery does that it gets to another colliery and that they adopt that as a reason for doing it also? Yes; very likely.
3040. That unless the other colliery adopts the same system it cannot compete in the market? I think that refers to wages.
3041. Does it not also refer to output? I do not think so.
3042. Assuming that you had another mine alongside of you at Helensburgh doing a similar amount of trade to yourself, and the men at that particular mine were working longer hours than you were, would you not make that an argument why you should follow suit? Perhaps I should.
3043. Do you not think that that is a reason for uniformity all round? I think it ought to be left to mutual agreement.
3044. Have you any objection to eight hours? If I could get eight hours actual work from the miners I would be very glad.
3045. You object to legislation on the matter? Yes; although the miners are supposed to work eight hours, we get say nine and a half hours from our other shiftmen, and if you put in a clause to make it eight hours from bank to bank we would lose at least two hours from our shiftmen, so that you cannot take the miners by themselves.
3046. Is that your only objection? Yes.
3047. Do you not think there would be considerable activity thrown into the business? No; take the ordinary Saturday when we are only working seven hours, we do not get eight hours output, we only get seven hours output. I think it is a very objectionable thing. If you put eight hours into seven hours you may possibly have more accidents, and competition causes high enough pressure at present. I have worked the thing out upon this question of eight hours.
3048. What do you think it would add to the cost? If it is made eight hours from bank to bank as I read the Bill, it will virtually reduce the working time of our miners to six and a quarter hours.
3049. Why;—will you kindly explain how you arrive at this conclusion? It takes us forty minutes for each shift to wind men up and down, and at least an average of twenty minutes to walk to their working places, and twenty minutes back again. There is an hour and twenty minutes. Then, there is half an hour for meals, and that practically leaves six and a quarter hours work. It will reduce the wheelers from nine and a half to eight hours, and winding from eight hours to seven and a quarter hours. The winding is reduced by the time of winding the men up and down.
3050. Assuming that the men ought to be down the pit within the eight hours—that your winding was taken out of the business altogether, and also cut out the time of coming up,—would you be in favour of that being embodied in an Act of Parliament? No, I am against compulsory legislation altogether.
3051. Do you know that there is legislation at the present time for boys? Yes.
3052. Have you any objection to legislation of that kind? I do not object to the present Act for boys at the age of 13, but I think the proposal to raise it to 14 years of age is objectionable. In England it is 12 years of age. The conditions of the mines in our days are very favourable to health. It is not the same now as it was thirty or forty years ago, when the mines were insufficiently ventilated. We have no prematurely old men now in the mining community. The health of miners has improved very greatly during the last thirty years. I can recollect men who were prematurely old miners at thirty years of age.
3053. What made them prematurely old men? Bad ventilation. Speaking generally the mines are well ventilated now, and there is no reason why boys should not enter them at 13 years of age.
3054. Have you been in any other mines? I have been in a few, and I do not see why every mine should not be the same if inspectors carry out their duties.
3055. Is bad ventilation the fault of the inspectors? I think the minimum 100 cubic feet per minute under the present Act is the cause.

3056.

- D. A. W. Robertson, Esq.  
24 Sept., 1895.
3056. How do you interpret the Act in that respect? I think the 100 cubic feet minimum is a dangerous provision, because if there was no such provision as that in the present Act, an inspector going round, if he found a place was not adequately ventilated, and it is possible to have a mine not properly ventilated with 1,000 feet of air, he could see that sufficient air was given. An inspector now goes round and finds that there is 150 cubic feet of air per minute, and he says, "Very well, you have 150 cubic feet of air per minute"—in fact he says, "I can do nothing."
3057. *President.*] Will you look at the three sub-sections, in section 12 of the present Act dealing with this matter. You say that if an inspector finds 100 cubic feet of air that he can do no more. Will you tell me what this means? It means this, that supposing the inspector was to prosecute a manager for insufficient ventilation, the manager can say, "I have got the statutory requirement."
3058. In my opinion he could do nothing of the kind? With all respect to your opinion, my experience is that that is what it works out to.
3059. You mean to say that that is the practice that prevails? I mean to say that if a manager has succeeded in providing 100 cubic feet of air per minute, he can snap his fingers at the inspector.
3060. My reading of the Act is, that a manager has to have a 100 cubic feet of air at all events, and if that quantity of air is not enough he has to give what is necessary? I think in the English Act they have done wisely in not providing for what is an adequate amount of ventilation. I think 100 cubic feet is too little, and that the ventilation ought not to be governed by the number of men in a mine, but that the condition of the mine should govern the ventilation.
3061. If the ventilation is not adequate with 100 cubic feet of air, my reading of the present Act is that an adequate amount of air must be provided? That is not the way the officers read it. My opinion is that if you provide an adequate amount of ventilation you do not want to provide for anything else—bratticing, cut-throughs, or anything else.
3062. Supposing we say an adequate amount of ventilation, not less than 150 cubic feet, should be given? I fancy that if a prosecution was taken against the manager that he would be all right.
3063. Supposing the words were put, that an adequate amount of ventilation, not less than 150 cubic feet of pure air per minute, should be given to dilute and render harmless noxious gases, &c. If it was put in that way, do you not think that a manager would have to put in 150 cubic feet of air, and as much more as was necessary to be adequate;—will you tell me what harm there is in that? I think it is dangerous to define what is adequate.
3064. It does not define what is adequate, but that they are not to have less air in any case? I think it would be a debatable point.
3065. Would there be any harm as far as the condition of the atmosphere was concerned? I consider 100 cubic feet of air per minute ridiculously small, because I want to see the mines well ventilated.
3066. *Mr. Gregson.*] Your idea is that a mine would be better ventilated by having the word "adequate" alone? It is my opinion that the conditions of the mines themselves have to do with ventilation.
3067. *President.*] In a gassy mine, from actual necessity there would always be ventilation sufficient, but in a mine where there is no gas a manager has not to contemplate that danger, and the desire is in that case to see that the men are supplied with that air? That is all right enough; but take our case, where we require 1,500 or 2,000 feet per minute, and I submit this 100 or 150 feet of air per minute would be dangerous. A reckless manager might reduce it; he might not care to burn so much coal for his fans and boilers, and sail close to the limit of safety.
3068. *Mr. Gregson.*] Would it not be dangerous where there is no gas;—would it not be better without a minimum altogether? Yes; it is not because I object to ventilation, but because it is better for the men.
3069. *President.*] You see a mine manager, who is chary about giving his men air, if he does not provide 100 feet for the men they would be suffering? It would depend altogether upon the conditions. There might be some mines that would not require 100 feet of air.
3070. Suppose that a manager did not supply enough air—say he supplied 50 feet;—if it is left to him, and his mine is not a gassy one, there is no incentive on his part to supply a large amount of air to keep down gas, and he only gives what he thinks is enough. In that case would it not be better to say that he must supply, at all events, 150 feet of air and as much more as necessary? He has to in such a case. That unfortunate clause would apply to the conditions of a mine that requires so much more.
3071. If we say an adequate amount of ventilation which is not to be less, it does not say that it is not to be more? It is a general hint not to supply more. When the Act of 1876 was framed it was intended as ventilation for sanitary purposes. There were no gassy mines then.
3072. *Mr. Curley.*] Were you in this Colony in 1876? No; but there were no gassy mines then, and possibly anything beyond sanitary purposes would not be contemplated. I think it is a fact that in 1876 there were no gassy mines.
3073. *Mr. Gregson.*] It is only in this Bill that you get any limitation as to the minimum? Yes.
3074. Do you get any limitation as to the minimum in the English Act? No.
3075. *President.*] I think we are all agreed that everything should be done for the better ventilation of mines. Mr. Gregson and Mr. Robertson think it would be better to leave a minimum out altogether. It is my opinion that under the present Act the men are entitled to an adequate amount of ventilation; that if they require 1,000 cubic feet of air they are entitled to have it. I think that they are to have 100 cubic feet of air at all hazards, and in cases where more is necessary, that more shall be given. That, however, was not the trouble that was pointed out by Mr. Edden. His difficulty was that the air had to sweep past each working place, that if a man said to the inspector that he had not enough air, the inspector would not measure the air in the bord but in the air-way, and if he found there was 100 cubic feet of air he would consider that everything was all right? I do not think the inspectors would agree with Mr. Edden in his contention.
3076. Take it that through the absence of air a man's working place is stifling, that he complains to the inspector, and the inspector goes with his anemometer, and says to that man, "I cannot help you," because he finds that 100 feet of air is sweeping past the working place;—do you agree that the men working in that bord should be supplied with an adequate amount of air? Undoubtedly.
3077. You think that the danger lies in saying anything about 150 feet of air, in case that quantity should not be enough? Certainly, that is so.
3078. *Mr. Curley.*] Do you know that the air has to meet with a considerable amount of friction in travelling throughout the mine? Yes.
3079. What amount of friction does it meet with in proportion to the air travelling at the Metropolitan Colliery? It takes about 250-horse power of an engine to overcome the friction. 3080.

D. A. W.  
Robertson,  
Esq.

24 Sept., 1895.

3080. Do you think that in a mine without either furnace power or other mechanical power, that friction could be overcome with natural means? If you can supply ventilation by natural means it is very well, but it is very unreliable.
3081. Would you get much air into a working place where that is done? When our two shafts were communicated, strange to say, by natural ventilation we obtained over 100,000 ft. of air per minute, but we could not depend on that, it depended altogether on the state of the atmosphere.
3082. Do you think that if the workings were in anything like half a mile or a mile the men would get anything like a fair amount of ventilation under such circumstances? I do not think we could obtain one quarter of that amount now. It was simply in the beginning of the colliery, and the workings were very limited. Of course nobody believes in natural ventilation now-a-days.
3083. Do you think that natural ventilation in a mine should exist? No, I do not think so.
3084. Do you know Inspector Dixon? I do.
3085. Did he inspect the Greta Colliery while you were in charge there? Yes.
3086. Do you consider him an efficient inspector, from what you have seen of him? Yes; I think he is a man of ability, and a capable man.
3087. There is a provision in the proposed Bill with regard to giving additional powers to inspectors. Do you think that inspectors should have a fair amount of power? I have no objection to inspectors having all reasonable powers. Provided inspectors are men of standing in the profession, and not the creatures of a weak Minister, I say, by all means, let them have any reasonable power.
3088. Do you think that an inspector should have power to withdraw the men in case of danger? If the danger was apparent I should say so, by all means.
3089. I suppose you are aware that in these days of coal-mining we get men on a Board of Directors who are not practical men? I think that prevails more in New South Wales than in the Old Country, where directorates are born and bred in the coal-mining profession. In England you will find, I think, a larger amount of practical men on Boards of Directors than in this Colony.
3090. In this Colony is not a manager's business sometimes liable to be interfered with by men over him, lacking a proper knowledge of the system of mining? I think that depends a great deal on the manager. If he is a man of little character, or a weak man, he may be unduly influenced.
3091. Do you think that a Board that has very little mining knowledge, and whose chief object is to provide good dividends, may not press a manager unduly? There might be a danger of their doing so.
3092. Is not that one reason why an inspector should be invested with a fair amount of power? An inspector should have power, provided he is a capable man, and has the confidence of the community, and is not under any influences.
3093. Do you believe that there should be some stipulated minimum in the proposed Bill with regard to the size of pillars? No, I do not. I think that would be a dangerous provision; unless the circumstances and conditions of a mine are alike you cannot have a stipulated or a minimum size for pillars. The question is very much to my mind like the definition of adequate ventilation.
3094. Is not a manager left entirely free under our present Act with regard to the size of pillars? Yes.
3095. If you had known of several collapses, and that numbers of men had lost their lives in consequence of a fall coming over pillars, would that not necessarily involve something being done to avert a calamity of that kind? I think the pillars ought to be sufficient to sustain the roof under the conditions prevailing in that particular mine.
3096. If they have not been sufficient under an absolute system of freedom, where managers have had all their own way, don't you think that something ought to be done? Suppose you have a minimum size for pillars, for what depth is that size of pillar to be sufficient. If you have a 10-yard pillar, and that is sufficient for 100 feet in depth, what are you to do in the case of 1,500 feet in depth; and if you have a pillar of 10 yards each way, and the roof is good, and it is sufficient under those conditions, what are you to do when the roof is bad? The conditions vary from day to day in different mines very much—perhaps I should say from place to place. To-day we may have a good roof, to-morrow a bad roof; one mine may have a hard coal, and another mine a soft coal. I do not think you can lay down any rules; it must be left to the discretion of the manager.
3097. Will you look at Rule 46 on page 32 of the proposed Bill, "Size of pillars in mines not under ocean, &c." (see Appendix A);—Do you approve of that section? No, I do not.
3098. What do you object to in that section? I do not see the reason for the limitation to eight yards in the former part of the Rule.
3099. If you read further on in the Rule, you will see something in regard to Welsh bords;—what is your objection to that section? I object to any limitation at all. I think a bord should be any width you like. Why should it be limited to eight yards when we are working with ten-yard bords?
3100. Would you not call ten yards a Welsh bord? A Welsh bord is a bord with a double road, and packed walls in the centre. We do not attempt to build the wall, but merely put the debris in the middle.
3101. You do not believe in a minimum size for pillars? No, I do not.
3102. Now with regard to the size of pillars under tidal waters. Will you kindly look at Rule 42 on page 31 of the Bill—"Width of pillars and position under ocean" (see Appendix A);—do you believe in a provision of that character in connection with mining under tidal waters? I do not think it is possible to have a provision of that sort. It would be absurd to apply such a provision as that, to the proposed Sydney Harbour Colliery, because any system of working there could not be affected by the ocean.
3103. Would you not make any provision where the strata is of a limited thickness? I think that would be all covered by giving the power to the inspectors. If an inspector thought it was not safe, he could object, and if there was any dispute he could go to arbitration.
3104. Would not that make the inspector create almost an Act of Parliament himself? You cannot lay down rules to apply to all conditions. I do not see how you are to get out of the difficulty.
3105. No matter if there are only the alluvial deposits, or rock, you would leave the matter absolutely free? This clause does not say so. If the clause said so, I might answer the question in a different way.
3106. Do you know any of the collieries in the north that are working under tidal waters, such collieries as Stockton, Hetton, and Wickham and Bullock Island? Yes.
3107. Would you not say that there should be some stipulated minimum in regard to those collieries? I think it would be extremely difficult to lay down any rules even with the conditions of those collieries.

The

D. A. W.  
Robertson,  
Esq.  
24 Sept., 1895.

The seam differs in thickness, and in its proximity to the surface, and I cannot see how you can formulate rules to guide the management under all those conditions.

3108. Have you heard tell of falls coming to the surface in connection with any of those collieries. Would you think that that was a satisfactory condition of affairs? No. I should think that was the time for an inspector to step in and do his duty.

3109. Would you not consider a condition of affairs like that, if they were known to be beyond dispute, some reason why there should be something embodied in the Bill? No, I cannot agree with that. That would be a reason for great vigilance and great care; but you cannot go into the details of mine management in an Act of Parliament.

3110. Why? You can only lay down general principles. Immediately you interfere with details, you get involved at once, and the conditions are changing with every colliery.

3111. Where you know that the deposits overhead were nearly all alluvial deposits, and a limited thickness of rock, would you not consider that there should be bores kept in advance of the winning places? It would depend on the circumstances, and every care should be exercised to render the workings reasonably secure.

3112. Should there be any doubt about substantial pillars being left under these conditions? Substantial pillars ought to be left.

3113. Do you think that pillar working should be permitted under those circumstances? I must know the thickness of the seam to answer that question.

3114. Say the seam ranged from 8 to 10 feet, and higher, or thicker? How near would it be to the alluvial deposit?

3115. Say the alluvial deposit ran pretty well down? I should say that in such a case there would be considerable danger if the pillars were taken out.

3116. Do you think that a miner should have any experience under ground before he works at the face of the coal? No, I do not think so. I do not think that it is at all necessary.

3117. Would you take a man and send him down to the coal-face without any experience? Yes, with an experienced man, without a doubt. A man must gain his experience some time. If he goes down as a boy, he still has to get his experience.

3118. Will you look at Rule 41, on page 31 of the Bill, "Persons not to be employed in coal-getting without experience" (*see Appendix A*);—do you approve of that section? I think it would be a great hardship in New South Wales, because if we had to mine with experienced miners, we could not get them. In the old country you can always get experienced miners, but here we have to take gold miners, and men who have been working in tunnels. Some of the best men I have have been working in railway tunnels, and so forth.

3119. Do you know that the last Report of the Department of Mines points out a large decrease in the number of miners. The report says that in the Northern district, in the year under notice, there has been a decrease of 746 persons employed in and about the collieries, and an increase of 401,662 tons of coal raised;—if there has been a large decrease like that for one year, would not that point to considerable depression in the coal trade, and that men had been driven to other occupations? It might, and it might be the attractions at the new gold-fields, because we know that miners do go to these fields.

3120. Have you many applications for work in your district? Just now, we have not many applications, and if I had to wait until I could get skilled miners, we would not have half enough.

3121. If you advertised for skilled miners, would you not get them? I would get a number of applications, but there is a difficulty in getting skilled men—good men.

3122. Do you find from experience, that the skilled men are the best men? I find the most careful men are those who have been engaged in gold-mines, or in railway tunnels, and in our mine they can earn as good wages as experienced miners after a month or two's practice.

3123. This section of the Bill says, that an inexperienced man shall not be allowed to work alone. Does not that get over any difficulty you may have with regard to this section? I think there would be a difficulty in carrying that out. Suppose a man's mate was not in the mine, and I am not supposed to know whether his mate is there or not, I would be liable to a prosecution, if I allowed him to work without his mate.

3124. Do all your men go in together at the one time? Yes.

3125. Do they work two in one place? Mostly two, occasionally three.

3126. *President.*] Do you think that you would be liable to a prosecution in such a case as you have mentioned? Say the unskilled man goes down and is working for two or three hours alone. If the deputy finds him working alone, he would say where is your mate, and if his mate was not there, it would be the deputy's duty to send that man home.

3127. *Mr. Curley.*] What kind of drums have you in connection with your winding engine? They are wrought-iron arms, and heavy ironbark flagging.

3128. Are they conical drums? I do not like conical drums at all. When you get off the flat drum, you introduce another element. The conical drum is not as safe as the flat drum in my experience.

3129. Do you object to inspectors going round the colliery on behalf of the miners to make check-inspections? No, but I think it might be dispensed with, where there is a desire on the part of the management to do everything that money can do for the sake of the men. I think it is in bad taste, where the men know that everything that can be done is done for their safety.

3130. Does it cost the management anything? No.

3131. Do you think it can do much harm? I never fear a visit from the miners' inspector, but I think it might be dispensed with, where they admit that everything that can be done for their safety is done.

3132. Has this system of check-inspection been carried out at your colliery? Yes, but it has lapsed.

3133. Do you think it is a necessary matter, where the ventilation is carried out in a sort of indifferent way? I do not know that it does any good.

3134. Does it not draw attention to certain defects occasionally? It might; but I do not know that on the whole it does any good. I admit, however, that the miners have the right to make this inspection.

3135. How often does the Government inspector visit your colliery? It is the usual two month's inspection. Of course, if there is any accident he comes to make inquiries.

3136. Does the inspector give you any intimation of when he is coming? No, never.

3137. I think you said that you were the manager of the Greta Colliery for some time? Yes.

3138.

3138. Were you manager at Greta at the time the fire took place? No; that was just before my time.
3139. Had you any trouble with the ventilation there? Yes, I had. The ventilation depended on a very shallow furnace shaft, and the downcast shaft was a pretty deep one, and in summer weather the ventilation varied a good deal. I first put on an additional furnace, and then a fan. The fan was just about ready to start when I left the colliery.
3140. What was the method of working there? Bord and pillar, the stereotyped method in the north.
3141. Did you carry out that method while you were there? Yes.
3142. Did you continue to do so? You cannot alter the system of a mine in a month, or even within a year.
3143. While you had that trouble with the ventilation would the men be very satisfied with the situation;—would they not have to put up with some defects? I am prepared to say that the men found no fault with the ventilation.
3144. Do you think that was the interpretation of the Act? I am not sure of it. The men got 100 cubic feet of air per minute, and that satisfied them. The anxiety was more on my side; I am sure of that.
3145. Had you any extensive falls in Greta when you were there? No.
3146. Did you inspect the shafts by your own officers at Greta? Yes; they were regularly inspected by the officials.
3147. Do you do the same at the Metropolitan Colliery? Yes, frequently. Four men go down both shafts every week slowly and examine every inch of them.
3148. Did you see anything that attracted your attention at Greta? No, but I am free to say that the strata in New South Wales is more dangerous than I have experienced it at Home, and I would be inclined to say, that all the shafts in this Colony should be bricked from top to bottom. I know that opinion is not shared by other managers, who are quite as well able to judge as I am. The shafts here are affected by the weather, you may sound them, and in 20 minutes they will burst off with the weather. At Home, when you sound a stone, and it rings, you know it will be safe for all time, but here it seems to be affected by the weather.
3149. *Mr. Gregson.*] In your examination before the Select Committee of the Legislative Council, in December, 1890, were you not referring to the Bill that had been introduced, in 1889? Yes.
3150. Have you read the present Bill sufficiently to know whether it is similar in its provisions to the Bill of 1889? There are so many Bills, that I think I have got mixed up with them.
3151. The Bill of 1889 was introduced by Mr. Sydney Smith, the present Minister for Mines. Do you think that the present Bill is pretty much on the same lines as that Bill? Yes, I think it is.
3152. Do you recollect the evidence that you gave then? I do.
3153. Do you think that evidence would apply pretty well to the present Bill? Well, I think it would.
3154. You were speaking mostly as to principles then. Are your ideas on the matter of ventilation pretty much now, what they were in 1890? Yes.
3155. Do you think the provision for an adequate quantity of ventilation, would enable us to dispense with all the rigmaroles of cut-throughs, splits, and other provisions? Yes, I think so.
3156. Are you perfectly well satisfied, in your own mind, that it would be sufficiently good in the miner's interest, if the interpretation of an adequate quantity of ventilation was left to the inspector? Yes, I am quite satisfied in my own mind.
3157. That if the inspector came and said, you have not sufficient air, you must put more, that that would be sufficient for the miner, not only for his safety, but for his comfort? I think so.
3158. In working under inspectors in the old country, was it not your experience that the manager tried to do as much as possible to meet the requirements of the inspector? Yes.
3159. Is that the general rule with managers? I think so, unless it was a vital question they would never for a moment dispute the matter.
3160. Would you not think it a point to be made, that you should establish with the inspector, a character that he might rely upon you for doing a fair thing? Yes, I have always tried to do so, and I can speak for nine-tenths of the collieries at home.
3161. You would like to see the inspector in a position to say, "Well, I know Mr. Robertson is doing the best he can there"? Yes, if you do not have an inspector in touch with you, you might find it hard to carry out your duties. It is better to have the sympathies of the inspector, if you are endeavouring to carry out the spirit of the Act.
3162. In your evidence before that Select Committee, in 1890, you say that the inspector should be empowered to do this, that, and the other thing, without reference to headquarters? I think so.
3163. Do you think there is anything in the circumstances of this Colony that would render you less willing to act under the direction of inspectors than in the old country? That is rather a delicate question to answer. I have always got on amicably with the inspectors here, but I do not think they are as independent here as the inspectors at home. Here they are almost afraid to move of their own accord. They are not as independent as the inspectors are at home.
3164. Do you think that arises from the system under which they work? I think so. I do not impugn their ability.
3165. You think that they look to headquarters, and will not take action until they hear from headquarters, that they will not take an independent position? Yes, there is no mistaking that the Minister interferes with the inspectors here more than the Secretary of State does at home. I think political influence is felt more here than at home. There is no such thing as politics at home in the management of the Coal Mines Regulation Bill.
3166. Notwithstanding that, you think it would be sufficiently good in the miners' interest to work under the Council's alterations in the present Bill? I think so.
3167. Trusting to the manager to do all that he thinks ought to be done? Yes.
3168. And to the inspector to make him do it right, if he has not already done it? Yes, given good inspectors, and ample power, you have only got to lay down general principles.
3169. With regard to the provisions in the Bill for pillars. Have you read the report of the Royal Commission on Collieries adjacent to Ferndale. Do you recollect that that Commission proposed a regular size for pillars, and a maximum width for bords, under tidal waters (*see Appendix A*)? I think I could concur with that, for the reasons that Commission has given in the former part of the clause in their report dealing with this matter, but I think with regard to the latter part of the clause, I would leave the management free, with the supervision of the inspectors.

D. A. W.  
Robertson,  
Esq.  
24 Sept., 1895.

- D. A. W. Robertson, Esq.,  
24 Sept., 1895.
3170. Do you take it, that they mean that the alteration should be in the direction of safety? Yes.
3171. They propose a minimum thickness of eight yards for pillars, and a maximum width of six yards for bords, and leave the management free to exercise their discretion in altering these sizes so as to increase the general safety? Yes.
3172. Are you quite satisfied to accept, on the authority of that Commission, a provision of that kind? I think so, but I object to defining the adequate sizes of pillars at all.
3173. Even under tidal waters? Yes I think so, I think that might be dangerous. It might be found to be desirable to have the pillars very much larger. I think that an 8-yard pillar is small, as a matter of economy. You can never recover with economy small pillars.
3174. On the whole, perhaps, you are of opinion that it would be better not to specify the width of pillars or bords under tidal waters? I think the system should be left, so as to be adopted to suit the conditions, whatever they are.
3175. Do you agree with your evidence given in 1890 with regard to the size of pillars in collieries that are worked under the land;—you said then that there should be no restrictions whatever? Yes, I do.
3176. That would apply either to ordinary pillars or pillars on the main road? Yes; I would leave it all to the manager on the grounds of safety entirely. There is one point in the Bill, with regard to the division of a mine into splits, that I take decided objection to. Can anyone explain to me what is gained by reducing the number of men to sixty?
3177. *Mr. Curley.*] Is this not a reason why there should be a limitation to the number of the men, that when you commence with a volume of ventilation for each split, if you have a very large number of men in that split, the air as it is going round the men picks up inferior elements in its march, and will not the last of the men in the split get what it carries round, and have to breathe that to a great extent? You can usually meet that by sufficient ventilation. It does not matter whether you have 70 or 700 men in a split, if you have sufficient ventilation. It is all met by the provision for adequate ventilation. We know the advantage of splitting the air, but sometimes it is very inconvenient.
3178. Have you seen what Mr. Hopton says on this subject? I do not know that he is a stronger advocate than I am. To ventilate a mine sufficiently, you must have splits; you could not ventilate a mine with one current of air. I submit if you have 700 men or seventy men, that if you provide sufficient ventilation, the air would be just as pure from 700 men as from seventy men. It is all met by adequate ventilation.
3179. *Mr. Gregson.*] You think it is all included in the term adequate ventilation? Yes.
3180. Have you read the Bill sufficiently to be able to say that you are with the Legislative Council in the amendments they have made in the Bill? I think so.
3181. Do you think they have met the case? I think so.
3182. Do you think they have eliminated most of the blemishes in the Bill? Yes.
3183. And, on the whole, do you agree with them? Yes; no one can be more anxious than I am for a workable measure, but it must be a workable measure.
3184. *Mr. Curley.*] You said something a little while ago, about the Home Secretary not interfering with the inspectors. Do you know that he has sometimes given them specific instructions? No doubt he has.
3185. *President.*] Did you not mean that out here, people are very much nearer to each other? Out here there is more of the political business.
3186. *Mr. Curley.*] Will you look at this book of Mr. Nelson Boyd's, "Coal Pits and Pit Men," and see what he says in connection with the Home Secretary and anonymous communications:—

"The Home Secretary, in reviewing the debate, repeated the statement that accidents had greatly diminished since the passing of the Act. He looked on the certificate of colliery managers as quite as important as those granted to masters of vessels, and had always given instructions to prosecute managers when there was sufficient cause for doing so; but for safety it was necessary to depend mainly on the responsibility of employers and employed. He repudiated the view that inspectors were not to visit a mine unless an accident had occurred, and he had issued 'consolidated instructions' to the inspectors on that subject. These instructions enjoined on the inspectors to examine a mine on invitation or complaint; to pay attention to anonymous complaints without divulging the source of their information; not to send notice of intended visits to mines unless advisable to do so; and to examine mines as frequently as possible without announcing their intention, as the liability to an official inspection without previous warning might be a most effective prevention of abuse. Lastly, that a record should be kept of the inspections and the results obtained."

Do you see that inspectors have to pay attention to anonymous communications? Yes; I agree with that.

3187. *President.*] What is the salary of an inspector in England? I think £600, and some of them run up to £800.
3188. What is the salary of an inspector here? I think about £400, or £450; perhaps not as much as that. The salary of an inspector at Home is equal to double the salary of an inspector here.
3189. Why do you say that it is equal to double the salary of an inspector here? We always reckon that a salary at Home is equal to double the salary here. I do not think that the money that is paid to an inspector here is sufficient.
3190. *Mr. Curley.*] You said just now that you agreed with the amendments made by the Legislative Council in the Bill we have under consideration? Yes.
3191. Are you aware that some of the evidence you have given is quite in opposition to the views of the Legislative Council? Yes; you are quite right in that.
3192. *President.*] The grave thing, as I understand it, is sub-section 5 of section 21, in the Bill, on page 8 (*see Appendix A*). Do you think, in your opinion, that an inspector should have power to withdraw all the men in case of danger? I think it is only a reasonable thing.
3193. Then you agree with the Legislative Assembly in that matter? I do certainly.
3194. Do you think it is right to put it in the power of one man to withdraw all the men in that way? (*Mr. Gregson*): I think you thought differently in 1890. This is part of your evidence given at that time:—

87. *Mr. Hoskins.*] In reference to sub-clause 7 of clause 21 in the bill, which provides that the miners may be withdrawn from a mine if the inspector finds cause of danger;—is there in the English Act any such power given to an inspector to act on his own motion? I do not think so.

88. Did you ever hear of such a power being given to one man? I have not heard of it.

89. I suppose your long experience in connection with mining has led you to arrive at the conclusion that differences of opinion exist between persons of large experience in mining as to what may be considered dangerous in working a mine? Undoubtedly.

90. There is no general concurrence of opinion on this subject? Oh, no.

91. Therefore you think the power given under sub-clause 7, which enables an inspector to close a mine, if in his opinion it is dangerous to work a portion of the mine, is a power that ought not to be vested in one man? Undoubtedly not.

92. Have you ever heard of any such power being vested in one man to interfere with the private enterprise of an individual? I have never heard of such a power.

93. *Mr. Macintosh.*] With regard to a mine being dangerous—is it not easy of proof when inflammable gas is present? That may be a matter of opinion. It depends altogether upon the quantity of gas that is present.

94. But as to its being dangerous? It opens up a very wide subject of discussion.

95. You object to the appointment of a chief inspector, because you think, as he would have to be consulted on any matter arising, it would lead to circumlocution? Yes and delay. He cannot, of course, be resident in the district.

96. You would prefer to have a district inspector? Yes, responsible to the Minister.

97. And you think that to entrust these powers to a man of the high attainments you have mentioned would be dangerous? Yes, I do.

98. And that the lives of the miners should be risked simply because there might be a difference of opinion between the inspector and the mine manager;—that the danger should continue until arbitration could be brought about? No. It does not follow that because an inspector deems a mine dangerous the lives of the miners are in danger until the dispute is settled. I do not think what I propose would tend to endanger the lives of the men in any way.

99. Not in the case of inflammable gas? The mere fact of an inspector stating that a mine was dangerous would not endanger the lives of the workmen. It might put the proprietors to considerable expense and annoyance.

100. Are there any instruments that test the quantity of gas in a mine? Oh, yes; the ordinary Davey or safety lamp will test that.

101. *Chairman.*] Danger from inflammable gas in a mine may arise very suddenly, may it not? It may.

102. And in case of such sudden danger arising you say you disapprove of the inspector having power to order the men out of the mine;—in whom would you vest such power? Well, I think the managers are quite competent to deal with that question.

103. But suppose the inspector and manager differ in opinion;—it is a matter of immediate moment;—to whom would you give the power? It would not be a matter of immediate moment, because the inspector might be hundreds of miles away at the time the danger arose. He cannot be there always, of course.

104. But suppose a dispute arose between a manager and an inspector as to immediate danger, to whom would you give the power to decide? I should leave the responsibility of continuing operations on the manager. He is responsible. If he is wrong he may lose his certificate.

105. Would he have any other liability under such responsibility? He might lose his certificate and lose his occupation, and that would be quite enough.

106. Supposing by the non-withdrawal of the men an accident happened and lives were lost, what would be his responsibility then? Well, as I said, there would be an inquiry into his fitness and competency under this Bill, and his certificate might be withdrawn, and his means of livelihood taken away. I am not quite sure that he is not liable to imprisonment, but of that I cannot speak positively.

107. Do you not think that under such circumstances as these a chief inspector as a referee would be of use? Undoubtedly he would be of use. If he was a man who had the respect of the community we should in all probability take his advice. It is frequently done.

108. *Mr. W. H. Suttor.*] Have you read section 41 of the English Act dealing with the powers of inspectors? Yes.

109. Does not that seem to give the English inspectors unlimited power with regard to dealing with mines? No; I do not think it gives the inspector the power that is given here.

110. *Mr. Wood.*] You have urged a great many objections against General Rule 7, giving the Inspector power to withdraw miners if he finds cause of danger. I think you told the Committee you were not aware of any such provision ever having been in existence? Yes.

111. Are you not aware that this provision is in the existing Act, which has been in operation in the Colony for the last fourteen years? No; I cannot say I am.

112. Are you aware of any instance in which inconvenience has been suffered through the inspectors having that power under the existing Act? No.

113. Seeing that the present Act has been in operation for fourteen years, and that no inconvenience has arisen from the inspectors having this power, why should you suppose there would be any danger in their having the same power in the future? I can only speak for three years or so out of the fourteen. There might have been inconvenience for all I know to the contrary; but whether or not I think it unwise to give inspectors such power.

114. But the fact that you did not know that such a power was in existence would show that the managers have not been harassed very seriously by the exercise of that power? I have not, certainly.

You say in reply to *Mr. Macintosh* (question 91), that you do not think the power to close a mine should be vested in one man? Yes; but you could not close a mine without referring the matter to arbitration, and at that time there was an idea of some fussy interference on the part of inspectors.

3195. *Mr. Gregson.*] Consider the thing now, don't you think it would be better to leave such power to the manager? I cannot conceive of any manager of any standing, or knowledge, or experience, who would allow his men to work under dangerous conditions; but still, I think, there ought to be a power in the event of operations being carried on, and the mine obviously unsafe, to compel him to withdraw the men.

3196. *Mr. Ourley.*] Is that your opinion, *Mr. Robertson*? I think so. I do not mean that an inspector should enter into a dispute with a deputy as to trifling details, but rather that my remarks should apply to cases where there is great danger.

3197. Have you ever known an inspector at Home stop a portion of a colliery because there was gas there and it was not safe to work. I think *Mr. Hopton* gives an instance of that? *Mr. Hopton*, in his book, is talking of things that occurred twenty or thirty years ago.

3198. *President.*] Do you say that this sub-section 5 of the Bill, to require the manager to withdraw the men from any mine, should stand in the Bill? I should qualify that by saying that they shall not enter the mine until the inspector says it is safe, until the matter is referred to arbitration. In any dispute between a manager and inspector there is a provision in the Bill for referring that dispute to arbitration.

3199. *Mr. Gregson.*] We are talking of an inspector that comes across something that he thinks would be immediately dangerous, and under this provision he has power to withdraw the men there and then;—that, you think, is a proper thing to do? We could not have the inspectors entering into a dispute with the deputies. We are supposing that it is something grave affecting the whole of the mine, or a portion of it. I think these powers should only apply to specially dangerous conditions.

3200. *President.*] I can hardly conceive of men being withdrawn where there is not danger;—you can say that a mine is dangerous because there might be some movement, but there might be a difference of opinion;—the inspector might say, "You ought to withdraw the men—I think this is dangerous," and the manager may differ from him, and then go to arbitration about it;—that movement might suddenly result in some accident? If there was a movement in portion of the workings, of course an accident might occur at any moment; but, on the other hand, it might be delayed for weeks. If the inspector was a practical man I do not think there could be any dispute in such a case. I cannot say I recollect any great conflict of opinion between an inspector and a manager.

3201. If the manager was a competent man, don't you think he would withdraw the men? Yes.

3202. If the manager was told by the inspector that he thought there was cause for danger, would not the manager withdraw the men? I think so.

D. A. W.  
Robertson,  
Esq.

24 Sept., 1895.

D. A. W.  
Robertson,  
Esq.  
24 Sept., 1895.

3203. Don't you think he would withdraw the men without the inspector saying anything at all;—would not he see the danger and withdraw the men? I am not prepared to say that.

3204. It has been put that a manager might have a certain order to complete, and that it might be a pressing matter with him, and might probably override all other considerations;—do you think that a manager having pressing business and with an anxiety to fulfil that business, that it would weigh with him in such a manner as to make him ignore the men's lives? I cannot conceive of any man doing such a thing.

3205. What do you say then to this sub-section;—do you think that it should remain in the Bill or that it should not? Personally, I would not have any objection to that sub-section.

3206. Would you be willing to put that power in the hands of the inspector? Yes; in the hands of a capable man who is not interested in any way.

3207. *Mr. Curley.*] Put yourself in the position of an inspector, and assume that you went to inspect a colliery, and saw an apparent danger impending which threatened the risking of men's lives, would you not, under such circumstances as that, say that the men should be withdrawn? Certainly I would.

3208. Would you like to have such powers invested in you to act? I think it would be desirable under those circumstances.

3209. If you were the manager of that colliery would you not take out the men on your own part? Certainly.

3210. Suppose the inspector said, "Well, I think the men ought to be withdrawn"—and you can only conceive of the danger in a case in which there may be two opinions; supposing I said, as an inspector, "I think the men should come out," and you, as a manager, thought the place would hold for a few days, would you be guided by your own opinion or by mine? I would not take the responsibility after the inspector said he thought the thing was dangerous.

3211. *Mr. Gregson.*] Would not any manager's situation be imperilled in such a case? He would be in a very peculiar position.

3212. Don't you think he would be likely to act on the inspector's opinion, rather than on his own opinion? Managers may act with the best of motives, and yet be careless.

3213. *President.*] Do you think that this sub-section that we are considering should remain in the Bill? I do. I do not think it would be exercised without due cause. I consider that clause of very much less importance than some of the other clauses.

3214. Is there anything in sub-section 4 of the same section (*see Appendix A*); I want to know what the value of this book is;—do you think that sub-section should remain in the Bill? I think so. In sub-section 1, I think that an examination once a month is absurd. The statistics give a very favourable report of the care that has been taken in connection with coal-mining in this Colony.

3215. Will you now look at sub-section 2 (*see Appendix A*); do you want those words, "except when absolutely necessary"? I don't think there is anything wrong with that.

3216. *Mr. Gregson.*] Don't you think it would be a great deal better to follow the English Act? I think it would be better to take the English Act altogether.

3217. *President.*] There was an English Coal-mining Act about 1862, and one in 1872, and another in 1887, and we say we are going to have a Coal-mining Act of 1894, based on these Acts. The third sub-section of the proposed Bill, is the same as the English sub-section, and we have taken that, but the next sub-section is apparently the bone of contention, do you think that that sub-section 5 should remain in the Bill? Yes, I do.

3218. Do you also think that sub-section 4, about entering a report in a book, should remain in the Bill? Personally, I should prefer it. We would have a record of an inspector's examination, and he could not say after that the mine was dangerous and he knew it.

3219. *Mr. Gregson.*] If he knew it was dangerous, and he did not tell the manager or the deputy, or whoever he saw, would he not be very much to blame? Yes, I think he would. An accident might occur in a month, or sometime after his visit, and I think it would be well to have a record.

3220. *President.*] The Upper House have suggested, that with the powers given to an inspector under sub-section 5 of the Bill, he might ruin a colliery. I will read you their objection to the sub-section:—

Because the new clause, which is an exact copy of section 41 of the English Act of 1887, provides all that is necessary to enable an inspector to do his duty if he understands his work, whilst, on the contrary, if clause 21 was retained, it would hand over in an arbitrary way the whole of the mining operations of this Colony to the whim and caprice of, it might be, an incompetent inspector, and would give him too absolute a power, which is undesirable. The power he possesses now under the present Coal-fields Regulation Act is quite sufficient, if not too extensive as it is, whilst the substitution of section 21 in lieu of the law as it now stands would endow the inspector with such substantial power that, at his will, he could ruin any mining company if he thought fit. All he would require to do, without rhyme or reason, would be to announce to the colliery manager that it was his wish the men should be withdrawn from the mine, in which case 400 or 500 men would be thrown out of employment, and a repetition of what occurred at the Stockton Mine possibly be the result. In that case the mining authorities declared the pit unsafe, ordered the men to be withdrawn, and the men themselves, after some enforced idleness, petitioned the manager to be allowed to go back to work as the mine was safe, notwithstanding the opinion expressed to the contrary by the mining authorities. The men went back to work, and have been at work for the last two years, in the face of the order that they should be withdrawn, and the fact that a prosecution was instituted against the manager for not complying with the mining authorities' orders, the manager being fined for working, what was then alleged, a property which was unsafe, but which, as has already been stated, has been at work for two years since, and is at the present moment in operation?

I do not think it would ruin a mine. It might cause some inconvenience until the matter was referred to arbitration.

3221. Have you sufficient confidence in the men, that you think will be appointed, to invest them with that power? Yes, I think so. Referring to that matter of the Stockton Mine, although operations have gone on, it does not prove that the action taken by the inspectors was wrong. Subsequent operations may have proved that work can be conducted safely, but it does not say that the inspectors were wrong. They may have apprehended danger, and I think they acted on the safe side.

3222. Is it still your opinion that this sub-section 5 of section 21 should remain in the Bill? Yes.

3223. *Mr. Gregson.*] Can you think of any other matter in which your opinion is different to-day to what it was some years ago; would the evidence you gave in 1890 apply to the present Bill? I think it would.

3224. *Mr. Curley.*] Will you look at rule [40] 38 on page 30 of the Bill, "Periodical inspection on behalf of workmen" (*see Appendix A*);—what do you think of that rule? I do not think that section ought to be in the Bill.

3225. Do you object to the check-inspectors forwarding a report themselves? No; but I do not see why

a manager should forward a report criticising his own management. Then the question arises, what is danger; he might retain the report and not send it.

3226. *Mr. Gregson.*] Have you read the report of the Royal Commission on Labour in England? I have read the proceedings from time to time.

3227. Are you aware that that Commission inquired into the operation of the Act of 1887, and that they reported that the working of this Act was very satisfactory? Yes. I venture to say that if these clauses had been embodied in the English Act, it would not have been so satisfactory; that is, if you are going to instruct a man how he is to work a mine he is simply a convenient peg to hang the responsibility upon. There is nothing left to his experience, judgement, or skill.

D. A. W.  
Robertson,  
Esq.  
24 Sept., 1895.

[Witness withdrew.]

John McGeachie sworn and examined:—

3228. *Mr. Curley.*] What are you, Mr. McGeachie? I am the manager of the Coal Cliff Colliery.

3229. How long have you occupied that position? About fourteen months.

3230. Have you managed any other colliery previous to your managing the Coal Cliff Colliery? No; not direct management.

3231. What positions have you held in connection with collieries? All positions in a mine, from a trapper to a manager.

3232. Have you acted as deputy and as overman? I have acted as deputy, but not for a long period as overman.

3233. How long have you been out in this country? About eight years.

3234. Have you been mining in Great Britain? Yes; in Scotland.

3235. What mines have you been connected with in Scotland? I have been in Carron and Co.'s mines, situated in Lanarkshire, in Scotland.

3236. Were you mining there, or did you occupy the position of deputy? I have mined there as well.

3237. What was the system of mining there? The long wall system, and pillar and stall system.

3238. What was the height of the seams? They varied from 18 inches to 5 feet in different collieries.

3239. What was the depth of the pits there? We calculate the depth in fathoms. They were from 50 fathoms to 172 fathoms deep.

3240. What was the width of the bords you drove? Generally, under the long wall system, from 6 to 8 yard bords.

3241. What pillars did you leave? In some mines from 12 yards, other mines 15 yards, and some 10 yards.

3242. What was the length of the bords before you put in a cut-through? It all depended on the system we were working.

3243. Can you recollect what distances they were? They varied so much that I cannot remember exactly.

3244. Do you recollect the distance within a yard or two? I have seen them wrought from 50 yards to 100 yards.

3245. Were there cut-throughs between those distances? Yes.

3246. How far would you go before you put a cut-through through? We generally put them through every 20 or 30 yards.

3247. Do you call them walls? Yes; or cut-throughs.

3248. And you put them every 20 or 30 yards? Yes.

3249. Was there much bratticing done there? If there was any gas we always used brattice.

3250. How many men have you working under you at the Coal Cliff Colliery? About forty-five.

3251. Is that colliery what is known as the old Coal Cliff Colliery? Yes.

3252. Have you been long in the Southern district? For about six years.

3253. Were you in the district some years ago when there was some talk about a creep at Coal Cliff? I was at the Metropolitan Colliery at that time.

3254. *Mr. Gregson.*] What were you doing at the Metropolitan Colliery? I was roadsman; my position was to superintend the wheeling; to get out the coal.

3255. *Mr. Curley.*] Can you say anything about the creep at Coal Cliff. Was it in the interior of the mine? No.

3256. What system of mining did they adopt there? Bord and pillar, or pillar and stall.

3257. Have you a shaft there? Yes; an air-shaft.

3258. Do you know the depth of the air-shaft? About 100 feet.

3259. Do you work far under the mountain there? We are about three quarters of a mile in.

3260. Have you any idea what the depth would be there? The mountain rises and falls about Coal Cliff.

3261. Can you say what the highest pinnacle is? About 500 feet.

3262. What is the width of your bords? Eight yards.

3263. What is the size of your pillars? Twelve yards.

3264. Were they 12 yards when you took the management of the colliery? Yes; 11½ yards or 12 yards.

3265. Is your colliery a very dry colliery? No; it is of a dampish nature.

3266. Are the men's places very wet? No.

3267. Are they a little damp at the face? Going to the dip they are.

3268. Is there any dripping from the roof? None.

3269. Is it a clear seam? Yes.

3270. Have you any bands in the seam? There is a band, a parting between the bottom and the top coal.

3271. What is the height of your seam? Five feet.

3272. Have you any gas to contend with? No.

3273. Have you any fire damp? No.

3274. Have you had any complaints against the ventilation at any time? I have never heard any.

3275. *President.*] How is your mine ventilated? By furnace.

3276. *Mr. Curley.*] Do you pay the men by weight? Yes.

3277. Has your weighman any other duties to perform besides being weighman? Yes; he assists at the screens.

J. McGeachie,  
Esq.  
24 Sept., 1895.

- J. McGeachie, Esq. 3278. Does he do any clerical work besides his own? No.
3279. How many skips do you weigh in a day? I leave that to the weighman and the check-weighman, I give no orders about the weighing. The weighman and check-weighman arrange that between them.
- 24 Sept., 1895. 3280. Can you tell us the average number of skips weighed in a day? I cannot give you the average number of skips.
3281. *Mr. Gregson.*] What is your average weight? 12 cwt. 2 qrs.
3282. Have you standard weight at your colliery? Yes.
3283. What is your standard? 13 cwt. 2 qrs. That is the average for the past three months.
3284. *Mr. Curley.*] Does your bridge record any more than 13 cwt. 2 qrs.? Yes.
3285. How much does your bridge record? 10 tons.
3286. Do you weigh your skips in the waggon? Yes.
3287. Cannot you give the Commission some idea of the number of skips that are weighed in a day? I have no idea of how many skips are weighed in a day.
3288. Are you not the manager of the colliery, and do you not know what is transpiring at the colliery with regard to the weighing as much as any man about the place? Yes.
3289. Do you never look into the weigh-cabin and ask the weighman how many skips he has weighed? No.
3290. If you weigh a waggon do you not weigh enough skips to fill that waggon? You can only weigh one skip in each waggon. When they are weighing the check-weighman and the Company's weighman arrange the skips that are going to be weighed before the sets come to the surface. Suppose there is one skip in the waggon, when the set arrives they will require to only weigh one skip in that waggon. That is taken for one number, and there are about five skips that will go in the waggon.
3291. Do any of these skips weigh over the 13 cwt. 2 qrs.? When I introduced the standard weight I believe there were one or two skips. The standard weight was introduced to relieve the rolling stock.
3292. At the present time suppose a skip was to come out that weighed more than 13 cwt. 2 qrs., would that weight be recorded for that day? Yes; but there are no skips that come out over 13 cwt. 2 qrs. If our average weight is 12 cwt. 2 qrs., you cannot have skips 13 cwt. 2 qrs.
3293. If a skip came out more than 13 cwt. 2 qrs., would the miner get that weight. Supposing for that particular day a man was weighed over 13 cwt. 2 qrs., would you allow that record to be taken for that man? No.
3294. You would not allow it to be taken by the check-weighman? No, not by the check-weighman.
3295. Can the bridge make a record over the 13 cwt. 2 qrs. for the miner? It can.
3296. But you will not permit the check weighman to take that record? No.
3297. *Mr. Gregson.*] Is the Coal Cliff Colliery the same as the Clifton Colliery? Old Clifton is the Coal Cliff Colliery.
3298. *Mr. Curley.*] Are there some days that you never weigh at all? Yes, there are days we do not weigh.
3299. Why is that? It is left between the check weighman and the Company's weighman to arrange that for themselves.
3300. Can the check-weighman compel the other man to weigh? They have sanction to weigh at any time. It does not make any difference to me, how many skips are weighed.
3301. Have the men ever asked you to have more skips weighed than you do weigh? No, never.
3302. Has the check-weighman ever asked you? No.
3303. Has the weighman ever objected to certain weights called by the check-weighman? I have never heard of it.
3304. *Mr. Gregson.*] As far as you are concerned has the check-weighman power to call for skips at any time of the day? No.
3305. Do you object to him having that power;—do you think there would be anything prejudicial to the Company if he had that power? It is left to the weighman. I do not see that it would do for them both to have power. If we had to weigh all day it would be a drawback to the output. Coal Cliff belongs to the old school of collieries. All the outside work is done near the jetty, and the coal has to be shovelled down the screen.
3306. If the weighbridge was kept going all day, would that be prejudicial to the Company? It would.
3307. In what way? It would stop the output.
3308. Have you not room for another screen? No.
3309. *Mr. Curley.*] Have you not any idea about the quantity of skips that are weighed at your colliery? No; I have not any idea of how many skips are weighed.
3310. How do you weigh your coal for going away? In the waggons.
3311. Do you weigh that coal yourselves? The Company's weighman weighs that coal.
3312. Do you ever compare that weight, the weight you send away in the vessel, with the weight you pay the miners? No.
3313. Do you never make any comparison? Yes; I have made a comparison.
3314. How often do you compare these weights? Fortnightly.
3315. How do you find them stand? Sometimes the Company is 2 tons to the bad and sometimes 2 tons to the good.
3316. Is the difference as little as 2 tons? Yes; sometimes only 2 cwt.
3317. What is the largest difference you recollect? Not more than that.
3318. When did you last make a comparison of these weights? Well, I quite forget what it was for the last pay. I cannot mention any single pay.
3319. When you make a comparison in this way have you not to have some consultation with the weighman, about the quantity of weight he hands in? No.
3320. Who does he hand the weights in to? He hands the weights to me. They are left in the office.
3321. Is the record of the skips weighed not brought to the office also? No; it is left in the weigh-cabin.
3322. From the quantity of tonnage the weighman brings in, could you not give the number of skips that are weighed? I cannot say how many skips are weighed.
3323. You must have some recollection of some of these tonnages for the fortnight. Can you tell us what tonnage they represent. Will you give us the weighman's account of your tonnage that you get from him every fortnight? Some fortnights we send away only 250 tons of coal, and on other fortnights 700 to 800 tons of coal.

3324. When the 250 tons of coal goes away, what quantity of weight have you from the weighman? J. McGenchie, Esq.  
The weighman's weight varies sometimes, 1 ton, sometimes 2 tons.
3325. I am asking you the quantity of tonnage weighed? All the coal is weighed on the weighbridge.
3326. Is there not a certain tonnage weighed every day, according to the number of skips? It is all weighed by the skips. 24 Sept., 1895.
3327. Do you know the tonnage it represents? No; I do not know how many skips are weighed.
3328. Is it a fact that you really do not know the number of skips that are weighed at your colliery in a day? I cannot tell you how many skips are weighed. Some days they do not weigh at all, some days they weigh in the forenoon, and some days in the afternoon.
3329. Do any weeks pass without any weighing at all? No, not a week. I have never had any complaints from any of the men.
3330. *Mr. Gregson.*] How far is your weighbridge from the ship's side? About 250 yards.
3331. How many waggons have you at your colliery? 150 waggons.
3332. *Mr. Curley.*] What hours do you work? The mine is open from 7 o'clock to 5 o'clock.
3333. Do the men do any water-bailing? No.
3334. Have you no water-bailing? The wheelers do the water-bailing.
3335. Do the men bail into a cask? At times.
3336. Then the men do do some water-bailing? There is one bord; the main dip.
3337. When they do not bail the water out, do they sit down till that is done? Yes.
- 3337½. Does that happen very often? I have never ordered the men to bail water yet.
3338. If those representations are made to you, do you remedy them? Yes.
3339. Are the hours that you have spoken about the regular hours that you work? We sometimes vary an hour. We have a jetty exposed to the open sea, and we only work half time. If we want to load a boat we start at 2 o'clock in the morning, and knock off at 2 o'clock in the afternoon.
3340. Do the men ever go in at 3 or 4 o'clock in the morning and knock off at 5 o'clock in the afternoon? We have done so.
3341. How many hours do you reckon a man should work there? Have you any stipulated time? The miners go in at 7 o'clock, and come back at 5 o'clock. We have two shifts, a front shift and a back shift.
3342. When does the front shift come out? The front shift works from 7 o'clock until 3 o'clock.
3343. If the miners come out before 5 o'clock do you find fault with them? Not unless we are waiting on coal.
3344. Suppose you are waiting on coal? There is no fault found. If a boat comes in at 8 or 9 o'clock, we start the mine, and if a miner comes out before the boat is loaded I would find fault with him. If he went in at 7 o'clock and came out at 5 o'clock I would not find fault with him.
3345. If you were pressed frequently for boats in this manner, would you still request the men to work? No; I would put on more men.
3346. Do you think that eight hours is long enough for a man to work in a mine? I do not know. I think a man should please himself on that matter.
3347. I think you said you had been mining yourself? Yes.
3348. Did you consider when you were mining that eight hours was long enough to work? I have seen some days when six hours was long enough, but that was when I was not well. Some days I could work ten hours.
3349. Do you think that eight hours is long enough for a man to work? Yes, but if required eight, or eight-and-a-half, or nine hours, at times.
3350. Do you still say that you cannot give us the average number of skips that you weigh at your colliery? No, I cannot.
3351. What would you consider a fair average for the number of men you have working at the colliery now;—how many men have you? Forty-five men, but only twenty-five to thirty of them are getting coal.
3352. How many skips does each bord of men send out in a day? About twelve skips.
3353. What would you consider a fair average of skips to be weighed in the day for these thirty men? I do not see that it matters much how many skips are weighed.
3354. *Mr. Gregson.*] The more skips that are weighed the nearer the approach to absolute facts? Well yes, but if they get an average I do not see that that would make any difference.
3355. Do you think that it is possible that any four of the men working for you, could go four months without having a skip weighed? They could do that; that is one bord of men.
3356. Would you be surprised if you were told that that had been the case? I would be surprised.
3357. If you have fifteen bords of men, and they send out twelve skips a day, that is 180 skips in all, what would you consider a fair average out of that number to be weighed to get anything like a reasonable margin of knowing what the weight actually is? I think if one or two of those skips were weighed, that that could be taken as a fair average.
3358. What do you think is a fair average yourself? Well, two or three skips.
3359. You think that two or three skips, out of 180, is a fair average? I suppose, twenty out of that number would be a fair average.
3360. Could you weigh twenty skips a day on the one screen? Yes.
3361. Could you do that without interfering with the working of the pit? No.
3362. Would not the weighing of twenty skips occupy the greater part of the day? It would occupy three hours of the weighbridge each day.
3363. Do you think there is anything like this number of skips weighed at your colliery? I believe we have, at times.
3364. Say for a quarter—the last quarter—is there anything like this average number of skips weighed? I do not know how many skips are weighed at the colliery. The weighman and the check-weighman arrange that between themselves. I have heard no complaints, so I have never interfered with it.
3365. Has any individual man mentioned the matter to you? No.
3366. Might not the check-weighman have requested the weighman to weigh more coal, and may he not have refused? I have never heard of that.
3367. Do you know whether your weighman has objected to certain weights that have been made occasionally? No.

[Witness withdrew.]

WEDNESDAY,

WEDNESDAY, 25 SEPTEMBER, 1895.

[The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.]

Present:—

FRANCIS EDWARD ROGERS, Esq., Q.C. (PRESIDENT).

JAMES CURLEY, Esq.,

JESSE GREGSON, Esq.

Witness, Thomas Canning:—

- Mr. T. Canning.  
25 Sept., 1895.
3363. *Mr. Curley.*] What are you, Mr. Canning? I am a furnace-man.  
 3369. At what colliery are you employed? At the Duckenfield Colliery.  
 3370. How long have you held that position? For between two years and six months and three years. I cannot say exactly.  
 3371. Have you been employed in the Duckenfield Colliery for any length of time? I have been employed at Duckenfield over four years.  
 3372. Have you worked as a miner? I worked as a miner when I went there first.  
 3373. Did you do any other work? I was also at the pump.  
 3374. Have you done anything else? No.  
 3375. What time did you go to work in the morning? I am there at 6 o'clock.  
 3376. Are you continuously employed at the furnace the whole of the day? Yes.  
 3377. Do you do any other work? No.  
 3378. What time do you cease work? At 3 o'clock in the afternoon.  
 3379. Does anybody relieve you when you cease work? No.  
 3380. You have nobody that takes your place? No.  
 3381. Do you damp the fire down when you knock off work? Yes, one half.  
 3382. Does the fire stop in that state till you get there next morning? Yes.  
 3383. During the day do you keep the fire in fair motion? Yes.  
 3384. Do you keep a good blaze of fire going? Yes.  
 3385. What are your instructions from the manager with regard to keeping the fire going;—have you any instructions at all, or do you use your own discretion? I received instructions once to keep the fire blazing away.  
 3386. What time do the men in that mine go to work in the morning? They go to work very irregularly, some earlier, and some later. I should say they leave the pit top at half-past 5 sometimes.  
 3387. Do they go into the pit by the shaft? No, by the tunnel. I enter the pit by the shaft at half-past 5 o'clock, and I meet them at the furnace when I get there.  
 3388. Is there anybody in the mine before you? I have seen lights in the bords when I have gone past.  
 3389. Do you go into the mine the same way as the men? I go down the shaft, and go in by the fault district.  
 3390. Where do you see these men's lights? In the fault district.  
 3391. Do you judge from that that these men are in there before you go in? Yes.  
 3392. Do you know if there is any stated time at that colliery for the men to enter the mine? Nothing but the miners' rules—that they leave the pit top at 6 o'clock and retire at 3 o'clock, and go in at 7 o'clock and retire at 4 o'clock.  
 3393. Is there any stipulated rule on the part of the management? Not that I am aware of.  
 3394. Have you seen the colliery rules? Yes.  
 3395. Is there anything in these rules about this matter? I do not know if there is.  
 3396. Have you the colliery rules with you? Yes. [*Copy of rules handed to Mr. Curley.*]  
 3397. You do not know of any regulation about the men going into the mine apart from what the miners have themselves? No, sir.  
 3398. As a practical man, do you think that regulation is sufficient for the management of a colliery? No, I do not.  
 3399. Do you think that there should be a definite time for men to go to their work? Yes.  
 3400. Do you think that they should go to work uniformly? Yes.  
 3401. *President.*] Would that be practicable;—is the furnace always going? No; the furnace starts at 6 o'clock. I believe that there should be a stated rule for all the workmen, and that the furnace-man should be the first to enter the mine.  
 3402. *Mr. Curley.*] You think that the furnace-man should precede the miners? Yes; for half an hour at least, to get his furnace started before the men enter the mine.  
 3403. Do you not think it would be better if the furnace-man entered the mine an hour before the miners? Yes.  
 3404. Do you think it would be better if the furnace was kept going all night? Yes.  
 3405. Are there a few men working on the night shift in that colliery? Yes.  
 3406. If the furnace is not kept going at night, how is the mine ventilated? I think there is always sufficient natural ventilation, besides that the fire is not out.  
 3407. Is it not possible that the ventilation may be very stagnant if the furnace is damped down during the night, and that these men may not have sufficient ventilation? I think it is the experience of the men that are working at night that they have the best of it.  
 3408. Do you think that they have plenty of air? I think so. There is a natural current of air, and the fire is to cope with the extra necessity during the day. The fire is damped up sufficiently to keep going all night. The air is not better during the night than during the day, but it is better air on account of the absence of the other workmen. There is not so much air used by the men at night, and consequently not so many noxious fumes.  
 3409. When do the men leave the mine? We have two shifts, one shift goes in at 6 o'clock and leaves at 3 o'clock, and the other shift goes in at 7 o'clock and leaves at 4 o'clock.  
 3410. Are the men working in the mine an hour after the furnace is damped down? Yes, half of them; the back shift men.  
 3411. Do you know if any of the men stop in the mine the whole of the day? No, I do not.  
 3412. Do you know if any of the men stop in the mine after 4 o'clock?  
 3413. Might they not do so without your knowledge? Yes.

3414.

3414. Do you ever see any of the men going home late in the evening? No, not miners.
3415. Do you live in the locality of the mine? I am living at the far end of the town—on the outskirts of the town.
3416. Do you think that the furnace should be kept going the full time during the day until the men leave the colliery? I think so; still I make this proviso, that those men who are in the mine between 3 and 4 o'clock have as good air as the men that are there all day, on account of half of the men being away.
3417. Is it the intake shaft that you travel in by in the morning? There is more than one intake, but that is one of them?
3418. What is the depth of your shaft? I cannot give any idea. I cannot speak of that.
3419. Is the shaft a considerable depth? I have merely heard remarks about the depth of the shaft.
3420. What remarks have you heard? I think I have heard them say that it is 260 feet deep, but I cannot say.
3421. Are the workings in a considerable distance from the furnace shaft? Yes.
3422. How far would you estimate they are in? From which shaft?
3423. Say from the downcast shaft? The downcast shaft is just at the end of the workings. There might be five cut-throughs.
3424. Is the downcast shaft the hauling shaft? We have no hauling shaft.
3425. Do you fetch your coal out by the tunnel? Yes.
3426. Do you know the number of men working in the colliery? No; I do not.
3427. How far are the workings in from where you enter the mine? The first workings begin after five or six cut-throughs.
3428. How far are the workings at the furthest point the other way? How far will the men have to travel there in the morning, to the furthest point, to get to their work? About a mile and a half from the tunnel mouth. (*Witness illustrates the air-course of the fault district of the colliery*).
3429. From the description you have just given on paper, the air course appears to be very much zig-zag? Yes.
3430. Is that the ventilation that comes in the tunnel;—is the tunnel the intake? No.
3431. The downcast shaft? Yes; that is the main intake.
3432. Is the tunnel not the intake in the ordinary sense of the term? No, not for the fault.
3433. Is any part of the mine ventilated from the tunnel? There is ventilation from the tunnel, but it does not depend on the tunnel. The fault is closed off from the tunnel mouth altogether. The tunnel will supply part of the dip, and other workings, but they have other shafts for that.
3434. The road that you take to go into the mine in the morning, is that an intake or return? The intake.
3435. Do you notice the air rather stagnant in the mornings when you go in? No, not generally, when the tunnel is working regularly. When it stands the air is stiff.
3436. Do you mean when there is no work? Yes; for three or four days, or a week.
3437. Does the air then get stagnant or flat? Yes.
3438. Do you keep the furnace going at much of a pace on those occasions? No.
3439. Is that on account of economy;—to save fuel? I suppose to save fuel.
3440. What are you doing when the mine is not working? Idle.
3441. Who looks after the furnace? The fire is kept banked up—smouldering.
3442. Is there anybody, so far as you know, attending to the furnace? There is nobody there permanently. Somebody goes in in the morning and evening and banks it up for the night, to keep it smouldering.
3443. Was it at this mine the men were affected with foul air a week or two ago? No; that was at the Back Creek mine.

[Witness withdrew.]

John Odgers sworn and examined:—

3444. *Mr. Curley.*] Where are you working Mr. Odgers? At the Back Creek Colliery.
3445. What occupation do you follow? I have been working as furnace-man since about last March twelve months.
3446. What time do you go to work in the morning? At six o'clock.
3447. What time do you cease work? I knock off work about half-past three o'clock. I arrange to get on the top by four o'clock.
3448. Is there any other furnace-man employed at the colliery besides yourself? There is one at the No. 2 furnace, in the No. 4 tunnel.
3449. Is that in another section of the mine? Yes.
3450. Is it in the Back Creek tunnel? No.
3451. Is there any other furnace-man in the Back Creek Tunnel besides yourself? Yes; there are two furnace-men, one to each furnace.
3452. Are there two furnaces in the Back Creek tunnel? Yes.
3453. Is that the furnace you were referring to just now? I am working in the No. 2 tunnel at Back Creek.
3454. Is there any other furnace-man in the No 2 tunnel besides yourself? No; I am the only furnace-man.
3455. Do you bank the fire down in the evening when you leave off work? Yes.
3456. Does the fire smoulder till you go back next day? I put it so as to get a good fire next morning when I go back to work.
3457. Do you see any of the miners at work when you are going to work in the morning? I do not go down as far as the miners are.
3458. Do you know whether the miners go to work before you? Yes; a good many of them go to work before me.
3459. What time do you think some of the miners go to work? From what I have been told some of them go to work at four or five o'clock in the morning. I hear them talk amongst themselves.

3460.

Mr.  
T. Canning,  
24 Sept., 1895.

Mr.  
J. Odgers,  
25 Sept., 1895.

- Mr. J. Odgers.  
25 Sept., 1895.
3460. Can you say whether this is true or not? No; I cannot say. It looks like it when I go in in the morning, because I see their picks gone, and I think that is a good proof they are at work.
3461. You notice that the picks are gone? Yes; I have taken notice of that many a time.
3462. Would the whole of the men be in the mine then? No; part of them. They would not be all in.
3463. Have you any particular instructions from the manager about the furnace work? No; not any particular instructions, but to keep on a good fire. They come and look at it once in a while, but I have had no complaints.
3464. Do you know the quantity of coal you burn in a day? About three skips of coal a day, unscreened coal (round and small coal mixed), about 13 or 14 cwt. in the skips.
3465. Can you use more coal than the three skips if you wished? I am not limited in any way.
3466. Is that about your average quantity? Yes, that is about the average quantity used.
3467. Do you know how many men there are in the No. 2 tunnel? No, I cannot say. I think last quarter there were 46 tokens running. I got that information from the bank-rider, but I would not like to say it is a fact. I know that there are not many men working down there, because there is only one section of the pit working.
3468. Have you worked as a practical miner there? Yes; but I am not a coal miner. I have been used to quartz reefing and copper mining.
3469. How long have you been working at coal mining? About 5 or 6 years.
3470. Do you not consider yourself as practical as most of the men who are working? Perhaps so.
3471. Do you like coal mining as well as quartz mining? No; I prefer quartz reefing to coal mining.
3472. Is quartz mining more pleasant work than coal mining? It depends on what a man is used to. If I had gone into coal mining in my early days I do not suppose I would have disliked it.
3473. *President.*] Is coal mining just as comfortable as quartz reefing? I think so.
3474. *Mr. Curley.*] Do you have good and bad ventilation in quartz reefing as well as in coal mining? There is plenty there, I can assure you.
3475. Have you heard tell of any circumstances arising of a peculiar character at Minmi a few days ago;—had not a few men to be brought out of the mine? Yes.
3476. Was that in the tunnel you were working in? Yes; the dump pile caught alight through the bush fires. The dirt on the top caught fire, and the smoke went down the air-shaft.
3477. Was not that rather an exceptional circumstance? Yes, exceptional.
3478. How far is the downcast shaft from the furnace shaft—the intake;—have you any shafts there except the furnace shaft? I suppose 500 or 600 yards—more very likely, that is in a straight course from one shaft to the other; perhaps it is 600 or 700 yards.
3479. Did you see these logs that took fire? No, I did not see them. One of the men boarding with me gave me to understand what it was. It seems they were old logs from the bush, and the bush fires caught on the dirt, and this caught the dump pile, and the smoke issuing from the fire went down the air shaft.
3480. What do you call the dump pile? The dump heap.
3481. Is that a heap outside the shaft altogether? The heap consists of the debris from the sinking of the shaft, and is outside of the pit altogether.
3482. Did you see any of the men that were brought out of the mine? No; I was not working when it happened; my son went to the furnace that day.
3483. Did the manager or anybody else come to see your son that day? They came to see if the furnace was going all right, and told him to throw his coal on quickly, and not to stop there long. There is a door back from the furnace, which is the intake for fresh air, and through that door you get fresh air.
3484. Did they say to keep the furnace in motion a little smarter than usual? No; they told him to keep his fire on as well as he could, and to slip out of the way as fast as he could.
3485. Did he go in at the usual time that morning? Yes.

[Witness withdrew.]

Peter Curran sworn and examined:—

- Mr. P. Curran.  
25 Sept., 1895.
3486. *Mr. Curley.*] What occupation do you follow? I am a miner.
3487. How long have you worked as a coal-miner? For nineteen years.
3488. In what mines have you worked? I wrought nine years in mines in Scotland, and ten years within a few months in New South Wales, in the Minmi Collieries.
3489. *Mr. Gregson.*] How many years have you worked at Minmi? Nearly ten years—within two months of ten years.
3490. Are you working there now? No; not at present. I am living there, but I have been out of employment for six months.
3491. *Mr. Curley.*] Have you worked at those collieries up to that time? Yes.
3492. Have you worked at both collieries? Yes; at Duckenfield and at Back Creek; nearly an equal division of the time between them both.
3493. Which of the collieries did you work at last? At the Duckenfield Colliery.
3494. How long is it since you worked at the Back Creek Colliery? About two years ago.
3495. Was there a system of cavilling between these two collieries at one time? Yes; up to nearly two years ago, I think.
3496. Had you opportunities of being cavilled at one mine or the other? Yes; every three months.
3497. Has there been fire-damp given off at any of these mines? Yes.
3498. At which of the collieries is this fire-damp given off? Specially in the No. 4 Colliery; that is, Back Creek. There are two collieries there, No. 2 and No. 4.
3499. Are they separate and distinct collieries? The workings communicate; they are built in, but they are distinct and separate collieries. The old workings of the one adjoin the other.
3500. Has there been fire-damp given off in the No. 2 tunnel? Not to my knowledge. There has been, but it was in the course of opening out the workings, and they have closed that part. I do not know of fire-damp to any extent in the current workings of the No. 2 Colliery.
3501. Do you recollect a fire at one of these collieries some years ago? It was previous to my being there. I have passed through the section in the course of making inspections.
3502. Have you acted as check-inspector? Yes; on several occasions.

3503. In which of the collieries did you act as check-inspector? For the three collieries; that is, the two Back Creek collieries and the Duckenfield Colliery.

3504. How long were you in that position? I think I acted in that capacity for two years at various times.

3505. When you were check inspector did you ever notice any defects in connection with the ventilation? Yes.

3506. What were they? Deficiency in the quantity of the air travelling in certain sections of the workings, and the accumulation of black damp in some quarters.

3507. Did you notice particularly where this black damp was coming from? It was exuding from the sides of the travelling road leading to the fault heading workings where a creep had taken place. At the time I came to Minni the creep was actually on. This creep had closed the original travelling way, and they had to cut a new travelling way through the debris. This is now the travelling road through the old workings, hence the cause of the black damp.

3508. Is this black damp noticeable travelling past it? Yes, you can smell it, and it is perceptible on the light of the lamp.

3509. *President.*] Can you smell black damp? You feel a strangeness in it for the time being, and people who are not strong are effected by it. This black damp is only in the travelling way, and it might affect you for ten minutes or a quarter of an hour. A few years ago we had to come home from work for two or three days a week on account of this damp. It was lodged in the travelling way.

3510. Does it lodge in any particular place? At night it accumulated in greater quantities than during the day in the travelling or hauling roadway.

3511. Do you say you had to go home because you were ill? We could not pass through this black damp in the mornings. There is a down-cast shaft at the further end of the working. This is the return way from the workings, and the men have to travel this road where the black damp exudes. The furnace is damped down at night, and this is the reason why this damp accumulates. I do not think it is so bad now.

3512. When you were working there was it bad? Yes.

3513. Would you say that mine was inadequately ventilated? It is the result of the method of working the mine in the past, through not leaving sufficiently strong pillars in years gone by. The pillars are crushed out, and the roof has fallen in, and it is not repairable as it is. The roof of the roadway is supported by a continuous row of wooden pillars on each side, and the coal behind these pillars is crushed to dust.

3514. You think that nothing will take it away but proper ventilation? Quite so.

3515. *Mr. Curley.*] Is the furnace banked down at night? Yes, when I was check-inspector to my knowledge the furnace-man banked the furnace up about 3 o'clock. It was very perceptible, when working in the face we could always tell whether the furnace was banked up or not. In the morning the current of air in the mine was very weak, you could always feel it get stronger about 8 o'clock. The furnace-man comes back to work at 6 o'clock in the morning, and puts the furnace in full blast.

3516. Did you ever make any request that this furnace should be kept going night and day? The Lodge has in years past made this request. There have been two men engaged in the furnace, but there is only one now. The miners complain that the mine is not sufficiently ventilated. They believe that where there is a furnace, the current of air should be kept going night and day.

3517. Do you know whether men work in the mine at night occasionally? Yes.

3518. Is that an exceptional thing? When they are opening new workings—special places—there are six or eight men, and a water-bailer engaged at night, and sometimes brushers are at work that cannot be done in the daytime.

3519. These brushers are taking away part of the roof to give greater height in the main ways? Yes.

3520. Have you any records showing that there have been reports made about this ventilation? I have. I have acted as secretary, but I have not brought the secretary's books with me. I have brought one or two check-inspectors' reports with regard to the ventilation. I will read some of them:—

Inspection in 1890 :—There was a large quantity of stagnant water and mud lying about.

Inspection in 1886 :—Throughout two sections of the mine the anemometer would not act at all in what is termed the E heading and the D heading sections.

3521. *Mr. Gregson.*] Were you check-inspector then? No, Sir, I just followed shortly after that. The check-inspectors' names were George Nix and James Cook. The thermometer registered 74 degrees, and there was no result with the anemometer.

3522. *Mr. Curley.*] What was the height of the seam there? It was then about 4 feet 6 inches, I think. The old tunnel, I think, averaged about 4 feet 6 inches then all through.

3523. Were these measurements taken on the headings? Yes.

3524. Would that be the main intake road for that particular district? Yes.

3525. What time of the year was that in? In May. I did not bring the minute book. We made complaints to the manager about this report, and received promises that the matter would be remedied, but there was no remedy. We sent to Inspector Dixon, but he did not come, and the Lodge then sent to Mr. Mackenzie, the Examiner of Coal-fields, and he asked Mr. Dixon to attend. This state of things continued for two or three years. The manager was taken to Court, and fined for bad ventilation, and for driving bords over the specified distances, from 36 to 39 yards before the air.

3526. What year was that in? I think, between 1886 and 1888, but I am not certain.

3527. Was that prosecution taken at the instigation of the inspector? Yes, under the pressure of the Lodge. The Lodge brought the matter under the notice of Inspector Dixon, and finally under the notice of Mr. Mackenzie, the Examiner of Coalfields, and the result was that the firm was prosecuted and fined by the Court. In 1891, in what is called the fault section of the Duckenfield Colliery, there were two places where there was no result with the anemometer.

3528. Could you not get a register? No.

3529. Do you know the height of the seam? It varies from 4 feet 5 inches to 4 feet 7 inches, or an average of 4 feet 6 inches. The average height of the seam in the Duckenfield Colliery is 4 feet 6 inches. In a report made on November 25th, but I cannot give the year, the temperature by the thermometer was as high as 78 degrees, and 74 and 75 degrees. Another report on a certain portion of the Duckenfield Colliery says there was no result with the anemometer. That was in what was called the No. 3 flat.

The

Mr.  
P. Curran.  
25 Sept., 1895.

The anemometer would not act through insufficiency of air. There are two or three reports in 1893 and 1894 which state that the average amount of air travelling was not more than 120 feet, a little over 100 feet in some instances, with 72 degrees and 74 degrees of temperature.

3530. Were there any of the districts in which the air was not up to the requirements of the Act? Only in those places where I have mentioned no results. I have a report for February, 1894, where the average is a little over 120—125 and 127—with 72 degrees of an average for the thermometer. I may state that the check-inspector had always something to say about the insanitary condition of part of the roadways in most of his reports.

3531. Have you noticed whether any brattice is used in connection with some of these places? Yes.

3532. Can you understand why a mine of that description should not be well ventilated? My own convictions are, without prejudice, that it is from a point of economy, and want of due regard to the health of the miners. What leads me to believe so is that, while acting as check-inspector, we have complained to the overseer that the air was a little over 100 feet, and that we thought that there was need for more air. He said that he had met the requirements of the Act. When men were firing shots they were stifled for the want of greater power for ventilating.

3533. Is there much refuse in that seam;—have you to throw much refuse out of the coal into the working place? Yes; there are two bands in the seam known as penny bands; also 6 inches and 3 inches of inferior coal treated as refuse with thin layers of clay on the top of the seam; the whole refuse in general measures 1 foot.

3534. Have you to clean all this away from the coal? Yes.

3535. And throw it back into the working place? Yes.

3536. Along with the slack that you make? Yes.

3537. Does this refuse frequently fill up the sides of the roadway? Yes; up to the roof in some places. It is quite a common thing in the No. 3 and No. 4 workings, and what is known as the H and the fault workings, to have just sufficient egress and entrance for the skip into the bord, through the place being built up on either side nearly to the roof. The cause of that is chiefly due to the fact that there is no place for the refuse made at the opening away of the bord, and the miner has to stow it up behind him. That is, in my opinion, the cause of the smoke remaining in the bords. I do not say it is a general thing, but it is of more common occurrence than the exemption. It is specially common in No. 4 heading. In that heading it is nearly up to the roof all the way.

3538. What is the width of the bords you work? Eight yards.

3539. What is the size of the pillars? They vary. Some of the pillars are, I think, cut through in one day. They would not be more than 2 or 3 feet. Others, again, go to 8 or 9 yards.

3540. Did that occur up to the time you left the colliery? Yes.

3541. Are these things still going on in the same way? Yes. I have wrought in bords, and have gone through from one side to the men on the other side, and have had to leave my bord when these men have been firing shots. That was in the H heading and also in the No. 4 heading. In the No. 4 heading I was working two bords from a man who was shot in his own bord by his mates who were working in the other bord. That man was on the accident fund for nine days.

3542. Did the shot go through the pillar? Yes.

3543. Did the shot go through from one place to the other? Yes. The man's name was Willoughby, and the numbers of the bords were 30 and 31. Several times to my knowledge the shot has removed part of the pillar—shattered the pillar on the other side.

3544. With regard to working in a bord, if the manager wishes you to make the place narrower does he put a chalk mark on it? Yes.

3545. Does he request you to respect that mark? Yes. He says that such mark is to be observed. He gives injunctions to that effect.

3546. Could he drive these bords by a line if he pleased to do so? Yes; there is nothing to prevent him.

3547. Would that be to keep his pillars to a uniform size? They drive headings and cut-throughs by line always; but, as far as the bords are concerned, they do not do so with them.

3548. Have you worked in the smaller pillars when they have been taken out? I have not wrought in pillar work. I have only wrought in cut-throughs there. I know of some instances where men have gone through two pillars in a day, and perhaps they might be a fortnight going through the next pillars.

3549. When men are extracting pillars, do they look to the main roads for safety? Yes.

3550. Is that in the event of an impending fall? Yes.

3551. Do you think that these small pillars are sufficient to keep the main road safe? No; I do not think so.

3552. With regard to the cleaning of the coal;—is there a heavy penalty imposed if you send out refuse? Yes; the penalties graduate.

3553. What is the custom in this respect? In the first instance you are cautioned, but you have to see the manager in every instance. You are compelled to go to the colliery knowing there is no work. You go into the office, and they tell you there is no work, you go home, and then have to see the manager. I have known men to remain at home thinking they were putting in their penance for the offence, and when they came to the mine the day following they were sent home again to suffer the indignity of being sent home.

3554. Are they stopped for any length of time? One day generally; sometimes two or three days; sometimes instant dismissal.

3555. Have you what is known as the regulation dirt-scale? No; we have made an attempt yearly to get it. We have placed it before the manager, but he says that his judgment shall be the only arbiter as to what shall be done. In most of the places the air is so bad through the smoke that the men cannot see what they are filling. There is 1 foot of dirt, and men who want to fill clean coal are surprised when they come to the surface to see the dirty coal. A vitiated atmosphere, with smoke, lies there all day. I used to work, and put no coal out, in order to fire two or three shots at night, and then fill the coal next day, for fear of this penalty, but now miners have to rush and do all they can.

3556. Have you anything like what is known as the standard weight at that colliery? No; there is a standard weight to a certain degree. New-comers are placed on 10 cwt. till they are weighed, and should they be weighed 11 or 12 cwt., they get that weight as their average from that day forward until weighed again, but they may be filling 11 or 12 cwt. and only get this 10 cwt. up to the day on which they are first weighed. As check-weighman, I have found that men have been losing 1 and 2 cwt. per skip filling 4 or 5 skips daily for a fortnight.

3557.

Mr.  
P. Curran.

25 Sept., 1895.

3557. If they are not weighed for some days, how are you going to give them the standard? The average of the colliery should be placed as the standard weight.

3558. What do the skips carry as a rule? They vary—from 10 to 13 cwt. The average is 11 cwt. 1 qr. or 11 cwt. 2 qr.—7 lb. or 14 lb.

3559. Do you consider that what is termed the standard weight should be entirely abolished altogether? Most certainly I do.

3560. Is it abolished at Minmi? Yes.

3561. Is there any complaint there about the number of skips that are weighed? Yes; because when they are on low-weight they do not weigh for a week or a fortnight, and know that they have fully 2 or 3 cwt. more on a skip. I have known men while I was check-weighman, good fillers of coal, who never varied their weight, but by an accident on the roadway their skips might get upset, and so they might lose 1 or 2 cwt., and they may stand on that weight for a week, although they actually filled 1 or 2 cwt. more. In some cases the miner may work on tender coal for a day, and that may detract 2 cwt. off his weight. He may get on good coal next day, but the weight of the tender coal will be taken as the standard till he is weighed again. I have known men not to be weighed for a fortnight, and some men may be weighed twice or three times in a day. It is all by accident.

3562. Do you weigh continuously during the whole of the day? No.

3563. What was your regulation with regard to weighing? Only the will or the caprice of the masters' weighman. He had to oversee the timber and the topmen, do the ticketing of the trucks going away, arrange for the filling of slack coal, and various other duties. Whenever he had to perform these functions the weighing ceased.

3564. What colliery was that in? The Duckenfield Colliery.

3565. Did the same thing apply to the other colliery? Yes.

3566. What were the number of skips weighed in a day? Sixty or eighty, as near as I can judge.

3567. What number of skips would come up the tunnel in a day? About 1,000 skips per day.

3568-9. Do you think the men are satisfied with the average number of skips that are weighed? No, I do not think so.

3570. What do the men want? Well, I believe, to give them justice, that every skip should be weighed; or, if it is not possible to do that, that they should exercise the present system of averaging to a greater degree, and keep the weighman standing there weighing.

3571. Do you think that the average would be acceptable provided there were a fair number of skips weighed? That would be preferable to the present system; but the opinion of the miners is that every skip should be weighed.

3572. *President.*] Would not that be utterly impracticable at some of the mines? It is not impracticable, but it might interfere with the hauling to a certain extent. In Scotland where I came from they weighed every skip.

3573. Would it not be unreasonable to expect that every skip should be weighed with the condition of things here;—if a larger proportion of skips were weighed, would not that do? That would be more favourable than things are at present; but, to give justice to men and masters, I believe that all material should be weighed. I do not think that the miners would stornly hold out for a condition of things that was going to militate against the working of the colliery; but if it is possible, with any degree of justice, it should be done. I think that all material produced should be weighed.

3574. Would it be better for the miners if the whole of the mines were shut up? Well, I do not know.

3575. Would it not throw a lot of men out of employment? If there were not so many mines open there would not be so many miners. There might be a better regulation of the trade. Men might fall back on other occupations.

3576. *Mr. Curley.*] Do you think that in the absence of every skip being weighed, that if a fair proportion of the skips that come out of the mine were weighed, that would give the men better satisfaction? Yes; I do believe so. Both the miners' weighman and the masters' weighman get into very bad grace with the miners; but the minors' weighman is not to blame, because he has only to stand by and see the weight registered.

3577. If the miners' weighman had power to compel the masters' weighman to weigh, would that do? That is what is wanted, and would give a better average of the weighing of the skips.

3578. Do you think that the men should have the right to select their own check-weighmen? Yes.

3579. Do you think they should have the right to select him outside of the colliery if they chose to? Yes.

3580. Have you any reasons to give for that opinion? Yes; I can quote two reasons. There were two men who were employed at the colliery for years as miners, and who were selected by the miners for the position of check-weighmen. One was named William Teague. He was the miners' secretary and delegate, and took positions in the miners' lodge before he was check-weighman. Because of his outspokenness it was well-known the manager had no affection for him. He was selected for weighman, and was in that capacity for six months, when an election took place. There were other candidates in the field, and he was defeated. The miners then worked for him to try and get him on the coal, but the manager refused. We did everything to get him reinstated, but failed. He could not get work in the district, and consequently had to leave. He died shortly afterwards of poverty, and his body was found up at Lithgow. Another instance was John Jenkins, who has wrought in the Minmi Colliery for seven years. He was selected by the miners as their weighman about a year and a half ago. He was in that position about six months, when a strike took place. When the strike ended the miners went back to work, but when Jenkins went to go back to his work the manager objected, and would not allow him to stand on the bridge. He asked for other work, but was refused; and to this day he is unemployed. That is between six and seven months ago, and he has no work to-day. In consequence of this the people of Minmi have made a collection to aid him to go to Coolgardie. Seeing that a man has no security for being reinstated in his work as a miner should he be defeated in the course of a ballot for the position of check-weighman, I think the miners should choose whoever they like as their check-weighman, especially when the manager will not reinstate him if he is chosen from the men at the colliery.

3581. Has the Company absolute power to select whom they please? Yes.

3582. Can they appoint who they like? Yes.

3583. Was there any charge brought against these men you have referred to that you are aware of? Not to my knowledge. If there had been the manager would have informed the lodge; the lodge has sent

Mr.  
P. Curran.  
25 Sept., 1895.

deputation after deputation, but without satisfaction. In the case of Teaguc, twenty men obtained employment while we were soliciting work for him.

3584. After waiting on the strength of a promise, he had subsequently to leave? Yes; as far as Jenkins was concerned, I believe the manager regarded that all relations between employer and employed had ceased when the strike took place, and he took up the ground that Jenkins was not in the employ of the Company, and he held that only an employee should be check-weighman.

3585. Are you aware that a manager can take up that position, legally, under the present Act? I think so; but it is a wrong provision in my opinion.

3586. Did you know both these men personally? Yes.

3587. Were they steady, sober men? They were both Good Templars, and educated men, well able for the office, courteous and civil at all times; perhaps they were too well educated.

3588. Do you mean to say that the employers want a flathead as check-weighman? Well, I don't say so.

3589. *President.*] Do you think so? The proprietors don't care for a man who bristles with principles.

3590. *Mr. Curley.*] Do you think that intelligence can be crushed—that it can be put out of sight? It is crushed very much at the present time.

3591. Coming back to the internal working of the colliery;—do you know anything about the inspection of the colliery in the morning—do you know the practice in that respect? A certain mark is placed on the working place, with the day of the month, which is generally an indication that the fireman has been there examining the place.

3592. Have you seen that mark? Yes.

3593. Did you expect to see it there? Yes; it was sometimes placed on a shovel, so as it could be seen.

3594. What would you conclude if you did not see the mark on the shovel? You would conclude that the fireman had not inspected the place.

3595. In that case, would anybody tell you that you were not to go in? No.

3596. Do you know the rule that says a workman shall not go into his place until it is inspected? I think there is a rule to that effect; I know the fireman does stop some miners sometimes to tell them there is danger.

3597. What would the danger arise from? Accumulation of gas; there is one portion of the mine where there is a probability of gas, that is in the No. 4 tunnel Back Creek Collieries.

3598. Do you know for a fact that there is fire-damp given off occasionally? Yes; when they are opening up the headings in the No. 4 tunnel.

3599. Is it a usual thing to put a mark on the shovel, or on the coal face, to show that the mine has been inspected? Yes; to give an indication that the place has been visited; and should there be danger there is a danger board placed at the road end to warn men not to enter the place. At the Duckenfield Colliery, till within three or four years ago, it was never inspected till they met with the presence of gas in Nos. 4, 5, 6, and 7 headings, and the miners made application for the fireman to visit there.

3600. Were these headings in the Duckenfield Colliery? Yes; in the dip workings.

3601. Was fire-damp found there? Yes; that necessitated the appointment of a fireman.

3602. Did the management not appoint a fireman until the men asked for him? No.

3603. Would he still examine those places independently of the mine working? It is generally understood that one half of the mine is not examined at the present time. Gas has not been found, and they think it is not necessary to inspect the places in the morning.

3604. Do you think that every place in the mine should be inspected? Yes; one does not know what may occur with a change of atmosphere. A short time ago, about a fortnight ago I think, about fifty or sixty men went to work, and they had to leave the workings when they had been in from a quarter to half an hour. Eight or nine of them were wheeled to the surface. The men had to all leave the workings by 7 o'clock, overcome by some fumes that were of an extraordinary nature, not to be found there at any other time. Not being employed at the colliery I do not know much about it, but the men told me that they did not find this mark on the working place, nor had they made it on that section of the mine. They concluded the fireman had not visited that section.

3605. They concluded that he had not visited that section that morning? Yes.

3606. What conclusion did the men arrive at as to the cause of this? The men themselves could not clearly understand what the cause was. They knew it was some irregularity in the air. It was discovered that the debris which had been taken from the downcast shaft, that was in the bush some distance away, had taken fire—some assume by the late bush-fires. Some wood had been intermixed with a kind of inferior coal and rock, and it had taken fire also, and the sulphurous fumes emanating therefrom went down the air shaft. I visited the shaft and saw the burning material that had been removed from close behind the shaft. I believe that to be the cause. It was discovered by the officials.

3607. Was that an occurrence of an exceptional character? Yes, purely exceptional; and it may never occur again. It proves to my mind that these shafts should be built up with a widening area a given height above the surface so that the air entering the shaft may be as free as possible from contact with putrifying substances, or poisonous gases originating through combustion of material lying close to the mouth of the shaft. The mouth of the shaft is level with the ground, and this material is piled several feet above the surface close by. The miners perceived this smell for three days before it took this intensified form and compelled them to cease work.

3608. The miners did not perceive it to such an aggravated extent as on this particular day? It seized them all at once just when they got to work. I think it proves conclusively that there was no one there before they went to work.

3609. What time do these men go to their places? At all hours. They are in before the furnace-man often. The furnace-man has informed me that most of the miners have their picks off the rack when he goes in. They are ten hours in the mine.

3610. Have you any engine planes in any of these mines? Yes.

3611. Do you have many accidents on these roads? Yes; in No. 4 tunnel about four years ago there was a man killed, by the name of Ephraim Ilamer, by the set. He was not a stranger, but had not taken notice that the man-holes were all on one side. He went to the other side and found out his mistake, and tried to squeeze between the skips, and lost his life.

3612. Were there sufficient man-holes according to the Act? Yes; but they were all on one side of the road.

3613. Do you know of any other accidents? There was another accident in the old tunnel at the Duckenfield

Mr.  
P. Curran.  
25 Sept., 1895.

Duckenfield Colliery. The miner's name was Walsh. Both the No. 4 and No. 2 tunnels are double width, but in the old tunnel you have to travel between the roads. Walsh was travelling between the roads, and met with an accident which killed him.

3614. Are there any man-holes there? Yes; at the Duckenfield Colliery there is a great turn, and it is difficult to hear the set coming. It travels at a great speed. For a considerable distance the road is so narrow that a man can easily stretch across and touch both sides of the road at the same time with his hands.

3615. Are the man-holes on each side of the road? Yes; I think they are alternated on either side.

3616. Do you know of any other accidents that have taken place? There was an accident, not fatal, to a man named Halestone. He was on what we call the landing from the top where the double road comes in. He was met at the crossing, and the empty set passed over him and broke two or three of his ribs. He was, however, able to work a few months afterwards. This is the only travelling road for the miners out of that tunnel—that is in between the rails of the hauling road.

3617. Have you looked over the proposed Bill? I have made a scanty perusal of it.

3618. Did you notice whether these refuge places were kept clear at all times? Yes; very clear. Some were not very high. You had to stoop down to enter them. On the average they were about 5 ft. high; some of them were not as high.

3619. What depth were they? I could not be accurate as to the depth. It takes three men as close as they can get together to get into them. They vary a good deal. They utilise the old place ends for half of the man-holes.

3620. Do you think if the man-holes were made on both sides of the road that that would be an improvement? I think it would. The miners about there never thought that there were no man-holes on that side.

3621. Have you been up there since? No; they have a new travelling road altogether now at No. 4 tunnel, Back Creek.

3622. Has this defect been remedied? Yes.

3623. Have you what is known as a spragman in the colliery? Until about two years ago there was none.

3624. What are a spragman's duties? He is supposed to go round and see that the miners place sprags at the working face, to secure the coal when they are holing it.

3625. Does he go round and warn the men? Yes.

3626. Do you believe in having these spragmen? I do.

3627. Do you think they are necessary? Yes; because there are miners who are careless as long as they do not see danger. Although I believe it is carried out in some cases very harshly, I think, in some parts, it should be the general rule.

3628. With regard to the provisions of the proposed Bill, have you looked over them? Yes, in a cursory manner.

3629. Have you seen the provision in the Bill dealing with the hours of employment—section 36, on page 17 (see Appendix A.)? Yes.

3630. Do you believe in the proposal in the Bill with regard to the working hours? Yes, I do.

3631. Do you know that it is proposed to make a change? Yes, to eight hours.

3632. Do you believe in the legalisation of the eight hours? I do.

3633. Do you think that eight hours is long enough for a man to work in a mine? My personal opinion is that it is too long.

3634. *President.*] Supposing a manager wanted a man to stop an hour or two later in the day to finish a vessel that was wanting coal, would the men agree to that? No; I should not consent to such a thing.

3635. *Mr. Curley.*] Don't you think that would become a general custom? There would be always boats on hand, I think. I think that trade would go on with the eight hours as it does with the ten hours at present. I think the traffic would adapt itself to the hours.

3636. Do you think it would interfere with the trade? No, I do not think so. I do not think that men should work any more than eight hours. From a physical point of view it is too much in a coal-mine in the vitiated atmosphere where the miner works.

3637. Do you know that proprietors occasionally suspend the whole of the operations of a colliery? Yes.

3638. Have they done so quite recently to your knowledge? Yes, they have shut down a colliery.

3639. Have they closed down one of the collieries in your district? Yes; the No. 2 and No. 4 tunnels were closed down.

3640. For how long were they closed? For four or six months.

3641. When was that? I should think about two years ago.

3642. Was that not working less than eight hours? I did not say it was in connection with the hours.

3643. Was not that working less than eight hours at that particular colliery? Yes; there were some hundreds of men thrown out of work under the pretence that the colliery would never work again. At the same time there were certain hints given that if the men would submit to a reduction they could go to work at any time.

3644. Have you thought the question out fully with regard to the eight hours? Yes.

3645. Do you think it would affect wages in any way? Yes, I do. It would minimise the time. The miners at present are receiving no more than they can possibly exist upon by working the ten hours a day. If they worked eight hours they could not live on less, therefore the miner would have the protection that he would not be giving labour away over the eight hours.

3646. *President.*] Do you think the miners would raise as much coal in eight hours as they do in ten hours, and get as much money? They would have to receive a higher tonnage rate.

3647. If the masters could not pay a higher tonnage rate, what then? They would be thrown out of employment. My experience is that the tendency with employers is to extend the hours of labour. One reduction comes, and then another, and, to meet this, another hour is put upon their labour. I have found amongst proprietors that the cause is competition amongst themselves, and that the miner is being used for that purpose. As long as the miner is willing to put on another hour, so they go on. I say it should stop at eight hours, and so allow the miner a wage to live upon. They are now taking boys of 13 years of age to do what their fathers were doing. Where two men used to work now they do with one. For the moral tone of society the law should compel eight hours to be a day's work, and no more. If coal is a necessity it will be got then, but it should not come out of flesh and blood.

3648. *Mr. Curley.*] In a competition period such as you have mentioned, and with a market overstocked with

Mr.  
P. Curran,  
25 Sept., 1896.

with labour, have the men very much say as to what their conditions shall be? They have any amount to say, but it has no effect on the proprietors. Circumstances command them, and if they disobey, they can go hungry.

3649. Do you think that eight hours is the general wish of the men as a body? I am certain of it. In the district where I come from the miners are agitating, by public meetings, for eight hours. One half of the time is taken up dealing with recalcitrant members, trying to bring them back to eight hours. There is a general complaint against the present condition of things.

3650. Do you ever hear many people say they are opposed to men working the eight hours? Very few.

3651. Even proprietors? I cannot say that I do.

3652. Is not their chief objection the matter of legislation? I believe the proprietors generally are not opposed to eight hours, but they are opposed to legislation on the subject. I hold that if a man believes in a principle, and sees that principle exposed to danger, or imperilled, that he should not fear to see it ratified by law.

3653. You said that a man would not get as much coal in the eight hours as he would in the ten hours—taking it over a number of years don't you think he would? I would not say altogether. A practical man with science expends an amount of energy, and taking an average for six months or a year of the energy expended, I think he will produce as much in eight hours as ten hours, because it produces bad health. Within a given time, I don't think he would produce as much by working ten hours as he would by working eight hours, because excessive toil impairs the constitution and consequently brings a premature destruction of the labourers' nerve power.

3654. In any case, do you think the miners are willing to take the consequences of anything that might arise? I do.

3655. No matter whether wages are effected or otherwise? Yes.

3656. Do you think the miners have fully considered that phase of the question? I do believe that.

3657. Apart from trades-unionism altogether, do you think that eight hours is long enough for a man to work? I do, conscientiously. I think it ought to be the maximum limit, because a miner's occupation is peculiar from any other occupation. There are two or three hours occupied going to and from work, and I hold that a miner should have so much time to himself every day.

3658. Have you looked at the clause with regard to ventilation in the Bill, section [50] 47, on page 23 (*see Appendix A.*)? Yes.

3659. Do you know that the proposed Bill has a provision stipulating a higher minimum quantity of air? Yes; the present Act specifies 100 feet, and the intended Bill 150 feet, which I believe is highly necessary.

3660. Do you believe in a stipulated minimum at all? I do.

3661. *President.*] If you had not that minimum in the present Act I believe it would be better in the way the inspectors have read the Act. It has been stated that they measure the air in the airway, and that if the necessary quantity of air is there according to the Act they have no power to remedy a deficiency of air in the working places? Where we find the air 100 feet we think there should be a greater quantity of air.

3662. The danger is in stipulating an amount for fear of its being misread. The difficulty is that if you specify a minimum in the proposed Bill it may be misread again? The miners are prepared to abide by the consequences, and they are prepared to go further than that minimum rather than have no minimum at all. If an overseer was to say there is an adequate amount of air, the contention would be as to what an adequate amount of air was. I think it would be much better to say there shall be a certain amount of air as a minimum. I believe that 100 feet of air is not sufficient, I think it should be 150 feet, and if possible more. I know the amount of air travelling in the intakes provides for double that quantity, but it is squandered. It would compel the proprietors to see that that amount of air was conducted to the working face.

3663. *Mr. Curley.*] Does the air not occasionally scale over the stoppings? Yes; if the air that enters the intakes was properly conducted all would be right, but it gets squandered through the stoppings not being kept in order.

3664. Do you know what the stoppings are built with at Brown's collieries? Yes; the refuse 6 inch and 3 inch with bands and slack, and sometimes portions of material taken out of the roof where it is necessary to add to the height of the road.

3665. Are the stoppings plastered with lime? No.

3666. Are not the main stoppings plastered with lime? Some of them are brick work and some not.

3667. Have you noticed occasionally that the air will scale away where the stopping shrinks? Yes.

3668. Do you still think that a minimum quantity of air should be stipulated in the proposed Bill? I do.

3669. Do you think that the Bill could be worded in such a way with regard to the minimum quantity that the manager could not say that that was all the air he had to provide? I think so. Mine managers at the present time work from a point of economy, especially at the Minni collieries.

3670. Do you find fault with working from a point of economy? The adequate amount of air I hold, under present conditions, would be the lowest public opinion would admit of their working the colliery.

3671. Is the economy you complain of the economy that limits the proper ventilation for the mine? Yes; there should be a very efficient eye kept to see that these stoppings are filled up, that the airways are kept in good condition, and that the furnace is kept going night and day. I hold that the stipulated amount of air should be higher than at present, and I maintain that an adequate amount of air would become in public opinion a certain amount according to whatever conditions prevailed, and that it should be specified what that should be for the protection of the miners. The health of the miners should not be imperilled on any monetary consideration.

3672. Have you noticed the provision in the Bill giving the inspector power to withdraw the men from the mine in case of danger? Yes.

3673. *President.*] Do you think it is right the inspector should have that power? Yes.

3674. If an inspector had that power given to him, do you think that it should be used only in cases of imminent danger? Yes. My opinion is that that power should be invested in the Government Inspector of the mine. If he is qualified to understand the nature of these cases I think he should be given the power to prevent loss of life—that is, in cases of imminent danger.

3675. Might not there be other circumstances besides gas to cause danger in a mine? Yes; such as mining under tidal waters, creeps in collieries, where indications are given days previous by pillars cracking, and so forth.

3676. *Mr. Gregson.*] Do you know if a strike took place at the Minni Colliery about six months ago, with reference to a proposed reduction in the minimum height of the seam? Yes.

3677.

3677. Did the miners who were at work then retire from the colliery? They refused to accept the terms.  
 3678. Were you one of those miners? Yes.  
 3679. Have you been out of work ever since? Yes.  
 3680. *Mr. Curley.*] Have you applied for work at that colliery again since the strike? No.  
 3681. Have you not made any application for work? No; for certain reasons I have not.  
 3682. Do you occupy one of the Company's houses? There is a dispute between us on that subject at present. They have taken the matter to the Court, and they have withdrawn from the case.  
 3683. *President.*] In the meantime, are you paying any rent? No.  
 3684. *Mr. Gregson.*] Does not the house belong to the Company? I will not say so; I built the house, and agreed to pay 30s. a year for ground rent, to be deducted from my wages.  
 3685. *Mr. Curley.*] Did the Company give you a lease of the ground you built your house on? I built the house on a temporary lease, upon the understanding that my lease would be renewed when it expired. Instead of renewing the lease, they come and say that I will have to pay a weekly rental, and be prepared to quit at a week's notice, although I built the house and paid for everything in connection with it. If, after doing that, a man comes and says it is his, I cannot see that it is.

*Mr.  
P. Curran.*  
25 Sept., 1895.

[Witness withdrew.]

William Lowe sworn and examined:—

3686. *Mr. Curley.*] What occupation do you follow? I am a miner.  
 3687. What colliery are you working at? At present I am employed at the West Wallsend Colliery.  
 3688. Have you followed mining for any length of time? Yes, from childhood; from when I was about 10 years of age.  
 3689. What mines have you worked at in Great Britain? I have worked at four collieries in the county of Durham.  
 3690. What are the names of the mines you have worked in? The Tudhoe Colliery and the Binchester Colliery.  
 3691. Have you worked in any other collieries in Great Britain? Yes; in the Broomside Colliery.  
 3692. Any other collieries? In the Sunnybrow Colliery.  
 3693. What was the method of working in these collieries? In some of them bord and stall, and in some longwall.  
 3694. In what collieries did you work the longwall system? In Tudhoe and Broomside.  
 3695. What was the practice in the other collieries? Bord and stall.  
 3696. Do you know the depth of any of these collieries? Approximately, they were somewhere about 80 fathoms deep.  
 3697. That would be about 480 feet? Yes.  
 3698. Do you know the width of the bords where they worked under the bord and pillar system? They used to work them six yards wide, but before I left five yards wide.  
 3699. Where was that? In the Binchester Colliery.  
 3700. What was the size of the pillars? The ordinary pillars were 12 yards thick, by 30 yards in length. The ordinary bord pillars were 12 yards in width and 30 yards in length.  
 3701. What was the size of the pillars in the other two collieries? They were just about the same size.  
 3702. What was the depth of these collieries? About 50 fathoms deep—300 feet.  
 3703. What was the height of the seams? From 4 feet to 5 feet high, or an average of 4 ft. 6 in.  
 3704. Did they use any brattice in these collieries? They bratticed right up to the face where the bord and stall system was worked.  
 3705. What collieries have you worked in in New South Wales? In the Hetton and Seaham Collieries; at present I am working in the West Wallsend Colliery.  
 3706. What was the system of working at the Hetton Colliery? Six-yard bords and six-yard pillars.  
 3707. Had you much refuse to contend with at the Hetton Colliery where you worked the jerry? Only the jerry in the bottoms.  
 3708. What was the thickness of that jerry? From 5 in. up to about 7 in. thick.  
 3709. Did that band run right across the bord? Yes, right across the bord.  
 3710. Were you ever in any wet places in that colliery;—did the seam make much water? The winning crosscuts were very wet. We had very often to use two damboards to dam the water back.  
 3711. Do you know whether they keep bores in advance at that colliery? Yes; but I could not state the distances ahead.  
 3712. Who puts these bores in? A man is kept specially for the purpose, and works in the night time.  
 3713. Did you ever notice the ventilation in any way defective in some of the places at the Hetton Colliery? It was very defective in the narrow workings.  
 3714. With regard to Wickham and Bullock Island Colliery; but, before we go to that, what are the sizes of the pillars at the Hetton Colliery? Six yards.  
 3715. What is the width of the bords at that colliery? Six yards.  
 3716. Were the bords driven by line? No.  
 3717. Were the pillars kept to a uniform size? They were kept somewhere nearly about a uniform size.  
 3718. Do you know whether they are working under tidal waters at the Hetton Colliery? Yes; they work all under tidal waters.  
 3719. Did you ever hear any motion overhead? Yes; on two or three occasions we have heard the noise of the ferry boats going up the harbour when we were working down in the mine.  
 3720. Was that noise quite clear? Yes; quite distinct.  
 3721. Are you sure there could be no mistake about it? None whatever.  
 3722. Do you think that a colliery in that position would have to be worked very carefully? I do.  
 3723. *Mr. Gregson.*] Was the water salt? Yes; very salt in the workings; most of the water was of a brackish nature.  
 3724. *Mr. Curley.*] Does the Wickham and Bullock Island Colliery adjoin the Hetton Colliery? Yes.  
 3725. Does the same practice prevail at that colliery as at the Hetton colliery? I have never worked there. I have only worked at the Hetton Colliery on Bullock Island.  
 3726. Have you worked at the Seaham colliery? Yes.

*Mr. W. Lowe*  
25 Sept., 1895.

3727.

- Mr. W. Lowe, 3727. How long have you worked at that colliery? For three years. I worked there up to the time of the fire.
- 25 Sept., 1895. 3728. Did the fire that occurred there lead to the closing of the colliery? Yes.
3729. Were you working at the Seaham colliery at the time of the fire? Yes.
3730. Did you work there as a practical miner? I worked there for six months as a miner on the coal.
3731. What was your occupation later on? I was acting as fireman for the rest of my time at that colliery.
3732. Was it part of your duty to inspect the working places of the colliery in the morning? It was my duty to inspect one district every morning when the pit was working.
3733. Who inspected the other districts? There was another fireman on the opposite side of the pit.
3734. Were all the places in the colliery inspected every morning before the miners went to work? Yes; all round the pit.
3735. Was that done by order of the manager? Yes.
3736. Had the men to see you before they went into their working places? Yes; every morning we had to stand and see every miner at the pit bottom.
3737. Was there any fire-damp given off in that mine? In the north-east workings we had to keep it bratticed to within 3 feet of the face to keep it clear, or as near that as possible.
3738. Do the workings in that district rise or dip? They rise.
3739. In what position is your upcast shaft? To the rise of the mine.
3740. How far is it away from the downcast shaft? I cannot say definitely, but somewhere about 7 or 8 chains.
3741. What is the height of that seam? According to the system of working, the average was about 5 feet.
3742. Would this represent something like a section of the coal. [*Witness shown a section of the coal from the report of the Department of Mines for 1889, see Appendix T.*] Yes, that is a section of the seam showing the band and the roof.
3743. What kind of brattice do you use at that colliery? Canvas cloth.
3744. Can you use that canvas cloth for a considerable time? Yes, under different conditions. I have some of that cloth in use that has been there ever since I went to Seaham. It was in use when the pit knocked off.
3745. Is the gas very active in that mine? In one section of my district it was very active.
3746. Did it require special vigilance? Yes, special vigilance.
3747. Do you use safety lamps there? No, we work all by naked light.
3748. Do you depend on the ventilation? Yes.
3749. Is the mine ventilated by fan or by furnace? By fan.
3750. What kind of a fan is it? A Waddle fan.
3751. Do you know the diameter of the fan? I cannot say exactly what the diameter is.
3752. Would you consider the cost of bratticing for that colliery a specially expensive item? Well, as far as the expense is concerned, once the brattice is put up, it will last for a very long while.
3753. Is the expense, then, merely nominal? Yes.
3754. Is there any fire-damp given off in the dip section of that mine? We have never found any in the examinations.
3755. What is the width of the bords? 8 yards.
3756. Do you know the size of the pillars? 6 yards.
3757. What is the depth of the shaft? 460 feet.
3758. Are these shafts in the valley leading up to the mountain? One of the shafts is in the valley—the down-cast shaft, and the up-cast shaft is two-thirds of the distance up the mountain.
3759. Are your workings leading mainly towards the mountain? The headings are driven east and west, and the bords are working mostly through the range.
3760. Do the workings rise or dip in that direction? They are rising towards the range.
3761. What is the ratio of the rise? It varies greatly. In the west workings it is about 1 in 12, or 1 in 14, and in the east workings 1 in 8.
3762. Is it what you would call a moderate rise? In the west, yes; in the east, more than generally.
3763. When you get under that mountain will you get a considerable quantity of weight? Yes.
3764. Will that represent a greater depth in the mine? Yes.
3765. Did you say that you had only a 6-yard pillar? Yes.
3766. Do you ever discuss this matter of sufficient pillars with the manager at all? Yes, with the underground manager, but never with the manager.
3767. Who is the underground manager? I refer to Mr. William Henderson, the late underground manager.
3768. Was he the underground manager? Yes, under Mr. John Turnbull.
3769. Has he been employed in the mine since? No.
3770. Where is he now? In Victoria.
3771. Is he still living at West Wallsend? His family is still living there.
3772. How do you ventilate the mine? By four splits, two on each side of the mine, two on the east side, and two on the west side.
3773. Was the mine ventilated in that way when you first went there? No; by furnace, and only two splits.
3774. What condition was the ventilation in at that time? It was very poor, but the number of men employed was not so large.
3775. Was the ventilation anything like it is now? Nothing like it is now.
3776. It is ventilated by fan now? Yes.
3777. Was this fan put up later on? Yes; the fan has only been up about eighteen months.
3778. Did you make the splits previous to, or since the erection of the fan? Since the erection of the fan.
3779. Where do your splits start from? East, 2½ chains from the pit bottom, and west, 20 chains from the pit bottom.
3780. When you put these splits in did you notice a considerable advantage in the ventilation? It more than doubled the air in the east workings, and it gave one-third more air in the west workings.

3781. Do you think that a mine should always be vigorously ventilated? Yes; and in a mine of that description specially so.
3782. Do you believe in splits? Yes.
3783. Have you considered this question of ventilation? I have made it a great study during the last three years.
3784. Is that part of your work? It is my sole work to look after the ventilation.
3785. Did you look after the putting up of brattice? Yes; I looked after that right through the pit where I was last working. I looked after the putting of all the brattice up.
3786. *Mr. Gregson.*] Did you put up all the brattice in the Seaham Colliery? Yes; till the colliery stopped.
3787. *Mr. Curley.*] Do you say that you had to put up the brattice for the whole of the colliery? Yes; but since the change of management—since Mr. Turnbull left and Mr. Fairley took charge—the miners have been reduced to two-thirds.
3788. Did they reduce the underground men? Yes; there was one fireman instead of two.
3789. Were you the fireman that was kept on? Yes.
3790. How many men were employed there as underground officials when Mr. Turnbull was manager? There were four—two on the back shift that came down at 7 o'clock; but their duties were more numerous than what they were later on.
3791. Do you know the number of men employed when Mr. Turnbull was there? Approximately 250 men.
3792. How many men were employed later on? One hundred and twenty-four men.
3793. Does that 6-yard pillar you have referred to apply to the main roads, and everything in the mine? No, only to the ordinary bord pillars.
3794. What kind of pillars did you leave near the main road? They were 16 or 18 yards thick.
3795. Away from those pillars, were the other pillars only 6 yards? Yes, 6 yards.
3796. Are you a practical man? Yes.
3797. Do you know the depth of that colliery? Yes.
3798. You know that it is going under a mountain? Yes.
3799. Knowing that, would you regard those 6-yard pillars as of anything like an adequate size? No; in conference with the underground manager we always objected to the size of the pillars.
3800. If you had to take up an independent position as a manager would you leave larger pillars? I would grade them off, and leave nothing less than 8 yards.
3801. Have you had any experience in extracting pillars? Yes; I have had a little experience at home.
3802. Do you believe that the coal can be obtained better by leaving larger pillars? Yes; pretty nearly all the coal can be got with the larger pillar, but with small pillars you often lose a lot of coal.
3803. Have you a very strong roof at that colliery? Yes, a splendid roof.
3804. Do you think it will be likely to stand for a considerable time? Yes.
3805. If you were taking out pillars, would you not require a larger pillar to break it off when it once comes away? In beginning to take pillars out, a larger pillar would be needed to break the first fall.
3806. Have you commenced to work any pillars out there yet? No.
3807. Is the mine a comparatively new mine? Yes.
3808. Have you looked over the proposed new Mining Bill? No.
3809. Do you know that there is a provision in the Bill to alter the hours of working, to bring them down from what they are now to eight hours? Yes.
3810. Do you think that eight hours is long enough for a man to work in a mine? Yes, quite sufficient.
3811. Do you think that such a matter can be better arranged between the men and the manager, or do you think that there should be legislation upon the subject? Well, it is a question that I have not taken much time to study, but I think there is a possibility of it being agreed to between the men and the managers. In some cases, however, it would be very difficult to decide.
3812. Do the men mostly work eight hours in that particular colliery? Yes; exclusive of meal hours.
3813. Have you not given the question of legislation on this matter any consideration? No; I have not.
3814. Do you know the provisions in the present Act with regard to ventilation? Yes.
3815. The proposed bill stipulates for a minimum of 150 cubic feet of air, but that is objected to by the Legislative Council, who want the provision that is in the English Act, which provides for an adequate quantity of air without a minimum. Do you consider that a stipulated minimum quantity of air should be embodied in an Act of Parliament? I think that there should be nothing less than 150 feet of air, especially in connection with the mine that I have worked in during the last three years, that is in the gassy section.
3816. Leaving out of sight a gassy mine for the present, for ordinary sanitary purposes don't you know that the defect would be in providing ventilation where there is no gas? Yes; if there is no proviso for a minimum quantity it leaves it to the caprice of a manager as to what is an adequate quantity.
3817. Do you think a manager might attempt to take advantage of the word "adequate"? All that I can say is that I have seen cases where, with very little trouble, a manager could have given more ventilation, but did not do it.
3818. Does that impress you with the idea that there should be a minimum quantity stipulated? Yes.
3819. The present Act of 1876 states that the air shall sweep undiminished past each working place;—do you think that the air should be carried into the working place? Yes; it does very little good in passing along the heading when the bord gets in 30 yards. The miners do not feel much effect from the air on the heading.
3820. Have you noticed in your experience that in some of the mines a good deal of refuse has been put on each side of the bord? In the present mine I am working in there is fully two-thirds of the side filled up with refuse.
3821. If this is so, how is this air to get into the working place? The system we use would be to carry it in in the intake side, and leave the wide side for the return.
3822. Do you mean to carry it in by brattice? Yes.
3823. Do you think that the shortening of the cut-throughs would be an advantage? Not if brattice-cloth was used as a means of ventilating.
3824. Do you think that if brattice was put up there would be no need to shorten the cut-throughs? Yes, I think there would be no need to shorten the cut-throughs.
3825. As things are carried out at present, do you think that the cut-throughs are too long? Yes, far too long.

Mr. W. Lowe.  
25 Sept., 1895.

- Mr. W. Lowe. 3826. *President.*] What do you say should be the proper distance in front of the air? Fifteen yards in front of the air.
- 25 Sept., 1896. 3827. *Mr. Curley.*] If you had a 35-yard cut-through, would that mean 20 yards of bratticing? Yes; about that quantity.
3828. Do you think that part of this refuse could be utilised for the purpose of bratticing? Yes; what is thrown back on the road side could be utilised along with the brattice cloth.
3829. Would you regard bratticing as a very serious item of cost? I think the cost is merely nominal after the stock of brattice has once been worked up. Our purchase of new brattice would only run about one bale in every two months.
3830. What is the size of a bale of brattice? About 100 yards.
3831. Is that double width? Yes; double width.
3832. Would that be 2 yards in width, and 1 yard in length? Yes.
3833. From the experience you have had in using brattice, do you state that it can be used over and over again? There is brattice cloth in use now at the Seaham Colliery that has been in use over three years.
3834. There is a clause in the proposed bill with regard to giving power to the inspector to withdraw men in the face of danger. The Legislative Council has objected to and erased this clause. Do you think an inspector should have this power? I think it is only fair to allow the inspector power, if there is real danger, to withdraw the men.
3835. Do you think that is a power that ought to be vested in the inspector? Yes.
3836. *President.*] You think that an inspector should have that power in case of imminent danger? Yes. In the case of a creep, it generally gives warning for some time. With a strong roof it will be a couple of months.
3837. Do you think that this great power to inspectors should only be given in cases of imminent danger? Yes.
3838. Not unless there was imminent danger? I scarcely think that any of the inspectors would use such a power, except in cases of imminent danger.
3839. If you gave the inspector that power, you would not give it to him except in a case of immediately impending danger—a danger close at hand? Dangers might appear in two or three different lights, and as inspector of mines, and a man of practical experience, it would only be in the case of danger that he would attempt to withdraw the men. Only in a case of immediately impending danger.
3840. Is that all that you would give that power for? Yes.
3841. *Mr. Curley.*] With regard to a creep, in the case of a strong roof, if there was any appearance of it being on the move, and the inspector came in when this motion was going on, don't you think it would be right for him to have some authority to say whether the men should be withdrawn? It would all depend on the conditions at that time. I have seen instances where pillars have been worked out, where it would creep weeks before it came away. It generally gives warning before it comes away. In a case of that sort, I think it would depend greatly upon the nature of the roof as to the length of time it would be creeping, and they would scarcely exercise the power in an unjust manner under those conditions.
3842. Do you think that an inspector would endeavour to act with some kind of judgment under such circumstances? Yes.
3843. You think that he would not use his judgment in any arbitrary way? No; he would simply use his experience of the nature of the ground.
3844. Do you know the present inspectors? I only know one.
3845. Which of the inspectors is that? Mr. Humble.
3846. Have you met him occasionally? He used to come to the Seaham Colliery.
3847. What opinion have you formed of Mr. Humble? I think he is a thoroughly efficient officer.
3848. Has he made suggestions to you at any time with regard to what would be for the benefit of the colliery? Yes on small matters; he has given advice, and I have generally followed it out.
3849. Have you benefited by that advice? Yes.
3850. Are you aware when the inspector is coming to the colliery to make an inspection? No.
3851. Do you generally expect him every two months, or so? I think once in every eight or nine weeks, although sometimes it is only six weeks between his visits.
3852. Do you know whether the question of the 6-yard pillars at Seaham has been a matter for discussion at any time between the inspector and the manager? He has drawn our attention to the size of the pillars, but I know nothing about any conversation with the manager.
3853. What do you mean when you say that he has drawn your attention to the pillars? When we have encroached on the pillar he has drawn our attention to it.
3854. Do you drive your bords by line? Yes, with Mr. Turnbull during the last twelve months of his management.
3855. Have you been doing so later on? We have not followed the same principle since he left the colliery.
3856. Do you think that principle should be adopted? I think it is the best method of working to keep the pillars intact.
3857. Does it keep the pillars to a uniform size? Yes.
3858. Did you get your instructions principally from Mr. Henderson, the underground manager? He was the underground manager under Mr. Turnbull.
3859. Were you at the Seaham Colliery when this fire occurred recently? I was fireman at the time.
3860. Were you in the mine the day the fire occurred? No, not on the day the fire was reported.
3861. Was the mine not at work? The mine had only worked one day that week.
3862. Were you only working when the mine was working? I had only worked one day more than the mine.
3863. Do you know anything of the origin of that fire? The origin of the fire is unknown.
3864. Is it one of the mysteries appertaining to fires? Yes, as far as I am aware.
3865. Were you in the mine after the fire occurred? I was about one of the first in the mine after the underground manager discovered the fire.
3866. Where was this fire situated? In the flat, in the north-east workings of the mine.
3867. After attempting to put it out, was it decided to close the mine down? Yes.
3868. Did they fail to accomplish the object of putting it out at the time? Yes.

[Witness withdrew.]

MONDAY, 30 SEPTEMBER, 1895.

[The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.]

Present:—

FRANCIS EDWARD ROGERS, Esq., Q.C. (PRESIDENT).

JAMES CURLEY, Esq.

JESSE GREGSON, Esq.

Jonathan Coates sworn and examined:—

3869. *President.*] What are you, Mr. Coates? I am a farmer and dairyman.
3870. Have you ever been a coal-miner? Yes.
3871. How many years have you been a coal-miner? Fourteen years.
3872. Have you been coal-mining in this Colony for that length of time? In England, and in this Colony.
3873. How long have you been coal-mining in England? Nine years.
3874. And the rest of the time you have been in this Colony? Yes.
3875. What mines have you been working in in this Colony? In the Minmi collieries in the Newcastle district, and at two collieries in the Southern district, and two collieries in the Western district.
3876. *Mr. Curley.*] What collieries have you worked at in the Western district? At the Vale of Clwydd and the New Vale Collieries.
3877. Are you well acquainted with the system of weighing in the Western district? Yes; I am very well acquainted with the system of weighing.
3878. Have you conversed with men working at other collieries to ascertain from them the system of weighing in the same district? Yes.
3879. What was the system of weighing at the collieries you have worked at? There was no uniform system. It was a system of averaging, but it appeared to be very unsatisfactory, and has been proved in many cases to be unsatisfactory to the men.
3880. For what reason was it unsatisfactory? Chiefly that there was far too small a number of skips weighed in proportion to the number of skips raised.
3881. Was that a subject of common complaint? It was the most serious complaint, and it was the general complaint.
3882. *President.*] What position did you hold in the colliery? I was check-weighman at the Vale of Clwydd Colliery.
3883. *Mr. Curley.*] How long ago is it since you held the position of check-weighman? Something like two years ago, or a little over.
3884. Did you hold that position for any length of time? Something like two years, or a little over.
3885. *President.*] Two years ago you were a check-weighman? Yes.
3886. *Mr. Curley.*] Did the manager call the skips to be weighed, or what was the understanding about the system of weighing? The system of weighing was that the manager had full control and absolute power to call for what skips he liked. The check-weighman had no power whatever; he simply saw that the skips were weighed correctly as far as he could judge, but the manager had sole control over the calling of the skips.
3887. Would the weighman on behalf of the Company make this call? Quite so.
3888. *President.*] Do you say that the check-weighman had no voice in what skips should be weighed? Yes. That is one objection to the system now prevailing. The men now contend, and have for many years contended, that they ought to have the same power for the calling of the skips as the weighman on behalf of the Company.
3889. *Mr. Curley.*] Has the Company's weighman any other duties besides weighing? Yes.
3890. What other duties are these? As a rule, the manager weighed the coal, but not at all times. He had at times a clerk, and this clerk used to assist him.
3891. What colliery are you speaking about? The Vale of Clywdd.
3892. Who was the manager of that colliery? Mr. Thomas Broughall.
3893. *President.*] How many skips, on an average, used to be weighed? I have a statement here which will give particulars.
3894. *Mr. Gregson.*] Where did you get the figures in this return from? From the present check-weighmen in the Western district.
3895. Have you taken these figures from the check-weighmen's books yourself? Yes; the check-weighmen were present with me when I took these figures. I took the figures myself, in conjunction with the present check-weighmen.
3896. *President.*] Whose books are these? The books, of course, belonging to the Miners' Association. While the check-weighman is there, of course he is for the time being the owner of the books.
3897. *Mr. Curley.*] Are these figures copies from the check-weighmen's books? Yes.
3898. What particulars have you with you? The quantity of skips drawn since the 12th January in the present year up to the present time, at the Vale of Clywdd Colliery, is 20,474 skips.
3899. What date is this return up to? Up to 28th September, inclusive—up to last Saturday.
3900. How many skips have been weighed out of that number of skips? 130 skips.
3901. *President.*] Have you any record to show whether these skips are weighed once in a day, once in a week, or once in a fortnight? As near as we can get at it, it was from two to six weeks. They may weigh a small number of skips in one day, and then go from two to six weeks without weighing any skips at all. They would have a lapse sometimes for two months, and in one case three months, between the periods of weighing.
3902. *Mr. Curley.*] What year are you referring to? This year—1895.
3903. Do you think that one skip in 157 is anything like a fair proportion of skips to weigh? No; I do not.
3904. Have there been very many complaints made to the manager about the insufficient number of skips that were weighed? During my time there were many complaints of that description made.
3905. Was the manager ever requested to weigh more skips from time to time? Yes.
3906. Was he urged to do so? Yes.

Mr.  
J. Coates.  
30 Sept., 1895.

- Mr. J. Coates. 3907. Did the manager decline to weigh more skips, or what reply did he make to these representations? He never gave any definite reply as to how many skips he would weigh. He regarded it as his absolute right to weigh when he thought proper, and as many skips as he thought proper. He never gave us any more satisfaction than that.
- 30 Sept., 1895. 3908. *Mr. Gregson.*] Where is Mr. Broughall now? He is the manager of the same colliery still.
3909. *President.*] Would he have a record of the number of skips weighed for the period you have mentioned? He ought to have. I think he should have a record.
3910. *Mr. Curley.*] Can you give us any information with regard to any of the other mines in your district? Yes; the Zig Zag Mine.
3911. Have you the figures in a similar way for that mine? Yes.
3912. Have you taken these figures from the check-weighman's books? Yes.
3913. What period do these figures cover? The same period.
3914. Will you give us the particulars with regard to this mine? The number of skips drawn from the 12th of January to the 28th of September, inclusive, is 20,348.
3915. Why do you fix the date on the 12th January? Because that was the first pay in the new year.
3916. What number of skips were weighed out of that quantity? 225.
3917. *Mr. Gregson.*] Only 225 skips? Yes; only 225.
3918. No more? No more.
3919. *Mr. Curley.*] Who is the manager of the Zig Zag Colliery? Mr. John Wilson.
3920. Do you think that one skip in every ninety is anything like a reasonable number of skips to be weighed to get at a fair average of the weight? No, sir; I do not.
3921. Do you know if there have been any complaints made at this colliery with regard to the weighing? I can only say what the check-weighman has stated to me. He gave me to understand that many complaints had been made at that colliery of a similar character to those made at all the other collieries.
3922. Do you know of any other colliery where this system prevails? Yes; at the Eskbank Colliery.
3923. Have you the figures for that colliery for the same period? Yes.
3924. What are the figures? The number of skips drawn was 22,957.
3925. What number were weighed there out of that quantity? 102 have been weighed.
3926. *Mr. Gregson.*] Only 102 skips weighed? Yes, sir.
3927. *Mr. Curley.*] Do you think that one skip in 225 is anything like a reasonable proportion of skips to be weighed? No; I do not.
3928. Have complaints been made at that colliery as well? I cannot say positively, but from what I can hear they have.
3929. What is it that you have heard? The men state that they are anxious, and have appealed to have more skips weighed. The same complaints are made at that colliery as at other collieries in the district.
3930. Notwithstanding these complaints, does the same system of weighing still go on? Yes.
3931. Can you give us any information with regard to any other colliery? In connection with the Eskbank Colliery, they have another small coal mine where there are only a small number of men employed, and there they hardly ever weigh at all. They give the men an average of 14 cwt. 1 qr. per skip.
3932. *President.*] Is not that standard weight? They suppose that the men fill this amount of coal in every skip.
3933. *Mr. Curley.*] Do you mean to say that they assume that quantity is in every skip? Yes.
3934. Is that all the men are paid for? Yes; these skips come out of the tunnel, and go to the ironworks for local consumption, and they base their calculations on the weight of the skips.
3935. Who is the manager of that colliery? Mr. John Spooner.
3936. *Mr. Gregson.*] How many men are employed there? I cannot say exactly. I have made inquiries, but I cannot get the information exactly. As near as I could ascertain it was six men.
3937. I suppose when the men engage they know the system on which the weighing is done, and accept work on those terms? Yes.
3938. *Mr. Curley.*] How many men are employed at the Vale of Clwydd Colliery? Twenty-five is the average number all the year round.
3939. How many men are employed at the Zig-zag Colliery? A similar number of men.
3940. How many men are employed at the Eskbank Colliery? They employ also about the same number of men. The number of men employed ranges from twenty to thirty.
3941. *President.*] Are there only twenty-five men employed at each of these mines? Yes; from twenty to thirty men all the year round.
3942. *Mr. Curley.*] Are there any other mines you wish to refer to? I have not the figures for any of the other collieries, because there is no check-weighman, and it was impossible for me to get the figures.
3943. Do you know how they weigh at these other collieries;—are the men paid by average weight at the mines where there is no check-weighman? Yes.
3944. What are the names of these collieries? The Lithgow Valley and the Hermitage Collieries, and the Vale and Oakley Park Collieries.
3945. *President.*] Have you anything to do with coal-mining now? No, sir; I may say that at the Lithgow Valley and Hermitage Collieries they weigh a larger percentage of skips than any of the other collieries in the district.
3946. *Mr. Curley.*] Is the number of skips weighed small at the Vale and Oakley Park Collieries? At the Oakley Park Colliery, from information received lately, the quantity is very small indeed there.
3947. Who is the manager at the Lithgow Valley Colliery? Mr. Campbell.
3948. Who is the manager at the Vale Colliery? Mr. Blackwell.
3949. What is the manager's name at the Oakley Park Colliery? Mr. Robert Hayes.
3950. Do you think that every skip should be weighed? In the absence of some amicable arrangement being arrived at between an employer and his workmen, I do.
3951. If there was a fair number of skips weighed during each working day, do you think that would satisfy the men? I do. I have a copy of the colliery rules, in which it states that a certain number of skips shall be weighed, and that is agreed to by the men and the employers.
3952. What colliery does that rule apply to? To the Vale Colliery.
3953. Was that some time ago? About five years ago.

3954. *President.*] Do you say that the men would be satisfied if a fair number of skips were weighed? *Mr. J. Coates.*  
Yes.
3955. *Mr. Gregson.*] What do you mean by a fair number? The lowest number I have heard mentioned when a meeting has been called for the purpose of dealing with this matter was 5 per cent., or one skip in every twenty. Meetings have been called several times upon this question, and that is the lowest number that has been agreed upon. 30 Sept., 1895.
3956. *President.*] That has been suggested as a fair number? Yes.
3957. *Mr. Curley.*] Is that embodied in your rules? Not exactly, but something similar.
3958. What does the rule say? Rule 19 says, That the duties of the check-weighman shall be to see justice done in the weighing of the miners' coal, and also other matters relative to the miners' interest. He shall place on a board kept for the purpose the correct number of each miner's skips filled and brought out of the mine on each working day. He shall also place on the same board the average weight of each miner's coal that has been weighed on such day as weighing has been carried on by the Company's weighman and himself. He should further see that there is at least sixty skips per month weighed, and should the Company's weighman refuse to assist in weighing the said sixty skips, he shall draw the manager's attention to same, in writing. It shall also be the duty of the check-weighman to make a balance-sheet every fortnight showing the number each single or pair of men have filled during that period, and to assist the underground manager and general turnkeeper in every respect to regulate the turn fairly in the various headings or flats. He shall in person with the company's weighman test the weighbridge every fortnight, and should he not be satisfied with the correctness of the bridge he shall immediately bring same under the notice of the manager. He shall keep a full set of books showing all miners' work, and shall attend all meetings, and shall be paid fortnightly by the miners. 20.—In the event of the check-weighman not being able to attend to his duties he shall find a qualified substitute for one day only, in order that the decision of the lodge may be obtained confirming such appointment or otherwise. 21.—The check-weighman to be elected quarterly (by ballot), but should it be proved to the satisfaction of a majority of the lodge that the check-weighman has in any way misconducted himself at any time during the quarter, he shall be dealt with as a majority of the lodge may deem proper, but should the majority of the miners be in favour of his removal he shall be employed on the coal, providing he is a miner.
3959. *President.*] That rule says sixty skips per month? Yes.
3960. How many skips are raised per month? At present something like 2,400.
3961. Was that the number at that time? Yes; there might have been a little more trade at that time. Trade fluctuated at the Vale Colliery to a great extent at the time referred to.
3962. *Mr. Curley.*] Whether the colliery worked much or little, was that stipulation carried out? It was supposed to be carried out.
3963. Was it carried out? In some cases, but not in all. It is not carried out at present. It finally drifted, and was put on one side like many more things.
3964. Do you say that work at that colliery fluctuated a great deal? Yes; just at that time.
3965. Previous to this rule being agreed to, had there been any dissatisfaction about the number of skips that were weighed? Yes; that agreement was the outcome of the dissatisfaction.
3966. Do you say that the Company's weighman or the manager has the sole right of weighing? Yes.
3967. How could you enforce a condition of that kind unless the manager was willing to comply? No; it was left entirely to his option whether he did it or not.
3968. Is the manager's name signed to that agreement? Yes; it is signed on behalf of the Company by Mr. William Henderson, as colliery manager, and by Mr. John B. Turnbull, as consulting manager. Mr. Turnbull was the head manager, and Mr. Henderson was the manager under him. Mr. Henderson was overman, or underground manager, but Mr. Turnbull was always appealed to in any case of dispute.
3969. Did you find Mr. Henderson a man that would carry out any contract he made, as far as he was concerned? I always found he would.
3970. Have you anything else you would like to refer to? There are one or two other matters that have been discussed many, many times by the men. One of them is the selection of the check-weighman.
3971. What have you to say about this matter? The men in the Western district have contended for many years that they should have full and wide choice for the men to be selected as check-weighmen.
3972. *President.*] Do you mean to say that the check-weighman should not necessarily be an employee of the mine? Yes; that is what I mean.
3973. *Mr. Curley.*] Do you believe that is what should be done yourself? I do.
3974. What makes you form that opinion? In the first place, seeing that the men have to pay the check-weighman, I think it is only right that they should have full choice with regard to the man that is to be employed. I think it is only being on an equal with the employers. They have full choice as to whom they appoint, and I think it is only right that the men should be allowed the same liberty and freedom.
3975. Do you ballot for a check-weighman every three or six months? Yes; if there are more nominations than one.
3976. In the event of the weighman being balloted out at any time, would the employer give him a start at the colliery again? I have never seen a case where they have refused to do so, but they could refuse if they chose.
3977. Is that one of your reasons why you think a check-weighman should be selected from anywhere? Yes, sir.
3978. Is there anything else you wish to refer to? There is one other thing I would like to mention, and that is with regard to ambulances.
3979. What have you to say upon this matter? The men in the Western district appear to be under the impression that ambulances should be provided at every colliery, in case of accident. It is not so long ago since a miner was seriously injured at the Vale of Clwydd Colliery, and they had to put him into a skip, and the consequence was, that his injuries were aggravated. Since that accident the men think it is really necessary that ambulances should be provided.
3980. *President.*] Is there a rule in any Act that you know of that ambulances should be provided? Yes, though I do not think it is compulsory.
3981. *Mr. Gregson.*] Is the coal clean in the Lithgow mines? Yes, fairly clean.
3982. Are the miners paid for round coal? Yes; round coal only. They are paid for small coal if they have instructions to fill small coal only. They have always been paid for screened round coal.

- Mr. J. Coates  
30 Sept., 1895.
3983. *Mr. Curley.*] Weighed at the bottom of the screen? Yes; weighed at the bottom of the screen. There is one other matter in connection with the weighing that I would like to mention, and that is the adjustment of the weighing-machine. I know from experience that the men have had to contribute towards paying the Inspector of Weights and Measures for examining the machine.
3984. Do you consider that the inspector should examine those weights and measures in the same way as he does any other weights and measures? I think he should.
3985. You think the men should not be asked to contribute toward the expenses in this matter? Yes; I consider it unjust.
3986. *Mr. Gregson.*] Who do you think should pay for it? The inspector is a man who is in the service of the Stato, and for that reason particularly the miners think that he should not charge anything.
3987. Is not the inspector paid by fees? Quite so.
3988. Then who is to pay the fees? He does not charge anything in our district for testing storekeepers' weights, and I think this should apply to the miners as well.
3989. *President.*] Do you know that there is a proposal in the Bill we have under consideration about ambulances;—will you look at rule 34, old rule 36, on page 30, of the Bill (*see Appendix A*)? Yes; but it is not carried out.
3990. It is in the proposed Bill; your suggestion, therefore, seems to have been anticipated? Yes. In connection with the adjustment of the weighing-machines, the miners think that the employers should provide what is known as Government stamped weights. As a rule, they have 56-lb. stamped weights, and the men think that there should be at every colliery weights that should weigh half a ton at least, so that the weighing-machines could be adjusted at any time they may think it necessary.
3991. In the proposed Bill there is a section, on page 21 of the Bill, dealing with the application of the Weights and Measures Act to the weighing-machines used at mines [*see Appendix A*] ? Yes; but under the present system of adjusting the machine, the beam is only adjusted, and not the machine.
3992. Must we not expect that the inspector will do his duty? The Government machines are tested in the way the men are anxious to have their machines adjusted. Something like half a ton of weights are placed on a table, and the men desire that both the beam and the machines shall be tested.
3993. *Mr. Curley.*] When you have worked in these mines, have you ever experienced any defective ventilation? Yes.
3994. In what colliery have you noticed the ventilation defective? In the Vale of Clwydd Colliery.
3995. What was the nature of the defect? That the air was not sent around the mine in its proper course, in a proper way.
3996. Do you mean by that, that it might be on the heading, but not in the working place? Quite so. When it is registered, there was always a sufficient quantity of air in the heading, but not in the face.
3997. *President.*] Is the working place the same as the working face? Just the same.
3998. Did the inspector or the manager appear to be satisfied if there was air sweeping along the air-way? Yes.
3999. Do you know how much air? I cannot state the quantity.
4000. *Mr. Curley.*] What you wish to convey is that there might be sufficient air, but the air might not go up to where the men were working in the working place? Yes. Every time the men's inspectors went round they could always register air far and above what was specified in the Act at the Vale of Clwydd Colliery.
4001. Was that on the heading? Yes, but not on the working faces; and that is where the trouble used to be continually cropping up.
4002. Are you speaking from your own experience? Yes.
4003. Did you experience these defects in the air personally? Yes; in that particular mine. I never experienced anything like it in the Vale Colliery. The Vale and Vale of Clwydd Collieries are the only two collieries I have worked at in the Western district.
4004. Have you heard of complaints at any of the other collieries? Yes, sir.
4005. Did you hear these complaints in conversation with the men? Yes.
4006. Would brattico have assisted to get the air into the working face? Yes, it would.
4007. Do you think shorter cut-throughs would be an improvement? Yes, I do.
4008. *President.*] Do you want both these things? Not necessarily.
4009. You want the air there, no matter how it is got there? Yes.
4010. *Mr. Curley.*] Do you think if the bord was a shorter distance up, before they put the cut-through, that that would improve matters? Yes.
4011. *President.*] Do you care whether the bord went up 500 yards or more as long as you got your air? Not as long as there is good air; that is all that is required.
4012. *Mr. Curley.*] Would you not be more likely to get that air with the bord a short distance, say, 20 or 25 yards? Decidedly so.

[Witness withdrew.]

John Estell sworn and examined:—

- Mr. J. Estell.  
30 Sept., 1895.
4013. *President.*] What is your name? John Estell.
4014. *Mr. Curley.*] What occupation do you follow? I am a miner.
4015. How long have you been mining in this Colony? For about eleven years in this Colony.
4016. *President.*] What mines have you worked in here? At the Wallsend Colliery, at the Co-operative Colliery, and at Miami; but not as a miner at Miami. I was working underground at Miami and am at present employed at the Wallsend Colliery.
4017. *Mr. Curley.*] How long have you worked at Wallsend? Four years.
4018. Have you worked in different parts of the mine during that time? Yes; all over the mine.
4019. Have you a system of quarterly cavilling? Yes.
4020. By that means do you have opportunities of getting into different parts of the mine? Yes; into different districts.
4021. Have you a Miner's Lodge at that colliery? Yes.
4022. Do you hold any office in connection with that Lodge? I am secretary of the Lodge at the present time.

Mr.  
J. Estell.  
30 Sept., 1895.

4023. How is the Wallsend colliery ventilated, by furnace or by fan? One portion is ventilated by furnaces, and the other portion by fan.

4024. Are there a large number of men employed at the colliery? I should say about 550 miners.

4025. What is the system of working? Bord and pillar.

4026. What is the height of the seam? It varies from 8 feet to about 5 feet 6 inches, or perhaps a little under 5 feet in some places.

4027. What is the width of the bords? The working bords are generally 8 yards wide.

4028. What is the size of the pillars? They are supposed to be 8 yards.

4029. Have you ever worked where the pillars have been less than 8 yards? Yes; I have taken pillars out less than 8 yards.

4030. What size have you taken pillars out? I have taken them out as thin as 3½ yards.

4031. Has the roof ever fallen at the sides, when you have taken these narrow pillars out? While taking the narrow pillars out, the roof has fallen out at the sides, that is before we started to take the pillars out. The stone lays on the old goaf.

4032. Did you take these pillars out going from the heading inwards? Yes.

4033. Was it a critical matter to work pillars of that description? Yes, on account of stone falling on the slack; you cannot get the roof properly timbered on that account.

4034. Would the stones slide into the face? Yes; it was very dangerous in some cases.

4035. Did it entail a lot more labour? Yes.

4036. What is your experience of the ventilation in that colliery? In some cases it was fairly good, but in other cases it was not as it should be. I have seen it where it has not been very good.

4037. What part of the mine was that in? In the Jubilee district. In a district we call Mogag, it is not very good. There have been a great number of complaints from these districts.

4038. How many men are there in the Jubilee district? About 170 or 180. There are some splits that are good; but there are other splits that are not as good, depending chiefly upon the opening and shutting of doors. As a check-inspector I have been where we could not get a reading in some of those splits.

4039. Did you notice a report that came under the notice of the lodge some time ago? Yes; about three months ago.

4040. Was there a very limited quantity of air recorded for some of the men? Yes.

4041. Was that in the Jubilee district? Yes.

4042. Is it a serious matter for the men when the ventilation is very defective? Yes; one of the worst things a miner can suffer from, at the present time, is defective ventilation, because if it does not affect him in one way it does in another.

4043. Have you experienced any serious effects from bad ventilation, yourself? I cannot say I have. I cannot say I have been affected; although I have felt bad with pains in my head through white damp. I put it down to that; but it did not last long.

4044. Do you not think it is a serious matter if you are affected in the head with bad air? Yes; but I have not been affected with asthma and broken wind, in the same way as I have seen a lot of miners affected.

4045. Do you attribute that to bad ventilation? Yes; to bad air.

4046. If you had to continue to work in that air any length of time, do you think it would affect you eventually? There are portions of the mine that I think would affect me, if I had to work there any length of time.

4047. Is that in the Jubilee district? Yes.

4048. How is that district ventilated? Since a report was brought under the notice of the lodge, they have made an improvement in the ventilation.

4049. How is the district ventilated? By a fan.

4050. Do you know if the fan is kept going to its full capacity? I cannot say. By what I have heard, it is not kept going to its full capacity, because they say it can lift 200,000 feet per minute, and I think the largest report we ever got was 80,000 feet.

4051. Was that at the return? Yes.

4052. What was your intake for that district? I cannot say, there are three or four different intakes in the Jubilee district.

4053. You have stated that an improvement in the ventilation had been made there. Was that on account of representations made to the manager or the overman? Their attention was drawn to the matter by the check-inspectors, and I believe the check-inspectors were told, that if they had been a week later, the improvement would have been made. Working there I think there is an improvement in the split.

4054. Have you acted as check-inspector on certain occasions? Yes.

4055. Have you ever noticed the bord ends to be left open on the main roads? Yes.

4056. You refer to the old bord ends? Yes.

4057. Have you ever noticed the bord ends to be left open at Wallsend? Yes.

4058. Have they been left over for purposes of ventilation. Do you know if that was the idea? I suppose that is the idea, but it is causing a lot of air to waste that should go to the working places. It would do far more good, if the air was confined to the working places.

4059. Does that district give off any gas? Yes, to a small extent. Towards the dip-workings, you can always hear the gas whistling. You can hear the gas in all the working places in the district.

4060. Do you mean fire-damp? Yes.

4061. Will not that probably be the reason, why these bord ends are left open, to prevent this fire-damp from floating about? That might be their object in doing it.

4062. Do you know the number of men that work in the Jubilee district? I think between 170 and 180 miners.

4063. Have you a downcast and a upcast shaft there? Yes.

4064. How far are these shafts apart? I cannot say exactly. They may be a quarter of a mile apart. They are a considerable distance apart.

4065. Do you know the stipulated minimum quantity of air to be supplied under the present Act? Yes, 100 feet of air, and in the proposed Bill it is 150 feet of air.

- Mr. J. Estell.  
30 Sep., 1895
4066. Do you approve of the provisions of the Bill with regard to ventilation? I do.
4067. Do you think there should be a stipulated minimum quantity in the Bill? I do.
4068. With regard to the size of the pillars you referred to just now. Do you think the larger pillar or the smaller pillar is the best to work out? I think the larger pillar.
4069. Do you think the larger pillar is safer to work out, than the smaller? Yes, you have more chance to timber your place, and more room to work with the larger pillar.
4070. Are you likely to get more of the pillar out? Yes.
4071. Do you think that large pillars should be left? I do; I think it to the interest of the employers, and miners, to leave large pillars.
4072. Have you ever worked in any district, in the Wallsend colliery, where the roof has been showing indications of coming down on the pillars, where it has been weighting, or pressing on the pillars? Yes.
4073. Did that occur where there were small pillars? Where I have worked, we had large pillars.
4074. In the whole district were there large or small pillars? It varied in many cases.
4075. Do the men rely upon the pillars for safety in the main ways? Yes, in case of accident.
4076. In case of a break in the roof? Yes.
4077. Have you read the clause in the bill with regard to the powers of inspectors; have you read that part which gives the inspector power to withdraw the men in case of danger? Yes, I have read that.
4078. Do you approve of that provision in the Bill? I do.
4079. *President.*] Would you only give that power to the inspector in case of very present danger? Yes.
4080. Do you suppose that any manager in a case of pressing danger would keep the men in the mine? I think the inspector should be the best judge in cases of that description. The inspectors are supposed to act in an impartial way between the men and the manager.
4081. Would you only give that power to the inspectors in cases of imminent danger? Yes.
4082. Do you not think that a manager, in a case of imminent danger, would compel the men to come out? Yes; but the manager may look at it from a selfish standpoint, and the inspector would take an impartial view of things. I think that power should remain in the hands of the inspectors.
4083. *Mr. Curley.*] So far as small pillars are concerned; if larger pillars were left in the mine do you think it would do away almost completely with the power of any inspector requesting men to be withdrawn, as far as that is concerned? It would have a great tendency in that respect.
4084. In a case of that kind, such a circumstance might never arise? Yes.
4085. That is provided larger pillars were left? Yes; that is in case of a crush.
4086. Were you at Wallsend when there was a large crush there some years ago? No.
4087. Do you know anything about a man named Oughton who met with his death at that colliery? I only know of that matter from conversations with men who were working there at the time. I know nothing about it personally.
4088. Have you worked at the Co-operative Company's mine? Yes.
4089. Have you noticed any defects in connection with the ventilation at that colliery? A matter in connection with the ventilation there was brought under my notice. One of the miners at that colliery complained of the amount of air travelling past his working place, and requested me, as check inspector, to go back and take the measurement in one of the old cut-throughs, and we found a larger reading in one of the old cut-throughs than we did at the working faces.
4090. Were you the check-inspector at that time? Yes.
4091. What did you measure the air with? The anemometer.
4092. Was the complaint that the air was not going into the working places? Yes; that it was being distributed through the old workings.
4093. Did you ever meet with any fire-damp in that colliery? No.
4094. How is that mine ventilated? By furnace.
4095. What is the system of working there? Bord and pillar.
4096. What was the width of the bords? Similar to Wallsend.
4097. What was the width of the pillars? Similar to Wallsend.
4098. Were the pillars 4 yards or 8 yards wide? There were some thin and some thick. I have seen them that thin that I could knock a hole through them.
4099. You have seen them so thin that you could knock a hole through them? Yes; in exceptional cases.
4100. Do you know of any extensive fall while you were there? Yes; there was one big fall while I was there.
4101. Did the fall come over the pillars? Yes, I believe it went over a good number of pillars; it went right down to the working faces.
4102. Did this occur at night-time? No; during the day.
4103. Were the men called out? Yes; but I was not working in that particular district, therefore it did not affect me, but when I came out of the mine I found all the men out also. They had all been called out on account of the fall.
4104. Do you know how many men would be in that district? No; I have no idea.
4105. Can you recollect how long ago it is since this happened? I think about ten years ago—perhaps not quite ten years ago.
4106. Did a circumstance of that kind impress upon you that larger pillars should be left in these collieries? Yes; I thought that at the time, and especially in that part of the mine where they were working, which was on to a fault, and from a fault.
4107. Is the size of these pillars left solely to the discretion of the manager? Yes; men may encroach on a pillar, but it is the manager's duty to stop that.
4108. If a miner is going too wide, cannot they chalk him off and say that so much has to be left on? Yes.
4109. Is this order generally obeyed? Yes; in all cases, I think.
4110. A manager would either have power from his Board of Directors to carry out the system of mining, or he would guide his Board of Directors, and either of these, or both combined, would be responsible for the size of pillars? Yes.
4111. Is it not a matter the miner has nothing to do with? Yes.
- 4112-3. Do you believe in the provision in the Bill for a stipulated minimum size for pillars? Yes.

4114. *President.*] Do you not think that the size of pillars should be left to the discretion of the manager? I think it would be better if they were 8-yard pillars.

4115. *Mr. Curley.*] Can you place any faith in the discretion of managers from what has taken place in the past? I believe it would be better if there were hard and fast rules.

4116. *President.*] Would you make the manager a mere automaton? I believe it would be better to have it all in black and white for the safety of the miners.

4117. *Mr. Curley.*] Do you think that men's lives should be placed in jeopardy? No, I do not.

4118. Will you look at section [30] 28, sub-section III, on page 14 of the Bill [*see Appendix A*].—do you think that the buildings, streets, roads, creeks, rivers, bays, and limits of any tidal waters should be exhibited on the same plan as the workings of the mine? I do; I think it is a very important matter. In municipalities where there are large interests at stake, and where persons have their dwellings on the surface, I think that colliery owners should be prevented from taking out the coal indiscriminately, and by doing so causing subsidences.

4119. Do you know much about this matter of undermining? In the municipality I am in we have had a lot of trouble with Mr. Sneddon, who is taking out the coal from the old Co-operative Colliery. My place was let down in consequence of a large subsidence, caused by this undermining, and the damage to my house would have been greater if it had not been that a large area was affected, and the strata was very thick in that particular place. The fall extended over about 5 acres of surface land. In Plattsburg it will cause a lot of damage if they are allowed to take out this coal indiscriminately.

4120. *President.*] Are they never to take these pillars out? I should place that power in the hands of the inspectors, and if they did take the pillars out they should make proper provision for the holding up of the ground. In cases where timber is put in it only requires years to rot that timber, and then there is nothing to keep the surface up.

4121. What would you have? I do not know. It is a certainty that if they take the pillars out the surface will subside.

4122. *Mr. Gregson.*] Did you build your house? Yes.

4123. Did you buy the land? Yes.

4124. Did you know at the time the coal was underlying it? I believed at the time it was.

4125. Did you buy the coal as well as the surface? No; only the surface.

4126. Have you not your remedy against the person who disturbed the surface? It would be hard to find out who was the responsible party.

4127. *Mr. Curley.*] Do you think that everybody should run into litigation over matters of this kind to assert their rights? No; we have had a lot of expense in the municipality owing to this undermining, especially with Mr. Sneddon.

4128. What is the size of your allotment? Sixty-six feet frontage, and 132 feet depth.

4129. In what street is this allotment? In High-street.

4130. Is that in Plattsburg Municipality? Yes, Plattsburg Municipality.

4131. Where did this fall affect the allotment? About half-way up. The crack in my place is not more than 6 inches under the surface; but I think the crush went from top to bottom.

4132. Did the surface subside much? My house went down 6 or 8 inches. The fall extended over 5 acres, and my house happened to be in the centre, but another house adjoining mine, went down a foot or 18 inches.

4133. Were these weatherboard houses? Yes; if they had been brick, they would have been no good.

4134. Do you know the names of the individuals the fall has effected? One was David Clough.

4135. Do you know of anybody else? Some of the house belonged to the Newcastle Building Society, but Clough's house was the worst of the lot.

4136. Did the Co-operative Company do this undermining themselves? Yes; the Co-operative Company did the undermining, but Sneddon took the water out after he leased the mine, and that is what we suppose is the cause of the subsidence, that is on account of the water being taken out from the old workings.

4137. Was this water taken out with a view to commence working these old workings again? I believe so.

4138. Will you look at rule 25 on page 29 of the Bill, "Coal not to be wrought under roads" [*see Appendix A*].—have you read that rule? Yes.

4139. Do you believe that a provision of that kind should remain in the Bill? Yes.

4140. If roads are affected in a municipality, is it not a serious matter for the rate-payers if the roads come down? I think it is a very serious matter. I think that the officers of the municipality should have the right to inspect all plans of the underground workings of any mine, to see what is going on, and if necessary, have power to enter an injunction, against work proceeding where there is likely to be a large amount of damage done.

4141. What is the system of working at your colliery with regard to hours? We are supposed to work eight hours per day, but there has been no uniform system until lately. The majority of the men work from 7 o'clock to 3 o'clock, and from 8 o'clock to 4 o'clock.

4142. When you say there has been no uniform system, do you mean to convey the idea that the men go into the mine at any hour? Yes.

4143. What time would they be going in? I have seen men going in at half-past 12 o'clock at night. They would get into the pit a little after 1 o'clock in the morning.

4144. When would the working places be inspected, or are they inspected? Yes, they are supposed to be.

4145. Do you know whether they are or not? I cannot. The only thing I have taken notice of, is the date chalked up on the lid in the face of the bord.

4146. Is there a mark put up there? Yes.

4147. Who puts that mark there? The fireman. So far as the Jubilee district is concerned I know it is inspected lately.

4148. What about the other districts? I think they inspect those as well.

4149. Have you seen the fireman's mark in those districts? I have never taken notice of his mark.

4150. Do you think there should be a uniform time for men to go into the mine? Yes.

4151. Do you think there should be a uniform time for coming out of the mine? Yes.

4152. Do you know the provision in the Bill for the regulation of the working hours? Yes.

4153. Do you believe in that provision? Yes, I do.

4154. Would you rather see the question of hours embodied in a Bill for legislation, or left to be arranged

in

Mr.  
J. Estell.  
30 Sept., 1895.

- Mr. J. Estell. in a mutual way between the men and the managers? I prefer to see it legalised. I think that is the only way we can bring about the eight hours. I think if it is left to mutual agreement it will be abortive.
- 30 Sept., 1895. 4155. Do you think the men wish for this legislation? I do; the men as a body all desire it. Some men take advantage to make a few shillings more, and I think these men are likely to go on doing so if it is not legalised, but I believe that although there are men who work these longer hours for the sake of the little extra they can earn, that every man is in favour of the eight hours being legalised.
4156. How are you paid at Wallsend? By the average weight.
4157. Is the average weight system satisfactory? Yes; as far as we are concerned. It would be more satisfactory if we could get the skips weighed oftener.
4158. How many skips are weighed now on an average? I should say one in every twelve or thirteen.
4159. Are any of the workings wet in your colliery? Yes.
4160. What districts would this apply to? To mostly all the districts more or less.
4161. Do you find the work very uncomfortable where it is wet? Yes; it is uncomfortable.
4162. Do you set your own timber? Yes.
4163. Do you lay your own rails? Yes; after they leave the turn.
4164. Have you any jerry? Yes; in the Lambton district.
4165. Is this jerry a kind of shale or stone band? A stone band.
4166. Does it run right across the seam? Yes.
4167. What thickness is it? From 2 to 16 inches.
4168. What are the stoppings built with in your main intake? Bricks at the present time.
4169. When you were check-inspecting, did you pay particular attention to these intakes, to see if the air was scaling away? Yes.
4170. Have you noticed the air scaling away? Yes.
4171. When you noticed this, did you draw the attention of the manager to it? Yes; but he has generally rectified this, after his attention has been drawn to it.

[Witness withdrew.]

William Bower sworn and examined:—

- Mr. W. Bower. 4172. *President.*] What is your name? William Bower.
- 30 Sept., 1895. 4173. What are you? I am a coal-miner?
4174. Where are you employed? At the Wallsend Colliery.
4175. How long have you been coal-mining? I have been twenty-five years getting coal, and about twenty-eight years below ground altogether.
4176. What collieries have you been employed at? At various collieries in the Northern district of this Colony.
4177. *Mr. Curley.*] What collieries have you worked at in the Northern district? At Lambton, New Lambton, Waratah tunnels, Co-operative Colliery, Minmi, and Wallsend. I also worked for a short time at the Curlewis Colliery, near Gunnedah.
4178. Where are you working at the present time? At the Wallsend Colliery.
4179. How long have you been at Wallsend? For about thirteen or fourteen years.
4180. Have you worked in different districts of the Wallsend Colliery? Yes; pretty well all over the mine.
4181. What is your experience of the ventilation at that colliery? It fluctuates a good deal. Sometimes a split may be good at the time of one inspection and bad at the time of another inspection. I have worked in very bad air and in excellent air.
4182. What are the districts where you have found any defects in regard to the ventilation? The worst district now is known as No. 2 tunnel, or Willis' district, as it is generally called.
4183. What is the defect in that district? Want of ventilation.
4184. Is there not a sufficient quantity of air supplied? There is not sufficient air along the faces. There is sufficient air at the intake, but it is not conveyed along the working cut-throughs.
4185. Are there very many men in that district? I think there are sixty-six miners working there; and, besides the miners, six boys and six horses.
4186. Do you know anything about a check inspector's report that was made some time ago, and a defect shown in that report with regard to the ventilation? This is a copy of the check inspector's report dated 22nd July, 1895. It shows a deficiency of air in the No. 2 tunnel, and states that at the intake there was 13,340 cubic feet of air per minute. That would be about 300 yards from the nearest working place, and about six bords along we only got 5,040 cubic feet of air, and from that up to the return the anemometer would not register.
4187. What air did you find at the return? The anemometer would not register in the return; that is, within 200 yards of the working faces.
4188. What air did you get in the up-cast? 36,480 cubic feet of air per minute.
4189. How much was the air at the intake? 13,340 cubic feet of air per minute at the intake of the split.
4190. Could you not get any more than those small readings that you have named? That is all.
4191. Where had the air gone that came in the intake? We have tried to find out whether the big furnace and No. 1 tunnel did not get hold of it, and take it away. It is the impression of the overman and deputies that it gets away like that. They do not seem to be able to keep it from the lower workings of the mine.
4192. Has anything been done to remedy this matter since? I have not been round, but some of the men tell me that it is a little better. I do not think, however, that it is possible to remedy this without a radical remedy.
4193. What would that remedy be? My idea is, that they should hole the boundary cross-cut through to No. 2 tunnel, and make that the return, but that would be a matter of time. This state of things in that tunnel has been going on for two years.
4194. *Mr. Gregson.*] Has the inspector's attention been called to it? I think so.
4195. Is it not usual when the check inspectors find anything wrong to communicate with the inspector? No.
4196. Is there any objection to that being done? I do not think so.
4197. Why is it not done? The check inspector has to enter his report in a book kept in the office, and if the miners ordered a copy of that report to be sent to the inspector it would be done.

Mr.  
W. Bower.  
30 Sept., 1895.

4198. *Mr. Curley.*] Are you one of the check-inspectors? Yes; I am one of the check-inspectors at present.
4199. Did you draw the manager's attention to this matter? I drew the overman's attention to it.
4200. What did the overman say? He said he was doing all he could, and since that he has said that he would try to remedy it.
4201. *President.*] What will that bring about;—is there anything that you can say it has done already? I cannot say. At the present time there are men who could not work in that air, because of the effect it has upon their health. I know that there are men working in the mine at the present time who could not work there owing to the state of the ventilation.
4202. *Mr. Gregson.*] Is this district known generally by the name of the No. 2 tunnel? Yes.
4203. Does it cover the whole of the No. 2 tunnel workings? Yes; there are only sixty-eight men cavelled into it this present quarter.
4204. *Mr. Curley.*] Would the men nearest the intake fare better than the men farther in? Undoubtedly. The air strikes No. 30 bord first, I believe, and the numbers run less towards the boundary, and the air is less.
4205. Are there usually comments made upon this defective ventilation when it comes out like this? A report, when it is read at the lodge, is commented upon, and we very often have a chat with the overman or the deputy, and he promises to do his best to remedy things. If he does make an attempt we do not report anything but the bare inspection; that is, we do not make any note to go to the public. This report was commented upon in a meeting of the lodge, and the press got hold of it, but there was more made of it than might have been under ordinary circumstances. This tunnel has been anything but well aired for the last two years at any rate.
4206. You said something with regard to a big furnace;—how many furnaces have you? We have three up-cast shafts.
4207. Is there a district known by the name of the Jubilee district? Yes.
4208. How was the ventilation in that district? It was very good as a rule, although sometimes we found a deficiency. The most trouble is the long distance the air travels before it reaches the men. There is a lot of moisture in the air. Part of the air comes from the mouth of the tunnel, and another portion from a travelling road tunnel, both a mile or over from the workings, and it seems to pick up moisture on the way. The Jubilee district is ventilated by the fan.
4209. The fan is situated at the up-cast? Yes.
4210. Do you know whether this ventilation travels over a wide area of old workings? No; it is pretty well confined. The air does not seem to travel anywhere but in the travelling way all the way in. The No. 2 split is aired from the same current, but the workings from the intake to the return are very much scattered. With three pairs of men at the intake, the air was good, but it travelled over some hundreds of yards of water before it reached the next men. We have complained of this, and the manager has promised to attend to it. The complaints have been that the powder smoke did not seem to dissolve—the air seemed to be charged with smoke all the time.
4211. Would it do that with a vigorous current of ventilation? Good dry air does not, because it dissolves very quickly. On 22nd July the surface temperature at 8 o'clock in the morning was 45 degrees, and the thermometer registered 72 degrees at the intakes of Nos. 1 and 2 splits.
4212. Did you ever see any of the old bord ends left open? They were invariably left open in Wallsend, except just where the bords are broken off the main heading.
4213. Would not the air in that case have a wide area to travel over? It would have, and there would be very little force at all. In the rise workings the air has always a tendency to go down to the lowest part.
4214. Are some of those workings damp and wet? Yes; there are some wet places here and there.
4215. Is not the whole of the trouble with the ventilation that it does not get up to the working faces in sufficient quantities and purity? As a rule, we have plenty of air at the intake of the split, but you will find a want of air on the cut-through next to the working place. Supposing the air is registering 200 cubic feet per man, at the intake, you might find no reading a dozen bords along the split.
4216. Is there much brattice used in the mine to conduct the air? There is no brattice used at all, except where there is fire-damp.
4217. Have you any fire-damp in the Jubilee district? Yes, there is a little continually. On the dip side it always gives off a little gas.
4218. Are the working-places inspected every morning? I believe so. I know there is a fireman supposed to go round, but I have never seen a mark myself.
4219. Have you never seen a mark in the Jubilee district? No; the only mark I have seen was the date on the fireman's notice board.
4220. Would that be an indication that he had inspected the district? It would be reasonable to suppose that he had been round, but those boards are placed about a quarter of a mile from the working places.
4221. Do you think that the fireman should inspect these places, and that there should be no doubt about it? He should.
4222. What is the width of the bords? Eight yards.
4223. What is the width of the pillars? Eight yards.
4224. Have the pillars always been 8 yards wide? No; not always.
4225. What size have the pillars been? They were 4 yards at one time, and 6 yards subsequent to that; but latterly they have been 8-yard pillars.
4226. Have you seen some of the pillars very thin? Yes; I have cut through them with a few blows of the pick. I have seen no pillar at all left, but just the shell. As a matter of fact, a man was killed through the thinness of a pillar; he was shot through the pillar.
4227. How long ago was that? I think it was in 1876 or 1878, but I would not be sure.
4228. Were you working as the Wallsend Colliery at that time? No; I was working at the Co-operative Colliery at that time.
4229. Did you know of the circumstances through being at the inquest? I was present at the inquest, but I knew all about the circumstances at the time.
4230. Did you know of a man named Oughton being killed in the Wallsend Colliery? Yes.
4231. How did that accident occur? It occurred through a crush, or creop. The ground seemed to fall away suddenly, and the man was lost. Plenty of the other men had to run for their lives.

- Mr. W. Bower.  
30 Sept., 1895.
4232. Was that an extensive fall of roof? It was said to be so.
4233. Did it come over the pillars? It did at that particular time.
4234. What was that fall caused by? It was on account of insufficient support for the roof. There have been repeated losses of ground, apparently through having insufficient pillars, but latterly, I know they are leaving larger pillars in Wallsend. I think a manager ought to know what would carry the strata.
4235. *President.*] Do you think it is necessary to legislate for a matter of this kind? I think it should be compulsory.
4236. How can you tell what is enough? I do not know how you can tell what is enough, but I am satisfied that 8-yard pillars will break an enormous thickness of cover, and they are quite strong enough to cut off the ground when it falls. If you were taking out a series of pillars there might be a dozen pillars taken out before a fall takes place, and if the pillars were weak the weight might be crushing them, but the stronger pillars cut the ground. That is the experience I have gained in the Wallsend Colliery up to the present time.
4237. *Mr. Curley.*] Have you worked in some very narrow pillars yourself? Yes; but I objected to work.
4238. Why did you object? Because it was not safe to work. You cannot make a reasonable wage in a day, and that caused me to say I would not do it.
4239. Do you regard the larger pillar as a safer method of working? Yes.
4240. Do you think the larger pillar is more economical for the management? Yes.
4241. Do you think that they get more coal out by leaving a larger pillar? Yes; they pride themselves they will get the whole of the coal out. We used to lose a lot of coal with the smaller pillars.
4242. Do you think that this is a matter that should be legislated for? Undoubtedly I do.
4243. Will you look at section 30, 28 of the Bill, sub-section 3, on page 14 of the Bill (*see Appendix A*). Do you think that there should be a surface plan provided in connection with collieries, showing all streets, roads, buildings, creeks, rivers, and other things mentioned in that sub-section? Yes; I think so.
4244. Do you know anything about the undermining of streets, roads or buildings? Yes; I have had some experience, and it has cost me a good few pounds.
4245. Where have you had that experience? At Brookstown.
4246. What do you refer to? The undermining of Brookstown.
4247. Is Brookstown a local name? Yes; it is a suburb of Wallsend.
4248. What was the nature of the undermining there? There was a piece of coal that was left by Mr. Laidley, the lessee of the Co-operative Colliery, and after his lease had expired the proprietors re-leased the colliery to another party, and he started to take the coal out under these buildings. It cost us an equity suit, and after buying allotments we were forced to leave. We were driven to law, with the result that we got very little satisfaction.
4249. *President.*] What became of your land? By a mutual arrangement, the gentleman who is working the estate bought our land over; but we were compelled to shift from the township through this undermining ruining it.
4250. The present lessee of the estate, you say, has bought you out? Yes; it cost us £220, and we got for that only £190.
4251. So that you lost £30? Yes; besides being compelled to shift from a locality I liked.
4252. What did you do? Bought another piece of land from the Wallsend Company.
4253. How much ground was let down? About 7½ acres. The allotments were ¼-acre allotments.
4254. Were the allotments all occupied? The large majority of them were occupied.
4255. Was the whole of the township let down? The present lessee was compelled by an equity suit to secure all the streets after an expenditure of £800.
4256. Did the Council expend that sum? Yes; the two Councils, but I think they recovered it from the Government afterwards. That was the expenditure to save the roads from being destroyed.
4257. Were all the houses let down? The ground is all down now, except where the present lessee has shifted the houses to suit himself.
4258. What sort of houses were they? Pretty well all weatherboard and frame houses.
4259. *Mr. Curley.*] Were the people apprised of this undermining, or had they to take their chance? We had no opportunity to know anything about it. As soon as we did we got a deputation together, and sent to Mr. Brookes who sold the land, and offered him the same amount of royalty to let the coal alone, but he said that it was too late, because he had already leased it to Mr. Sneddon. He would, however, have received more money from the residents.
4260. Do you think it is a right thing for an owner to let his land and then sell his coal? No. Sneddon is now taking out all the supports under the Plattsburg township.
4261. Who leased the coal to Mr. Sneddon? Mr. Brookes. Mr. Laidley's lease had expired and Mr. Brookes re-leased to Mr. Sneddon. Mr. Laidley had given up drawing coal from that particular tunnel before Mr. Sneddon got it.
4262. Did the Co-operative Company sell that land? No; the land was owned by Mr. Brookes, Mr. Kenrick, and Mr. Platt.
4263. Did the Co-operative Company have a full knowledge that these buildings were there? Yes.
4264. Would they have the power of granting a lease for what is going on now? It is still the same lease and part and parcel of the same estate.
4265. Then the Co-operative Company have nothing whatever to do with it? No; I do not think they pay any royalty to Mr. Brookes, except for the railway that goes over his land.
4266. Will you look now at Rule 25 on page 29 of the Bill (*see Appendix A*). Do you think that provision in the Bill is necessary? I do, under existing circumstances, where the coal is so near the surface. The same thing is applicable to the railways at the present time. If I recollect rightly at the Greta Colliery they were compelled to put their headings under the railway to suit the railway authorities. They were not allowed to take the coal out under the railway, and the same thing, I should think, ought to apply to a good road.
4267. *President.*] Can you conceive of any weight on an ordinary road such as a train? At Brookstown I have seen a cart go down nearly out of sight. That was in the Wallsend workings on a public road.
4268. *Mr. Curley.*] Do you think the travelling public have a right to be considered under such circumstances? I think so.
4269. Do you think that the municipalities should be subject to litigation in the way they have been? I do not think so.
- 4270.

Mr.  
W. Bower.  
30 Sept., 1895.

4270. You have had experience in connection with several other collieries—Lambton, New Lambton, Minmi, Co-operative, and Waratah;—did you experience anything in connection with the ventilation at any of those collieries? I have worked in good and bad air in all of them.
4271. Was the air not conducted up to the working face? That was the reason.
4272. Have you seen statements made by some of the managers about the cost of bratticing? I have heard an overman say that the cost of bratticing would make very little difference.
4273. You have heard an overman say that it would make no material difference? Yes; I have heard that stated.
4274. Where was that statement made? At the Wallsend Colliery.
4275. Do you think it would cost anything like 4d. or 6d. a ton for bratticing? No, nothing like that.
4276. Do you think that sum would nearly pay for the whole underground account of the colliery? I think it would come nearer to that than to the cost of bratticing.
4277. Could not a good deal of the refuse of the mine be used for conducting the air in connection with brattice? It is used now; wherever it can be used it is used.
4278. *President.*] You do not care what is used,—what you want is air at the working face? Yes; that is our greatest trouble. It would make mining much more comfortable if we had better ventilation.
4279. *Mr. Curley.*] Will you look at section [50] 47, on page 23 of the Bill, "Ventilation of Mine"; do you notice several erasures in connection with this clause—they represent the amendments made by the Legislative Council, and the clause without these erasures is as it was originally sent up by the Legislative Assembly (*see Appendix A*);—what do you think of that provision as it originally stood? It would make things a great deal better if we had it.
4280. Do you think that the clause as originally drafted should remain in the Bill? Yes.
4281. *President.*] Suppose the clause ran this way: (say) an adequate amount of ventilation, not in any case less than 150 cubic feet of pure air per minute for each man and each boy, and as much more as may be necessary, shall be constantly produced in every mine to dilute and render harmless noxious gases, &c.;—would not that meet all that you want? I think it would.
4282. You would not want cut-throughs or bratticing? Certainly; we want the air to the working face.
4283. Is the working face the working place? If it means the working face, why not send the air along the working face?
4284. I do not want the manager hampered; so long as he gives the proper amount of ventilation, what more do you want—say an adequate amount of ventilation, to be not less in any case than 150 cubic feet of pure air per minute, and as much more as may be necessary, shall be constantly produced to dilute and render harmless noxious gases, &c.;—will not that meet what you want? Yes; that will do all that I want. It is matterless to me how the manager does it, as long as he brings the air to me, whether he does it by brattice or otherwise.
4285. It has been pointed out that the provision in the present Act, subsection 3 of clause 12, says that the air is to sweep undiminished along the airway, past each working place? Yes; that is our difficulty at present. The difficulty is that the air is not carried into the working place. We are bound to average the air from the intake, and it does not matter which way it gets to the return.
4286. *Mr. Curley.*] Do you think that the shorter cut-through is likely to produce better ventilation? It will cool the place considerably.
4287. Might not shorter cut-throughs in some cases dispense with bratticing? Of course.
4288. *President.*] So long as you get the air you do not care whether it is by brattice or cut-through;—would you not be satisfied, no matter how you get it? Yes; but we cannot imagine any other system, other than bratticing or cut-throughs. Our only trouble is to get the air.
4289. Would not the way I have put it be the better way? I think it would be all that is needed.
4290. Let the manager find out how to do it? As long as the manager carried the quantity of air in it does not matter which way he does it; but I cannot imagine how it could be done, except by brattice or shorter cut-throughs.
4291. *Mr. Curley.*] Do you know that the principle at the present time is to drive cut-throughs? Yes.
4292. Are you in favour of the shorter cut-throughs? I have always been in favour of the shorter cut-throughs. They would assist many a time in getting the pillars out.
4293. Do you believe in splits—the currents of air being split into sections throughout different parts of the mine? Yes; I have worked in a mine with only one current of air, and I know what it is.
4294. Have you given any attention to the question of the hours of working that the Bill proposes to legislate for? Yes.
4295. What is your opinion upon this matter? That eight hours is long enough to be below ground.
4296. Do you think that it is a matter for legislation? Yes; I think it should be compulsory.
4297. So that if you went to work for ten hours you would be liable to be punished for working the extra two hours? Yes; I think that is necessary.
4298. *President.*] Do you think that is right? Yes; there have been men carried out of the pit before they would leave.
4299. Why? Completely exhausted in trying to make as much as they possibly can.
4300. *Mr. Curley.*] Do you think it is the opinion of the men, generally, that eight hours should be a legal day's work? Yes; since I started to work, I can recollect Mr. Garrard, the present Minister for Education, coming round our district, and we subscribed 2s. per man to assist the iron-workers to get the eight hours.
4301. *President.*] Do you think it should be made a penal matter? I do not see how we can do it by any other means than by legislation. There are plenty of men working more than eight hours, and others doing their best to keep up with them; but I think that eight hours is too long to be in a mine.
4302. *Mr. Curley.*] Do you believe in a uniform starting time? Yes; we have nearly successfully brought that about at Wallsend now.
4303. Do you think that men should be permitted to go into a mine when they please? I do not think so.
4304. Have you seen the provision in the Bill, giving an inspector power to withdraw the men in case of danger;—will you look at section 21, sub-section 5, on page 8 of the Bill (*see Appendix A*);—do you agree with that provision? Yes.

- Mr. W. Bower.  
30 Sept., 1895.
4305. *President.*] Would you allow the inspector to withdraw the men unless the danger was imminent—immediate danger? Why use the qualification, imminent danger?
4306. Because the inspector might ruin a mine-owner if he was incompetent or arbitrary? I can hardly imagine a man like that getting such a position.
4307. You cannot say what you may get in the future. Suppose you get a capricious man, or an ignorant man, do you think you would put it in the hands of a man, perhaps of an arbitrary disposition, to take the men out of the mine, if the manager differed from him. Would you not rather put it to cases of imminent or immediate danger. Do you think that any manager would dare to refuse if the inspector said there was danger? He might dare to do so.
4308. Will you look at section 22 [20] on page 9 of the Bill, "notice by inspector of causes of danger not expressly provided against" (*see Appendix A*)? I think that provision would cover the ground for a long standing creep.
4309. Would the manager take the men out in the case of inflammable gas? I believe he would, for the sake of the mine itself.
4310. What other cases are there? Say, working towards a large body of water. There might be a difference of opinion, in the case of an abandoned mine lying full of water.
4311. Would they not in such a case go to arbitration? There would be a certain amount of risk while the arbitration is going on.
4312. Do you think that ten days is too long a time to allow the manager for sending his objection to the Minister? It might be, if he was driving a narrow place with six or eight men, continually going night and day. The plans showing an abandoned mine may be wrong, and of course neither the manager nor the inspector would know how near they were to those workings, and if you waited for an arbitration court to settle whether there was any risk, and kept the place going, it might be holed through, with the result that some men would lose their lives.
4313. Are those the only things you can mention, inflammable-gas, a creep, or working towards a flooded mine? Quite so!
4314. *Mr. Curley.*] Do you think the inspector should have the power that it is proposed to give him under this sub-section 5 of the Bill? Yes, I do, because I cannot understand why he should not have it when there is danger. It is a power somebody should have, and I think the inspector is the man that should have it.
4315. *President.*] If the inspector makes a mistake, you have this to consider, that he takes away the means from the men of earning their bread? That is better than their death perhaps.
4316. If this danger is so apparent, would not the manager surely see it just as well as the inspector? Sometimes you would think that a manager was not inhuman, but he was very neglectful. We have, only a week ago, a case which occurred in a tunnel at Mimui, and that might have ended in a catastrophe owing to the bush fires.
4317. Was not that a most exceptional thing? It is a clear case to show that the mine should have been inspected before the men went in.
4318. *Mr. Curley.*] Are you paid on a system of average weight at Wallsend? Yes.
4319. Are you satisfied with the average system? I cannot say that we are satisfied, because we consider we should be paid for all we fill, although I believe it is the best system in the Northern district.
4320. Are you not legally entitled to all the weight you put out? Yes.
4321. *President.*] On the average system, you are practically paid for what you are putting out? I hardly think it would pan out in that way.
4322. Why? We only get a certain proportion of skips weighed.
4323. If you get a good proportion of skips weighed, might it not be either for, or against you? We are held responsible for all the coal that is wasted, for all the coal that falls off on the road to the screens, and that means, many tons in the 24 hours as a rule, so that we do not get paid for all we fill.
4324. Is that because the miners are filling too full? No; if we filled within the wood we would be interfering with the output. They give us an 8-inch standard, and if we fill over that we lose the coal altogether.
4325. *Mr. Curley.*] Does not the coal in that case go to an accident fund? Yes; but it is a loss to the individual.
4326. *President.*] If these skips are packed properly, would the coal fall off? I am afraid it would, at the speed they travel. When the skips come together on the flat, there is a lot of bumping, and we have got that to put up with.
4327. Where would you have the coal weighed—down below? No: on the surface would do me.
4328. Would not the same thing you are calling attention to always happen? If the skips were filled level with the top of the wood, I do not think we would lose any coal. I think it would be easy to put 8 inches on the top of the skip, and for us to work not to fill any higher than that, and this would not interfere with the output.
4329. Do you object to the proportion of skips that is weighed? I would like to see them all weighed if possible.
4330. If that is not practicable,—if you wanted all the skips weighed, might not it cause a lot of the mines to cease working? I have been informed that if any mining expert told Mr. Alcock that he could not erect a machine that would do this, he would have a very small opinion of their intelligence. On the Government weighbridge they weigh while travelling, and why could that not be done with the skips?
4331. Who is Mr. Alcock? An English weighing-machine maker. I believe that in a colliery in New Zealand they weigh every skip. The name of the colliery is, I think, Brunnerton, and they ship at Westport. There is a large output at that colliery.
4332. *Mr. Curley.*] Would you like to see more skips weighed—is this the only matter that is complained about at present? Yes; I would like to see all the skips weighed if possible.
4333. In the absence of that, what would you suggest? I believe we have as fair a proportion of skips weighed as we can get. We cannot complain about that. I believe all the coal is weighed at Wallsend that can be weighed, and that if any more was required to be weighed, they would need another weigh-screen under present conditions.
4334. Was there a reasonable proportion of skips weighed at the other collieries you have been connected with? No. There was standard weight at the Co-operative Colliery. I have seen a discrepancy of 3 and 4 cwt. between what we were paid and what we sent out.

4335. *Mr. Gregson.*] Is the weighbridge at the Wallsend Colliery kept going all day? Yes; from 7 o'clock in the morning to 4 o'clock in the afternoon; that is the information I have received from the check-weighman.

*Mr. W. Bower.*  
30 Sept., 1895.

4336. Is every skip weighed that goes into the waggon? Yes, with the exception of the first and the last skip. The last skip is not weighed, because some of the coal is apt to roll off the waggon; it is liable to tumble over the side when they are putting the last skip of coal on the waggon.

[Witness withdrew.]

Thomas Abel sworn and examined:—

4337. *Mr. Curley.*] Where do you reside, Mr. Abel? At Plattsburg, Wallsend.

4338. *President.*] What are you? Council clerk for the municipality of Plattsburg.

4339. *Mr. Curley.*] Have you held that position under the Council for some time? For nineteen years, I think; but I have been connected with Municipal Councils for the last twenty-four years.

*Mr. T. Abel.*  
30 Sept., 1895.

4340. Have you seen the proposed Bill in connection with the Regulation of Coal-mines? I think so.

4341. Will you look at section 30 [28], sub-section 3, on page 14 of the Bill (*see Appendix A*); what is your opinion of that provision? I think it is a similar clause to the one in the Bill of the 12th of September, 1894.

4342. Do you see a provision in that sub-section for a surface plan? Yes.

4343. Do you notice that there is to be shown on that plan all streets, roads, buildings, creeks, rivers, bays, &c.;—do you believe in a provision of that character? Yes; but I think the clause itself is not sufficiently strong. It says "That there shall also be so provided, *if required*, a surface plan." I should like to erase those words and say "There shall also be so provided a surface plan," in order to make it compulsory to provide such a plan.

4344. Will you now look at Rule 25, on page 29, of the Bill—"Coal not to be wrought under roads"—[*see Appendix A*]; what have you to say to that Rule? I have seen that section before.

4345. Do you think a section of that character should be embodied in the Bill? Yes; but it only says that the inspector shall have the right to say what position the headings shall be driven under the roads, but it does not apply to any other mining operations under roads.

4346. Do you know of any instances of streets having been interfered with by undermining? We have had considerable experience in connection with that matter. It has cost the two councils, jointly, £1,075 10s. 2d. to test a mining matter of that kind. I have a paper with me showing the expenses we have been put to in connection with a matter of that kind. I have also a document in connection with the undermining of Brookstown properties. In the Supreme Court of N.S.W., in Equity, between Her Majesty's Attorney-General for the Colony of N.S.W. on the relation of the borough of Wallsend, the two councils proceeded against Messrs. Alexander and Andrew Sneddon for undermining the streets of that borough. They applied for an injunction against the Messrs. Sneddon to prevent them mining, so as to render the surface unsafe. The decree was simply that the mines should be allowed under the streets, but that the workings were to be under the supervision of Mr. Thomas Croudace; and our experience since then is, that there is no improvement. One of the main streets only this year came in, and in connection with that particular portion of Brookstown, the people who had property on the place, finding that they were going to be undermined, had to make the best bargain they could for their properties. The people got a certain amount for their property; but they had to take what was decided upon by the arbitrators, who were Mr. Thomas Fryar and myself.

4347. Did you agree upon the matter of compensation? Yes; we mutually agreed.

4348. Did these people build prior to the mines being there? No; the surface right was only sold the owners reserving the mineral right to themselves. The owners leased the right of the mineral, at a royalty of so much per ton, and as it is to the interest of the man that leased the mineral to get as much coal as he can, the result is, that the peoples homes are ruined. At the present time, we have the same undermining being carried out to a very large extent by the same gentleman whom we had this injunction against.

4349. Do you think if these streets had been properly secured they could have come down? No, certainly not. If sufficient coal supports had been left, they would not have come down. If the pillars had been left, the streets would have remained intact.

4350. Do you know the depth there from the surface down to the coal? In some places it is 130 feet, and at other places it is very thin. We put down a bore in Brookstown, and found it 135 feet.

4351. *President.*] Which part of the surface came down? It all came down; it is down altogether now. As soon as the people sold their properties, Sneddon took away all the coal.

4352. *Mr. Curley.*] Who makes good these streets when they tumble in? The Council has to do this, because they are liable if any accident takes place. In connection with the main road from Plattsburg to Minmi, we were aware that the Summer Hill Colliery, was undermining that road, and we applied to the Government to make an inspection. Mr. Humble, one of the inspectors in the Northern district, was sent to make the inspection, but he said, that all he had to do was to see to the safety of the men employed, and that he had nothing to do with the safety of the road.

4353. Has any undermining taken place at Plattsburg recently? Yes, on the 2nd of August, 1894, we had a very extensive subsidence, extending across High-street, and Neilson-street, and several properties were damaged. Alderman John Estell's house was one, and I know of two or three other houses belonging to the Building Society that were damaged to a considerable extent, but of course we have no remedy.

4354. *Mr. Gregson.*] You say there is no remedy. Could you not have sued the person who mined the coal? No; the persons who mined the coal, were the proprietors of the old Co-operative Colliery, and they left what they considered sufficient supports for that time. Then, the owners of the estate not content with what they had previously got, leased the remainder of the coal to Alexander Sneddon. The cause of the subsidence was considered to be the pumping out of the water, to get to the main body of the coal.

4355. Do you think the pumping of the water out was the main cause of the subsidence? It would be a very difficult thing to prove in connection with the last subsidence that took place. Some of the houses a quarter of a mile from where the fall took place were damaged, and one house was almost split in two. It would be very difficult to prove who did the undermining under that house. They might say, the mine was not conducted under that house.

4356.

Mr. T. Abel. 4356. Do you know whether they have any of these difficulties in Great Britain? I really cannot say about Great Britain; but they are difficulties which we have experienced in this country. We have had the experience of spending £1,075 on an action, in which we could clearly show that the surface was undermined; but we could get no satisfaction.

30 Sept., 1895.

4357. *Mr. Curley.*] Do you think that municipalities should be harassed in that way? I think the experience we have had in this matter will do the Council for all time.

4358. Was it the Wallsend road that was undermined? No; we were appealing against the undermining of Union and Cowper Streets,—two streets of Brookstown.

4359. Were those streets dedicated by the owners of the property? Yes,

4360. Were they dedicated, previous to the right being given to work the coal? Yes; I understand that was the case.

4361. If this condition of things is pursued, is it not liable to involve the municipalities in serious consequences? If the present undermining is allowed to continue, as it is being carried on, there can be no question that the Council will be put to serious expense, because the streets must of necessity collapse. Mr. Sneddon, I know, is working as near the outcrop as he possibly can, and what was thought sufficient support before cannot be sufficient support now. We know from the sound of the shots that they are not working far from the surface, and can often hear the men working with their picks, and it also shakes all the crockery in the house in certain instances.

4362. *Mr. Gregson.*] It seems to me to be a marvellous thing that this should be going on;—has anything been done to prevent it? We applied to the Minister to get a joint inspection, on the 13th of August last, of the underground mining operations of the Messrs. Sneddon, to ascertain what was being done under the roads and streets of the borough, and when the inspection took place, or was supposed to take place, we appointed Alderman Robert Davidson, who ought to be a qualified man, because he was the overman of the Co-operative Colliery for twenty years, until he retired. When the Council's representative and the inspectors went into the mine Mr. Sneddon refused them the right to inspect his workings. They were permitted to inspect the workings of the old Co-operative Colliery, but they met with foul air, and could get no further through the place standing so long. Our joint inspection to ascertain what had taken place had therefore no effect. On the 27th or the 28th of August, accompanied by the Mayor of Plattsburg, we interviewed the Minister for Mines, to ascertain if something could not be done in order to get an inspection of this particular colliery's workings. We thought that if the Minister would nominate the Council's representatives that that would get over the difficulty; but the Minister could not see his way to do that, and we have not been able to do anything else. We know from the sound below that undermining is being carried on, but to what extent we can only surmise. Our experience of the Brookstown results makes us think that when Mr. Sneddon has done with it there will be very little left.

4363. Do you know of any other places in the district where this state of things exists? Yes, at Tighe's Hill.

4364. Was it not the Crown that was responsible for that road? Yes; that was a different case.

4365. Do you know of any other cases? Yes; at Lambton, and at North Lambton, through undermining the streets have come down. When I was a miner, I was working under the roads and streets there. At New Lambton I only know about the main road that is under the control of the Government. It is well known that many pit-falls have taken place on this road. I am positive also that the Minmi road is considerably undermined.

4366. Is that a proclaimed road? Yes, it is recognised as a main road; but whether it is in the full acceptance of the term, I could not say. I think the Maitland road is the only main road in the district; but the other road is under the control of the Government at the present time.

4367. Does it not seem to you that it is rather a severe penalty on other coal-owners to pass this clause upon them, owing to the default of two or three others, seeing that they are cases in which owners could protect themselves, or seek a remedy for the damage done. Is there a remedy? Yes; there is a remedy. If the mine operations are carried on under the control of the inspectors, they would know what supports should be left to support the cover over the seam. Their duties at present are simply to see that the mine operations are carried on, with a view to the safety of the workmen employed.

4368. Can they not give evidence, in an action brought by owners of the surface, against those who are doing the undermining? I know in connection with that case at Brookstown, that before we could get an inspection of the mine, we had to deposit with the Lands office £75, in order to ascertain what was being carried on, and a poor man could hardly do that.

4369. There are poor men apparently concerned in this. Might they not band themselves together? At Brookstown all the residents did band themselves together, for the purpose of protecting themselves, but they found it was an expensive luxury to go to law, and preferred to go to arbitration, and take whatever award might be given. They could not carry on the expense of testing a case.

4370. *Mr. Curley.*] Was that arbitration a matter of mutual arrangement? It was a matter of mutual arrangement between the property holders, after the decision of the Court was given. The decision was that the Messrs. Sneddon should have permission to mine under these streets under the supervision of Mr. Thomas Croudace. The property holders were under the impression that the Council had virtually lost the case, and that Mr. Sneddon had the privilege to mine under the streets, and they were forced to go to arbitration.

4371. Do you think that cases of this character call for immediate legislation? I do. I know where my home is, that Messrs. Sneddon will come and take the feet from under my house; I know that the mineral is there, but he has the right to it, and if I have to take any steps to prevent him, I should find myself in the hands of the Law Courts. I would strongly suggest, that in connection with that particular section of the Bill, where this plan is to be provided, that the words should be inserted, "There shall be provided a surface plan on the same scale, &c." The wording, "if required," leaves it too open a matter altogether. I think that plan should be open to the municipal authorities, on the production of an order from the Minister for Mines.

4372. Why the Minister for Mines? He could grant permission to see the plan, if some substantial reason was given for wanting to see it.

4373. Would it not do to leave it to the inspectors? In that case it would mean going to law and calling the inspectors.

4374. Is there anything else in connection with this matter you would like to refer to? In connection with Rule 25 on page 29 of the Bill (*see Appendix A*), it seems to me that it does not meet our case at all.

It

It deals with headings going under roads, but it does not deal with the matter of mining the coal. Our Council sent a motion to the recent Municipal Conference dealing with the matter. The motion submitted by the Council reads as follows:—"And that in order to permanently secure the safety of all public roads, streets, lanes, or buildings, adjacent thereto, within the boundaries of any municipality, it shall be the duty of the Minister for Mines, his examiners or inspectors, to at least once in every six months, inspect all mining under such roads, streets, lanes or buildings, and take such steps, as the Minister or his officers may deem necessary to insure the permanent safety of such roads, streets, lanes, or buildings."

Mr. T. Abel.  
30 Sept., 1895.

[Witness withdrew.]

William Henry Goodman sworn and examined:—

4375. *President.*] What are you, Mr. Goodman? I am a storekeeper.  
 4376. Where do you reside? At Stockton, near Newcastle.  
 4377. *Mr. Curley.*] Are you an alderman of the Municipal Council of Stockton? Yes.  
 4378. Do you hold the position of Mayor of that municipality? Yes.  
 4379. *Mr. Gregson.*] Is this the first year of your mayoralty? Yes; I have been Mayor of Stockton since February of this year.  
 4380. *President.*] How long have you been an alderman? About three and a half years.  
 4381. *Mr. Curley.*] Have you resided at Stockton for a number of years? I will have been a resident of Stockton for ten years on the 16th of next month.  
 4382. Do you know the Stockton Colliery? Yes; I have worked in that colliery for about five years.  
 4383. How long ago is it since you worked there? I started to work in the Stockton Colliery in October, 1885, and worked there up to 1890.  
 4384. Do you know of any extensive fall that occurred in that mine some years ago? There was an extensive fall in the No. 2 heading, I think, in 1889.  
 4385. Was that one of the main roads? That is the main roadway.  
 4386. How many men would work inside of where that fall took place? At that time, I think there were a greater part of the bottom seam, and also of the top seam working inside of this fall. There was only one heading working in the bottom seam besides No. 2, and that was No. 3. There were not many men working in No. 3.  
 4387. Were nearly the whole of the men in the colliery working inside of that fall? Yes.  
 4388. Would the fall affect both seams? Yes, it affected both seams.  
 4389. Was the main roadway closed up? Yes; the main way was closed for some considerable time, but I cannot say the exact time. The pit was idle for some weeks.  
 4390. How do you account for that fall taking place? I think it was due to the reckless way in which the pit was opened out—robbing the pillars.  
 4391. Do you think the fall was caused through leaving too small pillars? Yes.  
 4392. Do you know of any surface subsidences that have taken place in the township of Stockton? Yes.  
 4393. This is a plan of the Stockton township (*plan produced*). Will you look at this plan, and indicate, if you can, where the subsidences have taken place (*see Plan, Appendix U*)? There is one fall in Stockton-street, and this street is supposed to be on the 100 feet water frontage. This street, from between Clyde-street and King-street, runs a distance of from 8 to 9 chains. It does not reach quite to Clyde-street, and the surface in this part has gone down about 2 feet on the street. The Government, of course, put in the alignment stones, and since the levels have been taken by our surveyor, Mr. Gardiner, we find this street has gone down about 2 feet. The subsidence extends from the water frontage to William street, and the William-street houses were affected a good deal in the way of plaster and walls cracking. They are nearly all wooden houses, and in some instances, the foundation has gone away, and left the houses standing. The properties, facing Stockton-street, have gone down so much, that if it was not for our road the tide would ebb and flow into their yards. We had to take away the surface water from their yards. The yards of Keenan, Davis, and Taylor, are the three persons who are most affected there.  
 4394. Has the land gone down where these properties stand? A piece of ground about 9 or 10 chains in diameter, has gone down nearly 2 feet and in some places more.  
 4395. Have you any idea when these subsidences took place? In October, 1892.  
 4396. *Mr. Gregson.*] Where is the position of the Stockton shaft (*see plan, Appendix U*)? It is near the northern breakwater.  
 4397. *Mr. Curley.*] Are both the upcast and the downcast shafts together? They are a distance of from 20 to 25 yards apart. We have another subsidence further down at the corner of Maitland and Hunter Streets (*see Plan, Appendix U*), and according to the levels our inspector has given us, the surface there has also gone down 20 inches. It takes in a good deal of Stockton-street. It did a considerable amount of damage, breaking the stones, &c., and the estimate for repairs to replace it, to bring it up to its original level, is £250.  
 4398. *Mr. Gregson.*] Did you make any claim upon the Stockton Coal-mining Company for the damage done? We wrote to the Company, but they ignored our letter, or rather took no notice of it. This fall has extended as far as Mitchell-street and Crown-street (*see Plan, Appendix U*). My premises are situated near to this part, and it has cracked a brick building there. We have often heard the shocks and people are often alarmed by a noise at night-time and in the day-time like thunder.  
 4399. *Mr. Curley.*] When did this fall take place? About two years ago.  
 4400. Would that be in 1893? Yes; December, 1893.  
 4401. When did that other fall occur? Fourteen months after the first fall.  
 4402. *President.*] Why could not the municipality recover from the Stockton Company? The advice we received was that private property holders could recover, but that municipal councils, as custodians, had no redress whatever.  
 4403. *Mr. Curley.*] Can you point out on that plan any other subsidences apart from the two you have mentioned? No; I cannot say I can.  
 4404. *President.*] Was that decision given on the grounds of the Municipalities Act? I think the answer was, that as custodians of the streets the Council had no redress to recover from any company or to recover from the estate. I think we asked the question both ways, whether we could recover from the owner of the estate or from the coal company, and that was the answer we received. I think our solicitors drew our

Mr. W. H.  
Goodman.  
30 Sept., 1895.

- Mr. W. H. Goodman.  
30 Sept., 1895.
- our attention to a case that had been tried in England recently, and it was pointed out that they were unsuccessful there. It was a case something similar to ours of a coal-mine falling in and damaging the property of a council, and they could get no redress.
4405. Supposing you have a Municipal Council Chambers, and, through undermining, those chambers gave way or were cracked and broken, were you advised that you could not recover for that? I do not know whether that question was put.
4406. Was the question put, whether you could recover for your streets? Yes; and we were advised that private property-holders could recover. I think that some of the residents—Callen, Breckenridge, and Pilot Warner—are taking the matter up now. Chatfield's steps, in Stockton-street, are cracked right up the front, at one corner, and the building had been up for some four or five years before this crack took place.
4407. Do you know whose opinion was taken upon this matter? The solicitors for the Council were Messrs. Sparke and Millard, of Newcastle.
4408. *Mr. Curley.*] Were there any valuable buildings on this site? Mr. Peter Callen's house is a building that cost, I should think, from £1,500 to £1,600. The fall did a considerable amount of damage. It shattered the foundations, cement, and plaster of the houses in every shape and form.
4409. Did you see yourself that several of these steps were shattered, together with the supports to the houses? Yes; the houses are shifted. The water-spouting of the houses, instead of carrying the water to the back, carries it down over the front of the houses. The spouting holds no water at the back, and some of the other houses are canting over to one side.
4410. How far are these subsidences from the river? Maitland and Stockton Streets are about 120 yards, and where the other fall took place, between Clyde and King Streets, the distance varies. Some part of the street is on the hundred feet reservation, and in other places the streets would be from 10 to 20 yards off high-water mark.
4411. *President.*] Did you get a written opinion on this matter? Yes, from Sparke and Millard, and also from the Municipal Association.
4412. Can you let us see that opinion? Yes, we can send you a copy. I will see the Council Clerk about it. [*See Appendix V.*]
4413. *Mr. Curley.*] Was the mine very wet or damp where you used to work? Some places were wet, and some places were dry.
4414. Did you notice if the water was salt? Yes, it was all salt.
4415. Did the mine dip or rise from the shaft? The No. 2 heading was rising very fast.
4416. How deep is the shaft? 350 feet.
4417. Is there water all round it? Yes; I worked in the No. 2 heading a good deal, and it was rising very fast when I worked there. I have heard since that it is dipping, but I do not know how far this is true.
4418. Do you say that several buildings were affected by these subsidences? Yes; seven or eight buildings are affected to a large extent; and of course there are several minor things that could be mentioned.
4419. Has the Council applied to the company for something for the renewal of these streets? Yes.
4420. And do you say that that communication has never been answered? Yes. We also asked the company to receive a deputation, but they refused to do so.
4421. Do you think the manager of the company would have a full knowledge of all these things? The management says that it is the dredging of the harbour that is causing the landslips on the surface—that the dredging of the harbour is causing these streets to come down.
4422. Would the dredging of the harbour cause these thuds and sounds like thunder? I can hardly see that it could.
4423. Do you believe that the dredging of the harbour has anything to do with it? No, I do not; I think the foreshore has not been affected at all.
4424. This is near the water? Yes. At Stockton the surface is all composed of sand, and I do not see how it could possibly slip.
4425. Will you look at section [30] 28, sub-section 3, on page 14 of the Bill (*see Appendix A*)? Yes.
4426. Do you think that a provision of that kind should be embodied in this Bill? Yes; I think so. The people living on the surface should, I think, have the right of knowing what is going on down below. A case in point is that part of Stockton-street is supposed to be on the 100-feet reservation, and we have not the slightest doubt that that has gone down 2 feet, and this 100 feet of coal is supposed to be left in there.
4427. Is that not a matter that you could have referred to the Minister? I am not sure whether we did not write to the Minister. There is a clause in the Municipalities Act that gives power to refer to the Minister, and to ask him for an inspection of the mine. I think we wrote to the Minister; but I forget the reply we received. I remember the matter being talked about. The question would arise whether the Stockton Company had a right to take this coal out or not, and we, of course, think they had no right to take the coal out.
4428. Could you not ascertain from the Minister whether they had that right or not? I forget the nature of the correspondence on the subject. I think we wrote and asked the Minister, but I forget the answer we received.
4429. Will you look at the 38th section of the present Act:

38. Upon the affidavit of any person taken before any Justice of the Peace or Commissioner of the Supreme Court for taking affidavits claiming to be legally or equitably interested in any mine or in any land adjoining or near to any other mine that the owner of such last-mentioned mine is or is by the person making such affidavit believed to be encroached upon such first-mentioned mine or land the Minister may by writing under his hand authorise the examiner or inspector together with a mining surveyor or experienced miner to enter upon such last-mentioned mine or land for the purpose of ascertaining whether any such encroachment has been made and if so the extent thereof. But before granting such authority the Minister shall require the person making or lodging the affidavit to deposit such a sum of money not exceeding one hundred pounds as shall be necessary to cover the cost of such inspection. The persons so authorised may thereupon enter on the mine or land described in such order and descend any shaft or enter any mine and for such purpose use the engines and other machinery ordinarily employed for that purpose by the persons whose shaft or mine shall be descended or entered and make such plans and sections of the mine or land entered upon and of any drives or other works therein as shall be necessary for the purpose aforesaid. And the owner or agent of the mine to be entered upon shall render all necessary assistance to the person so authorised. And every such examiner or surveyor or miner shall before entering on such mine or land make a statutory declaration before any person authorised to take the same that he will not (except as a witness in a Court of Justice) without the consent in writing of the owner of the mine or land to be entered upon divulge or cause to be divulged to any person whomsoever any information obtained upon or by such entry save only as to whether such

such owner is encroaching on such first-mentioned mine or land and every person who shall act contrary to such declaration and any owner or agent who shall refuse such assistance as shall be necessary to enable the persons authorised by the Minister to descend the shaft or enter and examine the mine shall forfeit and pay a sum not exceeding ten pounds. Provided always that the Minister may out of the sum deposited as aforesaid defray the cost of such inspection and if such owner or agent render such assistance as shall be necessary for the purposes aforesaid and if there be no encroachment may out of such sum award to such owner compensation for any loss or expense to which he may be put by reason of such inspection.

Mr. W. H.  
Goodman.  
30 Sept., 1895.

4430-1. Do you think that section touches the case in point? Yes; that applies to entering a mine. There is also another difficulty we could see. We had two or three persons in our Council who had a very fair idea of how this thing had been worked, and there was a difficulty in getting an inspection, knowing that they knew the state of the pillars, and also that very little care had been taken in this respect. We thought there would be some difficulty in getting in there, even if we wanted to.

4432. Has the Council done anything beyond appealing to the Company? Nothing beyond asking legal advice.

4433. Will you now look at Rule 25, on page 29 of the Bill—"Coal not to be wrought under roads." [See Appendix A.] Do you believe in a provision of that kind being in the Bill? Yes; I think there should be a provision not to allow the bord to be driven if it was running parallel with any street. In course of time, through the coal being of a soft nature, and the pillars crumbling away, there is danger of the streets being affected. I think a provision should be made to carry the workings, if possible, free from streets, or in the event of their driving under streets, that the cut throughs, or headings, shall be driven as provided in this rule.

4434. *President.*] Supposing this is the case, that the owner of the Stockton estate grants to you the right to get all the minerals under the estate, and he grants to me the mere surface of the land, I knowing well enough that at the time I take the grant of the surface that you have the right of the minerals, does it not seem hard that you are not to get your coal because of that; if people choose with their eyes open to make a village or a little town, and then get it made a municipality, because they have done that, are they to deprive others of their rights? I think there is a lot to be said on both sides.

4435. *Mr. Curley.*] Is this not a matter that the Municipal Councils could take up and deal with themselves? I do not think the Municipal Council has any right to interfere with private property. They have only the care and construction of the streets.

4436. *President.*] Can you say whether these streets were dedicated to the Council? Maitland-street was dedicated by the Stockton Estate, and Stockton-street which coincides with part of the Stockton to Raymond Terrace Government road by the Government by the proclamation of incorporation. Some time after the Council was formed, the Government asked the Council to take the road over, and gave them a grant of £120 a year for three years. It was aligned before the disturbances took place, but not before the coal was taken out; and it was pointed out that the important point was whether the coal had been taken out before the street actually became the property of the Council. There is another question with regard to Government ground. The Government have sold a portion of the land, and the people have paid a very high price for it, and the question is, is it right to allow the Stockton Coal Company who have taken up the right to mine under Government ground to let this ground down.

4437. *Mr. Curley.*] Would you kindly point out the Government land on this plan? Yes. [See Appendix U.]

4437½. When was that Government land indicated on the plan sold? About seven years ago.

[Witness withdrew].

Thomas Adams sworn and examined:—

4438. *Mr. Curley.*] What are you by occupation? A miner.

4439. Have you had much experience in mining? Seven years experience.

4440. Where have you worked? In Queensland and in the Newcastle district.

4441. Have you been long in the Newcastle district? About six years.

4442. What collieries have you worked at in Newcastle? At the Newcastle Coal Company's mine.

4443. Have you worked at the A and B pits? Yes.

4444. What pit are you working in at the present time? The B pit.

4445. Do you know the number of men employed in each pit? I cannot say the number of men in each pit, but I know the number in both pits.

4446. Can you form any idea of the number of men in the B pit? I should say there were about 200 miners in the B pit.

4447. How many miners are there in the A pit? 270.

4448. What is the width of the bords in these collieries? Eight yards.

4449. What is the size of the pillars? They vary. Some are 6 yards, some 8 yards, and sometimes they go more.

4450. Have the pillars always been that size since you went to that colliery? Yes.

4451. Are you paid at that colliery by average weight? By the standard weight.

4452. What is your standard weight? Twelve cwt; no weight is recognised above that.

4453. I suppose a record is taken by the check-weighman occasionally, to see what weight men are getting;—if a skip weighed over the 12 cwt., would it not be recorded? No, the company will not weigh. If it goes 12 cwt. they leave the machine. They only recognise 12 cwt.

4454. Are you sure of that? Positive.

4455. How does a man know when he fills over 12 cwt? The check-weighman guesses at it.

4456. Do you consider that standard weight should be abolished? I do.

4457. Are you paid by the average at that colliery? No.

4458. Do you not get the average of the skips that are weighed? If a skip gets weighed to-day 12 cwt., you get paid for the full amount of skips that day as 12 cwt. If to-morrow, it is 11 cwt., you get all the skips at 11 cwt.

4459. What would be done, supposing you were weighed twice in a day? In that case the skips are averaged. If you get weighed twice in one day you stand on the average.

4460. Do you think that where there is the standard weight, the miner gets a fair average? No, he does not.

4461. Does that not arise from this, that probably one skip may be over 12 cwt., and another under the 12 cwt? If you get a skip 12 cwt. 2 qrs., and another skip 11 cwt. 2 qrs., they do not recognise that half cwt; they only recognise the 12 cwt., and the 11 cwt. 2 qrs.

4462.

Mr. T. Adams.  
30 Sept., 1895.

- Mr. T. Adams. 4462. What is your opinion with regard to the number of skips that are weighed? I think that every skip should be weighed. I have had experience in England, where we were weighing from two pits, and we had every skip weighed there.
- 30 Sept., 1895
4463. What number of skips came out of that mine per day? I cannot say the number of skips.
4464. Was it a large output? Yes.
4465. And every skip was weighed? Yes.
4466. Where was the weighing-machine? Between the two pits. It had a face like a clock, and with every skip that went over, a finger pointed to the weight.
4467. Was it a self-registering machine? Yes.
4468. Were these machines very costly? I cannot say.
4469. What mines were these machines used in? This was in Staffordshire, England.
4470. Did you work in any of these mines as a coal getter? No.
4471. What were you doing there? I was weighing for the masters, against the check-weighman.
4472. From the experience you have had in England, you know that it is possible to weigh every skip without interfering with the output of the mine? Yes.
4473. Do you think these machines are costly items? I have not the least idea.
4474. Do you know the average number of skips that are weighed at the Newcastle Company's colliery in a day or a fortnight? There are about between thirty and forty skips weighed daily at the A pit, and I should say, about thirty skips per day at the B pit, that is as near as I can judge.
4475. How many skips will be drawn from these two pits in a day? They reckon to draw at the A pit about 900 skips.
4476. Is that a day's work? Yes.
4477. How many skips would go to the waggon? About fifteen skips.
4478. Can you say exactly what the number is? I cannot give you the number any nearer.
4479. Do the men ever make any complaints about the number of skips that are weighed there? Yes; very often.
4480. Do you consider that a sufficient number of skips to weigh in proportion to the day's work? No, I do not.
4481. If an increased number of skips were weighed, do you think that would give more satisfaction to the men than what is given now? It might give more satisfaction as regards myself, but from what I have heard the men say they would sooner have every skip weighed.
4482. Is that the opinion of the men so far as your colliery is concerned? Yes; that is my experience, from what I have heard the men talk about.
4483. They think that every skip should be weighed? Yes.
4484. Is the company's weighman at the weighbridge all day? Yes.
4485. Has he any other duties to perform? Not that I am aware of.
4486. Has he any clerical duties? Not that I am aware of.
4487. Has he anything to do with looking after screenmen, waggons, or anything of that sort? No.
4488. Has this question of an insufficient number of skips being weighed ever been referred to the manager? It has not been referred to the manager while I have been in office; but when the other secretary was there I believe it was referred to him.
4489. Do you hold the position of secretary to the lodge? Yes; I have held the position of secretary to the lodge for four months.
4490. Have you ever examined any of the provisions in the proposed new Bill? No, I have never seen it.
4491. Have you worked in different parts of both these collieries? I have worked in all sections of both pits with the exception of one.
4492. What section was that? The No. 9 section.
4493. Have you ever noticed any defects in connection with the ventilation of that colliery? Yes; I have filled the position of check-inspector, and I have very often found defects in the ventilation.
4494. Were you the check-inspector for both pits? Yes.
4495. In what districts have you found these defects in the ventilation? In a district called No. 2, in the A pit; and also in a district called No. 1, in the same pit. There is very good ventilation in the B pit.
4496. What was the nature of the defects in the ventilation you refer to? Bad air. I have known the thermometer range up to 79 degrees. I have here the check-inspector's report for the 16th and 17th of October, 1893. It says: "We found the air deficient in No. 7 heading, 109 pillar, through want of a canvas, which the deputy promised to put up at once. We also found it slack in No. 2, at 47 pillar. In fact it was not up to the previous inspection in any of the headings in No. 2 district. The air-ways and travelling roads were in fair condition, and we found a fair supply of timber on the various flats." That report was signed by Thomas Oswald, and Thomas Adams, check-inspectors.
4497. Was that on the heading? Yes.
4498. If the air was bad on the heading, how would it be with the men working in the face? I have known the men have to come out of the face, and go into the heading for a breath of air.
4499. Have you made any report since this report? Yes.
4500. Do you notice any further deficiencies in the ventilation? Yes. On the 2nd and 3rd April, 1894, we found the air-ways and travelling-roads in good condition, and plenty of timber on the flats. We also examined the ropes and cages. And in our opinion the cages at the A pit are in a bad state of repair owing to the rivets and bolts being loose. We found the B pit cages in a much worse condition, and we think that the wire that is attached to the middle chains should be removed, and the chains substantially repaired. And the cover on the south side cage wants replacing by a new one, the present one being full of holes, and patched with timber. We attribute the cause of not being able to get a reading in No. 3 Heading, B pit to the following:—Firstly to no one being in attendance at the furnace after 2 p.m. Secondly, to the door leading to the pick-rack being left open at times. We would recommend that another door be erected, one door not being sufficient to meet the requirements. We also draw the overman's attention to what is known as the stable door, as it was in a very dilapidated condition which he promised to rectify.—(Signed) Emanuel Rigby, Robert Wells, Check inspectors.

TUESDAY, 1 OCTOBER, 1895.

[The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.]

Present:—

FRANCIS EDWARD ROGERS, Esq., Q.C. (PRESIDENT).

JAMES CURLEY, Esq. | JESSE GREGSON, Esq.

Thomas Adams' examination continued:—

4501. *Mr. Curley.*] I think you were referring to the Check Inspector's reports when we closed last night? Yes.

4502. Are there any other reports that have been made, subsequent to the one you referred to, that show further defects in connection with the ventilation? No, I don't think there are. I may state that we have had no inspection since the one in 1894.

4503. You have never been authorised to go round? No. The last inspection is in the book.

4504. Is your experience, where you have noticed any defects in the ventilation, that the air was not conducted up into the working place? Yes, always. In my experience I have never seen it conducted up to the working face—it is always in the headings.

4505. Do you think it should be turned into the bord? Yes.

4506. And kept well up to the face? Yes.

4507. Have you seen the proposed Bill? No.

4508. Will you look at sections 50, 47, rule 1, page 23 (*see Appendix A*). You will see several erasures in the clause there where lines are struck out. Those lines that you see run through in the clause, and also the larger letters that you see inserted, represent the amendments by the Legislative Council, and the clause without those erasures and larger letters represents the clause as it was originally in the Bill, and as it left the Legislative Assembly. Do you believe that there should be a minimum quantity of air provided—of 150 cubic feet—for each miner? Yes, I do; and I believe if the thermometer runs over 70° the air ought to be condemned. From my experience, I do not think the air is pure after the thermometer ranges over that.

4509. You think a high temperature shows a defect in the ventilation? Yes, it does.

4510. Is this a matter that you have studied and thought out? Yes, it is.

4511. What would you consider a medium temperature? I would say between 60° and 70°. I have seen it in the Newcastle Company's B Pit as low as 59° and 60°. Of course it is very good air there.

4512. Do you believe in the shorter cut-throughs, from 35 to 25 yards? I do not know that that would make much difference, providing there was good air, or if the air was taken up to the men with brattice.

4513. Is there much refuse in the Newcastle Company's seam? Yes, a good deal.

4514. Is there what is known as a Jerry-band in the seam? Yes, in some sections of it.

4515. Does it run right across the seam? Yes.

4516. How thick is it? From 16 to 17 inches.

4517. Is that worked? Yes, on some sections.

4518. Have the men to put it on one side, and clean it from the coal? Yes; clean it from the coal, and put it on one side.

4519. Do you think some of this refuse could be utilised in certain cases for the conducting of the air by packing it at the side of the road? Yes, I believe it could be used to pack up all the old bords. It would make a very great difference to the air, and save the expenditure of buying brattice.

4520. Is there any fire-damp given off in that mine? I never saw any in my experience.

4521. Did you notice much waste in connection with the air when you have made check inspections? Yes; on account of these old bords not being stopped up.

4522. As a rule, did you find a fair quantity of air on the intake? Yes. I have found it deficient in a certain section in the Newcastle Company's Pit No. 1. I have seen the time when we could not get a reading at all, and at other times you could get good readings.

4523. In a case where you could not get a reading, would you consider the air very slack and stagnant? Yes.

4524. Do you believe the air should be conducted in a mine in splits? Yes, provided there are not too many men on each split.

4525. Do you know the limit the Act proposes with regard to the number of men? Sixty.

4526. Do you think sixty a fair number of men to be in a split? Yes, I should say so.

4527. Have you given any attention to the question of hours that the men work? At the Newcastle Company's Collieries the miners work eight hours as nearly as possible. The first shift goes down the mine at 6 a.m. and knocks off at 2 p.m.; the back shift goes down at 8 a.m. and knocks off at 4 p.m. I may say that the wheelers go to work at 7 a.m. and stop drawing coal at 4 p.m., and then very often fill slack till 6 p.m.

4528. Do you believe that there should be a uniform starting time in the mine? I do.

4529. And also a uniform time for casing work? Yes.

4530. Are you in favour of the proposal to fix the hours at eight by legislation;—do you believe in the hours being legislated for? I do.

4531. Is there any security for the present working hours;—could not a manager alter them, if he thought fit, at any time, and request the men to work longer? Yes; I believe he could.

4532. Do you think eight hours long enough for a man to be in the mine? Quite sufficient.

4533. When you have been making your inspections have you ever inspected the shafts? No, I never have.

4534. Do you think they are worthy of consideration? Yes, I do. I consider that the check inspectors ought to examine ropes, gauges, shafts, and everything—provided they understand them.

4535. If a man saw any loose stones in a shaft do you think he would understand what that meant? Oh, yes.

4536. Do you consider that the shafts should be at a reasonable distance from each other? Yes; I believe they should be.

4537. The Bill proposes that they should be fifty yards apart;—I think the Legislative Council proposes something like ten yards, and the Legislative Assembly has suggested thirty yards;—what do you think of it? I should think thirty yards is a fair distance.

Mr.  
T. Adams.  
1 Oct., 1895.

- Mr. T. Adams.  
1 Oct., 1895.
4538. Is your colliery working anything like full time? No; about half time, as nearly as possible.
4539. Do you think working only eight hours would interfere very much with the output of a colliery? No; I don't.
4540. Do you think the cost of bratticing to regulate the ventilation in a mine would be a very serious item, or would it be merely a nominal charge? No; I do not think it would be very serious. Of course it would cause the expenditure to be a little higher in working the mine; but I consider that they could utilise the refuse instead of brattice.
4541. Could they do this in a great many instances? Yes.
4542. *President.*] Do you mean build it up? Yes; I may say that sometimes they do this in the Newcastle Co.'s A pit. I have seen it done. We were making an inspection in this section I am speaking of, and we could not get any readings; we therefore pointed out to the overman that he had better stop up those old bords, and he had them stopped with refuse, and the next time we went round we could take a reading.
4543. *Mr. Curley.*] Do you think managers should see numbers of these things without the men having to point them out to them? Yes; I believe they know about it without the men pointing out the defects to them.
4544. Can you understand why this is not done without the men having to point it out to them? No; I cannot understand it at all. I have seen times when we have found defects and pointed them out, and no notice has been taken of them.
4545. How are these two collieries ventilated? By furnaces.  
[Witness withdrew.]

Alexander Mathieson sworn and examined.

- A. Mathieson, Esq.  
1 Oct., 1895.
4546. *Mr. Curley.*] What profession do you follow? That of colliery manager.
4547. What colliery are you now in charge of? The Hetton Colliery.
4548. Have you been manager for some time at the Hetton Colliery? I have been manager of the Hetton Colliery from the start, but I have not had the full management of it all the time. I have had the management of it for all the time except about three or three and a half years.
4549. *Mr. Gregson.*] How many years have you managed the colliery? Four years this last time, and a little over two years when they first started to sink.
4550. *Mr. Curley.*] Were you in charge of the sinking operations? Yes; looking after them on behalf of the company.
4551. Have you one or two shafts? Two.
4552. Where is the pit situated? At Carrington.
4553. Can you point it out on this plan? [*Plan handed to witness.—Witness marks location in pencil.*]
4554. Are you pretty well acquainted with the deposits that were gone through in the sinking of these shafts? Yes, pretty well.
4555. What were they? Sand, clay, and shale.
4556. What shale had you at the down cast shaft? Shale and blue metal—about 50 or 55 feet—I am not sure which.
4557. What had you with regard to your up-cast shaft? About 90 or 95 feet.
4558. Can you outline on the plan where the leasehold extends. Is it leasehold? Yes. This plan does not give it all.
4559. Does it not give a portion of it? No; it only gives two of the leases and part of the third.
4560. Don't you work this portion (*indicating on plan—see Appendix W*)? Yes.
4561. It does show a considerable portion? Yes; it shows three of the leases. The middle lease is 14. The others are 13 and 12 (*see Appendix W*).
4562. Is the principal portion of your work under the harbour? Yes.
4563. What is your method of working? Bord and pillar.
4564. What is the width of your bords? Six yards.
4565. What is the size of your pillars? Six yards.
4566. Have you seen the report of the Royal Commission on Collieries adjacent to Ferndale? It is a long time ago now.
4567. Have you seen any intimation from the Examiner of Coal-fields in regard to any recommendations the Commission made for the regulation of collieries under ocean leaseholds and tidal waters. Has any official communication been sent to the managers, do you know? No; not that I am aware of.
4568. Will you look at these recommendations here on pages 128-9 of the report of the Department of Mines, 1887—Tidal Leaseholds and Ocean Leaseholds (*see Appendix Q*)? I have not seen these before. We do not comply with the 7 feet in thickness.
4569. What do you mean by the 7 feet in thickness? The thickness of coal to be wrought not to exceed 7 feet.
4570. That means, I presume, that it is intimated that there is to be some top coal left;—is that what you consider from the recommendation? That is what I would consider from that, but leaving top coal up would not make us safe.
4571. Would it not help to do so? Not in the slightest, because it would not stop up. In fact, in the biggest part of our lease, leaving top coal up is a danger instead of a safety, because after being thoroughly wet and left to itself to dry, it is likely to catch fire when it falls and lies after the waters draw off it.
4572. Have you known top coal to stand for years? Some; some does not stand for many months, in fact, not for many weeks.
4573. What section of the coal are you referring to as falling? The top band.
4574. How thick is it? About 3 ft. 10 in., or 4 feet in most places; in some places only 3 feet.
4575. Do you mean to say that the coal, without being worked, will fall of its own accord? Yes; it will.
4576. In a six-yard place? Yes.
4577. Where have you noticed that? In our mine.
4578. In what section of the mine? In different sections.
4579. I suppose your sections have local names,—can you tell us the local names of the sections? It falls in what we call the back of the shaft, and it falls in No. 2 section.
4580. Of its own accord? Yes.
- 4581.

A. Mathieson,  
Esq.  
1 Oct., 1895.

4581. What do you attribute it to? The freeness of the coal; it is very free and brittle in places.
4582. Would that be in particularly soft places? No. The coal is a tender coal in places.
4583. Is it anywhere near the fault? No; nowhere near it. In fact, as far as the fault is concerned, we get our strongest coal alongside the faults.
4584. Does your mine make any quantities of water? No; not extra quantities.
4585. Did you report in your last half-yearly report that the mine was giving off the usual quantity of water? About the usual quantity.
4586. What is the usual quantity? I am sure I could not say. I never bothered to make it up to see what it is. It has never been excessive, and therefore it never troubled me.
4587. When you have come to any fault, has any given quantity of water come off additional to what was being made in the mine? We do get places where we get a little more water than at other places, and when we get it at those places it usually takes off somewhere else. I do not think we are pumping many more gallons now than we did at first.
4588. Is that where you are working under the harbour? We are getting none under the harbour—to the dip—at all to speak of.
4589. Have you any idea of the thickness of the rock overhead as you are going to the dip? The rock overhead, going to the dip, I suppose, will be 220 or 230 feet.
4590. How did you arrive at that calculation? Because they have got the rock in the harbour over our head. They are blasting in the harbour at the present time.
4591. Are they boring down or sinking? The Government is blasting it out.
4592. Is that overhead where you are working? Yes, we are working there too.
4593. Do you think a six-yard pillar is sufficient to meet all exigencies there? Yes,—any quantity—in fact, it is a waste to leave six yards.
4594. *President.*] Is that under the water? Yes.
4595. *Mr. Curley.*] How many yards would you like to leave? I think it is right to leave six yards, but five would carry it quite comfortably—in fact four would carry it.
4596. Where the coal is brittle and free, like that to which you have just referred, don't you think that in order to carry a given quantity of weight you would require some large pillar of some reasonable dimensions? No; I don't think so.
4597. Would the coal being brittle and free, or solid and hard, make any difference? No; it does not seem to affect the stone overhead.
4598. I suppose you will admit that it will have to carry weight, a considerable quantity in time, as the mine gets worked? The stone will have to carry the weight.
4599. Will the stone stand of its own accord without being supported? Yes.
4600. Even if the pillars were taken out? No; if you have all the pillars out, away it will come.
4601. Then you do admit that the pillars keep the stone up? Yes; certainly.
4602. In your leading drives do you keep bores in advance for a given distance? Yes.
4603. How far? No particular distance. It sometimes just depends on the time the man is in. He bores them not less than 12 feet, and sometimes 18 feet, to save him from coming back again next shift.
4604. What is the least distance you keep them in advance? He never bores them less than 12 feet. If he has time he will bore them 16 or 18 feet to save him from coming back next shift.
4605. Does your leasehold extend at all under the cranes? No, except that there are 4 acres going out under the cranes for the connection. That is the only thing we hold under the wharf.
4606. Do you leave the requisite pillars there in the same way? No; we have only got two drives through.
4607. Does your leasehold extend much northward up the harbour from your mine? Yes; a good distance north.
4608. Are you working up that way? Yes; a little.
4609. Do you think the rock will run out there or get thinner as you go north? No; I think it holds about the same as far as any bores that have been put down are concerned.
4610. Have you had any indications of the roof breaking down going north? No, none whatever.
4611. Or in any other part of the mine? No; not in any part of the mine.
4612. If at any time there was the slightest indication of the roof coming down in any part of the mine in that way, would you encourage an immediate report being made to you of such occurrence? Certainly I would, and report it to my directors.
4613. Would you encourage a report being made at once from the workmen where any circumstance of that character occurred? If the workmen made a report I would go and see to it myself.
4614. Do you have any discussions on these matters with your officials, such as your overmen or deputies, at any time? No; because we never need to have it.
4615. You do not think it necessary to talk these matters over? No.
4616. Not in a colliery situated such as yours? No; because both he and I travel the places sufficiently often to see these things.
4617. Are you down in the mine pretty frequently? Yes.
4618. Do you propose to work out any pillars? No; in fact our lease would not allow us, therefore there is no use in our proposing it.
4619. Is there a stipulation in the lease that you are not to work the pillars? Yes.
4620. Do you ventilate your colliery by furnace or by fan? By fan.
4621. What fan is it? A Guibal fan.
4622. Is the ventilation well sustained throughout the mine at all times? Yes, at all times.
4623. Have you ever heard any complaints? No. When I say "No," I mean there are complaints sometimes, but very rarely.
4624. What do you consider a compliance with the Act of 1876 with regard to the air? There is any quantity of air so far as the 1876 Act is concerned.
4625. That is, is it either large or small? It is quite sufficient air for our mine.
4626. How do you define the Act with regard to supplying a given quantity to each miner? According to the Act we are supposed to have 100 feet sweeping along our airways for each man or boy, and 150 feet for a horse. That is the quantity according to the Act, and you have to keep it up.
4627. The minimum quantity? Yes.

- A. Mathieson, Esq.  
1 Oct., 1895.
4628. Do you consider that you comply with the Act if the minimum quantity is there? Yes.
4629. The Act does not prevent you from giving more? No.
4630. Do you aim at giving more than that? Yes, I think we do, as a rule.
4631. Do you do anything to carry it into the bords with brattice or anything like that? No, not without we have a place going to the rise, and we do not see our way to putting in a cut-through.
4632. At the 35 yards? Yes. Going to the rise we may cut them a little shorter.
4633. You say you leave no top coal in the colliery? In some places we do, but in very few places.
4634. Have you ever made a computation of the ventilation circulating throughout the whole of the mine, to ascertain how far you are exceeding the minimum quantity stipulated in the Act? Yes, we do at times—in fact, we are always above it as far as that is concerned. So far as I am aware, I do not think we have ever been below it.
4635. You say that you do not conduct it into the bords by brattice or anything? No.
4636. Is it not possible that you may have a fair quantity of air on the heading, and that the man in a bord who is pretty well up his 35 yards may have very defective ventilation? No; I have never found it so.
4637. Do the miners use powder for blasting in your mine? Yes.
4638. Cannot they get the coal without it? Yes, they could if they would do a little more work; they use too much powder.
4639. Do you think practical men like to waste powder? There are some practical men who do not, but others do.
4640. Is that not the exception;—would you say that, as a rule, men use far more powder than is required? They do, as a rule.
4641. Do you think practical men, after years of experience, would not know how to gauge the powder? A great number of them use the powder on purpose to save a little labour.
4642. Have you any regulated distance that they have to hole before a shot is fired? No, we have not. All we do is to make them hole it, but no certain distance, and cut one side if possible. We make them hole it a fair distance. We have no certain distance fixed.
4643. There must be some understanding? The understanding is that they are to go about 3 feet. Some places we do not get the facing, but most places we do.
4644. Is that fairly well carried out in the colliery? In most cases it is.
4645. You go round the colliery pretty frequently, and I suppose you have full opportunities of judging of this matter? Yes; but they sometimes watch us.
4646. I suppose you watch them? Yes.
4647. Do you know the provisions in the proposed Bill for increasing the minimum quantity of ventilation? Yes; I have gone through the new Bill.
4648. What do you think of the provisions? It depends upon which provisions you refer to. We can hardly tell how the Bill is now.
4649. Will you look at section 47, rule 1, page 23 (*see Appendix A*)? Yes; the way the Bill is sought to be passed now it says, "an adequate amount of ventilation."
4650. Are there not two opinions on the matter? Yes, there are at present.
4651. One opinion is that there should be an adequate amount, and the other that there should be 150 cubic feet as a minimum? Yes.
4652. Which would not prevent you from providing more? No.
4653. It also stipulates that the cut-through shall not be more than 25 yards before the current of air? Yes.
4654. Do you approve of that? No; I think 35 yards is quite near enough.
4655. Seeing that you do not put brattice into those places, do you not think that the 25 yards would be a considerable improvement—it would be 10 yards less? Yes; but the miner suffers nothing at 35 yards, except it is a rise place.
4656. Then you do admit that in a rise place he is suffering? We generally put them a little closer in a rise place.
4657. You put the cut-through over a little sooner? Yes.
4658. If you did not, what would be the result? I do not know that there would be a great deal of difference, but we do it for convenience sake for the men and for ourselves as well.
4659. Are you opposed to putting brattice in the place at all to give better ventilation? Yes; I am opposed to it because it is money thrown away where there is no gas.
4660. Do you think men want ventilation in mines even where there is no gas? Yes; they are getting sufficient ventilation at the present time in the mines, and we have got men there who are as healthy as any men going, and they work in the mines to quite as big an age as any other class of men.
4661. How far is your mine in underground at present? Fully a mile in some places.
4662. You still intend to go further, I suppose? Yes; we have no intention of stopping.
4663. What is your objection to bratticing? The expense.
4664. Could you not utilise some of the refuse in the mine? If we do, it is expensive.
4665. Have the men to stack a good deal of this refuse behind them? With us they have not.
4666. Have they not to throw it behind them in the gob? No; very little.
4667. Would that be where there is no jerry to work? We have very little jerry in any part of our mine now. We have morgan, but that we work with our shift men.
4668. What would be the extent of the additional cost in the event of your being willing to conduct the air with brattice? That depends upon what seam of coal it is. Our seam differs from others. There would be a wide difference in the expense.
4669. Take your seam, for instance? Take it all through, I suppose it runs 2d. a ton.
4670. Is your seam a very thick seam? Yes.
4671. How thick? In some places, taking stone and coal in all, we work about 25 feet.
4672. How much refuse would you have in that thickness? Ten or 11 feet of refuse.
4673. Do you work that? Yes.
4674. Where you have it that thick? Yes; most of the places we do.
4675. Do you not think 2d. a ton is an excessive estimate? No; because the brattice cloth that we got out here lasts no time.
4676. Not even in the dry workings? Not even in the dry workings.

A. Mathieson,  
Esq.  
1 Oct., 1895.

4677. How long? I could not say. I don't think above three or four months.
4678. Do you think it would last as many years? It won't with us.
4679. Have you tried it to any extent? No; just in a few places.
4680. I presume that even in the case of requiring to brattice it would not ruin the Company in any shape or form if it was put to that cost? If the Company was put to that cost it would simply amount to this—that as far as they are concerned at the present time they could not suffer it.
4681. Why? Because they are not getting sufficient returns for the coal.
4682. Whose fault is that? That I do not know anything about.
4683. Is that not owing to internal competition amongst the proprietors themselves? I could not say.
4684. Do you think it is? No; I don't think it is as far as that is concerned. I suppose it is because we have more coal than we have a demand for, and other places competing with us.
4685. What other places are competing with you? We have the Southern collieries competing with us. Japan is competing with us, and Victoria is competing with us.
4686. What have been your worst competition periods during the last two or three years? About the present time, except we go back a great many years ago. There was one time before when it was very bad.
4687. What has your colliery done in the last three years in the way of profit making? That I could not say.
4688. Don't you know? No, I don't.
4689. Are you a shareholder in the colliery? I am.
4690. Do you mean to say that you know nothing about that? I don't know exactly what we made.
4691. Do you get a balance sheet? Yes; I got one from the Newcastle company, but I have not looked at it.
4692. Is that your last half-yearly balance sheet? [*Balance sheet handed witness.*] No; this is not the last half-year.
4693. What date is it? This is December, 1894. We have had one since that.
4694. What does the balance sheet of 1894 show;—what was your reserve at that time? As far as reserves are concerned they are generally a matter of figures.
4695. Have you paid off a liability of £30,000 during the last three years? Not that I am aware of.
4696. Was any dividend paid to you last half year at all? I believe there was something paid; what it was I could not say.
4697. Have you not drawn it? Yes; it was banked by me as far as that is concerned. I believe it was drawn almost before it was banked.
4698. You got a balance sheet, I presume? Yes; I have got a balance sheet in the office.
4699. Have you looked at it? No, I have not gone through it.
4700. *President.*] Are you a shareholder yourself? Yes.
4701. *Mr. Curley.*] If you can make profits in competition periods such as you are passing through now, would a matter of bratticing hamper you? Yes, it would; in fact, every farthing you put on the coal hampers us, especially when it is of no service.
4702. *President.*] What do you mean by "no service"? For no service in this way: The air at the present time, according to our present Act, is good and clear enough. I know that the air in our bords at the present is better than it is in one half of the warehouses in Sydney.
4703. *Mr. Curley.*] You have admitted already that when a bord is going to the rise, you occasionally put brattice there to carry the air up? Yes, certainly we comply with these things without being forced to do so.
4704. You may do so, but if you were not to do so, would you still consider that you were within the meaning of the Act if you were not to put the brattice there? We don't go by the Act altogether; we generally use a little consideration.
4705. Could you do so? We could do so. We could go 35 yards according to the Act.
4706. Is it not possible for a manager to sail on the minimum quantity? I don't think there are many managers who do it.
4707. Do you believe that ventilation is one of the chief features to be regarded in connection with mining? Yes, and we give it too.
4708. *President.*] That is to say, you always have more than the minimum? Yes, except in very rare cases, and at rare times when we may not be exactly up to it. That will sometimes occur in the best regulated mines you can get.
4709. *Mr. Curley.*] What did you say the size of your fan was? 30 ft. x 10 ft.
4710. What number of revolutions does it travel at? From 40 to 45.
4711. When does your fan-man go to work? Five o'clock in the morning.
4712. When does he cease work? Ten at night.
4713. Have you only the one fan-man? Two.
4714. Is there a night fan-man as well? Part night and part day. There are two of them for that time.
4715. Are they there from 5 o'clock in the morning till 10 at night? Yes.
4716. Do the two fanmen work this period of time between them? Yes.
4717. Have you men working in the mine occasionally during the night? Two or three water-bailers.
4718. No miners? No.
4719. Have you never any men working at any driving—special places? No; they are done at that time.
4720. What time do the miners go to work in the morning? Six o'clock.
4721. Have you two shifts of men? Yes, a front and a back shift.
4722. What hours do you work the miners and the pit? The front shift goes down at 6, and leaves off at half-past 1, and the back shift goes down at 8, and leaves off at 4.
4723. Can the men come out of the pit when they please? No. If they want to come out when they please, we can draw them up the air shaft.
4724. Do they do it? No; they wont go.
4725. Do you know the provision with regard to the regulation of hours in the proposed Bill? Yes; that is eight hours, and twenty minutes out of that for food.
4726. Do you approve of that? I don't. I don't think that there should be an Act at all to say what time a man shall work. A man's labour is his capital.
4727. May he not be compelled under certain conditions to work longer occasionally? I do not think he would be compelled at any time.

- A. Mathieson, Esq.  
1 Oct., 1895.
4728. Not by a manager even? It is very seldom a manager can compel them if they don't wish to work.
4729. Do you know of any requests that have been made by managers to men to work longer time—an hour or two longer in the day? No.
4730. You don't know of any? No; not to work an hour or two longer.
4731. Would you be surprised to know that it has been done? Yes, I would.
4732. Do you think it should be done? Yes; I think we have a right to do so if we require the coal.
4733. You think you have a right to ask the men to work as long as you please? To work a fair number of hours.
4734. You said just now that a man's labour was his capital? I say so still. I think a man should not be restricted by Act of Parliament.
4735. He should be permitted to work as long as he likes? Yes.
4736. On the other hand may he not be compelled to work against his will under certain conditions? No; I don't think it. You might just as well limit a man with his capital, and say that if he had a few thousand pounds he must only speculate a portion of it, and keep the rest of it idle. It is just the same with a man's labour.
4737. Do you know that when conditions change at one mine as against another mine these conditions make a reason why the same conditions should prevail at the other colliery? They do not give us much reason to change.
4738. Do you know that it is very often quoted by the colliery managers themselves, that because something is done at another colliery that is a reason why something should be done at theirs as well? Yes; but it is not often that we get these chances.
4739. Don't you think it would settle a very much vexed question if the matter was legislated for? I do not. I believe in every man having his own free will to do with his labour as he chooses. Why should we have eight hours in a Coal-mines Bill more than for any other class of work.
4740. Do you think coal-mining is superior work to other classes of work? I do not think it is superior, and I do not think it is inferior—the majority of it.
4741. You do not consider it is a precarious calling do you? It is not if care is taken. It is like every other calling. You can go to any trade you like, and there is danger in it if you do not look out for it. It is the same in coal-mining.
4742. Is it not regarded as a precarious occupation? Yes; but there is a great deal more danger made out of it than there is in it.
4743. Have you worked as a coal-miner? I have not. I have worked at every other position in the mine except at the coal, but I have seen plenty of work.
4744. You are not speaking then of your own personal experience? No; but I can tell when a man is working the coal.
4745. Do you think if there was no provision in the Bill with regard to the hours the managers would impose conditions against the will of the men with regard to the length of the hours? As far as the manager imposing conditions is concerned they have never had the chance to impose very much on the men.
4746. What do you mean by that statement? The men keep them ground tight enough to the wall without anything else.
4747. Do you mean to say that the men take any undue advantage in any way? They have always done so.
4748. In what particular respect? In all respects.
4749. Can you point to any instances? There are plenty without pointing to them. The Newcastle district speaks for itself.
4750. In what respect? You are as well aware as I am that at all times if the men thought a colliery was in difficulties they would impose whatever they thought fit on the company.
4751. Have they done that with regard to your colliery? They did not get much chance to do it with regard to us. They did at one time. They kept us pretty well to the grindstone at one time.
4752. You have not given a direct instance yet, although I have asked you several times;—have you not kept them to the grindstone just as well? No; we have acted very fairly and reasonably with them all through.
4753. Have they not done the same with regard to you? They have lately.
4754. Has it not been a matter of mutuality? Yes, lately; I will say that.
4755. How is the weighing conducted at your colliery? At the bottom of the screen.
4756. Do you pay on an average weight? Yes.
4757. Have you a standard weight? Yes.
4758. What is the standard? 12 cwt.
4759. Have the men objected to that sometimes? Yes; some years ago.
4760. Do you think their objection was reasonable? No, I don't.
4761. Is that a condition of things that you impose? Yes; standard weight.
4762. You insist on that? Yes.
4763. Why do you fix a standard weight? For many reasons; because by fixing a standard weight we know what our hauling and lifting are. If we have no standard weight, we do not know what they really fill. We have all our machinery ordered in proportion—ropes and everything else.
4764. If the men were to fill their skips level and full to the wood of the skip, would you be satisfied? Yes; they have been repeatedly told to do it.
4765. Is there any gauge that you allow them to fill over the top of the skip? No; we do not fix them to any gauge.
4766. You know that is done, I suppose? At some collieries it is.
4767. Is it done in your colliery? No; we have no gauge.
4768. How high are your skips filled above the wood of the skip? You may say about 6 inches is an average.
4769. Do you think that is a fairly reasonable distance to fill above the wood? Yes.
4770. Is there much fear of the coal falling off the skip? No; not if it is properly packed, but it does even fall off at that height.
4771. Seeing that the men fill in that way, don't you think they are entitled to all the weight they do fill? No, I don't; because in some places the coal is that easy to be got that they could fill higher.

4772. What quantity of weight do you gain by a process of that kind beyond what you pay the miner? A. Mathieson; Esq.  
That I could not say; I don't think we gain any.
4773. Don't you gain the excess that is filled beyond that in any case? There is very little excess filled with us. 1 Oct., 1895.
4774. But is there not some? Very rarely now.
4775. Is there any? Some times a skip may go above 12 cwt., but there are not many now that do, and there have not been for years.
4776. You mean to say that you know nothing about this excess weight? No; I never make up my weight as far as that is concerned—in fact, I don't know what our shipping weight is.
4777. Do you know the number of tons you handle in a given time—a quarter or a half a year—from the colliery? Yes; the miners' tonnage.
4778. The quantity of tonnage paid to the miners? Yes.
4779. You say you do not know the quantity of shipping tonnage? No, I don't.
4780. Does your shipping manager ever intimate to you that he wants a given quantity of tonnage? No.
4781. Or ask you if you can load a vessel of a stipulated size, and whether he can have so many waggons of round coal? Oh, yes, as far as that is concerned.
4782. You know nothing in that particular respect? No, I don't.
4783. Do you never get the shipping tonnage for the satisfaction of knowing whether you are gaining or losing in weight—and making comparison of what goes away? No, I never do. They sometimes grumble at my items losing.
4784. Do you know for a fact that you are paying for less than you are sending away? I am very confident we are not.
4785. Do you weigh every waggon? No.
4786. Is every waggon weighed that goes away? The Government weighs them, we do not.
4787. You insist on every waggon being weighed? Yes; the Government get their weight.
4788. Is your weighman kept at the bridge all day? Yes.
4789. How many skips in the day do you weigh? I think he gets through about sixty.
4790. Do you employ many miners? Yes, we have got about 265 or 270.
4791. Are the men's places inspected previous to their starting work in the morning? Yes.
4792. Has that to be done according to your instructions? Yes, we have a man for that purpose.
4793. *President.*] With regard to that quantity of air. Is there such a great difference between 100 feet and 150 feet. Even under the present Act there has to be an adequate amount of ventilation with a minimum of 100 feet. Surely the collieries must now be in a position, in case 100 feet is not sufficient to give 150 feet? 150 is one half more; there are plenty of places where they are not in a position to give the 150 feet I am confident.
4794. Is 100 feet enough for the men? Yes, quite sufficient if it is conducted round the mine.
4795. Would you have it conducted into the working places? Not into the bords.
4796. Why not? It would be too expensive.
4797. Might not men be working in these places and nearly smothered for want of air? There is not the slightest fear of that.
4798. Don't these men work in the bords with hardly anything on? Yes.
4799. And they are perspiring very freely are they not? Some of them—very few; not so much as a man in a warehouse as a rule.
4800. Do you say you would not have the air conducted into the bords? No more than at present.
4801. How much is that? According to the Act 35 yards.
4802. Do you say that for 35 yards the men should not have air conducted into the place at all? There is quite sufficient air in the place then. The air is quite good enough in the place without it is a place going very much to the rise; certainly the air is a little foul then. At the present time we put our cut-throughs a little closer in these places.
4803. How close do you put them? We have got some as close as 30 yards. There may be some closer than that, but in a place going to the level or going to the dip 35 yards is close enough.
4804. *Mr. Curley.*] Do the inspectors occasionally draw your attention to matters in the mine? They have had no occasion to do so, I think, for a long time.
4805. Have they ever done so? I think they did shortly after I took charge.
4806. Do you appreciate a matter of that kind when they draw your attention to it? Yes; or even if the men were to draw my attention to it.
4807. You do not resent it as anything like undue interference? No; I do not. I thank the inspectors or the men if they have anything to say. I am only too pleased to know about it.
4808. Who is the inspector that visits your colliery? Inspector Humble, and Inspector Dixon occasionally.
4809. Do you look upon them as efficient officers? I do.
4810. *President.*] Do you say that a man can do his work properly 35 yards before the air? Yes.
4811. Is the air not conducted into the working place at all? No.
4812. You do not think it should be? No.
4813. Except, I suppose, in case of gas? Except in case of gas; you are bound to do it then.
4814. I suppose some men might prefer to have gas so that they would get better air? No; I think they get very fair air in these mines. It is very seldom we hear the men grumble about the air.
4815. They do grumble sometimes, I suppose? Oh, yes.
4816. I suppose they will stand a great deal before they will grumble? Not as a rule; if they find the air slack or anything like that they will soon direct our attention to it.
4817. When they grumble what do you do? We see to it, and force a little more air round in that district.
4818. How do you force it round? By taking it off from the other districts with our regulators. Perhaps in some districts we have got too much air going round, and we regulate it by our regulators.
4819. When they complain of want of air in a bord for instance? If it is going round the headings and cut-throughs, you will never hear them grumble in the bord, or very rarely.
4820. Very rarely you hear them grumble? Yes.
4821. When they do grumble, do you do anything in the way of sending the air in? If there is not sufficient air we, perhaps, close our regulator a little bit on the one side and open it on the other. That will cause more air to go round the district.

- A. Mathieson, Esq.  
1 Oct., 1895.
4822. You do not send it into the bord by any means? No; sometimes we put a brattice across the heading.
4823. If the air is not going into the bord, do you put brattice in? Yes, we put brattice across the heading to drive it up the bord to come down through the cut-through. They have merely to turn it to put it down the cut-throughs. That is done in every colliery at the present time. We either put brattice up or put a door in. We do that at the present time; but to take a brattice down the bord is a different thing altogether. According to this Bill every bord would need brattice down it. The Bill says:—"Brattice within 15 yards of the face."
4824. What is the meaning of "single headings"? We have to brattice single headings.
4825. Would there be no cut-through in a single heading? No. We have to brattice them.
4826. As a matter of fact in single headings don't you have to brattice? Yes.
4827. Why does the Bill say any more than you do? The Act refers to bratticing down the bords.
4828. The Bill says, "In single headings, or where gas is known to be generated, it shall be bratticed up within three yards of the face of such working place,"—is a working place the same as a working face? We call them all working places as far as we are concerned.
4829. Do you say that if the air is conducted into the bords in some other way, either by brattice before the cut-throughs, or in any mode you like, that there would be any material extra expense in giving air into these bords so that the men may have a proper atmosphere to work in? To carry it according to the provisions of this Bill would cost us nearly 2d. per ton extra.
4830. What is that for? For bratticing up.
4831. Is that the cost of the material and the labour? Yes, the material and the labour.
4832. What do you get a ton now? Seven shillings and sixpence, I think.
4833. You would get 7s. 4d. instead of 7s. 6d.? Yes. It would take 2d. per ton off it.
4834. You say there is no close, bad air in these places? No.
4835. You say you would let them have 100 feet? Yes; I have no objection myself—in fact I see no objection to that Act.
4836. That air only comes along the air-way, not into the working place? We are never supposed to take it into the working place.
4837. You are not bound, you say, to take it into the working place? No.
4838. No matter how bad it may be? No.
4839. No matter how bad it may be the Act does not compel you? No, it does not.
4840. Supposing a manager is neglectful of the health of his men, don't you think that the Act ought to compel him to give more air if he does not give them sufficient? If they compel him according to the old Act to carry 100 feet of air round they will all get sufficient.
4841. The miners say not? Only a few of the miners say that.
4842. *Mr. Gregson.*] Please read through clause 21, sub-clause 5, p. 8 of the Bill, and state whether you are in favor of a provision giving the Inspector power to withdraw the men from the mine (*see Appendix A*)? No, I am not, as far as I am concerned.
4843. Under any circumstances? Not under any circumstances.
4844. Suppose imminent danger exists? If there is imminent danger I think the manager should have a say in it.
4845. I asked you whether you favor a provision in the Bill enabling an inspector to withdraw the men under any circumstances? No; it is giving him too much power.
4846. Supposing that an inspector in making his visit to the mine saw that the men were in imminent danger what is your opinion as to the course that he would take at the present time? There is no doubt that at the present time if he saw there was danger to two or three only he might tell them to come out for a few minutes till he sent word to the manager, if the manager was not with him.
4847. That of course you would look upon as a fair exercise of his judgment? Yes, as a caution.
4848. It is not that he would have the power to do it, but that it would be reasonable? Yes.
4849. Seeing the position the men were in he would give them a caution? Yes.
4850. Does the Inspector ever give you notice when he is coming? No.
4851. Does he often come without your knowledge? Yes. We never know when he is going to hop in on us.
4852. I presume he generally finds some one in charge of the mine? Yes.
4853. If you are not there, is the overman there? Yes.
4854. If the overman was not there, or the deputy, would he not come against somebody in charge of the place? Yes.
4855. Supposing that he had seen a place where imminent danger existed, would he not under those circumstances say to the official, "My opinion of that place is that you had better have the men out of it?" Yes.
4856. That is the course you think he would adopt now? Yes; that is what he does now.
4857. Under those circumstances, would the official of the mine take immediate action do you think? Yes; I think he would. Certainly, as far as we are concerned, we have never had occasion to do it, but that is what he would do.
4858. *President.*] Supposing there was imminent danger, and the manager did not take the men out? In that case the manager renders himself liable to the Act. He would be liable to be punished if he lost any men through his action. He would be taken up for manslaughter.
4859. *Mr. Gregson.*] Would he be taking a great responsibility? Yes.
4860. A greater responsibility than most managers would accept? Yes.
4861. No matter what the urgency was? Yes.
4862. From your knowledge of the inspectors, are they men whose advice and counsel you are willing to accept? Yes.
4863. Are you glad to accept advice and counsel at all times? Yes.
4864. If you had a doubt about any particular workings or any question was being debated, and the inspector was there, would you put the question to him, "What is your opinion in reference to so-and-so"? Yes; I would as far as I am concerned.
4865. Would you be glad to have his advice? Yes.
4866. Is it your opinion from what you know of the general conduct of affairs, that managers, as a rule, try to do what they know the inspectors would require or wish them to do? No; I don't think so.
4867. You don't think that the managers, as a rule, try to do what they know the inspector wishes them to do? I think, as a rule, they generally do everything that the inspector wishes them to do in reason.
- 4868.

4868. Supposing they know the inspector would like a certain thing done, would they not put themselves out of the way to do it? I don't think there is one man in the Newcastle district that would do so.
4869. That would refuse to do it you mean? That would refuse to do it.
4870. Supposing that the manager knows that the inspector would like a certain thing done, is it not your opinion that the manager would try to do it? If he thought it was requisite he would. If he thought it was not requisite I don't think he would do it.
4871. Not even if the inspector wished it done? No; not if he thought it was not requisite.
4872. You don't think that the manager attaches any value to having the inspector's confidence? If there was any danger he would.
4873. But in a general way—apart from danger? As far as I am concerned I have never had to require it, therefore I cannot say.
4874. Between yourself and the inspectors there is a feeling of confidence, I suppose? Yes.
4875. You believe he has confidence in you? Yes.
4876. And you know that, from his knowledge and ability, he is a man in whom you can place confidence? Yes; as far as I am individually concerned; I put every confidence in our present inspector.
4877. And notwithstanding that, you think that the sub-section to which I have drawn your attention should not be in any Act of Parliament? No; it is giving inspectors too much power.
4878. *President.*] You say it is giving inspectors too much power? Yes.
4879. If the clause merely allowed them to withdraw the men in cases of imminent and immediate danger, with power to send to the Minister at once, and see whether a continued withdrawal should exist, which should be determined by arbitration, would that be too much power? That would be too much power, because the mine would be at a standstill during that time, therefore I think that if the inspector sees imminent danger, he should call in the manager, or the next in authority, and consult with him.
4880. I take it that before he withdrew the men he would consult with the manager;—I suppose you have confidence in the inspectors? Yes.
4881. Assuming you have an inspector who knows his business, do you think that, unless there was imminent danger, he or any other inspector—no matter who he was—would dare to withdraw the men, because it is a very serious step to take? It is a very serious step, but one man's opinion might lead him to think there was imminent danger, yet if he called a second man in he might be able to show him that there was not.
4882. Why should you suppose that the inspector would exercise this power improperly any more than that the manager would behave improperly? I do not think either of them would behave improperly; but you must bear in mind what some inspectors may do, and especially if they are at variance with the manager.
4883. Are they ever at variance with the manager? Not that I am aware of, but you sometimes do get arbitrary men in.
4884. Suppose there is a manager who is more anxious about the profits of his mine than the lives of the men under him, do you think it would be a good power to give him;—don't you think he might be very unwilling to withdraw the men? I don't think so.
4885. Might he not minimise the amount of danger in his mind in certain cases? As far as that is concerned I do not see that it should be left to any one man to withdraw men out of the mine.
4886. But it is left to one man if it is left to the manager to withdraw them in case of danger? The manager is better able to judge than the inspector because he is continually there, but the inspector coming in haphazard, and a little trouble being on, he might think there was more danger than there really was.
4887. Surely he would make inquiry and find out whether it was a case of imminent danger? He might not. Some men are more timid than others.
4888. If he was a capable man he would? Yes.
4889. You would not mind the power being put in the hands of a capable man? I do not believe in putting it in the hands of any one man. I don't think one man should be allowed to withdraw men out of a mine.
4890. *Mr. Curley.*] Do you know of any case where men have lost their lives in consequence of not having been withdrawn in time? No; I cannot say that I do.
4891. Do you know of a case in the Northern district? No; I cannot say that I do.
4892. Do you know anything about the Hamilton Pit disaster? Yes.
4893. Do you know that there were men who left the mine that morning of their own accord and came out? Yes; I believe they did.
4894. Do you recollect that in that case a number of men lost their lives? Yes; it was an exceptional case.
4895. Do you recollect, too, that the night previous to the Bulli explosion there was a small explosion in the mine? No; I could not say that I do.
4896. In case of imminent danger presenting itself to an inspector don't you think that he should exercise his judgment with regard to the safety of the workmen in the mine? I do not think it should be left with the inspector.
4897. Why not? Because, as I said before, he is very seldom there, and if there is any danger the manager would know it far better than he would know it.
4898. Then I understand you to say that you would not leave it to one man? No; but certainly the manager can take it on himself, and would take it on himself, because he has the whole charge of the mine, and has the responsibility of the men. Even in the Northern district I have worked myself where a place was working, and we have kept the miners out, and we have worked till she has come in and had just time to get away.
4899. Anyway, you do not consider it is a power the inspector should have? No; I do not.
4900. Don't you think it would be a provision which would be the means of providing for greater safety if the inspectors had this power? I don't think so.
4901. *President.*] Do you suppose it would be ever exercised corruptly? You cannot tell. It might be. It depends on the class of men you have to deal with.
4902. *Mr. Curley.*] The inspectors have no interest in mines, have they? I believe not.
4903. Have you any proprietary interest in other collieries than Hotton? A little interest in Newcastle.

[Witness withdrew.]

James

A. Mathieson,  
Esq.  
1 Oct., 1895.

James Fletcher sworn and examined :—

- J. Fletcher,  
Esq.  
1 Oct., 1895.
4904. *President.*] What are you, Mr. Fletcher? A mining manager.
4905. At what mine? The Wickham and Bullock Island Colliery.
4906. *Mr. Curley.*] How long have you been manager there? About nine years in November, I believe.
4907. What is your system of working? Bord and pillar.
4908. What is the width of your bords? Six-yard bords.
4909. What is the width of the pillars? Six-yard pillars.
4910. *President.*] Are you working under the water at all? Yes; the whole of the present workings of the colliery are under water.
4911. *Mr. Curley.*] What is the depth of your shafts? The winding shaft is about 215 feet, and the air-shaft is about 263 feet—that is, on to the coal-head.
4912. Are your main workings going towards the north or coming south? We have worked towards the north and south-east, and both east and west.
4913. Do you work under Throsby's Creek? Yes.
4914. Do any of your workings go under the harbour? No; we have no workings underneath the harbour.
4915. Do they go underneath the basin? Yes.
4916. The basin at Carrington? Yes.
4917. Does your colliery make much water? Very little water.
4918. Are you aware that you have a very limited quantity of rock in that down-cast shaft? I consider we have a very good cover of rock. We have somewhere about 50 feet of rock there.
4919. In the down-cast shaft? Yes, I think so.
4920. Are you sure? I do not think it will be much under 50 feet. We have more than that in the air-shaft any way.
4921. Have you seen the report of the inspection that was made at your colliery by Mr. Turnbull and myself in connection with the last Commission (*see Appendix Q*)? No; I have not seen that before. I think that would be before my time.
4922. Have you not read that before? No, I have not read that before. I have read some of it. I have always been under the impression that there was a greater thickness of rock than that. You would not be able to get the top of the rock for the cylinders. I was not there at the sinking of that shaft.
4923. Taking your up-cast shaft and your down-cast shaft, do you think that the indications are that the rock is thinning out as you go north? Yes; but we have put down two bore-holes at the north end of the island, which have proved that we have a very hard conglomerate and sandstone in that direction.
4924. How far is that pit away from your down-cast shaft? I should think a mile or over from our down-cast shaft northwards. In the air shaft the rock is much thicker. We have also a greater thickness of clay in the air shaft.
4925. What is the quantity of rock in that bore that you put down? I think there is about 90 feet of hard conglomerate and sandstone in the bore we put down—in fact, we put two bores down.
4926. Can you indicate on this plan where you put the bores down? [*Witness marks the location of the bores Nos. 1 and 2 on the plan. See Appendix X.*]
4927. What did you say was the thickness of the rock there? About 90 feet.
4928. What other deposits did you pass through? Sand was the first, and then we passed through some clay and gravel.
4929. Who put these bores down for you? Mr. Harper had the contract, and Mr. Allan Wild had the diamond drill there to do the boring.
4930. What year was that in? It was during 1888; I know it was during the strike.
4931. Have you any leading-places going northward at present? At present we are not driving.
4932. Not northward? No. We have sufficient work opened out to last a time, so that we have discontinued driving any further. We were not making much water in that direction when we were driving north, considering it is a maiden cross-cut.
4933. Have any of the places going northward at any time broken down in the roof when you were driving? Only when we took the full height of the seam out, and then the fall was only a kind of shale. You can walk over the falls in any of the bords with safety—in fact, in all parts of the pit. They merely arch themselves, and I consider it has made a splendid roof. It has never gone through any of that rock. It is a kind of shale mixed with coal bands. Above what we call band coal there is a seam mixed with refuse that is not workable.
4934. Would those falls take place in a 6-yard bord? They have done so sometimes.
4935. What height did the fall go up to? I suppose 4 or 5 feet above the top of the seam in the north workings, and down in the dip side much about the same.
4936. Did any sand or gravel ever come down when you had a fall like that? No; not in any place I have seen.
4937. In none of your headings, or bords, or cross-cuts? I never saw any falls in the headings or cross-cuts.
4938. Do you keep any bore-holes in advance of you in the leading places? We have done so in the northward direction, but we have not done any work there for a long time in driving cut-throughs. I have cut several places up through the morgan and through the seam. I have put a bore up to see what kind of roof there was there for my own private information.
4939. I mean in the coal straight ahead? Yes; we have had bore-holes in it.
4940. Do you keep them going in? No; we have no winning places now.
4941. With regard to the dip workings—have you anything of that kind there? No; not since we got into the basin. We did before we commenced to go into the basin.
4942. Have you any leading places going there at present, or are they standing? No; we have driven down to this boundary A [*indicating*]. Of course, we have driven a heading along to this boundary B [*indicating*], and the same up to that C [*indicating*]. We are driving below that again to work these bords, D and E, up the bank. It is not necessary there now. [*See Appendix X.*]
4943. Then you have kept the bores ahead of you? We never kept any bores ahead of us in the basin, but we did in going down towards the Bullock Island bridge.
4944. Have you got to your boundary down that way yet? Down to the bridge—yes. Of course when  
we

we get out to the boundary we have two more sections of the seam to work. We work the big tops second up to the boundary.

J. Fletcher,  
Esq.

4945. Do you propose to work the whole of the coal, both big top and top band, right through to the roof? Yes; we do that now.

1 Oct., 1895.

4946. Do you intend to do that right through the mine? Yes.

4947. No matter in what direction you are going? Yes. From these bords and our air shaft, and the winding shaft, we have pretty well tested the whole of the royalty, and I do not see where there is any danger, considering the roof we have, and leaving a 6-yard pillar.

4948. Do you recollect the creep that took place at Linwood some time ago? Yes.

4949. Was that part of your estate? We leased it to Walker, and then he formed it into a company. The creep was here, F [indicating on plan. See Appendix X].

4950. Was your mine not holed to that in any way? Yes; we had a connection, but we now have two brick and cement dams put in.

4951. That creep took place in what is known as the Linwood, didn't it? Yes.

4952. That you leased to the Linwood Colliery? Yes.

4953. Will you mark where the Linwood Colliery was? I think it was down here somewhere, G. [Witness marks location on plan. See Appendix X].

4954. Where do you say the connection was between Linwood Colliery and your colliery? There was a drive from the Linwood pit down by the railway siding to our colliery.

4955. Where have you put those dams in those drives? The dams are put here somewhere, H. [Witness marks location on plan. See Appendix X.]

4956. Have you an accurate plan of the workings of Linwood? No; we have not.

4957. Will your workings approach those workings later on? No; we won't come near them. We have done all we intend to do in that direction, but we have not gone anywhere near them.

4958. Is it possible that mine might accumulate a lot of water? I don't think it will. I think the water percolates through the bottom now from the workings along this part, I. [Indicating. See Appendix X.] I believe if the dams were taken out it would be perfectly dry behind. I have had the Government Inspector up there several times, and we have looked at it, and that is my opinion.

4959. Do you think that the system you are now pursuing under these waters is perfectly safe? Yes; I do.

4960. Have you carried out that system ever since you went to the colliery? Yes.

4961. Was it in vogue when you got there? Yes; 6-yard bords and 6-yard pillars.

4962. Do you intend to work the pillars out at all? The Government lease won't allow us.

4963. Is it a condition in the lease? Yes; I think so.

4964. Are you sure of it? If we attempt to work the pillars they can cancel the lease at once.

4965. *President.*] It is one of the conditions of the lease that you shall leave them? Yes; I think so.

4966. *Mr. Curley.*] Have you seen the lease yourself? No.

4967. You have not seen these conditions? I have not seen whether we are allowed to work the pillars, but I am certain the Government would not allow us to do so. The present inspectors have written that if we attempted to widen the bords out from 6 yards they would cancel the lease. Of course we have never attempted to do it.

4968. What is your system of ventilation;—have you a fan or a furnace? A fan.

4969. How is your mine ventilated;—is the ventilation kept up to the Act? Yes; we have no complaints from any of the inspectors. We have sufficient ventilation.

4970. Have you any difficulties with the ventilation in certain sections of your mine? Our northern workings are the most difficult to ventilate, because the air has further to travel; still we have sufficient ventilation.

4971. What do you call sufficient? We have more than what the Act states we ought to have.

4972. How do you read the Act? That every man, boy, and horse shall have 100 cubic feet of air per minute.

4973. You think that if every man, boy, and horse gets that quantity of air the Act is fully complied with? Yes.

4974. Does not it say that that is to be the minimum quantity? Yes, of course it does.

4975. If you provide the minimum quantity you consider the Act is complied with? We never do that; we generally give them more.

4976. Is that how you read the Act? We have not had any check-inspectors in our colliery for about two years. We have had no complaints from the inspectors of the ventilation being deficient.

4977. Do you care very much about the men's inspectors exercising their duties? I don't know what you mean.

4978. Do you like to see them exercise their office? It never makes any difference to me what they do; I always afford them every assistance when they are busy—in fact, I always send the overman or the deputy belonging to each district to go round with them, because, as you know, a check inspector does not know the way round the workings. I may say that sometimes men are appointed as check inspectors who never should be check inspectors. I suppose they are appointed simply because they have plenty of tongue when they are at the meetings.

4979. Do you like a man to be dumb? I do not like a man to be dumb. I would not like to be dumb myself. My meaning is that sometimes men go to the meetings and make a noise about ventilation who do not know when a place is properly ventilated.

4980. Those are matters of opinion, I presume? Whether it is an opinion or not, it is a fact.

4981. You have your view of the matter? Yes.

4982. And I presume the men have their view of the matter? Yes. A man who has been working in a pit for twelve or eighteen months has not had sufficient experience.

4983. *President.*] Do you mean that men without sufficient capacity obtain appointments by making themselves prominent? Yes. I like to see a man who is appointed to that position know something about a place being safe.

4984. You mean to say he may get appointed and yet know nothing about it? Yes.

4985. Because he makes himself either popular or prominent? Yes.

4986. *Mr. Curley.*] Do you think men have a right to education;—there must be a beginning somewhere? I did not get my education in mining in eighteen months. I do not call a man working on the face

J. Fletcher,  
Esq.  
1 Oct., 1895.

face a practical miner. Only a man who knows how to do different work is a practical miner. If you bring a man back from the face and ask him to do other work outside of getting coal he is unable to do it. You will find hundreds of men in the north of England where they are not supposed to set their own timber—the deputy does it—and when they come back to set a prop they cannot do it.

4987. Do you know of hundreds and thousands of men in England who can set props? It all depends on whether they were brought up as miners. In Staffordshire the men have to set their own timber.

4988. In the north of England don't they set their props? They are not supposed to set them. The deputy does it.

4989. Are they not supposed to set an occasional prop if there is danger? I suppose they do.

4990. Don't you know they do? I never saw them do it. I have been underground manager in the north of England, and when I would be going round the men would complain that the deputy had not been in to set the props.

4991. Don't you think a man would set his prop if the deputy had not been round? I don't.

4992. Do you think he would exercise fair judgment? I don't know that he would.

4993. Don't you think a man learns in a mine after a certain time? Certainly; but he does not learn to be a timberer, and to travel round old places where he has been getting coal all his life, and know they are safe to pass in.

4994. Don't you think your opinions are an indication that you resent these men exercising these functions? I never object to the check inspectors. I afford them every facility for making an inspection. In fact, I have travelled round the pit with them myself. You may put an air crossing, or you may alter your split and they would not know anything about it. I have known check inspectors measure the same in-take twice over. I do not condemn them all. I know some of them are very good men. When I require a deputy I always like to take a man from amongst the men that have been working there.

4995. Do you usually find him a capable man? Yes; if he is not he soon has to leave.

4996. *Mr. Gregson.*] He would not be chosen unless you thought him capable? No.

4997. *Mr. Curley.*] Then you do come across a miner occasionally who knows something? I did not say that I came across miners that didn't know anything, but some of them get appointed to these positions who are not able to do the work.

4998. Anyway, have you any objection to their exercising the functions? Not at all, and I think it says a great deal when the miners have not had a check inspection in our colliery on their behalf for the last two years or so.

4999. Do you discharge many men from your colliery? Yes; very often for breaches of the special rules—such as holeing without sprags—not having sufficient timber in.

5000. How many have you discharged recently? I suppose I have discharged fifty men during this year for breaches of the special rules. I do not say that I have discharged them for ever. I have put them on again, but they were discharged all the same.

5001. Are there some whom you have discharged for ever? I do not think so.

5002. Have they appealed to you to get back to work? I suppose they have.

5003. And have you put them on? No.

5004. For the time being, have you discharged them? Yes.

5005. With regard to ventilation, have you any objection to the men making complaints about any defects at any time? No, certainly not. I am always pleased when they do.

5006. With regard to the mine generally, you know that you work under tidal waters;—if the men, at any time, noticed anything that was likely to lead to danger, would you be very pleased if they were to mention it to you? Yes, certainly.

5007. Or report it to your deputies? Yes.

5008. Is it one of your conditions, in connection with the special rules, that they should do so? Yes; I think there is something in the Act about the miner notifying to someone in charge if there is anything wrong.

5009. You have no objection? Not the slightest. I am always pleased.

5010. Have you looked over the proposed Bill? Yes.

5011. Do you know the provision with regard to ventilation, section 47, rule No. 1, page 23 (*see Appendix A*)? Yes.

5012. Do you understand those lines that are drawn across to be alterations proposed by the Legislative Council? Yes.

5013. And that the clause as it originally stood was the condition in which it left the Legislative Assembly? Yes.

5014. Do you believe in the provision for 150 cubic feet of air as a minimum? No; I believe in the amendment as it stands here with the other part crossed out.

5015. *President.*] Without any minimum? Yes, without any minimum.

5016. *Mr. Curley.*] Who would be the judge in regard to the minimum if you had no stipulation in the Act? I could not say who would be the judge. I should think the manager would be able to judge.

5017. If the manager said there was an adequate amount, and the miners said there was not—what then? The inspector would interfere then, I suppose.

5018. Do you object to the men asking the inspector to come? No; not at all. That is what the inspector is there for, I suppose.

5019. Have you any objection to the minimum quantity of air, as stipulated in the present Act? No, I don't object to that either; but I think the other is something similar to the English Act, which seems to work well in England.

5020. Don't you know that the great bulk of the mines in England are gaseous mines? Certainly they are.

5021. Have not the proprietors there to ventilate for the protection of their own property? Certainly they have to.

5022. And for the safety of the men as well? Yes.

5023. Do you think there is not the same impelling motive power where you have no gas? I suppose that if this was really the ventilation clause, and the men said it was not sufficient, the inspector can cause you to give them more. That is what the inspector is for, I should think.

5024. Does not the present Act say something about an adequate amount of ventilation? Yes; but, of course

course, it says that an adequate amount of ventilation shall be constantly produced in every mine; but it shall not be less than 100 cubic feet per minute as a minimum.

5025. *President.*] Have they not construed that to mean they are quite satisfied when 100 cubic feet is there? The inspector cannot interfere with you if you have 100 cubic feet.

5026. They give the go-by altogether to the words, "As a minimum," because it is quite plain that the supply of air must be adequate, and that if 100 feet is not enough there must be as much more as is necessary? If a complaint was made to the inspector, and he came and inspected the colliery, and took the quantity of air passing in that district, and found that it only gave 100 feet, and he then ordered more, I should think you would be obliged to give more.

5027. *Mr. Gregson.*] Have you of your own knowledge ever known a case in which that has been done? No, I have not. I know for my own part that we measure our ventilation ourselves, and if we find that we have not just over the 100 feet we always put more in. That is speaking for myself.

5028. *Mr. Curley.*] Do you think 100 feet is rather limited in quantity? No; I think 100 feet is very good.

5029. Considering that the cut-throughs are 35 yards away? Yes; if you were to put 100 feet into every bord the men would not be able to work, because they cannot work with their clothes on, and I should think it would be injurious to their health.

5030. *President.*] Why not? All miners work with their shirts off.

5031. Is that because of the want of air? Not so much that, but because they can get about their work much better.

5032. *Mr. Gregson.*] Do they work with their shirts on in England? No; in longwall I have seen them work with their shirts on, but in bords they do not.

5033. They do not strip to their drawers? In bord and pillar work they do.

5034. *Mr. Curley.*] What county is that in? County of Durham.

5035. What colliery? I could mention six collieries—Trimdon and Deaf Hill collieries.

5036. What is the depth of these collieries? 150, 160, or 170 fathoms.

5037. That is 900 or 1,000 feet deep? Yes; I do not remember exactly the depth. It is a long while ago now—Coxhoe Collieries. I know, however, that when I work I always prefer to work with my clothes off, although I have not done such a great deal.

5038. *Mr. Gregson.*] In England? Yes. In New South Wales as well.

5039. Do they use much brattice in the mines at home? Yes; in all mines where there is gas given off they are bratticed up.

5040. Is the air well conducted up to the face? Yes.

5041. *President.*] By brattice? Yes.

5042. Then if they would get cold if the air was conducted up, how is it they do not get cold there, because the gas does not have any effect on their not getting cold? They may work in their shirts in a place where there is an extra quantity of air, but if you brattice every place up the last places in the section must be very warm, and all that air is conveyed to each man; you must reduce the velocity, I should think, by having it bratticed up so much, because you cannot make a very large intake where there is a seam that contains dirt, as it must be built up in some portion of the bord, and to run the brattice up it has a sort of a crawling road up in many places.

5043. *Mr. Curley.*] Can you not utilise some of this refuse to conduct the air? Yes, you could; but you would require bricks and mortar as well, and that would be a great expense.

5044. Is brattice very cheap stuff? You can buy it cheaply, but it does not last very long. If you want to put a good brattice up, especially where skips are filled the way we fill them here, you must have a good brattice cloth, otherwise it would be torn down by every skip that went through.

5045. If it was in the side of the bords, the skip would not rub against it? But you must have it in the main bord as well.

5046. You do not require a large quantity for screen doors? It all depends on the thickness of the seam. I know that only last week I had a brattice stopping put in one of our bords, and it took two men a half day each to fix it up properly. Of course we have a very thick seam.

5047. That was where it was necessary to close the bord end up? Yes, and leave a road for the horse to pass through as well.

5048. Do you think that the bords should be bratticed? Where there is no gas coming off I do not consider it necessary to brattice a bord up.

5049. Not to conduct the ventilation? No; because the air in passing along the heading will always strike a certain distance up. A man is never 35 yards away from it; even if the bord is up 35 yards the air will always strike into the bord.

5050. In your experience in collieries in the Colonies, and in England, have you never seen that in the bord end there is a length or two of brattice put up to give the air a slight sweep into the place? Yes.

5051. Have you noticed that to be fairly frequent at Home? Yes; where there was no gas given off they had simply hanging screens and a little brattice into the bord, and where the gas was coming off they would brattice it right up into the face.

5052. *Mr. Gregson.*] That is doing without the door in the heading? They would have the door in the heading as well—the canvas door—and formed round into the bord.

5053. Bringing the brattice close down into the heading and doing without the door? They would be only able to do that where there were no horses or boys travelling.

5054. If there was room between the end of the sconce and the opposite wall of the heading? You would not get much ventilation in that way.

5055. You have not seen it? No.

5056. That would only take a part of the air up? Yes.

5057. *Mr. Curley.*] Would you prefer a shorter cut-through, or the brattice. To have your cut-through put in sooner instead of bratticing up. Instead of having it 35 yards, would you rather reduce it by a few yards? I do not think it is necessary where there is no gas given off.

5058. I am not asking you that. I am asking you as between brattice and the distance. If it had to come to that, would you prefer the shorter cut-through or the brattice? I suppose you would do with the one that was the cheaper. Of course, I could not say which would be the cheaper.

5059. Have you not formed an opinion upon this matter? I have not.

J. Fletcher,  
Esq.  
1 Oct., 1895.

- J. Fletcher,  
Esq.  
1 Oct., 1895.
5060. Have you made any estimate as to what you think the cost of bratticing would be, provided brattice had to be adopted? I know that with the thick seam we have in our mine it would be not less than 3d. per ton.
5061. Is your colliery the adjoining colliery to Hetton? Yes.
5062. The seams are practically the same? No; they are not.
5063. Identically the same in thickness? No; they are not.
5064. Where do they differ? They are not the same in thickness, because we are working 15 feet of coal in our dip workings, and they are not working 15 feet in any part of their mine.
5065. Are you sure of that? Quite certain.
5066. If they are working the whole seam where it is 25 feet thick don't you think that in some places they would have as much coal as you? If they are they would have, but I don't think they are.
5067. If the manager had made a statement to that effect would you think it was being done? He ought to know better than I do. Mine is only outside hearsay.
5068. Then you cannot say definitely what they are doing in that respect? No.
5069. Their mine might be as thick as yours? Yes, it may be, about the shaft; but on the North side and the South side, where they are working now, I do not think the coal is so thick as ours.
5070. Don't you think 3d. per ton is an extraordinary estimate? No.
5071. Will not an estimate of that kind nearly cover the whole of your underground account with regard to paying full wages and everything else? Yes, I daresay it would; but I am speaking of an extra cost with the bratticing. How could we brattice up a bord the day we work the bottom section—that is, including the Jerry, and the Jerry-bands and Morgan, and we worked the top portion of the big tops. It would require two or three men to keep them going—to brattice it up.
5072. Within 15 yards of the face? I am calculating on it being bratticed up to the face.
5073. The Act says "within 15 yards of the face"? It would be a great cost. It is a very high seam.
5074. The 46th section of the proposed Bill, sub-clause 3, says, "which shall be taken to within 15 yards of each working face by brattice or otherwise";—there you could utilise your refuse if it was possible to do so;—in some cases I daresay you will admit you can partially use it? That would be entailing a greater cost, too, if we had to utilise the refuse there.
5075. Why? It would have to be built properly, or it would not stand.
5076. Could not the *débris* as it is thrown back there in many instances be partly utilised as it is lying? If you must put a wall to carry up ventilation, you must put it on a proper foundation.
5077. Is it not air-tight in many instances where the larger *débris* is thrown and the smaller *débris* is thrown on top of it? After we took the first section and commenced the second, we would have 6 or 7 feet high to brattice up, unless we got down to the refuse lying at the bottom section of the seam and shovelled it up, and built a wall. To do that would take a couple of men in every bord.
5078. In that case, would you prefer the shorter bord or cut-through to the bratticing;—wouldn't that dispense with any idea of bratticing? If the cut-through was shorter, there would be less brattice to put up.
5079. That would get rid of the objection in that respect? Yes.
5080. You believe ventilation should be one of the main features of a mine? I think ventilation is the first point in pit law.
5081. Is that one of the things you aim at yourself in your mine? Yes.
5082. To keep a vigorous current of ventilation? Yes, I do.
