5083. Would the cost in any way be a serious matter to you if you had to resort to bratticing? It would. It would be a serious matter to the miners too, because any extra cost that is put on must be shared by the miners. We must make some profits, otherwise the collieries would be closed and the miners would be the sufferers in the end. The miners would have to come down in their hewing rate to meet these extra demands.
5084. Do you think the miners should pay for everything? I do not say that, but you are not going to employ men and pay them a wage and not get anything out of it yourself.
5085. I daresay you will admit that there is many a year that the miner gets very little himself? Yes, I am very sorry to say they are getting very little now in consequence of bad trade.
5086. He scarcely gets subsistence wages? The men in our pit do well when the pit is at work. They make a fair average.
5087. Are they not likely to be cavilled out any time that you please to resort to a system of cavilling out? If I had a colliery I should certainly close it or any part of it if I thought fit; but I do not see that any of the miners have anything to do with that.
5088. Will you not admit that if an occurrence of that kind takes place it materially affects their earnings? Yes, I know that if it were passed in the new Mining Bill that each miner should have 150 cubic feet of air, we could do with less men than we have.
5089. You think so? I do not think so. I am certain of it. We could still maintain the same output, and give those who remained 150 cubic feet; but if we are going to give every man, boy, and horse 150 feet it means driving our fan at a great speed.
5090. What sort of fan have you? We have one of Walker's patents—a 16-ft. fan.
5091. Is the fan 16 feet in diameter? Yes.
5092. What is the width? Six feet.
5093. What revolutions do you run it at? About forty when the pit is at work.
5094. When does your fan-man set it in motion? It never stops.
5095. Neither night nor day? No.
5096. Do you keep two men there? No, one man—8-hour shifts.
5097. There is one man in the day-time and one man at night? Two men in the day-time; three men for the twenty-four hours—8-hour shifts.
5098. Do you think that the ventilating apparatus of a colliery should be kept going the whole of the time? It all depends on circumstances; it is not necessary in some cases.
5099. Why? There are some mines where there are no men or horses in during the night; in that case there is no necessity to run a fan, because, in most of the mines where they have water to attend to, the pumping of the water and the exhaust from the pump will cause a good circulation. We can get from 18,000 to 20,000 cubic feet of air now in our mine, without the fan going, when the pump is working; but it does not always suit me to work the pump; I try to work it through the day.
- 5100.

5100. In every mine are there not generally a number of men employed at night time? Yes, in some mines there are.

5101. Does your mine give off any gas? No.

5102. No fire-damp at all? No.

5103. Have you many men working at night time? We have not many in the night time. What we call the night men are the men who go on the afternoon shift at 2 o'clock.

5104. When do they cease? They finish about 10; sometimes before. Of course these men on the afternoon shift have an advantage over the day men; they get their skips in better for them; the skips are provided and the driver simply takes them in, and when they get their quantity they come out.

5105. Have you men to inspect the mine every morning? The mine is inspected every morning before the men go into their working places, and always has been.

5106. Do you believe in a rule of that kind? I do.

5107. Do you think it should be adopted in all mines? Yes; I think it is quite necessary. It is a benefit to the proprietor, the manager, and everybody. I think it is carried out at most of the collieries in the Newcastle district. I know it was carried out in the A. and A. Co.'s pits when I worked there.

5108. Have the last few years been rather trying for your company? Yes; I should think the companies have all suffered a great deal during the last few years.

5109. Has your company declared its usual dividend? Not within the last two or three years, I am sorry to say.

5110. Did it not declare an 8 per cent. dividend on the last half year? Yes; I believe it did.

5111. And the usual dividend on preference shares? Yes.

5112. Do you hold any proprietary interest in the mine? I do not; nor in any of the mines. I have an interest in a few gold mines which I would like to sell out.

5113. Have you thought over the clause with regard to working hours? Yes; I have considered it.

5114. How many hours do your men work? The front shift men go down at 6 o'clock in the morning and return to the surface at 2; the back shift men go down at 8 and return at 4.

5115. Do you think eight hours long enough for a man to work in a mine? They do not work eight hours. I think if a man works eight hours it is a fair day's work.

5116. Do you consider that the inspector should have power to withdraw the men from the mine in case of danger? As far as I am concerned if the inspector saw danger and withdrew the men I should think he would be taking the responsibility off my shoulders a great deal; it would not, therefore, hurt me in that way.

5117. Do you believe he should have the power? Yes, I do not see why he should not; the inspectors are all competent men, and I do not think they would withdraw the miners unless there really was danger.

5118. I suppose you understand that the withdrawal of the men does not necessarily mean the closing of the mine? No, you can employ them in other parts if they are all right.

5119. They might be only withdrawn for a limited time, until it was seen what was going to be the outcome of anything that was transpiring in the mine? Yes.

5120. You think there is no harm in an inspector having that power? I don't think there is.

5121. You do not look upon it as a dangerous power to place in the hands of competent men do you? No. I think it takes a great deal of responsibility off the manager, because there is many a time when a manager likes a little advice and if he knows that he is getting it from men who are competent to give it it is a benefit to him.

5122. Do you find the present inspectors fairly intelligent men as far as you have met them? Yes.

5123. Have they made any recommendations to you occasionally with regard to any incidental matters? No; they have never had occasion to draw my attention to anything wrong in the mine. Of course, when I first went there I was summoned for not having sufficient ventilation. I had not been there five months before that occurred.

5124. Was that in the early stages of your taking the management of the Company? Yes.

5125. *Mr. Gregson.*] Were you convicted? Yes, I was fined.

5126. *Mr. Curley.*] What was the trouble on that occasion? Not having sufficient ventilation. Of course we had no fan then. We were simply getting our ventilation from the Linwood shaft. It was a very hot day when the inspector came, and he did not get his proper reading. Of course, the inspector told the magistrate straight that I had improved the ventilation since I had been there, but that still it was not up to the Act.

5127. *Mr. Gregson.*] What did you do? I took the men off the day shift and put them on the afternoon shift. The men themselves were quite willing to go on working until such time as we got means of ventilation.

5128. Are your night shift men and day shift men down together any part of the day? No. The night shift men come on at 4 o'clock.

5129. *Mr. Curley.*] The fact of the men being willing to continue working, I suppose, impressed you with an idea of their reasonableness? Of course it did. I do not know whether it was reasonableness or to shirk getting on the night shift, because there are not many men who like the night shift. They said they were quite agreeable to continue working of course.

5130. They said they were willing to adopt anything that was reasonable? Yes.

5131. Did you cavill men out some time ago? Yes.

5132. Was that in consequence of want of ventilation? No.

5133. How many men did you cavill out? I think there were about 60, but they have all been reinstated since with the exception of one or two who left the Colony.

5134. *President.*] Do you say 150 cubic feet of air is too much? I do not think it is too much. You can give them 500 if you have got it.

5135. Would giving them 150 feet of air cause very much extra expense? It would cause extra expense. Another thing is that in order to keep your machinery right to supply that ventilation you would reduce your number of hands.

5136. Would you reduce the number of hands working in the mine? Yes, at the present time, so that you would be able to give those left 150 feet, and still be able to maintain your output. All collieries put a number of men on. Men come and ask for work, and they give them a start on account of bad times, and if such a thing became law the proprietors would say, "We cannot go on breaking machinery; we must reduce the hands." A manager would not do it. He would say "We must reduce the hands."

J. Fletcher,  
Esq.  
1 Oct., 1895. For my own part, as far as the ventilation clause is concerned—in fact, the whole of the clauses—should prefer the English Act, because the mines in England turn out as much coal in a week as we do in a year, and it seems to work right with them.

5137. *Mr. Curley.*] Have you not the gas operating there? Well, there is gas operating in this Colony.  
5138. *Mr. Gregson.*] Are there mines in England which have no gas? There are. There is no manager who will run the risk of not having plenty of ventilation if there is gas coming off, because it means putting his miners on with safety-lamps, which is a disadvantage to a mining proprietor, because the miner cannot see to do his work so well with the safety-lamp, and there is the risk of filling dirty coal. It is a great point to-day to have your coal clean.

5139. *Mr. Curley.*] Is not that one of the reasons why you should have a good current of ventilation? Yes.

5140. Because it will sweep out the powder smoke? Yes; if you have a good current of air passing along the heading there will be very little smoke left. There is a great deal of powder smoke made through a miner's own negligence. Sometimes he over-does the thing and gives it too much powder, and does not do his work as he ought to do it.

5141. Does not a practical man always try to gauge his powder within a reasonable limit? Yes; but sometimes you find them the other way; in fact, I think a good clause that ought to be enacted in the new Bill would be to do away with shooting.

5142. *Mr. Gregson.*] Do you not find that the young men use more powder than is necessary? Yes. They have got these drilling machines, and a man can put a hole in in five minutes; whereas if he had to jump it, he would wedge it down. We have men in our pit who never use any powder.

5143. Do you prefer the English Act in all matters? Yes, I do.

5144. Were you working under the 1872 Act in England? Yes; I left England in 1885—this month.

5145. Do you know anything of the English Act of 1887? No; I do not remember much about it. I was out here then.

5146. Have you read it? Yes, I have read it.

5147. Do you know what it enacts pretty well? Yes.

5148. Are you content to accept that? I am.

5149. Do you think an inspector should have power in case of imminent danger to call out the men? Yes, I do. It takes a great deal of responsibility off the manager.

[Witness withdrew.]

James Henry Ronaldson sworn and examined:—

J. H.  
Ronaldson,  
Esq.

1 Oct., 1895.

5150. *Mr. Curley.*] What is your occupation? I am a mining engineer.

5151. Are you manager of the Mount Kembla Colliery at present? Yes.

5152. How long have you been in that position? Six years.

5153. Have you been manager at any other collieries? Yes; in Scotland and England.

5154. In what districts? In Ayrshire, in Scotland, and in Cumberland, in England.

5155. Have you had a good deal of mining experience? Yes; I have had experience in Scotland, England, Wales, Belgium, and Australia.

5156. What is your system of working at Mount Kembla? Pillar and bord.

5157. Have you been long-wall working there in certain cases? Yes.

5158. Has that been abandoned? Yes.

5159. What is the width of your bords? Eight yards and 12 yards.

5160. Have you a double road in these 12-yard bords? Yes.

5161. What is the size of your pillars. Sixteen yards. Some of them are 12 just now, but we are increasing them to 16, and some are 16 now.

5162. Do you enter the mine by a tunnel? We do.

5163. Do you go under a mountain? Yes; under a range of hills.

5164. Is your coal-seam situated in a mountain range? Yes.

5165. Is there much surface strata above you? It varies from a few feet to 400 or 500 feet.

5166. Do you believe in the larger pillars? I do.

5167. Do you think they are the best method of mining? Always.

5168. Do they give more protection to your roadways? Yes.

5169. Do they give better security in working the mine, taking the pillars out later on? Within certain limits, yes. It is not an unlimited safety. I mean that it is possible to have them even too large for safety.

5170. Do you think 12 or 16 yard pillars are too large? No.

5171. Not for 400 or 500 feet of cover? No.

5172. *President.*] What do you mean by having them too large for safety? In the subsequent pillar working these are split up. You get occasionally such a long spread of open gob that they may be standing so much on props as to add an element of danger on account of the extent.

5173. *Mr. Curley.*] Still there would be always signs, even in that case, of a breakaway if it was likely to come? Yes.

5174. The men would always have time to get into safe roadways with a large pillar? They would; but other things being equal, going beyond a certain length there would be greater danger.

5175. Going an unreasonable length? Yes; I do not know whether your second last question meant to imply that I thought these pillars of 12 or 16 yards were absolutely necessary under that cover or not, if so, I do not think them absolutely necessary.

5176. Do you think a 12-yard pillar and a 16-yard pillar in that way would give ample security to the workmen? Yes.

5177. And I presume they are the most economical for the Company? On the whole, they are.

5178. I do not suppose you would do it if it was not? No; safety is our chief object at Kembla.

5179. Still you have an idea of economy at the same time? Yes, certainly.

5180. Have not all managers this object in view as well? They would be very foolish if they had not.

5181. Do you think safety should be the first consideration? Yes, certainly.

J. H.  
Roundson,  
Esq.  
1 Oct., 1895.

5182. That should stand paramount above all others? Yes.
5183. Do you go on to the boundary with your coal as a rule, and work the pillars back? We have never reached the boundary in any part of our property.
5184. You have a very wide area? Yes.
5185. Where you do take the pillars out in any sectional districts; I presume you always leave very substantial pillars near your main roadways? Always.
5186. What size? Forty yards at least from the back-headings—frequently more.
5187. What pillars have you open between the back and the front heading? From 8 to 10 yards; in a few cases 16 yards.
5188. Do you look upon that as an essential principle of mining—this large pillar near your roadway, where you are taking out sectional pillars in that way? Yes. One wants to get to the coal beyond with the pillar and stall work.
5189. Do you think your roadway should always be above suspicion of anything of that kind? Yes.
5190. What method of weighing have you there;—do you pay the men by weight? Yes.
5191. Do you pay on a system of average? Yes.
5192. Have you any standard weight? No.
5193. Is the weigh-man continuously at the weigh-bridge? Yes.
5194. Has he any other duties? Yes.
5195. What are they? He attends to the letting of houses during the day, and in his spare time, after hours, he has other clerical duties.
5196. After the working hours? Yes. He also sees that any new men are provided with rules in accordance with the Act.
5197. Has he anything to do with overlooking the screen-men? No.
5198. Have you a foreman for that particular work? Yes.
5199. Do you know anything like the average number of skips that are weighed there in a day? About forty-five skips a day, speaking roughly.
5200. What number of skips do you bring out in a day? About 1,000 large and small skips.
5201. Skips to be weighed I mean—round coal? About 950 would be a fair average.
5202. Do you think the men are satisfied with the average? Yes.
5203. Do they make any complaints? Not to me.
5204. Have they ever made any representations to you to weigh more? No. Some days we weigh loss, but that is a fair thing so far as I recollect.
5205. Are there any days when you do not weigh at all? No.
5206. Do you weigh every day you work? Yes.
5207. What are your working hours—your drawing hours? Seven till 5.
5208. When do the miners go to work? One shift goes in at 6; the other at half-past 8.
5209. When does the shift that goes in at 6 come out? From 2 to half-past 2.
5210. And the other shift? From half-past 4 to 5.
5211. Have you ever worked that mine longer than that? We have on one occasion in 6 years.
5212. What was that done for. To fulfil an order. A large boat came to the jetty, and by working longer we were able to complete her that night, and let her away—one of the intercolonial boats.
5213. Have you ever requested the men to work on what is known as pay Saturday? Frequently.
5214. Have the men complied with your request? Latterly they have.
5215. Do they work on the pay Saturday? They do.
5216. When did this start? Within the last four months I should think—about four months ago.
5217. Do you recollect posting a notice up at the colliery dated 15th June, 1895? I do. I cannot say the date. I remember posting a notice anyhow. [*Notice handed witness. See Appendix Y.*] The 15th June, 1895, is right.
5218. Did you stipulate in that notice that the men should work for such number of hours as the exigencies of the trade demanded? Yes.
5219. What did you mean by that;—did it mean that you wanted them to work till 12 o'clock at night—did it mean anything like that? As I told them at the time, it meant anything within reason. We do not demand unreasonable things at Kembla.
5220. Is the pay Saturday an old historical institution in connection with mining? Not within my experience until I came to Australia.
5221. Were you ever in the north of England? Yes, in Cumberland.
5222. Were you ever in Durham county? I have been there, but I was never employed there.
5223. Do you know that there are several thousands of miners employed in that county? I do.
5224. How many thousands would you think? I do not know; I am not up in the numbers in the north of England, having never been employed there.
5225. Were you ever in the county of Northumberland? Yes.
5226. Do you know that there are several thousands of miners employed there? I do.
5227. Do you know if the pay Saturday exists there? I believe it does. There are many thousands employed there, but they only form a small portion of the total number in the United Kingdom.
5228. Do you think there are anything like 70,000 or 80,000 miners in the two counties? I should not think there would be quite so many. I should not dispute it, however.
5229. Have the Mount Kembla miners always had this pay Saturday as a holiday as far as you know;—was it in existence when you came there? Not when I knew Mount Kembla first, but it has been since I went there permanently.
5230. I am speaking of you as manager;—have they had it for the five or six years you have been there? Yes; they have.
5231. What is the arrangement now;—the men did not acquiesce in the demand that you made upon them, did they? I do not think they did at the time; they did afterwards. The arrangement is that when the trade requires it they shall go in at 6 o'clock in the morning and work till 12.
5232. Six-hour shifts? Six-hour shifts. We do not often ask them to do it, but it has occurred I think twice, to the best of my recollection, in order to fulfil important orders.
5233. *President.*] Was that on a pay Saturday? Yes; I may say that previously when they did not work on pay Saturdays I have seen the mine idle for three or four days of that week, and the men have been

J. H.  
Ronaldson,  
Esq.  
1 Oct., 1895.

been requested to work on the pay Saturday in order to fulfil some order, and they have refused up to this time I have mentioned.

5234. *Mr. Curley.*] Have you many men employed there? About 165 miners.

5235. Have you a large plant? Yes.

5236. Waggon? Yes; a large number of waggons—200.

5237. Do the waggons carry many tons? Six and a quarter tons.

5238. Then you have over 1,200 tons standing? About that.

5239. Have you at any other time requested the men to work beyond the stipulated hours during the day? On one occasion we did, which I have previously mentioned.

5240. You have not done it since? No.

5241. Have you not requested the men since to work longer? No.

5242. What hours do you consider they work at the face? Seven and a quarter hours at the face—longer sometimes; there are individual exceptions.

5243. I understood you to say that they came out about half-past two? I said from two to half-past two.

5244. That they went in at six and came out at from two to half-past two? That is so.

5245. Do they not go in before this occasionally? Some of the men do occasionally; it is very rarely though.

5246. The great bulk of them? No; it is very rarely.

5247. Are you at the mine to see them go in? No; the firemen always are.

5248. Is your mine a good distance in? The straight tunnel is a mile and a third.

5249. Do you think that these hours are quite long enough for the men? If they work hard I dare say it is a fair number of hours, but I would rather see them work a little longer sometimes.

5250. Do you think a man can tire himself in that time? He can tire himself in eight hours if he works hard at the face, but it greatly depends upon the man, and how he works.

5251. Do you recollect an accident occurring some time ago at Mount Kembla where you were approaching some work—an explosion? Yes.

5252. Were you manager at the time? Yes.

5253. How did that occur? It arose from a working coming on an old working which had been out of use for several years in which there was a small accumulation of gas. One man holed through, and instead of going out and reporting the occurrence to the fireman he went into his neighbour's heading, and the two of them proceeded to the face where they had gone through and discussed matters. The gas came through the hole and exploded, burning these two men to some extent.

5254. *President*] Was anyone killed? No.

5255. *Mr. Curley.*] Had you a bore in advance at the time? No; no bore.

5256. Did you know you were approaching these workings? Yes.

5257. Do you think bores should be kept in advance in approaching old workings? When there is supposed to be any danger—yes.

5258. Could you know what danger there would be there? We had reasonable grounds to suppose there was no danger.

5259. Was your judgment mistaken in that case? Yes—or knowledge. In connection with that particular accident we had taken very special precautions to eliminate any danger as we thought, and having done so we thought the bore was not necessary.

5260. How do you ventilate the mine? By furnace.

5261. Is your mine fairly well ventilated? Yes; very well.

5262. Have you had any complaints from the men at any time? We never have had any complaints that I can recollect.

5263. Has the inspector ever complained? No.

5264. Does the mine give off any fire damp? Very rarely, in cracks.

5265. It does give off a little? Yes, from fissures rarely.

5266. It either gives it off or does not give it off? It gives it off rarely.

5267. In what section of the mine is this? All sections.

5268. Have you a system of inspection every morning before the men enter the mine? Yes; the fireman examines every place.

5269. Does he indicate that he has been there by any mark on the place? He always chalks it, in accordance with the Mining Act as embodied in our special rules.

5270. Do you know the proposed Mining Bill,—have you looked over it? I have only seen it this forenoon with the amendments.

5271. Do you use much brattice in your mine? Not a very large amount.

5272. You do use it? Yes.

5273. In the bords or headings? Headings.

5274. Do you use it in the bords? Occasionally.

5275. Is there a portion of your mine which goes to the rise or dips? It both goes to the rise and dips.

5276. What are these places where you have to put in the brattice? Where, perhaps, on account of some fault or dislocation in the strata, we are induced to go further than the 35-yard regulation.

5277. Do you put it in for that purpose? Yes.

5278. To conduct the air up to the working face? Yes.

5279. Do you think the air should be conducted up to the working faces of the mine? In every case, no.

5280. As a rule? No.

5281. Do you ventilate to reach the minimum quantity, or to get over it, or what? We try to get the largest quantity of air possible.

5282. What is your average? From 60,000 to 70,000 cubic feet per minute.

5283. What is the average per man? About 250 cubic feet, I think, for horse and man.

5284. Are the men compelled to blast to get the coal in your mine? In some places they are.

5285. Cannot they get it without blasting? In some places they can, but as a rule they use powder.

5286. Do you say the average per man, boy, and horse is about 250 feet? I think it must be about 250 feet.

5287. Do you agree with the proposed minimum in the new Bill of 150 feet? I think there should be no definite figure stated.

5288. *President.*] Merely adequate? Merely adequate,

5289.

J. H.  
Ronaldson,  
Esq.  
1 Oct., 1895.

5289. *Mr. Ourley.*] Why do you state that? Because, in the first place, it provides a loophole for very bad ventilation.

5290. *President.*] Why? 150 cubic feet per man in certain cases may be much too small a quantity to ventilate a mine thoroughly. The manager might say, if he is found fault with about it, "Well, I have the requisite quantity according to the Act."

5291. How can he say that, if it has to be not less than that, and as much more as is necessary? If it says the minimum is 150 without anything else.

5292. Suppose it says this: "An adequate amount of ventilation, not in any case less than 150 cubic feet per minute for each man and boy, and as much more as may be necessary";—what would you say to that? The excuse then would not hold good.

5293. Do you mean to say that if you put a minimum it gives a loophole to a negligent or inconsiderate manager to give that amount and no more? Yes; I do.

5294. *Mr. Ourley.*] Is that the reason why you wish to dispense with it? That is one reason.

5295. *President.*] Can you give us any other reasons? I don't think there is much objection to that clause—that there should be a minimum of 150 feet, and that there should be adequate ventilation.

5296. Is 150 feet too much? No.

5297. As the Council left it, it reads, "An adequate," &c., down to word "therein" (*see Appendix A, clause 47, rule 1, page 23*)? That, I think, fulfils all that is required.

5298. "And no place shall be driven," &c., down to word "mine" (*see Appendix A, clause 47, rule 1, page 23*)? I think it is a very short-sighted idea altogether which suggested any such thing as the 35-yard cut-through. Mines in this Colony must inevitably go deeper and deeper as time goes on; and to limit the pillars, as is done here, by insisting on having a cut-through every 35 yards, is folly, because in a very deep mine you would require larger pillars than 35 yards in many cases—35 yards square even.

5299. Then you mean to say you might have to go a great deal more? A great deal more. In certain cases the pillars would require to be a great deal more than 35 yards square.

5300. Therefore you think that part of the clause should come out altogether? Yes; that part of it. It is too hard and fast a rule altogether.

5301. You do not see any objection, do you, to a minimum, provided it does not allow the loophole you mention? Not the minimum of 150 feet.

5302. You would not have that minimum? I do not object to the minimum of 150 feet.

5303. Suppose it read this way, "an adequate amount of ventilation not in any case less than 150 cubic feet of pure air per minute, and as much more as may be necessary for each man, boy, and horse, shall be constantly produced in every mine and shall sweep undiminished along the airways and into each working place to dilute and render harmless noxious gases to such an extent that the working places of the shafts, levels, stables, and workings of the mine, and the travelling roads to and from those working places shall be in a fit state for working and passing therein"? I don't approve of that, for this reason—that if that be attempted it will act as a tremendous drag on the general current of ventilation, and by trying to improve it at one point, they will do more harm at other points—that is to say, they would decrease the general quantity of air passing through the mine by increasing the friction very much. It is like a man trying to walk up this street and down another street in the city; he must tire himself out. There is a great deal of energy expended in that. In the same way there is a great deal of energy expended in trying to pass a current of air round these courses in the mine.

5304. Supposing you were in a deep place, and you say it is unwise to have the 35 yards cut-through,—how would they ventilate this place? They must merely accept the evil. They must put in a brattice if there is gas, and they go beyond a reasonable distance.

5305. Don't you think 35 yards is a good distance for a man to be away from the air;—you have gas in your mine? We do not take it into account at all.

5306. *Mr. Ourley.*] You do not treat it with contempt, I suppose? No; I don't.

5307. *President.*] Are there any means of satisfying the men by giving them a minimum, and still not doing any harm to the Bill? I think there should be no minimum mentioned with regard to the distance.

5308. Don't you think it better to have some provision saying that the men shall be supplied with air in some way or other? Yes.

5309. Suppose you have not a good man as manager, and the men are left without sufficient air, if no minimum is mentioned his view of adequacy and their view of adequacy might be entirely different? I would not object very strongly to this 35-yard distance, though I don't like it; I would not object to it provided it were made quite clear in the clauses following that where a greater distance is gone it should be sufficient to take the end of the bratticing up to within 35 yards of the face, and not to within 3 yards of the face.

5310. *Mr. Gregson.*] Would not you prefer to take the English legislation? Yes.

5311. Without any of this humbug about cut-throughs, or bratticing, or anything of that kind? Yes; that is, take the English Act *in toto*.

5312. That is, as the Council have left this clause, strictly in accordance with the wording of the English Act, eliminating this last paragraph about the 35 yards? Yes.

5313. *President.*] Do you say this from a strong objection to giving a minimum. Supposing you provide that they cannot make a loophole of the minimum. The English Act says:—"That a constant amount of ventilation shall be produced under the control of a certificated manager"? That appears to my mind to fulfil all that is really required; at the same time I say I would not object very strongly to this 35-yard clause if it were made quite clear that in the event of more than 35 yards being driven, it should be sufficient to take the bratticing up such a distance that the air would be conducted to within 35 yards of the working face.

5314. Do you say a man has to work 35 yards before the current of air? He may in certain cases do so, especially going to the dip.

5315. *Mr. Gregson.*] Does not the decision as to what is requisite rest with the inspector? I should not dispute his ruling in such a case.

5316. If there was any dispute between the men and the manager as to whether there was an adequate quantity or not, would not the inspector be called in? Yes.

5317. Would he not say whether it was adequate or not? Yes.

5318. And there is an end to it? Yes. I would take that as an end to it. If it was stated, say, that the ventilating current should be taken as near to the working faces as reasonably, practicable I think it would go

J. H.  
Ronaldson,  
Esq.  
1 Oct., 1895.

go very far to meet the case without making a very hard and fast rule. The inspector, if complaints were made, might then come in and say, "This current is not taken as near as is reasonably practicable," and of course that would be a point if a dispute arose which would be subject to arbitration. We want, if possible, to get a rule, which, while being a good rule, is to a certain extent elastic.

5319. *Mr. Curley.*] In that case do you not throw the onus of complaint on to the miner as to what may be reasonably practicable? Yes, and on the judgment of the inspector.

5320. In the first place, must not the miner originate the business himself? Yes, and it is quite right that he should do so, if there is any ground to do it. Should he be afraid to do it?

5321. I do not say he should be afraid to do it, but you know that there are numbers of men who do not like to make these complaints? If a complaint is made to the inspector it is made perfectly anonymously so far as the management is concerned; that is to say the management does not know who is making the complaint. In no case do I know of any complaint ever having been made at our colliery, neither do I in any case know the name of any man who has made a complaint, if indeed any complaint has been made.

5322. Do you believe that a man should complain anonymously? No; to the inspector they ought to send their names. It would be absurd to complain anonymously because he could not investigate the particular instance if the complaint were made anonymously.

5323. *President.*] If they said such and such a place is unfit to work, could they not complain anonymously in that way? Yes, in that way. I do not object to any man making a complaint, and sending it to the Inspector if he has any ground for complaining. What I mean to say is that I have no doubt complaints have been made about Mount Kembla, as I have no doubt they have been made about other mines to the inspectors, but I do not know any man's name who has ever made a complaint, so that apparently it is with perfect safety a man can use his right to complain to the inspector.

5324. *Mr. Curley.*] You appear to object to bratticing generally? I would not brattice every bord unless there was apparent danger.

5325. Would you shorten the distance of the bord and put the cut-through in sooner? No.

5326. *President.*] Would a cut-through make a pillar 35 yards square? No; you start with the thickness of your pillar first. It may be 8 yards, as is common in Newcastle, or 16 yards, as it is with us.

5327. You say that so far from being 35 yards you may have pillars of very much greater area than that? Very much larger indeed.

5328. *Mr. Curley.*] In the case of having the larger pillar will you not then have to use the brattice? Yes. What I say is that I would be content if the Bill asks that the air should be taken by means of brattice within a reasonable distance of the face, but not within 3 yards of the face.

5329. The Bill says 15 yards by brattice or otherwise? No; I still say it ought to be taken within a reasonable distance of the face by means of cut-throughs or brattice.

5330. With regard to that previous section that you have been referring to, do you object to its being taken within 3 yards of the face of the work where gas exists. Do you not see that that applies to gas there? I think that that is perfectly useless because you are not allowed to work where there is gas forming a certain cap on the lamp, and if the brattice is taken up to within a distance sufficient to adequately ventilate the place, that is quite sufficient.

5331. When you say you are not allowed to work where the gas is forming a cap on the lamp, what do you mean by that—who prevents you? The Act, or common sense. I think the Act does; I know common sense does. I think I am wrong in supposing there is anything in the present Act.

5332. Then the statement that you make is not correct with reference to the present Act not allowing you to work where there is gas forming a cap on the lamp? I suppose I am in error in stating that; at the same time the place must be safe. The Act provides for withdrawing people from the work if the place is unsafe from gas or otherwise.

5333. Do you know that the Bill states that where gas exists the place has got to be bratticed up to within 3 yards of the face? Yes; but I object to that.

5334. If you will look at sub-section 4 of section 12 you will find that that is in the present Act? The same objection applies to that as to the other.

5335. Have you heard tell of the Bulli explosion? Yes.

5336. Do you know the Commission said something about the neglect to brattice in that case;—have you read the report of the Commission? I have read it, but it is a long time ago.

5337. Do you not know that a reference was made there to bratticing? I do not know for certain.

5338. *Mr. Gregson.*] Do you not think that in Great Britain they know a great deal about mining? A great deal more than they do here.

5339. Do you not think that on the whole we had better be guided by their experience? I think so entirely. I have said so all along. I stated to Mr. Reid, who was talking to me about the matter, that if we accepted the English Act we would be doing very well. It was after seven years of hard work of the best men in the Kingdom that the Act was formulated. The Royal Commission sat for seven years. Statistics show that the list of accidents in New South Wales can stand comparison very well with the list of accidents at Home and on the Continent also, including France, Germany, and Belgium. I know the statistics here have been used to put an altogether different complexion on the position, because this Bulli disaster, occurring in a small community such as ours, swelled the average very much indeed; but if that year was left out, and the average taken from that year on—1887, I think it was—it will be found that the average number of accidents per 1,000 men in this Colony is considerably less than per 1,000 men at Home.

5340. And these lists even eliminate from the Home figures the accidents from fire-damp, from which we have very little trouble here? Possibly so.

5341. I suppose you recollect enough of the Bulli accident to form some conclusion as to what was wrong there? I was not in the Colony at the time.

5342. *President.*] Suppose there is a minimum of 150 feet;—that is not too large a minimum, is it? No; I think no one would object to that minimum.

5343. There has been some talk about more machinery being necessary to produce half as much more air as is required by the present Act; Mr. Fletcher and Mr. Mattheson both spoke about it;—do you think there is anything in that? I do not think there is, unless the appliances are very small. If you have a given resistance, and want to increase the air, you must simply increase the power.

5344. *Mr. Curley.*] Will you look at the Report of the Commissioners on the subject of bratticing, p. 23 :—

*Fourthly.*—That the person or persons to whom blame is attachable for this disastrous accident is the man Westwood, or his mate (both deceased), who at the moment were working at the face of No. 2 heading, and who prepared and fired the shot, which, in the opinion of the Commission, was the immediate or primary cause of the explosion. The Commission are, however, of opinion that the deputy, Robert Millward (deceased), Richard White, overman, and to a less extent (except in the matter of providing bratticing, for which he was alone responsible), Alexander Ross, manager, were guilty of contributory negligence.

J. H.  
Ronaldson,  
Esq.  
1 Oct., 1895.

Do you see that the Commission attach some importance there to bratticing? Yes, I do. Of course, though I was not in the Colony, I read the report some years ago, and did form some idea as to how the Bulli accident originated.

5345. Has that not to be done in England where they have gaseous mines to contend with? Yes.

5346. And all these matters have to be reckoned with? They have.

5347. What is the height of your seam? It runs from about 4 ft. 6 in. up to about 7 feet at present.

5348. Do you think that the inspector should have power to call the men out in case of danger? No.

5349. Why? I think that the manager being responsible for the safe working of the mine, is the man who ought to do that, and that his powers and responsibilities should be delegated to no one else, or overruled by no one else. At the same time I think that if the inspector made a strong representation to a manager that a mine or part of a mine was unsafe, no manager would go against the opinion of the inspector.

5350. You think not? I think not, and if he did, then it is very easy to refer to some one else.

5351. *President.*] Supposing a manager did differ with the inspector and declined to call the men out, and that there was some dreadful catastrophe, what satisfaction is that to the survivors of the men, or the men themselves, if they are not killed but injured very much? No satisfaction at all.

5352. Would there be any harm in giving the inspector power to call out the men in case of imminent danger, with a provision in the section that the withdrawal could not be continued, or if the withdrawal were continued, with power to send at once to the Minister and have the matter referred to arbitration? If the first part of the clause were adopted, it would be most necessary that some higher power than the inspector ought to be referred to, so that the matter might be referred to arbitration.

5353. Do you see harm in that. Is it not rather an unlikely state of things we are thinking of; is it likely the inspector would order the men out of the mine? Unless there was very good cause, I think he would not.

5354. Would you not have as much faith in the inspector as in the manager? No.

5355. Why? Because he does not know all the peculiarities of the mine as thoroughly as the manager does. The manager, you may say, lives at the mine, and has all the features of it at his fingers' ends; and the inspector, however good a man he may be, necessarily cannot have all the details so thoroughly at his fingers' ends.

5356. What imminent dangers could there be;—clause 21, subsection 5, p. 8, of the Bill reads as follows: "To require the manager to withdraw the men from the mine if at any time he finds that by reason of inflammable gases prevailing in any mine, or any part thereof, or of any cause whatever, the mine or the said part is dangerous." Inflammable gases are no doubt one thing that might prevail, and be the cause of imminent danger? A creep or a crush would.

5357. Would not that be a thing occurring suddenly? As a rule, yes.

5358. Then is it not a thousand chances to one whether the inspector would be there at that moment? It is extremely unlikely.

5359. If there is any real necessity for the section I should think that the power should only be given in cases of imminent or immediate danger, with a proviso that the men, with the mine owner or manager, shall have power to protest to the Minister against the continued withdrawal, and have the matter settled by arbitration? Yes; I think that might fulfil the requirements.

5360. Would there be any harm in such a section, then? No; I think not—that is, where imminent danger exists.

5361. I should put in both words, "imminent" and "immediate" danger so as to make it quite plain that there should be no arbitrary power, and to prevent an inspector saying "Oh, I think there is danger, you must come out"? Exactly, I think that would meet the case.

5362. Do you think there is a necessity for even what I have suggested. Do you think that it is a proper power to give. Can you understand a case practically occurring in which there would be that imminent danger apparent, and the manager would not take out the men himself? I cannot imagine it occurring but still it might occur if the manager was a fool, or incapable, or incompetent. The last part of your question is very necessary, because it appears that at present an inspector may object to men working in some place which is dangerous, after it has been reported to him, and until he gives his opinion that the place is perfectly safe for men to work in, the manager if he sends the men to work there is under a penalty, as I read the proposed Bill. There was a case like that at Stockton; a danger occurred there; the manager thought it was safe as I understand it; the inspector never passed it as being safe; the manager, if I remember rightly, was prosecuted, or was to have been prosecuted, because the men started work.

5363. Do you think if the clause is to go in at all it should go in with the proviso for referring the matter to arbitration? Yes, certainly.

5364. That you think would not be very much harm? No, not if it were done immediately and promptly.

5365. *Mr. Gregson.*] Would you be in favour of anything that would relieve the manager from the general sense of responsibility? No, I would not.

5366. With those qualifications, which the President has put to you, would it, to a certain extent, relieve the manager from his feelings of responsibility? Yes, it would.

5367. Would not that be obnoxious and prejudicial? Prejudicial. That was the one idea running through my mind that it would relieve him to a certain extent of the feeling of responsibility, and that is an undesirable thing. Goodness knows there is enough responsibility on him, but he is the right man to bear it.

5368. *Mr. Curley.*] Have you a knowledge of the occurrences which have taken place at the different collieries for a number of years—I mean the subsidences, collapses of main roads in collieries over a wide area—not at one colliery, but at several? I know of only one particular instance.

J. H.  
Ronaldson,  
Esq.  
1 Oct., 1895.

5369. Where is that? The Hamilton Pit. I think it is somewhere at Newcastle where a crush occurred.
5370. If you knew of several collieries where internal derangement had taken place over wide areas of the collieries, would not that convince you that there was some reason for this distrust you speak about in relying on managers? Certainly not—not necessarily.
5371. Not when they have been left with a free hand to look after the matter as they pleased? Not necessarily at all. It is a very strange reflection on the system of inspection when you say that.
5372. You turn it off on to the inspection, and yet you advocate that the manager should have the whole responsibility; now when I put it before you, you put it off on to the inspector, and want to saddle him with the responsibility? I do not, but with the powers he has under the present Act I say that if those conditions exist they reflect very seriously on the inspectors, as well as on the management. I mean to say, however, that these accidents, crushes and creeps, all may occur in well regulated mines.
5373. *Mr. Gregson.*] In spite of all the Acts of Parliament that have ever been printed? Yes, that have ever been printed, or ever will be printed. We can do much to diminish the risk of these accidents, but still it is possible for them to occur in well regulated mines.
5374. *Mr. Curley.*] Do you mean main roads can come down when a main road breaks down over the pillars, and shuts up the men so to speak for the time;—how do you look upon a circumstance of that character? I should not like to defend such a condition of affairs speaking generally, but I should like to have all the circumstances before me. For instance, if it were pillar work close alongside, and this main road was being abandoned, there would be nothing in that. The crush might extend for a considerable distance back on the road during pillar work.
5375. I asked you some time ago if you thought that substantial pillars should be left along the main roads in order to secure them? Yes.
- 5375½. You said you believed in that? Yes.
5376. Can you realise that a fall would come over these pillars if they were left in that way? I have seen crushings and creeps come for a long distance over what were supposed to be substantial pillars.
5377. Where was that? In Scotland.
5378. Where in Scotland? In Ayrshire.
5379. What were the circumstances? A creep occurred in that colliery.
5380. What was the thickness of the pillars? The pillars were stoops as they call them there—about 20 yards square.
5381. What was the depth of the mine? I suppose the depth, counting the dip, was 300 or 400 feet.
5382. What was the name of the mine? Barleith.
5383. Did it come over many pillars of that description? Yes.
5384. How many? I cannot say; I was not managing that colliery. It is a case, however, which occurs to my mind.
5385. Did you see it? No, but I was in the colliery afterwards and the circumstances were detailed to me.
5386. It was a matter of hearsay? Yes, from reliable parties.
5387. *Mr. Gregson.*] Amongst the circumstances you would like to be informed about before you pass an opinion on any of these matters I suppose the nature of the floor would be one? Yes.
5388. It would be very little use to leave a big pillar if you have a bad floor? Yes.
5389. Supposing you do not know the floor is bad—that you assume the floor is good, and that you have no reason to assume anything else—then your pillar might be forgiven if it gives way? Yes, if the floor is bad. I think it is hardly fair to take a hypothetical case unless all the conditions are given.
5390. *Mr. Curley.*] If you knew this system had been a 4-yard pillar business, and the depth about 200 feet, and the floor hard sandstone, and the roof a strong roof, and the width of the bords 8 yards with the pillar working? I think these pillars are too small.
5391. You think the Inspector should not have this power to withdraw the men from the mine? I think not, except with such limitations as have been suggested by the President.
5392. *President.*] And even then you are doubtful about it—you hardly think that it is practically of use? I do not think it is practically of use.
5393. *Mr. Curley.*] Have you ever compared the weights paid to the men at your colliery as against the weights in any other way in connection with the waggons? Yes, I have.
5394. Have you noticed any variation? Yes, from time to time.
5395. How does it run? Sometimes we have had a loss; at other times we have had a gain.
5396. Taking it all round? Taking it all round for the year's working we run pretty close.
- [Witness withdrew.]

George Errington sworn and examined:—

Mr. G.  
Errington.  
1 Oct., 1895.

5397. *Mr. Curley.*] What occupation do you follow? Mining.
5398. Where are you working? I have worked in the Hetton Company's mine.
5399. Where are you working at the present time? New Lambton.
5400. Have you worked at any other collieries in the district? Yes.
5401. What collieries? Hetton, Stockton, and the Lambton mines.
5402. How long did you work at Lambton? Three years.
5403. During your experience in working in that mine did you ever notice any defective ventilation? Yes; any amount of defective ventilation.
5404. In what section of the mine was this? What is commonly known as the straight down, and another flat commonly known as Pairish's Flat. Pairish's Flat is the worst ventilated flat in the whole of the mine.
5405. Is that mine a considerable distance in? Yes; a considerable distance.
5406. Was the defect that the air was not conducted into the working place, or was there a defect on the heading? There was a defect in some headings, and in others there was plenty of air, but it was not conducted properly into the working place; it swept past the working places instead of being conducted up to the working face.
5407. Do you think that the air should be conducted into a man's working place? Yes, I do.
5408. How long were you at the Hetton colliery? Between three and four years.
5409. Did you notice any defect there? Yes.
5410. In a similar way? Yes.
- 5411.

Mr. G.  
Errington.  
1 Oct., 1895.

5411. What defect? What they call the third right hand, particularly.
5412. Did you work at both these collieries as a practical miner? Yes.
5413. Did you notice anything like that in the Stockton colliery? I did not notice it so much there because I was a wheeler there.
5414. Have you read the proposed Bill? Yes, I have read a little of it.
5415. Do you know the proposal to increase the minimum quantity of air? Yes.
5416. Do you consider that is a necessary provision? Yes, very necessary.
5417. Do you think the cut-throughs should be shortened? Yes, I think the cut-throughs ought to be shortened, and that there ought to be proper appliances to conduct the air into the working face.
5418. Do you know what the condition is in the present Act—that the bord is to be driven before the cut-through 35 yards? Yes.
5419. Do you think that distance should be shortened, as proposed in the Bill? Yes.
5420. Do you know that it is proposed to shorten the distance to 25 yards? Yes.
5421. Do you know that the Legislative Council proposes to strike out the minimum quantity, and simply to leave the clause to be defined by the word "adequate"? Yes.
5422. Do you think that that would meet the requirements of the condition? No; I do not. The amount must be stipulated.
5423. Do you believe in a definitely-stipulated minimum quantity? Yes.
5424. Does that prevent the manager from supplying more if he thinks fit? No.
5425. Does it prevent him, under our present Act, from supplying more than the 100 feet? No.
5426. Do you know anything about the question of hours;—have you given any attention to that? Yes; I gave a little attention to it.
5427. Do you believe that the hours should be legislated for? Yes.
5428. Do you believe in the regulation for eight hours? Yes.
5429. Do you think this is a general opinion among the men? Yes; the majority of the men hold that opinion.
5430. Do you think the inspector should have power to withdraw the men in case of danger? Yes; I do.
5431. *President.*] You are being asked now about a proposed Bill. Do you believe in it as it left the Assembly? Yes.
5432. Do you not believe in the Legislative Council's amendments? No, none of them.
5433. *Mr. Curley.*] Will you look at the 28th section of the Bill which is here before you, page 14, sub-section 3. [*See Appendix A.*] Do you think that there should be a surface plan provided at the different collieries, showing the streets, roads, buildings, creeks, rivers, bays, swamps, navigable waters, and limits of any tidal waters within the said boundary? Yes, I do. I think there is no borough in the Colony which suffers more than the one I represent at the present time by under-mining.
5434. What borough? New Lambton.
5435. Do you hold any official position? I am the Mayor of New Lambton.
5436. Have you lived about New Lambton for any considerable time? Twelve years.
5437. Do you know the locality well? Yes.
5438. Has there been any under-mining carried on there? Yes, to a considerable extent, by the Scottish-Australian Mining Company and the New Lambton Company.
5439. Has this been on the streets in some cases? Yes, we have got subsidences on the main road.
5440. Do you know the names of any of the streets? Yes; Regent-street, our principal street, subsided to a considerable extent, and damaged the public school—split the gable end of the public school between four and five years ago. The Education Department has had to repair it at considerable expense through the undermining.
5441. Have any of the buildings been affected round about the place that you are aware of? Yes, several. Several people have had to remove their houses on account of them being dangerous to live in.
5442. Here is another section, page 29, Rule 25 [*See Appendix A.*]. Do you notice that "The coal shall not be wrought under any proclaimed or made road without the sanction in writing of the Minister";—do you think that is an absolutely necessary provision? Yes, absolutely necessary. I understand that the Minister has stopped two or three places now from undermining in our borough.
5443. Have representations been made to him? Yes, by the Council and by deputations.
5444. *President.*] How has he stopped them? On account of their taking the pillars out from underneath the main road.
5445. Under what power has he stopped them? From the report of his inspectors. He said he had power to prevent them from mining under the main road. We had subsidences in close proximity to the Government tramway, or within 9 or 10 feet.
5446. Where is that at? At the Borough of North Lambton.
5447. *Mr. Curley.*] Has it put the Council to any considerable expense? Yes, considerable expense.
5448. To repair some of these streets? Yes, filling in.
5449. Do you know whether the Companies contributed in any way to assist the Council? Not a cent. They have only paid ordinary rates, the same as any other ratepayer.
5450. Have you ever taken any legal advice in connection with this under-mining? No.
5451. You have not found it necessary to do that yet? No. We have always appealed to the Minister for Mines.
5452. *Mr. Gregson.*] Has he always helped you? Yes. He stopped two shafts from being put down within the last two or three months. These shafts were being put down to work out a few pillars that had been left in. These pillars were the main support of the main road from Newcastle to Minmi. They were within 120 feet of the Board's water-main, and within 50 feet of the tramline. He considered it dangerous to allow them to undermine and take those pillars out, and he stopped it.
5453. Did he do all you wanted? In those two particular instances he did. Before the borough was incorporated the Scottish Australian Mining Company had the right to mine for coal there. I think they had a lease at 5s. per acre, and before the place was incorporated they had worked out the coal. The people were living on a commonage land at that time; but now they have a right and title to allotments, and the Minister, to prevent depreciation of the allotments, has stopped it. I may state that Mr. Smith a few days ago stated to the deputation that waited on him that he would like to see provision made in the Mining Bill to prevent them from mining under roads and streets.

Mr. G.  
Errington.  
1 Oct., 1895.

5454. He has got the power now, for instance? Yes; wherever it comes under his jurisdiction. In some cases he has the power; in others he has not.
5455. In New Lambton the coal had been worked, and they proclaimed streets over the worked out ground? Yes.
5456. Who did that? The Government. It is nearly all Government land.
5457. Did they sell allotments adjoining the street over worked out coal? Yes; some people have removed their houses, because they were afraid to live there.
5458. *Mr. Curley.*] Have they permitted under-mining in some cases on this ground since? Not to my knowledge; the lease of the Scottish Australian Mining Company expired, and then the Government sold the allotments. They aligned the streets, and sold the commonage allotments, and since then people have made applications for vacant allotments to take out these pillars to mine for coal. The Minister is preventing them from mining now in order to prevent them from depreciating the value of adjacent Crown allotments.
5459. In this particular instance that you have now cited with regard to the Government giving out these leases to take out the pillars, they are doing it with the full knowledge of having sold these lands? Yes.
5460. Cannot you make a protest against this kind of thing? Yes; we protested against that, and I may state that wherever we have made out a good case against their taking out these pillars to let down the road Mr. Smith stopped them in a very prompt and effective way on our representations.
5461. When you worked at Lambton did you know anything about the payment-for-weight business that was going on? Yes.
5462. The average? Yes.
5463. Was there a standard weight there? Yes; a standard weight of 14 cwt. 2 qrs.
5464. Did the men ever try to get this abolished? Yes; we made several attempts to get it abolished, but we could not.
5465. Do you think the men are satisfied with getting an average number of skips? We would like to see every skip weighed. That is the men's idea on the matter.
5466. Do you think there is a feeling in that direction? Yes; it is the fairest way too.
5467. Is that your opinion? Yes.
5468. In the absence of that, do you think that there should be a fair number of skips weighed? Yes; as many skips weighed as is possible in the absence of not getting every skip weighed.
5469. *President.*] What would be a fair proportion? It would all depend on the output.
5470. One in twenty? More than that.
5471. One in ten? More than that; four or five in ten. Every other skip would be a fair proportion.
5472. Nearly all of them? No; one-half of them. I have seen weighing done in the old country, and the work was not stopped at all.
5473. *Mr. Curley.*] Have you done much work in the old country? A little.
5474. What part? In the county of Durham.
5475. Did you ever set any props there? Yes.
5476. Could you set them? Yes.
5477. Could the miners, as a rule, set props? Yes.
5478. What kind of a statement would you think this to be—that a miner could not set a prop? I should think it to be a very absurd statement indeed to make. Every man that has been employed as a miner has had to put timber up for his own safety.
5479. Occasionally? Yes.
5480. Were deputies employed in that district? Yes; deputies were employed. Sometimes when a man wanted a prop in his own place for his own safety, and the deputy was not near enough, he had to put it up until the deputy arrived.
5481. Was it not a rule that the props were cut to the proper length? Yes; the stone was of such a hard nature that they could not sink the props, and they had to be cut to the proper length.
5482. Is it quite an easy matter to set a prop? Yes; if the prop is the proper length there is not much difficulty.
5483. What would be the height of the seams? The seam I worked in was 5 ft. 6 in.
5484. Would those props be very easy to handle? Yes; handy timber.

[Witness withdrew.]

WEDNESDAY, 2 OCTOBER, 1895.

[The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.]

Present:—

FRANCIS EDWARD ROGERS, Esq., Q.C. (PRESIDENT).

JAMES CURLEY, Esq.

JESSE GREGSON, Esq.

James Henry-Ronaldson re-examined:—

J. H.  
Ronaldson,  
Esq.  
2 Oct., 1895.

5485. *Witness.*] Yesterday I was asked if economy was an object in the working of a mine, and I replied that it was. One of the objections which seems to obtain to some extent to the proposal to brattice every bord in a mine must be the expense, because in trying to make out what might be the cost I arrived at the following figures. The average width of bords, counting the narrow headings and the bords themselves, might be put at 6 yards. If we reckon up the cost of the material and the cost of putting it up, I do not see how it can come to less than 3d. per ton.
5486. *President.*] For bratticing every bord? Bratticing every bord. Then I notice that it is proposed to make compulsory the working of the mine for eight hours only per day. As I understand it, that means both for hewers and for shift-men. If we decrease the working hours of the shift-men we must in most cases decrease the out-put, with a proportionate cost to some one, or decreased wages to the shift-men. For that item alone I think the cost would be increased by about 7d. per ton.

5487.

J. H.  
Ronaldson,  
Esq.

2 Oct., 1895.

5487. *Mr. Ourley.*] On what item? On the shift work. Then capital must also lie idle during the same time, if instead of working ten hours, we work eight hours, or whatever the proportion might be. The capital involved must be idle a proportionate time. That, in our case, I do not estimate at less than 4d. per ton. Those would be the first results, and as the working of collieries just now is attended with next to no profit—in some cases with loss—I do not see how some collieries could continue to work. If they are not closed, it must inevitably mean a reduction in wages. Some prominence seems to have been given to the notice requiring the men to work on pay Saturdays at Kembla. I should be glad to state why we are anxious that work should go on at Mount Kembla on pay Saturdays when required. In the South all our shipping is dependent on the weather. We ship in an open roadstead. We have no shelter whatever. No Government money has been spent in that district, except at Wollongong, as it has been in some of the other ports. In Newcastle, for instance, large sums of money have been spent. We, however, have no harbour except at Wollongong, which is most inadequate for any large shipping, so that we are entirely dependent on the weather for our constant work.

5488. *President.*] Where do you ship? At Port Kembla, an open roadstead, at a jetty made by the Company itself.

5489. Out into the ocean? Out into the ocean. There have been two jetties there. They cost the Company £28,000. We have a railway from 7 to 8 miles long over very difficult country. It has cost about £30,000. I have heard it so stated. I should certainly put it myself at £25,000. To cover that long line of railway, and to work that colliery regularly, we have been at the expense of providing 205 waggons at present. It all amounts to a very large capital. If the weather is bad the mine is kept idle for days, and occasionally it has happened that the weather has moderated towards the end of the week on a pay Saturday, and we have been anxious to work then both to keep the capital in operation and to supply our customers, who may have been waiting, and in some cases have waited, a long time for the supply of their order, so that down in the south we have really very serious disabilities to work under as compared with other districts, and we think it altogether unreasonable that on account of any custom which has been imported from the old country, or which has grown up here, we should be debarred from exercising what seems only a reasonable power in working on the days on which we are able to work. In addition to these 205 waggons, we have three locomotives. We have the up-keep of our line; we have the up-keep of the jetty, which may be put down as having a life of from eight to ten or twelve years according to circumstances. The life of it may be put down at that time.

5490. Have the men been willing to work on these pay Saturdays? They were not up to within about three and a half months ago.

5491. Are they willing now? Yes; they are willing now. They have acquiesced in our request. Individually, I know for certain that many of the men have been quite willing to work on the pay Saturdays; as a body they have not been. To a large extent I put that down to the union, and to those who lead the union. Three years ago delegates of the men admitted to me privately, after discussion between them and directors of the Company, that the *raison d'être* of not working on pay Saturdays had entirely disappeared; that it was an old custom.

5492. What was the reason originally? Originally, trade was very good; I remember the time when at Kembla they worked twelve days in the fortnight. Men naturally under those conditions had very little time to themselves. They wanted a rest, and they wanted time to execute their own commissions or business. We have always said that had we been fortunate enough to have trade such as that we would have been only too glad to be idle on pay Saturday. For repairs alone to machinery we would be glad to have one free day as a rule. We looked at it as being a very strong evil, and an evil that required a strong remedy, considering the times.

5493. *Mr. Ourley.*] You stated that the fixing of the eight hours would impose an additional cost to the management of 7d. per ton. I think so.

5494. Is that what you say? Yes, that is what I mean.

5495. How do you arrive at that? The oncost is 3s. per ton.

5496. At the present time? At the present time—oncost—and fixed charges.

5497. That includes the payments to the miners? No, that is not oncost—that is by contract.

5498. *President.*] What do you mean by oncost? The shift work, and everything that is paid by day wages; also some standing charges are included in that.

5499. *Mr. Ourley.*] Do you mean that 7d. per ton would be added to the expenses of the working of the under-ground account? No, to the whole oncost, under-ground and above-ground, and standing charges.

5500. What do you mean by standing charges? Charges which are always divided by the output to arrive at the cost per ton.

5501. What are they? There are shipping charges, railway men, managerial expenses, and office expenses.

5502. Do you say that your under-ground account, and your upper-ground account at the present time cost you 3s. per ton? Yes, and standing charges.

5503. How do you arrive at that? By these costs which I mentioned—managerial and office.

5504. That includes the manager's salary? Yes.

5505. The overmen's? Yes.

5506. And all the shift-men? The oncost, yes. I mean everything but the hewing of coal. That is the meaning of it.

5507. What are you paid yourself? I think it will be sufficient to give the general charges.

5508. What is your salary? I decline to answer.

5509. What are your overmen's wages? Fourteen shillings per day.

5510. How many deputies have you? Three; firemen we call them.

5511. What are their wages? Eight shillings per day.

5512. Do they work full time? Yes; sometimes over the twelve days.

5513. Do they ever work under it? They have not for a long time, to the best of my recollection.

5514. Have you deputies apart from firemen? No.

5515. Road men? Yes.

5516. How many road men? We pay somewhat differently from Newcastle. We have a man who contracts for that work. He contracts for the wheeling, and the road-men's work, repairs, taking up roads, and the various oncosts of that kind about the pit.

5517.

- J. H. Ronaldson, Esq.  
2 Oct., 1895.
5517. Have you only one road man that contracts for this? No; we have others that do other contract work in the mine.
5518. What are the terms of this contract? We pay so much per ton.
5519. Do you pay this man so much per ton? Yes.
5520. What is it? At the present moment, 11d. per ton.
5521. You say that he contracts to wheel and take up roads in the mine? Yes.
5522. Lay down the roads, and keep the roads in repair? Yes; that is the bord roads. Outside of his contract there is a large amount of work which the Company does itself in the laying of main roads, extending engine planes, putting in rope haulage, making over-casts, providing for drainage.
5523. Do you do this by shift-men? Yes.
5524. How many are there? It just depends upon the work. Sometimes there may be twenty, sometimes half a dozen. It is irregular. These are little things that come in only occasionally in the life of a colliery.
5525. How many permanent shift-men have you? We have three permanent shift-men. Two I should put it.
5526. What wages do you pay them? Seven shillings and sixpence. For instance, we have expended, I suppose, about £2,000 recently on the extension and improvement of the rope haulage in order to diminish the standing cost of wheeling and hauling.
5527. But that is not a permanent cost? It must be distributed.
5528. It is not a cost that will take place next week, or anything like that? Certainly not. Those are things which must be put down against the coal, and which only the coal can meet. It is difficult to estimate them in the way you are doing by trying to get at the number of shift-men employed per day.
5529. The books are always there to prove it. These men's wages are paid whether they are engaged one week or two? Yes.
5530. You say the laying of these main roads, rope extension, over-cast, &c., is a work which is done by the permanent shift-men? No, sometimes by the permanent shift-men, and sometimes by special contract with other men. You have got to add pumping charges, furnace-men, stoking, engine-men.
5531. How many furnace-men have you? Two.
5532. Engine-men? Two pump-men, one engine-man.
5533. What is the furnace-men's wages? Five shillings and sixpence.
5534. Engine-man? Eight shillings.
5535. Pump-men? I think it is 8s. and 7s. 6d.
5536. Do any other men come into this account—either under ground or above ground? Add prop wood.
5537. The eight hours has nothing to do with the timber, has it? It is a standing charge. It has not, so far as the division is concerned. We have got to add the timber to the cost of our coal.
5538. What is your cost for timber? For pit props I suppose about 1d. to 1½d. would be fairly accurate. Then there is sawn timber, which comes into the general accounts of course.
5539. What is your charge for that? That must come to about 1d. too.
5540. What do you do with the sawn timber? Making and repairing skips, and all the different things about the colliery erections.
5541. Is there anything else? Blacksmiths.
5542. How many? Three.
5543. What are their wages? Two at 9s. 4d., one at 7s. 9d. There are also strikers; one at 6s. 6d., one at 5s. 6d. I will not guarantee every figure. It is perfectly impossible to do that from memory, but those are figures as near as I can remember. One pick-sharper, 6s. 6d. Four carpenters.
5544. Are they not included in this sawn timber for making and repairing skips, erecting buildings, &c.? No; that is material alone I gave you.
5545. You use the words "making and repairing skips"? You asked me what the material was used for, and that was my explanation.
5546. That 1d. per ton was not included in the wages? No.
5547. What are the carpenters' wages? One at 9s., one at 8s., one at 7s. 6d., and one at 6s. 6d. There are also engineers, one at 11s., one at 9s. 6d., and a boy at 2s. 3d.
5548. What is this boy? He is in the engineers' shop—an odd boy. There is also a brakesman.
5549. Is not that the engine-man? No.
5550. How many? One at 8s. 6d.; assistant, 5s. 6d. There is also an incline-man at 6s. 6d. and an incline-boy at 2s. 9d. One weigh-man at 8s. Two loco-drivers, one at 9s., and one at 8s. 6d. Two stokers, one at 7s. 6d., and one at 6s. 6d. Cleaner, 6s. 6d. Weigh-man, £3 per week.
5551. Is he employed by the week? Yes.
5552. Is he fully employed? Yes. Fettleers, one at 8s. 6d., two at 6s., three at 5s. 9d. Wharfingers, one at 11s., four at 6s. 6d. As far as I recollect that is the shift time. To that you have got to add an indefinite amount, which I cannot particularise, for overtime, in nearly every item. Frequently when we work six, six and a half, or seven days, a large number of these are employed full time, and sometimes overtime. There are also all the colliery accounts, which with us are very heavy.
5553. What is the average number of men your colliery worked with within the past twelve months? I could not tell you with accuracy without referring to documents.
5554. Can you tell us the quantity of tonnage raised in the twelve months—for 1894? I prefer to refer to the documents, if you will allow me. The Blue Book, probably, would tell, therefore it is unnecessary for me to say.
5555. Your quantity of output is represented as 127,155 tons for last year. Does that represent round and small coal? It must.
5556. What is your percentage of small to round? About three to one.
5557. You get three of round to one of small? We get more than that. Only about 25 per cent. of the total output is small.
5558. Can you give the number of days worked last year—the average per fortnight? No, I cannot.
5559. What do you think it was? I prefer not to say until I can state accurately.
5560. Approximately at present? I prefer not to state.
5561. You cannot give any approximation? I prefer not to give an approximation.
5562. Do you think it was half time? More than half time.

J. H.  
Ronaldson,  
Esq.  
2 Oct., 1895.

5563. Much more? I do not think I can answer that any further. I will give you accurate information if you wish it in a day.
5564. With regard to these items that you have given me here? Have you put down colliery accounts?
5565. What do you mean by colliery accounts? Accounts paid to merchants for materials.
5566. I have put down the item for props, and the item for sawn timber? The sawn timber is included, but you have also to put down the colliery accounts.
5567. What is included in those? Iron, oils, greases, waste—all material which is used at the colliery.
5568. What is the cost of that? I cannot give you that accurately.
5569. Can you give it approximately? No.
5570. You never go into these things? I go into a certain amount; but there is a certain amount which does not pass through the pay sheet, but goes through the Sydney office only, and that is not in my department at all.
5571. I presume that from your long experience with collieries you have some idea what the cost is? I know that occasionally it amounts to 6d.
5572. I want a general average? I would rather not give a general average.
5573. Are these things not calculated at the end of the year to see what has been the permanent cost of the different items? I have no doubt they do it at our Sydney office, but it does not come within my sphere.
5574. Do you know that it is done to ascertain these charges? I am not certain.
5575. Not from your long experience with collieries? I speak of Mount Kembla Colliery at present.
5576. Do you know this has been done in other collieries with which you have been connected? Yes.
5577. You know that it is done? Yes.
5578. You cannot state anything with regard to it? Not definitely; I might only mislead you.
5579. Would that not come into the estimate which you have already given? No.
5580. With regard to the on-cost business? Yes; in the 3s. of course. You were trying just now, as I understood, to arrive at how this 3s. is made up.
5581. *Mr. Gregson.*] Do you include colliery office expenses in the 3s.? Yes.
5582. *Mr. Curley.*] With regard to several of these items which you have given me here, numbers of them, I presume, can only be calculated for the days that the men are at work. Take furnace-men for example. If the pit is idle are they there? Sometimes they are—more frequently than not.
5583. Engine-men? Pump-men are always there.
5584. The engine-man? His time is nearly full—not quite.
5585. These pump-men? They are always there. They have frequently overtime in addition to the twelve days.
5586. Blacksmiths? Usually full time—occasionally overtime?
5587. Does that "Usually full time" not also mean occasionally not full time? Quite so.
5588. Strikers? Very much the same as the smiths.
5589. Pick-sharper? Not full time, but more than the pit time.
5590. Carpenters? Nearly full time. One of them has full time, and the others are nearly full time, with sometimes overtime.
5591. Engineers? Full time and over.
5592. Boys? The boy is full time.
5593. Brakesman? Full time.
5594. Assistant? More than pit time considerably, but not full time.
5595. Incline men? Considerably more than pit time; boy, ditto; weighman, usually over the twelve days; engine-drivers, considerably in excess of full time. To be as accurate as possible, they are usually full time at least, and sometimes considerably over full time. Stokers, same as drivers; waggon weighman, full time; fettlers, nearly full time; wharfinger and men, full time.
5596. You said something this morning about unions. Have you an objection to unions? Not to a well regulated union.
5597. Do you wish to be the judge of a well regulated union? I want to form my own opinion about it.
5598. Do you want to manage the union yourself? Certainly not; I should be very sorry to.
5599. Are unions exceptional matters at different collieries? No.
5600. Are they not almost universal? They are in this Colony.
5601. And almost all over the world? I believe that unions are very common at Home, though the proportion of unionists at Home is comparatively small. I do not suppose there are more than 25 per cent. of unionists at Home in the whole labouring community.
5602. Are they very strong in the mining districts at Home? They are.
5603. Do you know that they are legalised—have the right of association? I believe they have.
5604. Have the proprietors a combination—any association? Yes, frequently.
5605. Have they any association in the southern district at the present time? For vend they have—some of them.
5606. Is your colliery identified with the association? Yes; with the selling association.
5607. The Proprietors' Association? No. It is identified with the Southern Coal Owners' Agency for selling coal.
5608. That is a combination amongst colliery owners? Yes; for selling coal.
5609. For mutual purposes of trade? Yes.
5610. Or any other purposes there may be joint action upon? No, I believe not.
5611. Did you discharge the president of the district union from your colliery some time ago? Yes, I did.
5612. Without notice? Yes, for breaking the colliery rules, and he came to me and begged to be allowed to work another fortnight, in order to make arrangements whereby he might leave Mount Kembla. Having given him that permission, he at once stood for the position of check-weighman.
5613. Did he not, previous to standing for the position of check-weighman, sue you in the local police court for wages? No; he stood for the position of check-weighman, which at once showed that he did not intend to leave the mountain if he could remain on it. As I took his action in coming to me, and asking to be allowed to stop a little longer in order that he might get away from the mountain, simply to be a subterfuge to be allowed to enter the colliery again, I immediately discharged him. He then took me to court, and won his case for a fortnight's wages.

J. H.  
Ronaldson,  
Esq.  
2 Oct., 1895.

5614. Did you wish him to leave without this fortnight's notice? I did, after he applied for the position of weighman, which showed that he did not want to leave the mountain, but that he had only been trying to get the better of me.
5615. You assumed he was trying to get the better of you? I knew it. I know it now.
5616. Had he not a perfect right to accept the position of check-weighman if it was open to him to do so? Not under the circumstances.
5617. You wished to get him away from the place altogether? I did. The subsequent action shows that I was right in trying to do so.
5618. Either with or without notice you wanted to get rid of him? No.
5619. Latterly you did? I did latterly.
5620. And legally he was right in the matter of his wages? I believe that legally he was wrong.
5621. And yet he got a judgment? He did.
5622. *President.*] Where? Before the Police Magistrate.
5623. *Mr. Curley.*] You did not test the legality of the decision any further? I do not think we could—it was such a small sum. I think it was final, if I understand the law aright. It was under the "Small Debts Act."
5624. In that case you will admit he was legally right? Technically, we will say, he was legally right; otherwise, I think he was not.
5625. Were you sorry that he was elected check-weighman? Under all the circumstances I was.
5626. *President.*] Under the present Act must a check-weighman be an employee of the mine? Yes. He was not really an employee when his term of office began, or for some time before his term of office. We protested, but it was such a small matter we did not go any further.
5627. *Mr. Curley.*] I suppose a ballot was taken for the position? Yes, before the duties began.
5628. Did you endeavour to influence the ballot? Not to my recollection, except by giving two of the miners, who came to us as delegates, my version of the story.
5629. Have you seen the Check Weighers Act which has been passed in England (*see Appendix E*)? Yes.
5630. Do you approve of an Act of Parliament of that description? Yes; there is no objection to that.
5631. *President.*] Do you know that under the present English Act the check weighman need not be an employee of the company? I know that.
5632. Do you know that the Upper House has put in that he must be an employee of the company? Yes.
5633. What do you say to that? I am inclined to think he should be an employee of the company.
5634. But you have no strong objection? As I said yesterday, I would adopt the English Act as it stands. I would adopt the Act as a whole; still I think it would be better that he should be an employee.
5635. *Mr. Gregson.*] Is that one of the things you would like to see altered? Yes.
5636. *President.*] But you are not very strong about that? I would not raise any great objection if I could get a good Act otherwise. It is a minor point really.
5637. *Mr. Curley.*] Do you think an endeavour was made to influence the ballot in connection with this man? No.
5638. Either by yourself or the overman? I think not.
5639. But you did when he was appointed as check-weighman? We protested against his appointment in court in that case; that was all we did.
5640. What was your objection to him? I prefer not to raise a libel case. There was a personal difference connected with the work.
5641. Is not a personal difference liable at all times to arise even with other men, and will not personal differences exist as long as the world lasts? Yes; still it had a connection with the work.
5642. There will be different views upon these matters, I presume, as long as the world stands, as between manager and men, and do you not think that the men have a right to their views? A perfect right.
5643. And the right to express them? A perfect right.
5644. You have no objection to that? None whatever.
5645. I presume you know that if this man did not act as President of the Association somebody else would act in his place? I am sure of that.
5646. If you were not in the position of Manager of the Mount Kembla Colliery I suppose somebody else would be? Yes; that goes without saying.
5647. I think you told us the height of your seam? Yes; I said from 4 feet 6 inches to 7 feet.
5648. What area of the mine is the thinnest portion of the seam in all directions—take it in the aggregate—what proportion of thin coal is there throughout the whole mine, as against the high coal in other portions of the mine? Where do you draw the dividing line? I do not call 4 ft. 6 in. thin coal. In many districts in England it would not be.
5649. Four feet six inches is in comparison with 7 ft.? We must have a dividing line.
5650. In what district or section of the mine does this 4 ft. 6 in. coal exist? The shaft district.
5651. How many places have you going into that district? About twenty-five or thirty places; not all in thin coal, though. Some of that coal is fairly thick, though it is in that district that the thin coal occurs. Thin coal occurs in the shaft district chiefly.
5652. How many places are there going in the thin coal in the shaft district? Would you call a thin coal,—up to 5 ft.
5653. Yes, if you like, up to 5 ft. Say twenty places. Then throughout the mine places occur, even in thick coal, where you have got to give thin coal measurement on account of the rolls that come in.
5654. You have thin coal in other places? Yes, from time to time.
5655. Do these rolls run a large distance? Many yards.
5656. How far? Fifty and seventy yards occasionally; sometimes only a few yards long. They are very variable.
5657. What would you consider to be the average height of your seam all through, taking the thin and the thick coal together? I should say about 5 feet 6 inches.
5658. Five feet 6 inches throughout the whole mine? As we are working at present. Might I add in connection with the cost which you have taken down that you have got to add the colliery accounts, which I think you have done already, and all the depreciation on plant.
5659. What do you mean by colliery accounts? Accounts for all the material that is got for the colliery—iron, greases, wastes, oils, &c. Then there is the cost for the depreciation of plant and material, which is a very serious item with us.

5660. What is it? For instance, the jetty, which cost £16,000, we estimate has a life of perhaps from eight to twelve years. We have a second jetty now, and the Colliery has been in existence for fifteen or sixteen years, I believe. We had the end of it washed away entirely during one storm, and it had to be renewed at a very serious cost.

J. H.  
Ronaldson,  
Esq.  
2 Oct., 1895.

[Witness withdrew.]

Andrew Nicol sworn and examined:—

5661. *President.*] What are you? I am check-weighman at the Coal Cliff Colliery.
5662. *Mr. Curley.*] How long have you been check-weighman there? About thirteen months at Coal Cliff. Previous to that thirteen months there was no check-weighman for a little over four years.
5663. Have you worked at the colliery long? About three years.
5664. Do you know anything about the system of weighing there? Yes, certainly.
5665. What is the average number of skips weighed—do you weigh every day? No; it is sometimes weeks on a stretch before we weigh. I have complained repeatedly to the management of the method of weighing the miners' coal.
5666. Are you paid by the average weight? Yes, we are.
5667. What does the weigh-bridge register? Since I was elected check-weighman the management put up a standard weight of 13 cwt. 2 qrs., which was never at that colliery before.
5668. Will the bar not go any higher;—can you make any higher register than 13 cwt. 2 qr.? Certainly. Previous to the four years I am alluding to, when I was elected check-weighman, the average at the colliery used to run about 15 cwt.
5669. And has the standard been fixed at 13 cwt. 2 qr.? Thirteen cwt. 2 qr. He stated to me his reason for fixing that standard at 13 cwt. 2 qr. was to save his rolling-stock; but I have no doubt he meant something by that, because I never saw him complain yet, no matter how full the skips were, so long as they went over the 13 cwt. 2 qr.
5670. Have you tried to get the standard weight put to one side? Certainly; I have tried to get it not put up at all.
5671. I suppose you did that at the request of the men? Certainly.
5672. Do you go a considerable time without weighing? I have a statement here which I have taken for the fourteen weeks, from May 20th to August 24th, 1895,—from audit to audit. The number of days worked is forty-seven out of eighty-four working days.
5673. Those are the days the weighing-machine was at work? No; the days the miners worked. Number of miners' skips tipped, 6,894; number of times weighing done during that period, twice. That was on June 12th and June 24th they weighed during that fourteen weeks.
5674. *Mr. Gregson.*] They did not weigh at any other time? At no other time. Number of skips weighed, 16.
5675. *President.*] Out of 6,894? Yes. On June 12th they weighed nine, and on June 24th they weighed seven.
5676. *Mr. Curley.*] Does the weighman have the control of the weighing there? The weighman is supposed to have the control; but I think Mr. David McGeachie, one of the lessees, has got the control.
5677. *Mr. Gregson.*] Was the check-weighman standing by all this time ready to see these skips weighed? Yes, I was.
5678. Were you standing by the whole time? Yes.
5679. *President.*] Did you ask them to weigh any more? I repeatedly complained at the loose method of weighing miners' coal.
5680. Did you say you were standing by all this time during those fourteen weeks—were you there on these forty-seven days? Yes.
5681. Did you ask to have any more weighed? I asked repeatedly the same question.
5682. Did you ask the Company's weighman to weigh more? Yes.
5683. You did on this occasion? Yes, and on several other occasions.
5684. But you did on this occasion? Yes.
5685. *Mr. Curley.*] Do you know anything about the number of hours worked down there? Every full day that we work is a day of ten hours, both men going in together to be at the face at 7 a.m., and leaving the face again at 5 p.m., excepting on several occasions when men have left the face at 4 o'clock, after being in the pit for nine hours, and then they have been chastised for doing it.
5686. How do you know they have been chastised? They have told me so, and two of them I heard the management chastise myself. They told these two that it must not happen again, or else they would have to abide by the consequences.
5687. Is this a regular matter? It is a regular thing.
5688. *Mr. Gregson.*] What is a regular thing? Both men working ten hours a day.
5689. *Mr. Curley.*] Are you speaking from what you see yourself? I am. There are three days in this fourteen weeks that I have just given you in which the working hours ranged from fourteen to sixteen hours—June 18th, 19th, and 20th.
5690. How do they range from fourteen to sixteen hours? By starting at 12 o'clock and 3 or 4 o'clock in the morning.
5691. Twelve o'clock at midnight? Yes, 12 at midnight till 5 o'clock in the evening. It would be half-past 5 o'clock before they would be outside.
5692. Do the men stop in from 12 o'clock at midnight till 5 o'clock the next evening? Yes, they have done that repeatedly—not only on this occasion.
5693. Did the manager request them to do that? Yes; when he wants the men to work these hours, he generally sends a boy round in the evening between 8 and 9 o'clock to tell the men to start at 12 o'clock, or 3 or 4, whatever the time may be.
5694. How long ago is it since he did this? This was in June.
5695. Has he done anything of that kind later on? Only an hour once or twice. We started at 7 and worked till 6, but it is occurring every day in a full day's work to work both men from 7 o'clock till 5. I have got the names of those that he has chastised if you wish to have them.
5696. Do you think the men as a whole want to stop in the pit that length of time? They do not want to stop in the pit, but they dare not say anything for fear of being victimised. I have got a minute taken out of the Minute-book of the Lodge which I shall read to you. It will show you that the men do not

Mr. A. Nicol.  
2 Oct., 1895.

not

- Mr. A. Nichol.  
2 Oct., 1895.
- not believe in working more than eight hours. The minute is to this effect:—"That we, the Coal Cliff operatives, believe in working no more than eight hours, and wish the same to become a legal day's work." That was carried unanimously at a full meeting.
5697. How long ago was that? That was carried last week. I have not got the date. The feeling of the men when they are in a body is that they shall not work any more than eight hours; but owing to the depression, and the way in which they have been tyrannised over, they are in fact afraid to say one word for themselves.
5698. Do you think that if the men were to make much of a protest that they would be requested to leave the colliery, is that what you mean? They would. I know they would. I have got enough proof that men have been practically told if they did not work they would get somebody else to do so.
5699. Is that one of the reasons that makes you think the hours should be legislated for? Yes, certainly. I think there should be a hard and fast law legalising eight hours as a day's work. On Monday, September 16th, I, as one of a deputation, waited on Mr. John M'Geachie *re* the reduction that is on at present, and we wished to have an agreement drawn up.
5700. Mr. Gregson.] Are you out on strike now? Yes, on a reduction of 2d. per ton.
5701. Mr. Curley.] You are not working now? No; Mr. M'Geachie distinctly stated to that deputation that whoever was employed at the Coal Cliff Colliery would be required to work as long as he wanted them to work, and as long as he required the coal.
5702. They would have to stop in the pit during his pleasure? Yes; that is what he practically meant.
5703. That was the answer he made to a deputation? Yes.

[Witness withdrew.]

William Thompson Philpot sworn and examined:—

- Mr. W. T. Philpot.  
2 Oct., 1895.
5704. Mr. Curley.] What occupation do you follow? Coal-mining.
5705. President.] You are a coal-miner? Yes.
5706. Mr. Curley.] Are you coal-mining at present? Not at the present time.
5707. President.] Are you out on strike? No, I am a check-weighman.
5708. Where? At the Corrimal Colliery.
5709. Mr. Curley.] Have you been check-weighman for long there? Since the 15th March, 1894.
5710. Mr. Gregson.] About 18 months? About 18 months.
5711. Mr. Curley.] What is your system of weighing? We average the weights every fortnight.
5712. Do you average the number of skips? We average the number of skips.
5713. Have you any standard weight at the colliery? No standard weight.
5714. What is the number of skips weighed daily? They differ. Sometimes we have weighed sixty, and sometimes eight; some days we weigh none.
5715. Could you weigh sixty every day the mine works if the weighman was at the bridge, that is when you work a full day of 10 hours? It would be heavy work to get them through. That day that we weighed the sixty we had an extra man there.
5716. Does the coal want much cleaning at the bridge? There is not much dirt comes down amongst the coal.
5717. What was the trouble then? The coal has shovelled when on the screen. There is a gate across the screen, and it is held down by a handle. Of course when the skips are tipped into the screen the coal stops against this gate, and the weighman lifts up the handle to let it fall gradually down the screen, and what is left up has to be scraped down with a shovel. The weighing-machine is a Pooley spring-balanced machine with a pan attached. It is so fixed that it will lift out of its place, so that they can use the screen when they are not weighing.
5718. Do they miss many days occasionally when they do not weigh in this way? It is not regular. Some days they do not weigh at all. We have not weighed I think for the last three weeks that I have been on. We have not weighed any in that time.
5719. Have you worked much? We have not worked much this last fortnight. We have been three and a quarter days on coal, and four days on slack in the last fortnight.
5720. That is for a fortnight? Yes.
5721. Did much coal come out in those three days? Before I go further I might state that on the slack days we have some headings working, and of course the coal comes out on the slack days. I think there are seven headings so far as I can recollect, and these men fill coal on the slack days, and their coal came out on the four slack days, and for this fortnight there are 3,520 skips of coal, giving as the weight paid to miners, 1,920 tons 13 cwt. 3 qrs. 14 lbs. During that time there were 1,887 slack skips, and they are averaged at 10 cwt. per skip.
5722. Do you say that for these latter days there has not been any weighed at all? No skips weighed for the past fortnight. That is the only fortnight there has been none weighed since I have been on the check-weighing.
5723. Have you made an average for the quarter, or anything like that? I have an average for the last 12 months, from June 30th, 1894, to June 30th, 1895, and the average upon skips comes out 13 per thousand, and for the total output—slack skips and coal skips—9.75.
5724. Do you say upon the round coal there is about 13 for each thousand? Yes.
5725. Do you think about 1 in 80 is anything like a fair average to weigh? No, I think we ought to weigh more.
5726. Have the men ever expressed themselves as dissatisfied with the limited number of skips that are weighed? Yes, the men have done so to me.
5727. Have you complained to the weighman or the manager? I have complained to the weighman, but I could not draw your attention to any complaint to the manager, although, when I first went on the weigh there was no notice put upon the pay-sheet of what the average of the skips weighed were, and I found the number not weighed to be so great one fortnight that I put it on, and since that time there has been a little more weighing done. The manager had noticed the small number of the skips weighed, and on the average there have been a few more weighed since then.
5728. When did you do that? I could not tell you exactly the date I did it.
5729. Some months ago? Some months ago, and I have always kept that up every fortnight. I put it this way, "One skip weighed out of 101" or "One skip weighed out out of 75," as the case might be, sometimes less and sometimes more. I put that on the pay-sheet.

5730.

5730. Showing the men's weight? Yes, showing the men's weight.

5731. Do you think the men wish every skip to be weighed, or would they be satisfied with an average, if there was a reasonable amount weighed? As far as I have heard the men express their ideas, they wish every skip to be weighed.

Mr.  
W. T. Philpot.  
2 Oct., 1896.

5732. Do you think that would involve much expense? My opinion is that every skip ought to be weighed. As regards the additional expense on the present system, which is to pay for round coal, there would be an expense at Corrimal, but slack coal being a marketable commodity, I think the miners could be paid on the gross, and there would not then be a great deal more expense than the attaching of a machine to weigh the whole.

5733. They would have to erect a new machine I suppose? Under the present system they would have to erect new screens.

5734. *President.*] Do you not think that if they weighed a larger average of skips the whole difficulty could be met? I think an agreement might perhaps be drawn up to weigh a certain average, but for my part I want every skip weighed.

5735. *Mr. Curley.*] Do you think that when you are paid on the amount that you produce, you have a right to have the exact quantity that you produce weighed? Yes, I think I have a right on the lines of justice for the whole to be weighed.

5736. Do you know anything about the hours worked at Corrimal? Sometimes we work overtime.

5737. Do you do much of that? Yes; I think we do a good deal.

5738. What do you mean by "overtime"? The regular shift that we work is from 7 till 5 o'clock. Sometimes we work after 5 o'clock, and that is overtime—anything later than 5. Sometimes in the morning we may start an hour earlier and knock off at 5 o'clock at night, and the hour earlier before 7 in the morning is overtime.

5739. You say this is done occasionally? Occasionally it is done by starting in the morning earlier, but generally they are a few minutes over 5 o'clock almost every night.

5740. Did you take any note of when this occurred? Yes; I have got my time as I took it. I am paid myself regarding the overtime.

5741. Can you tell us when this occurred? This is a three weeks' pay. On June 17th, we started at 6 a.m. in the morning, and knocked off at 6:50 at night. On June 18th we started at 6 o'clock in the morning and knocked off at 6:45. I might make the statement here that this is my time. The pit, perhaps, might knock off at 6 o'clock. The fifty minutes and the forty-five minutes might belong to me, inasmuch as the incline is run after the pit is knocked off. The inside will have run from 6 o'clock to 6 o'clock, but the screens will have been running from 6 a.m. to 6:50 p.m., and from 6 a.m. to 6:45 p.m.

5742. Do you stop there to see if there is any coal-weighing done? Yes.

5743. Can you give us the pit time as near as you can—that is, when the men would go in and come out? When we have worked this overtime there has generally been chalked up the night before on one of the water tanks by the master, "The pit will hang on at 6 o'clock, and the front shift men will be expected to go in at 6 o'clock, and knock off at 2 o'clock. The back shift men shall go in at 10 and knock off at 6 o'clock." That is only eight hours for the miners, but the wheelers are going all that time from 6 till 6.

5744. Are these wheelers men or boys? You may call them young men of from 17 to 18 years of age; some, perhaps, are older.

5745. On these days they have been employed about twelve hours? Yes, about twelve hours.

5746. Has there been anything of that kind done quite recently? On June 30th we worked upon coal from 6 o'clock to 6:50. That is my own time. The pit works then from 6 o'clock to 6. Those are the orders.

5747. Is that making you stop there almost thirteen hours a day? Yes; I am stopping there that time. If the men go in at 6 o'clock in the morning I go at 6.

5748. *Mr. Gregson.*] Are you paid by the hour? I am paid by the day; of course, I keep every minute, and everything over my hours. I put in eight hours after that. I am paid from 7 o'clock to 5 o'clock as a shift.

5749. You are paid for everything over eight hours? No, sir; from 7 o'clock in the morning till 5 o'clock in the evening is ten hours. One hour is included in that for meals. That is a shift. I am paid for that as one shift; everything over those hours I am paid for at the rate of eight hours per shift.

5750. *Mr. Curley.*] You put in overtime? Yes.

5751. *Mr. Gregson.*] Are you rather glad of the overtime? Personally, I am not.

5752. *Mr. Curley.*] Would you prefer the regular thing? I would prefer the regular thing, which is a day's work, and go home.

5753. You do not believe in working a day and a half? No; I do not believe in working a day and a half in the twenty-four hours.

5754. Do you think the men are satisfied with the eight hours? As far as I can get an expression from the men, I think the men would be satisfied with the eight hours.

5755. Do they believe in a matter of this kind being left to the management—in a mutual agreement—or do they want it legislated for? All the information I can gain is that it will have to be done by legislation—that there is no hope of getting it in any other way.

5756. Do you think these young men that you spoke about would prefer to work only the eight hours instead of twelve? Yes; I think they would. I have heard expressions of opinion, but not from the young men themselves, that they have been very much dissatisfied with having to stop this overtime.

5757. Whom have you heard these expressions from? From some of the miners.

5758. Have the miners ever been requested to go back to the mine at night-time, after they have worked their shift during the day? Yes, miners have been requested; but I could not point to a particular person.

5759. Would that be only an occasional circumstance? Only an occasional circumstance, I think.

5760. What weight does a man start with when he starts at the colliery? The average weight of the skips that are weighed during the fortnight if he is not weighed; it used to be different when I first started; it used to be 10.2 and 11. We have two weights at our colliery. There are four different sizes of skips, but they are classified into two weights.

5761. There would be large skips and small ones? Yes; they go under the name of Tommy skips and Kembla skips. Tommy is the larger skip, and Kembla the smaller.

5762. Do you arrive at anything like a fair average with these skips running in that fashion? We average

Mr.  
W. T. Philpot.  
2 Oct., 1895.

average all the skips up every fortnight on the weight-book, and if a man is weighed three times in the fortnight he is paid on the average of those three weights that are taken. We take all that has been weighed during the fortnight and strike the average from that, and that is the average for the colliery for that fortnight, and if a young man should start, and he has not been weighed, then he is paid at that average.

5763. Where you have such a disparity between skips as you have mentioned, is it not almost a necessity for every skip to be weighed in order that a man should get a fair average weight? I think it is.

5764. *Mr. Gregson.*] Did you tell us the number of days you worked when you turned out that 3,520 skips? We worked seven and a quarter days, and three-quarters of a day overtime. That is my own time.

5765. Can you give an idea of the average number of days you worked for any period? No; I never took the average of days worked.

5766. Would it be half-time? Yes; more than half-time. During the fortnight there have been some few hours through the night when coal came out that I have not been there.

[Witness withdrew.]

David Ritchie sworn and examined:—

Mr.  
D. Ritchie.  
2 Oct., 1895.

5767. *President.*] What are you? I am at present check-weighman for the employees of the Mount Kembla Colliery.

5768. That is Mr. Ronaldson's colliery? Yes.

5769. *Mr. Ourley.*] Had you worked at the Mount Kembla Colliery previous to becoming check-weighman? Yes; I worked in the colliery for about fifteen months previous to becoming check-weighman.

5770. Have you worked in the Wollongong District for any period of time at other mines? Yes; I have been connected with the mines in the Illawarra District for the last eleven or twelve years.

5771. What other mines did you work at in that district? Mount Pleasant and Mount Keira.

5772. How long have you held the position of check-weighman? A little over twelve months now.

5773. What is the system of weighing there;—are the men paid on the average, or do you weigh every skip? The system of weighing there is that, supposing two men start fresh at the colliery to-day, they are placed on what is called the standing average for the pit, which gives them 10 cwt, 3 qrs. for each skip. There are two kinds of skips in that particular pit. One skip is an iron one, and the other is a wooden one. One will carry about 2 cwt. more than the other. They stand on that weight until they happen to be weighed, and no man can tell when that will be, because the system of weighing that is carried on at present is entirely in the hands of the Company itself. It is a matter of their pleasure as to how many shall be weighed, if any. I have just gone over my book, and I find that the average for the last fortnight runs twenty-four to the thousand. Of every thousand that are drawn from the pit there are twenty-four weighed. That is for the fortnight ending 28th September.

5774. *Mr. Gregson.*] For one fortnight only? For one fortnight only. I have gone through my books for the last quarter. There are men working in the pit who, I can prove, have been standing on this 10 cwt. 3 qrs.—the pit average—for two months without being weighed. My books also show that men in the adjoining places, working similar coal, are standing on 14 and 15 cwt. That is their weight.

5775. *Mr. Ourley.*] Have you the numbers that these men run? Yes. I have also taken the trouble to go through the last fortnight's work, and I find that the average of every skip that comes out of that pit runs 11 cwt. 2 qrs. 21 lb. That is taking the small with the large skips. The pit is worked in four flats. They are known as No. 1, No. 4, No. 5, and the shaft. The section that these men I have just spoken about were working in is No. 1. They were working in the best part of the pit for weight. I have taken the trouble to average the skips from that particular section for the last fortnight, and I find that the average weight of the skips runs 11 cwt. 3 qrs. 14 lb. for that section, where those men were receiving 10 cwt. 3 qrs.

5776. With regard to this 10 cwt. 3 qrs. that you speak about as a standard for a man to begin with, have you ever approached the manager to try and get that altered in any way? Personally I have not. I have not been able to approach the manager upon anything.

5777. *President.*] Why? For the simple reason that he would not acknowledge me in anything. He would not speak to me upon any consideration. What his reasons are for not doing so I do not know; they are best known to himself.

5778. Are you check-weighman there now? I am check-weighman there at the present time. There is no end of grumbling every day with regard to the twenty-four per thousand. The men are continually grumbling about not being weighed, and the power is not mine to weigh, though I receive all the grumbling, being their representative there. As it is at the present time the Company's weighman has a great many other duties to attend to, and sometimes I have seen him away out of the weigh-cabin for an hour at a stretch. Of course during the time he is away all weighing is suspended. That accounts for the very small number of skips that are being weighed. To show that the men have just grounds for grumbling at that particular colliery I may say that there are four sections in that pit, as I mentioned before. Every skip that has come out of the section known as No. 1 in the last fortnight runs an average of 11 cwt. 3 qrs. 14 lb. Every skip that has come out of section No. 4 runs an average of 8 cwt. 2 qrs. There is a very marked difference. At the end of the quarter, or any other time during the quarter, men who leave this No. 4 section to go to No. 1 section carry their 8 cwt. 2 qrs. of an average with them to the No. 1 section, and they may stand there for two months on that low weight, when men adjoining them may be filling 15 cwt.

5779. *Mr. Gregson.*] In the opposite case, when a man leaves the No. 1 section, where the weight is 11 cwt. 3 qrs. 14 lb., and goes down to the No. 4 section, where the weight is 8 cwt. 2 qrs., does he carry the 11 cwt. 3 qrs. 14 lb. weight? He does; the system is not fair at all. There are not many skips come out of the No. 4 section where the low weight is. There are only six or seven men working there at the present time. They get one set a day, and that one set would take about fifty skips. One pair of men will have, perhaps, thirteen or fifteen skips on that set, and the weighman, if he thinks fit, can weigh the whole of the men working in that section where they are running the low weights any day he likes. On the other hand, there are about ninety men working in the other section, known as No. 1, where the high weights are obtained; one pair of men will not have more than two skips on one set, and some sets they will miss altogether, so you see the chances of getting weighed out of the No. 1 section are not nearly so

many

Mr.  
D. Ritchie.  
2 Oct., 1895.

many as they are in the No. 4 section. A man going in from the heavy weight into the low weight simply can be weighed the following morning, but the man going from where the low weight is prevailing to where the high weight is prevailing may stand there for the time I have mentioned, two months on a stretch without being weighed at all.

5780. To cure that you want more skips weighed? Yes, we want more skips weighed.

5781. Would keeping one screen going all day answer the purpose? It would be a great improvement; but I do not think anything would give satisfaction other than weighing every skip.

5782. Supposing one screen were kept going the whole day, there would be very much less loss either one side or the other? The loss would be still great to the men.

5783. How would it be? The screens for weighing are so unworkable and unwieldy that if they were weighing the whole day they would not weigh a fair percentage.

5784. How many skips have you weighed in a whole day? Myself and the Company's weighman have weighed on an exceptional day fifty.

5785. What is the number of skips you bring out in a day? They average about 1,000.

5786. Fifty out of a thousand? Yes; that is an exceptional day, mind. The screen is so flat that it wants one shoving it down and the other pulling it down. Although I act as check-weighman, I assist in pulling it down.

5787. Do you consider one skip in twenty is a fair average? No.

5788. If you get one in twenty weighed, is it not likely that if there is any error it is just as liable to be on one side as the other? No.

5789. Why? A skip is always liable to lose coal coming out, but never likely to gain. If it should happen that one that has lost a certain portion of coal coming out of the mine should be weighed, the whole of the skips for that particular day, and for as many days as you might stand on the weight of that skip, go at the same weight.

5790. Suppose that all the skips were weighed, would not the miner suffer the loss on the skips that lost weight travelling from the bord to the weighbridge? On the one skip alone.

5791. But every skip you want weighed? Yes.

5792. If they are all tumbling coal off, would they lose that? I do not mean to imply that all skips lose coal. I mean that one skip out of the day's work might get broken on the way, and that one in particular might be the one that would be weighed. If a man fills twelve skips in the day, and one out of the twelve gets broken, that one might be weighed, and the other eleven are averaged at that weight.

5793. *President.*] Supposing there is a skip that no coal tumbles out of? He gets the benefit.

5794. Supposing coal tumbles out of the whole lot that he brings, would he not get the benefit afterwards? He would get the benefit, but it would not be likely to occur.

5795. *Mr. Gregson.*] Do you object to a skip being weighed when it is a broken skip? I do; but there is a standing rule there, which is enforced by Mr. Ronaldson, or others when he is not about there, that unless a skip is marked by the wheeler, or other official inside, it must be weighed.

5796. *President.*] What does marking mean? That it has been broken previously to leaving their hands. I pointed out to the Company's weighman that after leaving the wheelers and those in charge of the flats a skip has a long way to travel at Mount Kembla, and that it is an easy matter for it to get broken after leaving their hands and to come out without being marked at all. It can be proved that without it breaking at all a good quantity of coal falls off on the road.

5797. *Mr. Gregson.*] If they were better packed, would it happen? That is not the only cause. Coal is not all of one nature. You will find brittle coal that will not carry far, and you will find some coal which will carry any distance provided it is packed properly. A man may have brittle coal and it will not carry far, because a bit of a jolt going round a turn will send it away, consequently the number of skips that have been weighed there is altogether inadequate in my opinion, and I can testify to the grumbling of the men there daily. I can also testify to the just ground they have for grumbling, which my books will prove.

5798. You were speaking about twenty-four to the thousand; if you could manage fifty to the thousand, would it be a great improvement? Of course it would be a great improvement.

5799. But you think nothing will be perfect short of weighing the whole of the skips? Nothing short of it. I admit, however, that to weigh fifty in a thousand would be a very vast improvement. Of course I have already said it would not give the satisfaction that people would desire to see prevailing. My own opinion is that the matter of cost in making the necessary alterations to begin with should not stand in the way of meting out justice to all hands who are employed. I do not think there should be any limit to meting out justice; that is my candid opinion. Justice should be served to all at any cost.

5800. *Mr. Curley.*] Do you not think that that is a plea that can be constantly put forward on the part of the proprietors that you are always going to run them into additional cost? Certainly that plea has always been put forward, and always will be while it is listened to.

5801. Do you know anything about the working-hours at Mount Kembla? Yes; the system at present in vogue there is what is known as an eight-hours shift—that is to say, the pit draws coal for a period of ten hours. The front shift goes in at 6 o'clock in the morning, and comes out again at half-past 2. What is known as the back shift goes in at 8-30 and comes out at 5 o'clock. That is the system that is generally worked there. On the 15th June, 1895, the following notice was posted up:—

Fourteen days from this date miners and other workmen employed at this colliery will be required to work on Pay Saturdays for such number of hours as the exigencies of trade demand, and to start work at any time up to 9 a.m. as on other days when required; and employment will be subject to acquiescence in this rule.

J. H. RONALDSON, Manager,  
Mount Kembla Colliery.

On the 17th July last the overman stopped the front shift as they came out of the pit, and told them that both shifts had to be in at 6 o'clock in the morning and come out at 5 o'clock; that is to say, that they should extend their working-hours from eight to ten hours. He asked them if they were willing to propose that it should be done, and only one man in that crowd put the question to the meeting, and because the men did not vote for it the overman said to them, "What is the matter with your hands that you can't hold them up and vote." The same course was pursued in regard to the back shift; the overman intercepted them and told them that the front shift had agreed to go in at 6 in the morning and come out at 5 o'clock. The back shift, on hearing the statement, said nothing, but dispersed. As secretary of the lodge I called a meeting that evening to see what action they intended to take in the matter. A resolution

Mr.  
D. Ritchie.  
2 Oct., 1895.

resolution was put to the meeting, and unanimously carried, that the men adhere to the eight-hour system and decline to comply with the request which has been placed before them. The boat came in late on Thursday, and on Friday morning the men went to their work on the usual shifts. The overman was there and wanted to know why they were not in at the stipulated time, 6 o'clock, both shifts together. They said they were on the regular shifts, and that they had not agreed to go in both shifts together. He then said, "The screw is going on you now all right."

5802. *Mr. Curley.*] All you have said simply amounts to this, that at Mount Kembla an attempt was made to extend the hours from eight to ten? Yes.

5803. And the men declined to work these ten hours at the request of the manager? Yes, they did.

5804. Was there any further attempt made to ask them to consent to it later on? No further attempt only what I have stated. The manager told them that they would have to do it, and that this must not occur again when they were told to go in at that hour. They were notified to go in on the Saturday undoubtedly.

5805. The men would not agree to this? No.

5806. Notwithstanding the appeals of the manager? They would not agree to it.

5807. Did he then give a notice about the working on the Pay-Saturday subsequent to this? He gave a notice previous to this. That was his final notice which I have just placed before you. He gave a notice previous to that which the men would not entertain, consequently for the Pay-Saturday following, this notice was given. This notice was a fortnight later than the other one, to make that as a final fourteen days' notice that they would have to accept the alteration.

5808. And the men to come to some kind of agreement agreed to what is now going on? Yes.

5809. Are they now working what is part of the Pay-Saturday? Yes; they agreed to go in at 6 and come out at 12 o'clock.

5810. Has there ever been any request made in that district for the miners to work on a Sunday? Not to my knowledge. I have heard of it having been done, but I cannot say that I know of it.

5811. It has not occurred so far as you know? Not any further than I have heard it rumoured that it was so.

5812. You do not know where any requests have been made for the men to work on a Sunday? No.

5813. *President.*] Do they work regularly on the Pay-Saturdays, or only when there is some emergency? The understanding was that it should occur only in cases of emergency.

5814. You do not generally work full time? This last fortnight or two they have started eleven separate days in the twelve.

5815. You cannot take that as a general rule? No; it is not a general rule.

5816. The colliery is not kept in full work? No; it is not.

5817. If the colliery was kept at full work the miners would be very glad indeed to have their holiday on the Pay-Saturday, but when it is not at full work do they look upon it as a great hardship to have to work on Pay-Saturday, and get paid for it? They do, for the simple reason that, although the pit does not work every day, they are compelled to be there to go to work when called upon, so that practically the men are bound every day. They have to hold themselves in readiness every day in the twelve, and they always look upon the Pay-Saturday as a day to attend to their private affairs.

5818. Until what time are they obliged to hold themselves in readiness every day. Suppose that I am a miner and that there is no work doing on Monday, after what time on Monday am I free? At Mount Kembla you would be free at about 8 o'clock in the morning.

5819. Free for the day? They do not start after 9 o'clock. At the adjoining collieries, Mount Pleasant, and Mount Kiera, you are not at liberty before 12 o'clock in the day. You must hold yourself in readiness up to that time.

5820. In one case from 8, and in the other case from 12 o'clock, the men have a holiday when the mine is not in full work? Yes.

5821. Do you consider it a very great hardship under these circumstances to have to work on Pay-Saturdays when an emergency arises, supposing that for ten days or a week at a stretch the colliery is not at work at all; have you not got practically those days to yourself at Mount Kembla after 9 o'clock, and at the adjoining collieries after 12 o'clock? Yes.

5822. Yet you look upon it as a very great grievance that when an emergency exists you should work on the Pay-Saturday? Yes, we do. Working men are not men who have always got money to put their hands on during the working days of the fortnight. The Pay-Saturday is the only day they practically have it.

5823. Supposing they have not been at work all the week, what money would they have on the Pay-Saturday that they want the holiday on? The pays are usually made up fortnightly, and it is rarely, if ever, that there is a whole fortnight without work. Whatever work is done during that fortnight is not paid for until the Pay-Saturday, or Pay-Friday night.

5824. Supposing on the last Pay-Saturday they get their money, and that in the following week there is no work doing at the mine, would they not have all the week in that case to do what they like? They have to square up their last fortnight, but at the expiration of the next fortnight they are expected to be as punctual.

5825. Is the object of having the Pay-Saturday to spend their money as soon as they get it? Not entirely so. They look upon it as one day in the twelve which they should have to themselves—for instance, they have got their associations; these associations sometimes set a certain day apart to transact their business, and they cannot set a day apart depending on an idle day in the fortnight. If they have one stipulated day which they know will be theirs they can arrange their business for that day. We look upon it as a hardship to be compelled to give every day up. At present in the Illawarra district, if the men's association should want to have some meeting on the Pay-Saturday, the owners make the men work on that day. We have direct proof of that. That is the reason why we look upon it that Pay-Saturday is the one day we should have absolute control over.

5826. *Mr. Curley.*] How do you view the question of legislation in regard to hours? I view it, on behalf of men who are employed in coal mines, that the stipulated number of hours should not be more than eight hours from bank to bank. Eight hours I contend is quite enough to be engaged under ground.

5827. Do you think there should be legislation at all on the matter? Certainly. I am certainly of opinion that the men themselves are not strong enough to enforce what they desire to have. I can bring resolution

resolution after resolution that has been moved by the men, and carried unanimously, calling for an eight-hour day, and they are not strong enough to enforce it themselves. They are craving to have it through legislation. More than that, they are desirous that it should be made compulsory, and that they should be punished if they did more than eight hours' work. I come in contact with hundreds of them, and that is their unanimous opinion.

5828. Is this your own individual opinion that eight hours should be made compulsory? Yes, that is my individual opinion, and I am very firm upon it.

5829. By legislation? Yes, by legislation, and I am firmly of opinion also that there should be a penal clause to enforce it.

5830. *Mr. Curley.*] Can you give us the number of days your colliery worked last year? I cannot at present, but I can give you the exact time the pit worked from the 24th June to the 28th September, both days inclusive. The number of days were sixty-one and three quarters.

5831. Were they full days? They were not all full days; I make them into full days.

5832. Is what you have given us the total? Yes; that makes full days. There have been more starts than that, but that is the total put into days.

[Witness withdrew.]

David Mason sworn and examined:—

5833. *Mr. Curley.*] What is your occupation? Miner.

5834. *President.*] Where? Lambton.

5835. *Mr. Curley.*] Have you worked at Lambton for some time? Twenty years.

5836. Have you followed mining all your life? Yes; since I was ten years of age.

5837. What is the system of working at Lambton? Bord and pillar working.

5838. What is the width of the bords? The width of the bords is 8 yards.

5839. And the pillars? Four yards, I believe.

5840. Has that been the system of mining, as far as you know? So far as Lambton is concerned.

5841. Have you worked in pillars at the Lambton Colliery? Yes; I am working in pillars at the present time.

5842. Do you know of any falls that have taken place, of any extent, in connection with the pillar working? Yes; a great many falls have taken place since I have been there working pillars.

5843. Do you know of any falls that have taken place, where men have had to fly for their lives, and had a narrow escape in getting out? There was one particular instance, in the New Chum district, where they had a very narrow escape of their lives at one time; but I was not working in that portion of the mine at that particular time.

5844. Was this a matter of general conversation amongst the men? At that particular time, and for some time after the fall it was.

5845. Did you converse with some of these men yourself? Yes; most of the men lost their tools.

5846. That is their working gear? Yes.

5847. Were many of them affected in that way? I could not say exactly what quantity of men were working in that district; but I know the tools were all replaced by the management.

5848. Later on? Later on.

5849. Did you hear the men say whether the roof had come over the pillars? I heard the men say that the roof had come over the pillars unexpectedly.

5850. Have you worked in some very small pillars yourself—very thin pillars? I have at times. Generally speaking though the pillars at Lambton are about 4 yards wide; but there are instances sometimes where one encroaches on the other in the bords, and it makes the pillar smaller—5 and 6 feet sometimes. I have worked in pillars that small.

5851. Have you sometimes worked in a pillar that runs pretty well into the goaf away from the main road? Yes; in one particular instance I have.

5852. Did you consider that that was a safe method of working pillars—did you like it? When we thought that there was any danger we reported the matter to the overman, and he ordered us out of it.

5853. Did you draw his attention at any time while you were working there to the fact, that you thought it was dangerous to work there? Yes.

5854. With an experience of that kind, do you consider that larger pillars should be left in the mines? A great deal depends upon the height of the seam. The seam at that time, at Lambton Colliery, was 8 feet 6 inches; now it is only from 5 to 6 feet.

5855. Do you think a good deal depends upon the strata above the seam? Yes, I do.

5856. Have you any idea as to the depth of the mine? It is a tunnel. Of course in some portions we are working now there would be 300 or 400 feet of surface on it, I daresay; that would require larger pillars to support it.

5857. Do you think that there should be larger pillars left than the 4 yards, where the surface is anything like what you state above the coal-seam? I think where there is a great depth of covering over a seam, the pillars should be 6 yards wide.

5858. And in some cases, I suppose, they should be much larger? It depends a good deal on the nature of the coal. Some coal frets a good deal—it is tender; other coal is very strong. The majority of the Lambton coal at present is strong coal.

5859. Is this pillar working a business that has been left entirely in the hands of the management? I believe so.

5860. How many miners are there working in the Lambton Colliery now? Somewhere between 160 and 170.

5861. Having worked in the Lambton mine for the number of years you mentioned, I daresay you know a good deal about the ventilation in the different parts of the mine? Yes, I do.

5862. Have you found any defects in the ventilation occasionally in some of the districts? At times we have. Generally speaking, it is pretty well ventilated; but there are times when we have to complain.

5863. On these occasions, when you have to complain, have you noticed that the air is very injurious to the men who have to work in these places? Yes.

5864. What defects have you had most to complain of—can you recollect? Not particularly. Generally speaking,

Mr.  
D. Ritchie.  
2 Oct., 1895.

Mr. D. Mason.  
2 Oct., 1895.

- Mr. D. Mason, speaking, as I have said before, it has pretty good ventilation; but there are times when we have to complain to the manager about the scarcity of air, and he has generally had that remedied. In the Straight Down district there have been complaints lately.
5865. Is that what you call Fairish's Flat? No; Fairish's Flat is to the crop.
5866. Are there many men in the Straight Down? I could not exactly say, because I have not been down there. I believe there are ten or twelve bords down there.
5867. Have there been complaints there quite recently? Yes.
5868. Have you heard the men complaining yourself about it? Being Chairman of the Lambton miners, of course the complaint was made to me.
5869. *Mr. Gregson.*] Are you Chairman of the Lodge? Yes.
5870. *Mr. Curley.*] When these complaints are made do you generally make representations to the manager? Yes. We did not on this occasion, but we sent the check inspectors round in order that they should test the air, and see if there was any reason for complaining. That is our mode of doing business generally.
5871. Did the check inspectors report substantiate the representations of the men? The check inspectors have not given their report yet.
5872. Do you consider that the ventilation should be continued into the working face? Yes; I think that is highly necessary.
5873. Do you think it sufficient to have it simply passing along the heading without going into the working place? No, I do not.
5874. Do you consider that one of the defects of the present Act? I think that is one of the greatest and most important defects in connection with mining.
5875. Have you thought over the matter of conducting the air into a bord by bratticing, or would you shorten the distance of the cut-through? I have had some experience in connection with that at the Lambton Mine. A short time ago Mr. Croudace started to brattice the bords, and there was a considerable improvement. I told Mr. Croudace himself it was one of the most beneficial acts he ever conferred upon the men by doing so.
5876. Did he do this of his own accord? As far as I can understand.
5877. Do you know what districts that was in? The Far Flat district I was working in at that particular time.
5878. Was the brattice put into your place? Yes.
5879. Did you find it a considerable improvement? I found a considerable improvement, because the end of the old bords were stopped up, and the air was conveyed into the face.
5880. Do you think that every miner would experience a similiar benefit if that was carried out in connection with mining? There seemed to be a general expression of that opinion on that occasion amongst the Lambton men.
5881. Was the brattice carried very far up the place at the time? Within about 10 yards in some instances.
5882. From the bord end? From the bord end.
5883. Was it canvas brattice? Tarred with Stockholm tar, I believe.
5884. Have you looked over the proposed Bill with regard to the increased minimum quantity of ventilation. Have you seen the proposed Bill? I saw the last proposed Bill some time ago, but not recently.
5885. Look at section 47, p. 23, Rule 1. [*See Appendix A.*] Those marks that run through the clause there represent the amendments suggested by the Legislative Council, that is, they strike those out, and those larger additional black letters which you see placed in they have substituted. If you read the clause right through without those marks, and omit what has been placed there by the Legislative Council, you will have the clause as it originally stood. You will see that it provides for 150 feet as a minimum quantity, and also for cut-throughs at 25 yards. Do you consider that would be an improvement? I would consider that a great improvement. That is, 50 feet more of air would pass per man.
5886. Along the heading? Along the heading.
5887. And with the shorter cut-through? With the shorter cut-through.
5888. You think it would be a great improvement? I think it would be a great improvement. I would not think it necessary to shorten the cut-through if it were bratticed in the way I have mentioned.
5889. Without the brattice? Without the brattice I should consider it a great improvement. I think it is plenty far enough—in fact too far for bords going to the rise.
5890. The 25 yards? The 25 yards. A bord going to the rise or any places going to the rise are very difficult to air.
5891. Do you think a provision of that kind should be in the Bill? Yes, I think so.
5892. Do you think that the minimum should be increased beyond what it is at the present time? Yes; I think 150 feet would be a very good provision. You must understand that at the present time the present Act says 35 yards. Then there are 2 yards of a cut-through, and the width of the pillar is counted in addition to that before you get the air, so that in many cases I have found it has been 41 yards instead of 35 yards where it has been a thick pillar.
5893. Do you think a minimum quantity is necessary in a mine? I think the minimum quantity is absolutely necessary.
5894. Do you think the word "adequate" would meet the conditions? It would leave it an open question as to what the manager thought was really adequate.
5895. Do you not think a good deal of difference of opinion would arise on that question? I am satisfied about that.
5896. And that while the manager said it was adequate the men in all probability would consider in some cases it was not adequate? Yes. Some districts are far different to others. With regard to other mines working close to the crop the same as Fairish's, where there is a lot of heavy carbon, it is highly desirable that there should be a large amount of pure air, because the air is so detrimental to a man's constitution. The places in a mine vary so much with regard to noxious gases. In Fairish's Flat particularly there is a lot of carbon.
5897. What kind of gas? Carbon—heavy, dense air, that seems to come out.
5898. Carbonic acid gas? Yes. Although it is good work, there are plenty of men who would exchange to a rather hard laborious place sooner than work in it; the air is so detrimental to their constitutions.

Mr. D. Mason.

2 Oct., 1896.

5899. Would they prefer to change into worse work for purer air? Yes.
5900. Have you known that done? Yes, I have known that done; yet it appears to be well ventilated.
5901. Do you mean to say that there is an element in the air that causes it to be impure? Yes, I do.
5902. Although there appears to be a good quantity of air there? Yes, I do.
5903. Is that where there is some return air? No, it is in nearly all the places in the crop work at Fairish's Flat. If you put your light down on the bottom it will almost go black.
5904. Is that in consequence of this black damp, or carbonic acid gas escaping out of the old workings? The workings are of a very damp nature, and it appears to come from both the roof and the bottom, so far as I can understand.
5905. Do you consider that to be most injurious to the health of the men? I do, and it has been found out to be so by the men themselves.
5906. Have you made representations to the manager about this particular air? Yes, there have been representations made to the manager, and he has had shafts put up to cause a greater circulation of the air, and that remedied the defect to a very large extent.
5907. Do you know Mr. Evans, who used to be there as check-weighman? Yes.
5908. Do you know that the colliery suspended work some time ago? For five weeks I believe; we all had notice.
5909. Did you all have notice that your services would not be required? Yes.
5910. At the termination of that notice did the mine come to a standstill? The mine came to a stand for five weeks.
5911. Was Evans your check-weighman at that time? He was the check-weighman when we ceased work.
5912. Did the colliery resume work again after that five weeks? Yes.
5913. Were the men still willing to engage Evans in his old position? Yes; as far as I could understand. In fact, it was understood that he was still the check-weighman.
5914. You understood that? Yes.
5915. Do you know if he went to see the manager to see if he would engage him as one of the employees, in order that he could take up his old position? He did, at my request. I requested him to do so, knowing that the Act said he must be an employee of the colliery before he could resume his work.
5916. You advised him to do that? Yes, I advised him to do it.
5917. Do you know that the manager refused to do that? Yes; the manager refused to give him employment.
5918. In that way was he prevented from taking up his position? Yes; I believe Mr. Evans waited upon the management himself with regard to it.
5919. Do you know that he did? I know he did, and they refused to employ him.
5920. Had the men to make another appointment from one of their number? Yes.
5921. Do you consider that the workmen at a colliery should have the right to select their check-weighman from wherever they choose—either from amongst themselves, or from outside the colliery if they think fit? I think they should be left to their own choice, seeing that they have to pay the check-weighman for looking after their interests.
5922. Do you consider that the standard weight should be abolished? Personally, I do.
5923. Do you know if this is the feeling of the men at the colliery? I could not say that at the present time. There was an agitation with regard to that some years ago.
5924. Was it the wish of the men that the standard weight should be discontinued? At that particular time it was.
5925. Have you any idea of the number of skips that are weighed at Lambton in a day? I could not say exactly, but I asked the check-weighman some time back, and I think he told me then from 90 to 100 a day.
5926. Do you think it is that many? I could not say. That is what he told me on that particular occasion—from 90 to 100. I could not say exactly. It is a matter I never interfere with.
5927. Have you heard the men express a wish that every skip should be weighed? Some men have expressed the wish. It is done I believe in the county of Durham, and those men that have been used to that principle of weighing wish the same principle adopted out here.
5928. Do you think it is the most accurate way of ascertaining a man's weight? Yes; I think it is.
5929. Do you think a miner should be paid for all he produces? Yes; I think he should be paid for all he fills.
5930. What hours do you work at the Lambton Colliery? Eight hours.
5931. That is, the men work eight hours? The miners.
5932. The colliery, I presume, works ten hours inclusive of the time for meals? It starts at 7 o'clock and knocks off at 4 o'clock, with one hour for meals. There are two breaks.
5933. The drawing hours are really eight, exclusive of the time for meals? Yes; that is all.
5934. That is for drawing coal? Yes; there is half an hour at breakfast and half an hour at dinner.
5935. Have you known of any attempt to extend the hours? No; I have not.
5936. Are they uniformly kept up to that standard? Yes.
5937. Do you think that the eight hours should be embodied in legislation? I think it should be.
5938. Have the men any guarantee that the eight hours will be continued at any time? No; they have no more guarantee against the eight hours being increased than they have against a reduction in the wages.
5939. Would that be one of the reasons why you wish the eight hours to be legislated for? Yes.
5940. Do you think it is long enough for a man to be working in a mine? I think it is too long if anything.
5941. Do you think it is the general wish of the men that the eight hours should be legislated for? In the Northern District it is.
5942. Have you a full opportunity of hearing the men express their opinions pretty freely? Yes; I have been Chairman of the Lambton Lodge for four years, and I have been invited to other collieries at meetings where there has been an expression given of that opinion. I am satisfied from what I have heard that it is the general opinion of the miners that there should be an enactment.
5943. In matters of danger in connection with the mine, do you believe that the Inspector for Collieries should have the power to withdraw the men? Yes; I do.

- Mr. D. Mason. 5944. You would not leave that power in the hands of the manager? No; simply for the reason that the manager is always very anxious to get as much coal out as he possibly can.
- 2 Oct., 1895. 5945. Do you think that his anxiety to get the coal out might make him hazard whether the men should be brought out or not? I think that, although I could not say so as far as Lambton is concerned. Whenever there has been any danger apprehended there the men have been called out at once, although the places have not come down for weeks after. Still I think it should be left in the hands of the Inspector to call out any men when he thinks the mine is not fit to work in.
5946. Although you hold the opinion that you think the manager would withdraw the men? Yes, I do. Some managers would, I could not say for all.
5947. You think some managers would? Some managers would; I could not say for all. I would not leave it an open question.
5948. Whether they would or would not would you leave that power in the hands of the Inspector? Yes; I would.
5949. In the event of apparent danger, and the manager objecting to the men coming out or being withdrawn, would you wish that a manager, at the request of the men, should send for the Inspector at once in order that there might be a consultation on the matter? Yes; where there was an opinion of that description expressed, I would.
5950. You know the men cannot very well, of their own accord, leave the mine? No; they are not allowed to do that without instructions from the management.

[Witness withdrew.]

James Rowan, Esq., Inspector of Collieries, sworn and examined:—

- J. Rowan, Esq. 5951. *President.*] You are an inspector under the Coal-fields Act? Under the present Coal Mines Regulation Act.
- 2 Oct., 1895. 5952. For what district? The Southern and the Western Districts.
5953. *Mr. Curley.*] How long have you held the position of Inspector of Collieries? Twelve years.
5954. *President.*] Before you held the position of inspector did you understand the management of coal mines? Yes. I have been in the mines since I was 9 years of age. I have passed through all the different branches of coal-mining, stone-mining, and sinking, and was manager of a colliery in Scotland for ten years. I passed a government examination at home, and received my certificate of competency under the English Coal Mines Regulation Act of 1872.
5955. *Mr. Curley.*] What positions have you held out in this colony? I sunk a shaft for Mr. Fletcher, in Wallsend, at Plattsburg—the Co-operative Company, and then I was deputy under young Mr. Fletcher in the Co-operative Colliery.
5956. I suppose you are pretty well acquainted with the various systems of mining, such as longwall, pillar, and stall? Yes, pretty fairly; I passed through them all.
5957. In carrying out your duties as inspector, if you see anything irregular in connection with any of those mines you inspect, do you draw the manager's attention to it at once? In connection with inspections I make under the present Act, if there is any breach in connection with the Coal Mines Act, or the special rules of the colliery, of course the manager is dealt with, but in practice if there is any danger which is not expressed in the Coal Mines Regulation Act or the special rules, we deal with it under the 25th section.
5958. That is with regard to the withdrawal of the men? That is in connection with any practice that is dangerous in the opinion of the Inspector he draws the manager's attention to it, shows him where the danger exists, and requests him to remedy the matter forthwith. The manager then has the power to appeal against the Inspector's judgment to the Minister for Mines, and then the case has to go to arbitration.
5959. Have you met with any defects in connection with those mines in your district at different times? Yes, they are cropping up occasionally.
5960. What is the nature of these defects that you have come across occasionally? Defects that are not expressed in the Act. I might cite one of which I think has been referred to. Sometime ago I received a letter from the Minister for Mines, Mr. Abigail, that they had received notice that a serious land-slip had taken place at Coal Cliff Colliery, and instructed me to leave at once, inspect, and report upon it. There was a great commotion amongst the people about the place, and the severance had been made for three quarters of a mile in a semi-circle. It had upset one of the railway bridges, and twisted the side of the Police-station. After I went below I made a careful examination. I was satisfied that it was no subsidence underground, that had caused, or was making the land slip. So far as I could judge I calculate there were 200 feet of cover seemingly on one great move. I went to the manager and said: "Mr. Williams, this is serious, this is a dangerous affair. I think it would be better if you were to stop the men from working till the cause and effect of this landslip be further ascertained." He did so; the men were idle for three days. It had been an alluvial bed about 200 ft. deep, and it seemed to be on a hydraulic move, and I was afraid the whole thing would slip over and engulf the men who were under it, because they were on the edge of the water. This severance on the surface seemed to subside in some way or other. The miners themselves had been doing some testing by boring, and they were satisfied there was no danger. Eighty signed to the effect that they were willing to work. That is one of the positions that inspectors are placed in. It all ended well; but suppose it had been the other way, which it might have been, it would have been said "The inspector was called, went down the pit and examined it; the matter was allowed to go on, and eighty men were engulfed." In that case the men and the press would have been for lynching me, and I would have stood a public disgrace to the department to which I have the honor to belong.
5961. *President.*] Did the manager do what you asked him at once? He did.
5962. And everything was obviated? There was evidence given that I had stopped the colliery, and the company was going to sue the Government for £20,000 damages.
5963. *Mr. Curley.*] What evidence do you refer to? The evidence given at the time that an inspector had stopped the Coal Cliff Colliery.
5964. When was this evidence given? I think the evidence was taken before this new Coal Mines Bill.
5965. Do you refer to some Select Committee? Yes.

J. Rowan,  
Esq.  
2 Oct., 1895.

5966. Do you know who tendered that evidence? I could not say on the spot from memory.

5967. *President.*] Do you know who asked you the questions? It was not me. It only came out in the evidence.

5968. It came out by somebody else? Yes; I mentioned this because Mr. Curley asked me if I found any difficulty in connection with matters in mine inspection.

5969. *Mr. Gregson.*] Assuming that, where is the difficulty? There is a difficulty, if an inspector sees anything dangerous, in calling out the men on his own authority. I think, so far as he is concerned, that the present 25th section stands pretty well—that if he sees danger he is to write to the manager of the colliery, and state wherein the danger exists, and request him to remedy the matter forthwith, and the manager has the power to appeal against the inspector's judgment.

5970. *President.*] Do you say you want more power given? No; no more power, but it places an inspector in an awkward position to have power to do certain things on his own opinion, because he might be wrong, and yet things might be very dangerous.

5971. You mean to say you would rather he should not have any more power than he has? No more power than he has.

5972. Then you do not agree with any clause which says that the inspector shall have power in cases of danger to withdraw the men? No; I think it is too much power to place in the hands of any inspector.

5973. You know the clause I refer to? I do; and I only cited a case where it was very difficult to know how to act. Although I might not wish or believe that the inspector should have absolute power, nevertheless in the case I cited at Coal Cliff I was brought to a standstill, and had to act almost on my own responsibility.

5974. Do you think that if there is a case of imminent danger, the inspector should have power himself to withdraw the men? The danger must be immediate. I do not see any difficulty, because I never saw a case where the manager would object.

5975. In any case where you think an inspector would call the men out, you believe a remonstrance with the manager would be quite sufficient? I think so.

5976. Or rather that a representation to the manager would be quite sufficient? Yes; and serving him with a notice besides, stating wherein the danger exists. I think Mr. Croudace had something to do with that matter I referred to.

5977. *Mr. Gregson.*] You are quite content with the powers given under the 25th section of the present Act? Yes.

5978. And do not want them enlarged? No.

5979. *Mr. Curley.*] Is the very case that you have cited not an argument why you should have that power; you virtually took that power on on that occasion, or at least you moved the manager? I moved the manager in connection with it.

5980. Is not that very case you have cited an argument that the inspector should have this power? Yes; but the argument brought against the inspector is that that very thing is standing even now, and I was ridiculed on account of its not taking place. It was said that the colliery had been stopped for three days owing to want of knowledge on the part of the inspector.

5981. *President.*] Nobody blames you, surely? They were going to blame the Government to the extent of £20,000, and if it was not for John Robertson they would have done it too.

5982. The late Sir John Robertson? Yes; he was a sort of partner in the Coal Cliff Colliery.

5983. *Mr. Curley.*] Have you noticed the legal opinion which was taken by the Department some time ago, that an inspector was not to apprehend danger, or anything of that kind (*see Appendix Z*)? No; I could not say that I saw anything directly like that. I do not think there would be a great deal of difficulty with an intelligent management in drawing their attention to danger. They know as well as you if there is any difficulty or immediate danger.

5984. *President.*] Supposing there was a difference of opinion, and the inspector thought the men ought to be withdrawn, and the manager differed from him, either from self-interest—that is to say the employers' interest—or any other motive, do you think in that case that the inspector or the manager should have power to withdraw the men? If it came to a question of that kind I think the inspector should have a good say in it; but under the 25th section of the present Act, the Inspector serves the manager with a notice, and he can then appeal against the inspector's judgment. It is then out of the hands of the manager and the inspector, and in the hands of an arbitrator.

5985. Suppose I am the manager, and you say to me "I think that looks very bad. You had better withdraw the men," and you serve me with a notice, and the matter goes to arbitration—that takes some ten days? Yes, several days.

5986. Supposing the mine comes down in the meantime: what becomes of the men? That places it in a different light, but the manager is supposed to be a trained manager who has passed through examinations and knows the whole strata, and the working of the mine. With his intelligence he should know all about it as well as you know. It is just like two lawyers in one case.

5987. *Mr. Gregson.*] There would scarcely be a difference of opinion? There would not be much.

5988. *President.*] Do you mean to say that the cases in which a manager would refuse to comply with the request of the inspector, where there was imminent danger, would be very rare—that they would both probably agree at once? Yes, I am almost certain of that.

5989. So that you think practically there would be no use in any provision saying that the inspector should have power in cases of imminent danger to withdraw the men? I do not think so, or else it would be a very outrageous case.

5990. *Mr. Curley.*] Do you know of any such case as that in existence at the present time in connection with collieries? I know by repute of Stockton; that is all I know of.

5991. Do you know that the inspectors have not certified that that colliery is safe yet? I know it just by hearsay a little. I cannot say I know it. I do not go up to that district. It is out of my district altogether.

5992. *President.*] Who are the gentlemen in charge of that district? John Dixon, Mr. Humble, and Mr. Bates.

5993. *Mr. Curley.*] Do you know Inspector Dixon and Inspector Humble? Yes; they are both very good men.

5994. If you had known that they had both declined to certify that a mine was safe, when men had been

J. Rowan,  
Esq.

2 Oct., 1895.

withdrawn from it, and that they had requested the men not to re-enter until such time as they certified that it was safe, do you think their word should be respected? I do not know the full facts of the case. Did they request the manager to withdraw the men?

5995. No. The manager withdrew the men. They inspected the colliery, and they certified that the men should not enter the mine again until they certified it was safe? I think that the inspectors' opinions should have gone very far, although a certain time has elapsed and nothing has taken place, nevertheless it is fortunate it has not.

5996. Could not either one party or the other have gone to arbitration under the Act in such a case? I would have thought so. I would have thought that if the Government had served them with notice under the 25th section that the matter would then have been settled by a court of arbitration.

5997. Seeing that you have a circumstance of the character I have alluded to in existence, would that not impress you with the idea that the inspector should have some definite power and authority? As the President said, if it was a case of real imminent danger—almost a tumbling-down case—and you requested him to do so, and he did not do it, then I believe the inspector should have power to act, but that scarcely ever happens.

5998. That is in any case of apparent danger? Yes. Suppose you went into a pit and they had been taking out pillars, and you knew there was a great deal of ground exhausted, and the main drawing-way was very slightly supported with exhausted pillars, and you heard a creep—the floor packing, that is heaving, and the roof crushing, and the pillars crumbling, why you would say, "I am far enough; how many men are working in here?" "Twenty." "Why, are you not afraid that the whole thing will collapse? You know there is very little support on the side." "Oh, it's all right; she will fall through and settle down right enough." But I say, "It might be that the whole thing will close, and close us all in." In this case I say he should take out the men. If he would not take out the men, then I say the inspector should have power to say in the case of danger which is ahead, "I will do it on my own responsibility;" but prospective danger is a question of opinion.

5999. *President.*] You do not agree with the section as it stands here? No, not exactly. I believe in an immediate danger. If you see any danger coming meet it and meet it straight away; but I do not believe in anything prospective or unlikely.

6000. That is to say, a danger plainly some distance off? Some distance off that you thought of.

6001. Then you think there is quite enough provision by telling the manager what you want him to do and letting him go to arbitration? Yes. He must appeal against your judgment within seven days. Then it is out of the hands of both the manager and the inspector; but, in a case of immediate danger that requires to be dealt with, I think the inspector should have power to withdraw the men if the manager would not do it.

6002. *Mr. Gregson.*] In that illustration you gave us just now do you not think the manager would be just as ready as you would be to have the men out? That is what I said. I only said in an extreme case, A trained manager who had passed through the ordeal and knew the strata of the pit he had been working in should be in a better position to judge than the inspector, except it was a case of immediate danger.

6003. *Mr. Ourley.*] Do you know that inspectors of collieries, even before the 1872 Act was passed in England, stopped portions of mines or a portion of a mine where they thought it was somewhat dangerous for men to work—that they took that responsibility;—have you seen a circumstance of that kind in Hopton's book? No, I cannot say that I have.

6004. Look at the case he cites here on page 335 of his book "Conversation on Mines"—"The ventilation of the colliery was very bad. Only 19,000 feet of air per minute passed through the workings, and the mine gave off much explosive gas. The lamps in several parts were unsafe to work with, and the inspector found it necessary to stop some part of the mine. Gas came out of the workings now and then, and filled the safety lamps hundreds of yards along the main pony roads." Do you see there that Hopton speaks about the inspector stopping the mine or any portion of it? Yes.

6005. Do you not think that the inspector has taken some power in his hands when he talks about him stopping the mine where he thought it was dangerous for men to work? He seems to have done it on that occasion. The great difficulty I see is that the manager would be in a position to have a thorough knowledge of the danger as well as the inspector would have, and then I do not think he would run the risk of life and property if he really thought there was danger. I do not see where there would be any interest or advantage to him to allow life or property to be endangered.

6006. A manager might not have the idea of sacrificing anything in his mind at all, but still he might err in his judgment? Quite likely.

6007. And if there was a conflict of opinion, and the men had appealed to him about this matter being dangerous, and he had declined to withdraw the men, do you think it would be better if they had the power to request him to send for the inspector at once? Yes—present danger, as I have already said. I do not think I can say anything more to make it any plainer. If you are in the midst of a danger, and the manager will not do it, I think the inspector ought to have power according to law to do it on his own responsibility.

6008. *Mr. Gregson.*] You think the men would not require him to do it in that case—it would not want much calling attention to? No; that is only taking an extreme case.

6009. *Mr. Ourley.*] This sub-section 5 (clause 21) (*see Appendix A*) refers definitely to inflammable gas. You will admit, I dare say, that that is not a matter to be trifled with, or looked upon in an inconsiderate way? No, it is not. I had only one case in connection with inflammable gas, but of course the manager reported to me straight away, and I came down and found that the men had destroyed a certain amount of brattice, and 13,500 cubic feet of gas had accumulated in eight hours. Of course, the manager suspended the men straight away.

6010. Where was that? In the Metropolitan Colliery.

6011. *President.*] You think a good manager would know as much about the danger as an inspector? That is what I say. A man who has graduated and passed through the whole thing, and knows the strata of the whole colliery, because he is there daily, would know as much about it as the inspector.

6012. Would he withdraw the men in the case I put? Yes.

6013. You think the section as amended in the way I have suggested is unnecessary? You put it in connection with being in the midst of the danger, the inspector thoroughly believing that the danger was there,

J. Rowan,  
Esq.  
2 Oct., 1895.

there, and that it was not something prospective, or something likely to come about; but I would say, suppose he was standing in the danger, and that he requested the manager to do it, and he would not, then the inspector ought to have power to deal with it.

6014. Could such a case exist? It is supposing a very extreme thing, because the managers are there and have the interests of the men and the property in their charge. I do not see why the manager should sacrifice or destroy the property for any cause.

6015. *Mr. Gregson.*] To say nothing of loss of life? No.

6016. *Mr. Curley.*] Do you think the men's lives should be the first consideration? Yes; life before property.

6017. Then you can imagine that a condition of things may exist where it would be necessary for the inspector to have the power to withdraw the men? Yes; it may so happen, but it is very unlikely. I think if he serves the manager with notice in the presence of the danger, and the manager will not act, then the inspector ought to have the power to do so.

6018. Do you, in going your rounds in connection with these mines, draw the manager's attention to matters that strike you at any time as requiring attention;—do you draw their attention verbally to these matters, or give them a distinct communication in writing upon the subject? In connection with any danger?

6019. In circumstances of any importance? If it is of any importance I might go round the mine and say, "There is no breach in connection with the Act, or the special rules; everything seems to be going right enough, but there is a certain thing you have to watch a little bit. I may be wrong, but nevertheless you just think it over." I might go that length without dealing with him in writing. In nearly every case I have had he has said, "I have not thought it over, but I will think it over, and do it. Prevention before cure." In common cases he has done the thing without any notice at all; things that are not of great danger—some little thing which requires a little thought.

6020. *President.*] Have you generally found the managers compliant with your desire? Yes.

6021. Have you found any exceptions? There was one case. I was only a witness in that case. That was in Newcastle-Wallsend, where Inspector Dixon requested a manager to do a certain thing which he did not comply with.

6022. *Mr. Curley.*] Did you inspect the colliery? Yes; I went round. Mr. Dixon could give you all the particulars. The facts were that there were seven blowers giving off fire-damp, which the inspector considered dangerous, and he served the manager with notice under the 25th section to remedy the matter. Of course the manager did not comply with the inspector's notice, for which he was brought to court, and fined £1.

6023. It was a breach of the Act? Yes.

6024. I think you have had some experience in the southern district in a mine that was giving off gas at Bulli? Yes.

6025. Did you see that gas given off yourself? Yes. I could not say that I could see it. There was one occasion I think when a man was working in a narrow cutting, that I thought I could detect a blue cap on the light by holding it away in a crevice. The first indication is a tapering blue light, in a safety lamp, caused by the gas.

6026. Did you consider the question of bratticing at that time in connection with any of these places? No; I did not think that there was really any need of bratticing. There was a good current of ventilation, and I did not see any need for it in going through casually. Of course we all see things differently now.

6027. Do you know that the Act provides that where a place is giving off gas it is to be bratticed up to within three yards of the face? Yes.

6028. Do you not think that it is one of the inspector's duties to notice this? Yes.

6029. That is that an inspector ought to fully realise that gas is a very serious business? Yes.

6030. You say you did not give much attention to the brattice at that time? No; I did not say that I did not give any attention to it.

6031. You said that you did not see that it was necessary? Yes.

6032. Do you know that is one of the points raised by the Commission that inquired into the business—that they referred to the question of bratticing? No. I know it says "Where gas is given off." But it is a question where gas is given off. I say I never saw anything to lead me to believe gas was given off, except in the case I told you, in the crevice—in a recess.

6033. Here is one of your reports dated the 2nd September, 1886, in which you make the following statement—referring to the Hill End district:—"The miners in this division are working with safety-lamps as the coal gives off a small portion of fire-damp. Strict discipline is exercised by the management to ensure safety, &c." That was in the Hill End district after they passed through the cinder-coal.

6034. Then you make another statement in connection with another report made later on in the same year. It is dated December 22nd. Referring to the Hill End district again you say:—"This is the division of workings that used to generate fire-damp, and where the men when working had locked safety-lamps." In these reports I notice that you make reference to the bad state of the return air-way as well? Yes.

6035. Did you refer the matter verbally to the manager in connection with that;—were your instructions of a verbal character? A verbal character.

6036. You never gave him any written communication? No.

6037. Do you not think a definite written communication on these matters would be better? Yes; it might be better.

6038. And that there would be more attention paid to it? Yes.

6039. Have you adopted a course of that character since the Bulli disaster? Yes; if occasion required it, I would. I do not know actually that I have had occasion to do so since then.

6040. You even come on into the 2nd March in the year 1887—only a brief time before this calamity—and you make this statement in your report, referring to the Hill End district: "Fifty men employed; four of them working in narrow headings with safety-lamps, owing to the coal giving off a small percentage of fire-damp."—That was on the 2nd March. When did this disaster take place? I cannot recollect.

6041. Was it the 17th or the 18th? It might be; I could not say.

J. Rowan,  
Esq.  
2 Oct., 1895.

6042. It was in the same month—you see, therefore, what a serious matter can come out of a small incident within a few days. Has that impressed you with the idea of paying more attention to this limited quantity of gas that may be given off at any mine? There are connections and conditions in that which require a great deal of explanation. I positively believe that the Bulli explosion was caused by a very little gas.

6043. Whether it was caused by little gas or much gas, I daresay you will admit that it was a fearful calamity? Oh, yes.

6044. And that the results were most calamitous? Yes.

6045. And if there was a small amount of gas—as you now express the opinion that there was—is that not all the more reason for serious attention being given to the question of gas, even in small quantities? Yes; undivided attention should be given to it, I believe.

6046. Would that impress you with the idea of paying attention to the question of brattice where gas is given off? Yes; where gas is given off.

6047. Would it also impress you with the idea of having the returns in an efficient condition, so that there could be a clear scope for the ventilation? Yes. There should be a defined recognised return-way for the ventilation. Notwithstanding there might be sufficient space for the return to pass, there should be a proper way.

6048. You think that the return should always be efficient? Yes.

6049. Free from obstructions? Yes.

6050. You appear to have drawn particular attention to the state of that return on more than one occasion? Yes; I know that I drew attention to it. The men were out at the time, and they could not get men to come to do it. They tried to get volunteers to come down, but there had been some trade dispute on, and the men would not come. The manager said that as soon as ever the colliery started it would be his first duty to get the thing attended to. Some had fallen in at the time the dispute was on, and he said, "I tried to get men, and cannot, but as soon as I can get them to come I will make it the first point."

6051. Do you not think in matters of that description that a definite communication, or some instructions from you should come under the manager's notice? I admit that.

6052. Do you at the present time intimate verbally to the managers, or do you write to them when you see anything amiss? If there is anything amiss I write to them, except as I said before, when it is any light thing that might come about, where no danger was likely to occur of any consequence. In that case I might draw their attention to it only, and advise them, but if anything has to be dealt with I serve notice under the 25th section.

6053. Have you had occasion to intimate to any of the managers recently the withdrawal of any men? No. We have had them in court for breaches of special rules, and for dealing lightly with matches in their possession.

6054. Where has this been? At the Metropolitan Colliery. We had six cases all at once there.

6055. Is that long ago? Some eight or nine months ago. We had two cases about three weeks ago. One was a miner from Newcastle. The manager and deputies take periodical days to inspect, and on going round to examine their clothes a match was found inside the lining of one man's vest pocket. He said he did not know he had got it there at all. He was very poor. He travelled from Sydney up there and carried his swag. Another man had an old match in the lining of his pocket. Both of these men were brought to court. It might have been in his pocket for months. The manager did not believe it was with any wilful intent. Nevertheless for the sake of strict discipline it had to be dealt with.

6056. *President.*] What became of them? They got a good character from the manager, and being very poor, and all the circumstances of the case being taken into consideration, they were fined 10s. with all expenses, and were told that if ever they came before the Court again they would be dealt with to the utmost rigour of the law. They got a great caution as to what might have happened.

6057. *Mr. Curley.*] Have you been in the Western District lately? I was up there lately, and was called away to come here.

6058. Did you visit the Vale of Clydd Mine while you were up there? A portion of it. I have to go back and finish up the Western District, and have to go on to Capertee after that.

6059. Did you notice anything amiss when you went round there? No. There is a division I was not up to yet. I have to go back. The portion I was in seemed all right enough.

6060. Did you visit the Oakey Park Mine? I visited portion of that too.

6061. Do you know that the ventilation there is simply a natural ventilation? Yes; there is a waterfall going down one side. It seems to be always pretty well up to the mark so far as I could see.

6062. Do you think natural ventilation is to be depended on? Not altogether, but fire damp has never been seen or known to exist in the Lithgow District. It is a moist and very clear atmosphere all through; there is no dust at all in it; everything is moist and wet; you can see a light 100 yards away quite clearly.

6063. Do you account for that by the altitude of the land there? I do not know about the altitude. The nature of the coal has something to do with it. You see the water dropping away from the coal in the solid.

6064. Have you ever suggested to the manager the idea of the erection of a furnace? No; I found the conditions of the Act were complied with. It was a water power to create a current. As everything was going right, I did not see that it was necessary that I should do so.

6065. How far are the workings in underground at the furthest point? I could not say;  $\frac{1}{2}$  mile perhaps.

6066. Do you think they are a mile? They might be; I could not say.

6067. Are there any of these workings going to the rise? They are dipping partly. There is a sort of swallows all through it.

6068. Are there no rise workings in the mine at Oakey Park? Yes; there are a few places to the rise.

6069. Do they rise much? Not very much.

6070. What would it be? They may be one in twelve or something like that. I could not say the grade exactly.

6071. Do you know the number of men in the mine? About twenty altogether.

6072. At present? Yes; only about ten I think work during the day. The next day perhaps the ten who have been working to-day are out of the mine, and the other ten work.

6073. Have you ever received any communication complaining of the defective ventilation in that colliery? I got a notice only to-day to make an inspection there.

6074. From whom? From the Department.

6075. *Mr. Gregson.*] Do you ever get complaints made to you, or requests to examine mines without their coming through the Department? Yes; at times I do.

6076. Do you act on them? Yes.

6077. *President.*] If you got an anonymous communication asking you to go to a certain mine, would you go? Yes; I would go.

6078. *Mr. Curley.*] You would pay attention to an anonymous communication? Yes, because men say they do not like to put their names to complaints.

6079. You said that the requirements of the Act were complied with—how do you define the requirements of the Act being complied with with regard to ventilation? I read it that every mine to which this Act applies shall provide 100 cubic feet of air for the men.

6080. *President.*] Suppose a man is supplied with a 100 cubic feet of air, is he supplied with enough? That is according to the Act.

6081. You are leaving out altogether the words "Not less as a minimum"? It is a minimum I am referring to.

6082. Supposing that in any mine—not a gaseous or fiery mine—there is great want of air, and the men are complaining in regard to it, do you say that if you find there is 100 feet of air passing along the air-way you pay no heed to that complaint? That is the Act being complied with.

6083. You have got to see that it is adequate—"An adequate amount of ventilation shall mean not less (as a minimum) than 100 cubic feet of pure air per minute"—but there has always to be an adequate amount of air? I would not say it was enough. In the western mines, where it is moist and wet, 100 cubic feet is enough. I would think if that was got it would comply with the Act.

6084. Because you would think it enough? Yes, in connection with the condition of the workings; but if I found there were only 100 cubic feet in the Metropolitan Colliery, that would not be an adequate amount to meet the requirements of that mine.

6085. Do not take such a prominent instance as the Metropolitan Mine, because the Metropolitan Mine beyond all doubt is a very gaseous mine, in which I suppose you have to supply 700 or 800 cubic feet, but take the case of a mine that is not a gaseous mine, but a mine in which the workings are starved for want of air; do you say you consider your functions or duties would be satisfactorily fulfilled if you were to go out into the air-way and find 100 cubic feet passing along? I thought that would meet the requirements of the Act.

6086. "An adequate amount of ventilation shall mean 100 feet of pure air." That is the way you read it? Yes.

6087. You leave out altogether the words "not less than as a minimum." You have got to be satisfied, if it is necessary that 500 cubic feet of air should pass along the air-ways, that it is there. What do working places mean? Where the men are actually working in.

6088. Are "working place" and "working face" synonymous terms? Yes. Commonly in longwall they call them working places, and in pillar and stall they call them working faces.

6089. *Mr. Gregson.*] Is not the face the wall of coal in front of you? Yes.

6090. What you are picking at? Yes. It is generally understood the working face is close up to where the men are working the solid coal.

6091. *President.*] Supposing this room were a bord, the wall would be the face? The working face is the face of the coal where the men are working, that is an 8-yard face or a 4 or 5 yard face of coal which the men may be working at.

6092. If they are not synonymous of course my argument is not so strong; but even granting that, do you not see that the second subsection of clause 12 of the Coal Mines Regulation Act, 1876, says (*see Appendix B*). That means working places of the shafts, levels, &c.? Yes.

6093. *Mr. Gregson.*] You have stated that when there are 100 feet of air the Act has been complied with? Yes. You mean to say that the interpretation of this is, that though there may be 100 cubic feet of air, the inspector might think that he could go over that, and that that would not be an adequate amount?

6094. That he is to have as much more as he thinks is adequate. Your construction leaves out altogether the words "Not less as a minimum than." Supposing you struck out of this section altogether the words "Not less as a minimum than" your construction would be right, because it would mean an adequate amount of ventilation would be 100 feet; but if you leave in "Not less as a minimum than" you might want 1,000 feet? Yes.

6095. *Mr. Curley.*] Have any of the collieries in the Western district attempted to work on Sunday? Yes. I heard through a newspaper report that they did.

6096. Do you know personally? I believe it has been done; but I could not understand for the life of me what they were doing it for. They were brought to court in connection with it.

6097. Who brought them to Court? I do not know who brought them to Court. They were brought before the magistrate any way.

6098. Do you know anything about this personally? No, nothing at all. I was in the Southern district when I heard the case was brought before the Lithgow Court, and that they were fined for working.

[Witness withdrew.]

J. Rowan,  
Esq.  
2 Oct., 1895.

TUESDAY, 8 OCTOBER, 1895.

[The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.]

Present:—

FRANCIS EDWARD ROGERS, Esq., Q.C. (PRESIDENT).

JAMES CURLEY, Esq.

JESSE GREGSON, Esq.

Thomas Owen sworn and examined:—

Mr. T. Owen. 6099. What are you, Mr. Owen? I am a check weighman.

8 Oct., 1895. 6100. At what colliery do you act as check-weighman? At the South Waratah Colliery.

6101. Is not that colliery generally known as the Waratah Colliery? Yes; but it is being worked now by the Caledonian Company.

6102. How long have you been working at this colliery? Eight years.

6103. Have you worked in the mine? I worked for two weeks in the mine.

6104. Have you been check-weighman during the rest of your time? Yes.

6105. What is the system of weighing there? They pay by the average weight.

6106. Have you what is known as the standard weight? No.

6107. What is about the average weight of your skips? They vary considerably from 9 cwt. to 17 cwt. That is the weight the men fill.

6108. Does the weight vary owing to the way the miners fill, or is it owing to the nature of the coal? It is owing to the way they fill, and also to the nature of the coal; some of the men are indifferent as to how they fill, and others take a delight in filling a large skip.

6109. How many skips do you weigh in a day? Some days they weigh seven, some days twenty, and other days none at all.

6110. Do you ever weigh more than twenty skips in a day? Twenty-five skips is the highest number weighed during the last twelve months.

6111. Is that in one day? Yes, in one day.

6112. How many miners are employed at the colliery? 148 miners.

6113. Are there a large number of skips coming out of the mine in a day? The average number of skips for the last four weeks has been 462 daily. That is the average output of skips for large coal each day.

6114. *President.*] Did that average number of skips come out of the mine when they were weighing only seven skips daily? Yes, that is the average number of skips for the last twelve weeks.6115. *Mr. Curley.*] Do you consider that that is anything like a fair number of skips to weigh each day out of the number of skips that come out of the mine? No, I do not.

6116. Have the men ever complained about getting more skips weighed? Yes, repeatedly.

6117. What replies have they received to their representations? The manager has always promised to weigh more, but that promise has never been fulfilled.

6118. Is there anything to prevent more skips being weighed? No.

6119. Were there any more skips weighed at any other time? Yes; when the old company had the colliery they weighed thirty or forty skips every day.

6120. Did the old company weigh every day? Yes, every day.

6121. Did this colliery change hands some time ago? Yes; twelve months ago last August, as near as I can say. It might be a little later.

6122. Do you know if the men wish every skip to be weighed? Yes.

6123. Is it the opinion of the men that every skip should be weighed? Yes.

6124. Would they be satisfied with an average if a fair number of skips were weighed? Provided they could not get the whole of the skips weighed, they would like to have more skips weighed.

6125. *President.*] Would they be satisfied if a fair percentage of the skips were weighed? Yes.

6126. What would you call a fair percentage of the number of skips to be weighed? One in five.

6127. *Mr. Curley.*] How many screens have you? Only one screen, exclusive of the weighbridge screen.

6128. Is it a travelling screen? Yes.

6129. Is the most of the coal tipped over that travelling screen? Yes.

6130. Is there any impediment to weighing more coal at the weighbridge? No impediment whatever.

6131. How do you arrange for the weighing of the skips. Do you call a skip in turn, or what method is adopted? We agree in the morning to take the first skip in the cage, and continue all day while weighing taking the first skip in the cage.

6132. Do two skips come up in the cage? Yes.

6133. Do you take the second skip in the cage on some days? Yes.

6134. Have you any control in sending the skips to the weighbridge? None whatever.

6135. Who controls that? We agree in the morning which skip we will take, and as soon as the company's weighman is ready, he calls the skip.

6136. Has the company's weighman any other duties? Yes, several. He is the clerk of the colliery as well.

6137. Does he leave the weighbridge to do clerical duties? Yes.

6138. *President.*] Have the men no control over the number of skips to be weighed? No control whatever. The company's weighman starts to weigh when he thinks proper at any time of the day.6139. *Mr. Curley.*] Who is the manager of that colliery? Mr. Duncan M'Geachie.

6140. Have you ever had any conversation with Mr. M'Geachie about the weighing of the skips? Yes; I have spoken to him several times about it.

6141. Does he not appear to see the reasonableness of what you put before him? Yes; he always admits it.

6142. Is it a matter of general complaint among the men that there are not more skips weighed? Yes; there are complaints made every day.

6143. Do you know anything about the men being in the mine for a considerable time on one occasion? Yes, on the 20th April, 1893, when the shaft fell in.

6144. Was that the main downcast shaft? Yes.

6145. The hauling shaft? Yes.

6146.

6146. Do you know anything about the circumstances in connection with this matter? I was there when the fall occurred.
6147. Where did the fall occur? Near the surface.
6148. *President.*] How did it fall in? The sides gave in.
6149. *Mr. Curley.*] Did it make a crash? Yes.
6150. Was that what attracted your attention? Yes.
6151. Do you know anything about a steampipe going down the shaft? Yes; the manager's theory was that the steampipe had burst and affected the shaft.
6152. Did this pipe give any report when it broke? It gave a little report, but not much.
6153. Do you know if the shaft was completely blocked up on that occasion? No, it was not completely blocked up.
6154. Was it completely blocked up at the bottom of the shaft? Yes; but not on that particular day. It was blocked up a few days afterwards.
6155. Was it in such a ragged condition that the men could not get out? They could not get near the shaft, so they could not come up.
6156. Was the mine brought to a standstill when that accident occurred? Yes, for fifteen weeks.
6157. Had the men to come out through the other shaft? Yes.
6158. What shaft was that? The upcast, known as the Flaggy Creek shaft.
6159. Is that shaft a considerable distance away from the other shaft? About a mile and a quarter away.
6160. Have you heard anything said by the men, or do you know anything about the pillars giving way, or about a creep? Yes; there was a creep near the upcast shaft.
6161. When did this creep occur? About three months previous to the main shaft falling in.
6162. How do you know this? I heard the men complain that they lost all their working places.
6163. What time did the men start to come to the upcast shaft that day? About 10 o'clock in the morning.
6164. Was that when the fall took place? Yes. The first cage of men came up the upcast shaft about a quarter to 3 o'clock in the afternoon.
6165. Had the furnace to be cooled down before the shaft could be used? Yes; steam had to be got up on the top, because there was no one stationed at the engine on the top.
6166. If any foul air had accumulated, would it not have been a serious matter for these men? Yes, a serious matter.
6167. Has that upcast shaft been recently on fire? It was not the shaft; it was near the downcast shaft.
6168. What was the cause of that fire? There was a small Cameron pump near the main shaft, but the cause was never found out.
6169. Do you know anything about it? No; I know nothing about it.
6170. Have you worked in mines? Yes.
6171. What collieries have you worked in? At New Lambton, East Waratah, and at the Waratah colliery.
6172. Do you think that the shafts at a colliery should be a reasonable distance apart from each other? Yes.
6173. *President.*] What do you call a reasonable distance? I should think 50 yards, at the least.
6174. Can you understand why, in England, the Act only says 15 yards? I think that the shafts should not be closer than 50 yards.
6175. *Mr. Curley.*] Have you heard tell of the Ferndale disaster? Yes.
6176. Did you see the quantity of sand that was washed away from the surface there? Yes.
6177. Were you there? Yes.
6178. Was that before it got filled up with tidal waters? I saw it before it was filled up.
6179. Did you see several acres of sand that were washed into the mine? Yes.
6180. Knowing that we have collieries with a good deal of silt and delta in connection with them on the surface, don't you think that if anything was to happen to one of the shafts that it is possible it might affect the others? Yes.
6181. And that there might be no outlet for the men? Yes.
6182. Was this shaft bricked? No, it was not bricked.
6183. Did you look down the shaft? Yes.
6184. How was it supported? By slabs—timbers.
6185. Is there any other shaft about that colliery? Yes, there is another shaft within about 40 yards of the main shaft.
6186. Was that a shaft that was once identified with this colliery? Yes, a furnace-shaft.
6187. Was it an abandoned shaft? Yes.
6188. Has that shaft been abandoned since the time you were working as check-weighman? Yes.
6189. Do you know any reasons why it was abandoned? At the time Mr. Neilson was manager there he changed the air-course, and made the Flaggy Creek the furnace shaft. It had been a very small shaft.
6190. Which was the small shaft? The Flaggy Creek shaft.
6191. Do you know the size of that shaft? No.
6192. Do you know the diameter of the downcast shaft? I cannot give the diameter accurately.
6193. Was it abandoned because anything was the matter with it? It is in a very bad state at present.
6194. Is it in use at the present time? No, but the present manager is going to repair it.
6195. Is he going to utilize it again? Yes, as an outlet.
6196. Have you seen this shaft yourself? No, I have not.

[Witness withdrew]

Henry Hanlon sworn and examined:—

6197. *Mr. Curley.*] What is your occupation Mr. Hanlon? I am a miner.
6198. Where are you employed? At the Waratah Colliery; I think they call it the Caledonian Mine now.
6199. Have you worked at any other collieries? Yes.
6200. Where have you worked? At the Lambton Colliery.

Mr.  
H. Hanlon.  
8 Oct., 1895.

6201.

Mr.  
H. Hanlon.  
8 Oct., 1895.

6201. Have you worked at any other collieries? No.
6202. How long did you work at the Lambton Colliery? For twenty-seven years.
6203. Have you followed mining for a long period of time? Yes; I was in a pit before I was twelve years old.
6204. How long have you been at the Waratah Colliery? Three years.
6205. Do you know anything about the system of weighing at that colliery;—are you paid there by the average? The skips are averaged. If you get three or four skips weighed, you get the average of those skips.
6206. *Mr. Gregson.*] Are you paid on the average? Yes, we are paid on the average.
6207. *Mr. Curley.*] Do you get many skips weighed? Very few. Sometimes for nearly a week there is never a skip weighed.
6208. Is that in connection with some numbers only? No, with all numbers. I have seen them go for two or three or four days without weighing any skips at all.
6209. Does this occur occasionally? Yes, occasionally.
6210. Is this a matter of common complaint amongst the men? Yes; it is a matter of great complaint amongst the men.
6211. Could more skips be weighed? Yes.
6212. If the Company felt inclined to do so? Yes.
6213. Have you any control over the weighing? No control whatever. We have visited the manager many times, and have complained to him of not being weighed oftener.
6214. What does the manager say? He says that he will do all that he possibly can, but the same thing still goes on. Only this last week there has been very little coal weighed. I should say an average of about five skips a day.
6215. *Mr. Gregson.*] How do you know how many skips are weighed? The numbers are put up on the pit-top every night. If there are no numbers put up we know that there are no skips weighed. There is a slate put up at the top, and if it is not up we know there has been no weighing.
6216. Who puts that slate up? The check-weighman.
6217. Is it put up for your information? Yes, for our information.
6218. *Mr. Curley.*] Was there a time when there were more skips weighed? Yes; there was a time when there were more than twice as many skips weighed.
6219. Was that during the time you have been at this colliery? Yes.
6220. Who was the manager of the colliery at that time? Part of the time, Mr. Ramsay, and after him, Mr. Neilson.
6221. *Mr. Gregson.*] Had you a travelling belt then? Yes, in Mr. Neilson's time, but not in Mr. Ramsay's time.
6222. *Mr. Curley.*] Were you in the mine some time ago, when a fall occurred in connection with the shaft? Yes; it was on the 20th of April, on a Thursday, that the shaft came in.
6223. In what year was that? In 1893.
6224. How were you apprised of this occurrence having taken place in the shaft? The first information we received was about 20 minutes to 11 o'clock, when we were told to knock off work.
6225. Did you cease work? Yes.
6226. Were you advised to come to the furnace shaft? We were going out at the main shaft, and we were told to wait near the furnace shaft—to sit there until we got further orders.
6227. Were you told that there was a fall in the main shaft? Yes, we were told that there was a fall in the main shaft.
6228. Who told you that? The deputies and the onsetter. The onsetter came from the downcast shaft to the furnace shaft.
6229. Did he say that there was much of a fall? He said it was coming down all the time after he left. He did not say whether there was a great deal or not.
6230. Do you say that you were told to go out by the furnace shaft, and that you had to wait for some time near that shaft? Yes.
6231. While you were waiting there, did you look around at all? Yes, we were looking around; some men stopped there all the time, and others were walking about. We were ordered to stop between two doors, about 50 yards apart, and we were not supposed to go any nearer the furnace without orders from the overman or deputy, who was sitting the other side of the door.
6232. Did you go to the furnace shaft later on? About 3 o'clock, twelve men at a time were allowed to ascend through the furnace shaft.
6233. Was there a large opening to this return shaft—a big return air-way? No, it was not a very big air-way, on account of the timbers and chocks. About three or four months before that there was a large creep right around there.
6234. Did these chocks and this timber you saw give you the impression that there had been a creep? We knew there had been a creep, because we helped to pull the rails out. There was a creep three months before around the furnace shaft, and I was one that helped to pull the rails out while the creep was on?
6235. Did you know the creep was on? Yes.
6236. Would you regard this as a crush? It was the roof coming down on account of the thin pillars. That was the reason of the creep, I think.
6237. Were the pillars too thin? We know they were too thin.
6238. Did you see any of these pillars? Yes; several of them. In Mr. Ramsay's time I have seen men holing through into one another through the pillars being that thin.
6239. Was that the upcast shaft at the time that creep came on? Yes; the furnace shaft or the upcast shaft.
6240. Was this a very narrow passage that you had to go through to this furnace shaft? About 20 yards towards the furnace the passage we had to travel would be about 6 or 7 feet wide. When we went to the furnace shaft we had to take a roundabout turn about the furnace to get into the cage. It was about 6 or 7 feet where we got into the cage.
6241. Do you think it is a mistaken idea to leave small pillars round about shafts? Yes; I think it is not a very good idea to leave small pillars in any part of a mine.
6242. Do you think that substantial pillars should be left about a mine? Yes. 6243.

Mr.  
H. Hunlon.  
8 Oct., 1895.

6243. Is the larger pillar safer to work for the workmen? Yes; the system the present Company is working now is a great deal different to the way the old Company worked.

6244. Was the old system the 8-yard bord? Yes, and 4-yard pillars. Many times miners have holed into each other in several places.

6245. *President.*] How do they tell what to work by? Under the new management you are supposed to keep as near 8 yards as you possibly can, and if you are over 8 yards it is the duty of the overman to chalk you off.

6246. *Mr. Gregson.*] Do you say that 8-yard bords and 4-yard pillars was the custom of the old Company? Yes.

6247. Was it not the district custom? Well, I can not say. I only worked at Lambton.

6248. Was it the custom at Lambton? Yes.

6249. *Mr. Curley.*] Have you worked in pillars yourself at Waratah? No.

6250. Have you worked in pillars at Lambton? Yes.

6251. Did the caving in of that shaft lead to the suspension of work? Yes, for a good many months. I think about four months, but I know it was a few months.

6252. Do you think that the shafts in a colliery should be a reasonable distance apart from each other? Yes.

6253. *President.*] What do you call a reasonable distance? Fifty yards.

6254. Do you think they should not be less than 50 yards apart? I think so, but that is only my opinion.

6255. *Mr. Curley.*] Do you think if the shafts are fixed too near each other that one may break into the other? Yes; if it is loose ground one will affect the other.

6256. Have you ever noticed anything in this shaft at Waratah when you were going down it;—did you have lights when going down? Some men carry lights, but I never noticed anything. Instead of being bricked, the shaft was faced with brattice for a good many feet down the shaft.

6257. Have you worked in pillars at the Lambton Colliery? Yes.

6258. Have you noticed the pillars there to be very thin in some cases? Yes; we have started on a 4-yard pillar, and before we got very far we have not been a yard and a half, the pillar has thinned so much. When we turned the bord away the pillar would be 4 yards, and before we got 10 yards she would not be  $1\frac{1}{2}$  yards thick. I have seen pillars in Lambton that were not 1 yard thick.

6259. Do you mean that the pillars ran in till they got a yard thick? Yes; they have tapered out till they got that thin.

6260. Were the bords driven by any line? No, none of the bords were driven by line.

6261. Would not that account for the want of uniformity in the pillar? Yes.

6262. Did you ever work very thin pillars far away from the main road—say, two or three pillars ahead, into the goaf? No; I cannot say I have. The goaf was behind us.

6263. Did you bring the pillars back? Yes.

6264. Were you in the Lambton Colliery when any big crush came away? Yes; I was there when there were two or three crushes in the straight-down flats.

6265. Did these crushes come over the pillars? Yes; in many instances. The first creep in Lambton was over twenty years ago, and it came over all the pillars.

6266. How many pillars did it come over? It did not come to the main bank. The pillar is 70 yards thick in that bank—the main engine road—but it came from that straight out.

6267. Did it come over several pillars? Yes, dozens of pillars, and buried a fearful lot of skips.

6268. *Mr. Gregson.*] Were there a lot of skips and rails lost? Yes.

6269. *Mr. Curley.*] Have you seen other crushes since that crush? Yes, where half a flat has been lost; two flats in the straight down.

6270. Which flats were these? The first and the second flats.

6271. How long ago was this? About ten years ago, or less, since I saw the last crush.

6272. Having seen all these crushes, do you think that more substantial pillars should be left in the mines than what there are? Yes, I do, and always did. It needs more substantial pillars for the safety of the men and property.

6273. *Mr. Gregson.*] Did you not say that the Company who has the Waratah Colliery now is leaving larger pillars? I think they are leaving 8-yard bords and 8-yard pillars, and 12-yard bords and 12-yard pillars.

6274. *Mr. Curley.*] During the time you have worked at Waratah and at Lambton have you noticed any defects in connection with the ventilation? Yes. At the Waratah Colliery, as far as the main roads are concerned, the ventilation is good, but where the men are, after a man gets a little up the bord, say 10 or 15 yards, he is nearly roasted.

6275. Have you experienced that yourself in Waratah? Yes, I have experienced that myself.

6276. Have you experienced that in more than one place or district? Yes, in two or three districts; more in some districts than in others.

6277. Are any of those districts that you have been working in going to the rise? Yes; one is going to the rise now, and one place going to the dip is affected in the way I have stated.

6278. Have you worked in the rise? Yes, but not in the dip.

6279. Have you found the ventilation very defective there? Yes, very defective in the rise places. I am speaking of places I am now working in.

6280. Is the air still defective? Yes; after you are up a certain distance it is fearfully hot.

6281. Is not the difficulty that while the ventilation is passing along the heading it does not go into the working place? Yes, that is the difficulty.

6282. *President.*] Do the men come out of the working places to get air? In many instances the men have had to come out into the heading for a few minutes to get air. I have heard men complaining. Younger men can stand it better than the older men, but the older men have to come out where the air does not go to the face.

6283. *Mr. Curley.*] Do you know the quantity of air provided in the Act that you are working under now—the Act of 1876? Yes; it provides for 100 cubic feet of air.

6284. Do you know that the new Bill proposes to increase that quantity to 150 cubic feet? Yes.

6285. The Legislative Council wish that provision to be erased, and the word "adequate" to be inserted instead, and consider that will be quite sufficient to meet the case;—do you think so? No, I do not; because

Mr.  
H. Hanlon.  
8 Oct., 1895.

- because if it is an adequate amount of air we cannot say what that quantity will be. The manager or the overman would be the judges, and might say if there was not 100 feet of air it was adequate.
6286. Do you believe in a minimum quantity being stated? Yes.
6287. *President.*] Have you ever worked in England? I have trapped in England.
6288. Is there any trouble about ventilation there? No, because in England an adequate amount of air must be got to sweep the gas, but where there is no gas, I do not think an adequate amount would do at all.
6289. *Mr. Gregson.*] What about the mines in England that have no gas? I suppose they will be affected in the same way as I am speaking of.
6290. Have you heard of any complaints being made there? No.
6291. Have you heard men talk about this matter? No, not about mines where gas does not exist.
6292. *Mr. Curley.*] Do you know the provision in the Bill with regard to the shortening of cut-throughs? [*See Appendix A.*] Yes.
6293. Do you know it proposes to reduce the distance to 25 yards? Yes.
6294. Do you believe that the cut-throughs should be lessened to 25 yards? I think it would be a great benefit if they were lessened.
6295. Do you think that the working place should be bratticed, and the air taken to within 15 yards of the face? If she was bratticed within a certain distance of the face, the men would get the air.
6296. Do you think that if brattice was used under the present system, that would meet the circumstances of the case? I think so.
6297. Do you think it would be better to leave it to the manager? If the management had it all in their hands it is questionable what they might do. They might say, if the miner wanted air, that there was quite sufficient without brattice.
6298. They could not do that if there was a minimum? We have had disputes about the minimum under the present Act. We have appointed check-inspectors, and they have taken the air, and afterwards the management have taken the air and differed from them.
6299. How do they measure the air? With the anemometer.
6300. How did they come to differ? The check-inspectors put their measurements down in a book kept in the colliery office, and, as soon as the manager saw this, he went into the mine and found more air than the check-inspectors.
6301. *Mr. Gregson.*] Did the manager find a door open? Perhaps so. In a week or so there was a joint inspection. The Government inspector was called over, and that was all the satisfaction we got, although men were complaining and laid up on account of bad health.
6302. *Mr. Curley.*] Where was this? At Lambton and at Waratah. At Lambton it was before Mr. Croudace got the new furnace.
6303. Has the new furnace improved things? It was worse with the new furnace than with the old furnace in my time.
6304. Was that your experience? Yes.
6305. Do you think that the air should sweep around the working face, or be carried within a reasonable distance of the face? If we could get it carried within a reasonable distance of the face, it would be a great improvement.
6306. Would you be more likely to get the air than you are at the present time? Yes; there is no doubt of that.
6307. In the absence of bratticing to carry the air up into the cut-through at the present distance, 35 yards, would you be in favour of the cut-throughs being shortened, so that the air might sweep within a nearer distance of the face? Yes; it would be better ventilation if the cut-throughs were shorter.
6308. Do you think that an inspector should have power to withdraw the men in case of danger? Yes; it is not until lately that I knew they had not this power.
6309. Will you look at the provision in the Bill, section 21, sub-section 5, on page 8, giving them this power (*see Appendix A*);—do you think that an inspector should have this power? I do.
6310. Would you leave this power in the hands of the manager alone, or do you think it better to be in the hands of the inspector? I think it is better in the hands of the inspector.
6311. *President.*] In cases of imminent danger? In cases of danger to life.
6312. Would you divide the responsibility between the inspector and the manager? No; I would leave the full responsibility with the inspector, because he acts independently between the manager and the men.
6313. Suppose there was danger when the inspector was not about? Then the manager is the responsible party.
6314. Don't you think it is better for the manager to have absolute responsibility? No; I have seen it stated by the manager that there was no danger when there was danger. The miner knows as well as the overman or manager where danger exists.
6315. *Mr. Gregson.*] Why does he want calling out if he knows this? If the man says there is danger and the manager says there is no danger, the manager may turn round and say, "If you think there is danger you can go; I can get somebody else." That has been done, and may happen again if the control was left in the manager's hands.
6316. You have not got the inspector there always? If there is danger he can be written for.
6317. Is there any objection to writing for the inspector? No; but when he comes he has no power.
6318. Has he not sufficient power to deal with a difference of opinion between him and the manager;—do you know what is provided in the present Act? Yes.
6319. How is the question to be settled under the Act? I do not know.
6320. I may tell you that arbitration is provided for;—the inspector insists upon going to arbitration? We have had none of those cases.
6321. Have you known of a case in which the manager and the inspector have differed? No, not any cases.
6322. Does it often happen that the inspector sees danger and the manager does not agree with him? There are very often cases where a miner sees danger, where with a very small expense it could be rectified, but the manager will not do it.
6323. Could you not write for the inspector? Yes, but there is a lot of red-tapeism about that.

6324. Suppose a miner sees little things that would improve the safety of the mine, and he writes for the inspector to come, and the inspector agrees with him, would he not prevail upon the manager to do it? Yes.

Mr.  
H. Hanlon.  
8 Oct., 1895.

6325. Do you know of any cases where the manager would not do what the inspector ordered him? No.

6326. Did you ever hear of such a case? No.

6327. On the whole, do you not think that the present provision in the Act meets the circumstances fairly well? It might in many instances. I can point out a case in which the manager and I differed on the air question. We were about 46 yards before the air, which, according to the old Act, should not be more than 35 yards; and I complained to the overman, and said I would report it to the inspector. He bratticed this bord up, and told me at the same time it would have no effect. If I had had to brattice it I would have bratticed it differently, but he said, "That carries out the Act."

6328. Did it have the effect you wanted? No; it made the air worse.

6329. What did you do? Nothing; because I might have got the sack.

6330. Why did you not write to the inspector? Well, I do not know.

6331. Did you ever know of a case in which the inspector was written to anonymously, and took no notice? No.

6332. Might you not have written to the inspector and pointed out this to him? Then the manager would have put it down to Henry Hanlon.

6333. If you do not do this, how is the inspector to know? Where a joint inspection is called, if the miners write to the Government for the joint inspection, I think the inspector notifies both the manager and the men at the same time.

6334. Would it not be better to write to the inspector anonymously, rather than have this joint inspection. Do not the check-inspectors charge you for every inspection they make? Yes, but there are many men who have not the ability to write.

6335. Do you not know perfectly well that if a man cannot write himself, he will find many men who can? I know plenty of men who say that before they will differ they will work it out for this quarter.

6336. Have you heard that the Secretary of State in England has approved of anonymous letters being sent to inspectors? No.

6337. Have you never heard of an anonymous letter being sent to an inspector? No.

6338. *Mr. Curley.*] From your experience, Mr. Hanlon, do you think that a manager likes any complaints about the mine lodged with the inspector? No, he does not.

6339. Does he not seem opposed to anything of the kind being done? Yes.

6340. Did you think the system of ventilation wants more attention altogether? Yes.

6341. Are you speaking from your personal experience? Yes.

6342. *Mr. Gregson.*] Have you ever known a manager to be haughty because of a complaint being made to the inspector? Yes, I have. I mean that he was not satisfied.

6343. Because of the complaint being made to the inspector? Yes.

6344. *Mr. Curley.*] Have you given any attention to the question of working-hours? Yes.

6345. What hours do you work at present? Eight hours in the face, or nine hours from bank to bank.

6346. Have you thought about the proposed legislation for eight hours. Will you look at section 36 on page 17 of the Bill (*see Appendix A*); do you see the provision there? Yes.

6347. Do you approve of that provision? Yes.

6348. Do you think that this is a matter that should be settled mutually between the manager and the men? No; I think it should be settled by legislation.

6349. *President.*] Are you going to make the party who works more than eight hours punishable for doing so? Yes; I believe in a penalty in that case.

6350. *Mr. Curley.*] Do you think it is the general opinion of the men that the question of the hours of employment is a matter for legislation? Yes.

6351. Is that the opinion of the men generally? Yes.

6352. Have you talked this matter over with the men pretty frequently? Yes, and we have held meetings upon the subject.

6353. *Mr. Gregson.*] Have you ever paid any attention to what has passed on the subject in Great Britain? Not lately, but I have seen that there are some men in Great Britain who are against it. I have read of men of good standing being in favour of the eight hours, and I know that some are against it.

6354. Can you understand that there should be anyone against such a matter? I think that those who are against it say that it takes away the liberty of the subject.

6355. Have you not seen that some are frightened about it affecting their trade? No.

6356. Do you not see that if one country puts limitations upon its trade, and another country does not, that the trade will go from one country to the other? The only conclusion I have come to is that anyone who has worked eight hours has worked long enough.

6357. *President.*] Can you legislate for such a matter as this;—are you going to make it punishable if a man works more than eight hours? I am of opinion that the man who works more than eight hours ought to be punished.

6358. No matter, if from some cause or the other, he does not work three days out of the week, are you going to make it punishable if he wishes to make up for that idle time on the 4th or 5th day? The opinion is, that if we had this eight hours, we would work more constantly, and that the man who works ten hours, takes the work that another man ought to be doing. Some men, I know work for twelve or fourteen hours a day, knowing that when they get this work they may not get more for some time, but I am of opinion that they should not work more than eight hours.

6359. Are you regardless of whether the trade goes away or not;—suppose that legislation was given, and you lost your trade, what would you say then? I do not think we would lose trade up in the north. We are waiting on the trade up there under the present system.

6360. You must remember that you are asking for legislation for the south as well as the north, and we are told of cases in which a steamer comes, and if she does not get what she requires, she goes elsewhere. Do you think it well therefore, under such circumstances to put a limit? In such cases, I think they should put on two shifts of men.

6361. Would not that add to the cost of the coal? I cannot see that it would.

Mr.  
H. Hanlon.  
8 Oct., 1895.

6362. *Mr. Curley.*] Don't you think that in these districts it is simply a matter for them to regulate the trade—the loading of the coal? I think so.
6363. *Mr. Gregson.*] Do you know that you must not judge the south from Newcastle. In the southern districts, the people have no harbours whatever; they have had to make their own railways and wharfs, and their trade is fitful; a steamer may come suddenly, and want a good deal of coal. In Newcastle you may have your coal ready for shipment, but in the south they have none of these facilities. What do you think of the eight hours in such a case as I have put? I cannot study the southern district any more than the northern district. If they have plenty of waggons, they can fill them up, and have plenty of coal.
6364. I suppose you know that waggons cost money? Yes.
6365. And that money costs interest? Yes.
6366. And that means an additional cost to the coal? Yes; but, I think, the southern collieries should be just as well prepared as the northern district collieries.
6367. Do the miners in Newcastle work eight hours? Yes; but we are nine hours down in the pit.
6368. Would you say that that was the general rule? Where there is a tunnel, they may not, or where there are two shifts of men, but where I am they do.
6369. Do you work eight hours at Lambton? It all depends upon where you were working. I have worked ten hours.
6370. *Mr. Curley.*] Do you think the managers are favourable to the eight hours. Have you ever heard them say anything against it? No, I have not.
6371. *President.*] Are you going to penalise a man who wishes to work more than eight hours? We look at it, that if an Act was passed to legalise the eight hours, what is the good of that Act if it is broken? Some penalty must be put into it.
6372. *Mr. Curley.*] Do you know that some of the managers in the south are trying to get the men to work more than eight hours? Yes, I have heard that as information.
6373. Do you know that a manager in the western district, has called his men out to work on a Sunday? I was not aware of that.
6374. Would you be surprised to hear that that is a fact? It would not happen up in the north.
6375. Do you think a man has much choice in these days? He has no choice at the present time, that is, if he chooses to be the bread-winner of his family.
6376. *Mr. Gregson.*] Suppose trade improved, and we got eight or ten days work, what would you say then? I think that the man who wished to work more than eight hours then ought to be fined. Instead of being more than eight hours, it ought to be less. In the north of England the miners only work six hours.
6377. Is it one of your objects to divide the work better by saying that a man shall not do more than a certain amount of work? That may be one object, and the other is that a man may have a standard wage. We want to prevent another man competing against him by working twelve hours.
6378. *Mr. Curley.*] Don't you think that one of the objects is that after a man has done a day's work he should have a reasonable time for recreation? Yes; the cry has been—eight hours rest, eight hours work, and eight hours recreation.
6379. *Mr. Gregson.*] Do you think it wise to penalise the man who works more than eight hours? Yes, I do; I think that if a law is passed there ought to be a penalty for breaking it.
6380. You want to prohibit a man working longer than eight hours? Yes.
6381. And you want the work more distributed? That is one reason.
- 6382-3. And what is the other reason? That I think eight hours is long enough for a man to work.

[Witness withdrew.]

William Quinn sworn and examined:—

Mr.  
W. Quinn.  
8 Oct., 1895.

6384. *Mr. Curley.*] What is your occupation, Mr. Quinn? I am a miner.
6385. Where are you working at the present time? At South Waratah.
6386. How long have you worked at South Waratah? This time, nearly five years; I cannot exactly say to a month, but it is close to that time.
6387. Have you worked at any other collieries in the Northern District? Yes.
6388. Where have you worked? At the Glebe and New Lambton Collieries.
6389. Does the Glebe Colliery belong to the Newcastle Company? Yes; both the sea pit and the old pit.
6390. Have you worked in any other pit? I was in Minmi for a short time.
6391. Have you followed the occupation of a miner for a great number of years? I never did anything else in my life.
6392. Do you know the system of weighing at Waratah? Yes.
6393. Are the men paid there by the average weight? Yes, by the average weight.
6394. Do you get many skips weighed? Very few, lately; sometimes five or six skips in a day; it might be seven, eight, or nine skips.
6395. Do you think that will give anything like a fair average to the men working there? Well, I do not feel satisfied with the quantity weighed, nor do the men, as a rule.
6396. Is this a matter of complaint amongst the men generally? Yes, there have been deputations appointed to interview Mr. McGeachie, the manager; in fact, I have been sent to him by the men.
6397. What does he say to your representations? He says that he will weigh as many skips as possible. That is all the reply we received.
6398. Have things improved in the weighing business? They go on as usual, I think.
6399. Do the men wish every skip to be weighed, or are you satisfied with the average, provided a fair number of skips is weighed? I think the body of the men would rather have every skip weighed.
6400. *President.*] Suppose that is impracticable, would not the men be satisfied if a fair average number of skips were weighed? I think they would.
6401. What do you think is a fair average number of skips to weigh? One in five.
6402. Would not one in twenty do you? I consider that one in twenty is a very small average.
6403. *Mr. Gregson.*] Would it be better than what you have now? Yes, it would.
- 6404-5. *Mr. Curley.*] Do you think you lose much by this system of averaging? Well, I cannot say so. I think the men have lost of late through there not being so many skips weighed. 6406.

Mr.  
W. Quinn.  
8 Oct., 1893

6406. Do you think the manager always knows how the weights stand with regard to these averages? Well, I cannot say.
6407. Does he weigh his own coal on the line? I cannot say whether he weighs the coal or whether the Government weighs the coal.
6408. Is the probability that he does know the weight he gets? Yes.
6409. Does he know the weight he is paying for? I suppose so.
6410. Do you think that if a reasonable number of skips were weighed there would be any complaints at all? I do not think there would be as many complaints as there are if a reasonable number of skips were weighed.
6411. How long do you say you have worked in the Waratah Colliery? Close on five years this time.
6412. Do you recollect anything that occurred at the Waratah Colliery in connection with one of the shafts about two years ago? I remember one of the shafts being blocked in when the lining boards or the cribbing gave way, but I did not see it myself.
6413. Did you hear of it? Yes; I think it was about half-past 10 when we got to hear of the accident in the mine.
6414. How long was this ago? It happened on the 20th of April, 1893.
6415. Who informed you that anything was wrong? The wheelers brought word into the heading where we were working.
6416. Were you advised to cease work and go to some other place in the mine? No; there was no advice given. The men simply got to know that the shaft had fallen in, and they put on their clothes and went into the main heading, and Drury, who was deputy then, told the men they would have to go up Flaggy Creek.
6417. Was that towards the furnace shaft? That is the furnace shaft.
6418. Did you go up that way? Yes, to a certain part. There was a door there, and they would not allow anyone to go through that door for two or three hours.
6419. Were you stationed at a certain point? Yes, in the heading going up to the furnace.
6420. Were you told not to go past this point? Yes.
6421. Did you get instructions to leave the mine later on? Yes; when they started to send up the men, only three men were allowed to go up in the cage at the one time.
6422. Did you pass out that way along with the other men? Yes; the biggest portion of the men went out that way. A few of the men went out by the No. 3 workings, through a heading that was naturally finished. It was an old district.
6423. Would those men have to come to the furnace shaft? Yes.
6424. Did you notice much timber set on the road as you were going out? Yes.
6425. Did you notice any chocks? Yes; chocks, slabs, and timber nearly all the way.
6426. Do you know if the creep bordered on that shaft? I was working in the pillars when the creep came on.
6427. *Mr. Gregson.*] Was this at the time of the creep? Previous to the shaft falling in.
6428. *Mr. Curley.*] How long before the shaft fell in? Three months before the shaft fell in. The creep had not got thoroughly settled when the shaft fell in.
6429. Was that caused through the roof coming down? Yes.
6430. Was the roof weighting on the pillars? Yes.
6431. Did it give any indication in coming over the pillars? Yes, it went over five pillars. We were working in the sixth pillar, and it crossed the narrow bord, and went over another six pillars. That was in the No. 9 workings.
6432. Did it approach very near to this upcast shaft? Yes, it went pretty close to it.
6433. Do you think that there should be larger pillars left in the vicinity of the shafts? Yes, I do.
6434. Did you find some of the pillars that you were working in very narrow? I have seen them all thicknesses, from 8 yards down to 2 yards, or even smaller than 2 yards.
6435. Were any of the pillars 8 yards at that time? Yes, odd ones.
6436. Do you know anything about the depth of that shaft at Flaggy Creek? Well, I cannot say exactly.
6437. Do you think that more substantial pillars should be left in mines? Well, I have seen them very weak, and I think it would be a benefit if they were stronger.
6438. Do you think if the pillars were larger it would be safer for the men to work them? I do.
6439. Do you think that the management would get more coal out with larger pillars? Yes; if a place is crushed you cannot get the same quantity of coal out.
6440. Have you ever noticed any defect in connection with the ventilation at Waratah? There has been pretty fair ventilation where I have been working lately, but I cannot speak for higher up.
6441. Where are you working? At No. 1 Little Flat section.
6442. Have you worked in any other places besides where you are working now? Yes.
6443. How have you found the ventilation in these places? I have seen it where it ought to have been a lot better.
6444. What districts do you refer to? At the time they were working at Berrima it was pretty bad at one time, and at the top end of No. 1 I have seen it bad.
6445. Was the defect in these places that the air was not going to the face? The air was not going near the face.
6446. Was there a fair quantity of air on the headings or main roads at these times? Not too good.
6447. Would the air in that case generally be defective? At the time I was speaking of the top end of No. 1 flat was naturally the last of the split, and that would have a tendency to make the air a little worse.
6448. Do you think the ventilation should be conducted up to the working-face, or within a reasonable distance of the working-face? I would like to see the air up to the face.
6449. *President.*] Would it be practicable to do this in all cases? I have seen it where it has been practicable.
6450. Where? In England, in South Yorkshire.
6451. What were the names of the mines? Ardejeley Oaks and Swaithemain Mines. There was an explosion in the Ardejeley Oaks in 1866; the mine fired on the 12th of December, 1866.
6452. *Mr. Curley.*] What did they do there? They bratticed it, and took the air to within 9 feet of the face.

Mr.  
W. Quihii.  
8 Oct., 1895.

6453. Was that in a thick seam or in a thin seam? In a thick seam.
6454. How thick was the seam? It was from 7 feet to 7 feet 6 inches, up to 8 feet thick. They worked the seam in two sections.
6455. Did they use canvas brattice? I have seen canvas brattice and lining-boards used.
6456. Were they  $\frac{1}{2}$ -inch lining-boards? Yes; I have seen both sorts of bratticing.
6457. Was there a lot of gas in these mines? Yes, plenty of fire-damp.
6458. Had they to be bratticed up to sweep out the fire-damp? Yes.
6459. From your experience of the collieries you have worked in here, do you consider that more attention should be paid to the subject of ventilation? Well, I believe it would be better for all parties if more attention was paid to the matter of ventilation.
6460. Do you speak from your own experience? Yes; I believe that.
6461. Have you to get the coal by blasting at the Waratah Colliery? Yes.
6462. Is it a strong seam to work? Yes.
6463. Have you several bands in the seam? Yes, three bands.
6464. Does it require good ventilation to sweep out the powder smoke? Yes.
6465. Do you know that the proposed Bill stipulates for a higher minimum quantity of air than the present Act? I believe it does.
6466. Have you read the proposed Bill? No.
6467. The present Act stipulates for 100 cubic feet of air, and the proposed Bill stipulates for 150 cubic feet;—do you believe in a minimum? I think that, if there was a minimum of 150 cubic feet, it would be better than it is at present.
6468. Have you had occasion to make complaints to the manager at different times about the ventilation? No; I am not aware that I have had to complain more than once, and that was at the time Mr. Neilson was manager there.
6469. What district were you working in then? The Ganning bord in No. 1, Little Flat.
6470. Did you consider that you were too far in advance of the air? It was a little gas that showed.
6471. Did you draw the manager's attention to this? Yes; as soon as I found that gas was there I sent for the manager at once.
6472. Did the gas show on the light? It lit up.
6473. *Mr. Gregson.*] Did the manager put it right? Yes; he bratticed it right away.
6474. *President.*] Was it a sudden manifestation of gas? It came suddenly, and as soon as I laid a complaint brattice was put in at once.
6475. *Mr. Curley.*] Before you got the brattice, did you consider the air was a little slack? The air was not too good before the brattice was put up.
6476. At these other collieries you have spoken about, did you consider the ventilation in some of these places, defective or not? It is so long since I was at these collieries that I cannot say exactly whether they were affected much at the time. At the time I was at the Glebe Colliery there were several complaints about the ventilation in different districts there, but I was never lucky enough to work in them.
6477. From that incident that took place in connection with the Waratah shaft, do you consider that shafts should be a reasonable distance apart from each other? I believe they should.
6478. What do you consider a reasonable distance? I think about 50 or 60 yards between the two shafts.
6479. Have you known any instances where the shafts have collapsed into each other? I know of no instance myself. I have heard tell of instances, but I have never seen them.
6480. Where have you heard of such a thing happening? I have heard of one case at the Oaks Colliery.
6481. How did that collapse? One of the shafts gave way, on account of sand, and it ran the other in. It also took the head-gear away.
6482. Were these shafts very far apart? I think they were about 21 feet apart. They have opened up one shaft since the explosion.
6483. Do you elect your own check-weighman at Waratah? Yes.
6484. Do you think the men should have the right to elect their check-weighman from whom they please? I do.
6485. Do you ballot for your check-weighman every three or six months? That is the rule if it is required, but our check-weighman has had no opposition lately.

[Witness withdrew.]

John Archibald Neilson, Esq., sworn and examined:—

J. A. Neilson,  
Esq.  
8 Oct., 1895.

6486. *President.*] What is your occupation, Mr. Neilson? I am a mining agent; at present I am agent for the Merewether Estate. I have been a mining manager up to July last year.
6487. What collieries have you managed? I have been manager of the West Wallsend and Waratah Collieries.
6488. *Mr. Curley.*] Have you had a good deal of experience in connection with mining? I have had fifteen years experience—five years as manager, and I have been for five years agent for the estate of the late E. C. Merewether, I was for three years manager at West Wallsend, and two years manager at Waratah.
6489. Did you serve your time at the Wallsend Colliery? Yes.
6490. Did you serve your time under your father, the late J. Y. Neilson? Yes, under my father.
6491. You say you have managed the West Wallsend Colliery for some time? Yes, for three years.
6492. And you have managed the Waratah Colliery? Yes; I was for about nineteen months at South Waratah, the Charlestown Pit.
6493. Do you know anything of an occurrence that took place in connection with one of the shafts at that pit? Yes, I do.
6494. When did that accident happen? I think it occurred about two years ago last April, three months after I went there.
6495. Did that accident occur in the downcast shaft? Yes, in the main downcast shaft.
6496. Was it the main hauling shaft? Yes, the downcast shaft.
6497. What time of the day did this occur? Between half-past 10 and 11 in the morning.

6498.

6498. Was it a cave in from the surface down the shaft, or how did it arise? It arose from the collapse of a crib, 40 feet from the surface. J. A. Neilson,  
Esq.
6499. Had this worn away, or had it burst out; had the timber decayed? Yes, the timber had decayed.
6500. Did much of the shaft give way at the time? No; I do not suppose there would be 1 cwt. that fell from the side of the shaft at the time. It displaced the slides, and that was the trouble. 8 Oct., 1895.
6501. *Mr. Gregson.*] Did that prevent the winding of the cage? Yes.
6502. *Mr. Curley.*] Did you have to stop winding in consequence of that? Yes.
6503. Did you consider it unsafe for men to go up the shaft? Yes, it was unsafe for men to go up the shaft.
6504. Did the whole of the shaft subsequently collapse later on? Yes, the following day while effecting repairs it collapsed higher up the shaft.
6505. Did that run to the surface? Yes, the broken ground ran to the surface.
6506. How much would go away? It would be impossible for me to estimate the quantity, because in re-building the shaft a lot of other stuff was taken down.
6507. Could you not estimate the quantity from the top of the pit, to where it ran? I believe there was about 35 or 40 feet from where she broke away from the surface.
6508. *Mr. Gregson.*] Was that from the upper part of the shaft? Yes, to the surface from where the break had taken place.
6509. *Mr. Curley.*] How far did it extend from the point of the shaft, along the surface ground, taking a direct line? What fell away would be about 23 or 24 feet, but we afterwards took a lot more away in effecting our repairs.
6510. Can you give us a rough sketch on paper? Yes. [*See sketch Appendix 1.*]
6511. Does that sketch represent the shaft and the area that went away? Yes, it would be in diameter about 20 or 25 feet.
6512. Would the part that gave way below undermine the upper part? Yes, it did undermine the upper part, and this caused the collapse at the top.
6513. When this occurrence took place how did you communicate with the men down below? With a line.
6514. Did you advise the deputy or the overman to call upon the men to cease work? I advised the deputy and overman to get the men up the shaft—that we had to lift the men in the event of an accident taking place.
6515. Was that out of the upcast shaft? Yes; out of the upcast shaft.
6516. How long were you getting the men out? About six and a half hours, I think. The occurrence took place between half-past 10 and 11, and we had the first men up about half-past 5.
6517. Had you any steam at the time? Yes; we had steam at the main shaft, the winding shaft, but not at the upcast shaft.
6518. How did you draw the men out there? I had an engine-driver, a spare man, partly employed for that purpose. The boilers, engines, ropes, and cage were kept in thorough working order, and as soon as ever the accident occurred this man was sent over to get up steam.
6519. Had not the furnaces to be cooled down before the men could be got out? The furnace had to be put out for the men to travel in the shaft. We did put the furnace out.
6520. Do you know anything about a creep that bordered upon the furnace shaft? Yes.
6521. How long was that previous to this other occurrence? The creep was on when I took charge. I took charge in November, and the accident happened in April, so that would be 4 or 5 months previously. It was practically over when I took charge.
6522. Did you anticipate any danger in connection with that shaft during the time that creep was there? Yes; and prepared to meet it, and did meet it successfully.
6523. Was that your principal upcast? We had three shafts at the colliery; one was the main downcast, and that one was the main upcast. The other one was sometimes the upcast, or the downcast. It would be the main upcast shaft.
6524. Did the other shaft become either the upcast or the downcast? Yes; according as we arranged it to suit our purposes.
6525. Could you go up and down that shaft? I never went up and down it.
6526. Was it ever used? No; never used.
6527. Had you a direct road to this unused shaft? Well, there were two headings going into it. One would be a direct line 10 or 12 chains, and the other a direct line of 2 chains, as far as I can remember.
6528. Had you direct connection with it? Yes.
6529. Do you think that these pillars had been left rather thin near the proximity of that shaft—the shaft pillars? No, not under the circumstances, because the shaft was solid on one side. It was right on to the boundary, and there was solid coal there.
6530. What was the size of the shaft pillar on the front? About 16 yards, so far as my memory serves me, but I cannot say with any exactness.
6531. Was that pillar broken in any way—was there a small road through it? Not to my knowledge. There was a small road between the arch of the furnace and the coal. I would have to turn edgeways to go through. It would be about 2 feet wide between the arch of the brickwork and the pillar side.
6532. What distance was that in? On that side it was in 5 or 6 yards, and then it went into a small pick-rack. It was originally a side of the rib, and they had a small pick-rack there for the men to get their tools when they went down. (*See sketch Appendix*).
6533. Had you generally to put in timber to save the road leading into that on either of the sides? On the low side I never put in a stick. With regard to the crush on the northern side, I timbered and put in chocks along the edge of the main shaft pillar.
6534. Had that working been carried out long before you went there? Yes, prior to my taking charge; in fact, the crush was virtually over when I took charge, and it was the after effects that I was protecting myself against with the timber.
6535. Would that crush be quite settled for some time? No, for some months after it would not be thoroughly quiet, but the actual danger would be over.
6536. Did you take this course to guard against the possibility of this load coming down? Yes.
6537. Do you know the system carried out with regard to working the colliery? Yes, pillar and stall.

- J. A. Neilson, Esq.  
8 Oct., 1895.
6538. Was it the usual district system of 8-yard bords and 4-yard pillars? I never saw any of the workings in the crush, but the plan showed 8-yard bords and 6-yard pillars. In the actual working that was the system before I took charge.
6539. Do you know the depth of the shaft? It was between 450 and 500 feet.
6540. *Mr. Gregson.*] Was that the depth of the upcast shaft? Yes.
6541. *Mr. Curley.*] What pillars did you carry at West Wallsend? Eight-yard bords and 8-yard pillars.
6542. Do you think the increased size of the pillar is an advantage? It depends on circumstances entirely.
6543. Well, say, for a mine of that depth? Then, it depends on circumstances.
6544. What particular circumstances does it depend upon? The pillars in West Wallsend were increased to that thickness, because we were just breaking away from around the shaft. We were opening out the workings from the shaft at that time.
6545. Would you not leave a larger pillar as a shaft pillar? We left 120 yards around the shaft. The size of the pillars would depend upon the nature of the roof to a great extent.
6546. In a mine of that depth, would you not consider the 8-yard pillar an advantage? It depends upon the circumstances of the roof, and the system of the working in which they are taking the pillars out.
6547. Have you seen a statement by Wardle with regard to the working of pillars? No.
6548. Will you look at his "Reference Book on Practical Mining" (3rd edition, page 262), and tell us what he says there? Yes; "Many good collieries have been ruined, and thousands of acres of valuable coal lost through having the pillars of too small dimensions."
6549. Do you think that small pillars are a danger and a menace to a colliery? If the pillars are too small, certainly.
6550. Do you think, from what you know of the Northern District, that many of these pillars have been left too small? I have seen coal lost with pillars being too small.
6551. Would that lead you to the belief that an increased size of pillars would be a superior system of management? No; not in all cases. I have been taught by my father's records that in some collieries in the district the system is the best to get the greatest amount of coal per acre.
6552. Have you not to look to something else besides winning coal? Yes; there are all sorts of considerations.
6553. Are there no considerations for the safety of the workmen? Yes.
6554. Is not that the prime consideration? I have always considered the safety of the workmen first, and the commercial part of the business afterwards.
6555. Do you know that the opinion is gaining ground that the larger the pillar the greater the quantity of coal to be got? We have found that with the smaller pillar in some cases we get more coal per acre.
6556. Have you read any authors in connection with colliery management in England? Yes.
6557. Do they not approve of the larger pillars? Yes.
6558. Do they not state that a larger quantity of coal can be got out by leaving larger pillars? Yes; most of the authors say that.
6559. If that obtains in England, don't you think it will have the same application here? It may not obtain in every place; it all depends on the system adopted.
6560. In a general way, do you not think it would have the same application here? I should think it would.
6561. Are not the main roads leading to the shafts the only outlets for the men? Yes.
6562. Do you think that these roads should be above suspicion at all times with regard to the size of the pillars that are left there? Yes.
6563. Regarding the spare shaft you have spoken of at Waratah, what condition is that shaft in? I have no idea; I have never been down it.
6564. Was that shaft in disuse when you went there? Yes.
6565. Do you know from any records why that shaft was abandoned? The secretary told me that it was unnecessary with the other shaft they had there.
6566. From the collapse of that shaft, did that impress you with the idea that it would be better to wall or brick these shafts? I always prefer bricking.
6567. Do you think that shafts should be at a reasonable distance apart? Yes.
6568. How far apart do you think they should be? If the two shafts are to be close together, I would not have them any nearer than 20 yards.
6569. Do you know that in the Northern districts that some of the collieries are put down on a good deal of delta? Yes.
6570. If those shafts were nearly approximating one another, and an accident took place, is it not possible that silt might keep running? Yes; where shafts are close together there is a liability to that happening.
6571. Do you think that 20 yards is a sufficient distance for shafts to be apart in such cases? I have not had any experience of that sort.
6572. Did you see the sand that washed into the Ferndale Colliery? No.
6573. Were you down at the scene of that disturbance? No.
6574. Do not you think that shafts 20 yards apart would be rather near in such a case as that? On considering it, I think it would be rather near on a delta colliery, or quicksand. It depends on the depth of the quicksand of course.
6575. Were you working 6-yard pillars or 4-yard pillars at the Waratah Colliery? I was working on two different systems at that colliery. I finished up all the old workings on the old system.
6576. What was the old system? Eight-yard bords and 6-yard pillars. Under the new system I was going to start 8-yard bords and 8-yard pillars on the new main roads that were being driven.
6577. Do you consider that if a pillar is intended to be left a certain size it should be left that size? I believe that if a pillar is intended to be left 8 yards it should be left 8 yards.
6578. Do you think that there should be some endeavour to keep the pillars to a uniform size? Yes.
6579. Was that done under the 4-yard pillar system in any of the collieries you know of;—were the pillars kept to a uniform size? Every care was taken at Wallsend. In the new tunnel, we had a 4-yard system, and regular measurements were taken by the overman.
6580. Did you ever know of one pillar encroaching on another pillar? That was according to arrangements.
6581. What do you mean by according to arrangements? By my father's orders—the manager's instructions in crop coal.

6582. Have you ever noticed that narrow pillars are very difficult for men to work in, in cases where the roof is down on each side of the pillar, through a lot of refuse tumbling on each side of the pillar? It depends on how they work. At Wallsend they would leave two ribs on, and there was no difficulty, and at collieries I have visited lately they do the same thing. J. A. Neilson,  
Esq.  
8 Oct., 1895.
6583. Will that rib answer the purpose? It stops on long enough to keep the fall from the next bord.
6584. Is it not only a shell? Yes, it is met by timber, on the side of the rib. Of course, cases do occur where it comes through.
6585. When you were managing collieries, how did you read the present Coal Mines Regulation Act with regard to ventilation? I read it that it was necessary to give 100 cubic feet of pure air for every man, boy, and horse.
6586. Does not the Act say that that has to be the minimum quantity of air? Yes.
6587. Did you make the minimum the maximum? No, it is seldom that it is so.
6588. In every case where that was carried out, have you only had 100 cubic feet of air, wherever you had a split. Did you work under the split system at the collieries you were managing? Yes.
6589. Supposing you had 100 cubic feet of air, for each man, boy, and horse, in these splits, would you consider the Act had been complied with? Certainly not, if there were other reasons that made it necessary to have more air.
6590. What do you mean by other reasons to have more air? The presence of a great quantity of gas might make it necessary to have more air, or the 100 cubic feet of air might be adequate where there was gas.
6591. Putting the question of gas on one side, if you had no gas there, and every man, boy, and horse was getting this 100 cubic feet of air, would you consider that fully met the requirements of the Act? I would.
6592. Would you think the Act complied with, when the minimum quantity was supplied? Yes, if I had that quantity of air, I would consider it sufficient.
6593. Would you think you had complied with the Act? Yes.
6594. Will you look at the sections in the present Act dealing with ventilation (*see Appendix B*). Do you see anything about an adequate quantity of air, in sub-section 2? Yes.
6595. Do you think that the two clauses should be read together, the adequate quantity and the minimum quantity? It depends on circumstances entirely.
6596. Do you mean where there is no gas? I might have more than an adequate quantity for clearing the ordinary gases, apart from fire-damp.
6597. In any case, if you had 100 cubic feet of air, would you consider the Act was complied with where there was no gas? Yes; under ordinary circumstances, under general conditions, I would consider that I had fulfilled the requirements of the Act if I had 100 cubic feet of air per minute.
6598. Did you find any section of the Waratah Colliery difficult to ventilate? Yes; we had a difficulty in two bords next to the crush, but that was stopped immediately. I changed the system when I went there, and we found no difficulty whatever.
6599. When you were there as manager did the company's weighman have any other duties to perform besides his weighing? The weighman had no duties apart from the weighing.
6600. Was he kept at the weighbridge the whole of the time? Yes; cleaning and weighing the coal on the weighbridge.
6601. Do you know the average number of skips that were weighed in a day? I have no recollection.
6602. Did you leave the business of weighing pretty well between the company's weighman and the miners' check-weighman? The screen overseer was there to superintend any matters, and the weighing was almost absolutely left between the miners' check-weighman and the company's weighman.
6603. Did the men ever make any complaints to you about the weighing? I do not recollect any complaints.

[Witness withdrew.]

Duncan M'Geachie sworn and examined:—

6604. *Mr. Curley.*] What is your occupation, Mr. M'Geachie? I am a colliery manager.
6605. What colliery are you managing at present? The Waratah Colliery.
6606. Have you had charge of any other collieries? Yes.
6607. Where? Some at home, and some here.
6608. What collieries have you been connected with in Great Britain? I worked for the Carron Company in all the different branches of colliery work, and at the latter end as general assistant.
6609. Have you had charge of any other collieries in Scotland? No; I was with the Carron Company until I came out here.
6610. What collieries have you been identified with out here? The Greta and the New Wallsend collieries, and the one I am in now in the northern district, and the Coalcliff colliery in the southern district.
6611. What were you at the Greta Colliery? Surveyor and general assistant.
6612. What position did you occupy at the Coalcliff Colliery? I was the manager of the Coalcliff Colliery.
6613. Were you the manager at New Wallsend? Yes.
6614. Does your experience of collieries extend over a number of years? Yes.
6615. How long have you been at the Waratah Colliery? About eighteen months, I think.
6616. Do you know anything about the system of weighing at Waratah? Yes.
6617. How are the men paid there? By average weight.
6618. Is there a weighman on behalf of the company there? Yes.
6619. Is he stationed there? Yes.
6620. Is he there every day? He is supposed to be there every day.
6621. Has he any other duties to perform besides weighing? He supervises the other men on the pit-top.
6622. Is he a kind of foreman over the top men? Yes; he can see everything from the machine when he is weighing.
6623. Is he supposed to perform any clerical duties at the colliery? Yes; he has to do all the clerical work in connection with the weighing, but I think he generally does that at night.

D. M'Geachie,  
Esq.  
8 Oct., 1895.

- D. McGeachie, Esq.  
8 Oct., 1895.
6624. Are there any days that you do not weigh at all? Not that I am aware of, but if we are running unscreened coal it is rather awkward to weigh. Last week, I think, we loaded some unscreened coal, and there might possibly have been no weighing done on that particular day.
6625. Will you explain what you mean? Our weigh-screen is on the large coal road, and any coal weighed when we are sending away unscreened coal, would be sent away as such. On that account there might be no weighing on that particular day, but I could not say whether there was or was not.
6626. Do you take unscreened coal over your shaker? Yes; everything goes over the shaker.
6627. What difficulty stands in the road of weighing? None; but, as I have already said, every skip of coal weighed when loading unscreened coal would go away as unscreened. It is not a difficulty.
6628. Is that the reason you give for no coal being weighed on certain days? Yes; for no coal being weighed on these days.
6629. Have you any idea of the average number of skips that are weighed every day? I think about twenty-five or thirty skips per day.
6630. Do you think it is as many as that? Some days last fortnight we were over thirty skips, and I should say we would average from twenty-five to thirty skips per day for the last fortnight.
6631. Do you know that the average number of skips weighed for the last three months has been seventeen per day? I cannot say for so long a time as that. I am referring to the last fortnight; but I think the average must be more than you mention.
6632. Do you think the check-weighman ought to know? He should know if he is there at all times when skips are being weighed, but there are many times skips may be weighed when he is not there; such as days when the special places only are working.
6633. How many men have you in these special places? From fourteen to sixteen; but for the last fortnight we have had very few special places going.
6634. Have you had any complaints upon the subject of weighing from the men? Some time ago I had, but since then I have weighed more skips than they anticipated could be weighed.
6635. How many skips was that? We have weighed over thirty in one day, and they were under the impression that fifteen was the greatest number that could be weighed. We put up a new weigh-screen and bridge, and can weigh more skips than with the old one.
6636. Are you sure that you have weighed thirty skips in one day? Yes, because I have seen it in the book.
6637. If you have done that once, can you not do it again? Yes.
6638. Was that number of skips weighed when the colliery was going a full day? Yes.
6639. How many skips do you draw on an average in the day? Four or five hundred skips.
6640. What do these skips carry? They average from 12 to 13 cwt.; some of the skips go 9 cwt., and some 16 cwt., and the general average is about 12½ cwt.
6641. Do you consider that is a very high number of skips to weigh out of the number of skips that come out of the pit daily? I do not see that it makes any difference what number of skips are weighed, so long as the men fill honestly. If a man fills every skip alike, it can make very little difference to him.
6642. Do you know, from your experience, that it is utterly impossible to fill all skips to weigh alike? We have weighed as high as four skips in a day from one bord, and found not more than half a cwt. of difference.
6643. Does not a miner get into tender coal sometimes? Very seldom at Waratah.
6644. Have you no tender coal at Waratah? No; it is all good coal there.
6645. Have you any faults in the mine? There are, but not in the present workings.
6646. Do you not get tender coal adjacent to these faults? We have crossed none in my time.
6647. Do you think you would get a more exact average if you weighed a greater number of skips than you do weigh? I find very little difference, taking the fortnight all through. We like to weigh as many skips as we can to comply with the wish of the men as much as possible.
6648. How do you weigh your waggons for the colliery? We weigh ourselves, and take the Government weight also.
6649. Do you ever compare that weight with what you pay the men for? It comes out very near. Sometimes we pay the men for more coal than we get, and sometimes we may be a few tons to the good.
6650. Have you struck an average covering three or twelve months as to the loss or gain on each side? I strike it each fortnight. Some fortnights it is a little to the good, and some fortnights a little to the bad, but for the whole year I do not think there would be a difference of 20 tons either way. I could not say positively whether it would be a gain or a loss for the year.
6651. Have you been at the Waratah Colliery for twelve months? Yes.
6652. Do you say that you have made no comparison of these weights for the twelve months that you have been there? No; I have not.
6653. Do you inspect the shafts pretty regularly at Waratah? The shafts are inspected every week, sometimes oftener. They are always inspected on the Saturday.
6654. How are the shafts standing at the present time? Pretty fair.
6655. Do you know that there was a collapse at the main shaft some time ago? Yes; I have heard that.
6656. Have you any cribs in the main shaft? There are no cribs in the main shaft.
6657. Is the main shaft walled? It is bricked down to the solid rock.
6658. Have you looked pretty well about the furnace shaft? Yes.
6659. And about the roadways at the bottom leading to it? There is only one main road leading to the furnace shaft. We have made a new road there recently.
6660. Have you abandoned the old road? Yes.
6661. Why did you do that? Because she was crushing too much.
6662. Was that on the old road? Yes.
6663. Were you afraid that the road would collapse? Yes, I could see that it would collapse.
6664. Do you consider that this new road that you have made will be much safer? Yes, it is perfectly safe. It is on good ground as far as can be seen at present.
6665. From what you saw of that crushing, what opinion did you form of the pillars in that locality? There would be very little pillars there I should think from what I have seen.
6666. What system of work are you carrying out at present? Bord and pillar.
6667. What is the width of your bord? The bords are 8 yards and 12 yards, and we have also narrow bords 4 yards.
- 6668.

D. M'Geachie,  
Esq.  
8 Oct., 1895.

6668. Is this 12-yard bord a new idea? No.
6669. Is it a new idea up in that district? It may be new in that district.
6670. Is it a new idea in Waratah? Yes; it is the first at Waratah that I am aware of.
6671. Had you any difficulty in coming to any arrangement with the men in connection with that system of working? No, not after they got started with it.
6672. Had you any difficulty with the officers of the Miners' Association in any way? No, I cannot say I had. Of course, they did not care about making a start; but after they did, they were quite satisfied with the work. It is very hard to tell what may be called a difficulty with the officers of the Miners' Association.
6673. Had you any difficulty about terms to commence upon? No, none whatever, any more than a consultation once or twice.
6674. Would you call that hostile opposition? Not by any means; it was easily got over.
6675. What pillars are you leaving at Waratah? From 8 yards to 16 yards.
6676. Do you believe in larger pillars being left? Yes; I believe in good large pillars, although those who leave large pillars are often crippled by others who do not leave them, simply because they have less yardage. It does not take so much yardage to work the small pillars. People who work with small pillars can often work at a less cost than people who leave large pillars.
6677. Do you not come in with the large pillar later on? We have not come to that.
6678. Is not that a compensating element? Yes, to a certain extent, of course; but you have to live until you get that.
6679. Do you know that pillar work is worked at a less rate than solid work? I am aware of that.
6680. Do you know that pillar work is worked at a less price than the other work, and will not this compensate you for the yard work? Yes; but you have to look a long while before you.
6681. Does not the Company take the colliery in the aggregate, looking at the question of costs;—do they not look upon the mine as a whole? They have to look to the present as well as the future. We may not get pillars for four or five years, owing to the work that has been done there previously.
6682. What do you mean by that? We do not know how she has been crushing; and if we began to remove the pillars now we might do something detrimental to our own interest. I want to leave something solid between the old work and the new work.
6683. Do you think that is owing to the thin pillars left there previously? Yes; to the insufficiency of pillars.
6684. Does that new road to the upcast shaft give a better outlet? It is more direct for the men who are at work. It is much shorter and more direct.
6685. Has your ventilation been improved by it? It has a little; but we improved the ventilation very materially before making that road.
6686. How is the colliery ventilated as a whole? Fair.
6687. *Mr. Gregson.*] Is the colliery ventilated by furnace? Yes.
6688. Are you still using the furnace? Yes.
6689. Are you putting up a fan? Yes; we are just starting at the foundations now.
6690. *Mr. Curley.*] Is your furnace-man there all day? Yes.
6691. When does he begin work? At 4:30 in the morning, with the fireman.
6692. Do you find any of the rise places difficult to ventilate? We did not work them for some time after starting. At first there was no ventilation there at all, no doubt caused through the crushing in of some of the old workings.
6693. Had you any complaints about the ventilation from the men? No.
6694. Not then? No, there were no men in that section.
6695. Have some of the men complained to you since? I removed ten men from a split last week, through the making of the new road interfering with the ventilation.
6696. What did you do with those men? I put them in at night instead of in the day.
6697. How do you read the present Act, with regard to ventilation [*see Appendix B.*]? I take it that every man must get 100 cubic feet of air per minute.
6698. *President.*] If he has 100 cubic feet of air, has he enough? In some cases he would have enough, and in other cases he would not; it depends altogether on the conditions. In some mines 300 cubic feet of air would not be enough for a man.
6699. Supposing it is not a gassy mine, and 100 feet is going along the airway, and there are complaints about the air, would that quantity be sufficient according to the Act? It all depends upon the conditions. Every mine is under different conditions, and what will suit one mine will not suit another.
6700. *Mr. Curley.*] Take your own mine,—have you any fire-damp there? Yes.
6701. In what district do you find this fire-damp? In the new headings. I work part of the mine with safety-lamps.
6702. Is there much fire-damp given off? Sufficient to warn me to work with safety-lamps.
6703. Does that cover much of your mine? I have only the two prospecting headings going in that way, but we will have a large field of coal there directly.
6704. Have you any fire-damp in the other districts? I have only seen fire-damp in one part of the mine.
6705. If you gave 100 cubic feet of air there, would you consider that the Act had been complied with? Yes; in any district I would be complying with the Act.
6706. *President.*] Why would you be complying with the Act? Because the Act stipulates 100 cubic feet of air.
6707. Will you look at the Act; it says:—
- (2) An adequate amount of ventilation shall be constantly produced in every mine to dilute and render harmless noxious gases, to such an extent that the working places of the shafts, levels, stables, and workings of such mine and the travelling roads to and from such working places shall be in a fit state for working and passing therein.
- (3) An adequate amount of ventilation shall mean not less (as a minimum) than 100 cubic feet of pure air per minute for each man, boy, and horse, which shall sweep undiminished along the airway past each working place.
- What do you say to that? I think an adequate amount of ventilation is sufficient to cover the whole thing, and that it should be left to the management to say what is an adequate amount of ventilation.
6708. Do you mean to say that there is no need for a minimum quantity to be stipulated? Yes; that might cover the faults of careless management. Careful managers will see that they have an adequate amount.
6709. Suppose you have 100 cubic feet of air going through your mine, do you consider that the Act is complied with? Yes, if we have 100 cubic feet of air for every man, boy, and horse. 6710.

- D. M'Geachie, Esq. 6710. Do you think the Act is complied with whether that is enough or not? If you have 100 cubic feet of air you are complying with the Act.
- 8 Oct., 1895. 6711. Does not the Act say, "Not less, as a minimum"? Yes.
6712. You must have 100 cubic feet of air under all circumstances; and if more air is necessary, surely more air must be given? Yes, I admit that; but I would consider I would be complying with the Act if I had 100 cubic feet of air for every man.
6713. What effect do you give to the adequate amount? That it shall mean not less than 100 cubic feet of air.
6714. What sense do you give the word "adequate"? What you think is a fair quantity to keep the place clear.
6715. If 100 feet is not enough, must you not have 1,000 feet if necessary? Certainly.
6716. I do not understand what you mean by complying with the Act. The Act, as I read it, means that you must have 100 feet of air, and just as much more as the men want? I was always under the impression that if you had 100 cubic feet of air for every man you covered the Act.
6717. *Mr. Gregson.*] What do you think now? It is explained now in a very different way.
6718. How do you take the explanation—do you think it covers the Act now as it stands? I do not follow it.
6719. Can you tell us why? Simply because of the words, "not less, as a minimum, than 100 cubic feet of air per minute." If I had that I always thought I was clear of the Act, but in the meantime we have three times that quantity of air.
6720. *President.*] Take a case in which 100 cubic feet of air is absolutely insufficient, do you say you can not be found fault with under this Act? Yes; if you can get 100 cubic feet of air for every man, it must be fit to live in.
6721. Supposing by reason of some external cause, say a blazing hot wind or bush fires, you send 100 feet of air, but still the men are absolutely hardly able to breathe, do you mean to say that you have complied with the Act? So far as any prosecution is concerned I would consider I was clear of the Act, but in a case of that kind I would say that the men would require more air.
6722. Will you look at sub-section 3 and strike out the words "not less, as a minimum, than," and read the clause as it stands without these words;—you clearly then comply with the Act if you give 100 cubic feet of pure air;—these words, therefore, "not less, as a minimum, than," might as well be left out of the Act altogether;—why are these words put there at all? I suppose you can increase it beyond 100 feet if you like.
6723. *Mr. Curley.*] Is not that making the minimum the maximum, as the section stands? No doubt it is.
6724. *President.*] If you say that you have complied with the Act when you give 100 cubic feet of air, is not that making the minimum the maximum quantity, as *Mr. Curley* says? I think the English Act is very clear on that point.
6725. *Mr. Curley.*] Have you had any particular instance, when the inspector has made an examination, where you have just been within the meaning of the Act? It has never been reported to me if that was the case.
6726. *Mr. Gregson.*] Has the inspector ever found fault with any part of the arrangement in your colliery? No; he has been highly pleased with all the alterations that we have made in the ventilation.
6727. *Mr. Curley.*] Have you looked over the proposed new Bill? I have only seen it once, or so.
6728. Have you given any attention to it? Yes.
6729. Were you acquainted with the English Act before this? Yes.
6730. *Mr. Gregson.*] Are you speaking of the Act of 1872? Yes.
6731. *President.*] When did you come out to this Colony? About eight years ago.
6732. Would the Act of 1872 have been in operation when you left England? Yes, about then.
6733. *Mr. Curley.*] Have you read the English Act of 1887? No, I have not.
6734. Do you know the provision in the proposed Bill with regard to the powers of inspectors. Will you look at section 21, sub-section 5, on page 8 [*see Appendix A.*]? Yes.
6735. Do you think that the power to withdraw men in case of danger should be invested in the inspector? I do not think that it should be invested altogether in the inspector.
6736. Why? I think the manager should say whether the men should be withdrawn, as he has the whole responsibility of the mine. He is there continually, and the inspector only glances through the mine, the manager should therefore know more of the details than the inspector.
6737. Should not an inspector know that an inflammable gas is a dangerous thing? Yes.
6738. If there was a difference of opinion between an inspector and the manager about an impending danger, do you think the manager should override the opinion of the inspector? I cannot see why the inspector should have the whole power to stop the working of a colliery.
6739. Do you think an inspector would do such a thing for any trivial little matter? I do not say he would, and I do not think that any manager would keep men in a mine if he thought there was danger.
6740. Do you not think that managers are liable to be mistaken in their judgments as well as inspectors? No doubt they are, but the manager should know more than the inspector, who comes only for an hour, and goes through the place every month or six weeks.
6741. If an inspector has been in the district for a number of years, and is going round these mines from time to time, may he not know as much as the manager? Yes, in a general way, but not as to details.
6742. Are not most of the inspectors men of observation? Yes; and a great many managers are the same.
6743. An inspector comes to a mine for a particular purpose, to examine the mine and use his observation, and to note every passing event he sees? No doubt.
6744. Might he not in particular cases of apparent danger see something prior even to the manager, and know what should be done under such circumstances? I cannot see that he could.
6745. In certain cases, if a manager has a pushing trade to do, might not one of the motives, as far as he is concerned, be to meet his output? No; I do not think that is a manager's views altogether. I think the managers of all collieries have as great respect for the lives of those under them as any inspectors.
6746. Might not that be one of the motives that would weigh with a manager? Yes; he has to get out as much coal as possible.

6747. *President.*] Would the exigency to get a good output, to meet pressing trade demands, make a manager underrate danger? No; not in the least degree;—at all events, it would not do so with me.
6748. While it might not do so with you, are there not other managers besides yourself whose judgments might be affected from this cause? I take it that other managers are as careful as I am, and I would not put men's lives in danger for the sake of a few tons of coal.
6749. If an inspector came to a colliery, and in his opinion he thought it was not safe, and the manager thought it was safe, do you think that the manager's opinion should override the inspector's opinion? The manager, in my opinion, is the responsible man, and surely he would not keep men there under such circumstances.
6750. Suppose an inspector came and saw what he thought was imminent danger, and that serious loss of life might ensue if the men were not withdrawn, but the manager thought otherwise and would not withdraw the men, how would you end a controversy of that kind? If an inspector could point out to me where the danger was to arise from, I might accept his views.
6751. Would not that make the inspector's voice of no effect;—would his opinion not be set on one side in holding to the Act? Suppose the safety of the men is concerned, I do not think the manager would look to the Act; I think he would see first to the safety of the men.
6752. *Mr. Gregson.*] If the inspector could give you reason to think that he has reasonable grounds for apprehending danger, would you not give way? Yes, of course; but I would say that the manager should be the responsible party. The inspector might come and see a little danger, but a great deal of the details he might know nothing about. To know as much as the manager, he would have to know everything from the main downcast shaft to the upcast shaft.
6753. *President.*] You think that the inspector might withdraw the men from a supposed danger? Yes; he might take for a real danger what was only a supposed danger. No man knows these things except the manager, who has charge of the pit. An inspector cannot go into the details of the colliery in the same way as a manager. The manager has everything at his finger-ends, and the inspector has not.
6754. *Mr. Curley.*] Would not an inspector, before he took a step of that kind, converse with the manager and ask his opinion? I do not know that he would; he could snap his fingers in the manager's face with this power.
6755. *President.*] Would you give an inspector power to withdraw the men in case of imminent and immediate danger, with the provision that the manager, if he objected, could appeal to the Minister at once, and have the matter settled by arbitration? I think that power would be a great drawback to the colliery.
6756. In what way? Because the colliery would have to stand while the arbitration was going on.
6757. Do you think an inspector would dare to withdraw the men unless it was in a case of imminent or immediate danger? In the meantime the manager sees the imminent danger, and has the men withdrawn.
6758. *Mr. Gregson.*] Can you imagine a case in which it would be possible for an inspector making periodical visits to the pit to see an impending danger that would not be known to the manager or the overman at the time? I do not think I could imagine such a case; such a thing could hardly occur.
6759. Would not a manager or an overman know what his duty was if he saw impending danger in a mine? Yes; the first thing a manager would think about would be the safety of the men.
6760. *President.*] Would that be the case with all managers; would all managers do that? Any managers I have met would not hesitate to do a thing of that kind.
6761. Have you met many managers? I have met a great many managers in the north and in the south, and I think the first thing they would fly to would be the safety of the men.
6762. *Mr. Curley.*] Can you not understand a difference of opinion arising between an inspector and the manager? I can, in isolated cases.
6763. I will put a case: a mine is giving off a fair quantity of gas, and the inspector goes in and finds the ventilation is not sufficient to cope with the gas, that an explosion may occur at any moment, and he says to the manager, "I am afraid there is some danger in there; I have noticed a certain quantity of gas, and you have no safety-lamps; the men are all working with naked lights, and I think these men ought to be withdrawn until such a time as they are supplied with safety-lamps, or until you get a better current of ventilation"; but the manager says, "No, I think the matter is all right, there is no fear, and I decline to withdraw the men"; would you give the inspector power to withdraw the men under such circumstances as these? I think very few men would do such a thing as that. A manager would never allow men to work with naked lights in the face of gas, and, if the men were working with naked lights, the inspector would not be likely to go in with a safety-lamp to find it.
6764. Do you know that in this Colony an individual instance has taken place at one of the collieries from this cause, where men have worked through a portion of the day, and have come back from their work to take their breakfast, and when they have gone into the mine again a gas explosion has occurred? Where did the gas come from?
6765. It was in the working-place? Where you are working coal there is always a certain amount of risk to be run, and that is a thing that could not be known to the inspector or the manager.
6766. If a series of accidents had taken place from this cause, it must not only have been seen, but it must also have been known. If an inspector said that the men should be withdrawn until better ventilation or safety-lamps were provided, do you think a manager's opinion should override an inspector's opinion in a case like that? I cannot see that any manager would stoop to do a thing of that kind—that he would keep men working, where gas would explode, with a naked light.
6767. If a series of accidents had taken place in a section of a mine, would you not have a knowledge of that, and know that fire-damp was given off; if you did not provide the men with safety-lamps, or withdraw them, and the inspector came round and said that you must withdraw them, would not that be a case for them to be withdrawn? With me there would be a provision to guard against that. If there was gas there, and men were working with naked lights, it would explode before any person could tell. In a section of a mine where such was the case, I would not allow men to work with naked lights.
6768. Would you give an inspector power to withdraw the men in a case of that kind? I should say that the manager of that mine should not be a manager.
6769. Would that help matters if an inspector said the men ought to be withdrawn; should his opinion prevail? I think that is an isolated case.

- D. McGeachie, Esq.  
8 Oct., 1896.
6770. Would you, in such a case as that, give the inspector power to withdraw the men? I think that power should be invested in the management.
6771. If the management will not do it, do you think the inspector should have the power? I think there is a great danger in giving that power to the inspectors.
6772. Might not an inspector, on the other hand, be as good a man as the manager, or even better? Yes, even a better man. I confess they may be better men than I am, but they cannot know as much about the mine as the manager.
6773. Could not an inspector know something about a circumstance like that I have brought under your notice? I cannot think any manager would do such a thing as that.
6774. Would you give an inspector power under such circumstances as these to withdraw the men if the manager declined to do it? No; I would not give the inspector power to withdraw the men.
6775. Would you run the risk? No; I would not run the risk. If I thought there was any risk, the men would not be there for one minute.
6776. Suppose that the roof was crushing down upon a number of small pillars, and you had a number of men working in that district, and you could notice the roof working, and the inspector came along and said, "I am afraid you are going to have a crush here; you had better get the men out," but the manager said, "I do not think there is any great danger; I do not think the place will come in just yet";—would you then give the inspector power to withdraw the men? I do not think it is possible for the inspector to know when a mine would collapse. The nature of the coal and the nature of the roof would have to be taken into consideration. It might crush for weeks and months, and the manager might know, but the inspector could not tell when the crush would come. I think the manager would be the most capable man to give an opinion on a matter of that kind.
6777. Could not the inspector examine the roof, and the pillars, and the floor, as well as the manager? Yes; but you cannot tell by looking at the roof when the roof will fall.
6778. In a case of that description, if the inspector held the opinion that it was unsafe for the men to work, would you not give him the power to withdraw the men? I think the management should have that power; I cannot alter what I have already stated; I think the manager should know a little more than the inspectors, because he hears the pit start crushing, and is there till she falls.
6779. *Mr. Gregson.*] Might not a manager be experienced, an overman be experienced, and a fireman may go his rounds, and still there may be danger half-an-hour afterwards, which neither the manager, the overman, nor the fireman could see? Yes; and nothing in creation could prevent such.
6780. *Mr. Curley.*] Do you think that mining legislation has tended to improve matters of that kind? Yes; but it is impossible to foresee everything.
6781. In the event of your working the mine, and you considered that it was not necessary to withdraw the men, although the inspector had been there and offered his opinion that he considered it was unsafe, could the men come out of their own accord if they thought they should not work;—would you not expect them to stay there and do their work if you thought there was no impending danger? No, certainly not; because the Rule says that if there is any danger they must withdraw at once from where the danger is.
6782. Is not that always subject to your jurisdiction as the manager;—whatever they may think or say, or whatever the Rules say, is not everything subject to your jurisdiction? You cannot ask a man to go into a place where he thinks it is dangerous. I do not think a manager would ask men to stay in a mine if they thought it was dangerous.
6783. Do you think a deputy would? No, I do not think so.
6784. *Mr. Gregson.*] I suppose you can imagine a case where a man did leave his place, and the manager disagreed with him;—would a manager be wicked enough, if a man left his place because it was dangerous, to say that if he did not go back to his work he would have to leave his employment? I do not know any manager that would do such a thing.
6785. *President.*] You seem to think the suggestions made in connection with this clause are worthless, because they point to matters that are unlikely to arise? Yes.
6786. That they are not practicable, or within the range of probability? No.
6787. *Mr. Curley.*] Do you know that there is something in the present Act dealing with the powers of inspectors. Will you look at the 25th section of the present Act, on page 9:—

25. If in any respect (which is not provided against by any express provision of this Act or by any special rule) any inspector find any mine or any part thereof or any matter thing or practice in or connected with any such mine to be dangerous or defective so as in his opinion to threaten or tend to the bodily injury of any person such inspector may give notice in writing thereof to the owner or agent of the mine and shall state in such notice the particulars in which he considers such mine or any part thereof or any matter thing or practice to be dangerous or defective and require the same to be remedied and unless the same be forthwith remedied the inspector shall also report the same to the Minister. If the owner or agent of the mine objects to remedy the matter complained of in the notice he may within seven days after the receipt of such notice send his objection in writing stating the grounds thereof to the Minister and thereupon the matter shall be determined by arbitration in manner provided by this Act in relation to the special rules and the date of the receipt of such objection shall be deemed to be the date of the reference. If the owner or agent fail to comply either with the requisition of the notice given by the inspector when no objection is sent within the time aforesaid or with award made on arbitration within twenty days after the receipt of such notice or the making of the award (as the case may be) he shall be guilty of an offence against this Act and the notice and award shall respectively be deemed to be written notice of such offence. Provided that the Court if satisfied that the owner or agent has taken active measures for complying with the notice or award but has not with reasonable diligence been able to complete the works may adjourn any proceedings taken before them for punishing such offence and if the works are completed within a reasonable time no penalty shall be inflicted. No person shall be precluded by any agreement from doing such acts as may be necessary to comply with the provisions of this section or be liable under any contract to any penalty or forfeiture for doing such acts.

Do you see the power given to an inspector there? Yes.

6788. Do you object to that power? No, I approve of that clause, because it gives time to consider the matter, but to give an inspector power to stop a mine at a moments notice is out of the question altogether.
6789. I think you have assumed that there might be cases of imminent danger where a manager might have to withdraw the men himself? You never know; it might happen in my mine to-morrow. It would not be the first time I have had to withdraw men.
6790. You think that circumstances might arise over and over again where you may have to withdraw the men? Yes; circumstances may occur any day in any mine.
6791. If a manager has to take up this position, what is your objection to an inspector having the same power? Because an inspector may stop a mine for a supposed danger, but a manager knows whether there

there is danger or not, and he will withdraw the men if he sees danger. The inspector may think he sees D.M'Geachie, danger when there is really no danger. Esq.

6792. Suppose a manager had great anxiety for the pit to go on working? I do not think that any manager would stoop to keep men's lives in danger for all the output of the whole of the Newcastle mines. 8 Oct., 1895.

6793. Do you know that there is a colliery in the northern district where the inspectors have never been satisfied as to its safety? No doubt the manager is satisfied that the mine is safe, otherwise he would not be going on working.

6794. Would you care to take up a position of that kind yourself? I would rather not answer that question unless pressed to do so.

[Witness withdraw.]

WEDNESDAY, 9 OCTOBER, 1895.

[The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.]

Present:—

FRANCIS EDWARD ROGERS, ESQ., Q.C., PRESIDENT.

JAMES CURLEY, Esq. | JESSE GREGSON, Esq.

George Wright Batey sworn and examined:—

6795. *President.*] What are you, Mr. Batey? I am Council Clerk at Greta.

6796. Have you followed any other occupation? Yes; I have been a coal-miner.

6797. What collieries have you worked in? I have worked at Greta, the Glebe, and East Waratah Collieries, and I have been coal-mining in England. 9 Oct., 1895.

6798. Where have you been working in England? In the Newcastle coal-fields, in the county of Northumberland.

6799. *Mr. Curley.*] What collieries have you worked at in England? In the West Wylam Collieries, under the Mickley Coal Company.

6800. Did you work long at West Wylam? I went into the West Wylam Colliery when I was about 14½ years of age.

6801. What was the system of working there? Bord and pillar.

6802. What was the width of the bords? 4 yard bords—12 feet.

6803. What was the size of the pillars? 16 yards by 22 yards.

6804. Was the bord 22 yards in length? Yes; 22 yards in length, and 4 yards wide. The cut-throughs were 22 yards apart; what we called walls.

6805. Do you know the depth of that mine? I am not certain. There were tunnels, and I think the depth would be about 200 feet; possibly less.

6806. What was the thickness of the seam? There were several seams.

6807. What was the thickness of the seam you worked in? I worked in them all; they ranged from 2 feet 3 inches to about 4 feet. There was one seam they called the yard seam, which was practically speaking 3 feet thick.

6808. How was the ventilation conducted; was any brattice used? Brattice was used where necessary of course. The ventilation was pretty good owing to the bords being shorter, and the thickness of the seam.

6809. Was that mine ventilated by furnace or by fan? By fan.

6810. How long have you worked at the Greta Colliery? For about three years, as near as I can recollect; up to about four years ago.

6811. Did you work in different parts of the colliery? Yes.

6812. Are you acquainted with almost the whole of the workings of the colliery? Practically speaking, yes.

6813. Did you ever do any check inspecting at that colliery? Yes; I was check inspector for about 8 months.

6814. Is the Greta seam on an angle to the rise? Yes; it dips about 1 in 5 or 1 in 6; or from 10 to 12 degrees.

6815. Does it rise in the same proportion in the opposite direction? Yes.

6816. Did you ever notice any defects in connection with the ventilation when you were there? Yes.

6817. What was the nature of these defects? The principal thing would be the want of ventilation at the working face. Want of canvas, or some artificial means of carrying the air to the face, was the principal defect.

6818. Did you always find sufficient air in the headings, or in the air course? As a rule, we found a sufficient quantity of air in the main levels to meet the requirements, taking it on the average.

6819. *President.*] What do you call a sufficient quantity of air? Allowing 100 feet of air per man, according to the wording of the Act.

6820. *Mr. Curley.*] Did you find the minimum quantity of air there? Yes.

6821. *President.*] Was that enough? Of course, going by the Act it was.

6822. Was it enough for the men? My opinion would be that it was not enough.

6823. Do you think that there ought to have been more air in the airways? I think so.

6824. *Mr. Curley.*] On the main level, near the working place, did you find the air as brisk as you found it on the main roads? No; I have with me a diagram, that will illustrate what I wish to point out, if it is admissible [*Diagram produced, see Appendix 2.*]

6825. What does this diagram represent? A pair of levels; it is a sectional plan. Eight men are working at the faces. A being the last cut-through the full quantity of air for these eight men, exclusive of wheelers and horses—that is, say, one horse and one wheeler—should go through B; and the minimum quantity would be 1,000 feet of air, but back in the main level from about (say) half-a-dozen to ten cut-throughs the quantity, although being found there, was not found in the last cut-through. We could not get a revolution of the instrument at A, because the air was sealing through the previous cut-throughs, and the men were complaining about the air being bad. 6826.

- Mr. G. W. Batey. 6826. How far was the ventilating current from the other places? It would be within the 35 yards if properly conducted, but the air was seeping through the old cut-throughs.
- 9 Oct., 1895 6827. The air did not come up to the working-place? No.
6828. What district did that represent? It was either the No. 1 or the No. 2 South level, on the north side of the pit. I would not be sure whether it was the No. 1 or the No. 2 level. I have another diagram referring to another district, called the Long Gig District. [See diagram, Appendix G 2.]
6829. Was there a defect there? Yes; I had to call the Government inspector's attention to this matter.
6830. What does that diagram illustrate? The same defect, but there is a technical point raised on this plan. With reference to the measurement the Act prescribes 35 yards, and the underground officials were taking their measurements from the level. The men complained of the deficiency of air when firing shots, and they had to come out for half-an-hour, until the smoke partially cleared away. As check inspectors we based our measurements from the air current on the main level, and the underground official took his measurements from the bottom of the heading, consequently the distance of the bord was less than 35 yards according to his measurements, and, according to our calculations, 38 yards. The Government inspector made a special inspection of this particular locality through our having to report the matter.
6831. Were you present at this inspection? Yes. Mr. Bates and Mr. Humble, Government inspectors, the manager of the colliery, two underground officials, and myself and colleague were present.
6832. What locality was that in? It was on the top of the Long gig, on the south side of the shaft.
6833. Whose view of the matter did the Government inspectors bear out? They substantiated my view of the matter.
6834. Did they uphold the views of the check inspectors? Yes.
6835. That the working-place was in advance of the air-current? Yes; it was 3 yards over the distance.
6836. Was there any brattice used there at all, to conduct the air into that particular place? None whatever.
6837. Would the air be deficient there, apart from the shot-firing? Yes.
6838. Was that to the rise of the mine? Yes. Being to the rise, irrespective of the firing, the impure air would stop in the place.
6839. There was nothing to drive it out? Nothing, except the passage of the skip.
6840. What means do you think should have been adopted;—what was done? Nothing was done.
6841. Was nothing done after the inspectors were there? Nothing was done till the No. 2 cut-through was put through. When the No. 2 cut-through was put through, bratticing was put across No. 1 cut-through, and consequently the air was forced up to No. 2 cut-through, past the bottom of the heading; that, of course, brought it within the distance.
6842. Did the manager endeavour to get that cut-through over as quickly as he could? Yes; they had just commenced it at that particular time.
6843. What was the thickness of the cut-throughs at that time? 8 yards, I believe.
6844. Had you many complaints about the ventilation when you were going your rounds as check-inspector? Yes; I had once a case of my own, that I had to draw the attention of the officials to, of the same nature.
6845. Was it a case similar to the one you have referred to? It was not the same distance; it was within the distance, but the air was quite as deficient.
6846. Do you mean to say it was not over the 35 yards? Yes; it was under the 35 yards.
6847. And was the air still defective? Yes; I had to leave the face on account of the bad air affecting my head.
6848. You suffered personally from the effects of bad ventilation? Yes.
6849. Had you to leave the colliery? No; I had to leave the working-place and go down to the level to get fresh air.
6850. Did you complain to the manager about this? No, to the underground official.
6851. What did he say when you made these representations to him? He remarked that it was not as bad as the C Pit. The C Pit had a particularly bad name at that time.
6852. Did you get any redress in connection with this matter? None whatever. I remarked, what had the C Pit to do with it?
6853. Do you think that some steps should be taken to get the ventilation into the working-place? Yes; particularly with a seam of the nature of the Greta seam, owing to the amount of pitch.
6854. Do you know anything about the proposed Coal-mines Regulation Bill? I have not had an opportunity of going through it carefully. I have glanced at the ventilation clauses.
6855. Will you look at section [50] 47, rule 1, on page 23 of the Bill; the words crossed out and the words in large letters denote the amendments, made by the Legislative Council, and without the erasures the clause reads as it was originally drafted (see Appendix A);—will you read the clause as it was originally drafted? Yes.
6856. Do you notice that it is proposed by the Legislative Assembly to make the minimum quantity of air 150 cubic feet, and the cut-throughs 25 yards? Yes.
6857. The Legislative Council erase these provisions, and think the word "adequate" will meet all that is required, and they substitute 35 yards, for 25 yards with regard to the cut-throughs. Do you consider, that the proposed minimum quantity of 150 cubic feet, should be adhered to in the Bill? Yes, I think it should be adhered to.
6858. Are you of opinion that the word "adequate" would meet the case? I do not think so; one man's opinion might differ from another man's opinion on that word.
6859. What have you to say about the 25 yards? I think it is quite enough; I think 35 yards is considerably more than it should be.
6860. Do you find the air stagnant going to the rise at Greta? Even at the 25-yards in a mine like the Greta Mine it would require some bratticing. Places might be 20 yards in, or less, and then I have known complaints to be made. The specific gravity of heated air being less than pure air, consequently it must lodge in the face.
6861. Was the mine ventilated by fan or by furnace? When I first started to work in the mine, in 1888, the furnace was in operation.
6862. Was there a fan in operation later on? Yes; Mr. Robertson put up a fan, and abolished the furnace.

6863. During the periods you have referred to, with regard to the defects in the ventilation, was that during the time the fan was there, or during the time the furnace was there? I am under the impression that it was after the fan was in operation; it was in the time of the fan.
6864. Will you look at section [49] 46, sub-section 3, on page 23 of the Bill (*see Appendix A*). You will see a provision there for bratticing the places. The section proposes that the air shall be taken by brattice or otherwise to within 15 yards of each working-place. What do you think of this provision? It would be an improvement.
6865. Do you think it would be a great improvement on the present system? Decidedly.
6866. Do you think that brattice would be a very costly matter to the mine-owners? It is a thing I have never worked out, but I cannot see that it would be a costly matter.
6867. Have you given the matter any consideration? No; not to go into figures.
6868. Is the Greta Colliery a dry colliery? Yes; but there have been places wet to the dip.
6869. What is the average height of the seam? The working seam upon an average is about 8 feet high, and to go up to the brassy tops it would range from 12 to 15 feet.
6870. What is the usual height that is worked? When I was in the colliery it was worked from the floor up to the white stone, something like 8 feet, and I have known it 6 feet.
6871. Have you a lot of gob refuse in the mine? Yes, a good deal; there was more gob there than any other colliery in the district as a rule.
6872. Is that owing to the refuse you got out of the seam? Yes.
6873. Do you think that any portion of that refuse could be utilised on the side of the road, to act as a conductor in connection with brattice, to gob up a portion of the side? I dare say it could be utilised.
6874. Is there much brattice used in that mine? I should say, as a rule, very little, and only in the main levels. I have worked in main levels where bratticing was carried up to the prescribed distance in the Act.
6875. Was that in the leading roads? Yes; where there was gas.
6876. Is there fire-damp given off at Greta? Yes; I was nearly burnt once, and I have heard tell of other men who have nearly been burnt by the explosion of gas.
6877. Have you heard tell of any accident occurring from gas exploding? I have not heard of any serious accident; just a little singe.
6878. Have you known of any men being incapacitated from following their work through gas exploding? No; not during the time I have been at Greta.
6879. When you were check-inspecting, had you occasion to draw the manager's attention to the gas? No, I cannot say that I have.
6880. Do you always look upon it as an important matter where there is gas given off—fire-damp? Yes; the only danger with gas was in some of the leading places.
6881. Was that where you were winning out new ground? Yes.
6882. Did you ever work any pillars at Greta? No, I have never done any pillar work at Greta.
6883. Did you see any pillars worked there? Well, scarcely; I have seen places going loose at one end; two bords running together.
6884. Do you mean to say that you have seen pillars cut through when working a bord? I would not say that was the case, but I have known one bord that was working alongside of another old one; the two places were not going at the same time.
6885. Were the bords driven by any line? As a rule, they were; it was compulsory in Greta. It is a different seam as far as the cleavage is concerned. The backs or facings do not run parallel as in other seams.
6886. Was there any large fall, while you were at Greta, in connection with pillar-working? Not that I am aware of.
6887. Do you know anything about the system of weighing at Greta? The system was an average; they do not weigh every skip.
6888. Do you know that there is a proposal in the Bill to shorten the hours of employment to eight per day (*see Appendix A*)? I believe there is.
6889. Will you look at section 36, on page 17 of the Bill,—what hours did you work at Greta while you were there? I went down before 7 o'clock.
6890. When did you come out? After 4 o'clock. The hours for winding were from 7 o'clock to 4 o'clock, exclusive of the meal hour—from half-past eleven till half-past twelve.
6891. Do you live in Greta at the present time? Yes.
6892. Have you lived there since you left the mine? I have lived in Greta for seven and a half years.
6893. Have you ever heard the men discussing this question of eight hours amongst themselves? Yes, I have often heard them talk about it.
6894. Do you think the men wish the hours to be regulated by Act of Parliament? Decidedly; that is the expression of opinion I have heard.
6895. As far as you can form an opinion yourself, do you think this can be better managed by mutual arrangement, or would you rather see it done by Act of Parliament? I would rather see it done by Act of Parliament.
6896. Do you know any of the reasons the men advance for this opinion? I know the reason I give myself, and that is,—that under present conditions the men are not in a position to make a bargain that would be satisfactory to them.
6897. You think that the men are not in a position to come to a mutual arrangement on this matter? No; they are not, simply on account of the conditions under which they are working. They would have the worst of the deal in the position they are in; they are not able to do it.
6898. You think that at the present time the bargain is all on one side? Yes; that is what I mean.
6899. Do you think it would be a very difficult matter to arrange the working hours under present conditions? Yes; decidedly it would.
6900. Do you think the output could be got at the Greta Colliery that the company would wish by working the eight hours. Could they get the same aggregate output? Yes; I think, on the whole, the same output could be got.
6901. Are there many men employed at the Greta Colliery. Has the Colliery much trade? As a rule they go up to 700 tons per day; I am speaking of the time when I was connected with the mine.
6902. Did you always think that eight hours was long enough to be in the mine yourself? Rather.

Mr.  
G. W. Batey.  
9 Oct., 1895.

- Mr. G. W. Batcy.  
9 Oct., 1895.
6903. Did you work shorter hours in England? Yes; considerably shorter hours; five or six hours a day in the seventies. The back shift worked from 10 till 4.
6904. What time did you go down the mine? The front shift went down at 4 o'clock, and the back shift men went down at 10 and relieved the front shift men. The back shift men came out again at 4 o'clock or 4:30.
6905. Would the pit not wind from 6 till 10 o'clock? No; from half-past 6 till half-past 4 o'clock.
6906. Would that not virtually make your hours about six and a half hours? Yes.
6907. By the time you got out of the mine? Yes.
6908. Do you think the men are asking for anything very unreasonable when they are asking for eight hours to be stipulated in an Act of Parliament? I do not think so; practice has proved that as much coal is got out, if not more, during the shorter hours in England than the longer hours.
6909. Do you think that the same thing would apply to every mine? I think so.
6910. Are you speaking of the aggregate output? Yes; we could always do as much in the shorter hours as we could do in the longer hours. The men would work a little harder.
6911. With better ventilation in the mine, and shorter hours of working, you think that men could apply themselves more vigorously to their work? Yes.
6912. Were the wages reduced in any way under the system you have mentioned? Oh, no.
6913. Did you still earn the same amount of wages as you did under the longer hours? Yes.
6914. Had you worked there when the hours were longer? These hours I have given were the longer hours; the hours were shortened a little afterwards. The hours had been from half-past 10 to 4 o'clock, and they came back afterwards to from 10 o'clock till half-past 4 o'clock.
6915. Had the hours been longer than this at one time? Yes, before I had any experience at a coal mine myself.
6916. When that joint inspection took place at Greta, do you know whether the inspectors enjoined upon the manager the necessity of getting more vigorous ventilation? I cannot remember anything said of that character; there was nothing said in my presence.
6917. Will you look at section 21, sub-section 5, on page 8 on the Bill (*see Appendix A*), and read the clause over? Yes.
6918. Do you see that that sub-section gives an inspector power to withdraw the men in case of danger? Yes.
6919. Do you think that an inspector should have that power, or do you think the power should be left in the hands of the manager? I think the inspector should have the power, myself.
6920. Do you think the manager would withdraw the men at all times in case of danger? I would not trust some of them.
6921. Do you think that in many cases he might leave the men working in the mine until they came out of their own accord? I think so; I think the Government inspector should be better able to judge than the average manager.
6922. Do you think that the inspector would stand in a more independent position than the manager in a matter of that kind? I think so.
6923. Do you think there would be anything to harrass his mind, such as getting the output out of the colliery? Not a bit of it.
6924. From what you have seen in the Greta mine do you think that an inspector wants more power? I think so.
6925. *Mr. Gregson.*] Do you mean that he wants more power, or that it is desirable that he should have more power? I think it is desirable that the inspector should have more power.
6926. *Mr. Curley.*] Did you ever know of any creep at the Greta Colliery? When I was in the mine there was nothing of any consequence, but I have heard enough about it since.
6927. What have you heard about it? I have heard possibly the whole of the history, as far as conversation is concerned.
6928. Was this information received from men that worked in the mine? Yes.
6929. And who knew about it? Yes.
6930. What did they tell you? I have heard men say that it was a danger, and go as far as to say that it was causing danger to the shafts of the colliery. The Greta shaft was in the vicinity of the creep.
6931. Which shaft do you refer to? The main shaft.
6932. Have you heard men who were working in the mine express themselves in this way? Yes.
6933. When was this? The first start of the creep was about 1889 or 1890. What makes me remember this is that while going in and coming out of the mine I have sometimes seen officials taking away crushed coal and dirt from the side of the travelling road.
6934. Have you seen that yourself? Yes.
6935. Did that give you an idea that there was a crush on? Yes; as a practical miner I knew what it meant.
6936. Was that far from the shaft? Not more than from 5 to 10 chains—10 chains possibly.
6937. Do you know the size of the shaft pillars anywhere near the shaft? I cannot say. While going my rounds as check-inspector I have noticed a great space, just in behind the main level, where the coal had been all taken away. It has been generally stated that the shaft pillars were not of sufficient size.
6938. When the check-inspectors saw this did they move the company to take steps to try and chock it? Not that I am aware of.
6939. By putting in chocks? I cannot say chocks, but I have seen large timber put in. I may state that even the officials considered those dangers, inasmuch as they dare not make a little road past the shaft bottom for any skips. It was, however, done ultimately.
6940. Did you ever inspect the shaft while check-inspecting? No; we would have had to do that at night-time.
6941. Did you not consider that part of your duty? I did at that time, but of course there were obstacles in the way.
6942. Do you think the company would have offered any objection? I cannot say; I never asked them.
6943. Did you ever notice anything wrong with the shaft yourself? I cannot say that I have ever noticed anything wrong. I have heard from the men at the bottom of stones coming down the shaft on several occasions.

6944. *President.*] Do you mean stones falling from the sides? Yes; loose ground falling from the sides.
6945. *Mr. Curley.*] Did you hear of this at the time you were check-inspecting, and if so, did it not imbue you with the idea that the shaft should be inspected? I knew that the check-inspectors had no power to do anything in connection with the matter, at least the Act did not provide any power.
6946. The check-inspectors are there to draw attention to any grievance; should they not have drawn attention to the condition of the shaft? Yes; but I was under the impression that the Government-Inspector knew as much about it as we did.
6947. Do you not know that the Government Inspectors are not always on the spot—that they only come at intervals? I would not say the Inspectors' attention was not drawn to it, but we never drew his attention to it.
6948. Had you not the power to inspect the shaft as check-inspectors? Yes.
6949. Do you know that the Home Secretary has requested the inspectors at Home to take notice of anonymous communications? No; I did not know that.
6950. Do you believe that substantial pillars should be left at all times in a mine? I think so. I think it would be both economical and safe.
6951. Are the pillars got out at less cost by leaving larger pillars? I think the management get a larger percentage of good coal from the large pillars.
6952. Is the coal got out at a less price? Yes; pillar working is done at a less price.
6953. By leaving larger pillars would you not get the coal at less cost, and better coal? Yes, because it would not be crushed so much.
6954. *President.*] Do you know that under this Bill managers must pass an examination;—and, if so, don't you think they would know the best way of working a mine without it being laid down by law? Yes; but we also know that two managers differ, even in England, where the Act is so strict in these matters, but I am not sure whether the English Act provides for the size of pillars.
6955. The English Act has no provision in this respect? I was under the impression the size of pillars was in the English Act.
6956. In England it is left to the manager if he is a competent man, and is not that the best way? Yes, if he is a competent man.
6957. *Mr. Curley.*] Do you know that in this Colony there have been a series of crushes owing to small pillars? Yes.
6958. Would you be disposed to say that there should be no limit to the size of pillars? I think there should be a limit in the Bill.
6959. Do you know that there is no provision in our present Act with regard to the size of pillars? Yes.
6960. Do you know that every manager has had absolute freedom in this respect? Just so. I think it would give greater power into the hands of the inspector if there was a limit to the size of the pillar.

[Witness withdrew.]

Mr. William Kennedy sworn and examined:—

6961. *President.*] What is your name? William Kennedy.
6962. What are you? I am a coal miner.
6963. Where? Greta.
6964. How long have you been at Greta? About seven years.
6965. Where were you before you went to Greta? I was at New Lambton before I went there.
6966. How long were you at New Lambton? About two years.
6967. Where were you before you went to New Lambton? I was at Burwood.
6968. In this Colony? Yes; in what they call the Old Burwood mine.
6969. How long were you at Burwood? Only a few months.
6970. Where were you before you went to Burwood? At Minmi.
6971. How long were you at Minmi? About three months.
6972. Where were you before that? In New Zealand.
6973. Were you coal-mining in New Zealand? Yes.
6974. How long were you in New Zealand? About three years.
6975. What part of New Zealand were you working? At Brunner, about 7 miles from Greymouth.
6976. Was that a coal mine? Yes.
6977. How long were you at that mine? About three years at that mine.
6978. Where were you before that? I was in several very small places on the east coast of New Zealand; at one place called Springfield.
6979. Were you ever in England? No; I have been in Scotland.
6980. Were you coal-mining in Scotland? Yes.
6981. *Mr. Curley.*] How long have you been at the Greta Colliery? Seven years.
6982. *President.* How long were you coal-mining in Scotland? Well, I was reared there; I would be in the mine about six or seven years I should think.
6983. Were you getting coal there? Yes, I was getting coal before I left England. I wrought in the mine as a boy and got coal afterwards.
6984. Did you go to New Zealand from Scotland? Yes.
6985. *Mr. Curley.*] Have you virtually been following mining the whole of your life? Yes, nearly the whole of my life.
6986. Were the seams you worked in in Scotland very thin seams? Some of them were thin seams.
6987. What was the thickness of the seam? The first mine I was in the seam was about a yard thick, and the other seam in the same pit was about 5 feet 6 inches thick.
6988. Were there many men employed in that mine where the seam was 5 feet 6 inches thick? Yes, a large quantity of men.
6989. Were there more than 100 men? Yes.
6990. Were there 200 men? It may be about 200.
6991. How long is that ago. It might be fourteen years. I can hardly say the exact date.
6992. Were you working under the English Act of 1872 when you were in Scotland? I was only young when I was there.

Mr.  
G. W. Batey.  
9 Oct., 1895.

Mr.  
W. Kennedy.  
9 Oct., 1895.

- Mr. W. Kennedy, 9 Oct., 1895.
6993. *President.*] What years were you working in Scotland? About twenty-seven years ago.
6994. How long is it since you left Scotland? I left Scotland about fourteen years ago.
6995. *Mr. Curley.*] Is it about fourteen or fifteen years ago since you worked in the 5-ft. 6-in. mine as a working miner? Yes; the seam was about 5 feet 6 inches thick when I left there.
6996. Was it worked on the long-wall system, or bord and pillar? The last mine I worked in was bord and pillar.
6997. Can you recollect how that colliery was ventilated? Yes.
6998. Do you know the width of the bords? Eight feet; they drove them this width to get to the boundary, and left the pillars 10 yards square; they drove to the boundary, and worked the pillars backwards.
6999. What distance would you go before you put a cut-through over? Ten yards.
7000. Did you have a cut-through every 10 yards? Yes; the pillar was 10 yards square, or supposed to be.
7001. Was there good ventilation in the mine? Very good.
7002. Was it fan or furnace ventilation? I am not positive.
7003. Did you work in different parts of that colliery? I only wrought in one section of it.
7004. Coming to the Greta colliery—you say you have been there seven years? Yes.
7005. Have you worked in all the different parts of that colliery? I have wrought in every district—in nearly every part of the pit.
7006. *Mr. Gregson.*] Are you still working at the Greta Colliery? Yes.
7007. *Mr. Curley.*] What has been your experience at that colliery with regard to the ventilation? The ventilation has been very slack.
7008. Has that been confined to certain sections of the mine, or are you speaking in a general way? Some sections in the pit are worse than others; some of the rise sections, are particularly deficient.
7009. Did you always find the rise sections the worst? Yes.
7010. *President.*] Does not the air travel to the rise? Not very well.
7011. *Mr. Curley.*] Have you ever acted as check-inspector at Greta? I have.
7012. How long have you acted as check-inspector? I believe for six months.
7013. Is this some time ago? Yes, a good while ago, about the latter part of 1891.
7014. When you were acting as check-inspector, had you to draw attention to defects in the ventilation? Yes, several times.
7015. What were the nature of the defects; were they that the air was not getting up to the working face? Part of the difficulty was, that the air did not get up to the working face; I do not think the current of air was large enough.
7016. Have you any check-inspectors' reports with you? I have.
7017. Do they refer to when you acted as check-inspector yourself? Yes.
7018. Are there any defects mentioned in these reports? Yes.
7019. Will you let us know what these defects are? This is an inspection made in the rise workings on the 7th, 8th, and 9th October, 1891:—

Miners' Inspection Report of Greta Colliery, 7th, 8th, and 9th October, 1891.

MAIN intake for No. 3 split, little jig workings, taken top of jig: 3,932 feet for forty-two men, boys, and horses, giving an average of 93½ feet of air per minute. We found the air very slack in this section, owing to the canvas regulator being out of order bottom of long jig.

We found three canvases in need of repairs in No. 4 split, straight in between front and back level, allowing a large quantity of air to escape.

(Signed) ROBERT HINDLEY,  
WILLIAM KENNEDY,  
Miners' Check-inspectors.

7020. Have you any other reports that you wish to refer to? Yes; but they are not my own inspections.
7021. Will you tell us what these reports say?

Miners' Check-inspectors' Report of Greta Colliery, May 8th, 9th, and 11th, 1891.

MAIN intake of little jig workings, 2,838 cubic feet per minute for thirty-six men and horses, allowing each 78 cubic feet per minute.

Report that the air is deficient in little jig No. 3 split. We could not get the anemometer to register in any of the cut-throughs next working places, owing to canvases being in a bad state of repair and cut-throughs not filled up; canvas wants repairing at bottom of No. 16 heading.

(Signed) ROBERT DUNN,  
ROBERT HINDLEY,  
Miners' Check-inspectors.

7022. Have you any other reports of inspections? I have another report for the same year on the same place.

7023. What does this report say?

Miners' Check-inspectors' Report of Greta Colliery, March 23rd, 24th, and 25th, 1891.

Main intake for No. 2 Split, straight in, 3,465 cubic feet per minute for thirty-four men and horse, allowing each 102 cubic feet of air per minute.

(Signed) ROBERT DUNN,  
JAS. L. FERGUSON,  
Miners' Check-inspectors.

7024. *President.*] Will you look at rule [40] 38 on page 30 of the Bill, "Periodical inspection on behalf of workmen"—(see *Appendix A*)—do you see the words there, "Not being mining engineers, who are practical working miners"? Yes.

7025. Looking at the fact that mining engineers may make it their business to get appointed, and might get a knowledge of any mines, don't you think these words that I have drawn your attention to are properly left in the rule;—if you have facilities for making the appointment, would not your own men, or any two men from another mine, who are not mining engineers, quite satisfy you? So far as the check-inspecting of the mine is concerned, I think we could do without mining engineers.

7026. *Mr. Curley.*] Do you think that check-inspectors should be men appointed from the colliery? I would be in favour of men being appointed from the colliery, as long as the colliery was of the standing, say of 100 men. Where there is a greater number of men, you always have practical men to appoint.

7027. Do you know that in a small mine, it is difficult to get these men appointed? Yes; I am aware of that.

7028.

7028. *President.*] Have miners friends in other mines? Yes; always some friends in different mines.
7029. *Mr. Curley.*] Would not that create some friction in some places;—might not the managers object to them leaving? I believe there would be friction if strangers were coming about a mine appointed from other places.
7030. *President.*] Would there not be friction also if they were men who made a regular business of making these inspections? Yes; I think the engineers would be the worst.
7031. *Mr. Curley.*] I am putting it, that in a small mine they might not be able to get men of their own, and might wish to bring two men from some other colliery, and the manager might object to these men leaving their work to come and do this work, and then there could not be any check inspection, unless they appointed them from their own number? Yes; there might be friction in that way.
7032. Do you think that the men to be appointed should be men from a particular colliery itself? Taking the district as it stands, I believe in men being appointed at the colliery.
7033. Have you noticed any defects in connection with the ventilation at other collieries you have worked at in the northern district? Not very many. One of the collieries was worked on the long-wall system, and the ventilation is always good there.
7034. Was that the New Lambton Colliery? Yes.
7035. Would the current of air sweep right round the working face? Yes, it was sometimes very cool. I was close to the shaft-bottom at Burwood, working near the shaft-bottom, and at Minmi, of course in the new tunnel, there was always a very good current of air.
7036. Was that in the Duckenfield Mine? They call it the new tunnel.
7037. How many years ago is it since you were there? Between nine and ten years ago.
7038. Were there very many men employed in that tunnel? At that time I think there were about 150 men—there may have been more.
7039. How long were you at Minmi? About three months only.
7040. Did you work in all parts of the pit? No, only in one section of the mine.
7041. Have you given any attention to the question of pillars in a mine? Yes.
7042. Have you noticed anything in connection with the pillars at any of the collieries where you have been employed? Yes, at Greta, when she took the creep.
7043. Were you at Greta when this creep took place? Yes.
7044. Were you working at the colliery at that time? Yes.
7045. Did this creep affect many of the pillars? They had to draw one section of the dip workings altogether; it affected between forty and fifty places, and they had to take the men out.
7046. Where the men were withdrawn did they timber the places, or did the places come in? They only timbered close to the main headings, and no one was allowed back off the main road.
7047. Did they stop the place? Yes.
7048. What section of the pit was that in? The north side of the dip.
7049. Is that the only place where you have noticed the pillars thin? They were thin, on the straight, in the south side.
7050. Is that in addition to the other place you have mentioned? Yes.
7051. What did you notice in this part? That the place was generally working and throwing coal off the pillars, and they stopped the splitting of some of the pillars there.
7052. Were they splitting pillars? Yes.
7053. And did they stop splitting these pillars in consequence of this creep? Yes.
7054. Does that impress you with the idea that larger pillars should be left in these collieries? Yes; a lot of places want larger pillars, and especially when they are next the main roads.
7055. Away from the main roads have you to go on to interior workings further in? Yes.
7056. Do you regard the principal headings as the main roads when you get further in? Yes.
7057. Do you think there should ever be any doubt about the size of pillars? Pillars should always be of sufficient size.
7058. Is that a man's only escape if anything occurs? That is the only way if they come down to get out.
7059. Do you think the Bill should stipulate there should be a minimum size for pillars? Yes.
7060. Would you leave that matter in the hands of the manager? No.
7061. Do you think that there should be legislation on the eight hours? Yes; I think it is long enough for any man to work.
7062. Say it has been a slack week, that there has been nothing to do all the week, Monday, Tuesday, Wednesday, and Thursday have gone by, and on the Friday there is some pressure, and you want to earn a little more money, would you like to work ten hours to make that money, owing to the slackness of trade during the week;—would you let a man do that? It is my opinion that in eight hours a man does a sufficient quantity of work—that he does all that is required.
7063. Do you think that is the general opinion amongst the miners? Yes; I believe it is the general opinion of all the miners in the district.
7064. *President.*] Would you like to send a man to gaol for working eight and a half hours? Yes; in a general way.
7065. *Mr. Curley.*] Did you work under the eight-hour system in New Zealand? It was in full operation when I left.
7066. Was that agreed to mutually between the men and the manager or was it the law? I would not like to say it was the law.
7067. *President.*] When did you leave New Zealand? About ten years ago. We used to be called out of bed at any time, and we were practically there and dare not move away at any time of the day. At 7 o'clock at night sometimes you would be called away, but the men and the manager came to an understanding that the front shift would go to work at 6 o'clock and the back shift at 9 o'clock. It worked very well, and the trade increased instead of going away; but whether this was owing to the new system I will not say.
7068. Under what conditions did you work? Under the new system we were free to go away, on what we call an idle day.
7069. Do you say that trade increased on account of this? No; but it did not decrease.
7070. *Mr. Curley.*] Was it a fact that the trade did increase notwithstanding the alteration in your hours? Yes.

Mr.  
W. Kennedy.  
9 Oct., 1895.

- Mr. W. Kennedy. 7071. You had a definite time of going in and coming out? Yes; that was agreed to and not broken.
- 9 Oct., 1895. 7072. How long was this system in operation before you left New Zealand;—was it an eight-hour system? Yes; strictly eight hours.
7073. How long did you work under this system? I believe about two years; the last two years I was at that mine.
7074. Was there any hitch between the men and the managers about the hours when this system was once adopted? No, there was never any hitch between the managers and the men.
7075. Would you judge from that that the system worked satisfactorily? Yes; I base my judgment on that.
7076. Will you look at section 21, subsection 5, on page 8 of the Bill, "to require the manager to withdraw the men in case of danger" (*see Appendix A*);—do you think that the power given in that section should be invested in the inspector? Yes, if he sees the danger necessary for doing so.
7077. *President.*] Do you think a manager would risk the men's lives if he saw pressing danger? I would not like to charge a manager with risking men's lives, but I think the Government inspector should have power to withdraw the men.
7078. *Mr. Curley.*] Is it not possible that the manager might have a different opinion to the inspector—that he might be anxious to get out a quantity of coal, and that might weigh to some extent with him—I do not say that it would make him keep the men there, but he might think he could get another day's output without withdrawing the men? I think it is possible such a case might arise.
7079. *Mr. Gregson.*] Do you think the men have power to leave where there is danger? That would be to set up the men's opinion against the manager's.
7080. If the danger was great, would you want the manager's permission to come out of the mine? No, not if the danger was great. If the danger was great you would come out to see the deputy, and he might say the place is quite safe, and then, if you should leave the mine, perhaps you might be wrong. You would have to put your opinion against his.
7081. *Mr. Curley.*] Has not the manager the discipline of the mine, and are not the men subject to his control? Yes.
7082. Has not that very frequently great weight with the men? It has.
7083. As to whether they will come out in opposition to the manager's opinion? A man must see great danger before he will come out in opposition to the manager.
7084. In the case of those pillars working, did you say the manager withdrew the men from there? Yes.
7085. Do you think the men would have come out if the manager had not withdrawn them? They were still working when the manager withdrew them.
7086. Did they feel over-satisfied upon the matter? There was a lot of talk about it.
7087. Did they look to the manager to withdraw them? Yes.
7088. Did they come out till the manager withdrew them? No.
7089. In the event of an inspector coming to the colliery, and the manager not seeing fit to withdraw the men, and the inspector thinking they should be withdrawn, should the inspector have power to act in that case? Yes.
7090. Would you give the inspector that power under the Bill? Yes.
7091. Did you ever inspect the Greta shaft when you were there? No.
7092. Did you ever inspect the main shaft? No.
7093. Did you not consider it a part of your duty to do so? No, not then.
7094. Do you know that, under the Act, check-inspectors have power to inspect the shafts, levels, planes, return airways, ventilating apparatus, old workings, and machinery;—you see that you have this power under the present Act? Yes; but the men do not like, when they are appointed check-inspectors, to retard the work of the pit, except there might be some great danger apparent.
7095. Could not the check-inspectors inspect the shaft after the pit was done winding? Of course, they could do it at dinner-time if they wanted to do it.
7096. *Mr. Gregson.*] Did you ever make a complaint to any of the Government inspectors in respect to any of these deficiencies you have found? I have only made a report in the book in the colliery office, and the inspector reads that report when he comes.
7097. Were you ever a sufferer personally? Yes.
7098. Do you not think it would have been a wise proceeding on your part to let the inspector know these things? The inspector always knew as far as the check-inspectors were concerned, because the book was in the colliery office.
7099. Did you ever send the inspector a note, to ask him to come to the colliery? He has come by invitation, but not from me personally.
7100. What was the result of his visit? The air was very defective.
7101. What was the result of the inspector coming to the colliery? He found the quantity of air in certain places not what it ought to be.
7102. Was the defect remedied? Yes.
7103. Is not that a legitimate and desirable proceeding to take when a man finds himself in deficient ventilation? That was the proceeding at that time, but that proceeding could not be taken now.
7104. Why not;—you need not write your name? I understood that the Government inspector would not recognise anonymous letters.
7105. *President.*] In cases where men would be liable to dismissal, or where things might be made unpleasant for them, it would alter the case, and it might not be undesirable for them to write anonymously. In England it is absolutely invited? I do not think it is generally known that the inspector would take any notice of a letter of that description.
7106. I think he ought to? I do not think it is generally known.
7107. *Mr. Gregson.*] Did you not say that there was one case in which an inspector did take notice? Yes; but there was a signature to that letter.
7108. *President.*] If a letter was sent to the inspector drawing attention to some grievance, and you ended up by saying, "I should like to sign my name, but if I do so I will be dismissed,"—do you not think an inspector would take notice of that letter? It is the general impression that the Government inspector would not take notice of such a letter, because he might get a terrible lot of this correspondence.
7109. *Mr. Gregson.*] Of course, he would use his own judgment? Just so.

7110. *Mr. Curley.*] Do you know that the Secretary of State in England has pointed out to the inspectors there, that they are to take notice of anonymous communications? I was not aware of that.
7111. Have you given any opinion this morning with regard to the clause in the proposed Bill, providing for increased ventilation? I do not think so.
7112. Will you look at section 50, 47, rule 1, on page 23 of the Bill, "ventilation of mines." The words crased and in large letters denote the amendments made by the Legislative Council, and the clause as it stood originally is as it left the Legislative Assembly (*see Appendix A*);—do you think that there should be a stipulated minimum quantity of air in the Bill? Yes.
7113. Do you think the word "adequate" would meet the case? I do not think it would, especially in the northern district of this Colony.
7114. Do you believe that there should be a stipulated minimum quantity? Yes.
7115. This Bill proposes to increase the minimum quantity of air from 100 to 150 cubic feet;—do you think it is necessary to increase the minimum from 100 to 150 cubic feet? Yes; so far as our experience has gone lately it is.
7116. Do you believe in the cut-throughs being shortened to 25 yards—the Bill originally proposed that, and the Council have reinserted 35 yards;—do you think that 35 yards is too far away? I think 25 yards would make a great deal better ventilation.
7117. *President.*] If the air was conducted into the working places would it matter what length you went before a cut-through was put in? If the air was conducted into the working places it would not matter.
7118. Whether it is to be done by brattice or shorter cut-throughs, does it matter so long as you get the air? Our experience under the 35 yards is, that it is very difficult to get the air near the working places. Even with brattice, there are plenty of parts where there may be a sufficient quantity of air at the mouth of the in-take, but in the working places you cannot get it.
7119. Suppose there was something like this in the Bill, "An adequate amount of ventilation, not in any case less than 150 cubic feet of pure air per minute, for each man and each boy, shall be constantly produced in every mine, and shall be conducted along the airway, and into each working place";—do you think that would meet the case? Yes, with a minimum of 150 cubic feet.
7120. You want it put so that the air shall be conducted into each working place? Yes.
7121. Do you care how this is done so long as you get the air? No, not so long as they put the air into the working face.
7122. *Mr. Curley.*] You know the system of working that is carried on at the present time? Yes.
7123. You know that under the present practice of working the cut-throughs are a certain distance apart? Yes.
7124. Do you think the men are more likely to get proper ventilation with the shorter cut-throughs? Yes, decidedly.
7125. Do you think the men would be more likely to get the air in those rise-places by shorter cut-throughs? Yes.
7126. In the absence of the Inspector of Collieries coming to the colliery, might not the manager say, for a certain section of the mine, or for the whole mine, that in his opinion there was adequate ventilation, as far as he was concerned? I think the word "adequate" is too broad, and that a great deal of friction would arise between the men, the inspector, and the manager as to its interpretation.
7127. If the minimum was in the Bill, do you think that would secure to the men more guarantee of getting the air? Yes; that would secure a certain amount of air.

[Witness withdrew.]

Peter Bowling sworn and examined:—

7128. *President.*] What is your name? Peter Bowling.
7129. *Mr. Curley.*] What is your occupation, Mr. Bowling? I am a coal-miner.
7130. *President.*] Where are you working at present? At West Wallsend.
7131. *Mr. Curley.*] Have you worked at any other collieries? Yes.
7132. Where have you worked in this Colony? At Greta, Minmi, Dudley, and Cardiff.
7133. Are those the only mines you have worked in in this Colony? Yes; I have worked in Gippsland, Victoria, as well.
7134. Was that in the Coal Creek mines? Yes, in the Korrumburra district.
7135. Have you worked at coal-mines in the United Kingdom? Yes; in Fifeshire, Scotland.
7136. What mines have you worked in there? In one called Town Hill, and Cowdenbeath, and I was for a little time in a place they call the Wreath Colliery.
7137. Were you working there as a coal-getter? Yes.
7138. Were the seams there thick or thin seams? They varied from about 3 feet high to 5 feet high.
7139. In which mine was the 5-foot seam? It was a section of the Town Hill seam.
7140. Did you work long at that mine? The first three years of my working experience was in that mine.
7141. Were you working there as coal-getter? Yes; for about eighteen months, as a coal-getter.
7142. What was the system of working there? In the 5-foot seam it was bord and pillar, and longwall in the 3-foot seam.
7143. Do you recollect the width of the bords? Yes, if you could call them bords; they would not be called bords here.
7144. What would you call them here? They would be called narrow bords in this country if they were worked here.
7145. What was the width of your pillar? I cannot be certain, but as near as I can say, perhaps 9 or 10 yards, perhaps more, perhaps less. I was a young lad at the time, and I did not take particular notice then.
7146. Do you know the distance the bords went up before you put a wall, or a cut-through over? It was the length of the pillars I mentioned; what they call the main levels were just the same as the other bords. They were worked square, and the pillars were taken out afterwards.
7147. Did you extract the pillars after you got up to the boundary? Yes: we got all the coal coming back.
7148. Did you bring the pillars back? Yes.

Mr.  
W. Kennedy.  
9 Oct., 1895.

Mr.  
P. Bowling.  
9 Oct., 1895.

Mr.  
P. Bowling.  
9 Oct., 1895.

7149. How was the mine ventilated;—was there any brattice used? No brattice. If you call screens brattice, there was brattice.

7150. Was it canvas? Yes.

7151. Did you ever see any wood brattice put up in this mine? No.

7152. How long have you worked at West Wallsend? About fifteen months, but I would not be certain. It was shortly after they started, after the pit had been shut down.

7153. Did you find the ventilation fairly satisfactory there? Yes; I have very little to complain of.

7154. Is it an extensive mine;—are the workings very far in? The workings at present are not very far in.

7155. How far are the workings in? About 400 or 500 yards at the most.

7156. Are there many men working there? At present there are 210 miners. I do not know the number of wheelers and shift men, but if I say 350 in all I would be underneath the mark.

7157. Have you had an addition to the men there recently? Yes; there are three men in a bord there now. The reason of this is, that the manager asked us to share our work with the Seaham men, and we did so, in consequence of the closing down of the Seaham Colliery.

7158. Is the West Wallsend Colliery ventilated by fan or by furnace? By fan.

7159. Do you know if there have been any complaints there about the ventilation? There is one section that we call the dip, where I have heard men complain that the stopings of the old workings were not closed up enough, and that they would have better air if they would do so.

7160. Was the air scaling over the old workings? Yes; scaling over the old workings.

7161. I understood you to say that you had worked at the Minmi Colliery? Yes.

7162. How long ago is it since you worked at Minmi? When I came to the country twelve years ago I worked there for twelve or fourteen months.

7163. What mine did you work in there? I worked in both; they cavilled alternately. It was called the New Tunnel, and is known as No. 2 now; but it was called the New Tunnel at that time.

7164. How did you find the ventilation there then? It was not very good the first time.

7165. Have you been there since? Yes, about fifteen months ago.

7166. What mine did you work in then? In the New Tunnel again. That was on the last occasion.

7167. How did you find the ventilation then? I did not find it sufficient, as I thought; not nearly so good as when I was there before. It seemed to be more heated and less of it.

7168. In any defect that you have noticed in connection with the ventilation, have you observed whether it was owing to the current of air not coming in strong enough or that it was not conducted up to the working face? I believe if the current was conducted to the face it would be enough in most cases.

7169. How long ago is it since you worked at the Cardiff Colliery? Three years ago.

7170. How did you find the ventilation there? It was so near the surface when I was there, that it was very inferior ventilation. I was driving a heading there and it was very hot. You could not see for powder smoke. There is a lot of powder used there.

7171. Is it a hard coal to work? It is a very hard coal to shoot—a rough, hard coal. My mate whom I worked with had often to go home on account of the powder smoke. He was an older man than I was and could not stand the smoke.

7172. What other mine did you say you have worked at? Dudley.

7173. When did you work there? Previous to going to Cardiff.

7174. Is the Dudley Colliery a comparatively new colliery? Yes; a comparatively new colliery.

7175. How did you find the ventilation there? Very good, all that I saw of it. There was a little gas there; but the air is led into the face with brattice in most cases where there is fire-damp given off.

7176. *Mr. Gregson.*] Do the men there work with safety-lamps? No, not in Dudley.

7177. *Mr. Curley.*] Did they depend on the ventilation? Yes.

7178. Do you know the provision in the proposed Bill, with regard to ventilation. Will you look at section 50 [47] Rule I, on page 23. The lines you see scored out there indicate the amendments proposed by the Legislative Council, and also the insertion of those two words at the bottom of the page, "thirty-five yards." If you read the clause right through without noticing those lines, and the introduction of the words "thirty-five yards," that is the clause as it came from the Legislative Assembly to the Council (*see Appendix A*);—do you wish to say anything about this rule? Yes; I have read the clause, but I cannot thoroughly understand it.

7179. Do you see the provision there to increase the minimum quantity of air in the mine? Yes; the minimum quantity is 100 feet under the present Act, and there is a provision here, scored out, that provides for 150 cubic feet.

7180. Do you think that there should be a stipulated minimum quantity of air in the Bill? I am sure that there should be a minimum quantity stipulated.

7181. Do you see the object of the Legislative Council in striking out those words;—they wish the word "adequate" to cover everything? Certainly; that would do if an adequate amount was specified.

7182. Do you think that would be leaving the matter too indefinite altogether? Yes; it could not work very well.

7183. *President.*] If a manager gave you all the air that you wanted, would you not be satisfied? Some managers think we should have a lot of air, and other managers think we need no air at all; some will give you enough, and others not enough.

7184. *Mr. Curley.*] Do you think that the increasing of the minimum quantity of air to 150 cubic feet is a necessary provision? I do; because I have worked in places where check inspectors have made a report, and have specified that we had all the air that is required by the Act, and I knew, to be healthy, we should have more air than 100 feet.

7185. Was that your own experience? Yes; my own experience.

7186. Can you say where that was? Yes; at Greta.

7187. Have you worked at the Greta Colliery? Yes; for five years after I left Minmi the first time.

7188. Was the air you have referred to deficient in the rise or the dip workings? In the rise workings; generally the dip workings were comparatively very well ventilated.

7189. Do you think the cut-throughs should be shortened to 25 yards? Yes; I think that would be a very good improvement.

7190. *President.*] Supposing there was a minimum amount of air specified—say, 150 cubic feet—and it is  
to

Mr.  
P. Bowling.  
9 Oct., 1895.

to be conducted along the air-ways into the working places—that that was laid down in the Bill—would there be any necessity to say whether it shall be got by cut-throughs, bratticing, or anything else; suppose it says an adequate amount of air, not less than a certain amount—you say 150 cubic feet—and it specifies that the air shall be conducted into the working-places—would it not be better to let them find out how this is to be done? Scarcely, because there are certain seams where heat generates in the bord—what we call white-damp. That could not be driven out very easily in workings that go to the rise, not by brattice or any other way; but I think the cut-throughs, being shorter, would do it.

7191. If you read the section you will see that the air is to dilute and render harmless noxious gases to such an extent that the working-places shall be in a fit state for working and passing therein;—it is an adequate amount of air, not to be less than 150 cubic feet, to be conducted along the airways and into the working-places, constantly produced, to render harmless noxious gases, &c.;—would not that do all that you require? Yes; if it rendered harmless noxious gases. According to that, then, it would be absolutely unnecessary to have any cut-throughs at all.

7192. They would have to render harmless noxious gases in the working-place? I understand; if you led the air up to the face it would render the gases harmless in the working-place.

7193. I am suggesting to let the manager devise what means he likes to render harmless noxious gases, and give adequate ventilation? If it is practicable to do that it would do. If it is practicable to lead the air without cut-throughs or brattice it will do.

7194. I should let the manager choose what method he likes;—you are to have the air there, no matter how it gets there? Yes, in the working-place. It is a matter of opinion as to how it shall be got.

7195. If you had an adequate amount of air, to be in any case not less than 100 cubic feet, and as much more as is necessary, to be constantly produced along the airways, into each working-place, to dilute and render harmless noxious gases to such an extent that the working-places, &c., shall be in a fit state for working and passing therein, would that be all that is required? Yes; that is what we want.

7196. *Mr. Curley.*] Would you be more likely to get the required quantity with the shorter cut-through? Yes; that would cool the place very much.

7197. What do you think of the provision in section [49]46, sub-section 3 (*see Appendix A*);—do you see what is said there about brattice? Yes; that is to work the mine in splits. That is how the place I am in at present is worked.

7198. Is that a principle you believe in? Yes.

7199. Do you see that by this subsection 3, the air is to be taken to the working places to within 15 yards where gas does not exist, and to within 3 yards where gas does exist, by brattice or otherwise;—do you agree with that subsection? I would certainly.

7200. Do you think that brattice would be a very costly item at West Wallsend? I think the cost would be nominal; I do not think there would be much cost.

7201. *President.*] Is labour not required to put brattice up? There is a little labour putting it up, but after the first cost of material, according to the number of tons put out at West Wallsend every day, I could keep it going at something a little over a  $\frac{1}{4}$ d. a ton.

7202. *Mr. Gregson.*] What would be the cost of the material? About 6d. or 7d. a yard.

7203. What would that make it per yard per ton of coal? The pit yields about 460 tons of coal per day, and in the average amount of places, you would not have more than 15 yards of brattice to put up. I know there is little or no labour in putting it up, because the props are put up by the men for their own safety, and the canvas is only nailed up by two or three nails. That is done where I am at present.

7204. *Mr. Curley.*] Is there canvas used in every bord? Yes, where I am.

7205. *Mr. Gregson.*] How much do you say it would cost per ton? About  $\frac{1}{4}$ d. per ton.

7206. Does that include finding the stuff? No; after the first cost you would take seventy bords and 15 yards of brattice for each bord, at West Wallsend, and one breadth of canvas does from the top of the seam to the bottom. The original cost should come to about £30.

7207. How long would the canvas last? I have had practical experience of that, with a man specially looking after it, it will last for two years.

7208. In how many places could you use it over again? Until it was finished.

7209. How many times do you think it could be used? It depends on how continuously the pit works. If the pit is working full time the places will be worked down quickly.

7210. What would the cost be in the first instance? My estimate does not include the first cost of the material. After the first cost I would be prepared to carry it out at  $\frac{1}{4}$ d. per ton.

7211. I want you to explain how you could do it? I estimate the cost of looking after it would be 10s. per day, and the cost of material in the first instance would be about £30.

7212. How long would it last? At least two or three years; but of course that would depend on circumstances.

7213. If you worked one day in the two years it would cost 1s. 4d. per ton? Yes.

7214. If you worked two days in the year would it cost half of that amount? Well, I cannot say. I have not worked it out; but I am prepared to say that it will cost me  $\frac{1}{4}$ d. per ton to keep it up at West Wallsend.

7215. When you made this calculation, how many working days did you allow in the week? Four days a week.

7216. Would you call four days a week good work? Yes, very good work.

7217. *Mr. Curley.*] Do you think the amount you have mentioned would cover the cost? Yes; as far as I have worked it out it would come to a fraction over  $\frac{1}{4}$ d. per ton. I would be willing to take it at that amount, leaving out the first cost.

7218. Would this include the canvas for the whole of the mine? Yes; there are seventy bords, each 15 yards.

7219. *President.*] Did you say that your daily output was about 450 tons? Yes; that was what the check weighman told me the output was.

7220. *Mr. Curley.*] Did you ask him for the purpose of obtaining accurate information upon this matter? Yes; and he would be the most likely person to be able to tell me.

7221. Do you think that bratticing in connection with these collieries would cost anything like 5d. or 6d. per ton? There are no collieries that I know where it would be likely to cost that amount.

7222. Would you consider that an exaggerated statement? Yes; very exaggerated, as far as I have seen.

7223. Would you think that an estimate of that kind had been very much overgauged? Yes; I cannot think how an estimate of that kind could have been arrived at.

7224.

Mr.  
F. Howling.  
9 Oct., 1895.

7224. *President.*] Would it not depend on the number of days the pit was working? Yes; that would make a great deal of difference, but not sufficient to make that difference.

7225. *Mr. Curley.*] In estimating these matters, have you not to take a number of years to arrive at a fair estimate of the cost? I think if you averaged the mines for three years you would come close to the average working. There is another way to look at it, namely, that the more a mine works, the more profit the employer makes.

7226. *Mr. Gregson.*] Might it not be the other way on, that the more the mine works, the more the mine-owner loses? I have never looked at it in that way; I never thought the mine-owner lost.

7227. *Mr. Curley.*] Have you thought over the question of hours in connection with collieries? Yes; I have formed an opinion on that question, in the same way as other men.

7228. Do you know the provision in the Bill to make the working hours eight? Yes.

7229. Do you agree with that provision? If a thing is worth doing, it should be carried into effect, and if there is no other way than by making it a penal matter, it should be done.

7230. *President.*] Do you agree with making eight hours a legal days work? I have never worked anywhere. In Gippsland we worked from 8 o'clock till 4 o'clock, from bank to bank. There is an Act framed and hung up in the pit in Gippsland making it compulsory. I never heard anything said against it, it worked very well, and I think eight hours is long enough to work.

7231. *Mr. Curley.*] Was there any friction between the men and the manager there, in connection with this matter? No; there was not. I was asked by the manager to work, not only overtime, but on Sunday and Christmas day. There is a specific clause in the Bill that allows for special work.

7232. Have you any objection to that clause? Not the slightest, I think it is necessary. I worked on Sunday and Christmas day twelve months ago last Christmas.

7233. Was that in order to execute special work that had to be done? Yes.

7234. Do you think that there should be legislation upon this matter? I do, decidedly; on any good matter.

7235. Do you think that there should be legislation upon this eight-hour question? I believe there should be legislation.

7236. Do you think that this matter could be better carried out in a mutual way between the manager and the men? No; the present system of competition amongst the employers has reduced wages almost as low as possible, and the same factor (I mean the force of competition) might force the good employer to increase the hours of labour. Some of the employers are good and some bad; if they were all good there would be no necessity for legislation. As it is, I think it is necessary there should be legislation on the matter. That is my opinion.

7237. How are you paid with regard to weight? There are different systems of weighing. They have a different system at West Wallsend to what they had at Minmi. In the former place if I was weighed three times during the fortnight (say) 11 cwt. the first time, 12 cwt. the second, and 13 cwt. the last, that would give me an average of 12 cwt. per skip for the whole fortnight. Under this system I might be weighed 13 cwt. the first day of the pay and not be weighed again until the last, when through some circumstance I might be caught on 8 or 9 cwt., or less. I have been caught on 7 cwt. 1 qr.; and that would reduce me considerably, and put me out in calculating my income.

7238. Do you look upon that as unsatisfactory? Yes, very unsatisfactory.

7239. Do you think when your weights are taken for a day that your skips should be averaged at that weight until you are weighed again? Yes, I would be agreeable to that, if we got so many skips per day weighed of those that come out of the pit.

7240. *President.*] What percentage of skips do you want weighed? I would say one in every three.

7241. *Mr. Curley.*] Do you know the manager of the Wallsend Colliery says he weighs one out of every eight skips? I did not know that.

7242. What is your estimate? About thirty out of a hundred, or one out of every three or four.

7243. Do you think the men would be satisfied with an average if a certain number of skips were weighed? Yes; if one out of every three or four were weighed, and each weight should stand until I am weighed again, and then when I am weighed again that weight should stand till the next time, and so on.

7244. *President.*] Is not that the present system? No; if I am weighed to-day, and weighed again later on, those weights are taken on the average, and I am paid on the average for the pay.

7245. *Mr. Curley.*] You do not believe in the system of average that you have spoken about? No; I believe if we got one out of every three skips weighed, that average should stand till I was weighed again.

7246. Is that a different system of averaging to anything that you have been used to? Yes; I prefer the old system of averaging; allowing each day to stand for itself, for that weight to carry until I am weighed again.

7247. Would you prefer to have every skip weighed in preference to that? Yes.

7248. Do you think that every skip should be weighed? I do.

7249. Is that the only way to get the exact average? It is the only way that I can see to get the exact production.

7250. Have you worked at any collieries where you have noticed the pillars to be very thin? In Minmi twelve years ago I went through into the next place; I worked right through into the other bord.

7251. Do you think that more substantial pillars should be left in the mines? Yes; I do not see why they should not.

7252. Have you noticed the provision in the Bill with regard to the powers of inspectors? Yes.

7253. Will you look at section 21, sub-section No. 5, on page 8 of the Bill (*see Appendix A*)? Yes.

7254. Do you see any reference there to the inspector having power to withdraw the men in case of danger? Yes.

7255. Do you think that the inspector should have power to withdraw the men in case of danger? Yes, I think he should.

7256. Would you leave that power in the hands of the manager? No; I would like the power to be in the hands of an independent party; one who has nothing to lose or gain by ordering the men out of the mine.

7257. When you say the inspector has nothing to lose or gain, what has the manager to lose or gain? He has this to lose—if those in a position above him should take it into their heads that he should not order the men out, they might get someone who is not so conscientious to replace him. He might lose his position unless he was forced to withdraw the men by the inspector.

7258.

7258. If a manager was pressed for a certain output of coal, would that have any weight with him. Say, he wanted to supply an order and was menaced by a danger in the mine, might he not think he would wear the day out? He might. Mr.  
P. Bowling.  
9 Oct., 1895.

7259. Might he hazard the danger? He might.

7260. Do you know any manager that would? Yes.

[Witness withdrew.]

Mr. James Cook sworn and examined:—

7261. *President.*] What are you, Mr. Cook? A miner. Mr. J. Cook.  
9 Oct., 1895.

7262. Where are you working? At Burwood.

7263. Where were you before you were at Burwood? At Minmi.

7264. Have you worked in England? Yes; in Scotland.

7265. Have you worked as a miner in Scotland? Yes.

7266. How many years have you worked in Scotland? About fourteen years.

7267. How many years in Minmi? Sixteen years.

7268. And how long at Burwood? About six months.

7269. Are Minmi and Burwood the only two mines you have worked at in this Colony? Yes. I have worked at Joaja Creek, but that was only for five weeks. That is the only time that I have been away from the Northern district.

7270. *Mr. Curley.*] Was the Minmi Colliery the first colliery you worked in in this Colony? Yes.

7271. Have you been in mostly all the mines up at Minmi? Yes.

7272. Are there not two or three different tunnels there? Yes, four; but there is one standing now.

7273. Have you worked in several sections in the different collieries? I have worked in three of the different tunnels, and in all the different sections of the three separate tunnels.

7274. What are the names of the tunnels? The Duckenfield, or Old Tunnel; then No. 2 and No. 4 Brown's Tunnel. Those are the only three I have worked in.

7275. What was the width of the bords where you were working? Eight yards, generally.

7276. What was the width of the pillars? I have seen some of the pillars as thin as 1 yard, but they were supposed to be not less than 5 yards; it was turned away 5 yards. I have seen them go to within a yard.

7277. Were the bords driven by any line? No.

7278. Who was the man who regulated the width of the bord if it got too wide or too narrow? The overseer; if he saw you too wide he would tell you to draw in; chalk your bord.

7279. Were you expected to respect that mark? Yes.

7280. Had you to obey his orders? Yes.

7281. Was the whole of the control of the business in the hands of the overman? Yes; or oversoor.

7282. Have you worked in pillars at Minmi? No.

7283. Have you never worked in pillars at any of these tunnels? No; I never did.

7284. Not in those sixteen years you speak about? No.

7285. Do you know whether there were any pillars worked? Yes; in the No. 2 tunnel, in the old No. 6, section, and in what we call the rise.

7286. Have you any idea what the depth of those mines is from the surface? No.

7287. Do the workings go under the mountain range, or how are they situated? Mostly all the Minmi workings are under the mountain ranges.

7288. Have you any idea of the depth? I cannot be positive; I remember Mr. Drurie saying it was 112 feet below the surface, in one part of the workings.

7289. Who was Mr. Drurie? The overseer.

7290. Do you know of any extensive fall that has taken place in any of these tunnels? Not an extensive fall; I knew of a crush coming across one of the sections.

7291. Did that creep come over the pillars? Yes.

7292. What section of the mine was it in? In the fault heading section of the old tunnel.

7293. Do you know if it came over any main road? The main road, now, is a complete block of wood, on both sides from one end to the other; what we call pig-styes are built as close to one another as they can get.

7294. Was that the main road where this crush took place? I think so.

7295. Do you know if it came over the main road at the time? I am not aware that it come across the main road; but I know that the main road is composed of these pig-styes.

7296. Do you know that this is where the crush took place, or were you told about it? It was told to me.

7297. Did this crush happen while you were at the colliery? It happened when I was working in the new tunnel; in No. 2.

7298. Do you know something about this, through conversations with men about the place? Yes.

7299. Were any men thrown out of work at the time it happened? Yes, all that section.

7300. Do you know the number of men? I cannot say the number of men.

7301. Did you ever notice the ventilation to be in any way defective, in any of those tunnels you have worked in? At times I have seen it so.

7302. Was the defect that there was not sufficient air going into the heading, or that it was not going into the working face? There was one defect in the Duckenfield Colliery, that the air was not going into the section in sufficient quantities.

7303. Can you give any reason why that was not done? It was not conducted in the manner to put it into the workings. We had to call the attention of the Inspector of Collieries to the matter, and a joint inspection was made by Mr. Jno. Dixon, Inspector of Collieries, Mr. Geo. Nix, and myself.

7304. What came out of this joint inspection? That the manager found ways and means of conducting the air into that section.

7305. Was that after this joint inspection took place? Yes.

7306. Had that any connection with a prosecution that took place? No.

7307. Do you know of any prosecution? Yes; that was for a deficiency of air in another section of the mine altogether.

7308. Was it in the same tunnel? Yes. 7309.

- Mr. J. Cook, 7309. Was there a joint inspection on that particular occasion, or did you only send for the inspector? I cannot recollect whether there was a joint inspection or not.
- 9 Oct., 1895. 7310. Did this happen some time ago? Yes, a good few years ago.
7311. *Mr. Gregson.*] Do you recollect if any complaints were made to the inspector? I was not acting-secretary for that tunnel at the time.
7312. *Mr. Curley.*] Had complaints been made? Yes.
7313. Do you know whether any complaints were made to the inspector at that time? I cannot say; I know a deficiency was found, and Mr. Croft as manager, was taken to the Wallsend court, and Mr. William Penman was one of the witnesses.
7314. Had complaints been made to the inspector? I believe so.
7315. And was this the result? Yes.
7316. From the experience you have had at these collieries, do you think that more attention should be paid to the ventilation? In one of them more attention should be paid.
7317. Did that impress you with the idea that more attention should be paid to the ventilation and that there should be an attempt to get it up to the working face? Yes.
7318. *Mr. Gregson.*] What was the result of the prosecution? The manager was fined for the infringement of the Act, but I forget the amount; he was fined; costs of Court and witnesses expenses.
7319. There was a conviction then? Yes, against Mr. Croft.
7320. Was there any improvement made in the ventilation in the same place afterwards? Yes.
7321. *President.*] Who brought the manager to the Court? I believe the Inspector of Collieries.
7322. Who put the inspector in motion? Complaints had been made.
7323. *Mr. Curley.*] Have you read the proposed Coal Mines Bill? Yes.
7324. Will you look at section [50] 47, rule 1, on page 23 of the Bill (*see Appendix A*). The lines you see there represent the amendments suggested by the Legislative Council, and the words "35 yards" are inserted by the Council instead of 25 yards. The clause without these words is as sent to the Council by the Legislative Assembly. Do you think the minimum quantity of air should be increased from 100 to 150 cubic feet? I do.
7325. Do you believe that there should be a stipulated minimum in the Bill? I do.
7326. The Legislative Council think that this can be met by the word "adequate";—do you think that that would be leaving the matter too indefinite? My opinion is that it would be a bone of contention between the two parties as to what would be an adequate amount.
7327. Do you think the provision in the Bill with regard to the minimum quantity will help you over that difficulty? Yes.
7328. What do you think about shorter cut-throughs? I prefer shorter cut-throughs to bratticing.
7329. Do you think bratticing is required if there are these shorter cut-throughs? In my opinion, the shorter cut-throughs would dispense with bratticing.
7330. If the cut-through is to stand at 35 yards, would you require brattice to get the air up to the face? Yes.
7331. Will you look at section [49], 46, sub-section 3 (*see Appendix A*); it says the air shall be taken to each working face by brattice or otherwise;—do you consider, if the cut-through is to remain at 35 yards, that that provision should be in the Bill? I do, if it is to be 35 yards between the cut-throughs.
7332. With regard to the matter of pillars you have referred to, did that impress you with the idea that larger pillars should be left in a mine? I think there should be larger pillars than some of the pillars that are left in Minmi.
7333. Do you think that some effort should be made to endeavour to leave the pillar the size that it is intended to be left? Yes.
7334. *Mr. Gregson.*] Who robs the pillar now? I consider he is an unpractical miner who does so.
7335. Who robs the pillar now? The miner.
7336. If he was a practical miner could he not carry his pillars straight through? Yes.
7337. *Mr. Curley.*] Does not the manager regulate the pillars? Yes; if he finds the most practical miner widening out, he will chalk him off.
7338. Has he not deputies in the mine every day to look after these matters? Yes.
7339. With regard to the colliery you are working at now, do you say that you have worked there about six months? Yes.
7340. Is there any fire-damp given off at that colliery? Not to my knowledge.
7341. Is that the next colliery to Dudley? Yes.
7342. How far is that colliery away from Dudley? The men tell me it is twenty minutes walk over-land.
7343. Is it practically the same coal-field? Yes.
7344. Do you know whether this is comparatively a new mine;—are the workings far from the shaft? No; it is Old Burwood Colliery which is going towards the new shaft.
7345. Are their workings near the old shaft? It takes me a quarter of an hour or twenty minutes to travel to the working face.
7346. How is the Burwood Colliery ventilated? By furnace. Last week we could not get up our own shaft through something being broken, and we had to go out the other road. We had occasion to go by the old pit past the furnace shaft through the rope breaking in the new pit.
7347. How have you found the ventilation in that colliery? I have only been in one section all the time I have been there.
7348. What section was that? No. 8 heading, and I cannot complain of any deficiency in the ventilation there.
7349. Is any brattice used where you are? Yes, in the bord I am in now, there is brattice led into it.
7350. Taking your experiences, where you have worked with brattice and where you have worked without it, do you find brattice to be a considerable advantage? Under some circumstances it requires brattice; because the bord where I am working is being driven back, what was No. 1 bord of that section they are driving back, splitting the big pillar, and the canvas is laid down backwards to get the air into us.
7351. *Mr. Gregson.*] Do you approve of the effect of the brattice? Yes, I do.
7352. Do you think it is an improvement? Yes.
7353. *Mr. Curley.*] Have you to use much powder there in blasting your coal? Very little.
7354. When you have to use powder, with the brattice put in the way you have described, does it clear away the smoke pretty freely? Yes; it does not lie long beside us.
- 7355.

Mr. J. Cook.

9 Oct., 1895.

7355. How are you paid at that colliery? By average weight.
7356. *Mr. Gregson.*] Not by standard weight? No.
7357. *Mr. Curley.*] Is there no standard weight at that colliery? Not at that colliery.
7358. Is it not one of the Scottish-Australian Mining Company's collieries? Yes.
7359. Do you get a fair amount of skips weighed during the day? I am weighed once or twice a day; I cannot say if others are as lucky.
7360. Is there a fair number of skips weighed? Yes; I can see by the weigh-slate that they weigh as many as sixty to seventy-eight skips in a day. The check-weighman always puts on the slate the average for the day.
7361. Do you think that is a fair proportion of skips to weigh? Yes; for the number of tokens running—100 tokens.
7362. Would that represent 200 men? Yes; and they fill seven and eight skips per two men per bord.
7363. Would that be from 700 to 800 skips per day? Yes.
7364. How many skips are weighed out of that number? Sixty to seventy skips.
7365. Have you heard any complaints about having more skips weighed at that colliery? No; not at that colliery.
7366. Does each day's average stand for itself;—supposing you were weighed on the Monday, would that weight stand till you are weighed again? Yes, they do not average the two weights.
7367. They do not average the two weights unless you have two or three weights on the same day? No; they are averaged if you have two or three weights on the same day.
7368. *Mr. Gregson.*] Can either the weighman or the check-weighman choose the skips to be weighed? I have no knowledge of that.
7369. Can they see the skips? No, not at Burwood.
7370. Are the weighmen at the foot of the weigh-screen? Yes.
7371. *Mr. Curley.*] Will that be 10 or 12 feet below what is known as the pit-top? Yes; about 15 feet.
7372. Have they some signal to the banksman, if they want a skip? I do not know.
7373. *Mr. Gregson.*] Do you keep the weighbridge going all day? There is a lad who puts the skip on the travelling belt when he knows the weighbridge is empty.
7374. *Mr. Curley.*] Do you think the weighbridge is kept going pretty well all day? It must be, to give sixty or seventy skips per day.
7375. Do you think the weighman is exclusively employed at that work, judging from the weights? He must be.
7376. Have you thought over the question of the working hours? I think that eight hours is enough for any man to work.
7377. *President.*] Supposing a man has had a spell of idleness, and chooses to work half an hour, or two hours extra, do you think he should be punishable for that? He might not be made punishable, but I think it should not be allowed.
7378. Suppose he says, I must work a little more to pull up, and he makes up by overtime, would you punish him for that? Well, I would, if he was to make a custom of it.
7379. *Mr. Curley.*] Don't you think this would eventually become a custom? I think so, if it was allowed to one or two, it would draw the others on.
7380. Do you think it would become a regular matter to work long hours? It has been in the past.
7381. Would that be quoted by other collieries, and adduced as a reason why they should do a similar thing themselves? I believe it would.
7382. Do you think that this is a matter that should be legislated for? I do.
7383. Do you know of any instances where men have worked very long hours? I have heard it reported that some men have worked twelve or fourteen hours, but I have never worked beside them.
7384. Where was this? In Minmi.
7385. Do you go in there mostly by tunnels? Yes.
7386. Do the men go in very early in the morning? As a general rule, they go in between 6 and 7 o'clock in the morning, and come out again from 3:30 to 4 o'clock in the afternoon.
7387. May certain men not go in earlier? It has been reported that certain men have gone in at 2 or 3 o'clock in the morning, and have not come out till 4 o'clock in the afternoon.
7388. Do you think that men should be allowed to go in and out when they like? No.
7389. Might they not go in before the fireman went his rounds, and if they did so, might not something occur? Yes; I have known two men sent out by the fireman in Minmi for being at their work when he went round; on the first occasion he cautioned them, and the next morning he sent them home, because he had received orders from the manager to do so if he caught them again.
7390. *Mr. Gregson.*] Do you approve of that? Yes.
7391. In the interests of the men's own safety? Yes.
7392. *Mr. Curley.*] Was there any fire-damp given off at that time? There was; perhaps not in their bord, but in that section of the mine.
7393. Was not that really a very serious matter for these men to come in before the fireman? It was.

[Witness withdrew.]

MONDAY,

MONDAY, 14 OCTOBER, 1895.

[The Commission met in the Board-room, Chief Secretary's Office, at 10 a.m.]

Present:—

FRANCIS EDWARD ROGERS, Esq., Q.C., PRESIDENT.

JAMES CURLEY, Esq.

JESSE GREGSON, Esq.

Mr. Robert Hay sworn and examined:—

Mr. R. Hay. 7394. *Mr. Curley.*] What occupation do you follow, Mr. Hay? I am the manager of the Oakey Park Colliery, at Lithgow.

14 Oct., 1895. 7395. Have you been manager at any other collieries? Yes, in England; but not in this Colony. I have been employed at other collieries in this Colony, but not as manager. I was overman at the Mount Kembla Colliery.

7396. How long ago is it since you were at the Mount Kembla Colliery? I left Mount Kembla on the last day of the year 1890; very nearly five years ago.

7397. What were you at Mount Kembla? I was getting coal, and was also underviewer there.

7398. Would that be practically manager of the colliery? I had a say in the management.

7399. *Mr. Gregson.*] Were you getting coal when you went there first? Yes.

7400. *Mr. Curley.*] How long were you there getting coal? Two and a half years.

7401. Have you a fair knowledge of the Mount Kembla Mine? Yes, of what was then the Mount Kembla Mine.

7402. Is not what was then, pretty well Mount Kembla still? There is new management there now; of course, the coal would be much the same.

7403. Would not the conditions generally be much the same? I cannot say that; I have never been there since.

7404. Was there much timber used in the Mount Kembla Mine when you were there? As much as was required; we took care not to let the men be without props or timber.

7405. Did they use this timber on each side of the roadway? Yes, where necessary.

7406. How was the mine worked when you were there? The ordinary bords in one part, and longwall in another part.

7407. In the bords, what distance would the timber be set apart; would you put a row of props on each side of the roadway? Yes.

7408. How many? About 3 feet apart, closer if necessary; if dangerous, we put them thicker.

7409. What would be the average; what would be the distance apart of the roadside props on each side of the bord, taking the good with the bad? I should say the average would be about 2 ft. 6 in. or 2 feet.

7410. Is that taking the good with the bad all round? Yes; speaking approximately. Wherever there were props needed we always put them.

7411. Did you ever drive a bord where the timber was much further apart than that where the roof was good? I have driven bords in every part of that mine, and I should give that as a fair average distance in the bord.

7412. Did you use much timber in the longwall? Yes; we packed it and used timber. We did not use timber in the roadway.

7413. Had you any trouble with the ventilation at Mount Kembla? It was not as good as it should have been, until we got the furnace-shaft down, and that remedied everything.

7414. Was the furnace erected when you were there? Not the new furnace. There was a new furnace erected at the bottom of the new shaft. The ventilation was very much improved by the new shaft.

7415. What number of men were employed when you were there? About eighty to 100 numbers were generally running. I should say, speaking approximately, about 150 or 160 men.

7416. Did you find much difficulty in the ventilation of the places to the rise? No, we did not find much difficulty. We worked the longwall mostly to the rise, where the seam was under 5 feet.

7417. You took the current of the air right round? Yes; the current went across the faces.

7418. Was the furnace you have spoken about commenced when you were there? It was just completed, and the ventilation was improved very much.

7419. Have you given any consideration to the difference between furnace ventilation and fan ventilation? Yes; if you have a deep shaft, and not much gas, furnace-ventilation is the best. Even with gas, I think furnace-ventilation is the best. For a shallow shaft I think the fan is the best.

7420. You think the fan is the best for a shallow shaft? I do.

7421. Would you call the shaft at the Helensburgh Colliery a shallow-shaft? There is a tremendous amount of gas there, and if there is much gas a fan might be preferable.

7422. Have you read any mining authorities on the contrast between the cost of furnace ventilation and the cost by fan ventilation? That must be regulated by the circumstances. Where you sell the small coal the fan will be cheaper, because if the small coal is a drug you can use it in the furnace.

7423. Cannot you use the small coal also in connection with the fan? A little of it.

7424. Have you seen what Mr. Percy says about the contrast between the cost of ventilation by fan and the cost of ventilation by furnace? Not as to the cost.

7425. Will you look at this book, and see what Mr. Percy states with regard to the cost of these two methods of ventilation? [*Witness reads.*]

THE MECHANICAL ENGINEERING OF COLLIERIES. By C. M. Percy, Consulting Engineer, &c., &c., &c. (Volume II, page 29.)

The ordinary Guibal fan cannot avoid the vibration, whilst the improved fan can work at practically any speed, and set up no vibration. The fan erected by the Wigan Coal and Iron Company is 30 feet in diameter; and was erected to take the place of two ventilating furnaces, which produced 142,000 cubic feet of air per minute, and to do so consumed 12 tons 17 cwt. of coal in the twenty-four hours. The fan now working produces the same quantity of air with a consumption of 4 tons 2 cwt. of fuel for the same period; and there is this considerable distinction in the fuel: the furnace used good Arley Mine mixture, whilst the fan consumes common Buzzard slack. The saving in fuel alone is over £3 in twenty-four hours, and the calculation for a year is easily made.

7426. What have you to say upon that statement? In the Wigan district the mines are deep and very hot, and there is a great advantage there on this account. They have the heat of the mine to assist in the ventilation as well as the fan, and this, of course, would aid in that result. Mr. R. Hay.  
14 Oct., 1895.

7427. Do you think that furnaces are going out of date, and that fans are taking their places in recent years? I do.

7428. Do you not think that furnace ventilation will eventually become a thing of the past? I think that too; but furnace ventilation can be applied with splendid advantage under certain conditions.

7429. How long have you been the manager of the Oakey Park Colliery in the Lithgow district? Since the beginning of January, 1891, about four years and a half.

7430. Did you work there previous to being manager? No, I did not.

7431. Do you hold any proprietary interest in that colliery? Yes; I have a little interest in the colliery, although I did not hold any interest when I went there first as manager. I was there three years before I took any interest in the mine financially.

7432. Do you enter the mine by tunnel or by shaft? We have two shafts.

7433. What are the depths of your shafts? 315 feet from the surface—105 yards.

7434. Are both shafts the same depth? About the same depth.

7435. Can you tell us the diameter of the shafts? One is about 11 feet and the other 10 feet. I cannot speak definitely, because I was not there at the sinking of these shafts.

7436. Which is the 11-foot shaft? The present upcast shaft.

7437. And the downcast shaft is about 10 feet? Yes, about 10 feet.

7438. How many men have you employed at the Oakey Park Colliery? We have twenty men getting coal.

7439. Have you employed more men than that number? When I went there there were forty-five men employed.

7440. Is the number of men employed affected by the condition of the trade? Yes; trade has not fluctuated much on the right side lately.

7441. Have your workings extended far into the mine? They have extended pretty rapidly lately on account of the boundary of the Vale Mine coming near us.

7442. What distance are your workings in? Forty-two or 43 chains.

7443. Is your furthest working place half a mile in? Yes, about that; 42 or 43 chains would be slightly over that I think.

7444. Will they be three-quarters of a mile in? Not so far as that; I give the distance as 42 or 43 chains.

7445. Have you a system of furnace ventilation at that colliery? We have not. We ventilate by steam and a waterfall. We are on the point of completing a furnace there.

7446. Is it only a matter of thought, or have you entered practically upon the work? The men at the bottom are clearing out for it now.

7447. Has any actual work begun in this direction? Yes; two men have been working at the pit bottom all the last week widening out for it.

7448. What is this waterfall you have spoken about? It is coming down the downcast shaft on account of it not being properly cemented at first.

7449. Is it water conveyed down the shaft? No; it falls down naturally. It comes down 30 feet from the top.

7450. Is there much body of water behind where this water drops from? There is evidently a spring, because the water is always there.

7451. Is it simply what percolates through the strata? It falls incessantly and continuously.

7452. How does it approach the mine? A way from the surface, 30 feet from the top of the shaft; but we do most with steam.

7453. Is there any chance of that force of water during any heavy rainfall endangering the condition of your colliery? I can assure you there is not, but the steam is used all day in the upcast shaft.

7454. Does the steam influence the ventilation in the shaft? There are pipes laid down to the big pump at the bottom of the shaft.

7455. *Mr. Gregson.*] Do you exhaust into the shaft? Yes; and of course there is the heat of the pipes all the way down.

7456. *Mr. Curley.*] Does your ventilation ever change—does your downcast ever become the upcast? I have never known that, although a very hot day will militate against us a little, but it will never put the ventilation in a really bad state.

7457. Do you know that, as a rule, the smaller shaft is used for the upcast? It should not be.

7458. Do you think that is the opinion of mining authorities? Circumstances might force a man to that opinion, but I would put the upcast larger than the downcast.

7459. Have you read what Mr. Wardle says on this matter? No. Again, the system of furnace, or fan, ventilation, comes in here. If you use a furnace the upcast shaft must be the largest.

7459½. This is what Mr. Wardle says on this subject:—

REFERENCE BOOK ON PRACTICAL COAL-MINING. By W. Wardle, F.S.S.C. (3rd edition.)

*Section 239 on Ventilation.*—Which shaft do you consider should be the downcast—the larger or the smaller one—when fan ventilation is applied? The downcast should be the larger if there is any difference, whatever may be the power employed. The ventilating fan placed at the top of the upcast only reduces the atmospheric pressure on the top of the upcast to a partial vacuum; the atmospheric pressure upon the top of the downcast then comes into operation, and forms a ventilating pressure or power, propelling the air through the airways and upcast shaft, and the greater the depth and diameter the greater will be the weight of the column of air in the downcast. This will be understood when we consider that a column of air 1 foot square, and of the full height of the atmosphere, weighs nearly 1 ton. Another column of air in the underground air ways, and at the bottom of the downcast, are compressed in the higher layers in the shaft, and the atmosphere above the shaft, and the greater the depth and diameter of the downcast the greater will be compression. Air is also elastic—that is it can be expanded by heat or by reducing the pressure at the top of the upcast. The ventilating fan would, therefore, create a large vacuum at the top of a 10-foot upcast that it would at the top of a 16-foot upcast; consequently by making the 10-foot the upcast, and the 16-foot the downcast, two natural powers would assist the ventilation, viz.: a large column of air in the downcast (once put in motion is power), and the large vacuum at the top of the upcast caused by the fan. The late J. J. Atkinson, speaking upon this point, says "The intake air in dip or descendent-workings acts as a ventilating power assisting any other ventilating power that may be in existence;" and as already quoted, that "the downcast should be made of the greatest practicable area."

7460. What have you to say to this statement? With regard to the sinking of shafts, my opinion is that you sink the big shaft cheaper than the small one.

7461.

- Mr. B. Hay: 7461. Have you ever noticed defects in the ventilation under the conditions you have stated just now;—you said that a hot day occasionally militated against the prevailing conditions? A very hot day will militate a little.
7462. Have you ever noticed the ventilation stagnant? It was not as brisk as it was at other times, but it could not be called stagnant.
7463. Are you aware that there would be a considerable amount of friction to be overcome with the air travelling? Yes.
7464. How do the men fare when the conditions are as you have stated? Very well; there have been no complaints made to me about the ventilation.
7465. Do you know whether the men have complained to anybody else? I do not know.
7466. If the men had complained, do you think they would have a reason for complaining? Not a sufficient reason; still, if they had complained, I would have taken it in a friendly way.
7467. A man would not complain without a reason, you think? It depends upon the sort of man very largely.
7468. Is a man who is not given to complaints a fine fellow? I would not like to say that; but if a man complained to me, I would believe in the complaint enough to investigate it, and see if anything was wrong. A man would not be dismissed for giving me information.
7469. Is it not possible that a man may submit to a great deal before he would make a complaint? I do not think my men would; we are on pretty good terms.
7470. Do you work in a very friendly way with your men? We do.
7471. How do you interpret the present Coal Mines Act of 1876? I interpret it in its literal sense.
7472. *President.*] Supposing a miner complained of want of air, how would you interpret the Act as to the quantity of air you or the manager would have to supply? The Act specifies that he should have 200 cubic feet of air per minute.
7473. Which Act do you refer to? The Act of 1876.
7474. Do you give your men 200 cubic feet of air? We give them as much as we can; more than 200 cubic feet of air goes into the mine.
7475. *Mr. Curley.*] What about the air travelling into the working face? There is a loss before it gets there. You cannot find any quantity of air in the working place if a man is 35 yards before the current of air.
7476. Will you look at section 12, subsection 3, of the Act of 1876;—what is the minimum quantity of air mentioned in that section? 100 cubic feet; I always understood that it was 200 cubic feet, but I could not have read it so. Perhaps it is the new Bill that stipulates for 200 cubic feet.
7477. Have you, as manager, measured the air yourself? I generally measure the air on Friday.
7478. When you measure the air, where do you measure it? In the far end of the mine.
7479. Do you measure the air on the main air-way? On the main heading.
7480. What distance do you measure the air from the working face? I measure it at a distance of not more than a chain from the headings.
7481. Can you give us a brief sketch of your mine? Yes [*tracing of colliery workings produced*]; this tracing is not mine, it belongs to the Mines Department.
7482. Is the tracing an accurate one? Yes. [*See Appendix 3.*]
7483. *President.*] How far apart are your shafts? About  $4\frac{1}{2}$  chains apart. The air goes in at the number 2 shaft, and finds its way along the back heading; then it goes along the travelling road.
7484. *Mr. Curley.*] Do you know on what scale this plan is drawn? Yes, 1 chain to the  $\frac{1}{4}$  inch.
7485. When you measured the air, where did you measure it? In number 2 heading; then I measured it to the furthest cut-through, between the two headings—the furthest stenton.
7486. What quantity of air did you find? I got 7,000 cubic feet of air in the first measurement.
7487. Was that at the intake? Yes.
7488. What quantity of air did you get further up? 4,000 feet at the far end of all.
7489. Where did the other 3,000 feet of air go to? It had been lost in the stoppings. The furthest place has a much larger area than the first one, and there is always a less quantity of air there.
7490. Do you mean to say that a certain quantity of air had scaled over the stoppings? I think so.
7491. What kind of stoppings do you use? Small coal stoppings, but we are altering that now, and commencing with brick stoppings.
7492. Are the stoppings in your mine all small-coal stoppings? Yes; up till the present time.
7493. Have you small-coal stoppings in your main air-ways? Yes; the main heading is stopped with small coal.
7494. Do you say that you are now starting to put in brick stoppings? Yes; to come right out with brick stoppings.
7495. Have you measured the air in the return? I did not take the return; but I would get more air in the return than in the intake.
7496. Did you not take the air in the return for your own satisfaction, to see what air was in the return? No, I did not.
7497. Did you take any reading at any other time when you took the air? Yes.
7498. If you did not take a reading, you must have taken it for granted that there would be more air? I took it for granted; if fresh air can be got in the main heading it is bound to be got in the return.
7499. Is that a satisfactory way to take the air? In Lithgow we grow lax, on account of the harmless nature of the mines.
7500. Do you mean that you are not so particular as if there was gas there? Not nearly so.
7501. Have you ever seen any fire-damp in your colliery? No; we have never had any fire-damp.
7502. Have you ever seen any carbonic-acid gas or black-damp? No; I have never seen anything like that.
7503. Have you ever seen gases of any description? No gases of any description have ever been seen there.
7504. Did you say that at one time there were forty-five men employed at your mine? Yes; it was a new mine then. It had not been extended.
7505. Have you any idea what the velocity of the air travelling was when you took it at that time? There was one place, of an area of about 40 feet, where we got close upon 200 revolutions per minute.
7506. Was that quantity of air registered by the anemometer? Yes; Dickenson's anemometer—one of the latest.
7507. Did you take a reading at the return at any other time besides this;—you say you took no reading when you took the last measurement? I got 16,000 feet half-way. 7508.

7508. Can you tell us the last time you took a reading at the return? Yes, about a month ago, half-way in on the return. Mr. R. Hay.  
14 Oct., 1895.
7509. What quantity of air did you get? 16,000 cubic feet.
7510. What quantity did you get in the intake? I only took the return.
7511. What was your object in doing that? Something else, I suppose, cropped up to take my attention.
7512. Can you give us any idea of when you took the air, both in the intake and the return? I cannot give you a date.
7513. Have you done so within the last three months? No.
7514. Do you work bord and pillar system at your colliery? Yes.
7515. What is the width of your bords? The bords at the present time run from 4 to 8 yards wide, but we have had some wider bords.
7516. What is the size of your pillars? They vary from about 15 to 20 yards.
7517. Are they all large pillars? Yes, fairly good pillars.
7518. Are the pillars all the size you have mentioned? I am not speaking of the workings before I went there; the pillars then were not that size.
7519. What size were the pillars before you went there? They varied very much.
7520. What sizes were they? In some instances 12 yards, and down to as low as about 4 yards.
7521. Have you seen these pillars in the colliery yourself? Yes; I have seen them that size.
7522. What kind of pillars do you think should be carried for a colliery of that depth? They should be good pillars. The strata is much thicker where the coal is worked now than it was at the pit bottom. The shaft is in a gully.
7523. Have you to carry more weight as you proceed further in? Yes; but it is a marvellous roof.
7524. Will the roof not require something to support it? In some instances it will require very little indeed.
7525. Is it your experience that when the pillars have to be taken out that the roof comes down? It is better when it does so.
7526. Do you think that mining operations are conducted with a view to the roof coming down eventually, when the pillars have to be removed? Yes; if I had to remove pillars I would like to see the roof come down, although there would be some trouble to get the roof down at Lithgow.
7527. Do you think a mine should be conducted from that point of view? I do.
7528. How do you pay your men at Lithgow? By weight.
7529. Have you a system of averaging? Yes; if they are weighed more than once, the weights are averaged, but if not, the last weight taken prevails.
7530. How often do you weigh? We have not weighed very much lately; we have had the screens down lately.
7531. Before you started to make any alterations, how many skips did you weigh? We used to weigh once or twice a week, but very much oftener when the men kept a check-weigher. When trade was bad the men could not afford to keep a check-weigher.
7532. Would the check-weigher stop you from weighing;—has he anything to do with the number of skips that are weighed? I always let him have a say.
7533. In what way? If he came to me and said, "Do you not think we had better weigh a few skips?" if I could do so, I would do it, if I had nothing else particularly on.
7534. Have you a weighman for the Company at your colliery? We have no weighman.
7535. Do you weigh the skips yourself? Yes, when they are weighed.
7536. How often do you weigh at present;—do you weigh once a day, once a week, once a fortnight, or once a month? We have not weighed for the last four months. The screens had decayed, and I was compelled to pull them all down, and the weigh-bridge at the same time.
7537. In such cases, is it not usual to take one screen down at a time? The alteration was of such a nature that we had to stop the use of all.
7538. How did you get your coal away while these alterations were going on? We were idle for a fortnight, and then commenced before we were ready, and did what we could during the time. It was a month before we got the principal screens in working order. Then we commenced the weigh-screen.
7539. How long is it since you got the screens and the weigh-bridge in order? About a month ago.
7540. Is it a month ago since the weigh-screen was in position? The weigh-screen was put up about a month ago, but we have been adjusting the machine, and so forth.
7541. Do I understand you to say that this has reference to the last four months? Yes.
7542. How often did you weigh for the four months preceding that time? We used to weigh pretty often then.
7543. How often? Once or twice a week we would weigh ten or twelve skips, but I cannot speak accurately as to the time we weighed, since the check-weighman has not been there.
7544. How long is it since the men have been without a check-weigher? Two, or two and a half years. The men had a check-weighman there when trade was so as the men could keep him.
7545. Did you ever make any comparison between the weights you paid the men for and the weights you sent away? I have not done so lately. I have not made any comparisons during the last six or eight months.
7546. When did you make a comparison before that time? I have made comparisons, but not lately.
7547. How did these comparisons come out? They came out on both sides. One fortnight the Company was about 20 tons behind, and another fortnight they had an over-weight of 15 tons. As a matter of fact, we had two daymen filling coal one day, but we had actually that over what we paid the men.
7548. Do you say that you have not bothered about making any comparisons during the past six or eight months? I am pretty certain that during the past two or three months it ran pretty accurately, although we had no weigh-bridge. Of course, the men knew they could trust us, and saw we could not help not weighing.
7549. Is your roof a fairly good roof? Yes, a splendid roof; it is really a coal roof.
7550. Do you leave so much of the coal up? 5 ft. 6 in. of the coal is considered good, and that is worked. The tops run 4 ft. 6 in. in some places, and down to 2 feet.
7551. What hours do you work? We blow the whistle for the men at a quarter to 8 o'clock in the morning, and they commence to go down then—that is, after the deputy has looked round, and we blow the whistle for them to come out again at half-past 4 o'clock in the afternoon.

Mr. R. Hay. 7552. Do you inspect the mine every morning before the men enter? Yes, every working-place.  
 14 Oct., 1895. 7553. Is this done by the deputy? Yes; the deputy is the only man with any authority, and he does this.  
 7554. Does he make a report in any book kept for the purpose? He generally signs a book, stating how he finds the mine. He says, "I have examined the working-places, &c., &c."  
 7555. Do you inspect your shafts? Yes; about once a week.  
 7556. Are your shafts walled? They are walled down to the rock; not beyond that.  
 7557. Do you inspect your ropes? Yes.  
 7558. Your boilers? Yes.  
 7559. What ropes do you use? Three-inch ropes.  
 7560. Do you calculate the life-time of these ropes? They run very much under their working power. As soon as there is a broken wire I take it out.  
 7561. How often do you inspect your boilers? We blow them off occasionally, and the engine-man inspects them.  
 7562. What life-time do you give your boilers? That would depend on the class of boiler.  
 7563. What class of boilers have you? Cornish boilers—one with one tube and another with two tubes.  
 7564. How long have these boilers been in use? One has been in use five and a half years, and is in splendid condition. One is a second-hand boiler, but it is a good one.  
 7565. Do you know how long it was in use before you bought it? No; I cannot say; but it is really a good sound boiler.  
 7566. Have you never inquired how long it was in use before you bought it? I have only examined the boiler.  
 7567. Do you keep an engineer? We have an engine-man, not an engineer.  
 7568. Does the whole responsibility of the boilers depend upon yourself and this engine-man? Yes.  
 7569. Who pays attention to the examination of the boilers? I pay attention to this myself.  
 7570. You say that you do not know how long that boiler was in use before you bought it? No.  
 7571. Is not that a matter that you should inquire into for your own information? I think if the boiler is good, and worked under pressure, there can be no danger.  
 7572. Do not you think that length of days has something to do with a boiler remaining good or bad? Certainly.  
 7573. Have you ever requested the men to work longer hours lately? Not more than the pit time.  
 7574. What system would you call that? That the men were working about eight hours.  
 7575. Do you think eight hours is long enough for a man to work in a mine? I would not ask a man to work any more than eight hours in the coal-face.  
 7576. *President.*] Do you work the bord and pillar system at your mine? Yes; I have what is called the Welsh bord.  
 7577. Do you use brattice? Yes; in the main headings.  
 7578. How do you get air into the bords? We do not put anything in to conduct the air; we always take care to have a cut-through in under the 35 yards.  
 7579. Are the men working 35 yards before the air? Yes.  
 7580. How do they get the air? That is a difficult point; but they do get it. I never had a man come out to get air.  
 7581. Is it very hot in your bords? Not very hot; it is not nearly so hot as I have seen it in the Yorkshire mines. I should say it was from 60 to 70 degrees Fahrenheit.  
 7582. *Mr. Curley.*] Have you ever tried the temperature? No, I have not.  
 7583. *President.*] How many skips do you weigh every day? We have had all the pit top pulled down during the last few months.  
 7584. How many skips do you weigh in a day, when the mine is in full swing? When the check-weighman was there we weighed considerably more than we do now. I should think we weigh about 3 per cent. since the check-weighman left.  
 7585. Why do you weigh a less number of skips now than when the check-weighman was there? Because there are much fewer men.  
 7586. How many skips did you weigh when the check-weighman was there? About 5 or 6 per cent.  
 7587. Why has the weighing fallen off 3 per cent.? The Company never kept a weighman there; I do the weighing myself.  
 7588. Do you still do the weighing? Yes.  
 7589. Have the men complained to you about the number of skips that are weighed? No, they have not. As a matter of fact the men were just filling as they liked for about three months.  
 7590. What average did they get paid on during that time? At the weight they stood at when they were last weighed.  
 7591. *Mr. Curley.*] Is it your colliery that works on Sunday? No; I would not do that. We have no necessity to work on the week-days, even with our few men, in the present condition of trade. Our men will make from 9 to 10 shillings per day while they are at work.  
 7592. Is your seam a clean seam, or have you any refuse? There is a band which runs from about an eighth of an inch to an inch in the seam.  
 7593. What is the height of your seam? About 5 ft. 6 in. high.  
 7594. Is it an easy seam to work? Yes, a very easy seam to work.  
 7595. Do you use any powder? Not in the coal; sometimes we come upon what is called a roll, and we put a shot or two in. These rolls sometimes cut the coal completely out.  
 7596. How many men do you employ? Twenty men on the coal, besides wheelers and day men.  
 7597. How many men do you employ altogether? Thirty men and boys.

[Witness withdrew.]

son quon son dntos ow was the ...

Thomas Broughall sworn and examined.

Mr. T. Broughall. 7598. *President.*] What are you, Mr. Broughall? I am a colliery manager.  
 7599. Where is your mine? I am manager of the Vale of Gwynedd Colliery, Lithgow.  
 14 Oct., 1895. 7600. *Mr. Curley.*] Have you managed any other collieries, Mr. Broughall? I have not managed any other collieries in this country, but I have in the old country; I have had little mines of my own in this country, at Tigue's Hill and Watford.

Mr.  
T. Bronghall.  
14 Oct., 1895.

7601. Have you managed these little mines of your own? Yes; both at Tighe's Hill and at Waratah.
7602. How long have you been connected with mining pursuits? For about forty-nine years.
7603. How long have you managed at the Vale of Clwydd Colliery? A little over six years.
7604. Do you hold any proprietary interest in that colliery? Yes; I have a few shares.
7605. How do you enter the mine there? By a shaft.
7606. What are the depths of your shafts? Both shafts are 230 feet deep.
7607. How is your mine ventilated? By furnace.
7608. Do you know the diameter of your shafts? The winding shaft, the downcast shaft, is 14 feet by 6 feet, and the furnace shaft, the upcast shaft, is 8 feet.
7609. What is the system of working at that colliery? Bord and pillar.
7610. How do you find the ventilation at your colliery? It is very good on one side, and I have over the quantity required by the Act on the other side, but I have a long way to take the air to the lower workings.
7611. How far have you to take it? 1,400 yards, but that will not last for any length of time, because in six or seven months we hope to finish there.
7612. When you say you have over the quantity required by the Act, what do you mean by that statement? I have ten men in that part of the colliery on the average, and I have 2,500 cubic feet of air.
7613. You have over the stipulated minimum quantity of air? Yes; and on the other side of the pit I have any amount of air.
7614. Although you have the quantity of air you state, does the ventilation appear at any time still somewhat deficient? Not in the workings. It is pretty warm in the main headings. I carry steam 1,200 yards to the pumps; that is in the outlet.
7615. If you carry steam down to where you speak of, if it is in the return going out, it will not affect the men? It does not affect the men at all. I carry steam in the pipes 1,200 yards, but that does not come near the men at all.
7616. Will not those hot pipes increase the temperature? No; that is in the return.
7617. The whole of it is in the return? Yes; both steam and water and everything.
7618. Have the men ever complained to you about the ventilation in any of those parts? I have never had any complaints, for some few years. I had complaints at first, because I had to make airways about 800 yards through old workings. There were no airways at all; the air found its way through the old workings, till I made the airways.
7619. Did you find the ventilation very defective when you took charge? Yes; it was at that time.
7620. How many men would there be working at the colliery at that time? In that part of the district, about twelve or fourteen men, that is including the men who were working the airways. I made two airways outside where the pipes were in altogether. The exhaust steam does not travel up the main heading, but in a separate course by itself.
7621. Does it go into the return? Yes; there is one return through the old workings, and there is another return through the main heading, that is the outlet, where the steam pipes are in.
7622. At the pump you are speaking about, is there anything given off there that goes into the intake? No; it all goes into the return.
7623. How many men have you employed in the mine altogether? About twenty-six at the present time.
7624. *Mr. Gregson.*] Is that the number of men employed underground? Yes; the number employed underground.
7625. *Mr. Curley.*] Is the system worked bord and pillar? Yes.
7626. What is the width of your places? Eight yards.
7627. What is the width of the pillars? Four or 4½ yards. The pillars on the side of the Ganning bord, or main heading, are 10 yards.
7628. What kind of a roof have you? There is from 4 ft. 6 in. to 5 feet of inferior coal, and then we have a hard sandstone.
7629. Is there any bad roof in any part of your mine? No; there are a few places where the coal comes down to the rock, but nothing past that.
7630. Do you use much timber to keep that up? Yes; to keep the coal up. In some places it takes a good deal of timber, and in others not so much.
7631. Had you an accident at that colliery some time ago? Yes; I was driving through the end of an old bord—a bord that had been worked sixteen or seventeen years ago. I drove back into it in the new workings, and an accident happened, but that is the only accident I have had.
7632. How did that accident occur? I was in the place five minutes before the accident occurred, and ordered the man to put some timber in. He had five or six props, and I told him to put sleepers instead of the short lids. He went to put the timber up, and the top coal came away. It was entirely his own fault; in fact, I would have punished him for it, but I thought he was punished enough by being hurt.
7633. Do you always keep plenty of timber supplied to the men? Yes; I have never had a complaint yet in this respect. It is a thing I am very particular in watching.
7634. Have you any fire-damp in your colliery? No.
7635. What stoppings have you? Just the slack stoppings.
7636. Are they slack stoppings all over the colliery? Yes, pretty nearly; they are built with the tops, or anything of that sort. They are quite good enough for that class of coal.
7637. Are they quite good enough in the main intakes? Yes.
7638. Is that your opinion? There is nothing at all to alter my opinion, because the coal there will never catch fire, or anything of that sort. I have seen coal where if you put 5 or 6 tons of slack it would be afire in a fortnight, but not in this Colony.
7639. Have you known of collieries being on fire in this Colony? I have heard tell of them, but I have never worked in one.
7640. How do you pay the men at the colliery? By the average weight.
7641. Do you weigh many skips? I weigh sometimes two or three times a week, and sometimes I go for a fortnight without weighing.
7642. Do you weigh the skips yourself? Yes.
7643. Have you no weighman? No; I just weigh when I have a bit of time.
7644. Have you had any complaints about weighing? No; I have not had any complaints for the last three years.

- Mr. T. Broughall. 7645. Have the men a check-weighman at your colliery? They have never been without a check-weighman there.
- 14 Oct., 1895. 7646. Do you weigh when the check-weighman asks you to weigh? He never asks me to weigh. I have never been asked to weigh for, I dare say, the last three years.
7647. You simply weigh of your own accord? Yes.
7648. And at times when it is convenient to yourself? Yes.
7649. Has the check-weighman never suggested to you that more skips should be weighed? No; not of late.
7650. Has he complained to you at any time about the number of skips that were weighed? Yes; two or three years ago.
7651. Do you weigh the coal you send away for the company on the same weighbridge? No; it is weighed on the Government railway bridge.
7652. Do you ever make a comparison between the weights you send away and the weights you pay the men? Sometimes I am a little behind, and sometimes I am a little ahead; taking it all through, there is not much difference at the year's end.
7653. Who has the advantage? Sometimes the men have had a few tons to the good, and sometimes I have had a few tons to the good.
7654. Can you give us the exact quantities for last year? I have not worked it out; I do not think I should be called to answer these questions.
7655. How many skips have you weighed during the last month or two? I cannot exactly say; I weighed last Monday, a week to-day.
7656. Have you weighed any coal since last Monday? No.
7657. *Mr. Gregson.*] What is the check-weighman doing when you do not weigh? He sits there smoking his pipe.
7658. Do the men pay him for doing that? Yes; he has a better billet than I have.
7659. *Mr. Curley.*] Can the check-weighman weigh in your absence? No.
7660. Can he weigh when you are there unless you are weighing? No.
7661. Is the weighing a matter that he has nothing to do with? Yes; I give him a chance to weigh when he likes, when I am present. If I weigh, he sees I do not cheat him; and on the other hand, I see that he does not cheat me.
7662. What hours do you work at the Vale of Clwydd Colliery? Eight hours.
7663. Do you work with one shift, or with two shifts of men? I have been working with two shifts of men during the last two or three weeks. I have had five or six men on at night.
7664. Does your colliery make very much water? Yes; the workings that have been worked out for years all work down into the one place. I cannot pump a great body of water on account of the distance the steam is taken; I have not much power.
7665. Does the water affect the men's places very much? No; I work their places up to the rise.
7666. Are these men that you speak of, in the farthest-in places, working to the rise? They are now.
7667. Does your place rise much? No; not more than 1 in 40; there may be a place or two in swallow's a little more. It is a very flat mine as a rule.
7668. When did you last measure the quantities of air there? I think it was about a fortnight ago.
7669. What was your record? I did not measure it in the new workings.
7670. What do you mean by the new workings? I have one lot of workings going north, and another lot of workings going south; north are the old workings. I took no register of the new workings, but the register of the other workings was 2,520 cubic feet.
7671. Did you take the register in the return? Yes; in the main return. I had about 7,000 cubic feet in the main return.
7672. Were both these readings taken in the main return? No; one was taken in the intake, about 50 yards from the men.
7673. What section of the mine was it where you took the reading? In the inlet section, before it went to the men. I have only ten men at the most in that section where I measured the air, and four miners, a wheeler, and a day-man at night—six altogether.
7674. What time does your furnace-man begin his work? I do not keep a regular furnace-man; the road-man attends to the furnace first thing in the morning, and then about 3 o'clock in the afternoon, and if I go down the mine I stir the furnace up myself.
7675. Do you know the quantity of coal you burn in a day in the furnace? About four skips day and night; the skips carry about 10 cwt.
7676. That is about 2 tons a day? Yes.
7677. Do you use all small coal? Yes.
7678. Day and night? Yes; we only bank the furnace up at night.
7679. What time does the road-man go into the mine? About 6 o'clock.
7680. Does he go to the furnace when he goes in? Yes, first thing.
7681. Have you ever attempted to work your mine longer than the eight hours you have spoken about? No.
7682. *President.*] How do your men get supplied with air in the bords? I never work them beyond 25 or 30 yards before a cut through. If I run a bord over the distance I put in brattice.
7683. Until they get to the cut-through, is there lots of air? Yes.
7684. How do you explain this? The air will always strike in if it goes from the second cut-through. I have brattice in the second cut-through, and turn it up, then it goes to the whole lot.
7685. *Mr. Curley.*] Do you know anything about the size of the pillars, about your shafts? I cannot say; on the one side there are no pillars at all.
7686. What side is that? The winding shaft; there are no pillars 30 yards from the pit bottom. There is an acre and not a pillar in it; from what they tell me, it has been like that for the last fourteen years.
7687. Do you know the reason of that? At that time they took all the pillars—everything out. That was in the good times, when they wanted coal, but it has not moved since.
7688. Is that at the main downcast shaft? Yes; nothing has moved, not a pound of anything since I have been there.
7689. Is there no support? Nothing at all.

7690. Can you send the Commission a sketch showing this? I should have to survey the part first. These pillars are 30 yards from the shaft, what we call rolls. It has been a water-course at one time, and they are about 6 or 7 yards through. They run at an angle; the rolls support the roof, and as long as they are there it will never move. Mr.  
T. Broughall.  
14 Oct., 1895.
7691. What are the other pillars round about that shaft? Some of them are 8 and 10 yards, some more. The tops have fallen, and you cannot get in to see them.
7692. Do you know what condition the upcast-shaft is in? The pillars are good round that shaft. They seem very fair good-sized pillars.
7693. What size are they? Some of them are 8 yards and some 10 yards. Of course the tops are down, and you cannot tell exactly what they are.
7694. If the roof is good, could you not travel over the tops? Yes; but it would not be very pleasant. Some of the places are only 9 and 10 inches high, and a man like myself could not get through them very well.

[Witness withdrew.]

Mr. John Wilson sworn and examined:—

7695. *Mr. Curley.*] What are you, Mr. Wilson? I am colliery manager of the Zig-zag Colliery, Lithgow. Mr.  
J. Wilson.  
14 Oct., 1895.
7696. Have you been manager at any other colliery? No.
7697. How long have you been connected with coal-mines in this Colony? Since I was 12 years old.
7698. What mines have you been connected with? The Vale of Clwydd Mine, at Lithgow; and I was at the South Bulli Colliery for six months.
7699. What were you doing at the Vale of Clwydd Colliery? I was working under my father there.
7700. Have you held any position such as deputy or overman? I was working about the screens, and in the office, and used to go round down below with the overman.
7701. Did you do the same sort of work in South Bulli? I went there for the purpose of surveying and looking after things; but that was while I was manager of the Zig-zag Colliery.
7702. *Mr. Gregson.*] How many years have you been coal-mining altogether? Nineteen years.
7703. Have you ever seen any other mines than the three you have mentioned? Yes; I have seen other mines.
7704. Have you ever worked at any other collieries? No; those are the only three collieries I have worked at.
7705. *Mr. Curley.*] How long have you been manager at the Zig-zag Colliery? About ten years, I think.
7706. How many men are there employed at that colliery? About twenty-six miners.
7707. Have you had a larger number of men employed at any time? We had, miners and shaft men, all told, close on 100 men at one time.
7708. What system of working have you at that colliery? Bord and pillar.
7709. What is the width of your bords? Twelve yards.
7710. What is the size of your pillars? Six yards.
7711. Do you build packs in the middle of the bord? No; we have no packs.
7712. Have you a double roadway? Yes; a double roadway.
7713. Do you use much timber? About four rows of props.
7714. How far are these props apart? They are in rows, going up the bord, about 6 to 8 feet apart.
7715. Do you enter your mine by a tunnel or by a shaft? By a shaft.
7716. What is the depth of your downcast shaft? 200 feet.
7717. How is your mine ventilated? By furnace.
7718. Is your upcast-shaft the same depth as your downcast-shaft? The upcast-shaft is 160 feet deep.
7719. Do your workings rise towards the upcast shaft? Yes; they rise towards the upcast.
7720. Do you know the size of your pillars at the upcast-shaft? I cannot tell you the different sizes; when they were sunk, we were working 8-yard bords. It is only two years ago, since I started the 12-yard bords. The pillars round the shaft are different sizes.
7721. *Mr. Gregson.*] What cover have you over the workings generally? At the present time our workings have about 130 feet of cover.
7722. Have you any workings extending under the hill? We are not working there at the present time.
7723. Have you worked under the hill? Yes.
7724. What cover would there be there? About 900 feet of cover.
7725. What was the size of the bords there? Eight-yard bords and 4-yard pillars, but, as a general rule, some of the pillars were left larger.
7726. *President.*] Were not those very small pillars to leave for such a cover? I do not think so. It a good strong roof.
7727. What kind of a roof was it? Sandstone, and fire clay on top of that.
7728. *Mr. Curley.*] Have any of those pillars been worked out on the side you are now? No.
7729. Have you not started to take the pillars out? No.
7730. What is the size of your pillars on your main roads at the present time? I generally level them about 6 to 8 yards.
7731. Cannot you give us any idea of the size of those shaft-pillars you have referred to? No; not from memory.
7732. Have you never noticed what the size was? I have seen them occasionally.
7733. Can you get round about these pillars? Yes.
7734. *Mr. Gregson.*] Have you never noticed the size of these pillars? When the surveying was done, I knew the size of them, but I cannot tell the size from memory.
7735. *Mr. Curley.*] Do you know the size of the pillars round about the downcast-shaft? I cannot tell the size of them.
7736. Have you any records in the office that will show the size of these pillars? The plans will show the size.
7737. Have you any idea of the area of the ground you are not working now, where you say these 4-yard pillars are standing? Something like 150 acres.
7738. Has all that ground been worked? Yes. 7739,

- Mr. J. Wilson.  
14 Oct., 1895.
7739. What is the area where you are carrying out this 12-yard bord system; the area you are going over, and what you propose to go over? That would be rather a difficult question to answer.
7740. What is the area you have gone over at the present time? About 40 acres.
7741. Have you not some idea of the distance you are going beyond that? Yes.
7742. Is it an extensive area? No; the property is only about 400 acres altogether; I think it is about 90 acres, the other side of where we are working.
7743. Do you give any attention to the carrying capacity of your strata, and what it will take to support the weight; is that a matter you have given much attention to? The attention we give to it is based on the experience we have had in the 8-yard and 4-yard pillars.
7744. Whom does this property belong to? To trustees.
7745. Who are the proprietors of the colliery at present? Mr. Thomas Saywell and my father, Mr. Wilson; it is leasehold property.
7746. Have you any interest in the colliery yourself? No.
7747. How do you find the ventilation in that colliery? We generally keep up to about 20,000 feet, but we can rise up to 50,000 feet if we like.
7748. Is there plenty of ventilation going at the present time for the men that are there? Yes.
7749. Have you measured the air recently? Not within the last twelve months.
7750. Have you not taken any measurement of the air within the last twelve months? No.
7751. Is the colliery inspected in the morning before the men go to work? No.
7752. When does your furnace-man commence his work? He gets down the pit about twenty minutes to 7 in the morning.
7753. When does he come back again? At 5 o'clock at night.
7754. Is he at the furnace the whole of the time, or is he doing other work? He has other work to do.
7755. When do the men go down? They commence to go down at a quarter to 7 o'clock in the morning.
7756. When do they cease work? At 3 o'clock in the afternoon; they are generally on the surface at 3 o'clock. Sometimes they work a little overtime if it is necessary.
7757. Do they work overtime when you want them to do so? Yes.
7758. An hour or two sometimes? No; an hour.
7759. Did you ever request them to work on Sunday? I did once.
7760. When was this? Just after last Christmas.
7761. What was your object in requesting them to work on Sunday? We were behind in our trade. I had to send machinery to Sydney, and we could not keep our trade going; so I thought I would put a few men in on the Sunday; the extra trade would only last for a week.
7762. Did the men object? No.
7763. Did they not say they would rather not go to work? No; only a few of them turned up; I only wished them to work half a day.
7764. Did you give them any intimation on the Saturday that you wanted them to go to work on the Sunday? Yes; on the Saturday evening.
7765. Did you see the men yourself upon this matter? No; I put up the usual notice on the pit requesting them to go to work on Sunday.
7766. Could not this trade have waited rather than go to this extent? No; because people sending orders want to get them as soon as they can—at once. The orders were urgent.
7767. Did you do this entirely on your own responsibility, or was it the wish of your proprietors? I did it on my own responsibility; I was not asked to do it by the proprietors.
7768. Do you not think we can do without Sunday work? I think so. That is the first time we have worked on Sunday for a number of years. I do not believe in Sunday work if it can be avoided.
7769. Did the law step in and interfere in this matter? Yes.
7770. *Mr. Gregson.*] Were you summoned? Yes.
7771. *Mr. Curley.*] Were the men summoned as well as yourself? Yes.
7772. Were you all convicted? Yes.
7773. Were you all fined? Yes; we were all fined.
7774. Were the men fined as well as yourself? Yes.
7775. Who paid the fines? The fines were returned, but I did not ask for my fine.
7776. Did you pay the fines for the men? No.
7777. Did the company pay the fines for the men? No.
7778. How are the men paid at that colliery? They are paid by weight.
7779. Have you any standard weight there? No; we have no standard weight.
7780. Do you pay on an average? Yes; on the average of the coal that is weighed.
7781. How often do you weigh—do you weigh very much? We weigh once a week sometimes; sometimes once a fortnight; and we may weigh two or three days following.
7782. Who weighs the coal? I do.
7783. Have the men a check-weighman? Yes.
7784. Has he any say in the number of skips that shall be weighed? No.
7785. Did you weigh any coal last week? Yes; I think I weighed on one day last week.
7786. How many skips do you weigh when you do weigh? Different numbers; sometimes half a dozen, sometimes twenty, sometimes ten.
7787. Were you manager at that colliery at the time you had about 100 men employed there? Yes.
7788. How many skips did you weigh then,—did you weigh then in a similar way to what you do now? We generally used to weigh more at that time.
7789. Did you do the weighing yourself then? Yes; I used to weigh then.
7790. What do your skips carry? The average is 14 cwt. 2 quarters; some men fill 16 cwt. and 16½ cwt.
7791. Does your coal vary very much in the mine;—do the men ever get into soft or tender coal? No; the difficulty is that it is too hard; it keeps just about the one thing.
7792. Have the men ever complained to you about not having a sufficient number of skips weighed? Not latterly.
7793. Did the men complain to you upon this matter some time ago? They used to complain sometimes.
7794. *Mr. Gregson.*] How many years ago is it since they complained? Perhaps three or four years ago.
7795. Have you had any complaints from the men during the last three years? No.
7796. *Mr. Curley.*] Has the check-weighman ever complained to you? No.

7797. Has he never asked you to weigh more skips? No.
7798. Has he never suggested to you that it would be advisable to weigh more skips? No; sometimes he has asked me when I was going to weigh.
7799. Do you not look upon that as a request to weigh? I suppose it is in one way.
7800. How many skips did you weigh when you had this larger number of men working at the colliery? I cannot tell from memory.
7801. Did you weigh every day then, or only occasionally? Just occasionally.
7802. Has your present system of weighing been in operation since the colliery was opened out? Yes.
7803. Have you ever made any comparison between the weights you send away, and the weights you pay the miners for? I have not done it for a couple of years.
7804. Before that time did you make any comparison of these weights? I used to run it up sometimes.
7805. How did it run up? Sometimes we had a little over, and sometimes we had a little under; we could not always get at it exactly, because we would have trucks standing in the siding loaded.
7806. Has there been a check-weighman at the colliery all the time? For the last nine or ten years there has been a check-weighman at the colliery. When the colliery first started, there was no check-weighman for a while.
7807. Is your mine a very dry mine, or have you any water to contend with? Some of the places in the mine are wet; we have a good drop of water to pump.
7808. Have you to bail any water from the men's places? Very little; we are working all to the rise.
- 7808½. Have you any water to the dip? I have not worked the dip for a number of years.
7809. How many places have you working where there is water to contend with? Five places.
7810. Do you bail the water in these places? No; the water runs away from them. If there is much water we take it out, but if not they take it out themselves.
7811. Have any of the miners to wait for any length of time before they get to their work in consequence of this water? Occasionally they have to wait.
7812. Is there any fire-damp given off in that colliery at all? No.
7813. Have you never noticed any fire-damp? No; no gas whatever.
7814. Have you ever noticed any black-damp? No.
7815. Do you use any brattice to carry the air up into the men's places? No.
7816. What kind of stoppings have you? Small coal stoppings.
7817. Are the stoppings all small coal stoppings? The majority of them are; I think we have one brick stopping.
7818. *Mr. Gregson.*] How do you put the small coal together? We pile it up.
7819. *Mr. Curley.*] Have you these small coal stoppings on your main intakes as well? Yes.
7820. Do you ever notice that the small coal shrinks in these stoppings occasionally? Yes; we generally go round them when they shrink.
7821. And pile them up again? Yes; there is always a large body of the slack.
7822. How much do you put there? About 8 feet at the bottom, and I suppose a couple of feet at the top.
7823. Is this slack coal that you get from the working of the mine? Yes.
7824. Is it all good slack coal? Yes.
7825. Have you much of a market for your slack coal? No; a very poor market.
7826. Do you send some slack coal away? Yes; we send some away.
7827. How much do you send away? Perhaps a couple of hundred tons a month; I cannot say exactly.
7828. How many tons of round coal would you send away a month? I suppose we would average about 1,900 tons a month.
7829. How many tons of small coal would you consider there would be stowed in these bord ends that you use for stoppings? I cannot tell you; I have not gone to the trouble to calculate it.

[Witness withdrew.]

Mr. Joseph Brown Barclay sworn and examined:—

7830. *Mr. Curley.*] What are you, Mr. Barclay? I am Mayor of the Municipality of Hamilton at the present time.
7831. Have you been an alderman there for some considerable time? During the last three years I have been an alderman there.
7832. Have you been an alderman of the Municipality of Wickham for some time? Yes; this is my sixth year.
7833. *President.*] Are you an alderman for both municipalities, Wickham and Hamilton? Yes.
7834. *Mr. Curley.*] Have you held the position of Mayor of Wickham? No; I have not been Mayor of Wickham.
7835. Will you look at sub-section 3, of section [30] 28, on page 14 of the Bill;—you will notice in that sub-section a provision for a surface plan, showing all the streets, roads, buildings, creeks, rivers, bays, swamps, navigable waters, and limits of any tidal waters within the boundary? Yes.
7836. Do you think a clause of that description is necessary? Decidedly; it is what the Council has been endeavouring to procure for years.
7837. You will see that the clause says: "If required, a surface plan, &c.";—do you not think it ought to be a positive matter? I think it ought to be compulsory; more especially as regards Wickham.
7838. *President.*] Why do you say especially as regards Wickham? I think it ought to be in possession of the Municipal Council, seeing they have the maintenance of the streets, and are liable in case of any accident, no matter whether it is caused by undermining or not.
7839. ~~Supposing the underground mine-owner has absolute right to do what he chooses, and the municipality comes there after and makes streets, and the mine-owner lets down the ground and causes a subsidence, what are you going to do in a matter of that kind?~~ The mine-owner has no right to dedicate the street.
7840. ~~Or how does he dedicate the street? Does he sell?~~ The street must be dedicated from the owner to the council before it can be made a public thoroughfare, and the law does not allow the council to spend the ratepayers' money unless it is so. The mine-owner makes it over to the council as a deed of gift, as it were.

Mr.  
J. Wilson.  
14 Oct., 1895.

Mr.  
J. B. Barclay.  
14 Oct., 1895.

- Mr. J. B. Barclay. 7841. *Mr. Curley.*] Do you know of any streets that have been undermined in the Municipality of Wickham? Oh, yes; North Wickham is practically ruined.
- 14 Oct., 1895. 7842. *President.*] Does the mine-owner sell the surface? Yes, exclusive of the mineral; but the Ferndale people reserved no mineral in some cases.
7843. *Mr. Curley.*] Where have the streets been undermined? From Flemming-street up to Smedmore-street, was all undermined by the Maryville Colliery Company, and the Wickham and Bullock Island Company. Practically speaking it was not the fault of the Wickham and Bullock Island directorate; it was the fault of the Linwood Colliery. The Wickham and Bullock Island Colliery, had to suffer for all Mr. Walker's misdeeds. A great many people got a verdict against the colliery proprietors for damage done.
7844. Can you mention any other part that was affected by undermining? Only the northern part was affected—no other part that I am aware of.
7845. Do you say that the Wickham and Bullock Island Company had to suffer for the misdeeds of the Linwood Company? Yes.
7846. When the Wickham and Bullock Island Company allowed the Linwood people to take that portion of their lease could they not have reserved the right of supervision by their own manager to see that the work was carried on in such a way that no undermining could have taken place? They ought to have done that, but mining several years ago was carried on in a very loose way, without regard either to safety of limb or property.
7847. Do you know of the undermining of streets in any other locality? Not streets; there is a good portion of the Hamilton Municipality at the Newcastle boundary, that has fallen away during the last few years, from Melville-street, on the tramway line, that is the boundary between the two municipalities. The subsidences have taken place between Melville-street and the Raccourse.
7848. Does this property come up to Melville-street? Yes, right up to Melville-street; it was all ratable property.
7849. Has the Municipality of Wickham been put to any inconvenience in connection with this undermining? The residents have complained of being afraid of their places coming from under them.
7850. Have your streets in Wickham been affected? Not to any great extent.
7851. Do you know of any undermining that took place near Tighe's Hill? Yes, it is pretty well honey-combed there all through.
7852. Do you know whether this undermining has given the Municipal Council any trouble? Yes; there was a great deal of expense incurred there, through a party by the name of Bevan mining a part of the old Ferndale Colliery.
7853. Was it ever discovered who it was that did that undermining? There was some trouble, but that was the supposition.
7854. Was there not some difficulty in finding out who had done it? Yes.
7855. Do you think that municipalities should be run into expense or litigation in matters of this description? No; I think that every mine-owner should be compelled by law to secure the streets in all instances.
7856. Do you think that the mines ought to be worked in such a way that they would not be a menace to the public, as far as safety is concerned? Certainly.
7857. And that municipalities should not be thrown into litigation? Yes; there is a great deal of money spent by municipalities in keeping the streets in repair.
7858. Have the municipalities any money to throw away; I suppose they are not too affluent? I am sorry to say they are not. The Municipality of Hamilton is pretty sound, but I cannot say so much for Wickham. The whole of the northern part of the Wickham Municipality is resting on water; it is honeycombed right through; it is only the water that is keeping it up. The water has filled the whole of the Maryville workings.
7859. Do you think the Maryville workings have been flooded by Throsby's Creek? Yes.
7860. Can you say that is so beyond dispute? I made the cylinders for the shaft, and I was an eye-witness to the tide ebbing and flowing, and have seen the sea-weed there. There were two air-shafts put in the Maryville property; the first one was lost.
7861. Will you look at rule 25, on page 29 of the Bill (*see Appendix A*)? Yes.
7862. Do you think that is a necessary provision in the Bill? I think so; I think the Minister ought to have that right.
7863. The marks you see drawn through both these clauses indicate that the Legislative Council is opposed to them being in the Bill. From your experience in connection with municipalities, do you think that these clauses are essential in a Coal-mines Bill? I think so; I see no necessity for opposition to the clauses. I fail to see why the mine proprietors ought to be hampered, but, at the same time I think there ought to be a provision by law to secure life and limb and property.
7864. Do you think that there should be any question about the safety of the public streets? None whatever.
7865. Did you refer just now to some undermining towards the Glebe—what did you refer to? That belongs to the A.A. Company. I should think it affected from 15 to 20 acres.
7866. Is that near Melville-street? Right up to the fence of Melville-street.
7867. Do you think that has gone over the street? I am not prepared to say that; I know there was great difficulty in laying the tramway there, and that a lot of expense was incurred.
7868. Have you had any subsidences in connection with any of your streets in Hamilton? No.
7869. You do not know of any subsidences in Hamilton? I am told that some four or five years ago, one of the telegraph poles went down in James-street, but I am not prepared to say that was caused by undermining, because if a telegraph post went down, something else would be likely to go also. It might have been caused by the strata, water percolating, or something of that kind.
7870. Do you know of any undermining towards the Glebe in any way? There is no undermining there to my knowledge.
7871. Have none of the streets over that way been affected? None of the streets there have been affected to my knowledge.
7872. Is the undermining of streets a matter that the municipalities have had under consideration for some time? Yes; a few years ago there was great agitation in Wickham; a committee was formed, and several deputations were sent from it upon this matter. We demanded an inspection of the Ferndale mine, and asked to see a plan, but our requests were refused.
- 7873.

7873. Whom did you make the request to to see the plan? I think the request was made to the manager, Mr. Jno. Powell.

7874. Could you get no information from anybody? No.

7875. Do you think that is a proper position for a municipality to be placed in where mining is carried on? Decidedly not.

7876. Do you think there is any disposition on the part of municipalities to harass collieries in any way? No, quite the opposite; I speak for the two municipalities I belong to. In fact, as regards Hamilton, the A.A. Company has been both father and mother to that municipality. It is a town that has been practically built up by that company.

7877. You say there is no disposition on the part of aldermen to harass a company? No.

7878. Do you not think that you ought to be able to form a very good opinion on that matter, taking into consideration the experience you have had? I ought to be able to form an opinion on it.

7879. When you made this mild request, do you not think the information should have been forthcoming? I think the information should have been given.

7880. Have you found it necessary to take a legal opinion upon these matters? I believe a legal opinion was taken outside the Municipal Council by the committee that was formed at Wickham as to whether they could demand an inspection, or to see the plan.

7881. Can you give us any idea what the legal opinion was? I have no knowledge myself; I only know from hearsay.

7882. You have not seen the opinion yourself? No, I have not.

7883. Have the municipalities had this matter under consideration at different times? Yes, more especially at Wickham. We have no knowledge where the Ferndale Company has mined through or what streets they have gone through.

7884. *President.*] You spoke about the A.A. Company being both father and mother to one of the municipalities;—what municipality did you refer to? Hamilton and Wickham as well.

7885. Have they let down any streets in Hamilton? No, not to my knowledge.

7886. I will read you what the Legislative Council has to say about this rule 25:—

The Legislative Council insists upon its amendment in clause 50, page 26, which omits rule 25,—because it is the business of the Crown when leasing coal to see that sufficient provision is made for protecting the surface, and that owners of the mineral long before any improvements in the shape of roads or townships were in existence ought not to be punished now by losing their coal, as it is by no action of theirs that circumstances have produced an apparent necessity for not mining the coal which they are entitled to. Practically in nearly all mining townships the large companies make provision, even at the proprietor's expense, for the maintenance of the surface where the safety of the travelling public has to be considered. It is notorious that roads have been made long after the coal has been taken out, and the authorities ought to have known this would one day result in a settlement of the surface before they made the roads.

What do you say to that? In a great many cases what is stated there is correct.

7887. The difficulty in providing legislation is that the mine people have a right to the mineral? If that is so the municipality ought to put up with whatever arises. The Council has accepted the dedication of the streets, and after they have spent thousands of pounds they cry out; but why did they accept the dedication.

7888. Whom did they accept the dedication from? Building Societies.

7889. Have the Building Societies built the houses? No; they have bought large tracts of land where the mineral was actually reserved, and they have cut the land up into allotments, and have sold these allotments at high prices, with a surface right only, and the Council are bound by the consequences.

7890. Supposing a man has a mine where coal has not been taken out; that he has an absolute right to the mineral, but somebody else has the surface without any rights being reserved, would it not be hard to prevent the coal-owner from taking his coal out? If I was a coal-owner I would have the coal.

7891. Would you take the coal out? Yes.

7892. Is there not a difficulty in legislating for a matter of this kind? Yes.

7893. You do not know what the rights of the people are? No, that is the difficulty; if one person has got the coal he has the right to take it, and if he endangers life and limb then the trouble ensues.

7894. Does not the trouble come in by the surface people chancing it? Legislation should have stepped in to prevent them dealing in that way. I think the mine-owner might be assisted by the Government to take all means necessary to protect any road from being dangerous. I think the country should take the matter in hand.

7895. How could the Government assist the mine-owner? If the A.A. Company left coal on each side of the street it would be impossible to take that property down.

7896. Why should they be prevented from taking the coal out underneath a road? That is a knotty point.

7897. Is it not confiscation? Yes, confiscation.

7898. *Mr. Gregson.*] I suppose you know that these troubles are not peculiar to this country: that they have the same thing in England;—have you heard how they get over the difficulty there? They have the same troubles in England. Although I was reared amongst them, we had no municipalities to contend with; it was mostly private owners, and they generally got over the difficulty.

7899. Have you heard of a street that has been let down where the colliery owners have made it good? Yes; I have heard of that in Newcastle, but the difficulty is that everybody is a mine-owner now-a-days.

7900. How can you legislate for one without affecting the other? The difficulty is that these small proprietors have not the means to remedy any of these matters. At New Lambton you might pass over a road to-night, and to-morrow it might collapse. It is all honey-combed at the present time. I think under the present system in the Colony that it would be a great injustice to put too many restrictions on the mine-owners, because they could not cope with them. If they want to put restrictions such as to compel them to put up brick arches to support the strata, many of them could not do it. I think that legislation should treat the coal in the same manner that gold and silver is treated. I think at the present time the wealth of the Colony is being squandered—given away under its value, by allowing the coal to be sold at such a ridiculous price.

7901. How can you regulate that? I think it is hard to regulate the coal industry. I can buy silver at a certain price, and make a profit, if I was allowed to make what I buy into the coin of the realm, but I am not allowed to do that; they will not allow me to do what I like with it.

7902. *President.*] Do you mean that you are not allowed to coin it? Yes.

7903. There is nothing to prevent you, if you are a jeweller, in making it into anything you might like?

Mr. J. B. Barclay. I know that; but what I mean is that coal is the greatest source of wealth we have in the country, and if legislation is going so far as to put restrictions upon men and masters, it should put a minimum selling price on coal.

14 Oct., 1895.

7904. Would not the trade, if such a thing was done, be taken by other countries? I do not see it; the Newcastle coal is going for half of its value at the present time. The men that have been mostly the cause of this, have been the small coal proprietors, and they have also caused the damage to the streets.

7905. *Mr. Curley.*] Do you not think that some of the large proprietors have set the small proprietors going? Yes.

7906. Even when they were bound by an agreement with the workmen? Yes; but I believe the principal proprietors are prepared to deal fairly with their men.

7907. *President.*] Supposing people have the right to get all the mineral in a certain part of ground, how can you hamper them by having certain matters referred to the Minister? In place of the Minister I would prefer a committee of three. We may get anybody as a Minister of Mines, and I think it is a dangerous thing to give one man this power, because he might not be a practical man. On behalf of the municipalities I should object to them being answerable to the Minister.

7908. *Mr. Curley.*] Do you know a municipality where they wrote to a company some time ago in connection with the undermining of a street, drawing attention to what the Council had done, and asking them to consider the matter, and that they never received a reply to their communication? I would not be sure about that; but I have heard something about Brookstown and Wallsend. I am of opinion that where mines are worked under public streets, it would do no harm for an inspector to report to the Minister as to their stability or otherwise.

7909. Is this not one of your difficulties in connection with the dedication of a street—that you do so without any information whatever? Yes; we have no information; but if the owners of the property did not sell the surface there could be no municipality. Take, for instance, Mimmi, and also Hamilton; if the A. A. Company had not sold the surface, there would be no municipality. Hence the municipality arose.

7910. *President.*] Did they agree to leave supports? That I cannot say.

7911. *Mr. Curley.*] Will the same thing apply to Wickham? Yes; Mr. A. A. Dangar's property was sold in the same way; but I understand from the deeds that in some instances there was no reservation whatever, and in other portions the mineral was reserved.

7912. Do you mean to say that in one case there was no reservation of mineral, and in the other case there was? Yes; the people were satisfied in the case of no reservation for the mineral that they were taking the mineral out, but they could not get an inspection. The mine was worked by the Ferndale Company, and is full of water now.

7913. *President.*] Would a plan of the mine have shown you that? Yes; in Lambton the Minister is actually preventing them from taking what they have actually purchased.

7914. By what authority does he do that? I only know that he does it; I think they can claim compensation from the Government for the value of the coal.

7915. *Mr. Curley.*] I suppose, apart from the past, you can understand that there is a good deal of coal to be gone on with in the future, and to be leased to companies? I would think so.

7916. If irregularities have taken place in the past might they not be remedied in the future? I think we should try to prevent a recurrence in the future.

7917. *Mr. Gregson.*] How are you going to deal with a thing like this;—it is all very well to say a thing ought to be done, but how are you going to do it? It is a knotty point. It might be this way. If the municipality had a main road or street running through the property, well knowing by the plan it was going to be undermined, and considering it dangerous, I think, as has been done in the past in several cases, that the municipality and the mine-owner ought to come together.

7918. If it is a proclaimed road, it is the Government, and the municipality might have a claim against the Government for permitting it to be done? Yes; every street, after the *Gazette* notice, is a proclaimed road.

7919. It seems to me that the Government should be held responsible just as much as the mine-owner? The difficulty is, that any unpractical man can go and make the Minister do what he likes.

7920. That is the objection to the clause as it stands;—the objection is that the Minister deals with coal land outside the Government? Yes; that is the objection.

7921. *Mr. Curley.*] Many owners of the coal also own the surface, which they have sold, and got value for that surface, and if people come and put their residences on the surface, where comes their right later on to depreciate the value of that?

*Mr. Gregson:* They have no right.

—*Witness:* If I purchase the surface, and in the deed the mineral is reserved by the owner of that property, I am contributing to letting down my own property. I buy it with all risks, so that it is a knotty point to determine which way to deal with it. At the same time life may be lost.

7922. *Mr. Gregson.*] That very seldom happens? Very seldom.

7923. Do you not think that more is made of this than circumstances warrant, and that it will make municipalities more careful in the future before they take the dedication of roads? Yes; I think so. In municipalities, like other things, unpractical men get into them, and if they are asked to accept the dedication of anything, they will accept. One set of aldermen may do this, and another set of aldermen may not.

7924. *Mr. Curley.*] Do you know that wherever a mine is opened, a good deal of land has been offered, and a good deal of land is sold, and must not that be the natural condition of things? About the only exception is Brown's property, in the Northern district. They are the only people who have retained their property. The other companies have all sold.

7925. Do you think, judging from the past, you may anticipate that the same thing will occur again? Yes; most decidedly.

7926. Do you think it is desirable for persons who have purchased the surface to be thrown into litigation in these matters;—should coal-owners have the right to ruin homesteads when they have sold the surface? The difficulty is when they have sold the surface and the mineral to different parties.

7927. Will not persons be taking up coal in the future, in the same way as they have done in the past? Yes; I think it should be provided against in the future. In the future, if a company takes up a large tract of land, and they sell the surface, I say that after selling the surface and getting that value, it would be unfair to let them practically ruin it by taking the mineral out afterwards.

7928.

7928. *Mr. Gregson.*] Do you know of any case in which coal has been worked under a lease from the Government in the Northern District? No.

7929. Supposing that coal has been leased by the Government, and that afterwards the Government have sold the surface over this very tract of land, and then by-and-bye that the coal is worked out, and the allotments tumble down, who is to blame in this matter? The Government, I presume. They have done so; the Government have sold part of the commonage near Newcastle, and it is practically undermined. They have actually sold the pillars, allowed the lessees to take the pillars out, and the whole thing will collapse. The present Government has done this, so that we need not go to private owners for an example. The Minister has done this. In one place the Government have sold the ground in allotments of a quarter of an acre, and have refused permission to one man to take coal out of his own allotment, and a little way from this, they have let the pillars that are left in to other parties, to mine the coal and let the whole surface down. That has been done this year.

7930. Do you approve of that being done? No; but there is no doubt that it has been done.

7931. What municipality is that in? The Waratah Municipality.

7932. Do you know that this has been done there? Certainly; it is a rabbit warren, as it is, and now the whole thing will collapse from start to finish.

7933. *Mr. Curley.*] That question may arise with regard to present conditions; could not that be got over to some extent by Valuation Boards of Arbitration? It might be got over in that way. Those who have bought the coal have a perfect right to get their coal, and there ought to be a midway, say—that the Government, the Council, and the mine-owner should decide what each ought to pay for keeping life and limb safe. I do not think the mine-owner should be made culpable for the whole lot; he bought the mineral in all good faith, and I do not think he ought to suffer.

7934. Would you not make the mine-owner responsible where he purchased both the surface and mineral? Certainly; where he purchased the surface and mineral, but not where it is sold to different parties.

[Witness withdrew.]

Mr. Thomas Arthur Lloyd sworn and examined:—

7935. *Mr. Curley.*] What are you, Mr. Lloyd? I am connected with the Borough Council of Newcastle.

7936. What office do you hold under the Council? I hold several offices; but I am known as the Inspector of Nuisances.

7937. Is it your duty, as Inspector of Nuisances, to look pretty well round the Municipality? Yes.

7938. Will you look at the proposed Bill, section 30 [28], sub-section 3, on page 14 (*see Appendix A*). Do you notice that that rule provides for a surface plan showing all streets, roads, buildings, creeks, rivers, bays, swamps, navigable waters, and limits of any tidal waters within the boundary? Yes.

7939. Do you think that is a necessary provision in a Coal-mines Bill? I would think so.

7940. Do you know anything about the undermining of streets in or around your municipality? Yes; as regards the surface.

7941. Where do you refer to? In the vicinity of Melville-street, within the Municipality of Newcastle.

7942. What are the streets there that you know with regard to a subsidence of the surface? The whole of the surface has subsided, I should say, to an extent of perhaps 20 acres.

7943. *President.*] Twenty acres? I should imagine so; 20 acres on the western side of Melville-street, extending towards Hamilton.

7944. *Mr. Curley.*] Does the subsidence come over on to Melville-street at all? I believe it does, it comes to the boundary of Melville-street nearly its whole length, and where the tramway at present runs, it took some months to fill up. It was filled up to the surface level, and subsided again and again.

7945. Do you know that this was directly in consequence of undermining? I only know from hearsay; I have inquired from miners the cause of this.

7946. Have you had a conversation with the miners about this subsidence? Yes, with numbers of miners.

7947. What opinions did these miners express on the subject? They said it was owing to taking away the pillars from under the street.

7948. *President.*] What was the name of the mine? I think it is the Borehole Mine.

7949. *Mr. Curley.*] Do you know who filled the street up? The Council filled the street up in the first instance, and the contractors for the tramway-line, in the second, and third instances.

7950. Did this run the Council into much expense? I know a considerable sum was collected amongst the ratepayers, and that the Council added to this sum, and formed the street.

7951. Do you know whether the Company was appealed to, to contribute anything towards this matter? Not to my knowledge.

7952. Do you know if the Council made any appeal on the matter themselves? It is not within my recollection, but I have some idea that when Mr. Buchanan was Mayor, something of the sort was spoken of.

7953. Do you know with what result? I do not.

7954. Did you not hear Mr. Buchanan refer to the matter, and make any statement about the business? I have no recollection of his doing so. The only thing I remember was the putting down of an iron bore to ascertain the depth. I think he said he put a bore down some 100 feet, and failed to find the bottom.

7955. Do you think that the bore was put down to the depth the seam lays at? Perhaps not; I scarcely think it was.

7956. Do you say he found a vacuum where the roof was broken away? I judge it was something of that sort.

7957. Did Mr. Buchanan say to what extent that vacuum was? He said it extended a considerable distance.

7958. If the subsidence came to the surface, do you think there would be much of a vacuum—the strata over the coal? No; I scarcely think that, from what I have heard since from miners who say that a large bed of sand existed there.

7959. Would it be sand and rock and clay, together? I suppose so.

7960. If it came to the surface, would not that body go down? I think so.

7961.

Mr.  
J. B. Barclay.  
14 Oct., 1895.

Mr.  
T. A. Lloyd.  
14 Oct., 1895.

- Mr. T. A. Lloyd.  
14 Oct., 1895.
- 7960½. If you put down a bore in that situation, would you discover much of a vacuum? You might in places where the coal was taken out.
7961. Have you any idea what it cost the Council to fill up this place? No, I have not; I would not like to say.
7962. How long was this ago? About six and a-half years ago, as near as I can remember.
7963. Have you noticed any undermining in any other places, anywhere about Newcastle? Only at the Borehole, and at the Sea Pit. I have been down the Borehole Pit, and the Sea Pit.
7964. Is that the only locality you can speak about? Yes.
7965. You cannot speak of any other localities round there? No.
7966. Will you look at rule 25, on page 29 of the Bill, (*see Appendix A*), and see what is said in that rule about working coal under any proclaimed or made road? Yes.
7967. Do you think that the Minister should have some say about the working of coal under a proclaimed road? Yes, I think so; and I have often thought—adjacent to a proclaimed road.
7968. Do you think a clause like that should be embodied in a Coal-mining Bill? Yes, I should think so, for the protection of the roads and the public.
7969. Do you consider that the public has any right to be menaced in any way with regard to public roads? I think that companies getting coal from under roads should be compelled to protect the surface in such a way as it would not subside.
7970. Do you think that municipalities are liable to be run into a good deal of expense if they have to look after the maintenance of roads where undermining is allowed to go on? Possibly; I should think heavy damages at times.
7971. Do you think they might be held responsible if any accident should take place? I think so.
7972. Do you form that opinion owing to your knowing that they have the control of the streets? Yes; because they have the whole management of the roads and streets.
7973. Do you know of any actions that have been brought against the Council in connection with the keeping up of streets about Newcastle? I know of one or two, and of others that have been settled privately rather than go to law.
7974. From what you know of these circumstances, what opinion have you formed with regard to this undermining? I am influenced by the opinion of Judge Backhouse in connection with a place where lights were not exhibited where the street was hoarded. This case cost the Council £200. At that time the Council gave evidence that they had advertised in the newspapers that the road was closed against traffic, and Judge Backhouse's opinion was that for an advertisement to that effect to be of any value, evidence would have to be given, that the injured party had a knowledge of that advertisement. Since that decision I have been most cautious to report any defects I may notice in the roads.
7975. How long is that ago? About three years ago.
- 7976-7. Was that subsequent to this undermining you have been speaking about? Yes.
7978. Did you make any report about that undermining? Only verbally, to the different Mayors, with reference to the nuisances caused since the land subsided.
7979. Was this a dedicated street at the time of this occurrence? Yes, to the best of my knowledge.
7980. Do you know if traffic had to be stopped on the street? Yes.
7981. Was the street made at the time? Yes, the street had been made; I remember that, because a concrete culvert gave way at the same time.
7982. Do you think that companies who sell and dedicate the surface, should have some respect for it? Yes, I think so; I think no one would purchase unless they thought so.
7983. Do you think that a great number of people who purchase the surface, knowing that the mineral is underneath it, expect that the surface will be respected? Yes.
7984. Do you know if the Council has ever taken any action in connection with undermining, either by itself or jointly with any other municipality? I am inclined to think they took joint action with the Wallsend Council.
7985. Was this matter much spoken about at the time in the Newcastle Council? I do not know that it was very much spoken about; it would be at an improvement committee meeting if it was.
7986. Were you present at those meetings? Very seldom.
7987. The meetings you would attend would be the Council meetings? Yes.
7988. How far along the street did you say that the street was affected? Nearly its whole length, from Parry-street to Kemp-street.
7989. What distance would that be? Roughly speaking, about  $\frac{1}{4}$  of a mile.
7990. Can you estimate what the subsidence would be in depth—in feet? I would not like to undertake to say what depth it would be. In some places, judging by the fences and what is known as the back road to the racecourse, I suppose it would be some 6 feet there.
7991. I want you to refer to Melville-street principally;—can you give any estimate of the subsidence there in a general way? No, I cannot, because the fences and paddocks have all disappeared; some of them have disappeared altogether.
7992. Has the surface gone away bodily? It has subsided very considerably.
7993. Cannot you give an estimate of the average depth of the subsidence itself? I would not like to say what the depth was, because almost immediately after it subsided they had to fill it up again. I know one particular place, known as the 2nd culvert, went down to a depth of 10 feet, I suppose. That was after the tram contractors had filled it up once, and the second time it had subsided, then it was bottomed with ti-tree scrub.
7994. Would the Council get the material from the company to fill this up? It was filled up with sand.
7995. Had you plenty of sand close by? Yes; on the street.
7996. The Legislative Council have objected to the two clauses I have drawn your attention to, being embodied in this Bill. Can you understand why there should be any objection to them yourself? No; I do not see any objection to them; they seem, as far as my knowledge goes, to be very necessary. I suppose the sanction of the Minister could be obtained to work the coal under roads and streets.
7997. Don't you think that a surface plan showing streets, roads, and buildings, and the other things mentioned, would be very necessary information for a municipality? Yes, I think it would be very necessary.

7998. Are you aware that at the present time the Council cannot get hold of any plans, to inspect? I have heard so.
7999. Can you see any reason why these clauses should not remain in the Bill, as originally proposed? In my opinion they should remain in the Bill.
8000. Are you aware that there is a good deal of mining going on beneath the City of Newcastle? I have been so informed.
8001. Would you like to see the streets of Newcastle honeycombed by any process of mining? Certainly not.
- 8001½. Would you like to see the buildings of the city shattered? Certainly not; it would be an enormous expense to the Councils, if such was the case, and to private people as well.

[Witness withdrew.]

TUESDAY, 15 OCTOBER, 1895.

[The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.]

Present:—

FRANCIS EDWARD ROGERS, Esq., Q.C. (PRESIDENT).

JAMES CURLEY, Esq.

JESSE GREGSON, Esq.

Mr. John Owen sworn and examined:—

8002. *Mr. Curley.*] What are you, Mr. Owen? A miner.
8003. *President.*] Where are you employed? At Lithgow.
8004. How long have you been a coal-miner? About twenty-five years.
8005. Have you been coal-mining at Home as well as in this Colony? I have had between five and six years' experience at Home.
8006. Where were you employed in England? In various mines in South Wales.
8007. Have you been employed the rest of the time in this country? Yes.
8008. Where have you been employed in this Colony? Mostly in the Lithgow collieries.
8009. *Mr. Curley.*] Have you worked in many of the mines in Lithgow? I have worked in nearly all the mines there.
8010. What are the names of the mines you have worked at in Lithgow? At the Vale of Clwydd Colliery, the New Vale, or the Vale Colliery, as it is generally called, and the Oakey Park Colliery; also at the Iron works, adit, and at the Eskbank Colliery. I am working at the Eskbank Colliery at the present time.
8011. How many years have you been in the Lithgow district? I have been in the Lithgow district about eighteen years, with a slight intermission of a few months.
8012. Did you work long in the Vale of Clwydd Colliery? I worked for some years there.
8013. How long did you work there? About five years.
8014. Is it long since you worked there? Four years—perhaps a little over four years.
8015. Were you coal-mining there? Yes; I was a miner there.
8016. Have you filled any other position in the colliery? Yes; I have been deputy and underground manager.
8017. Have you a thorough knowledge of the Vale of Clwydd Colliery? Yes; a pretty fair knowledge of that colliery.
8018. What was the system of working when you were there? Pillar and stall.
8019. Do you know the width of the bords? As a rule they were 8 yards wide.
8020. Do you know the size of the pillars? They were about 8 yards, as near as I can remember.
8021. Had you a good roof in that mine? Yes, a very good roof.
8022. Was it a strong roof? Yes, a strong roof.
8023. Did you do any pillar-working when you were there? No.
8024. Is there any pillar-working going on there now? No, not to my knowledge.
8025. Do you know anything about the pillars round about the shaft? Yes, I do.
8026. What size are the pillars about the shaft? There are one or two substantial pillars; otherwise it has been mined very extensively in very close proximity to the shaft.
8027. Which shaft do you refer to? The winding shaft—the downcast shaft.
8028. Is that on one side of the pit? Yes.
8029. Which side of the shaft is that on? On the north-west side.
8030. Do you say that the coal has been mined very extensively close to that shaft? Yes, very extensively indeed.
8031. Would you consider that that side of the shaft is left without any protection whatever? Without the slightest support, with the exception of the pillar or two near the shaft.
8032. Do you know the size of those pillars? No, I cannot say the size.
8033. Do you know anything about the pillars around the air shaft? There are better pillars there, but the roof is not so good—it is a very bad roof.
8034. *President.*] Where you say these pillars near the shaft are insufficient, is the roof good? Yes.
8035. Do you think it is safe there? At the present time it is safe; but in the event of other pillars being worked out I would say it will not be very safe.
8036. Does the inspector see that mine? Yes; he is down there pretty often.
8037. What inspector visits that colliery? Inspector Rowan.
8038. *Mr. Curley.*] You have spoken about the roof being very bad near the air shaft? Yes.
8039. Does that prevail all round the workings in that district? Yes.
8040. What section of the mine would you call that? Nearly south-east.
8041. Is this rock or top-coal? Rotten rock; they have to drive very narrow in order to get through it; in fact, when I was there they had not gone through it.
8042. Do you know anything about an accident that occurred there recently? No.
8043. How long ago is it since you worked at the Oakey Park Colliery? About two years ago.
8044. Were the workings very close to the shaft bottom at that time? Yes, at Oakey Park.

Mr.  
T. A. Lloyd.  
14 Oct., 1895.

Mr. J. Owen.  
15 Oct., 1895.

- Mr. J. Owen. 8045. Did you notice what pillars, or were there any pillars left at the shaft bottom at that time? Yes; good pillars.
- 15 Oct., 1895. 8046. Have you a shaft at the Eskbank Colliery? Yes.
8047. What size are the pillars about that shaft? There are very large pillars there.
8048. What is your system of working at that colliery? Pillar and stall.
8049. What sized pillars do you leave? In the Eskbank Colliery it is different to the other collieries. The Eskbank Colliery is worked under the town of Lithgow, and they are obliged to leave very large pillars. The proprietor of the estate values the surface as much as the coal, therefore it is to his interest to leave very large pillars, and large pillars are left at that particular colliery.
8050. How many men are employed at the present time in the Eskbank Colliery? Twenty miners.
8051. Have you ever had more than that number of miners employed there? Yes; about fifty or sixty miners.
8052. Does the number of men at these mines fluctuate a good deal according to the trade? Yes.
8053. Will you look at section 2 of the proposed Bill, sub-section 3 (c) on page 2 (*see Appendix A*). You will notice that the word "ten" has been erased and the word "thirty" has been introduced by the Legislative Council, as the number of persons that may be employed below ground without being under the control of a manager. The Legislative Assembly has agreed to the word "twenty" being inserted, as the number of persons to be exempt from this section. Do you think that a mine, with a limited number of men, should not be under the control of a manager? I consider that any number of men should be under the control of a manager. In that case nearly all the mines in Lithgow would be exempt from the jurisdiction of the inspector. If this clause was passed, as it has been amended by the Legislative Council, all, or nearly all, the mines in Lithgow would not be required to have a manager.
8054. *President.*] Do you say that, no matter how many men may be employed in a mine, you would have a manager? Yes; I would have someone in charge, even for the ten men, because I consider their lives are quite as valuable as twenty tons. In my opinion, some person should be in charge of a mine irrespective of number, otherwise there would be no form.
8055. *Mr. Curley.*] You think that there should be some authority to enforce discipline, and that proper mining regulations should be adhered to? Yes; I am of that opinion.
8056. Do you think that there is a great deal of discipline up in the Lithgow district at the present time? I think there is as much discipline there as anywhere else.
8057. Have you looked at the provisions in the proposed Bill with regard to ventilation? Yes.
8058. Will you look at section 50 [47], rule 1, on page 23 of the Bill (*see Appendix A*). You will notice the lines that are erased in this rule—they represent the amendments suggested by the Legislative Council—and the clause without these amendments is as it originally went from the Legislative Assembly. You will also see the words "twenty-five" struck out, and the words "thirty-five" yards inserted. What do you think of that section;—do you believe in a stipulated minimum quantity of air for a mine? Yes; I think it is advisable to have a stipulated minimum quantity of air.
8059. Do you think that the men should always have a certain quantity of ventilation absolutely assured to them? Yes; there is no question about it.
8060. Do you think that 35 yards is too far in advance of the air? I think that 35 yards is too far in advance of the air at the present time.
8061. Have you worked in places that have been going to the rise in some of those mines? Yes.
8062. Does the air travel very fast up-hill? No; not without being forced.
8063. I notice, when you were examined before a Select Committee of the Legislative Assembly, on the 18th of April, 1894, you made reference to 50 cubic feet of air being quite sufficient for the Western collieries;—will you read what you are reported to have said when giving evidence before Mr. Fegan's Select Committee?
2658. And I suppose you are acquainted with the various systems of ventilation? Yes.
2659. What do you think is the best system, as a practical man—I suppose splitting? As I told you before, it is necessary to adopt various methods, according to various circumstances. It would not be practicable, for instance, to work a colliery like the Helensburg Colliery in the same way that you would work collieries like those at Lithgow.
2660. How is that? In the first place, the western collieries do not generate gas at all, whereas the Helensburg Colliery does; and, in order to ensure safety, you would have to work the Helensburg Colliery in a different way to that which would be necessary in the western collieries.
2661. You mean that more ventilation would be required? Yes.
2662. But not that it would be necessary to alter the system of work? In the western collieries, owing to the coal being damp and the depth shallow, 50 cubic feet of air per man would be quite sufficient at the present time. That seems remarkable, but it is nevertheless a fact.
2663. Do I understand you to say that where it is shallow and damp 50 cubic feet per man is sufficient? It would be safer in some cases to work with 50 feet of air than in other cases with 300 feet. We could do with 50 feet.
2664. I understand that you are referring to the danger of explosion;—you say that if you had only 50 cubic feet in Lithgow there would be no explosion, whilst if you had double that quantity at Helensburg or any other colliery generating gas there would be an explosion? Certainly. At Lithgow there would not be the same danger to life.
2665. At the same time, you would not say that 50 cubic feet would be sufficient to keep a mine in a good sanitary condition? Certainly not.
- What I wished to convey in my evidence before that Select Committee is not here. Although I rectified my evidence when the proof was sent to me, before it was printed, my revisions do not appear. What I wished to state was this, that one mine may be better off with 50 cubic feet of air than another mine under different conditions may be with 500 cubic feet of air. I never wished to advocate that 50 cubic feet of air was sufficient.
8064. Did you intend to convey that 50 cubic feet of air was a sufficient quantity of air for anybody? No, certainly not.
8065. Do you think some effort should be made to get the air into the working face, so that the men should have the advantage of it? Yes.
8066. How do you think the present Act has been read with regard to the minimum quantity of air;—how has it been interpreted? I think, as a rule—but I may be wrong—that 100 cubic feet of air is taken as the maximum.
8067. Do you think that is the way the Act has been read? Yes.
8068. Is that the way the Act has been read by the managers? Yes; by the managers and the inspectors, although I have always thought differently. I thought that the 100 cubic feet of air was the minimum quantity, with as much more as was necessary.
8069. In the Vale of Clwydd Colliery, did you ever notice the ventilation to be defective occasionally? Yes, very defective; I have seen it in such a state that you could not burn a candle. 8070.

Mr. J. Owen.

15 Oct., 1895.

8070. What section of the colliery was that in? In the dip workings.
8071. Was that defect owing to black damp? It was due to a defective return.
8072. In what way were the returns defective? By being allowed to fall in; this stopped the ventilation, and then black damp, or carbonic acid gas accumulated.
8073. Had you many men in that section of the colliery when this occurred? Yes.
8074. How many men were in that section? As near as I can remember, about twenty men; it might be a few more or less.
8075. Would all these places be more or less affected by this black damp? Yes; we have had several times to go home, and could not go to work in consequence of this.
8076. In the conducting of mining operations do you think that more attention wants to be paid to these returns? Yes.
8077. How are the men paid up in the Lithgow district? By average weight.
8078. Do you know anything about the system of weighing that is carried out in that district? Yes.
8079. Do all the managers up in that district weigh their own coal? Do you mean without a check-weighman?
8080. Without a weighman of their own? The manager, as a rule, weighs all the coal.
8081. At the different collieries? At the different collieries.
8082. Does that apply to all the collieries? Yes; I think so.
8083. Do you think they would do that if a larger number of men were employed? No.
8084. Would they have a weighman in that case? At some of the collieries; but, as a rule, the manager has always been in the habit of weighing at all the collieries.
8085. Have the men been satisfied with the number of skips that have been weighed at the different collieries? No.
8086. Has this been a matter of long standing complaint? Yes; almost chronic. It has caused many troubles in the west. The weighing has caused more trouble than anything else.
8087. Have you frequently appealed to the managers upon this matter? Yes.
8088. Do matters still remain as they were? Sometimes they do not weigh for twelve months. I have known instances where no skips have been weighed for eighteen months.
8089. Where was that? At the Vale of Clwydd Colliery; but not under the present management.
8090. Were the men paid on the same average as they had been paid when they were last weighed? They were paid on the average of the last skips that were weighed. If a man gets weighed to-day, and does not get weighed again for six or seven months, he will be paid on that particular weight.
8091. Have the skips grown in size during these periods of weighing? I do not know.
8092. Have you seen them sent to be repaired occasionally? Yes.
8093. Did you notice if they had grown? Sometimes they sent them to be repaired.
8094. Is that a matter you cannot speak definitely upon? Yes.
8095. Do you look upon that as a most unsatisfactory piece of business? I look upon it as very unsatisfactory.
8096. Could you get no redress? We appealed to the Government through the Minister for Mines, the late Mr. Fletcher. Mr. Want was Attorney-General at the time, and we were advised by the Government that we could not compel the manager to weigh any certain number of skips; that so long as he had a weighbridge at the mine the Act was complied with. Anyhow, we could get no redress.
8097. Did you ever take a test case to the Court? No.
8098. Do you not think that under the Act you could demand that every skip should be weighed? I do not think so; that is, of course, judging by the opinion that we have received from our legal advisers. At times we have had counsel's opinion on the subject.
8099. Do you know that legal men differ in their opinions occasionally? I admit that.
8100. In the absence of your having tested the point, the question still remains in doubt? Yes; all that we have done is to consult a gentleman in Sydney.
8101. What was his opinion? Similar to the opinion we received from the Attorney-General,—that we could not force the manager to weigh any certain number of skips; in other words, that we could not claim to be paid according to the weight of the mineral gotten.
8102. Although you had an agreement with the manager to that effect? No.
8103. Had you not an agreement with the manager at the particular time? There was no agreement; when a man seeks employment he is put on, and it goes by custom.
8104. Had you no agreement at that particular time you refer to? No agreement.
8105. In the absence of an agreement, would there not be some understanding of some description? We were supposed to be paid according to the provisions of the Act.
8106. Have matters improved much since;—how do they stand at the present time? They stand about the same; at some of the collieries the weighing is satisfactory, but at others it is not. Some of the managers, if they happen to get down to a low weight, will not be in a hurry to weigh again, but if the weights happen to go up, it very soon follows that the manager weighs again.
8107. Do you know that to be a fact? It is an absolute fact. I do not say that there is a motive, but that it occurs.
8108. Can you judge what the motive is yourself? My opinion, perhaps, would not be evidence.
8109. Undoubtedly your opinion is evidence? I am not sure of motive, but I know it occurs. The coal does not always remain the same; sometimes a man is in good coal, and in that case he can fill good weight. In other places the coal will be tender, small, brittle, or rotten, and if he happens to be weighed in that coal he would not get good weight, and when he got into good coal again he would not be satisfied with the weight he got in the rotten coal, although the manager would keep him at that weight. I have known that to be done for months and months, although the men have appealed to the manager to be weighed.
8110. Is this a matter of occasional occurrence? It happens now and again.
8111. Is not that a reason in itself why men should be weighed oftener in your district? Certainly.
8112. Do you think the men are satisfied with the average weight? The men would be satisfied with a fair average weight.
8113. *President.*] What would you call a fair average weight? For the men to get a certain number of skips weighed, say five, or two and a half per cent., or a certain percentage of the output weighed. Say I fill 100 skips, and I get five weighed, I would be prepared to take one in twenty as an average, and I believe the men would be perfectly satisfied if we could insist on that being done.

8114.

- Mr. J. Owen. 15 Oct, 1895. S114. *Mr. Curley.*] Is there any general feeling in your district that every skip should be weighed? In consequence of this gross injustice, naturally the feeling is that way.
- S115. Have the men the idea that they are being plundered or robbed? They do not say much; they seem to tolerate it.
- S116. Do you think that it is owing to this practice prevailing that gives rise to wishing for every skip to be weighed? Yes, I do.
- S117. What do you think about the regulations in the proposed Bill for the working hours—the stipulation in the Bill providing for eight hours, section 36, on page 17, of the Bill (*see Appendix A*)? I believe in it; I believe it should be in the Bill.
- S118. Do you think it is a matter for legislation? Yes, I do.
- S119. Would you not rather leave it to the manager and the men to agree between themselves in a mutual way? No.
- S120. Is this the feeling of the men generally in your locality? Yes.
- S121. Have you had an opportunity of knowing their opinions? Yes.
- S122. Have you held any official position in connection with the miners' organisation? Yes; I have been District Secretary for a number of years.
- S123. And you know this to be the general feeling of the men? Yes.
- S124. Have there been many attempts to work longer hours in your district? No; not to work longer hours, with the exception of keeping the men down the pit—that is to say, eight hours in the face, irrespective of an hour for meals. It used to be eight hours altogether.
- S125. From bank to bank? No; from bank to face; but eight hours altogether. Now it is nine hours in some of the collieries, although they reckon it is only eight hours, because they have two breaks—one for breakfast and one for lunch.
- S126. Do they insist upon the men remaining nine hours in the mine? Yes.
- S127. Where is this? At the Lithgow collieries.
- S128. Will it take the men long to get to their working places there? About twenty minutes.
- S129. Do they ever work longer at the Zig-zag Colliery? Yes; they have worked on Sunday there on one occasion.
- S130. Was that only on one occasion? Yes; fortunately only on one occasion.
- S131. They did not repeat it? No.
- S132. Would you argue, from the step taken in that instance, that there should be some regulation with regard to the working hours? Yes.
- S133. Have you given any attention to the question of pillars in a mine;—do you think substantial pillars should be left in a mine? Yes, until you get to the boundary and work back. Unless you have substantial pillars it will not be safe when you are coming back; especially in the heading.
- S134. Have you noticed any very small pillars left in any of those mines at Lithgow? Yes, sometimes. Sometimes a large pillar may be split, and made into two pillars.
- S135. Are the bords driven by line there? As near as practicable.
- S136. Will you look at section 21, sub-section 5, on page 8 of the proposed Bill (*see Appendix A*);—you will notice that there is a provision there for the inspector to withdraw the men in case of danger? Yes.
- S137. Do you think the inspector should have power to withdraw the men in case of danger? Yes, I do.
- S138. You agree with that provision? Yes.
- S139. Would you leave it altogether in the hands of the manager, or do you think it better to be left in the hands of the inspector? I think the manager should also have the power, because the inspector is not always on the job.
- S140. Do you know that the manager has this power at all times? Yes.
- S141. In the event of a difference of opinion between the manager and the inspector, do you think the inspector should have power to withdraw the men? I think the inspector should have the power to withdraw the men.
- S142. If the inspector was on the spot, and there was an apparent danger, and a difference of opinion arose between him and the manager, do you think that the inspector's opinion should override the manager's opinion? Yes, I do.
- S143. There is a provision in the proposed Bill with regard to the appointment of a check-weigher, suggesting that he can be appointed from anywhere the men may choose; the Legislative Council are opposed to this and are of opinion that he should be appointed from the workmen of the colliery;—do you think that the men should have the right to appoint any man they like from anywhere? Yes; as they do in England. I consider, seeing the miners have to pay the check-weigher, that they should have the same privilege of employing him as anybody else.
- S144. Do you ballot for the check-weighman up in your district? Yes.
- S145. Do you ballot for him every quarter? Yes; every quarter.
- S146. If he is balloted out cannot the manager ignore him if he thinks fit, and not take him back to the mine? Yes.
- S147. Have you ever known that to be done? The manager, as a rule, always re-employs him.
- S148. Have they always taken the check-weigher back in your locality? Yes, I think so.
- S149. I notice a part of your evidence given before the Select Committee, of which Mr. Fegan was chairman, refers to the visits of the inspector;—you say that there is a system of telephoning from one mine to the other when the inspector is in the district? Yes.
- S150. Are you sure that they know at the different collieries when the inspector is about to visit them by that means? Yes; we are peculiarly situated in that district. The Southern District inspector, Mr. Rowan, comes up every six or eight weeks to the Western District, and it is known by all the managers that he is there on his official visit, and through all the mines being connected by telephone, it is an easy matter for them to let one another know the inspector's movements.

[Witness withdrew.]

Daniel M'Auliffe sworn and examined:—

8151. *President.*] What are you, Mr. M'Auliffe? I am a colliery manager.
8152. What colliery are you the manager of at present? The Stockton Colliery.
8153. How long have you been there as colliery manager? For nearly five years—say, about four-and-a-half years.
8154. What were you before you were manager? Overman.
8155. For how long were you overman? For nearly five years.
8156. What were you before that? I was deputy for about three months.
8157. Have you ever worked yourself in a mine? Yes; I have been in a mine since I was about 9½ years old.
8158. How long ago was that? I have had about thirty-four years experience in mining.
8159. *Mr. Curley.*] Is the Stockton mine the only mine you have managed? Yes; the only mine I have been manager of.
8160. When you were deputy there, what was the system of working in the Stockton colliery? Bord and stall.
8161. What was the width of your bords? Eight yards.
8162. What was the size of the pillars? Six yards.
8163. Were the pillars kept at this uniform size? They were occasionally cut out, through the men going too wide. It is a difficult task to keep men from cleaving the pillars—widening out.
8164. In your position as deputy, when you observed any encroachment on the pillar in that way, would you endeavour to draw them into the required width? Certainly.
8165. Would you put a chalk mark on the face? Yes, and order them to leave it on.
8166. Did the men thoroughly understand what that chalk mark meant? Certainly.
8167. Did you travel the returns very much? I did.
8168. Did you ever pass through any of the old workings? I did.
8169. Did you notice how the pillars had been left, previous to your being manager there? I did.
8170. What was the thickness of these pillars? In some cases they were 4 yards, and in some cases under 4 yards.
8171. What district would these pillars be in? What we call the top drive district, and part of the C heading.
8172. Where were these workings situated;—were they leading under the harbour or under the land? They were leading out towards the ocean.
8173. Would these workings be under the ocean at all? No.
8174. Not at that particular time? No; not at that particular time.
8175. Have you gone under the ocean in that direction since? No; we did put a drive about 40 yards under the ocean, but we struck troubled ground, and we stopped.
8176. Have you met with a good deal of cinder coal in that colliery? We have.
8177. Have you had considerable difficulty with that cinder coal? Yes.
8178. Do you work under the harbour at all, in any of the other workings? We have not touched the harbour at all.
8179. Have you any coal under the harbour? No.
8180. *President.*] Have you no coal under the harbour at Stockton? No, sir.
8181. *Mr. Curley.*] How far does your leasehold extend toward the harbour on the south side of your colliery? Our leasehold extends to the waters of the Hunter; the owners of the estate claim their lease is from the waters of the Pacific to the waters of the Hunter. The owners of the estate claim that we have the right of all the mineral in this area.
8182. You consider you have the right to mine to the full extent of where they state their lease extends? We consider we have that right.
8183. On the south side of your mine, going towards the harbour, have you mined to the full extent of your lease? In some places we have, and in other places we have not.
8184. Going up towards Maitland-street, the street that you reside in, have you mined up in that direction? Yes.
8185. How far have you gone in that direction? To the boundary in that district.
8186. Does the boundary there extend to the waters of the Hunter as well? The boundary, according to the State lease, is from the waters of the Hunter to the waters of the Pacific; our boundary is supposed to run to high-water mark. We were mining in one place to that boundary when Mr. Mackenzie, the Examiner of Coal-fields, claimed the right of 100 feet reservation, and ordered us to stop working, and we stopped working there.
8187. *President.*] Was that on the Hunter side or on the Pacific side? On the Hunter side.
8188. *Mr. Curley.*] Had you mined under part of that 100 feet reservation? Yes. We considered we had a right to do so; but when the Government officials stopped us from doing so we stopped.
8189. How far does your lease extend up from Maitland-street, going north-west? It extends a considerable distance beyond Maitland-street—beyond the main road. Maitland-street branches into the main road that leads to the Cabbage-tree.
8190. Does the same reservation apply to the foreshore there as applies to Maitland-street? We were working all round the river side from our shafts. This is where Mr. Mackenzie, the Examiner of Coal-fields, interfered with us, and claimed that we had no right to mine under the reservation. We inquired about it. The owners of the estate claimed the coal, and the Government held us responsible for the coal that was in there, and as we could not see our way clear to fight the Government, we went on no further.
8191. Have the owners of the estate taken any action in the matter since? I cannot say that. I believe the owners of the estate say they will hold us responsible for the amount of coal that is in that part—that is, for the royalty for the coal that is there.
8192. *President.*] It is to your interest to get out as much coal as possible? I expect so.
8193. *Mr. Curley.*] Taking a line from your shoots, right round Maitland-street, and away northwards up the Hunter, does your property extend far up that way? It extends about as far as the Public School.
8194. Taking a line by your shoots, there is the whole reservation right round? Yes; there is a 10-acre block that intervenes—the disputed piece.

D. M'Auliffe,  
Esq.  
15 Oct., 1895.

- D. M<sup>r</sup> Auliffe, Esq.  
15 Oct., 1895.
8195. Is that between the Stockton Company and the Hetton Company? Yes.
8196. Is that matter settled yet? The ground is lying idle yet; there is no one touching it.
8197. What are the depths of your shafts? The old one is 360 feet deep.
8198. What is the depth of your upcast shaft? It is about the same depth.
8199. What distance are your shafts apart? From about 25 yards to 30 yards; I forget the exact measurement.
8200. How are these shafts secured;—have you tubbing in them? Yes; the soft ground is tubbed down to the hard rock.
8201. With iron casing? Yes.
8202. What is the extent of your tubbing? In the old shaft I think there is 92 feet of tubbing.
8203. Do you know anything with regard to the upcast shaft? I think there is about 112 feet of tubbing in the No. 2 shaft.
8204. Have you regular periods for the inspection of these shafts? Yes.
8205. How often do you inspect them? Every week, at least.
8206. Have you noticed any cracks or flaws, or anything in connection with this tubbing during your periods of inspection? No.
8207. Do they seem to be as sound as ever? Yes.
8208. Have you done much pillar extracting in your mine? There is no extraction of pillars there, only when the men take too much off.
8209. Have you never extracted any pillars at all? No, never.
8210. Do you propose to take any pillars out? Only in this way; if we wish to make a horse road, of course we take out part of the pillars, to make the flat in that particular part.
8211. *Mr. Gregson.*] Have you any intention of working your pillars? No.
8212. *Mr. Curley.*] Did I understand you to say that you had not gone under the Pacific Ocean? No.
8213. Does your lease go under the ocean? We have an ocean leasehold.
8214. Have you worked any part of that leasehold? The new workings are going under the ocean.
8215. *President.*] How far does your lease extend under the ocean? About a mile.
8216. Right out into the ocean? Yes.
8217. Will you work right out there? I hope we will work for a good few miles out there; that is if the coal continues good.
8218. Is the coal continuing good under the ocean? Yes.
8219. *Mr. Curley.*] What point does your ocean leasehold start from? From the boundary of the Scotch Company's taking.
8220. Does it extend far from the Northern Breakwater? Yes, straight across. We have a quarter of a mile running along the ocean outside of that again; we have 2,000 acres under the ocean.
8221. Is that into the bight? Yes, straight across to the bight. We join on to the Hetton Company's taking. The Hetton Company's taking swings round the bight, and we strike straight across the bight.
8222. The Hetton Company's taking extends round the northern breakwater into the bight? Yes.
8223. And you start from that point? Yes.
8224. Is the mine dipping or rising in that direction? Dipping.
8225. *President.*] Have you to pay much to the Government for these leases under the ocean; do you give them so much per acre? No, a royalty of so much per ton; we pay a royalty of so much per ton for our ocean takings. We pay a royalty also to the Quigley Estate, but we bought the mineral right from the Scotch Company.
8226. *Mr. Curley.*] Have you made any soundings to ascertain how the strata is running out into the ocean? We bore every 20 yards upwards.
8227. *President.*] Do you bore under the ocean? We put a bore hole upwards every 20 yards; we bore to see what strata we have above our heads. We bore 30 feet from the top of the coal, to find out what sort of strata we have above our head.
8228. *Mr. Curley.*] I think you have misapprehended my question. Have you taken any surface soundings to see whether there was a dip or otherwise. I mean right into the water itself? The Government has soundings showing the depths of water all across that bight.
8229. Does the strata dip in the ocean the same as it does in your mine; how does it carry? There is no bore, and I do not think there could be a bore put down in the ocean amongst the breakers.
8230. I am talking about soundings? We have a map of the Government soundings, showing the soundings in the different parts of this bight.
8231. Can you tell me whether the strata dips at the surface—the ocean bottom? It dips a little; I think the greatest depth is 17 or 18 feet across the bight.
8232. Is that the dip? I think 17 or 18 feet is the deepest soundings shown there—the deepest part of the ocean bottom across that bight.
8233. *Mr. Gregson.*] Is that 17 or 18 feet or 17 or 18 fathoms? Feet; across the bight.
8234. Are you sure that it is feet and not fathoms? I am sure it is feet—17 or 18 feet.
8235. *Mr. Curley.*] Is that the full extent of your lease—the furthest point into the ocean? I cannot be exactly positive about the furthest point; we have two leases, and the place is dotted with soundings all over.
8236. Are you carrying out the six-yard bords there? Eight-yard pillars and six-yard bords.
8237. Do you find the rock very good in that direction? It is.
8238. Do you make much water in the leading places? Not a great deal of water; it is dipping heavily, and it gives a little trouble getting the water out.
8239. Have you just completed a new shaft there? Yes; we have broken the workings into it, but have not exactly finished it yet.
8240. Are you putting a drive in? Yes, from the old workings to the new pit drive.
8241. Had you much rock at the bottom of that new shaft? A fair quantity.
8242. How much rock did you have? About 48 feet.
8243. Was that at the bottom of the shaft? Yes.
8244. What class of rock was it? The ordinary sandstone and shale.
8245. Was it soft or did it appear pretty substantial? It is a good fair rock, some parts of the cap of it were softish.
8246. Had you a break-down of roof some time ago in that colliery? Yes.
8247. Did you get any quantity of water in at that time? Yes.

D. M'Auliffe,  
Esq.  
15 Oct., 1895.

8248. In what part of the mine was this? In what we call Gardiner's heading district.
8249. Was that break-down in a bord or in a heading? In a bord.
8250. Was it in a six-yard bord, or in an eight-yard bord? In a six-yard bord; there are no eight-yard bords in this district.
8251. Was the break in the bord very extensive? No, not very extensive.
8252. *President.*] Can you tell us what the thickness of the cover is under the ocean? Yes; we know the level of our workings at the working face and the water level on the top, and of course then we know what thickness there is at any given point; we know how the level stands with respect to the level of our shafts.
8253. *Mr. Gregson.*] How deep are you below high water-mark? 321 feet.
8254. *President.*] If it is only 18 feet, you must have 300 feet of solid cover? Yes.
8255. *Mr. Curley.*] Is that anything like the breakdown that was in Gardiner's heading [*Witness shown woodcut in Appendix to final report from Mr. Fegan's Select Committee, page 43*]? Yes.
8256. What came down when this rock came away;—did you get any clay? Yes.
8257. Was there much force of water? There was a middling force of water for a while.
8258. What was the stream of water like? Roughly speaking, 10,000 gallons an hour. There was a fall in the roof, and the water came in at about 10,000 gallons an hour.
8259. *President.*] How did you get rid of that water? We pumped it out.
8260. *Mr. Curley.*] Did you erect dams to block the water back? Not to block the water back. I erected dams and put pipes in, to allow the water to run off.
8261. Were the dams very substantial? I think so; most mining experts considered they were.
8262. What were the dimensions of those dams? There were about 40 yards of sand and sand bags, piled as close as they could be packed to the roof with stays to each tier, to keep them in their place, and on the outside of that was a brick and cement dam, one 9 feet and the other 11 feet; we had three dams on the outside of the sand and sand-bags.
8263. *President.*] Where was this fall? In a bord, a worked-out place, and part of the roof came down and the water came away. The pipes are still in, and the water is still running, but fully one third pined off.
8264. Is there any danger working there now after this has happened? I do not think there is any danger. These things always happen in mines, and they are the same as they were before when the difficulty is remedied.
8265. *Mr. Curley.*] What time of the day did this occur—do you recollect the date? 17th February, 1893; it occurred between half-past 9 and 10 o'clock.
8266. Did you call the men out? I went down the pit and saw where the water had given off, and I saw the overman and some of the workmen trying to put a dam across it with bars and props. I called the overman back, and told him that the only way I thought the matter could be dealt with was to stop the pit, and get all the sand and bags we could to dam her back. That could not be done keeping the pit working, so I knocked all hands off, and put all hands on to send the sand down the pit in bags from the top.
8267. Did all the men come out of the mine? A certain portion of them.
8268. When this occurrence took place, and you saw what it was like, you say you gave orders for the men to knock off? Yes, for the material to be brought in to deal with the difficulty. It was impossible to work the pit and attend to that also.
8269. Did you knock the pit off because you apprehended any danger, or simply to deal with the matter of the dam? Simply to deal with the matter of the dam, and to effect the necessary repairs.
8270. Did you think that your pumping machinery was able to cope with that water at the time? Certainly it was.
8271. *President.*] Do you have to keep the pumps always going now? We keep the pumps going at a certain speed, but of course our pumping power is far greater than the amount of water we are pumping at present.
8272. Will the water always come in there? We have pipes in to allow it to come, but the water is reduced considerably.
8273. *Mr. Curley.*] What was your pumping power at that time? We could pump from 40,000 to 50,000 gallons per hour.
8274. How many gallons per hour was the water making? About 10,000 gallons per hour.
8275. Did you report the matter to the inspectors? I did.
8276. You thought it was a matter of sufficient importance to be reported? Certainly.
8277. *President.*] What would you call the mishap that took place there? An ordinary fall of roof.
8278. Is that a thing that often takes place in a mine? It is quite usual.
8279. *Mr. Curley.*] Would you not call an inrush of water like that an unusual occurrence? It is not an unusual occurrence. Perhaps double or treble that quantity of water is not a great lot.
8280. *Mr. Gregson.*] Do you think it was nothing out of the way? Nothing out of the way.
8281. *Mr. Curley.*] Have you seen that kind of thing occur in other mines? Certainly.
8282. From the roof? Yes; when a fall has taken place, and a feeder has come in.
8283. Have you seen anything similar to that fall that took place at your colliery? Yes.
8284. Where have you seen anything similar to that? A far larger feeder took place in the A.A. Company's workings. A far greater quantity of water was given off for a considerable time.
8285. Does the same quantity of water still run in that feeder? It has pined off fully one third.
8286. Do you think this water is coming from the ocean? I do not think so.
8287. Where do you think the water is coming from? It may be travelling along the strata, a considerable distance.
8288. *President.*] Is it salt water? Mineral water.
8289. Is it the regular salt water like what you will get in the ocean? It is not so salt as the ocean water.
8290. *Mr. Curley.*] Did the inspectors come to the colliery? They did.
8291. Did they make a report on the matter? They did.
8292. Have you seen their report? I have.
8293. Was the report to the effect that the men were not to enter the mine until they considered it safe for them to re-enter? Partly that. Mr. Mackenzie, the Examiner of Coal-fields visited the mine, and the inspectors visited the mine daily until I had what I considered the repairs, &c., finished. 8294.

D. M'Auliffe, Esq. 15 Oct., 1895. 8294. *President.*] Did you have the men out or call the attention of the inspectors to the difficulty before you set to work to make the repairs—how did the inspectors know anything about it? I reported the matter to the inspectors. When anything unusual happens in the mine we make it a rule to report the thing to the inspector at once. We think it better to go direct to them rather than that it should come from any outside source which might be misleading.

8295. *Mr. Curley.*] How long was the mine stopped? About a fortnight.

8296. What was the nature of this report? When I had effected the repairs, the inspectors—Mr. Mackenzie, Examiner of Coal-fields, and the inspectors of the district—visited the mine, and I used these words, "Can we make a start now?" Mr. Mackenzie said I could do as I liked, but that he would not sign that the mine was safe.

8297. Whose names were appended to that report? Mr. John Dixon and Mr. Humble's names.

8298. What was the nature of the report? I forget the exact wording of it. [*See Report, Appendix I.*]

8299. Was there any statement in that report saying, that the men were not to enter the mine until the inspectors considered it safe? As far as I remember, the report stated that there were certain portions of the mine that they considered unsafe, and they would not sign the book saying that it was safe. When we went round the mine on this particular day, I considered that we had the dams and the timbering all round nearly finished, and I said to Mr. Mackenzie, "All these men are wanting to get to work; we will get to work to-morrow;" he said, "You can do as you like, but I won't sign;" I said, "Why?" He said, "I do not consider it is safe to work." I said, "Well, Mr. Mackenzie, previous to this you considered the mine safe; there is a certain thing that has happened that has been remedied, and if you will say that it is not remedied to your liking, then I will do all I can to make it so." He told me, he would not answer me upon such a question. He asked me would I say that there would not be another inrush of water, and I said "No." I said, "Will you say, where there is one likely to take place, supposing another inrush takes place, I claim that the same means can be used, as has been used this time," and I asked him if there was a volume of water fifty times as strong, did he consider there would be any danger to life and limb. He said he would not answer the question; he said, "That is the law."

8300. *President.*] What did he say was the law? He meant with reference to dealing with the question of agreeing to let us go on. He said, "You can start if you like," but he said he would not give his permission.

8301. *Mr. Curley.*] Did you not draw his attention to the 25th section of the present Coal Mines Act (*see Appendix B*)? I did not, I did not feel much in the humour for paying attention to clauses of Acts.

8302. Don't you think you could have done so;—you see what the section says? That was not the section we were charged under. If they had charged us under that section we could have gone to arbitration; but they sued us upon a clause that we could not go to arbitration on. They sued us under clause 12, section 5.

(5.) If at any time it is found by the person in charge of a mine, or any part thereof, or by the examiner or inspector that by reason of noxious gases prevailing in such mine, or such part thereof, or of any cause whatever the mine or the said part is dangerous, every workman shall be withdrawn therefrom, and the examiner or inspector shall inspect the same (and if the danger arises from inflammable gas shall make such inspection with a locked safety-lamp), and in every case shall make a true report of the condition of such mine or part thereof, and no workman shall, except in so far as is necessary for inquiry into the cause of danger, or for the removal thereof, or for exploration, be readmitted into the mine or such part thereof as was so found dangerous until the same is stated by the examiner or inspector to be safe. Every such report shall be recorded in a book which shall be kept at the mine for the purpose, and shall be signed by the person reporting.

8303. Do you see that you could have called Mr. Mackenzie's attention to the 25th section of the Act (*see Appendix B*), and that the matter could have been referred to arbitration? Mr. Mackenzie drew my attention to this sub-section 5, of clause 12, on page 4, of the present Act. That was the clause they took action upon. On the other clause we might have gone to arbitration, but under the clause we were sued on we had no redress.

8304. At this particular time, before the matter got that far, could you not have drawn Mr. Mackenzie's attention to the 25th section of the Act and say, that the matter should be referred to arbitration? I think our lawyer in the case pointed this out, but they sued us under sub-section 5 of clause 12.

8305. I am speaking about the time when you wished to resume work? We could not do that, and the next thing we had to do was to break the law. When the inspectors would not sign, our miners came to me and I told them what the inspectors had said. I told them to go back and pick six of their best men, and that I would hold an inspection with those six best men, and the officers of the mine with myself. They appointed the six men, and we went through the whole of the mine, and examined the seat of the trouble, and the remainder of the mine as well. I also gave them all the records we had in reference to bores, and the Government Blue Book, and told them they would find all the information we had in that book, besides, what we would supply them with ourselves, and asked them to go and well consider the matter, and if they thought that after their examination the mine was safe to work in, I would start the pit and break the law. The result was, that we started the pit, and we were sued under the section of the Act I have named. We were fined £20, and £4 for four days penalty at £1 per day. The matter then dropped, and they did not sue us after that.

8306. I want to draw your attention to this 25th section of the present Act again (*see Appendix B*). Could you not have drawn the inspector's attention to this section of the Act. It stipulates that if there was any objection to remedy, or anything of the kind, that you had the option to send a notice of the same in writing to the Minister, and that the matter could be determined by arbitration. In this case you could have said what you have referred to here, *viz.*, "that I have endeavoured to remedy the business to the best of my ability, and if you are not satisfied let the matter go to arbitration;"—could you not have done that? No; they simply sued us for breaking sub-section 5 of the Act without their permission.

8307. Was there anything to prevent you from drawing their attention to this section? I asked for an opinion on that matter, and the answer I received was that I had simply broken the law, and that Mr. Mackenzie was suing me, and I had no redress.

8308. *Mr. Gregson.*] Did the inspector take action under the 25th section of the Act? No; under sub-section 5 of the Act.

8309. Are you sure it was under sub-section 5 of the Act? Yes.

8310. Are you sure that you had no notice under the 25th section of the Act? I am sure I had not.

8311. *President.*] Did you get any notice at all, or did you only get a summons to appear at the Police Court? Yes; but I would not be too positive. I think that all I got was the summons for breaking the law; but I know it was under sub-section 5 of the Act. 8312.

8312. *Mr. Curley.*] Did you not get any information from the inspector or Examiner of Coal-fields about this report in the book? I saw what they had written in the book.
8313. Did you take that as an intimation? Yes; that I would have to take the risk on my own shoulders.
8314. *Mr. Gregson.*] What notice did you get? I only remember the summons.
8315. *Mr. Curley.*] Apart from that recorded report in the book, did the Examiner of Coal-fields or the inspectors give you any official intimation calling attention to that report? I think I did receive an official intimation from Mr. Mackenzie.
8316. And you did not draw their attention to section 25 of the Act? No.
8317. I suppose you have read the Act pretty often? I read it occasionally.
8318. *President.*] Had you a lawyer? Yes. I pointed out that if I had been sued under the 25th section of the Act, we would have had a chance of redress.
8319. Who was your lawyer? Mr. Windeyer.
8320. *Mr. Curley.*] Can you send the Commission that official notification that you have spoken about? I will see if I can find it.
8321. Will you send us both the report and the official notification? Yes. [*See Appendix I.*]
8322. Have you noticed any more places in your mine that have broken down in a similar way to this? We have had falls in different parts of the pit, but they have not given water off.
8323. Had you worked the coal near the roof at that time? There are two top bands.
8324. Was there not a small portion of coal near the roof? There is a 2-foot band left on the roof.
8325. Have you had any water given off in any other places since this fall? No.
8326. Are these dams regularly inspected? Yes.
8327. Do you see any signs of them giving way? No.
8328. Do you intend to use this shaft that has recently been sunk as an outlet for the men? I intend to let them go down in the usual way.
8329. What is the object of that shaft being put down? We intended to haul coal from our ocean leases.
8330. Was it not suggested some time ago that that third shaft was to go down as an outlet for the men in consequence of the main road caving in some time ago? I know nothing about that.
8331. Do you inspect the colliery every morning before the men resume work? Yes.
8332. Who carries out these duties? The brattice men usually go round in the morning; the deputies, men appointed for that purpose.
8333. Do you, as a practical man, consider that any danger whatever is to be apprehended in that mine? I can see no danger whatever.
8334. Do you say that there is no danger in the working of the Stockton Colliery? I do not say there is no danger. There is a certain amount of danger in all mines.
8335. Do you consider there is any special danger in the working of the Stockton Colliery? No.
8336. You know the situation of the colliery? I do.
8337. Do you think, knowing the situation of the colliery, that very great care will have to be exercised in the Stockton Colliery? I think that special care needs to be taken in any mine, or at any work.
8338. *President.*] Do you think there will have to be any extra care taken in the Stockton Colliery, as compared with work in other mines? We do that for our own security. We put in more timber than is used in any other mines in the district.
8339. Why do you do that? To do everything in a line with caution.
8340. *Mr. Curley.*] Do you renew the timber in the old places? Yes, thicken them up.
8341. *President.*] Is this done all through the mine? Yes, wherever our workings are.
8342. Whether they are under the land or under the water? Yes.
8343. *Mr. Curley.*] How do you interpret the present Act with regard to the quantity of air to be supplied to the miners;—will you look at section 12, sub-clauses 2 and 3 of the Act (*see Appendix B*); as a matter of practice, what do you construe those sections to mean;—suppose I am an inspector, and a man is working in a bord, and is suffering from want of ventilation? I would prove what amount of air that man had by testing what amount of air was travelling.
8344. *President.*] What amount of air must you have? According to the Act we must have 100 cubic feet of air.
8345. Is that enough air? That is enough under the Act, but there may be conditions where it would not be enough.
8346. Do you say that if you have 100 cubic feet of air, no matter what the state of the air may be, that you are protected by the Act? Yes.
8347. What meaning do you give to the words, "not less as a minimum than";—do you think they might as well be out of the Act altogether? I think so. I think making a hard and fast law is a mistake.
8348. I am not asking you that;—what do the words mean, "not less as a minimum than 100 cubic feet of pure air per minute for each man, boy, and horse shall sweep undiminished along the airway past each working place";—does not that mean 100 cubic feet of air, and as much more as is wanted? I do not think so.
8349. *Mr. Curley.*] Have you seen the Check-weighers Act that has been passed in England? No.
8350. This is the Act (*Witness reads, see Appendix B*). Do you agree with that Act? No.
8351. Why do you not agree with it? Because I think our law at present is preferable to that. I think the men employed at a colliery are better and more suitable to have as weighmen perhaps than men outside.
8352. Does this Act refer to men outside? I think so.
8353. *President.*] Do you know that under the English Act the men have the right to select their check-weighman from whom they please? Yes, the English Act gives them power to appoint any person.
8354. The suggestion is, that the person selected should be an employee of the mine—do you agree with that? I do.
8355. Why? The principal reason I have, is that an employee of the mine is more likely to work without causing friction than the employment of a man outside. I think he will pull on better than the man outside. There is no disguising this fact, that the men may appoint a man who is a noted mischiefmaker, and who will cause no end of trouble. A man on the weighbridge can cause a lot of trouble, and still keep clear of the Act, so that you cannot remove him.
8356. Why do they allow this privilege in England? I do not know.

- D. M'Auliffe, Esq.  
15 Oct., 1895.
8357. *Mr. Curley.*] Do you not think that the English Act points out that the mischievous persons have been the managers? It might not intimate that.
8358. Does it not intimate to you that there has been some kind of intimidation used, or such an Act could not have been passed? I do not agree with you in that.
8359. Do you not see that the object of the Act is to prevent a manager from dismissing men for holding a meeting for the appointing of a check-weigher? I do not know that any manager attempts to dismiss a man for appointing a check-weighman.
8360. Do you think they would have passed that Act in England if there had not been some reason for doing so? That is doubtful; there is a cry now for a new mining Bill, but the general body of the men, to my mind, have not that cry.
8361. I suppose the managers do not want a new mining Bill? The managers have no fear of a just Bill.
8362. Are you here to speak on behalf of the men? I am here to speak on behalf of the Bill,—on the points that are not workable for either manager or men, and that will be mischievous.
8363. Do you think that everything that is unreasonable is always on the side of the men? No, I do not say so.
8364. *President.*] Do you think that the check-weigher should be an employee of the mine? I do.
8365. *Mr. Curley.*] In the event of the men at your colliery wishing to hold a meeting for the appointment of a check-weigher, would you in any way interfere with them as a manager? The only answer I can give to that is that when my men did come to me and speak in reference to a weighman, I told them I would only be too pleased for them to select a check-weighman, and that the Act gave them that power.
8366. Suppose your men hold a meeting to-morrow, or any day hence from this, to appoint a check-weighman, would you offer any objection? If they had no check-weigher, and considered an alteration necessary, the check-weigher's term being up, certainly I would not.
8367. Suppose they wanted to hold a meeting to-morrow for the purpose of appointing a check-weigher, would you, as a manager, interfere with them? Certainly not, if the body of the men wanted a meeting. I have done that before, and helped them to appoint a check-weighman; I have given them our boxes for balloting for him.
8368. *President.*] I would like to go back to this question of ventilation;—do you not see that by the Act an adequate amount of ventilation has always to be supplied, and that an adequate amount of ventilation shall mean not less, as a minimum, than 100 cubic feet of pure air for each man, boy, and horse,—that you must have that at all times, and as much more as necessary? Still, if you had the 100 cubic feet of air, you would be acting under the conditions of the law.
8369. If that was not an adequate amount you would not? That is why 100 cubic feet is put there.
8370. Your reading of the Act would give the go-by to the minimum altogether if that was so. It is always to be 100 cubic feet of air, but it is always to be adequate, whatever it is. There may be cases where 500 cubic feet of air is required;—then, do you mean to say that you have satisfied the Act if you have only 100 cubic feet of air? I think so.
8371. What does a minimum mean but that the lowest possible quantity is 100 cubic feet; but you are to have an adequate amount, not less, as a minimum, than 100 cubic feet of pure air. The Act does not say that an adequate amount of air is to be 100 cubic feet, but that you are to have 100 cubic feet of air on all occasions? I have not read the Act in that way.
8372. *Mr. Curley.*] Will you send the Commission the report of the inspectors in connection with that fall of roof at your colliery, and the notice you received from Mr. Mackenzie—the first notice that was put into the book? Yes. [*See Appendix I.*]

[Witness withdrew.]

John Barnes Nicholson, M.L.A., sworn and examined:—

- J. B. Nicholson, Esq., M.L.A.  
15 Oct., 1895.
8373. *President.*] What has been your business, Mr. Nicholson? I have been a coal-miner for the most of my lifetime.
8374. *Mr. Curley.*] Are you one of the Members of the Legislative Assembly at the present time? Yes, I am a Member of the Legislative Assembly at the present time.
8375. *President.*] Where have you been coal-mining in this Colony? Principally at Bulli.
8376. *Mr. Curley.*] Did you work long at Bulli? For four years.
8377. How long is that ago? I started there in the beginning of 1883.
8378. Were you working at Bulli close up to the time of the calamity that took place there? I was working there up to the time the men came out on strike.
8379. Did you start again when the colliery resumed work after the strike? No.
8380. Did this calamity take place there soon after the resumption of work? Yes; very shortly afterwards.
8381. How was the ventilation in the Bulli Colliery during the time you worked there? It was very bad.
- 8382-3. In what section of the mine was the ventilation defective? I worked in almost every section of the colliery. We cavilled every three months, and I had a turn in every section of the mine more than once.
8384. In what sections of the mine did you find the greatest defects in the ventilation? In what we call Slacky and Mackay's Grip.
8385. Were the districts known as the Slacky district and the Grip district? Yes.
8386. Were there many men in these districts? A good many.
8387. What number of men were there in these districts? From fifty to sixty men, as near as my memory serves me.
8388. Were there that number of men in each district? Yes, in each district.
8389. What was the nature of the defects in the ventilation? No efficient means were made to carry the air up to the working place.
8390. Were the cut-throughs a great distance apart in some places? Yes; in some places there were no cut-throughs at all.

8391.

J. B.  
Nicholson,  
Esq., M.L.A.  
15 Oct., 1895.

8391. What distance would you be ahead of the air? In some places over 70 yards, without a cut-through being put through at all.
8392. *President.*] Was there any brattice used to take the air into the working place? Nothing at all.
8393. Was there plenty of air sweeping along the airway? As a rule there was. There was a split at the top of Hill End, at the top of the first incline.
8394. How far would the air extend into the bord? It might go 10 or 15 yards up the bords, according to the volume of air travelling.
8395. If there was bad ventilation, was it because you were working so far without a cut-through? Yes.
8396. *Mr. Curley.*] Did you refuse to work in that place, where you were working 70 yards before the air? Yes; I gave it up—took my tools out.
8397. Is the air likely to get there without a cut-through? No; it is not.
8398. Is it likely to get there without brattice? No; it is not.
8399. Had you complained about this to the manager? I complained every morning to the deputy or the manager.
8400. Who was the deputy? In that particular place the deputy was Mr. Fred. Robins.
8401. Would your case represent other cases that you knew of? That was, perhaps, an extreme case; but to show you how loose the system of ventilation was, after I had a few angry words with Mr. White, the overman, he started me to drive a narrow place, in order to put a cut-through to the last bord working. The entrance to that bord was 57 yards away from the heading face. My mate started from Jones Brothers' bord, and I drove over to him, and that cut-through was 19½ yards.
8402. Is the whole of the trouble in connection with the ventilation,—the fact of the air not getting up to the working place? In many cases that is the whole of the trouble. I think the mines could be ventilated if they had the means to carry the air up to the working place.
8403. *President.*] What are the means? Cut-throughs as a rule. In some of the collieries they comply with the existing Act, but in others they do not.
8404. Do you mean to say that they give the go-by to the Act in some cases? Yes; take the place I have mentioned. I have held always that they put a wrong construction on the Act.
8405. What do you say? I hold that the cut-through is not put through until it is holed on the opposite side of the pillar. If you take the literal meaning of the Act it says, "No place shall be driven more than 35 yards before the current of air without a cut-through put through, or bratticed up within 3 yards of the face of such working place." It is never put through till you hole on the other side.
8406. *Mr. Curley.*] Do you mean to say that they read the Act as though it was worded in the Act exclusive of the cut-through? Quite so. I have argued the matter out with practical men, who have given in to it. The last few words appear to me to be quite conclusive.
8407. *President.*] It is generally read that if they have 100 cubic feet of air they have complied with the Act? It is; where they have measured the air in the intake, and then in one or two places in the outlet, you can get the average amount of air to establish a minimum according to the provision in the Act, but if you go to measure where the air is required—at the working-face—you could not get the anemometer to register at all.
8408. If you have the air going along the airway, they say if they have 100 cubic feet of air that is enough sweeping past each working place; but I think that is wrong, because they leave out the words "not less as a minimum than";—I say that it means that an adequate amount of ventilation shall be produced to render the workings fit for working in? I have no doubt that is the meaning, but the wording of the Act means that the air shall simply go along the heading. I believe every miner would be satisfied with 100 cubic feet of air if it measured that quantity at the working-face.
8409. *Mr. Curley.*] If you had that quantity of air in the working-face? Yes.
8410. *President.*] Do you think it would be better if it was provided that the air should be constantly produced in each working face as near to the working face as is reasonably practicable? Some manager might say it was not practicable. I admit that the great thing is to conduct the air into the working face. I have had a varied experience in mines, and I think there is no difficulty in getting the air into the working face. I worked at Vancouver Island, and every place in the mine there was bratticed to within 3 yards of the working face.
8411. Was that a gassy mine? Not particularly so. I never saw any gas in Bulli when I first went there.
8412. Do you say that the air should always be within 3 yards of the working-face? Yes.
8413. Why do they say in the proposed Bill within 15 yards of the working-face where there is no gas? Simply to compromise and to save money.
8414. *Mr. Curley.*] Don't you think the suggestion made by the President with the word "practicable" would be a dangerous provision? I do.
8415. Do you know the provision in the proposed Bill with regard to ventilation? Yes.
8416. It stipulates for a minimum of 150 cubic feet? Yes.
8417. Do you believe in a minimum quantity being stipulated? Yes; I believe in a minimum of 100 cubic feet if the air was taken to the face of the working, or within the distance stipulated for bratticing,—that is within 9 feet of the working-face.
8418. Will you look at section 49, 46, sub-section 3, on page 23 of the Bill;—it states "that each district shall be supplied with a separate current of fresh air, which shall be taken to within 15 yards of each working-face by brattice or otherwise where gas does not exist, and to within 3 yards of the working-face where gas does exist"? The distance I mean is 3 yards, because it is practically what I have been accustomed to in Vancouver Island. The air there was taken to within 3 yards of the face.
8419. What was the height of the seam there? It varied from 3 feet up to 12 feet.
8420. Did they use ½-inch tongued and grooved planed boards there? Yes.
8421. Were the bords worked very narrow? Eight yards, and 8 feet headings, or 8 feet levels.
8422. Would you consider the system of that kind of ventilation very good? It was all that could be asked for.
8423. Were there many men employed in that mine? From 200 to 250 men.
8424. Do you consider that there should be substantial pillars left in a mine? I do.
8425. How did you find the pillars at Bulli when you were working there? Some were very thick, and some were the reverse. Where the faults were the work had to be laid out accordingly.

J. B.  
Nicholson,  
Esq., M.L.A.  
15 Oct., 1895.

8426. Did you work any pillars out there? No, we never worked any pillars. As a matter of fact, there were no pillars drawn to my knowledge when I worked there.
8427. Was the mine very deep—had it much weight to carry? It was right under the mountain. In the section where I was working in 1886, it was something like 800 or 900 feet below the surface.
8428. Did you ever do any check-inspecting there? Only on one occasion, and that was after the explosion took place.
8429. Did you go right round the mine? I did.
8430. Did you go into the return? Yes.
8431. How did you find the return? I found it fairly good; much better than I expected, taking into consideration the conditions of the colliery all through.
8432. Did you say that you had complained about the ventilation prior to this? Yes, frequently to the overman and to the deputies.
8433. How long before the calamity would it be that you worked in that place 70 yards before the air? I believe it was the quarter previous to the pit knocking off—prior to the suspension of work during the strike.
8434. Would you look upon the representations made at that time in the light of personal complaints, so far as you yourself were concerned? Yes.
8435. Had you written to Inspector Rowan at any time about these matters? No, I never wrote to the inspector. I tried to see him on two different occasions, when he was inspecting the mine, but owing to the fact that he did not come into the heading I did not see him, although I followed him to the flat.
8436. Do you think Inspector Rowan had any knowledge of these places being driven so far in advance of the air? I would not like to say. He was taken into the mine under the guidance of Mr. White, and he went where Mr. White liked to show him; that was the system in the Illawarra district.
8437. Do you say that the system in the Illawarra district was for the inspector to go where the manager took him? I understand that was the system.
8438. Do you not think an inspector should go into almost every part of the mine? My experience is that they do not go into every part of the mine.
8439. Have you seen the inspector's reports upon the state of the Bulli return prior to that calamity? I have seen them but it is so long ago that I have no recollection of what was said.
8440. If the inspector complained of the returns would not that lead you to think that he had inspected them? [*See Reports, Appendix L*]. I scarcely can understand where the return is in the Bulli district.
8441. Do you notice in that report that Inspector Rowan refers to the return? Yes; but he does not state in what portion of the pit.
8442. Would you not regard that as the main return? Possibly that is what he refers to.
8443. Would you understand it that way? Yes.
8444. Would that lead you to the belief that Inspector Rowan had inspected these returns, seeing that he mentions the matter in his report? There was a portion of the return where it was not possible for a man to walk upright, but on the whole I have no grounds for complaint. There was a large volume of air travelling when I took the measurements.
8445. Do you think that a good effective return should be one of the principal features of mining? A good return is undoubtedly essential to ventilation.
8446. Have you ever looked at subsection 5, section 21, on page 8 of the Bill, giving the inspector power to withdraw the men in case of danger? Yes.
8447. Do you think it is desirable that the inspector should have this power? I do.
8448. Do you think it is possible for a controversy to arise between the manager and the inspector as to what is danger? There is a possibility of such a thing arising, but if the Bill gives the inspector absolute power, having the power he will use it.
8449. You think that the inspector should have this power? I think so. I can give you an instance why an inspector should have that power. Some six years ago at Mount Kembla the men complained to me that they had a very dangerous travelling way in the No. 6 heading, and I wrote to Inspector Rowan and asked him to come and make an inspection. I had a reply back from Mrs. Rowan that the inspector was in the western district. I either wrote or wired for him to come at once, and he came down and made the inspection, and the result was that he asked the manager, or told him, to take the men out until he had timbered this heading and rendered it safe for everybody to travel in.
8450. Was this in consequence of a bad roof? Yes.
8451. In consequence of insufficient timber? There was no timber at all in the heading at that time.
8452. What was your system of weighing at Bulli;—had you standard weight? We had no standard weight. They weighed a limited number of skips daily, and we got the average of the weights for the fortnight for the pay.
8453. Was the weighman at the weighbridge all the time? No; he was not there nearly all the time.
8454. Had he other duties to perform? Yes; looking after all the surface-men.
8455. Did you consider that that was a satisfactory matter? No.
8456. Do you think the weighman should be at the pit the whole of the time to weigh? Yes; and that they should weigh every skip that comes out of the mine.
- 8456½. You think that every skip should be weighed? I do.
8457. Did they pay by weight at Vancouver Island, when you were there? Yes.
8458. What was the system of weighing there? They weighed every skip that came out of the mine.
8459. Did they have a self-registering machine? They had one of Fairbank's machines.
8460. Did they weigh both round and small coal together? Every man was supposed to clean his coal, and if he sent out an unusual quantity of slack (say 1 or 2 cwt.) he would lose so much off the skip; that is the system that is followed out very much throughout the United States.
8461. The general system there is to weigh every skip? Yes, and take so much off, if an extra quantity of slack coal is sent out, perhaps from 2 to 5 cwt., according to the size of the skips.
8462. You think that it is not impossible to weigh every skip? No, not at all.
8463. In the absence of that, do you think the men would be satisfied if a fair average number of skips were weighed? It appears that they have been satisfied in this Colony, but it is the only place I have worked at where such a state of things existed. They either worked by the ton or at so much per skip.
8464. *President.*] I would like to ask you something further upon the subject of ventilation;—you say that the air ought to be conveyed to within 3 yards of the working face? I think so. 8465.

8465. Would you require brattice right up to within 3 yards of the face? We had it at the Wellington pit at Vancouver Island. If we had not quite enough room to put in another length of brattice, we were supplied with a piece of oil-cloth to fill up the measurement; then after we had 3 clear yards, the shiftman would put in another length of brattice, and our oil-cloth would lay by till we wanted it again.

8466. How would you express what you think is required, if you were drafting a clause for ventilation? The plainest term would be that the air should sweep round each working face, and that would necessitate either shorter cut-throughs or brattice.

8467. *Mr. Curley.*] Unless you have something making this matter definite, does it not leave very wide latitude in the hands of a manager? The worst feature is that it leads to eternal conflict between the manager and the men, where there is a matter of dispute, unless it is definitely expressed.

8468. *Mr. Gregson.*] How can this happen when the inspector is there? The inspector is very seldom there.

8469. Have you any knowledge of the working of the English Act? I have worked in Scotland, but I have never worked in England.

8470. Did you work under the Act of 1872? I presume it was the Act of 1872.

8471. Had you any occasion to find fault with the frequency of the visits of the inspector there? Not that I am aware of.

8472. Did you look to the inspector to see to the working of the Act? Yes.

8473-4. Why should we not expect the same thing to happen here? We should have the same thing here.

8475. Do you think that there is anything due to the system under which the inspectors work that would make their visits of less value to the miners than you would wish them to be? I would not feel justified in expressing anything harsh, but the manner in which I have seen inspectors pay their visits, and the number of times I have seen them in conflict with the check-inspectors with regard to ventilation, leads me to believe that they have not been honest in their reports. The number of times I have looked for the inspector, to show him some places that I thought needed his attention, leads me to think that there was something in the system adopted by the manager to prevent the inspector getting a knowledge of the facts that existed.

8476. Supposing your suspicions are well-founded, what cure can you suggest? It is hard to suggest a cure. I do not think the manager ought to be warned of the inspector's visit.

8477. Do you think, if the inspector was made responsible to the Minister, things would be better in the future than they are? I do.

8478. Would you approve of that being done? I would.

8479. Would that make all the difference? If the inspector had more responsibility devolving upon him he would pay more attention to the various inspections he makes.

[Witness withdrew.]

Frank Croudace sworn and examined:—

8480. *Mr. Gregson.*] What are you, Mr. Croudace? I am the manager of the Lambton Colliery.

8481. How long have you been managing the Lambton Colliery? For four years.

8482. We have had some evidence with reference to the loss of employment by a Mr. Treharne Evans, and you have been called to-day mainly for the purpose of giving you an opportunity for saying anything you have to say with regard to this matter. Mr. Evans puts it, that upon the pit shutting down he was at the time employed as check-weighman, and that upon the pit reopening he could not get re-employment? Previous to the closing down of the pit, Treharne Evans was employed as check-weighman by the miners, and on restarting the colliery again he did not start along with the other men. He wanted to come back on the bridge, but we objected, because the Act says that the check-weigher shall be an employee of the colliery, and as he was not an employee of the colliery he was, consequently, not open for the position.

8483. Did he ask you to be allowed to go back on the colliery? Yes; and I told him I could not take him back.

8484. Did he distinctly ask you for employment on the coal? Yes, he asked for work of any sort; first on the coal, and then he said anything would do.

8485. What you have said confirms the evidence Mr. Evans has given;—have you any explanation to offer, or anything more to say? He had no right whatever to come back as an employee of the colliery. He, along with some hundred other men, knocked off at the time.

8486. *President.*] Why did they knock off? The colliery closed up, because we were working at a loss. We came to a fresh arrangement with the miners, and opened the mines again, and out of about 300 miners formerly employed, we only re-employed 200 men.

8487. Are there any grounds for saying that you knocked the men off to get rid of some objectionable characters? None whatever.

8488. Had you any objection to Treharne Evans? No.

8489. You did not close the colliery and make that an excuse for not re-employing him again? The colliery was being worked at a loss, and we could not carry on, but the miners made fresh terms, and we re-opened the mine again.

8490. *Mr. Curley.*] Have you a system of standard weight at your colliery? We have.

8491. What is the standard? Sixteen cwt., at the present time.

8492. Have you increased the standard? Yes; from 14 cwt. 2 qrs. to 16 cwt.

8493. What did the average weight of the colliery run when the standard stood at 14 cwt. 2 qrs.? I cannot say without looking the matter up. I have seen the tubs weigh 11 cwt., 12 cwt., 14 cwt. 2 qrs., 15 cwt., and 15½ cwt.

8494. Do you know what the average is now? I have not looked that up. We have some tubs 12 cwt., and some up to 16 cwt., since we have altered the weight we have allowed the miners to fill coal higher. We have allowed them to put more coal above the woodwork.

8495. Do you make a comparison between the weights you send away and the weights you pay the men? I compare the weights every fortnight.

8496.

J. B.  
Nicholson,  
Esq., M.L.A.  
15 Oct., 1895.

F. Croudace,  
Esq.  
15 Oct., 1895.

- F. Croudace, Esq., 15 Oct., 1895. 8496. How do they come out? As a rule, we paid more to the miners than we received.  
 8497. Is not that a good argument for abolishing the standard weight? Not for the men. I have seen it in favour of the men, and also in favour of the company.  
 8498. Do you weigh a fair quantity of coal? We weigh as much as we can.  
 8499. How long have you been in charge of the Lambton Colliery as manager? About four years; I was assistant manager some time before that.  
 8500. Have you made yourself familiar with the Coal Mines Act we are working under now? Fairly familiar.  
 8501. How do you interpret the clause about ventilation;—will you read sub-sections 2 and 3 of the present Act (*see Appendix B*)? By those clauses you must not have less than 100 cubic feet of air going round the airways for the men.  
 8502. Supposing that you had 100 cubic feet of air for everybody, would you consider you had complied with the terms of the Act? Yes; unless there was gas found, and I had to remove it.  
 8503. Would you consider you had complied with the Act where there is no gas? In that case 100 feet would be sufficient.  
 8504. *President.*] There is to be 100 cubic feet of air going round for each man, according to the Act? Yes.  
 8505. And if this is not enough, you must put as much more as is necessary? Yes.  
 8506. *Mr. Curley.*] Would you say you would be complying with the terms of the Act if you gave 100 cubic feet of air? Yes; taking it without gas 100 cubic feet of air is quite sufficient, and with gas 100 cubic feet of air might also be sufficient, but if there was more gas there would need to be more air.  
 8507. Have you had to put brattice up in your colliery? We have done so; but we were not compelled to do it.  
 8508. What was your object in putting brattice up? Merely as an experiment, to try how it would work.  
 8509. Did you find that it gave better results to the men? The men never told me so; but it is only natural that it should be better, because the air is taken closer than it would be otherwise.  
 8510. Have the men represented to you that there has been white damp found in any particular district of your colliery? There may be some white damp coming from time to time from the old workings.  
 8511. Have the men requested you to do something for this particular district? Yes; and we closed it off, where this foul gas was coming off.  
 8512. Did you not put some brattice up where this white damp was given off? I cannot remember any places myself.  
 8513. We have had this given in evidence from Mr. David Mason? I cannot call to my mind any place.  
 8514. If he stated you had done this for the benefit of the men, would you be inclined to credit his statement as a truthful statement? I would take Mason to be a truthful man.  
 8515. Do you go into the workings of your colliery pretty frequently? Sometimes every day.  
 8516. Do you take the measurements of the air? Occasionally I do.  
 8517. How frequently do you measure the air? I can generally tell what the air is like when going round with the lamp, and sometimes I take the instrument.  
 8518. How frequently do you measure the air? It may be some months at times before I measure the air myself.

[Witness withdrew.]

David Watkins, M.L.A., sworn and examined:—

- D. Watkins, Esq., M.L.A., 15 Oct., 1895. 8519. *President.*] What are you, Mr. Watkins? I am a Member of the Legislative Assembly at the present time.  
 8520. What were you before you were a Member of the Legislative Assembly? I was a coal-miner.  
 8521. Were you a coal-miner in this Colony, or in England, or both? In this Colony only.  
 8522. Where have you been coal-mining in this Colony? I spent the whole of my time in the Wallsend Colliery, in the Newcastle district.  
 8523. How many years have you been in the Wallsend Colliery? I have been hewing coal for about twelve years, as near as I can recollect.  
 8524. Were you connected with the colliery longer than that? Yes; for some two years prior to that I was water bailing, and doing other things. While hewing coal I held the position of Secretary for the Wallsend Lodge.  
 8525. *Mr. Curley.*] Have you worked in different parts of the Wallsend Colliery? I have worked in every part of the Wallsend Colliery—that is, every part of the colliery that was working during the years in which I was employed there.  
 8526. Will there be very many parts of the colliery opened since you left? The same districts, as far as I know, are still in existence; there may be one or two small districts worked out.  
 8527. How long have you been a Member of the Legislative Assembly? Since 1894; about sixteen months.  
 8528. Have you ever noticed any defects in connection with the ventilation in any of the places you have worked in? Invariably I have noticed things in connection with the ventilation which did not at all satisfy me as a practical miner. I might say that, as Secretary of the Wallsend Lodge, I have received many complaints from different parts of the mine from the miners from time to time. I have a recollection of once being called upon to apply to the Government for a joint inspection.  
 8529. How many years ago is it since you asked for that joint inspection? I think either three or four years ago.  
 8530. Was that during the time Mr. Ross was colliery manager? Yes; during Mr. Ross' time.  
 8531. What district in the colliery did that inspection have reference to? It applied generally to the whole of the mine. Of course, speaking from memory, there were some districts worse than others, but it was the general condition of the mine.  
 8532. The ventilation generally was considered at that time to be unsatisfactory? Yes; that is so.  
 8533. Were there any particular districts that were more difficult to ventilate than others? They had the greatest difficulty with the little tunnel—No. 2 tunnel, that was the surface workings—the crop workings. Black damp used to be more prevalent in these workings than in the other portions of the mine.  
 8534. Were the complaints about the ventilation in this particular district anything like general? Complaints were very general. It was considered one of the easiest districts to work, but I have known men to say they would rather work in the harder places on account of having better air. 8535.

D. Walkint,  
Esq., M.L.A.  
18 Oct., 1895.

8535. They preferred a pure atmosphere and harder work to an impure atmosphere and easy work? Yes; I always looked at it in that way myself. I would sooner work in the harder places with good air than in the easy places with bad air.

8536. Did you find the ventilation in these defective parts very injurious to your health? Yes; on many occasions I have detected symptoms of weakness in the legs after a day's work would be done, and the work would not be nearly so hard as in the deeper portions of the mine.

8537. Would the cure for that have been a vigorous current of ventilation well conducted up the working-face? Yes; I do not know of any other cure for black damp than that. Being heavier than the air, it takes a considerable current of ventilation to remove it.

8538. In that particular district you have referred to, do you think men could work for any length of time, say a quarter, or two quarters, without being seriously affected? I cannot say that a man working there for a quarter would come out without being affected. They generally suffer in these places with a bad cold—a nasty cough.

8539. *President.*] Did the ventilation in those places affect you in that way? Yes; I have noticed it also with my mate. He was affected with pit asthma, and you could always tell directly when he went to work in a place like this. It would come upon him in the shape of a cough.

8540. *Mr. Curley.*] As a rule, does it affect a man more as he advances in years? I take it so.

8541. When you say that you had to call for a joint inspection does that mean, also, that you have had to bring the matter under the notice of the manager of the colliery occasionally? Yes; it meant that we would not call a joint inspection before we had laid the matter before the manager, and of course the old books would bear out the nature of the complaints that had been made to the manager before a step of that description was taken. I am speaking from memory, but our course would naturally be to complain to the manager.

8542. *Mr. Gregson.*] Did you complain to the manager without result? Yes; according to our opinion.

8543. *Mr. Curley.*] Something might have been done by the manager that was, in your opinion, unsatisfactory? Quite so.

8544. Something might have been done that was not quite up to your expectations? Yes; that is what I mean.

8545. Have you always worked in a general way fairly amicably, as a whole, with the manager of the Wallsend Colliery? Yes; he has always treated us in a courteous manner, and listened to our complaints.

8546. Have you given any attention to the proposed new Coal Mines Regulation Bill? Yes; I was in the House when the Bill went through, and I have gone through it a few times.

8547. Would you look at subsection III of section 49, 46, on page 23 of the Bill (*see Appendix A*). Do you notice what is proposed in that sub-section? Yes—the Legislative Council wish to strike that sub-section out.

8548. Do you consider that one of the chief matters of complaint that the miners have is that the air is not brought up to the working-face? Yes; that is the whole trouble. Our check inspectors have told us that they could find a current of air on the heading—probably 30 or 40 yards from where the men were working, but none in the face.

8549. *President.*] What amount of air did they get there? 100 cubic feet invariably.

8550. According to the inspectors was that quantity of air sufficient? Yes.

8551. According to the managers, was it sufficient? Yes; according to the managers it was sufficient. I have had a good deal of experience in this matter, and have had occasion to notice the air in different parts of the mine. In carrying out my duties as secretary of the lodge I used to go round the mine appointing turn-keepers, and I have stood and found the air in the heading, but on account of the smoke in the bord you could not see the lights of the men.

8552. Is it the contention that if 100 cubic feet of air is produced in the headings the Act is complied with? That is the way the Act is read by the inspectors.

8553. The Act says in sub-section III that an adequate amount of ventilation shall mean *not less as a minimum than* 100 cubic feet of pure air per minute for each man, boy, and horse;—do you say that the inspectors give no meaning to the words “not less as a minimum than.” What the Act means is that there must be 100 cubic feet of air always, and as much more as will secure an adequate supply? The point of contention, I take it, is that the air shall sweep, undiminished, along the airway past each working-place.

8554. Have you not to give some meaning to sub-section II, of the Act (*see Appendix B*). 100 cubic feet of air, according to my reading of the Act, is to be the minimum quantity always, but there is to be an adequate amount in all places? If that construction had been put on the Act, the miners' difficulty would be overcome, but the practice has been that if the air swept along the airway past each working-place the Act was complied with.

8555. That is, if the air measured 100 cubic feet in the heading or 35 yards from the miner? Yes; I can quite understand that a boy and horse might get the air, but the miner would not get it if it was 35 yards from him. I have no doubt that was the intention of the Act.

8556. Why should this wrong construction have been put on the Act? I do not know. The difference between the Legislative Council and the Legislative Assembly is that the miner wishes to put it in plain language so that there shall be no doubt about it, but the Council does not seem to be willing to assent to this.

8557. The Council say this: If you put in a minimum quantity the Act may be misunderstood again, but if you say an adequate amount of air the manager will have to supply an adequate amount, no matter what it may be? I have this objection to the word “adequate.” I take it that nearly all the mines in England have explosive gases, and where these explosive gases are found the word “adequate” will work right enough, but if you have a mine invaded by black-damp a non-explosive gas; in that case a manager might say 50 cubic feet of air would be sufficient.

8558. Would not that manager find his men sick and ill, and would not an inspector if he knew his duty put the matter right;—we are all agreed that the air should be there, but the question is, what is the least harmful way to legislate for it? I take it that the English Act provides for bratticing.

8559. I may tell you that the English Act does not provide for bratticing? I am afraid if a minimum quantity of air is not put into the Bill we shall have several of our mines in the same condition as they are at present.

8560. Not sufficiently ventilated? I think it would be a dangerous thing to leave the minimum quantity of air out of the Bill. In the case of a small colliery, where they do not care to go to any great expense, and

D. Watkins,  
Esq., M.L.A.  
15 Oct., 1895.

and their machinery not being the best, without a minimum quantity being specified they would think 50 feet enough. If the air is brought up to the working face I think 100 cubic feet of air as a minimum would be a fair thing if brought to within 15 yards of the working face where gas does not exist.

8561. *Mr. Curley.*] You assume that with 100 cubic feet of air the bord would be bratticed up to within 15 yards of the working place;—do you care how the air is brought there? No. I prefer brattice to shorter cut-throughs, because so long as the brattice is there the air must go, provided there is the power to drive it.

8562. Are you not more likely to get the air with the shorter cut-through in the event of no brattice being there? Certainly; if there is no brattice and we have the shorter cut-through, but taking the two systems I favour the brattice.

8563. Do you know that under our present Act, the 35 yards is read inclusive of the cut-through; that you have to take both the 35 yards and the cut-through as well? That is too vague; it is possible for a man to be 45 yards in front of the air.

8564. Where you have a thick cut-through? Yes.

8565. What you have stated, Mr. Watkins, with regard to section 49 [46] of the Bill, will practically cover section 50, 47, rule 1, dealing with the ventilation? Yes; it practically covers everything.

8566. Can you understand the Legislative Council's objection to wishing that part of sub-section III, which refers to bratticing within 3 yards of the working face where gas does exist, being left out? I do not know what the Council had in view in dealing with that clause, but I have heard that they are endeavouring to get an amended Mining Act in England.

8567. *President.*] There is an amended Act in England called the Check-weighers Act, and there is another, but it is a Bill? I knew they were amending the English Act in some form, but seeing the mine-owners have to brattice where there is gas, why object to putting this section in the Bill.

8568. Was not this section really in the present Act? Yes.

8569. *Mr. Curley.*] Is not the whole of your contention with regard to the ventilation that the air should be conducted up to the working face? Undoubtedly; and I think it should be specially defined by law what that means.

8570. Do you mean to say that there should be a stipulated minimum quantity in the Bill? Yes.

8571. *President.*] Do you want it provided also that the air shall be taken to within 15 yards of the working face where gas does not exist, and to within 3 yards where gas does exist? Yes; because I take it that we will have to deal with more gas in the future than we have in the past.

8572. *Mr. Curley.*] Were these workings in the Wallsend Colliery that you have spoken about with regard to the defects in the ventilation to the rise, or to the rise and the dip alike? They were at the extreme rise, what we call the crop coal, where we found the black damp, and in the deeper workings they used to find a little gas occasionally. I recollect two men being burnt there, one was a foreman, and the other a miner. It was some days before I actually knew the man was burnt. When I knew of the accident I made inquiries, and found that it had not been reported. The man was burnt very seriously from his neck down.

8573. Do you say that the accident was not reported? It had not been reported until I wrote about it.

8574. Do you think accidents of this character should be reported? Undoubtedly. The wording of the present Act is that accidents are not to be reported unless they are serious, and this accident was not considered serious by the doctor.

8575. *President.*] What section of the Act do you refer to;—the section in the proposed Bill is 31 [29] on page 15 (*see Appendix A*), and provides that if an accident is caused by gas, or the explosion of a boiler, it is to be reported? Yes; that is in the new Bill, but I was referring to the present Act. The 28th section of the present Act says:—

28. Whenever loss of life or serious personal injury to any person employed in or about any mine occurs by reason of any explosion or other accident whatever within such mine or any pit or shaft thereof or any works or machinery connected therewith, the owner or agent shall, within twenty-four hours next after such accident, give notice in writing thereof to the examiner or to the inspector of the district in which such accident shall have occurred, and shall specify in such notice the probable cost thereof. And every owner or agent who neglects to send or cause to be sent such notice within the time aforesaid shall for every such offence be liable to a penalty not exceeding twenty pounds. And the examiner or the inspector shall forthwith, after inspection, report the accident and the cause thereof to the Minister, and in such report shall state whether, in his opinion, such accident was due to or caused by any act or default or negligence of the owner or agent.

8576. Where an injury is caused by explosion notice must be given, but in other cases the accident must be of a serious nature; there are all sorts of small accidents that occur in mines, such as a piece of coal falling on a man's foot;—do you want these minor accidents reported? Yes; it is a serious matter whenever a man finds gas.

8577. In the proposed Bill, no matter what the accident is, notice would have to be given if the accident is caused by an explosion? I mentioned this accident just to show how lax a manager can be. Although the doctor gave it as his opinion that the accident was not serious, the man was burnt red raw, and I think it was sufficiently serious to be reported.

8578. *Mr. Curley.*] Do you know Musgrave that was injured in the Lambton Mine? Yes; I knew him well.

8579. Do you know anything about his injuries? Yes; I have had it explained by him, and I have read it in the newspapers. I know the Association sued the Company on Musgrave's behalf.

8580. Do you think that the word "serious" should remain in this section of the Bill? I would prefer to see the word "serious" eliminated, because it throws the responsibility upon the doctor of the place, and so far as a light accident is concerned, I do not think it is much trouble to report the matter to the inspector, and the inspector might judge for himself as to its seriousness or otherwise. Of course, Musgrave's accident happened from what he thought was a defective manhole.

8581. The accident took place on the engine plane, and it was a matter of controversy as to the origin of it? Yes; no doubt about that.

8582. Was there a deficient manhole on that engine plane? Yes; still, I think it is sufficient to say that these manholes should be of a stipulated size. I held then, and hold now, that the manholes should be a stipulated size in the engine planes.

8583. Do you consider that there should be substantial pillars left at all times in a mine? Yes; my experience at Wallsend was such that it brought me in contact with a good deal of pillar working. I do not think any collieries extract more pillars than the Wallsend Colliery, and I think it better for the Company and everybody concerned to work with the larger pillars.

8584.

D. Watkins,  
Esq., M.L.A.  
15 Oct., 1895.

8584. Do you think that larger pillars are safer for the men? Undoubtedly.

8585. Do you think that larger pillars are more economical for the management? I think so. It is recognised by all practical managers that if you can manage to get a break the remaining pillars are safer. I think in cases where they do not extract pillars they should have larger pillars. Pillars will only last a certain time, and they are the only things to keep the superincumbent strata up.

8586. Did you see anything special with regard to pillar-working when you were working in the Wallsend Colliery, with regard to the opinion you have expressed? I have seen falls in pillars both in the dip workings, and in the shell workings. I worked in the No. 2 tunnel after the 1890 strike. I have a recollection of being ordered to extract a pillar under circumstances that gave very little protection to the miner, and where, if we had been called upon to run, we would practically have had to run through the danger to escape. The pillars had what we call windowed holes.

8587. *President.*] What size would these pillars have been if they had not worked into each other? Either 4 or 6 yard pillars.

8588. How long would they be? Thirty-five yards; but they were only 4 or 6 yards thick. The Wallsend Company worked their seam for a considerable time on the 4-yard pillar system, but since then they have altered the system to 6 yards and 8 yards.

8589. *Mr. Curley.*] What was, at the time you have referred to, supposed to be the dimension of the pillar was not so in a great many cases? Yes; in that case they lost quite a number of pillars further back, and a few bords as well. They had two falls at that time by which they lost the working places.

8590. The experience you have had leads you to the opinion that larger pillars should be left in a mine? Yes.

8591. *President.*] Do you think that mines will be worked deeper in the future? Yes.

8592. If you prescribed a certain size for pillars, do you not think it might lead to some misconstruction again. Have you seen pillars of insufficient size left within the last two years? I have been nearly two years away from coal-mining. I did work pillars that have been fairly good pillars, and I take it that the deepness of the mine would not affect the size of the pillar. The greatest danger with regard to pillars is what we know as the surface break.

8593. *Mr. Curley.*] Has the manager at any time had to withdraw the men when you were working pillars? I could not cite a case where the general body of men have been withdrawn. The general rule has been, since Mr. Ross' time, to have a deputy standing back in the heading where they have a danger, to see that the timber was kept up behind him. It is necessary very often in extracting these pillars to withdraw the men for a short time. The men might be withdrawn to-night, and go in again to-morrow, according to how the roof is settling. In the case I have referred to, I was particularly disgusted, because no provision was made for the safety of the men. We had to take up our own road to save the Company's plant that was there.

8594. *President.*] In the case you have referred to, must not the manager have been very incompetent? It was the overman or under manager.

8595. Was not the manager responsible? Yes.

8596. Was it the fault of the overman in this case? Yes.

8597. If the manager had been compelled to exercise personal supervision the thing would not have occurred? It would have been almost impracticable for the manager to exercise personal supervision himself. The manager of a large colliery like the Wallsend Colliery does not go below very often.

8598. Then the overman could not have been a competent person? In my opinion he was not. The fact remained that the pillar that was behind us was rent in shreds.

8599. Will you look at sub-section 2 of section 3, on page 2 of the Bill (*see Appendix A*), "Daily supervision of mine by manager or under manager";—if there was daily supervision by a manager or under manager one could hardly think that such a thing could have taken place? I think there is a provision of that kind in the present Act.

8600. *Mr. Curley.*] Does not this bring you back to the same point, viz., that the system of leaving the thin pillar is simply a great mistake;—does it not bring you back to that position? Yes, I think so. Speaking of the management at the Wallsend Colliery generally, the extracting of pillars was done very skillfully, but if the pillars were small a large portion of the coal would be lost.

8601. If the pillars are small, would they not be critical to work for the miners themselves? No doubt. It is a common thing where the bords have fallen to lose your place through the stone sliding in, and you are right amongst the timber then.

8602. Will you look at sub-clause 5, section 21, on page 8 of the Bill, the clause giving the inspector the power to withdraw the men in case of danger (*see Appendix A*)? Yes.

8603. Do you think it is desirable that the inspector should have this power? I think so. I do not see any grounds the Upper House can have for objecting to that clause. I am of opinion that the present Act gives that power now.

8604. *President.*] It gives them power to go to arbitration? Sub-section 5, clause 12, of the present Act, says, "If at any time it is found by the person in charge of a mine, or any part thereof, or by the examiner or inspector, that by reason of noxious gases prevailing in such a mine, or such part thereof, or of any cause whatever, the mine, or the said part, is dangerous, every workman shall be withdrawn therefrom, and the examiner or inspector shall inspect the same (and if the danger arises from inflammable gas shall make such inspection with a locked safety-lamp), and in every case shall make a true report of the condition of such mine, or part thereof, and no workman shall, except in so far as is necessary for inquiry, into the cause of danger, or for the removal thereof, or for exploration, be re-admitted into the mine, or such part thereof, as was so found dangerous until the same is stated by the examiner or inspector to be safe. Every such report shall be recorded in a book, which should be kept at the mine for the purpose, and shall be signed by the person reporting." I take it that under that clause the inspectors have the same power.

8605. *Mr. Curley.*] The provision in the proposed Bill is, then, no new provision? I take it as practically the same clause.

8606. *President.*] If an inspector said to a manager that he thought the mine was dangerous, and that the men ought to be withdrawn, can you understand a manager taking the responsibility upon himself and leaving the men there? It becomes a question of opinion as to whether the lives of the men are to be subject to that man's opinion.

D. Watkins,  
Esq., M.L.A.  
15 Oct., 1895.

8607. It has been put that if a manager had some doubt himself, and an inspector came along and did not see, or did not say anything to the manager, that the manager who was doubtful himself might have his doubt removed by the inspector not noticing or saying anything about it;—do you not think a manager would act in such a case on his own opinion? From the experience of the past, which is all we have to guide us, I would not like to trust him.

8608. Would not there be a different order of things if this Bill passes? I take it that the Bill, as amended by the Legislative Council, will be practically worse than the present Act.

8609. *Mr. Curley.*] Can you conceive of a position of this kind—that a controversy might arise between an inspector and a manager as to the men being withdrawn under certain conditions, and the manager to hesitate about the withdrawal of the men, and still the inspector might think the men should be brought out? I can quite understand those conditions. The Stockton case has often been referred to, and while the mine is stopped it might also have fallen in.

8610. *President.*] The difficulty is to give this divided responsibility? Perhaps so.

8611. *Mr. Curley.*] In a case where there was a controversy between the manager and the inspector, seeing the inspector holds the responsible position, do you not think that he ought to have some say in a matter of that description? I think so. My experience of the Government inspectors is that they would not do anything of that description without thinking the matter out—they would not do anything arbitrarily.

8612. *President.*] Do you think that any manager, if an inspector said that he thought the men should be withdrawn, would dare to keep the men in the mine? Of course, that is a matter of conjecture.

8613. It is a matter of human nature? I would rather have this provision in the Bill. The question of losing coal comes in here; I have known men to be working to get as much coal out as possible to create a fall. They knew the place was settling, and they wanted to get out as much coal as they could before the fall took place, or that the weight was pressing on the adjoining portion of the mine; and therefore it would be to his advantage to have that down, and they would take as much coal out as they possibly could to get that strata or the entire roof down. On the other hand, being under contract renders them over anxious to keep working regardless of danger, thinking of the few shillings they have a chance of getting. I think it would be safer to throw the responsibility upon the men appointed by the Government; but, of course, in the general supervision of the mine the manager has to take that responsibility.

8614. *Mr. Curley.*] Do you think that the men should have the right to select their check-weighman from whom they please? Yes; the Legislative Council wish to say that the check-weigher shall be an employee of the colliery. I think the men should have the widest choice possible, because as soon as a man is appointed check-weigher he practically leaves the employment of the colliery, and there is no guarantee that he will get his work back. You will notice in sub-section II of section 43, 40, on page 19 of the Bill (*see Appendix A*), that the Council have struck out the words "tareing of tubs and trams." In a colliery where they might be weighing every tub or tram, or, as we call them, skips, a check-weighman would be practically useless. He would have no chance of tareing the tubs or trams, and his position would practically be rendered void. He could not ascertain the exact weight unless he averaged the tubs in the morning.

8615. What have you to say with regard to rule 40, 38, on page 30 of the Bill, with regard to the check inspectors (*see Appendix A*);—you will see the words inserted in that rule, "not being mining engineers who are practical working miners?" I moved those words, "not being mining engineers," should be struck out. They provide there that they shall not be practical; even though a man might be a practical engineer he could not be a check-inspector. I think those words should be struck out, because these inspectors have powers somewhere else in the Bill to inspect the ropes and other things.

8616. *President.*] The difficulty was that any persons might appoint two of their number, or any two persons, to inspect the mine, and it was to prevent outside engineers or perhaps foreign intrusion into the mine who might give information to others? I am afraid that would be a debatable point. It is distinctly said they shall appoint two of their number.

8617. If the people having this knowledge appoint two of their number they must not take outside engineers, because they might get two people who might be employed by some opposition company? But they have to make a report.

8618. If there are two persons in a mine who are mining engineers they can be appointed? I think they should have the power to appoint anybody outside, because their actions are guarded by the provisions of the Bill in such a way that they can do nothing arbitrarily. The miners might think it economical to appoint two persons to inspect the whole of the district, but under this provision I take it they would be debarred from doing so.

8619. The Bill says that they could not appoint a mining engineer outside the mine? There might be a colliery where they had a miner with a knowledge of engineering, but it would debar them from appointing that man. I think those words in the section are dangerous.

8620. Your opinion is that the words, "not being mining engineers," govern the whole thing? I think so. In another part of the Bill they are empowered to inspect the shafts, ropes, pulleys, &c., and it is useless giving the miners power to do this, unless they have power to appoint men who have a knowledge of these things.

8621. Do you think it has been found to work so;—the English Act contains these words, but in the English Act they are new? Yes; I think it would be nonsensical to assume that the miners would get one of the other managers to be one of their check-inspectors. Where the two men have to depend on the proprietors of that colliery, it restricts them in a certain sense. I have found that those men in writing their reports have not done that justice that I think ought to have been done. If this benefit is to be conceded to the men, as it ought to be, I think they should have full choice.

8622. Is there anything else that you would like to refer to in the Bill? Yes; I would like to refer to rule 34, on page 30, with regard to the examination of boilers (*see Appendix A*). I think that is a very necessary rule. It is three months ago since the miners at Teralba complained to me that the pump of one of their boilers had tumbled out, and three weeks ago I wrote to the Department asking that a boiler in the Merrylands Collieries Estate might be inspected.

8623. Is there anything else you would like to refer to? Yes. Rule 19, on page 28 of the Bill, "trolley over pit mouth" (*see Appendix A*). I think that rule is absolutely necessary in all cases.

[Witness withdrew.]

WEDNESDAY,

WEDNESDAY, 16 OCTOBER, 1895.

[The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.]

Present:—

FRANCIS EDWARD ROGERS, Esq., Q.C., PRESIDENT.

JAMES CURLEY, Esq. | JESSE GREGSON, Esq.

Mr. John Dixon, Senior Inspector of Collieries, sworn and examined:—

8624. *Mr. Curley.*] What are you, Mr. Dixon? I am senior Inspector of Collieries in the Colony.
8625. How long have you held the position of inspector? I have been an inspector for thirteen years and four months.
8626. Prior to your becoming an inspector, what occupation did you follow? I was a miner.
8627. Have you been connected with all phases of mining? Yes.
8628. During your experience, what kinds of mining have you been connected with? Gold, shale, and coal.
8629. At what age did you become acquainted with mining? I was between 10 and 11 years of age.
8630. Where did you first gain your mining experience? In the County of Durham, in England.
8631. What was the name of the mine you worked at in Durham? At a place called Haswell.
8632. Were you employed at Haswell very long? About four years as a boy.
8633. Did you come out to this Colony after that? Yes; at about the age of 15.
8634. What collieries have you been connected with out here since you came from England? The first place I worked at was at a sinking pit, at Hoxham, in the northern district. That was as a boy.
8635. Who were you working with then? My father. He had charge of the place.
8636. Was your father a practical man? Yes.
8637. Did you have the contract for the sinking of the shaft? My father had the contract, and we were boring in the sinking pit.
8638. Have you done much boring in your time? Yes; a considerable amount.
8639. Where? In the northern district, and at Mittagong and at Hartley Vale.
8640. Have you been boring in any particular localities in the northern district? Yes; all over the northern district.
8641. Can you name the localities? Yes; at Stockton. We discovered the coal at Stockton by boring. Then we bored for the Waratah Company, down by Tighe's Hill, and for Mr. Merewether, where South Waratah is now, and at Flaggy Creek.
8642. Have you had much experience in sinking shafts? Yes.
8643. I suppose you have gone through some very critical ground during your experience in mining? Yes, especially in gold-mining—very severe ground.
8644. Where did you begin coal-mining? I began what we call cutting coal first in the A. A. Company's Colliery.
8645. How long ago was that? That was in the beginning of 1862.
8646. Were you employed at the A. A. Company's Colliery very long? Yes; for a good while.
8647. Were you employed in any other colliery in the northern district? Yes; I worked in Old Lambton Colliery in the latter end of the year 1863, but I did not work there for any length of time.
8648. What other collieries have you worked in? I worked at Mittagong, in an anthracite mine, and in opening out new places. I worked as a miner there, and I took charge of the place after my father. Before he died I was managing the place under Mr. Levick, who was the head manager.
8649. Then, practically, the whole of your lifetime you have been connected with mining pursuits? Yes; I have been in every grade of coal-mining from a trap-door up.
8650. During the term of your inspectorship I suppose your attention has been called to different matters in connection with the various mines? Yes.
8651. In the course of your inspectorship you have no doubt had complaints made to you? Yes.
8652. Have you found those complaints to be well founded? A few of them.
8653. What has been the nature of the complaints? Sometimes they have been in connection with ventilation, and various other things besides. The last complaint I had was from Greta in connection with the catches at the pit top. The man was not there when the men came up, but I got that rectified very soon.
8654. Are these complaints mostly made to you in some kind of an official way? Yes; I have had anonymous letters, but mostly the complaints have been made officially.
8655. When you get anonymous letters, do you pay any attention to them? I do; but it is much against my grain.
8656. *President.*] Why do you say that? Because I do not care to go into a pit, where perhaps somebody is laughing at me behind my back.
8657. Do you not think it would be a bad thing to overlook any complaint that might be made to you anonymously? I have always looked upon such communications just as if they had been signed.
8658. *Mr. Curley.*] Do you know that the Secretary of State at Home has requested the inspectors there to take notice of anonymous communications? Yes; I have known that for some length of time.
8659. Do you know instances in which it would be very difficult for men to complain in any other way? Yes.
8660. How often do you make your inspections of the different collieries? If there are no accidents I get round now pretty well in about seven weeks.
- 8661-5. What collieries do you visit in your capacity as inspector? The principal collieries I visit are the two mines belonging to the A.A. Company, the Newcastle Company's mines, and the Burwood Colliery, the Burwood Extended, South Waratah, New Lambton, Ebben Vale, and Durham. I have also three mines I go to in Gunnedah, one in Curlewis, one in Muswellbrook, and all the small places about the Waratah Commonage and New Lambton. I sometimes travel with the other inspectors, taking a portion of the work with Mr. Humble in Bullock Island, Hetton, and Stockton.
8666. Do you measure the air when you make these inspections in the different districts you go to? Yes.
8667. Do you measure the air both in the intake and in the return? Yes.
8668. I suppose you measure the air on the headings—the main air-ways? Yes; on the main air-ways, at the commencement of a district, and two or three places going through the mine, and then at the end.

Mr. J. Dixon.  
16 Oct., 1895.

8669.

- Mr. J. Dixon. 8669. Do you ever go into any of the men's working-places? Yes; in some of the collieries I travel over every working-place.
- 16 Oct., 1895. 8670. Do you generally go into the rise workings of a colliery? Yes.
8671. And see how the men are off there for ventilation? Yes.
8672. How do you understand the provisions of the present Act with regard to ventilation; when does a colliery come within the requirements of the Act of 1876;—will you look at the sub-clauses in the Act before you on the table (*see Appendix B*)? I understand that an adequate amount of ventilation shall be constantly produced in every mine to carry away noxious gases, to such an extent that the working-places of the shafts, levels, stables, and workings of the mine, and the travelling roads to and from such working-places, shall be in a fit state for working and passing therein, and that adequate amount of ventilation is to be within 35 yards of the working face—the face of the bord or the face of the headings, or the horse road, or whatever it may be. That is the interpretation according to this Act. An adequate quantity of ventilation shall mean not less as a minimum than 100 cubic feet of pure air per minute for each man, boy, and horse, and if I find cases where this 100 cubic feet of air is not enough I do not hesitate to say that it is not an adequate quantity, and I get more air put in. That is the way I read the Act. The 100 cubic feet of air is only put in as a safeguard, and people must not come below that quantity. I was one who helped to frame this Bill, and I think I know a little about it. I was one of a deputation that came to Sydney about it, and I made a speech about it at an aggregate meeting.
8673. What was the intention of the application of that Bill? To better the condition of the miners. There is nothing in the 1872 Act of England to say how far the men shall work before the current of air, and we thought we had gained a point over the English Act when we put this in. Our intention, in the first instance, was to have the distance 30 yards ahead of the air, but the masters wanted it to be 40 yards, and we split the difference, and that makes it the 35 yards.
8674. *President.*] Do you know the present English Act—the Act of 1887? Yes.
8675. *Mr. Curley.*] With regard to the section of the present Act you have referred to, section 2, does it not say something there about an adequate amount of ventilation? Yes; that an adequate amount of ventilation shall be constantly produced.
8676. Does it not also mention something about the working-place? Yes; that it shall sweep undiminished along the air-way past each working-place.
8677. *President.*] What construction do you put on those words? That is that the air passes along the heading; it only goes into the working-place by diffusion.
8678. What construction do you put on subsection 2 of the present Act (*see Appendix B*);—does that not mean that there is air to be kept in the working-place, and that the minimum quantity mentioned in subsection 3 is always to be there? Subsection 3 simply qualifies subsection 2.
8679. It seems a pity that it was qualified, because a great many people say that if there is 100 cubic feet of air passing along the air-ways the Act is complied with? They make a mistake, and there are other managers who do not believe that the Act is complied with if they have this minimum quantity. Of course, there may be men who will take shelter behind this 100 cubic feet.
8680. Do you think that there should be a minimum quantity of air specified in any Act? I do. I think it is a safeguard, and I have always believed in it.
8681. According to my reading of the Act, you give the right construction to these subsections, although there may be others who think that the Act goes further than you go; you do not fail to give a meaning to the words "not less as a minimum than," but these people read the minimum quantity as the maximum quantity? I have heard people talk like that, but it is quite wrong, according to my reading of the Act.
8682. *Mr. Curley.*] Do you know that intelligent managers have read the Act in this way? Yes; but in some respects I dispute with them, when they go on that point. I had a case in the A. A. Company's No. 2 pit, where they were working pillars. The workings were going to the rise, and, although there were only sixteen men employed, it was very hot. Although there were only about sixteen men in there, I thought the ventilation was not sufficient, and Mr. Paul Turnbull, the overman, was of the same mind as myself. There were 10,000 cubic feet of air going in, and he was struggling to put in another 4,000 feet.
8683. In the writing of the reports you make from time to time in connection with the ventilation, do you invariably state that you find a certain quantity of air going into the mine? Yes.
8684. And that you find the Act complied with? Yes; that is the wording in the usual yearly reports.
8685. Has that reference to the measurement of the air upon the heading? That must be taken in the aggregate. When we give the total quantity of air we must give the total number of men, boys, and horses, and if you take the aggregate amount of air you must take the number of men, boys, and horses. It would not do to give simply the number of men in the splits, because every man is using that air. The yearly report is not given in the way I would like to write it.
8686. How would you like to write it? Something like the English inspectors write their reports. I would like to give the accidents and a synopsis generally of the pit. I would like to show that we have had our eyes open in going round, and give something to show for our work.
8687. With regard to that aggregate quantity that you speak of, do you take the measurement as near to the shaft bottom as you can get it? Yes, the intake.
8688. Then do you take the return passing out to the furnace? Yes.
8689. And then you give the aggregate results, according to what you find? Yes.
8690. Then do you calculate the number of people that are in the mine? Yes; from the onsetters.
8691. Is that basis taken upon this 100 cubic feet of air? No; it is lost sight of there. We do not go and say there is so much for each man, boy, and horse. We do in the different districts. Say we had so many men in a split, we see that none of these splits are overcrowded; that is, that none of the splits have over seventy men. We see that there is so much air in the district, and that gives so much for each man, boy, and horse. In the yearly report it is simply to say what amount of air is produced in the mine for each man, boy, and horse.
8692. Do the other inspectors put the same construction on the present Act as yourself? Yes.
8693. *President.*] Does Mr. Rowan, in the Southern district, put the same construction on the Act? I believe he puts the same construction on the Act as I do.
8694. *Mr. Curley.*] If he gave a different construction to the construction you have put up on the Act, would you think he was of a different opinion to yourself? I would think he was. I know that Mr.

- Humble and I are both of the same mind, and that Mr. Bates is of the same opinion. I may say that it is a very rare thing for us to get a district where there is simply 100 cubic feet of air travelling. I have districts where I can get up to 450 cubic feet for each man, boy, and horse in the splits. Mr. J. Dixon.  
16 Oct., 1895.
8695. In your inspections have you found any grave complaints with regard to want of air? No, not as to the total quantity supplied; but what I should like to see is, the air taken into each man's bord, or into the working-places. It should be put into the same extent into the working bords. I do not mean to say that it should be produced up into the face, but that it should be put in to sweep the noxious gases out.
8696. Do you think that it would be a matter of very serious cost to brattice within a limited distance of the face? No.
8697. You do not think that it would be a matter of very serious cost to brattice within a limited distance of the face? No; that is to say, to keep the brattice to within 15 yards of the working face. My estimate of the cost of doing this would be 1½d. per ton, and that would include the cost of the brattice, the putting of it up, and everything else.
8698. Is not your estimate rather over than under the mark? No; when Mr. Humble comes to give evidence, you will find he has all the calculations in connection with this matter, and there is no getting away from it. You will find that it can be done at a cost of not more than 1½d. per ton. [*See Appendix O.*]
8699. Has your calculation been made upon the basis of the actual tonnage that you know has come out of the mines? It is taken upon the cubic contents of a bord, say 4 feet high and 8 yards wide and 35 yards long, between the headings, and 5 feet high, 6 feet high, and up to 9 feet high, and allowing 25 per cent. for the dirt, it runs out at about 1½d. per ton. It runs out in nearly every instance to a tick. There is a lot of small coal filled afterwards that is a source of profit to the masters, and which will reduce this calculation.
8700. Have you calculated what is thrown back? Twenty-five per cent. has been allowed for the dirt and small coal. In some of the seams there is a great breakage, but the masters have been given the benefit of the doubt.
8701. What would you say to a statement that puts the cost down to 3d. per ton, or even more in some instances? I would consider it outrageous.
8702. Do you not think that a ½d. per ton would cover the cost of bratticing? No; 1½d. per ton.
8703. What kind of brattice was your estimate based on? Canvas cloth.
8704. What life-time did you allow for this canvas cloth? You can only give an approximation in this particular, because if you get into a damp place the canvas cloth will not bear its own weight sometimes; you can put your fingers through it in a month. Where I have seen calculations giving it at a very low rate, the calculations have been made upon it lasting through three cut-throughs.
8705. Have you estimated any life-time for the brattice? No; I simply thought that the last 15 yards might be utilised again, and, in dry places, that the same brattice could be utilised for two bords, but in a damp place for only one bord.
8706. Do you think that any other kind of brattice would be cheaper? Do you refer to wood brattice?
8707. Yes; ½-inch tongued and grooved boards;—would the water rot these boards as quickly as the other brattice? I have seen it used, and I prefer the wood, because there is a nasty smell that comes from the brattice cloth.
8708. Could you estimate the life of wood brattice? No.
8709. Would it be more expensive? Yes; it would have to be tongued and grooved boards.
8710. Would it not last all the longer? Mr. MacCabe has them in 6-foot lengths.
8711. Do you know that wood brattice is largely used in England? Yes; wood brattice was used in England when I was a boy.
8712. Do you think that canvas cloth would last anything like eighteen months, or a couple of years? I do not.
8713. If a man had been putting it up for that length of time who had had experience with it, had made a statement to that effect, would you be inclined to believe him? He might have seen brattice last that length of time, but I have seen brattice that would not last more than three months. I have seen new brattice put up to-day, and in three weeks after it was only fit to come down again. Of course, there are different kinds and degrees of brattice cloth.
8714. Would that be where there was a great deal of friction with the skips? There is other brattice that would stand the skips. There is a sort of bagging brattice, something like an old chaff bag, and if hung a certain way the weight of it will break it. That is an inferior brattice.
8715. Do you say that you believe in a minimum quantity of air being stipulated in an Act? I do.
8716. What minimum quantity of air do you think should be specified? Let me put it in my own way. I know places where, if the bords are bratticed, you cannot get what certain people ask for, that is 150 cubic feet of air through the district, because to brattice the bords would increase the friction.
8717. I am asking you for your own opinion? I consider that a minimum of 100 cubic feet should be stipulated as a safeguard; that is, as enough in conjunction with the word adequate.
8718. Do you think that if a minimum of 100 cubic feet is specified, and if something is done to conduct the air to the working face, that that would meet the requirements at the present time? I do; if the air was switched into the bords, I think we would hear no more about it, because that is where the air is to go.
8719. Do you believe in the distance specified in the Bill with regard to cut-throughs in rule 1 (*see Appendix A*)? If the bords are bratticed people could put cut-throughs where they liked. If it is specified that the air shall be kept to within 15 yards of the working face, that would make 20 yards of brattice in a 35-yard place.
8720. In a general way throughout the mine, do you pay attention to other matters beyond the ventilation? Yes; my eyes are on the lookout from the moment I go into a mine till I come out, and my chief thought is to keep people safe.
8721. Do you inspect the shafts in the collieries you visit? Yes; I do not say I go on a cradle and inspect them, because that is done every week by special men.
8722. You do not see that done? No.
8723. Is that inspection reported to you? Yes; it is put in the report books at the colliery.
8724. Do you look at the shafts when you go down in the cage? Yes.
8725. Can you make a fairly accurate inspection? Yes; by running slowly down.

- Mr. J. Dixon.  
16 Oct., 1895.
8726. How are most of the shafts you visit timbered? Some of them have very little timber in at all; where the strata is soft, they are bricked.
8727. Is that the case with every mine in the district? Yes; they are either bricked, or have iron cylinders.
8728. Are the Greta shafts bricked? There is nothing to brick in Greta; it is one of the hardest shafts in the Colony—hard conglomerate. As a rule I have insisted on having the surface strata bricked up, and that has been very often in my time.
8729. Do you know the Waratah shaft? Yes.
8730. What was the support in that shaft? Wood at the top.
8731. Was it the decay of this wood that led to the collapse of that shaft? I fancy it was from the side, where there was a leakage of surface water. It was a peculiar shaft altogether, but of course it was sunk before my time.
8732. Do you pay any attention to the pillars round about these shafts, to see if they are any size round the shafts? I do look at shaft pillars, and as a rule all that have been made of late years are pretty substantial.
8733. No matter when they have been made, do you know what they are? Yes; I know what they are.
8734. Have you any idea what the dimensions of the pillars are? I cannot give the dimension of them on the spur of the moment, but some of them are not a bit better than they ought to be.
8735. Are they as good as they ought to be? In the Newcastle Company's old pit there is not much shaft pillars, but there are splendid shaft pillars in the new pit.
8736. Where these shaft pillars are of too limited dimensions, could not there be packing done? There is packing.
8737. At what colliery is this packing? There is not a bit of fear now.
8738. Has this been done since the crush took place there? It was done at the time of the crush; they had to do it on the north side to save the shaft, and she is there now as safe as a church.
8739. Was that a very extensive crush? Yes; about 120 yards on one side of the shaft, as close as a box.
8740. What do you attribute that crush to? To the turning away of wide boards too near the shaft pillars some years ago.
8741. Would that have anything to do with the present management? No; it had to do with the management before Mr. Ross' time. It was in Mr. Ross' time, and only for some 8-yard pillars that he left, I would not like to tell you what might have happened there. I give him credit for leaving these 8-yard pillars.
8742. What was the size of the pillars? Four yards.
8743. Did the fall come over the pillars? Yes; it floored them in all directions.
8744. Is this a question that you think more attention will have to be paid to in the future? Attention has been paid to it in the Northern district for some time past. We have nothing less than an 8-yard pillar except in Wickham and Bullock Island, or Hetton. In other collieries the pillars are 8 yards and upwards.
8745. How far do you go back when you say for some time past? Several years—some of them since the Hamilton Pit disaster.
8746. Are you sure they are all 8-yard pillars in the Northern district? I am certain they are, except at Wickham and Bullock Island and Hetton. I know they are at the places that I go to.
8747. Are they not 6 yards at Seaham? I do not go to Seaham.
8748. Do you think it is a mistake to work with too small pillars? Yes; I do, if work is carried on with a view to extracting pillars.
8749. Do you think that it is a mistake to work with too small pillars whether work is carried on with a view to extracting them or not? That is a big question. I know of pillars 4 yards and less that have been standing for thirty years, and no grind on them yet.
8750. Do you know that there are other places where extensive falls have come over the pillars? Yes; it is only the question of getting a start to get what we call a loose end. I am a firm believer in large pillars, especially where they have to be extracted.
8751. Have you ever drawn the manager's attention to small pillars? Yes.
8752. At what collieries have you done this? I think I have drawn Mr. Ross' attention to keeping larger pillars.
8753. Did you draw his attention to this before the fall? No; after the fall. I have never notified anyone about the pillars. It is not within the scope of my duty here. If I saw that any danger was likely to occur I might do so.
8754. Have you not a very wide latitude under the 25th section of the present Act (*see Appendix B*)? Yes; for things that are not provided in the Act, but that always lands us in arbitration. The 25th section says, "If in any respect any inspector finds any mine, or any part thereof, or any matter, thing, or practice in or connected with any such mine, to be dangerous or defective, so as, in his opinion, to threaten or tend to the bodily injury of any person, such inspector may give notice in writing thereof to the owner or agent of the mine, and shall state in such notice the particulars in which he considers such mine or any part thereof, or any matter, thing, or practice to be dangerous or defective, and require the same to be remedied, and unless the same be forthwith remedied the inspector shall also report the same to the Minister. If the owner or agent of the mine objects to remedy the matter complained of in the notice, he may, within seven days after the receipt of such notice, send his objection in writing, stating the grounds thereof to the Minister, and thereupon the matter shall be determined by arbitration in manner provided by this Act in relation to the special rules, and the date of the receipt of such objection shall be deemed to be the date of the reference, &c."
8755. Suppose it did land you in arbitration? If I saw where it was necessary I would not hesitate to use that section. I have used it on more than one occasion to get something remedied.
- 8756-7. Would you not in many cases, from your practical knowledge of coal-mining, apprehend danger from a certain system of working that you saw pursued in the mine? If I saw 4-yard pillars, and knew that there was to be no pillar-coal extraction, I would not apprehend danger.
8758. If you knew that pillars were going to be extracted, and saw that very limited pillars were being left, what would you do in that case? In that case I should not use this 25th section of the Act, not if they were old workings.

8759. In the new system of working collieries, is not every mine worked with a view to extracting pillars? Not always; pillar extraction is of recent date in the Northern district except in Wallsend. I do not suppose there has been a pillar taken out in Brown's Collieries, or at Duckenfield, or at Seaham and West Wallsend. Mr. J. Dixon.  
16 Oct., 1895.
8760. Are not the Seaham and West Wallsend Collieries new collieries? Yes.
8761. Then I am to take it that you have never drawn attention to the matter of pillars? Not by giving notice.
8762. You have not given any official intimation on the matter of pillars? I cannot say that I have.
8763. Do you not think this is a matter that comes within your province as an inspector? The 25th section of the Act says, "If any inspector find any mine or any part thereof, or any matter, thing, or practice in or connected with such mine to be dangerous or defective, so as, in his opinion, to threaten or tend to the bodily injury of any person, such an inspector may give notice in writing to the owner or agent of the mine." I might serve notice on a person and the pillars might stand for generations afterwards. The question is whether a thing is tending to bodily harm.
8764. The Act only provides that an inspector may give notice. Is it not only a notice? Yes; but it might cause trouble afterwards if the matter was taken to arbitration. If it went to arbitration and the pillars were standing intact, there would be nothing to go upon. You could not ask a man to make a 5-yard pillar out of a 4-yard pillar.
8765. If you considered that the mining practice that was being pursued was not conducted on principles that you would consider safe, would not you, as an inspector, feel bound to take action in such a case? If mining operations were not conducted on safe principles I would never rest until I got them on safe principles. That is my way of doing business. In South Waratah they are leaving a large barrier between the old workings and the new workings, and I am quite pleased with what they are doing.
8766. Do you know there was a crush at South Waratah, coming towards the return? I have a right to know something about that. I was there a good many times over that thing. I saw that crush coming on six weeks before it came, and drew the overman's attention to it, and he would not believe it; but she came and shut the road off, and the overman would not credit it. I told him to keep a look out when the crush was on. The crush never came to the surface.
8767. Are you satisfied with the system of working that has been followed in the past with regard to leaving these limited pillars? I am.
8768. Do you think that the way pillars have been extracted is hazardous to the men? Speaking as an inspector, I do not like to see pillar extracting where the pillars are much under 5 yards.
8769. Would you like to work yourself where the pillars are very thin? I would not like to say that. I have seen thin pillars that were quite as comfortable as other pillars, and I have seen other pillars not so. It largely depends on the roof. If you have a roof that you can break off at any time, there is no danger.
8770. Is not this a serious matter for the workmen? I do not know of a place where there is pillar working where there are not plenty of retreats for the men. I know of a place that is just finished where there was pillar-working for years. I used to go there, and they had the smallest pillars I have seen, and the men working them never had a scratch on them.
8771. You have given an instance of a crush on the main road in the Newcastle Company's Colliery—an extensive crush? Yes.
8772. Do you know of any other collieries besides the Newcastle Company's mine where any falls have come over the pillars? Yes.
8773. Can you say where? In the Hamilton Pit; and I know the fall came over the pillars in South Waratah at the time of that crush.
- 8773½. Have you ever known a fall come over the pillars at Lambton? Over pillars?
8774. Yes, over pillars? I am quite sure about Lambton.
8775. Have you ever known anything of this kind to happen at Wallsend? No; not at Wallsend.
8776. Nor Minmi? They do not extract pillars at Minmi.
8777. Have you ever known any section of the work at Minmi come over pillars? I believe they had a big fall at Minmi before I took office.
8778. Do you know anything about a fall that took place at the Co-operative Colliery? I do;—to a great extent it came down over the pillars. It is about the worst thing I know.
8779. That fall was coming over the pillars? Yes.
8780. Did you make a report about that Hamilton Pit matter? Yes.
8781. Was your report handed in at the inquest on that disaster? I had not made my report then.
8782. Have you that report with you now? No; I wrote two reports on that matter.
8783. Can you give us the substance of your reports? In my reports I gave the history of the place and how the accident happened. I was down the pit within a few minutes after she caved in, and gave the history of the thing from start to finish, together with a lot of evidence that was taken at the inquest. There were about eleven sheets of foolscap altogether in one of my reports (*see Report, Appendix S*).
8784. Did you come to the same conclusion with the jury upon this matter? Yes; about the pillars; that she came over the pillars on the cross-cut.
8785. Was the cross-cut the main road for the men to come out by? Yes.
8786. Do you know that a number of lives were lost through that disaster? Yes.
8787. And that a number of men had a very narrow escape? Yes, they had; I was there when they came through.
8788. Did you report in your annual report any of the accidents that happened to the men beyond the men that actually lost their lives? No.
8789. Did you not hear a tale from these men about the way they were affected when coming out? It would be a sorry experience. I tried to find that track, but never could.
8790. Was it not a considerable shock to those men? Without a doubt it was.
8791. Would you consider that it was a personal injury? No; a man might get a shock that might injure him for life, but if it had been a broken limb or leg it would have been a different thing to report.
8792. Did not some of these men say that they were knocked down? Yes; and plenty of us have been knocked down.
8793. Do you know that as far as the man Ford was concerned that he pursued his claim for injuries in the Law Courts? I do.
8794. And that legally his claim was sustained? Yes. 8795.

Mr. J. Dixon. 8795. Do you not think that some reference should have been made to these men in the reports? I do not, or else I should have made reference to them. I did refer to their coming out, but I did not refer to any injuries because I did not know that they had received any injuries.

16 Oct., 1895.

8796. I refer to your tabulated statement? Yes.

8797. Were you at the inquiry? I was.

8798. Mr. Gregson.] What inquiry do you refer to? At the inquest on the bodies of Herbert Pettit and Hodson.

8799. Mr. Curley.] Will you look at this letter, dated 22nd June, 1889;—it is a notification that was sent by the manager of the A.A. Company to the Examiner of Coal-fields in connection with the Hamilton Pit disaster;—will you read what it says:—

Jno. M'Kenzie, Esq., Examiner of Coal-fields,—  
Sir,

A.A. Company, Hamilton, 22 June, 1889.

Mr. Turnbull desires me to inform you that a heavy fall of roof has occurred in Hamilton Pit cross-cut. There are about fourteen men entombed, and no likelihood of getting them out at present.

I have, &c.,

HY. COX,

Clerk.

Mr. Inspector Dixon for the usual report, in compliance with sections 28 and 29 of Coal Mines Regulation Act (1876), as soon as the circumstances in connection with this sad accident will admit of its being made.—J.M., 24/6/89. Mr. Dixon, Inspector of Collieries, B.C., 24/6/89. Returned with report.—J.D., 6/8/89.

As the result of this communication, did you make a report on this matter? Yes; I made two reports on the matter.

8800. Will you look at the finding of the jury on the Hamilton Pit disaster? [*Witness reads, see Appendix S.*]

8801. Will you now look at the rider? [*Witness reads, see Appendix S.*]

8802. Had the men any other possible escape from this accident other than the main cross-cut road? No; that was the only way of escape.

8803. Was the main cross-cut road entirely blocked? Yes; for a long distance.

8804. For what distance was the road blocked? I forget just at the present, but it was a good part of 60 or 80 yards; I should think to Murphy's Heading end.

8805. Were most of the bodies recovered? They were all recovered.

8806. Do you recollect the bodies that were found in Murphy's heading? I do.

8807. Were those bodies crushed by any roof? Three of them were not, but I believe Hodson got his death blow coming out.

8808. Did he get his death blow from the roof? Either from the roof or from the side. He was all open on his side, and he laid down on his back and died.

8809. President.] Was it a regular hole on his side? Yes, as if a piece of something had struck him and opened his side.

8810. Mr. Curley.] Was there a lot of coal thrown off the pillars into the heading? It squeezed in. It was Murphy's heading that did the mischief. It was a bad bottom that set that place away and caused the mischief. The roof was weighting at the back, and through the pillars sinking the whole thing was set away. The pillars were unbroken, but the bottom gave way, just as a narrow wheel will sink in the mud, not like a wide wheel. I was wondering what did the mischief, until I got into Murphy's heading, and I saw places where roof and floor met. That was what did the whole mischief.

8811. President.] What would have obviated that? Larger pillars. A large pillar will not sink as quickly as a small one.

8812. Mr. Curley.] Do you think a larger pillar would have obviated that catastrophe? A large pillar will not sink in the same way as a small pillar.

8813. Was that roadway laid on any refuse, or anything like that? I know it was not. I know the heading as well as I know my own house.

8814. Did the fall come a good bit outside Murphy's heading? It was simply as if the whole thing was in motion. The roof at one time was going in a big body right from the goaf, but it got arrested, and the roof in the open space broke down. The big body got arrested from going to the goaf and the roof and cross-cut—that is, the shaly stuff got away down.

8815. Did you hear most of the evidence that was given at that inquiry? Yes.

8816. Do you know that numbers of the men stated that the place was on the move in different headings? Yes; on the Saturday morning.

8817. Was that on the morning of the fall? Yes.

8818. Did some of the men leave the mine when this occurred? Yes; and I am surprised they did not all leave.

8819. Are you not surprised they were not called out? I am surprised that practical men did not come out.

8820. Are you surprised that they were not called out? I believe they should have been called out.

8821. President.] Who should have called them out? The overman.

8822. Mr. Curley.] Was there an extensive fall in the Stockton Colliery some time ago, where the roof came over the pillars? Yes. When I say "yes," I cannot speak positively about it, because I was not in the place. I do not go to Stockton, because my brother is overman at that colliery.

8823. Was there a fall there in the year 1889? Yes.

8824. Who was the manager there then? Mr. Thomas.

8825. Did you go to the colliery then? Yes.

8826. Do you know of any big fall that occurred on the roadway at that time? Yes.

8827. What did you attribute that fall to? To the shale between the two seams; but the fall never went to the surface. It is a nasty brittle shale, that will break down through anything.

8828. Did the fall come over any pillars? No. Of course it was on the main road, and it took the back return to some extent; but I cannot say it came over any pillars. It seemed simply to keep to the roadway.

8829. How far did the fall extend? I cannot say now, but it was a pretty good distance.

8830. Have you seen some very thin pillars in the Stockton Colliery? Yes; I gave that in my evidence before the Royal Commission on Collieries, adjacent to Ferndale, which held its sittings at Newcastle.

8831. Did you draw the manager's attention to these small pillars? Yes; and got him to chock some of the bords to support the roof, because I thought the pillars were not good enough. It is a very friable coal at Stockton.

8832.

Mr. J. Dixon.

16 Oct., 1895.

8832. Do you know the Stockton ocean leasehold? Yes.
8833. Is the roof of the same character going in that direction? It seems to be a rather better roof than the roof on the mainland as far as I can see of the strata. It seems harder rock there.
8834. Is that dipping going to the ocean? Yes.
8835. How much is it dipping? I think there is about 240 feet of cover from the bottom of the water to the top of the coal.
8836. Will that all be rock? No.
8837. How much rock do you think there will be? Forty feet or more by the borings.
8838. Do you think that special care will have to be exercised with regard to that colliery? There are 8-yard pillars and 6-yard bords, and there is not a better timbered pit in the Colony. Men are kept specially for that purpose. It is splendid timber; I have not seen better timber anywhere. They keep special timber men to keep the old places well timbered.
8839. Do you know whether there is any clause in the Stockton lease that prevents them from extracting pillars? Yes.
8840. You know that? Yes; the lease prohibits the extraction of pillars. They would get a taste of the Pacific there if they took pillars out.
8841. Do you know whether any of their workings have come under the harbour? I do not think there are any workings under the harbour. I do not keep the plans, but I do not think they are under the harbour.
8842. Have you seen any surface subsidences at Stockton? I saw a crack or two on the road there one day.
8843. Have you made any report upon these subsidences? Yes; Mr. Humble and I made a joint report on these I believe. There was a report that it had cracked the Catholic church. There is no doubt the church was cracked, but I could not say what did it.
8844. Did you see any of the kerbstones in the streets? Yes; they were just as if the rats had been under them.
8845. Did you see any supports come away from under the houses? I saw some of the front gates that would not open or shut very well.
8846. Did you see any of the steps to those houses cracked? Yes; two or three of the steps.
8847. Would you judge from that that there had been a subsidence there? Yes; that there was something wrong somewhere, but from the height of a seam like the Stockton seam I would have looked for greater results on the surface.
8848. Do you know if there were any pillars taken out at the Stockton Colliery? I am satisfied there has never been a pillar extracted at that colliery.
8849. Would you think that any fall had gone over the pillars? Yes; I saw it do it on the other side of the pit, in Mr. Thomas' time.
8850. In what section of the pit was that? In the No. 17 Ganning bord.
8851. Was that on the side next to the Pacific? About the middle of the peninsula; nearer the Pacific.
8852. Was it on the side facing the Pacific? Yes, in the top seam. I was there all night one night when that creep was on, listening for indications.
8853. Did it come over several pillars? Yes; it was a peculiar coal; some of the pillars were literally a small coal heap. We know that you cannot melt coal, but you could almost melt that.
8854. Was the coal very brittle? Yes; it was a lovely bit of coal; it was like tar when you put it on the fire. That and the A.A. Company's sea pit is the grandest bit of coal in Australia.
8855. Were you sent for to go to Stockton some few years ago? I was.
8856. Can you tell us what it was you were sent for? The roof had come away, and a lot of water had come in.
8857. Was it much of a break-down in the roof? I think about 12 or 14 feet, as far as we could see, and about 18 feet across, shaped something like a bell mouth.
8858. Did you go over there? Yes.
8859. And what did you do? Mr. Humble, Mr. M'Auliffe, and I went down the pit, together with the night-shift boss, and a dismal time it was for the four of us.
8860. What did you see when you got there? We found the water pouring down, and the sand running in all directions. The sand was almost knee deep in some of the bords then.
8861. Was there very much water at that time? Yes; there would be a large amount of water, but you could not estimate the quantity then, because it was shedding all over. It seemed to be coming like a flood, and you could not estimate the quantity till the pipes were put in.
8862. Was the water very salt? As salt as the sea.
8863. Would you judge from that that it was ocean water? No; that it was water that was held in suspension in that peninsula. I have an idea that there was a set through, and that the water worked through that sand, because you got fresh water on the top.
8864. As you got down, did you get this salt water? Yes.
8865. Do you know what attempts were made at the time to cope with this difficulty in the mine? I do.
8866. Did the manager put in several dams? Yes; after he stopped the inrush of the sand. I reckon that manager did the cleverest thing that has been done in the coal trade. I do not think there has ever been a cleverer thing done in the country, and I said to Mr. M'Auliffe, "You are doing right."
8867. Did he put these dams on the outside of the sand bags? Yes.
8868. When all this was completed, did you make a report about the matter? Yes; Mr. Humble and I made two or three reports.
8869. At that particular time did you not make one particular report? Yes.
8870. Did you stipulate in your report that the men were not to re-enter the mine? No; we put that in a book that is kept at the office.
8871. Did you stipulate that the men were not to re-enter the mine until such time as you declared the mine to be safe;—was that the substance of the report? Yes.
8872. When you made that report, had you any idea whatever of closing the mine up altogether? No, not that I know of.
8873. What was the object of the report? It was to hinder the men from going back until the mine was considered to be safe.

- Mr. J. Dixon. 8874. What had you in your minds at the time ;—did you wish to have anything carried out? We had in our minds the rectifying of this evil, but the thing that was foremost in our minds was that the bottom of the downcast and furnace shaft was 100 feet below the level of the workings. The main shafts were the only outlets for the men, and 22 chains along the main road there was a place 5 feet lower than the shaft bottom that could be blocked with water, and that was what we kept in our minds all the time. Until the third shaft was sunk we could not certify to the pit being safe.
- 16 Oct., 1895. 8875. Were you afraid of the water cutting off any means of escape for the men? Yes, that was the way we looked at it; because when that fall took place there was nothing to say that another fall might not take place.
8876. Do you think the fall had been an extensive one? It was a local fall, and it is a local fall with water that we have to be most afraid of.
8877. *Mr. Gregson.*] What was the size of the bord? It was a 6-yard bord, that came away close to the pillar side. It had a cut-through close to where it came away. I do not fear a place where we have a large body of clay, but it is a local fall that I care most about, because such a fall might get hold of a feeder of water and do a lot of damage.
8878. Have you seen any reason to alter your opinion about the matter since? We declared the pit safe on Monday last, because the third shaft is now down. That shaft is 70 feet above the level of the other shaft that we had a doubt about, and in case of emergency there is an outlet for the men; they need not run to the other shafts at all. There is a capital road right away to it.
8879. In the leading places in connection with this colliery are bores kept in advance of the workings? Yes; in the leading headings.
8880. To what distance are these bores kept? From 8 to 10 feet.
8881. Do you visit that colliery very often? Only with Mr. Humble. I see his reports, because they come through my hands. Mr. Humble can tell you all about this colliery, because he goes there regularly.
8882. *Mr. Curley.*] Do you say that the C Pit is working out towards the ocean? No.
8883. They do not go into the ocean? They have not gone yet, but there is one cross-cut pretty near. The only place working under the ocean at present is Stockton.
8884. Have you taken any soundings? Yes; the soundings have been taken by the Government all over that bight.
8885. Do you know if any information has been obtained with regard to the surface deposits down to the rock? No; it would be an impossibility to get them.
8886. Is there anything impossible in these days? That is impossible. I know what it is to bore in quicksand, and I think, when they bore up over, and see 30 or 40 feet of cover, they have a very good margin with the timber they are using.
8887. *Mr. Gregson.*] Are they working any bords under the ocean yet? Yes.
8888. *Mr. Curley.*] Do you think the 6-yard bord system can be carried out there? Yes; and an 8-yard pillar. I think a 6-yard bord can stand as well as a 4-yard bord, especially where that shale is.
8889. Do you know if the mine is making much water? Yes; but nothing to equal the power they have to cope with it.
8890. Is it making water to the dip? Yes; you can reckon Stockton virgin country, and she is bound to make a lot of water.
8891. Do you think the 6-yard bord is safe enough there? Yes; as far as can be seen at present.
8892. Will you look at sections 18-16 and 19-17, on page 17 of the proposed Bill (*see Appendix A*) ;—do you notice the amendment that has been made in sub-section III of section 19-17 with regard to the certificates of inspectors? Yes; I notice it has been marked off.
8893. It has been marked off by the Legislative Council? Yes; but the Legislative Council has not insisted on its amendment. That section will be carried now if the Bill goes back as it was in its original form.
8894. Without the words the Legislative Council have introduced into it;—as it originally left the Legislative Assembly? Yes; on the motion of Mr. Alexander Brown that sub-section was carried by the House.
8895. Do you think that that sub-section should stand as it was originally drafted by the Legislative Assembly? I do.
8896. *President.*] Have the Legislative Council agreed to that subsection as originally drafted? Yes; the Council does not insist on its amendments in section 19-17 of the Bill.
8897. *Mr. Gregson.*] You said that you had seen for yourself the explanation of the occurrence in Murphy's heading? Yes.
8898. What was the nature of what you saw? The throwing up of the bottom that gave the roof scope.
8899. Are you aware that borings had been made to prove the bottom stone? Yes; after the disaster.
8900. Did these borings show that the bottom stone was unreliable? Yes; that there was a soft layer of rock underneath the first hard crust.
8901. Is that a usual thing in the Northern district? It is a very unusual thing in the bottom of the No. 6 seam.
8902. Have you known it to be elsewhere in any part of the district? I have known the bottom to pucker once, but I do not know of a soft bottom anywhere else in the district.
8903. Had you any reason to suppose that there was any danger of the bottom giving way? No.
8904. Do you think that the management should have had any reason to suspect it? No.
8905. At the time after the jury in the two inquests came to their conclusion, and their verdicts were given, were these facts known? No; they were not known until after the inquest.
8906. Evidence to that effect could not have been given at the time, and was not laid before the jury? No.
8907. What is the lesson you have gathered from all that has taken place. Do you think the accident could have been provided against by legislation? Larger pillars would have prevented the accident. They would not have been so liable to sink. She would have broken back in the goaf.
8908. In compelling people to leave larger pillars, would not there be a considerable loss of coal? My experience is that more coal will be got with larger pillars.
8909. If you work the pillars? Yes.
8910. In places where it is not intended to work the pillars, if legislation is insisted upon, do you say that

- that it would not cost the loss of a lot of coal to the country at large? It would; but the lesson to be learnt is that they are leaving larger pillars now.
8911. Even where they are leaving the pillars and do not intend to work them out? That Hamilton pit roof is the most peculiar roof I ever saw. It is the hardest roof I ever saw.
8912. Would you think it necessary as shown by this disaster that legislation should be given upon this subject now? As a matter of fact, I do not think we should legislate for the size of pillars. I think it ought to be left to the discretion of the manager, except under tidal waters, and then the Government can do what is required in their leases.
8913. *Mr. Curley.*] You think that provision can be made by the Government for stopping the pillars from being taken out? Yes.
8914. Do you think the size of the pillars should be stipulated in these leases? Yes.
8915. *President.*] Why do you think so? Because under tidal waters every precaution must be used. We want to have a pillar that will bear the strata for twenty-five or thirty years, and the Government has the power to say, when granting leases, "Your pillars must be of such and such size." The size of the pillars can be left out of the Bill, and the Government, in their leases, can deal with the size of pillars under tidal waters.
8916. *Mr. Curley.*] What are you going to specify if you do not do it in definite language. Are you going to leave it a matter of speculation under tidal waters? It is provided for in definite language in the Government leases.
8917. In any case, with regard to the Hamilton Pit disaster, whether the bottom came up or the top came down, or whether it was both combined, do you consider that the accident was caused through the weakness of the pillars? Yes; and the strong roof.
8918. *Mr. Gregson.*] And the bottom? It was the tremendous weight of roof that caused that bottom to pucker.
8919. An ordinary floor would not have pucked? I do not think so.
8920. *Mr. Curley.*] What part of Murphy's heading did you say showed indications of this;—how far was it from the cross-cut? I cannot tell the distance. It was beyond where we found Hodson. Hodson came out of a narrow place, and it was about there that the thing could be seen quite plain.
8921. *Mr. Gregson.*] Were borings put down to test the bottom? Yes.
8922. *Mr. Curley.*] How far was that from the main cross-cut? It was pretty well 100 yards where Hodson was found, but it was fallen or disturbed all the way to the cross-cut. The place was not more than half the height down there. There was a settling down, or rising up. It was a creep, not a crush. A creep is where the bottom and top creep together.
8923. Do you know that this crush went to the surface? I do.
8924. Would not that be an indication that it was a crush? It was an indication that she crept and then the whole body settled.
8925. Do you know the height of that heading, near the cross-cut, before the fall took place? When she was working it was a good horse-height—perhaps 6 feet.
8926. What was the height of that heading after the fall? Just high enough for me to crawl on my belly.
8927. Was that near the cross-cut? Yes; a good distance down. I was down there three times before the men got in there with their timber, and nearly killed myself.
8928. Do you mean to say that at Murphy's heading end, abutting to the cross-cut, after the men went in to clear the heading there was no more room than for you to crawl on your belly? I was there before they cleared the heading, and tried to get through three times, and nearly killed myself.
8929. Was Hodson's body found on some coal on a ledge? Yes. I got to one end of the coal, and Hodson's body was on the other side of the coal, and through the place working over our heads we dare not remove anything.
8930. Do you think Hodson had attempted to work his way out through the coal on the top? Yes; we suppose so, for about 20 yards. I worked my way in through the small hole along with others.
8931. You said something with regard to the old pit—the mine now working;—do you notice a similar roof there? Yes; in No. 3 district.
8932. Is pillar extraction going on there now? Yes.
8933. What is the size of the pillars there? Some 4 yards, some 5 yards, and others 6 yards.
8934. Is every precaution being taken in the working of this to guard against a similar fatality? My word, there is. I never saw more timber on hand than there is in that pit, and I am down there very often. It takes me two or three days to go through the pit.
8935. Can you give us a sketch of the Borehole pit No. 2, giving an outline of the pillar working road being carried on? [*Witness draws sketch.*] All the pillars are nearly out in the old No. 5. Through the fault they are working down on the lower heading with two or three pillars. A certain portion of the ground is all standing. They are working on the third and fourth heading three pillars.
8936. What distance will you be from the main road to the pillar working? About seven pillars in No. 3 and the galley.
8937. What are the sizes of the pillars? From 4 to 6-yard pillars; but on the horse road they are all good.
8938. Are the pillars not in the same irregular condition that they have been for years past; that is, that they are not uniform? They are not uniform; they might be 4 yards and under 3 yards in some instances. The size is on the pillar end, but I cannot say what width they are in the centre.
8939. Are you working under a good deal of uncertainty? There is a good deal of uncertainty in all pillar working; but when men do their best what can be said. The officers of the pit are there, and if that roof shows any signs of coming on they would hunt every man out of the pit. They have strict orders to withdraw the men if the roof shows any signs of coming on.
8940. Are these the manager's instructions? Yes; every man is tutored in the roads, leading out of the pit. In the old galley they got nearly every pillar out, and every man was well tutored about the way out.
8941. Is the timbering good? Yes; it is splendid timbering.
8942. Are chocks set? Yes.
- 8942½. *Mr. Gregson.*] Is the bottom stone proved? Yes.
8943. What is the bottom stone? Good—the ordinary grey post.
8944. Is the galley road the same? Yes.
8945. Is the galley road the same in the bottom? Yes.

- Mr. J. Dixon. 8946. Is the road you have spoken about as being so hard now the No. 3 road that led to Murphy's Heading? Yes; Hodson's Heading was a branch off the main road.
- 16 Oct., 1895. 8947. Was it any great distance from Murphy's Heading? I should say about a couple of hundred yards, because Murphy's Heading was about the fifth up the cross-cut.
8948. *Mr. Curley.*] Have you looked at the section in the proposed Bill dealing with the powers of inspectors. Will you look at section 21, sub-section 5, on page 8 of the Bill (*see Appendix A*); you will see that that sub-section gives the inspector power to withdraw the men in case of danger? Yes.
8949. What is your opinion upon that sub-section;—do you think that power should be vested in the inspector? My opinion is that the manager or the overman ought to have power to withdraw the men.
8950. *President.*] You do not think the inspector should have that power? Not the inspector; I do not believe it is a power that should be in everybody's hand, and in the case of the inspector he only visits the pit now and then.
8951. *Mr. Curley.*] I suppose the inspector gets pretty familiar with the colliery in making his visitations;—has he not a very good knowledge of the pit? In a matter of the roof weighting, that roof has certain stages to go through before it will break, and a roof may be working to-day very badly and may cease working at night or the day after. An inspector may go into the pit on the following day and find everything quiet, and on the third day there may be a collapse. In such a case the manager might turn and get behind the inspector's back, and say, "The inspector was here in the pit yesterday, and said nothing about this." It is my opinion that the manager should have this power.
8952. Suppose a case in which an inspector saw danger, and told the manager that he thought the men should be withdrawn, do you think after the inspector telling him this the manager would take upon himself to keep the men in? Never; that is my experience.
8953. *President.*] You must not consider the managers of the large mines only;—do you think the managers of any of the smaller mines, who might be bothered with pressure of trade, would dare to keep the men in when the inspector thought that they should be withdrawn? No, I do not. I know every one of the managers in the Colony, both north and south, and all the mines. I inspected the southern and western mines before Mr. Rowan was appointed inspector, and know every manager and every overman, and I say now that I do not know a manager who, if I told him that I thought the men should be withdrawn, would refuse to do so.
8954. You have no interest, I suppose, with the managers in this matter? I have not; I am simply giving my own opinion.
8955. Your interest is the safety of the men employed? Yes; I am prepared to go night and day if I can keep them safe.
8956. Can you mention one exception where managers have not complied with your instructions? I said if we saw danger. Suppose there was actual danger, and we, as inspectors, said to a manager, "You had better withdraw the men," I cannot conceive of an instance in which our request would not be complied with. I was in the A.A. Company's mine three weeks ago, when three men were drawing a jud, and I said, "I would have those men out of there before that jud comes down," and the deputy went and took the men out there and then, without any bother. I thought it right to do so, because while the place was working behind them they could not get out.
8957. *Mr. Curley.*] If you had not been there, probably this might not have been done? It might not have been done, and nothing might have happened, but I know that in the old country they withdraw men where juds come down, and I thought it right to do so; but I am prohibited from anticipating danger, according to the opinion given by the Attorney-General (*see Appendix Z*).
8958. Assuming that you went into a colliery as an inspector, and that you noticed something in connection with the mine that was likely to bring about some loss of life, and that you brought this under the notice of the manager, as an intimation that practically the men should be withdrawn; but that under the Act you had not the power to withdraw them, the whole power being in the hands of the manager; that there was a difference of opinion, and the manager said he did not think there was any fear, and did not agree with you in apprehending danger;—what should be done in a case of that kind? The manager would be amenable in such a case.
8959. If life was lost, that would not bring life back? I know it would not.
8960. In a case like that, do you not think that an inspector's opinion should prevail over the opinion of the manager? If I went into a place and saw men in absolute danger, I would request them to come out.
8961. Independent of the manager? Yes.
8962. Suppose the Act did not give you that power? I am afraid in that case my own humane feeling would override the Act.
8963. Do you still think that the power which this sub-section seeks to give should be left in the hands of the manager? I think the man who withdraws the men should have the power to send them back.
8964. Would this not hamper you as an inspector? No; it does not hamper the English inspectors. If I inspected a colliery, and saw men working in danger, I would request the officer in charge to withdraw the men, and if he did not withdraw them I would withdraw them myself.
8965. Would you withdraw them if the power to do so was not provided in the Act? Yes.
8966. How often do you make your inspections? Every six or seven weeks at the present time.
8967. Did you not say in that inquiry upon the Hamilton Pit disaster that the inspectors did not visit the mines often enough? Yes; but we were short-handed then. We have an additional inspector since that time.
8968. How many collieries have you on your list now? About seventy collieries. It takes four days to do the Wallsend Colliery, and it takes me three good days to do the Newcastle Company's mines, that is to go through every district, and two days to do the old pit. I go into every pillar-working in the place.
8969. Do you find in making your official visits to the different collieries that the managers afford you every facility for making your inspections? Yes.
8970. Do they know when you are coming? No; not further than that I may be seen.
8971. Have you gone to any of these collieries when the manager has not been about? Yes.
8972. Your visits of inspection are not known to the colliery managers? No; they are surprise visits. I go when I think proper.
8973. In making your inspections, do you pay much attention to the engine roads? Yes.
8974. Do you pay attention also to the refuge places? Yes; to see that they are kept clear.

8975. Do you examine to see whether these refuge places are a proper distance apart? Yes; in most of Mr. J. Dixon. the pits I have measured them personally.

8976. *Mr. Gregson.*] Do you approve of cutting into the roof in cases where they are not high enough? 16 Oct., 1895. No.

8977. Do you believe in cutting into the floor? Yes; sooner than into the roof.

8978. Do you think the refuge holes should be made upright? They should be made so that a person can walk in without striking his head.

8979. In a case where the seam is not high enough you would sink into the floor? Yes; rather than the roof.

8980. Would not that cause danger sometimes? No; it could be made on the slope. I would never think of cutting up into the roof in a seam like the Seaham seam, where gas is given off. I would have them sloped from the rib, and I believe in the man-holes being 3 feet wide.

8981. *President.*] Will you look at rule 15, on page 28 of the Bill (*see Appendix A*). You will see that the Legislative Assembly say these man-holes should be "6 feet high, 3 feet wide, and 4 feet deep," and the Legislative Council amend that and say "of sufficient length, and at least 3 feet in width?" Yes; but that is where the horse is drawing the skips, not on the engine roads. The rule dealing with this matter is rule 14. It is an innovation to make man-holes on a horse road.

8982. On the horse roads would you have it as the Legislative Assembly has put it? I do not think it would be any hardship to do what the Assembly wants.

8983. Have you any objection to what the Assembly proposes as the size for these man-holes—6 feet high, 3 feet wide, and 4 feet deep? I have no objection to that whatever. I notice that rule 19, "trolley over pit mouth," is scratched out by the Legislative Council. It is my opinion that that rule should remain in the Bill.

8984. *Mr. Curley.*] Is there anything else in the Bill you would like to refer to? Yes; to section 46, [43] sub-section B (*see Appendix A*), relating to the distance between the two shafts. The Legislative Assembly put the distance between the shafts at 50 yards, and the Legislative Council has amended this to 15 yards. I am in favour of the 50 yards. I think 15 yards is too close.

8985. The Assembly has agreed to compromise this, and put the distance as 30 yards? I go in for 50 yards. I know that the distance apart of some shafts is none too much, and 50 yards gives room for shaft pillars. There is also a greater factor of safety there. You can get your shaft pillars in 50 yards, but you cannot get them in 15 yards. Fifteen yards is too close; with 50 yards you get substantial pillars.

8986. *Mr. Gregson.*] Is it not equally possible to get good shaft pillars with a minimum distance, as with a greater distance? No; there is the mouldering of the pillars to be taken into consideration, and if there is anything in the shape of a crush those shaft pillars go. This was the case with the shaft pillars in the Newcastle Company's mine. When the crush came on there, both shafts were saved with great difficulty. If one shaft had gone, it is my opinion that it would have taken the other shaft with it.

8987. What distance are the shafts apart there? Twenty yards apart; and if one shaft goes the other must go. We have the shafts in some of the collieries as much as 15 chains apart.

8988. *Mr. Curley.*] Do you know the surface deposits in some of the collieries? Yes.

8989. Have you been in the Vale of Clwydd colliery? Yes.

8990. Have you noticed the shaft pillar there on one side of the shaft? Yes.

8991. Have you noticed any extensive vacant ground? Yes, one side of that shaft is completely riddled with workings.

8992. Do you notice anything else in the Bill that you would like to draw attention to? I would like to refer to Rule 21, [20] on page 28 of the Bill (*see Appendix A*). The words there—"every shaft in course of sinking shall be kept clear of all noxious gases, by a fan or some other appliance"—have been eliminated by the Legislative Council. I believe in that provision being kept in the Bill.

8993. Why do you believe in that provision? If the shaft is not kept clear of noxious gases, and men have to work there in numbers, in powder smoke, or dynamite, it is not a desirable thing, especially in hot weather, and I believe that every shaft should be kept clear of gases in the course of sinking, for the comfort of the men.

8994. *Mr. Gregson.*] Will you look at Rule 12, sub-section D, on page 26 of the Bill, "nor shall coal, or coal dust, be used for tamping." We have had some evidence given with regard to that sub-section. What is your opinion on that matter? I believe in the amendment.

8995. *Mr. Curley.*] The Legislative Assembly proposes to introduce the word "dry," which will make the amendment read "nor shall dry coal, or coal-dust be used for tamping." What do you think of that suggestion? There are very few people who will tamp with dry coal.

8996. *Mr. Gregson.*] Do you approve of the rule as printed? Yes, I do. That would apply in a mine that is very dusty, where there is no fire-damp given off, if it be true what they tell us of the action of coal dust.

8997. What have you to say to sub-section E. You will see that the words, "Provided that no person shall return to a place where such charge has missed fire until a period of eight hours has elapsed from the lighting of the fuse attached to such charge," have been struck out? I believe it ought to be eight hours at the very least. No men are allowed to return within the eight hours in the northern district.

8998. Would it be any limitation to the period if it was limited to places where fuso only was used;—may we not have electric arrangements for firing shots? You will not get a missed shot with electricity.

8999. Would you recommend the insertion of the words, "where fuse is used." Do miners use squibs out here? I believe in the squibs, in preference to the fuse; I think it is safer.

9000. Do you think it is only where fuse is used that these words are required? I think it is better to leave it the way it is.

9001. You prefer to let it be as it is? Yes; it is a hardship for men to lose a day's work, but that is better than their lives or their eyes.

9002. *President.*] If the rule provided that in cases where a fuse is used, no person should return to a place where a charge has missed fire, until a period of eight hours has elapsed from the lighting of the fuse attached to the charge; do you think that would meet the case? Yes; that will do.

9003. Referring to sub-section D, in many places, I suppose, they have nothing but coal-dust;—would it meet your difficulty if it reads, "nor shall dry coal or coal-dust be used for tamping"? I know men carry baked clay rather than tamp with coal-dust, and most people, when using small coal, wet it.

Mr. J. Dixon. 9004. Do you think it is better not to allow the use of coal-dust at all? I think so. I think that is where we get the blown-out shots from. A shot that blows out and does not do its work, will tail out 4 or 5 feet in a flame, and a fire may take place and somebody get singed.

16 Oct., 1895.

9005. The miners say, "If we damp it, why should we not use it";—do you think there is any difficulty in putting this in, "nor shall dry coal or coal-dust be used for tamping";—you would not allow them to use dry coal? No; I believe in the wet coal.

9006. You would put in, "nor shall dry coal or coal-dust be used for tamping"? Yes; it would be an easy matter to run a skip of tamping into a flat.

9007. Mr. Gregson.] That is only to apply to where safety-lamps are used? Yes.

9008. Nor in any mine where safety-lamps are used shall dry coal or coal-dust be used for tamping;—do you agree with that? Yes; I am against shooting at all where gas is.

9009. Mr. Curley. Have you seen what Fairley says about coal-dust? Yes; I have nearly all the mining books that are published.

9009½. He makes this statement,—

*Ventilation Made Easy*.—W. Fairley, F.G.S. Page 76. 70. Is coal-dust explosive? Several mining authorities have given it as their most decided opinion that it is so; but on the other hand a large number of practical mining engineers do not believe that it is in itself explosive, without some small mixture of fire damp. Recognising the importance of the question as touching the safety of coal mining, the Government have appointed a Royal Commission, who are now engaged in enquiring into the question.

Page 86. The Royal Commission appointed to enquire into the question of coal-dust and colliery explosions have already taken evidence from several practical and scientific men on the subject, some of whom have expressed their doubts as to the explosibility of coal-dust—without the presence of, at any rate, a small proportion of inflammable gas. The writer cannot call to mind any colliery explosion having taken place from coal-dust during his forty years' experience in coal-mining operations in different districts. The Commission, in their final report (p. 48), say:—"The following facts relating to the part played by dust in coal-mine explosions may, however, now be regarded as conclusively established. (1.) The occurrence of a blown-out shot in working places where very highly inflammable coal-dust exists in great abundance may, even in the total absence of fire-damp, possibly give rise to violent explosions, or may, at any rate, be followed by the propagation of flame through very considerable areas, and even by the communication of flame to distant parts of the workings where explosive mixtures, or dust deposits in association with non-explosive gas mixtures, exist. (2.) The occurrence of a blown-out shot in localities where only small proportions of fire-damp exist in the air, in the presence of even comparatively slightly inflammable or actually non-inflammable but very fine, dry, and porous dusts, may give rise to explosions, the flame from which may reach to distant localities where either gas accumulations or deposits of inflammable coal-dust may be inflamed, and may extend the disastrous results to other regions."

I am not quite of that opinion. I believe there has not been a pure and simple coal-dust explosion. I believe coal-dust has been a stalking-horse more than once.

9010. Do you think that sub-section D, of Rule 12, should read "nor shall dry coal, or coal-dust be used for tamping"? Yes, I would agree to that.

9011. Is that your final decision? Yes; that dry coal shall not be used for tamping.

9012. Would you provide for the watering of those mines where it is very dusty? Yes, where there is fire-damp; I believe the mine should be watered. I would sooner travel in mud than in dust.

9013. Do you think a mine should be ventilated by a fan where fire-damp is given off? Yes, I believe in a fan.

9014. Have you given any attention to the question of the eight hours? Yes, but I would sooner not talk about the eight hours.

9015. With regard to special rules, do you think that there should be some aim towards uniformity in this respect? I believe the special rules should be uniform throughout the Colony, and that the signals should be the same at every colliery.

9016. Mr. Gregson.] How is that to be arrived at;—who is to settle what these special rules shall be? I think some of us could settle that with the help of one or two managers. Special rules are pretty well uniform in England.

9017. Is that a matter of authority or a matter of convenience? I think it is a matter that would cause everyone to know everything about a place. At the present time we have one thing at one place and another thing at another place. The special rules at present do not meet requirements. I think a lot of detail could be put in special rules that would cover every place.

9018. Mr. Curley.] Is there not this advantage—that when a manager or the men make themselves acquainted with these special rules, if there is anything like uniformity, the men will know these are the prevailing special rules in all collieries? Yes; the men at the present time may know one set of rules at one colliery, and go to another colliery where there is a different set of special rules.

9019. Mr. Gregson.] You think that section 59, on page 34, of the Bill should be allowed to stand (*see Appendix A*)? That is not uniformity, because section 59 says, "a set or sets."

9020. Mr. Curley.] Would that not partly meet the case, because a set or sets would almost cover the whole matter? A colliery might have no gas, but there would be rules to meet that, and there are rules that might never be needed in one colliery that might be necessary in another.

9021. Mr. Gregson.] Suppose that you provide for a Committee to settle what the special rules shall be, that within a certain time after the passing of the Act the special rules throughout the Colony shall be uniform, and that this Committee shall consist of so many managers and inspectors and so many men to say what the special rules shall be? Yes.

9022. Mr. Curley.] Would not the Executive Council consult the inspectors upon these rules? Yes; we would report upon them.

9023. President.] Is it possible for one set of rules to suit all mines? Yes; I think there ought to be uniformity in special rules.

9024. Mr. Curley.] With regard to special rules, do you know of an accident that occurred at New Lambton some time ago? Yes.

9025. Do you know of a man coming up the shaft with a timber trolley, and a miner going down on the opposite cage? Yes.

9026. Was that in conformity with the special rules of that colliery? No; the man was taken to court and fined, because it was a breach of the special rules. I reported at the time that it was a breach of the rules.

9027. Do you think a cage should stop at the flat landing like that? No, and I notified the manager that it should be done no more. I fell in with the rider of the jury.

9028. Was there a rider in that case? The verdict was accidental death, and the rider was to this effect, that the descending cage should go right to the bottom before being stopped.

9029. Have you inspected the Burwood Extended shaft lately? Yes.

9030.

Mr. J. Dixon.

16 Oct., 1895.

9030. Have you ever noticed anything requiring your attention there? No.
9031. Have you noticed nothing recently there? No.
9032. Did you notice anything some time ago? A certain party drew my attention to something in connection with the shaft. I examined it, and two men working at the pit examined it and said it was all right, and I looked myself, and could find nothing wrong with it.
9033. Have you seen anything wrong there at any time requiring attention? No.
9034. Do you know the circumstances in connection with the bucket that fell down the shaft at West Wallsend? Yes; the rope broke; the wire became oxidised, and the bucket went down and killed a man. After that accident I had the ropes re-socketed every two months.
9035. Do you know anything about that colliery that was flooded near Ferndale at Tighe's Hill? Yes.
9036. How did it become flooded? By Tighe's Creek. There were four men who had the colliery on tribute, and there was a fall in a bord just on the edge of the creek. They filled it up with some sort of rubbish instead of barricading it off and making a dam, and the result was that the next spring tide made an opening, and one of the men who did the business is lying there yet. I reckon it was their own fault for doing a thing like that.
9037. Did they get any water in the bord when the cave-in first took place? When the cave-in took place the tide was out, and the spring tide came in and set this stuff away. I knew nothing about it till the man was drowned.
9038. Did you inspect that colliery? Yes; but never went into these old workings which were finished.
9039. I notice, in reading these reports, that a number of accidents take place in these sinking pits, occasioned by stones or something else falling down the shaft? Yes; stones from the sides of the shaft, but not from any other foreign matter.
9040. Would you not call a hamner something else? There is a history about those things.
9041. Do you think a sinking shaft should be in charge of somebody? I think a sinking shaft should be lined following the men—timbered or something else.
9042. Do you know anything about Finlay's accident from fire-damp at Wallsend? No.
9043. You did not visit him? No.
9044. Who inspects the Wallsend Colliery? A large part of the colliery is inspected by Mr. Bates, and Mr. Humble takes the other part.
9045. Do you go to Minmi? No; nor West Wallsend.
9046. Have you any recollection of those gas explosions that took place at Thornleigh? I cannot say what exploded; I think it was something off the fire;—it might have been carbonic oxide. We never found any fire-damp in that place at all.
9047. Do you look upon the existence of gas in a mine as an indication that very close attention will have to be paid to the working of it? Yes; I do not like gas. Some people seem to think very little of it, but I think it is a silent enemy.
9048. Did you institute some legal proceedings against the Wallsend Company some time ago? Yes; in Mr. Neilson's time.
9049. What was the nature of these proceedings? For allowing gas to go into the workings with an intake current of air on to the naked lights.
9050. Was your view of the matter upheld by the Court? Yes, after a severe fight between two of the leading barristers of the country.
9051. *Mr. Gregson.*] There has been a lot of trouble about the undermining of roads, Mr. Dixon? Yes, there has been a lot of trouble.
9052. Will you look at sub-section 3 of section 30 [28], on page 14 of the Bill (*see Appendix A*);—you will see that, besides a plan of the workings, there is to be provided, if required, a surface plan on the same scale showing all streets, roads, buildings, creeks, rivers, bays, swamps, navigable waters, and limits of any tidal waters within the boundary:—what occurs to me is the difficulty of enabling municipalities to get a sight of this surface plan; do you think that it should fall within the duties of the inspector to afford the information? No.
9053. Not if it were provided for in the Bill? Of course, if it was provided for we would have to do it; but that plan could be kept in the colliery office or in the record office at Newcastle, and the municipalities or anyone belonging to them, if they wished to see the plan, could have a look at it.
9054. Would not that be as bad as having to go to the pit office to see the plan;—cannot you suggest any better way out of the difficulty—would it not be better for the municipality to be able to obtain the authority of the Minister for the inspector to report on the condition of the roads;—there is no doubt it is a difficulty in the way of the municipalities, and the question is whether it is worth while to put on the inspectors the duty of telling the municipalities what is going on? I am of opinion that there should be a surface plan.
9055. My difficulty is the best way to give the municipalities the information? Let the municipalities apply to the inspector, and let the inspector give a short tracing showing what they require, that is if the Minister gave his consent.
9056. I would not be in favour of the municipalities seeing the pit plan? I should give them a tracing showing what they require upon their making application to the Minister.
9057. *Mr. Curley.*] Do you not think the surface plan mentioned in this sub-section should provide what is indicated, viz., streets, roads, buildings, creeks, rivers, bays, swamps, &c.? I do; I am in favour of that.
9058. Would you have a surface plan to show these things? Yes; I think the whole thing could be put on one plan. The plan at the Metropolitan Colliery shows the whole of the surface, buildings, railways, levels, and township. It is a pretty plan and shows everything.
9059. Do you think there is any difficulty in carrying that out at other collieries? I think the surface and underground workings can be shown very nicely on the one plan.
9060. *President.*] Referring again to the matter of ventilation—what do you think of a clause like this:

An adequate amount of ventilation shall be constantly produced in every mine, to be in every case at least 100 cubic feet of pure air per minute, and as much more as the inspector may direct, for each man, boy, and horse employed therein, a sufficient quantity whereof, according to the judgment of the inspector, shall be taken to within 15 yards of the working faces in non-gaseous mines, and to within 3 yards of the working faces in gaseous mines, to dilute and render harmless noxious gases, &c., &c.

I think it is very good.

9061.

- Mr. J. Dixon. 9061. Is it putting too much on the colliery? I think it goes into the commercial business.
- 16 Oct., 1895. 9062. Did you not say that brattice would not cost more than 1½d. per ton? Yes.
9063. *Mr. Gregson.*] If that were done would you dispense with splits, cut-throughs, and all other matters of detail, and leave it to the manager? As long as an adequate quantity of air is kept 15 yards from the men, I think you can dispense with these things.
9064. *President.*] Do you think that 100 cubic feet of air as a minimum is enough? Yes, as some basis to argue from.
9065. Do you think that a clause drafted somewhat in the way I have suggested would meet the case? Yes, I think it is well worded.
9066. Do you say that you approve of the provisions in the Bill for pillars in the case of mines that are working under the ocean. Will you look at rule 42, on page 31 of the Bill (*see Appendix A*);—do you think that that rule should be left in the Bill? Yes, I think the whole of that rule should be left in the Bill.
9067. Do you think there is any necessity for rule 43 (*see Appendix A*)? I do not think there is any necessity for that rule now, because we cannot make old mines into new mines.
9068. Will you now look at rule 44 (*see Appendix A*);—do you think there is any need for that rule in the Bill? Yes, I think that rule is right, but there is one thing that I object to. I think the words “and from the face of every bord a borehole shall be kept going not less than 12 feet in advance, &c.,” should be left out.
9069. Then rule 44 would stand thus, “In the case of working coal under tidal waters or rivers from one road of every pair of ‘winning off’ or leading, headings or levels (which shall not, except for sidings, exceed 8 feet in width), and in the case of working under the ocean or tidal waters every ‘winning off’ or leading heading or levels shall be driven at least 100 yards in advance of the working bords, and shall not exceed 8 feet in width except for sidings”? Yes, I think that would do.
9070. *Mr. Ourley.*] Where would you keep your borings? In the headings; there is no necessity to bore in every bord.
9071. Would you have a bore in the horse-roads? Yes.
9072. *President.*] Do you think there is any need for rule 45 (*see Appendix A*)? I think that is quite right about tidal waters. I think that we should know the deposit on the land adjacent to tidal waters. If we know where the top of the rock is that is enough.
9073. Do you think that rule 46 (*see Appendix A*) is necessary in the Bill? I do not think it is necessary.
9074. What have you to say to rule 51 (*see Appendix A*)? I think that is a necessary rule, because there are some small places that would need exemptions.
9075. *Mr. Gregson.*] Do you know that you will not find any of these provisions in the English Act? I know that.
9076. Then why do you think it is necessary in this country? Because we are greatly in advance of England in many things connected with collieries. In England the seams are deeper. I know a place that is worked under the ocean under the long-wall system where they take everything out; but in this country we could not do it with the cover we have.
9077. Why load the managers with all these provisions when there are no such provisions in the English Act;—boring, for one thing, and rule 51, which you say you think is necessary? I do not think that rule 51 is going to affect anybody.
9078. It is the policy of the English Act to require the manager to do certain things;—the manager is supposed to be competent to work the mine, and these matters should be left to him? As far as tidal waters are concerned the Government should state in their leases what the size of the pillars should be.
9079. That is another matter;—what do you want with more than rule 42;—I think that rule 42 should be provided because it is the recommendation of a Royal Commission? I think every rule is tinged with the recommendation of that Royal Commission.
9080. Is it your opinion that all these rules should stand? It is my opinion that where there are winning places going under tidal waters there should be a bore kept going.
9081. *Mr. Ourley.*] No matter what it is called? Yes; if it is a narrow bord or anything else that is a leading place.
9082. Do you not think that rule 51 (*see Appendix A*) is a little objectionable? The light I take it in is that going into unproven ground the Minister would not exempt anybody.
9083. Is it your opinion that rule 51 should stand? I think it should stand.
9084. *President.*] Do you want the latter part of section 52 [48] (*see Appendix A*)? That is not to interfere with anything that has already been done.
9085. Do you only want it under ocean and tidal waters? It can be left to the manager not under tidal waters.
9086. Do you think that rule 41 on page 31 (*see Appendix A*) is a proper rule to be in the Bill, “Person not to be employed in coal-getting without experience”? That is a rule I cannot understand. I cannot understand how a man is going to be a coal-getter until he is a coal-getter.
9087. It means an inexperienced man; the word “alone” is a bad word. What it is intended is that a man is not to work except he has an experienced miner with him? I cannot say I approve of the rule in the way it is. I have known scores of old gold-miners that are now the best of our coal-miners, and if a rule like this is put in a Bill these men would not have been able to get work. It would debar the employment of a good honest man who knows all about mining and timbering everything but coal.
9088. Do you think that this rule should not be in the Bill? Experienced men might object to work with anyone who is inexperienced. I once saw ninety-six Italians hewing coal and I never saw better timbering in my life. They were free labourers and I cannot see how the matter of inexperience would hold good there.
9089. *Mr. Ourley.*] Take a mine like the Helensburgh Mine;—would you allow any man to go into the face there? No, certainly not. In a fiery mine nobody but an experienced man should work, because every man’s life is depending on somebody else in a fiery mine.
9090. *President.*] The Council’s objection to rules 41, 42, 43, 44, 45, and 46 is that legislation of this character would simply destroy the coal-mining industry of the Colony, and particularly that of the Newcastle district;—do you think that provisions of this character would ruin the mines of the Newcastle district? No, nor any other district. I am not in love with it, but I will say nothing against it.

9091. Do you think that rule 41 should remain in the Bill? I would sooner see the lads that are brought up in the pits get these positions than strangers. Mr. J. Dixon.
9092. Then you think that that rule should be left in the Bill? I think it should be left in the Bill. It is in the boys' favour, because they have been there for two years. 16 Oct., 1895.
9093. On the question of weighing, do you know anything about the average number of skips that are weighed? I do.
9094. Do you know anything about the weighing in the southern district? No.
9095. Will you look at section 41 [38] on page 18 of the Bill—"payment to persons employed in mines by weight" (see Appendix A)? I believe the Council's amendment here ought to be left out—I refer to the words "large coal or shale."
9096. And that the men should be paid for everything they get? Yes; I think the section should be left as the Assembly sent it up. There are times when men are coming to a fault where they will get very soft coal, and perhaps in one shift two men would not make more than two skips of coal, and if the words "large coal" were left in the Bill it would block these men getting paid for anything but the large coal they send up. Now they fill all away together "shandygaff," and if these words were left in the section it would be detrimental to the men in soft coal. The words "large coal" should not be left in the section. The men are paid for large coal at the bottom of the screen, but any manager who liked to say "I am only going to pay you for large coal" might bind a man down to what he gets, viz., large coal only. In some of the districts the whole thing will be filled all away together some of these days.
9097. Mr. Gregson.] That would have to be provided for to meet the case of the Wallarah Collieries? Yes.
9098. Cases have arisen in England where the men have to be paid for everything they send out, and to avoid that trouble the Council have endeavoured, with some defects, to provide for the system as it is carried on in the North. They have endeavoured to put into words the present system in the North, and your objection to filling round and small can be met by underlining the necessary words? That is only one of my objections.
9099. Mr. Curley.] Do you know managers who would have no hesitation in interpreting the clause in that way? Yes, if men were filling soft coal. I remember the time when we were paid for all we were filling in the Newcastle district at 24 cwt. to the ton.
9100. President.] Was that to make allowance for the small coal? Yes.
9101. You want the words "large coal or shale" left out of this section? Yes.
9102. Do you know anything about any complaints about the average? No.
9103. Have there been complaints in the North about the average number of skips that are weighed? No; I know nothing about that.
9104. You are not in a position to give us any information upon that subject? No.

[Witness withdrew.]

William Humble, Inspector of Collieries, sworn and examined:—

9105. Mr. Curley.] What are you, Mr. Humble? I am an Inspector of Collieries for the Northern District. Mr.  
W. Humble.
9106. When were you appointed an inspector of collieries? In February, 1890. 16 Oct., 1895.
9107. Before you were an inspector where did you gain your experience in connection with mining? My experience reaches over twenty-five years.
9108. Where were you employed? Chiefly in the county of Durham, England. I was seven months at the Wickham and Bullock Island Colliery, in the Northern District of this Colony, and the rest of the time I have been an inspector of collieries.
9109. What positions have you occupied in connection with the mines in England? I have occupied every official position from a deputy upwards.
9110. Have you occupied the position of manager? Yes.
9111. Do you hold a certificate? Yes; I hold a first-class certificate under the Imperial Act of 1872.
9112. Were these mines you were connected with in the North of England large mines? They were mines drawing from 500 to 700 tons of coal per day.
9113. What was the system of working pursued in these mines? In my time the bord and pillar system. There had been some long-wall, but that system was not working at the time I held any official position.
9114. What was the depth of the mines you worked in? One of the two mines that I was connected with was 1,000 feet deep, and the other a little over 450 feet,—perhaps 480 feet deep.
9115. What was the width of your bords in the mine that was 480 feet deep? Five yards.
9116. What was the size of the pillars? At one time the size of the pillars varied from 12 yards to 20 yards, but when I left the pillars were 16 yards in width.
9117. What was the length of your bord? Thirty yards.
9118. Did you use any brattice in this mine? Yes.
9119. How much brattice did you use? In the Harvey seam we bratticed every bord to within a few feet of the face, in special cases, but it was generally to within 3 or 4 yards of the face.
9120. Did you use any brattice in the other mine you have mentioned? Yes; brattice was used, but it was kept nearer the face than in the first case. It was a very fiery mine, and the brattice had to be kept up to within 2 or 3 feet of the face.
9121. How did you ventilate those mines;—were they divided off into districts? We ventilated each district by itself.
9122. After each district was ventilated, did the air go into the return? Yes.
9123. The two currents did not commingle before they got into the return? No.
9124. Do you believe in that system of ventilation? Yes.
9125. Do you believe in that system for the gaseous as well as the non-gaseous mines? Yes, for any mine.

9126.

Mr. W. Humble.  
16 Oct., 1895.

9126. Have you gone into the question of bratticing with regard to the present proposed Mining Bill? I have given it some attention, and from my experience in the northern district I think the cost of bratticing, together with the cost of fixing the brattice, would increase the cost of getting the coal by 1½d. per ton in that district.

9127. How do you arrive at a calculation of that kind;—what kind of bratticing do you provide for? Canvas cloth. My estimate has been based upon the output of large coal only, and of course there is a quantity of small coal that is made every day, which is of value now; and if that was taken into consideration and made apply to the total cost, it would make my calculation less than 1½d. per ton.

9128. By how much do you think it would reduce your calculation? It would make it less than 1d. per ton.

9129. Does small coal carry a market value at the present time? It is in great demand in some of the collieries in the Northern District.

9130. *President.*] What is this small coal used for? Chiefly for bunker coal in steamers, on account of it being cheaper than the large coal.

9131. *Mr. Curley.*] Are you aware that when the value of the coal stands at a higher ratio, that the small coal, as a rule, rises in proportion? I understand so.

9132. Have you made a comparison as to the cost between canvas cloth brattice and ½-inch wood brattice? No; but I am inclined to think that the canvas cloth brattice would be cheaper and easier worked than ½-inch boards. I believe that wood brattice is liable to be broken when it is taken down. From an experience extending over several years, I know that wood brattice is much more liable to be broken than the canvas cloth.

9133. *President.*] What size is this wood brattice? It is ½-inch deal, 6 feet long, and 10 inches wide, three pieces being fastened together to form one leaf. It simply means putting in a wood partition. Where every bord is bratticed it is not necessary to use plaster.

9134. *Mr. Curley.*] Do you know that at the Helensburgh Colliery, at the present time, there is a good deal of refuse and small coal used? I have never been at the Helensburgh mine, therefore I cannot speak on that subject.

9135. If the manager of that colliery has made a statement to the effect that a good deal of refuse was used in the 12-yard bords that they have at that colliery, and that the air was taken up one side and taken down the other, do you not think that where that could be done that your calculation would be materially affected as to cost? Yes; I have no doubt it would decrease the cost if that could be done.

9136-7. If the manager of that colliery had stated that it was done, would you be inclined to accept his statement? Yes; I could not disbelieve what he said.

9138-9. Have you given any particular time for this canvas brattice to last? No; no particular time, but in the estimate I have made (*see Appendix O*), I say that the cost will depend on the regularity of working. The brattice will be fixed a few yards at a time as the working-face advances, and even under the most adverse conditions, such as wet, moist, and vitiated atmospheres, which tend to destroy the canvas, the last few yards of it used in one bord will always be available for use in another bord, and under favourable conditions all the brattice used in one bord will serve a second bord, without extra cost, except that of fixing. I might state that I have been informed that in one of the mines in the Northern District they have brattice which has been in use for almost three years; but the conditions at that mine are favourable to the long life of the brattice.

9140. What are the conditions of that mine? The mine is very dry, there is no wet or moist atmosphere, and it is a comparatively clean mine.

9141. Are there not numbers of other mines that are dry as well? I know of several mines that are dry, but they are not so dry as this mine I have instanced.

9142. What mines do you inspect? Wickham and Bullock Island, Stockton, Hetton, Seaham, West Wallsend, Minni, Dudley, Wallarah, part of the Wallsend Colliery, the Co-operative Colliery, and several of the smaller mines in the East Maitland district. I think I have twenty-two or twenty-four mines altogether that I take.

9143. Do you regard the cost of bratticing as being anything like a very serious matter, taking the collieries all round? No, indeed I do not. Although my estimate makes the cost 1½d. per ton, if the cost was borne by the total output of the colliery it would be much less. Take a mine, for instance, where half the output is from pillars. These pillars will require no brattice, but they are yielding half the output, and if the output carries the cost of the brattice, then my estimate will be considerably reduced. The extraction of pillars needs no brattice, because the air current can be coursed and kept up to within a reasonable distance of the working-place by stoppings, in a similar way to the method adopted where top coal is wrought.

9144. Is that because these pillars are coming back, and that you have to take the brattice down as you come back? As a matter of fact there is no brattice; when pillars are taken out, they can be taken out without the aid of brattice.

9145. Will you look at section [49] 46 of the Bill, subsection (III), on page 23 (*see Appendix A*);—what have you to say with regard to carrying the air to the working-face in connection with that section? I do not think that brattice would be necessary under this clause in the matter of taking out pillars. The pillars, before they are taken out, are connected with the headings, and it is an easy matter to circulate a current of air and keep that current of air close to the working-place without the aid of canvas; that, of course, is to within 3 or 4 yards.

9146. Do you say that your calculation does not cover that? My calculation of 1½d. per ton excludes those favourable conditions. If the pillars are to bear a certain proportion of the cost of bratticing, then my estimate must come down. I have based my estimate on round coal only taken out of the bords. If we have a case where a mine has its workings extended to the boundary, and there is no other work except the extraction of pillars, that mine could be wrought without any bratticing whatever by coursing the air up one bord and down another. The brattice is necessary in the first working only—driving into virgin ground.

9147. What do you think of those estimates that put the cost of bratticing down at 3d. and 4d. per ton? I do not believe those estimates are correct.

9148. Is your calculation based upon any height of seam? I take six different heights. In the first case I take the number of cubic yards of coal in a bord 4 feet high, and I find that the total number of tons of large coal would be a certain quantity, and the total cost of brattice a certain amount. The cost

cost for bratticing that bord to within 15 yards of the face, with  $\frac{1}{2}$ d. per ton allowed for fixing, would amount to  $1\frac{1}{2}$ d. per ton, and for a bord 5 feet high the cost would be the same, and for a bord 6 feet high the cost comes out to the same figure. I made my calculations also for bords 7, 8, and 9 feet high, and the average cost of bratticing in those six cases amounts to 1.47d. per ton.

9149. That is an average of a fraction over 6 feet? Yes; about  $6\frac{1}{2}$  feet.

9150. If a manager had given an estimate of the height of his seam all round as 5 feet, and said that the cost for bratticing that seam would be 3d. per ton, would you think that his calculation was anything like accurate? No; I would say that his calculations were based on unusual conditions, or that they were an exaggeration.

9151. With regard to the provision in the proposed Bill for ventilation, section [50] 47, rule 1, on page 23 (see Appendix A), do you think that the air should be carried up into the working-face so far as that section is concerned? My opinion is that the working-places should be generally ventilated.

9152. *President.*] Is the working-place and the working-face the same thing? Yes; the working-face and the working-place are synonymous terms.

9153. *Mr. Curley.*] What is your opinion about stipulating a minimum quantity of air in the Bill? I believe that the stipulating of a minimum quantity of air is a great protection to the inspector, but I would much rather see the Bill provide for an adequate amount of ventilation and stop there. I would much sooner say nothing about a minimum quantity of air, or the distance that a man should work before the current of air, or anything else that is in the Act of 1876.

9154. How do you read subsections (II) and (III) of section 12 of the Act of 1876 (see Appendix B)? Subsection 2 says that an adequate amount of ventilation shall be constantly produced in every mine to dilute and render harmless noxious gases to such an extent that the workings shall be in a fit state for working and passing therein; and subsection (III) says that that adequate amount of ventilation shall mean not less than 100 cubic feet of pure air per minute, for each man, boy, and horse. It means that every place in the mine that is at work must be adequately ventilated.

9155. *President.*] With how much air? With no particular quantity of air, but with an adequate amount, which may mean 1,000 feet. Subsection (III) says that there shall not be less than 100 cubic feet of air as a minimum.

9156. What do you say about the minimum? That there must be always 100 cubic feet of air, and as much more as may be necessary.

9157. Where? Under the present Act it must not be more than 35 yards from the working-place.

9158. *Mr. Gregson.*] You would get over the difficulty by having an adequate quantity of air in the workings, and stop at that? Yes.

9159. *Mr. Curley.*] What do you make of that 35 yards, and the 100 cubic feet of air? If I, as an inspector, went into a mine and found that there was 100 cubic feet of air for each man, boy, and horse, flowing round any particular district, I should consider that quantity sufficient; but if I also found that that district was troubled with fire-damp, by virtue of this subsection (II) of the Act, I could call upon the manager to supply more than 100 cubic feet of air.

9160. Leaving fire-damp out of the question? Leaving out fire-damp, if I, as an inspector, found that a manager was supplying 100 cubic feet of air for each man, boy, and horse, in a district free from gas, I would have no case against him. If I carried such a case into court we would lose it.

9161. *President.*] Do you say that 100 cubic feet of air would be held by the court to be enough? Yes.

9162. You do not want more than 100 cubic feet of air to support life; but supposing there is black-damp? Then it would need more than 100 cubic feet of air.

9163. What would you do then? I should call upon the manager to provide adequate ventilation. I went to one mine and found that one particular district was supplied with more than the minimum quantity of air provided by the Act, but I also found explosive gas, and I called upon the manager to provide adequate ventilation. In another case I found the minimum amount of air according to the Act was provided, but the temperature was so high that I considered the district to be inadequately ventilated, and I called upon the manager to increase the current of air, and he did so. In neither of these cases did I look upon the 100 cubic feet of air as adequate ventilation.

9164. *Mr. Curley.*] How do you read the Act, putting this black-damp out of the road altogether? If I went into a mine where neither black-damp nor fire-damp were found, I would consider that if there were 100 cubic feet of air for each man, boy, and horse, it was sufficient.

9165. The Act provides that air shall sweep undiminished along the air-way past each working-place;—what does that mean? Past the entrance to each working-place.

9166. *Mr. Gregson.*] Do you go into the working-places when making your visits as an inspector? Yes.

9167. Do you ever find places where you believe there is an inadequate quantity of air in the working-place? Yes; in some cases I find the working-face to be warm, but that is chiefly due to the large amount of powder that has been used.

9168. Suppose you find such a case, what do you do;—do you call upon the manager to rectify the defect? Not unless the working-face is more than 35 yards before the air.

9169. Do not the managers think that the Act is complied with if they have 100 cubic feet of air? Yes; I believe that. I do not remember one case that has been taken into court.

9170. Do you think that if subsections (III) and (IV) of the present Act were struck out, and subsection (II) only was left in, that you could ensure to every working miner in this country a sufficient quantity of air? Yes.

9171. Do you think that subsection (II) of the present Act would give you sufficient power? Yes; we are tied by subsections (III) and (IV).

9172. In any Act that was passed by the Legislature, would you be content with that provision? Yes.

9173. Without anything being said about splits or anything else? Yes; I think the adequate amount of ventilation is sufficient. Every part of the mine would be ventilated if subsection (II) or a similar section was law.

9174. Some miners object that the manager would have the interpretation of what an adequate quantity was? I think the inspector would have a voice in the matter as well.

9175. You think that the manager would have to agree with the inspector, and go to arbitration, or go to court and defend a charge? Yes.

9176. You think that the present subsection of the present Act that provides for an adequate amount of ventilation would be quite sufficient? Yes; I have no great objection to the minimum, but I would sooner see it adequate only.

Mr.  
W. Humble.  
16 Oct., 1895.

- Mr. W. Humble. 16 Oct., 1895. 9177. The miners ask for a certain amount of air to be specified in the Bill;—they want a minimum quantity? If a manager is disinclined to provide an adequate amount of air, it is my opinion that he will be disinclined to provide a minimum quantity.
9178. Do you think there is a danger in putting a minimum quantity in the Bill? No, not a danger; but if we are to have fiery mines, this minimum would be useless.
9179. Do you think that any minimum would be a disadvantage rather than otherwise? While I have no desire to have a minimum, I can scarcely say it would be a disadvantage.
9180. Is there much cause for complaint in the matter of ventilation at present? Some mines that I inspect are excellently ventilated, and in other mines there is room for improvement. There are one or two of the mines where the working-places are driven to the rise, and the air does not diffuse into the face in those places, as it does in a place that is going level or dipping.
9181. *Mr. Curley.*] Do you not know that a place has to go 35 yards before the air, and that there is a cut-through to be put over in addition to that? Yes.
9182. Can you understand that the air will scarcely diffuse that distance? Yes, it will to some extent; but not to such an extent as to remove the steam and smoke from the miner.
9183. *President.*] Or the exhalations from his body? Yes.

MONDAY, 21 OCTOBER, 1895.

[*The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.*]

Present:—

FRANCIS EDWARD ROGERS, Esq., Q.C. (PRESIDENT).

JAMES CURLEY, Esq.

JESSE GREGSON, Esq.

William Humble, Inspector of Collieries, re-examined:—

Mr. W. Humble. 21 Oct., 1895. *Witness.*] With the permission of the President and members of the Commission, I would like to supplement, or, perhaps, put more concisely, my evidence given on Wednesday last in connection with the matter of ventilation, section 12, sub-sections II, III, and IV of the Act of 1876:—

1. In my opinion sub-section II is the only provision necessary for good ventilation, and would be much better without the two succeeding sub-sections, which qualify, and, to some extent, render ineffective, this comprehensive sub-section.

2. I have no great objection to the retention of a minimum quantity of air, providing it is made clear that such must not be a bar to the enforcement of adequate ventilation.

3. In some cases sub-section II has been applied when the volume of air flowing exceeded the minimum quantity, but the conditions were such that had the management objected to increase the quantity, there were reasonable prospects of enforcing our demands.

4. If the working-places, roadways, &c., are adequately ventilated, or, if brattice is used, there is no necessity for that part of sub-section IV, which states that "no place shall be driven more than 35 yards before the current of air, &c."

9184. *President.*] Will this meet your views,—“An adequate amount of ventilation to be not in any case less than 100 cubic feet of pure air per minute, for each man, boy and horse, shall be constantly produced in every mine, and as much more as the inspector may direct, a sufficient quantity whereof, according to the judgment of the inspector, shall be taken to within 15 yards of the working-faces in non-gaseous mines, and to within 3 yards of the working-faces in gaseous mines, to dilute and render harmless noxious gases to such an extent that the working-places of the shafts, levels, stables, and workings of the mine, and the travelling roads to and from those working-places shall be in a fit state for working and passing therein? That meets my views exactly; I think it is necessary.

9185. *Mr. Gregson.*] With reference to that answer:—assuming, Mr. Humble, that a place is 9 feet high, and the ordinary width of bords 8 yards, how will you measure the air for the two men in that bord; will your mill turn with 200 feet of air? No; I do not think the anemometer will register that quantity.

9186. How do you propose to measure the air? I propose to measure it at the entrance to the split; to see that an adequate amount of air was entering the district, and that there was no unnecessary leakage. We could assume from that that every man was getting his proportion, knowing that there was an amount of air equal to that quantity entering the district. I do not suppose we will be able to measure the air at the entrance to each bord.

9187. Will not that be against the minimum being stipulated? I think the main object to be kept in view is adequate ventilation.

9188. Suppose that you as an inspector say that the quantity of air travelling is not adequate, and the manager—assuming that you get hold of a man that wants to have his own way—says it is adequate. You have a regulation quantity of air, viz., 200 feet for the two men, and you are told that the minimum quantity is there? Our reply would be that we did not think the minimum quantity was an adequate amount, and that he must put in more air.

9189. You do not care whether the minimum quantity is there or not? That would be my answer to the objection.

9190. Then what would be the advantage of having a minimum quantity stipulated? In some cases managers would claim that 100 cubic feet of air, or whatever the minimum quantity was, was more than was necessary, and content themselves with putting in 80 cubic feet of air. There are some mines where men are working close to the air shaft, where they might claim that 80 cubic feet of air was sufficient; but, if a minimum quantity was stipulated, they would know they must not go below that minimum.

9191. Do you say that you would measure the air at the intake of the split? Yes.

9192. How would you conduct the air to the working places in that split? I should be inclined to take the whole current round, or as much as could be taken round, after leakages had been provided for. I would have that leakage as small as possible to carry the current round each bord.

9193. Assuming that sixty men were in a split, would you pass the whole of that current (6,000 cubic feet) to the men? I should carry that air into the working face as far as possible. This is not a theoretical idea, because I have worked as an official for several years, where the quantity was carried into every bord by brattice.

9194. Do you not think it would be better to scale off a sufficient quantity of air for each bord? In some cases the scalings admit of so much leakage. 9195.

Mr.  
W. Humble.  
21 Oct., 1895.

9195. Would it not be all in one district? Yes; there might be a very small quantity of that volume of air in one part, and an excess in the other. Directly you commence to scale the split, you are liable to lose a lot of air in any one particular district.

9196. *President.*] Say 6,000 cubic feet of air was going in, whatever the appliances may be that you might use, would it turn that 6,000 cubic feet of air in? Yes; after providing for the leakage that occurs in every bord. The thing to turn the air in is a canvas door, and there is always a certain amount of leakage at those doors. I should carry the current of air into every bord, with the exception of the air that was scaling through those doors.

9197. If 6,000 cubic feet of air was taken in to the men, would that be too much draught in these places? No: in a wide bord, where the coal is very thick, if 200 cubic feet of air was taken into that bord, there would scarcely be any velocity. The velocity would be so small that it would not remove the powder smoke and exhalations as it ought to do.

9198. Have you heard of the system of sconcing the air into the bord? I take that to mean diverting the current from the heading into the bord for a short distance. I know one mine that is aired in that way, and they get a decent current of air to the face of each bord. It is because the velocity of the air is high, and this sconce takes up a certain amount of air out of the heading into the bord. Perhaps that is only one-sixth of the total quantity of air.

9199. Would it not be a good thing to sconce the air? Yes, very good; but not sufficient in some cases.

9200. I do not contemplate that 6,000 feet of air is to go into every bord where two men are working? In some cases it is necessary, although I do not think it would be advisable to put it into every bord.

9201. *Mr. Gregson.*] You are to say that there is an adequate amount of air in every place, not only in the first bord, but in the last bord of the district? If I found that a particular bord was not getting an adequate amount of ventilation, I think I should have the power to call upon them to put in more than (say) one-sixth of the current.

9202. To do what is necessary? Yes; the necessary thing to do would be to place one of those canvas doors to prevent the loss of the current of air, and make it travel up behind the bratticing into the working place.

9203. Would you not be robbing Peter to pay Paul? No.

9204. *President.*] The section I have drawn and submitted to you would not suit your views. I have suggested that 100 cubic feet of air, and as much more as may be necessary, should be caused to flow along the airways, and into each working-place? I take that to mean, that the current must be caused to flow.

9205. *Mr. Gregson.*] Do you not think that by far the simplest plan would be to leave it to the inspector to say whether there was an adequate quantity of air, and if it was not adequate, for the manager to make it adequate? Yes; but I take it, under the clause the President has drawn, he would still have that power.

9206. *President.*] What Mr. Gregson wishes to point out, is that the minimum quantity of air would be too much if you are going to turn 6,000 cubic feet of air to two men, that in that case, these men will have a great deal more air than they want? I have not seen a body of men get more air than they want. It is a common occurrence for two men to have more than 6,000 feet of air when they are turning a particular bord away. The air in that case must necessarily pass over those two men.

9207. *Mr. Curley.*] Does not that occur in every mine? Yes; in some parts of a mine every day.

9208. *President.*] Would it meet your views to say an adequate amount of ventilation, and leave out the minimum altogether? Yes; that would meet my views. I do not regard a minimum quantity as being necessary in any new law. I think if they can ventilate their mines in Great Britain without a minimum quantity, that we can do it in this Colony.

9209. The miners, want a minimum quantity provided, because they are frightened that the managers will not give them enough air;—they think a manager might be parsimonious about the amount of air? Yes, sometimes negligent.

9210. Do you think that a minimum quantity of air, ought or ought not to be stipulated in an Act of Parliament? I think it would be advisable to keep the minimum quantity in.

9211. You do not think that the minimum being stipulated would do any harm? I do not think so.

9212. Mr. Gregson has raised a difficulty about the 6,000 cubic feet of air going into the first bord;—my idea of the minimum was that not less than 100 cubic feet of air per man should go up to within 15 yards of the working place? I think if you had inserted the word "undiminished" the whole current could not in practice be made to go into each bord.

9213. You do not want to give more than 200 cubic feet of air to two men working in a bord;—if there are sixty men working in a district, and there is 6,000 cubic feet of air being supplied to these men, I do not want this 6,000 feet of air to go into every bord where two men are working? Suppose you left out any mention about the air-current being turned into every bord. If you stipulated for adequate ventilation, that would mean that every part of the mine should be adequately ventilated.

9214. We are suggesting fresh legislation with the knowledge of the Act that still exists, and it may be a long while before the minds of the managers are disabused of the idea that it is not enough for the air to be flowing past the entrance of the working place;—I want to see the air brought into the working place to whatever may be considered a reasonable distance, and we have been told that 15 yards is a reasonable distance;—I do not want the men to have 6,000 feet of air, if 6,000 feet is not necessary. I have said that the current of air is to flow along the airways and into each working-place, but I do not want the whole 6,000 cubic feet of air flowing into each working-place? If we were to find in each bord the quantity of air for two men, I think that the section could be complied with.

9215. That is, if you found 100 cubic feet of air, that would be enough? Yes, for each man.

9216. How can you measure this 100 cubic feet of air? It is easily measured in thin seams, where the area is small; and there can be a fair approximation without the anemometer.

9217. By confining the air? I should not do that. I claim to be able to measure the air by the deflection of the flame of the lamp, where the anemometer would not work at all.

9218. You think your senses would do to say this is a fair place for a man to work in? Yes.

9219. It seems to me that an inspector should be able to tell by his own senses whether there was an adequate quantity of ventilation or not? We, as inspectors, are in the mines sometimes when there is no shot-firing, and sometimes in the mine when there is shot-firing. There might be an adequate amount

Mr.  
W. Humble.  
21 Oct., 1895.

of ventilation while we were there, when there was no shot-firing, but if we went back when the powder-smoke was there, we might consider there was not an adequate amount of ventilation.

9220. *Mr. Curley.*] You would not get the powder-smoke out if there was not velocity enough in the current to get it out? No.

9221. *Mr. Gregson.*] The powder-smoke would have to be taken out? Yes.

9222. *Mr. Curley.*] Referring to that matter of turning the whole of the current into the first place on a split, is it absolutely necessary for a manager to do that? No; if he is called upon to adequately ventilate the face it is not necessary that he should put that quantity of air into every bord.

9223. Would he be within the meaning of the clause the President has suggested [*see Question No. 9184*] provided a certain quantity of air was going into that place? Yes.

9224. He would make his canvas door to admit any portion of the current? Yes; it is simply a question of arranging the canvas door at the entrance. He would be able to carry one-half, or any portion of the current.

9225. *Mr. Gregson.*] With reference to the shafts;—do you make periodical examinations of the shafts in the collieries you visit? I make no examination on the cradle. I take the opportunity of seeing the shaft sides as much as possible when passing up and down in the cage.

9226. Do you travel slowly in these shafts? Yes, always so, from the bottom to the surface in the sinking shaft, for the purpose of examination.

9227. Is the Waratah Mine amongst the mines you look after? No.

9228. Amongst the mines you have under your charge, are there any wooden walls in the upper part of the shafts? I do not remember one. I think they are all either brick or stone.

9229. What steps do you take with regard to seeing to the security of the ropes? I generally ascertain whether the ropes have been examined by a competent man, and, in addition to that, I give as much attention to them myself as I can without impeding the working of the mine.

9230. Is the work of the inspection of these ropes by a competent man recorded in a book kept at the colliery for the purpose? I think not. This is done in one particular mine, but the Act does not provide that it shall be done. It is done as a matter of choice by the manager.

9231. Do you only inquire when the last examination was made? Yes; or in the case I have mentioned, where it is recorded in a book, of course I look in the book.

9232. Are you acquainted with the English Coal Mines Act? Yes.

9233. Do you think there is anything additional needed in that Act with regard to the safety of the men? No, I do not remember anything; I do not think so.

9234. Do you think if that Act was properly administered, that every precaution has been taken that could be taken? I think so. My opinion of that Act is that it would work very well here. If there is a great objection to it by the miners, my proposal would be that the English Act should be taken here, and given a trial (say) for two or three years, and then let it come up for revision.

9235. *President.*] That could not be? I think the first two Coal Mines Acts in Great Britain were made for five years each, and ultimately they became permanent measures.

9236. *Mr. Gregson.*] Do you know of any circumstance that would render the Coal Mines Act of Great Britain inapplicable to this Colony? No, not one.

9237. Either in the Northern, Southern, or Western districts of the Colony? I can only speak of the Northern mines.

9238. Have you no knowledge of the other districts? No knowledge. I have never visited one of the mines in the other districts.

9239. *Mr. Curley.*] Have you a stipulated district—a sectional district that you visit? There are three inspectors for the Northern district, and whilst we have no hard and fast lines drawn, we have our own mines that we can work on for weeks, without clashing with each other. Sometimes I may go to some of Mr. Dixon's mines, and sometimes he may go to some of my mines, according to arrangement.

9240. Do you all stand in the same relative position as inspectors? We have all equal responsibilities, as far as I know.

9241. With regard to the examination of those ropes;—do you ever inquire into the lifetime of the ropes—as to the time they have been in use? Yes, sometimes. I know the ropes pretty well in the largest mines, through giving them general attention, and sometimes the manager and I have a talk about the substitution of new ropes.

9242. Do you do the same thing with the boilers;—do you inquire into the lifetime of the boilers? I do not think I have done so, as a whole, but I may have done so in the case of some particular boiler.

9243. Do you inquire as to whether the boilers were new or second-hand when they were put in? I have made inquiries, and found that the boilers were new when they were put in, and also that some were second-hand. I know of several second-hand boilers that are working now. I witnessed the testing of one three or four weeks ago.

9244. Returning again to the examination of the shafts—if it be the case that in any instance there is timber to support the shafts, will not this timber decay in time? Yes.

9245. I understood you to say that, as far as you have inspected the shafts, you are not aware that there is any woodwork in those you have inspected? I am not aware that there is any woodwork in the larger shafts. In some of the smaller shafts, they are lined with wood from top to bottom.

9246. Do you know the Wickham and Bullock Island and the Stockton and Hetton Collieries? Yes.

9247. Do you inspect the shafts at these collieries? Yes; I have given them general supervision. I have inspected the Stockton shaft very minutely. I went there for the purpose.

9248. Did you ever notice anything particular in that shaft? No, only a piece of coal resting on the bunting. I noticed the cast-iron tubbing-plates were scaling off in the inside.

9249. Do you think they will give out in time? Yes; but at that time I considered they were quite strong enough. They had very little head of water to keep back.

9250. Do you know that some of these plates are cracked in some of the mines? There are some cracked in the Hetton shaft.

9251. Do you know that there are some of these plates cracked in the Wickham and Bullock Island shafts? I have never seen them.

9252. Do you know there was a report made by Mr. Turnbull and myself? Yes; I read it last week. [*See Appendix Q.*]

Mr.  
W. Humble.  
21 Oct., 1895.

9253. Do you give any attention to the question of pillars in a colliery? Yes; generally speaking, I have a talk with the manager if I consider that his pillars are being left too small, or if they are showing any signs of weakness, and I think in one or two instances I have been the means of getting them to increase the size of pillars.

9254. Do you think that an inspector should pay attention to the size of pillars? Yes, as well as anything else in the mine.

9255. I think you told us at the beginning of your examination that in the mines you worked at in England they left rather unusually large pillars? Yes; I think that the general size of pillars was about 30 yards by 16 yards.

9256. Was that the size of the pillars in the mine you mentioned as being from 400 to 500 feet deep? Yes; fully 600 feet deep. The shaft was 480 feet, and I think the workings were covered by about 600 feet of strata.

9257. A colliery, I suppose, will not feel the weight of the strata to any serious extent, until it gets fairly well opened out? No; in very deep mines the pillars show the weight before the roadways are driven very far. I speak of mines 1,500 or 2,000 feet deep.

9258. Would you not call 1,000 feet a very fair distance? Yes.

9259. What would be the pressure? One pound to the square inch for every foot of depth. I think it is that, but I am not certain.

9260. Have you noticed that some of the pillars out here have been left exceptionally thin? Yes; some of them have been left very thin.

9261. Too thin? Far too thin.

9262. Did you inspect the Seaham Colliery when it was working? Yes; I have inspected the Seaham Colliery for three or four years.

9263. What was the size of the pillars that were being left at that colliery? Nothing less than 6 yards, and some of them were 8 yards.

9264. Are not some of the workings of that mine going under a mountain? Yes, almost all of them.

9265. Will they not have a tremendous weight to carry? I suppose they will. Some of the workings will be covered by well on to 1,000 feet in some parts of the mountain.

9266. Do you think that a 6-yard pillar is limited to carry that amount of weight? Yes; I think they will find a 6-yard pillar is too small, inasmuch as they will not be able to take the pillars out successfully. They may support the strata until they commence to extract those pillars, but then they will find them to be too small.

9267. The supposition is, then, that every colliery is worked with a view of extracting pillars later on? Yes.

9268. Will it not be rather late in the day to think of the pillars after the mine has been working for some years? I think the manager will find out he is making a mistake; too late. I do not mean to say that pillars of that size will be dangerous to the men employed, but that the management will find that the pillars are too small to be successfully taken out. They need not necessarily be of undue danger to the men.

9269. If that method of working is pursued, and this heavy weight is there, might it not come over a lot of pillars? It must be borne in mind that those pillars are not more than  $4\frac{1}{2}$  feet high. The seam is thin, and the coal is hard, and I believe that the pillars there would give abundance of warning, and support that roof for a long time, and give warning all the time if the roof was attempting to break down. It is different to a thick seam. Those small pillars resist a great deal of weight, and invariably give a great amount of warning.

9270. You mean to say that the small pillars will resist a greater weight in a seam of that character than they would if it was a thicker seam? That is what I mean exactly.

9271. You know that miners look for refuge in the workings of these pillars, that they look to the heading, and expect that to be above suspicion:—do you not think it should be above suspicion? Yes; I think so. So much depends upon the roof. If you had a very hard rock overlying that, that would not break until there was a large area of coal extracted, then it might break dangerously; but taking other roofs that are softer with every few yards of coal that are taken out, and the timber withdrawn, that roof comes down. Some of the roofs will break down after three or four props have been drawn, and almost choke the place from where they have taken the coal.

9272. Do you not think that an 8 or a 10 yard pillar at a colliery like Seaham would be nearer the mark? It would certainly be much better. I think the question of size of pillars is slowly righting itself. I think we will find very few of those small pillars in the deep seams.

9273. *President.*] Do you think that this question of pillars needs legislation? I do not think so. There is a section in the present Act—section 25—(see Appendix B) giving an inspector power, if he finds pillars too small, to take action and make them leave larger pillars. Apart from that, I do not think we ought to have other power.

9274. You think this matter of pillars is righting itself by the attention given to it by the managers? Yes.

9275. Probably the inspectors are giving some attention themselves? Yes.

9276. *Mr. Curley.*] If that power has been in the hands of inspectors for years, do you think it has been exercised? I do not remember any case that has been taken under that section of the Act.

9277. Do you remember any communication made by the inspectors? I think some years ago there were representations made to the Stockton Company, but that was before I entered the Service.

9278. Was not that in consequence of the report of a Royal Commission? Yes; and in consequence of a crush they had in the Stockton Mine.

9279. Was the first crush subsequent to the Royal Commission sitting? I think it was.

9280. If an inspector has that power now under the section of the Act you have named, he must have had it all this time? Yes, he must have. I think the reading of the section is plain enough. Section 25 of the present Act reads:—

25. If in any respect (which is not provided against by any express provision of this Act or by any special rule) any inspector find any mine, or any part thereof, or any matter, thing, or practice in or connected with any such mine to be dangerous or defective so as, in his opinion, to threaten or tend to the bodily injury of any person, such inspector may give notice in writing thereof to the owner or agent of the mine, and shall state in such notice the particulars in which he considers such mine, or any part thereof, or any matter, thing, or practice to be dangerous or defective, and require the same to be remedied, and unless the same be forthwith remedied the inspector shall also report the same to the Minister.

Mr.  
W. Humble.  
21 Oct., 1895.

If the owner or agent of the mine objects to remedy the matter complained of in the notice, he may, within seven days after the receipt of such notice, send his objection in writing, stating the grounds thereof to the Minister, and thereupon the matter shall be determined by arbitration in manner provided by this Act in relation to the special rules, and the date of the receipt of such objection shall be deemed to be the date of the reference. If the owner or agent fail to comply either with the requisition of the notice given by the inspector when no objection is sent within the time aforesaid, or with award made on arbitration within twenty days after the receipt of such notice, or the making of the award (as the case may be), he shall be guilty of an offence against this Act, and the notice and award shall respectively be deemed to be written notice of such offence. Provided that the Court, if satisfied that the owner or agent has taken active measures for complying with the notice or award, but has not with reasonable diligence been able to complete the works, may adjourn any proceedings taken before them for punishing such offence, and if the works are completed within a reasonable time no penalty shall be inflicted. No person shall be precluded by any agreement from doing such acts as may be necessary to comply with the provisions of this section or be liable under any contract to any penalty or forfeiture for doing such acts.

9281. I think Mr. Dixon during his examination made reference to a communication from the Attorney-General at that time to the effect that the inspectors were not to apprehend danger (*see Appendix Z*);—do you know anything about that opinion? I think I have seen the Attorney-General's opinion on that matter. I think it was Mr. Attorney-General Barton who gave that opinion.

9282. Do you know what it had reference to? I think it had reference to the Stockton Colliery. It was to the effect that we were not to apprehend remote danger; that we were not to take action on something that might not mature for twelve months; that the danger must be imminent.

9283. With regard to the pillar question;—if the danger must be imminent, no matter how irregular the colliery may be worked at the present time, would you think under that document that you had no right to take action in a matter of this kind? If in our opinion the pillars were too small, and we were to take action under the 25th section of the present Act I have just read, the case would go to arbitration.

9284. Would not that of itself be a very good business? I think so.

9285. Would it not at least draw attention to the question? Yes.

9286. And give some prominence to it? Yes, it would.

9287. Have you been the inspector that has visited the Stockton Colliery for some length of time? Yes; I suppose for four years.

9288. Do you know if any pillars have been worked out at that colliery? No pillars have been worked out at that colliery to my knowledge.

9289. Do you know that there has been a surface subsidence there? Yes.

9290. What would you attribute that surface subsidence to? That the pillars were too small to resist the weight.

9291. Would that refer to the time before you visited the colliery as an inspector? Yes, with one exception. The pillars that afterwards collapsed were all formed before I knew the colliery.

9292. What is that exception? The No. 45 top-drive district was opened out since I became an inspector, and it collapsed some two years ago.

9293. Were the pillars in that district left very thin? No; they were practically 6 yards in width, but there were other circumstances that I think induced the fall.

9294. What were those circumstances? The inclination was very high for the Stockton Colliery. It was some 5 or 6 inches to the yard, and the coal in that district was very soft and tender. It was the upper section of the No. 6 Borehole Seam and was extra tender, and that tenderness, together with the pillars resting on the side of the hill, taxed their strength.

9295. Do you think that in a place like that the pillars should have been left proportionately larger? Yes.

9296-7. Would the surface strata be over 200 feet? It would be 275 feet or nearly 300 feet there. I ranges from 275 to 300 feet.

9298. Had you occasion to make a report in connection with the Stockton Colliery some time ago? Yes.

9299. Have you altered your opinion since that report with regard to that mine? Yes; since the No. 3 shaft was connected with the workings.

9300. Have you a copy of the latest report on that matter? I have.

9301. As we have had this matter several times before us, I want the report that deals with it particularly? There are two reports, one dated the 23rd September, 1895, and the other dated 28th September, 1895. [*Reports read*]:—

Stockton Colliery, 23 September, 1895.

We hereby certify having seen and travelled the connection made on the 20th instant between the workings and the No. 3 new shaft.

The bottom of this shaft being about 70 feet above the bottom of both main and upcast shafts affords the persons employed in the mine "a means of exit in case of a panic caused by a large flow of water into the mine."

We are, therefore, of the opinion that at the present time the mine is safe, and, in accordance with the provisions of section 12, subsection (v), of the Coal Mines Regulation Act, 1876, hereby state the same.

JOHN DIXON,  
WILLIAM HUMBLE,  
Inspectors of Collieries.

Connection of Stockton Colliery Workings with the No. 3 New Shaft.

Sir,

Coal-fields Office, Newcastle, 28 September, 1895.

Learning that the above new shaft had been connected with the workings of the colliery on Friday last, the 20th instant, we visited the colliery on Monday morning, the 23rd instant, and have the honor to report as follows:—

2. Accompanied by Messrs. M'Auliffe, and Dixon, the manager, and overman, we travelled this connecting road, and ascended the new shaft, which is provided with a sinker's bucket running in guides. Although a portion of the connecting drive has yet to be enlarged and permanently timbered, there is a good road through it. The bottom of this shaft is approximately 70 feet above the bottom of main and upcast shafts, and it, therefore, affords "a means of exit in case of a panic caused by a large flow of water into the mine," and removes what we have long looked upon as a menace to the safety of the men employed in the workings situated far above (some upwards of 100 feet) the level of the two shafts then in use.

3. In our opinion, the mine is now in a condition that permits us to certify that it is safe, and we have, therefore, reported the same in a book at the colliery office, a copy of such report being herewith annexed.

We have, &c.,  
JOHN DIXON,  
WILLIAM HUMBLE,  
Inspectors of Collieries.

John Mackenzie, Esq., Examiner of Coalfields, Sydney.

9302. *President.*] I would like to draw your attention to rule 42, on page 31 of the proposed Bill (*see Appendix A*); you will see that the suggestion is that the bords should only be one-half the width of the pillars;—is it necessary that where the bords are 6 yards the pillars should be 12 yards wide? No; I do not think so. In the mines we have, and in the mines that we are likely to work under tidal waters, it is not necessary. It is leaving too much coal.

9303.

9303. Would this provision not mean the loss of employment to a lot of men? Yes.

9304. Might not such a provision shut down a colliery altogether? Yes; at present prices the mines with one exception, are not working at a profit.

Mr.  
W. Humble.  
21 Oct., 1895.

9305. Is there any more necessity for pillars being a specified size under tidal waters than under ground? The great fear is that the place might be suddenly flooded. I think any provision as regards working under tidal waters should be left, as it is now, to be embodied in the Crown leases.

9306. Would you legislate for it at all? I think not.

9307. I notice there is a recommendation with regard to working under tidal waters in the report of the Commissioners on Collicries adjacent to Ferndale. They say:—

The Commission are of opinion that the thickness of pillars should be materially increased beyond that generally considered necessary in the district. The strength of these pillars may be increased by a judicious arrangement of cut-throughs and roads, so as to have as few roads intersecting or branching from a main road at one place as possible. Zig-zagging pillars, with respect to cut-throughs, may be advisable. The width of bords in the district is 8 yards. In the case of collicries working under the above conditions, this width would, in the opinion of the Commission, court disaster. The width of bords should be materially reduced, and the greatest care taken to secure the roof with timber. In these general opinions the Commission are supported by almost every witness who submitted himself for examination. While many of these gentlemen condescended upon specific widths of bords and thickness of pillars, the Commission prefer, in the absence of particular and detailed information, to enunciate general opinion only, and to report that, while these should be graduated or fixed by a knowledge of all the circumstances, yet it might be advisable to state that in the case of ocean leaseholds a minimum thickness of (say) 8 yards for pillars, or maximum width of 6 yards for bords, might be insisted upon, leaving the management free to exercise their discretion in altering these (by increasing the maximum thickness or decreasing the minimum width) so as to increase the general safety.

? I believe in that for the present depth that we are working our coal-mines, but if we had workings at a less depth it might be advisable to decrease the size of the bords.

9308. The Commissioners suggest legislation in their report? Yes.

9309. They suggest a minimum thickness and maximum width for bords;—do you think that this should be legislated for? No; I do not think it is necessary to put it into the Bill. The Crown has the coal, and the Crown provides for the size of pillars and the width of bords, and also for borings.

9310. You would leave it a matter like this, and trust to the competency of the inspectors? Yes. In one particular case I drew attention to the size of pillars in one of the tidal-water collicries.

9311. *Mr. Curley.*] What colliery do you refer to? Stockton.

9312. What was the size of the pillars you had to draw attention to? I found several pillars smaller than 6 yards. The width of these pillars were 4 or 4½ yards.

9313. Was that the width of pillars under the ocean? No; but practically under tidal waters.

9314. *President.*] If this 8-yard minimum for pillars, and the bords to be half the size of pillars, became law, would it have the effect of closing up any of our mines? I do not know about closing the mines, but it would prevent two or three of the mines from making any profit under present prices. Stockton would get one-third less coal out of each bord, and may have to pay more for getting it.

9315. What is the size of the pillars they have there now? Under the ocean, 6-yard bords and 8-yard pillars; and under the land, 6-yard bords and 6-yard pillars.

9316. Do you think those sizes are sufficient at the present depth under the water? Yes.

9317. *Mr. Curley.*] You said that some of the surface at Stockton had subsided with 6-yard pillars where there was a high inclination? Yes; but there is not that high inclination now.

9318. How do you know what it will be under the ocean? No one can tell.

9319. If the inclination goes downwards instead of upwards, would they continue to work with 8-yard pillars? That area of ground is interfered with very materially by cinder coal and very strong igneous rock. It has passed through the seam altogether, and makes those pillars stronger than they would be without it. They are stronger than if they were formed with tender coal.

9320. You are assuming that this is going to continue when practically it might not exist; this cinder coal might run clean out of the seam? In my opinion, if the cinder coal did run out, then the 8-yard pillars would be sufficiently strong in any part of the Stockton lease.

9321. You think so? I think so.

9322. Do you inspect the Wickham and Bullock Island Colliery? Yes.

9323. And also the Hetton Colliery? And also the Hetton Colliery.

9324. Have you been asked any questions with regard to the Linwood Colliery? No.

9325. Do you know the situation of the Linwood Colliery? I know the situation of the Linwood shafts, but I have never been down there.

9326. Were you working at the Wickham and Bullock Island Colliery at the time the Linwood Colliery wound up? I think so; I am sure I was.

9327. Have you heard tell of a creep at that colliery? Yes.

9328. Do you know there is a dam there at the present time? There are two dams; I helped to build them.

9329. Is there much water in the Linwood Colliery at the present time? I think not.

9330. Is it flooded? I think not. I know, when the Ferndale Colliery ceased working, the Linwood Colliery was not flooded.

9331. Was the Linwood Colliery worked from the shaft situated on the west side of Throsby's Creek? Yes.

9332. Is there any water in the Linwood shaft? I do not know whether there is any water in the Linwood shaft, but I do not think it is very high if there is any water there at all.

9333. Would it not be worth your while to know something about it, seeing that the two places are close to one another? When we know that the dams are sufficient to resist the maximum pressure of water, there can be no danger of it coming through the dams.

9334. *Mr. Gregson.*] Are the workings at Wickham and Bullock Island not approaching Linwood at any other places? Not now. The workings nearest to Linwood were stopped while I was deputy.

9335. *Mr. Curley.*] Have you a knowledge of the Ferndale Colliery when it was flooded some years ago? I know nothing of that.

9336. Have you a knowledge of the plan? I may have seen the plan once.

9337. Do you not think it would be worth your while to become acquainted with it? The ground is never likely to be opened.

- Mr. W. Humble.  
21 Oct., 1885.
9338. Does the Wickham and Bullock Island lease run up that way? No; the boundary of the lease is the edge of Throsby's Creek right up the Smelting Works Road.
9339. Does it approach the Ferndale works at all? No.
9340. Are you sure of that? I am certain of that.
9341. Why? I can see from the Wickham and Bullock Island plan that almost all the workings are now driven to the boundary of their lease, and the boundary is the western side of Throsby's Creek.
9342. How do you know anything about the situation, if you know nothing about the Ferndale plan? I said I had seen the plan once, and from what I have read I know the workings of the Ferndale Colliery were not driven anywhere near to that point.
9343. You think so—that is, as far as you can go? I saw the plan of Ferndale once, and have a pretty good idea.
9344. Is the plan in your office? I presume it is; I think I saw it in charge of Mr. Powell, the late manager.
9345. Have you ever seen the plan since? No.
9346. Have you noticed any collapses of roof coming north in the Wickham and Bullock Island workings? I have seen innumerable falls in the bords.
9347. Do they go far up? Fifteen or 18 feet was the greatest distance.
9348. Have you heard tell of sand or gravel coming down in connection with these falls? No; not in the Wickham and Bullock Island Mine.
9349. Do you know the quantity of rock at the bottom of their upcast shaft? I think they have over 100 feet of rock at the bottom of their upcast shaft. I believe the shaft is about 260 feet deep, and they have upwards of 100 feet of good hard rock.
9350. Will you look at the report of the Commissioners on the condition of the collieries adjacent to Ferndale, page 179;—you will notice a letter there dated 12th August, 1886, and signed by Mr. William Turnbull and myself,—

To the Chairman and Members, Royal Commission,—  
Gentlemen,

We, the undersigned, chosen by you to examine the Bullock Island Colliery shaft, beg to state that we did so on the 11th instant. We measured the seam at the bottom of this shaft, and found it to be (including coal and bands) 18 ft. 9 in. in thickness, and the rock immediately above this seam, which Mr. Monikin said was 25 feet thick, we found to be 27 ft. 6 in. The manager informed us that the cast-iron cylinders were set into this rock, but he could not say how far. We examined each of the cylinders in this shaft, and found that the thirty-first cylinder from the surface was split longitudinally, crossing all the joints, and extending all round the shaft in this particular cylinder. This break was wedged up some of the way, and made water-tight with wedges  $\frac{5}{8}$  of an inch in thickness at the head. We also found that the thirty-fifth cylinder was split in a longitudinal direction, and extended about two-thirds of the way round the shaft, and crossing the joints of the segments. This break was also wedged up with wedges  $\frac{5}{8}$  of an inch in thickness at the head, and made almost water-tight. These broken cylinders are situated in the clay stratum, there being about 29 feet of clay above the first broken cylinder, and about 41 feet about the second broken cylinder.

We have, &c.,

WILLIAM TURNBULL,  
JAMES CURLEY,  
Members of Royal Commission.

Does that say anything about 100 feet? You said the upcast shaft.

9351. I mean the downcast shaft. Do you know the depth of the downcast shaft? I understand it is about 217 feet, but I do not know the quantity of rock.
9352. Do you think that will get thin or thicker, as it goes north? I think it gets thinner as it goes north.
9353. Will not that be a matter that should be given some attention as the workings go further? I believe we are giving it attention at the present time. We reckon that the weakest part of the Wickham and Bullock Island Colliery is that going north.
9354. How is the Hetton Colliery situated? Its weakest part is going north.
9355. Under the harbour? Yes.
9356. Will that require special attention? Yes.
9357. Do you think it will be safe to take the top coal down there? Yes; there is so much dirt made in that seam, that after you take all the valuable coal you find there is not such a large space to fill up in each bord. The roof falls, and does not break very high before the bord is completely choked up.
9358. Do you think that the 6-yard pillar in both of these collieries is ample to meet the circumstances? Yes; I think so, in both of the collieries.
9359. *President.*] Have they 6-yard pillars and 6-yard bords at both of these collieries? Yes.
9360. Do you think that is enough in these collieries, and also in Stockton? The Stockton working ocean lease has 8-yard pillars. If this is modified at any time I think the bords may have to be reduced from 6 yards to 4 yards. They know that a modification may be necessary.
9361. Is there any fear of the roof coming down between the pillars? Yes; that is the fear. Of course, the wider the bords, the greater is the fear of the roof breaking.
9362. *Mr. Curley.*] Do you have a conversation occasionally with some of these managers? Yes, often.
9363. If any unusual occurrence takes place, do you ask them to apprise you of what is going on? Yes; and I think they generally do.
9364. Are there any of the Greta collieries that come under your jurisdiction? I have been at East Greta twice, but that was because Mr. Bates was not well.
9365. Did you pay any attention to the pillars when you were there? I think the pillars were about 8 yards. They were extracting some of the pillars when I was there.
9366. How far was that away from the shaft? They have no shaft; it is a pair of adits with a dip slope.
9367. Do they go in at the outcrop? Yes.
9368. Do you know if that was anywhere near where the dam was constructed? I think it is a little to one side of the dam. I think it was quite far enough from the dam.
9369. Do you know anything about the shaft pillars at that colliery? No; they have no shaft, and therefore they have no shaft-pillars. They may have a small ventilation shaft, a few feet in depth.
9370. Do you know if they have a shaft or not? I have not seen it. The main entrance is the adit.
9371. Do you know the strength of the pillars between these two roads? No; I do not.
9372. Is that seam on a very high inclination? About 42 degrees.
9373. *Mr. Gregson.*] About one in one? Pretty nearly one in one.
9374. *President.*] Returning again to the matter of ventilation;—do you think it would do any harm if the 6,000 cubic feet of air went into each bord? No.

9375. Would it be too much draught? It would be a pretty good draught, but it need not be carried so near to the face if a large body of air has to go in.

9376. My idea is, that if two men are working in a bord that each of these men should have 100 cubic feet of air;—have you anything further you would like to say on this matter? You are of opinion that the difficulty is not covered by adequate ventilation. I know better how a mine should be ventilated than I know how to provide a section to deal with it. Would you permit me to refer to one matter, that is the periods of inspection under this Bill. As it came from the Legislative Council there is no time mentioned for making inspections, and I think that is quite right. I think I am speaking for Mr. Dixon, Mr. Bates, and myself, in saying that no time should be specified with regard to making inspections.

9377. You wish to make your inspections as often as you like? Yes; to take the large mines as often as we like, and leave the smaller mines till we have time to do them.

9378. It is not the smaller mines that require your intervention? I know there has been no change in some of the smaller mines whatever. There has been no need to interfere at all with them.

9379. How many men do you think it necessary to have in a mine to require a certificated manager;—the Legislative Assembly says ten persons, and the Legislative Council amend this number to thirty, and the Legislative Assembly upon reconsideration compromise the matter and say twenty persons—what do you say? I should say that it is necessary to have a certificated manager when there are upwards of twenty men.

9380. You would not say ten persons? No; but perhaps it would be as well to have some control over a mine with twenty men. The New Zealand Coal Mines Act provides for a permit which is to be renewed annually. This permit is issued on the report of the inspector, and they have, therefore, some control over that man, because he must be on his best behaviour or he would not get his permit renewed.

9381. *Mr. Curley.*] Do you know that Mr. Dixon gave it as his opinion at the Hamilton Pit inquiry, that the inspections should be more frequent? Did he mean that the inspections of the Government Inspectors should be more frequent?

9382. Yes, that was his meaning? Well, I hardly think that that is his opinion now.

9383. With reference to that sunker's bucket coming up the Stockton shaft;—do you not think a cage would be preferable? They intend putting in a cage.

[Witness withdrew.]

Wilson Rennie sworn and examined:—

9384. *Mr. Curley.*] What are you, Mr. Rennie? I am a colliery manager.

9385. What colliery do you manage at the present time? The Greta Colliery.

9386. Have you been manager at any other colliery? Yes; at the Burwood Extended, and Wickham and Bullock Island Collieries.

9387. Were you a manager previous to your going into the Northern district? Yes; in the old country.

9388. Where in the old country? In Scotland.

9389. How long have you been manager at the Greta Colliery? I will have been manager of that colliery twelve months on the 5th of next November.

9390. Before being manager of the Greta Colliery, you say you were manager at the Burwood Extended Colliery? Yes.

9391. Were you at the Burwood Extended Colliery, when the shafts were put down? Yes; from the surface to the Borehole seam in the main shaft, and the air or upcast shaft was sunk from the Victoria tunnel seam to the Borehole seam a depth of 240 feet.

9392. Do you know if they had any exceptional trouble with any of the shafts? None whatever.

9393. Was it sound rock all the way through? It was not sound rock; the strata varied.

9394. What did you pass through? We had loamy clay on the top intermixed with ironstone bands; that is on the surface.

9395. What did you have below the surface? Post and shale; post at intervals, grey and white and conglomerate.

9396. Are these shafts timbered, or how were they secured? The soft strata is secured with 9-inch brickwork.

9397. How are they secured lower down? Where the conglomerate and hard post is, they are not secured.

9398. Is it hard strata all the way down? Pretty well all the way down after you pass through the second seam. I may say there is 130 feet of brickwork from the surface down.

9399. Have you had occasion to do any repairs to any of the shafts to prevent any stone going down? We had to clear one part.

9400. What distance are these shafts apart? I think they are between 40 and 50 yards apart as near as I can remember.

9401. Have you any knowledge of the shaft pillars that were left there? Yes.

9402. What were they? Three chains square—66 yards.

9403. Coming to Greta. What is your system of working there? Pillar and stall, or stoop and room as we call it in Scotland.

9404. Is the seam very much at an angle at the Greta Colliery? It dips about 1 in 5.

9405. How is your ventilation at that colliery? Very good; we have no complaints.

9406. Have you any trouble in getting the ventilation to the rise workings? No.

9407. Have you no trouble whatever? No.

9408. Do you know anything about a creep that took place at Greta lately? Yes; on the north side of the shaft in the main dip. All the main road was affected by the creep.

9409. Did that creep go anywhere near the shaft? No.

9410. How far is it away from the shaft? Six or 8 chains down the dip before it was affected; that is literally speaking, about 8 chains from the bottom.

9411. Did this creep occur while you were there? No; it was before I went there. I have opened all that up. There was 5 feet of coal there, and it is a solid working on that side of the pit.

9412. How do you read the present Act in connection with ventilation. When do you understand that the provisions in section 12, sub-sections 2 and 3 are complied with (*see Appendix B*)? I think the word adequate is quite sufficient in all cases. I do not think it is necessary to stipulate any quantity.

9413. I am asking you how you construe the meaning of the present Act? It stipulates 100 cubic feet of air as a minimum, but that may be quite sufficient in some cases, and too little in other cases. I think if the minimum

Mr.  
W. Humble.  
21 Oct., 1895.

Mr.  
W. Rennie.  
21 Oct., 1895.

Mr.  
W. Rennie.  
21 Oct., 1895.

minimum quantity was abandoned, the word "adequate" is sufficient. There is no prudent manager who would ask a man to work where a place was not properly ventilated.

9414. Assuming you had 100 cubic feet of air in every working place in the Greta Colliery, would you consider that that 100 cubic feet of air was sufficient? Yes, certainly; even if an accident occurred, and I had worked the ventilation up to the quantity provided by the Act, I would consider I was all right. I would in any case see that the ventilation was there.

9415. You think that the Act would be complied with if you had only 100 cubic feet of air? Certainly.

9416. Does not the Act say something about that being a minimum quantity? Yes.

9417. Does the Act prevent you from providing more air? No. If I had an accident, and 100 cubic feet of air were there, I would say I had complied with the Act, and that they could not get at me.

9418. What accident do you mean? Suppose an explosion took place. If a mine gives off gas it must be ventilated accordingly. This Act would prevent the law from punishing me if I had the stipulated quantity of air provided in the Act.

9419. Are you sure of that? Yes, as I interpret the Act.

9420. Does not the present Act go beyond the opinion you express? No, I do not think so.

9421. Will you read sub-sections 2, 3, and 4 of section 12 of the present Act again (*see Appendix B*);—you will see in sub-section 4 that no place is to be driven more than 35 yards before the current of air without a cut-through put through, or bratticed up within 3 yards of the face of such working place? That brattice means in headings;—it does not say into bords. It states that the air shall pass 35 yards, and means that driving a pair of headings, if the cut-through is not put through and gas is given off, you must have the brattice 3 yards from the face. The Act says without a cut-through put through or bratticed up within 3 yards of the face of such working place.

9422. Did you not say that if an accident took place from an explosion that you were quite secure as a manager under the minimum quantity of 100 cubic feet? They could not get at me if I had that quantity there. If an accident happened accidentally they could not get at me if I had the stipulated quantity of air, but there is no prudent manager who would ask a man to go into a mine that is insufficiently ventilated. I think the word "adequate" is quite sufficient. It means that you must have sufficient ventilation to ventilate that mine.

9423. If gas was given off, and an explosion occurred, do you think that quantity would have been adequate? That is supposititious. If there is gas in a mine it does not issue without the deputy having a knowledge of it and reporting it to the manager.

9424. Is there any fire-damp given off at the Greta Colliery? I have seen no fire-damp at that colliery.

9425. Has any fire-damp ever been reported to you? No; they have never seen any to my knowledge.

9426. Do you inspect the working places at that colliery every morning? Yes; there is a deputy for that purpose. It is always done before the men start work.

9427. Are you pretty frequently in the mine yourself? I may say that I am down one part or other of the mine daily.

9428. If there was fire-damp given off in any particular district you would know something about it? Yes; because the deputy reports daily in his report-book in the morning.

9429. What number of men have you working in the mine at the present time? About 290 all told—wheelers included—when we stopped working. We have been idle for three or four weeks.

9430. What kind of doors have you for regulating the ventilation? Timber doors.

9431. Are they all timber doors where the ventilation is going into the main intakes? Yes, all timber doors. That is to separate the main intakes from the returns where access is wanted, and where not wanted stoppings are put in of stone and rubbish.

9432. Is that where the horses are passing through? No.

9433. What kind of doors have you where the horses are passing through? Screen doors.

9434. Is that on the main intake? No.

9435. Where is it? On the bord ends of the last cut-throughs.

9436. Do any of these screen doors get materially damaged occasionally? Sometimes they get a little torn, but there is always a deputy to look to that.

9437. Do they go long without being repaired? No; that is a matter that has daily attention. There is a separate deputy for every section.

9438. What is the effect if these screen doors get damaged during the day? If one gets damaged we put it up again. If it is done by a horse or a driver it is reported to the deputy at once; but where these screens are hung it does not interfere with the ventilation materially.

9439. What size pillars have you in that colliery? Eight yards by 35 yards; but I have adopted 12-yard pillars, because we are working wider bords in some places.

9440. Were the pillars left 8 yards previous to your being there? Some of them were a little thinner than that.

9441. Were some of them very much thinner? According to the plan it shows 8-yard pillars.

9442. What have you found in your experience where you have seen these pillars? I have found them 6 yards by 35 yards, and very few at that; they may vary a little.

9443. Do you know the depth of the shaft? I think about 463 or 465 feet deep.

9444. Are you splitting any of the pillars at the present time? Yes; in the south-east side.

9445. What is the size of those pillars? Thirty-five yards by 8 yards.

9446. They are 8-yard pillars by 35 yards? Yes.

9447. How much coal are you taking out? About 6 yards in the centre.

9448. Is that anywhere near any of the main workings? No; that is going back on the inside.

9449. Have you any knowledge of the shaft pillars at Greta? I cannot say exactly the size of them. I did not measure exactly the size of them on the plan, and of course I could not get round.

9450. You have not got round the shaft pillars to know what they are? No, I have not.

9451. Do you think it is worth your while to make yourself acquainted with them? As soon as I get an opportunity I will get round them.

9452. Do you know that a seam with a high inclination like that will require some pillar to support it? Yes; just the same as another seam.

9453. You think no more there than anywhere else? It is advisable to have them a little stronger on the steep incline, because the pressure naturally bears downwards.

9454. How are your men paid at Greta;—have you a system of averaging? Yes.

9455.

Mr.  
W. Rennie.  
21 Oct., 1895.

9455. Are the men paid by weight? Yes.
9456. Have you any check-weighman there? Yes.
9457. How do you weigh? In the usual way. We tip the skip into the weigh-screen, and both weighmen are there. I suppose the two of them decide upon whatever skip they like before it comes to the surface.
9458. You pay on a system of average? Yes.
9459. Are there many skips weighed during the day? I believe there will be as many as thirty or forty on some days, and on other days less.
9460. Are there any days that you do not weigh at all? We weigh every day.
9461. Is the matter of weighing left pretty much in the hands of the weighman and the check-weighman? It is entirely in the hands of the two men.
9462. Does the company's weighman perform any other duties besides weighing? He has no other duties besides weighing.
9463. Have you ever seen the Act that has been recently passed in England called "The Check-weigher's Act" (see Appendix E)? When did this come to pass?
9464. In 1894? Is this another revision of the English Act.
9465. Yes? I never saw that before. I do not think much of it.
9466. *President.*] Why? It simply means that a manager has no power at all for the guidance of his men; that the men can call meetings and impede the working; do anything they like to create a disturbance. They may come and meet in the vicinity of the colliery, probably on the pit top, or anywhere else;—probably when the men are going down the shaft, and, consequently, they may stop the day's work. According to that Act the men can do anything that they pretty well like.
9467. *Mr. Curley.*] Does not the Act only apply to the election of a check-weighman? They can stop the pit and do anything, and if the manager takes any steps to prevent their meetings it is an offence against the Act.
9468. Are you not taking an exaggerated view of the situation? I do not think so. The Act says:—  
If the owner, agent, or manager of any mine, or any person employed by, or acting under instructions of any such owner, agent, or manager, interferes with the appointment of a check-weigher, or refuses to afford proper facilities for the holding of any meeting for the purpose of making such appointment in any case in which the persons entitled to make the appointment do not possess or are unable to obtain a suitable meeting-place; or attempts, whether by threats, bribes, promises, notice of dismissal, or otherwise, however to exercise improper influence in respect of such appointment; or to induce the person entitled to appoint a check-weigher or any of them, not to reappoint a check-weigher, or to vote for or against any particular person or class of persons in the appointment of a check-weigher, such owner, agent, or manager, shall be guilty of an offence against the Coal Mines Regulation Act, 1887.
9469. What do they call a suitable meeting-place? They may meet on the pit top, and stop the day's work, which we know they have done before.
9470. I do not know that that has been done in the election of a check-weighman? It has been done. A check-weighman comes to a man and says, "You were not weighed fair," or, "There is some dirt in your skip," and being an irritable man, and not wanting to work, the consequence is that he wants a meeting; and this is all caused through the check-weighman.
9471. The check-weighman cannot do that;—that is not the election of a check-weighman;—that has nothing whatever to do with the election of a check-weighman? If there is a dispute with one check-weighman they may want to elect another.
9472. Do you not know that the men, as a rule, hold their meetings away from the colliery altogether? I do; but I know also that they have held their meetings on the pit top in many cases, and at one time they stopped the pit. If they have any grievance let them ask redress after the day's work is over.
9473. Do you not know that, as a rule, they hold their meetings away from the colliery altogether? I do not know what the general rule may be. They generally hold meetings in a paddock, and come from that to the pit-top.
9474. What is the general rule? I do not think they have any general rule. I have seen them oftener meeting inside the paddock than anything else.
9475. Do you not know they hold their meetings in a hall? But there is not always a hall.
9476. Is it the rule to hold meetings on the pit top? No; I do not say it is the rule, but that they have done it at Greta.
9477. Have you protested against it? Yes.
9478. And was it discontinued? Yes; and they called a meeting in the south main level, and the consequence was they brought thirty men to the pit bottom.
9479. What was that about? Because they thought they were not getting skips quickly enough. I told them if they had any grievance that they should come to me after 4 o'clock; that is, if any accident occurred. Sometimes they have to wait on skips through a few skips coming off the road or anything going wrong with the haulage.
9480. Have you any objection to the men holding a meeting for the purpose of selecting a check-weighman? No, certainly not; if they hold a meeting in a reasonable place.
9481. Would you interfere with them at all? Certainly not; I would not interfere with that.
9482. Do you think that is a right that the men should exercise? I think it is a right for them to see they get justice. I do not object to that for one moment.
9483. Have any of the men complained to you about the ventilation being deficient in any part of the mine? No; not since I have been at Greta.
9484. I suppose a man can complain there if he thought the ventilation was deficient? I am always ready to receive any man and to hear what he has to say, and to deal with him in a reasonable manner.
9485. There would be nothing standing in the way with regard to a man making a complaint to you? No, nothing; so long as he makes his complaint in a reasonable way, and does not impede the work or interfere with any one else.
9486. Suppose that a man found the air so that he could not work that day, that the place was not fit to work in, and he came out, would you call that impeding the work? He is quite justified, under such circumstances, in leaving his work.
9487. If a number of men found that the ventilation was so bad that they could not work, and came out, would you call that impeding the work? No, not if they were all affected in the same way; but if one was affected and the others were not, I would certainly object to it.
9488. Have you any check-inspectors exercising their functions at the present time? None that I am aware of.

- Mr. W. Rennie.  
21 Oct., 1895.
9489. Would you object to the men appointing check-inspectors? No; certainly not.  
9490. They could appoint check-inspectors if they thought fit? Yes.  
9491. Has the inspector ever drawn your attention to anything in connection with the colliery during his visits? The Government inspector has not to my knowledge. There has been nothing to call for attention on his part that I know of.  
9492. If he did draw your attention at any time to any matters in connection with the colliery, would you take notice of what he said? I certainly would see to it at once.  
9493. Do you say that you have no difficulty at all with the ventilation of that colliery? No difficulty so far.  
9494. Is the ventilation well sustained throughout the colliery? Yes; I have had no complaints.  
9495. Do you know yourself that the ventilation is well sustained? Well, I am satisfied myself. I have been through all the workings, and am satisfied with the ventilation.  
9496. When did you last measure the air? I cannot give the exact date. It was just before I stopped work.  
9497. How long is it since you stopped work? We have not done much work during the last five weeks.  
9498. How often did you measure the air before you stopped work? I generally measured the air once a fortnight, both in the fan-chamber and in the main intakes and the returns. I got the whole return in the fan-chamber.  
9499. Can you give us the readings you got in the intakes on the last occasion? I could not give it from memory.  
9500. Can you give us the reading in the returns? In the main return I can.  
9501. Can you give us the intake? The total amount in the main aircourse was about 96,000 cubic feet, and in the main return I think it was about 102,000 cubic feet.  
9502. Have the men to use powder at that colliery to get their coal? Yes.  
9503. They have to use powder in the risc places? Yes.  
9504. Have you noticed whether the powder smoke hangs about very much? It does not.  
9505. Not even in the risc places? No. I have seen a shot fired, and in less than five minutes the place was clear.  
9506. Do you ventilate the mine by fan? Yes; by a Guibal fan.  
9507. When does your fireman go to work? At 12 o'clock at night, and knocks off at 6 o'clock the next night—eighteen hours between the two shifts.  
9508. You have two fan-engine men? Yes.

[Witness withdrew.]

James Jackson sworn and examined:—

- Mr. J. Jackson,  
21 Oct., 1895.
9509. *President.*] What are you, Mr. Jackson? A miner.  
9510. Where are you working at present? At the Hetton Colliery.  
9511. How long have you been mining? About sixteen years.  
9512. Where? Seven years at Hetton, and nine years in the old country, in the county of Durham.  
9513. Were you working nine years in England before you came out here? Yes.  
9514. *Mr. Curley.*] Have you worked at any other colliery but the Hetton Colliery in this Colony? I did work about three weeks at a little colliery at Hexham.  
9515. Was that at North Stockton? Yes; at North Stockton.  
9516. Did that colliery stop work? Yes.  
9517. Do you recollect what brought about the stoppage? The stoppage was brought about by something in connection with the shaft.  
9518. Did the shaft collapse, or something like that? Yes.  
9519. *Mr. Gregson.*] Was it a slight failure in the coal? I cannot say that.  
9520. *Mr. Curley.*] Have you worked in nearly every part of the Hetton Colliery, in different districts? Yes.  
9521. Had you a system of quarterly cavilling? Yes.  
9522. Have they had a system of quarterly cavilling all the time you have been there? Yes; ever since I have been at Hetton.  
9523. Have you had opportunities by that means of getting into different parts of the mine? Yes.  
9524. How have you found the ventilation at that colliery? It has been good in some parts, and very bad in others. It is bad in parts of the mine to-day.  
9525. What section of the mine would you call that? From Steel's No. 1 to the old 5th Left.  
9526. How many places would that effect? To the best of my knowledge between twenty and twenty-five places.  
9527. Is this the district you have spoken about where the ventilation has been very bad? Yes.  
9528. What has been the matter there;—has the air not been getting up to the face? According to the reports there has not been sufficient air going into the districts. I brought a sketch with me that you might learn something from. [*See Appendix 4*].  
9529. Will you show us how the air is travelling? [*Witness shows.*] The air in some places is so bad that the men cannot live in it. They cannot work as they ought to work. The air has a scope through a large area into the return.  
9530. What do you consider the difficulty yourself? I think it is that the cut-throughs are driven too far. The places are driven too far before a cut-through is put over, or else there ought to be bratticing put up. The defect arises through the air not being properly controlled.  
9531. Do you mean that the air is not conducted up to the working face? Yes.  
9532. Do you think that there is sufficient air going into the district if it was properly conducted? I think so.  
9533. Have these places ever been complained about? Many a time. In fact, last quarter, although the pit was not working barely half-time, there were men who could not work when there was work.  
9534. Did the manager find these men other places? No.  
9535. What had they to do? Lie idle.  
9536. *Mr. Gregson.*] To whom were the complaints made? To the deputy, I suppose.  
9537. *Mr. Curley.*] Have you been working in that district yourself? Yes; in Steel's No. 3.  
9538. Did you find the air slack? Yes.  
9539. How long ago was this? About nine months ago.

9540. Have you worked in No. 1? I worked in No. 1 when she was going special, when the bottom seam was worked, but that is four years ago.

Mr.  
J. Jackson.

9541. Do you think that if the air was conducted to the working face, that that would remedy the whole matter? I do.

21 Oct., 1895.

9542. How far will these places go in from the shaft bottom? To the best of my belief between 700 and 800 yards.

9543. Are these places going to the rise or to the dip? They are going to the rise.

9544. Do you know if any of these cut-throughs that you have spoken about have been put through at a shorter distance than 35 yards? I do not think so.

9545. *Mr. Gregson.*] Have you ever complained to the inspector? No; only to the manager.

9546. Why have you not complained to the inspector? Because we thought it would be better to get it remedied through the manager.

9547. If the manager did not remedy it, was there not another reference left? Yes; that is a fact.

9548. You did not care to go beyond the manager with your complaint? No; in fact in the state we are in, we can scarcely get men to take offices for fear they might be going too far.

9549. Could you not complain to the inspector without the management knowing anything about the complaint? Yes; that is true.

9550. *Mr. Curley.*] Do you know that the Home Secretary has recommended that the inspector should take notice of anonymous communications? Yes.

9551. You know that? Yes.

9552. Would not that be one way of letting the inspector know about the position of things? Yes; he would know then.

9553. Do you think that the manager should remedy these matters when his attention is drawn to them? Yes, I think he ought to; I might state that a matter comes into my mind in that connection. There is a place in Tighe's Heading going special at the present time. One of the headings got into a fault, and the manager stopped the heading and made the front heading the back heading, and started two men to turn a bord on the backs, and these men were working in there. One cut-through was driven before the heading was over, and the heading holed into the cut-through; and through the manager not putting canvas up to push this air into the men; ten days elapsed, and the day the canvas was hung it was not hung when the men went in at 6 o'clock in the morning, but the check-inspectors happened to be going round that day, and it was hung when the back shift came in at 8 o'clock.

9554. Did the men complain about that place being deficiently ventilated? Yes.

9555. Were there men very much affected in that case? Yes.

9556. Did they complain to the overman or to the deputy? To the deputy.

9557. Taking it all round, how long has this one particular district you have spoken about been deficiently ventilated? Taking it all round, since the working started in that district, it dates back to 1890.

9558. How many men are there in that district? From forty to fifty men.

9559. Does that impress you with the necessity for the air being conducted up to the working-places by a system of bratticing or shorter cut-throughs? Yes.

9560. Do you think that this is absolutely necessary? I do.

9561. Do you know whether the check-inspectors got the minimum quantity of air when they took their last measurement? In some parts of the mine they did not get any reading.

9562. Do you know the reading they would get at the intake split. They got a good reading at the intake split.

9563. Then the fault laid with the distribution of the air? Yes.

9564. Do you know if that was considered a direct split by itself, or whether it was part of another split, where those forty men were? It was not a split by itself.

9565. When you say forty men, do you mean forty men including the front and back shifts? No; forty men in all.

9566. Do you know whether any of these men complained to the manager or not? They complained to the manager as well as the overman.

9567. What did the manager say? He said he would try and remedy it.

9568. From what you know, do you consider that it has been remedied? As far as I know, I do not think it has been remedied.

9569. Has it been remedied sufficiently? There has been something done in one part, but nothing done in the other part.

9570. What part do you mean? In the old fifth left, but there has been nothing done in Steel's No. 1.

9571. Do you see much brattice-cloth used in the colliery at all? There has been no brattice put up; only canvas doors.

9572. In the headings? Yes.

9573. Not in the men's places? There has never been any brattice put up to my knowledge.

9574. Have you any fire-damp in the Hetton Colliery? I cannot say.

9575. Have you ever seen any fire-damp? I have never seen any fire-damp.

9576. Do you think there is any fire-damp? Yes; I think there is some.

9577. *President.*] Why do you think so? I was working behind the shaft, and there was some coal that had been lying there for a certain time, and when you went to disturb it, it was just like a fire; it was very hot. It was small coal that had been lying there for a considerable time.

9578. That would not be gas? That is the only reason I can give.

9579. You have seen nothing beyond this to indicate there was any fire-damp in that colliery? No; nothing.

9580. There is nothing to make you think that is fire-damp? No. This small coal was lying by, and I do not think it had ever been wet.

9581. *Mr. Curley.*] What is the width of your bords? Six yards.

9582. What is the size of the pillars? Six yards.

9583. Are the bords driven by line? Yes.

9584. *President.*] There is no danger from that at all? No, sir.

9585. That is all right? Yes, all right.

9586. Is that colliery under the water? Yes.

9587. Is it under the Newcastle harbour? Yes.

9588.

- Mr. J. Jackson.  
21 Oct., 1895.
9588. *Mr. Curley.*] Is the roof hard and solid? Yes; there is a good hard roof. When you take the debris and the morgan band down, there is a sort of seggar clay, and above this soft stuff there is a good hard solid roof.
9589. Have you sounded it yourself? Yes.
9590. How much of this clay comes down? From 2 to 4 feet.
9591. Do you think there is any danger from the principle adopted of the 6-yard bords being worked under the harbour? I do not think so. I do not think I would have worked there if I had thought that.
9592. *President.*] Have you seen indications of any danger? No. There have been lots of things said about hearing ferry-boats. You can hear the ferry-boats going over quite distinctly, and you can almost tell the time of day in some places. You can hear the propeller going, and can tell the distinction between a large and a small steamer.
9593. This does not scare you? No; I think there is a good sound roof between us. Water, I think, is a conductor of sound. When the dredges are dredging you can hear the buckets on the bottom.
9594. *Mr. Curley.*] Do you consider that a colliery in that situation will have to be very carefully looked after? Yes, I do.
9595. *President.*] And except with regard to the ventilation, is it carefully looked after? Yes, very carefully. Every place is driven by line, and if you get 3 inches out they make you come back.
9596. *Mr. Curley.*] They chalk you off? Yes; there is a man who comes every morning, and puts the sight on, and if you are 3 inches out, he makes you leave it on. He chalks you off there and then. They are very particular as regards the pillars.
9597. Do they make you set a tree? Yes; and a cap-piece.
9598. Will that make men very careful about keeping their proper width? Yes; it does.
9599. A man does not want to put this extra timber in? No.
9600. *President.*] Has he to do it at his own expense? Yes; he has to do it with his own labour, and while he is doing that he is not getting coal.
9601. *Mr. Curley.*] Which way is the colliery going to the dip? Down the harbour.
9602. Do you go much to the rise the other way? They have not worked the workings up the harbour, for the last two years and five months. They were going to the rise, and the coal was not very good. It was very soft, mucky coal.
9603. Have you come across any faults? Yes, two.
9604. Is there much water given off? Not much.
9605. Is the colliery very dry, taken on the whole? No, wet on the whole; it is not so wet as it used to be.
9606. Do you find wet places very comfortable to work in? No; there were a lot of men suffering at one time.
9607. Suffering from rheumatics? No; if they took the water out, they got no pay for it, and they used to wait till somebody took it out.
9608. Do you often find that the case? It is not so bad now. The manager said he would remedy it as much as he could; but when the pit was lying idle, the company could not afford to send water-bailers to do it. After the men come down they do not get started in the face until 10 o'clock, on account of the water.
9609. Are you paid by weight at that colliery? Yes.
9610. Have you a standard-weight? Yes.
9611. What is the standard? Twelve hundredweight.
9612. Does the bridge register any more than that weight? Yes; but we do not see any more than that weight.
9613. How do you account for that? They will not put it over that. They did, but a bit of a case came on, and ever since that, they have never put it over 12 cwt.
9614. Was that a case in which you made a claim for payment over the standard weight some time ago? Yes.
9615. Were you non-suited in that case in the Court? Yes.
9616. Do you know the reasons for being non-suited? I do not.
9617. Where was the case tried? At Newcastle.
9618. Do you know how long ago that is? To the best of my knowledge, I think it is about three years and six months ago.
9619. Are the men satisfied with the standard weight? No.
9620. Do they want to see it done away with altogether? They do.
9621. How are the skips weighed? Two skips come up in each cage, and the weighman rings a bell for a skip, and they take the first skip in the cage one day and the second skip in the cage the next day. There is a door at the entrance to the box, and this door is drawn back to let the coal down gradually. If the skip goes 12 cwt. you get 12 cwt., but if it goes under 12 cwt. you get paid for what you fill; if it goes over 12 cwt. you do not get anything for what is over. If you have two skips weighed in the day—one 13 cwt. and another 11 cwt.—you get an average of 11 cwt. 2 qrs. They take half of the 12 cwt. and put it on to the half of the 11 cwt., and that makes it 11 cwt. 2 qrs. for that day.
9622. Instead of 12 cwt.? Yes; that is what it ought to be. If any miner fills a skip, and there is 16 cwt. or 17 cwt. of coal in that skip, he only sees 12 cwt. in it.
9623. He is not even educated as to the weight he is filling? No, he is not.
9624. If he knew he was filling over the standard he would know how to gauge it? Yes.
9625. How many skips do you get weighed in a day? Upon an average, 150 skips per day.
9626. Are there 150 skips weighed in one day? Yes.
9627. One hundred and fifty in one day? Yes.
9628. Are you sure of that? I would not say exactly; there might be 100 skips weighed some days and more on other days.
9629. Do you think there is that number of skips weighed? Yes; I should have said that some days there will be 50 skips weighed.
9630. *President.*] You have nothing to complain of except the standard weight? That is all. My opinion is that every skip should be weighed—slack and everything together.
9631. *Mr. Curley.*] Do you think that every individual skip should be weighed? Yes.
9632. Have you ever given the question of working hours any consideration? Yes.

9633. What time do you work at Hetton? At the present time the front-shift men go down at 6 o'clock, and they are not supposed to leave till a quarter past 1 o'clock; the back-shift men go down at 8 o'clock, and no man is allowed to leave the place till 4 o'clock. We have had men sent to the manager for leaving the place at three minutes to 4, and men have been sent back for being on the flat at three minutes past 4, and the manager has told men that if they leave the place before they have permission they must put up with the consequences. As near as I can say, the back shift men are working eight and a half hours.
9634. How many hours are they in the pit altogether? They are eight and a half hours in the pit.
9635. Do you think this question of the working hours is a matter that should be legislated for? Yes.
9636. Why do you think that? Because I think that with the men we have employed at the present time these hours are sufficient for any man to work to give these men employment.
9637. Is that your reason? Yes; one of my principal reasons.
9638. You think that eight hours is long enough to work? Yes.
9639. *President.*] Would you punish any man who cared to work longer than that? Yes; I would, if I had my way.
9640. *Mr. Curley.*] Do you think it would interfere much with the colliery if the hours were legislated for? I do not think so.
9641. You do not think it would interfere with the output? No. If they wanted a large output they would put two shifts of men on.
9642. Do you think that is the general opinion of the men? Yes.
9643. That the hours of labour in the mines should be legislated for? Yes.
9644. What was the system of working in those collieries you have referred to at home? The men used to come down in the front shift at 4 o'clock in the morning, and rise at a quarter past 11 o'clock, and the back shift used to come down at half-past 10 o'clock and rise at 5 o'clock; that was in the last colliery I worked in at home.
9645. What was the system of work pursued there? Bord and pillar.
9646. It was the same system that you are working here? Yes.
9647. What was the width of your bords? Six yards.
9648. What was the size of the pillars? Sixteen yards. We used to take the pillars out.
9649. What was the length of your bord? Twenty-five yards.
9650. Did they use any brattice there? Yes.
9651. Did they use much brattice? Yes; they bratticed right up to the face every day.
9652. How near the face? To within 4 feet of the face.
9653. How deep was that mine? About 160 fathoms deep.
9654. What was the name of the colliery? The Waldridge Fell Colliery.
9655. That colliery was 960 feet deep? Yes.
9656. Was there any gas in that colliery? Yes.
9657. Was there any fire-damp? Yes.
9658. Do you think that there should be substantial pillars left in collieries where it is intended to take pillars out? I do.

Mr.  
J. Jackson.  
Oct., 1895.

[Witness withdrew.]

Samuel Rees sworn and examined:—

9659. *President.*] What are you, Mr. Rees? I am a coal-miner.
9660. How long have you been a coal-miner? About 23 years.
9661. Where have you worked? I have worked in the Northern and Western districts, and I am working in the Southern district now.
9662. In this Colony? Yes.
9663. *Mr. Curley.*] Where are you working at the present time? At the Metropolitan Colliery, Helensburgh.
9664. How long have you worked at that colliery? For five years and four months.
9665. Do the miners there work with safety lamps? Yes.
9666. Have they worked with safety lamps during the whole of the time you have been there? Yes, during the whole of the time.
9667. The whole of the miners? Yes; the whole of the miners.
9668. There are no naked lights allowed in that colliery at all? No; no naked lights are allowed at all.
9669. Are the lamps carefully examined every morning? Yes.
9670. Are they examined on the pit top or down below? They are examined down below.
9671. Does the same individual examine the lamps always, or do different men examine them? The deputy over the district you are working in examines the lamps of the miners.
9672. Each particular deputy for the different districts overlooks the lamps? Yes.
9673. Do you know yourself that the lamps are carefully inspected? Yes.
9674. Do you see that done? Yes; and I always try them myself afterwards to make sure.
9675. Who cleans these lamps. Are they cleaned by the men or by the company? The company cleans the lamps.
9676. Do you always find them in good trim? Yes; I have no occasion to complain.
9677. Have the lamps shields on them? Yes.
9678. If there are any breakages in the gauze, are the lamps removed immediately? An accident may happen to a lamp, and it may be a month before that is put right.
9679. Yes, but do you not get another lamp immediately? Yes; and we have to report the accident at once.
9680. Is that one of the special rules at the mine? Yes.
9681. And every man is supposed to obey these laws? Yes.
9682. Do the lamps meet with any accidents of any consequence? Sometimes they get broken; a fall of stone may come on them at times.
9683. Do you know whether there are many accidents that happen to the lamps? There are not many; they are very rare.

Mr. S. Rees.  
Oct., 1895.

9684.

- Mr. S. Rees. 9684. What is your system of working there? We are working the Welsh bord and pillar work.
- 21 Oct., 1895. 9685. How wide is the Welsh bord? Ten yards wide.
9686. Is there any bratticing used at that colliery to conduct the air? Yes, if it is necessary.
9687. Do you pack your refuse in between the two roadways? Yes.
9688. Do you build it up to the roof? Yes.
9689. And does this refuse act partly as a conductor for the air? Yes; and if that is not sufficient, brattice is used.
9690. Does it take much brattice, as far as you have seen? No, not in the Welsh bords.
9691. Very little? Yes, very little.
9692. Are the most of the miners employed at that colliery practical miners? Yes; the majority of them are.
9693. Have you to see the deputy every morning before you get into your working place? Yes.
9694. No man is allowed to go into his working place until he has seen the deputy? No.
9695. Have you ever come across any gas at all;—have you ever seen gas show in the lamp? Well, not since they have had the new fan working.
9696. Did you see gas before that? Yes, when we were driving headings, before we opened out bords.
9697. You have seen a little on the top of the light? Yes.
9698. Is there a good vigorous current of ventilation going through the mine? Yes.
9699. You have no complaints to make with regard to the ventilation? No complaints at all.
9700. Do you know what distance they drive the bords before they put a cut-through over? I have driven them myself 100 yards.
9701. You have driven 100 yards without a cut-through being put in? Yes.
9702. Have you still had plenty of ventilation? Yes.
9703. Do you know the number of men working in that colliery? I cannot give the exact number.
9704. Give us the number as exact as you can;—are there more than 200 men working there? Yes; about 230 miners.
9705. There are over 200 miners? Yes, about 230 miners.
9706. What is the height of your seam? It is 8 ft. 6 in. In many cases they do not work the bottom coal. There is 2 ft. 4 in. of bottom coal.
9707. Would that make it about 6 ft.? Yes, about 6 ft. mostly; sometimes higher, sometimes less.
9708. From what you have seen of the ventilation in that colliery do you think the same ventilation can be carried out in other collieries? Yes.
9709. Have you worked in collieries where the ventilation has been different to what you have found it there? Yes.
9710. What collieries do you refer to? At the Co-operative Colliery in the Northern District.
9711. How was the ventilation there? In some cases very bad.
9712. Was there any fire-damp in the Co-operative Colliery? I have never seen any.
9713. How are you paid down at the Metropolitan Colliery;—are you paid on the average weight? If we get weighed, we get paid on that weight. The weights are all put together and averaged, and the man who does not get his coal weighed gets paid according to the average of the others.
9714. Do you get many skips weighed in a day? No, very few.
9715. How many skips do they weigh in a day? They averaged about twelve skips per day during the last three weeks.
9716. How many skips a day come out of the colliery? From 850 to 900 skips.
9717. Are the men satisfied with this method of weighing? No, they are not; they have tried to get it remedied very often.
9718. Do you know how many skips have been weighed within the last three months or six months? The average will run for the whole of that time thirteen skips per day.
9719. That would be the average? Yes.
9720. Would you call that a very small number? Yes.
9721. A ridiculously small number? Yes.
9722. Do you think that more skips should be weighed? Yes, they should weigh more with their present appliances. I should think they ought to weigh more than double that quantity. Even then the men would not consider that satisfactory.
9723. The men would not consider it satisfactory if double that number of skips were weighed? No.
9724. What would give the men satisfaction? I do not think they would be satisfied unless they had every skip weighed.
9725. Do you think that it is the opinion of the men that they should have every skip weighed? Yes.
9726. Is that your opinion as well? Yes.
9727. Have the men made complaints to the manager about the limited number of skips that were being weighed? Yes, both by letter and by deputation.
9728. What did the manager say with regard to the representation of the men? The last time we sent a deputation to the manager was eleven months ago. We were weighing at that time nineteen skips per day, and we pointed out that that number of skips was not giving satisfaction to the men. The manager said he could not remedy it; that the only way to remedy it was to make the weighman keep on till the pit knocked off, but that would only have given us three more skips per day.
9729. What hours do you work at the Metropolitan Colliery? We start to go down at 7.30 in the morning, and start to come up at 4.30 in the afternoon; all the men must be down before 8 o'clock.
9730. Do both shifts go down together? Yes.
9731. You only work the one shift? Yes, that is the general run, but there are special places with three shifts.
9732. Has the manager ever requested you to work longer hours than those you have mentioned at any time? Yes.
9733. What has he requested you to do? On different occasions he has asked us to work 2 hours over time.
9734. Did you do that? It was done once, but the men refused to do it any more.
9735. Has the manager ever asked you to work on Pay Saturday? Yes, he has asked us three or four times to work on Pay Saturday.
9736. Can you remember the date when he asked you to do this? He has asked us at different times during the last 2 years. He asked us last Thursday to work on Pay Saturday. 9737.

9737. When these requests are made are they made with any authority, such as if you do not do it something else will follow? Yes; only last Thursday the manager threatened to fill the pit with men, so that the miners employed there would only get half-time. Mr. S. Rees.  
21 Oct., 1895.
9738. Has the manager ever requested you to work on Sundays? No, but they are doing it all the same; they are working there every alternate Sunday.
9739. What are they working at? Cutting coal.
9740. Cutting coal on the Sunday? Yes.
9741. Do you know that for a fact? Yes.
9742. Is it special work? Yes; it is on the back Sundays, not the pay-week.
9743. Do they go in late on Sunday night? They go in an hour earlier on Saturday night, and they are supposed to knock off earlier. They knock off at 2 o'clock on Sunday morning.
9744. Instead of 4 o'clock? Yes.
9745. How many men do this? About twenty men; perhaps more.
9746. Is this a request made by the management for the men to do this, or do they insist upon it being done? Well, the men do not want to work, but they do not like to say anything. They were told that they had to work those hours when they started this special work.
9747. Have you ever thought over the question of legislation with regard to the working hours? Yes; that is a matter that is continually brought before the miners' meetings by one or other of the miners.
9748. Do you think that the hours for working in the mines should be legislated for? Yes; we can never fix the hours unless they are fixed by law.
9749. Do you think it is the wish of the men that the working hours should be fixed by law? I am positive it is the wish of the men at the Metropolitan Colliery.
9750. That the eight hours should be fixed by law? Yes.
9751. Do you do your own timbering? Yes.
9752. You set your own timber? Yes.
9753. Do you lay your own roads? Yes.
9754. Is the coal very free in many cases down there? Yes, very free.
9755. Unless a man is a thoroughly practical man is he liable to accident? Yes.
9756. And even if he is a practical man? Yes.
9757. Do many accidents take place at that colliery? Yes, a good many.
9758. Do these accidents occur from the coal being thrown out, or from the roof? Well, with the roof and the coal.
9759. Is the roof a bad roof? Some places are very bad.
9760. Have you to use slabs? Yes.
9761. Have you always to keep plenty of timber at hand? Yes.
9762. Is the mine a very dry mine? Yes, a very dry mine.
9763. Do they ever water the roads? Not the travelling roads. I do not know about the other roads.
9764. Have you worked at any other colliery in the Southern district? Yes; at South Bulli and at North Bulli.
9765. How did you find the ventilation at those collieries? Not nearly so good as it is at the Metropolitan Colliery.
9766. *President.*] Are they not obliged to have good ventilation at the Metropolitan Colliery? Yes, we could not work without it.

[Witness withdrew.]

Thomas Lionel Bates, Inspector of Collieries, sworn and examined:—

9767. *President.*] What are you, Mr. Bates? One of the Inspectors of Collieries for the Northern district. I presume I can go anywhere, but I am stationed in the north. Mr.  
T. L. Bates.  
21 Oct., 1895.
9768. How long have you been an inspector in the Northern district? Eight and a half years.
9769. *Mr. Curley.*] Have you had much mining experience previous to your being appointed an inspector? Yes, I have been connected with mines for twenty-one years.
9770. Where? For eleven years in England, and eighteen months in New Zealand.
9771. What collieries have you been connected with in England? The Rother Vale Collieries, in South Yorkshire.
9772. Do you hold a certificate? Yes, I hold a first-class manager's certificate.
9773. Under the 1872 Act? Yes.
9774. *President.*] Where have you been employed out here? I have been nothing in this Colony except an inspector.
9775. *Mr. Curley.*] What collieries do you inspect in the Northern district? I inspect a portion of the Wallsend Colliery, and the Lambton Colliery, Greta Colliery, the Anvil Creek, at Greta, and a few collieries about Maitland, and the Singleton collieries. Of course, I take all those that Mr. Dixon and Mr. Humble do not take. We divide the work.
9776. Do you inspect the East Greta Colliery? Yes.
9777. And the Greta Colliery? Yes, and Greta.
9778. How do you construe the present Act with regard to the quantity of ventilation required for a mine? I consider that there must not be less than 100 cubic feet of air per minute for each man, boy, and horse passing along the airway past each working-place.
9779. *President.*] Supposing that there is that quantity of air, do you consider that the Act is satisfied? Not necessarily. There may be special circumstances in which it might be desirable to have more air than that, in order to have an adequate amount of ventilation.
9780. *Mr. Curley.*] What are the special circumstances? The existence of noxious gases.
9781. *President.*] Suppose the men were stifled for want of air, would you not give them more air without any of the noxious gases;—would you think that 100 cubic feet was enough where there is no gas? No; I should say that it was not adequate.

9782.

Mr.  
T. L. Bates.  
21 Oct., 1895.

9782. Supposing the men were working up a bord, is the air to come up the bord? No; the Act says past each working-place. If I found the quantity of air going past the bord I should consider the Act was complied with. Of course, the bord begins with the fresh air and works away from it. A dip-bord is much easier to ventilate than a rise-bord.

9783. If it is a rise-bord there will be some difficulty in getting the air into it? Yes; the air will not go so easily.

9784. Supposing there is an 8-yard pillar, and a miner has to work 35 yards in front of the air, has he to work through an extra 8 yards, making 43 yards altogether;—does he have to put his cut-through in at 27 yards? No; he can come 35 yards, and then put the cut-through through.

9785. That would be 43 yards? Yes.

9786. He has to come 35 yards and then make the cut-through, and the cut-through is added on to the length of the bord, and therefore he would work 43 yards in front of the air? Yes, he would.

9787. *Mr. Curley.*] Do you think that would be the fulfilment of the Act if that was done? Yes, of the present Act.

9788. Is there anything said in the present Act about a minimum quantity? It says that the minimum shall be 100 cubic feet of pure air per minute.

9789. *President.*] Supposing that noxious gas was found in the cut-through, what then? A hundred cubic feet of air would not be enough.

9790. Supposing there was gas in the bord—you say there is to be 100 cubic feet of air as a minimum sweeping along the airway past each working-place;—the working-place is the bord? Yes.

9791. Supposing a miner is working 35 yards in front of the air, and there is gas, what then? I should not consider the 100 cubic feet of air adequate then, because it would not be safe for men to be working in the cut-through with gas in it. The quantity of ventilation would not be adequate then. You would have to use some artificial means to get the air into the cut-through in that case.

9792. *Mr. Gregson.*] Do such cases arise? I have never known one in my experience.

9793. Have you seen cases in which the men have not had adequate ventilation where they are working? I have found cases where there has been less than 100 cubic feet of air, and I consider that is inadequate.

9794. Did you measure the air in the bords? No—where it comes along the airway.

9795. Can you be sure that the men were working with less than 100 cubic feet of air? Yes, if there was actually less than 100 cubic feet in the airways.

9796. Might not some of the men have the benefit of the whole of the air? They might; but if there is a certain quantity of air going in, and there is not 100 cubic feet for each man, I would consider that amount of ventilation deficient.

9797. Will you look at subsection 2 of section 12 of the present Act: "An adequate amount of ventilation shall be constantly produced in every mine to dilute and render harmless noxious gases to such an extent that the working-places of the shafts, levels, stables, and workings of such mine, and the travelling roads to and from such working-places, shall be in a fit state for working and passing therein";—don't you think that is explicit enough—it means that a man must have sufficient air wherever he is in all the working-places? I admit that a man must have plenty of fresh air to work in.

9798. *President.*] Is not *Mr. Gregson* right in saying that there must be an adequate amount of ventilation for the men:—the Act does not say that the working-places are not to be adequately ventilated—do you see that? Yes.

9799. *Mr. Curley.*] From the practice you carry out, according to your statement, you think if there is no gas in the mine, and there is a certain quantity of air going into the split, taking the quantity of air and the number of men, that if each man, boy, and horse has 100 cubic feet of air you can consider the Act is complied with? Yes, I do; except under circumstances where there might be more air required. If there were no exceptional circumstances, I should say the present Act had been complied with.

9800. *President.*] No matter how hot it might be in the bord? No.

9801. Supposing it was a 14-yard pillar, does your argument still hold good? It does.

9802. Would a man have sufficient air there? He would have the quantity required by the Act.

9803. Do you think a man working in a 35-yard bord with 8 or 12 yard pillars before he got his cut-through over would have adequate air there? I do not think he would, but the Act would be complied with, because of these confusing sections about the quantity. I refer to subsections 3 and 4. [*See Appendix B.*]

9804. Have you taken that interpretation of the Act upon yourself, or have the managers thrown that interpretation upon you? It is the interpretation that has been adopted, and what has obtained with the other inspectors. When I was appointed inspector I inquired from the others, in order that I might know what to base my opinion upon.

9805. *Mr. Gregson.*] Had you anything in the way of instructions when you first joined the Service as an inspector? No, I had no instructions whatever. We were left to work the Act out.

9806. *Mr. Curley.*] Did *Mr. Mackenzie*, the Examiner of Coal Fields, not give you any instructions? None at all.

9807. Did he never state how the Act was to be defined? I do not know that I asked him when I was appointed as an inspector. I asked *Mr. Dixon* on various points, and I did not differ, and I acted upon them in conjunction with him.

9808. Do you go into the working-places off the heading occasionally? Yes, very frequently.

9809. Do you do that when you inspect the different collieries? Yes.

9810. Have you ever noticed certain places in the Lambton Colliery where brattice was put in? Yes, in some of the places.

9811. Was that at the request of the men, or did you suggest it? I did not suggest it; I have never had to suggest it.

9812. The manager has done that without any suggestion from you? Yes, he has.

9813. Do you inspect the Jubilee district of the Wallsend Colliery? Yes.

9814. How is the ventilation in that district? Much better than it used to be. It is fairly good now.

9815. What used it to be? It used to be good, but it is better now, because they have an additional intake. They get a portion of the air in without it having to travel so far.

9816. Does it go round the men's places? Certainly it does.

9817. Have you heard of any complaints in any parts of the Wallsend Colliery about defective ventilation? I have had no complaints made to me—none at all.

9818.

9818. Did you notice a report that appeared in the paper where a very limited reading was announced in one of the check-inspector's reports? I may have; but I do not take much notice of what I see in the papers.

Mr.  
T. L. Bates.

21 Oct., 1895.

9819. If you saw a reading that gave an average of 35 cubic feet per minute as the amount of air travelling, and this was an accurate statement by the check-inspectors, would you consider the ventilation was very defective there? Yes, if that report was accurate.

9820. Will you look at the check-inspector's report (*see Appendix P*)? Yes; but I do not believe in the newspaper reports. This has reference to Wallsend, but I do not take any notice of such things in the papers.

9821. Suppose that was true? If that was the quantity of air travelling it is too little; it is an infringement of the Act.

9822. *President.*] Whether the Act requires any minimum or not would it be adequate? No; anything under 100 cubic feet would be too little if there was nothing mentioned in the Act. I would fix 100 cubic feet as a minimum.

9823. *Mr. Ourley.*] Would you not also say that a man should have some of that 100 cubic feet of air in his bord? My action in the matter would depend on what the Act said.

9824. What is your opinion in that respect;—should the men have the ventilation in the working-places? Yes; I am as anxious as anyone that the men should have plenty of air to work with.

9825. *President.*] Your idea is that if you had to supply an adequate amount of ventilation you would see that the air was conducted to the working-places? Yes; it will not go there unless it is conducted by some means or other. It will not go there by itself.

9826. Do you say that it should be specified in the Act that that should be done;—looking at the fact that you have an Act which says it is enough if the air is taken past the working-place, do you think that new legislation should specify that the air should be taken into the working-place? I question whether you should say how it is to be done.

9827. Should the Act say how it should be taken there? I do not think so.

9828. Would you have any minimum specified in the Act? I have been thinking a good deal about that minimum. I have held the opinion that there should be no minimum, that we should simply say an adequate amount.

9829. Do you think if sub-section 3 (*see Appendix B*) had not been in the present Act that the Act would have been far better to work under? No doubt it would.

9830. But through there having been a minimum at one time do you think there should be a minimum in a new Bill, so that there should be no mistake about it? If there is no minimum stated we should have to fix a minimum in our own minds. I think on further consideration there might be a minimum fixed as a basis to start from.

9831. And if the minimum was not enough you would give more air? Yes; I would like to have power to give as much more air as is wanted.

9832. Would this meet your views:—"An adequate amount of ventilation shall be constantly produced in every mine, to be in every case at least 100 cubic feet of pure air per minute, and as much more as the inspector may direct for each man, boy, and horse employed therein, a sufficient quantity whereof, according to the judgment of the inspector, shall be taken to within 15 yards of the working-places in non-gaseous mines, and to within 3 yards of the working-places in gaseous mines, to dilute and render harmless noxious gases to such an extent that the working-places of the shafts, levels, stables, and workings of the mine, and the travelling roads to and from those working-places shall be in a fit state for working and passing therein"? Yes, I have no objection whatever to that. I think that might meet the case. The manager must take air into the working-place by any means he may think desirable.

9833. *Mr. Curley.*] Have you noticed the air in the Greta Colliery in the rise places to be somewhat flat at the working-face;—do you go into the men's places frequently? Yes.

9834. How is the air there? It is warm in the rise bords. They are 13 feet high in some of these places, and naturally they get warm, although there may be a very large quantity of air sweeping past.

9835. *Mr. Gregson.*] Suppose you had such a place as that, and you were working under a clause such as the President has just read, how would you proceed to carry out that clause? It would have to be bratticed.

9836. What air would you carry in? You would not need to carry more than the air for two men. I would not carry the whole of the current. If I had 6,000 cubic feet I could not take it all in, because I should lose a certain quantity at the bord end, but I could put a portion of it in, say 2,000 feet, or according to the manner in which the brattice would be placed.

9837. Would you not get some of this air diluted and some undiluted? The greatest quantity of air would go straight along the heading. The brattice would catch one-third or two-thirds, and that would come back again and join the other current, and so on. It is a matter of arranging the brattices. I would not send all the air into the bord.

9838. Don't you think the terms of this clause would oblige you to put the whole of the air in? I scarcely thought so when it was being read. You cannot put the whole of the air in; you are bound to lose some.

9839. If you are content with a minimum, and the minimum is to be 100 cubic feet, if the men had the 200 cubic feet of air per minute in the face, wherever they were working—in the bord or in the cut-through—would you be satisfied, or do you think they should be satisfied? Yes, I should think so.

9840. In a place like that you were speaking of in Greta, how would you measure that air? You could not measure that small quantity in a large place.

9841. How would you word that clause to give equal satisfaction to all of the men? I do not think that I could.

9842. *President.*] Is there any way of specifying it;—how can you find out what is adequate ventilation if your anemometer will not work? We can tell by the lamp pretty well how the air is going.

9843. *Mr. Gregson.*] How did they manage in England? I never saw an inspector measure the air in England. They leave it to the manager.

9844. Would not the same thing be possible here? They are rather different out here to what they are at Home.

9845. Where is the difference, I would like to know? If left to the manager there would be considerable trouble here with the miners.

- Mr. 9846. Why here more than in England? The men here seem to make frivolous complaints.  
 T. L. Batcs. 9847. If the men have good cause for complaint, and you rectify the grievance do you mind their  
 21 Oct., 1895. grumbling? No.
9848. Are there in your opinion any distinctions between Great Britain and this Colony that would render the English Act inapplicable here? If there was no quantity stated, and an inspector said to the manager, "You have not enough air," and the manager said "I have," the inspector might call some men and the manager would call some managers to say that there was sufficient air. The question would have to be settled in Court, and would they not have to fix a minimum quantity then?
9849. It is simply a question as to whether the ventilation is adequate or inadequate;—it is a matter for the arbitrators to settle who is right? I suppose they would have to settle it that way, but it would be a difficult matter to settle.
9850. Would there be any more difficulty in settling a dispute here than in England? If an inspector at Home complained it is always remedied at once without going to law.
9851. Why should it not be so here? I do not see why it should not be so.
9852. *Mr. Curley.*] Is there not much more gas in England? The mine I was connected with in England was very gassy.
9853. Is not this one of the conditions that must compel an efficient system of ventilation to be carried out in connection with the mines for the protection of the property itself? Exactly.
9854. Do the men have plenty of air in Great Britain? We had plenty of air where I was, and I should say on the whole that there was plenty of air. There were complaints made to the inspectors occasionally.
9855. And they were rectified? Yes.
9856. Do you know that there are some pits in England that are not gassy? Yes; but I still think the minimum should be stated.
9857. Do you think the English Act is defective in that respect? I do not know that it is defective, but I think a minimum would save a lot of trouble.
9858. *Mr. Gregson.*] It strikes me it would create difficulties? I think we would have something to work upon.
9859. If you say the air is insufficient that is the end of it; it does not matter whether you have an anemometer or not? Perhaps not.
9860. *President.*] How would this meet the difficulty, "and a sufficient quantity thereof"? How would that apply to the long-wall system?
9861. I give you a minimum of so much for the men, and then as you do not want all that—you do not want 6,000 feet where there are only two men working—I say, "and a sufficient quantity whereof shall be"? A sufficient quantity would be determined by the inspector. There might be bother with the manager. I might say to the manager, "You have not got enough air," and he might say, "I have," and a dispute would then arise upon the interpretation.
9862. *Mr. Gregson.*] Are you not there in authority? Then it would go to arbitration.
9863. *Mr. Curley.*] And the men that were working there would have to put up with the consequences, and be half poisoned probably if there was insufficient air? Yes.
9864. *Mr. Gregson.*] I do not understand why there should be these difficulties in this country at all, or why an Act that has been found sufficient in Great Britain should not answer here? Because it is not thought to go far enough. It is not supposed to go far enough into detail.
9865. Do you think that is the fault of the Act? I think it is possible to have too much detail.
9866. The English Act leaves it to the inspector, and you say that Act does not go far enough,—would you leave it like the English Act? I should leave it "adequate" according to the English Act.
9867. Would you leave it according to the English Act just as it is? I would.
9868. *Mr. Curley.*] How would you get rid of that difficulty you have pointed out, where your opinion is against the manager and his opinion against yours,—where would be the determining point? If I said the air was not enough I should have to cause him to supply the necessary quantity. If there was no minimum stated in the Act I should not consider the place properly ventilated with less than 100 cubic feet.
9869. *Mr. Gregson.*] Suppose you were an inspector in England, working under this Act, you would have the same difficulty there. They simply say "This place is not adequately ventilated; you must put a little more air in"? The manager would do it at once.
9870. And the probability is they would do it here? I wish they would.
9871. *President.*] Is there more difficulty with the managers here than in England? I think so. I know that if an inspector asks for a thing to be done in England it is done at once.
9872. And if you ask here are your requests not complied with at once? It is done in a tardy way. It is done just to keep within the Act and nothing more. I do not really see why the English Act should not answer all purposes here. There are some gassy mines there and more difficult workings.
9873. It has been said that in England men have better ventilation because of the existence of gases; here we have a large number of mines not gassy, and they say that on this account managers will not give ventilation unless a quantity is specified? Yes.
9874. *Mr. Gregson.*] One reason of that is the difficulty that you have been under with regard to the ventilation clauses? Yes; that is the whole root of the thing.
9875. If sub-clauses 3 and 4 were taken out of the present Act, you would have simply the wording of the English Act; and do you think this trouble would have occurred if the Act in this country was in accordance with the English Act, or would you be prepared to face it with a clause like the English Act only? I think I would.
9876. *President.*] We agree that the men should have the air, but the question is how are they to have it;—unless it is specified I think there is likely to be difficulty? It simplifies matters if it is specified that the air shall be taken into the working-places.
9877. *Mr. Curley.*] You know that there is a lot of refuse made in these very high mines that you have been speaking about? Yes, a lot; 3 or 4 feet high.
9878. Have you ever been at the Helensburgh Colliery? No; I have not seen it.
9879. Do you not think that a lot of this refuse could be utilised? In some cases it would assist a great deal. It could be utilised to assist the air into the face.

Mr.  
T. L. Bates.  
21 Oct., 1895.

9880. In conjunction with brattice-cloth? Yes; that could be done.
9881. Do you believe in a minimum quantity being stipulated in the Act? I would rather think it out, and give the matter further consideration.
9882. Do you consider that the air should be conducted up to the working face? It would not be adequate if it was not.
9883. That is one way of answering the question, but I would like you to give us a direct answer? The air must be taken into the place to the men.
9884. Have you given any attention to the question of pillars? No; not particular attention.
9885. Do you think that is a matter that an inspector should give much attention to? Yes; but I do not think that there should be anything about the size of pillars in the Bill. I think that is superfluous.
9886. How many years do you say you have been an inspector? Eight and a half years.
9887. Have you ever drawn attention to the size of pillars during that period? I do not recollect any case in which I have.
9888. Is this not a matter worthy of an inspector's attention? Yes; but that can be dealt with under the 25th section of the present Act. [See Appendix B].
9889. If inspectors pay no attention to these matters now, will it not be bad later on? I pay attention when necessary.
9890. Do you know that pillars may be worked later on? Yes.
9891. And that danger may arise through sufficient pillars not being left? I know that if you do not leave pillars you cannot keep the roof up.
9892. Do you know that the men had to be drawn out at Greta in connection with the creep that occurred there? There was a creep there some two or three years ago, and the men had to be taken away, but the creep was not where the men were working.
9893. Had the men to be withdrawn? Yes; as a precautionary measure.
9894. Where was the creep? A long way to the rise.
9895. Where were the men? Down the hill. They were withdrawn as a precautionary measure in case the creep reached to where they were working.
9896. Do you know the size of the pillars that were left at Greta? There were no pillars at all in some places in the old workings—nothing to speak of.
9897. Do you know that that seam is at an acute angle? No; it is not very steep.
9898. What is it;—is it 1 in 5 or 6? Something about that.
9899. Do you not consider that steep? Moderately steep; not nearly as steep as East Greta.
9900. Do you think that the 3-yard pillars you have spoken about were anything like adequate to be left there? No, I do not think that 3-yard pillars were adequate there.
9901. Did you draw any attention to these matters as an inspector? No, because these pillars were in the old workings twenty years ago.
9902. Was that before your time? Yes, ten years before my time; more than that.
9903. Do you know anything about the splitting of the pillars that is going on at the present time? I know that some large pillars have been split, and that this has been chiefly done to find places for men to work in.
9904. Do you know anything about the shaft pillars at the Greta Colliery? I only know from the plan showing what coal has been left there.
9905. Do you know from your own practical knowledge as an inspector? At one time I measured the pillars near the shaft.
9906. What size did you find these pillars? I found a very large pillar on one side, but it was not so large on the other side. I do not remember the sizes.
9907. Do you know anything about the shaft pillars at East Greta? There is no shaft at East Greta. That colliery is worked by an adit.
9908. Do you know the sizes of the pillars between the two outlets how far they are apart from each other? 70 or 80 yards between two outlets, or perhaps more than that.
9909. What pillars are left in that colliery? They leave about 6-yard pillars; some are larger; near the outcrop they are 12 yards.
9910. Have you any idea what is the weight the seam has got to carry? It varies; it begins at nothing, and goes to a good depth.
9911. Does it dip considerably? Yes, one in one—forty-five degrees.
9912. May it not have to carry a tremendous weight in the course of time? Of course it will. It will be a tremendous depth in time.
9913. Will not that necessitate substantial pillars being left? The places are well timbered; they do not take much coal out.
9914. What is the width of the places? 8-yard bords. They only take 7 or 8 feet of coal out.
9915. Do you mean 7 or 8 feet in height? Yes.
9916. Taking a seam at that inclination, will it not require a larger pillar than if it was on the flat? Yes.
9917. Don't you think it will require larger pillars when they get down, to carry the weight? Yes.
9918. Don't you think a mine has got to carry more weight after it gets opened out—after a course of years? I suppose it has; then there is more coal extracted of course.
9919. Anticipating the weight, should not a good substantial pillar be left? In my opinion, it is perfectly safe at the present time.
9920. But in the future? I do not know that they are going to extract pillars.
9921. Is not that generally the intention; Yes, in most of the mines; but this is an exceptional mine altogether.
9922. Are you aware that companies do not like to leave any coal if they can get it out? They look to get all they can out.
9923. Is it not best to think of these matters now than to reflect later on? Perhaps so.
9924. Do you think that a mine should be a man-trap for men? Certainly not. I do not think that at all.
9925. Do you know whether they have adopted the idea of leaving larger pillars at Wallsend recently? They have some time ago. They are leaving 8-yard pillars now.
9926. Have the management done that of their own accord? I presume they have; they have not done it at my instigation.

- Mr. T. L. Bates.  
21 Oct., 1895.
9927. Do you know if any pillars have been worked out at East Greta? I think a few have been worked out at one side of the pit.
9928. You said just now that you did not know whether they were going to take any pillars out? I do not know that they are going to do it in the future.
9929. Did they take the pillars out where there is a high inclination of the seam? Yes.
9930. If they took them out there could they not take them out anywhere else? They could do so.
9931. Do you know anything about a dam there anywhere near where these pillars have been extracted? I do not think it is very near.
9932. How far is it away? I never measured it; I cannot tell you.
9933. Is it not worthy of your attention? Perhaps it is.
9934. What other mines do you inspect besides Lambton, Wallsend, East Greta, Greta, and Anvil Creek? All the mines at Singleton and at West Maitland.
9935. About the engine places and refuge places;—is this a matter that you have given serious attention to? Yes.
9936. Have not numbers of men met with accidents from time to time on the engine places? Yes.
9937. Have not some of them lost their lives? Yes, they have; that is quite true. While we are on that subject I would like to make a remark with regard to the refuge places. I am doubtful if there should be a stipulated size. The danger is of their being too wide, because if they are too wide there is the greatest danger of skips running into them. It is my opinion that the refuge places should be made narrow with plenty of depth.
9938. *Mr. Gregson.*] What about the height in a low seam? If the seam is 5 feet high the refuge places should be 5 feet high.
9939. What if the seam was 4 feet? I would make the refuge places 4 feet high.
9940. Would you fit them into the floor? I do not think so.
9941. Would you take down any roof? No, certainly not; I would not touch the roof. I think they ought to be narrower.
9942. What do you mean by wide? Three or four yards.
9943. You don't like that;—what is about the limit to what you do like? About 3 feet wide and flat, and room to get into them.
9944. *Mr. Curley.*] And how deep? I should not like to say how deep. You might make a minimum not less than 4 feet, or as much more as they liked; as deep as they liked, but not less than 4 feet in.
9945. That is not a very big place, 3 feet wide and 4 feet deep;—would not 6 feet be better? Yes.
9946. Where there is bottom taken up for to run the road down, don't you think that where the manhole is the men should be able to get in without stepping up? Are you referring to that case of Musgrave's. I do not think that would be an element of danger, provided the step was not too high.
9947. It does not matter what height the carch was? I would not like to have them climb too high.
9948. Do you think they should be in level? I do not see any objection to a slight step up.
9949. Would you limit it to a step up? I would not put anything in the Act as to what height it should be. Some of the accidents are largely due to carelessness. I have seen this when I have been in the mine.
9950. May not a man mis-gauge his distance without running any risk? If he knew the sets were coming he ought to take refuge where he is.
9951. Is there anything else that you would like to refer to in the Bill? I think there should be no time specified for the inspector's visits; they should be surprise visits.
9952. Do you think the inspections should be oftener than what they are;—I will read you a statement I have taken from Inspector Dixon's report with regard to the Hamilton Pit affair. He says:—"I do not think Government inspectors visit the mines sufficiently often?" Yes; with some mines we know better than anyone else how often we ought to go. I think it should be left to us to go when we think it is necessary.

[Witness withdrew.]

TUESDAY, 22 OCTOBER, 1895.

[The Commission met in the Board-room, Chief Secretary's Office, at 10 a.m.]

Present:—

FRANCIS EDWARD ROGERS, Esq. Q.C. (PRESIDENT).

JAMES CURLEY, Esq. | JESSE GREGSON, Esq.

Thomas Parton sworn and examined:—

- Mr. T. Parton.  
22 Oct., 1895.
9953. *President.*] What are you, Mr. Parton? I am a mining engineer and colliery manager.
9954. What colliery do you manage at the present time? The Wallarah Coal Company.
9955. Where is the Wallarah Colliery situated? Sixteen miles south of Newcastle, on the coast.
9956. *Mr. Gregson.*] Do you hold a certificate of competency under the English Act? Yes; under the English Act of 1872.
9957. Were you managing coal-mines in England? Yes; before that time, and up to the time I came out here.
9958. Where were these mines situated? In Staffordshire, Warwickshire, Worcestershire, and Shropshire.
9959. How many years' experience have you had in England altogether? Over twenty-five years.
9960. In England? Yes.
9961. What year did you come to this country in? In 1888—about 7 years ago.
9962. Where have you been during that time? At Wallarah.
9963. Have you been there the whole of the time? Yes, the whole of the time. I am consulting engineer for one or two collieries besides.
9964. Does your recollection go back as far as the negotiations or preparations for the Act of 1872, in England;—do you recollect any of the circumstances in connection with the passing of that Act? Yes.
9965. Was it at the instance of the men or at the instance of the coal-owners? I think it was a great deal at the instigation of the men. 9966,

Mr.  
T. Parton.  
22 Oct., 1895.

9966. Under what Act were you working collieries previous to the Act of 1872? There was an Act of 1850 in England. It was under the Act of 1872 that a certificate was conferred upon managers. It was the first Act that required certificates of competency and certificates of service.

9967. In carrying out the Act of 1872, did you begin to see quickly an improvement in the system adopted? Most decidedly.

9968. Was the system advantageous to the mine-owners? Yes; to the mine-owners and to the whole of the trade.

9969. In about the year 1883 was not a Royal Commission appointed to inquire into accidents in coal-mines? Yes.

9970. And the result of that Commission's labours was the passing of the Act of 1887? Yes; the Commission was appointed chiefly in consequence of the explosions in gaseous mines.

9971. Do you know anything, personally, of that inquiry;—did you give evidence? No; not personally. I came out here about that time, and went back home again, and I was not in the old country so much as before.

9972. Was it under the Act of 1872 that Government inspectors were first appointed? No; inspectors were appointed before the Act of 1872. I remember the first inspector that was appointed to the Staffordshire district.

9973. What class of men were the inspectors chosen from as a rule? They were highly educated men.

9974. Had they been colliery managers? I do not think they had been all practical managers, but they were highly skilled men.

9975. Do you know most of the men who have been appointed since to those positions? Yes; personally.

9976. From what class of men were the recent appointments made? Several of them were managers, but they were first class managers, highly educated, and well skilled in the technical departments.

9977. You have spoken of highly educated men? Yes, they would not be taken from the under-managers. They were men who held good positions, and served apprenticeships to colliery engineers—men above the class of the underground manager.

9978. Would they be University men? Some of them.

9979. Would they pass the Royal School of Mining in Jermyn-street? Some of them.

9980. They were all men of good practical knowledge? Yes; of good practical knowledge. One, in fact, has served under my father as an assistant, and he was about the lowest on the scale. He was a practical man, but not so highly educated as the others, but still a thoroughly good man.

9981. After the Act of 1872 came into force, was there any friction between the inspectors and the managers? There was a little friction at first. The managers had not been used to being controlled by anybody outside of themselves, it was therefore rather irksome to have to come under strict discipline.

9982. Did you ever hear of anything to lead to arbitration? I do not remember one case in my supervision, and my knowledge of those districts. I have heard of such cases in the north of England, but in the three counties I have spoken of, I do not remember one case.

9983. Would not public opinion force the managers to give way to the inspectors? The want of discipline and extra care was so palpable to every man that there was no difficulty. They had been used to primitive ways that were destructive alike to life and property, but afterwards they had to give in to what was as a necessity.

9984. In the course of time did the managers look upon the inspectors as men they could consult? Yes, certainly; the inspectors, in a few years, were looked upon as being the authorities on mining. An inspector never had to speak twice, because he was looked upon by managers and men as an authority, and they thought that what he said was correct;—and, generally speaking, it was.

9985. Did the managers make it their interest to meet the inspectors' wishes? Yes, as far as possible. They were men you could not play with. They represented the Home Secretary, and therefore carried with them authority. They would not tolerate the slightest disrespect, either from owners or managers. They were trusted, and there was very little friction.

9986. What was the ultimate penalty under the Act of 1872, supposing the manager set up his authority against an inspector? I forget the penalty, but I do not know of a case in which a manager has set himself against an inspector.

9987. It was not on account of the powers given to the inspectors under the Act, but rather that the manager recognised the experience and extended knowledge of the inspector? That was it. I had a great deal to do with the inspectors. I took an interest in the scientific institutions in the counties, and I was president of the Mining Institute, where we had 500 or 600 members. We used to go about inspecting the mines, and so I came in contact with them a great deal, and I know their characters very well.

9988. About what salary would an inspector receive? About £800 per annum.

9989. Would that be the highest salary? I think the Northern district paid a little higher salary. The mines were very gaseous in that district. The salary was as low as £600. It ranged from £600 to £800. There was one, a chief of the inspectors, who perhaps received a little more, but I am confident of the £800 in our district. I am not sure what salaries were paid in South Wales or the North of England.

9990. Are the pits in your part of England mostly gassy pits? There are very few gassy pits, on the same footing as the Metropolitan Colliery here. There we had the 10-yard coal, and found gas occasionally, but not sufficient to justify working with lamps. In the seam below that, one seam would be free from gas, and the low coal would be very gaseous. Some parts would be worked with safety-lamps, but not the whole of the estate.

9991. Were some of the seams worked entirely without safety-lamps? Yes; the bulk of them in those three counties. To-day the seam in one of the collieries is 420 yards deep and in the other 620 yards deep; all worked with naked light. They use candles there; not tin lamps, as they do here. The examination on every shift was with a locked safety-lamp; that was imperative.

9992. Do you recollect the clause in the proposed Bill that applies to ventilation;—will you look at section [50] 47, rule 1, on page 23 of the Bill (*see Appendix A*);—what is your opinion of that provision? About adequate ventilation?

9993. Yes? This rule gives the inspector full power to decide himself whether the ventilation is adequate or not. If he went into a mine, and he thought there was not sufficient ventilation, he would say so, and

you

Mr.  
T. Parson.  
22 Oct., 1895.

you would have to alter it. He gives you sufficient notice. In England he always had a basis himself to go upon, and that was that 200 cubic feet of air per minute should be the minimum quantity. He thought that every man, under the most favourable circumstances, should have 200 cubic feet of air per minute, per man and horse, but if there were circumstances that required more air, he would say that there should be more. If there were not 200 cubic feet of air it was not adequate, and he would summon you for it not being sufficient, on the grounds of health alone.

9994. Take the case of one of the collieries you have spoken of, what was the height of the seam? The seams were various heights.

9995. Will you give an instance of a high seam? One half of Staffordshire contains a seam that is 30 feet thick.

9996. What colliery are you speaking about? The Sandwell Park Colliery; that is 420 yards deep.

9997. What would be the output of that colliery? 1,200 tons of coal per day.

9998. Would that be all round coal? No, altogether; they make various sizes. Then there was the Hampstead Colliery, adjoining that colliery; that was 620 yards deep, and they are doing about 1,800 tons per day.

9999. Is there any gas in any of those pits? Very little. In the openings, where the top coal is, gas is frequently found. That is the only place in those 10-yard seams where gas is generally found.

10000. What is the system of working? Square work—a modification of pillar and stall—the pillars are squarer than in the latter system.

10001. What width of stalls do you have between the pillars? Twelve and 14 yards, according to the character of the coal.

10002. Do you work the seam in sections? We take the bottom out first, and gradually work up, and any rubbish is thrown down below. They have to get ladders for the top coal. They cut 9 or 10 feet of the top coal, and drop it all at once.

10003. Is it tender coal? Something like Newcastle coal.

10004. Is there much breakage? Yes; a great deal.

10005. In working out the bottom section, have you seen any traces of gas? Very seldom; with ordinary ventilation, no gas.

10006. Were they working with naked lights? Yes, always, and they are to-day. They have had an explosion since I returned, at the Sandwell Park Colliery; it was through some negligence on the part of one of the deputies.

10007. Was anybody hurt? Yes, three persons; one was badly hurt, but it was through thorough negligence.

10008. Was the ventilation at that pit managed in districts;—were there separate districts? Yes.

10009. Do you call them districts or splits? Splits.

10010. How many men were there in a split? About seventy men.

10011. How many men were there in each of these stalls? About a dozen or more.

10012. Would a dozen men work there? Yes, comfortably. In some places there would be more than 500 tons, and sometimes more than 1,000 tons in one fall.

10013. Do the men work in gangs? They work two at a skip, and there are men throwing the coal back; two loading, and one or two breaking the coal and throwing it back.

10014. What number of men would be working in one of these working-places? I should think there would be room for a dozen men.

10015. As a rule, would a dozen men work in these places? When the coal is thrown they could put that number of men in.

10016. How were the seventy men in a split distributed? In the different openings.

10017. How many openings would there be for each split, speaking on the average? Five or six, possibly a little more.

10018. Would there be an average of ten men in each of the openings? At times; not always.

10019. What was the height of the bottom section? They took from about 9 to 12 feet out.

10020. If there were ten men in one of these openings, and the inspector insisted upon 200 cubic feet of air for each man, 2,000 cubic feet of air would pass into these openings? Yes.

10021. And the intake of the split would have to measure 14,000 cubic feet of air? Yes.

10022. Will you kindly tell us how your air is divided? By bratticing chiefly; not close bratticing.

10023. What quantity of air would be taken into one of the openings? Not more than the 2,000 cubic feet of air if there is no gas.

10024. In what way would you take that much air in and no more? By regulating the air; extending the brattice into the heading. It is not necessary to close in the heading altogether, but to turn it round a little like a hopper will force sufficient air in.

10025. You will extend the wing of the hopper accordingly as you want more air? Yes. There is a separate return for each split.

10026. No second set of men have to deal with the air already used? Not the second split. That was not always so, but that is the most recent method. They were a long time before they began to split the air in Staffordshire, but that was the most recent and by far the best method. In long wall, of course, it is very different.

10027. Would the inspector have any difficulty in making up his mind as to whether the air was adequate? Not the slightest. The inspector always took his anemometer into the mine, and always used it in the various sections of the openings.

10028. Will there be any difficulty in the third place? No; we used to make a place for him in the heading to measure the air.

10029. He did not depend on his own senses, but had the anemometer to show him? Almost invariably he had the anemometer. The inspectors did not go down periodically. It might be six months before they would enter a mine, unless there was an accident, and when they did go they would go to every part and test it. If they came for an accident they did not do that. In that case they would leave the whole mine till another time. When they made an inspection they went right through the mine.

10030. Have they ever been called by the men by anonymous communications? That is very common.

10031. Do the inspectors attend to anonymous communications? Always. They do not like anonymous communications; they prefer it being open, but I know lots of things that have been reported anonymously.

10032.

Mr.  
T. Parton  
22 Oct., 1895.

10032. Do the men recognise that as being their remedy in a case where they are insufficiently ventilated? Yes; and very rightly so in many cases.

10033. Speaking of the square work, how far would the bratticing extend towards the face? Only just to go through the rib.

10034. You merely pointed the air in? Yes.

10035. In driving these openings you had 10 yards to go before you holed into any place? Yes.

10036. How would the air be taken? Sometimes by bratticing, or pipes.

10037. How close would the air be to the face? Perhaps 6 or 7 yards. I have known it 10 yards.

10038. The return air gets back into the intake? Yes, while they are driving.

10039. I saw something in the Report of the Royal Commission on Labour to the effect that the inspectors' visits had not been quite frequent enough;—was there any feeling of that kind in England? I do not think so.

10040. Perhaps that was a complaint on the part of the men? I never heard of it.

10041. Any way, it was a frequent practice, if there was occasion for it, to send a communication to the inspector? Yes; it was very common, and the inspector always came or sent an assistant.

10042. Did the inspectors have a sufficient knowledge of the individual mines to find their way without one of the mine officials? They would always take an official with them.

10043. Was there any notice given of their visits? No; I never had any notice. I remember one case in which I received an intimation, but that was a case where some men were burnt very badly. We could not trace any gas afterwards, and it was a mystery to us how the accident happened. The inspector came, and he did not know what to do. There was plenty of air, so he appointed a day to have the air stopped, to see if we could force gas by doing so, but we did not clear the mystery then—still there was no gas. A few months afterwards we were working the same seam, and the rock came in one of the roads—what we call the gob roads—and it exposed a seam of chance coal which we did not know anything about. The gas had actually come down hill from this seam of coal, and that explained the mystery.

10044. Is there much shot-firing in working that coal? A great deal.

10045. When the inspectors visit the colliery, in consequence of a call from the men, do they often find something wanting attention, or have they found it was a false alarm? There were grounds for complaint very often.

10046. Did they apply a prompt remedy? Yes; straight away.

10047. Was there any delay about it? Not the slightest.

10048. With regard to other matters than ventilation, do the inspectors have anything to say about what they deem to be a faulty system of working? They would discuss the matter over with the manager, but they would not attempt to interfere beyond that. We often used to discuss the methods of different kinds of working.

10049. But in a glaring case, such as the insufficient size of pillars? Anything affecting the safety of the men they would interfere with at once.

10050. Do the inspectors examine the shafts? Yes.

10051. Did they do this periodically when they came? They generally used to go down the shafts slowly.

10052. Did they ride on the top of the cage? No; ordinarily they inspected the shafts just with the lights of the lamp. I never saw them make a close inspection.

10053. What about the ropes? They did not examine the ropes themselves. The first thing they did would be to look at the report book, which had everything up to date, and if there was any defect they would speak about it. If it was all right they accepted that, and then they would go through the workings; but they never inspected, in the same way as the mine, the ropes or the shafts, unless something occurred that would justify their doing so.

10054. What system had you for inspecting the pit boilers? Up to about fifteen years ago there was no rule or custom—it was simply left to the engineer; but from that time they have been under the control of an insurance company. The insurance company sends an inspector round periodically, and a certificate is given. After the pay Saturday the boilers would be emptied and go under examination.

10055. *President.*] What do they insure? You pay so much to the insurance company, and if you follow out their suggestions, they take the responsibility of any explosion.

10056. Would they pay whatever damage there was through a boiler bursting? Yes; they take the whole responsibility. They have a lot of inspectors, and if they found that their instructions were not carried out, the policy would be nil.

10057. Is it a regular policy? Yes; it is a good system, and works well.

10058. *A. r. Gregson.*] Is the system general throughout England? It is in the Midland Counties; I think it is now pretty general.

10059. Were check-inspectors appointed by the men in England? No.

10060. The men have no check-inspectors? No.

10061. Had they power to appoint check-inspectors under the Act? Yes; but I never knew any check-inspectors in our districts.

10062. You have been all your time at Wallarah, but I suppose you have visited other mines in the Northern District? Yes; a good many of them.

10063. Have you visited any mines in the Southern District? Yes; and in the Western District. I am consulting viewer for the Metropolitan Colliery, and I go west occasionally.

10064. Generally speaking, do you think the provisions in the English Act are applicable to this Colony? I think so. Taking your Northern seams alone, there are a lot of things in the English Act that are not required; but taking the deep mines—the Metropolitan Colliery, for example—that requires as much care as any mine in England; but generally speaking, the English Act would suit this Colony.

10065. As a manager, would you be content to work any of the mines here under the English Act? Quite content. I have not seen the new Bill in England. I know the Act of 1887, but not the Bill since.

10066. *President.*] Do you know about the Check-weighman's Act? Yes; I know that there has been no general alteration since 1887.

10067. *Mr. Gregson.*] With regard to the ventilation; one of the difficulties pointed out here is the interpretation of the existing Act of 1876;—are you acquainted with the provisions of that Act with regard to ventilation? Yes.

10068.

Mr.  
T. Parton.  
22 Oct., 1895.

10068. *President.*] Will you look at subsections II, III, and IV, of section 12 (*see Appendix B*)? Yes; subsection II is similar to the English Act, but the next subsection says: "That an adequate amount of ventilation shall mean not less (as a minimum) than 100 cubic feet of pure air per minute for each man, boy, and horse, which shall sweep undiminished along the air-way past each working-place." That is very ambiguous.

10069. How do you read that subsection;—what would be your administration of it? The general interpretation has been that if you have 100 cubic feet of air the Act has been complied with.

10070. One of the difficulties pointed out is that this has been the interpretation? Yes; I know that from personal experience.

10071. And that unless something is done to ensure the minimum quantity of air in the pit, the same difficulty will prevail in the future as has been in the past? Why does not that difficulty prevail in Great Britain, where the mines are so extensive and so dangerous? The inspectors there have sufficient power to say whether the ventilation is adequate or not. I never knew a case to arise under the English Act.

10072. Do you treat it as a difficulty? Yes; no doubt.

10073. How should that difficulty be got over;—what provisions would you propose in the new Bill? I should be content to take subsection II, and let that stand as it is, and let the inspectors have the power to decide.

10074. We come to another difficulty, that in some of the seams that are pretty high, and where there are two men, a wheeler, and a horse, assuming that the same quantity of air as your inspector thought necessary in England, viz., 200 cubic feet, or, in all, 800 cubic feet passed into each working-place, in some of the places would not there be a difficulty in measuring that air? Yes; there would be some difficulty, unless they had a very narrow place; but the inspector could judge for himself by the flame on his light.

10075. And by his senses? Yes.

10076. Would you be content to abide by his judgment? Yes.

10077. You think there should be no difficulty whatever in carrying out a clause as worded in subsection II of the present Act, owing to the indefiniteness of what is an adequate quantity or what is an inadequate quantity? There might have been some little difficulty in England, but it has come upon them gradually since 1872. It is understood there that there must be 200 cubic feet of air or thereabouts, and you would have to take that for granted here.

10078. Whatever the inspector thought was necessary, whether it was 100, 200, 300 cubic feet or more, would not that have to be left to the inspector? Certainly; but I have no strong objection to its being fixed at 200 cubic feet as a minimum quantity only.

10079. Do you think there is any difficulty on the part of an inspector carrying out a provision that does not stipulate for a minimum quantity? Not the slightest difficulty. In the aggregate the mines of Great Britain are turning out more coal than the mines of the world, and there is no difficulty there.

10080. You think, then, that the practice of Great Britain should be a guide? That is the best guide under the sun.

10081. You think that is enough to warrant you following the enactments there? Yes; you have the skill and practice of the known world there. If there is any change takes place, it is made use of there immediately. You have all the skill of the world to prevent accidents. I do not say it is perfect, but they keep changing according to circumstances. As far as human knowledge can go, you have all the skill up to date in working the British mines right through. The difference is, that you cannot have the same skill here. You have not the variety of coal-mining here. Leaving out the Metropolitan Colliery, you have the simplest mining under the sun—the easiest, and the safest to work. In English mining you get all kinds of difficulties—long wall, modified in many ways; pillar and stall, under a variety of conditions; gaseous mines; different kinds of roof; and the Act provides safety over all those conditions, so that you get the advantage of all this varied experience.

10082. You would be willing to take the English Act without experimenting at all? Yes, most decidedly. They have done the experimenting for us.

10083. You have not only in your mind ventilation, but the size of pillars, and other things? Yes; the Government inspector would not interfere with your system of working except you were working under water, and if he saw that you were working a system that would end in disaster, he would step in and stop the workings immediately. I do not think it is right outside tidal waters for any Act to say that you shall work your mines and have only a certain size for bords or pillars. It might be safe in one mine to work bords 10 yards and in another 4 yards. I think it is iniquitous to fix any size. I think it should be left to the manager of the colliery.

10084. *President.*] Under tidal waters? That should be decided by the Government.

10085. *Mr. Gregson.*] Who are the lessors? Yes; I think it would be sufficient to leave it to them.

10086. That being the case, you would not propose any provision in the Bill? No; that is a matter for the Government leases to deal with.

10087. There is a provision in the Bill, Mr. Parton, on page 8, wishing to give an inspector power to withdraw men in case of danger;—I refer to subsection (v) of section 21 (*see Appendix A*); you will see that that clause is struck out by the Legislative Council;—what do you think of that subsection? An English inspector, if he came into the mine, and saw it was unsafe, would order the manager to stop in a moment at his peril. It is part of an inspector's duty, as I take it, to do so. He is the same as the captain of a ship. He has to look after the safety of the lives. If he goes into a mine, and he sees that a place is not safe, it is his duty to withdraw the men.

10088. Would you have that subsection in the Bill? I do not object to it.

10089. Would it reduce the responsibility of the manager? I do not think so.

10090. Do you think that the manager might feel, supposing he apprehended danger, inclined to say, "Well, the inspector has been here, and he said nothing about this, therefore I must be all right";—would the manager or the inspector have the most intimate knowledge of the mine? The manager may have a knowledge of the mine, but may take risks that the inspector would never dream of.

10091. *President.*] Do you believe in that subsection (v)? I believe that an inspector should have power to stop any part of the mine that he considered was not safe to work.

10092. Would you give an inspector power to call the men out? What is the good of an inspector if he has not that power.

10093. Supposing an inspector says to the manager, "This is dangerous; the men ought to be called out," but the manager differs from him, and says, "I won't call the men out";—the case would then go to arbitration,

arbitration, but do you think that any manager would dare to keep the men in the mine if an inspector said any part of it was dangerous—would he dare to go on? I should not think so; I would not allow my under-manager to do so.

10094. Is it practically necessary that subsection (v) should be in a Bill giving an inspector power to call the men out;—suppose you did not get a good inspector, would you allow an inspector to have that power, because in some instances he might ruin a mine-owner by calling the men out? I am still of the opinion that an inspector, if he is worthy of the name, should have power to tell the manager to stop that part of the mine, and if the manager thinks different, it is a matter to be settled afterwards, but while they are holding the arbitration the thing may be blown up. An inspector would not take that risk unless there was danger. I never knew of a case where a manager would run in the face of an inspector. If the inspector is not far above an ordinary person he has no right to be an inspector. He is the same as the captain of a vessel, who is supposed to know more than the boy about the decks.

10095. It is your opinion that subsection (v) should remain? I am in favour of the inspector having proper power to stop any part of a mine that might be dangerous, and if he has not that power I think that he ought not to be an inspector.

10096. Do you think that this subsection should read this way, "Where imminent and immediate danger exists"? Yes; I assume that it would be in the case of imminent or immediate danger.

10097. Would you leave it to imminent and immediate danger? Yes; that would be better, in extreme cases.

10098. In such cases only you would allow the inspector to call the men out? Yes; in case of imminent or immediate danger.

10099. Present danger? Yes.

10100. Do you think this is a matter calling for legislation;—do you think that a manager would dare to resist an inspector without it being enacted at all? Is there not a case in point at Stockton?

10101. But the inspectors have since declared that mine to be safe? But there they went on in spite of the inspector.

10102. Was it supposed to be dangerous—likely to cause loss of life at any moment? Yes; that would meet what I wish to intimate.

10103. Do you know that the English Act contains nothing on this subject? Yes; because the inspector has the power there.

10104. *Mr. Gregson.*] The inspector here would have the same power as the inspector in England, so that if it is not necessary in England it ought not to be necessary here;—perhaps you do not find the same amount of discipline here? That is just my difficulty. I am trying to avoid saying anything derogatory to the colonial method of working the mines.

10105. *President.*] Do you think there is not the same deference paid to authority? I find that a difficulty myself, but I see it more elsewhere; more than I do in my own place.

10106. Is that where the whole difficulty comes in? Yes.

10107. *Mr. Curley.*] Are you not likely to put in a qualification to hamper an inspector; if a man is a thoroughly capable man, and intelligent, which inspectors are assumed to be, do you not think the clause would stand better as it is at the present time;—does not the word "dangerous" cover everything? If an inspector is equal to what I have told you, I have no objection to the clause remaining as it is; that is, assuming the inspectors are up to the standard they ought to be.

10108. *Mr. Gregson.*] Would you not be content to try the English Act with the materials we have? Yes; if the inspectors have the same power that the inspectors have at home, I would not object to giving it a trial.

10109. And make the inspectors responsible for their own districts in the carrying out of the Act? Yes.

10110. You are filling round and small coal away together at Wallarah? Yes.

10111. Will you look at section [41] 38, on page 18 of the Bill (*see Appendix A*), "payment of persons employed in mines by weight"—you will see that some words in that section are left out, and other words are inserted;—I think you will see that there is a little alteration wanted to meet your case? Yes; this only applies to large coal.

10112. Do you approve generally of the effort on the part of the Legislative Council to make the wording of the clause apply to the circumstances of the Colony as a whole? Yes.

10113. The wording of the clause as it left the Assembly is according to the English Act? Yes.

10114. Do you approve of the effort of the Legislative Council to apply the clause to the practice here? I do not. It leaves out the small with us altogether. I would not override the system of the Colony altogether—a system that has been in vogue for years; but I am working on a different system. The present system of weighing coal goes on all right.

10115. Working generally, selling round coal, other than round, and small coal? Yes.

10116. Is it not reasonable to make the clause applicable to the circumstances in practice? Certainly.

10117. Your circumstances might be met with "where large and small coal is filled away and sold together the coal should be weighed in the skip"? It is not sold together, the men are only paid on it. After it leaves the weigh-bridge it is divided, and you can make round or small, or whatever you like to do with it.

10118. You would require an additional provision for the taring of the tubs? Yes; the tare is taken of the tubs. We weigh every skip, and an average is taken of the skips, and the skip is balanced to that.

10119. Does not the skip vary? There is a check-weighman, and he checks them as often as he can.

10120. Is there any difficulty in drafting a clause to meet your case? No difficulty.

10120½. Would it be possible to require that all the coal should be weighed in the north? It would upset the surface arrangements. If you have a clean seam with very little band, you might do that—that is, without any risk of dirt or rubbish with your coal, but if you have any dirt you would get a vast amount of rubbish, that would give trouble to deal with. I would not do it with our seam if it was not a clean seam. Our coal seam is favourable for the system we have adopted.

10121. You have a weigh-bridge at the tunnel mouth? Just at the foot of the screens—some 300 or 400 yards away. Every skip passes over the weigh-bridge before it gets to the screen. Our coal requires no handling for band.

10122. You simply separate the small from the round? Yes, that is all.

10123. How many skips a day are you lifting? Between 500 and 600 tons per day, and the skips will hold from 15 cwt. to 16 cwt. each.

Mr.  
T. Parton.  
22 Oct., 1895.

Mr.  
T. Parton.  
22 Oct., 1895.

10124. And you weigh every skip? Yes; every skip.  
 10125. *Mr. Curley.*] Do you know anything about the cost of those weighing machines with a dial—self-registering machines? About £12 apiece. I should think an ordinary weigh-bridge for skips would cost from £10 to £15.  
 10126. Would you regard that as a costly matter to any large company? No.  
 10127. How long will that kind of weigh-bridge last? From ten to twelve years, with a good maker.  
 10128. That would practically mean that the cost would be nothing, so to speak? The cost is not much.  
 10129. You spoke just now about separating the coal;—are you aware that in a number of the collieries in the Northern district there is what is known as the shaker screen, for separating the round from the small coal? Yes.  
 10130. And that practically the whole of the output of the colliery goes over that screen in the day with the exception of what goes to the weigh-bridge? Yes.  
 10131. In that respect, therefore, there would be very little alteration needed? Yes, as far as I know.  
 10132. Would not the weighing of every skip simply mean the computation of what quantity of slack was in the skip, to make a certain allowance in the payment for that;—would not that meet the difficulty of weighing every skip if the standard of the computation could be agreed on between the men and the proprietors? Yes, by mutual arrangement, taking the average of a number of mines over an extensive period.  
 10133. How is your mine ventilated at Wallarah? By furnace.  
 10134. Have you erected a furnace there recently? No; we are sinking a new shaft, but have nothing recent.  
 10135. Not in the new tunnel you opened out some time ago? No.  
 10136. Your furnace, in that case, is very small? There are two furnaces—one for each split.  
 10137. You have not to sink your shaft very deep? No; about 30 or 40 feet.  
 10138. Have you any fire-damp in your colliery? No.  
 10139. Have you a system of inspection every morning? Yes; every morning a man goes in and marks every place with the date.  
 10140. Should that system of inspection be carried out in every colliery? Yes.  
 10141. With regard to sub-section (v) of section 21, giving the inspector power to withdraw men in the face of danger—will you be kind enough to look at that subsection again? Yes.  
 10142. You see, in the first place, that the section deals with inflammable gases prevailing in any mine or part thereof, or of any cause whatever, the mine or the said part is dangerous, the inspector shall have the power to require the manager to withdraw the men. In the first place, he attempts to move the manager; the matter is under discussion before anything is done, and, in the event of the manager declining to comply with the request of the inspector, should not the inspector have the power to order the men out? Most decidedly; that is my view of inspectorship.  
 10143. Do you think the inspectors should pay attention to the size of pillars? They should pay attention to anything that affects the safety of the men. The first thing that the inspector should have in view is, that the mine is being worked under safe conditions. The biggest part of his duty is to look after the safety of the men from whatever cause.  
 10144. *President.*] In those places you mention, where blocks of coal were left 10 yards square, would there be practically a cut-through every 10 yards? It cannot be compared to the bord and pillar system, but you get the air clearer than under the bord and pillar system.  
 10145. If we had always had the English Act of 1872, or sub-section (ii) of the present Act in this Colony, I can understand there being no difficulty with regard to an adequate quantity of ventilation. If you simply provide for an adequate amount of ventilation, do you not think that it may be considered that it has only to sweep past the working-places—will they understand the administration of it;—will they give the men air up in the bords if you do not prescribe for it? I think we should have a minimum here.  
 10146-7. Would you take the air up to within a reasonable distance of the working-place? Yes; to within a reasonable distance.  
 10148. Tell me if this provision would meet your views: "An adequate amount of ventilation shall be constantly produced in every mine, to be in every case at least 100 cubic feet of pure air per minute, and as much more as the inspector may direct, for each man, boy, and horse employed therein, a sufficient quantity whereof, according to the judgment of the inspector, shall be taken to within 15 yards of the working-faces in non-gaseous mines, and to within 3 yards of the working-faces in gaseous mines, to dilute and render harmless noxious gases to such an extent that the working-faces of the shafts, levels, stables, and workings of the mine, and the travelling roads to and from those working-faces shall be in a fit state for working and passing therein"? I think that is intelligible.  
 10149. Does that carry out what you think is right? I do not see any objection to that. In some cases the present system is good enough; it is in my workings at present, but in a mine going to the rise there would not be the same ventilation in the rise as in the dip.  
 10150. Inspectors and managers have been satisfied with 100 cubic feet of air in the past;—do you think it wise to lay down a rule that the air shall be conducted into the working-faces in the future? Yes; I think so.

[Witness withdrew.]

Andrew Sneddon sworn and examined:—

Mr.  
A. Sneddon.  
22 Oct., 1895.

10151. *President.*] What are you, Mr. Sneddon? I am a colliery proprietor and manager.  
 10152. Do you manage your own colliery? Yes.  
 10153. How many years experience have you had in mining? About thirty-five years.  
 10154. Have you worked as a practical miner yourself? Yes, I have.  
 10155. *Mr. Gregson.*] You wanted to have an opportunity for giving evidence before this Commission? Yes.  
 10156. Will you kindly tell us what evidence you wish to give? I wish to speak with reference to the Bill generally. I presume the evidence wanted is on the points of the Bill as it left the Lower House, and the amendments made by the Upper House. I have a list of the clauses I think I should speak on. Section 3, sub-section (1), on page 2 of the Bill (*see Appendix A*). I approve of the amendments made in

in this clause by the Legislative Council, providing that daily supervision shall be exercised either by the manager or by an under-manager. Section 6, sub-sections (i, ii, iii, and iv), on page 3 of the Bill (*see Appendix A*). What has been substituted by the Legislative Council in new section 6 is pretty much the same.

Mr.  
A. Snoddon.  
22 Oct., 1895.

10157. *President.*] What have you to say to section 8, on page 3 of the Bill, "qualification and attendance of engine man" (*see Appendix A*);—what do you say to that section? I do not think that is necessary; I think the provisions of the Bill as regards boilers and engines should be left to a special law, and should not apply specially to collieries. Section 9, sub-sections (i, ii, iii), on pages 4 and 5 of the Bill (*see Appendix A*). The same remarks apply to this section as apply to section 8. Section [11] 10, sub-section (i), on page 5 of the Bill (*see Appendix A*). I approve of the amendments in this sub-section that the Court of Inquiry should be a District Court Judge, police magistrate, or stipendiary magistrate. Section 17, on page 7 of the Bill (*see Appendix A*). I do not think that clause is necessary. I look upon it as being inquisitorial. Section [19] 17, sub-section (iii), on page 7 of the Bill (*see Appendix A*). I think the clause should stand as it was originally drafted with regard to certificates of service. The clause should stand as it left the Lower House. Section 21, sub-sections (i, ii, iii, iv, and v), of page 8 of the Bill "powers of inspectors" (*see Appendix A*). I consider the powers given under this clause to inspectors are too extensive.

10158. *President.*] Do you mean the clause as it left the Legislative Assembly or the clause that has been substituted by the Legislative Council? The Legislative Council's clause is more moderate, and I approve of it. The original clause provides that an examination should be made once in each month, and the Legislative Council's clause, is as often as may be necessary.

10159. And you approve of that? I do. It would be for the inspector to judge.

10160. What have you to say to sub-section (v), giving the inspector power to withdraw men in case of danger? I approve of the Legislative Council's amendments. That gives a general expression about the powers of the inspectors without going so much into detail.

10161. What is the next clause that you would like to speak about? Section [22] 20, sub-section (i) on page 9 of the Bill (*see Appendix A*). I approve of the amendment leaving out the words "and enter such report in a book at the mine." The next section is [30] 28, sub-section (iii), on page 14 of the Bill (*see Appendix A*). I approve of the omission of that subsection, because in my case it would be a very serious matter to have to provide all that is required there on my plans. Sub-section [vi] (v), on page 14 of the Bill (*see Appendix A*). I object to the power here conferred upon the Minister as to the exhibition of plans, and giving information. What is here provided, I contend is provided in section [77] 71, on page 37 of the Bill (*see Appendix A*). The next section is section 36, on page 17 of the Bill, "hours of employment" (*see Appendix A*). I do not consider that this is a matter for legislation at all. Section [37] 34, on the same page (*see Appendix A*). I think ten hours is excessive for boys to be employed under ground.

10162. *Mr. Gregson.*] How many hours would you put it? I would limit it to eight hours actual employment. Section [41] 38, sub-section (i), "payment of persons employed in mines by weight" (*see Appendix A*). I object to this clause *in toto*. It is evidently intended that payment in all cases should be made by weight, and I think it should be optional with any colliery proprietor as to the method of payment. I consider it is much better to pay by measurement from a point of economy, and you can also more easily keep your workings uniform. For instance, I pay by measurement, and by so doing I can maintain the pillars to a uniform thickness. There is no inducement for the men to have their places extra wide, as if they were paid by weight, and my experience is that work is carried on more peacefully than where payment is made by weight. Nearly all the trouble that has been in the Northern district has been in consequence of disputes in connection with payment by weight, and for allowances that had to be made for matter other than coal. Sub-section (iii) of the same clause (*see Appendix A*). This subsection has reference to the standard-weight and standard-bar system. This is a question that has caused a great deal of trouble in the Northern district, and I cannot see that the substitution of the standard-bar for the standard-weight is any advantage to any one concerned. Under the standard-weight the miner knows to what extent he may fill, but under the standard-bar he may, if the coal happens to be too high, lose more coal than he would under the standard-weight. Of course it is necessary that there should be some check to prevent excessive filling of skips, and I consider the standard-weight preferable where a check has to be exercised. Section [43] 40, sub-section (i), page 19 of the Bill (*see Appendix A*). This section refers to the appointment of the check-weighman. I think the choice of a person to fill that position should be limited to the employees of the colliery. Section [44] 41, sub-section (i), page 20 of the Bill (*see Appendix A*). This is compulsory payment of the check-weighman. I think it is very improper to insert such a power in the Bill. I have known cases where the men, by a majority, have ordered the check-weighmen not to act for certain individuals, and if such a power exists the men might have to pay for a service that was not rendered to them. Section [50] 47, on page 23, "ventilation of mines" (*see Appendix A*). I approve of this rule as amended by the Legislative Council, because I consider it would be a physical impossibility to put any quantity of pure air into a mine. By the words "pure air" I understand that the air is to be as pure as in the daylight.

10163. *President.*] Why do you object to this? Because the air, in passing round the mine, gets contaminated.

10164. Is it not sent in pure? Yes; it is pure at the entrance, but the clause provides that it is to be constantly produced and sweep undiminished along the airways. I also do not approve of the shortening of the bords.

10165. *Mr. Curley.*] How do you read the present Act of Parliament on the ventilation business? It reads, "that an adequate amount of ventilation shall be constantly produced in every mine to dilute and render harmless noxious gases to such an extent that the working-places of the shafts, levels, stables, and workings of such mine and the travelling-roads to and from such places shall be in a fit state for working and passing therein, and that an adequate amount of ventilation shall mean not less than 100 cubic feet of pure air per minute."

10166. *President.*] How do you understand that section? That 100 cubic feet of pure air per minute shall sweep undiminished along the airway;—that is, that that volume of air is to travel along the main airways.

10167. Is any of it to go into the working-face? No; I do not think it is intended that the air current should be carried into the bords.

10168. What are the people to do up there? There is a distribution from the main current. 10169.

- Mr. A. Sneddon.  
22 Oct., 1895.
10169. When they are 35 yards up the bord? Generally, if a place becomes too hot, they put a cut-through over.
10170. *Mr. Curley.*] How thick are the pillars in some cases? They vary—4 yards sometimes.
10171. And 35 and 8? Is 43.
10172. Is that a long distance in front of the air? Going to the rise it may be.
10173. You say it may be;—is it? In some cases. The conditions are not all alike.
10174. Well, under the conditions you cite—going to the rise? One set of workings may rise steeper than another. A place going to dip can go double the distance of a place to the rise.
10175. That would be 86 yards before the air? I believe it would be as good at 86 yards in the dip as at 43 yards in the rise.
10176. Then the cut-through should be half the distance that they are at the present time? I do not think there should be any hard and fast rule. I sometimes put them over at less than 35 yards.
10177. Do you think that the men should have efficient ventilation? Undoubtedly.
10178. That there should always be efficient ventilation throughout the mine? Yes; that there should always be an air current.
10179. *President.*] Everywhere? I do not know whether it is possible to produce it everywhere.
10180. It is possible to produce it everywhere, but do you think the men should work without sufficient air in any place? No.
10181. Well, how are they to get it? Well, the provisions made in most cases are sufficient.
10182. Under the present Act it is not sufficient, because you say the men work 43 yards in front of the air;—what air is there for them then? The passing along of this current of air carries any impurities that are in the working-place. It is only possible in the case of a long-wall to ventilate every working-place.
10183. If people use brattice, could they not ventilate the bords and working-places? The air-current can be carried into the working-place, but to do so you would impair the efficiency of the current.
10184. In that case you would send down a little more air? I question whether you can. You would have to multiply your currents so much. If the mine is divided into parts and the whole current is to be carried into each bord, there are four right-angle turns in each bord. As I read the clause, the air is to be carried past each working-place under the present Act; of course, the air in passing the working-place is distributed into the working-place.
10185. *Mr. Curley.*] Without any means to put it there; it comes of its own accord? Yes; it gets there. When a man goes into his place in the morning the air is fresher than when he left there the previous evening.
10186. *President.*] Do you say that a place is fresher in the morning than it is in the afternoon? Yes; the air-current, while circulating in the night-time, has purified the mine. There is nothing to contaminate the mine.
10187. *Mr. Curley.*] How do you ventilate your mine? By natural draught.
10188. Have you a furnace? Yes.
10189. What kind of a furnace? Brick.
10190. Do you keep it going all day? Yes; all day.
10191. When does your furnaceman start work? I have no furnaceman.
10192. Who looks after the furnace? The person in charge of the mine.
10193. The overman? Yes; the overman.
10194. How many men do you employ at the colliery? Not a great many.
10195. *President.*] How many men are employed? About 50 or 60 at one mine, and about 30 at another.
10196. *Mr. Curley.*] Take the Northern Extended Mine; is that where you have the 50 or 60 men? Yes.
10197. Where there is gas in a mine has not the air current to be taken to the working-face? Where there is gas in the mine it follows, as a matter of course, that the air-current must travel to prevent the accumulation of gas.
10198. If there is black-damp, must you not attempt to get that out? You cannot work in carbonic-acid gas.
10199. In some cases, is it not imperative to get the air-current up to the working-face to get this gas out? Yes; otherwise you cannot work at all.
10200. So that the air-current can be got to the working-face if required? Yes, it is possible; but it is not a general thing that every place in a mine is subject to gas—either explosive gas or carbonic-acid gas.
10201. Does not every place want ventilation? Yes; every place wants ventilation, and every place is ventilated.
10202. Seeing that you say the present conditions are sufficient, in even the rise places, would you propose that in the dip places these places should be extended to double the distance of what they are? No; I would not, for other reasons than ventilation.
10203. What is the next clause in the proposed Bill that you wish to refer to? Rule 4, sub-section (1) (*see Appendix A*), with reference to the inspection of mines. It is quite evident that this inspection is intended where gas exists, I think the clause should be amended, and read, "That where gas exists a competent person, or competent persons." As the rule stands, I consider it should be amended.
10204. *President.*] I do not think we can amend it, as both Houses have agreed to that rule? Will there not be a new Bill introduced? The next rule I wish to refer to is rule 6, on page 25, "fencing of entrances" (*see Appendix A*). I have the same objection to that rule.
10205. *Mr. Curley.*] I might ask you, do you inspect your mine every morning? I do not.
10206. Does the overman? He is about the mine, and passes through it every day.
10207. Does he inspect the mine every morning? I do not think he does.
10208. Are none of your mines inspected every morning? No; I do not think it is necessary. Where no gas exists there is no inspection necessary for that purpose. I was saying that I have the same objection to rule 6 as I had to rule 4, sub-section 1.
10209. *Mr. Gregson.*] That rule is not objected to by either House? I am glad to hear it.
10210. All parties have agreed to let that rule stand;—no one objects to it except yourself? I think it is not necessary. No workman has any right to be in any place but his own. If I have to fence every place that is not in actual use, I will have a lot of work to do which I consider is utterly useless. The next rule I would like to draw attention to is part E, of rule 12 (*see Appendix A*). The original clause provides

Mr.  
A. Sneddon.  
22 Oct., 1895.

provides that no person shall return to a place where a charge has missed fire until a period of eight hours has elapsed from the lighting of the fuse attached to such charge. Would that include a squib?

*President:* Yes, as it stands.

10211. *President.*] Will it suit you to say, "But in places where a fuse is used, no person shall return to a place where a charge has missed fire, &c."? Yes.

10212. *Mr. Gregson.*] What is the next item you wish to refer to? Rule [20] 19, on page 28—"Trolley over pit mouth." (*See Appendix A.*) I think that rule ought to stand. I think it is a reasonable provision, especially where a shaft is sunk with the aid of an engine, a gin, or a whip. The next rule is rule 25, on page 29—"Coal not to be wrought under roads (*see Appendix A.*)". This rule prohibits the working of coal under any proclaimed road, without the sanction of the Minister. It has been struck out by the Legislative Council, and I am in favour of the omission, as it would prejudice me very materially in my operations.

10213. You are mining under roads? Yes.

10214. What right have you to the coal? I have a lease of the coal.

10215. From whom? Brooks, Kenrick, and Platt.

10216. Was that lease given to you before that road was made? No; but the coal was leased prior to the dedication of any streets or roads.

10217. You are the assignee of their lease? Yes.

10218. Was your lease transferred from somebody else after that road was made? Yes.

10219. How long ago is it since you got this lease? Fourteen or fifteen years ago.

10220. Had those people the right to lease that coal? Yes; they reserved the right to work the coal in all the land they sold.

10221. Did they dedicate the streets? In some cases they did, and in other cases there was no dedication. I am working with a view to protecting the safety of the streets.

10222. Have you not let a street or two down because of your operations? The Newcastle Road was let down.

10223. Was that a proclaimed road? Yes; it was a main road.

10224. Was it a dedicated road? I cannot say.

10225. You object to this rule as it stands? I do. It would have the effect of closing one of my mines.

10226. *Mr. Curley.*] Have you done a lot of undermining about Brookstown? Yes; I worked all the coal that I could get—all that was profitable to work.

10227. Do you know of a street collapsing some time ago and a cart going down on the street, although it was supposed to be kept up? I do not.

10228. You do not know anything about that? I do not.

10229. It does not trouble you whether the streets or the houses come down? I have had to pay for anything I have done, and I have taken all reasonable caution to prevent subsidences.

10230. Had not the whole of the people to make arrangements with you in order that they might get away? I bought the properties at a valuation.

10231. Did not they agree to some kind of valuation in consequence of the scare that your workings were creating? I do not know why there is a scare where I am working.

10232. There was a scare? Interested parties got up a scare.

10233. Had they a right to do so? No; they had no right to do so. If I injure another person I am responsible for it.

10234. You are responsible this far: that unless anybody pursues their right you will in no way recognise it—that is, unless they pursue it in a legal way? Whatever rights persons have I cannot take them from them.

10235. Did you recognise the rights of these people before this arbitration was agreed to? I laid the place out with a view to working with safety.

10236. Did you work it with safety? Yes.

10237. Did any houses collapse? Yes; but that was after I bought them.

10238. Did any houses collapse before you bought them? No.

10239. Did any of the streets collapse? I did not buy any of the streets.

10240. Did any of the streets collapse? No, I do not think so. I have no recollection that they did.

10241. Do you know that the Municipal Councils have stated that this matter has put them to a good deal of expense, in putting streets into repair, and in going into litigation on the matter? I am aware that the Council and their representatives have made all sorts of wild statements. No Councils have been to any expense in repairing streets in connection with my workings.

10242. If a street went down, who would have to repair it but the Council? I do not know of any case where I am working where the municipalities have had to repair a street.

10243. But where you have been working formerly? I have repaired all damages that have occurred to any streets.

10244. Do you know whether the Councils have expended any sums of money for repairing streets? Not for repairing streets.

10245. They have not done that? I have no knowledge that they have ever done so.

10246. If it has been stated that they have been put to expenses, should we accept the statement from a man who is likely to know? I say that, of my knowledge, neither of those Councils have been put to any expense repairing streets.

10247. Have you undermined any properties recently? I am undermining properties now.

10248. Have you damaged the surface in any way? No; I am mining with a view to the safety of the surface.

10249. Do you know Estell's place? Yes.

10250. Have you not injured his property? No.

10251. Had he a tank there? Yes.

10252. Was that tank destroyed? Yes.

10253. Was that the result of undermining? Yes.

10254. Was not that an injury to a man's property? It is an injury to a man's property.

10255. *Mr. Gregson.*] Do you say that you did not do it? Yes: Estell's property is over old workings that had been worked long before he purchased the property or the time at which I received the right to work the coal.

10256. *Mr. Curley.*] How do you account for it collapsing quite recently? I cannot say. 10257.

Mr.  
A. Sneddon.  
22 Oct., 1895.

10257. Have you pumped any water out there recently? Yes; with a view to working whatever coal I have a right to work.
10258. Had you commenced operations anywhere near this property at all? Nowhere near it.
10259. Had you not begun to pump water? Yes; for some considerable time.
10260. From this particular locality? From the Old Co-operative Mine.
10261. *Mr. Gregson.*] In doing so, did you drain the water from those mines;—have you lowered the level of the water generally in the Old Co-operative Mine? Yes.
10262. *Mr. Curley.*] Did you do any undermining on the public road going to Minmi? Yes.
10263. Was that with the permission of the Department? No.
10264. Had you the right to work under the road? Yes.
10265. Who from? The lessors.
10266. How long has that road been made? Some years.
10267. In that case, did you work with a view to safeguard the road? Yes, I did.
10268. You had some regard to the surface? Yes, I had. I worked places 5 yards wide, where the usual practice is 8 yards wide.
10269. *Mr. Gregson.*] What pillars did you leave? Four and 5-yard pillars.
10270. What was the cover? It varied from 30 feet to 70 feet.
10271. *Mr. Curley.*] Do you think that parties who take up surface land, with the mineral underneath, where the owners have both surface and mineral rights, that after selling the surface owners should allow the coal to be worked in any shape or from? I think if a man sells land and reserves the coal, he does so with the intention of working the coal.
10272. Should he respect the surface value that he sells where people buy it and make homesteads? When a man reserves coal he reserves it with the intention of working it.
10273. Should he respect the surface he has sold? In the places I am working I am working with a view to that object. I have no right to be expected to answer for other people. I think every man has a right to do the best with his property.
10274. Either surface or mineral? Yes.
10275. According to your opinion, should he do so? I do not think so. I think he has a right to work as much as is consistent with the safety of the surface.
10276. Have you anything else that you would like to refer to in the Bill? I would like to refer to rule 34, on page 30, "Examination of boilers" (*see Appendix A*). This rule has been struck out by the Legislative Council, and I think properly so. I think that until a general law is passed that collieries should not be picked out for special legislation in this respect.
10277. How many boilers have you at your Northern Extended Colliery? Two.
10278. How long is it since you purchased them;—how long have they been in use? One has been in use six years.
10279. What about the other one? It has been in use about a year less—five years.
10280. Were they in use before you got them? One of them was.
10281. Where was it in use? At Yates' place, at New Lambton.
10282. Do you know how long it was in use? For a short time.
10283. How long? Not more than a year.
10284. Was it new when Yates got it? I understand it was.
10285. Are they very large boilers? No, small boilers.
10286. What pressure do you work them at? From 40 lb. to 50 lb.
10287. What pressure will they carry? I never tested either of those two boilers. The horizontal boiler for the hauling engine has been tested since the repairs, but it has not been put into work yet.
10288. Do you keep an engineer? I could not say I have an engineer. The man who has charge of the engine and boilers has an engineer's certificate for river steamers.
10289. Is this the man you depend upon for the inspection of the boilers? Yes; I have also had considerable experience myself in connection with boilers.
10290. Can you see any harm that an inspection would do with regard to the inspection of your boilers? I do not think it would do any harm, but until there is a general law passed for the inspection of machinery generally, I do not think that collieries should be singled out. It is not to any colliery proprietor's interest to have defective boilers.
10291. What harm can an inspection do? It cannot do any harm. It will probably be an additional appointment for somebody—an additional burden on the State.
10292. And may it not be the means of preventing some boilers being blown up? I think the Newcastle district has been very free from explosions, showing that reasonable care must have been taken in the management of collieries.
10293. Is that the only reason you can give that it will be burdensome on the State? I have no wish to add to the burdens of the State.
10294. That is the only wish you have? I draw things rather fine. I believe a law for boilers is necessary generally.
10295. Even if it would entail inspectors being appointed? Yes.
10296. In that case the State would have to bear the expense? Yes.
10297. Do you know the system that is in operation in England with regard to boilers? No.
10298. Have you never heard the proprietors talk of the insurance system in connection with boilers? I cannot speak of the practice at home. I was young when I came to this country.
10299. Is there any other matter that you wish to refer to in the Bill? Yes; rule [35] 33, on page 30, which provides for a barometer and thermometer (*see Appendix A*).
10300. *Mr. Gregson.*] There is no objection to that rule? But I object to it.
10301. Nobody else objects to it? In the case of either of my collieries the cost of a barometer and thermometer might as well be thrown into the sea. The rule should be amended to read "Where gas exists."
10302. If the majority are of opinion that that rule should exist, we cannot alter it? I think the law should be framed to meet all cases.
10303. What would a barometer and thermometer cost? Whatever the money was, it would be money wasted. To the like of the A. A. Company it is no object, but in my case it is. I might as well place a barometer and thermometer up on a tree. I think the law should be constructed in an elastic way, to meet various

various conditions. A barometer and thermometer being unnecessary I may not put them there, and consequently I may be liable to a prosecution from the inspector.

10304. *President.*] Do you think there would be a prosecution? In my experience there are any amount of people who are on the alert to prosecute me.

10305. *Mr. Gregson.*] This rule applies to where a shaft is being sunk? I know it does, and if I started to sink a shaft, I should want a barometer and thermometer.

10306. *President.*] Look at what a mine includes, in section [78] 72, on page 38 of the Bill (*see Appendix A*). That section is the same as the English Act, and everybody concurs that the English Act is good? In some cases, the English Act does not apply to the local conditions.

10307. *Mr. Gregson.*] Shall we pass to the next matter you wish to refer to in the Bill? The next matter is rule 41, on page 31—"Person not to be employed in coal-getting without experience." (*See Appendix A*). I object to the whole of that rule, to what might be called inexperienced miners.

10308. Why? As an employer of labour I should have all the labour that is available when it is required.

10309. But you are not to allow a man without experience to work alone, because he might blow up the other people? In the case of a gassy mine it might be a reasonable provision, but it was not inserted for that purpose.

10310. *President.*] It is in the English Act. I cannot understand any reason except that an inexperienced man shall not work without an experienced man? The chief reason is that in times of labour troubles you shall not take any outside labour.

10311. *Mr. Curley.*] You only assume that, Mr. Sneddon? I assume it with good grounds.

10312. *President.*] Do you object to rule 42 (*see Appendix A*)? Yes; these provisions do not affect me in my operations, but, speaking in the interests of the coal-trade generally, I consider it is unnecessarily meddling with the details of management, and, if passed, I think, if I was the proprietor, I should consider whether it was better to shut up or carry on.

10313. Does that apply also to rules 43, 44, 45, and 46 (*see Appendix A*)? Yes; and to section 51, which is consequent on those rules.

10314. *Mr. Curley.*] What precautions would you take yourself? If I was in charge of a mine under tidal waters I would take such precautions as I would deem necessary in the interests of the property and the workmen.

10315. What would you do under the ocean? I would work a bigger proportion of the coal than is spoken about in these rules.

10316. What would you do? I would work half of it.

10317. *Mr. Gregson.*] Would not that depend on circumstances? Yes; but I say all this detail is better left to the management.

10318. *Mr. Curley.*] If you had gas, what would you do? I should take whatever precautions I deemed necessary under the surrounding circumstances.

10319. Would you like to be absolutely free—to have your own way? I cannot, because under the Act the inspectors have certain powers, and if I was to do anything to endanger the men the inspector would act.

10320. Should the inspector have power to draw your attention to general matters? Yes, undoubtedly.

10321. And if he did not think you were right, he should bring you to book? Then it is a question of who is right and who is wrong. It is a very intricate question, and we have had examples.

10322. Would you stipulate any width for bords under the ocean? It would depend on the cover and the nature of the cover. Under certain circumstances, it would be justifiable to work bords the ordinary width.

10323. Eight yards? Yes.

10324. With 200 feet of cover? It would depend what the cover is. If 150 feet of that was water it would not be safe.

10325. What would you do then? Reduce the area.

10326. To what distance? It might be a half.

10327. What would you leave the pillars? Not in excess of the area worked.

10328. *President.*] Would you work narrower bords and have more frequent supports? Yes. It specifies the maximum width of a bord as 6 yards, and you must leave the pillar 12 yards. Where a 6-yard bord was safe a 6-yard support on each side would be ample; that is, in a seam of the normal height. Of course, if it was a high seam, the pillar would be in proportion to the height.

10329. If it was a deeper seam? Then you must take the height of the seam and the weight of the cover.

10330. Would you prohibit the removal of the pillars? In certain cases it might be safe to remove pillars. If there is 100 feet of stiff clay, or a considerable thickness of clay, it might be possible to remove pillars. The German Ocean is worked under and the coal is all taken out.

10331. What is the depth there? About 1,000 feet, or thereabouts.

10332. Would you put in bores in advance in your leading drives, or anything like that? If I had no knowledge of the depth of water I would. Any person working under such conditions would have to post himself up with all the information available.

10333. *President.*] Have you anything else you wish to refer to in the Bill? I think I have passed one matter—rule [40] 38, on page 30, "Periodical inspection on behalf of workmen" (*see Appendix A*).

10334. You do not want the words "any two persons"? I want the clause to read "miners employed in mines."

10335. You do not want "any two persons"? No; not any two persons.

10336. Well? The next thing to which I take exception is section [63] 58, sub-section (II), on page 35 (*see Appendix A*)—the inequality of the penalties. I always understood that in British law all men were equal under the law, but in this section certain men are singled out for extraordinary penalties. I am aware that this section is in the English Act, but to my mind that is no justification. With regard to the under-manager, he may not be able to pay a fine any more than the ordinary workman.

10337. He is supposed to be a more intelligent man? There are certain circumstances in which he might have to commit a breach of the law. The section provides for a fine of £20, but in the case of the other person, £2. In my opinion, the penalty should be the same.

10338. The Lower House wants £1 to read £5; I do not think it is material? It is a matter of principle.

10339. *Mr. Gregson.*] Have you lost sight of the fact that you gave evidence in December, 1890, in connection with this Bill, which is almost the same as you are giving to-day? No.

10340.

Mr.  
A. Sneddon.

22 Oct., 1895.

Mr.  
A. Sneddon.  
22 Oct., 1895.

10340. If you were not called some time sooner, it was because we had this evidence here, which will be given full weight to. The evidence you have given to-day is only a repetition of that? I think there are some matters that are additional. The next, and final matter I wish to refer to, is section [77] 71, on page 37 of the Bill. (*See Appendix A*).

10341. *President.*] There is no doubt about that section? I think it should be amended to read after the word "mine" (of which he is the owner or lessee of the minerals in such adjoining lands). The object of the Bill is to guard against encroachment on other properties, and if the persons claim an inspection who do not own the mineral, there can be no encroachment. The term "equitably interested" is very wide and elastic. I have a right to mine under the streets of Platsburg, and in carrying out that mining, no person should have the right of inspection, when I am not encroaching. The property is mine. It is quite justifiable in the case of an adjoining mine-owner.

10342. Why not? Because it gives power to a person owning adjoining land. Why should he have the right, if he knows the coal was sold and he only bought the land?

10343. If you have a right to mine you are not encroaching, but if I own this land I have a right to see where you are working? Under this clause an application was made to inspect my colliery, and I objected because I thought the applicants had no right, but I was ultimately prosecuted and fined, and yet I was right, because they had no right to the coal.

10344. *Mr. Curley.*] You object to the Council having a right to inspect your colliery? I do.

10345. *Mr. Gregson.*] Have they not the care of the streets? Yes.

10346. And do you object to their knowing what is going on underneath the streets? Yes, I do. I have the right of mining under the streets, and I know that there are certain consequences attached to careless mining, and I guard against these, and if anything occurs I have to pay the piper.

10347. Might it not save you a great deal of trouble if the Council had power to see what you are doing? The trouble has been all the other way; it has been purely a personal matter.

10348. *President.*] I do not see how much trouble could arise from an inspection. Do you say that the Municipal Council should not have power to see whether you are mining skilfully or not;—would it not be better for anybody if they had the right to get an injunction against you? An injunction was applied for, and the Judge admitted my right to mine under the streets.

10349. You had to work under the supervision of Mr. Croudace? Yes; but Mr. Croudace did not make any improvement on the method I was working under.

10350. Do you not think people should have the right to see that everything is safe;—should not the Council have the power to look after the interests of the ratepayers? These powers in my case have been wrongly used. I have been put to great annoyance and expense by Municipal Councils in my district, because it was a personal matter.

10351. We are not considering a case between two private people;—can you say that it is wrong for the municipality to have the right to see that you are mining in such a way as to be able to say that it is safe for anybody? There is no such provision in the English law, and if it is not necessary in England there can be no necessity in this Colony.

10352. *Mr. Curley.*] Do you not know that in England the mines are down a great depth? It is there as here; they are both shallow and deep.

10353. Have they shallow mines in England? Yes. Previous to my advent in mining in the Northern district there was never any question as to mining under roads, and no special care was taken wherever a mine was carried on. No matter what the circumstances were it was the ordinary width; but when I came into mining I was not able to work in harmony with the Miners' Union, and every means was taken advantage of to combat me.

10354. You put it down to the Miners' Union? Yes.

10355. Did you ever know the Miners' Union to interfere in these lawsuits? No; but the prominent men in the Miners' Union are the prominent men in municipal matters.

10356. Did you ever know me, as Secretary of the Association, to interfere with any of your undermining business? No, certainly not; but only recently the Chairman of the Miners' Union went with a deputation from the Municipal Conference to the Minister for Mines and there made statements which were untrue and of which he had no means of knowing whether they were true or not.

10357. Should you not add something else to that statement;—should you not say that the Chairman of the Miners' Union owns a homestead on the Co-operative Estate? I am not undermining his homestead, nor likely to undermine it.

10358. Is he not an alderman of the borough? Yes.

10359. Is he not Mayor at the present time? Yes.

10360. Has he not the right to look after the streets? You can often kill a dog with butter.

10361. Because a man happens to be identified with the Union everything he does of a public character is to be attributed to the Union? He made a statement to the Minister that he had no means of ascertaining whether it was true or not. One statement was that I was removing pillars under the old Co-operative Colliery, and, as a matter of fact, the surface would subside; but, as a matter of fact, no pillars have been removed.

10362. Do you intend to take any pillars out? What my future action will be I cannot say; but in the future I must take into consideration the safety of the surface.

10363. You will please yourself what you do? I will please myself what I do with my own. I will not undermine anybody's property for the sake of undermining it and laying it down.

10364. You think the municipalities have no right of inspection to see whether the streets have been interfered with? In my own case it has been purely a personal matter.

10365. The Miners' Union have never taken any action in this matter, and is not that the best proof that they have done nothing? They did not need to do so.

10366. I think you have told us, with regard to the weighing business, that that particular clause in the Bill would compel you to pay by weight. Where do you find that stated in the clause? From my reading of the section I believe that will be the effect of it, and I think those who succeeded in getting the clause drawn intended it to act in that way. That clause has been specially framed to catch me, as well as rule 25. You have given the Department a great deal of trouble about me and my workings.

10367. You say that section [41] 38 in the proposed Bill (*see Appendix A*) would compel you to pay by weight if it became law? I think so.

10368. Where do you find it in the clause;—does it not say "where the amount of wages paid to any of the

Mr.  
A. Sneddon,  
22 Oct., 1895.

the persons employed in a mine depends on the amount of large shale or coal gotten by them, those persons shall be paid according to the actual weight of such large shale or coal gotten by them, such weight being ascertained in such manner as may be agreed upon by the owner, agent, or manager of the mine on the one part, and the persons so employed on the other part; and in the absence of such agreement such coal or shale shall be truly weighed either at the bottom of the screen or at the place as near to the pit-mouth as is reasonably practicable, &c."—that is, where there is a regulation as to the payment by weight? In the absence of a specific agreement between me and the parties, the clause would compel me to pay by weight.

10369-70. Is that your reason for objecting to it? Yes.

10371. Is your mine almost the only mine where the system of not paying by weight is existing;—is yours not an isolated case? I do not know of any other mine that is not paying by weight.

10372. You do not know of any other proprietary? At the present time I cannot think of any.

10373. Do you not think you are an exception to the general rule in that case? I believe I am an exception in the district. I do not see fit to adopt the method.

10374. I think you said that there was considerable trouble about the payment for certain matters that had to be cleaned from the coal in connection with this very clause? Yes.

10375. Is not that a specific payment that has to be paid for in connection with the workings of a colliery in the way of bands and so on; I am speaking in a general way? Of course it is bound to be a matter of dispute when deductions have to be made. That is one of the reasons why I prefer payment by measurement.

10376. The only matter is that the men are supposed to fill clean coal? I believe the inducement is greater to fill clean coal by measurement than by weight.

10377. That your system is superior to any other system in the district? In that respect it is. If a man is employed by weight, and he can pass stone, there is an inducement to do so.

10378. Do you not know that where a miner is paid by weight, that, as a rule, coal when it is put down the screen goes into the weigh-box, and that it comes under the scrutiny of the weighman? Yes.

10379. And that the refuse is taken out before the coal is weighed? Yes.

10380. What inducement can there be then? The inducement to me to pay by measurement instead of weight is a matter of economy. I save the expense of the men's wages, also the cost of a weigh screen, and weighing apparatus, and there is no friction with the men about being cheated. Every man can check his own work; it is there for him to measure as well as me, and another advantage is that I can with less trouble keep my pillars uniform, because there is no inducement for the men to work the place wider than it ought to be. Beyond a certain width they are not paid.

10381. Are these your only reasons? I think they are good valid reasons.

10382. Is your chief reason in this matter that in the method you have adopted you believe you get your coal worked cheaper than you would under another system? If circumstances were such that I had to pay by district weight, I would have to pay more by weight than I would by measurement. It is all a matter of profit, but the miners employed by me make more money than where they are employed by weight. If the local conditions are such that in the A. A. Company's mines a man can get 2 tons, and in my mine 4 tons with the same exertion, I have no right to pay him what the A. A. Company pays him. If 10s. is the standard, I have no right to pay him more than 10s.

10383. Is not this a matter of general agreement? I have never been a party to any of those agreements.

10384. Were you not a party when you were a miner yourself? Yes.

10385. In that case you were a party? Yes.

10386. With regard to this measurement business, would you have any objection to any man being appointed from amongst the men to go round and see that the measurements were correct, just in the same way as checking the weights? I would have no objection; but it is not necessary.

10387. I ask you that question again: in the event of the men wanting to appoint a man to look after their measurements, and to go round the whole of the colliery and take the measurements from time to time, would you have any objection to the men doing so? None whatever.

10388. Have you any objection to the men appointing a check-weigher? In my case there is no need for a check-weigher, as I do not pay by weight.

10389. Have you any objection to the men appointing a check-weigher? If I was paying by weight I would have no objection.

10390. Would you interfere with any of their meetings with regard to their ballots? I do not see how I could.

10391. Did you discharge some men some time ago? Yes, I did.

10392. How many? Four men.

10393. Why? I suppose that as a man is privileged to leave my employment I can have an equal right to dispense with his services when I think fit. The reason why these men were discharged was that they had made a demand to be paid by weight and I refused to accede to the request. Subsequently a formal request was sent to me in writing, signed by each man in the colliery, and I was given to understand that that course was pursued with your instructions. I declined to pay by weight on that formal request.

10394. And you discharged the men for making this formal request? I discharged the men for having gone in to work on my terms. They first of all signified their determination not to resume work, but when the other men were going to work they wanted to return to work too, and I declined to permit them, but at the solicitation of the other men I allowed them to start; but no sooner had they started than they got up this requisition to pay by weight, and I considered that they had not acted fairly, and therefore I dispensed with their services.

10395. Do you know, independently of what opinion I hold, that these men of their own accord wished to be paid by weight;—do you know that? I cannot say; but before that they had requested to be paid by weight and I declined to do so, and that was at the instigation of people not employed in the colliery.

10396. You think they have no mind of their own? I think they have a mind of their own.

10397. And, having that mind, do you think they should exercise it occasionally of their own free will? They have a mind of their own, but when they become members of an association they are supposed to submit themselves to the will of a majority.

10398. *President.*] I do not think there is anything else we wish you to refer to, Mr. Sneddon.

[Witness withdrew.]

Richard Thomas sworn and examined:—

- Mr. R. Thomas.  
22 Oct., 1895.
10399. *President.*] What are you, Mr. Thomas? I am colliery manager for Messrs. J. & A. Brown.
10400. Where? At the Brown's and Duckenfield Collieries, Minni.
10401. How long have you been a mining manager? As assistant and manager, I have been connected with mining for the last thirty years? I have been a colliery manager for nineteen years, and was an assistant previous to that.
10402. *Mr. Gregson.*] How many years experience have you had altogether? Thirty years altogether.
10403. Nineteen years of that thirty years as manager? Yes, nineteen years as manager. I hold a first-class certificate under the English Act.
10404. A certificate of competency? Yes.
10405. What other collieries have you managed? In this Colony, the Stockton Colliery; and in England, the Clydach Vale Colliery.
10406. In what part of the old country? In South Wales.
10407. In what year did you leave the old country? A little over nine years ago.
10408. Was that before the Act of 1887 came into force? Yes; I worked under the Act of 1872.
10409. Will you look at our present Coal Mines Act of 1876, subsections (ii), (iii), and (iv), of section 12, with regard to the ventilation of mines (*see Appendix B*);—how do you interpret those clauses? With regard to them as a whole?
10410. Generally, what is the effect of them? As far as the minimum is concerned, I do not consider it too much in a mine, but I think that going into detail too much hampers the working of a mine. I would not object to 100 cubic feet of air as a minimum, or even more; but taking it undiminished, without regard to certain circumstances in various portions of the mine, I think it rather hinders than helps the efficient working of the mine.
10411. What are you bound to give under that Act? 100 cubic feet of air.
10412. Having done that, have you done all that the Act requires? Yes.
10413. Where is that 100 cubic feet of air to be required? Along the airways past each working-place; but subsection (iv) makes the meaning clearer by saying no place shall be driven more than 35 yards before the current.
10414. If you supplied 100 cubic feet of air per minute along the airways past each working-place, would you consider that you had complied with the Act? I would.
10415. Is that the common acceptance of the wording of the Act? I think that is a reasonable construction.
10416. *President.*] Do you say that if you have supplied 100 cubic feet of air that you have done all that is necessary in all cases? So long as it is sufficient to dilute and render harmless noxious gases.
10417. If you have supplied 100 cubic feet of air, have you done all that is required by the Act? I have.
10418. No matter whether the gases are diluted or not? Oh, no; I consider I would not have done so. This provision makes it very difficult for the inspector to prove his case.
10419. What do the words "not less as a minimum" mean? It really means that you shall keep that place free from noxious gases, but even without noxious gases you must send 100 cubic feet of air there.
10420. What place do you refer to; you said you must keep that place free from gas? The working-place, and all places where men travel.
10421. Are all the working-places to be kept free from deleterious gases? I consider I am bound to do that by this Act.
10422. Is there anything else you have to do? Yes; to restrict the splits to seventy men.
10423. And have you not to keep the places in a fit state for working and passing therein? True, that is another provision.
10424. Do you think that the provisions in the proposed Bill are sufficient? I consider they are more than sufficient.
10425. What would you suggest for the proposed Bill? I consider that an adequate amount of ventilation is all that is required. That is still the provision in England, and the matter has been thoroughly thrashed out, and the inadequacy of this provision has never been spoken of by inspectors or miners' advocates. This is what we have acted upon all through. It gives the inspector full power, no matter if there was 300, 400, or 500 cubic feet of air, to prosecute a manager if the place was not fit for working or passing therein. Under the English Act a manager is not bound to provide any quantity.
10426. Do you think that sub-clauses (iii) and (iv) have tended to confuse matters and make them worse than they might have been? Yes, as they imply that the old workings do not need ventilation, whereas, the Royal Commission at home, in their final report—
10427. Which Royal Commission? The Commission on Accidents in Mines—have laid very great stress upon the importance of ventilating worked out parts of the mine.
10428. Do you think that subsections (iii) and (iv) of the present Act in this Colony have produced some confusion here? I have seen nothing as yet.
10429. You do not think that they have caused any confusion at all? Not as yet.
10430. You think that as long as an adequate amount of ventilation has to be supplied that these two subsections may be dispensed with? I am of that opinion.
10431. That, having an adequate amount of ventilation in all parts of the mine, nothing more is needed? I think not, and it gives the inspector a freer hand to demand what quantity he thinks necessary.
10432. Would you be surprised to hear that there has been a good deal of doubt cast upon the working of the present Act in this Colony;—have you not heard anything? No; I have not heard anything, except that it is supposed that this 100 cubic feet would hamper an inspector if he wanted to conduct a prosecution—that a Magistrate would take the 100 cubic feet as sufficient. I would take it that I would be bound by subsection (ii) in the same way as I would be at Home.
10433. You think that subsections (iii) and (iv) are superfluous? I consider the ground is wholly covered by subsection (ii).
10434. Would you accept the wording of the English Act with regard to ventilation in the proposed Bill;—that is virtually subsection (ii) of the Act of 1876? I would.
10435. You do not think that the provision in the proposed Bill with regard to splits and cut-throughs is necessary? No, I do not.
10436. Do you think that any minimum should be provided? I do not see any necessity for it, but I do not see any harm in a minimum.

Mr.  
R. Thomas.  
22 Oct., 1895.

10437. Do you not think there would be a doubt in the event of the magistrate convicting? In that respect I do. An inspector would have much greater difficulty in carrying his case through.
10438. You are aware that some of the seams in this Colony are 3 and 4 yards high? Yes.
10439. Supposing there was a minimum of 100 or 150 cubic feet of air per minute, how could you measure that air in the working-place? You could not measure it for a small number of men.
10440. There are two men working in each place as a rule, and occasionally a wheeler and a horse? Yes.
10441. That would be 600 cubic feet of air for a place 3 yards high? That would require a velocity of 30 feet, and the anemometer would not register that.
10442. How would an inspector know that the place was adequately ventilated? An inspector never uses the anemometer at home—he carries a safety-lamp.
10443. How would an inspector know, in the case we are speaking of, whether the mine was adequately ventilated? His light would show him.
10444. His lamp? Yes.
10445. And his own senses? Yes.
10446. His sense of smell would help him? No; not in all cases.
10447. Would he not smell the powder smoke? Yes.
10448. His own senses and the flame of his lamp would be sufficient? Yes; at home the inspector never measures the current.
10449. Do you think that would be sufficient to enable the inspector to say whether there was an adequate quantity of ventilation? Decidedly.
10450. If it were objected to—suppose the manager held a different opinion to the inspector, and said that the mine was adequately ventilated? In that case the inspector would always have the workmen to stand by to prove his case. If gas showed in his lamp the proof would be there at once.
10451. The case would go to arbitration? I have seen no case of dispute in which it was necessary to go into arbitration.
10452. Speaking of your general experience, is it likely that the manager would object to the inspector's dictum? I have never heard of a complaint to that effect at all.
10453. Do you think it is likely? I do not think it is.
10454. Do you think a manager would rectify the defect or fight it out before an Arbitration Board? I think there is the greatest wish on the part of managers to carry out whatever the inspector may require.
10455. To give more air if the inspector says more air is wanted? True.
10456. If the inspector does not use his anemometer in the working-places, where does he use it? At different places in the split. If he thinks the air is slack in any portion of the mine, he tries it in the main intakes and the returns.
10457. Assuming a split with sixty men in it, that would be 9,000 cubic feet of air on a basis of 150 cubic feet per minute, how many places would there be going in such a district? Thirty places.
10458. Allowing for the wheelers, say twenty-six or twenty-seven places? The wheelers are not counted.
10459. I assume a case for my own purpose;—assuming that there are sixty men, boys, and horses in a split, how many working-places would there be? Say twenty-seven.
10460. How would you propose to carry the air into each place of these twenty-seven places? I should propose to keep the full quantity on the main airway, and to take a sufficient quantity into each bord to dilute and render harmless noxious gases.
10461. How would you do that? By a sheet.
10462. How far would that be sufficient—say the bord was 35 yards? If it was rising very sharply I should think it necessary to go at least half the distance. In flat bords, or dip bords, perhaps 8 or 10 yards from the airway.
10463. Are you working under these conditions now? No; we adopt no system of bratticing at all.
10464. Does sufficient air go in? Yes; to dilute and render harmless noxious gases with the exception of powder smoke.
10465. Is that not to be provided for? It does not come exactly under the title of a dangerous gas; we do not put any bratticing for it.
10466. Although not a deleterious gas it is uncomfortable to work in? True.
10467. If you were without sub-clauses 3 and 4, would you have to alter your system of working in any way? No; we would carry on just as we are now.
10468. In doing so you think you would comply with the terms of the English Act, which is subsection (11) of the present Act in this Colony? Yes.
10469. You would not need any alteration whatever? None.
10470. Under those circumstances the inspector would be satisfied? Yes.
10471. How do you pay the minors for hewing at your colliery? Three shillings per ton.
10472. How do you measure the payment? By weight.
10473. Do you weigh all the skips? We take an average.
10474. Have you more than one weigh-bridge? One weigh-bridge at each colliery.
10475. How many screens have you for the coal to pass over? One weigh-screen and two travelling belts at each colliery.
10476. Is the weigh-bridge at a separate screen? Yes.
10477. Is that kept in operation the whole of the day? Yes.
10478. How many skips are weighed during the day? About thirty-five or forty would be a fair day's weighing.
10479. Has your weighman any other duties to perform? He simply sees that the men at the band-screen keep at their posts, but he can see that from the weigh-house.
10480. Are the men satisfied with the number of skips you weigh? I have never had any complaints.
10481. You have never had any complaints since you have been at Brown's collieries? There have been times when they did not consider that a sufficient quantity of skips were weighed, but that has been quickly remedied. Under ordinary circumstances there have been no complaints.
10482. How long is it since the last complaint? About three or four years ago.
10483. Did you increase the number of skips to be weighed? I told the weighers to keep up till the last hour of the day.
10484. And since then you have had no complaints? No, not since that time.

- Mr. R. Thomas.  
22 Oct., 1895.
10485. In your part of Wales, Mr. Thomas, were check-inspectors appointed by the men? Yes; they appointed check-inspectors, but we had to pay them before they would go round.
10486. Do you say that the mine-owners had to pay them? Yes; the miners would not take that amount of interest to send them around.
10487. You were anxious they should send check-inspectors around? Yes.
10488. Was that the usual practice? I know it was our practice.
10489. You do not know if it was done at other collieries? I cannot be positive.
10490. Do you know if the check-inspectors ever made complaints to the inspectors about anything they found wrong? No; I do not know of any such case.
10491. Are you aware that complaints have been made by the men to the inspectors? I heard on one occasion of an anonymous letter being sent to the inspector, and he inquired into the complaint.
10492. Did the inspector inquire into the complaint? Yes, he did.
10493. You have probably read in the reports that the Secretary of State in England encourages anonymous communications, and wishes the inspectors to attend to these complaints? Yes, and not to reveal the names.
10494. Do you look upon that as a fair protection? Yes.
10495. And as a manager you would not object to it? Not at all. If any man is dissatisfied, the sooner he is satisfied on that point the better.
10496. Have you ever had any notice of the visits of the inspectors to your colliery? No.
10497. How do they generally come? By 'bus from Wallsend. Sometimes I meet them in the workings when I am going round the mine.
10498. Have any complaints been made to the inspectors with regard to the Duckenfield mines? I have not heard of one.
10499. Has the inspector ever complained to you with regard to any of your arrangements? He notified me of the scarcity of air in one district of Brown's Colliery, and it was remedied. He visited it a few days afterwards and found that it was all right.
10500. Is that a thing that might happen in any mine? Yes.
10501. Occasionally? Yes, occasionally.
10502. The clause in the English Act that applies to the payment of the miner refers, you are probably aware, to mines of minerals other than coal? Yes.
10503. Are you aware that the Legislative Council when this Bill was before them proposed an alteration in the Bill to suit the practice carried on in this country? Yes.
10504. In your opinion is that a wise thing to do, or do you think it better to be contented with the wording of the old Act? I cannot see that there was ever any difficulty arising under the wording of the old Act.
10505. You would be content with the wording of the old Act? Yes; contracted to be gotten, I think, covers the ground, the meaning being large coal.
10506. The wording of the Act and the practice are not consistent with one another? The mineral contracted to be gotten is round marketable coal.
10507. Would you say round coal, not coal round and small? Yes.
10508. *Mr. Curley.*] Where it was contracted to be gotten in that way would it not mean still that? Yes; whatever is contracted to be gotten.
10509. *Mr. Gregson.*] Have you looked through the proposed Bill at all? Yes.
10510. Have you any suggestions to make that you would like to lay before the Commission? With regard to hours of employment, I consider that there is no necessity to compel men not to work more than eight hours. In fact, I think it is about the first time that legislation has interfered with adult labour, and until the hours they work can be proved to be hurtful or conducive to accident, I do not think they should be interfered with.
10511. Has that subject been inquired into in Great Britain? Yes, and largely petitioned against by the men themselves. In fact, one of the leading representatives of the men, Mr. Burt, took a very strong stand against it. It was endeavoured to be proved by the advocates that long hours were conducive to accidents, but in going into the matter they found that nearly all the accidents happened in the earlier parts of the day.
10512. Where did you get that information from? From the proceedings of the House of Commons.
10513. What is your authority for that statement? I read the reports of the proceedings in the *Colliery Guardian*. The speaker was Mr. David Thomas, my old master, and he presented a petition from 26,000 miners against that provision.
10514. *Mr. Curley.*] Do you know the number of hours they work in that district? Nine working hours.
10515. *Mr. Gregson.*] Was the occasion of the debate you speak of when the Bill was before the House of Commons last year? Yes.
10516. What became of the Bill? The eight-hour clause was thrown out.
10517. Why? On the strength of the opposition from the men themselves; that clinched the matter.
10518. Was it not on the proposition of your friend, Mr. Thomas, that it should be optional in each district? Yes; so that the miners should say whether they should have it or not.
10519. And then the promoters of the Bill threw it out? Yes.
10520. You consider that you are supported in what you say about the eight-hour provision by what has transpired in Great Britain? Yes; I consider that is likely to produce accidents. Any curtailment of the time will mean less attention to the safety of the working place. A miner may have filled his last skip, and finds it necessary to timber his bord, but his time is up, and next morning, through the bord not being properly timbered, it may lead to an accident through his wanting to get coal at once to keep the wheeler going. Most of the accidents in mines happen through the miner wanting to get the last bit of coal for the skip before he puts up a sprag or a prop.
10521. Have you any other remarks you would like to make with regard to the proposed Bill? With regard to the distance that shafts should be kept apart, I consider that 15 yards as a minimum is quite sufficient. There are circumstances where the surface area is limited, and to have the shafts 50 yards apart means not only a greater area on the surface, but allowing more for shaft pillars below.
10522. *President.*] What about 30 yards? I should say 20 yards is enough for all practical purposes, as the Minister has the right to use discretionary powers, if he considers a greater distance to be necessary.
10523. Not the Minister? I mean the inspector, 10524.

Mr.  
R. Thomas.  
22 Oct., 1896.

10524. Is there anything in this: One of our witnesses has said that in case of anything happening to one shaft, the other shaft would necessarily be involved. What do you think of that;—do you know any place where the shafts are only 15 yards apart? It is a little distance for shafts of a depth exceeding 200 feet, but for shallow shafts it is ample. With shafts 60 or 80 feet deep, it would be ridiculous to work a mine and take up 50 yards between the two shafts.

10525. *Mr. Gregson.*] It must apply to all the circumstances of the Colony;—should you not be content to compromise;—an Act of Parliament cannot be made to apply to shallow shafts only? An inspector has the right to require a greater distance where he thinks fit.

10526. Would you leave it to the inspector? Yes, under the dangerous practice clause. I do not think it is likely to affect us very much, because our seams are getting deeper and deeper.

10527. You consider that a good distance between shafts is advisable, not only for the stability of the shafts, but for the convenience on the surface? Yes.

10528. And underground too? Yes; I would not object to 30 yards.

10529. Have you anything else that you wish to draw attention to, Mr. Thomas? With regard to check-inspectors, I think that they should be appointed from amongst the men engaged in the mine. I refer to rule [40] 38, on page 30 of the Bill (*see Appendix A*).

10530. There again, you see, you have picked on one of the difficult matters? I will admit that I am against the recent English practice on that point, but our labour troubles lead us into many complications, and we may have men appointed to inspect our mines whose interest is not to keep the masters and men on an amicable footing. We do not find the same thing in England.

10531. *Mr. Curley.*] Is not that an unfounded insinuation you are making? We know that there are men——

10532. Can you point to any instance where check-inspectors have been appointed from any pernicious motives? Take for instance the experience they had at the Co-operative Colliery.

10533. *Mr. Gregson.*] As long as they were not mining engineers, would you object to them going round the mine on behalf of the workmen? I would object.

10534. You think it would be better for them to be chosen from men who are at the colliery? Yes. The men who are at the mine know most about it. There has been nothing in the past to show that their inspection has not been an adequate one.

10535. *Mr. Curley.*] A small mine might not be in a position to pay the men? They would have to pay more for an outsider.

10536. *Mr. Gregson.*] On behalf of the proprietors, they have committed themselves by saying they will take the English Act? I look upon this provision as a drawback; I am willing to take the English Act as a whole, but I am not willing to take the worst provisions in the English Act and have them tacked on to our own.

10537. What else would you like to refer to? I have nothing else. I think that in this matter of a certificated manager, where only ten men are employed, seeing that the Legislature intends to provide first-class men, that it is an unnecessary expense in a small mine. A second-class manager should be allowed to take a mine with thirty men or less.

10538. You would not suggest that the Act should ignore small mines; it has been suggested that managers of small mines might have a permit for a year—say, a permit on the inspector's recommendation;—what do you think of that suggestion? I prefer the certificate, because that is liable to be withdrawn in a case of incompetency or neglect. A matter of a permit would, perhaps, be difficult to deal with. I assume that a second-class certificate will be granted on showing practical knowledge. I do not think a mine should be left without a second-class certificated man.

10539. Have you anything else you wish to refer to, Mr. Thomas? I decidedly object to the word "serious" in subsection (1) of section [31] 29, on page 15 of the Bill, in connection with reporting accidents in mines (*see Appendix A*).

10540. *Mr. Curley.*] What is your objection to that section? Because it would cover all sorts of accidents. If a man cuts his finger it would have to be reported. We should want an inspector on the ground the whole of the time; and if an accident was reported, the working-place would have to be left idle until the inspector came. It would keep a manager going inquiring into these little things. It would keep the inspector going, and the mine idle, and I am sure the men in a short time would object to it. We have to keep the place idle now when an accident is reported.

10541. *Mr. Gregson.*] Have you anything else you wish to refer to? I object to allowing miners to depute any person outside of their own number to extract reports from the book in the colliery office.

10542. You do not object to any person employed in the mine inspecting the books or taking copies for themselves? No; we object to them deputing that right to anybody else.

10543. *President.*] Do you know that right is in the English Act? The same feeling would arise there as regards bringing anybody in as a check-inspector.

10544. *Mr. Curley.*] How long were you at the Stockton Colliery? About three years.

10545. In what year did you take the management there? In 1886.

10546. How did you find the condition of that mine with regard to the pillars? They were very thin pillars; a number of them were thin pillars. I do not think they were all thin pillars, but a great number of them were.

10547. Would you consider them too thin? Oh, yes.

10548. Had these pillars been left prior to your becoming manager? Yes.

10549. Did you leave any such pillars as these yourself? Not to my knowledge. They might run occasionally thin, but not in a general way. We kept lines on the bords, and occasionally they would run thin.

10550. Is the size of pillars a matter that requires consideration in colliery management? Undoubtedly.

10551. I believe there was an extensive fall during your management at Stockton? Yes.

10552. Where was this fall? At the top drive bords, where the most of those thin pillars were.

10553. Did it come over the pillars? It broke up with the pillars.

10554. Do you think that was one of the reasons that it broke up—I mean in consequence of the thin pillars? Yes.

10555. Did that fall go over any of the main roads? Yes.

10556. For any distance? For a distance of about 5 chains.

10557. Did that interfere with the working of the colliery at all? Yes; we had to stop the colliery.

- Mr.  
R. Thomas.  
22 Oct., 1895.
10558. What year was that in? About the end of the year 1888, or the beginning of the year 1889.
10559. Had you to suspend work? Yes.
10560. For some time? Yes.
10561. For how long? For about a fortnight.
10562. Did the roof give indications of coming away before it fell? There was a great deal of crushing on those pillars.
10563. For how long? It started at the far end, at a distance of five cut-throughs—150 yards. It started there for about two months before it fell.
10564. Did it fall during the day or during the night-time? It did not come away suddenly; it started at the face; we struck a win intrusion.
10565. It caused you to suspend work on your main way? It never blocked the main-way. We started timbering before it came on.
10566. You kept the men out as a precautionary measure during the time you were repairing it? Yes.
10567. Did the fall come right round the main-way where you put the timber in? It came in the top drive, in the upper portion of the seam.
10568. Was that the only fall you had of any dimensions while you were there? Yes, with the exception of an isolated bord, with the thin top coal, but never with the main roof.
10569. What kind of roof did you find in that fall;—what was the quality of it? Shale and sandstone; more shale than sandstone; thinly bedded.
10570. What distance would this be from the shaft bottom? I should think the nearest point would be 70 yards.
10571. Was that coming in a northerly direction, north-west or north-east from the shaft? The closest point would be almost northerly, if anything, a little west.
10572. Was there any quantity of water given off in any of those falls? No; not a drop.
10573. Was your main drive going up that way, from the top working or from the lower working? There was a main drive in the lower workings. They were called our north-west headings, and a drive crossing it to serve five or six bords. We had there a slant road.
10574. How did you find the pillars in the bottom seam? They were not quite so bad as the others, but they were thin in places. There was one group of bords—I think about seven or eight bords—where there was hardly a thick pillar in the lot; that was in the top drive.
10575. I am asking you about the bottom drive? There were thin pillars in the bottom drive.
10576. What was the width of the bords? They were supposed to be 8 yards.
10577. Were they 8 yards? There were some above that; they ran in some places as much as 10 yards.
10578. Did you put down a bore there? No; we bored from the lower seam up in the mine, but never on the surface.
10579. How far was that bore in? At a distance of (say) half a mile from the shaft, to test for the upper seam.
10580. Did you test it at any time for the thickness of the rock? Not above the upper seam.
10581. Do you know of any places that were worked under the harbour during your time? No.
10582. Not under tidal waters? No, not under tidal waters.
10583. Is there one of your intake roads at Minni, where you have passed through some ground where an extensive fall came away some years ago? That portion is closed up.
10584. Is that portion finished? Yes; what we call the straight in, or that was what it was called then.
10585. Is that where the men complained of passing through some black-damp occasionally? That was before my time.
10586. Do you know of any place of that kind at the present time? No; occasionally we see a little black-damp near the fault furnace.
10587. Is that on one of the intakes or the return? It is in the return, near to the furnace.
10588. Have the men to pass through this at all? No; they do not pass there now. They used to, but we have a separate communication now.
10589. What is the width of the bords you are driving now? Eight yards.
10590. What is the size of the pillars? Five yards.
10591. What do you think is the depth of the colliery? The deepest workings where we are at present would be something like about 300 feet.
10592. Do you drive your bords by line? No.
10593. Are your pillars kept to anything like the size you intend them—5 yards? Fairly well.
10594. Do you think that these pillars will be ample in pillar-working later on? I do not think we will be able to extract all the pillars.
10595. Why? Because there is not a sufficient margin of strength left.
10596. Do you know if the mine is worked with a view to extracting pillars? As far as I can understand, it is the intention of the proprietors to leave the pillars.
10597. Have you made any recommendations yourself as manager as to the utility of leaving larger pillars in the mine? No; so long as I know it is not their intention to work the pillars.
10598. Have you made any recommendations at any time? No, I have not.
10599. Has the inspector at any time when he has visited your colliery drawn your attention to the pillars at all? Never.
10600. Do you use any brattice or canvas at all? Only in the narrow headings.
10601. Not in the bords? No.
10602. Have you not some rise places? Yes.
10603. Where the men are 35 yards before the air, and have a cut-through to put over, another 5 yards, making about 40 yards before the current of air from the headings, do you not think that some of this canvas brattice might be used to conduct some of the air to the men? We could not do it with advantage. What the men are doing is that they place the dirt in such a way that it leaves a space behind.
10604. That is, the men are doing it themselves? There is no other way, because our place is blocked up with dirt. It does not leave brattice room with our seam.
10605. The men will have to put up with the inconvenience of deficient air in those cases;—I think you admitted that the powder smoke hung about these places? Yes.
10606. If you get 100 cubic feet of air you have spoken about on the heading as a minimum, I think I understood you to say you considered the Act complied with—that is where there is no fire-damp or black-damp? Yes.
- 10607.

Mr.  
R. Thomas.  
22 Oct., 1895.

10607. You consider the Act is complied with? Yes.
10608. Does it prevent you from providing more air? No; I think Mr. Fegan was kind enough to credit us with having 200 feet per man.
10609. Where? In the tables Mr. Fegan laid before the Select Committee.
10610. Do you not think with regard to the word "adequate" in any new provision, that that word to some extent would leave the question still in an indefinite form? It would leave it in this way: that the inspector could demand whatever quantity the mine required. We would either have to comply with his request, or submit the matter to arbitration.
10611. Might not this arbitration last for weeks? He could close the mine apprehending danger.
- 10611½. If the manager would not provide the air, should the inspector have that power if he thought fit? Yes.
10612. With regard to the appointment of a check-weigher;—have you any objection to the men selecting their check-weigher? No objection at all.
- 10612½. Have you any objection to the men meeting for that purpose? Decidedly not; we have encouraged them; we have even stopped the check-weighman's money for them.
10613. Do you measure the air in the mine very frequently? I generally take it by the flame on my lamp. I can judge by this very nearly, but if I have any doubt I take the anemometer.
- 10613½. How often do you take the anemometer? I do not think I have taken the anemometer in a dozen times in the whole time.
10614. When did you last take it? I suppose nearly eighteen months ago.
- 10614½. Have you a travelling screen at your colliery? Yes.
10615. At both places? Yes.
- 10615½. Do you find these travelling screens a great advantage? Yes.
10616. More economical than the old custom? Yes; more economical and more efficient.
- 10616½. Do you inspect the working-places in the mine every morning? Yes.
10617. In all parts of the pit? Yes.
- 10617½. Have you any fire-damp given off? In some of the winning-out headings.
10618. We had your furnace-men here, and I think they stated that their starting time was about 6 o'clock in the morning? Yes.
10619. Would it not be better for the men if the furnace-man was in the mine earlier? We have a man in all night. We damp the fire, and it gives a brisk blaze at 4 o'clock in the morning. If the man there all night finds the air not brisk, he goes to the furnace, and we have had no complaints of slackness in the air in the mornings.
10620. It struck me that you consumed a very limited quantity of coal? They keep a good brisk fire. We have three furnaces and a fan going.
10621. Can they use as much coal as they please? Yes, as much as they like; and if we find the fire dull we reprimand them for it.
10622. Do you regard good ventilation as one of the prime things in mining? I think a well-ventilated mine is the cheapest mine.
10623. I suppose you cannot get the coal very well without blasting? There must be a certain amount of blasting, although the best miners blast least.
10624. Where powder smoke is, it is difficult to clean coal unless you have a good current of ventilation? Yes.

[Witness withdrew.]

Jacob Carlos Jones sworn and examined:—

Mr.  
J. C. Jones.  
22 Oct., 1895.

10625. *Mr. Gregson.*] What are you, Mr. Jones? A colliery manager and mining engineer.
10626. What colliery do you represent? The South Bulli Colliery, in the Illawarra district.
10627. How many years have you been there? I have been five years at the South Bulli Colliery as manager, and ten years in the district as manager.
10628. How many years experience have you had in coal-mining altogether? Twenty-seven years.
10629. Out of that twenty-seven years how long have you been manager? Ten years in the Illawarra district, and I was assistant manager in the Newcastle district for seven years.
10630. You wanted to give some evidence in reference to the proposed Coal-mining Bill? Yes; I would like to say a few words upon the eight hours. It is intended to make eight hours compulsory in mines, and that is going to add from 4d. to 6d. a ton on to our cost. If we are going to make all our day men work eight hours only, it will prove that it is almost impracticable to work.
10631. You do not think that the eight hours clause should become law? Certainly not.
10632. And your reason is that it would be impracticable? Yes, and costly. It would reduce the labour of our men two hours a day.
10633. *Mr. Curley.*] You said 6d. per ton? Yes.
10634. *President.*] How long do your men work in the face of the mine? Eight hours; then the men outside of the mine must be taken into consideration; it would reduce their labour to, say, two hours per day. That is where the item of cost comes in. The additional cost to us would be enormous. Additional plant would be required to maintain the output, and the plant we have already would deteriorate, and we would get one-fifth less work out of them. Then, again, rolling-stock and all the machinery has to be maintained. I may say that nobody in the coal trade objects to the coal-getter working the eight hours, but the day men's labour is light, so that the plea of hard work does not come in as far as they are concerned.
10635. You say that nobody has asked the coal-getters to work more than eight hours? No; not at my colliery. Again, in the system of weighing, it is proposed to make us weigh every skip that comes out of the mine. In South Bulli, and probably in all the southern collieries, it is almost impracticable to do this. We have not the space on the surface, and our screens are just a few yards from the tunnel-mouth. We want space for a weigh-bridge and forty skips as well, and that we could not do; and then there is no benefit to anybody. In South Wales, where I have been, they weighed every skip, but there they had large skips carrying from 25 to 30 cwt. Then to show you the means they adopt there, they have the "billy fairplay," and it would be compulsory for us to have the same thing here. That is objectionable,  
and

Mr.  
J. C. Jones.  
22 Oct., 1895.

and has caused more strife than anything else. They rather think they are robbed because the skip is weighed in the gross, and it is tipped over the screen, and the "billy fairplay" shows 5 cwt. less. "Billy fairplay" is a box underneath the screen, and the weighman after weighing the skip in the gross tips it into the screen, and supposing the skip in the gross weighed 30 cwt., and the "billy fairplay" represented 5 cwt., the miner would only be paid for 25 cwt. That would cause more strife than the present system.

10636. *Mr. Curley.*] That is the system in South Wales;—may there not be instances where the small coal is paid for? Yes; and then it would be weighed just the same.

10637. If all coal was paid for, both small and large, would not that be fairer? It would involve alteration in the present practice, and it is not marketable in that way.

10638. Supposing one third was knocked off for small coal? I do not think it would be workable. The great objection to filling all away together, is the inducement for the miner to break his coal.

10639. If he knows that there is only one-third coming off, you think he will not bother about having a fair amount of large coal? That is it exactly. I found it in North Illawarra; the yield of slack increased 10 per cent.

10640. You think if the miner is only paid for large coal, he gets as much large as possible? Yes.

10641. *Mr. Gregson.*] You object to having every skip weighed? Yes, in the south.

10642. Where do you weigh? We weigh at the foot of the screen.

10643. You weigh every skip that is weighed, by itself? Yes.

10644. *President.*] What percentage of skips do you weigh? We weigh, on an average, thirty-five skips a day—about 3½ or 4 per cent. We get 1,000 skips per day, and we weigh thirty-five or forty skips out of that 1,000.

10645. Is your weighbridge going all day? Practically it is.

10646. Does your weighman do anything else besides weighing? No.

10647. *Mr. Gregson.*] What put it into your head that the Commission wanted every skip weighed? It is in the Bill.

10648. There is nothing to prevent arrangements being made? I have not looked to see that.

10649. *Mr. Curley.*] Have you a standard weight at South Bulli? Yes; 15 cwt. is the standard, and 13 cwt. 2 qrs. is the average of what we weigh.

10650. *President.*] Will you look at section [41] 38, on page 18 of the Bill, subsection (1)—"Payment of persons employed in mines by weight" (*see Appendix A*);—you will see the words between the lines 30 and 40—"such weight being ascertained in such manner as may be agreed upon by the owner, agent, or manager of the mine on the one part and the person so employed on the other part; and in the absence of such agreement, such coal or shale shall be truly weighed either at the bottom of the screen or at a place as near to the pit mouth as is reasonably practicable"? That is one of the amendments suggested by the Upper House.

10651. *Mr. Gregson.*] If you look at the clause in the present Act of 1876, you will see that there is nothing there to compel you to weigh every skip? I have it in my mind that it was suggested that every skip should be weighed; but if not, there is no necessity to object to it.

10652-3. The clause of the present Act has obtained for a good many years, and nobody has claimed under it that every skip should be weighed, and that is how the Assembly left it? There is no objection to it as it is at present; our miners have not complained about the weight.

10654. Under the proposed Bill standard weight is abolished? I wish it was not.

[Witness withdrew.]

WEDNESDAY, 23 OCTOBER, 1895.

[The Commission met in the Board Room, Chief Secretary's Office, at 10 a.m.]

Present:—

FRANCIS EDWARD ROGERS, Esq., Q.C., PRESIDENT.

JAMES CURLEY, Esq.

JESSE GREGSON, Esq.

Harrie Wood, Esq., Under Secretary, Department of Mines and Agriculture, sworn and examined:—

Harrie Wood,  
Esq.  
23 Oct., 1895.

10655. *President.*] You are the Under Secretary for Mines, Mr. Wood? Yes.

10656. How long have you occupied that position? Since 1874.

10657. *Mr. Curley.*] Have you a record of the principal communications that have passed between the Inspectors of Collieries and your Department? Yes; I have their reports.

10658. Have you the opinions given by the Attorney-General from time to time on matters pertaining to mining? Yes.

10659. Have you an opinion given by Mr. Attorney-General Barton, to the effect that inspectors were not to apprehend danger? Yes.

10660. Will you let the Commission see that document? Yes. [Document handed in. *See Appendix Z.*]

10661. I notice that there are two questions on this communication;—can you say how these questions came to be submitted;—were these questions submitted to the Attorney-General at the time? Yes.

10662. How did they come to be submitted? I presume some question was raised by somebody outside which we had to get information upon.

10663. I see that the first subject is, "If a mine, or any part of a mine, is found by the examiner or inspector to be dangerous, does (under General Rule 5) the obligation to withdraw the workmen from the mine rest upon the examiner, or inspector, or &c., &c.?" and the second subject is, "Is the examiner or inspector required, under General Rule 5, of section 25, to anticipate danger"? I may say that those specific questions were raised by me upon some communication that came to the Department.

10664. Did the inspector raise the question himself? Well, I really could not say that from memory. If I had been asked to look up the papers I have no doubt that I could have obtained that information for you. It would be proper to say that I raised these questions for submission to the Attorney-General.

10665. Have you a copy of Inspector Dixon's report in connection with the Hamilton Pit disaster? Yes. [Report handed in. *See Appendix S.*]

10666.

10666. In connection with any reports that an inspector may make with regard to the condition of a colliery which he may consider unsatisfactory, has he, in the first place, to submit those reports to the Department, or does he take individual action immediately? In the first place he usually reports to the Department.

Harris Wood,  
Esq.  
23 Oct., 1895.

10667. Is that only in cases where he is likely to take any action? Where he is proposing to take proceedings.

10668. It is only in cases of that character? Yes. He also reports the results of his periodical inspections to the Department.

10669. What is done supposing an inspector sees something that ought to be remedied immediately? He notifies the manager, and enters it in the book.

10670. Is that part of his duty? Yes.

10671. It has been stated here, by one of the inspectors at least, that intimations to managers are mostly given verbally? Yes.

10672. Do you not think that a written communication would carry more weight? My impression is that if there is anything the matter of serious consequence the inspector does as a matter of fact enter it in the book, and if trivial he will call the attention of the manager to the matter, and the manager would remedy it.

10673. What might be deemed a trivial matter might end with bad results? Yes.

10674. Would it not be better to have a written notification? I can imagine it would involve a considerable amount of trouble, and probably unnecessary trouble. An inspector might see little things of no great consequence perhaps better remedied than left alone, and on the spot he tells the manager and the under-manager, and the thing is dealt with at once.

10675. In the event of anything arising later on; a question of dispute might arise whether a manager had been informed, and in that case there would be only one man's word against the other? There would be a difficulty then.

10676. You could not say what was done unless a report was made? No. In answer to that, I may say that since the present Act has been in operation no such case has come under my notice, as far as my memory serves me.

10677. With regard to those leases under ocean waters? Yes.

10678. Have you fixed any conditions with regard to the issue of these leases? There are conditions in the leases.

10679. What leases now are affected by these conditions? The Hetton lease, some of the Stockton ocean leases, the Wickham and Bullock Island lease, and probably some few others; but any that are under the ocean or tidal waters contain these special conditions.

10680. *President.*] What are the conditions in these leases? Size of pillars and width of bords, and so on (*see Appendix Q*).

10681. Would that always be the case without legislation? Yes, I think so. I think we would continue to impose conditions such as these, or some modification of them.

10682. All the coal-fields under the ocean are worked under leases granted by the Government? Yes; leased from the Crown.

10683. There is no private property held at all? It is all Crown land.

10684. *Mr. Curley.*] Do you stipulate for companies taking soundings, or putting boreholes in advance of the main workings? Yes.

10685. *President.*] Will you look at the proposed Coal-mining Bill, rules 42, 44, and perhaps rule 45, on page 31 of the Bill (*see Appendix A*). These rules practically relate to mining under tidal waters, and under the ocean? Yes.

10686. Are conditions equivalent to those rules really inserted in every lease? Yes; I could not say they would be *verbatim*, but substantially the same.

10687. Having the same effect? Yes.

10688. Who inspects for you to see that the requirements of the lease are being fulfilled? The inspectors.

10689. Are they furnished with copies of the conditions? A copy of every lease is lodged in every office of the Examiner of Coal-fields, and is open to inspection by the inspectors at any time.

10690. *Mr. Curley.*] With regard to the duties of the inspectors,—has each particular inspector a certain district? Yes.

10691. They are individually inspectors on their own account? Yes; that is so, no doubt. The question of seniority arises where one may have to act for another. In the event of the Examiner of Coal-fields being absent Mr. Dixon may act for him, and the next in seniority may act for Mr. Dixon, and so on.

10692. So far as the Act is concerned, I do not suppose there is a senior position for anybody? Under the present Act the Examiner of Coal-fields is the head of the branch.

[Witness withdrew.]

Jacob Carlos Jones re-examined:—

*Witness:* Some remark was made yesterday, and I was led to understand that the basis of this inquiry is on the Bill as it left the Assembly and the amendments made by the Legislative Council. It was said that the Council approved of standard weight being abolished, and, if you will permit me, I strongly object to the abolition of the standard-weight system.

Mr.  
J. C. Jones.  
23 Oct., 1895.

10693. *President.*] While we have to consider the Bill as it left the Assembly and went to the Upper House, there are certain things that both Houses have agreed on, and one of these things is that the standard-weight system should be abolished? I shall abide by your ruling, by all means, but I thought the matter was open all through. This being the case, I will say no more about the standard weight. I would like to say something on the weighing of every skip.

10694. *Mr. Gregson.*] That is not obligatory in the Bill? Is there not an attempt made to make it obligatory?

10695. I do not think so. If you look at section [41] 38, on page 18 of the Bill (*see Appendix A*) you will see that it is not proposed to make it obligatory by the Legislative Assembly or by the Legislative Council.

Mr.  
J. C. Jones.  
23 Oct., 1895.

The Assembly had it "unless otherwise mutually agreed upon," and the Council had an equivalent provision—"in such manner as may be agreed upon by the owner, agent, or manager of the mine on the one part, and the persons so employed on the other part," so virtually it is the same opinion in both Houses? I see.

10696. There is a qualifying clause, "of the mineral contracted to be gotten"; the thing is qualified right through? Yes. I would like to refer to the pay Saturday. The section I refer to is section 36, on page 17 of the Bill, "hours of employment" (*see Appendix A*). In the south the miners themselves have given up the idea of an idle pay Saturday, because we have worked the last three consecutive pay Saturdays, and the miners have found this necessary where the trade is depending upon the weather. I certainly would object to see what is laid down here in clause 36 carried out.

10697. *Mr. Curley.*] Has not this been done after considerable pressure from the Company? No; I think their own wisdom has shown them that it is necessary.

10698. We know of notifications being put up on the pay Saturday? They have agreed to it in my case.

10699. They have agreed to it very reluctantly in some quarters, I know? Of course you are all aware we have no harbours down there, and that is a strong reason why we should work when the weather permits us.

10700. What time do you expect the men to start work in the day? Seven o'clock is the hour for a Saturday. There is only one shift on the Saturday.

10701. If you do not blow for them at 7 o'clock? They are not expected to work. If we want them to work on Saturday we blow the whistle the previous night at 5 o'clock.

10702. And on other days? We blow the whistle at 8 o'clock in the morning for the back shift.

10703. If there is no whistle are they free for the day? Yes.

10704. Do you get the men to work later than the usual hours during the week? No; unfortunately we have failed to get them.

10705. Have you requested them to do so? Yes; we have blown on some occasions after the usual hour, but the men would not turn up.

10706. You would have worked later if the men had complied with your request? Just so. The provision for bratticing in the Bill is certainly unnecessary. I have gone into a calculation for the last twelve months just to estimate pretty nearly what the bratticing would cost. We have driven 3,400 yards of bords and 5,660 yards of headings, and I have estimated for the purpose of calculation that an average of 9,000 yards has been driven for the year. That is the aggregate. Perhaps it is a little more than that; but that is the average for the twelve months.

10707. Was that last year? Yes; ending this month—from October to October. The cost of bratticing, the nails, and the extra props and the labour, I have estimated as £2,770, which is equivalent to 4 43d. per ton on an annual output of 150,000 tons.

10708. *President.*] Is that what bratticing would cost? That is it. It is difficult to work out, but that is as near as possible.

10709. *Mr. Curley.*] Have you put that quantity of coal out? No; our output last year was from 115,000 to 120,000 tons of large coal.

10710. Does this calculation include your small coal? No.

10711. How much would the quantity be, taking round and small altogether? 150,000 tons of round and small; probably more this year.

10712. How much more? 10,000 tons more this year than last, from October to October.

10713. Round and small? Yes.

10714. What is the height of your seam? The average height is from 7 ft. 6 in. to 8 feet.

10715. Does the whole of your mine run that average? Yes, all that we work; I do not include the rolls.

10716. What is your colliery capable of putting out with present appliances? 200,000 tons.

10717. Is that round and small? Yes.

10718. How many working miners have you, all told, for the places that you speak of? From 190 to 200 miners.

10719. Do two men work in a place? Yes.

10720. That would be ninety-five places you would have going? We have, I think, from ninety-five to 100 numbers.

10721. What brattice is your estimate based for—wood or canvas cloth? Canvas bratticing cloth.

10722. What price do you allow? Eight pence per square yard.

10723. Cannot you get it for 7d.? That includes delivery at the colliery, and we always get the widest we possibly can get.

10724. How many yards of bratticing would there be in each place? It depends on the system of working.

10725. Have you estimated for bratticing right up to the face? I have estimated brattice for what we have driven yards of coal. I have assumed that the brattice deteriorates every four months, or three times a year.

10726. How do you know it requires renewing two or three times every year? We know from experience; we use a little of it occasionally.

10727. Where? For ventilating purposes—doors and headings.

10728. Is your mine very dry? Perfectly dry. There is not only natural decay, but the wear and tear in pulling down and re-erecting it.

10729. If another man that had used brattice for a considerable period of time in a dry mine similar to yours had said that he had used it over and over again, and he had some that was there when he was there which had been in use for eighteen months, and this was in a mine where they were compelled to use brattice, do you not think he ought to know something about it? He ought to know something.

10730. If it did last the time he states, would that materially alter your calculation? Yes; it would reduce my cost. I estimated for South Bulli only.

10731. How many men have you calculated for? Four men.

10732. At how much per day? Seven to 8 shillings per day. It runs into £400—that is at 8s. per day for labour.

10733. Would not two men be an ample allowance for you to make? It takes two men now doing very little else than attending to the ventilation.

10734. If you make a calculation you have a right to confine them to that exclusively? Yes; if they were entirely on bratticing it would take four men to do it. You cannot get brattice the full width from floor to roof.

10735.

10735. If one man had looked after sixty places in another mine, in the face of that would you consider your calculation excessive? It depends on the conditions—the height of the seam and the various other things. One man could not look after sixty places in the South Bulli Mine. I would like to refer to the matter of pillars.

Mr.  
J. C. Jones.  
23 Oct., 1895.

10736. *President.*] Do you refer to working under the land or under the ocean? Under the land principally; there are special provisions under tidal waters.

10737. *Mr. Curley.*] Cannot you give us your opinion? My opinion is that large pillars undoubtedly should be maintained. I know that I have had to alter the system altogether at South Bulli. We are leaving large pillars.

10738. What size? From 12 to 20 yards.

10739. What is the width of your bord? About 8 yards.

10740. *President.*] Are you working under a mountain? Yes.

10741. Can you legislate for a matter like this satisfactorily? No.

10742. Must it not be left to the experience of the managers? Yes.

10743. The conditions vary in every mine? Yes.

10744. You cannot legislate for matters of that kind? You cannot manage a mine by Act of Parliament.

10745. *Mr. Gregson.*] Do you propose to work out your pillars? Yes, certainly; that is why I leave large pillars. If I did not intend to extract them, smaller pillars would have done.

10746. *Mr. Curley.*] Are not most mines worked with a view to extracting pillars? I do not know.

10747. *Mr. Gregson.*] It depends on the value of the ground overhead? Yes.

[Witness withdrew.]

Thomas Ellis sworn and examined:—

10748. *President.*] What are you, Mr. Ellis? I am a miner.

10749. How long have you been a miner? For nearly forty years.

10750. Where have you been employed? I was in the old country until eight years ago, and I have been in the South Coast of this Colony, Wollongong district, up to the latter part of 1890, and I was in Queensland for about one year and a half.

10751. What mines have you been employed at? At the Mount Kembla and the Metropolitan Collieries.

10752. Where have you been employed the remainder of the time? Since the latter part of 1890 I have been in the Northern district.

10753. *Mr. Gregson.*] What part of the Northern district? The Helton Mine.

10754. Have you been in the Helton Mine all the time? Yes.

10755. *Mr. Curley.*] Have you worked at the Helton Colliery for any length of time? Since four days after the unfortunate maritime strike was settled.

10756. You have worked there from that time until now? Yes.

10757. Are there any particular clauses in the proposed Bill that you wish to refer to? Taking the Bill as a whole, as I have seen it in the local papers, I think it is a very fair Bill.

10758. *President.*] Do you refer to the Bill as it left the Legislative Assembly, or as it has been amended by the Legislative Council? As it left the Legislative Assembly; but I think that there are one or two items that are not mentioned in the Bill that should be in it.

10759. *Mr. Curley.*] What are they? In the first place there should be a clause in the Bill that within a given time, say nine months from the passing of the Act, any deputy should hold an ambulance certificate, or else not hold the situation.

10760. *President.*] What is an ambulance certificate? To pass an examination in order that they might give aid to the injured.

10761. *Mr. Curley.*] That is nine months after the passing of the Act? Yes; that is a reasonable time for them to acquire the knowledge.

10762. Do you know that there is a provision in the Bill to this effect;—will you look at rule [36] 34, on page 30 of the Bill (*see Appendix A*)? Yes; but that should extend into the mine. Stretchers should be kept in different districts of the mine.

10763. Why do you advocate that? Because they are readier there, and more useful if kept on the spot. If they have to be brought from the surface it might cause delay in getting proper medical assistance.

10764. What is the method of bringing injured men out of the mine? To double them up and bring them out in a skip, which in some cases is very injurious to the patient.

10765. *President.*] Do they double a man up if he is hurt? It is usual to put them in a skip, and skips are about 40 inches in length. That is invariably the custom, and if they are injured about the thigh or the back, or internally, it is often a very serious matter to put them into a skip. There should always be a stretcher to put them in.

10766. Would it not depend upon the nature of the accident;—surely they would not double a man up and drop him into a skip? Let them make him as comfortable as they can, the length of the skip will not allow of him being laid out to the best advantage. I have had cases in the old country where, by having the men and the stretchers close to the part where the accident has occurred, it has saved a good deal of suffering.

10767. *Mr. Gregson.*] Is that the practice in the old country? Yes; and there are competitions there now for silver and gold medals.

10768. Is that the practice? Yes; and also ambulance baskets, scissors, sponges, bandages—what is called the St. John's Ambulance Basket.

10769. Is that obligatory under the Act? The employer I was last engaged with sent word out that it was compulsory for the deputies to hold an ambulance certificate, and that they had to keep an ambulance in every district of the mine.

10770. Will not rule 34 meet what you require,—“Where persons are employed underground, ambulances or stretchers, with splints and bandages, shall be kept at the mine ready for immediate use in case of accident”? They kept them down the mine before I left the old country.

10771. *Mr. Curley.*] What district was that in? Barnsley District—Moukbretton Colliery.

10772. Have you anything to say about the ventilation? Yes; where I am working this quarter we have bad ventilation.

10773.

Mr. T. Ellis.  
23 Oct., 1895.

- Mr. T. Ellis. 10773. What mine is that in? The Hetton Mine.
- 23 Oct., 1895. 10774. What is the name of the district? Steel's No. 1.
10775. What are you working in? A bord of tops; and what makes it a great deal worse, is that the Morgan has to be shot down. Although the ventilation is so bad the Morgan is shot down in the day-time, and we often cannot see the skip for powder-smoke. The pit was idle from the 3rd to the 14th of this month, and the Morgan shooting should have been done during that time, but when we went to work before the back shift came in we could not see through the Morgan shooters firing shots. They put from 1 lb. to 2 lb. of powder in each shot, and it makes it very bad for us to clean our coal and also to work.
- 10775½. Is there a fair amount of air on the heading? Not a good current; most of it is return air; it is all open workings, and there is no provision for each man to have his share of what comes into the heading.
10776. Do you think that bratticing should be used? Yes; or some other means of conducting the air into all the places.
10777. When you say the air is defective in that district is your case the only one? It is a general complaint in that district; that is, the 5th left hand and Steel's No. 1—they meet in each other.
10778. Have you worked in those districts for any length of time? Not till last quarter.
10779. Not during all the time you have been at the colliery? I was working in the 5th left-hand two years ago, when the bottoms were being taken out.
10780. Is there anything else you would like to refer to? I think the time has arrived to empower the Humane Society's officials to have access to the mine at any time they think fit.
10781. What is your object for requiring that? To stop cruelty to the horses—working the horses in a cruel way.
10782. Would you like to refer to anything else? The weighing clause I think needs amending standard weight should be abolished.
10783. *President.*] That is agreed to by both Houses of Parliament? Thank you.
10784. *Mr. Curley.*] You have a system of standard weight, and you object to it? Yes.
10785. You do not think it should be continued? No; I would like to see the day when every skip of coal that goes off the cage should be weighed.
10786. Have you approached the manager to get this standard weight done away with? Yes, and the directors too.
10787. How about the appointment of a check-weigher? I think the miners should choose whom they think fit, seeing that they have to pay him, and he cannot necessarily impede the working of the mine. If the miners like to go away from their own mine to select a check-weighman, I cannot see why they should not do so.
10788. What about the working hours? No longer than eight hours from bank to bank.
10789. Would you legislate for that, or leave it a matter between the men and the manager? I would legislate for it.
10790. *President.*] If a man worked longer than that time would you put him in gaol? I would.
10791. That is your idea of liberty? Yes; that is my idea of liberty. We are compelled to work longer than we wish, or move from the colliery.
10792. Are they very exact with regard to the working hours of the colliery? We must stop at the face until they knock us off. The men objected, and sent a deputation to the manager, but he would not flinch one iota, and, rather than cause a disturbance at the present time, the men submitted, but very unwillingly.
10793. *Mr. Curley.*] If you are sick, or wanted to come out for any special reason, would there be any objection? I know of no one who has been sick, who has been objected to, but men have been reported for being on the road away from their working-places, at three minutes past 4 o'clock.
10794. Are the places driven by line at your colliery? Yes.
10795. Do you know that you are working under tidal waters? Yes.
10796. Do you think that the mine is being carefully worked? Well, with regard to the pillars, fairly well. I cannot find any fault with regard to the work under tidal waters.
10797. *President.*] Every care is taken? Yes.
10798. *Mr. Curley.*] Have you ever seen anything of an unusual character that would require special attention? No. There have been times when the men reported things when I was delegate, that we had to see the manager about. It was when they were beginning to take the top coal out, and letting the roof down. The manager asked us to see the place, and to my knowledge there was no need of any fear or alarm.
10799. Do they leave timber in the bords? No; it is all drawn out.
10800. In the course of years, do you not think an extensive pressure will settle down on that mine? I do not think, according to the strata above it, that there is any fear of it breaking through.
10801. In the roof? In the roof.
10802. You do not think that timber is required in the bords after they are abandoned? Personally I do not.
10803. Have you ever written to the inspector on any matters in connection with the colliery? No; perhaps if I had done so, I might have been jeopardising my position.
10804. Do you know that the Home Secretary has informed the inspectors that they are to take notice of anonymous communications? No; I did not know that.
10805. That has been done? It will be a very wise plan.
10806. If anonymous letters are really sincere, and do not treat grounds of complaints in a light way, the value of these letters will remain? Yes.
10807. *President.*] You are in favour of the Bill as it left the Legislative Assembly, with the amendments you have suggested? Yes.
10808. You think the Bill as it left the Legislative Council is all wrong? Yes.

[Witness withdrew.]

Michael Yates sworn and examined:—

10809. *President.*] What are you, Mr. Yates? I call myself a miner; I have been a miner all my life. Mr. M. Yates.
10810. How many years have you been a miner? I went to work when I was eleven years old, and I am sixty-five years of age next month. I have been connected with mines for fifty-four years. 23 Oct., 1895.
10811. *Mr. Curley.*] Have you been a colliery manager? Yes; I have been working mines, and have been the manager of them.
10812. *President.*] Have you anything to do with those mines now? I have left mining now.
10813. How many years have you been manager of a colliery? I can hardly tell; I was managing a mine in the old country before I came out here.
10814. When did you come out here? In 1863. I went to work first for the A. A. Company.
10815. What as? A coal-miner.
10816. How long altogether? About half the time as a coal-miner, and half the time as overman and manager—perhaps eighteen years as overman and manager.
10817. How long were you manager in the old country? About ten years.
10818. In England? Yes; in England, South Staffordshire.
10819. You have been overman and manager for about eighteen years? Yes; about eighteen years.
10820. I understand that you wish to say something about the proposed Coal Mining Bill? Yes. I was one of a committee of three appointed by the miners to draw up suggestions to guide Mr. Farnell, when he administered the Mines Department, with regard to matters that would be suitable to be inserted in the Bill. The miners had persuaded Mr. Farnell to introduce the Bill, and I was made conversant with the present Bill, and what we had in it then. We wanted 200 cubic feet of air per minute as the minimum, or the standard, but that was cut down to 100 cubic feet. I still think we ought to have 200 cubic feet as a minimum quantity of air. The Bill was framed by Mr. Farnell, but did not become law until Mr. Lucas came into power.
10821. *Mr. Curley.*] You propose to increase the 100, or 150 cubic feet to 200 cubic feet as a minimum quantity? Yes. Under the present system of working—bord and stall—it is very difficult to conduct the air to the face sufficiently to give men good air to work in without bratticing, and bratticing is an expensive way of conducting the air where it can be avoided. If there was 200 cubic feet of air per minute, and the pillars were shortened, instead of having the cut-throughs every 35 yards, I would have a new road heading every 20 yards, and I think this, with the 200 cubic feet of air per minute, would be sufficient air to make it good for the men to work in without any doors or bratticing where there is no inflammable gas. Many years ago I read the evidence given before a Commission when they passed the first Coal-fields Act in England, and one colliery manager was in favour of a minimum quantity of air for sanitary purposes, to dilute the black-damp, powder-smoke, and bad smells from sweating horses. He was in favour of not less than 100 cubic feet; but under the present system it is not sufficient without bratticing, and I think 200 cubic feet would be required, to make it reasonably healthy, and these short pillars would do without any bratticing, or any doors. These cut-throughs are put through and often filled up with refuse. If they were made headings instead of cut-throughs the air would go through, and if they were limited to 30 yards, it would be better.
10822. Is not a cut-through and a heading the same thing;—you want the cut-throughs every 30 yards? Yes. The air travels down the heading instead of down the cut-throughs, and if it was made the heading all the air would be turned through the cut-throughs. I am very much in favour of retaining the minimum for sanitary purposes, independent of the fire-damp. The black-damp, sweating men, and powder smoke, is far more injurious than the fire-damp. You hear old miners say they wish there was more gas, because they would be compelled to have more air. The ill effects of black-damp show upon health stealthily, and it is often a matter of dispute between the inspectors and the managers. I heard a dispute between Mr. Winship and an inspector on this point. One said there was sufficient air, and the other said there was not. There are no means of proving when air is not pure enough for a man to live in it, and in the absence of that, a minimum quantity of 200 cubic feet of air per minute would remedy the evil, and make it healthy for men to work in—that is, with headings every 30 yards.
10823. You would make every bord 30 yards? Yes; the pillars every 30 yards. The air always takes the shortest course, and it will have to be stopped or blocked before it would force its way through the new cut-through.
10824. *President.*] Are you in favour of a minimum quantity being stipulated in the Bill? Yes; because it is so disputable what is sufficient under the present system. It would require 200 cubic feet of air per minute to make it healthy for men to work in.
10825. How will this clause meet your views: "An adequate amount of ventilation shall be constantly produced in every mine, to be in every case at least 100 cubic feet of pure air per minute, and as much more as the inspector may direct for each man, boy, and horse employed therein, a sufficient quantity whereof, according to the judgment of the inspector, shall be taken to within 15 yards of the working-faces in non-gaseous mines and to within 3 yards of the working-faces in gaseous mines to dilute and render harmless noxious gases, to such an extent that the working-places of the shafts, levels, stables, and workings of the mine, and the travelling roads to and from those working-places shall be in a fit state for working and passing therein"? The 100 cubic feet is scarcely enough.
10826. Is the other part of the clause enough? Fifteen yards would be half the distance; that will do, but it will be difficult to give effect to it.
10827. That is a matter for the manager—the place has to be ventilated? Yes; but you ought to have 200 cubic feet of air per minute, and lessen the men in a split from seventy to fifty men.
10828. Is not that a matter for the manager as to how many men should be in a split? Now, the managers work up to the standard, and they will not have less than the seventy men. They got up to the limit, and sometimes over; but I think fifty men are plenty in a split. If they can alter the system—if they could work on the long-wall system—the mine could be easier ventilated, and a less amount of air would be required, because the air sweeps the face all the time.
10829. *Mr. Curley.*] Can they work the long-wall system? Yes; some of the mines are very favourable to long-wall working. They made an attempt at New Lambton, but they did not understand it. This pillar and stall working is a national loss; there are two or three mines where half of the coal is left behind.
10830. What mines do you refer to? Lambton and New Lambton. I worked thousands of tons that they left at New Lambton. 10831.

- Mr. M. Yates. 10831. What about the people on the surface, when you took the lease from the Lambton people and took out the greater part of the coal? There was no one on the surface.
- 23 Oct., 1895. 10832. Did the surface come down? Yes.
10833. Do you know that in most of the mines where they are working the bord and pillar system it is the intention to take the pillars out later on? The New Lambton people left the pillars in; very few pillars were worked there.
10834. But in a general way? Yes, in a general way. It is the intention to take the pillars out, but it is impossible to work them all out.
10835. If larger pillars were left would they not get them out better? Yes, if they drove down the centre and worked back they would; but then there would be expense with the narrow work.
10836. *President.*] I suppose managers have considered all these matters? I cannot account why they do not adopt the longwall system. It is easier worked and there are no fast ends. As they undermine it they loosen it on one side and shoot it with the powder. In longwall the creep or the weight does all that. If it is properly managed there is a continual creep on the face, and that would prevent a lot of the blasting. In the Raspberry Gully pit—the Waratah pit—I introduced the system of wide bords. We had two roads, and we gobbed it up in the middle. There was a great quantity of powder-smoke, and the skips coming up the heading used to sweep the powder-smoke away immediately.

[Witness withdrew.]

Henry George Pullin sworn and examined:—

- Mr. 10837. *President.*] What are you? I am a miner, and have had twenty years experience as such in the Newcastle district. I am now working in the A.A. Company's Colliery, and have been working there all the time I have mentioned.
- H. G. Pullin. 23 Oct., 1895. 10838. *Mr. Ourley.*] Where are you working at the present time? At the Company's No. 2 pit, known as the Borehole.
10839. Have you worked a considerable time in the mine? Over twenty years.
10840. In that particular mine? Yes.
10841. Then you are pretty well acquainted with the whole colliery? Nearly all of it.
10842. What kind of work is being carried on at the present time;—is it all pillar-work? All pillar-work where I have been.
10843. Where you have been lately? Yes.
10844. For how long? For the last two years, as near as I can judge.
10845. Do you know the size of these pillars? Various sizes.
10846. Can you mention the sizes and widths of those you have worked in? From 3 yards up to 16 yards.
10847. Have you seen any less than 3 yards? I have not worked in any less. I have seen some less in the old workings.
10848. Have you seen any other men working in pillars less than 3 yards in width? No.
10849. How many men work in these 3-yard places at a time? Two.
10850. What particular district are you working in at the present time? No. 5 cross-cut section.
10851. Have you been in it when any fall has taken place in the goaf? Not at the exact time. I had to leave before it came in.
10852. You had to leave your working-place? Yes.
10853. When you knew it was working in the goaf? Yes.
10854. Did a fall of any extent take place? I could not tell how far it went.
10855. Did it come anywhere near the pillar you were working in? It came to the edge of it. It was solid outside of that.
10856. It broke off at the pillar? Yes.
10857. Have you noticed any other falls in the same way in the other districts? No; that is the only fall I have been near.
10858. Do you know whether that fall came over any pillars or not? It did not come over any outside. There may have been pillars that were left in.
10859. It did not come over any of the pillars that the men were working in? No.
10860. Do you sometimes find a small pillar very inconvenient to work in? It does not pay very well.
10861. You mean it does not pay the miner very well? Yes.
10862. Why? It is nearly all small coal.
10863. Is great care being exercised by the management at the present time in connection with the working of these pillars? As far as I am concerned they are very careful.
10864. As far as you have seen? Yes.
10865. Plenty of timber there? Yes.
10866. Have you noticed that to be the case in every part of the mine where you have worked pillars? Yes.
10867. There is no lack in the supply of timber? Not as far as I have seen.
10868. From what you have seen in connection with the working of these pillars, do you consider that larger pillars ought to be left in a mine? Larger than some that are left.
10869. You think that? Yes.
10870. *President.*] How old are those small pillars that have been left;—are they very many years old? It is hard to tell the age of some of them.
10871. They were there before your time? Yes.
10872. *Mr. Ourley.*] Have you ever acted as check inspector? Yes; on two or three occasions.
10873. And you have gone round the different parts of the mine? Yes; the whole of it where the air was travelling.
10874. Did you ever notice any defects in connection with the ventilation? In some places you could get no measurement.
10875. Did you consider that the air was defective in some places you visited? Yes.
10876. Did you bring this under the notice of the manager? Yes; of the manager or overman.
10877. Did they attempt to remedy matters? In nearly all cases they did.

10878.

10878. What was the defect; was it that the air was not taken up to the face; or was it that there was not sufficient going into the district? The travelling roads were blocked up in most instances.
10879. The travelling roads? The airways.
10880. Do you think that some effort should be made to keep the airways clear at all times? Yes.
10881. You have no standard weight at your colliery? No.
10882. You are paid for all you fill? We are paid for all we fill.
10883. Paid on an average? Yes.
10884. All weights that you get in one day are put together and averaged if there is more than one weight? Yes.
10885. And you are paid on that average? Yes.
10886. But you get a fair number of skips weighed? Yes.
10887. There are no complaints about that? No.
10888. How many men are there at this pillar-work at the present time? I think there are about 190 in the pit altogether, so far as I know.
10889. What is the system;—do they work in two or in three shifts? Two and three shifts—mostly three.
10890. Have you seen the proposed Bill which has passed the Legislative Assembly? Yes.
10891. Have you looked over it? Over some portions of it.
10892. Have you seen the erasures made in it by the Legislative Council? I have not taken particular notice of those.
10893. So far as you have seen any portion of the Bill have you anything to say in regard to it? No.
10894. You have nothing to say? No.
10895. Do you think that the ventilation should be conducted into the working-places of a mine? Yes.
10896. *President.*] Is it conducted into the working-places where you are? No; it is only on the outside of the working-places.
10897. At the entrance? Yes.
10898. *Mr. Curley.*] On the heading? Yes.
10899. When you were check-inspector I dare say you went into some of the men's places occasionally? Each one.
10900. You went into each man's place? Yes.
10901. Did you ever notice the powder-smoke hanging about the working-faces? Yes; in many cases.
10902. And if the air was conducted into those places do you not think it would tend to sweep that out? Yes.
10903. Have you noticed the powder-smoke hanging in your own places in certain cases? Yes.
10904. Longer than it should have done? Yes.
10905. And from that, I suppose, you would judge that the air should be brought more into the face of the place to sweep this smoke away? Yes.

[Witness withdrew.]

Jonathan May sworn and examined:—

10906. *President.*] What is your position now? Lecturer on Coal Mining under the Technical Education Department. I am a mining engineer and colliery manager.
- 10907-8. What experience have you had? From the age of 9 years to that of 17 years I discharged the duties of boys connected with mining, and from the age of 17 years to that of 21 years I studied the principles of mining under a gentleman—Mr. Cowley—who was mining engineer to the Duke of Cleveland. From that time to the present I have had the control of mining operations in every official capacity—as deputy, overman, under-manager, and manager. I hold a first-class certificate of competency under the English Act.
10909. *Mr. Curley.*] Where have you managed? Both in New South Wales and at Home.
- 10910-1. At what collieries? The Mittagong, and at the Boollara in Victoria.
10912. Where did you manage in England? At the Woodland Collieries, Durham, I was under-manager.
10913. How many years have you been out here? Ten years.
10914. Have you been in many mines out here? A good few of them.
10915. Visited them? Yes.
10916. In the north, or in any other districts? North, south, and west.
10917. Are you acquainted with the system of bord and pillar working? Yes.
10918. And long-wall working? Yes.
10919. Have you ever given much attention to the question of ventilation in connection with collieries? Yes.
- 10920-1. Are you acquainted with the opinions of mining authorities as to the quantity of air required in a mine? Yes.
- 10922-3. What is about the general tenor of these opinions with regard to the minimum quantity of air? I cannot do better than quote my own evidence in Mr. Fegan's report, page 5. "Mr. Herbert Mackworth said, 'a minimum of 100 cubic feet per man for each man and boy, for sanitary purposes alone, where there is no escape of fire-damp and little of any other mineral gas.' Mr. Hedley says:—'From 100 to 500 cubic feet per minute for each collier.' Mr. T. J. Taylor says:—'In a mine yielding no fire-damp, with 120 to 130 persons employed, a current of from 20,000 to 30,000 cubic feet per minute, properly conveyed up to the face of the working and made to sweep the district in which the people are employed; in fiery mines a much greater quantity than this.' Professor Phillips, another competent authority, says:—'In most of the fiery mines an average of 600 cubic feet per minute per collier.'" I do not think you could possibly get better authorities. They are all men of extensive experience. In Pennsylvania, America, the quantity must not be less than 200 cubic feet per minute.
- 10924-5. Who are you quoting from now? I am quoting the law of Pennsylvania, America.
- 10926-7. What book are you quoting from? "Ventilation made Easy," by Fairley. Professor Abel wrote a very instructive book in connection with accidents in mines, and you will find the same matter there. Article X:—Section III, of the Mining Laws of Pennsylvania, 1885, reads, "The minimum quantity of air thus produced shall not be less than two hundred (200) cubic feet for each and every person employed in any mine, and as much more as the circumstances may require."
10928. What page is that on? Page 78 of the American Edition. He says that "the quantity of air shall not be less than 200 cubic feet per minute." They make a distinction between the anthracite and the

Mr.  
H. G. Pullin.  
23 Oct., 1895.

Mr. J. May.  
23 Oct., 1895.

- Mr. J. May. the bituminous. The bituminous law of Pennsylvania states that "where fire-damp has been detected the minimum shall be not less than 150 cubic feet of air." They are both statute laws.
- 23 Oct., 1895. 10929. Of Pennsylvania? Both of Pennsylvania. One relates to anthracite mines, and the other to bituminous mines. In the anthracite mines they use a little more powder, and that is the reason of the difference.
10930. Are you satisfied from your mining experience that there should be a minimum quantity of air? Distinctly, there should be a minimum quantity. The average of those authorities gives it that there should not be less than 230 cubic feet of air. My own experience was obtained from a mine where there would be an average of 500 to 600 cubic feet of air per minute.
10931. That would be where there was gas or fire-damp given off? Yes; it is almost a God-send to have a little gas in a mine so far as the men's health is concerned.
10932. *President.*] Because they get more air? They are sure to get air then. There may have been innumerable difficulties before that as to producing the air; but once they get gas the air is there.
10933. The management supply it? They simply supply it; they put it in circulation at once.
10934. *Mr. Curley.*] What you mean by that statement is that it has got to be done in the interests of the colliery itself? It simply has to be done in the interests of the colliery. But there is one thing certain—that it is distinctly cheaper and more economical, so far as the management of the mine is concerned, to provide plenty of air, simply because they can get more work out of the men. The cheapest mines that I have ever been in have always been the best managed, both for ventilation and other arrangements; but ventilation particularly is a most important item.
10935. How do you account for that;—would you consider the men are more active at their work? If you do not provide a man with sufficient oxygen he cannot do the same amount of work he can do if he gets plenty of it.
10936. You think a mining law should stipulate a minimum quantity? Distinctly. Here are ten or twelve American States, every one of which has a minimum. Of course, they now produce more coal than Great Britain does.
10937. *Mr. Gregson.*] Per man? I could not say the amount per man, but the total amount of coal produced by these States has overtaken that produced in Great Britain.
10938. *Mr. Curley.*] That is, in the aggregate output? Yes.
10939. *President.*] Does that book give any extract from the statutes of any of those States? They are simply extracts, but they do not give the wording.
10940. What is the coal used here? Bituminous. We have no anthracite of any consequence. I do not remember any anthracite that we have.
10941. *Mr. Curley.*] Do you consider that the ventilation in a mine should be conducted up to the working-face in any shape or form? It is always conducted up to the working face if you have got fire-damp.
10942. *President.*] But apart from that, should it be conducted to within a reasonable distance of the working-face? It ought to be conducted within a reasonable distance of the face.
10943. What would you say that would be? Opinions differ very largely on that matter. I quite believe there was an intention on the part of whoever framed our Mining Act, to limit the distance each man should work before the air current; but really there is no limit now.
10944. Why? The Act says a man shall not work more than 35 yards in advance of the air without a cut-through put through.
10945. You mean there is no limit to the distance he may work before the air current? Not as the Act is interpreted.
10946. Do you not think that the Act meant that air was to be supplied everywhere—if it was properly administered? I have an idea that it meant to limit the distance a man should work before an air-current, and that it meant 35 yards. On page 4 it says, "and no working-place shall be driven more than 35 yards before the current of air, without a cut-through put through or bratticed up to within 3 yards of the face." My idea is that whoever framed that meant that they were to be 35 yards from the current of air to the intersection of the bord and cut-through.
10947. If there is 100 cubic feet going along the airway, would you say that the Act had been complied with? There might be 500 cubic feet going along the airway, and the Act would not be complied with. They limit it in one direction only; but if 100, 200, 300, 400, 500, or 1,000 cubic feet of air is not adequate, they must provide more.
10948. Look at sub-section 2; do you not think that they really meant that an adequate amount should be in each working-place, and that they made a great mistake by putting in sub-sections 3 and 4? I am sure they meant that there should be an adequate amount of air in each working-place, so that if the inspector went into a working-place and said it was not adequately ventilated, he could take action under these clauses to see that it was so. He could under section 25.
10949. It seems to contemplate that the men might work 35 yards before the air? It is not clearly worded; but that is what I think they meant. They meant that the men should work not more than 35 yards before the current, by driving the places 35 yards, and bratticing only one place. They could have a cut-through at 35 yards. [*Witness here explained on plan, that by bratticing the going bord all the rest of the bords could be holed at the 35 yards.*]
10950. *Mr. Curley.*] Under the present system? Yes.
10951. That would be a considerable improvement upon what is taking place? Yes; there is no difficulty about it. My own computation of the cost of bratticing is about one penny per ton to brattice the whole of them; but to brattice this one place it would only be about one-thirtieth part of it.
10952. *President.*] Do you say that a minimum amount of air should be provided in the Bill? Yes; distinctly a minimum amount. It is a distinct improvement on the English Act. The English Act says: "an adequate amount"; but it should never be forgotten that all English mining is in a very small area, and the consequence is that the inspectors—and even the managers themselves—have had a very careful training; and supposing one of the mines is badly ventilated, the men begin to talk about it, and the manager feels very much disgraced,—more especially in the case of a fiery mine. If a man gets burned in a fiery mine the manager feels terribly disgraced, and as a consequence you will always find plenty of ventilation. I would venture to say that the average mines in Great Britain vary from 300 to 400 cubic feet of air.

10953. *Mr. Curley.*] Have you looked at the suggestion in the proposed Bill—section 46—to carry the air within 15 yards of the face by brattice or otherwise? Yes.
10954. Would that be a very costly matter? To brattice every place in a fiery mine costs on an average 1d. per ton out here. There is some very good evidence on that point by Mr. Green, if you will refer to it. He thought it would not cost a penny. He thought it would cost about four-tenths of a penny per ton. I attach a great deal of importance to his evidence, for the reason that he was a certificated colliery manager who had been very carefully trained, and was actually doing the work himself at that time—or at least had done the work a short time previously to that at the Seaham Colliery. He stated that the cost would be about four-tenths of a penny. I would not ask any questions about a minimum, but establish it right away. There should be a minimum in every mine in the world. It would be a distinct improvement. I have known cases in England where a minimum would have been a distinct improvement to the English Act.
10955. To the English Act, 1887? Not of 1887. That has been passed since I came out here. The 1872 Act, I mean.
10956. The same section? Yes.
10957. You say it would have been a distinct improvement to the Act in England? Most certainly.
10958. Do you believe in a mine being divided into splits? Most certainly. [*Witness explains on plan.*]
10959. *President.*] Would those splits be a matter of good management? They ought to be compulsory, and then it is only making good management compulsory.
10960. *Mr. Curley.*] You consider the question of splits should be set out in legislation? Most distinctly. The Anthracite law of Pennsylvania says: "Not more than seventy-five persons shall be employed at the same time in one current or split." The Bituminous law of Pennsylvania says: "Not more than sixty-five persons shall be allowed to work in one current."
10961. Do you think there should be a limitation as to the distance that the place should be before the air? Yes.
10962. And that that should be definitely set out in legislation? Yes; most certainly.
10963. Would setting out these distinctions or methods of mining in any possible way hamper a good manager? Most certainly not. A competent manager always lays out his mine straight off on those lines. He always arranges to split his air, as by doing so he gets a very much larger quantity with the same ventilating power.
10964. You think a good manager would in no way look upon this as hampering him? Most certainly not.
10965. From your experience of mining do you think all this can be done, and done efficiently? You have it in the present Act. In the present New South Wales Act we have the principle of limiting the distance or dividing the air current. It states that not more than so many men shall be in a split.
10966. But the difficulty is to a great extent in connection with the administration? If you make some clear wording or instructions for the inspectors you would have no difficulty.
10967. How have you computed the cost of the brattice? By my own actual experience, which I have compared with the experience of others, at home it used to cost, for material and labour, barely a halfpenny a ton. That is my own computation. Out here, with higher wages and extra cost of material, I think it would cost a penny on an average. Of course, bad cases may cost a little more, and good cases may not cost quite so much, but I think it is a fair average.
10968. What would you think of statements of 4d., 5d., or 6d.? I should think that they included the hewing price in that. In one of our collieries in England we used to pay 7d. per ton. We used to brattice every place. I suppose the brattice would cost us a halfpenny, and the other 7d. or 7½d. for hewing and brattice.
10969. Was your estimate based on brattice cloth? Yes.
10970. At what price? I think we paid about 6d. per square yard, if I remember rightly.
10971. I mean the estimate you have made with regard to the mines here? I am speaking now of the penny per ton on the estimate I made in giving evidence before the Upper House. I am speaking from memory, but I am satisfied my figures were fairly correct at that time.
10972. What was the brattice composed of that you say cost a halfpenny per ton at home? Just canvas brattice similar to what we have here. I remember being with the Northern Institute and paying a visit to the Bore-hole Colliery once. It was just similar canvas to that. The same line.
10973. Do you look upon the system of ventilation as one of the chief items in connection with mine management? Most certainly. The best ventilated mines are always the most cheaply worked. There is no question about that.
10974. If mines can be bratticed at home in England, and the ventilation can be kept up at the efficient standard you speak of, do you not think the same thing can be done here? Most certainly; the same thing is done here in the Newcastle district. I think if you take the Seaham, West Wallsend, Durham, Burwood Extended, Dudley, and part of J. and A. Brown's collieries, you will find they are all bratticed. That is the evidence of one of the inspectors.
10975. You do not consider that the enacting of those provisions that are proposed in the new Bill with regard to a minimum quantity of air, the stipulation of distance before the air, or the bratticing or carrying of the air up to within 15 yards of the face, &c., will do anything that is calculated to ruin the mining industry in any shape or form? Certainly not.
10976. Would you regard a statement of that kind as a very absurd one? Yes; very absurd indeed, because there is only one part of it at present that is at all questionable—I would not say objectionable—and that is, the 15 yards before the air, where gas does not exist. The cost of bratticing every working place is probably, on an average, a penny per ton. It is quite possible that some arrangement might have been made with regard to improving the clause they speak of here, in reference to the 35 yards. The reason why all this trouble has cropped up about the ventilation is simply, I presume, on account of bad ventilation—that is, when this clause was put in the old Act. If men had never worked more than 35 yards before the air current, I am of opinion that trouble would not have cropped up about the 15 yards. It is better to limit the distance for a man to work to 15 yards. So far as working in the face is concerned, I would prefer to be only 15 yards in front of the air current. If the men had never been more than 35 yards before the air current, it is just possible we would never have had the 15 yards.
10977. But if managers themselves at the present time admit that the place gets warm, and that the powder smoke hangs even at 35 yards, do you not think there is reason—more particularly in the rise places—

Mr. J. May. places—why even then there should be a shorter distance before the air? If ever you mention the words “rise place,” they always say “dip place” next. The point is to take a level place and split the difference between the two. With that level place you should have in the Bill a reasonable distance that a man should work before the air current. If you think the 15 yards reasonable, all right; but you should have a reasonable limit.

23 Oct., 1895.

10978. Have you given any attention to the question of working hours as proposed in this Bill? Having been connected with mining ever since I have been a boy I have given a very great deal of attention to it.

10979. Do you know the hours worked in the counties of Durham and Northumberland, in England? In the collieries that I have had control of, the men averaged for ten years, thirteen hours a day—two shifts. I was ten years in my last appointment.

10980. It was stated here yesterday by a witness that Mr. Burt had opposed the legislation at home in connection with the eight hours? Yes; for the best reason in the world.

10981. Can you give any kind of reason why a circumstance of that kind should arise? Yes.

10982. What would you consider a sufficient reason for a circumstance of that kind? The best reason is perhaps the statement by Sir Joseph Pease in a deputation to Mr. Gladstone. He said, “The miners’ hours now worked were not unreasonable, for, on an average, over the whole United Kingdom they were only seven hours twenty minutes per day. The longest hours were at Nottingham—eight hours twenty-three minutes; and the shortest in Durham—five hours thirty-seven minutes.” Sir Joseph Pease is one of the most extensive coal proprietors in Great Britain.

10983. When was that statement made? That statement was made certainly within the last two years, when there was some little agitation over the eight hours. They carried it twice, if I remember rightly in the House of Commons.

10984. Do you think that this would in any way seriously affect the working of the collieries with regard to their outputs—taking the coal trade as a whole in the Colony? Certainly not.

10985. You do not think that to apply the eight hours would affect them injuriously in any way? No.

10986. *President.*] Would you punish a man for working more than eight hours? Oh, yes. There would not be the slightest use making a law if there was no penalty. If a man sends dirty coal out of the mine you may talk to him; but if you stop the skip or fine him he will not do it next time.

10987. *Mr. Curley.*] Do you think it would add anything like 7d. a ton to the cost? No; most certainly not. I could understand that being the case in a place like Great Britain, where they draw coal about eleven hours a day. If you suddenly dropped drawing coal from eleven hours to eight hours I could understand it; but out here, if I remember rightly, you had some arrangement in an agreement about eight hours or a little over in the Newcastle district. It might possibly mean a matter of fifteen minutes difference altogether between what you want and what they have actually in existence. You had an eight hours drawing coal in one of your agreements, I believe. The reason why Mr. Burt opposed the eight hours was because the men were not working the eight hours. It was simply lengthening their hours. That is why he opposed it. The men in Durham do not work eight hours by any means.

10988. Do you think that would be the principal reason why those representatives opposed it—if they did oppose it? That would be the reason.

10989. Because they had less than eight hours? Yes; because they had less. They are not going to lengthen their hours by Act of Parliament, surely. I am rather inclined to think I once read a remark of Mr. Burt or Chas. Fenwick’s, to the effect that if other men had not the sense to reduce their hours, they were not going to lengthen their hours to suit them.

10990. I suppose you know this Colony and the working conditions pretty well by this time? Yes; I have had nine years’ experience of it now.

10991. Do you think that any arrangement to shorten the hours to anything like eight uniformly can be brought about by mutual agreement between the men and the proprietors? Most certainly not. If you want it established as a principle you must do it by legislation.

10992. Do you consider eight hours quite long enough for any miner to work in a mine? I have always been used to much less than eight hours. I was telling you that the men in Durham and Northumberland do not average more than thirteen hours—if so much—two shifts, and having been used to short hours I have a very high opinion of the eight-hours principle.

10993. You said something just now about the inspectors having some kind of definite authority;—do you think it is desirable that the inspectors should have some definite powers or authority under this Act? Yes. If you want an inspector to act you must lay down very clearly his instructions. You could not have a better illustration than that case at Stockton, for example. I am certain that there are cases when an inspector might withdraw workmen, and you would find those very workmen perhaps finding fault with the inspector. You must make his instructions very clear, because he would not like those men to find fault with him if he thought it necessary to withdraw them for their own safety.

10994. And the manager might complain as well? Yes; you make his instructions clear and he will carry them out.

10995. *President.*] Is there a necessity to legislate about that;—would not a man who was properly administering the Act withdraw the men himself, supposing he saw pressing danger? Yes; under the English Act, which is very simple. The present Act of New South Wales is almost similarly worded. It simply says: “If from any cause whatever the inspector finds a place not safe, he must withdraw the men.”

10996. The Colonial Act does not say that. It says:—“The men shall be withdrawn”? Yes—“If from any cause whatever” covers the whole ground for the inspector. Page 8 of the proposed Bill, subsection (v) section 21 says: “Until the same is stated by the inspector to be safe.” Would not the English clause do there very well.

10997. Supposing an inspector came along and saw there was pressing danger, and said to the manager, “These men ought to be withdrawn at once; there is pressing danger;” do you think any manager would dare resist him? He would not do so if there was pressing danger, but it is simply a question of difference of opinion. Under the English Act, if an inspector finds any practice or thing that he considers dangerous he draws the attention of the manager to it, and if the manager thinks that the inspector is wrong, he just states his case to the Mines Department; and then the matter is settled by arbitration.

10998. That is the way here; do you not believe in that? Yes.

10999. Do you think it is necessary to have any such enactment as sub-section (v), page 8 (*see Appendix A*)? I prefer the English Act in that particular case. I can quite understand that there may be special cases sometimes.

Mr. J. May.  
23 Oct., 1895.

11000. I meant to say, would that section be of use practically? I prefer the English reading.

11001. *Mr. Curley.*] Do you not say that in the event of immediate danger the English Act says he is to give notice? If it was a case of immediate danger the Mines Inspector in Great Britain would go to the manager and ask him to stop the place; I cannot imagine an intelligent manager refusing to stop a place if there is immediate danger.

11002. Do you know that the inspector's authority has been defied here? Where?

11003. I think you cited the case of Stockton? They had a means of dealing with the case under the old Act in that particular instance. Clause 25 says:—"If in any respect (which is not provided against by any express provision of this Act, or by any special rule) any inspector find any mine, or any part thereof, or any matter, thing, or practice in, or connected with any such mine to be dangerous, or defective, so as in his opinion to threaten or tend to the bodily injury of any person, such inspector may give notice in writing to the owner or agent of the mine." The inspectors could have taken action under that clause. They could have used their own discretion whether they took the 5th sub-section of clause 12 or the 25th clause.

11004. They did take the 5th? Well, it proved to be useless. The mine went on.

11005. Did it not prove useless because the management and the men combined defied the inspector's authority? Then the inspector could have taken action under the 25th section.

11006. *President.*] There was only a pecuniary penalty imposed under the old Act, whereas now, for an offence against this Act or Bill, a man is liable to three months imprisonment. Is there any necessity to enact that 5th sub-section on p. 8. It is not in the English Act. Can you understand a manager refusing to withdraw the men in a case where the inspector says:—"There is danger; you must withdraw your men at once"? I cannot understand a manager refusing. At the same time I am satisfied that the inspector should have some definite instructions in a case of emergency, but under the English Act it is just about similar to that we have here. I have never heard of any difficulty under it. As for the Stockton case, I am perfectly satisfied they could have taken action under the 25th section.

11007. *Mr. Curley.*] Supposing they had taken action under the 25th section? Then it would have been referred to arbitration. The law was treated with contempt in that case, but if that had been referred to arbitration, it would not have been treated with contempt.

11008. But suppose the company had refused to go to arbitration? They are compelled to do so under the present Act.

11009. If they could defy the law in one instance, they could also do so in another? Not in an arbitration.

11010. If they would not go to arbitration, could you drag them there? Yes.

11011. With regard to such a case as the one you have just cited, where there is an emergency, and where something very serious is impending, would that be a time to wait for any arbitration? Most certainly not; but here it says, "If the owner or agent of the mine objects to remedy the matter complained of in the notice, he may, within seven days after the receipt of the notice sent him by the inspector, send an objection in writing, stating the grounds thereof to the Minister, and thereupon the matter shall be determined by arbitration in manner provided by the Act."

11012. I dare say you know the very peculiar conditions under which some of these men are now working—under tidal waters, &c.? Yes.

11013. And if any serious calamity was impending over a mine, would that be a time to talk about giving notice and waiting for arbitration? The best thing would be for the inspector to serve a notice on the manager.

11014. And stop the colliery? Just to serve a notice on him and then the matter would be settled, just the same as cases are settled under the English Act. I can quite understand there may be special cases of imminent danger, but in a case of that kind I could not understand how any manager would stop at all to think about the matter, but comply straight off with his request. I can give you an illustration. In Great Britain a mine was being worked on the long-wall principle. The inspector visited the mine, and he was not satisfied that the mine was safe if they fired shots in the gateway. The manager objected to discontinue shot-firing. The inspector said it was dangerous. The manager said, "I am quite satisfied that the place is not dangerous." Then the matter was settled by compulsory arbitration under the Act.

11015. *President.*] In the meantime, pending the decision, he did not fire any shots? If he had done so he would have had to take the consequences, which would have been very serious.

11016. What would they be? In the event of any of the men being injured or hurt by an explosion that would be a *prima facie* case for a prosecution. The manager must take the responsibility of his action until the matter is settled.

11017. That is to say, it would be the very strongest evidence of negligence against him? Yes.

11018. If a man's death was caused it would be the very strongest evidence of negligence, causing really manslaughter? Yes; I have never heard of any trouble like that under the English Act; but I can quite understand that a case could arise. That Stockton case could have been arranged under the 25th clause.

11019. To go back to what I was asking, there is no necessity, you think, for legislation to interfere in the way that 5th sub-section does? I consider that the English Act, so far as I am aware, is quite satisfactory.

11020. *Mr. Curley.*] Would you not add that part of clause 20, page 9 of the proposed Bill, which has been erased, viz., "and enter such report in a book at the mine"? I am satisfied with the English Act on that score.

11021. Is there anything else in the Act to which you would like to refer? I may say, generally, that to my way of thinking the best thing you could do would be to adopt the English Act. You have in the present Act the principle of a minimum quantity of air, the principle of limiting the distance before the air current, and the principle of limiting the number of men in a split. These are probably the three most important points so far as any alterations are concerned. I should certainly recommend you to adopt the English Act with those three additions—limit the distance which the men should work before an air current to a reasonable distance, have a minimum quantity of air, and have a maximum number of men in one split. These are about the principal points. There is one thing, however, about the English Act which I would like to point out, and that is the utter uselessness of the check-inspector's inspection. It is simply a useless inspection.

11022. It satisfies the men? If it pleases them it does not hurt anybody. You can quite see, however, that in a great number of these cases the check-inspectors are not in a position to say what the mine is like.

- Mr. J. May. like. You can readily understand that when work is very hard to get, no men are going to run the risk of making a statement which would offend the manager.
- 23 Oct., 1895. 11023. Mr. Gregson.] But as to that, they can please themselves? Certainly, if it pleases them all right; it is, however, utterly useless.
11024. Mr. Curley.] You said just now that you thought these were the leading points that should be embodied in the Bill in conjunction with the English Act? Limiting the distance before the air current, limiting the number of men in a split, and the minimum quantity of air—those are the three leading principles wanted. They are in the present Act.
11025. What about the eight hours? I would introduce it into the present Act on the lines of the Victorian Mines Act, which is eight hours from face to bank. There is a splitting of the difference.
11026. It would mean about eight and a quarter or eight and a half hours? Yes; and it is possible that if the eight hours principle was not put into the present Act, it could be put into a separate measure; but certainly I believe in making the eight hours compulsory.
11027. Either in this Act or out of it? Either in this Act, or by a separate Act.
11028. President.] But is it not a matter that ought to be fought out far more as a matter of general principle than in an Act of this kind? I think everyone admits that eight hours is long enough to work underground.
11029. The question is, should it be enacted? You will never get it otherwise. With reference to the examination by the workmen, I have pointed out why I consider it useless. I consider it would be better if the mine was inspected by the inspector more frequently.
11030. You mean by the Government inspectors? Yes. There is just one word I want to say about the certificates in the new Bill. If you make it similar to the English Act you will find that there must be a portion of that examination oral. I would strongly recommend that to be introduced. I now want to refer to one of the schedules in regard to the drawing of coal. In the English Act there is a table in which a return can be given of the number of days in a month on which coal has been worked. It is on page 21 of the English Act; "The number of days in each month in which coal or iron-stone has been drawn."
11031. You think that should be embodied in the Bill? The point about it is, that in the Bill they should have the number of days worked per week, to show the average at the end of the year of all the mines.
11032. The number of days that the colliery has been at work? Yes; per week. The reason of that is simply that there are a number of collieries in the Newcastle district which have been established without any warrant from a commercial point of view, and if you take the ten following collieries—the A. and A. Co., Newcastle, Wallsend, Lambton, Co-operative, Newcastle Coal Co., Waratah, Minmi, Stockton, Wickham and Bullock Island, and the Hetton—they could supply the whole of the trade in the Newcastle district by working not quite four days a week, and yet nearly twenty more mines have been established. There are the Greta, Burwood, New Lambton, Great Northern, Taralba, West Wallsend, Monk Wearmouth, South Burwood, Burwood Extended, and the Redhead. There has been over a million sterling spent on these mines, and the ten I first mentioned could supply the whole of the trade. I think it would be quite fair to say that one-third of the mines in the Newcastle district could supply the whole of the trade. That being the case, in the interests of legitimate mining, it would be only fair that some means should be adopted to give the public some idea of what is going on. There are two mines idle out of every three. That means that the capital spent on them is simply wasted.
11033. With regard to the question of pillars, do you consider that substantial pillars should be left in a mine? Most certainly.
11034. I suppose you know that in the working of pillars men have got to depend for their safety very frequently upon the pillars that are left when any extensive fall takes place in the goaf? Most certainly.
11035. Can a mine not be worked more economically with a larger pillar than with a smaller one? The pillars are always regulated by the depth from the surface. I have worked pillars from 5 yards by 20 yards to 25 yards by 30 yards, and the 5 yards by 20 yards were the stronger pillars, proportionately, to the work they had to do. You can always have a good idea about the pillar question this way. One inch square by twelve inches in depth, of average coal measures, equal 1 lb. in weight—that is the average pressure on the coal seam. One hundred feet would equal 100 lb. per square inch according to depth. At the bottom of this harbour here you would have a pressure of about 3,000 lb. weight per square inch.
11036. Do you think there should be a stipulated size with regard to the pillars under tidal waters in the ocean? Under tidal waters there should be some special arrangements, but that could be better arranged for when the leases were given.
11037. President.] By the Government? By the Government; but anyhow, for those leases that are at present in existence, the Government could always take action under that clause. They could always make some arrangements to make provision in that direction, but for future leases the Government should draw up certain regulations to cover their working under tidal waters. Take this case under Sydney harbour. That is not so dangerous as the Delta collieries, the ocean leases yonder at Newcastle.
11038. Mr. Gregson.] Did I understand you to say that there were provisions in the English Act for the examination of managers? The arrangement in all the best centres of Great Britain is that the examination shall be partly written and partly oral.
11039. Did I understand you to say that it was provided for under the English Act? It is not; but they are asking for it under the amended Act now.
11040. Where did you see a copy of the amended Act? I left it on my table at home. You will find it in the *Colliery Guardian*.
11041. Who introduced the Act? It was introduced by Mr. Asquith, the Home Secretary. It is customary in all the best centres to have it oral, but they want to make it compulsory. It is a great mistake not to have an oral examination.
11042. President.] They can have it how they like under the present Act? Yes; but they should make it compulsory. Suppose you put down written questions for candidates you will find perhaps that young men of good education, who are well coached, will fly through the examination, but if they had to pass an oral examination before two practical men, it might make a very great difference. In that case, however, the men who had practical experience would have a good show.

[Witness withdrew.]

Daniel

Daniel Alexander Wilberforce Robertson recalled :—

[At the request of the President and members of the Commission, and through a reference made by Mr. Dixon, senior inspector of collieries in the Northern district, Mr. Robertson was in attendance with his colliery plan, which shows all the important surface buildings, railways, tunnels, roads, creeks, and the township of Helensburgh, together with the reduced levels, both surface and underground, and the distances of the underground portions below the surface. The plan was inspected by the Commissioners.] Mr. D. A. W. Robertson.  
23 Oct., 1895.

11043. *Mr. Gregson.*] Do you approve of the whole of the surface being put on a pit plan? I approve of all the buildings and important surface features being shown on the plan.

11044. You do not think it sufficient to have a tracing? So far as the interest of the public is concerned, that would be sufficient, but as a matter of convenience to the manager I should prefer one plan, with the buildings, &c., shown over the workings. Our working plan is only for underground purposes. It is unnecessary to have a pair of plans, but it is necessary to have the information on one plan at least.

11045. *Mr. Curley.*] Do you find any difficulty in carrying this out? There is a little trouble, but no difficulty. It is a matter of surveying, and in a colliery of any consequence it should be done. If there is a staff there is no reason why it should not be done.

11046. You think it should be done? All important buildings should be shown on one plan at all events. I can speak of my experience of Home collieries, and there I have never seen it in any other way. Every colliery plan I have had to do with—and I have had a good deal to do with surveying, has had the important surface works on it.

11047. *Mr. Gregson.*] What cover have you over the goaf? About 1,450 feet at one place, but more at other places.

11048. Is the high ground extending? It is a series of gorges.

[Witness withdrew.]

TUESDAY, 5 NOVEMBER, 1895.

[The Commission met in the Board-room, Chief Secretary's Office, at 10 a.m.]

Present:—

FRANCIS EDWARD ROGERS, Esq., Q.C. (PRESIDENT.)

JAMES CURLEY, Esq. | JESSE GREGSON, Esq.

AFTERNOON SITTING.

Thomas Croudace, Esq., sworn and examined :—

11049. *President.*] What position do you occupy, Mr. Croudace? I am General Manager for the Scottish Australian Mining Company. T. Croudace,  
Esq.

11050. What mines come under your supervision? We have coal mines in Newcastle, and copper mines in another part of the Colony. 5 Nov., 1895.

11051. What collieries are you the General Manager of? The Lambton, Burwood, and Durham Collieries.

11052. I understand that you wish to give some evidence on the Coal Mines Bill, which this Commission is dealing with? Yes, I would like to refer to one or two matters in connection with the Bill.

11053. Will you kindly say what are the matters you wish to refer to? The first is the system of standard weight. We weigh by standard weight, or have a standard weight, at the Lambton Colliery, and I wish to lay before you a few simple facts upon this method of weighing. I prefer the system of standard weight to the standard bar system, and certainly before the unlimited filling of the coal tubs—that is, without any limit to the filling of the coal by the miners. It is absolutely necessary that there should be some check to prevent the over filling of the tubs by the miners, and one system adopted has been standard weight, and the other the standard bar, and of the two systems I think the standard weight is preferable. I would like to give a few facts in connection with our system of weighing by standard weight. I might explain that I know there is a prevailing opinion amongst the miners that the companies who adopt the standard weight system get a large preference, or a great advantage by acquiring a large quantity of coal in excess of the quantity paid to the miners, and I want to show what has taken place for ten years past, at the Lambton Colliery. I have the weights for each half-year, as paid to the miners, and as weighed over the Government weigh bridge before going into the ships. Commencing from 30th June, 1884, and terminating 19th October, 1895, rather more than 10 years, the figures I have show that we have suffered a loss, or paid to the miners 8,209 tons more than we have been paid for the coal that has gone into the ships according to the Government weight. I had at first the weights for five years taken out, and the figures showed a loss of some 2,000 tons.

11054. As far as standard weight is concerned, Mr. Croudace, I may tell you that both the Legislative Assembly and the Legislative Council have come to the conclusion that standard weight ought to be abolished? I know that, although I did my best to prevent it. I consider that where the system of standard weight is adopted any loss to the miner is minimised, because he rarely ever fills over from  $\frac{1}{2}$  a cwt. to 1 cwt. in the skip.

11055. I fear we cannot interfere in this matter? I thought it was in the power of the Commission to express an opinion whether they thought fit to alter the system. I know by experience that the loss by standard bar is much greater to the miner, and more difficult to deal with.

11056. I think as far as standard weight is concerned we need not take up your time. If you have anything else you wish to refer to, I think it would be better for you to do so? Yes, I would like to refer to the question of splits in the Act. I have always disagreed with that provision—that is, the number of men to be employed in each split. I think that in the system of working any colliery, and in fact working every colliery, that the number of men to work in each split ought to be left entirely to the management, for the very obvious reason that the manager is much more qualified and capable, both from his professional calling, and also from the facts that concern the men, such as the character and nature of the roof and floor, as to what is the best system of working, and also the division of that mine into parts. I think that the Bill should not control in any way, as it does now, by stipulating the number of men and boys, together with the horses that should be in a split. 11057.

- T. Croudace,  
Esq.  
5 Nov., 1895.
11057. Will you look at subsection 3 of section 49-46, on page 23 of the Bill. (*See Appendix A*). You object to that subsection being in the Bill? Yes; there is no man so well qualified to judge as the manager how many men should be employed in a split, and different mines really necessitate different operations—what will apply to one mine with given surroundings, cannot apply to another without probably serious loss. You cannot always work the longwall system, because if the roof and floor are soft it will not admit of it. In fact, you cannot lay down any hard and fast system, and I think that subsection should be erased, as it has been by the Upper House.
11058. Is there any other point that you wish to refer to? I think that the distance for cut-throughs should not be stipulated in a Bill. The distance is put down at 35 yards, and it was attempted to reduce this distance to 30 yards, but this, I think, should rest with the manager, because if he has any system of bratticing he can carry his cut-throughs much further, and the more cut-throughs you have, the more you weaken your coal-mine, or coal district.
11059. You think this is a matter that should be left to the management? Yes.
11060. As to the system of ventilation, do you mind telling me whether you think that the air should be taken to within a reasonable distance of the working face? I do; some little time ago I bratticed the whole of our Lambton Colliery, and I had not one expression of opinion from the miners, either verbally or by letter, of their approval of such a system, and I thought the least they would have done would be to express an opinion.
11061. Did they express any disapproval? Some of the miners objected to the smell of the brattice-cloth, and some thought that the current of ventilation was too strong going across the heading.
11062. *Mr. Curley.*] Did not Mason express an opinion on this matter? Not to me, personally.
11063. *President.*] If you say that nothing is to be said about cut-throughs, surely bratticing would be necessary? I believe in a certain amount of bratticing; but you must understand that under our present conditions it is absolutely necessary to brattice where gas exists.
11064. But where gas does not exist? So far as the principle is concerned, I do not dispute that a certain amount of bratticing would be more beneficial than without it; yet we have worked for a great many years without brattice. We had, some time ago, to ventilate more places than usual; but within the last two years—perhaps three years ago—I ventilated the whole of the mine. We have left off doing this for well on to twelve months, and as far as any opinion went none was expressed. Cut-throughs are necessary for air; but we used to have them at a distance of 40 yards, and this was reduced to 35 yards, and attempted to be reduced to 30 yards. Of course, if you do not have cut-throughs, you must have bratticing.
11065. You agree the men must have air? Undoubtedly. In the mines about Newcastle, and in the Southern district, every person that comes in displaces a certain quantity of air; and I may tell you that the men cannot work well in a draught. Where brattice is, men would have to shield themselves from the draught, because it would give them lumbago; in fact, it very frequently does. I think if you insist upon brattice, it should be recommended in moderation.
11066. We want to insist upon ventilation, but we may differ as to the mode of it. In the way the present Act has been administered, if there has been 100 cubic feet of air passing along the airway, it has been considered, in many instances, that the Act has been complied with? After thirty-three years' experience in this Colony, I can say that you rarely ever hear a man complain, unless his place is going ahead of the air. He may then complain and say—"it is getting hot, will you put a little brattice in?" and invariably, I may say, brattice is put into that place.
11067. How do men get air where you are working an ordinary bord? It goes past the end of the bord.
11068. Past the entrance? Yes.
11069. How does the air get into the bord? If it is a dip bord there is natural ventilation, the weight of the air finds the floor, and the heated air finds its way out by the roof; but in a rise bord it is not so.
11070. What do they do in a rise bord? Every time a tub comes into the bord it displaces the air, and every time a man or a horse comes in it displaces a certain amount of air, and the same natural ventilation goes on; but not in the same degree in the rise places as in the dip places.
11071. Do you not think that there ought to be some provision made either in accordance with the English Act, or in any other way for taking the air into these bords? I think so.
11072. For many years they have been used to looking upon the minimum of 100 cubic feet as adequate under the present Act, under all circumstances? Even before there was any minimum specified, they were satisfied with the quantity of air, excepting in special places—those that are going ahead of the ordinary workings.
11073. Is there any other point you would like to refer to, Mr. Croudace? I do not want to enforce the 35 yards before a cut-through is put through. I presume that these cut-throughs would have to ascertain under all conditions of the mine. In a fiery mine an explosion may occur, and the more openings there are render the danger attending the explosion, and the effect of the explosion, much greater. In the development of any new colliery the manager lays out his plans differently, and in all the main roads, the most approved system in England is to make the cut-throughs extend to 250 or 300 yards, so as to have a solid untouched block of coal between the two openings. Under this system, in the case of an explosion, the workings can be reached much more quickly than if you have ten cut-throughs in, say, 250 yards. The back cut-throughs are stopped up, and in the event of an explosion are blown to pieces, and would have to be built up to reach the workings where the explosion took place. That is prevented by putting cut-throughs at distances varying from 250 to 350 yards. When the first cut-through that may have been affected by the explosion has been stopped, you can go straight ahead for 250 or 300 yards before you come to another. I consider that system much better than forcing the cut-throughs to be put every 35 yards. This is only meant to refer to ordinary bords in the Bill; but it is necessary, for the protection of the coal-owner and the miners' lives, that these cut-throughs should be at the discretion of the manager.
11074. You think it is better to say nothing about cut-throughs in the Bill; but to provide for ventilation, and leave it to the manager to provide the best way to give it? I think so; I am sure of it.
11075. You would not provide for any minimum in the Bill? No; I do not believe in stating a minimum. We shelter ourselves under the minimum. I think you cannot beat the English Act which provides for an adequate amount of ventilation which may, in some instances, be only 40 or 50 feet, or it may be ten times as much.
11076. The difficulty in the way is that people have worked so long under an Act under which you say you have protected yourself;—if a minimum is not prescribed, 100 cubic feet of air may be considered safe under all circumstances? That may be done, of course. I think a manager would know when he is dealing with gas, which is the greatest enemy a manager has to deal with.
- 11077.

11077. Some people say that the miners prefer working in a gassy mine, because they get better ventilation? That is a common expression. There is always better ventilation where there is gas. T. Croudace, Esq.
11078. In this Colony the majority of the mines are not gassy, and that being so, would you not make some provision, looking at what the state of things has been, to have some stipulation as to the minimum, allowing managers at the same time to give as much as is necessary? I think the word "adequate" provides all that is necessary. I can scarcely realise a case where a manager would not wish to give a man a fair amount of air. 5 Nov., 1895.
11079. Is there any other point you wish to refer to in the Bill? I would like the Commission to bear in mind the cut-throughs in the case of the opening out of new mines. In the opening out of the Durham mine I have prepared for the system I have spoken about. The first stenton is 250 yards, and was all bratticed. If cut-throughs are provided to be put every 35 yards, I will have to make them, and so be prevented from carrying out the system I have described.
11080. I think all that is asked for is proper ventilation without insisting as to the particular mode of giving it:—there may be a strong difference of opinion as to whether a minimum quantity should be specified in the Bill? I understand.
11081. As to the mode of giving the ventilation, you think that should be left to the discretion of the manager? Yes; the cut-throughs should be left to the discretion of the manager.
11082. You think the way he should give the air should be left to his discretion? I do, without doubt.
11083. Are there any other matters in the Bill you would like to refer to? Yes; the question of working under ocean or tidal waters. I think that should not be altogether controlled by the Government. The sections in the Bill dealing with this matter have been eliminated by the Legislative Council.
11084. You think properly so? I do. It is specified in the Bill at what depths they are not to extract pillars, and that borings have to be certain widths, &c. I wish to point out that the cover over the coal-seam, and the thickness of the seam are important factors, and that it is absurd to lay down any such dictum as this.
11085. You want these things left to the discretion of the manager? I do. If you have a 10-foot seam, and have a roof over that, of say a good deal of sand, some clay and rotten shale, I think at a depth of between 400 and 500 feet you are allowed to extract that seam, but you are not allowed to extract a thinner seam with well stratified compacted rock. The thing is an absurdity on the face of it. Here again comes the necessity for leaving these things in the hands of the manager, holding him responsible for any damage through improper working. I think this ought to be eliminated from a Coal-mines Bill, otherwise it will prevent valuable properties from being worked, and may give, if there is a deeper seam, a privilege of working it to the detriment of the miner as well as the whole colliery.
11086. *Mr. Curley.* Have you an ocean lousehold? Yes, both at the Burwood and Durham collieries.
11087. You want absolute freedom to do as you please? I do.
11088. Without any restrictions? Yes.
11089. In any shape or form? Yes, except my own good sense after consultation with the officials from time to time. You may rely upon it I won't run any risk. I will not attempt to work when there is water, or run the risk of loss of life.
11090. Do you think that no other judgment ought to come in except the manager's? You have a judgment in connection with the inspectors. Although their powers have been curtailed by the amendment proposed by the Upper House, still they have the power to act.
11091. What power do you refer to? If they think it is dangerous they can create an arbitration. You will see with a very high seam, and very poor cover, say up to 500 feet, you can extract that, while under certain conditions such extraction would be highly dangerous.
11092. Where do you find that in the Bill? It is in the Act of 1876, that we are working under now. In rule 42 of the Bill it says, "In no case shall pillars under ocean or tidal waters be removed."
11093. If you had no provision, according to the opinion you now give, who is going to stop it? I can scarcely imagine a competent person having full charge of such things running such a risk.
11094. Do you know anything about the Stockton Colliery? Yes.
11095. Do you know the pillars that were left there? Yes, I do.
11096. Was there anybody to interfere at that colliery with the pillar working? Well, I do not know. I think the inspector, or inspectors, should have expressed an opinion upon those pillars.
11097. Should not the manager or his Board of Directors have prevented the inspectors doing that by doing it themselves on their own account? Undoubtedly.
11098. If you have examples that managers will not do these things, and no attention has been drawn to it by inspectors, has not the time arrived when something else should be done? I cannot realise how you are to do it in the way the Bill proposes.
11099. You would let the present system go on? I think the warning they have received at Stockton and Ferndale will be a warning that will last for generations in the Newcastle coal district; but because one man may have committed an error, it does not follow that others will, and that you should inflict penalties to operate in this harsh way.
11100. You cannot confine these errors to one mine or one manager? I think it is wrong to attempt anything by legislation in the way that is proposed. You cannot lay down the conditions; they lay themselves down, and the judgment of the manager comes in under the conditions to say what is the most desirable thing to do. I was going to call your attention to another matter in the Bill, to be found in rule 46, on page 32: "Size of pillars in mines not under river, or ocean, or tidal waters." (*See Appendix A*) It says: "Where it is intended to remove the pillars, the borings shall not exceed in width 8 yards, and the pillars shall not be less than 8 yards wide." Here a clear error is committed. In working the outcrop seams it will be found much cheaper and more desirable near the outcrop to leave thinner pillars, because the roof is imperfectly stratified and you lose your pillars, and the loss pillar you can lose the better. This is simply another instance of what I consider the want of soundness of judgment in laying down any hard and fast rule or principle for mining.
11101. Are you speaking now from your experience in the northern district? Yes.
11102. In enunciating this opinion? Yes; from experience, and what I know generally takes place.
11103. I am afraid the record of the district will be against you? No; I say you can get the coal out, *Mr. Curley*, and get it out more safely in the outcrop portions of our seam by leaving smaller pillars.
11104. Are you an advocate for leaving small pillars in a mine? As a rule, no. I advocate where there is ample cover, and of a proper character—that is, well stratified rock—large pillars. 11105.

- T. Croudace, Esq.  
5 Nov., 1895.
11105. What practice have you followed in that respect in the Lambton Colliery? Near the outcrop?
11106. All round the colliery? In the outcrop, small pillars; further to the dip, larger pillars.
11107. Have you not an all-round system of 8-yard bords and 4-yard pillars? We have them varying from about 2 or 3 yards up to 8 and 10 yards.
11108. Has not 8-yard bords and 4-yard pillars been the general practice? No.
11109. Not only in your colliery, but in the whole district? I cannot say much for the other collieries; they thicken their pillars as they go under deeper cover.
11110. I am going back a few years ago, before any prominence was given to this question? I think at that time they would be pretty well all on the outcrop.
11111. I am afraid not? The bulk of them, I think. You see Minmi is largely the outcrop, also Lambton, Wallsend, and Waratah. It is not until you come to the A. A. Co. and Newcastle Co. that the conditions alter.
11112. What about Minmi? That is largely an outcrop. Then their seam is much thinner towards the dip—much thinner than the generality of the seams.
11113. Are not some portions of the Minmi seam very deep? Under the ranges they may have it.
11114. Are not some portions of the Lambton seam very deep? Yes; under the ranges.
11115. Wallsend and Co-operative? I do not think there is a very deep cover under the Co-operative.
11116. Has the practice of the district improved in this respect—are larger pillars being left? Yes, I think so. All the new collieries are much deeper, as a rule, and better stratified, and they would naturally leave larger pillars, with a view to getting them extracted; but still I do not think the size of pillars ought to be laid down under a hard-and-fast rule. I think the time has come when 8-yard bords should be abolished; it is an old primitive system.
11117. About ventilation that you have spoken about;—how often do you think a manager should measure the air in the mine to see what he has going? Where a manager has not much gas it does not require much measurement.
11118. Would you fix a time in the Bill—say once a fortnight, or once a week, or something of that kind? I do not think there would be any harm in that.
11119. Say in each particular district? There would not be any harm in that.
11120. Would you ask them to enter these measurements in a book? It generally is. Under the English Act it is entered in a book, and under the English Act you deal with the thermometer and the barometer. Their mines are much more fiery; they have more atmospheric changes to deal with, in which the gas exudes under some conditions much more rapidly than under other conditions.
11121. Do you not get that in this country? Sometimes.
11122. Is it not likely that a manager may get lax when he knows there is no gas to look after? Where there is no gas you do not want so much air. A man breathes very little air in a minute. You could not swallow a cubic foot of air if you were paid £12,000 for it.
11123. Many a miner would like to swallow more than he gets? He could not swallow a cubic foot.
11124. Do you not think, as I have already put the question, that the fact of no fire-damp being in a mine has a tendency to make the manager lax with regard to the ventilation? It would make him somewhat indifferent, naturally. I wish it to be clearly understood that neither the coal-owner nor the mine-manager, or the miner has any greater enemy than fire-damp.
11125. Are there not other enemies, such as carbonic acid gas? Very very little carbonic acid gas, and that is near the outcrop, given off from the clay principally.
11126. Have you not a little of it? Yes; in our outcrop where we leave the small pillars. We had to commence a system of bratticing to overcome the carbonic acid from the clay overhead, but otherwise there is very little carbonic acid given off in the district. Of course, in a limestone country there is a large quantity of carbonic acid gas given off.
11127. Your workings are very extensive, especially in the Lambton Colliery? Yes.
11128. There is a large expansion of air throughout the mine? Yes.
11129. Under the present Act no place is to be driven more than 35 yards before a cut-through is put over or brattice used? Yes.
11130. A man has to put his cut-through over as well as that? Yes.
11131. That means more than 35 yards? Yes.
11132. Will not a man find the air defective in a rise bord? It is generally a little warmer as he gets to the cut-through.
11133. Have you worked simply to keep within the meaning of the Act, or to give a man substantial ventilation? We prefer good ventilation, because a man works better with good ventilation.
11134. You say that you have only bratticed a few places as an experiment, but, as a general rule, you do not use brattice? I say that we have been compelled from time to time in places that are in advance of the general workings, such as winning headings, to use brattice, because there was no means of putting a cut-through, and in the ordinary workings we have had to brattice in the outcrop coal where gas was given off. Some time ago I had all the working-places bratticed, and I assure you I have not had a man saying, "Well done!" or, "Thank you, Mr. Croudace, you have given us good air."
11135. Are you sure that Mason did not mention the matter to you? I know Mason did, not many weeks ago—within six weeks ago. I mentioned to him that it was a curious thing that none of the men had expressed approval of the bratticing.
11136. Did he express his approval of it? Yes; he did.
11137. You found one man? Yes; but that was afterwards, about five or six weeks ago.
11138. What was your object in bratticing the colliery? Just to see whether the men really wanted it, or whether it was beneficial.
11139. Did you think it was beneficial yourself? I would be bound to say it ought to be.
11140. Will you let us have a definite opinion? If you ask me if the principle of bratticing is better than without, I would say bratticing is better.
11141. Will the air come of itself without being conducted? Yes; in dip workings very readily.
11142. What distance? One hundred yards if necessary. I have seen myself perfect ventilation in a dip narrow bord.
11143. How far to the rise? Not so far to the rise.
11144. Would you like to work 100 yards in front of the air off a heading? I would rather have the air behind me.
- 11145.

T. Croudace,  
Esq.  
5 Nov., 1896.

11145. You have mentioned something about a mine being divided into parts? Yes.
11146. Where a mine is divided into parts every cut-through would not be of the dimensions you have spoken about;—you spoke about a cut-through not being put in for some 200 or 300 yards? Yes, the main drives, and all the panels of working; that is what I want to have protected. The ordinary bords are usually driven 44 yards.
11147. Are you sure? Yes.
11148. Are they not 30 yards? No; the pillars are usually 22 x 44.
11149. Where? In the most approved collieries and for a number of years.
11150. Can you mention any of the collieries? In the majority of the large collieries in the north of England.
11151. Can you name any of the collieries? That used to be the system when I was serving my time.
11152. Where were you serving your time? At the East Hetton Collieries. We had thirteen collieries there.
11153. How long ago? It is about forty years ago.
11154. Has the system of mining changed since that time? In some instances, but not in others.
11155. Is not the system now bords 20 and 30 yards in length? Not that I am aware of. Of course, I would like you to understand that it is necessary to have shorter pillars in working thicker seams. In Staffordshire there is quite a different system to the North of England. There they leave small square pillars.
11156. At short intervals? Yes; there they have different conditions to operate upon. Pillars are practically left in the place of props. The enormous height of the seam necessitates this.
11157. Have you ever been in the Cambois Colliery, or the Bedlington Collieries? Yes.
11158. What are the lengths of the bords at the Bedlington Coal Company's Colliery? I should say about 40 yards. I have not measured particularly where they are working their big pillars. In some of the districts they were working longwall.
11159. Do you not think the bord and pillars were both 30 yards? I cannot say positively, but I do not think so.
11160. Do you think a miner who worked there ought to know? Yes, I should think so, although miners do not always notice the distance.
11161. You have assigned a reason why you do not wish any interference with this matter? Yes.
11162. You want no stipulation in the Bill? No.
11163. Is it because you want to extend the length of your cut-through;—would you like to have that liberty? I would, undoubtedly.
11164. To any length you please? I would not extend it beyond 44 yards; that is 2 chains.
11165. You know the system of ventilation at the present time? Yes.
11166. How would you ventilate them if you extended them to 44 yards? I would take brattice in so far.
11167. How far? Just according to the conditions. If a dip bord, not more than 2 or 3 yards.
11168. Any gas in the mine? In a dip bord probably more than 2 or 3 yards from the canvas door. In a rise bord it might have to be taken 10 or 15 yards in. I do not think it would be necessary to take it beyond.
11169. Would you give the inspector power to say whether the place was sufficiently ventilated? Yes; always power to raise the question.
11170. And if he said there should be more ventilation, would you comply with what he said willingly? Not if I thought it did not require it.
11171. Would you challenge the inspector's opinion? I would. I think the opinion of a manager at any colliery is more to be relied upon than the opinion of an inspector, because he is in daily touch with the colliery, and an inspector may not visit the colliery more than once in two months.
11172. How are the inspectors going to carry out their duties if managers combat their opinions in the way you suggest;—who is responsible for the mine? If you make the inspectors responsible the managers will welcome the hour that it comes, but you cannot make the managers responsible under an Act, and then have the inspectors to come in and override them. Take the case at Stockton; the inspectors went down that mine and ordered the men out. Certain work had to be done, which was carried out, and the men then considered with the manager it was safe, and went back to work. The inspectors never gave them permission to go back, and they have been working there ever since.
11173. The inspectors have declared the mine safe? I did not know that. How long after?
11174. Are you sure in that particular case the inspectors ordered the men out of the mine? I always understood so.
11175. If the manager had made a statement that he stopped the mine in order to remedy what had taken place, would you be inclined to accept his statement? Yes.
11176. If he did that, the inspectors could not have done it? No; but at all times I would give more consideration and weight to the candid and honest opinion of a manager against an inspector, touching his own colliery.
11177. Is not the inspector appointed to see that the provisions of the Act are carried out? Yes.
11178. Should not deference be paid to the inspector's opinion by managers? So it will be on any grave point.
11179. But you have said you would challenge an inspector's opinion? If I thought there was plenty of air I would challenge his opinion, but if I did not I would not. I would not do it from any bias.
11180. You are furnishing reasons why there should be a stipulated minimum quantity in the Bill; with regard to that large cut-through you have spoken about, do you intend to have all the cut-throughs driven in such a fashion;—the remark you made about this thick pillar would apply to simply making a division? To lay out the mine in a proper manner.
11181. Was it not to make a separate district? No; to make provision for extracting the coal throughout the whole of the property in a safe and secure manner, and to afford the best means of dealing with any explosion that might occur in the inner operations of the workings.
11182. It has not reference to pillars alone? The cut-throughs deal with the system of working, and I contend or think that that must apply to a pair of headings.
11183. If you had a separate district, for instance, in the way you have cited it would be with a view to lessen the effect of an explosion? Yes.
11184. That part would simply be ventilated distinct from the other portion of the mine? No; the ventilation that comes into the whole passes along these airways.

- T. Croudace, Esq.  
6 Nov., 1895.
11185. It would pass into each particular district? Yes.  
11186. There would be a division in that case? Yes.  
11187. That would be a split of itself? Yes; but I do not want the splits to be limited or specified. They may be less or more according to the circumstances that surround them.  
11188. Is there not this danger, especially in the non-gaseous mines, that if you do not stipulate something, there is a danger of managers overcrowding a district, and the latter portion of the men getting nothing but a polluted atmosphere to breathe? How do you do when you have an extensive longwall face which may be a mile from one end to the other?  
11189. In that particular case the air comes fresh on to the men, and fresh out? No, it does not; it comes along the main intake and along the main face, and so it does in the bords.  
11190. It is confined on the longwall? You do it to the detriment of your ventilation if you carry it out too much. If you over-split you weaken the velocity and lessen the quantity. I am asking that it should be left in the hands of the management rather than in the powers given to the inspector.  
11191. I take for granted that one of your objects is to have the longer cut-through? Yes.  
11192. You do not want a number of men stipulated to be in a split? No.  
11193. You want to increase the number of men in a split? If necessary, certainly, and I might have less than the number in the split. I contend that any Act of Parliament should give full acknowledgment and power to the manager of any mine to use his own discretion as to the best means for carrying on that mine, and the more restrictions you put in the way the more you will destroy the coal industry.  
11194. You cannot make a comparison between the conditions in this Colony and those in England? No; you cannot.  
11195. Here we have not gas to deal with in a number of our mines? Quite so.  
11196. There is an absence of motive power to induce the manager to have sufficient ventilation in his colliery? Every manager knows that the purer the air the better the men can work. I want, if possible, to extract 1s. 6d. for every 1s. I pay, and we know that in really bad air a man does not work well. If he is at all asthmatical he is knocked out of time.  
11197. From what you have known of the mines in the past do you think more attention should be given to the question of ventilation in the future? Yes; perhaps there should be, because mines are becoming deeper and more gassy, and, therefore, require more attention. In that respect the mine-owner, mine manager, and miner has no greater enemy than gas.  
11198. Gas is sometimes a very good friend for the miner? I know the old expression.  
11199. Gas is a good friend? I know that, as you mean it.  
11200. *President.*] Would you mind looking at these Rules about ventilation in the laws of British Columbia;—you will notice the wording of the English Act in the first Rule (*see Appendix B*)? [*Witness reads.*] I presume our Act has been taken from this, or they have taken their Act from ours.  
11201. You do not agree with the Rules there referring to ventilation? I disagree with the minimum, and that a mine should be divided into limited splits; and I concur with what it says in Rule 1 about an adequate amount of ventilation—that is, unlimited power; a sufficient amount—an adequate amount.

[Witness withdrew.]

WEDNESDAY, 6 NOVEMBER, 1895.

[The Commission met in the Board-room, Chief Secretary's Office, at 2 p.m.]

Present:—

FRANCIS EDWARD ROGERS, Esq., Q.C. (PRESIDENT).

JAMES CURLEY, Esq. | JESSE GREGSON, Esq.

AFTERNOON SITTING.

Robert James Jury sworn and examined:—

- Mr. R. J. Jury.  
6 Nov., 1895.
11202. *President.*] What is your name? Robert James Jury.  
11203. What are you? I am a miner. At the present time I am engaged attending to the brattice in the Stockton Colliery.  
11204. How long have you been a miner? About twenty-five years altogether.  
11205. I believe you wanted to give some evidence before this Commission? Yes; I expressed a desire to be called: I saw that several witnesses who had previously given evidence before Select Committees had been called by the Commission, and I thought I would like to have the opportunity of doing the same as them, that is correcting themselves where they thought necessary in their former evidence.  
11206. What is it you would like to say? There are one or two matters I would like to mention.  
11207. Before whom have you given evidence before? Before a Select Committee of the Legislative Assembly, in April, 1894. In my previous evidence, at Question 810, I say, "In an ordinary pit the life of brattice would be from two to three years." Since giving that evidence I have had a good deal of experience in the work of bratticing, and I have also had an opportunity of talking to a great many men engaged in putting up bratticing. I am satisfied that I gave the life of brattice as too long, and if I had said from one to two years it would be more in accordance with the fact. I say still that a great deal depends upon the usage it gets—the care taken in its manipulation.  
11208. Assuming it to be cared for, you say it should last from one to two years? Yes.  
11209. *Mr. Curley.*] Are you speaking of ordinary canvas brattice? Yes; ordinary canvas brattice. In Question 862 of my former evidence, with regard to the inspection of the faces before the men commence work, I say, "I think it is a wise provision, although as a practical man I did not attach a very great deal of importance to it." I think it is a mistake to be too confident; it is much better to treat all men as requiring looking after.  
11210. You believe in the inspection? Yes, thoroughly, whether a man is practical or not. The next question I would like to refer to is No. 905, with reference to a series of questions put by Mr. Cann in regard to the drawing shaft being the upcast. I say there, that in the event of the drawing shaft being the upcast, the main road to the shaft would be loaded with all the impurities of the mine. I made a mistake in that. It does not necessarily follow that because the drawing shaft is the upcast, the main road would be loaded with all the impurities of the mine, because that main road might be a split in itself, and a back airway could reach the shaft, so that the impure air would not need to go all the way by the main travelling road.

11211.

11211. It would be the return airway if it was going back to the upcast shaft, if you made your main hauling shaft the upcast? The road to the hauling shaft might be one of a series of splits, and the body of the return air might be conveyed to the upcast shaft by means of another airway; not the main travelling road.

Mr.  
R. J. Jury.  
6 Nov., 1895.

11212. If you wanted to keep pure air on that road, would it not have to be conducted off the main road, and be brought clear back again? Not necessarily.

11213. What would you do? The impure air that had already ventilated a portion of the mine could be conveyed into the return, and on this main haulage road, the air that was passing to the shaft might only have ventilated a small portion of the mine.

11214. Part of a split? Yes; it is an error that I wanted the opportunity of correcting. The next question I wish to refer to is No. 965,—that is in regard to the examination of the mines periodically by the Government inspectors. I said in my former evidence, that I had a suspicion that the proprietors knew when the inspector was coming round, and that they were prepared for the occasion. I would like to say, although I am still of the opinion that in some cases the proprietors have had a knowledge when the inspector is coming round, that I do not believe the knowledge has been conveyed to them for the purpose of defeating the Coal Mines Regulation Act. It may be on account of the intermittent way the mines work, for the inspectors to get to know when the mine is going to work. Also, with regard to question 981, about the check-weighmen. I may say there is another part of my evidence where I say I do not know of a case where the men have not been able to appoint a man whom they thought fit; but I may say that that was an oversight, because I do remember a case, and I knew of the case at the time; but it had not occurred to my mind.

11215. *President.*] What case do you refer to? It was a case that occurred eighteen months ago at the Burwood Colliery. The colliery changed hands, and the new proprietors had a new lot of men. The new men desired to employ one of the old hands as their check-weighman, and they applied to the manager under the new proprietary, and he refused to allow them to employ this person on the grounds that he was an outsider and not an employee of the colliery. He was previously an employee of the colliery, but was not at that time.

11216. *Mr. Curley.*] Do you think the men should have the right to select their check-weighman from anywhere they please? As the men pay him they should have the right to employ whom they think fit.

11217. *President.*] That is what you said in your evidence before Mr. Fegan's Select Committee? Yes; but I omitted when giving my evidence then, to mention this particular case.

11218. *Mr. Curley.*] Do you think the men should hold the right of meetings? Yes.

11219. Without any interference? Yes, whatever. They should have the right of appointing who they think fit as weighman or check-inspector, because they have to pay these men. Of course, I still say that it is perfectly right if the check-weigher misconducts himself or impedes the working of the mine, he should be liable to be removed. Again, in Question 986, in regard to the thickness of pillars under tidal waters. I am asked if I think it is necessary to have still thicker pillars under tidal waters, and I say "Yes, increased vigilance will be required to be exercised in collieries working under tidal waters." That is not the kind of answer I ought to have given, for I have to admit that at that time I had no knowledge of those collieries that were working under tidal waters.

11220. Where were you working at that time? I was out of employment at that time; but I had been working at the Burwood Colliery, I spoke without having a knowledge of what I was questioned about. It is humiliating to have to say so; but I take the earliest opportunity to say that I was speaking beyond my knowledge at that time.

11221. *President.*] What do you say now? I do not think that increased vigilance is required at the present time, because I believe there is a great deal of vigilance in connection with the Government supervision of these collieries. I think the management and inspectors are very careful.

11222. *Mr. Gregson.*] Do you think everything is done that can be done? I do not know of anything more to be done. I know the working of the Stockton Colliery is very strict to ensure the safety of the men. Every place is driven by line, and they are strict to a few inches in regard to the width of bords and pillars, and a thoroughly good system of timbering is insisted upon.

11223. *President.*] You do not think there is any need for legislation with the way they are worked? I think there is quite enough legislation under the existing Act.

11224. *Mr. Curley.*] Do you know that the present Act does not interfere with pillars? Yes; but I understand the Government leases regulate these matters.

11225. Do you know that for a fact? Yes; I gather it from the evidence of the managers and Government inspectors, which they have given before the Select Committees.

11226. Would you have any objection to what is embodied in the lease being embodied in an Act of Parliament, with regard to the pillars? No, I would not; I think a 6-yard pillar is ample. In the discharge of my duties I have to travel round the pit every day the pit works, and I do not see any indication of the pillars crumbling away, or being subjected to any crush.

11227. Do you know if the mine is going to the dip? There is one portion of the mine going to the dip; but I understand you have had the Stockton Colliery manager through your hands, and I should fancy that is a question you should have put to him. There is one place that has been going to the dip for some little time.

11228. Is that going under the ocean? I believe it is going towards the ocean.

11229. You have some idea; you should have a thorough knowledge of the locality? Yes; on the surface.

11230. How long have you worked at Stockton? A little over twelve months. I would not like to say when I am below where I am by the surface.

11231. You have some idea? I really could not say positively.

11232. I suppose you go down in the cage? Yes.

11233. You know what direction you start from, taking either side of the shaft, and when you land at the bottom you know the points of the compass, north, south, east, and west; and you know the direction towards the ocean? I have only to repeat that I am not sure, and that I do not know positively of any place that is going to the ocean, or in what direction they are going.

11234. You say you have been told so? I have heard of one place; but I would not like to make a statement on what I have heard when I am on my oath.

11235. That particular place you have referred to that is going towards the ocean; is that place dipping? The particular place that I referred to as having heard of is going to the dip. 11236.

Mr.  
R. J. Jury.  
6 Nov., 1896.

11236. Much? It is not uniform. In some places the dip has been about 2 inches to the yard; then, again, less, and then, perhaps, a little more.

11237. If that has got to go any distance, would you be able to tell what cover you were carrying, if it was going under the ocean? I understand the conditions of the lease are, that they have to bore at certain distances apart to test the roof. I know that that is done, but I cannot say at what distances apart. I have no doubt the Commission has the power to get that information from persons about the colliery who are in a better position to give it than I am. I have been engaged in boring, but I could not say the distance apart of the holes; they usually bore 30 feet into the roof.

11238. Have you ever seen any surface subsidences? No, I have not; but I have read of them in the reports of the inquiries.

11239. You have read the reports? Yes; Mr. M'Auliffe's evidence, and the evidence of Mr. Humble; but I have not seen the subsidences.

11240. Would that lead you to the belief that pillars have not been left of sufficient dimensions, formerly? It is a certainty that if there has been a subsidence there has not been ample support for the roof; but all these things occurred before I went to Stockton. I only know what I have read, and that is public property.

11241. You have read these reports, and have a knowledge from that reading only? Yes.

11242. Apart from what may be in the lease, do you think there should be anything embodied in an Act of Parliament with regard to the size of pillars? That is rather a difficult question, because I would not know what standard to go by. I can quote half a dozen authorities, and they would all differ.

11243. Start from any standard you like; 50 feet of surface, or 100 feet, or anything you please? I am not sufficiently versed in mining to say what the size of the pillars should be. When I was questioned on this matter before I said, "So many managers have seen the folly of leaving insufficient pillars, we need not trouble any more on that score." We are not likely to hear anything more on that score in the future.

11244. Would not that impress upon you the necessity of putting it in a Bill? Scarcely; when I say the matter will right itself, I scarcely see the necessity for including it in a Bill. I have no objection to it going into a Bill; but I do not consider myself an authority to speak on such matters. If I see pillars fretting away or crushing, the impression is that they are not large enough; but there is nothing like that in the Stockton mine.

11245. How is it you are not an authority; have you not had a long mining experience? Yes.

11246. And yet you say you are not an authority. From your long mining experience you have a right to know something about these matters? That is a little flattering; but I must repeat my former statement that I do not consider myself qualified to give an opinion on pillars. I believe we have very little need to trouble on that score, it is quickly righting itself. We are not likely to have so many complaints in the future as we have had in the past. The proprietors and managers have had these matters forced upon them, and I do not think we need worry about these things.

11247. Were you at the Burwood Colliery when any pillars were affected there? You are referring to the creep there. I was not there at that time, but I have travelled that district.

11248. Have you seen the effect of the creep? Yes; I saw what was once the return air-way was nearly closed up, but these have been, and are, grand object lessons, and I do not think we are likely to see a repetition of such mistakes.

11249. Do you think these are matters inspectors should give more attention to than what they have done in the past? Yes; if it is likely to occur again, and I believe the inspectors will, and the same men who made these mistakes years ago, if they err in the future, will err on the side of safety. They have seen the wrong and the trouble of these things, and the matter will, I believe, be all right without Parliamentary interference.

11250. Do you go to every part of the Stockton Colliery occasionally? There are two districts which are examined by firemen in the Stockton mine. Before I was fireman permanently, I used to go round when one or the other fireman would be absent from work, and in that sense I have gone round all of the mine.

11251. What are the local names of the districts? The 48 district, 43 district, and No. 2 district.

11252. As far as you know, what size are the pillars? So far as I have seen, they are all 6-yard pillars, with the exception of some new work being opened out, where I believe the pillars are thicker; but that is only being opened out at the present time. I am not sure what thickness the new pillars are, but they are thicker than the ordinary pillars. There may be some more than 6 yards in those districts that I have mentioned, but I know that they are all standing good, and if there is any sign of crushing, or any props break, it would be my duty to report it, and have the matter rectified at once. If I did not report a matter of that kind I should get a reprimand.

11253. How many deputies have you at Stockton? Three; and the overman makes a circuit of the pit every day.

11254. Does the mine make much water at all in the districts you have referred to? There are wet places in the mine the same as there are at other collieries, and, of course, there are dry places; but, I think, there is ample power to throw a great deal more water up the shaft than what is going away, or is likely to go away. There are some very powerful pumps at the colliery.

11255. Do you consider the water that is made in the mine anything like excessive? Stockton might be called rather a wet pit; but I would not say excessively wet.

11256. Is there much water making where you said the dip work was being carried on? Yes; but not a great deal. All the water gravitates towards the dip workings from the higher parts of the mine, and that would make the district appear much wetter than it really is.

11257. Have you anything to do with the inspection of the dams that were put up some time ago? Yes.

11258. Are these dams inspected at regular intervals? I go there every seven days and make a thorough inspection for gas, and to see if the roof is safe and that the timber is all good. I believe it is the deputies' duty to go there also, and I know the underground manager goes there occasionally. The Government inspectors go there on every visit; but I cannot say how often they come. I go once in every seven days.

11259. Have you ever seen anything in connection with the dams that has caused you to draw the manager's attention to them? No.

11260. Are they standing in a substantial way? Yes.

11261. Are there pipes through them? Yes.

11262. What size? Six inches and 1 inch.

11263. How many? Two at each dam.

11264. What is the size of the largest pipe? It may be 6 inches; but I know it is not running a quarter full.

11265. Have you seen the connection between the new shaft and the workings? Yes; that is a portion of my district. I have travelled over that part.

11266. Have the men far to go to get to that shaft? I should say that portions of the workings may be 400 yards from the new shaft in a direct road. I am only speaking approximately; it may be either more or less.

11267. Do you know how much rock there was on the bottom of that shaft? No; I do not. The shaft was down and the place holed through before I went up to the new shaft. I only went to the new shaft by way of the road that is driven from the workings called the cross-cut.

11268. Do you know who the sinkers were that sunk that shaft? I do not know them.

11269. Has the shaft been put down since you went there? Yes; it has been bottomed since I went there.

11270. Were they local men? I do not know the men who bottomed that shaft.

11271. Have you noticed how far the tubbing goes down? No; I have not.

11272. Have you gone up the shaft? No; I know people have gone up and down occasionally since the connection has been made, but I have not.

11273. You do not wish to eliminate the word "vigilance" from your former evidence? I said "increased vigilance." I am quite anxious that vigilance should be exercised in any mine, but when I said "increased vigilance" I said what I should not have said.

11274. What should you have said? What I have already said, viz., that I had no practical knowledge of any colliery that was working under tidal waters at that time.

11275. You have a practical knowledge now? Yes.

11276. And vigilance will have to be displayed there at all times? Yes, the same as at every colliery.

11277. Any more so than anywhere else? No, not more so than anywhere else.

11278. Where a colliery is working under tidal waters, you would not say that more vigilance should be displayed than at any other colliery? I think it would suggest itself to most people's minds that there should be a certain amount of vigilance more required.

11279. Does it suggest itself to your mind? Yes.

11280. Do you know if borcholes are kept in advance of the leading places? Yes, in the leading places when opening up new ground.

11281. Do you know the distances? No, I do not.

11282. Is that a matter you control? No.

11283. Who looks after that? That is done in the night shift; it is under the night overman, Mr. McDonald. I would like to refer again to my former evidence. In question 1148 Mr. Nicholson asks me: "Suppose the men knock off at (say) 4 o'clock, and from half-past three to four every miner is firing his shots, what is the condition of the return for travelling in?" In reply I say, "It is totally unfit to be travelled in. The only circumstances under which it would be justifiable to travel in the return airway would be in case of accident." I think I made a mistake in that answer; in fact I am certain I made a mistake. I say "it is totally unfit to travel in"; but, while I am not in favour of making a travelling road a return airway, a mistake is often made in thinking the returns are more foul than they really are. Directly the air comes down the pit it commences to find its way into the return by leakage, and I do not think that the returns are as foul as we very often think them to be.

11284. You said "we"! who do you mean by "we"? I mean miners.

11285. But you are not here to speak for the miners? But I am correcting a mistake. On account of the great quantity of air finding its way into the return the result is that in many cases the air in the return is purer than it is in the face of the workings. That is to say, so much pure air finds its way into the return. Of course I do not wish to be understood to be in favour of men being compelled to travel in the return.

11286. You do not approve of men being compelled to travel in the return? No.

11287. With regard to the air in the return and the air in the face of the workings, do you think that the air should be conducted into the men's places? Well, I should like to see it turned into the bords. I am very anxious to see the distance between the cut-throughs shortened.

11288. You think the distance between the cut-throughs should be shortened? Yes.

11289. But, whether the distance between the cut-throughs is shortened or not, would you have the air taken to the working face? I would turn it into the bords. I attach a great deal more importance to the shorter cut-throughs than taking the air up to the face by brattice.

11290. The shorter cut-through you consider is the completer method? Yes; shortening the distance between the cut-throughs and strictly attending to the stoppings would be a much more effectual method of carrying on the ventilation than to depend on canvas cloth, and let the men work 35 yards away from the cut-through. I am anxious to give the air a turn into the bords, because the current of air going along a heading at right angles to the bord will have a tendency to go past and not into the bord.

11291. Unless it is conducted? Yes, turned or conducted. I do not think it necessary to extend the brattice very far up the bords. I have given a lot of thought to this matter, and have studied it practically in the mine, and I think, leaving the matter of expense out of the question, the most effectual way is to shorten the distance between the cut-throughs, and strictly attend to the stoppings.

11292. Do you brattice any places at Stockton? Yes.

11293. Are they the leading places or the ordinary bords? We brattice a good many of the ordinary bords on account of meeting with faults occasionally, which always makes it difficult to keep the air up to the face.

11294. Is there anything else you wish to refer to? No, there is nothing else to which I wish to refer, unless any of the members of the Commission wish to ask me any questions.

11295. Did you engage during the time the Stockton colliery was not considered to be safe by the inspectors? I engaged twelve months ago last month, but whether that was during the time the colliery was not considered safe or not I do not know. I am not aware whether the inspectors have removed their veto yet.

11296. They have? I was not aware of that.

11297. Were you asked to sign any document exempting the company from any liability? No, I was not; I never signed anything. I was supplied with a copy of the Colliery Rules, and I commenced to work

- Mr. R. J. Jury.  
6 Nov., 1895.
- work there as a general shift man. I am anxious to see the standard weight abolished, because I think it is an injustice, and I am anxious that the miners should have the fullest liberty in the choice of their check-weighman and also in the choice of their check-inspectors.
11298. Do you think they would be allowed to hold a meeting for the election of a check-weighman at Stockton? I cannot say. I knew there was some little trouble there some time ago, but whether that would be likely to occur again I do not know—I have not any idea. I know they have a check-weighman at the Stockton Colliery.
11299. Anyway you give it as your opinion that the miners should not be interfered with in these elections? The men should have the fullest liberty to select who they think fit, and it is perfectly right if a man misconducts himself, and by so doing impedes the working of the pit, that the manager should have the power to remove him at once as he has by the Act.
11300. Have you seen the Check-weigher's Act, recently passed in England? No, I have not.
11301. Will you look at it? [*Witness handed Act. See Appendix E.*] Yes.
11302. Do you approve of that? Yes; and I think we are working on similar conditions to those here. Our Coal Mines Act provides for the appointment of a check-weigher, and if any manager places any obstacle in the way he is committing an offence against the Act.
11303. You see the reference in the English Act to the election of a check-weigher? Yes.
11304. Do you approve of that? Yes; I approve of the men having the fullest liberty in the appointment of a check-weigher. I go further than the present Act, which says he must be one of their own number, and say that that limitation is not just. I am of opinion that there should be no limitation to their choice.
11305. In the holding of any meeting for the appointment of these men you do not think they should be interfered with? I do not think they should.
11306. In the same way you think the same liberty should be afforded to the men with regard to a check-inspector? Yes; if the miners wish to avail themselves of the provisions of the Act, either for a check-weigher or check-inspector, they ought not to be interfered with, and any manager who does interfere makes a mistake. With regard to the amendment made by the Legislative Council with reference to paying for large coal only, I am opposed to that. I hope the day will come when men will send all away together, and be paid for both large and small coal, because there is no doubt that there is a trade for both kinds of coal, and for a person to say in any Chamber that the object of the proprietors is to have the small coal thrown back, is not true. I say there is a great demand for small coal at the present time; in fact, I have it on the authority of those engaged in the business of selling that there is a greater demand for the small coal than there is for the large. I suppose it is on account of its cheapness, but I hope the day will come when the miners will fill away all together; of course that will necessitate a re-arrangement of prices, and that will be mutual between the employers and the miners. In all the collieries I have been connected with the managers have been getting out all the small coal they can, and that proves that there is a great demand. To alter the Act and say that nothing shall be paid for but large coal in my opinion is a great wrong.
11307. You say you believe in having shorter cut-throughs? Yes.
11308. What distance would you make them? It would probably result in a compromise; but I should say about 25 yards, and probably the compromise would be between 25 yards and 35 yards, as obtaining at the present time. Whether it results in the yard work being interfered with or not, I hope in the near future to see the cut-throughs shorter.
11309. Do you believe in the air being conducted to the working-face? I believe in the air being turned into the working bords.
11310. In the event of your working at the face, would you not like to have as much ventilation as possible? I am considering what is practicable and what can be brought about, and I believe if the air is simply turned into the bords we would have no complaints whatever, and that the places would be cool and tolerably pure. We should not have any complaints if this was done.
11311. That is with the shorter cut-throughs? Yes; it would not require to be taken very far up into the bords.
11312. Do you think the cut-through should be over by the time the man drives his distance up his bord? Yes; I do not believe in the construction of the Act as how far a man should drive before the air. I believe the 35 yards should include everything, cut-throughs and all.
11313. Do you put the cut-throughs over any quicker in rise places than 35 yards, or do you take them the full distance? There is no fixed rule on account of the number of dykes; but they are not allowed to go further than 35 yards before the air. If any man was found working more than 35 yards before the air I would be severely reprimanded.
11314. You know the construction that has been put upon the Act with regard to the 35 yards? Yes.
11315. It may mean a good deal more if a man has a good thick cut-through? Yes; there is a fault in the wording of the Act.
11316. Will you look at sub-section 4, of section 12, of the present Act, "and no place shall be driven more than 35 yards before the current of air without a cut-through put through or bratticed up within 3 yards of the face of such working place"? Different men put different constructions on things. I believe the 35 yards should include cut-through and everything else.
11317. Do you think the managers have put a wrong construction on that sub-section? Not the managers.
11318. The inspectors? You have hit it.
11319. What inspector? Inspector Humble; that is the way he interprets the Act.
11320. You think that is a wrong construction? It is not a liberal construction. It is not the construction I would like to put on it. I would like to see the Act worded so that a man could not err.
11321. If a man had to conduct the air up to the working face, do you not think he would prefer to put his cut-throughs at a shorter distance in preference to using so much brattice? It would resolve itself into a question of cost, and if a manager found it cheaper to drive the cut-throughs than to canvas up he would probably resort to that course. If he considered efficiency he would drive the cut-throughs in preference to the brattice.
11322. Have you ever found any fire-damp in the Stockton Colliery? No.
11323. *President.*] Have you anything further you wish to say? No; I have nothing further I wish to say, but I am in the hands of the Commission, if they wish to ask me any questions.

[Witness withdrew.]

## ROYAL COMMISSION ON COAL-MINING REGULATION BILL.

## APPENDIX.

## A.

## COAL MINES REGULATION BILL.

*SCHEDULE of the Amendments referred to in Message of 6th December, 1894.*

Page 1, clause 1, line 8.	Omit "December" insert "March"
Page 1, clause 1, line 8.	Omit "four" insert "five"
Page 2, clause 2, line 3.	Before "certificate" insert "first-class"
Page 2, clause 2, line 3.	Before "service" insert "a certificate of"
Page 2, clause 2, line 3.	After "service" insert "as manager"
Page 2, clause 2, line 6.	Omit "passing" insert "commencement"
Page 2, clause 2, line 8.	Omit "and" insert "or"
Page 2, clause 2, line 9.	Omit "each"
Page 2, clause 2, line 10.	Omit "ten" insert "five"
Page 2, clause 2, line 12.	After "owner" insert "or agent"
Page 2, clause 2, line 26.	Omit "ten" insert "thirty"
Page 2, clause 3, line 33.	Omit "a duly qualified" insert "an"
Page 2, clause 3, line 34.	Omit "in accordance with the provisions of this Act"
Page 2, clause 3, line 36.	Omit "after the passing of this Act"
Page 2, clause 3, line 36.	Omit "person" insert "under-manager"
Page 2, clause 3, line 37.	Omit "and then exercising supervision of a mine"
Page 2, clause 3, line 40.	Omit "six" insert "eight"
Page 2, clause 4, line 46.	Omit "while so contracting"
Page 2, clause 4, line 46.	After "for" insert "getting"
Page 2, clause 4, line 46.	After "mineral" insert "in any mine"
Page 2, clause 4, line 48.	After "under-manager" insert "of that mine"
Page 2, clause 5, line 53.	After "certificate" insert "of competency"
Page 2, clause 5, line 54.	Omit "has" insert "shall have"
Page 2, clause 5, line 55.	Omit "granting" insert "ascertaining the persons to receive"
Page 2, clause 5, line 56.	Omit "and service"
Page 2, clause 5, line 57.	Omit "a Board of"
Page 2, clause 5, line 57.	After "appointed" insert "by a Board"
Page 2, clause 5.	After line 57 insert (a) Three persons being owners or agents of mines in the "Colony of New South Wales"
Page 3, clause 5, line 2.	After "Colony" insert "not being owners, agents, or managers of a mine and"
Page 3, clause 6.	Omit clause 6 insert new clause 6.
Page 3, clause 7, line 47.	Omit "selection of persons to serve as examiners"
Page 3, clause 7, line 51.	Omit "One" insert "Two"
Pages 3 and 4, clause 8.	Omit clause 8 insert new clause 8.
Pages 4 and 5, clause 9.	Omit clause 9.
Page 5, clause 11, 10, line 35.	Before "Stipendiary" insert "or"
Page 5, clause 11, 10, line 35.	Omit "or other person or persons"
Page 5, clause 11, 10, line 47.	Omit "Act" insert "section and in section eleven"
Page 5, clause 11, 10, lines 52 and 53.	Omit "or otherwise deal with"
Page 6, clause 11, 10, line 5.	Omit "or otherwise deal with"
Page 6, clause 13, 12, line 32.	Omit "or otherwise dealt with"
Page 6, clause 13, 12, lines 33 and 34.	Omit "or a notification of the order of the Court"
Page 6, clause 13, 12, lines 38 and 39.	Omit "or otherwise dealt with"
Page 6, clause 15, 14, line 55.	After "for" second occurring insert "or for registration of"
Page 7, clause 17.	Omit clause 17.
Page 7, clause 19, 17, line 47.	After "inspector" insert "appointed"
Page 7, clause 19, 17, line 47.	Omit "passing" insert "commencement"
Page 7, clause 19, 17, line 48.	Before "certificate" insert "first class"
Page 7, clause 19, 17, line 49.	Omit "or service"
Page 7, clause 19, 17, line 49.	Omit "hereinbefore provided in regard to"
Page 7, clause 19, 17, line 49.	Omit "s" from "managers"

ANNO QUINQUAGESIMO OCTAVO

# VICTORIÆ REGINÆ.

\*\*\*\*\*

No. .

An Act to make better provision for the Regulation of Coal Mines and Collieries, and for other purposes connected therewith.

**W**HEREAS it is expedient to make better provision for the regulation and inspection of Coal Mines and Collieries and certain other Mines: Be it therefore enacted by the Queen's Most Excellent Majesty, by and with the advice and consent of the Legislative Council and Legislative Assembly of New South Wales in Parliament assembled, and by the authority of the same, as follows:—

1. (I) This Act shall come into operation on the first day of ~~December~~ <sup>March</sup>, one thousand eight hundred and ninety-four ~~four~~ <sup>five</sup> (which date is in this Act referred to as the commencement of this Act), and may be cited as the "Coal Mines Regulation Act, 1894." Preamble. Commencement, short title, and application of Act.
- (II) This Act shall apply to mines of coal and mines of shale.

### PART I.

#### 1. *Certificated Managers, Under-Managers, and Engine-drivers.*

2. (I) Every mine shall be under a manager, who shall be responsible for the control, management, and direction of the mine, and the owner or agent of every such mine shall nominate himself or some other person to be the manager of such mine, and shall send written notice to the inspector of the district of the manager's name and address. Appointment of manager of mine.

92—B

(II)

NOTE.—The words to be omitted are ruled through; those to be inserted are printed in black letter.

*Coal Mines Regulation.*

(II) A person shall not be qualified to be a manager of a mine unless he is for the time being registered as the holder of a first-class certificate of competency or a certificate of service as manager under this Act, or under the Imperial Act fifty and fifty-one Victoria, chapter fifty-eight, or any Act thereby repealed.

(III) If after the passing commencement of this Act any mine is worked for more than fourteen days without there being such a manager for the mine as is required by this section, the owner and or agent of the mine shall each be liable to a fine not exceeding fifty pounds, and to a further fine not exceeding ten five pounds for every day during which the mine is so worked ; provided that :—

(a) The owner or agent of the mine shall not be liable to any such fine if he proves that he had taken all reasonable means by the enforcement of this section to prevent the mine being worked in contravention to this section.

(b) If for any reasonable cause there is for the time being no manager of a mine qualified as required by this section, the owner or agent of the mine may appoint any competent person not holding a certificate under this Act to be manager, for a period not exceeding two months or such longer period as may elapse before such person has an opportunity in the district wherein the mine is situate of obtaining by examination a certificate under this Act, and shall send to the inspector of the district a written notice of the manager's name and address, and of the reason for his appointment; and

(c) A mine in which not more than ten thirty persons are employed below ground shall be exempt from the provisions of this section, unless the inspector of the district, by notice in writing served on the owner or agent of the mine, requires that it be under the control of a manager.

3. (I) In every mine required by this Act to be under the control of a certificated manager, daily personal supervision shall be exercised either by the manager or by a ~~duly-qualified~~ <sup>Daily supervision of mine by manager or under-manager</sup> an under-manager, ~~in accordance with the provisions of this Act,~~ nominated in writing by the owner or agent of the mine.

(II) ~~After the passing of this Act~~ Every person under-manager so nominated ~~and then exercising supervision of a mine~~ must hold either a first-class or second-class certificate under this Act or under the Imperial Act, fifty and fifty-one Victoria chapter fifty-eight, or any Act thereby repealed, or a certificate of service under section ~~six~~ eight of this Act, or under any of the said Imperial Acts, and shall, in the absence of the manager, have the same responsibility, and be subject to the same liabilities as the manager under this Act; but the nomination of an under-manager shall not affect the personal responsibility of the manager under this Act.

4. A contractor ~~while so contracting~~ for getting mineral in any mine, or person employed by such a contractor, is not eligible for the post of manager or under-manager of that mine under this Act. <sup>Disqualifications for post of manager or under-manager.</sup>

5. (I) There shall be two descriptions of certificates of competency under this Act—(1) first-class certificates, that is to say, certificates of fitness to be manager; and (2) second-class certificates, that is to say, certificates of fitness to be under-manager; but no person shall be entitled to a certificate of competency under this Act unless he ~~has~~ shall have had practical experience in a mine for at least five years. <sup>Certificates of competency to managers and under-managers.</sup>

(II) For the purpose of ~~granting~~ <sup>ascertaining</sup> the persons to receive certificates of competency ~~and service~~ for the purposes of this Act, ~~a Board of examiners~~ shall be appointed by a Board consisting of— <sup>Constitution of Board of Examiners.</sup>

(a) Three persons being owners or agents of mines in the Colony of New South Wales;

(a b)

*Coal Mines Regulation.*

(a b) Three persons employed or who have been employed in or about any mine in this Colony not being owners, agents, or managers of a mine; and

5 (b c) Three persons practising as mining engineers, or managers of mines in this Colony; and

(e d) One inspector under this Act.

(III) The members of the board shall be appointed and may be removed by the Minister, and shall hold office during his pleasure.

10 6. (I) A certificate of service shall be granted by the Minister to every person who satisfies the examiners either that before the passing of this Act he was exercising, and has since that date exercised, or that he has at any time within five years before the passing of this Act, for a period of not less than twelve months, exercised functions substantially corresponding to those of a manager 15 or an under-manager in a mine.

Grant of certificates of service in case of certain under-managers.

(II) Every such certificate of service shall contain particulars of the name, place, and time of birth, and the length and nature of the previous service of the person to whom the same is delivered; and a certificate of service may be refused to any person 20 who fails to give a full and satisfactory account of the particulars aforesaid, or to pay such registration fee as the Minister may direct, not exceeding that mentioned in the Second Schedule to this Act.

(III) A certificate of service granted under this section shall have the same effect for the purposes of this Act as a certificate 25 of competency granted under this Act.

(IV) A certificate of competency or of service granted under the Imperial Act fifty and fifty-one Victoria, chapter fifty-eight, or under any Act repealed thereby, or any other certificate of competency or service afforded by the examiners, shall be equivalent in all 30 respects to a similar certificate granted under this Act.

Certain certificates equivalent to certificates under this Act.

6. (i) The proceedings of the Board shall be in accordance with the rules contained in Schedule One to this Act.

Proceedings and powers of Board for appointing examiners.

(ii) The Board shall from time to time appoint examiners not being members of the Board, except with the consent of the 35 Minister, to conduct the examinations of applicants for certificates of competency under this Act, and may from time to time make, alter, and revoke rules as to the conduct of such examinations and the qualifications of the applicants so, however, that in every such examination regard shall be had to such knowledge as is necessary 40 for the practical working of mines in New South Wales, and that the examination and qualifications of applicants for second class certificates shall be suitable for practical working miners.

(iii) The Board shall make from time to time to the Minister a report of their proceedings, and of such other matters as 45 the Minister may from time to time require.

7. The Minister may from time to time make, alter, and revoke rules as to selection of persons to serve as examiners, the places and times of examinations of applicants for certificates of competency under this Act, the number and remuneration of the examiners, and 50 the fees to be paid by the applicants, so that the fees do not exceed those specified in Schedule One Two to this Act. Every such rule shall be observed by the Board appointed under this Act.

Rules by Minister as to examinations.

8. Subject to the provisions of section nine of this Act in any mine which is usually entered by means of machinery, or where 55 any shaft, plane, or level is used for the purpose of communication from one part to another part of a mine, and persons are taken up or down or along such shaft, plane, or level, by means of any engine, windlass, or gin, driven or worked by steam or any mechanical power, a competent male person not less than twenty years of age, and being the

Qualification and attendance of engine-man.

*Coal Mines Regulation.*

the holder of a certificate of competency or certificate of service, shall be appointed for the purpose of working the machinery which is employed in lowering and raising persons therein, and shall attend for that purpose during the whole time that any person is below ground in the mine, and such person shall have charge of all ropes, chains, or tackle connected with such machinery. Where any windlass, gin, or machine used for any of the purposes aforesaid, is worked by an animal or by manual labour, the person in charge of such engine, windlass, or gin, or of any part of the machinery, ropes, chains, or tackle connected therewith, must be a competent male person not less than eighteen years of age. Where the machinery is worked by an animal, the person under whose direction the driver of the animal acts, shall for the purposes of this rule be deemed to be the person in charge of the machinery.

15 8. (i) A certificate of service shall be granted by the Minister to every person who satisfies him either that before the commencement of this Act he was acting, and has since that day acted, or that he has at any time within five years before the commencement of this Act for a period of not less than twelve months acted, in the capacity of a 20 manager of a mine or such part of a mine as can under this Act be made a separate mine for the purposes of this Act.

Grant of certificates of service to existing managers.

(Note.—See clause 46 (i) of Bill.)

(ii) A certificate of service shall be granted by the Minister to every person who satisfies him either that before the commencement of this Act he was exercising, and has since that date exercised, or 25 that he has at any time within five years before the commencement of this Act for a period of not less than twelve months exercised, functions substantially corresponding to those of an under-manager in a mine.

Grant of certificates of service in case of certain under-managers.

(iii) Every such certificate of service shall contain particulars 30 of the name, place, and time of birth, and the length and nature of the previous service of the person to whom the same is delivered, and a certificate of service may be refused to any person who fails to give a full and satisfactory account of the particulars aforesaid, or to pay such registration fee as the Minister may direct, not exceeding that 35 mentioned in the Second Schedule to this Act.

(iv) A certificate of service granted under this section to a manager shall have the same effect for the purposes of this Act as a first-class certificate of competency granted under this Act; and a certificate of service granted under this section to an under-manager 40 shall have the same effect for the purposes of this Act as a second-class certificate of competency granted under this Act.

(v) Before granting a certificate of service to a manager or under-manager the Minister shall require the applicant to produce satisfactory evidence of his sobriety and general good conduct.

45 (vi) No certificate of service shall be granted in terms of this section unless it be proved by statutory declaration that during the twelve months aforesaid there has been an average of not less than thirty miners employed below ground under the control and supervision of the applicant for the said certificate.

50 (vii) A certificate of competency or of service granted under the Imperial Act fifty and fifty-one Victoria, chapter fifty-eight, or under any Act repealed thereby, or any other certificate of competency or service approved by the examiners, shall be equivalent in all respects to a similar certificate granted under this Act.

55 9. (i) A certificate of service shall be granted by the Minister to every person who satisfies the examiners either that before the passing of this Act he was exercising, and has since that date exercised, or that he has at any time within five years before the passing of this Act, for a period of not less than twelve months, exercised functions substantially corresponding to those of an engine-driver.

Grant of certificates of service in case of certain engine-drivers.

(ii)

*Coal Mines Regulation.*

(II) Every such certificate of service shall contain particulars of the name, place, and time of birth, and the length and nature of the previous service of the person to whom the same is delivered; and a certificate of service may be refused to any person who fails to give a full and satisfactory account of the particulars aforesaid, or to pay such registration fee as the Minister may direct not exceeding that mentioned in the First Schedule to this Act.

(III) The Minister may from time to time appoint a Board to examine candidates for certificates of competency, and may by regulations prescribe the mode of conducting such examinations and granting such certificates, and the conditions under which such certificates or certificates of service shall be held, or may be suspended or cancelled; and may from time to time make, alter, and revoke such regulations as aforesaid.

10. 9. (I) The Minister shall deliver to every applicant who is duly reported by the examiners to have passed the examination satisfactorily, and to have given satisfactory evidence of his sobriety, experience, ability, and general good conduct, such a certificate of competency as the case requires. The certificate shall be in such form as the Minister from time to time directs.

Grant of certificates to applicants on passing examination.

(II) A register of the holders of certificates of competency or service under this Act and under any of the Imperial Acts aforesaid shall be kept by such person and in such manner as the Minister from time to time directs.

11. 10. If at any time representation is made to the Minister by an inspector or otherwise that any manager or under-manager holding a certificate under this Act or under any Imperial Act is by reason of incompetency or gross negligence, unfit to discharge his duties, or has been convicted of an offence against this Act, the Minister may, if he think fit, cause inquiry to be made into the conduct of the manager or under-manager, and with respect to every such inquiry the following provisions shall have effect:—

Inquiry into competency of manager and cancellation of certificate in case of unfitness.

(I) The inquiry shall be public, and shall be held at such place as the Minister may appoint by such District Court Judge, Police Magistrate, or Stipendiary Magistrate, or other person or persons, as may be directed by the Minister, and either alone or with the assistance of any assessor or assessors named by the Minister.

(II) The Minister shall, before the commencement of the inquiry, furnish to the manager or under-manager a statement of the case on which the inquiry is instituted.

(III) Some person appointed by the Minister shall undertake the management of the case.

(IV) The manager or under-manager may attend the inquiry by himself, his counsel, solicitor, or agent, and may, if he thinks fit, be sworn and examined as an ordinary witness in the case.

(V) The person or persons appointed to hold the inquiry, in this Act section and in section eleven referred to as the court, shall, on the conclusion of the inquiry, send to the Minister a report containing a full statement of the case, and the opinion of the court thereon, and such report of, or extracts from the evidence, as the court may think fit.

(VI) The court shall have power to cancel or suspend or otherwise deal with the certificate of the manager or under-manager, if it finds that he is by reason of incompetency or gross negligence, or of his having been convicted of any offence against this Act, unfit to discharge his duty.

(VII) The court may, if it thinks fit, require a manager or under-manager to deliver up his certificate, and if any manager or under-manager fails without sufficient cause to the satisfaction

*Coal Mines Regulation.*

tion of the court, to comply with such requisition, he shall be liable to a fine not exceeding one hundred pounds. The court shall hold a certificate so delivered until the conclusion of the investigation, and shall then either restore, cancel, or suspend ~~or otherwise deal with~~ the certificate according to its judgment on the case.

5

(VIII) The court shall have for the purpose of the inquiry, all the powers of a court of Petty Sessions, and all the powers of an inspector under this Act.

10

(IX) The court may also, by summons signed by the court, require the attendance of all such persons as it thinks fit to summon and examine for the purpose of the inquiry; and every person so summoned shall be allowed such expenses as would be allowed to a witness attending on subpoena before the Supreme Court; and in case of dispute as to the amount to be allowed, the same shall be referred by the court to the Prothonotary who, on request signed by the court, shall ascertain and certify the proper amount of such expenses.

15

12. 11. (I) The court may make such order as it thinks fit respecting the costs and expenses of the inquiry, and such order shall, on the application of any party entitled to the benefit thereof, be enforced by any Stipendiary or Police Magistrate or any two Justices of the Peace in Petty Sessions, as if such costs and expenses were a fine imposed by that Court of Petty Sessions.

Costs and expenses of inquiry.

25

(II) The Minister may, if he thinks fit, pay to the person or persons constituting the court, including any assessors, such remuneration as he may appoint.

(III) Any costs and expenses ordered by the court to be paid by the Minister, and any remuneration paid under this section, shall be paid out of moneys provided by Parliament.

30

13. 12. (I) Where a certificate of a manager or under-manager is cancelled or suspended ~~or otherwise dealt with~~ in pursuance of this Act, the Minister shall cause the cancellation or suspension ~~or a notification of the order of the court~~ to be recorded in the register of holders of certificates.

Record of cancellation of certificate; restoration in certain cases.

(II) The Minister may at any time, if it is shown to him to be just so to do, renew or restore, on such terms as he thinks fit, any certificate which has been cancelled or suspended ~~or otherwise dealt with~~ in pursuance of this Act, and cause the renewal or restoration to be recorded in the register aforesaid.

40

14. 13. Whenever any person proves to the satisfaction of the Minister that he has, without fault on his part, lost or been deprived of any certificate granted to him under this Act or under any Imperial Act, the Minister shall, on payment of such fee, if any, as he may direct, but not exceeding the fee specified in Schedule Two to this Act, cause a copy of the certificate to which the applicant appears by the register to be entitled, to be made out and certified by the person who keeps the register, and delivered to the applicant; and any copy which purports to be so made and certified as aforesaid shall have all the effect of the original certificate.

Copy of certificate in case of loss.

50

15. 14. (I) All expenses incurred by the Minister in carrying into effect the provisions of this Act with respect to certificates of competency and service shall be defrayed out of moneys provided by Parliament.

Expenses in relation to certificates and application of fees.

55

(II) All fees payable by the applicants for examination for or for registration of, or for a copy of a certificate under this Act shall be paid into the Treasury as the Colonial Treasurer may from time to time direct, and be carried to the Consolidated Revenue Fund.

*Coal Mines Regulation.*

16- 15. Every person who commits any of the following offences ; Penalty for forgery of, or false declaration as to certificate.  
that is to say:—

- 5 (I) Forges, or counterfeits, or knowingly makes any false statement in any certificate of competency, or of service granted under this Act or the Imperial Act fifty and fifty-one Victoria chapter fifty-eight, or any Act repealed thereby, or any official copy of any such certificate; or
- 10 (II) Knowingly utters or uses any such certificate or copy which has been forged or counterfeited or contains any false statement; or
- 15 (III) For the purpose of obtaining for himself or any other person employment as a certificated manager or under-manager, or the grant, renewal, or restoration of any certificate under this Act or under any of the said Imperial Acts, or a copy thereof, either:—
- (a) Makes or gives any declaration, representation, statement, or evidence which is false in any particular; or
- 20 (b) Knowingly utters, produces, or makes use of any such declaration, representation, statement, or evidence, or any document containing the same,

shall be guilty of a misdemeanour, and be liable on conviction to imprisonment for a term not exceeding two years, with or without hard labour.

25 17. In any mine where a consulting engineer, viewer, managing director, or other person has power to give directions as to the mode of conducting the works of a mine either above or below ground, he shall enter such directions in detail in a book to be kept at the mine for that purpose, but, unless required to be produced in a Court of law, such book shall not be open to inspection by any person other than the Chief Inspector or an Inspector. Directions as to mode of conducting works to be entered in book.

*2. Inspection.*

35 18. 16. The persons who at the commencement of this Act are acting as inspectors under the Act hereby repealed shall continue to act in the same manner, and generally to be in the same position, as if they had been respectively appointed under this Act. Existing inspectors continued.

40 19. 17. (I) The Minister may from time to time appoint duly qualified persons to be inspectors (under whatever title he may from time to time fix) of mines, and assign them their duties, and may award them such salaries as he may think fit, or as Parliament may approve, and may remove any such inspector. Appointment of inspectors of mines.

(II) Notice of the appointment of every such inspector shall be published in the *Gazette*.

45 (III) Every such inspector is referred to in this Act as an inspector, and the inspector of a district means the inspector who is for the time being assigned to the district or portion of the Colony with reference to which the term is used.

50 Every Inspector appointed under this Act shall, after the passing commencement of this Act hold a first-class certificate of competency or service as hereinbefore provided in regard to Managers, but for the purposes of this Act service as an Inspector of Collieries will be equivalent to service as manager of a mine. Inspectors to hold certificates.

55 20. 18. Any person who practises or acts as or is a partner of any person who practises or acts as a land agent or mining engineer, or as a manager, viewer, agent, or valuer of mines, or arbitrator in any difference arising between owners, agents, or managers of mines, or is otherwise employed in or about any mine, or is a miner's agent or a mine-owner (whether the mine is one to which this Act applies or not) shall Disqualification of persons as inspectors.

*Coal Mines Regulation.*

shall not act as an inspector of mines under this Act, and no inspector shall be a partner or have any interest direct or indirect in any mine in the district under his charge.

21. An inspector under this Act shall have power to do all or Powers of inspectors.  
5 any of the following things, namely:—

- (I) To make at least once in each month such examination and inquiry as may be necessary to ascertain whether the provisions of this Act relating to matters above ground or below ground are complied with in the case of any mine.
- 10 (II) To enter, inspect, and examine any mine, and every part thereof, at all reasonable times by day and night, but so as not to impede or obstruct the working of the mine except when absolutely necessary.
- 15 (III) To examine into and make inquiry respecting the state and condition of any mine or any part thereof, and the ventilation of the mine, and the sufficiency of the special rules for the time being in force in the mine, and all matters and things connected with or relating to the safety of the persons employed in or about the mine or any mine contiguous thereto, or the care and treatment of the horses and other animals used in the mine.
- 20 (IV) To exercise such other powers as may be necessary for carrying this Act into effect, and shall enter in a book to be provided by the owner or manager a report of any defect, or anything in or about the mine tending to endanger the safety or health of the miners employed therein.
- 25 (v) To require the manager to withdraw the men from the mine if at any time he finds that, by reason of inflammable gases prevailing in any mine or any part thereof, or of any Miners may be withdrawn if inspector finds cause of danger.  
30 cause whatever, the mine or the said part is dangerous; and no person shall, except so far as is necessary for exploration or inquiry into the cause of danger or the removal thereof, be readmitted into the mine or such part thereof as was found dangerous, until the same is stated by the Inspector to be safe.
- 35 Every person who wilfully obstructs any inspector in the execution of his duty under this Act, and every owner, agent, and manager of a mine who refuses or neglects to furnish to the inspector the means necessary for making any entry, inspection, examination, or inquiry under this Act, in relation to the mine, shall be guilty of an offence  
40 against this Act.

19. An inspector under this Act shall have power to do all or Powers of inspectors.  
any of the following things, namely:—

- 45 (i) To make such examination and inquiry as may be necessary to ascertain whether the provisions of this Act relating to matters above ground or below ground are complied with in the case of any mine.
- (ii) To enter, inspect, and examine any mine, and every part thereof, at all reasonable times by day and night, but so as not to impede or obstruct the working of the mine.
- 50 (iii) To examine into and make inquiry respecting the state and condition of any mine or any part thereof, and the ventilation of the mine, and the sufficiency of the special rules for the time being in force in the mine, and all matters and things connected with or relating to the safety of the persons employed in or about the mine or any mine contiguous thereto, or the care and treatment of the horses and other animals used in the mine.
- 55 (iv) To exercise such other powers as may be necessary for carrying this Act into effect.

Every

*Coal Mines Regulation.*

Every person who wilfully obstructs any inspector in the execution of his duty under this Act, and every owner, agent, and manager of a mine who refuses or neglects to furnish to the inspector the means necessary for making any entry, inspection, examination, or inquiry under this Act, in relation to the mine, shall be guilty of an offence against this Act.

22. 20. (I) If in any respect (which is not provided against by any express provision of this Act or by any special rule) any inspector finds any mine or any part thereof, or any matter, thing, or practice in or connected with any such mine, or with the control, management, or direction thereof by the manager to be dangerous or defective, so as in his opinion to threaten or tend to the bodily injury of any person, he may give notice in writing thereof to the owner, agent, or manager of the mine, and shall state in the notice the particulars in which he considers the mine or any part thereof, or any matter, thing, or practice to be dangerous or defective, and require the same to be remedied, and unless the same be forthwith remedied shall also report the same to the Minister and enter such report in a book at the mine.

Notice by inspector of causes of danger not expressly provided against.

(II) If the owner, agent, or manager of the mine objects to remedy the matter complained of in the notice he may, within ten days after receipt of the notice, send his objection in writing, stating the grounds thereof to the Minister, and thereupon the matter shall be determined by arbitration in manner provided by this Act, and the date of the receipt of the objection shall be deemed to be the date of the reference.

(III) If the owner, agent, or manager fail, when no objection is sent as aforesaid, to comply with the requisition of the notice within ten days after the expiration of the time for objection, or when there has been an arbitration to comply with the award within the time fixed by the award, he shall be guilty of an offence against this Act, and the notice and award shall respectively be deemed to be written notice of the offence: Provided that the court, if satisfied that the owner, agent, or manager has taken active measures for complying with the notice or award, but has not, with reasonable diligence, been able to complete the works, may adjourn any proceedings taken before them for punishing the offence, and, if the works are completed within a reasonable time, no penalty shall be inflicted.

(IV) No person shall be precluded by any agreement from doing, or be liable under any contract to any penalty or forfeiture for doing, such acts as may be necessary in order to comply with the provisions of this section.

23. 21. Every inspector of a district under this Act shall make an annual report of his proceedings during the preceding year to the Minister, which report, when embodied in the Annual Report of the Department of Mines, shall be laid before both Houses of Parliament.

Annual reports of inspectors.

24. 22. Where in any mine an explosion or accident has caused loss of life or personal injury to any person, the Minister may at any time direct an inspector to make a special report with respect to the explosion or accident.

Special reports of inspectors.

25. 23. Where it appears to the Minister that a formal investigation of any explosion or accident and of its causes and circumstances is expedient, the Minister may direct such investigation to be held, and with respect to any such investigation the following provisions shall have effect:—

Formal investigation when directed by the Minister.

(I) The Minister may appoint a competent person to hold the investigation, and may appoint any person or persons possessing legal or special knowledge to act as assessor or assessors in holding the investigation.

*Coal Mines Regulation.*

- 5 (II) The person or persons so appointed (hereinafter called the court) shall hold the investigation in open court, in such manner and under such conditions as the court may think most effectual for ascertaining the causes and circumstances of the explosion or accident, and enabling the court to make the report in this section mentioned.
- 10 (III) The court shall have for the purpose of the investigation all the powers of a Court of Petty Sessions when acting as a court in hearing informations for offences against this Act, and all the powers of an inspector under this Act, and in addition the following powers, namely :
- 15 (a) Power to enter and inspect any place or building, the entry or inspection whereof appears to the court requisite for the said purpose.
- (b) Power, by summons signed by the court, to require the attendance of all such persons as it thinks fit to call before it and examine for the said purpose, and for that purpose to require answers or returns to such inquiries as it thinks fit to make.
- 20 (c) Power to require the production of all books, papers, plans, and documents which it considers important for the said purpose.
- (d) Power to administer an oath and require any person examined to make and sign a declaration of the truth of the statements made by him in his examination.
- 25 (IV) Persons attending as witnesses before the court shall be allowed such expenses as would be allowed to witnesses attending before the Supreme Court; and in case of dispute as to the amount to be allowed, the same shall be referred by the court to the Prothonotary, who, on request signed by the court, shall ascertain and certify the proper amount of the expenses.
- 30 (v) The court holding an investigation under this section shall make a report to the Minister, stating the causes of the explosion or accident and its circumstances, and adding any observations which the court thinks right to make.
- 35 (VI) All expenses incurred in and about an investigation under this section (including the remuneration of any person appointed to act as assessor) shall be deemed to be part of the expenses of the Minister in the execution of this Act.
- 40 (VII) Any person who without reasonable excuse (proof whereof shall lie on him) either fails, after having had the expenses (if any) to which he is entitled tendered to him, to comply with any summons or requisition of a court holding an investigation under this section, or prevents or impedes the court in the execution of its duty, shall for every such offence be liable to a fine not exceeding ten pounds, and in the case of a failure to comply with a requisition for making any return or producing any document shall be liable to a fine not exceeding ten pounds for every day that such failure continues.
- 45 50

26- 24. The Minister may cause any special report of an inspector Publication of or any report of a court, under this part of this Act, to be made public reports. at such time and in such manner as he may think fit.

*Arbitration.*

*Coal Mines Regulation.**Arbitration.*

27. 25. With respect to arbitrations under this Act, the following provisions shall have effect, notwithstanding anything to the contrary contained in the "~~Arbitration Act, 1892,~~" and except where they are inconsistent with the provisions of this Act the provisions of the "~~Arbitration Act, 1892,~~" shall apply to arbitrations under this Act:—

Provisions as to arbitrations.

- 10 (I) The parties to the arbitration are in this section deemed to be the owner, agent, or manager of the mine on the one hand, and the inspector of mines (on behalf of the Minister) on the other.
- (II) Each of the parties to the arbitration may, within fourteen days after the date of the reference, appoint an arbitrator.
- 15 (III) No person shall act as arbitrator or umpire under this Act who is employed in, or in the management of, or is interested in the mine to which the arbitration relates.
- (IV) The appointment of an arbitrator under this section shall be in writing, and notice of the appointment shall be forthwith sent to the other party to the arbitration, and shall not be revoked without the consent of that party.
- 20 (V) The death, removal, or other change in any of the parties to the arbitration shall not affect the proceedings under this section.
- (VI) If within the said fourteen days either of the parties fails to appoint an arbitrator, the arbitrator appointed by the other party may proceed to hear and determine the matter in difference, and in that case the award of the single arbitrator shall be final.
- 25 (VII) If before an award has been made any arbitrator appointed by either party dies or becomes incapable to act, or for seven days refuses or neglects to act, the party by whom such arbitrator was appointed may appoint some other person to act in his place, and if he fails to do so within seven days after notice in writing from the other party for that purpose, the remaining arbitrator may proceed to hear and determine the matter in difference, and in that case the award of the single arbitrator shall be final.
- 30 (VIII) In either of the foregoing cases where an arbitrator is empowered to act singly on one of the parties failing to appoint, the party so failing may, before the single arbitrator has actually proceeded in the arbitration, appoint an arbitrator, who shall then act as if no failure had occurred.
- 35 (IX) If the arbitrators fail to make their award within twenty-one days after the day on which the last of them was appointed, or within such extended time (if any) as may have been appointed for that purpose by both arbitrators under their hands, the matter in difference shall be determined by the umpire appointed as hereinafter mentioned.
- 40 (X) The arbitrators, before they enter on the matter referred to them, shall appoint, by writing under their hands, an umpire to decide on points on which they may differ.
- 45 (XI) If the umpire dies or becomes incapable of acting before he has made his award, or refuses to make his award within a reasonable time after the matter has been brought within his cognizance, the persons or person who appointed such umpire shall forthwith appoint another umpire in his place.
- 50 (XII) If the arbitrators refuse or fail, or for seven days after the request of either party neglect to appoint an umpire, then, on the application of either party, an umpire may be appointed by
- 55

*Coal Mines Regulation.*

by the Chairman of the General or Quarter Sessions of the Peace within the jurisdiction of which the mine or any shaft of the mine is situate.

- 5 (XIII) The decision of every umpire on the matters referred to him shall be final.
- (XIV) If a single arbitrator fails to make his award within twenty-one days after the day on which he was appointed, the party who appointed him may appoint another arbitrator to act in his place.
- 10 (XV) Arrangements shall, whenever practicable, be made for the matter in difference being heard at the same time, before the arbitrators and the umpire.
- (XVI) The arbitrators and the umpire, or any of them, may examine the parties and their witnesses on oath, and may also consult any counsel, engineer, or scientific person whom they may think it expedient to consult.
- 15 (XVII) The payment, if any, to be made to any arbitrator or umpire for his services shall be fixed by the Minister, and, together with the costs of the arbitration and award, shall be paid by the parties, or one of them, according as the award may direct. Such costs may be taxed by the Prothonotary, who, on the written application of either of the parties, shall ascertain and certify the proper amount thereof. The amount, if any, payable by the Minister shall be paid as part of the expenses of inspectors under this Act. The amount, if any, payable by the owner, agent, or manager, may, in the event of non-payment, be recovered in the same manner as fines under this Act.
- 20 (XVIII) Every person who is appointed an arbitrator or umpire under this section shall be a practical mining engineer, or a person accustomed to the working of mines, and every person who is appointed an umpire under this section shall be a District Court Judge, a Police or Stipendiary Magistrate, or a Barrister-at-Law; but when an award has been made under this section the arbitrator or umpire who made it shall be deemed to have been duly qualified as provided by this section.
- 30
- 35

*Coroners.*

- 40 28- 26. With respect to coroners' inquests on the bodies of persons whose death may have been caused by explosions or accidents in or about mines, the following provisions shall have effect:—
- Provisions as to coroners' inquests on deaths from accidents in mines.
- (I) Where a coroner holds an inquest on the body of any person whose death may have been caused by any explosion or accident, of which notice is required by this Act to be given to the inspector of the district, the coroner shall adjourn the inquest, unless an inspector, or some person on behalf of the Minister, is present to watch the proceedings.
- 45
- (II) The coroner, at least four days before holding the adjourned inquest, shall send to the inspector for the district notice in writing of the time and place of holding the adjourned inquest.
- 50
- (III) The coroner, before the adjournment, may take evidence to identify the body, and may order the interment thereof.
- 55
- (IV) If an explosion or accident has not occasioned the death of more than one person, and the coroner has sent to the inspector of the district notice of the time and place of holding the inquest at such time as to reach the inspector not less than twenty-four hours before the time of holding the
- the

*Coal Mines Regulation.*

the same, it shall not be imperative on him to adjourn the inquest in pursuance of this section if the majority of the jury think it unnecessary so to adjourn.

5 (v) An inspector shall be at liberty at any such inquest to examine any witness, subject nevertheless to the order of the coroner.

10 (vi) Where evidence is given at an inquest at which an inspector is not present of any neglect as having caused or contributed to the explosion or accident, or of any defect in or about the mine appearing to the coroner or jury to require a remedy, the coroner shall send to the inspector of the district notice in writing of such neglect or defect.

15 (vii) Any person having a personal interest in, or employed in, or in the management of the mine in which the explosion or accident occurred shall not be qualified to serve on the jury empanelled on the inquest; and it shall be the duty of the constable or other officer not to summon any person disqualified under this provision, and it shall be the duty of the coroner not to allow any such person to be sworn or to sit on  
20 the jury.

25 (viii) Any relative of any person whose death may have been caused by the explosion or accident with respect to which the inquest is being held, and the owner, agent, or manager of the mine in which the explosion or accident occurred, and any person appointed by the order in writing of the majority of the workmen employed at the said mine, shall be at liberty to attend and examine any witness, either in person or by his counsel, solicitor, or agent.

30 Every person who fails to comply with the provisions of this section shall be guilty of an offence against this Act.

*3. Returns, Plan, Notices, and Abandonment.*

29. 27. (i) On or before the twenty-first day of January in every year, the owner, agent, or manager of every mine shall send to the inspector of the district on behalf of the Minister a correct return, Returns by owner agent, or manager of mine.  
35 specifying, with respect to the year ending on the preceding thirty-first day of December, the particulars contained in the form in Schedule Two Three to this Act, or in such other form as may from time to time be prescribed in lieu of that form by the Minister: Provided that in the case of any mine which is not required by this Act to be under  
40 the control of a certificated manager, a return shall not be required of the particulars contained in Part B of the said form, unless or until the Minister otherwise prescribes.

(ii) Forms for the purpose of the returns required by this section shall from time to time, on application, be furnished by the  
45 inspector on behalf of the Minister.

(iii) The Minister may publish the aggregate results of the returns made under this section with respect to the whole Colony or any particular inspector's district, or any large portion of an inspector's district, and so much of any individual return as does not  
50 relate to the quantity of mineral gotten or wrought; but the portion of any individual return relating to the quantity of mineral gotten or wrought shall not be published without the consent of the person making the return, or of the owner of the mine to which it relates; and no person except an inspector, or the Minister, or the Under Secretary  
55 shall be entitled, without such consent, to see such portion as aforesaid of any individual return.

(iv)

*Coal Mines Regulation.*

(iv) Every owner agent or manager of a mine who fails to comply with this section or makes any return which is to his knowledge false in any particular shall be guilty of an offence against this Act.

30. 28. (i) The owner, agent, or manager of every mine shall keep <sup>Plan of mine to be kept at office.</sup> 5 in the office at the mine an accurate plan of the workings of the mine, showing the workings up to a date not more than ~~three~~ six months previously, and the general direction and rate of dip of the strata, together with a section of the strata sunk through, or if that be not reasonably practicable, a statement of the depth of the shaft, with a 10 section of the seam.

(ii) The owner, agent, or manager of the mine shall, on request at any time of an inspector under this Act, produce to him at the office at the mine such plan and section, and shall also on the like request mark on such plan and section the then state of the workings 15 of the mine; and the inspector shall be entitled to examine the plan and section, and for official purposes only to make a copy of any part thereof respectively.

(iii) The plan of the workings shall have delineated on it the position of all shafts and boreholes sunk within the colliery 20 surface boundary, with the depth to and thickness of the coal-seam passed through written alongside any shaft or bore-hole; and in addition to the plan hereinbefore provided for, there shall also be so provided, if required a surface plan on the same scale showing thereon all streets, roads, buildings, creeks, rivers, bays, swamps, navigable 25 waters, and limits of any tidal waters within the said boundary.

(iv) If the owner, agent, or manager of any mine fails to keep, or wilfully refuses to produce or allow to be examined, the plan and section aforesaid, or wilfully withholds any portion thereof, or wilfully refuses on request, to mark thereon the state of the workings 30 of the mine, or conceals any part of those workings, or produces an imperfect or inaccurate plan or section, he shall (unless he shows that he was ignorant of the concealment, imperfection, or inaccuracy) be guilty of an offence against this Act; and further, the inspector may by notice in writing (whether a penalty for the offence has or has not 35 been inflicted) require the owner, agent, or manager to cause an accurate plan and section, showing the particulars hereinbefore required, to be made within a reasonable time at the expense of the owner of the mine. Every such plan must be on a scale of not less than two chains to the inch or on the same scale as the plan for the time being 40 in use at the mine.

(v) If the owner, agent, or manager fails within twenty days after the requisition of the inspector, or within such further time as may be allowed by the Minister, to cause such plan and section to be made as hereby required, he shall be guilty of an offence against 45 this Act.

(vi) Every copy ~~or tracing~~, as aforesaid, shall be deposited in the principal office of the Department of Mines and Agriculture, and, except as evidence in a Court, no copy ~~or tracing~~ thereof shall be furnished nor information in relation thereto given, nor shall such 50 plans ~~or tracings~~ be open to inspection unless the Minister shall order that any owner or lessee of the land or of the surface thereof, or the officer of any municipality whose rights or interests may be affected by the working of the mine be permitted to see such portion of any plan ~~or tracing~~ as affects the right or interest of such owner, lessee, 55 or municipality.

(vii) If any officer shall furnish any copy, tracing, or information, or shall allow any person to inspect any such plan or tracing, unless directed by the Minister as aforesaid, he shall be guilty of an offence against this Act.

*Coal Mines Regulation.*

31- 29. Where in or about any mine, whether above or below ground, either:— Notice to be given of accidents in mines.

- 5 (I) Loss of life or any personal injury whatever to any person employed in or about the mine occurs by reason of any explosion of gas, or any explosive, or of any steam boiler; or loss of life or any serious personal injury to any person employed in or about the mine occurs by reason of any accident whatever, the owner, agent, or manager of the mine shall, ~~forthwith but not later than~~ within twenty-four hours next after the explosion or accident, send notice in writing of the explosion or accident and of the loss of life or personal injury occasioned thereby to the inspector of the district on behalf of the Minister, and shall specify in the notice the character of the explosion or accident, and the number of persons killed or injured respectively.
- 10
- 15 (II) Where loss of life or serious personal injury has immediately resulted from an explosion or accident, the place where the explosion or accident occurred shall be left as it was immediately after the explosion or accident, until the expiration of at least three days after the sending of such notice as aforesaid of such explosion or accident, or until the visit of the place by an inspector, whichever first happens, unless compliance with this enactment would tend to increase or continue a danger, or would impede the working of the mine.
- 20
- 25 (III) Where any personal injury, of which notice is required to be sent under this section, results in the death of the person injured, notice in writing of the death shall be sent to the inspector of the district on behalf of the Minister within twenty-four hours after such death comes to the knowledge of the owner, agent, or manager.
- 30

Every owner, agent, or manager who fails to act in compliance with this section shall be guilty of an offence against this Act.

32- 30. In any of the following cases, namely:—

- 35 (I) Where any working is commenced for the purpose of opening a new shaft for or a seam of any mine. Notice to be given of opening and abandonment of mine.
- (II) Where a shaft or seam of any mine is abandoned, or the working thereof discontinued.
- (III) Where the working of a shaft or a seam of any mine is recommenced after any abandonment or discontinuance for a period exceeding two months; or
- 40 (IV) Where any change occurs in the name of any mine, or in the name of the owner, agent, or manager of any mine to which this Act applies, or in the principal officers of any incorporated company which is the owner of a mine;
- 45 the owner, agent, or manager of the mine shall give notice thereof to the inspector of the district ~~forthwith~~ within one month after the commencement, abandonment, discontinuance, recommencement, or change; and if such notice is not given, the owner, agent, or manager shall be guilty of an offence against this Act.

50 33- 31. (I) Where any mine is abandoned or the working thereof discontinued, at whatever time the abandonment or discontinuance occurred, the owner thereof and every other person interested in the minerals of the mine shall cause the top of every shaft and every side entrance from the surface to be and to be kept securely fenced for the Fencing in case of abandoned mine.

55 prevention of accidents: Provided that,—

- (I) Subject to any contract to the contrary, the owner of the mine shall, as between himself and any other person interested in the minerals of the mine, be liable to carry into effect this

*Coal Mines Regulation.*

this section, and to pay any costs, charges, and expenses incurred by any other person interested in the minerals of the mine in carrying this section into effect.

5 (II) Nothing in this section shall exempt any person from any liability under any other Act or otherwise.

(II) If any person fails to act in conformity with this section, he shall be guilty of an offence against this Act.

10 (III) No person shall be precluded by any agreement from doing, or be liable under any contract to any damages, penalty, or forfeiture for doing such acts as may be necessary in order to comply with the provisions of this section.

(IV) If any occupier of land or other person wilfully obstructs the owner of a mine or other person interested as aforesaid in doing any such acts, he shall be guilty of an offence against this Act.

15 (V) Any shaft or side entrance which is not fenced as required by this section, and is within fifty yards of any highway, road, footpath, or place of public resort, or is in open or unenclosed land, shall be deemed to be a public nuisance.

20 34. 32. (I) Where any mine or seam is abandoned, the owner of the mine or seam at the time of its abandonment shall, within three months after the abandonment, send to the Minister an accurate plan showing the boundaries, the whole of the workings of the mine or seam up to the time of the abandonment, and the position of the workings with regard to the surfaces, and the general direction and rate of dip of the strata, together with a section of the strata sunk through, or if that is not reasonably practicable, a statement of the depth of the shaft, with a section of the seam. Every such plan must be on a scale of not less than two chains to the inch, or on the same scale as the plan used at the mine at the time of its abandonment.

Plan of abandoned mine or seam to be sent to Minister.

30 (II) The plan and section shall be preserved under the care of the Minister; but no person, except as provided in section ~~twenty-nine~~ **twenty-eight**, other than an inspector under this Act, shall be entitled, without the consent of the owner or agent of the mine or seam, to see the plan when so sent until after the expiration of ten years from the time of the abandonment.

35 (III) The owner or agent aforesaid shall also, within three months of the abandonment of the mine or seam, send to the inspector of the district, on behalf of the Minister, a correct return specifying, with respect to the period which has elapsed since the expiration of the year covered by the last annual return made under this Act, the particulars required in that return, and the provisions of this Act with respect to the said annual return shall apply to the return so sent.

40 (IV) If the owner or agent of a mine or seam fails to comply with this section he shall be guilty of an offence against this Act, and be liable to a fine not exceeding thirty pounds.

45 (V) A complaint or information of an offence under this section may be made or laid at any time within six months after abandonment of the mine or seam, or after service on the owner or agent aforesaid of a notice to comply with the requirements of this section, whichever last happens.

50 35. 33. All notices under this Act shall (unless expressly required to be in print) be in either writing or print (including lithograph), or partly in writing and partly in print (including lithograph), and all notices and documents required by this Act to be served or sent by or to an inspector may be either delivered personally, or served and sent by post by a prepaid registered letter; and if served or sent by post, shall be deemed to have been served and received respectively at the time when the letter containing the same would be delivered in the ordinary course of post; and in proving such service or sending, it shall be sufficient to prove that the letter containing the notice was properly addressed and put into the post.

Service of notices.

*Coal Mines Regulation.*

4. ~~Employment of Male Persons.~~

36. No person shall, except in case of emergency or when life or property are in danger, be employed below ground in any mine for more than eight hours on Monday, Tuesday, Wednesday, Thursday, and Friday, and for more than six hours on each alternate Saturday: And no person so employed below ground shall be employed in drawing or hewing coal on the pay Saturday, save and excepting the drawing of small coal necessary for the ventilation of the mine during the succeeding fortnight; and any contravention of this section by any person whomsoever shall be deemed an offence against this Act.

*Employment of Boys and Females.*

37. 34. (I) Subject to the provisions of section ~~thirty-eight~~ **thirty-five** of this Act (dealing with the employment of boys), no boy under the age of fourteen years and no female shall be employed in or about a mine. And no boys between the age of fourteen years and eighteen years shall be employed in or allowed to be, for the purpose of employment, in any mine below ground for more than ten hours on Monday, Tuesday, Wednesday, Thursday, Friday, and six hours on one Saturday and eight hours on the next Saturday.

20 For the purpose of this Act, with respect to the employment of such boys in a mine below ground, the following regulations shall have effect, that is to say:—

(i) There shall be allowed an interval of not less than twelve hours between each period of employment.

25 (ii) Each period of employment shall be inclusive of one hour for meals.

(iii) A week shall be deemed to begin at midnight on Saturday night, and to end at midnight on the succeeding Saturday night.

30 (II) The owner, agent, or manager of every mine shall keep in the office at the mine a register, and shall cause to be entered in that register, in such form as the Minister may from time to time prescribe or sanction, the name, age, residence, and date of first employment of all boys under the age of eighteen employed in the mine below ground, and of all such boys employed above ground in connection with the mine; and shall on request, produce the register to any inspector under this Act, and to any officer of the Department of Public Instruction, at the mine, at all reasonable times, and shall allow any such inspector or officer to inspect and copy the same.

40 (III) The immediate employer of every such boy, other than the owner, agent, or manager of the mine, before he causes the boy to be below ground in any mine, shall report to the manager of the mine, or to some person appointed by that manager, that he is about to employ the boy in the mine.

38. 35. The provisions of this Act shall not—

45 (I) Prevent a boy under the age of fourteen years who, before the ~~twenty-ninth day of August, one thousand eight hundred and ninety-four,~~ commencement of this Act, is lawfully employed in any mine below ground from continuing to be employed in a mine; nor

50 (II) Prevent a boy, who before the ~~twenty-ninth day of August, one thousand eight hundred and ninety-four,~~ commencement of this Act, is lawfully employed above ground in connection with any mine from continuing to be employed above ground in connection with a mine; nor

55 (III) Prevent a competent male person above the age of eighteen years who, before the commencement of this Act, is lawfully employed in working the machinery used for lowering and raising persons in a mine from continuing to be so employed.

*Coal Mines Regulation.*

39. 36. If any person contravenes or fails to comply with or permits any person to contravene or fail to comply with any provision of this Act with respect to the employment of boys or females, or to the register of boys, or to reporting the intended employment of boys, he shall be guilty of an offence against this Act; and in the event of any such contravention or non-compliance by any person whomsoever, the owner, agent, and manager of the mine shall each be guilty of an offence against this Act, unless he proves that he had taken all reasonable means, by publishing and to the best of his power enforcing the provisions of this Act, to prevent the contravention or non-compliance.

Penalty for employment of persons in contravention of Act.

*Wages.*

40. 37. (I) No wages shall be paid to any person employed in or about any mine at or within any public-house, beer-shop, or place for the sale of any spirits, beer, wine, cider, or other spirituous or fermented liquor, or other house of entertainment, or any office, garden, or place belonging or contiguous thereto or occupied therewith.

Prohibition of payment of wages at public-houses, &c.

(II) Every person who contravenes or fails to comply with or permits any person to contravene or fail to comply with this section shall be guilty of an offence against this Act; and in the event of any such contravention or non-compliance by any person whomsoever, the owner, agent, and manager of the mine shall each be guilty of an offence against this Act, unless he proves that he had taken all reasonable means, by publishing and to the best of his power enforcing the provisions of this section, to prevent the contravention or non-compliance.

41. 38. (I) Where the amount of wages paid to any of the persons employed in a mine depends on the amount of mineral large coal or shale gotten by them, those persons shall be paid according to the actual weight of such large coal or shale gotten by them, of the mineral contracted to be gotten, and unless otherwise mutually agreed upon all the mineral gotten by them such weight being ascertained in such manner as may be agreed upon by the owner, agent, or manager of the mine on the one part, and the persons so employed on the other part, and in the absence of such agreement such coal or shale shall be truly weighed either at the bottom of the screen or at a place as near to the pit mouth as is reasonably practicable: Provided that nothing in this section shall preclude the owner, agent, or manager of the mine from agreeing with the persons employed in the mine that deductions shall be made in respect of small coal, stones, or substances other than the mineral contracted to be gotten, which shall be sent out of the mine with the mineral contracted to be gotten, such large coal or shale, or in respect of any tubs being improperly filled in those cases where they are filled by the getter of the large coal or shale, or his drawer, or by the person immediately employed by him, such deductions being determined in such special mode as may be agreed upon between the owner, agent, or manager of the mine on the one hand, and the persons employed in the mine on the other; or by some person appointed in that behalf by the owner, agent, or manager, or (if any check weigher is stationed for this purpose as hereinafter mentioned) by such person and such check weigher, or in case of difference by a third person to be mutually agreed on by the owner, agent, or manager of the mine on the one hand, and the persons employed in the mine on the other, or in default of agreement appointed by a Chairman of a Court of Quarter Sessions within the jurisdiction of which any shaft of the mine is situate.

Payment of persons employed in mines by weight.

(II) If any person contravenes or fails to comply with, or permits any person to contravene or fail to comply with this section, he shall be guilty of an offence against this Act; and in the event of any such contravention or non-compliance by any person whomsoever, the owner, agent, and manager of the mine shall each be guilty of an offence

*Coal Mines Regulation.*

offence against this Act, unless he proves that he had taken all reasonable means by publishing and to the best of his power enforcing the provisions of this section to prevent the contravention or non-compliance.

5 (III) That Nothing in this Act shall be held to authorise or give any power to any owner or manager of a mine to pay miners by the method known as the standard weight system, and from and after the passing commencement of this Act that system shall be and is hereby abolished. But nothing herein contained shall be held to affect  
10 the power of any owner or manager of a mine to pay miners by the method known as the standard bar system.

(IV) Where it is proved to the satisfaction of the Minister, in the case of any mine or class of mines employing not more than twenty thirty persons under ground, to be expedient that the persons  
15 employed therein should, upon the joint representation of the owner or owners of any such mine or class of mines and the said persons, be paid by any method other than that provided by this Act, such Minister may, if he think fit, by order allow the same either without conditions or during the time and on the conditions specified in the order.

20 42. 39. Whenever any sum of money not exceeding fifty pounds shall be claimed to be due to any person on account of any kind of labour performed at any colliery in charge of owner or agent it shall be lawful for any Justice or Clerk of Petty Sessions, upon complaint made to him touching or concerning the non-payment of any such sum, to  
25 summon such owner or agent to appear before any two Justices at the nearest Petty Sessions, and the Justices there assembled may examine the parties and their respective witnesses touching the complaint, and may inspect any agreement or duplicate copy thereof if produced, and may make an order for the payment by such owner or agent of any  
30 sum not exceeding fifty pounds, as shall appear to such Justices lawfully due, together with all costs incurred and damage sustained by the complainant in prosecuting such claim, and in case of refusal or non-payment of any sum so ordered to be paid by such owner or agent, then such Justices shall issue their warrant to levy the same by  
35 distress and sale of all or a sufficient part of the goods, chattels, colliery produce, plant, rolling-stock, horses, and machinery of or belonging to the owner of such colliery: Provided always that no person making default in payment under this section shall be liable to imprisonment, any law to the contrary notwithstanding.

40 43. 40. (I) The persons who are employed in a mine, and are paid according to the weight of the mineral large coal or shale gotten by them, may, at their own cost, station a person who shall be an employee of the colliery (in this Act referred to as "a check weigher") at each place appointed for weighing the large coal or shale, and at each place  
45 appointed for determining the deductions, in order that he may, on behalf of the persons by whom he is so stationed, take a correct account of the weight of the mineral, large coal or shale, or determine correctly the deductions, as the case may be.

(II) A check weigher shall have every facility afforded to  
50 him for enabling him to fulfil the duties for which he is stationed, including facilities for examining and testing the weighing machine, and checking the ~~taring of tubs and trams weights~~ where necessary; and if at any mine proper facilities are not afforded to a check weigher as required by this section, the owner, agent, and manager of the mine  
55 shall each be guilty of an offence against this Act, unless he proves that he had taken all reasonable means to enforce to the best of his power the requirements of this section.

(III) A check weigher shall not be authorised in any way to impede or interrupt the working of the mine, or to interfere with the  
60 weighing, or with any of the workmen, or with the management of the  
the

Agent may be summoned for wages.

Appointment on part of men, and removal of check weigher.

*Coal Mines Regulation.*

the mine ; but shall be authorised only to take such account or determine such deductions as aforesaid, and the absence of a check weigher from the place at which he is stationed shall not be a reason for interrupting or delaying the weighing or the determination of deductions at such place respectively, but the same shall be done or made by the person appointed in that behalf by the owner, agent, or manager, unless the absent check weigher had reasonable ground to suppose that the weighing or the determination of the deductions, as the case may be, would not be proceeded with : Provided always that nothing in this section shall prevent a check weigher giving to any workman an account of the ~~mineral~~ large coal or shale gotten by him, or information with respect to the weighing or the weighing machine, ~~or the taring of the tubs or trams,~~ or with respect to the deductions, or any other matter within the scope of his duties as check weigher, so always, nevertheless, that the working of the mine be not interrupted or impeded.

(iv) If the owner, agent, or manager of the mine desires the removal of a check weigher on the ground that ~~the check weigher~~ he has impeded or interrupted the working of the mine, or interfered with the weighing or with any of the workmen, or with the management of the mine, or has at the mine, to the detriment of the owner, agent, or manager, done anything beyond taking such account, determining such deductions, or giving such information as aforesaid, ~~he the owner, agent, or manager may complain to a court of summary jurisdiction~~ the nearest Court of Petty Sessions who, if of opinion that the owner, agent, or manager shows sufficient *prima facie* ground for the removal of the check weigher, shall call on the check weigher to show cause against his removal.

(v) On the hearing\* of the case the Court shall hear the parties, and if they think that at the hearing sufficient ground is shown by the owner, agent, or manager to justify the removal of the check weigher, shall make a summary order for his removal, and the check weigher shall thereupon be removed, but without prejudice to the stationing of another check weigher in his place.

(vi) The Court may in every case make such order as to the costs of the proceedings as the Court may think just.

(vii) If, in pursuance of any order of exemption made by the Minister, the persons employed in a mine are paid by the measure or gauge of the ~~material~~ large coal or shale gotten by them, the provisions of this Act shall apply in like manner as if the term "weighing" included measuring and gauging, and the terms relating to weighing shall be construed accordingly.

(viii) If the person appointed by the owner, agent, or manager to weigh the ~~mineral~~ large coal or shale impedes or interrupts the check weigher in the proper discharge of his duties, or improperly interferes with or alters the weighing machine ~~or the tare~~ in order to prevent a correct account being taken of the weighing ~~and taring,~~ he shall be guilty of an offence against this Act.

44. 41. (i) Where a check weigher has been appointed by the majority, ascertained by ballot, of the persons employed in a mine who are paid according to the weight of the ~~mineral~~ large coal or shale gotten by them, and has acted as such, he may recover from any person for the time being employed at such mine and so paid, his proportion of the check weigher's wages or recompense, notwithstanding that any of the persons by whom the check weigher was appointed may have left the mine or others have entered the same since the check weigher's appointment, any rule of law or equity to the contrary notwithstanding.

(ii) It shall be lawful for the owner or manager of any mine, where the majority of the before-mentioned persons, ascertained as aforesaid, so agree, to retain the agreed contribution of the persons so employed and paid as aforesaid for the check weigher, and to pay and account for the same to the check weigher.

Remuneration of  
check weigher.

*Coal Mines Regulation.*

45- 42. (I) The "Weights and Measures Act," sixteenth Victoria number thirty-four, and any Act relating to weights and measures, shall apply to all weights, balances, scales, steelyards, and weighing machines used at any mine for determining the wages payable to any person employed in the mine according to the weight of the mineral large coal or shale gotten by him, in like manner as it applies to weights, balances, scales, steelyards, and weighing machines used for buying and selling, or for trade.

Application of 16  
Vict. No. 34, to  
weights, &c., used in  
mines.

(II) An inspector of weights and measures appointed under the said Act shall once at least in every six months inspect and examine in manner directed by the said Act the weights, balances, scales, steelyards, and weighing machines used or in the possession of any person for use as aforesaid at any mine within his district; and shall also make such inspection and examination at any other time in any case where he has reasonable cause to believe that there is in use at the mine any false or unjust weight, balance, scale, steelyard, or weighing machine. ~~or when required by the manager or majority of employers so to do.~~

(III) The inspector shall also inspect and examine the measures and gauges in use at the mines within his district; but nothing in this section shall prevent or interfere with the use of the measures or gauges ordinarily used at the mine.

(IV) An inspector may, for the purposes of this section, without any authorisation from a Justice of the Peace, exercise at or in any mine, as respects all weights, measures, scales, balances, steelyards, and weighing machines used or in the possession of any person for use at or in that mine, all such powers as he could exercise, if authorised in writing by a Justice of the Peace, under the "Weights and Measures Act," with respect to any such weights, measures, scales, balances, steelyards, and weighing machines as therein mentioned; and all the provisions of sections seventeen and eighteen of that Act, including the liability to penalties, shall apply to such inspection.

(V) The inspector of weights and measures shall not, in fulfilling the duties required of him under this section, impede or obstruct the working of the mine.

*Single Shafts.*

46- 43. (I) After the commencement of this Act the owner, agent, or manager of a mine shall not employ any person in the mine, or permit any person to be in the mine for the purpose of employment therein, unless the following conditions respecting shafts or outlets are complied with, that is to say,—

Prohibition of single  
shafts.

(a) There must be at least two shafts or outlets, with which every seam for the time being at work in the mine shall have a communication, so that such shafts or outlets shall afford separate means of ingress and egress available to the persons employed in every such seam, whether the shafts or outlets belong to the same mine or to more than one mine.

(b) Such shafts or outlets must not at any point be nearer to one another than ~~fifty~~ fifteen yards, and there shall be between such two shafts or outlets a communication not less than ~~six~~ four feet wide and six feet high, and in the case of communications made after the commencement of this Act between shafts or outlets, not less than six feet high.

(c) Proper apparatus for raising and lowering persons at each such shaft or outlet shall be kept on the works belonging to the mine, and such apparatus if not in actual use at the shafts or outlets shall be constantly available for use.

(II)

*Coal Mines Regulation.*

(II) Every owner, agent, and manager of a mine who acts in contravention of or fails to comply with this section shall be guilty of an offence against this Act.

(III) The Supreme Court, whether any other proceedings have or have not been taken, may, on the application of the Attorney-General, prohibit by injunction the working of any mine in which any person is employed, or is permitted to be for the purpose of employment in contravention of this section, and may award such costs in the matter of the injunction as the Court thinks just; but this provision shall be without prejudice to any other remedy permitted by law for enforcing the provisions of this Act.

(IV) Written notice of the intention to apply for such injunction in respect of any mine shall be given to the owner, agent, or manager of the mine not less than ten days before the application is made.

15 47. 44. No person shall be precluded by any agreement from doing such acts as may be necessary for providing a second shaft or outlet to a mine, where the same is required by this Act, or be liable under any contract to any penalty or forfeiture for doing such acts as may be necessary in order to comply with the provisions of this Act with respect to shafts or outlets. Agreements not to preclude compliance with Act.

20 48. 45. The foregoing provisions of this Act with respect to shafts or outlets shall not apply— Exceptions from provisions as to shafts.

(I) In the case of a new mine being opened—

- 25 (a) to any working for the purpose of making a communication between two or more shafts;
- (b) to any working for the purpose of searching for or proving minerals;

so long as not more than twenty persons are employed below ground at any one time in the whole of the different seams in connection with a single shaft or outlet: nor

30 (II) To any proved mine so long as it is exempted by order of the Minister on the ground either—

- 35 (a) that the quantity of mineral proved is not sufficient to repay the outlay which would be occasioned by sinking or making a second shaft or outlet, or by establishing communication with a second shaft or outlet, in any case where such communication existed and has become unavailable; or

- 40 (b) that the workings in any seam of the mine have reached the boundary of the property or the extremity of the mineral field of which that seam is a part, and that it is expedient to work away the pillars already formed in course of the ordinary working, notwithstanding that one of the shafts or outlets may be cut off by so working away the pillars of that seam;

45 and so long as not more than twenty persons are employed below ground at any one time in the whole of the different seams in connection with a single shaft or outlet; nor

(III) To any mine—

- 50 (a) while a shaft is being sunk, or an outlet being made; or
- (b) one of the shafts or outlets of which has become, by reason of some accident, unavailable for the use of the persons employed in the mine;

55 so long as the mine is exempted by order of the Minister, and as the conditions (if any) annexed to the order of exemption are duly observed.

The provision in this Act requiring the two shafts or outlets of a mine to be separated by a distance of not less than ~~five~~ fifteen yards shall not apply to any mine which is provided with two shafts sunk before ~~the first day of October, one thousand eight hundred and ninety-four,~~ commencement

*Coal Mines Regulation.*

commencement of this Act, but at that time separated by a distance of less than ten feet, or commenced to be sunk before the commencement of this Act, but separated by a distance of more than ten feet and less than fifty fifteen yards. The foregoing provisions of 5 this Act as to the dimensions of the communication between two shafts or outlets shall not apply to any mine or class of mines so long as the same is exempted therefrom by order of the Minister by reason of the thinness of the seams or other exigencies affecting that mine or class of mines, and so long as the conditions (if any) 10 annexed to the order of exemption are duly observed.

*6. Division of Mine into Splits Parts.*

49. 46. (I) Where two or more parts of a mine are worked separately, the owner, agent, or manager of the mine shall give notice in writing <sup>Division of mine into splits parts.</sup> to that effect to the inspector of the district, and thereupon each such 15 part shall, for all purposes of this Act, be deemed to be a separate mine.

(II) If the Minister is of opinion that the division of a mine in pursuance of this section tends to lead to evasion of the provisions of this Act, or otherwise to prevent the carrying of this Act 20 into effect, he may object to the division by notice served on the owner, agent, or manager of the mine; and the owner, agent, or manager, if he declines to acquiesce in such objection, may, within twenty days after receipt of the notice, send a notice to the inspector of the district, stating that he declines so to acquiesce, and thereupon the matter shall 25 be determined by arbitration in manner provided by this Act; and the date of the receipt of the last-mentioned notice shall be deemed to be the date of the reference.

(III) Within six months after the commencement of this Act, every mine, unless worked on the long-wall system, shall be 30 divided into districts or splits of not more than sixty men exclusive of wheelers and horses; and each district shall be supplied with a separate current of fresh air, which shall be taken to within fifteen yards of each working face by brattice or otherwise where gas does not exist, and to within three yards of the working face where gas 35 does exist.

## PART II.

*7. Rules.**General Rules.*

50. 47. The following general rules shall be observed, so far as is <sup>General rules.</sup> reasonably practicable, in every mine:—

*Rule 1.* An adequate amount of ventilation (~~not in any case less~~ <sup>Ventilation of mines.</sup> than one hundred and fifty cubic feet of pure air per minute for each man and each boy, and two hundred cubic feet for each horse employed in the mine) shall be constantly produced 45 in every mine, and shall sweep undiminished along the airways and into each working place to dilute and render harmless noxious gases to such an extent that the working places of the shafts, levels, stables, and workings of the mine, and the travelling roads to and from those working places shall be in a fit state for working and passing therein. And no 50 place shall be driven more than ~~twenty-five~~ **thirty-five** yards exclusive

---

*Coal Mines Regulation.*

---

exclusive of the cut-through away from the current of the air without a cut-through being put through. ~~and in single~~ headings, or where gas is known to be generated, it shall be brattice<sup>d</sup> up to within three yards of the face of such working place: And no return airways shall be used as travelling roads. In the case of mines required by this Act to be under the control of a certificated manager, the quantity of air in the respective splits or currents shall at least once in every month be measured and entered in a book to be kept for the purpose at the mine.

*Rule 2.* Where a fire is used for ventilation in any mine newly opened after the passing commencement of this Act, the return air, unless it be so diluted as not to be inflammable, shall be carried off clear of the fire by means of a dumb drift or air-way. Ventilation by fire

*Rule 3.* Where a mechanical contrivance for ventilation is introduced into any mine after the commencement of this Act, it shall be in such position and placed under such conditions as will tend to insure its being uninjured by an explosion. Ventilation by machinery.

*Rule 4.* A station or stations shall be appointed at the entrance to the mine, or to different parts of the mine, as the case may require, and the following provisions shall have effect:— Stations and inspection of condition as to ventilation, &c.

(I) As to inspection before commencing work:—

A competent person or competent persons ~~of not less than two years experience in a coal mine~~, appointed by the owner, agent, or manager for the purpose, not being contractors for getting minerals in the mine shall, within such time immediately before the commencement of each shift, as shall be fixed by special rules made under this Act, inspect each working face every part of the mine situate beyond the station or each of the stations, and in which workmen are to work or pass during that shift, and shall ascertain the condition thereof so far as the presence of gas, ventilation, roof, and sides, and general safety are concerned, and shall mark such working place visited.

No workman shall pass beyond any such station until the part of the mine beyond that station has been so examined and stated by such competent person to be safe.

The inspection shall be made with a locked safety lamp, except in the case of any mine in which inflammable gas has not been found within the preceding twelve months.

A report specifying where noxious or inflammable gas, if any, was found present, the condition of the ventilation, and what defects, if any, in roofs or sides, and what if any other source of danger were or was observed, shall be recorded without delay in a book to be kept at the mine for the purpose, and accessible to the workmen, and such report shall be signed by, and so far as the same does not consist of printed matter shall be in the handwriting of the person who made the inspection.

For the purpose of the foregoing provisions of this rule, two or more shifts succeeding one another without any interval are to be deemed to be one shift.

(II) As to inspection during shifts:—

A similar inspection shall be made in the course of each shift of all parts of the mine in which workmen are to work or pass during that shift, but it shall not be necessary to record a report of the same in a book: ~~unless danger is found to exist~~ Provided that in the case of a mine worked continuously

*Coal Mines Regulation.*

continuously throughout the twenty-four hours by a succession of shifts, the report of one of such inspections shall be recorded in manner above required.

- 5 *Rule 5.* A competent person or competent persons, appointed by the owner, agent, or manager for the purpose, shall, once at least in every twenty-four hours, examine the state of the external parts of the machinery, the state of the guides and conductors in the shafts, and the state of the head gear, ropes, chains, and other similar appliances of the mine which are in actual use both above ground and below ground, and shall once at least in every week examine the state of the shafts by which persons ascend or descend; and shall make a true report of the result of such examination, and every such report shall be recorded without delay in a book to be kept at the mine for the purpose, and shall be signed by the person who made the inspection. Inspection of machinery, &c., above and below ground.
- 10
- 15
- 20 *Rule 6.* Every entrance to any place which is not in actual use or course of working and extension shall be properly fenced across the whole width of the entrance, so as to prevent persons inadvertently entering the same. Fencing of entrances.
- 25 *Rule 7.* If at any time it is found by the person for the time being in charge of the mine, or any part thereof, that by reason of inflammable gases prevailing in the mine, or that part thereof, or of any cause whatever, the mine or that part is dangerous, every workman shall be ~~by such person~~ withdrawn from the mine or part so found dangerous, and a competent person appointed for the purpose shall inspect the mine or part so found dangerous, and if the danger arises from inflammable gas, shall inspect the mine or part with a locked safety lamp; and in every case shall make a true report of the condition of the mine or part; and a workman shall not, except in so far as is necessary for inquiring into the cause of danger or for the removal thereof, or for exploration, be readmitted into the mine, or part so found dangerous, until the same is stated by the person appointed as aforesaid not to be dangerous. Every such report shall be recorded in a book which shall be kept accessible to workmen at the mine for the purpose, and shall be signed by the person who made the inspection. Withdrawal of workmen in case of danger.
- 30
- 35
- 40 *Rule 8.* No lamp or light other than a locked safety lamp shall be allowed or used,— Use of safety lamps in certain places.
- 45 (a) In any place in a mine in which there is likely to be any such quantity of inflammable gas as to render the use of naked lights dangerous; or
- (b) In any working approaching near a place in which there is likely to be an accumulation of inflammable gas.
- And when it is necessary to work the coal in any part of a ventilating district with safety lamps, it shall not be allowable to work the coal with naked lights in another part of the same ventilating district situated between the place where such lamps are being used and the return air-way.
- 50 *Rule 9.* Wherever safety lamps are used, they shall be so constructed that they may be safely carried against the air current ordinarily prevailing in that part of the mine in which the lamps are for the time being in use, even though such current should be inflammable. Construction of safety lamps.
- 55 *Rule 10.* In any mine or part of a mine in which safety lamps are required by this Act, or by the special rules made in pursuance of this Act to be used,— Examination of safety lamps.
- 60 (1) A competent person appointed by the owner, agent, or manager for the purpose shall, either at the surface or at the appointed lamp station, examine every safety lamp immediately

*Coal Mines Regulation.*

immediately before it is taken into the workings for use, and ascertain it to be in safe working order and securely locked; and such lamps shall not be used until they have been so examined and found in safe working order and securely locked.

(II) A safety lamp shall not be unlocked except either at the appointed lamp station or for the purpose of firing a shot, in conformity with the provisions hereinafter contained.

(III) A person, unless he has been appointed either for the purpose of examining safety lamps, or for the purpose of firing shots, shall not have in his possession any contrivance for opening the lock of any safety lamp.

(IV) A person shall not have in his possession any lucifer match or apparatus of any kind for striking a light except within a completely closed chamber attached to the fuse of the shot.

*Rule 11.* Where safety lamps are required to be used, the position of the lamp stations for lighting or relighting the lamps shall not be in the return air. Lamp stations.

*Rule 12.* Any explosive substance shall only be used in the mine below ground as follows:— Use of explosives below ground.

(a) It shall not be stored in the mine.

(b) It shall not be taken into the mine, except in cartridges in a secure case or canister containing not more than five pounds: Provided that on the application of the owner, agent, or manager of any mine the Minister may, by order, exempt such mine from so much of this rule as forbids taking an explosive substance into the mine except in cartridges.

(c) A workman shall not have in use at one time in any one place more than one of such cases or canisters.

(d) In the process of charging or stemming for blasting, a person shall not use or have in his possession any iron or steel pricker, scraper, charger, tamping rod, or stemmer, nor shall coal or coal-dust be used for tamping.

(e) No explosive shall be forcibly pressed into a hole of insufficient size, and when a hole has been charged, the explosive shall not be unrammed; and no hole shall be bored for a charge at a distance of less than six inches from any hole where the charge has missed fire. ~~Provided that no person shall return to a place where such charge has missed fire until a period of eight hours has elapsed from the lighting of the fuse attached to such charge.~~

(f) In any place in which the use of a locked safety lamp is for the time being required by or in pursuance of this Act, or which is dry and dusty, no shot shall be fired except by, or under the direction of, a competent person appointed by the owner, agent, or manager of the mine; and such person shall not fire the shot or allow it to be fired until he has examined both the place itself where the shot is to be fired and all contiguous accessible places of the same seam within a radius of twenty yards, and has found such place safe for firing.

(g) If in any mine, at either of the inspections under rule four recorded last before a shot is to be fired, inflammable gas has been reported to be present in the ventilating district in which the shot is to be fired, the shot shall not be fired,—

(i) Unless a competent person, appointed as aforesaid, has examined the place where gas has been so reported to be

*Coal Mines Regulation.*

- be present, and has found that such gas has been cleared away, and that there is not at or near such place sufficient gas issuing or accumulated to render it unsafe to fire the shot; or
- 5 (II) Unless the explosive employed in firing the shot is so used with water or other contrivance as to prevent it from inflaming gas, or is of such a nature that it cannot inflame gas.
- 10 (h) If the place where a shot is to be fired is dry and dusty, then the shot shall not be fired unless one of the following conditions is observed, that is to say:—
- (i) Unless the place of firing and all contiguous accessible places within a radius of twenty yards therefrom are at the time of firing in a wet state from thorough watering or other treatment equivalent to watering, in all parts where dust is lodged, whether roof, floor, or sides; or
- 15 (II) In the case of places in which watering would injure the roof or floor, unless the explosive is so used with water or other contrivance as to prevent it from inflaming gas or dust, or is of such a nature that it cannot inflame gas or dust.
- (i) If such dry and dusty place is part of a main haulage road, or is a place contiguous thereto, and showing dust adhering to the roof and sides, no shot shall be fired there unless—
- 25 (i) Both the conditions mentioned in sub-head (h) have been observed; or
- (II) Unless such one of the conditions mentioned in sub-head (h) as may be applicable to the particular place has been observed, and moreover all workmen have been removed from the seam in which the shot is to be fired, and from all seams communicating with the shaft on the same level, except the men engaged in firing the shot, and such other persons, not exceeding ten, as are necessarily employed in attending to the ventilating furnaces, steam-boilers, engines, machinery, winding apparatus signals, or horses, or in inspecting the mine:
- 30 (k) In this Act “ventilating district” means such part of a seam as has an independent intake commencing from a main intake air-course, and an independent return air-way terminating at a main return air-course; and “main haulage road” means a road which has been, or for the time being is, in use for moving trams by steam or other mechanical power.
- 35 (l) Where a seam of a mine is not divided into separate ventilating districts the provisions in this Act relating to ventilating districts shall be read as though the word “seam” were substituted for the words “ventilating district.”
- 40
- 45 *Rule 13.* Where a place is likely to contain a dangerous accumulation of water, the working approaching that place shall not at any point within forty yards of that place exceed eight feet in width, and there shall be constantly kept at a sufficient distance, not being less than five yards in advance, at least one bore-hole, near the centre of the working, and sufficient flank bore-holes on each side.
- 50 *Rule 14.* Every underground plane on which persons travel, which is self-acting or worked by an engine, windlass, or gin, shall be provided (if exceeding thirty yards in length) with some proper means of communicating distinct and definite
- 55 Water and bore-holes.
- Signalling and man-holes for travelling planes worked by machinery.

---

*Coal Mines Regulation.*

---

- definite signals between the stopping places and the ends of the plane, and shall be provided in every case with sufficient man-holes for places of refuge, at intervals of not more than twenty yards, and of not less than six feet high, three feet wide, and four feet deep, or if there is not room for a person to stand between the side of a tub and the side of the plane, then (unless the tubs are moved by an endless chain or rope) at intervals of not more than ten yards.
- 5
- 10 *Rule 15.* Every road on which persons travel underground where the load is drawn by a horse or other animal shall be provided, at intervals of not more than fifty yards, with sufficient man-holes, or with places of refuge, and every such place of refuge shall be ~~six feet high, three feet wide, and four feet deep~~ of sufficient length, and at least three feet in width between the waggons running on the road and the side of such road. There shall be at least two proper travelling ways into every steam-engine room and boiler gallery. Man-holes for other travelling roads.
- 15
- 20 *Rule 16.* Every man-hole and every place of refuge shall be constantly kept clear, and no person shall place anything in any such man-hole or place of refuge. Man-holes to be kept clear.
- 25 *Rule 17.* Every travelling road on which a horse or other draught animal is used under-ground shall be of sufficient dimensions to allow the horse or other animal to pass without rubbing against the roof or timbering. Dimensions of travelling roads.
- 30 *Rule 18.* The top of every shaft which for the time being is out of use, or used only as an air-shaft, shall be and shall be kept securely fenced. Fencing of shafts.
- 35 *Rule 19.* Every shaft in course of sinking shall be provided with a trolley to run over the pit's mouth and receive the load when brought to the surface. Such trolley to be large enough to ~~cover the opening at the pit-top.~~ Trolley over pit mouth.
- 40 *Rule 20.* The top and all entrances between the top and bottom, including the sump, if any, of every working, ventilating, or pumping shaft shall be properly fenced, but this shall not be taken to forbid the temporary removal of the fence for the purpose of repairs or other operations, if proper precautions are used. Fencing of entrances to shafts.
- 45 *Rule 21.* Where the natural strata are not safe, every working or pumping shaft shall be securely cased, lined, or otherwise made secure. ~~Every shaft in course of sinking shall be kept clear of all noxious gases by a fan or some other appliance.~~ Securing of shafts. Sinking pit to be cleared of gas.
- 50 *Rule 22.* The roof and sides of every travelling road and working place shall be made secure, and a person shall not, unless appointed for the purpose of exploring or repairing, travel or work in any such travelling road or working place which is not made so secure. Securing of roofs and sides.
- 55 *Rule 23.* Where the timbering of the working places is done by the workmen employed therein, suitable timber shall be provided at the working place, gate end, pass bye, siding, or other similar place in the mine convenient to the workmen, and the distance between the sprags or holing props where they are required shall not exceed six feet or such less distance as may be ordered by the owner, agent, or manager. Timbering.
- Rule 24.* Where there is a downcast and furnace shaft to the same seam, and both such shafts are provided with apparatus in use for raising and lowering persons, every person employed in the mine shall, on giving reasonable notice, have the option of using the downcast shaft. Option of using downcast shaft.

*Rule*

*Coal Mines Regulation.*

- Rule 25.** The coal shall not be wrought under any proclaimed or Coal not to be wrought under roads  
made road without the sanction, in writing, of the Minister,  
but headings may be driven under any such road for the  
purpose of connecting the workings, or of working the coal  
on either side thereof, but all such headings shall be in such  
positions, of such dimensions, and so supported as the  
Inspector shall, by writing under his hand, direct.
- Rule 24.** In any mine which is usually entered by means of Attendance of  
machinery a competent male person not less than twenty-two engineman.  
years of age shall be appointed for the purpose of working  
the machinery which is employed in lowering and raising  
persons therein, and shall attend for that purpose during the  
whole time that any person is below ground in the mine.
- Where any shaft, plane, or level is used for the purpose  
of communication from one part to another part of a mine,  
and persons are taken up or down or along such shaft, plane,  
or level by means of any engine, windlass, or gin driven or  
worked by steam or any mechanical power, or by an animal,  
or by manual labour, the person in charge of such engine,  
windlass, or gin, or of any part of the machinery, ropes,  
chains, or tackle connected therewith must be a competent  
male person not less than eighteen years of age.
- Where the machinery is worked by an animal, the  
person under whose direction the driver of the animal acts  
shall for the purpose of this rule be deemed to be the person  
in charge of the machinery.
- Rule 26.** **25.** Every working shaft used for the purpose of drawing Means of signalling  
minerals or for the lowering or raising of persons shall, for working shafts.  
if exceeding fifty yards in depth, and not exempted in  
writing by the inspector of the district, be provided with  
guides and some proper means of communicating distinct and  
definite signals from the bottom of the shaft, and from every  
entrance for the time being in use between the surface and  
the bottom of the shaft to the surface, and from the surface  
to the bottom of the shaft and to every entrance for the time  
being in use between the surface, and the bottom of the shaft.
- Rule 27.** **26.** If in any mine the winding apparatus is not provided Overwinding.  
with some automatic contrivance to prevent overwinding,  
then the cage when men are being raised shall not be wound  
up at a speed exceeding three miles an hour, after the cage  
has reached a point in the shaft to be fixed by the special rules.
- Rule 28.** **27.** A sufficient cover overhead shall be used for every cage Cover overhead.  
or tub employed in lowering or raising persons in any  
working shaft, except where the cage or tub is worked by a  
windlass, or where persons are employed at work in the shaft,  
or where a written exemption is given by the inspector of  
the district.
- Rule 29.** **28.** A single-linked chain shall not be used for lowering or Chains.  
raising persons in any working shaft or plane, except for the  
short coupling chain attached to the cage or tub.
- Rule 30.** **29.** There shall be on the drum of every machine used for Prevention of rope  
lowering or raising persons, such flanges or horns, and also, slipping on drum.  
if the drum is conical, such other appliances as may be  
sufficient to prevent the rope from slipping.
- Rule 31.** **30.** There shall be attached to every machine worked by Break and indicator.  
steam, water, or mechanical power, and used for lowering or  
raising persons, an adequate break or breaks and a proper  
indicator (in addition to any mark on the rope) showing to  
the

*Coal Mines Regulation.*

the person who works the machine the position of the cage or tub in the shaft. If the drum is not on the crank shaft there shall be an adequate break on the drum shaft.

5 *Rule 32.* 31. Every fly-wheel and all exposed and dangerous parts of Fencing machinery. the machinery used in or about the mine shall be and shall be kept securely fenced.

10 *Rule 33.* 32. Each steam boiler, whether separate or one of a range, Safety-valves and gauges for boilers. shall have attached to it a proper safety-valve and also a proper steam-gauge and water-gauge to show respectively the pressure of steam and the height of water in each boiler.

15 *Rule 34.* At any mine where a boiler is used for generating steam, Examination of boilers. the owner or manager shall at least once in every six months cause every such boiler to be thoroughly examined and tested by a competent person, who shall, immediately after the completion of such examination and test, enter in a book to be kept at the mine for that purpose a full and true report of the result of such examination and test, and of the state of every boiler so examined and tested, and every such report shall be signed by the person making it, and shall bear date of the day of entry, and a copy of such report shall be forth-  
with sent to the Inspector.

20 *Rule 35.* 33. A barometer and thermometer shall be placed above Barometer, &c. ground in a conspicuous position near the entrance to the mine.

25 *Rule 36.* 34. Where persons are employed underground ambulances Stretchers. or stretchers, with splints and bandages, shall be kept at the mine ready for immediate use in case of accident.

30 *Rule 37.* 35. No person shall wilfully damage, or without proper Wilful damage. authority remove or render useless, any fence, fencing, manhole, place of refuge, casing, lining, guide, means of signalling, signal, cover, chain, flange, horn, break, indicator, steam-gauge, water-gauge, safety-valve, or other appliance or thing provided in any mine in compliance with this Act.

35 *Rule 38.* 36. Every person shall observe such directions with respect Observance of directions. to working as may be given to him with a view to comply with this Act or the special rules in force in the mine.

40 *Rule 39.* 37. The books mentioned in these rules shall be provided Books and copies thereof. by the owner, agent, or manager, and the books, or a correct copy thereof, shall be kept at the office at the mine, and any inspector under this Act, and any person employed in the mine or any one having the written authority of any inspector or person so employed, may at all reasonable times inspect and take copies of and extracts from any such books; but nothing in these rules shall be construed to impose the obligation of keeping any such book or a copy thereof for more than twelve months after the book has ceased to be used for entries therein under this Act. Any report by this Act required to be recorded in a book may be partly in print (including lithograph) and partly in writing.

50 *Rule 40.* 38. The persons employed in a mine may from time to time Periodical inspection on behalf of workmen. appoint two of their number or any two persons not being mining engineers who are practical working miners to inspect the mine at their own cost, and the persons so appointed shall be allowed once at least in every month, accompanied, if the owner, agent, or manager of the mine thinks fit, by himself or one or more officers of the mine, to go to every part of the mine, and to inspect the shafts, levels, planes, working places, return air-ways, ventilating apparatus, old workings, and machinery. Every facility shall be afforded  
by

*Coal Mines Regulation.*

- by the owner, agent, and manager, and all persons in the mine for the purpose of the inspection, and the persons appointed shall forthwith make a true report of the result of the inspection, and that report shall be recorded in a book to be kept at the mine for the purpose, and shall be signed by the persons who made the inspection, and if the report states the existence or apprehended existence of any danger, the owner, agent, or manager shall forthwith cause a true copy of the report to be sent to the inspector of the district.
- 5
- 10 **Rule 41.** No person not now employed as a coal getter shall be allowed to work alone as a coal getter in the face of the workings until he has had two years' experience of such work under the supervision of skilled workmen, or unless he shall have been previously employed for two years in or about the face of the workings of a mine.
- 15 **Rule 42.** Where the thickness of cover over the coal seam does not exceed eight hundred feet. Person not to be employed in coal getting without experience.
- 20 In the case of working coal by the pillar and stall system under river or tidal or ocean waters the workings shall be laid off systematically and carefully, and the size of the pillars shall be such as will afford ample support, after exposure to the crumbling effect of the air over many years, and shall not be less than twice the width of the bords or coal wrought out between such pillars. The bords on one side of the headings, levels, or cross-cuts, shall, unless prevented by rolls or faults, be driven opposite the bord pillars on the other side of the heading, level, or cross-cut. The minimum width of the pillars of coal shall be eight yards, and the maximum width of the bords or stalls six yards. And in no case shall the pillars under ocean or tidal waters be removed.
- 25
- 30 **Rule 43.** Every underground main road in a mine, which road is used for the purpose of haulage or for persons travelling therein, shall not exceed sixteen feet in width. And on each side of such road, other than a cross-drift or headway driven across bords in direction of the cleat or on the end, a barrier of coal or stone shall be left of not less than fourteen yards wide. No heading or bord through the barrier of coal shall exceed three yards wide, and such heading or bord shall not, without the express sanction as aforesaid, be less than ten yards apart: Provided that if any cross-drift or headway as aforesaid, or any heading on each side of which no barrier of coal shall have been left be at any time converted into or used as a main road sufficient support shall forthwith be constructed on each side thereof.
- 35
- 40
- 45 **Rule 44.** In the case of working coal under tidal waters or rivers, from one road of every pair of "winning off" or leading headings or levels (which shall not except for sidings exceed eight feet in width), and from the face of every bord a bore-hole shall be kept going not less than twelve feet in advance, for the purpose of foretelling the presence of any fissure, open joint, fault, or otherwise, and in the case of working under the ocean or tidal waters every "winning off" or leading headings or levels shall be driven at least one hundred yards in advance of the working bords, and shall not exceed eight feet in width except for sidings. Width of winning headings under tidal waters, &c.
- 50
- 55 **Rule 45.** Boreholes for the purpose of proving the thickness of the alluvial deposit shall be put down by the owner or manager on all lands fronting the ocean, tidal waters, or rivers where the thickness of the strata and deposits which overlie the Thickness of strata near ocean, &c., to be ascertained by boring
- the

*Coal Mines Regulation.*

- the coal worked or about to be worked is less than two hundred feet. Such boreholes, at distances not exceeding one hundred yards apart, shall be put down from the surface through the alluvial deposit to the rock, and to the rise of the coal seam worked. An account of the strata and deposits so bored through shall be furnished by the owner or manager to the Inspector when the boring has reached the rock.
- 5
- Rule 46.* In mines not under river or ocean or tidal waters worked on the pillar and stall system, where it is intended to remove the pillars, the stalls or bords shall not exceed in width eight yards, and the pillars shall not be less than eight yards wide. Where it is not proposed to remove the pillars they shall be of such dimensions as shall be necessary to support the roof. In mines worked on the long-wall system substantial supports shall be erected sufficient to protect the workmen. In mines worked on the Welsh bords or double-stall systems good, substantial, and sufficient pack walls shall be built, and a sufficient number of props set on each side of the pack walls.
- 10
- 15
- 20
51. If any owner or manager object to any of the following general rules, namely, general rule numbers forty-two, forty-three, forty-four, forty-five, and forty-six, being enforced or applied to a coal mine or colliery, he may give notice thereof to the Minister setting out his objections and the reasons therefor, and upon receipt of such notice
- 25
- the Minister may allow or disallow such objections or any of them. If the Minister allow such objections or any of them, he may order that the coal mine or colliery be exempt from the operation of any such rule or rules, or he may order that, so far as such coal mine or colliery is concerned, the provisions of any such general rule may be modified or
- 30
- varied. If the Minister disallow the objections, and the owner or manager do not withdraw such objections, the matter shall be referred to arbitration, and the arbitrators may make any order which under this section the Minister could make.
- 35
52. 48. Every person who contravenes or does not comply with any of the general rules in this Act shall be guilty of an offence against this Act; and in the event of any contravention of or non-compliance with any of the said general rules in the case of any mine to which this Act applies, by any person whomsoever, the owner, agent, and manager shall each be guilty of an offence against this Act, unless he
- 40
- proves that he had taken all reasonable means, by publishing and to the best of his power enforcing the said rules as regulations for the working of the mine, to prevent such contravention or non-compliance: ~~Provided that nothing contained in the general rules in regard to barriers of coal, or the size of bords, stalls, or pillars, shall~~
- 45
- be construed to affect or apply to any underground works constructed or completed before this Act comes into operation, nor prevent the removal of pillars of coal (in mines not under the ocean or river or tidal waters) which shall, prior to this Act coming into operation, have been left of a less size or thickness than herein prescribed, provided
- 50
- that in the removal of such pillars all necessary precautions be taken to prevent injury to the miners.

*Special Rules.*

53. 49. (1) There shall be established in every mine such rules (referred to in this Act as special rules) for the conduct and guidance
- 55
- of the persons acting in the management of such mine or employed in or about the mine as, under the particular state and circumstances of such

*Coal Mines Regulation.*

such mine, may appear best calculated to prevent dangerous accidents, and to provide for the safety, convenience, and proper discipline of the persons employed in or about the mine.

(II) Such special rules, when established, shall be signed in duplicate by the inspector who is inspector of the district at the time the rules are established, and shall be observed in and about every such mine (including any extension thereof) in the same manner as if they were enacted in this Act.

(III) If any person who is bound to observe the special rules established for any mine, acts in contravention of or fails to comply with any of them, he shall be guilty of an offence against this Act, and also the owner, agent, and manager of such mine shall each be guilty of an offence against this Act, unless he proves that he had taken all reasonable means, by publishing and to the best of his power enforcing the rules as regulations for the working of the mine, so as to prevent such contravention or non-compliance.

54. 50. (1) The owner, agent, or manager of every mine (~~where no special rules are in force~~) Establishment of new special rules. shall frame and transmit to the inspector of the district, for approval by the Minister, special rules for the mine within three months after the commencement of this Act, or within three months after the commencement (if subsequent to the commencement of this Act) of any working for the purpose of opening a new mine or of renewing the working of an old mine.

(II) The proposed special rules together with a printed or written notice specifying that any objection to the rules on the ground of anything contained therein or omitted therefrom may be sent by any of the persons employed in the mine to the inspector of the district, at his address, stated in the notice, shall, during not less than two weeks before the rules are transmitted to the inspector, be posted up in like manner as is provided in this Act respecting the publication of special rules for the information of persons employed in the mine; and a certificate that the rules and notice have been so posted up shall be sent to the inspector with two copies of the rules signed by the person sending the same.

(III) If the rules are not objected to by the Minister within forty days after their receipt by the inspector, they shall be established.

55. 51. (1) If the Minister is of opinion that the proposed special rules so transmitted, or any of them, do not sufficiently provide for the prevention of dangerous accidents in the mine, or for the safety or convenience of the persons employed in or about the mine, or are unreasonable, he may, within forty days after the rules are received by the inspector, object to the rules, and propose to the owner, agent, or manager, in writing, any modifications in the rules by way either of omission, alteration, substitution, or addition. The Minister may object to special rules.

(II) If the owner, agent, or manager does not, within twenty days after the modifications proposed by the Minister are received by him, object in writing to them, the proposed special rules, with those modifications, shall be established.

(III) If the owner, agent, or manager sends his objection in writing within the said twenty days to the Minister, the matter shall be referred to arbitration under this Act, and the date of the receipt of the objection by the Minister shall be deemed to be the date of the reference, and the rules shall be established as settled by an award on arbitration.

56. 52. (1) After special rules are established under this Act in any mine, the owner, agent, or manager of the mine may, from time to time, propose in writing to the inspector of the district, for the approval of the Minister, any amendment of the rules or any new special rules; Amendment of special rules.

*Coal Mines Regulation.*

and the provisions of this Act with respect to the original special rules shall apply to all such amendments and new rules in like manner, as nearly as may be, as they apply to the original rules.

(II) The Minister may from time to time propose in writing to the owner, agent, or manager of the mine any new special rules, or any amendment of the special rules; and the provisions of this Act with respect to a proposal of the Minister for modifying the special rules transmitted by the owner, agent, or manager of a mine shall apply to all such new special rules and amendments in like manner, as nearly as may be, as they apply to the proposal.

57- 53. If the owner, agent, or manager of any mine makes any false statement with respect to the posting up of the rules and notices, he shall be guilty of an offence against this Act; and if special rules for any mine are not transmitted within the time limited by this Act to the inspector for the approval of the Minister, the owner, agent, and manager of such mine shall each be guilty of an offence against this Act, unless he proves that he had taken all reasonable means, by enforcing to the best of his power the provisions of this Act, to secure the transmission of the rules.

58- 54. An inspector under this Act shall, when required, certify a copy which is shown to his satisfaction to be a true copy of any special rules which, for the time being, are established under this Act in any mine, and a copy so certified shall be evidence (but not to the exclusion of other proof) of such special rules, and of the fact that they are duly established under this Act and have been signed by the inspector.

59. The Governor, with the advice of the Executive Council, may make and publish in the *Gazette* a set or sets of special rules, and thereafter the rules so made and published shall be deemed the special rules of every mine to which this Act applies and in respect of which no special rules shall be in force: Provided that upon special rules being established for any mine, the special rules made by the Governor as aforesaid shall cease to apply to such mine.

60- 55. The special rules which at the commencement of this Act are in force under the Act hereby repealed in any mine shall continue to be the special rules in such mine until special rules are established under this Act for such mine, and while they so continue shall be of the same force as if they were established under this Act.

*Publication of abstract of Act and of Special Rules.*

61- 56. For the purpose of making known the provisions of this Act and the special rules to all persons employed in and about each mine, an abstract of this Act supplied, on the application of the owner, agent, or manager of the mine, by the inspector of the district on behalf of the Minister, and a correct copy of all the special rules shall be published as follows:—

(I) The owner, agent, or manager of the mine shall cause the abstract and copy of the rules, with the name of the mine and the name and address of the inspector of the district, and the name of the owner or agent and of the manager appended thereto, to be posted up, in legible characters, in some conspicuous place at or near the mine, where they may be conveniently read by the persons employed; and so often as the same become defaced, obliterated, or destroyed, shall cause them to be renewed with all reasonable despatch.

(II) The owner, agent, or manager shall supply a printed copy of the abstract and the special rules gratis to each person employed

*Coal Mines Regulation.*

employed in or about the mine who applies for a copy at the office at which the persons immediately employed by the owner, agent, or manager are paid.

5 (III) Every copy of the special rules shall be kept distinct from any rules which depend only on the contract between the employer and employed.

In the event of any non-compliance with the provisions of this section by any person whomsoever, the owner, agent, and manager shall each be guilty of an offence against this Act; but the owner, agent, or  
10 manager of such mine shall not be deemed guilty if he proves that he had taken all reasonable means, by enforcing, to the best of his power, the observance of this section to prevent such non-compliance.

62. 57. Every person who wilfully pulls down, injures, or defaces  
15 any abstract, notice, proposed special rules, or special rules, when posted up in pursuance of the provisions of this Act, or any notice posted up in pursuance of the special rules, shall be guilty of an offence against this Act. Pulling down or defacing notices

## PART III.

*Supplemental.*

20

*Legal Proceedings.*

63. 58. (I) Every person employed in or about a mine other than  
an owner, agent, or manager, who is guilty of any act or omission,  
which in the case of an owner, agent, or manager would be an  
offence against this Act, shall be deemed to be guilty of an offence  
25 against this Act. Penalty for offence against Act.

(II) Every person who is guilty of an offence against this Act for which a penalty is not expressly prescribed shall be liable to a fine not exceeding, if he is an owner, agent, or manager, or under manager, twenty pounds, and if he is any other person, two pounds  
30 for each offence; and if an inspector has given written notice of any such offence, to a further fine not exceeding ~~five pounds~~ one pound for every day after such notice that such offence continues to be committed.

64. 59. Where a person who is an owner, agent, manager, or under  
manager of, or a person employed in or about a mine is guilty of any  
35 offence against this Act which, in the opinion of the court that tries the case, is one which was reasonably calculated to endanger the the safety of the persons employed in or about the mine, or to cause serious personal injury to any of such persons, or to cause a dangerous accident, and was committed wilfully by the personal act, personal  
40 default, or personal negligence of the person accused, such person shall be liable, if the court is of opinion that a fine will not meet the circumstances of the case, to imprisonment with or without hard labour for a period not exceeding three months. Imprisonment for wilful neglect endangering life or limb.

65. 60. (I) All offences under this Act not declared to be mis-  
45 demeanours, and all fines under this Act, and all moneys and costs by this Act directed to be recovered as fines, may be prosecuted and recovered before a Stipendiary or Police Magistrate or any two Justices of the Peace in Petty Sessions. Summary proceedings for offences, fines, &c.

(II) Proceedings for the removal of a check weigher shall  
50 be deemed to be a matter on which Justices in Petty Sessions have authority by law to make an order; and summary orders under this Act may be made on complaint before Justices in Petty Sessions.

*Coal Mines Regulation.*

66. 61. In every part of the Colony the following provisions shall have effect:—

General provisions as to summary proceedings.

(i) Any complaint or information made or laid in pursuance of this Act shall (save as otherwise expressly provided by this Act) be made or laid within three months from the time when the matter of the complaint or information arose.

(ii) Any person charged with any offence under this Act may, if he thinks fit, be sworn and examined as an ordinary witness in the case.

(iii) The court shall, if required by either party, cause minutes of the evidence to be taken and preserved.

67. 62. If any person feels aggrieved by any conviction made by Justices in Petty Sessions on determining any information under this Act by which conviction, imprisonment, or a fine amounting to or exceeding one half the maximum fine is adjudged, he may appeal therefrom to a Court of Quarter Sessions in manner provided by section three of the Act of Council fifth William the Fourth, number twenty-two.

Appeal to Quarter Sessions.

68. 63. If it appears that a boy was employed on the representation of his parent or guardian that he was of the age at which his employment would not be in contravention of this Act, and under the belief in good faith that he was of that age, or that a person has worked alone as a coal-getter on his representation that he has had two years' experience of such work under the supervision of skilled workmen, or that he has been previously employed for two years in or about the face of the workings of a mine, and under the belief in good faith that he has had such experience or has been so previously employed, the owner, agent, or manager of the mine and employer shall be exempted from any penalty, and the parent or guardian or the person who has so worked alone, as the case may be, shall for the misrepresentation be deemed guilty of an offence against this Act.

Liability for misrepresentation as to age, &c.

69. 64. No prosecution shall be instituted against the owner, agent, manager, or under-manager or employee of a mine for any offence under this Act, not committed personally by such owner, agent, manager, or under-manager, or employee which can be prosecuted before Justices in Petty Sessions, except by an inspector or with the consent in writing of the Minister; and in the case of any offence of which the owner, agent, manager, or under-manager or employee of a mine is not guilty if he proves that he had taken all reasonable means to prevent the commission thereof, an inspector shall not institute any prosecution against such owner, agent, manager, or under-manager or employee if satisfied that he had taken such reasonable means as aforesaid. No prosecution shall be instituted against a coroner for any offence under this Act, except with the consent in writing of the Minister.

Prosecution of owners, agents, managers, &c.

70. 65. Where the owner, agent, or manager of a mine has taken proceedings under this Act against any person employed in or about a mine in respect of an offence committed under this Act, he shall within twenty-one days after the hearing of the case, report the result thereof to the inspector of the district.

Report of result of proceedings against workmen.

71. 66. (i) Nothing in this Act shall prevent any person from being indicted or liable under any other Act or otherwise to any other or higher penalty or punishment than is provided for any offence by this Act, so, however, that no person be punished twice for the same offence.

Saving for proceedings under other Acts.

(ii) If the Justices before whom a person is charged with an offence under this Act, think that proceedings ought to be taken against such person for such offence under any other Act or otherwise, they may adjourn the case to enable such proceedings to be taken.

*Coal Mines Regulation.*

72- 67. A person who is the owner, agent, or manager of any mine, or a miner or miner's agent, or the father, son, or brother, or father-in-law, son-in-law, or brother-in-law, of such owner, agent, or manager, or of a miner or miner's agent, or who is a director of a company being the owner of a mine, shall not, except with the consent in writing of both parties to the case, sit in Petty Sessions or adjudicate in respect of any offence under this Act.

Owner of mine, &c., not to act as Justice, &c., in proceedings under this Act.

73- 68. Where a fine is imposed under this Act for neglecting to send a notice of any explosion or accident, or for any offence against this Act which has occasioned loss of life or personal injury, the Minister may (if he thinks fit) direct such fine to be paid to or distributed among the persons injured, and the relatives of any persons whose death may have been occasioned by the explosion, accident, or offence, or among some of them: Provided that:—

Application of fines.

15 (I) Such persons did not in his opinion occasion or contribute to occasion the explosion or accident, and did not commit and were not parties to committing the offence;

20 (II) The fact of the payment or distribution shall not in any way affect or be receivable as evidence in any legal proceeding relative to or consequential on the explosion, accident, or offence.

Save as aforesaid all fines recovered under this Act shall be paid into the Treasury and carried to the Consolidated Revenue Fund.

*Miscellaneous.*

25 74- 69. If any question arises, otherwise than in legal proceedings, whether a mine is a mine to which this Act applies, the question shall be referred to the Minister, whose decision thereon shall be final.

Decision of question whether a mine is under this Act.

30 75- 70. Any order of or exemption granted by the Minister under this Act may be made, and from time to time revoked or altered by the Minister, either unconditionally or subject to such conditions as he may see fit, and shall be signed by the Minister, or Under Secretary.

Powers of Minister as to making and revoking orders.

35 76. The special rules or special sinking rules which at the commencement of this Act are in force in any mine under any Act hereby repealed shall continue to be the special rules in such mine until superseded by rules established under this Act.

Continuance of existing special rules.

40 77- 71. Upon the affidavit of any person taken before any Justice of the Peace or Commissioner of the Supreme Court for taking affidavits claiming to be legally or equitably interested in any mine or in any land adjoining or near to any other mine, that the owner of such last-mentioned mine is or is by the person making such affidavit believed to be encroached upon such first-mentioned mine or land, the Minister may, by writing under his hand, authorise the examiner or an inspector, together with a mining surveyor or experienced miner, to enter upon such last-mentioned mine or land for the purpose of

45 ascertaining whether any such encroachment has been made, and if so the extent thereof. But before granting such authority the Minister shall require the person making or lodging the affidavit to deposit such a sum of money not exceeding one hundred pounds as shall be necessary to cover the cost of such inspection. The persons so

50 authorised may thereupon enter on the mine or land described in such order and descend any shaft or enter any mine, and for such purpose use the engines and other machinery ordinarily employed for that purpose by the persons whose shaft or mine shall be descended or entered, and make such plans and sections of the mine or land entered upon and

55 of any drives or other works therein as shall be necessary for the purpose aforesaid; and the owner or agent of the mine to be entered upon shall render all necessary assistance to the person so authorised.

Entry on adjoining mine, &c., to ascertain whether owner, &c., is encroaching.

What may be done under such authority.

And

*Coal Mines Regulation.*

And every such examiner, inspector, or surveyor, or miner shall before entering on such mine or land make a statutory declaration before any person authorised to take the same that he will not (except as a witness in a Court of Justice) without the consent in writing of the owner of the mine or land to be entered upon, divulge or cause to be divulged to any person whomsoever any information obtained upon or by such entry save only as to whether such owner is encroaching on such first-mentioned mine or land; and every person who shall act contrary to such declaration, and any owner or agent who shall refuse such assistance as shall be necessary to enable the persons authorised by the Minister to descend the shaft or enter and examine the mine, shall forfeit and pay a sum not exceeding ten pounds: Provided always that the Minister may out of the sum deposited as aforesaid defray the cost of such inspection, and if such owner or agent render such assistance as shall be necessary for the purposes aforesaid, and if there be no encroachment, may out of such sum award to such owner compensation for any loss or expense to which he may be put by reason of such inspection.

Prior statutory  
declaration required.

Penalty.

78. 72. In this Act, unless the context otherwise requires :—
- “Mine” includes every shaft in the course of being sunk, and every level and inclined plane in the course of being driven, and all the shafts, levels, planes, works, tramways, and sidings, both below ground and above ground, in and adjacent to and belonging to the mine.
- “Shaft” includes pit.
- “Large coal” means all coal passing over a three-quarter inch screen.
- “Plan” includes a correct copy or tracing of any original plan.
- “Owner,” when used in relation to any mine, means any person or body corporate who is the immediate proprietor or lessee, or occupier of any mine, or of any part thereof, and does not include a person or body corporate who merely receives a royalty, rent, or fine from a mine, or is merely the proprietor of a mine, subject to any lease, grant, or license for the working thereof, or is merely the owner of the soil, and not interested in the minerals of the mine; but any contractor for the working of any mine, or any part thereof, shall be subject to this Act in like manner as if he were an owner, but so as not to exempt the owner from any liability.
- “Inspector”—An Inspector of Colliceries referred to in or appointed under section four hereof **Part II of this Act.**
- “Agent,” when used in relation to any mine, means, any person appointed as the representative of the owner in respect of any mine, or of any part thereof, and as such superior to a manager appointed in pursuance of this Act.
- “The Minister” means the Secretary for Mines.
- “Under Secretary” and “Assistant Under Secretary”—mean respectively means the Under Secretary and Assistant Under-Secretary of the Department of Mines.
- “The Treasury” means the Colonial Treasury.
- “Boy” means a male under the age of sixteen years.

Interpretation of  
terms.

*Transitory Provisions and Repeal.*

79. 73. All orders made by the Minister under the Act repealed by this Act, which are in force immediately before the commencement of this Act, shall be deemed to have been made under this Act.

Existing orders  
continued.

80. 74. Any enactment or document referring to the Act repealed by this Act, or to any enactment thereof, shall be construed to refer to this Act, and to the corresponding enactments thereof.

Construction of  
references to repealed  
Act.

*Coal Mines Regulation.*

§1. 75. The Act thirty-ninth Victoria number thirty-one is hereby <sup>Repeal of Act.</sup> repealed: Provided that this repeal shall not affect any exemption granted, or other thing done or suffered before the commencement of this Act; and all offences committed and penalties incurred and proceedings commenced before the commencement of this Act may be punished, recovered, continued, and completed in the same manner as if this Act had not passed.

SCHEDULES.

SCHEDULE I.

Section 6.

10 Proceedings of Board for Examinations.

1. The Board shall meet for the despatch of business, and shall from time to time make such regulations with respect to the summoning, notice, place, management, and adjournment of such meetings, and generally with respect to the transaction and management of business, including the quorum at meetings of the Board, as they think fit, subject to the following conditions:—

- 15 (a) An extraordinary meeting may be held at any time on the written requisition of three members of the Board addressed to the Chairman.
- (b) The quorum to be fixed by the Board shall consist of not less than three members.
- 20 (c) Every question shall be decided by a majority of votes of the members present and voting on that question.
- (d) The names of the members present as well as those voting upon each question shall be recorded.
- 25 (e) No business shall be transacted unless notice in writing of such business has been sent to every member of the Board seven days at least before the meeting.

2. The Board shall from time to time appoint some person to be Chairman and one other person to be Vice-Chairman.

3. If at any meeting the Chairman is not present at the time appointed for holding the same, the Vice-Chairman shall be the Chairman of the meeting; and if neither the Chairman nor Vice-Chairman shall be present, then the members present shall choose some one of their number to be Chairman of such meeting.

4. In case of an equality of votes at any meeting, the Chairman for the time being of such meeting shall have a second or casting vote.

5. The appointment of an examiner may be made by a minute of the Board signed by the Chairman.

6. The Board shall keep minutes of their proceedings, which may be inspected or copied by the Minister or any person authorised by him to inspect or copy the same.

TAKEN BEFORE

## THE SELECT COMMITTEE

ON THE

## COAL-MINES REGULATION BILL.

WEDNESDAY, 18 OCTOBER, 1893.

Present:—

HON. A. H. JACOB IN THE CHAIR.

HON. E. VICKERY,		HON. W. LAIDLEY,
HON. W. H. PIGOTT,		HON. H. E. KATER,
HON. A. H. JACOB.		

James R. M. Robertson, Esq., M.D., called in, sworn, and examined:—

1. *Chairman.*] Do you wish to give any further evidence? Nothing more than to insist upon the objections to the general features of the Bill to which I have referred already in my evidence, especially with reference to the sanitary clauses, the ventilation clauses, and all the consequential clauses, limiting the number of men and providing for the modes of working.
2. And you confirm all your evidence? Yes; I confirm all my evidence, and for the sake of conciseness I have written down the general features which I wish particularly to insist upon.
3. Then you hand in that document? Yes.

J. R. M.  
Robertson,  
Esq., M.D.

18 Oct., 1893

## COAL MINES BILL.

As submitted to the Select Committee of the Legislative Council, this Bill contains many objectionable features.

It contains clauses that will impose costly and embarrassing conditions upon owners that will increase the difficulty of conducting mines; some that will increase the danger of the operations, while no real advantage to the employees will be obtained.

The provision to commit one industry to a legal eight-hours' day is an experimental piece of legislation uncalled for and unnecessary. If persisted in it will lead to serious consequences to an industry at present on the threshold of collapse.

Some of the clauses are complex—ambiguous, and give unheard of administrative if not managerial functions upon irresponsible inspectors, who may not possess or have given evidence of their aptitude as such. Others are extremely dangerous, in so far as they prescribe details and a *modus operandi* on the most important matters connected with mining, and anticipate conditions that may not and actually do not exist, and that, being unknown, cannot be foreseen; others practically prevent managers from taking advantage of scientific discovery during the currency of the Act.

The general tenor and arrangement of the proposed Bill give indisputable evidence of the defective knowledge of the theory and practice of mining of those who advised or drafted the Bill. The state of their mining knowledge is much behind modern practice.

Without redeeming features in the way of providing substantial benefits not already possessed by employees, the proposed Bill abounds with irritating details, restrictive clauses that are unlikely to prove practicable, and would have an injurious effect upon management.

Respecting the sanitary clauses. Those dealing with the ventilation of mines are particularly unfortunate, and subversive alike of good management and of safety. They do not bear the impress of scientific attainments.

J. R. M.  
Robertson,  
Esq., M.D.  
18 Oct., 1898.

As I have explained, the blot of the existing Act (and it is perpetuated in the proposed measure) is the fatal absurdity of (1st) interpreting the meaning of the words "adequate" as applied to ventilation; (2nd), of limiting the number of men to be employed in a district; (3rd), in specifying the distance apart of cut-throughs, or in any way referring to our method of working to the exclusion of all others.

With respect to the 1st. An adequate amount of ventilation is said to mean 100 cubic feet per man per minute, but inasmuch as the atmosphere and the condition of a mine is never and can never be stable or constant, but ever varying, and as safety is attainable in no two or even the same mine by the same volume of ventilation, the maximum of insecurity, it will be perceived, may be assured to workmen who pin their faith on this unwise provision.

In one mine or part of a mine 100 cubic feet may be adequate, while in another 1,000 cubic feet might be insufficient. Such limitations and provisions are neither conducive to good management or safety. So long as 100 cubic feet is the law, no more can be demanded.

With regard to the 2nd,—limiting the number of men in a district or in a split of air,—there is nothing so well known or is better appreciated by a good manager as the extreme danger of inordinately splitting, dividing, weakening in force and efficiency, or attenuating a current of air, and in no way can ineffective ventilation be better ensured than by splitting air currents to death, as would be the case under the proposed and to a slightly less extent under the present Act.

If the intention is, as I am certain it is, to provide a current of air adequate in amount "to dilute and render harmless noxious gases," this laudable intention is frustrated by the interpreting clause or words referred to. Moreover, the unnecessary expense and physical resistance introduced by compulsory bratticing, thereby increasing the frictional resistance by increasing the rubbing surface and confining the current, and consequently the extra power required to produce the same amount of current that existed without bratticing (which retards, but does not increase the air current), might be so great and costly and so tardy of application that in event of a sudden burst of gas occurring it might be impossible to clear it out. These two provisions, I assure you, interpose insuperable obstacles to the proper ventilation of a mine.

If, on the other hand, the intention is to ensure at all times a strong, full, resistless, sufficient or adequate volume of air sufficient to clear away any gas, and for every requirement of workmen, what more can men desire? And if so, the limiting provisions should be erased, and adopt in their entirety the words of the English Act bearing upon the subject.

Furthermore, if the object is to encourage progress and the introduction of scientific and economical winning of our national resources in coal—that are none too abundant—all reference to "cut-throughs" or details as to procedure which pre-suppose only one method of working, or conditions that may not supervene and cannot be anticipated, should be erased.

By adopting the words of the English Act bearing upon these important provisions, I feel convinced you will confer a boon upon miners, and upon owners and managers, who would then vie with each other in introducing systems varied to suit the actual conditions that exist creditable to themselves and satisfactory to all connected with mining.

The whole of these repressive and irritating limitations are solely necessary by the unfortunate reference to what is meant by the words "adequate ventilation," and they afford an object lesson of the futility and danger of hastily acceding to the representations of workmen who, as a class, are not conversant with the nice and inexorable laws that regulate and control ventilation.

It must not be forgotten that the words referred to occurring in the English Act is the outcome of years of patient investigation and deliberation by the keenest forensic and mining intellects of the age. It was not, as is the case with the proposed Act, the outcome of hasty and amateur legislation, but is the product of long sustained investigation and inquiry, from representatives representing all shades of opinion and classes connected with mining in a densely populated and highly educated country that produces 190,000,000 tons of coal, irrespective of other stratified minerals, per annum, and under conditions the most varying and dangerous known.

The wording of the English Act is in no sense restrictive or harassing, it encourages but does not repress improvements, and is in no sense revolutionary or experimental, and it adequately provides for the safety of workmen. Under it a class of inspectors are appointed, of high scientific and scholastic attainments, who are not vested with the extraordinary powers attempted under the proposed bill.

The English Act differs from that proposed in being clearly and grammatically expressed. The phraseology is perfect. Its arrangement can scarce be improved, and its clauses are devoid of any captious or ambiguous interpolations such as deform some of the clauses of the measure under discussion.

As it is at present it conveys equivocal but no real advantages to workmen, while owners will be discouraged or ruined. It is unsuited to our requirements and is uncomplimentary to our condition, betraying a painful disregard for the requirements of methodical or skillful mining.

There is really no necessity for any interference with the present law, or for a new Mining Bill.

As it stands it is a menace to an important industry that is at present sorely beset and is daily being reduced to the verge of ruination.

In my opinion, if persisted in, it requires direction clauses deleted, others revised and altered—every word weighed so as to avoid harassing a section of the community at the expense of another equally desirable and necessary. The Bill requires arrangement and classification to be acceptable.

I repeat the objection I formerly urged in respect to the sections not now referred to. This is especially requisite with reference to the general rules, Part II, and to a less extent Part III, legal procedure.

The object of all classes should at the present critical juncture be to encourage not to hamper or harass coal mining, or to impose burdens upon owners that are uncalled for and cannot be borne. I take it that every possible avenue which can employ labour should be encouraged, not closed by forcing a crude Bill upon an unwilling section that carries no benefits to those who urge it on.

It may be out of place, but in my opinion it would have been more creditable to the humanitarian impulses of the House of Assembly, who have shown such alacrity to interfere with coal mining, had they extended their benevolent regard to the condition of the large number of miners employed in metalliferous mines, and where in the majority of cases safety and sanitary provisions are either unheeded or unknown.

The

## ON THE COAL-MINES REGULATION BILL.

The ludicrous feature is, however, presented of an overdesire to legislate on coal-mining and utterly neglect to extend to the larger number of workers engaged in or at metalliferous mines any of those legislative advantages that our coal-miners have so long enjoyed. Workmen engaged in or at metalliferous mines are apparently unworthy of the notice or solicitude of philanthropists or social reformers.

J. R. M.  
Roberts, Esq., M.D.

18 Oct., 1893.

*Wages.*

Clause 6. Where the amount of wages paid to any of the persons employed in a mine depends on the amount of mineral gotten by them, those persons shall be paid according to the actual weight gotten by them of the mineral extracted to be gotten, and unless otherwise mutually agreed upon the mineral gotten by them shall be truly weighed or averaged, as the custom may be, at a place as near to the pit or tunnel mouth as is reasonably practicable :

Provided that nothing in this section shall preclude the owner, agent, or manager of the mine from agreeing with the persons employed in the mine that deductions shall be made in respect of small coal, stones, or substances other than the part of the mineral extracted to be gotten, or in respect of any tubs, skips, baskets, being improperly filled in those cases where they are filled by the getter of the mineral, or his wheeler or substitute, or by a person immediately employed by him, such deductions being determined, &c., &c., &c.

Subsection (III). Any employee who fails to comply with the orders of the manager in respect of the safe loading or height of skips filled with mineral or other substances shall be guilty of an offence against this Act.

Mr. William Turnbull called in, sworn, and examined:—

4. *Chairman.*] Where do you live? At Newcastle.
5. What are you? A mining engineer.
6. *Mr. Vickery.*] Where are you employed now? At the A. A. Company's mine.
7. You have been manager there for a number of years? I have been there eighteen years and a half.
8. Prior to that had you not great experience in England? I was with the Hetton Coal Company for nine years, and I was under the Marquis of Londonderry Seaham Colliery for nine years. Those are about the largest collieries that there are in the North of England.
9. You have been manager of those collieries? Yes.
10. Are you experienced in the science of the ventilation of mines? That is a thing which I have taken a great interest in. For eleven years I was left at liberty and I used to do a lot of laying out of plans for ventilation; I did a great deal for America.
11. *Chairman.*] Have you read the Bill? Some of it.
12. Not the whole of it? I did not go through the whole of it; it is a disgraceful thing. I have a sketch of a colliery here from which I can explain what is required for ventilation.
13. It is a disgraceful Bill? Yes.
14. That is your opinion of the Bill? Yes, and must be the opinion of anyone who understands the ventilation of mines.
15. Do you allude specially to the provisions as to ventilation? Yes.
16. Why is it a disgraceful Bill? It would make it impossible for anyone to ventilate a pit.
17. It could not be done in accordance with the provisions of the Bill? No.
18. *Mr. Laidley.*] What effect would the Bill have as regards the expense of ventilation? It would cost the A. A. Company 6d. to 7d. a ton more for brattice work under this Bill.
19. And you consider that the present ventilation is sufficient? Quite sufficient.
20. Do your people ever complain of the want of ventilation of the mines? It is some years since I had any complaint.
21. Do you hear any complaints in the district as to ventilation? Yes, but not so much now.
22. Under this Bill ventilation would be impossible in many cases? If there was gas in a mine and I was bound to work under this Bill, I should say, "No, I will not do it." I would not attempt it because it would be impossible to do it.
23. *Chairman.*] You could not conform to the requirements of the Bill with regard to ventilation? Nothing like it.
24. What plan is that that you have with you? It represents the system of ventilation in the Sea-pit of the A. A. Company. On the eastern boundary it is all solid coal. In that part of the mine there would be ordinarily 600 feet of air per minute, but if gas was discovered there would have to be 8,000 or 10,000 feet of air per minute.
25. *Mr. Laidley.*] Is there any gas in that part of the mine now? No; take another place in the mine, under the Ocean, on the north-eastern side of the line, I should have to supply 9,000 or 10,000 feet of air per minute if there was any gas. The air is carried in by the blue lines on the plan and the red lines show the return air course. Suppose I give the men a full quantity of air; when I come to the heading at the end of the blue line going south-east, I should only want 200 feet of air. If there is an outburst of gas you must have 8,000 or 10,000 feet of air per minute. If I were left at liberty I should carry the air in the opposite way, and I should put all the pressure on the place where the red and blue lines meet.
26. What we understand is that the provision made for the supply of air under the Bill is more than adequate in some places and not sufficient in others? Yes.
27. *Chairman.*] What is it that is more desirable than the provisions of the Bill? You must have a pressure of air wherever there is gas.
28. *Mr. Laidley.*] Where there is gas you want a large quantity of air? Yes.
29. *Chairman.*] Are any of the provisions of the Bill opposed to what you are advocating? The Bill says that there must be 150 feet of air per minute for each man and 200 feet for each horse.
30. *Mr. Laidley.*] What the Committee are to understand is that the Bill lays down that a certain quantity of air must be supplied under any circumstances? Yes.
31. Do you say that the quantity of air provided for in the Bill is more than is necessary for safe ventilation? I can give the men more ventilation; they would get more with fewer splits.
32. They are asking for more splits? You are bound to have splits. There are eight splits shown in the plan of the A. A. Company's mine.
33. *Mr. Vickery.*] You disapprove of the practice of dividing a mine into splits? Certainly. Many a time I have not been guided by the existing Act.

Mr. W.  
Turnbull.

18 Oct., 1893.

- Mr. W. Turnbull.  
18 Oct., 1893.
34. *Chairman.*] Why? I have had black damp in the mine, and I had to supply more than the prescribed quantity of air.
35. *Mr. Vickery.*] Do you mean that by splitting up the air you will lessen its effectiveness? Certainly.
36. But when there is no danger you concentrate the air in one place? Yes.
37. *Chairman.*] Does not the Act provide for that? No.
38. *Mr. Laidley.*] The present Act says that the mine should have a sufficient quantity of air? I think it says that there must be not less than 100 feet per man and horse.
39. But is it not a fact that the quantity of air is in a great measure regulated by the mining inspector? If he is called upon by the men he will come, and if the manager can prove that he has a sufficient quantity of air travelling through the mine he is satisfied.
40. Under this Bill that could not be done, as it states the exact quantity of air required? They do the same under the present Act, but under the Bill there will be more splits. I am working with eight splits, but under the Bill I shall have to have sixteen splits.
41. Would it not be better for the miners generally to work under the existing Act than under this Bill? Certainly.
42. Better for the men? Yes, and more satisfactory to all concerned.
43. *Chairman.*] Do you consider that the provisions of the existing Act with regard to ventilation are better than those of the new Bill? They are, for this reason: Under the existing Act you can put seventy-five men and horses into one split, but under the Bill you could only put sixty men in, and that would necessitate more splits.
44. Would that lead to more expense? It must.
45. *Mr. Laidley.*] Where you get many splits is there less air? It is bound to be so.

[*The Hon. W. H. Pigott took the Chair.*]

46. *Mr. Vickery.*] Does not bratticing lessen the current of air by friction? Yes, a great deal. There are thirty-three bords on one part of the plan before me. If I had to brattice all those places I should have to have a door to every bord. Under this Bill I should have to have thirty-three doors in that split.
47. And that would add 6d. a ton to the cost of the coal, would it not? It would add 6d. or 7d. a ton to the cost of the coal.
48. Therefore you entirely disapprove of the provisions with regard to bratticing? Yes.
49. As regards the ventilation I think I understood you to say that you disapprove of any hard and fast amount of air being provided for in the Bill as dangerous? Yes.
50. Do you think that the Bill should not provide for an adequate amount of ventilation? Certainly, it must do that.
51. But you do not want the manager to be hampered by any particular amount of ventilation being prescribed? No.
52. You disagree altogether with the practice of dividing a mine into splits? You must have some splits, but you ought not to have so many as the Bill would make necessary.
53. *Mr. Laidley.*] Would it be possible for many of the mines in Newcastle and elsewhere to be worked under this new Bill? I do not think it would. Your cover depends greatly on the pressure you have on. I have seen where there was a current of 7,000 or 8,000 cubic feet of air per minute an outburst of gas that travelled back upon the fresh air 600 yards. That is at the Hetton Colliery. In the Seaham Colliery we were working under the sea and there was a fault, and 10 yards of solid coal were burst out by the rush of water and gas.
54. *Mr. Vickery.*] What you mean is that there should be sufficient ventilation to drive all the gas out? Yes; when I went down the pit I had to shut every place and put the pressure of air on the place where the coal was burst out. If we had been working under the provisions of a Bill like this we could not have done it.
55. *Mr. Laidley.*] I understood you to say that you would not have any fixed amount of air provided for in the Bill, but would simply require that there should be sufficient? Yes; and let each manager form his own opinion. The deeper we go in mining the more gas we shall get. At Newcastle many a thousand do not know about that and do not think of it.
56. How do you get ventilation under the sea? By fans. I have a fan that can drive 400,000 cubic feet of air per minute. The manager is to be punished by fines. He may be fined £50 and have his certificate withdrawn. I caught a miner not long since with his door left open.
57. *Chairman.*] What was that for? To get the fresh air himself and shut off ventilation from the other men. What could I do. I dismissed him; that was all that I could do. Under the English Act I could have taken him to Court.
58. Then that is an omission from this Bill? Yes. I worked under an Act at home and we had to try our own cases, and I had seven cases a day.
59. *Mr. Vickery.*] Do you approve generally of the provisions of the present English Mining Act? Yes, right through. As I told Mr. Smith at Newcastle, "Let us have the English Act, and I shall be satisfied."

WEDNESDAY, 25 OCTOBER, 1893.

Present:—

HON. W. H. PIGOTT IN THE CHAIR.

HON. W. LAIDLEY,		HON. A. H. JACOB,
HON. E. VICKERY,		HON. E. COMBES,
HON. H. E. KATER.		

Mr. William Turnbull further examined:—

- Mr. W. Turnbull.  
25 Oct., 1893.
60. *Chairman.*] You are prepared with a statement of your views in regard to the Coal-mines Regulation Bill? Yes; I hand in the following statement as my evidence:—"The following are my remarks on automatic contrivance to prevent overwinding, clause 10 sub-clause D of Coal-mines Regulation Bill:—I am opposed to this clause, if by it each colliery must provide an automatic brake to prevent overwinding, because of the great expense that each colliery would be put to in this district in providing the necessary appliance and fitting it up, necessitating, no doubt, in some cases the adoption of new machinery and engines

engines, and perhaps stopping the works for many weeks while the alterations were being effected. At our No. 2 pit we have a Walker's detaching-hook fitted to each of the winding-ropes, and when these hooks were first put on, I gave them a trial with two full skips in the cage—the cage, chains, and full skips weighing about 4 tons—and the result of the trial was most satisfactory, the hook detaching the rope and suspending the cage above the pit-top. On another occasion the engine-driver at this pit was engaged at the fly-wheel moving the engine over the dead point or centre, and in going back to his reversing lever his foot slipped and he fell, but before he could regain his feet and grasp the lever of the engine the empty cage was taken up toward the pulley-wheel, where the rope was detached by the patent detaching-hook and the cage left suspended, while the rope was taken over the pulley-wheel. I have also patent detaching-hooks fitted to the winding-ropes at Hamilton pit and at New Winning pit, and I am sure that these hooks will answer the purpose of preventing overwinding equally as well as the automatic brake and at far less cost. These hooks could be attached to the winding-ropes at any of the collieries without necessitating any stoppage of work or alteration to the machinery. At our New Winning Colliery the winding engines there were fitted out with automatic steam-brake and cut-off gear when being built. This is an arrangement by which, in the event of the cage being taken beyond a certain point above the catches, steam is turned on to a donkey-engine in the engine-house, which applies the brakes and cuts off the steam from the engine in one simultaneous movement. After the engines were fitted up at this pit I gave this automatic gear a thorough trial and found it to answer satisfactorily. On one occasion two skips of coal were put into the cage at the bottom of the pit—the full skips, cage, &c., weighing about 4 tons. The engines were started and the cages travelled at the rate of about  $11\frac{1}{2}$  miles per hour. I then called the engineman out of the engine-house away from the reversing lever altogether, and allowed the automatic gear to stop the engines, which it did after they had gone only 6 or 7 feet beyond the point where the brakes were first applied. This automatic gear is tested every day the pit works to see that it is in perfect working order. No men are drawn at this pit except the hooker-on and overman. The miners and others travel to and from their work through a tunnel which connects the surface with the underground workings. The shaft is 284 feet deep, and it takes the engine 17 seconds to make a winding.

Mr. W.  
Turnbull.  
25 Oct., 1893.

"*Working under Roads—Rule 29.*—I am opposed to this rule becoming law, for, in the case of the A. A. Company, where there are so many roads on the estate, it would mean cutting off a very large area of their coal land. I should like to know if in the event of any street being, say, two chains wide, how much coal would have to be left intact at each side of it. If much coal or any coal is to be left on each side of a street like this, there would be very little coal for the company to work out between it and the next street, and in fact what little there was would not pay to be worked, and therefore this rule would act very severely on any coal company situated like the A. A. Company. In our New Winning Colliery the workings extend under a large number of streets, but the bords are only driven 6 yards wide, leaving a pillar of coal between them of 12 yards in thickness. Cut-throughs are driven in every alternate pillar for ventilation purposes. By driving the cut-throughs like this I secure greater strength in the pillars than by cutting through every one of them. The headings are turned away at distances of about 70 yards apart, and driven from 8 to 10 feet wide. The above method of working I consider sufficiently secure for driving under streets or roads, but I might also add that where tender coal or faults are met with larger pillars are left in to support the roof, and especially is this done where buildings or roads are over the tender or faulty area.

"*Present Coal-mines Regulation Act.*—I should be quite satisfied with the present Coal-mines Regulation Act if the provisions in reference to ventilation were made the same as those in the English Act."

We have used the detaching hooks for a long time. I tried experiments with these things at home for years.

61. Have you always found that you worked satisfactorily? The detaching-hook does.

62. *Mr. Combes.*] Have you ever had any accidents from overwinding? No; but we have had men overwound. There are lots of different contrivances, but I have always found Walker's detaching-hook the best.

63. *Mr. Laidley.*] Do you think that the present Bill is workable in connection with the mines at Newcastle or in the south? Oh, no.

64. Would it greatly increase the cost of getting the coal? It would increase the cost of getting the coal by a great deal.

65. By how much per ton? At some collieries over a shilling a ton.

66. Do you think that there are many collieries which would be compelled to shut up if the Bill came into operation? They would be bound to shut up if this Bill passed; some are on the point of shutting up already.

67. You think that if the Bill were passed it would be the means of shutting up some of the collieries? Yes.

68. *Mr. Combes.*] Do you not think that the increased cost of getting the coal will result in the reduction of the men's wages? The men will not have it.

69. *Mr. Laidley.*] Would it not eventually mean a reduction of wages? Certainly; there would have to be a reduction or the collieries would have to shut up.

70. *Mr. Combes.*] You feel quite certain about that? I am quite certain about it. There are collieries closing now, the expense of working being too much with the present price of coal.

71. If this Bill is passed other mines will have to close? Yes.

72. *Mr. Jacob.*] The statement which you have handed in is your evidence? Yes.

Mr. George Henderson called in, sworn, and examined:—

73. *Chairman.*] What are you? I am a miners' secretary at the present time.

74. For the southern miners? Yes.

75. Do you desire to give evidence with regard to the Coal-mines Regulation Bill, now before Parliament? Yes.

76. Will you give your views as concisely as possible on the subject? I simply come to inform you that it is the desire of the southern miners that a compulsory eight hours' clause should be embodied in the Bill, and

Mr. G.  
Henderson.  
25 Oct., 1893.

Mr. G.  
Henderson.  
25. Oct., 1893.

and I may also state that, in the opinion of the Illawarra miners, the present Bill, framed as it is with the compulsory eight hours' clause, provision for ventilation, and an amendment regarding the appointment of inspectors, would suit very well.

77. *Mr. Jacob.*] You mean the Bill before the Committee? Yes, I mean the Coal-mines Regulation Bill. Rule 5 says:—"A competent person or competent persons appointed by the owner, agent, or manager, for the purpose, shall once at least in every twenty-four hours examine the state of the external parts of the machinery, the state of the guides and conductors in the shafts, and the state of the head gear, ropes," and so on. Of course, the miners are generally of opinion that the appointment of such person should not be left altogether in the hands of the manager, or of the agent, but that these appointments should be made from some other source, or at least, if the appointments are not made from some other source, that they should be sanctioned by some other authority after proper examination of the party in whose hands those duties are to be placed.

78. *Chairman.*] What source could you name? Say a committee.

79. A committee appointed by whom? By the law of the land, of course.

80. *Mr. Combes.*] By the Government? Yes. In the same way as the committee is appointed to administer the arbitration law.

81. *Chairman.*] How could a board of examiners or a committee examine the machinery every twenty-four hours? I say that the committee should examine the person to whom those duties are to be entrusted, in order that they may know whether he is a thoroughly qualified man.

82. What you mean is that no person should be appointed under that rule unless he is approved of by a board of examiners to be appointed by the Government? Just so.

83. *Mr. Vickery.*] And paid by the Government? I do not see that they could very well be paid by the Government, being workmen of the company.

84. *Mr. Combes.*] You speak of competent persons;—do you consider the superintendent of the mine a competent person? He ought to be.

85. But you would not be satisfied with his seeing that the machinery was in proper order? I do not know that the colliery manager would be a competent person to do that.

86. Do any accidents that have happened make you think that there should be another person whom you would call a competent person, not the manager of the mine? I have not seen any accidents, but I have heard of a great deal.

87. *Mr. Jacob.*] Is it the law now that a competent person shall be appointed by the manager or agent to perform the duties specified in the rule? It is.

88. A competent person is appointed? Yes.

89. Has that worked injuriously? Not that I know of.

90. *Chairman.*] Do you desire to give further evidence? I have no desire to give any more general evidence.

91. *Mr. Laidley.*] Do you approve of the Bill? Yes; with the amendments which I have suggested.

92. *Chairman.*] We are to understand that you, on behalf of the miners, approve of the Bill generally, except that you want a compulsory eight hours' clause, further provisions for ventilation, and rule 5 altered? Yes. Generally speaking we approve of the Bill, except the weighing clause; that clause is not sufficiently definite for us. We want that clause to provide that men who are paid by the weight of the mineral got shall have that mineral weighed. If it is not weighed the weight is only approximately ascertained. That is the rule now. The men are supposed to be paid by weight but practically they are not.

93. *Mr. Jacob.*] Have you the clause before you to which you are alluding? Yes; it says "where the amount of wages paid to any of the persons employed in a mine depends on the amount of mineral gotten by them, those persons shall be paid according to the actual weight gotten by them of the mineral contracted to be gotten, and unless otherwise mutually agreed upon all the mineral gotten by them shall be truly weighed at a place as reasonably near to the pit mouth as is practicable."

94. Is that not definite enough for your views? It is, if it were carried out.

95. *Mr. Combes.*] You want every skip weighed? Yes.

96. And you do not want anything deducted for bands? Oh! I do not mean that. When I say coal I mean coal. I do not mean that a man should receive pay for stone when he ought to be filling coal. We want to have the coal weighed, but it is not weighed at the present time.

97. *Mr. Jacob.*] You want the whole of the coal gotten to be weighed? That is the idea.

98. *Mr. Vickery.*] At most mines do they not weigh as many skips as there is time to weigh? In some they do not.

99. As a general rule there are two weighmen appointed, one on behalf of the men and the other on behalf of the owners? Yes.

100. They take a skip and weigh it as it comes up, but that does not prevent other skips going down over the screens, and an average is made? That is what they are doing, but it is not satisfactory.

101. Would it not take three or four times as much time to weigh every skip? In some cases four times the number could be weighed that is weighed at the present time.

102. *Mr. Laidley.*] Do I understand you to say that you would weigh every skip;—would that not lessen the quantity of coal put out every day? Not necessarily.

103. Would it not increase the cost per ton by necessitating the employment of more men? Not necessarily.

104. Not if every skip was weighed? It simply means that a weighing apparatus must be placed there for the purpose. At the present time there is no such thing.

105. I think I heard you say something about eight hours? There is a clause in the Bill, which says "no person shall, except in case of emergency or when life or property are in danger, work below ground in any mine for more than eight hours (inclusive of one break of twenty minutes for the purpose of obtaining food) on Monday, Tuesday, Wednesday, Thursday, and Friday, and for more than six hours on each alternate Saturday." That means, that twenty minutes is to be taken out of the eight hours for food? Yes.

106. Will not the production of coal be reduced materially during the day;—if the time was reduced to seven hours and forty minutes, would that not reduce the output? I do not think it would reduce it very much.

107. How could it be otherwise;—under the miners' rules you only put out so much per day per man? That is not the case that I am aware of.

108. *Chairman.*] Are we to understand that what you desire is that the men shall spend only eight hours in the mine? Yes; eight hours in the mine.

109. And that there shall be twenty minutes taken off that eight hours at the meal time? Yes.

110. And that the time occupied in going into and coming out the mine shall be included in that eight hours? Yes.

111. So that the miners will only work six and a half hours? Eight hours. That is eight hours from the tunnel mouth to the tunnel mouth.

112. *Mr. Laidley.*] And you do not think that that would reduce the production of the mine? I do not think that it will.

113. *Chairman.*] How long in some mines will it take from the time they enter the tunnel mouth till they get to their work? There are some mines where it would take twenty minutes, and some where it would possibly take more than that to get into the face of the mine. Perhaps half an hour.

114. In a case where it would take a miner half an hour to get from his work to the tunnel mouth and half an hour to get back again, and with twenty minutes off the eight hours as well, the men would only work five hours and twenty minutes? They would be eight hours in the mine.

115. Is this not the fact that provision is made that a man is only to be eight hours below ground in any mine, and that is to include one break of twenty minutes? Yes.

116. And you desire in addition to that that there be added to the break of twenty minutes the time occupied in entering and leaving the mine? Eight hours is to be a day's work.

117. Is not what you desire this, that the men shall be eight hours below ground? Yes.

118. Less twenty minutes for obtaining food and less the time occupied in going into and coming out of the mine, which in some cases may take an hour? No; in some cases half an hour.

119. Does not that mean that in such a case as that the man would only work six hours and forty minutes? Yes; at the face.

120. Do you think that would tend to develop the mines or to restrict them? I do not suppose it would do either, they will remain in their normal condition.

121. *Mr. Laidley.*] Has not the present Act worked equitably between miners and owners, have there been any complaints? I have heard any amount of complaints myself.

122. You fully approve of the provision with regard to the hours of employment? Yes.

123. Even that Saturday off every fortnight? Yes.

124. Do the men lose their pay for that Saturday? They are only paid for the time they work.

125. Would the men have to be paid for eight hours if they took so much time in going in and out of the mine? They are only paid for the results of their own labour.

126. *Mr. Combes.*] What about the wheelers and others;—they are paid by the day, are they not? There is a number of men who would be working at the tunnel mouth, and they would work fully eight hours with the exception of the twenty minutes.

127. *Mr. Laidley.*] In the ventilation clause there are provisions about compulsory bratticing;—do you approve of that? Yes.

128. Why? Because it is necessary to carry the pure air round to all the men working in the mine.

[*The Hon. A. H. Jacob took the Chair.*]

129. *Mr. Laidley.*] The Bill provides that there shall be not less than 150 cubic feet of air, and if the men receive a sufficient amount of air is that not sufficient without this bratticing? It is sufficient if it is given to them.

130. There are inspectors? Yes; but it is absolutely impossible to give a man sufficient air in the face of a mine without bratticing.

131. If the Bill provides that the owner of a colliery shall give a sufficient amount of air, what more is necessary? There is nothing more required; we want that to be done.

132. *Chairman.*] Do you think that there should be a hard and fast rule in the Bill, or would you leave it to the judgment of the inspector as to whether there is sufficient air or not;—do you want to have it defined in the Bill? I certainly think it ought to be defined in the Bill.

133. *Mr. Laidley.*] I presume that you quite understand that if this Bill came into force it would increase the burdens of the colliery proprietors—that it would increase the expense of working the mines very considerably? I suppose it would a little.

134. By how much a ton, do you think, if all these clauses were carried out? I have not attempted to estimate that.

135. Do you not think it would be the means of shutting up many of the mines, considering the present rate of wages? No, I do not think so.

136. *Mr. Vickery.*] I wish to ask whether you consider that the provision with regard to 150 cubic feet per minute should be retained in the Bill? I think it should be retained.

137. Have you anything further to say about ventilation;—what improvement would you suggest? I simply suggest the idea of having air conveyed to the men by the aid of brattices, that is not in the Bill.

138. Yes, it is in the Bill, but where should the brattice commence; rule 1 says, "It shall be bratticed up to within 3 yards of such working face;"—you mean from the cut through? Yes; from the main current of air wherever it may be.

139. *Mr. Kater.*] With regard to the 150 cubic feet of air which the Bill says shall be supplied, what is the usual allowance in most mines? I know one mine in our district where there is over 300 feet of air per man.

140. Tell me of one where there is less than 150 feet? I know another where there is less than 150 cubic feet.

141. How much less? Possibly in some cases 60 cubic feet less. That is the Woonona Mine.

142. And in these cases who decides the number of cubic feet that shall be carried up to the face? The chock inspectors decide it.

143. With whom does it rest to decide how much air shall be supplied to each man? The inspector for the district.

144. In the case of the Woonona Mine, the inspector said it should be 60 feet less than the minimum quantity fixed by the Bill? No; no one said that.

145. Did the miners complain of that? They complained to the public.

Mr. G.  
Henderson.  
25 Oct., 1893.

- Mr. G. Henderson.  
25 Oct., 1893.
146. Have they anyone to complain to which would necessitate the owner of the mine increasing the quantity of air supplied? Yes; they complained and had it remedied.
147. To whom? To the inspector of the district.
148. The miners appoint check inspectors? Yes; to go round and measure the air.
149. Have you considered the difference that there is between mines—some requiring more ventilation than others? Yes; some want 300 cubic feet of air, whilst others require only 150 cubic feet.
150. You would require a minimum of 150 cubic feet? Yes; I think that is little enough.
151. *Chairman.*] Would it be impossible and impracticable to get 150 cubic feet of air on the face? It is possible and practicable.
152. *Mr. Combes.*] How would you do it? By bratticing.

WEDNESDAY, 1 NOVEMBER, 1893.

Present:—

HON. A. H. JACOB IN THE CHAIR.

HON. W. LAIDLEY,  
HON. E. COMBES,

HON. J. HOSKINS,  
HON. E. VICKERY.

Mr. Adam Cook called in, sworn, and examined:—

- Mr. A. Cook.  
1 Nov., 1893.
153. *Chairman.*] What are you? A miner.
154. Where do you live? At Wallsend.
155. Have you come to give evidence with regard to the Coal-mines Regulation Bill? Yes; there are a few matters on which I should like to give my opinion.
156. *Mr. Vickery.*] Have you read the Bill through? Yes; once or twice.
157. *Chairman.*] Will you let us have your views upon the Bill? I may say that upon the whole the miners of the northern district are satisfied with the Bill as it has passed the Legislative Assembly, and would be very well pleased to see it become law as it stands. They are very anxious that the second clause, which provides for the eight hours' should become law.
158. Just as it is there? Yes; there is a strong desire to have the eight hours principle legalised. Strong representations have been made to Members of the Assembly on the subject, and for a number of years, at their annual demonstration, the miners have passed resolutions affirming the necessity of embodying that principle in a Bill of this kind. Another matter to which I would refer is the abolition of the standard weight. That has been a grievance in the northern districts for a number of years. I believe it only exists in three or four collieries at the present time; I think at about four collieries. At the colliery at which I am at present employed, the Co-operative Colliery, the standard weight was abolished about eighteen months ago. It had been in existence a great number of years previous to that. I reckon that it was nothing short of robbery the way in which the men were treated in regard to the standard weight. At the colliery at which I was working all over 13½ cwt. was not paid for, although 15 or 16 cwt. may have been in the skip.
159. *Mr. Combes.*] That was the weight of the whole skip? Yes.
160. It was not all coal? Yes; but there is a certain proportion of small coal in each skip that the miners are not paid for.
161. There were some bands? No; the miners were ordered to take the bands out. They are very severely punished if they do not do that. The miners are very severely punished if there is a small quantity of dirt in the skip.
162. Do you approve of the provisions of the Bill with regard to the standard weight? Yes; at the same time I admit of the necessity for protecting machinery and rolling-stock. The miners are not opposed to a standard height. It is easier to fill to a certain height than it is to a certain weight. The weight depends on the nature of the coal. Some coal may be of a more dense nature, and other coal may be more friable.
163. *Mr. Vickery.*] Are you opposed to limiting the weight, and not opposed to limiting the height? I am not opposed to limiting the height; that is necessary for the protection of the machinery.
164. You are opposed to limiting the weight? I am.
165. *Mr. Combes.*] I suppose that at most of the collieries, with the workings of which you are cognizant, a certain number of skips are weighed? Yes; they call it striking an average. That is the custom of most of the collieries in the northern district; they do not weigh every skip.
166. Do you not consider that fair? It is the custom of most of the collieries, and provision is made in this Bill for an agreement to be arrived at between the proprietors and the men as to weighing. I think that is a very fair provision.
167. *Mr. Laidley.*] The second clause says: "No person shall, except in case of emergency or when life or property is in danger, work below ground in any mine for more than eight hours (inclusive of one break of twenty minutes for the purpose of obtaining food), on Monday, Tuesday, Wednesday, Thursday, and Friday, and for more than six hours on each alternate Saturday." By that clause there is twenty minutes allowed for obtaining food, and that must come off the eight hours? Yes.
168. Would that not lessen the production of the coal? I do not see that it will. That is an objection that has always been raised in years gone by when the hours of work have been reduced, but the output is greater now, under the eight-hour system, than before the hours were reduced.
169. Do you not think, where there is a large output, taking off twenty minutes will reduce the output materially? Most decidedly, but the proprietors can make arrangements to bring the output up to the former standard without any additional expense to themselves. I do not think that there is any mine in the northern district engaged at present to its fullest capacity, and when trade is slack we find the proprietors cavilling the men out. If there is any extra demand, what is to prevent the proprietors from engaging additional men? The miners are paid by the ton and the wheelers by the score. They are paid by results.
170. Do you not think it would be against the miners' interests to have more men put into the mine? Not if the men are getting as much as they can do.
171. What does the Union permit you to do now? There is no restriction as to the amount of coal they may send out.

172. There used to be? Not since I went into the northern district.
173. Then you do not think that the reduction of the hours will make any difference in the production of coal? No, none but what can be easily overcome without any additional expense by the proprietors.
174. How would you do with the top men? I do not think the Bill says anything about the top men.
175. No; but they are subject to the Miners' Act; they are day men? The men employed on the top are sometimes paid by the ton and sometimes paid by the score.
176. A great many of them are day-wage men, I think? Yes.
177. You do not think that a reduction of the hours would make any reduction of the output? None but what can be easily overcome by the proprietors without additional expense.
178. In what way? As I have already explained, the miners are paid by the ton and the wheelers by the score. They could, therefore, put on more men in order to maintain the output.
179. Do you not think it would cause the employers to employ more men on the top if the men worked a certain number of hours? No; I do not think that would be necessary. Extra miners might be employed to bring the output up to the previous standard, but there would be no necessity to put extra men on at the top. There would be no more coal coming out of the mine, but there might be a few more men getting the coal.
180. You do not think that the restriction put on the hours of work will make any difference in the production of coal in the Newcastle district? No; I do not think it will.
181. It means, then, if you work four or five hours a day the difficulty can be got over by putting on more men? It is possible to carry an argument of that kind to an absurd conclusion.
182. *Mr. Combes.*] In addition to this twenty minutes, there is the time occupied by the men in getting down to their bords? That is outside the eight hours. According to the provisions of the Bill the miners may be eight hours at the face of the mine. It is very seldom that it takes the miners more than ten minutes to get their meals. There is no inducement for a miner to lie about at meal times. He generally has plenty of work, and the more quickly he swallows his tucker and gets to work the better it will be for himself.
183. It might take half an hour to get to the face, and if a man is to be only eight hours under ground and it takes him half an hour to go to the face and half an hour to return, that would take off one hour and twenty minutes? I should like to point out that under this clause the miners would be eight hours at the face. It might take a miner half an hour to go to his particular working place, and half an hour to return. In that case he would be something like nine hours underground.
184. *Chairman.*] That is your view of the working of the clause? I think it means eight hours' work.
185. *Mr. Laidley.*] As a rule, how many hours are they in the mine? I think about eight hours at the face. Nothing beyond what is asked in the clause.
186. *Mr. Hoskins.*] Your interpretation of the eight hours' provision is that it means eight hours working at the face, irrespective of the time it takes to go to and from it? Yes; according to this clause the miner would be working seven hours and forty minutes. There would be twenty minutes allowed for meals, and whatever time was occupied in travelling to and from the face would be outside that altogether.
187. *Chairman.*] Will you proceed with the next point? In connection with the abolition of the standard weight I may say that I do not think the miners have any particular desire to fill the skips in such a manner as was insinuated by Dr. Robertson. The miners in the northern districts on several occasions have tried to get that evil remedied, and they have proposed to fill the skips level full, or a couple of inches above the wood, but the managers threatened to stop the collieries altogether if they did that, showing conclusively that there is a strong desire on the part of the managers that the men should pile up the skips.
188. *Mr. Combes.*] Has that been done at your colliery? Yes; they used to build the skips up about 18 inches. In fact, I have seen them piled up about a couple of feet; but since the present manager took charge we have not had much difficulty in getting the standard weight abolished, and now the men only fill the skip a certain height. If a man goes over that height he loses his skip.
189. *Mr. Hoskins.*] What colliery is that? The Co-operative Colliery at Wallsend.
190. *Chairman.*] What is the next point to which you would draw attention? The provision with regard to bratticing, and the division of the mine into splits. I can give my opinion with regard to that and the subject of ventilation generally. I am thoroughly in favour of the clause as it stands, with the exception of the provision with regard to bratticing up each bord. I think 150 cubic feet of air per man and 200 cubic feet for each horse quite little enough, but still I do not see the necessity for bratticing up each bord to within 15 yards of the face. But I am a thorough believer in having shorter cut-throughs. Cut-throughs are places that are driven across the pillars for ventilation. The present Act provides that there shall be a cut-through at every 35 yards. This Bill provides that there shall be one at every 25 yards. I am a thorough believer, and the majority of the miners are also, in reducing the distance between the cut-throughs. It should be 25 yards instead of 35 yards, and 150 cubic feet should be the minimum quantity per man.
191. *Mr. Laidley.*] Would not that very much increase the cost of getting the coal? I think it would be a great benefit to the proprietors of the mine as well as to the miners.
192. Would it not greatly increase the cost? Not a great deal. I can show that it would be a benefit to the proprietors as well as to the miners. Very often the miners have to work 48 yards in front of a current of air. Supposing you put a cut through at every 35 yards; then to drive another 2 yards to get the necessary width, that makes 37 yards, and sometimes the length of the cut through is 8 yards; that makes 45 yards in which the men are working in front of the current of air. In most cases it is impossible to get the coal without using powder, and the places are always filled with powder smoke, so that it becomes an impossibility for the men to fill clean coal. Most of the managers in the northern district are pretty firm on this point, and talk about the men filling absolutely clean coal under circumstances which render it utterly impossible, especially if you consider the number of bands in the coal. In some places they have the two ordinary kinds of bands, also kerosene and a terrible amount of brass, clay bands, and other impurities, and when the places are completely filled with smoke the men cannot fill clean coal. I have known men to be stopped for a week, and in some cases for a fortnight, for sending 4 or 5 lb. of band in the skip. They are severely punished for this. Dr. Robertson's evidence would give you the impression that, through the leniency of the managers, the men are allowed to fill 14 lb. or 15 lb. of dirt in each skip, but that is not my experience. The managers are very careful about it, and they

- Mr. A. Cook. they punish a man severely for it. There are only two or three dirt scales in the northern district, and the manager has a right to punish a man if he finds  $\frac{1}{2}$  lb. of dirt in his skip, and he may give the same amount of punishment to a man with  $\frac{1}{2}$  lb. of dirt in his skip that he would to a man who had a cwt. of dirt in his skip. It depends on his temper.
193. *Chairman.*] You have used the expression "punish" very often;—how do they punish a man? They prevent him from coming to work for a day or two or more. If a man sends up dirt in his skip the manager will say, "You need not come to work again till I send for you."
194. *Mr. Laidley.*] Do you not think that the miners, by not clearing out the bands, have caused a great loss of trade to the Co-operative Pit? No; but they have been blamed for it.
195. You have spoken about the bratticing, would not that cause an increased cost per ton for getting the coal? I was going to point out that there would be this advantage in having shorter cut-throughs. The place would be kept freer of smoke and impurities and the men would be in a position to fill cleaner coal.
196. Do you not think that this extra bratticing, which is provided for in the Bill, would involve a cost of so much more per ton? Yes; but I am not prepared to back up that idea. I am in favour of shorter cut-throughs.
197. For every cut-through you have to turn off? Yes; but that does not cost any more to the proprietors.
198. Taking the Bill as a whole, the provision with regard to bratticing and the shortening of the hours, do you not think it will increase the cost to the owners per ton for getting the coal? I do not see why it should. In connection with the shorter cut-through, I may point out that it will be an advantage to the proprietors. The pillars in these bords have been made at certain distances, and it is the custom to take out the pillars afterwards, and to do that a cut-through is driven across the centre of each pillar. If the cut-throughs were 25 yards apart there would be no necessity for that extra cut-through. Putting one thing against the other, I do not think that any additional expense would be involved in getting the coal.
199. And you do not think that, under the provisions of this Bill, the cost of getting coal would be any greater than it is now? No; I do not think it would be any greater.
200. If this Bill were in force to-morrow, what would it cost the proprietors per ton extra? If the output were reduced, I think it is quite within the power of the proprietors to make it up without any extra expense. Extra miners could be employed, and extra wheelers, and these men are paid by results. As regards the ventilation clauses, I have already pointed out that if you place the men in a position to fill cleaner coal, that will be to the benefit of the proprietors, and the necessity to split the pillars in order to take them out will be obviated by having a cut-through at every 25 yards instead of at every 35 yards.
201. You do not think that if the Bill were in force it would cost the colliery proprietors any more to get the coal? No; under proper management and supervision I do not think it would.
202. Does not the present Act work well with us at the present in the north? There is lots of grumbling about ventilation and one thing and another. I do not think we should be insisting on alterations if we were satisfied with the present Act.
203. *Mr. Hoskins.*] Why are you dissatisfied? Owing to the lack of ventilation for one thing, and we want the eight hours legalised. We never had any trouble with the proprietors as regards the eight hours, but we want it placed beyond the power of the proprietors or anyone else to interfere with it. We recognise that we only hold it on sufferance at the present time.
204. Then the only objection which the miners have to the present law is that it does not provide for adequate ventilation and does not legalise the eight hours? Those are two of the principal objections.
205. *Mr. Laidley.*] Do you not think the interests of the colliery proprietors and those of the miners are identical? They ought to be.
206. Presuming that the Bill came into force to-morrow and that it cost so much more per ton to get the coal? I do not admit that.
207. If it did, do you not think that would recoil on the wages? I am not prepared to admit that. Dr. Robertson said it would increase the cost of getting the coal by 10d. per ton; but I think that is an absurdity. I do not see where the extra expense is going to come in.
208. *Mr. Hoskins.*] Do you or do you not consider that if, consequent upon the alterations you suggest, the cost of getting the coal was increased, that would act prejudicially to the interests of the Newcastle district? I believe it would if that were the case.
209. *Chairman.*] You do not admit that that would be the case? Certainly not. I do not believe that, under proper management, the cost of getting the coal would be increased one iota.
210. *Mr. Laidley.*] You are Secretary of the Miners' Union? No; I am President.
211. *Mr. Combes.*] Do you work as a minor? Yes; I have worked at the Co-operative Colliery for the last eleven years.
212. *Chairman.*] What is the next matter to which you wish to refer? I would refer to the provisions with regard to explosives. Sub-clause E of clause 12 says, "Provided that no person shall return to a place where such charge has missed fire until eight hours has elapsed from the time of lighting such fuse." I am not altogether a believer in that. I think that a provision such as that is right enough if applied to a fuse only, but in the majority of cases in the northern district the fuse is not used. What we call a squib is used, powder being wrapped in a paper and put into a hole. Perhaps, owing to some small obstacle in the hole, the shot may not go off, but I reckon that there is no danger after ten or fifteen minutes has elapsed. I think that to prevent a man from going back to the place for eight hours because a squib has not gone off would be unwise.
213. Would the squib be held to be a fuse? No.
214. But the word fuse is used in the Bill? It depends on what interpretation would be put upon the clause.
215. You think that a squib might be held to be a fuse? It might be. Where squibs are used a man might be allowed to go back in ten or fifteen minutes. It is a simple process, and there is less smoke in connection with squibs. They do not interfere so much with the ventilation. It is absolutely necessary to use a fuse where the mine is wet. There is a clause about the appointment of a check weighman. I think it is only right that if the miners having to pay a check weighman, they should appoint the man they think best fitted for the position, even though he is not employed in the mine. I believe that the employers object to the appointment of anyone not employed in the mine, but I can see no good grounds for such objection.

216. *Chairman.*] You approve of the provision in the Bill that the man appointed may be an outsider? *Mr. A. Cook.*  
Yes.

217. You think that as he is paid by the miners he ought to be appointed by the miners? Yes; and I think they have a right to appoint whom they like. But I may say that there has been no friction for a great number of years between the miners and the proprietors in the northern district, as far as check weighmen are concerned.

218. Apart from all you said with regard to the fuse and other matters, you are satisfied with the Bill as a whole? Yes; and I believe it meets with the thorough approval of the miners in the northern district.

219. And you speak on their behalf? Yes.

220. *Mr. Hoskins.*] How long have you been mining? For thirty years.

221. During the whole of that time have you been employed in this Colony? No; I have been between fourteen and fifteen years in this Colony.

222. Where were you before that? In Scotland.

223. Do you happen to know the number of persons engaged in coal-mining in the United Kingdom? I could not say. There was a quarter of a million on strike a few weeks ago.

224. There are about a million persons in England connected with coal-mining;—are you acquainted with the provisions of the English Coal-mines Regulation Act? I have not made it a particular study, but I know something about it.

225. Have you heard of any general feeling of dissatisfaction with the English Coal-mines Regulation Act? That I could not say. I believe there has been an agitation in England for a number of years to get the eight hours legalised, an agitation not confined to miners.

226. You have never heard any special objection urged against the English Coal-mines Regulation Act? Probably I have, but I am not able to say at present.

227. Do you not think that if an Act of Parliament, and a very stringent Act it is, but not one that does not cripple the industry, meets with general approval in Great Britain from both the employers and the miners, would not that Act be quite sufficient to regulate the coal-mines in this Colony? No; there is a clause in the English Act with regard to ventilation that I do not believe in, and the majority of the miners do not believe in it. There is no minimum specified in the English Act. I think it is absolutely necessary to have a minimum amount of air specified in the Act. I do not think it is reasonable to leave it in the hands of the manager or inspector. If recognised authorities say that 150 cubic feet of air is necessary that quantity at the very least ought to be assured to the men.

228. You have never heard from the Coal-miners' Unions, and they are very numerous in Great Britain, or from the coal-fields' representatives in the Imperial Parliament any strong objections to the Coal-mines Regulation Act? I do not know whether they are satisfied with it or not.

229. You have not heard of any petitions being sent to the Imperial Parliament asking for the repeal of the Act? I am not prepared to give an opinion upon it at all.

230. If the Coal-mines Regulation Act gives satisfaction in England, do you not think that such an Act would be sufficient in this Colony? I am not aware that the miners in England are satisfied with the Act.

231. Did you ever hear of any dissatisfaction, except as regards the eight hours question? Yes; there is dissatisfaction with regard to the ventilation of the mines too.

232. I ask whether, from your knowledge, there is any general objection urged against the provisions of the English Act for the regulation of coal-mines? I cannot say anything about it from my own knowledge. I think they ought not to be satisfied with an Act which does not legalise the eight hours, and which does not give a minimum amount of air. I am not prepared to discuss the English measure, or what the English miners think about it. What we want here is what we consider fair and reasonable, and ought to be embodied in the Bill.

233. Has it ever occurred to you that if you increased the cost of getting the coal, the miners, the coal owners, and the Colony generally would be placed at a disadvantage as regards the selling of the coal? That is beyond question. If anything is done to increase the cost of getting the coal it is bound to handicap the trade, but I am not prepared to admit that anything of the kind will take place.

234. Are you aware that under the English Act the inspector of the district has to be satisfied that adequate ventilation is provided without any particular quantity being specified? Yes; I believe that that is the case.

235. Do you not think that that would suffice here, or do you not think that the inspectors are to be trusted as much here as in England? That is a responsibility which I do not think it is fair to place on the shoulders of an inspector at all. The authorities say that a certain quantity of air is necessary for sanitary purposes, and the miners ought to be assured of at least that quantity, and I think that 150 feet is a fair minimum.

236. *Chairman.*] You think it should be specified in the Act instead of being left to the inspector? Certainly.

237. *Mr. Hoskins.*] What do you anticipate will be the gain to the miners by legalising the eight hours, seeing that eight hours is a day's labour in the district now? At present we have it only on sufferance. In the past we have had no difficulty about it, but I would place it beyond the power of any man to interfere with the eight hours.

[*The Hon. E. Combes took the Chair.*]

238. *Mr. Hoskins.*] Are you not aware that there is a large number of miners in Durham, Northumberland, and other parts of England who are very much opposed to legislation to fix the hours of labour for coal-miners? Yes; I believe that in the majority of cases in the northern counties the miners work only six hours a day, and the reason why they object to legalising the eight hours is that they are afraid that they would be compelled to work longer than they do at present.

239. Then, I gather from your evidence, that if the provisions with regard to ventilation and the hours of labour and as to bratticing were all enforced, nevertheless the price of coal would not be increased? I believe that the Bill would be satisfactory to the northern miners without the provisions for bratticing. I would not insist on that. I go for the cut-through at every 25 yards, and they should have the air conveyed along the headings nearest the working faces.

240. The only reason why you approve of the Bill is that you are in favour of eight hours being provided for by Act of Parliament? We wish to make it the law of the land.

241. For no other reason than that? We want to make it a certainty along with other amendments of varying importance already referred to.

- Mr. A. Cook. 242. Are there not a number of people who think that by making eight hours a day's work there would be employment provided for a larger number of people? No; the length of time which they work now is only eight hours.
- Nov., 1893.
243. *Chairman.*] You must be aware that one mine requires more ventilation than another; 150 cubic feet of air might be sufficient in the case of one mine whilst 1,000 cubic feet of air would not be enough in another;—do you not think it would be better to leave the matter in the hands of an inspector and let him say how much air shall be supplied? In mines where there is gas it will be absolutely necessary for each working place to be bratticed up to within 3 yards of the face. It will be impossible to work the mine unless this is done.
244. You have no suggestion to make with regard to ventilation except as regards bratticing? No; I will not insist on the bratticing.
245. Had it not better be left to an inspector to say, if he finds a mine dangerous, "I must have a brattice put here, or have another furnace put in"? The Government Inspectors will have that power, even under this Bill. We only ask that a minimum quantity of air should be specified. If, in the opinion of the inspector, more is required, more will have to be supplied.
246. Are you aware of the minimum specified by the English Act? There is no minimum in the English Act. It says that an adequate amount of air shall be supplied.
247. You do not think that sufficient? I think we ought to be assured of at least 150 cubic feet of air per man. Some people seem to think that we have no danger from gas, but we generally find out, when lives have been sacrificed that we have gas in the mines. Persons have been severely injured in some of the mines in the northern district, and there was a great loss of life at Bulli some years ago through an explosion of gas.
248. You are aware that very different opinions are held about the Bulli accident? It is believed that it was an explosion of gas, from which, I think, there can be no reasonable room for doubt.

WEDNESDAY, 15 NOVEMBER, 1893.

Present:—

HON. W. H. PIGOTT IN THE CHAIR.

HON. E. VICKERY,		HON. E. COMBES,
HON. W. LAIDLEY,		HON. H. E. KATER,
	HON. A. H. JACOB.	

Mr. Alexander Ross, junior, called in, sworn and examined:—

- Mr. A. Ross, junr. 249. *Chairman.*] What are you? Colliery manager for the Newcastle Wallsend Company.
- 15 Nov., 1893.
250. Have you read and considered the Bill which is now before us for the regulation of coal-mines? Yes.
251. Will you shortly state what your opinion is with regard to the Bill? I may state at the outset that I was examined in 1890 on the then Bill brought in by the Government. I still hold the opinion which I then expressed, that the collieries will be far better if we had the English Act in its entirety, with the exception of a few minor details, to suit the working of our colonial collieries. I was pleased to see that the Government, when they introduced their Bill, embodied in it most of the clauses of the English Act, but before it left the Assembly clauses were inserted which have destroyed the efficacy of the measure.
252. Have those clauses improved the Bill? No; they have destroyed the efficacy of the Bill generally in my opinion.
253. Can you particularise those clauses? I would first refer to clause 2. That has reference to the hours of employment. I am opposed to making eight hours a day's labour by law, because in cases of emergency, which do happen in the best regulated collieries, this compulsion would be found to work very harshly indeed.
254. *Mr. Laidley.*] It is eight hours with twenty minutes off? That stoppage of twenty minutes to the Wallsend colliery, which is the largest in the Colony and has put out the largest quantity of coal in the eight hours, would represent an additional expense in getting the coal from 4d. to 6d. a ton.
255. *Chairman.*] On the whole output for the year? On the whole output.
256. What is the average output per day? About 2,600 tons.
257. Suppose this provision as to the eight hours was in force, would it be beneficial to the workmen themselves? I do not see that it would. The arrangement existing between the miners and the mine-owners is such that eight hours per day are considered the drawing hours in the northern district.
258. But that is by a voluntary arrangement? That is an amicable arrangement between the two parties.
259. If it were made compulsory, would it be beneficial? No, it would be injurious.
260. Speaking generally, what effect would the introduction of the compulsory eight hours have upon the working of the mine? We have sometimes to retain men in the collieries, and boys to drive, if we have great falls. That is to ensure the working of the mine on the following morning. If the Bill is carried as proposed we shall not be able to keep men to do that. Fresh gangs will have to be employed, and that would involve additional expense, whereas if we have not a defined rule we could keep our shift men one or two hours to do what is wanted.
261. Then it would not be beneficial to the miners? No, nor to the mine-owners. The miners could not go to work the next morning if the mine was not repaired that night.
262. *Mr. Vickery.*] It is the usage of the district to work eight hours a day? Yes.
263. It is only exceptional to deviate from that? Yes. I have heard that it has been said that the managers in the north keep their boys at work more than eight hours a day. I have been a manager in the northern district for a period of sixteen years, and I know that since the arrangement came into force no manager keeps his boys working in the mine more than eight hours, except under very extraordinary circumstances.
264. *Chairman.*] So you are of opinion that the clause making eight hours compulsory is unnecessary? I think so.
265. *Mr. Combes.*] You say that it would increase the cost of getting the coal by 4d. per ton? Yes; it would add 4d. per ton to the 2,600 tons of coal which we draw during the eight hours.

Mr.  
A. Ross, junr.  
15 Nov., 1893.

266. *Mr. Kater.*] Do you draw 2,600 tons of coal every day? That is the average day of eight hours.
267. *Mr. Laidley.*] That loss is caused by the twenty minutes being taken off? Yes.
268. *Mr. Kater.*] Is that a matter of guess, or of absolute calculation? A matter of calculation.
269. *Mr. Vickery.*] That is a loss of £43 Gs. per day? Yes.
270. *Chairman.*] Have you anything else to say about clause 2? Clause 2 says that the men shall work six hours on each alternate Saturday. That I cannot understand. I may also say that I have 600 miners, 117 shaftmen, and fifty odd boys, and I have never heard this compulsory eight-hour system asked for.
271. Have you had any conversation with them about it? Yes, at times,
272. What opinion have they expressed about it? They say, "What is the eight hours needed for? We have our understanding with the proprietors, and they have never sought to transgress. We are rarely asked to work more than eight hours a day."
273. So, from your conversation with this large body of men, you are of opinion that the workmen do not desire a compulsory eight-hour system? I would not say that, but I have never heard of any complaint, because the proprietors have never sought to make the men work more than eight hours. Some miners work six hours, and some work seven; very rarely do any of them work eight hours. They go into the mines in the morning, and come out when they like. The latter part of clause 2 says, "And no person so employed below ground shall draw or hew coal on the pay Saturday." I think that is a very arbitrary provision. It might happen that we should want a few tons of coal drawn out. We might want to make a new flat, and want to draw coal to make additional places in the mine, but if this clause were passed we should be prevented from drawing any coal.
274. *Mr. Laidley.*] Have you heard any miners express their views upon the eight-hour question? I have had private conversations with them.
275. Do you think they approve of it? They would approve of it as a body.
276. *Chairman.*] You say that they already have exactly what the Bill proposes to give them? They have.
277. Have they every alternate Saturday off? Yes; that is pay day. It is a holiday throughout the northern district.
278. Every fortnight? Yes. Our boys do not work more than eight hours a day. Some say it is the boys they wish to protect. The boys are at their places for work in the morning at 7 o'clock; they have two half-hours for meals during the day, and they leave off at 4. They are in the mine more than eight hours, but they do not work more than eight hours. There is the time occupied in walking in and walking out, which, we think, ought not to be calculated in the working hours. It would not be calculated in the case of a mechanic going to and from his work in Sydney.
279. Is that calculated now? No; we simply ask the boys to work eight hours, whether they are driving a horse, pumping, or baling water.
280. *Mr. Laidley.*] If the Bill becomes law, will it not materially affect the export trade in coal? If there was a full trade it would affect it materially.
281. *Mr. Vickery.*] Would it not affect the trade still more if it was a small trade? The trade would not feel the loss; but if the harbour were full of ships, as I have often seen it, it would then affect the trade.
282. *Mr. Laidley.*] It would detain the vessels? Yes; that is what I mean.
283. It would be detrimental to the interests of the coal trade generally? Yes.
284. *Chairman.*] What is the next clause which you wish to speak upon? Clause 3, which refers to the boys. I wish to refer to the age at which boys are to be allowed to work. I would say, as I said before the last Committee, that I do not consider the provisions in the present law very hard. There is no hardship in asking a boy to go to work at 13 years of age. The Public Instruction Act says that a boy must go to school until he is 14, but it would be a hardship upon his struggling parents with large families to compel the boys to remain out of the mines until they are 14. A boy's work at 13 in the mines is very easy. I think that the age fixed by the present Act—13 years—is the proper age for a boy to commence work in the mines. In the English Act it is 12 years.
285. *Mr. Vickery.*] How much a day do you give such boys? From 2s. to 2s. 6d. It is a very great help to poor families.
286. *Mr. Kater.*] Can you say, from your own knowledge, whether the boys entering the mines at 13 years of age clashes with the Public Instruction Department? I have never heard that it does.
287. Have parents been brought up and fined for their boys not being at school? Not to my knowledge. When a lad reaches 13 years, and his father wants his assistance in the mine, he simply gets a certificate of competency from the inspector, and we employ him.
288. *Mr. Combes.*] The English Act makes the age twelve years, and you say it should be thirteen? Yes; I think it is a fair age.
289. *Chairman.*] Which is the next clause to which you would refer? Clause 5, which prohibits the payment of wages at public-houses. The clause says "or place belonging or contiguous thereto or occupied therewith." By an arrangement with the Bank of Australasia, the bank pays the miners in the employ of the Wallsend Company at the bank, instead of at the colliery. This is a matter of great convenience to the proprietors and to the men, but if this was passed, though it is in the English Act, the bank might not be able to pay the men, because the bank is on the same premises, on which there is a public-house erected.
290. *Mr. Laidley.*] Have you heard of any objection to it? None whatever. It may be said that as the public-house is close by, the men will go there to spend their money, but that does not happen.
291. *Chairman.*] Which is the next clause to which you would refer? I would refer to clause 6, which says that the miners shall be paid, "according to the actual weight gotten by them of the mineral contracted to be gotten, and unless otherwise mutually agreed upon, &c." I think that this provision is really unnecessary. The present Act works very agreeably indeed. The portion that I have read should stop at the words, "be paid according to the weight gotten by them." The present Act contains fewer words.
292. Do you think that the provisions of the present Act would work satisfactorily to all parties? I do. I have never heard of any quarrel between the miners and the employers about the matter, except in the matter of standard weight, which I shall refer to later on.
293. *Mr. Kater.*] What is your objection to these words;—Is it that they are unnecessary verbiage? I think so.
294. Have you any other objection to them? No.
295. *Chairman.*] What is the practice now;—Is not one skip weighed out of a number, and an average taken? Yes.

- Mr. A. Ross, junr.  
15 Nov., 1893.
296. Under this provision, every skip would have to be weighed, would it not? I think it would. It would mean that every skip of coal that came out of the mine must be weighed, if the miners demand it.
297. Is that practicable? It would not be practicable at Wallsend, it might be at small collieries, but we could not do it. We have 4,000 skips of coal taken out of the mine every eight hours. That is eight skips per minute. We could not weigh eight skips, as they came out of the tunnel. It would cause delay, and the miners would not be able to get their work out.
298. *Mr. Vickery.*] You weigh as many as two men can weigh, then take the average? We weigh one skip in every eight, and by actual calculation at the end of the fortnight, we find that nothing could be more fair. Sometimes it comes out a ton over, and sometimes a ton less. But nothing could be more fair to the miners than the system of averaging that we have now. I have never heard of any disputes in the collieries in the Newcastle District, in reference to that system. If the clause is passed as it is, the miners could insist on every skip being weighed, and that would be a great infliction on both parties.
299. *Mr. Laidley.*] Would it not mean great additional cost in the getting of the coal? Yes; not only in labour, but also in plant.
300. And the detention of the collieries generally? Yes.
301. And the ships in port? Yes.
302. *Mr. Kater.*] And you think that the extra labour would be quite useless? Yes; quite useless.
303. *Mr. Laidley.*] Have you heard complaints of the present mode of weighing? No.
304. The men do not object to it? I have not heard that they do.
305. *Mr. Combes.*] What is the practice in England under the present Act? I could only speak from hearsay.
306. *Mr. Kater.*] What is the provision in the English Act? Clause 12 of the English Act is very nearly the same as clause 6 of this Bill. Our mines having been constructed in accordance with the requirements of the present Act, I think it would be a very injurious thing to so alter the law as to cause extra expense all round. The present Act as it is would certainly do so.
307. *Mr. Laidley.*] If they had to weigh every skip would that mean the employment of more labour at the pit? Yes.
308. That means an extra cost per ton in getting the coal? Yes.
309. *Chairman.*] Do you know whether the provision in the English Act has been found difficult to work under? I could not say.
310. You have no actual knowledge as to how that clause works? Only from hearsay. Mr. Boyd, whom you have summoned to give evidence, and who is in my office, has lately come from England, and he can explain something about it.
311. *Mr. Jacob.*] What is the date of the English Act? 1887. I may say that a large number of collieries in England are still weighing as they were weighing before the Act was passed, the Act not being enforced where the miners and their employers agree.
312. *Chairman.*] Do you desire to say anything further with regard to clause 6? Yes; sub-clause 3, which refers to the standard weight is not in the English Act. That was added to the Bill by the Assembly. It was not introduced by the Government. I think that sub-clause would inflict an arbitrary rule upon the collieries which have always worked according to the standard weight. We have not the standard weight at Wallsend, but I know companies that have.
313. *Mr. Vickery.*] What do you mean by the standard weight? In this way: The proprietors say that the miners, in filling their skips, must not put more than a certain quantity of coal into each skip. By calculation, the proprietors know that the ropes that wind and haul the skips along, the axles, the skip wheels, and the plant are not capable of carrying more than the manager says the skip should hold. If the standard weight is 13 cwt. and the miner puts 13 cwt. 2 qrs. into his skip, he simply loses the 2 qrs. The miners can gauge their skips so closely, that very few of them fill more than the standard weight. When I was manager of the Newcastle Colliery I never had more than twenty pairs of men who could be caught filling more than the standard weight. By a standard gauge, if a miner's skip comes up filled too high, and stops the work, that coal has to be thrown out and the skip is put to the accident society, which receives the benefit of it.
314. *Mr. Laidley.*] If a miner fills a skip beyond 13 cwt. it will damage the machinery, will it not? Yes; it is likely to do so, and that is why the proprietors who have the standard weight agree mutually with the miners.
315. It has been the custom for years, has it not? Yes; at the Co-operative Colliery and others it has been the custom ever since the colliery started.
316. *Chairman.*] So you think that this provision would be prejudicial to the interests of both the masters and the men? Yes. The large majority of miners take good care not to fill more than the standard weight. I admit that some of them raise a great objection to it, but there is nothing in the objection. It is all in his own hands.
317. *Mr. Kater.*] Is it in favour of the miner or against him, filling the truck too full? It is in his favour, provided it does not exceed the standard.
318. Do you ever find a miner put more coal into the skip than he need put in? At the last colliery at which I was manager not more than twenty pairs would be found doing it in a fortnight.
319. Do you find many miners put much less into the skips than they ought to do? Yes.
320. Then it cuts both ways. If one side is mentioned the other ought to be? We do not say that they must not fill less than the standard weight.
321. Is it in favour of the miner if he puts less than the standard weight? No; the more he can keep to the average weight the more he will earn at the end of the fortnight.
322. What I want to get at is whether the miners, for their own benefit, put in less coal than they should do sometimes? They please themselves.
323. *Chairman.*] Which is the next clause to which you would refer? Clause 7, sub-clause 1. That section says:—

The persons who are employed in a mine, and are paid according to the weight of the material gotten by them, may, at their own cost, station a person (in this Act referred to as "a check-weigher") at each place appointed for determining the deductions, in order that he may, on behalf of the persons by whom he is so stationed, take a correct account of the weight of the mineral, or determine correctly the deductions, as the case may be.

I should like to see the words, "who shall be an employee of the colliery" inserted after the words "station a person."

324. What is the object of that? The miners can surely obtain a suitable person among the large number employed in the mine without going outside to choose a stranger, whose interests might be inimical to those of the proprietors. I do not object to any employec out of our 600 hands being chosen, but I do want to say that a person shall not be chosen outside of the Wallsend Colliery. Mr.  
A. Ross, junr.  
15 Nov., 1893.

325. *Mr. Jacob.*] Are you aware that the miners desire to have the right to choose a person outside the colliery? Some, I believe, have expressed that wish.

326. You think that should not be? I think that it is unnecessary.

327. *Mr. Laidley.*] There has been no complaint up to the present time about the check weighman not being one of themselves? Not that I have heard of. I should like to refer to this line, "at each place appointed for determining the deductions." "This gives the check-weigher the power to say what deductions shall be made in the skip. The miners sometimes fill dirty coal, but, if the check-weigher has to determine what is dirty coal, the whole thing will be in his hands. At present the proprietors' man says this is not marketable coal, and we cannot have it." If the clause remains as it is the check-weigher might say that it was marketable coal, and he would have power to determine the deductions. I think these words would be far better left out. We have no quarrel now with the men about the matter.

328. *Chairman.*] You say that you have had no trouble with your men upon the subject? I have not.

329. Do you desire to say anything further about that clause? Yes; the clause says—

(1) A check-weigher shall have every facility afforded to him for enabling him to fulfil the duties for which he is stationed, including facilities for examining and testing the weighing machine.

I should like it made to say that he is to see the testing of the weighing machine as he does now. He can ask at any time to have the weighing machine tested, and it would be tested at once. The clause also says, "and checking the taring of tubs and trams where necessary." I should like to erase these words. They imply that the miner can ask for every skip to be weighed that comes out of the colliery. At Wallsend that would be impossible.

330. *Mr. Laidley.*] Do you not think it is impossible in other mines? I do; but I speak more particularly of my own.

331. It would lead to great delay? Yes; and the output of a large colliery would be curtailed to a wonderful extent.

332. *Mr. Combes.*] Unless some very expensive machinery were erected for weighing, it would necessitate the employing of a great number of men? It would necessitate the employment of more hands as well as the altering of the machinery. It would be inflicting serious injury upon collieries that have been opened under the existing law. I would ask that in sub-clause 3 the words "or determine such deductions," and that the words "or the taring of the tubs" be taken out.

333. *Chairman.*] You object to the check-weigher having the power to determine the deductions? Yes.

334. *Mr. Laidley.*] On what grounds? He should not have power to determine the deductions. It is for the proprietor to say what coal is marketable and what is not.

335. *Mr. Vickery.*] You are willing that he should see the tubs tested, and see them tared? There is no taring at present, and to have it in the Bill means that they will have it in their power to say that every skip must be weighed.

336. *Mr. Combes.*] I do not understand that? The tubs are skips that go into the mine. Under the English Act they do tare the tubs if there is not an agreement on the subject between the masters and the men. It is a very satisfactory arrangement which now exists, and the miners agreed to it over twenty-five years ago. When the suggestion came out first to weigh the coal at the bottom of the screen, that is, when the small coal has passed between the bars. That practice has remained in existence ever since, and to my knowledge has never caused any dissatisfaction.

337. *Chairman.*] What is the next clause to which you object? I would ask to have the word "tare" struck out in all the sub-clauses of clause 8. The clause says:—

Where a check-weigher has been appointed by the majority, ascertained by ballot, of the persons employed in a mine who are paid according to the weight of the mineral gotten by them, and has acted as such, he may recover from any person for the time being employed at such mine and so paid, his proportion of the check-weigher's wages.

This does not refer to coal-mining. It is simply a matter between the miners and their check-weigher. The question of the payment of the check-weigher should not be provided for in the Act. It is giving power to the check-weigher to recover from every man in the pit. No doubt the check-weigher will take care that he gets his wages from the men.

338. *Mr. Kater.*] What objection is there to it;—is it not simply to allow the man to get his wages from the miners? They now pay the check-weigher through the lodge, but if eight or nine men left the lodge they would refuse to pay the check-weigher, and, according to the Bill, the lodge would have power to go to the manager and say, "You must deduct so much from that miner who will not pay the check-weigher." I do not really think it is necessary to have this in the Bill.

339. *Chairman.*] What is your next objection to the Bill? I would now refer to clause 10, sub-clause B, which says:—

Every mine shall be provided with some automatic contrivance to prevent over-winding.

That is not in the English Act, and I am opposed to it. I think it would lead to more accidents than happen now. A Commission sat in England not many years ago to ascertain exactly how the automatic contrivances were working, and they found that more fatal accidents happened in England where the automatic contrivances were in operation than in the same proportion of collieries where no such contrivance was used. If an engine-driver knows there is an appliance at the pulley-heads that will prevent an accident from over-winding taking place, he becomes careless. Depending on such contrivances has cost men their lives. If the machinery gets a little coal-dust into it, or gets out of order in any way, it fails to act when wanted, and accidents happen.

340. *Mr. Kater.*] Is this contrivance used in England? It is in some of the collieries.

341. In some only? Yes.

342. And do you know that in those collieries, as a rule, the winders have become careless, or is it only an inference on your part? I obtained my information from the report of the Royal Commission.

[*The Hon. E. Combes took the Chair.*]

Mr. A. Ross, junr. 343. *Chairman.*] What is the next clause to which you wish to refer? Clause 13, sub-clauses 1 and 2 of that clause are the same as the English Act, but sub-clause 3 is as follows:—

15 Nov., 1893.

Within six months after the commencement of this Act, every mine, unless worked on the long-wall system, shall be divided into districts or splits of not more than sixty men, exclusive of wheelers and horses; and each district shall be supplied with a separate current of fresh air, which shall be taken to within 15 yards of each working-face by brattices or otherwise where gas does not exist, and to within 3 yards of the working-face where gas does exist.

That sub-clause lays down a very hard-and-fast rule, which would not be found to work in the best interests of the coal-miners and the coal-owners. We all know that to divide air-ways into little splits really means weakening the current and lessening the ventilation throughout the mine.

344. Do you think it is practically possible to get as much air as that within 15 yards of the working-face? With the present appliances I say no. We should have to get additional appliances to get that quantity of air to within 15 yards of the face. I presented a working sketch to the last Committee, showing the injurious effect in my opinion of splitting the air too much. It would be much better to have splits of 100 men instead of sixty men. If all the bords and working-places in the Wallsend colliery had to be bratticed throughout, I calculate that I should have to get about 4,000 yards of brattice-cloth for the colliery, and from my calculation I have arrived at the conclusion that it would cost fully 5d. to 6d. per ton on the coal for the supply and maintenance of that bratticing. General rule 1 in clause 42 says:—

An adequate amount of ventilation (not in any case less than 150 cubic feet of pure air per minute for each man and each boy and 200 cubic feet for each horse employed in the mine) shall be constantly produced in every mine, and shall sweep undiminished along the airways and into each working-place.

I maintain that it is practically impossible to force that quantity of air undiminished into each working-face.

345. Without very expensive machinery? Yes.

346. It could not be done with the ordinary furnace? It could be done, but there would have to be additional furnaces, and very likely additional air-shafts.

347. These fans and other ventilating machinery are, I believe, very expensive? Very expensive indeed.

348. I have seen them 30 feet in diameter, and very costly? I think we have the largest fan in the Colony at the Wallsend Colliery; it is 40 feet in diameter.

349. What, in your opinion, would be the extra cost entailed in getting the coal if such a provision were carried out? For 5d. or 6d. per ton.

350. *Mr. Laidley.*] Under that clause only? Under that clause only.

351. *Chairman.*] You say this after making a minute calculation? Yes.

352. *Mr. Laidley.*] And there would be no further benefit to the men? I do not think so. If the brattice has to be in every bord to force the air from the first miner to the sixtieth man, the latter and large portion would receive all the foul air and smoke from the other men. It is much better to let the air pass the working-place. The clause says:—

And no place shall be driven more than 25 yards, exclusive of the cut-throughs, away from the current of the air.

353. Is not the present distance 35 yards? Yes.

354. If they only cut 25 yards, would not that mean more labour? I do not know that it would mean more labour, but it would mean greater cost in yardage, and certainly more shift-men would be required.

355. If you have to have a cut-through at every 25 yards, instead of every 35 yards, you must employ more labour? It would cost at least an additional 1½d. per ton for every ton of coal that came out of the mine, whilst there would be from 5d. to 6d. extra for the bratticing, and the latter would be of no benefit to the miner.

356. That would swell the estimate which you gave previously? Yes. That would have to be added to the 4d. a ton which I gave for the twenty minutes' loss of haulage or day's work. There would be that 4d. per ton; there would be from 5d. to 6d. for the expense of bratticing, and 1½d. a ton for the lessening of the cut-through. I do not see that there is the slightest necessity for having such hard-and-fast rules in coal-mining Acts. There is no quantity of air specified in the English Act, only there shall be an adequate quantity. That Act does not say that the air shall pass into each working-place. It does not give the length of the cut-throughs, and it does not say that men are not to travel by the air-ways. The English Act had three years' consideration from a Royal Commission from the most practical and scientific men, and we cannot put our experience against the best evidence that they could produce in the United Kingdom, yet they formulated a rule such as the English Act without specifying details such as is mentioned in this Bill. These hard-and-fast rules are decidedly more against the best interests of mining than in its favour.

357. *Chairman.*] Under the English Act, the mines are placed under inspectors? Yes; and whatever the inspector thinks right is generally done.

358. There are mines that are gaseous and mines that are not? Yes. The mines of England are far more dangerous than the mines in the Colonies, yet in England they have chosen to omit from the Act the hard-and-fast rules which our legislators seek to impose here, and which must mean that the mines are not so well managed.

359. *Mr. Kater.*] You say that the extra cost entailed by the bratticing will be from 5d. to 6d. per ton? Yes; for the bratticing and the maintenance of it.

360. You say that at present the proposed volume of air could not be forced round those places by bratticing? Yes.

361. But you do not say whether if you supplied an extra quantity of air it could be forced round? To force it round would require more appliances.

362. It could be forced round? Yes.

363. You seem to say that it could not be, and then it could if you got air enough? With the present appliances it could not be forced round.

364. With present appliances it could not be done? No.

365. Then your objection is entirely to the cost? I have also mentioned that it would not be for the benefit of the miners.

366. I think your sole objection is as to the matter of cost. You said it would cost an extra 5d. or 6d. a ton to put in the bratticing, supplying additional machinery to force the air round, and having to get so many yards of coal down? That is a matter of cost; I have mentioned also that it would be no benefit to the miners.

367. These, the three things which mean an additional cost, you object to? Yes; there are other things as well.

368. *Chairman.*] That extra cost comes to 5d. or 6d. a ton? Yes, without adding the cost of additional appliances.

369. *Mr. Kater.*] Within how many feet of the working-face does the air go now by brattice or otherwise? By the present Act it goes within 35 yards. That is the maximum. The air does go in and out to a certain extent of every place now by the movement of horses and skips, and the men also.

370. *Mr. Laidley.*] You mean that the miners should have sufficient air without regard to the cost? I do not mean to say that they should not have sufficient air but let the Act read as the English Act, or remain as it is, then we must have sufficient ventilation, but we should not be dictated to in detail as to how it should be supplied.

371. You would not have a hard-and-fast rule? No.

372. *Mr. Kater.*] All your objection is based on the matter of the cost to the mine-owners? That is one of my objections.

373. That is the whole of your objection;—you have mentioned three things which are all based on one objection—the additional cost? Yes; and without benefit to the miners.

374. *Mr. Laidley.*] You think that the miners ought to have a sufficient amount of air? Certainly, but allow the English Act or the present Act to remain in force.

375. Suppose the Bill became law to-morrow, would that not mean the employment of more labour? It would in some cases; but if the provisions with regard to ventilation were enforced some portions of the collieries would have to discontinue working, and a number of men would be thrown out of work.

376. What do you think would be the effect on the mines generally in the Newcastle district if the Bill became law? The effect would be very injurious.

377. Would it not cost more to produce the coal? It would certainly cost more throughout the whole of the Colony.

378. How much do you think? It would cost 4d. a ton in the lessening of the drawing; it would cost from 5d. to 6d. for bratticing, and 1½d. per ton for the extra yardage—from 9½d. to 10½d. per ton all round.

379. Could the coal be produced under this Bill so as to leave a margin of profit to the owners at the present price of coal? Not at the present price.

380. I want to lay particular emphasis on that question;—will there be any margin of profit to the owners if the provisions of this Bill are enforced? In my opinion there will not.

WEDNESDAY, 22 NOVEMBER, 1893.

Present:—

HON. A. H. JACOB IN THE CHAIR.

HON. J. HOSKINS,

HON. H. E. KATER,

HON. W. LAIDLEY,

HON. E. VICKERY,

HON. E. COMBES.

Alexander Ross, junior, further examined:—

381. *Chairman.*] Perhaps you will resume your evidence where you left off at the last sitting, that was at clause 13? My last examination closed at clause 13. The next clause to which I wish to refer is clause 26, sub-clause 2. The words "on application" in the fourteenth line should be struck out. I hold that if it is compulsory for each company to supply returns as stated, the forms should be supplied by the Lands Department, as is done now.

382. Without their being applied for by every company in the trade? They might forget to apply for the form at the end of the year. I would next refer to clause 27. I should prefer that the word "six" should be substituted for the word "three." In most of our collieries the seams are high, and the distance travelled in three months is short, so that surveys made every three months would be found to be travelling over the same ground, and there would be no additional ground shown on the plan. I would also refer to clause 34, sub-clause 5. This, I may say, is an additional sub-clause. It is not contained in the English Act. The powers given to inspectors in the clause are sufficient without this new sub-clause. It gives the inspector the power to require the manager to withdraw the men if he finds inflammable gas in the mine, or of any cause whatever. This, in my opinion, is giving too much power to inspectors, who cannot possibly know as well as the manager the true condition of his mine. The manager only should have the responsibility of his men.

383. *Mr. Hoskins.*] Is it not a fact that under the English Act the inspector has this power? No.

384. Have you read the English Act? I have; and I have not found anything in the English Act bearing upon it. The preceding clauses, 1, 2, 3, and 4, give the same powers as the English Act to the inspectors.

385. *Mr. Kater.*] If the inspector considers the mine dangerous, you would not allow him to withdraw the men? No; I think that responsibility should be on the shoulders of the manager.

386. Would it be possible for the manager not to know? I do not think so, if he has able officers under him. Rule 7 in clause 42 says: "If at any time it is found by the person for the time being in charge of the mine or any part thereof, that by reason of inflammable gases prevailing in the mine or the part thereof, or of any cause whatever, the mine or that part is dangerous, every workman shall be withdrawn from the mine or part found so dangerous." The power is given in that rule to the management to which I do not object at all.

387. *Mr. Vickery.*] Does not the 4th sub-clause give him almost the same power. It says: "To exercise such other powers as may be necessary for carrying this Act into effect"? I do not think it would reach that far, but it is a great power.

388. What is the next clause to which you would refer? Clause 42, rule 1. When dealing in my previous examination with clause 13, rule 1 of this clause was pretty well gone into. I should only here like further to say that if rule 1 on the ventilation of the mines in the English Act of 1872 has been found, after fifteen years' trial, to be so satisfactory as to be re-enacted, word for word, in the Act of 1887, after exhaustive examination on the subject by a Royal Commission, we ought, with every confidence, to adopt it word for word, and avoid the numerous details proposed in this Act.

- Mr. A. Ross, junr. 22 Nov., 1893.
389. *Mr. Combes.*] It was passed again in 1887? Yes.
390. And was never altered? Never altered, though a Royal Commission sat, and obtained the best opinions that could be obtained in the United Kingdom.
391. *Mr. Vickery.*] But they did re-enact it? Yes.
392. It provides for adequate ventilation? Yes.
393. *Mr. Kater.*] You wish to get rid of this provision? Yes, and insert the provision from the English Act.
394. What clause of the English Act? Clause 49, in the Act of 1887, relating to the ventilation of mines. It requires that an adequate amount of ventilation shall be constantly supplied in every mine to dilute and render harmless noxious gases, &c., &c.
395. *Chairman.*] What is the next clause to which you would refer? I wish to refer to rule 4. I advise that after the word "lamp," the following words in the English Act be inserted, "except in the case of any mine where inflammable gas has not been found within the preceding twelve months." That simply relates to the inspection of places each day by a proper man. The proposed Act requires that the competent person shall always have a safety-lamp, whether there is gas or not, but the English Act wisely provides that if there has been no gas found there for twelve months prior the man shall have power to inspect the places without a safety-lamp.
396. *Mr. Kater.*] Is that an advantage? It is a great advantage.
397. *Chairman.*] What objection is there to a safety-lamp? The safety-lamp is only necessary where there is gas. Without it the deputy has a better light, and gets along quicker, and is able to detect more readily dangerous places in every part that he visits.
398. The safety-lamp is not so convenient? It does not give such a good light as an ordinary lamp.
399. What is the next point to which you would refer? Rule 14. I object to manholes being made 6 feet high. It would be very absurd in a seam 4 feet high to make the manhole 2 feet higher, and in mines where gas existed it would be exceedingly dangerous. Let the height be made according to circumstances. In the English Act the height is 4 feet. I should advise that there should be no fixed height for the manholes. The manholes should not be higher than the seam.
400. *Mr. Vickery.*] If it is higher it allows the gas to accumulate in the top? Yes; the gas would naturally accumulate there.
401. *Mr. Kater.*] I suppose it might be made in the floor? Yes; but 4 feet would be enough for a man to stoop in. If a man should drop down 2 feet, that would be a nasty drop. When the seam is 6 feet high I have no objection to the manhole being 6 feet, but when the seam is less than that, let the manhole be the height of the seam.
402. *Chairman.*] What clause would you refer to next? In rule 15, 6 feet is again mentioned, and respecting that I would repeat what I have already said.
403. *Mr. Kater.*] Does not the English Act say that 4 feet shall be the minimum? I do not object to 4 feet.
404. *Chairman.*] What is the next point? Rules 17, 20, and 22, dealing with workings under tidal waters, ought not, in my opinion, to be inserted in the Bill. They are not in the English Act, though in Great Britain they have mines working miles under water.
405. What is the next point to which you would refer? Rule 24, dealing with pillars not under the ocean. That rule is not in the English Act. It is a great interference with coal-mining. The manager should be the best judge as to the size of the pillars left, and when to take them out. When working the Welsh bords it specifies that sufficient pack-walls should be built, when really good timber chocks, without the props outside, would be better.
406. What is the next point? Rule 29 refers to coal not to be worked under roads. I would advise that this be struck out altogether. It is unjust and too interfering.
407. *Mr. Hoskins.*] In what way is it unjust? I would refer you to the Wallsend Colliery, of which I am the manager. They have held their land for very many years, but the Government could at any time make new roads in any part of the estate, and if this provision is passed the Company could not work the coal underneath. It would interfere with the whole working of that part of the mine. After we pass through the roads we should have to start afresh.
408. *Mr. Kater.*] You have only to get the sanction in writing of the Minister? Yes; but I do not think that it is fair, seeing that the Company have had their land prior to the passing of the Act.
409. *Chairman.*] What is the next point to which you would refer? Rule 39, with regard to barometers, &c. I should advise that the words "where gas exists" be added to that rule; and, really, as far as my opinion goes, I would rather say erase the rule altogether. Where gas exists, barometers and thermometers tell the tale when the mischief has already been done. That is my experience. I would also refer to Rule 44, with regard to the appointment of workmen's inspectors. The words, "or any two persons not being mining engineers" I think should be struck out. I would also suggest that the words "the owners, agent, or manager" be struck out. Clause 7 deals with the grant of certificate of service. I approve of the clause, but the marginal note does not appear to be correct. I think it is only fair that long-service managers should have certificates of service the same as they had under the English Act of 1872.
410. *Mr. Hoskins.*] Are you pretty well acquainted with the provisions of the Coal Mines Regulation Act of England? I have read it through.
411. I suppose you are aware of the number of people who follow the occupation of coal-mining in Great Britain? The number is very great.
412. Would you prefer to have the English Act in force here? I would, with the exception of a few minor details, which I have enumerated.
413. Will you tell the Committee why you prefer to have the English Act instead of this Bill? Briefly, my reason for that is that it does not provide those hard-and-fast rules which are, in my opinion, so inimical to the best interests of mining throughout the Colony. The English Act does not interfere with mining as this Bill proposes to interfere.
414. Do you consider that if the Bill became law as it is now, that it would have not only a prejudicial effect on the working of the coal-mines, but that it would not be so effectual in preventing accidents as its authors imagine? Yes; I quite agree with that.
415. *Mr. Laidley.*] If this Act were in force, what would be its effect on the miners and mine-owners in the Newcastle district? It would deprive a great many men of work, and it would considerably increase the expense of working the mines, and it would certainly shut some of them up.

416. Would it close any of the mines at Newcastle? Under existing circumstances, it would.
417. They could not continue to work at the present prices of coal and labour? They could not.
418. Therefore, it would really recoil on the miners' wages? It would, eventually.
419. They would have to pay for it? I think so.
420. *Chairman.*] A Member of the other House has asked the Committee to summon two gentlemen from Newcastle, Mr. May and Mr. Green, who, he says, are mining teachers;—do you know them? Mr. May is employed by the Technological College to teach mining to young men; he has classes in various townships. I think he has three classes in the Northern district. Mr. Green I do not know.
421. *Mr. Laidley.*] Has he any in your district? He had one, but I think it has failed.
422. *Mr. Combes.*] Do you know what qualifications these gentlemen have? I do not. I know Mr. May only to speak to.
423. Have they been practical miners? I could not say; Mr. May has not been long in the Colony.
424. With reference to your evidence with regard to Rule 1, where you state that the cost of getting the coal would be increased so much a ton if the bratticing were carried out, I would ask whether, on further considering the subject, you have any doubt as to the correctness of the evidence you have given on that point? I am quite satisfied that it would cost what I have stated.
425. You did not make an extravagant estimate? No.

Mr.  
A. Ross, junr.  
22 Nov., 1893.

Adam A. Boyd called in, sworn, and examined:—

426. *Chairman.*] Where do you reside, and what are you? I reside at Wallsend, and I am mining surveyor for the Wallsend Company.
427. This Committee is holding an inquiry concerning the Coal-mines Regulation Bill, which has been sent to the Legislative Council from the Assembly;—have you studied that Bill at all? Yes; I have written down a statement that I have to make. I may mention first that I have had eleven years' experience in coal-mining; three and a half years in the Colony, and the rest in Great Britain, and I am the holder of a first-class certificate of competency from the Home Government as a mining manager. I am acquainted with the Coal Mines Regulation Act at present in operation at Home. The first part of the Bill to which I take objection is clause 2. If this clause is retained, which really means seven hours and forty minutes work, it will seriously limit the output of a mine. All well-regulated mines or collieries work up to their fullest capabilities. That is to say, the machinery is running its utmost, compatible with safety, so that lost time cannot be overtaken. Twenty minutes' curtailment in the working time would mean a proportional decrease in the output. At Wallsend this would mean a loss of, on an average, 128 tons per day. I think it is unnecessary for me to state that a decrease in the output is accompanied with a proportional increase in the cost. At Wallsend this would be an additional 4d. per ton on the output.
429. That would be the result if this clause were passed? Yes; owing to the deduction of the twenty minutes. At present we work eight hours a day.
430. *Mr. Vickery.*] What is the whole output of the mine? 2,600 tons a day.
431. And it would add 4d. a ton to the whole of that 2,600 tons? Yes.
432. *Chairman.*] What is the next matter to which you would refer? I should like to mention the restriction with regard to the employment of boys in mines. Clause 3 says that the age shall be fourteen years. The English Act makes it twelve years, and I think it has never been shown that it was any injury to the health of boys to be employed in mines at the age of twelve years. To take twelve months off would be a great hardship to parents, who are very often depending greatly on what their children can earn.
432. *Mr. Vickery.*] The present Act says thirteen years? Yes.
433. And you think that is old enough? Quite. The next clause to which I would refer is clause 6:—This clause imposes a very serious drawback to the output of a colliery being maintained. In fact it would be impossible in some of our large mines to carry on the work and weigh every skip. In England, where mining is all conducted by shafts, the output in each is limited, but here we have a mine drawing as many as 4,000 skips per day of eight hours, or on an average, eight skips per minute. Although this clause is in the English Act, yet it is not acted up to in its entirety, as I personally know a large number of collieries where occasionally a skip is weighed, and I can also point to others, but small collieries, where only one skip is drawn at a time, and where every skip is weighed. This, I think, clearly proves that where the output is large, it is an impossibility, or at least a great hindrance to work to weigh every skip.
434. Sometimes they draw thirty or forty skips at a time? In England, owing to the outcrop portions of the seams being exhausted, tunnels are quite out of date. There are nothing but shafts. Some of the older shafts are only drawing one skip at a time, and then there is plenty of time to weigh every skip.
435. *Mr. Combes.*] You weigh one skip in every four? We weigh one in eight.
436. *Mr. Laidley.*] You think it would be a serious loss of time to weigh every skip? Yes.
437. It is almost impossible, is it not? I do not see how it could be possible in a large mine like the Wallsend mine.
438. *Mr. Hoskins.*] Do you think it is necessary even in the interests of the miners? No; averaging is equally fair to miners and mine-owners.
439. *Chairman.*] What is the next clause to which you would refer? Clause 7:—No check-weigher should have the power given him to say what he considers should be deductions. He is not in a position to know what is really marketable coal. The master has the best knowledge of what he can sell.
440. Still this is in the English Act, which has been in operation for some years? Yes.
441. What is the next point to which you would refer? Clause 13, sub-clause 3, and rule 1, which goes with it. It is a great fallacy to fix any hard and fast rule regulating the size of splits. This should certainly be left to the judgment of the manager of the mine, who will see that the air is split most effectively. Splitting of air currents to a certain extent is advantageous to the quantity obtained, but as soon as a certain limit is reached the current becomes so sluggish that it does not effectively ventilate the workings. Unless where gas exists, bratticing should not be compulsory. It is quite unnecessary. Bratticing, as proposed in this Bill, would cause an enormous amount of friction to the air current,  
owing

Mr.  
A. A. Boyd.  
22 Nov., 1893.

Mr.  
A. A. Boyd.  
22 Nov., 1893.

owing to the increased area of rubbing surface offered to the current. Another and very strong objection is that the powder smoke, fumes, &c., would be conducted round and into every working place, making the atmosphere more vitiated than it otherwise would be. The number of men should not be stated. Allow the manager to manage his mine. I have seen a great many collieries at home, but I never saw brattice used in one of them unless where they worked with locked safety lamps and feared sudden outbursts of gas. In rule 1, to which I would like to draw your attention at present, as it goes hand in hand with the one under discussion, I think the words "adequate amount of ventilation" is quite sufficient without adding any arbitrary words regarding the quantity to be supplied. No fixed quantity is laid down in the English Act. There it is recognised that varying circumstances alter requirements. The words "and shall sweep undiminished along the air-ways and into each working place." It is impracticable to follow out the above clause. According to this it would be necessary to have everything air-tight, which is impossible underground. At present our mines are fitted with ventilating machines or furnaces with sufficient power to give 100 feet per man in compliance with the present Act. Then leaving out of the question the extra power it would take if brattice was employed, with this increase of air from 100 to 150 would mean an increase in the power of three and a half times—that is to say, where two boilers do the work it would take seven. No distance is specified in the English Act about cut-throughs, and yet I never heard a miner complain that it was too far behind him. It is absurd to think that a return air-way cannot be used as a travelling road. It is very unfair to many colliery proprietors who have gone to the expense of preparing a good travelling road, in which the return air courses. It is very unfair. Perhaps the whole system of ventilation might have to be changed, &c.

442. *Mr. Vickery.*] The cut-throughs, according to the Bill, are to be 25 yards apart? Yes.

443. In the present Act the distance is 35 yards, do you think there is any reason for reducing it? There is no reason at all. I do not think that the length of the cut-throughs ought to be stated in the Bill.

444. *Mr. Laidley.*] Does it not mean more labour if this is to be done and the bratticing carried out? I do not know that it means the employment of more labour.

445. Will there not be extra work in cutting 25 yards? There will be more labour.

446. *Mr. Combes.*] The question is whether doing this extra work would not involve more labour? Certainly it would.

447. *Mr. Kater.*] Supposing the extra work were done, would the miners themselves be benefited by having a greater quantity of air and better air? I think not. If the bratticing were carried out as proposed in the Bill the miners would receive all the powder smoke, and some of them would be nearly suffocated. At present the current sweeps past the bords and they get sufficient fresh air.

448. *Mr. Laidley.*] It would be injurious to them? Certainly.

449. *Mr. Kater.*] Surely those nearest the air current would be benefited? Yes; those in the first part of the split, but it would make it all the worse for those at the other end.

450. You just said that all would suffer; you said it would be worse for them all;—do you mean that? All would suffer except the first two or three. It would not be any better for them, and it would be worse for the other twenty-seven bords.

451. *Chairman.*] Then it would do more harm than good? Yes.

452. *Mr. Combes.*] Would that apply to the Welsh bords? Yes; of course it would not apply to a long wall.

453. *Chairman.*] What is the next point to which you wish to refer? Clause 27, which provides for the surveying of the mine every three months. I think that every six months is as often as is necessary. In these high seams which we are working here the face does not advance a pillar's length in the six months, so that to make it three months would simply mean that there would be nothing additional to put on the plan.

454. *Mr. Vickery.*] What you mean is that the mine plan should be completed every six months? Yes.

455. *Mr. Laidley.*] There is nothing to be gained by surveying the mine every three months? Nothing.

456. *Chairman.*] What is the next clause to which you would refer? Clause 34. I should like to mention sub-clause 5, about the inspector having power to withdraw the miners. I strongly object to the inspector possessing this power. The manager is responsible for the management of his mine, and he is the person who is best able to judge of its safety. The manager should be as little hampered as possible. He should be given full scope to use his judgment and experience. This clause is not in the English Act.

457. You consider the sub-clause wholly unnecessary? Yes. Rule 15, with regard to the height of the manhole, is altogether wrong. We might have a 4-foot seam or a 5-foot seam, and suppose the manhole is 6 feet high, and there is gas in the mine, the gas would lodge in the cavity, and if a man went into it with a light on his head, it would explode. The manhole ought not to be higher than the ordinary roof.

458. *Mr. Kater.*] I suppose you have compared notes with Mr. Ross about the clauses of this Bill? Not all the clauses.

459. You compared notes as to the Bill as to what you would object to? No.

460. *Chairman.*] You have simply expressed your own views? Yes. I did not compare notes with Mr. Ross on the Bill.

461. *Mr. Laidley.*] From your experience as a mining manager, what would be the effect of this Bill if passed? It would involve extra cost in getting coal.

462. Would it be much more? I should say from 10d. to 1s. a ton more.

463. *Mr. Kater.*] Is that a guess? No; I have gone into it.

464. You thought of that beforehand, and worked it out, did you? Yes.

465. Is that your own calculation, or did anyone else work it? It is taken from the clerk in the office.

466. *Mr. Laidley.*] Is anything to be gained by the men or anyone else by the passing of this Bill? No; nothing.

467. *Chairman.*] Have you a pretty good knowledge of the working of the English Act? Yes.

468. Would you prefer to have that Act in operation here or this Bill? With a few exceptions, I should prefer the English Act, though I do not consider that it is perfect.

469. But you would prefer it to this Bill? Oh, certainly.

470. Do you consider the existing Act in this Colony preferable to this Bill? Yes.

471. *Mr. Vickery.*] Is there really any need for a new Act in this Colony? I think not.

472. *Chairman.*] The present Act works well? Yes.

473. *Mr. Kater.*] It is quite sufficient? I think so.

474. It does not want mending, in your opinion? No.

475. *Mr. Laidley.*] Would it be possible for some of the mines at Newcastle to work at any profit at all under the Bill with the present price of coal? No; it would close up several mines in the Newcastle district.

476. *Mr. Kater.*] Have you ever heard of any agitation for the present Act to be amended, or for a new Act to be passed? No.

*Mr.*  
*A. A. Boyd.*  
22 Nov., 1893.

Joseph Croft called in, sworn, and examined:—

477. *Chairman.*] Where do you live? At Newcastle.

478. What are you? Manager of the Newcastle collieries.

479. Have you prepared written evidence on the Coal Mines Regulation Bill? I have.

480. Does that contain all your views on the subject? Yes.

481. Will you hand in that evidence on oath? Yes.

*Mr.*  
*J. Croft.*  
22 Nov., 1893.

*Part I clause 2—Employment of male persons.*—I think that the provisions regarding eight hours should be more definitely stated. The clause reads, "Work below ground in any mine more than eight hours inclusive of one break of twenty minutes for the purpose of obtaining food," on the days named, I should like it to say exclusive of one hour for meals and the time occupied travelling in and out of the mine. I do not wish in any way to increase the hours of employment beyond eight, but wish it to be distinctly stated that the eight hours should not include travelling in and travelling out, it simply means that as in every other occupation he is going to his work.

*Page 2, clause 6, sub-section (II).*—The system provided for in this clause could not be satisfactorily carried out in the working of a mine, it would very seriously interfere with the out-put, and the cost of the coal would be increased. From one of our mines we take out and tip five skips of coal per minute. How is it possible to weigh them. I would ask that the word "actual" in line 53 be omitted, and that in line 54 after the word "gotten" the words "as ascertained at the weigh-screen" be inserted.

*Page 3, clause 6, sub-section (III)—Standard weight.*—Erase this clause. You could not work your mine with such a provision in the law. There are many reasons for that. The manager is the best judge of what weight of skips his machinery will carry. He is the best judge as to what is safe, and the height to which the skips should be loaded. When a train of skips is coming along at the rate of 12 to 14 miles an hour with coal piled to high above the skips, it will simply knock everything to destruction. You put up appliances to carry a certain working-load, and if you allow the men to overload the skips you disarrange everything. The manager must have the power to enforce discipline.

*Page 3, clause 7, sub-section (1).*—*Appointment on part of men and removal of check-weigher.*—Line 39, after "person" add "who shall be an employee of the Company." Line 42, after the word "or" omit "determine correctly" insert "of." The check-weigher should not have the power to determine deduction, as it would lead up to no end of argument, confusion, and probable stoppage when refuse is sent out. A check-weigher should be an employee of the Company. They might appoint somebody who would be very offensive to the manager. They might appoint a man who had been dismissed for insulting conduct. We wish to prevent this possibility by making it imperative that the check-weigher should be an employee of the Company.

*Sub-section (II), line 46, after "and" insert "seeing"; line 47, omit "and checking the taring of tubs and trams where necessary."*

*Sub-section (III), line 56 and 57, omit "or determine such deductions"; also, in line 8, omit same words.*

*Sub-section (IV), line 17, omit "such"; same line, omit "determining"; line 18, omit "such deductions." The check-weigher in present Act was not allowed to interfere with the weighing authorised only to take such account.*

*Page 5, clause 10, section (d).*—*Automatic contrivance.*—Lines 55 and 56 to be omitted. This is not in English Act. I would rather leave the responsibility upon a competent engine-driver, and let him have no excuse for neglecting his work. The appliances get rusty, or something goes wrong with them. If you allow an engine-man to suppose that you have provided something to take away the danger, it will make him careless.

*Page 7, clause 13, sub-clause (III).*—*Division of Mines into Splits.*—I am opposed to the minimum size of splits. I take it that only a given quantity of air for ventilation can enter a shaft in a given period, and if this is divided up into a number of splits the current would be weakened, and a less quantity of air per minute is supplied than would be the case if there were fewer splits. Could work the mine better if I had 100 men in a split, and it would be better for the health of the miners, because it would give in moiety 4 feet of air every second instead of 2½ feet. Ask to have seventy men, exclusive of wheelers and horses, in each district, not sixty, as provided in clause. Object to brattice where gas does not exist, and ask that after "air," in line 30, the remainder of clause be omitted.

*Page 11, clause 26, sub-section (II), line 14, omit "on application."*

*Page 11, clause 27, line 32, omit "three," insert "six."*

*Page 14, clause 34—Miners may be withdrawn if inspector finds cause of danger.*—Erase sub-section (v). I do not think the inspector should have the power to withdraw the men from a mine unless the Government became responsible for any loss that may arise. Manager should be competent to judge as to the safety of his mine. An inspector cannot be expected to be so thoroughly acquainted with the conditions of a mine as the manager and overman who are in daily touch with the mine. I think that where the inspector is of opinion that danger exists he should have the power to call the attention of the manager or sub-manager to the matter, and if they disagree in opinion with the inspector, the aid of a third person might be called in.

*Page 19, part (II), rule (I).*—*General rules.* I look upon the provision as it stands in the Bill as impracticable and unnecessary, because a door would have to be erected opposite every place, and as there would be thirty places by the time the air would reach the last bords, the accumulation of impure air which would come from the other bords would be carried into the last bords, and have a very injurious effect on the miners working there. Ask for 100 instead of 50, as in line 25, cubic feet of pure air per minute for each man and boy; object to line 29, which says "and into each working place." I would be satisfied if, instead of into each working place the rule were to read, past each working place; I would ask for the same cut

Mr. J. Croft, cut through distances, as we have at present "35 yards, exclusive of the cut-through," not 25 yards. Line 36, after "through," omit down to "travelling roads" inclusive. Line 40 goes on to say, "and no return air-way shall be used as a travelling road"—that is wrong; there should be no such words in the rule; I have cleared out return air-ways for the purpose of making it a safe road for the men going in and out, in place of using the engine road; men can go in and out with perfect safety, and it is perfectly pure.

22 Nov., 1893.

Page 20, rule 4, sub-section (1). Object to the books being open to the inspection of the workmen, as they may be made a lever for vexatious complaints; should be open only to the inspectors.

Page 23, rule 17.—*Width of pillars and position under ocean.*—I think these provisions are an interference with the ordinary management. One part goes on to say, "and the size of the pillars shall be such as will afford ample support after exposure to the crumbling effect of the air over many years." No man could say what would be a proper size for the crumbling effect; ask that the minimum width of the pillars of coal shall be six yards. The thickness of pillar must be decided by the circumstances, the depth, thickness, and character of the coal.

Page 24, rule 20, line 17. After "every" omit "bord" insert "winning headings, narrow bords, or leading levels."

Page 25, rule 29. Would ask to erase the whole of the clause. I think that without any reference to the Minister or any interference of the inspector we ought to be allowed to continue our working in the ordinary course if the cover was sufficient to protect the road, say, anything like 100 feet.

Page 26, rule 39. Ask to add at end of this rule "where gas exists"

Page 26, rule 43. I object to the inspector giving any person a written authority to take copies of the extracts, object to any person employed in the mine being allowed to inspect and take extracts from the books. He should make the inspection himself, and quite independently. These independent reports should then go to the Chief Inspector, who would deal with them without any prejudice. Books should only be accessible to an inspector.

Page 27, rule 44. I think the miners inspectors should forward their own complaints, and not make the Mining Manager the vehicle for conveying the complaints of the men to the inspectors.

482. *Chairman.*] What is your opinion as to the result, if the Bill becomes law, to the interests of coal-miners, coal-owners, and others? It would make a loss, taking the three items into consideration, the bratticing, the extra yardage, and the loss of twenty minutes per day, 1s. a ton.

483. You have worked that out? Yes.

484. *Mr. Kater.*] What is your output? About 1,500 tons a day.

485. Would the Bill, if in force, leave any profit to the proprietors of the collieries? I am positive that it would be the means of closing several mines in the north. At our own colliery, it would mean the putting off of a great number of our hands, if we were to act up to the conditions imposed in the Bill.

486. *Mr. Hoskins.*] Would it also, if brought into operation, compel the mine-owners, if they wished to have any profit at all, or to keep the mines going to reduce the miner's wages? Decidedly the wages would have to be reduced the moment the new Act came into operation.

487. To what extent? I could not answer that at the moment.

488. *Chairman.*] Would you prefer the existing Act to this Bill? I should certainly prefer the Act which we are now working under.

489. *Mr. Vickery.*] Is there any great complaint by miners and others against the provisions of the existing Act? I have never heard anyone complain about the hours of labour.

490. *Mr. Kater.*] Has there been any complaint with regard to any other parts of the present Act? No.

491. Do you consider that the Act wants amending? A few clauses which I have referred to.

492. You are perfectly satisfied with it? I am satisfied, with the exception of clauses mentioned in my evidence. I have worked under it for fourteen years.

493. Are the miners satisfied with the present Act? Yes.

494. You have never heard anything to the contrary? No.

495. Are you conversant with the English Act? I have been through it several times.

496. Would you prefer it to the present Bill? With some modifications.

497. You prefer the present Act to this Bill? I do.

498. *Mr. Combes.*] You think that the powers given to the inspectors under the present Act are quite sufficient to ensure the safety and the proper working of the mine? Yes; I am against the inspectors having certain powers.

499. *Mr. Kater.*] Are you satisfied with the powers that the inspectors have under the present Act? Yes; with certain modifications, as stated.

500. You think they are sufficient for the safety of the mine? Yes.

501. You would not curtail them? Only in the way I have mentioned.

502. Are the inspectors under the present Act clothed with too much or too little power? I think they have too much power with reference to the stoppage of mines.

503. *Chairman.*] Is that power provided in this Bill? Yes.

504. *Mr. Laidley.*] Is it the English Act? No.

505. *Chairman.*] Would you like to say anything more? I should like to draw attention to the clause with reference to certificates of service. In a marginal note it says, "under managers"; it should be "under manages." The clause should read in the same way as that of the English Act of 1872.

WEDNESDAY, 29 NOVEMBER, 1893.

Present:—

HON. W. H. PIGOTT IN THE CHAIR.

HON. J. HOSKINS,

HON. E. COMBES,

HON. A. H. JACOB.

Mr. George Henry Green called in, sworn, and examined:—

506. *Chairman.*] What are you? A mining engineer by profession and a certificated colliery manager.
507. What are you doing at present? I am working as a shiftman below ground.
508. What experience have you had in mining? I have had seventeen years experience here and in the old country together? I commenced as a mining pupil.
509. What is a mining pupil? A mining pupil is one who is apprenticed under a mining engineer to serve his time according to the custom in the old country. They are called mining pupils in the old country. You must serve five years according to the English Act. Then you must sit for examination, which I did. In 1879 I received my certificate of competency as a colliery manager. Also I was teacher of the coal-mining classes connected with the Newcastle (New South Wales) Technical School for two years.
510. What experience have you had as a practical miner? I do not quite understand what you mean.
511. You are now working as shiftman in the mine? Yes.
512. Do you know anything about the getting out of coal? Yes; I know all the operations in connection with mines. I have served as overman; I have got coal for a short time; I have worked as repairer in the old country, and been overman, under manager, and manager.
513. You are acquainted with the Bill we are dealing with? Yes.
514. Have you gone through it? I have gone through a portion of it.
515. What portion? I looked at the general rules, principally in clause 42.
516. Have you confined your attention to those rules? No; I have not. But owing to circumstances over which I had no control I have not been able to give that amount of time to the measure which I intended to give to it.
517. Will you state what you approve of and what you object to in the Bill? In the first place, as regards ventilation, the first rule provides that there shall be a certain amount of ventilation.
518. It provides for an adequate amount? Yes; it specifies a minimum.
519. Have you any objection to that? I have no objection to the quantity as a minimum. My own opinion is that if it is supplemented by canvassing or bratticing in the working places a minimum of 125 cubic feet per minute would be sufficient.
520. Have you anything to say further with regard to the rules? I thought that when I came here some information would be asked for.
521. You have come to give us some information about the Bill;—we want to know what you have to say about it? I have not made any special preparation; I want to say something with reference to splitting the air. Sub-clause 3 of clause 13 says:—

Within six months after the commencement of this Act, every mine, unless worked on the long-wall system, shall be divided into districts or splits of not more than sixty men, exclusive of wheelers and horses; and each district shall be supplied with a separate current of fresh air, which shall be taken to within fifteen yards of each working face by brattice or otherwise where gas does not exist, and to within three yards of the working face where gas does exist.

First of all, I wish to speak with regard to splitting: As a professional man, who has had a lot of experience, and has had a good deal to do with the ventilation of mines, and who has made a good deal of experiments with regard to splitting and otherwise, that a general system of splitting is very desirable. Also, that up to a certain point it will always benefit the ventilation of a mine. I have found in the old country that you can divide your ventilation into a certain number of splits, but you must not go beyond that number, or certain disadvantages will attach to it. I find the usual number is from ten to a dozen splits in large collieries. In large collieries you can have that number without diminishing the efficiency of the ventilation. Of course, as a matter of fact, the limit to which you can carry your splitting depends on the size of your shafts, and in the case of gaseous mines the velocity of the air current which you get in the working faces. I find when the splits are carried out to ten or a dozen that then the limit is not reached, that is to say, that up to that point the velocity was not reduced below an effective one in the face of the workings, nor was the quantity of air so much increased as to require any enormous power to get it through the shafts. As regards the number of men in the splits, there is no provision here for splitting in long wall working. I do not suggest that any should be made, although I think it would be advantageous to do so, but I wish to say that if you have sixty men in a split you ought to be able to provide places for any number of men to get an output equal to that of the largest mines we have in existence at the present time. As regards the bratticing, I hold that the air which is taken into a working mine unless it is taken into the face where the miners are working is only half effective; in fact, not that I know from experience, that if you are working in the face of the working-places and have no air carried in, it may be 25 or 35 yards from the current, the men must be working in an unhealthy atmosphere. If you have a dip working-place it will ventilate itself to some extent, but where you have rise-places and working-places at which the roof is higher than the hole through which the air passes, in such a case you cannot possibly expect to get more than a very moderate amount of air passing to the miners' working-places. And, as a rule, in this district most of the very bad atmosphere is in the working-face. I know that it is so, and I think that bratticing ought to be carried out to some extent in those working-places. I believe the Bill provides that the brattice shall be taken to within 15 yards of each working-face. I believe that the matter of a yard or two is not of so much importance as that the air shall really be turned into those working-places.

522. *Mr. Jacob.*] There is a distinction made with regard to gas or no gas? I am referring particularly to places where there is no gas. No one requires information as to a place where there is gas. Anyone with any practical acquaintance with the subject would admit that a place must be bratticed if there is fire-damp. There are mines in the Newcastle district which are bratticed now. I have often heard it remarked by miners that they prefer to work in a mine in which there is a certain amount of gas, just sufficient to require a brattice to keep it away from the working face, the reason being that in such

cases

Mr.  
G. H. Green.

cases they get good air carried up to the place where they are working. I am informed that there is an objection to bratticing, as the cost of it is very high on the one hand, and, secondly, that the additional resistance offered to the ventilation will make it impossible to ventilate a mine. As regards both these points I am in a position to give a little information. As a matter of fact, every mine in which I have worked in the old country, and I have been in a score of the largest mines, canvassing is used. Where there is gas there must be brattice. It is a matter of necessity then, and no difficulty is found about it. I have been employed in mines where they have been raising 1,500 tons of coal a day. I was under manager at one such mine, and throughout the mine in what were called the "whole" workings, canvas was made use of to ventilate the working faces. It was carried up according to special rules, and kept within 4 yards of the working face. It was a deep and very fiery mine, and proper ventilation was provided by means of a large fan. I have been employed in a mine in the Newcastle district, in which a certain amount of gas is found, and of course it is found necessary there to do the same thing, to brattice the working-places, but not to such an extent as was necessary in the North of England; not to keep the brattice within 4 yards of the working face, but generally to brattice so far as was necessary to keep the places clear of gas. My occupation for a time consisted in canvassing faces and conducting the air into them, and I found it absolutely necessary to canvas every place that was either flat or rise.

523. *Mr. Combes.*] Not in the dip? It is not necessary in the dip places. That is not necessary unless you have much black damp, or holes in the roof, &c. As a matter of fact there are no difficulties that cannot be overcome in regard to the ventilation by canvassing the places. As a student of mining and the laws which govern the ventilation of mines, I can calculate closely what would be the result of putting canvas in certain districts; canvassing the stalls and bords. According to the accepted rules as regard ventilation, I can calculate what you might expect would be the increase of power in such a case. It would be as well for me to mention the figures. I assume the intake into a bord or working face to be 8 feet by 6 feet where the main intake is 10 feet by 7 feet. I assume that the 8 feet by 6 feet is divided off by the canvas bratticing; taking an ordinary split with sixty men in it, you have thirty bords, and the average amount of canvas you will have in them will be about 10 yards if you are going to brattice up 20 yards as a maximum: so that on an average you would have about 300 yards of canvas bratticing in the bords. Generally speaking, I do not think that the increase of power in any case would be more than 10 or 15 per cent. Of course the power varies exactly in proportion to the quantity of coal consumed. It means that you would have to use from 10 to 15 per cent. more coal. As to the cost of bratticing, I do not think that that is such a great item as some people may imagine it to be. When I was doing this work I had to brattice the places up every day of working, and the output of that district would be about 200 tons a day. If you take 5s. for a half-day and the output is 200 tons—a man could easily follow up 150 tons in that way—I was following up 200 tons a day. Take 150 tons as a fair output for half a shift, and say that a man is doing nothing but attending to the canvas, and say that the charge is 5s. for that class of work, it is lower now. That gives you something between 3d. and 4d. as the cost of the labour for the canvassing. That is what it actually cost in cases where I was employed. I know from my experience in English mining that in no case has it cost much more than that. I had a place out of which 200 tons a day were coming. I kept it all ventilated. I hung the sheeting, took down all the old canvas, and rehung it where it was required, and kept the ventilation going in all the places, the whole of which were canvassed, except two dip places.

524. *Mr. Combes.*] And you ventilated by the ordinary furnace? No—by a fan, 30 feet in diameter.

525. Was that in England? No; that is in the northern district of this Colony. The cost comes out much the same in the old country, where you have a deputy attending to the work. He attends to the timbering and to the laying of turns, and also does the brattice work. He generally has an output of 60 to 80 tons a day to deal with. Where the output is from 60 to 80 tons a day the amount of canvassing is very small. It does not mean much more than a dozen places (sometimes I have known eighteen), and the man has to put the cogs into their places. Part of his work consists in doing that in timbering and laying the road turns, and only a small proportion of his time is taken up with canvassing. That means that certainly not more than a quarter or a sixth of his time is taken up with this canvassing work.

526. Your fan was used as an exhaust fan? Yes. What I have said will give some idea of the actual cost of bratticing in some cases in this country.

527. *Chairman.*] Have you finished with that clause? I have to refer to the cost of the material. In the north of England the cost of brattice cloth is 6½d. or 7d. per square yard, the same as it is here. I have known a gaseous mine with a large output, in which every place in the "whole" was canvassed, and the cost of the "whole" output (that is, not including the output of the pillar workings) was about 16 of a penny per ton of the coal got—about one-sixth of a penny. Of course the cost of bratticing would vary slightly with the conditions. If you have a wet mine, or one which works only one day a week, the canvassing will not be so cheap an item as it is in a mine working six days a week. The canvas rots whether you are working every day or only one day in six. The sum of my experience is that canvassing can be carried out in favourable cases at a half-penny a ton in this Colony. I like to substantiate a statement like that, because I know that most people are under the impression that it costs a great deal more, and it is necessary to get actual facts to oppose to wholesale assertion.

528. *Mr. Combes.*] With regard to the ordinary price of bratticing, what would the increase of cost per ton be? In certain mines, where they have a little gas, there would be no increase at all. I never had to do with mines until recently that were not canvassed. All my experience has been in mines that were canvassed.

529. I suppose all mines are more or less canvassed? In some mines there are a few sheets, but they add nothing to the total cost. Even in long wall collieries, fiery mines, the cost of canvassing has been very small. I worked one out to satisfy myself, and it came to some few hundredths of a penny per ton.

530. You are not prepared to say what the increased cost per ton would be? No; I have stated what I have known to be the total cost in some instances, and that was a halfpenny per ton.

531. *Mr. Hoskins.*] I understand you to say that you have been assistant manager in some mine? Yes, assistant manager, and also manager, both in this country and in England.

532. Are you pretty well acquainted with the Bill generally? I have not read it through; I have only glanced at it. I received an invitation to come and give evidence.

533. Could you say whether if the provisions of the Bill were strictly enforced it would or would not increase the cost of getting coal? It would undoubtedly increase the cost somewhat. 534.

534. Can you give an approximate idea as to what amount? There is the question of the eight hours involved in that. The eight hours might cause a diminution in the output, and the increased cost would depend on the extent of that diminution. I know as a matter of fact that the limitation of the hours of boys in the North of England did not increase the cost of the coal to any great extent. I think that in the case of the reduction of the hours of the boys, with sundry other alterations, the cost of the coal was increased by something approaching 1d. a ton.

535. What do you consider would be the increased cost of getting the coal if this Bill were rigidly enforced? I cannot answer for the result of the eight hours. If the eight hours is passed, and the men are simply paid by the hour, the increase of coal would be very slight from that source; the improvement in the ventilation would probably amount altogether, including bratticing, to  $\frac{1}{2}$ d. I think, as a matter of fact, that there would be no great increase in the cost.

536. I understood you to say that if the Bill became law, and were strictly enforced, it would increase the cost of getting coal? Yes.

537. Are you in favour of enforcing the eight-hour system by law? I cannot say I am in favour of legalising or enforcing it.

538. Will you give us your objections to it? A reduction in the hours would always mean in the case of a colliery manager a certain amount of high-pressure work. I do not think that any colliery manager wishes to have any higher pressure than he has at present. A man does not want to be forced into matters of that sort. I think that haste and hurrying in mining has a tendency to increase the number of accidents. Perhaps this tendency has not come out as strongly as it might have done if there had not been a good many improvements of various kinds introduced along with the reduction of hours.

539. Have you any further objection to the eight hours being legalised? No. I think when a big majority are in favour of a certain kind of legislation I should be inclined to sacrifice my own opinion.

540. *Mr. Jacob.*] Are you aware that a majority are in favour of it? I believe that the majority of the miners desire the legalisation of the eight hours system.

541. Are they in favour of this eight hours provision in the Bill? I think they are in the Northern district.

542. *Mr. Hoskins.*] Does that mean eight hours from the top of the shaft until they come out again, or eight hours at the face? Eight hours on the top of the shaft.

543. That might be only seven hours working? It might be less. In the county of Durham, in England, it takes an hour and a half to get in and out of the mine.

544. As regards the men who are not paid for getting coal—the wheelers and others—they are paid by the day, are they not? Yes.

545. Supposing it were enacted that eight hours was a day's work, how would it be arranged with regard to those men? I suppose they would be paid in proportion to the hours they worked.

546. Would it not, in your opinion, result in a diminished output of coal? That does not follow, not if you have a sufficient number of miners and wheelers and others engaged in getting the coal. There are very few pits which are engaged in raising coal the whole of the day. The majority of them have a considerable amount of spare time both for hauling and winding. I think that with a little contrivance in the majority of cases the output need not be materially reduced; that is, if a sufficient number of men are placed in the mine to get the quantity of coal.

547. To get the same quantity of coal they are getting now; if a day's work is to be eight hours would it be necessary to employ a larger number of men? Yes.

548. Would not that tend to diminish the earnings of the miner? Not if the actual coal-getters can get their usual quantity. My experience is that a man would get as much coal in seven hours as he will in a longer time. As regards the daymen, I consider that they would have to suffer a reduction of their wages.

549. Are you acquainted with the provisions of the English Act regulating coal-mines in Great Britain? I have managed collieries under them.

550. Were you satisfied with the English Act? Yes; I was fairly well satisfied with it taking it all round.

551. I suppose you have some knowledge of the number of persons engaged in coal-mining in Great Britain? About 600,000.

552. Are you not of opinion that if the English Act were embodied in our legislation it ought to suffice to regulate the working of the mines here? I think the English Mines Regulation Act is a very good Act.

553. I suppose you are aware that the English Act provides that the English inspectors of mines shall be certificated men? Yes.

554. Is it not a fact that under the English Act it is in the discretion of the inspectors to decide when a portion of a coal-mine is unsafe, and that they are empowered to stop the working of the mine;—is not that discretion left with the inspector? No; the Act distinctly states that in case of a difference of opinion as to the necessity of stopping a mine the matter must be referred to arbitration.

555. It must be referred to arbitration if the proprietors of the colliery are not satisfied with the inspector's decision? Yes.

556. I suppose, as a matter of fact, that seldom occurs? It seldom occurs. I have not known many cases where the inspectors have acted on their own responsibility. Arbitration would be resorted to in a case where a manager thought the inspector wrong in his judgment.

557. Has that often occurred? Very rarely.

558. From your experience do you think these men are qualified for their position? Undoubtedly.

559. Do you or do you not think that the coal-mines inspectors here are equally qualified? I know only one of them, and I believe him to be thoroughly qualified.

560. *Mr. Combes.*] Do you not think that if the inspectors here are equally well-qualified men, as compared with those in England, the mines could be safely worked here if the matter was left to the decision of the inspectors, without having the mode of procedure indicated by hard-and-fast lines as it is in this Bill? I am not prepared to say what would be case in this Colony, but my experience is, as regards ventilation, that it is not satisfactory.

561. Have the inspectors been applied to by the miners? I cannot say. I have not been mixed up with miners' unions.

562. Being connected with the mines you should know? I have known the inspector's attention to be drawn to the fact that the minimum quantity of air was not being supplied. In most places where it has got below the minimum I think the manager has done his best to bring it up to the minimum.

563. That would be the case in England? Yes.

564.

- Mr. G. H. Green. 564. I presume you are aware that the Coal Mines Regulation Act in England has none of the strict technical hard-and-fast rules for the working of coal-mines which are embodied in this Bill—more is left to the inspectors of mines? More is left to the discretion of the inspectors of mines; but similar provisions to that in this Bill are contained in the special rules. As regards bratticing, in the Durham district the rule is that every place should be canvassed to within 4 yards of the face.
565. From your experience, with such a measure as this in force, where everything to be done is prescribed by rule, would it not be possible to greatly thwart mining enterprise by causing trouble in respect to alleged non-compliance with these strictly technical rules, and would it not be better to leave it more to the coal-mines inspector, as is done by the English Act? If there is any one particular item that you would mention I would give my opinion. As regards the ventilation the amount stated in the present Act is the minimum which ought to be supplied.
566. Are you aware that the minimum provided in the English Act is not the same as the minimum in this Bill? There is no minimum provided in the English Act. It says that an adequate amount of air shall be provided.
567. Mr. Hoskins.] Is not that sufficient? My experience is that the minimum amount is generally from 200 to 300 cubic feet of air per man.
568. Mr. Combes.] Suppose you go up to 200 cubic feet of air per man, and you have a dozen splits, and sixty men in a split, will not an enormous quantity of air be required? The quantity required would be 144,000 cubic feet.
569. Do you think you could possibly get that amount of air into a mine by ordinary draft ventilation? Yes. I have known cases in which much larger quantities of air have been circulated in a mine. I have known 180,000 cubic feet of air to be circulated.
570. With the fire? Yes; at the Hetton colliery they circulate over 200,000 cubic feet of air.
571. With regard to the eight hours, you stated that you did not think the time would make any difference in the cost of the coal, although in some cases the time occupied in going in and out of the colliery was an hour and a half? That was in England. I know that a man can go and earn what he is allowed to earn per day often in much less time than he usually takes.
572. I am referring to the men who are working at roads, at brattices, and other things—men who are not miners;—in your opinion, should not that twenty minutes be taken into consideration; should not eight hours be eight hours work at the face? I have already stated that as a colliery manager I should not advocate the eight hours. I should prefer longer hours for the purpose of getting the coal out.
573. What is your opinion about the twenty minutes? If the twenty minutes is taken off for travelling the remaining time should be quite sufficient for the men to do their work.
574. Is it not impossible that so much work can be done in the mine if this twenty minutes is deducted from the eight hours? As a matter of fact, in the North of England we found that the miners increased the work per hour as the hours were reduced. I believe that here the output per man would not be reduced, but even if it were there would not be any great difficulty in putting more men into the mine to make up the amount.
575. Chairman.] Have you anything further to say on the subject? In rule 34 I would suggest that the word "necessary" be substituted for the word "sufficient," in line 13. That is a rule taken from the English Act. It is intended to provide against a danger where the drums are made too conical. Up to a certain point a drum may be coned, and it is quite safe. After that a groove of some kind is provided, and we generally call these spiral drums. The word "sufficient" would cover all conical drums. In the case of an ordinary conical drum you can get any amount of arrangements that would be sufficient, but they might not be necessary. If a drum is not coned too much you can have a conical drum without any spirals or grooves to it. I may add that I am in favour of the manager and the under manager being certificated; and, further, that mines inspectors should pass an examination at least up to the standard of that passed by colliery managers in the old country, and should have a minimum of ten years' experience.

Mr. Jonathan May called in, sworn, and examined:—

- Mr. J. May. 576. Chairman.] What are you? A mining engineer and colliery manager. I hold a first-class certificate of competency under the English Act—being the highest diploma in coal-mining. I have been two years in present appointment—teacher of coal-mining, Government Technical Education Department, New South Wales.
577. What experience have you had? About twenty years' experience.
578. Continuous experience? Yes.
579. Have you gone through the Bill? Yes.
580. Do you approve generally of the principles of the Bill? I approve of the Bill generally. I think it is based very largely on the English Act, and I consider that the general framing of the Bill is intended to give us a very fair working measure.
581. Do you know the English Act pretty well? Very well indeed.
582. Do you know in what respects this Bill differs from the English Act? I notice that this Bill provides for a minimum quantity of air; that is one of the points in which it differs from the English Act.
583. Where it differs from the English Act do you approve of those differences? Yes; I approve of the three or four deviations that are made.
584. Do you approve of the eight hours? That is a matter which mining engineers do not have much to do with.
585. Taking the matter from a general point of view as regards the getting of coal and the working of the mine, will the introduction of the compulsory eight hours be beneficial or otherwise to the industry? In the North of England, where my experience was obtained, the men do not work very long hours. They object in the North of England to the eight hours, but it is because the men work only about seven hours. For ten years the two shifts of my men averaged about thirteen hours a day.
586. You do not approve of the eight hours? For that reason only I should not. The miners in the North of England say if men are so foolish as to work nine or ten hours, if they have not intelligence enough to get the eight hours for themselves, we will not lengthen our hours to suit them. Mr. Burt and other gentlemen have been used to seven hours and six and a half hours. I have before me the evidence of one  
of

of the largest coal-owners in England, Sir Joseph Peas, and he gives the number of hours which the miners work in Great Britain as seven hours and twenty minutes. The longest hours are at Nottingham, where the men work eight hours and twenty-three minutes, and the shortest in Durham, where in one case it is five hours and thirty-seven minutes. Mr. J. May  
29 Nov., 1893.

587. Is it your opinion that this second clause would not work beneficially either to the owners or the men? It would not work detrimentally, and considering the very great preponderance of opinion—in all mining communities—in favour of the eight hours principle, I think it would be a judicious settlement of the question.

588. If the hours are thus limited by law would it not have the effect of reducing the quantity of coal hewn? Most certainly not.

589. Then, with regard to the ventilation of the mine, the English Act provides simply that there should be an adequate amount? Yes.

590. This Bill provides a minimum? Yes.

591. Do you think that is a good thing? I think that providing a minimum quantity is a distinct improvement on the English Act. There is one matter which I would mention, and that is, that there would be some difficulty about defining the minimum. Suppose that the manager supplies 100 cubic feet of air and something took place, there is an idea that if 100 cubic feet of air per man is supplied, that exonerates him, but where the minimum is mentioned in the Act it would be very wise to have a distinct understanding that it shall by no means exonerate the management if there is not sufficient air. One hundred and fifty cubic feet of air is a fair and reasonable thing in a non-gaseous mine, but the mines which I have been used to had 400 and 500 cubic feet per man.

592. *Mr. Hoskins.*] Was that in this Colony? No; but you will find that in this Colony modern engineers, capable managers, are laying out their mines so as to get much larger quantities of air. Certainly 150 cubic feet of air is not an extra large quantity per man.

593. *Chairman.*] Is there any particular clause to which you desire to refer? At one time the mines used to work ten or eleven hours in England, but the boys were not permitted to work so long as that, the consequence being that we had to supply fresh boys at a certain time. From the experience which I have had I do not think it would be at all difficult for the men and boys to work eight hours, and to make arrangements for the mine to work ten or twelve hours, if required.

594. *Mr. Hoskins.*] I will refer you to the wheelers? The wheelers are working nine or ten hours at present. If the Bill came into force the wheelers would have to work only eight hours, but if the mine was to run for ten hours the manager would have to provide for men or boys to fill up the extra time.

595. *Mr. Combes.*] That would make it more expensive? Not if the daymen are paid so much per hour.

596. A lot of the men are paid by the day? I am speaking of the practicability of the thing.

597. *Mr. Hoskins.*] You have read the Bill through? Yes.

598. If it came into force would it not increase the cost of getting coal? It will increase the cost of day labour if the wages remain the same, but as far as any trouble or difficulty in introducing the eight hours it would not increase the cost of the coal by a penny a ton.

599. *Mr. Combes.*] The hewers of coal get so much per ton, and it does not matter to the proprietors how many hours they work;—it is the men who are paid by the day, and the cost of keeping the machinery going? The men work nine hours for 9s. Eight hours would probably mean 8s., or an equal ratio.

600. *Mr. Hoskins.*] It has been stated by a gentleman of great experience in coal-mining that if the Bill becomes law without material alteration it will increase the cost of getting coal at least 1s. a ton? That is really a marvellous statement, to say the least of it.

601. *Mr. Combes.*] There is the extra cost of bratticing 25 yards instead of 35 yards; that causes more labour, and the more labour there is the greater the cost? I have had an extensive experience with regard to bratticing, and my experience was that one deputy looked after the men, and did all the timbering. The men did their own timbering if the deputy was not there. The deputy supervised the men, laid the road, and put in what is called the bearing-up “stoppings,” and bratticed every bord and cut-through. The total cost of the deputy work in this case was about 1d. per ton. The proportion of his labour devoted to bratticing would be barely one-fifth of the total = one-fifth pence per ton. In the North of England, at those collieries, and they are a large proportion, where every bord and cut-through is bratticed, the cost of brattice per ton raised will be about one-eighth pence, or half a farthing, per ton.

WEDNESDAY, 6 DECEMBER, 1893.

Present:—

THE HON. A. H. JACOB IN THE CHAIR.

THE HON. E. COMBES.

THE HON. B. VICKERY.

Mr. Jonathan May, colliery manager, further examined:—

602. *Chairman.*] Are you a “certificated colliery manager”? Yes.

603. Under the Government? Yes; I am a teacher of mining under the Technical Education Department. Mr. J. May  
6 Dec., 1893.

604. Have you anything further to say in reference to this Bill? I was asked at the last meeting what would be the cost of bratticing. I have had a good deal of experience in bratticing. Bratticing was a general thing in the mines which I was used to. A deputy attended to the men, and to the timbering, if it was not put in when he reached the place. He supervised the men, and kept what is called the bearing-up stoppings in repair, and bratticed every place,—every cut-through and every bord,—and the cost of that was something like a penny a ton. The amount of labour devoted to the work of bratticing would probably be about one-fifth of his total labour, which would make the cost of labour for bratticing about one-fifth of a penny per ton.

605. *Mr. Combes.*] And there is the cost of the cloth? In the north of England that would average about one-fifth of a penny per ton of the coal raised. I might add, that bratticing is the rule in the north of England, that is the bratticing of every bord and every cut-through, in gaseous mines. I have here a plan of bord and pillar workings. In this case every district gets its own quantity of air. The air

**Mr. J. May.** air is conducted round the face by what are called bearing-up or face stoppings. Where I was for some years the deputy used to sign his name that he would keep the brattice within three yards of the face, but that became a dead letter, simply because the men used to say, "For heavens' sake take that brattice down." There was too much air for them.

6 Dec., 1898.

606. **Mr. Vickery.]** The Bill says the brattice must be taken to within three yards of the face? That is where gas exists. If provision were made for that in the Bill, it would not be done, because it would not be necessary. In the case I refer to, the brattice was seldom taken more than half way along the bord.

607. **Chairman.]** It would not be necessary to carry out that provision of the Bill? Not in that respect. There is no doubt that bratticing the air within three yards of the face has arisen out of accidents which would probably have been prevented if that had been carried out in the winning places, which in gaseous mines are bratticed as close up as is practicable.

608. **Mr. Vickery.]** In your estimate of the cost of bratticing, did you include the taking of the air to within three yards of the face? I know that, in extraordinary cases, you might take it to within three yards of the face, but not as a general rule.

609. **Mr. Combes.]** Under the present Act they can call the inspector's attention to these matters? Yes. The plan which I have produced shows the general system adopted. Under the present arrangements, there must be a cut-through at every thirty-five yards. Then, if there is no gas there, they are not compelled to brattice; if there is gas there, they are compelled to brattice. There may be carbonic acid gas, which is very injurious to a miner's health, but a man could not ask for bratticing for that.

610. **Chairman.]** Why could he not? Because it is not customary to do it, at present.

611. **Mr. Combes.]** He would only have to speak to the inspector? The inspector could not order it,—except where the air was extremely unsanitary,—owing to the difficulty of defining the phrase "adequate ventilation."

612. **Chairman.]** You are stating that of your own knowledge? Yes.

613. What is the next point to which you would refer? There is this point with regard to what is called adequate ventilation. It is difficult to define without some stated minimum.

614. That is provided for in the existing Act? Yes, and wisely so; it being so difficult to say what is adequate ventilation. Dr. Foster, in his evidence before the Mines Commission in Great Britain, said: "There is a difficulty. I find, in the wording of the Act. I mean in this respect. If you have to bring a charge of bad ventilation against the manager of a mine, you have to prove to the bench of magistrates (who don't understand the thing very often) that the ventilation was inadequate. The words are, 'an adequate amount of ventilation.' Now, you have to prove that it is in an unfit state for 'working and passing therein.' If you go before them, and they find that a candle will burn well and the manager says that the ventilation is perfectly good, and the candle burns perfectly upright—though you may feel convinced that the ventilation is not good by the smell of humanity and the smoke lying about,—then you would have a difficulty in proving your case."

615. **Mr. Combes.]** The ventilation, in my opinion, consists in changing the air? Yes; that is a very good definition.

616. Have you had any experience in the southern coal-fields of New South Wales, and in the western? I have been in the coal-fields in the Lithgow district, and I have been in the Illawarra district, and thoroughly understand their modes of working and mining conditions.

617. You know that there is no gas in the western district? You mean no carburetted hydrogen or "fire damp?"

618. Where the conditions are entirely different, I suppose you would not advise the adoption of a hard-and-fast rule with reference to ventilation? Not where the conditions do not require it.

619. You would not enforce one rule in several places? Where there are different conditions, should not there be different regulations? Yes.

620. And they could be set forth in any legislation that might take place? In the cases to which you refer I presume there is no gas.

621. If there is gas, more air will be required than where there is no gas? We say gas with regard to carburetted hydrogen or fire damp; but if there is carbonic acid gas or "choke damp," though a man's light will burn, it is very injurious to his health.

622. **Chairman.]** Which is the next point to which you desire to refer? I wish to refer to one of the schedules. It refers to the number of days in each month during which coal or shale has been drawn, a return of which has to be supplied. I should like to suggest that there be added to the annual report of the Mines Department the average number of days per week worked by the whole of the mines. At present we have a return from the report of that department specifying the quantity of coal sent away. I think it would be highly beneficial for the coal trade if the number of the working days of each mine were stated.

623. **Mr. Vickery.]** What would be the benefit of that? I think if that were done it would be a great protection to the capital employed in the coal-mining. From Newcastle there is about two and a half million tons of coal sent away annually. Now, ten of the mines in the Newcastle district could supply the whole of that by working three and a half days a week each, and all the other mines (fifteen or twenty more) are practically doing nothing. For example, the Greta Colliery has a capital of £150,000, but—like that of other mines—it is practically destroyed. If what I suggest was published in the report of the Department of Mines, when the public were being approached by the syndicate and their satellites, philosophers, and friends *re* the starting of new mines, they would say, "Here are mines doing nothing." Two mines out of three in the Newcastle district are doing nothing practically, and the consequences are most serious, not only to those who invest their money in mines, but to others. Those mines which got started, and which used to make good profits, are going down in value owing to the flotation dexterity of the syndicates. It was on the strength of those profits that the new mines were "successfully floated," and it is the "successful floaters" who are responsible for the commercially disastrous conflict between the workmen and the owners, interest in the district. It's a monstrous thing that legitimate mining companies like the Minmi, of Messrs. Brown, the A. A. Co., or the Lambton Colliery's should have their capital at the mercy of conscienceless syndicates. I believe that no country in the world is more efficiently supplied with thoroughly reliable scientific data as to its geological formation and mineral resources than New South Wales through its Mines Department. The names of Clarke, Wilkinson, David Pitman, and McKenzie are not more remarkable for scientific ability than personal probity. I am certain,

Mr. J. May,  
6 Dec., 1893.

certain, if the above suggestion were pointed out, they would readily adopt it in the Mines Department for the protection of *bona fide* mining capital from the syndicate-mongers and their unprincipled satellites. To hear the latter blaming the unions for destroying the British capitalists' confidence would be infinitely amusing were it not so immeasurably wicked.

624. *Chairman.*] What other point do you wish to refer to? I should like to make a remark about detaching hooks. Sub-clause D of clause 10 provides that every mine shall be provided with some automatic contrivance to prevent overwinding. There is beginning to be a great consensus of opinion that something should be done to provide a detaching hook for the cage. There has also been some misapprehension on the part of those who oppose this idea. There are three ideas connected with it. The first is to detach the cage, the next is to prevent the cage from jerking back. It has a catch-plate to hold the cage up. Unless some provision is made for the height of fall due to the kinetic energy of the cage it would drop back with a jerk. There are four principal ideas in overwinding: 1st, an automatic steam brake; 2nd, detaching hook; 3rd, keps; 4th, springs—to prevent headgear injury.

625. *Chairman.*] Would that not come under the provision as to the supplying of proper apparatus for raising and lowering persons? I thoroughly approve of the detaching hook, but some additional provision must be made in the shape of keps to prevent the cage from falling back and the other ideas suggested.

626. *Mr. Combes.*] Something to come out and bite it? That is one idea; another is to have some automatic arrangement to cut the steam off. I have known cases where the shock of the cage in coming back has torn away the support of the catch-plate for holding the cage.

627. *Chairman.*] Do you think it necessary to enter into all these details in the bill;—you see that the bill provides that all these apparatus shall be provided under a penalty? Yes; I approve of that.

628. *Mr. Vickery.*] You say that the apparatus provided for in the bill should be a detaching hook? Yes; and, in addition to that, there should be something to prevent the cage from flying against and damaging the headgear, also to counteract the jerk due to the slack chain, and keps to catch the cage.

629. What is the next point? I would now refer to the subject of splits. Sub-clause 3 of clause 13 says:—

Within six months after the commencement of this Act, every mine, unless worked on the long-wall system, shall be divided into districts or splits of not more than sixty men, exclusive of wheelers and horses; and each district shall be supplied with a separate current of fresh air, which shall be taken to within fifteen yards of each working face by brattice or otherwise where gas does not exist, and to within three yards of the working face where gas does exist.

I have here a plan showing a mine split up into districts with each district receiving fresh air. From my past experience I am sure that this will not trouble the managers. In the past there have been old mines which have been opened out by rule of thumb, and I have been very sorry for competent managers who took charge of such mines, because his conditions have been made for him, but where a competent mining manager has to make his own conditions the splits will not be any trouble to him. The splitting the air is a thoroughly established principle. A competent manager splits the air right off. Then each district is ventilated with pure air, and it is very much pleasanter for the manager, the workmen, and everybody else concerned, and its economy is beyond question.

630. *Chairman.*] Then you approve of the provisions in that clause? Yes; I thoroughly approve of that provision. That clause must have been introduced for this reason that an experienced colliery manager has no trouble in carrying out a thing like that. But in the cases of bad ventilating practice the air has gone round the mine in one unbroken volume, and the men have felt the bad effects of it and have objected to it. I have always had an idea that workmen who have worked in a mine which has been well laid out where the ventilation has been in separate splits will always ask to have this practice introduced.

631. *Mr. Vickery.*] Can you tell us why that idea was not introduced in the recent English Act? Probably for one of the best of reasons, namely, that it is the rule in the English mines. Splitting the air is the English mining practice. There are mines in the North of England where you would have an explosion every week if the air was not split. The home of good and efficient ventilation is the North of England, because that is where they first got large quantities of gas in coal-mining. The circumstances made such men as Nicholas Wood, John Wales, J. J. Atkinson, and W. Hopton. Their principle of ventilation is essentially separate splits—pure air.

632. What is the next thing to which you propose to refer? The next thing is the certificates of the managers. That is really the most important matter connected with the Bill. To have some guarantee that the manager is a thoroughly competent man is to have the best guarantee that the mine will be worked under good sanitary and safe conditions, and also economically.

633. *Chairman.*] You approve of that clause? Yes; but it is very singular that the agent is not mentioned here. I am referring to clause 14, which says:—

After one year from the passing of this Act, every mine shall be under a manager, who shall be responsible for the control, management, and direction of the mine, and the owner or agent of every such mine shall nominate himself or some other person to be the manager of such mine, and shall send written notice to the inspector of the district of the manager's name and address.

One of the weaknesses of the English Act was that the agent, who is not responsible under the Act, can interfere with the managers. It was felt to be a very great hardship that the manager, who was responsible to the Government, and responsible to public opinion as well as to his directors, should be subject to an agent going to give him instructions, whilst occasionally there might be a conflict of opinion.

634. *Mr. Vickery.*] You agree with this clause, do you not? I agree with it except that no irresponsible person should be allowed to give directions to the manager.

635. Under this clause the agent cannot interfere? We had some trouble about that in Great Britain.

636. *Chairman.*] Under a similar provision? Yes; that was one of the weaknesses of the Act. One agent might have three or four mines, and at each mine there would be a certificated manager, and that agent would give instructions to the managers of four or five mines. The inspectors set their faces strongly against it. They said, "Let us know who is really the manager, and do not make him responsible for somebody else's instructions."

637. Did that occur under the specific wording of this clause? Yes, it was a grievance which was felt at home very considerably.

638. How do you suggest we should get over it? I suggest that where any irresponsible person gives instructions those instructions should be made a note of. Just the same as when an inspector goes to a school and makes suggestions, which are entered in a book; so that if a certain mode of working has been adopted in obedience to an agent, the agent shall be responsible if an accident occurs. At present the manager is responsible and the agent goes scotfree.

Mr. J. May. 639. *Mr. Combes.*] The clause under consideration is almost word for word the same as the provision in the English Act? Yes; it was felt to be a defect among mining managers, who were the men who had to do the hard work. I would also refer to clause 15, which says:—

6 Dec., 1898.

In every mine required by this Act to be under the control of a certificated manager, daily personal supervision shall be exercised either by the manager or by a duly qualified under-manager, in accordance with the provisions of this Act, nominated in writing by the owner or agent of the mine.

I would suggest that it be provided that daily supervision shall be exercised by either the manager or a duly qualified under-manager; that is, an under-manager who holds a second-class certificate.

640. *Chairman.*] Those are the words in the Bill? I would also refer to clause 17, which provides for the constitution of a board appointing examiners for granting certificates of competency to managers and under-managers.

641. Do you approve of that clause? Yes, I approve of that for the purpose of granting certificates. I might say about the English examining board that the members are selected as being practical miners and practical mining engineers and mine owners. Those gentlemen, with the inspector for the district, and very often his assistant, constitute the board, and they conduct the oral examinations. I should just like to suggest that there should be an oral examination in conjunction with the other examination. Clause 27 makes provision with regard to the plan of the mine. I would strongly recommend that the provision with regard to the three months be retained, and that the mode of ventilation should be clearly and distinctly shown in the working plan of the mine up to date, so that an inspector could at once see the system practiced. Clause 33 makes provision for the disqualification of persons appointed as inspectors. I strongly recommend that that clause be retained as it has an important bearing on the welfare of the mining population. Clause 32 deals with the appointment of inspectors. I presume that the inspectors will have to get certificates under the Act the same as the managers. I should like to say that the granting of a certificate of service is in accordance with the spirit of the English Act. We had an inspector in England, Mr. Dickenson, who was regarded as the father of the inspectors at that time, and who knew more about coalmining than any fifty of the younger men, but it would have been absurd to ask him to pass an examination—it would be like comparing Count Von Moltke with some self-assured stuffed goose from some military school.

642. *Mr. Vickery.*] You approve of this clause? Yes; for nothing would be more supremely ridiculous than to ask that an inspector of such great natural ability, extensive experience, tact and judgment as Mr. Dixon, for example, should be placed on the same footing with some young gentleman who has "got a certificate." In the early days of inspection a great disparity existed betwixt the class of man acceptable to the owners, who objected to inspection, and the workmen who wanted it. The latter were most anxious to have men of practical experience, familiar with the minutest detail of underground operations. The spirit in which modern appointments are made is—given equality of theoretical knowledge—the preference is distinctly in favour of men with practical experience. That this is the practice in New South Wales is, I believe, principally due to the senior Mines Inspector, Mr. Dixon, who, to unimpeachable integrity as a man, adds the universal reputation of being one of the best practical mining engineers in Australia, and I believe Australia holds men who, in the science and practice of mining, equal any men in the world.

A 2.

No. 55.

MINUTES OF THE PROCEEDINGS OF THE LEGISLATIVE COUNCIL.

WEDNESDAY, 1 MAY, 1895.

1. The House met pursuant to adjournment. The President took the Chair at half-past Four o'clock.

*Members Present:—*

The Honorable Sir John Lackey, K.C.M.G., *President.*

The Honorable Richard Ryther Steer Bowker,  
M.D., M.R.C.P., Lond.,  
The Honorable William Robert Campbell,  
The Honorable Edward Combes, C.M.G.,  
The Honorable John Mildred Creed, M.R.C.S.,  
The Honorable Thomas Dalton,  
The Honorable Henry Carey Dangar,  
The Honorable John Davies, C.M.G.,  
The Honorable Andrew Garran, LL.D.,  
The Honorable Charles Augustus Goodchap,  
The Honorable Edward Greville,  
The Honorable Charles Gilbert Heydon,  
The Honorable Richard Hill,  
The Honorable James Hoskins,  
The Honorable Frederick Thomas Humphery,  
The Honorable Solomon Herbert Hyam,  
The Honorable Archibald Hamilton Jacob,  
The Honorable Henry Edward Kater,  
The Honorable Philip Gidley King,  
The Honorable George Lee,  
The Honorable John Macintosh,  
The Honorable Charles Kinniard Mackellar,  
M.B., C.M.,

The Honorable Henry Norman MacLaurin, M.D.,  
LL.D.,  
The Honorable Henry Moses,  
The Honorable James Norton, LL.D.,  
The Honorable Richard Edward O'Connor,  
The Honorable William Hilson Pigott,  
The Honorable Charles Edward Pilcher, Q.C.,  
The Honorable Sir Arthur Renwick, Kt., M.D.,  
F.R.C.S.,  
The Honorable Charles James Roberts, C.M.G.,  
The Honorable Richard Hutchinson Roberts,  
The Honorable Sir Julian Salomons, Q.C.,  
The Honorable Thomas Hawkins Smith,  
The Honorable William Henry Suttor,  
The Honorable George Thornton,  
The Honorable William Joseph Trickett,  
The Honorable Ebenezzer Vickery,  
The Honorable John Henry Waut, Q.C.,  
The Honorable James Watson,  
The Honorable Edmund Webb.

## (2.) Coal Mines Regulation Bill:—

MR. PRESIDENT,—

The Legislative Assembly having had under consideration the Legislative Council's Message, dated 6th December, 1894, requesting its concurrence in certain amendments made by the Council in the Coal Mines Regulation Bill,—

Agrees to the amendments in clause 1, but proposes to substitute the word "July" for the word "March" proposed to be inserted,—because the Bill is not likely to be passed much before the 1st July.

Agrees to the amendments in clause 2, page 2, lines 3 to 12 inclusive.

Agrees to that part of the amendment in clause 2, page 2, line 26, which omits the word "ten," but proposes to substitute the word "twenty" for the word "thirty" proposed to be inserted,—because it is considered that a mine employing more than twenty men should be under the control of a properly qualified manager.

Agrees to the amendments in clauses 3 and 4, and to those in clause 5, page 2, down to and including that in line 57.

Disagrees to the insertion in clause 5, page 2, after line 57, of the following words:—“(a) Three persons being owners or agents of mines in the Colony of New South Wales,” but proposes to further amend the clause by inserting after the word “persons,” in line 1, page 3, the words “being owners or agents of mines, or persons,”—because the three persons mentioned in subclauses (a) and (c) respectively represent in this Colony practically the same interest; and because, by this alteration, equal representation will be secured on the Board for the classes mainly interested in securing the services of capable examiners.

Agrees to the amendment in clause 5, page 2, line 59, to the omission of clause 6 and the insertion of a new clause instead thereof, and to the amendments in clause 7.

Disagrees to the omission of clauses 8 and 9,—because it is of the highest importance that a person on whose skill and care the lives of a number of persons and the safety of the owner's property depend, should be qualified to perform the work entrusted to him, and the qualification of such person can be best ascertained by examination as to competency or by evidence of service. General Rule 24 requires such person to be a competent person, but does not define how his competency is to be ascertained; and it would be a protection to the owner if such person were certificated.

Agrees to the insertion of a new clause to follow clause 8.

Agrees to the amendments in clauses 11 and 13.

Disagrees to the amendment in clause 15, which inserts the words “or for registration of;”—because no fee for registration has been named in the Schedule.

Disagrees to the omission of clause 17,—because it seems scarcely fair to the manager that he should be required to carry out instructions in which he may not concur but which he is compelled to obey, and without any record to show who gave such instructions.

Disagrees to the amendments in clause 19,—because any existing inspector who has no certificate should have an opportunity of getting one, and because the clause as amended reads as though an inspector can be appointed under the Act before its commencement.

Disagrees to the omission of clause 21 and the insertion of a new clause instead thereof,—because in the new clause the words “when absolutely necessary” are omitted, and it would be impossible for an inspector to make a proper inspection without impeding the work to some extent, however slight. And because it does not provide for the inspector to enter in a book the result of his inspection. And further, because it does not give the inspector power to require the manager to withdraw the men in case of danger.

Disagrees to the amendment in clause 22, which omits the words “and enter such report in a book at the mine,”—because such provision is considered desirable.

Agrees to the amendments in clause 27, but proposes to amend that on page 11, line 1, by omitting therefrom the words “a Police or Stipendiary Magistrate, or a Barrister-at-law,” and inserting the words “or other person agreed to by the arbitrators” instead thereof,

Agrees to the amendment in clause 29.

Disagrees to the amendment in clause 30, page 12, line 32, which omits the word “three” and inserts the word “six” instead thereof,—because six months is too long a period for the plotting of the workings to be in arrears.

Disagrees to the remaining amendments in clause 30,—because the want of the information provided for has on several occasions led to the working of coal outside the boundaries of the mine and the owners have been fined in consequence, and the Crown has lost revenue through owners having extracted coal outside their boundary.

Disagrees to the amendments in clause 31,—because the insertion of the word “serious” leaves it to the discretion of the manager what accidents shall and what shall not be reported. If proceedings are taken against a manager for not reporting an accident, he simply says he did not consider it serious. And with regard to the alteration as to the period within which the report shall be made, the original words of the clause are considered preferable.

Disagrees to the amendment in clause 32, which omits the word “forthwith” and inserts the words “within one month” instead thereof,—because there is no valid reason for delay.

Agrees to the amendments in clause 34, but proposes to further amend that clause by inserting in line 46, page 14, after the word “boundaries” the word “of.”

Agrees to the amendment in clause 35.

Disagrees to the omission of clause 36.—because the limitation of a day's labour to eight hours is desirable and is not a new provision. It is to be found in the Victorian Act, sections 353, 354, and 355, and also in our regulations relating to the inspection of metalliferous mines as to engine-men; so that it has been recognised in this Colony for nearly twenty years, and the provision is not contrary to the general practice in the mines.

Agrees to the amendment in clause 37, line 39.

Agrees

Agrees to the amendment in clause 37, line 41, which inserts after the word "mine" the words "And no boys between the age of fourteen years and eighteen years shall be employed in or allowed to be, for the purpose of employment, in any mine below ground for more than 'ten' hours on Monday, Tuesday, Wednesday, Thursday, Friday, and six hours on 'one' Saturday, and eight hours on the next 'Saturday.'"

"For the purpose of this Act, with respect to the employment of such boys in a mine below ground, the following regulations shall have effect, that is to say:—

"(I) There shall be allowed an interval of not less than twelve hours between each period of employment.

"(II) Each period of employment shall be inclusive of one hour for meals."

"(III) A week shall be deemed to begin at midnight on Saturday night, and to end at midnight on the succeeding Saturday night,"—

but proposes to amend such amendment by omitting the word "ten" and inserting the word "eight" instead thereof; by omitting the word "one"; by omitting the words "and eight hours on the next Saturday"; and by omitting the words "(II) Each period of employment shall be inclusive of one hour for meals,"—because ten hours per day is too long for the employment of boys in a mine.

Agrees to the remaining amendments in clause 37, and to those in clauses 38 and 40.

Disagrees to the amendments in clause 41,—because as this clause has been altered, payment by weight only applies to miners who are paid for "large coal." It may be true that under existing agreements the miners, as a rule, are paid only for large coal, but there are at least two coal mines in the Colony where the miners are paid for all the coal sent up, and their right to be so paid should not be taken from them, but they should be left free to make any contract that they and the owners think fit, and yet be entitled to be paid by weight. It does not follow that the present practice, viz., to pay for large coal only will not be altered in the near future, seeing the demand for and the price of small coal is increasing, unless as proposed by the Council, the right to alter be taken away by Act of Parliament; and because the addition to subclause (III) of clause 38 is unnecessary, as miners are not paid "by the method known as the standard-bar system"; the standard-bar is simply used to prevent skips being overfilled, and usually skips that are overfilled are not paid for.

Disagrees to the amendments in clause 43, down to and including that in line 25, page 18, which omits the word "he" and inserts the words "the owner, agent, or manager,"—because even when the miners are to be paid by "measure or gauge" they are only to be paid for "large coal"; and the check-weigher is not allowed to check the taring of tubs and trams, and the person appointed by the owner is not to be punished for improperly interfering with or altering the tare.

Agrees to the amendment in clause 43, page 18, line 26.

Disagrees to the remaining amendments in clause 43, for the reasons given for previous disagreements in this clause.

Disagrees to the amendment in clause 44,—because the men who are getting the mineral are those who should have the right to appoint the check-weigher, not merely those who are getting large coal.

Disagrees to the amendments in clause 45,—because, under this clause as amended, the "Weights and Measures Act" will only apply to weights, &c., used for weighing "large coal."

Agrees to the amendment in clause 46, line 54, which omits the word "fifty" but proposes to substitute the word "thirty" for the word "fifteen" proposed to be inserted.

Agrees to the remaining amendment in clause 46.

Agrees to the amendments in clause 48, but proposes to amend those in lines 2 and 7 by substituting the word "thirty" for the word "fifteen" proposed to be inserted in each case.

Disagrees to the amendment in clause 49, which omits subsection (III),—because if the provision as to splits be omitted there may be some difficulty about enforcing a separate current of air for each district.

Disagrees to the amendments in clause 50, page 21, lines 45 to 50,—because the omission of the minimum quantity of air will seriously increase the difficulties to be encountered by the inspectors, and will possibly lead to frequent and serious conflicts with the managers, and frequent references to arbitration or prosecution for offences against the Act, and may in some cases result in the cancellation or suspension of a manager's certificate, and in the interest of both owners and miners it would be expedient to have a minimum.

Agrees to the amendment in clause 50, page 21, line 55.

Disagrees to the amendment in clause 50, page 22, lines 2 to 6,—because without the use of brattice it is not clear how, if the rules as amended by the Council became law, a single heading could be driven more than 35 yards.

Agrees to the amendment in clause 50, page 22, line 12.

Disagrees to the amendments in clause 50, page 22, lines 23 to 56,—because it is important that inexperienced men should not be employed to make such inspections, as the lives of a number of men may depend upon the skill and care with which this duty is performed; if the place has to be marked the men can see for themselves that it has been visited before going into work; the extra cost is trifling, and the life of the man making the inspection might be endangered by using a naked light; and if danger exists it should be recorded in the book so that persons likely to be affected by such danger may know of its existence.

Disagrees to the amendment in clause 50, page 23, line 22, which omits the words "by such person,"—because it is important that there shall be no question as to the person on whom this important duty devolves.

Disagrees to the amendment in clause 50, page 24, line 14, which inserts the words "except within a completely-closed chamber attached to the fuse of the shot,"—because such words appear to be quite unnecessary.

Agrees to the amendments in clause 50, page 24, lines 21 and 22, and to that in clause 50, page 24, line 27, which inserts the words "nor 'shall' coal or coal-dust be used for tamping," but proposes to amend such amendment by inserting after the word "shall" the word "dry."

Disagrees

Disagrees to the amendment in clause 50, page 24, lines 32 to 35, which omits the words "Provided that no person shall return to a place where such charge has missed fire until a period of eight hours has elapsed from the lighting of the fuse attached to such charge,"—because it is very desirable that some period of time should elapse after a charge has missed fire before the men are allowed to return to the place.

Agrees to the amendment in clause 50, page 26, lines 5 and 6, which omits the words "six feet high, three feet wide, and four feet deep," and inserts the words "of sufficient length, and at least three feet in width," but proposes to amend the words proposed to be inserted by omitting the word "length" and inserting the word "height"; by omitting the word "three" and inserting the word "four"; and by inserting after the word "in" the words "depth and three feet in."

Disagrees to the amendment in clause 50, page 26, which omits *Rule 19*,—because the object of this rule being to prevent accidents it is thought it should be allowed to remain.

Disagrees to the amendment in clause 50, page 26, lines 32 and 33, which omits the words "Every shaft in course of sinking shall be kept clear of all noxious gases by a fan or some other appliance,"—because there can be no good reason why, if gas in a dangerous quantity exists in any shaft or pit, its removal should not be made compulsory. The need for this has been proved by experience.

Disagrees to the amendment in clause 50, page 26, which omits *Rule 25*,—because the removal of coal from under a road where the cover is thin and weak may endanger the lives not only of the men employed in the mine, but also of the travelling public.

Disagrees to the insertion of new *Rule 24*,—because it does not define what constitutes a "competent person." The responsibility rests upon the owner or manager, and in their own interest one would suppose they would wish the term to be defined.

Disagrees to the amendment in clause 50, page 27, which omits *Rule 34*,—because it is most important, in the interest of both owners and men, that every precaution should be taken to prevent explosions by reason of defects in boilers.

Disagrees to the amendment in clause 50, page 28, lines 12 and 13, which omits the words "or any one having the written authority of any inspector or person so employed,"—because these words appear necessary, and they occur in the English Act, and no doubt they have been inserted in that Act as the result of experience.

Disagrees to the amendment in clause 50, page 28, line 22, which inserts the words "not being mining engineers who are practical working miners,"—because the choice should not be restricted.

Disagrees to the amendment in clause 50, pages 28 and 29, which omits *Rules 41, 42, 43, 44, 45, and 46*; to the omission of clause 51; and to the omission of proviso to clause 52,—because it is necessary that none but experienced coal-miners should work alone. This provision is also in the English Act. Even though it be admitted that these rules, or some of them, may be unsuitable to some collieries, it will be conceded that they make for safety, and may be beneficial in some cases; and as ample provision is made in clause 51 for exempting a colliery to which they are not applicable, there should be no objection to embodying them in the Bill.

Agrees to the amendments in clause 54.

Disagrees to the amendment which omits clause 59,—because in the interest of both the owners and the miners it would be wise not to strike out this clause, as there may occur a period during which no special rules made by the owner can be in force when the special rules made by the Governor would supply the deficiency.

Disagrees to the amendment in clause 62, line 39, which omits the word "wilfully,"—because a person should not be liable to be punished for pulling down a notice, &c., accidentally.

Disagrees to the amendment in clause 63, line 6, which omits the words "five pounds" and inserts the words "one pound" instead thereof,—because the fine of one pound might not be effective. It rests with the Justices to fix the amount to suit the circumstances of each case.

Disagrees to the amendments in clause 69,—because it leaves a workman to be prosecuted by anybody, whereas the owner, agent, manager, or under manager, can be prosecuted only by an inspector.

Disagrees to the amendment in clause 72,—because under no circumstances should such persons be allowed to adjudicate.

Agrees to the omission of clause 76 and to the amendments in clause 77.

Disagrees to the amendment in clause 78, page 35, which inserts the words "Large coal means all coal passing over a three-quarter-inch screen,"—because too much of the coal raised will pass through the screen.

Agrees to the amendment in clause 78, page 36, line 6, which omits the words "section four hereof," and inserts the words "Part II of this Act," but proposes to amend the words proposed to be inserted by omitting the words "Part II of."

Agrees to the remaining amendments in clause 78, and to the insertion of new Schedule I.

Disagrees to the amendments in Schedule II, lines 40 and 41, which omit the word "(round)" and insert the word "(large)" instead thereof, and which omit the words "coal (small),"—because for statistical purposes it is necessary that the quantity of small coal raised should be known, especially as small coal is a saleable commodity.

Agrees to the remaining amendment in Schedule II.

And the Legislative Assembly requests the concurrence of the Legislative Council in the amendments upon the Council's amendments in the Bill.

Legislative Assembly Chamber,  
Sydney, 30th April, 1895.

J. P. ABBOTT,  
Speaker.

*Ordered*, on motion of Mr. Want, That the consideration of this Message in Committee stand an Order of the Day for this day fortnight.

No. 64.

## MINUTES OF THE PROCEEDINGS OF THE LEGISLATIVE COUNCIL.

THURSDAY, 13 JUNE, 1895.

1. The House met pursuant to adjournment. The President took the Chair at half-past Four o'clock.

*Members present :—*The Honorable Sir John Lackey, K.C.M.G., *President.*

The Honorable Richard Ryther Steer Bowker,  
M.D., M.R.C.P., Lond.,  
The Honorable Alexander Brown,  
The Honorable William Robert Campbell,  
The Honorable Samuel Charles,  
The Honorable Edward Combes, C.M.G.,  
The Honorable John Mildred Creed, M.R.C.S.,  
The Honorable Thomas Dalton,  
The Honorable Henry Carey Dangar,  
The Honorable John Davies, C.M.G.,  
The Honorable George Day,  
The Honorable Andrew Garran, LL.D.,  
The Honorable Charles Augustus Goodchap,  
The Honorable Edward Greville,  
The Honorable Charles Gilbert Heydon,  
The Honorable Louis Francis Heydon,  
The Honorable Richard Hill,  
The Honorable James Hoskins,  
The Honorable Frederick Thomas Humphery,  
The Honorable Solomon Herbert Hyam,  
The Honorable Archibald Hamilton Jacob,  
The Honorable Henry Edward Kater,  
The Honorable Andrew Taylor Kerr,  
The Honorable Philip Gidley King,  
The Honorable William Laidley,  
The Honorable George Lee,  
The Honorable William Alexander Long,

The Honorable John Lucas,  
The Honorable John Mackintosh,  
The Honorable Charles Kinnaird Mackellar,  
M.B., C.M.,  
The Honorable Henry Norman MacLaurin,  
M.D., LL.D.,  
The Honorable Henry Moses,  
The Honorable James Norton, LL.D.,  
The Honorable Richard Edward O'Connor,  
The Honorable William Hilson Pigott,  
The Honorable Charles Edward Pilcher, Q.C.,  
The Honorable Sir Arthur Renwick, Kt., M.D.,  
F.R.C.S.,  
The Honorable Charles James Roberts, C.M.G.,  
The Honorable Richard Hutchinson Roberts,  
The Honorable Alexander Ryrie,  
The Honorable Sir Julian Salomons, Q.C.,  
The Honorable Patrick Lindsay Crawford  
Shepherd,  
The Honorable Thomas Hawkins Smith,  
The Honorable William Henry Suttor,  
The Honorable George Thornton,  
The Honorable John Thomas Toohy,  
The Honorable William Joseph Trickett,  
The Honorable Ebenezer Vickery,  
The Honorable John Henry Want, Q.C.,  
The Honorable Robert Hoddle Driberg White.

4. COAL MINES REGULATION BILL:—Mr. Brown, as Chairman, having brought up the Report from the Select Committee appointed to draw up reasons for disagreeing to certain of the Assembly's amendments upon the Council's amendments, and for insisting upon certain of the Council's amendments disagreed to by the Assembly,—

The same was, on motion of Mr. Brown, read by the Clerk, viz. :—

THE SELECT COMMITTEE of the Legislative Council, to whom it was referred, on the 6th instant, to draw up reasons for disagreeing to certain of the Assembly's amendments upon the Council's amendments, and for insisting upon certain of the Council's amendments disagreed to by the Assembly, beg to recommend to your Honorable House,—

That the Council agrees to the Assembly's amendment upon the Council's amendment in clause 1, which substitutes the word "July" for the word "March."—

Disagrees to the Assembly's amendment upon the Council's amendment in clause 2, page 2, line 26, which proposes to substitute the word "twenty" for the word "thirty,"—because it is not considered necessary that a mine employing less than thirty men should be under the control of a certificated manager, and be subject to all the restrictions and responsibilities which would attach to a large mine, and it would mean considerably increased expenditure to a number of hard working and industrious men who are engaged now in developing small properties, which, if trammelled with the conditions under which large coal-mining properties ought to be worked, would be closed up.

Insists upon its amendment in clause 5, page 2, after line 57, which inserts the words "(a) Three persons being owners or agents of mines in the Colony of New South Wales," and disagrees to the Assembly's amendment in the same clause, page 3, line 1, which inserts the words "being owners or agents of mines or persons,"—because inasmuch as all parties should be represented on a Board of this kind, and it does not necessarily follow that the composition of the Board would be one-sided. The amendment follows closely the words of the English Act, which provides for representation on a similar Board of an exactly similar character. The Minister has the power to appoint and remove this Board, and they only hold office during his pleasure. The field outside is large enough to make a selection of a very capable and disinterested Board.

Insists upon its omission of clauses 8 and 9,—because it is not considered necessary either in the interests of the owners, nor is it any advantage to the workmen that the men in charge of machinery should have certificates of competency. For their own protection a qualified man is always provided by the owners, and great care is exercised in the selection of a sober, trustworthy person. It has not been found necessary with the large mining operations in the United Kingdom to have any such provision as this, and new clause 8 is a copy of the section of the English Mining Act, which deals with this question. Rule 24, the subsequent part of the Bill, makes the further necessary provision in connection with these sections.

Insists upon its amendment in clause 15, which inserts the words "or for registration of,"—because provision should be made for the payment of some fee by applicants for a certificate who have undergone examination in the United Kingdom or elsewhere, and who possess the necessary qualifications, and desire only to register in this Colony. Insists

Insists upon the admission of clause 17,—because of its apparently far-reaching and unnecessary operations. Apart from its impossibilities, some of the Companies' consulting engineers are not resident in the Colony, and whilst possessing an exceedingly competent manager at a high salary here questions connected with the general character of operations at the mine are submitted for the consulting engineer's judgment, though he is resident in England, and it would be impossible for such a person to conform to this section. The same contention may be raised regarding a managing director or the Board governing a company; besides, no good object could possibly be obtained by such a record. If orders were given to the manager, his proper business, provided he did not agree with the instructions given him, would be to at once record in writing, for conveyance to the authorities above him, his objections.

Does not insist upon its amendments in clause 19.

Insists upon its omission of clause 21 and the insertion of a new clause in lieu thereof,—because the new clause, which is an exact copy of section 41 of the English Act of 1887, provides all that is necessary to enable an Inspector to do his duty if he understands his work, whilst, on the contrary, if clause 21 was retained, it would hand over in an arbitrary way the whole of the mining operations of this Colony to the whim and caprice of, it might be, an incompetent Inspector, and would give him too absolute a power, which is undesirable. The power he possesses now under the present Coal-fields Regulation Act is quite sufficient, if not too extensive as it is, whilst the substitution of section 21 in lieu of the law as it now stands would endow the Inspector with such substantial power that, at his will, he could ruin any mining company if he thought fit. All he would require to do, without rhyme or reason, would be to announce to the colliery manager that it was his wish the men should be withdrawn from the mine, in which case 400 or 500 men would be thrown out of employment, and a repetition of what occurred at the Stockton mine possibly be the result. In that case the mining authorities declared the pit unsafe, ordered the men to be withdrawn, and the men themselves, after some enforced idleness, petitioned the manager to be allowed to go back to work as the mine was safe, notwithstanding the opinion expressed to the contrary by the mining authorities. The men went back to work, and have been at work for the last two years, in the face of the order that they should be withdrawn, and the fact that a prosecution was instituted against the manager for not complying with the mining authorities' orders, the manager being fined for working, what was then alleged, a property which was unsafe, but which, as has already been stated, has been at work for two years since, and is at the present moment in operation.

Insists upon its amendment in clause 22, which omits the words "and enter such report in a book at the mine,"—because the provision is entirely unnecessary, and not in conformity with the English Act.

Disagrees to the Assembly's amendment upon the Council's amendment in clause 27, page 11, line 1, which proposes to substitute the words "or other person agreed to by the arbitrators," for the words "a Police or Stipendiary Magistrate, or a Barrister-at-Law,"—because in matters of this kind it is necessary that all adjudications should be before some independent person, and it is thought that this can best be obtained by the retention of the officials designated as above.

Insists upon its amendment in clause 30, page 12, line 23, which omits the word "three" and inserts the word "six,"—because six months is not too long a period for the plotting of the workings to be in arrears, and it is the law now, and has been for years past, without causing any inconvenience, nor has it been a disadvantage to those concerned—employer or employed.

Insists upon its remaining amendments in clause 30,—because the words proposed to be omitted are unnecessary, ample provision being made in the Bill by re-enacting clause 38 of the present Coal Mines Regulation Act, which serves all the purposes for ascertaining the working of coal outside the boundaries of mines, and if the Crown have lost revenue, as alleged, through owners having taken coal outside their boundary, the fault lies in not making use of the provisions of the law as it now stands in section 38 referred to.

Insists upon its amendments in clause 31,—because it copies, word for word, section 35 of the English Act, and to refuse to insert the word "serious" would render the work of those called upon to supervise mining operations, a grave burden to them, and make them liable to be penalised for the most trifling accidents which are bound to occur in any large operations where hundreds of men are employed, and as a matter of fact, all serious injuries are always reported.

Insists upon its amendment in clause 32, which omits the word "forthwith" and inserts the words "within one month,"—because there is no valid reason for having it done immediately.

Disagrees to the Assembly's amendment upon the Council's amendment in clause 34, page 14, line 46, which proposes to insert after the word "boundaries" the word "of,"—because it is as well that any plan should show the surface boundaries as well as the workings underground.

Insists upon its omission of clause 36,—because it is not desirable to limit by legislation the hours of labour, and penalise any man for working beyond eight hours, or have any time stipulated by legislation, apart from the fact that the application of what is commonly known as the eight-hours system to coal-miners is unnecessary, inasmuch as, by voluntary combinations and regulations, they have now eight hours, with an idle Saturday every fortnight; besides, being contractors at so much per ton, they can go to work and leave off practically when they please.

Disagrees to the Assembly's amendments upon the Council's amendment in clause 37, line 41, which propose to substitute the word "eight" for the word "ten;" to omit the word "one;" to omit the words "and eight hours on the next Saturday;" and to omit the words "(1) Each period of employment shall be inclusive of one hour for meals,"—because this being the law now under the present Coal Mines Regulation Act, sections 8 and 9, any alterations in the present hours of working would curtail the output of the various mines, and lessen the wages earned by the workmen. The boys referred to in this section are not necessarily employed underground for ten hours. Under present arrangements they work now only eight hours, but it is necessary for them, as part of their employment, to travel in and out of the mine either with their horses, for gatekeeping or other purposes for which they may be employed underground, and the time for this varies according to the length of time the colliery has been opened. In some places it might occupy them altogether an hour—in others probably not ten minutes, and it must be borne in mind that one hour of the ten mentioned in the Statute is occupied exclusively for meals. It is necessary, in order to maintain the proper output of the mine, that these lads should be in attendance, and it is the training ground which all colliers like to give their sons before putting them to work on the coal.

Insists

Insists upon its amendments in clause 41,—because it is an honest attempt to settle by legislation for what the miners are paid, and if it is not ascertained by the provisions of this section, and any demand was made for payment for what is commonly known as “small coal,” it would involve an immediate reduction of the hewing rate now paid to the miner. His contract is to fill clean, round coal only, and he is paid an additional rate, which is taken into consideration, for the small coal that is unavoidably sent up and passes through the screens when the coal is being made marketable. Miners are not ordinarily employed to get small coal—if small coal is filled it is paid for; besides, the retention of the section will conform with the judgment of the House of Lords in several recent cases where a demand had been made to secure payment for small coal under the title of “mineral,” and it would set at rest any little uneasiness that may be felt upon this question. The law as it stands under the English Act and in our present Colonial Act, according to the judgment of the House of Lords, entitles the miner to be paid for small coal; but, with the exception of three or four demands in England, the law has not been invoked by the parties interested, they, no doubt, feeling that when payment was made for hewing large coal it also included small as above referred to, and it was only to harmonise the present legislation with the English Act, making the question more definite, that the clause was inserted, and which, in the interest of all parties, the Council desires now to insist upon. If this position be conceded then the insistence on subsection 3 is necessary.

Insists upon its amendments in clause 43 down to and including that in line 25, page 18, which omits the word “he” and inserts the words “the owner, agent, or manager,”—because it concedes ample provision for the protection of the wage-earner, and is the same provision as in the English law as at present, with the exception that it provides that the check-weigher shall be an employee of the colliery. This is the colonial law, and its operation has not been conducted with any disadvantages. It is often very desirable that persons who are not connected with the mine should not be allowed to act as check-weighers, and that the person filling this office should be an employee of the company.

Insists upon its remaining amendments in clause 43 disagreed to by the Assembly,—because it brings its provisions in conformity with the English Act.

Insists upon its amendment in clause 44,—because it is desirable that it may be brought within the provisions of clause 41.

Insists upon its amendments in clause 45,—because the miner is only to be paid for hewing large coal or shale.

Disagrees to the Assembly's amendment upon the Council's amendments in clause 46, line 54, which proposes to substitute the word “thirty” for the word “fifteen,” because this is in accordance with the English Act.

Disagrees with the Assembly's amendments upon the Council's amendments in clause 48, lines 2 and 7, which propose to substitute the word “thirty” for the word “fifteen” in each case,—because it forms part of the English Act.

Insists upon its amendment in clause 49, which omits subsection (III),—because this provision of the Bill refers only to the division of mine into parts, and it has been erroneously classed under the title of “Division of mine into splits,” and represents clauses 19 and 20 of the English Act, which describes it under the heading of “Division of mine into parts,” and not “Division of mine into splits,” and in the English Act the legislation is permissive, and not compulsory, the word “may” occurring in the English Act, but in this section it has been converted into “shall.”

Insists upon its amendments in clause 50, page 21, lines 45 to 50,—because the term “adequate” will be quite sufficient for every purpose connected with mining operations. It is sufficient for all the legislation on this class of mining in the United Kingdom, and gives rise to no difficulty there, and if administered here by competent people, the same results will follow. The present law provides for a minimum quantity of air, and if this is to be amended by the addition of any further prescribed figures, it is thought better to follow out the English practice, as our deep sinkings are producing fiery mines, where it is notorious that 100 feet (cubic) of air would be absolutely insufficient. As the law stands now, in one of the mines of this Colony, the quantity of air circulated as a matter of necessity is three times more than that required by law, and it is thought that the retention of the word “adequate” will be more than sufficiently satisfactory to determine special application to each mine where either less or more ventilation may be required. The quantity now in some places as fixed by law is very much too large, whilst in the case cited above it is very much too little.

Insists upon its amendment in clause 50, page 22, lines 2 to 6,—because it is not necessary to have bratticing as well as cut-throughs. One or other of these provisions is all that is necessary.

Insists upon its amendments in clause 50, page 22, lines 23 to 56, because this portion of the Act has only been brought into accordance with the exact wording of the English Act.

Insists upon its amendment in clause 50, page 23, line 22, which omits the words “by such person,”—because the words “by such person” do not appear in the English Act.

Insists upon its amendment in clause 50, page 24, line 14, which inserts the words “except within a completely-closed chamber attached to the fuse of the shot,”—because this is in accordance with the English Act, and is absolutely necessary in every fiery mine.

Disagrees to the Assembly's amendment upon the Council's amendment in clause 50, page 24, line 27, which proposes to insert after the word “shall” the word “dry,”—because this is not in accordance with the English Act, the word “dry” not being made use of, and it appears to the Council that the term “coal and coal-dust” would be quite sufficient to embrace coal of any character, whether dry or wet.

Insists upon its amendment in clause 50, page 24, lines 32 to 35, which omits the words “Provided that no person shall return to a place where such charge has missed fire until a period of eight hours has elapsed from the lighting of the fuse attached to such charge,”—because it does not appear to be part of English legislation, and it is unnecessary to make it part of statute law, and precautions are taken by the men themselves, by voluntary action on their part, of absenting themselves for a reasonable period where the shot misses fire.

Disagrees to the Assembly's amendments upon the Council's amendment in clause 50, page 26, lines 5 and 6, which propose to substitute the word “height” for the word “length” and the word “four” for the word “three” and to insert after the word “in” the words “depth and three feet in,”—because the provision to the extent of sufficient height and 3 feet in width is that provided for in the English Act, and should be sufficient for all purposes.

Insists

Insists upon its amendment in clause 50, page 26, which omits *Rule 19*,—because such a provision is unnecessary, and is really the course pursued as a matter of practice.

Insists upon its amendment in clause 50, page 26, lines 32 and 33, which omits the words "every shaft in course of sinking shall be kept clear of all noxious gases by a fan or some other appliance,"—because it is an addition to the English legislation on this subject which is considered to be unnecessary. The words "or otherwise made secure" in the rule itself is capable of a much larger construction than limiting an expression regarding it as it is proposed to do by the addition of the words "every shaft in course of sinking shall be kept clear, &c."

Insists upon its amendment in clause 50, page 26, which omits *Rule 25*,—because it is the business of the Crown when leasing coal to see that sufficient provision is made for protecting the surface, and that owners of the mineral long before any improvements in the shape of roads or townships were in existence ought not to be punished now by losing their coal, as it is by no action of theirs that circumstances have produced an apparent necessity for not mining the coal which they are entitled to. Practically in nearly all mining townships the large companies make provision—even at the proprietor's expense—for the maintenance of the surface where the safety of the travelling public has to be considered. It is notorious that roads have been made long after the coal has been taken out, and the authorities ought to have known this would one day result in a settlement of the surface before they made the roads.

Insists upon the insertion of new *Rule 24*,—because it is in conformity with the provisions of the English Act, and necessary to be placed here if the Council's omission of section 8 is maintained.

Insists upon its amendment in clause 50, page 27, which omits *Rule 34*,—because it forms no part of English legislation, nor of any legislation in this Colony, and it appears to be unnecessary.

Insists upon its amendment in clause 50, page 28, lines 12 and 13, which omits the words "or any one having the written authority of any inspector or person so employed,"—because they appear to be superfluous; besides, it is doubtful if the power of an inspector or employee should be delegated in this way, as such a power might be given for improper purposes.

Insists upon its amendment in clause 50, page 28, line 22,—which inserts the words "not being mining engineers who are practical working miners,"—because the retention of such authority as this would leave it open to the persons employed at the mine obtaining an inspection of a valuable mining property possibly for sinister purposes, and all that is required in an inspection of this kind can always be accomplished by two working miners.

Insists upon its amendments in clause 50, pages 28 and 29, which omit *Rules 41, 42, 43, 44, 45, and 46*; which omit clause 51, and the proviso to clause 52,—because legislation of this character would simply destroy the coal-mining industry of the Colony, and particularly that of the Newcastle District.

Insists upon its amendment which omits clause 59,—because it would be undesirable that there should be any set of special rules established by the Executive, whilst ample provision is made for all the preliminary mining operations under the Bill, and it would be the business of the authorities and everyone interested in the colliery operations to frame a set of special rules in accordance with the Act as speedily as possible, so as to govern the mining property for the interest of all concerned.

Insists upon its amendment in clause 62, line 39, which omits the word "wilfully,"—because any one pulling down notices should be punished. If it could be shown to the Court that it was the result of an accident, the offender could not be punished. In any case it would be difficult to obtain a conviction with the word "wilfully" retained in the section.

Insists upon its amendment in clause 63, line 6, which omits the words "five pounds" and inserts the words "one pound,"—because the section itself differentiates now to a serious extent between the manager and the workman. It provides a punishment not exceeding £20 as against the manager, and to anybody else, for a similar offence, a fine of £2. Besides, it assimilates the punishment of £1 to that provided for in the English Act.

Insists upon its amendments in clause 69,—because it is only right that offences committed by owners, agents, managers, or under managers should be prosecuted for by a specially constituted authority in the shape of an inspector under the Act, otherwise it would be competent for outsiders and employees to be constantly annoying those concerned in the administration of the mine by projecting charges of offences under the Act, which were frivolous and untenable, and the section as amended makes it an exact copy of clause 65 of the English Act of 1887.

Insists upon its amendment in clause 72,—because it leaves it optional to the parties interested to make the agreement, and, unless both parties are agreed, the adjudication could not take place, and it is part of the English Act, clause 69.

Insists upon its amendment in clause 78, page 35, which inserts the words "Large coal means all coal passing over a three-quarter-inch screen,"—because it is a consequential amendment to the definition of the term "mineral," which must be defined as in manner stated.

Disagrees to the Assembly's amendment upon the Council's amendment in clause 78, page 36, line 6, which proposes to omit the words "Part II of,"—because the duties and powers of an Inspector are defined under Part II.

Insists upon its amendments in Schedule II, lines 40 and 41, which omit the word "(round)" and insert the word "(large)," and which omit the words "coal (small),"—because they are consequential upon those already made, and it is unnecessary for statistical or any other purpose to have legislation in a Coal Mining Bill of this character, inasmuch as the information is always available from the Coal-mining Offices of the various collieries, and it is not in accordance with the returns asked for under Schedule 3 of the English Coal Mines Regulation Act of 1887.

Committee Room, No. 2,  
Sydney, 12th June, 1895.

ALEXANDER BROWN,  
Chairman.

Mr. Brown moved, That the report be now adopted.

Question put and passed.

Mr. Brown then moved, That the following Message be carried to the Legislative Assembly:—

MR. SPEAKER,

The Legislative Council having had under consideration the Legislative Assembly's Message, dated 30th April, 1895, in reference to the Coal Mines Regulation Bill:—

Agrees to the Assembly's amendment upon the Council's amendment in clause 1, which substitutes the word "July" for the word "March." Disagrees

Disagrees to the Assembly's amendment upon the Council's amendment in clause 2, page 2, line 26, which proposes to substitute the word "twenty" for the word "thirty,"—because it is not considered necessary that a mine employing less than thirty men should be under the control of a certificated manager, and be subject to all the restrictions and responsibilities which would attach to a large mine; and it would mean considerably increased expenditure to a number of hard-working and industrious men who are engaged now in developing small properties, which, if trammelled with the conditions under which large coal-mining properties ought to be worked, would be closed up.

Insists upon its amendment in clause 5, page 2, after line 57, which inserts the words "(a) Three persons being owners or agents of mines in the Colony of New South Wales," and disagrees to the Assembly's amendment in the same clause, page 3, line 1, which inserts the words "being owners or agents of mines or persons,"—because inasmuch as all parties should be represented on a Board of this kind, and it does not necessarily follow that the composition of the Board would be one sided. The amendment follows closely the words of the English Act, which provides for representation on a similar Board of an exactly similar character. The Minister has the power to appoint and remove this Board, and they only hold office during his pleasure. The field outside is large enough to make a selection of a very capable and disinterested Board.

Insists upon its omission of clauses 8 and 9,—because it is not considered necessary either in the interests of the owners, nor is it any advantage to the workmen that the men in charge of machinery should have certificates of competency. For their own protection a qualified man is always provided by the owners, and great care is exercised in the selection of a sober, trustworthy person. It has not been found necessary with the large mining operations in the United Kingdom to have any such provision as this, and new clause 8 is a copy of the section of the English Mining Act, which deals with this question. Rule 24, the subsequent part of the Bill, makes the further necessary provision in connection with these sections.

Insists upon its amendment in clause 15, which inserts the words "or for registration of,"—because provision should be made for the payment of some fee by applicants for a certificate who have undergone examination in the United Kingdom or elsewhere, and who possess the necessary qualifications, and desire only to register in this Colony.

Insists upon the omission of clause 17,—because of its apparently far-reaching and unnecessary operations. Apart from its impossibilities, some of the Companies' consulting engineers are not resident in the Colony, and whilst possessing an exceedingly competent manager at a high salary here questions connected with the general character of operations at the mine are submitted for the consulting engineer's judgment, though he is resident in England, and it would be impossible for such a person to conform to this section. The same contention may be raised regarding a managing director or the Board governing a company; besides, no good object could possibly be obtained by such a record. If orders were given to the manager, his proper business, provided he did not agree with the instructions given him, would be to at once record in writing, for conveyance to the authorities above him, his objections.

Does not insist upon its amendments in clause 19.

Insists upon its omission of clause 21 and the insertion of a new clause in lieu thereof,—because the new clause, which is an exact copy of section 41 of the English Act of 1887, provides all that is necessary to enable an inspector to do his duty if he understands his work, whilst, on the contrary, if clause 21 was retained, it would hand over in an arbitrary way the whole of the mining operations of this Colony to the whim and caprice of, it might be, an incompetent inspector, and would give him too absolute a power, which is undesirable. The power he possesses now under the present Coal-fields Regulation Act is quite sufficient, if not too extensive as it is, whilst the substitution of section 21 in lieu of the law as it now stands would endow the inspector with such substantial power that, at his will, he could ruin any mining company if he thought fit. All he would require to do, without rhyme or reason, would be to announce to the colliery manager that it was his wish the men should be withdrawn from the mine, in which case 400 or 500 men would be thrown out of employment, and a repetition of what occurred at the Stockton mine possibly be the result. In that case the mining authorities declared the pit unsafe, ordered the men to be withdrawn, and the men themselves, after some enforced idleness, petitioned the manager to be allowed to go back to work, as the mine was safe, notwithstanding the opinion expressed to the contrary by the mining authorities. The men went back to work, and have been at work for the last two years in the face of the order that they should be withdrawn, and the fact that a prosecution was instituted against the manager for not complying with the mining authorities orders, the manager being fined for working, what was then alleged, a property which was unsafe, but which, as has already been stated, has been at work for two years since, and is at the present moment in operation.

Insists upon its amendment in clause 22, which omits the words "and enter such report in a book at the mine,"—because the provision is entirely unnecessary, and not in conformity with the English Act.

Disagrees to the Assembly's amendment upon the Council's amendment in clause 27, page 11, line 1, which proposes to substitute the words "or other person agreed to by the arbitrators," for the words "a Police or Stipendiary Magistrate, or a Barrister-at-Law,"—because in matters of this kind it is necessary that all adjudications should be before some independent person, and it is thought that this can best be obtained by the retention of the officials designated as above.

Insists upon its amendment in clause 30, page 12, line 23, which omits the word "three" and inserts the word "six,"—because six months is not too long a period for the plotting of the workings to be in arrears, and it is the law now, and has been for years past, without causing any inconvenience, nor has it been a disadvantage to those concerned—employer or employed.

Insists upon its remaining amendments in clause 30,—because the words proposed to be omitted are unnecessary, ample provision being made in the Bill by re-enacting clause 38 of the present Coal Mines Regulation Act, which serves all the purposes for ascertaining the working of coal outside the boundaries of mines, and if the Crown have lost revenue, as alleged, through owners having taken coal outside their boundary, the fault lies in not making use of the provisions of the law as it now stands in section 38 referred to.

Insists upon its amendments in clause 31,—because it copies, word for word, section 35 of the English Act, and to refuse to insert the word "serious" would render the work of those called upon to supervise mining operations, a grave burden to them, and make them liable to be penalised for the most trifling accidents which are bound to occur in any large operations where hundreds of men are employed, and as a matter of fact, all serious injuries are always reported.

Insists

Insists upon its amendment in clause 32, which omits the word "forthwith" and inserts the words "within one month,"—because there is no valid reason for having it done immediately.

Disagrees to the Assembly's amendment upon the Council's amendment in clause 34, page 14, line 46, which proposes to insert after the word "boundaries" the word "of,"—because it is as well that any plan should show the surface boundaries as well as the workings underground.

Insists upon its omission of clause 36,—because it is not desirable to limit by legislation the hours of labour, and penalise any man for working beyond eight hours, or have any time stipulated by legislation, apart from the fact that the application of what is commonly known as the eight hours system to coal-miners is unnecessary, inasmuch as, by voluntary combinations and regulations, they have now eight hours, with an idle Saturday every fortnight, besides, being contractors at so much per ton, they can go to work, and leave off practically when they please.

Disagrees to the Assembly's amendments upon the Council's amendment in clause 37, line 41, which propose to substitute the word "eight" for the word "ten;" to omit the word "one;" to omit the words "and eight hours on the next Saturday;" and to omit the words "(11) Each period of "employment shall be inclusive of one hour for meals,"—because this being the law now under the present Coal Mines Regulation Act, sections 8 and 9, any alterations in the present hours of working would curtail the output of the various mines, and lessen the wages earned by the workmen. The boys referred to in this section are not necessarily employed under ground for ten hours. Under present arrangements they work now only eight hours, but it is necessary for them, as part of their employment, to travel in and out of the mine, either with their horses, for gatekeeping, or other purposes for which they may be employed underground, and the time for this varies according to the length of time the colliery has been opened. In some places it might occupy them altogether an hour—in others probably not ten minutes, and it must be borne in mind that one hour of the ten mentioned in the Statute is occupied exclusively for meals. It is necessary in order to maintain the proper output of the mine that these lads should be in attendance, and it is the training ground which all colliers like to give their sons before putting them to work on the coal.

Insists upon its amendments in clause 41,—because it is an honest attempt to settle by legislation for what the miners are paid, and if it is not ascertained by the provisions of this section, and any demand was made for payment for what is commonly known as "small coal" it would involve an immediate reduction of the hewing rate now paid to the miner. His contract is to fill clean round coal only, and he is paid an additional rate, which is taken into consideration, for the small coal that is unavoidably sent up and passes through the screens when the coal is being made marketable. Miners are not ordinarily employed to get small coal—if small coal is filled it is paid for; besides, the retention of the section will conform with the judgment of the House of Lords in several recent cases where a demand had been made to secure payment for small coal under the title of "mineral," and it would set at rest any little uneasiness that may be felt upon this question. The law as it stands under the English Act and in our present Colonial Act, according to the judgment of the House of Lords, entitles the miner to be paid for small coal; but, with the exception of three or four demands in England, the law has not been invoked by the parties interested, they, no doubt, feeling that when payment was made for hewing large coal it also included small as above referred to, and it was only to harmonise the present legislation with the English Act, making the question more definite, that the clause was inserted, and which, in the interest of all parties, the Council desires now to insist upon. If this position be conceded then the insistence on subsection 3 is necessary.

Insists upon its amendments in clause 43 down to and including that in line 25, page 18, which omits the word "he" and inserts the words, "the owner, agent or manager,"—because it concedes ample provision for the protection of the wage-earner, and is the same provision as in the English law as at present, with the exception that it provides that the check-weigher shall be an employee of the colliery. This is the colonial law, and its operation has not been conducted with any disadvantages. It is often very desirable that persons who are not connected with the mine should not be allowed to act as check-weighers, and that the person filling this office should be an employee of the company.

Insists upon its remaining amendments in clause 43 disagreed to by the Assembly,—because it brings its provisions in conformity with the English Act.

Insists upon its amendment in clause 44,—because it is desirable that it may be brought within the provisions of clause 41.

Insists upon its amendments in clause 45,—because the miner is only to be paid for hewing large coal or shale.

Disagrees to the Assembly's amendment upon the Council's amendment in clause 46, line 54, which proposes to substitute the word "thirty" for the word "fifteen",—because this is in accordance with the English Act.

Disagrees to the Assembly's amendments upon the Council's amendments in clause 48, lines 2 and 7, which propose to substitute the word "thirty" for the word "fifteen" in each case,—because it forms part of the English Act.

Insists upon its amendment in clause 49, which omits subsection (111),—because this provision of the Bill refers only to the division of mine into parts, and it has been erroneously classed under the title of "Division of mine into splits," and represents clauses 19 and 20 of the English Act, which describes it under the heading of "Division of mine into parts," and not "Division of mine into splits," and in the English Act the legislation is permissive, and not compulsory, the word "may" occurring in the English Act, but in this section it has been converted into "shall."

Insists upon its amendments in clause 50, page 21, lines 45 to 50,—because the term "adequate" will be quite sufficient for every purpose connected with mining operations. It is sufficient for all the legislation on this class of mining in the United Kingdom, and gives rise to no difficulty there, and if administered here by competent people, the same results will follow. The present law provides for a minimum quantity of air, and if this is to be amended by the addition of any further prescribed figures, it is thought better to follow out the English practice, as our deep sinkings are producing fiery mines, where it is notorious that 100 feet (cubic) of air would be absolutely insufficient. As the law stands now, in one of the mines of this Colony, the quantity of air circulated as a matter of necessity is three times more than that required by law, and it is thought that the retention of the word "adequate" will be more than sufficiently satisfactory to determine special application to each mine where either less or more ventilation may be required. The quantity now in some places as fixed by law is very much too large, whilst in the case cited above it is very much too little.

Insists

Insists upon its amendment in clause 50, page 22, lines 2 to 6,—because it is not necessary to have bratticing as well as cut-throughs. One or other of these provisions is all that is necessary.

Insists upon its amendments in clause 50, page 22, lines 23 to 56,—because this portion of the Act has only been brought into accordance with the exact wording of the English Act.

Insists upon its amendment in clause 50, page 23, line 22, which omits the words “by such person,”—because the words “by such person” do not appear in the English Act.

Insists upon its amendment in clause 50, page 24, line 14, which inserts the words “except within a completely closed chamber attached to the fuse of the shot,”—because this is in accordance with the English Act, and is absolutely necessary in every fiery mine.

Disagrees to the Assembly's amendment upon the Council's amendment in clause 50, page 24, line 27, which proposes to insert after the word “shall” the word “dry,”—because this is not in accordance with the English Act, the word “dry” not being made use of, and it appears to the Council that the term “coal and coal-dust” would be quite sufficient to embrace coal of any character, whether dry or wet.

Insists upon its amendment in clause 50, page 24, lines 32 to 35, which omits the words “Provided that no person shall return to a place where such charge has missed fire until a period of eight hours has elapsed from the lighting of the fuse attached to such charge,”—because it does not appear to be part of English legislation, and it is unnecessary to make it part of statute law, and precautions are taken by the men themselves, by voluntary action on their part, of absenting themselves for a reasonable period where the shot misses fire.

Disagrees to the Assembly's amendments upon the Council's amendment in clause 50, page 26, lines 5 and 6, which propose to substitute the word “height” for the word “length” and the word “four” for the word “three” and to insert after the word “in” the words “depth and three feet in,”—because the provision to the extent of sufficient height and 3 feet in width is that provided for in the English Act, and should be sufficient for all purposes.

Insists upon its amendment in clause 50, page 26, which omits *Rule 19*,—because such a provision is unnecessary, and is really the course pursued as a matter of practice.

Insists upon its amendment in clause 50, page 26, lines 32 and 33, which omits the words “every shaft in course of sinking shall be kept clear of all noxious gases by a fan or some other appliance,”—because it is an addition to the English legislation on this subject which is considered to be unnecessary. The words “or otherwise made secure” in the rule itself is capable of a much larger construction than limiting an expression regarding it as it is proposed to do by the addition of the words “every shaft in course of sinking shall be kept clear, &c.”

Insists upon its amendment in clause 50, page 26, which omits *Rule 25*,—because it is the business of the Crown when leasing coal to see that sufficient provision is made for protecting the surface, and that owners of the mineral long before any improvements in the shape of roads or townships were in existence ought not to be punished now by losing their coal, as it is by no action of theirs that circumstances have produced an apparent necessity for not mining the coal which they are entitled to. Practically in nearly all mining townships the large companies make provision—even at the proprietor's expense—for the maintenance of the surface where the safety of the travelling public has to be considered. It is notorious that roads have been made long after the coal has been taken out, and the authorities ought to have known this would one day result in a settlement of the surface before they made the roads.

Insists upon the insertion of new *Rule 24*,—because it is in conformity with the provisions of the English Act, and necessary to be placed here if the Council's omission of section 8 is maintained.

Insists upon its amendment in clause 50, page 27, which omits *Rule 34*,—because it forms no part of English legislation, nor of any legislation in this Colony, and it appears to be unnecessary.

Insists upon its amendment in clause 50, page 28, lines 12 and 13, which omits the words “or any one having the written authority of any inspector or person so employed,”—because they appear to be superfluous; besides, it is doubtful if the power of an inspector or employee should be delegated in this way, as such a power might be given for improper purposes.

Insists upon its amendment in clause 50, page 28, line 22, which inserts the words “not being mining engineers who are practical working miners,”—because the retention of such authority as this would leave it open to the persons employed at the mine obtaining an inspection of a valuable mining property possibly for sinister purposes, and all that is required in an inspection of this kind can always be accomplished by two working miners.

Insists upon its amendments in clause 50, pages 28 and 29, which omit *Rules 41, 42, 43, 44, 45, and 46*; which omit clause 51, and the proviso to clause 52,—because legislation of this character would simply destroy the coal-mining industry of the Colony, and particularly that of the Newcastle District.

Insists upon its amendment which omits clause 59,—because it would be undesirable that there should be any set of special rules established by the Executive, whilst ample provision is made for all the preliminary mining operations under the Bill, and it would be the business of the authorities and everyone interested in the colliery operations to frame a set of special rules in accordance with the Act as speedily as possible, so as to govern the mining property for the interest of all concerned.

Insists upon its amendment in clause 62, line 39, which omits the word “wilfully,”—because anyone pulling down notices should be punished. If it could be shown to the Court that it was the result of an accident, the offender could not be punished. In any case it would be difficult to obtain a conviction with the word “wilfully” retained in the section.

Insists upon its amendment in clause 63, line 6, which omits the words “five pounds” and inserts the words “one pound,”—because the section itself differentiates now to a serious extent between the manager and the workman. It provides a punishment not exceeding £20 as against the manager, and to anybody else, for a similar offence, a fine of £2. Besides, it assimilates the punishment of £1 to that provided for in the English Act.

Insists upon its amendments in clause 69,—because it is only right that offences committed by owners, agents, managers, or under managers should be prosecuted for by a specially constituted authority in the shape of an inspector under the Act, otherwise it would be competent for outsiders and employees to be constantly annoying those concerned in the administration of the mine by projecting charges of offences under the Act, which were frivolous and untenable, and the section as amended makes it an exact copy of clause 65 of the English Act of 1887.

Insists

Insists upon its amendment in clause 72,—because it leaves it optional to the parties interested to make the agreement, and, unless both parties are agreed, the adjudication could not take place, and it is part of the English Act, clause 69.

Insists upon its amendment in clause 78, page 35, which inserts the words "Large coal means all coal passing over a three-quarter-inch screen,"—because it is a consequential amendment to the definition of the term "mineral" which must be defined as in manner stated.

Disagrees to the Assembly's amendment upon the Council's amendment in clause 78, page 36, line 6, which proposes to omit the words "Part II of,"—because the duties and powers of an Inspector are defined under Part II.

Insists upon its amendments in Schedule II, lines 40 and 41, which omit the word "(round)" and insert the word "(large)" and which omit the words "coal (small),"—because they are consequential upon those already made, and it is unnecessary for statistical or any other purpose to have legislation in a Coal Mining Bill of this character, inasmuch as the information is always available from the Coal Mining Offices of the various collieries, and it is not in accordance with the returns asked for under Schedule 3 of the English Coal Mines Regulation Act of 1887.

## B.

### SECTIONS IN COAL MINES REGULATION ACT, NEW SOUTH WALES, 11th May, 1876, REFERRED TO IN EVIDENCE.

#### Section 12.

- (2) An adequate amount of ventilation shall be constantly produced in every mine to dilute and render harmless noxious gases to such an extent that the working places of the shafts levels stables and workings of such mine and the travelling roads to and from such working places shall be in a fit state for working and passing therein. General Rules
- (3) An adequate amount of ventilation shall mean not less (as a minimum) than one hundred cubic feet of pure air per minute for each man boy and horse which shall sweep undiminished along the airway past each working place.
- (4) Within six months after the commencement of this Act every mine shall be divided into districts or splits of not more than seventy men and each district shall be supplied with a separate current of fresh air. All intake air shall travel free from all stagnant water stables and old workings and no place shall be driven more than thirty-five yards before the current of air without a cut through put through or bratticed up within three yards of the face of such working place.
- (5) If at any time it is found by the person in charge of a mine or any part thereof or by the examiner or inspector that by reason of noxious gases prevailing in such mine or such part thereof or of any cause whatever the mine or the said part is dangerous every workman shall be withdrawn therefrom and the examiner or inspector shall inspect the same (and if the danger arises from inflammable gas shall make such inspection with a locked safety-lamp) and in every case shall make a true report of the condition of such mine or part thereof and no workman shall except in so far as is necessary for inquiry into the cause of danger or for the removal thereof or for exploration be readmitted into the mine or such part thereof as was so found dangerous until the same is stated by the examiner or inspector to be safe. Every such report shall be recorded in a book which shall be kept at the mine for the purpose and shall be signed by the person reporting.

Section 19. Where the amount of wages payable to any of the persons employed in a mine depends on the amount of mineral gotten by them such person shall after the first day of February one thousand eight hundred and seventy-six be paid according to the weight of the mineral gotten by them. Provided always that nothing herein contained shall preclude the owner or agent of the mine from agreeing with the persons employed in such mine that deductions shall be made in respect of stones or materials other than mineral contracted to be gotten which shall be sent out of the mine with such mineral or in respect of any tubs baskets or hutches being improperly filled in those cases where they are filled by the getter of the mineral or his drawer or by the persons immediately employed by him such deductions being determined by the banksman or weigher and check-weigher (if there be one) or in case of difference by a third party to be mutually agreed on by the owner agent or manager of the mine on the one hand and the persons employed in the mine on the other. Where it is proved to the satisfaction of the Minister that by reason of any exigencies existing in the case of any mine or class of mines to which the foregoing provisions in this section applies it is requisite or expedient that the persons employed in such mine or class of mines should not be paid by the weight of the mineral gotten by them or that the beginning of such payment by weight should be postponed such Minister may if he think fit by order exempt such mine or class of mines from the provisions of this section either without condition or during the time and upon the conditions specified in the order or postpone in such mine or class of mines the beginning of such payment by weight and may from time to time revoke or alter any such order. If any person contravenes or fails to comply with or permits any person to contravene or fail to comply with this section he shall be guilty of an offence against this Act and in the event of any contravention of or non-compliance with this section by any person whomsoever the owner agent and manager shall each be guilty of an offence against this Act unless he prove that he had taken all reasonable means by publishing and to the best of his power enforcing the provisions of this section to prevent such contravention and non-compliance. As to payment by weight of persons employed in mines.

Section 25. If in any respect (which is not provided against by any express provision of this Act or by any special rule) any inspector find any mine or any part thereof or any matter thing or practice in or connected with any such mine to be dangerous or defective so as in his opinion to threaten or tend to the bodily injury of any person such inspector may give notice in writing thereof to the owner or agent of the mine and shall state in such notice the particulars in which he considers such mine or any part thereof or any matter thing or practice to be dangerous or defective and require the same to be remedied and unless the same be forthwith remedied the inspector shall also report the same to the Minister. If the owner or agent of the mine objects to remedy the matter complained of in the notice he may within seven days after the receipt of such notice send his objection in writing stating the grounds thereof to the Notice by inspectors of causes of danger not provided for by the rules.

the Minister and thereupon the matter shall be determined by arbitration in manner provided by this Act in relation to the special rules and the date of the receipt of such objection shall be deemed to be the date of the reference. If the owner or agent fail to comply either with the requisition of the notice given by the inspector when no objection is sent within the time aforesaid or with award made on arbitration within twenty days after the receipt of such notice or the making of the award (as the case may be) he shall be guilty of an offence against this Act and the notice and award shall respectively be deemed to be written notice of such offence. Provided that the Court if satisfied that the owner or agent has taken active measures for complying with the notice or award but has not with reasonable diligence been able to complete the works may adjourn any proceedings taken before them for punishing such offence and if the works are completed within a reasonable time no penalty shall be inflicted. No person shall be precluded by any agreement from doing such acts as may be necessary to comply with the provisions of this section or be liable under any contract to any penalty or forfeiture for doing such acts.

NEW ZEALAND COAL MINES ACT, 1891.

*General Rules.*

Section 38—

Ventilation.

*Rule 1.*—An adequate amount of ventilation shall be constantly produced in every mine to such an extent that the shafts, winzes, sumps, levels, underground stables, and working-places of such mine, and the travelling roads to and from such working-places, shall be in a fit state for working and passing therein.

An adequate amount of ventilation shall mean not less than one hundred cubic feet of pure air per minute for each man and youth, and horse, pony, donkey, or mule, which shall sweep undiminished along the airway through each working place.

STATUTES OF BRITISH COLUMBIA, 51 Vic., c. 84.

PART II.—*Rules.*

Ventilation.

*Rule 1.*—An adequate amount of ventilation shall be constantly produced in every mine to dilute and render harmless noxious gases to such an extent that the working-places of the shafts, levels, stables, and workings of such mine, and the travelling roads to and from such working-places, shall be in a fit state for working and passing therein.

*Rule 2.*—An adequate amount of ventilation shall mean not less than one hundred cubic feet of pure air per minute for each man, boy, horse, and mule employed in a mine, and as much more as the inspector may direct, which shall sweep the face of each working-place. Every mine shall be divided into districts or splits of not more than seventy men in each district, and each district shall be supplied with a separate current of fresh air. All intake air shall travel free from all stagnant water, stables, and old workings, and every place shall be bratticed up within four yards of the face. On all main roads where a door is required, the inspector of mines may order that two doors shall be placed so that while boxes are being taken through the one the other shall remain closed and no air shall be lost.

REVISED STATUTES OF THE UNITED STATES.—Vol. 1, 2nd Edition, 1874–1891.

Chap. 564, March 3, 1891—An Act for the protection of the lives of miners in the Territories.

Ventilation to be provided.

Section 6. That the owners or managers of every coal mine at a depth of one hundred feet or more shall provide an adequate amount of ventilation of not less than fifty-five cubic feet of pure air per second, or thirty-three hundred cubic feet per minute, for every fifty men at work in said mine, and in like proportion for a greater number—which air shall, by proper appliances or machinery, be forced through such mine to the face of each and every working place, so as to dilute and render harmless and expel therefrom the noxious or poisonous gases; and all workings shall be kept clear of standing gas.

REVISED STATUTES OF NOVA SCOTIA.—Fifth series.

*General Rules.*

Section 25—

Ventilation.

*Rule 1.*—An adequate amount of ventilation shall be constantly produced in every mine to dilute and render harmless noxious gases to such an extent that the working-places of the shafts, levels, stables, winzes, sumps, and workings of such mine, and the travelling roads to and from such working-places, shall be in a fit state for working and passing therein.

C.

SECTIONS IN ENGLISH COAL-MINES REGULATION ACT, 1887, REFERRED TO IN EVIDENCE.

English Act 1887.  
Disqualification of persons as inspectors.  
Sec. 40.

Any person who practises or acts as or is a partner of any person who practises or acts as a land agent or mining engineer, or as a manager, viewer, agent, or valuer of mines, or arbitrator in any difference arising between owners, agents, or managers of mines, or is otherwise employed in or about any mine, or is a miner's agent or a mine-owner (whether the mine is one to which this Act applies or not), shall not act as an inspector of mines under this Act, and no inspector shall be a partner or have any interest direct or indirect in any mine in the district under his charge.

Act of 1870.  
N.S.W.

*Section 27.* No examiner or inspector shall act or practise as a land agent or as a manager viewer or agent or mining engineer or a valuer of land or arbitrator in any matter of dispute arising between owners of mines or be otherwise employed or interested in any way in any mine.

English Act 1887.  
Notice by inspector of causes of danger not expressly provided against.  
Sec. 42. Sub-sec. 1.

If in any respect (which is not provided against by any express provision of this Act, or by any special rule) an inspector finds any mine, or any part thereof, or any matter, thing, or practice in or connected with any such mine, or with the control, management, or direction thereof by the manager to be dangerous or defective, so as, in his opinion, to threaten or tend to the bodily injury of any person, he may give notice in writing thereof to the owner, agent, or manager of the mine, and shall state in the notice the particulars in which he considers the mine or any part thereof, or any matter, thing, or practice, to be dangerous or defective, and require the same to be remedied; and unless the same be forthwith remedied shall also report the same to a Secretary of State.

<sup>1</sup>Where

<sup>1</sup>Where in or about any mine, whether above or below ground, either—

- (i) loss of life or any personal injury whatever to any person employed in or about the mine occurs by reason of any explosion of gas, or of any explosive,<sup>2</sup> or of any steam boiler; or
- (ii) loss of life or any serious personal injury to any person employed in or about the mine occurs by reason of any accident whatever,

Notice to be given of accidents in mines. Sec. 25 Sub-sec. 1.

the owner, agent, or manager of the mine shall, within twenty-four hours next after the explosion or accident, send notice in writing of the explosion or accident and of the loss of life or personal injury occasioned thereby to the inspector of the district on behalf of a Secretary of State, and shall specify in the notice the character of the explosion or accident, and the number of persons killed or injured respectively.

<sup>1</sup> *The whole of this section in the English Act 1887 re-enacts, with considerable variations, section 39 of the Act of 1872.*

<sup>2</sup> "Powder" in the repealed section.

The following general rules<sup>1</sup> shall be observed, so far as is reasonably practicable,<sup>2</sup> in every mine:

#### Ventilation of Mine.<sup>3</sup>

Part II.  
Rules.  
General Rules.  
Sec. 49.

*Rule 1.* An adequate amount of ventilation shall be constantly produced in every mine to dilute and render harmless noxious gases to such an extent that the working-places of the shafts, levels, stables, and workings of the mine, and the travelling roads to and from those working-places shall be in a fit state for working and passing therein.<sup>4</sup>

In the case of mines required by this Act to be under the control of a certificated manager, the quantity of air in the respective splits or currents shall at least once in every month be measured and entered in a book to be kept for the purpose at the mine.

*Rule 2.* Where a fire is used for ventilation in any mine newly opened after the passing of this Act, the return air, unless it be so diluted as not to be inflammable, shall be carried off clear of the fire by means of a dumb drift or air-way.<sup>5</sup>

*Rule 3.* Where a mechanical contrivance for ventilation is introduced into any mine after the commencement of this Act, it shall be in such position and placed under such conditions as will tend to insure its being uninjured by an explosion.<sup>6</sup>

<sup>1</sup> *Any breach of these rules, by whomsoever committed, may be an offence on the part of the owner, agent, and manager.*

<sup>2</sup> *The words "reasonably practicable" are not to be construed with reference to what is practicable for the carrying on of the mine as a profitable business concern, but with reference merely to physical or engineering difficulties. (Wales v. Thomas, 16 Q.B.D. 310, a decision under the Act of 1872.) The words seem to apply to affirmative provisions only. Negative provisions are always practicable, because it is always possible to do nothing.*

<sup>3</sup> *The first clause of this rule is a re-enactment of rule 1, of section 51 of the Act of 1782.*

<sup>4</sup> *To comply with this provision ventilation must be produced even during the temporary suspension of actual work, as on Sundays, and it is necessary not only that the actual working-places and travelling roads should be ventilated, but also that the ventilation should pass through the contiguous parts although not actually in use; for so much of the mine must be kept so ventilated as to render the working-places and travelling roads safe. (A decision under a former Act which contained similar provisions.)*

<sup>5</sup> *This Rule is new.*

<sup>6</sup> *This Rule is new.*

#### D.

A Bill to Amend the English Coal Mines Regulation Act, 1887 (prepared and brought in by Mr. Secretary Asquith and Mr. George Russell).

[Ordered by the House of Commons to be printed, 4 April, 1895.]

A Bill to Amend the Coal Mines Regulation Act, 1887.

A.D. 1895.

BE it enacted by the Queen's most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, as follows:—

*Dangerous*

*Dangerous Mines.*

Notice that a mine is a dangerous mine. 50 & 51 Vict. c. 58.

1.—(1.) Where it appears to any inspector appointed under the Coal Mines Regulation Act, 1887 (in this Act referred to as the principal Act), that any mine, or seam, or part of a mine is dangerous, as being either fiery, or dry and dusty, or both, he shall serve a notification to that effect on the owner, agent, or manager of that mine, and from and after the expiration of *one month* after the service of the notification, or if the notification is confirmed on appeal under this Act, *one month* after such confirmation, the mine, or seam, or part of the mine mentioned in the notification shall be subject to the provisions of this Act with respect to dangerous mines.

(2.) For the purposes of this Act—

The expression “fiery mine” means a mine, or seam, or part of a mine, in the return air of which a dangerous per-centage of fire-damp is found.

The expression “dry and dusty mine” means a mine, or seam, or part of a mine in which a dangerous amount of dry coal-dust is found.

The expression “dangerous mine” means a mine or seam or part of a mine which is dangerous.

Constitution of Coal Mines Board.

2.—(1.) For the purposes of this Act there shall be a board of three persons, to be called “The Coal Mines Board” (in this Act referred to as the board), of whom the chairman shall be a person who is not a mine owner or a miner’s agent or employed in or about a mine, one other member shall be a person who is or has been an owner or manager of a mine, and the third shall be a person who is or has been employed in or about a mine and is not and has not been an owner or manager of a mine.

(2.) The powers of the board shall continue until the end of the year *one thousand eight hundred and ninety-eight*, and no longer, unless Parliament otherwise determines.

(3.) Each member of the board shall be appointed and may be removed by a Secretary of State.

(4.) On the occurrence of any vacancy in the board, or during the temporary absence of any member thereof through illness or other unavoidable cause, a Secretary of State may appoint a fit person to be a member, or to act temporarily as a member, as the case may be, in lieu of the member whose place is vacated, or who is temporarily absent as aforesaid.

(5.) Each member of the board shall be entitled to such remuneration as the Treasury may direct.

(6.) The board may, with the consent of a Secretary of State, and the consent of the Treasury as to number and remuneration, appoint or employ and remove such officers and persons, with such remuneration, as may appear necessary for enabling the board to perform their duties under this Act.

(7.) *The remuneration aforesaid, and all incidental expenses sanctioned by the Treasury of the performance of the duties of the board, shall be paid out of moneys provided by Parliament.*

Appeal to board against notice.

3.—Any owner, agent, or manager of a mine on whom a notification has been served under this Act by an inspector may appeal to the board, and may show cause against the notification, and the board shall either confirm the notification, or, if they are satisfied that the mine is not dangerous within the meaning of this Act, make an order annulling the notification, and the same shall be annulled accordingly, without prejudice to any power of issuing a fresh notification if circumstances should make it expedient so to do.

Powers and proceedings of board.

4.—(1.) For the purposes of and incidental to the hearing and determination of any appeal the board shall, subject to any rules of procedure made under this section, have all the powers of a court of summary jurisdiction when acting as a court in its ordinary jurisdiction, and all the powers of an inspector under the principal Act, and, in addition, the following powers, namely:—

- (a) power to enter and inspect, or to authorise any person to enter and inspect, any mine or premises the entry or inspection whereof appears to the board requisite for the said purposes;
- (b) power by summons, signed by the chairman of the board, to require the attendance of all such persons as they think fit to call before them and examine for the said purposes, and to require answers or returns to such inquiries as they think fit to make;
- (c) power to require the production of all books, papers, and documents which they consider important for the said purposes;
- (d) power to administer an oath and require any person to make and sign a declaration of the truth of the statements made by him in his examination.

(2.) every person attending as a witness before the board shall be allowed such expenses as would be allowed to a witness attending before a court of record.

(3.) The board may order any costs and expenses incurred in and about any appeal to be paid either by the appellant or by any person summoned before it or partly by the appellant and partly by any such person, as they may direct, and any such order shall, on the application of any person entitled to the benefit thereof, be enforced by any court of summary jurisdiction as if the costs and expenses were a penalty imposed by that court; but subject to any such order, such costs and expenses shall be deemed to be expenses of the board in the execution of this Act.

(4.) In case of dispute as to the amount to be allowed under this section for any costs or expenses, the board may, if they think fit, refer the matter to a master of the Supreme Court, who, on request signed by the chairman of the board, shall ascertain and certify the proper amount of the costs or expenses.

42 & 43 Vict. c. 58. Special rules as to dangerous mines.

(5.) If any person without reasonable excuse (proof whereof shall lie on him) either fail, after he has had the expenses (if any) to which he is entitled tendered to him, to comply with any summons or requisition of the board under this section, or prevents or impedes the board in the execution of their duty, he shall for every such offence be liable on summary conviction to a fine not exceeding *ten pounds*, and in case of failure to comply with any requisition for making any return or producing any document, shall be liable on summary conviction to a fine not exceeding *ten pounds* for every day that such failure continues.

(6.) The board may, with approval of the Secretary of State, make rules as to the procedure to be followed in cases of appeal to the board, including the time and notice of appeal, and as to fees to be paid by appellants and other parties.

(7.) The Public Offices Fees Act, 1879, shall apply to fees payable under this Act.

5.—(1.) A Secretary of State may make special rules for the conduct and guidance of the persons acting in the management of any dangerous mine or employed in or about the mine with respect to any of the following matters:—

- (a) the lights to be used in the mine; and
- (b) the explosives to be used in the mine, the mode of using and storing such explosives, and of making and stemming holes, and the times at which and the manner in which shots are to be fired in the mine; and
- (c)

- (c) the watering of the mine or any ways or places therein ; and
- (d) generally the precautions to be adopted for the prevention of accidents from fire-damp and coal-dust.

(2.) Any special rules made under this section shall be served on the owner, agent, or manager of the mine to which they are to apply, and if the owner, agent, or manager does not within *twenty days* after the special rules are received by him object in writing to them, the proposed special rules shall be established.

(3.) If the owner, agent, or manager sends his objection in writing within the said twenty days to the Secretary of State the matter shall be referred to arbitration under the principal Act, and the date of the receipt of the objection by the Secretary of State shall be deemed to be the date of the reference, and the rules shall be established as settled by an award on arbitration.

(4.) While any such special rules are in force in any dangerous mine, any general rule contained in section forty-nine of the principal Act, and any special rule established under the principal Act, which may be inconsistent with any special rules made under this section shall, to the extent of such inconsistency, be suspended in relation to that mine.

(5.) Any special rules made under this section shall come into force on such date or dates as may be therein appointed, and from and after the date on which any such rule comes into force it shall be observed in and about the mine to which it applies in like manner as if it were enacted in the principal Act.

(6.) Sections fifty-seven and fifty-eight of the principal Act shall apply to the publication of special rules made under this section in like manner as to the publication of special rules established under that Act.

6.—In any dangerous mine no shot shall be fired unless all the workmen employed therein are for the time being out of the mine, except those firing the shot and others necessarily present, not exceeding ten persons, or such greater number as may be allowed in the case of the mine by special permission of a Secretary of State.

#### *Miscellaneous Amendments.*

7.—Where any matter in difference is referred to arbitration under the principal Act, and where any appeal against any notification is brought before the board under this Act, the arbitrators or umpire, or the board, as the case may be, may, on the application of any of the workmen employed in the mine to which the arbitration or notification relates, and on such security, if any, as may appear to the arbitrators or umpire or board sufficient to provide for the costs of and consequential on the application, appoint any person to represent the workmen, or any class of them, on the arbitration or appeal, and any person so appointed shall be entitled to attend and take part in the proceedings of the arbitration or appeal to such extent and in such manner as the board may direct, and be subject to the same liability with respect to costs as if he were a party to the arbitration or appeal.

8.—(1.) Any agreement to vary wages in accordance with the amount of stones or substances other than the mineral contracted to be gotten, or in accordance with the mode of filling any tubs, baskets, or hatches, shall be treated as an agreement for deductions under section twelve of the principal Act.

(2.) In estimating any deduction under that section, regard may be had not only to the amount of the stones or substances aforesaid, or to the nature or extent of the improper filling, but also to the diminution in the value of the coal or to any additional expense caused thereby.

(3.) Any such agreement for deductions, and any deduction made in pursuance thereof, shall be illegal, null, and void unless—

- (a) the agreement is evidenced by a memorandum in writing signed by the workman ; and
- (b) the deduction authorised by the agreement is reasonable, having regard to all the circumstances of the case.

(4.) Any deduction made in pursuance of any such agreement shall not be lawful unless particulars in writing, showing the nature and items of the deduction, are supplied to the workman on each occasion when the deduction is made.

9.—(1.) A statutory declaration made by any person acting or claiming to act as a check-weigher under section thirteen of the principal Act, or by any other person entitled to be represented by such a check-weigher, to the effect that he was present at a meeting for the purpose of appointing a check-weigher, and that the person named in the declaration was duly appointed check-weigher by that meeting, shall be *prima facie* evidence of that appointment.

(2.) Where the check-weigher was appointed by a majority ascertained by ballot of the persons employed in the mine, and paid according to the mineral gotten by them, the declaration shall so state, and if it does not so state, then it shall state the names of the persons by whom or on whose behalf the check-weigher was appointed. Where a check-weigher is appointed by such a majority as aforesaid he shall be deemed to be appointed on behalf of all the persons employed in the mine who are entitled to appoint him.

(3.) The facilities to be afforded to a check-weigher under section thirteen of the principal Act shall include a shelter from the weather and a desk or table at which the check-weigher may write.

10. The annual return under section thirty-three of the principal Act shall, with respect to the year mentioned in that section, show for each mine, in such form as the Secretary of State may prescribe,—

- (1) to the best of the information and belief of the person making the return, the distribution of the coal gotten at the mine, specifying whether it is supplied for colliery consumption, for domestic consumption, for the manufacture of coke, for the manufacture of gas, for other manufacturing purposes, or for export ; and
- (2) the quantity and value of coke produced at the mine ; and
- (3) the rates of and total amount paid for royalties, rents, and wayleaves, in respect of coal, ironstone, fireclay, oil shale, and other minerals respectively ; and
- (4) the average price of coal at the pit's mouth,

Plan of abandoned mine.

11. Section thirty-eight of the principal Act shall be amended as follows:—

(1.) The following subsection shall be substituted for subsection one:—

“(1.) Where any mine or seam is abandoned, the person who is owner of the mine or seam at the time of its abandonment shall, within *three months* after the abandonment, send to a Secretary of State:

- (i.) An accurate plan of the mine or seam, being either the original working plan or an accurate copy thereof made by a competent draftsman, and showing—
- (a) the boundaries of the workings of the mine or seam, including not only the working faces but also all headings in advance thereof, up to the time of the abandonment;
  - (b) the pillars of coal or other mineral remaining unworked;
  - (c) the position, direction, and extent of every known fault or dislocation of the seam with its vertical throw;
  - (d) the position of the workings with regard to the surface;
  - (e) the general direction and rate of dip of the strata; and
  - (f) a statement of the depth of the shaft from the surface to the seam abandoned; and
- (ii.) A section of the strata sunk through, or if that is not reasonably practicable, a statement of the depth of the shaft with a section of the seam.

“Every such plan must be on a scale of not less than that of the ordnance survey of twenty-five inches to the mile, or on the same scale as the plan used at the mine at the time of its abandonment.”

(2.) In sub-section two, after the words “without the consent of the owner of the mine or seam” shall be inserted the words “or the licence of a Secretary of State.”

(3.) The following sub-sections shall be added to the said section:—

“(6.) At any time after the expiration of *ten years* from the time of the abandonment, the Secretary of State may, with the consent of any local authority, deposit with that authority the said plan and section, or may authorise the local authority to deposit the same in any public library or other public building, and may make rules for the safe custody, inspection, and copying of the same, and as to the fees (if any) to be taken in respect thereof. Every plan and section so deposited shall be delivered up to the Secretary of State on demand.”

“(7.) The High Court, or in Scotland the Court of Session, may, on application, by or on behalf of the Secretary of State, make an order requiring any person who has for the time being the custody or possession of any plan or section of an abandoned mine or seam to produce the same to the Secretary of State for the purpose of inspecting or copying the same.”

Amendment of general rules as to inspection, trimming of lamps, and tamping.

12.—(1.) The inspection before the commencement of work required by Rule 4 (i.) contained in section forty-nine of the principal Act shall extend to the roadways and to all parts of the mine the condition of which may affect the safety of the mine.

(2.) Rule 10 of the general rules contained in section forty-nine of the principal Act shall apply to the trimming of safety lamps in like manner as to the examining thereof, and shall be read as if the words “and trim,” “and trimmed,” and “and trimming” were respectively used after the words “examine,” “examined,” and “examining” wherever those words respectively occur.

(3.) A safety lamp shall not be used in any mine or part of a mine unless it is the property of the owner of the mine, and no portion of any safety lamp shall be removed by any person from the mine while the lamp is in ordinary use.

(4.) In Rule 12 of the said general rules, for the words “nor shall coal or coal dust be used for tamping” shall be substituted the words “and only clay or other non-inflammable substances shall be used for tamping.”

Provision as to explosives.

13.—An explosive shall not be used in any mine unless it is of a kind for the time being certified by a Secretary of State as fit to be used in that mine or in any designated class of mines including that mine, and the Secretary of State may grant certificates for the purpose of this section in such form, on such terms, and subject to such conditions as he thinks fit.

Qualification and examination for certificates.

14.—(1.) To sub-section one of section twenty-three of the principal Act shall be added the following words “or such experience or other training as the board to which he applies may consider equivalent to such five years’ experience.”

(2.) The examinations for certificates of competency under the principal Act shall be partly by examination papers and partly by oral examination.

(3.) The examination by examination papers shall be conducted by examiners to be appointed by a Secretary of State, and any rules made by any board under section twenty-four of the principal Act, so far as relates to the examiners appointed under this section, shall not have effect until approved by the Secretary of State; but save as aforesaid section twenty-four of the principal Act shall apply to all examinations conducted under the provisions of the principal Act as amended by this Act.

#### Short Title.

Short title.  
57 & 58 Vict.  
c. 52.

15.—This Act may be cited as the Coal Mines Regulation Act, 1895, and the principal Act and the Coal Mines (Check Weighers) Act, 1894, and this Act may be cited collectively as the Coal Mines Regulation Acts 1887 to 1895.

### E.

#### CHAPTER 52.

An Act to amend the provisions of the English Coal-mines Regulation Act, 1887, with respect to Check-weighers. [25th August, 1894.]

BE it enacted by the Queen’s Most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons in this present Parliament assembled, and by the authority of the same, as follows:—

Penalty for interference with office of check-weigher.

1. If the owner, agent, or manager of any mine, or any person employed by or acting under the instructions of any such owner, agent, or manager, interferes with the appointment of a check-weigher, or refuses to afford proper facilities for the holding of any meeting for the purpose of making such appointment, in any case in which the persons entitled to make the appointment do not possess or are unable

unable

unable to obtain a suitable meeting place, or attempts, whether by threats, bribes, promises, notice of dismissal, or otherwise howsoever to exercise improper influence in respect of such appointment, or to induce the persons entitled to appoint a check-weigher or any of them, not to re-appoint a check-weigher, or to vote for or against any particular person, or class of persons, in the appointment of a check-weigher, such owner, agent, or manager shall be guilty of an offence against the Coal-mines Regulation Act, 1887.

2. This Act may be cited as the Coal-mines (Check-weigher) Act, 1894.

50 and 51 Vic,  
c. 55.

Short title.

### E1.

#### CHECK-WEIGHERS' STATEMENTS, Southern District Collieries; Minutes of Evidence, Questions 1619-1805. MOUNT PLEASANT COLLIERY.

- Question 1. Have you a standard weight? Yes, a standard weight fixed at 20 cwt.
- " 2. How many skips have been weighed per 1,000 filled for the past three months? For the past three months, dating up to September 7th, 1895, 13,081 skips of coal have been booked to the miners' account; out of that amount 306 skips have been weighed; taking the amount per 1,000, we have weighed 23 and  $\frac{1}{2}$  skips per 1,000.
- " 3. How many men are there who have not been weighed for the past month, two months, or three months? Fourteen numbers have not been weighed for a fortnight, or twenty-seven men in all, dating from August 23rd to September 7th. Two numbers have not been weighed for a period of three weeks, or four men in all, from August 13th to September 7th. One number has not been weighed for a period of eight weeks, or two men in all, from July 15th to September 7th. One number has not been weighed for a period of nine and a half weeks, or one man in all, from July 4th to September 7th.

H. R. MURDOCH,  
Check-weighman.

#### COALCLIFF COLLIERY.

June 17th to September 7th, 1895.

This list comprises the number of times each miner was weighed during the last twelve weeks.

Miners' Nos.	No. of times weighed.	
1	...	Left the colliery June 24th.
2	3	Once June 24th, and twice on September 3rd.
3	...	Left the colliery July 9th.
4	1	On June 24th.
5	1	On September 3rd.
6	1	On " " "
7	...	Not weighed during past three months.
8	1	On June 24th.
9	...	Not weighed during past three months.
10	1	On September 3rd.
11	...	Not weighed.
12	...	" " paid by the average of the mine, and has not been weighed up to September 9th.
13	1	On June 24th.
14	...	Employed at the colliery from July 22nd, and paid by average, and not weighed up to September 9th.
16	1	On June 24th.
22	3	Once on June 24th, and twice on September 3rd.
63	...	An old miner named Wm. Walker, principally sending out slack.

It will be seen by the above list that there have been only two weighings during this period, and the number of days worked is thirty-eight.

Miners' Weighed, September 3rd, 1895.

Nos.	cwt. qr. lb.		cwt. qr. lb.		
1					September 4th. Objected to this weigh, because he did not call on the weigh until the set was out at the tunnel mouth, and got them removed from the sheet.
2	13	2 0	13	2 0	This average went up, 1 qr.; ought to be 14 cwt. 1 qr. 7 lb. if the standard weight was removed.
5	13	1 14	13	2 0	No. 5 went up from 12 cwt. 3 qr. to 13 cwt. 1 qr. 14 lb.
6	11	1 0	13	2 0	This number lost 2 qr. 14 lb. He did not want him.
10	12	1 0	13	2 0	This number lost 2 qr. 14 lb. He did not want him.
22	12	3 0	12	1 14	This number went up 3 qr. 7 lb.

The above is what they call weighing by average at the Coalcliff Colliery.

We used to get 3d. a cask for bailing water, but that is done away with. If you do not bail it you can sit there until somebody comes to do it—that is, there is no other place for you; this has happened with several men, now and again. We have also to pay 1s. per fortnight for house coal, but had not to do it before. As regards the eight hours, I should like to see it become an established fact. There are men in the Coalcliff Colliery who go in at 12 o'clock at night and are not out until 5.30 p.m. the next night, and they have often had to go in and work from 3 and 4 o'clock in the morning until 5 p.m. at night. At one time if they wished an early start the manager would ask if we would oblige him, but he does not do it now; he simply sends round some one between 8 and 9 o'clock to tell us that he wants us to start at a certain hour in the morning, and there is no more about it; yet people will say we have the eight hours. I have known him repeatedly chastise men for coming out of the colliery after being in nine and ten hours, just because it was not 5 o'clock; and yet, in the face of all this, it is said we do not want the eight-hour clause because we have it already. I would like to know where we have it. Both men generally go in

in together now ; it is not as it used to be, a front and back shift, and I have heard the manager tell men that were on the back shift that it was time they were in, and then it was not much after 7 o'clock ; their reason could not be because they got more coal out, because they do not average any more now than they did when they were working the eight hours, front and back shift.

Coalcliff Colliery, September 9th, 1895.

A. NICOL,  
Check-weighman.

METROPOLITAN COLLIERY, Helensburgh.

Miners skips drawn from the Metropolitan Mine from the 8th July until the 31st August, 1895, were 31,549 ; number weighed, 477 ; average, 1 in 66.

THOS. HALL, Check-weighman.

SOUTH CLIFTON COLLIERY, 10th September, 1895.

1. Number of skips weighed per 1,000, 1 to each 255.
2. Number of men not weighed for three months, 12.
3. Number of men not weighed for two months, 32.
4. Number of men not weighed for one month, 58.
5. Number of men getting coal, 70.
6. Total number of skips weighed for three months, 53.

The above is for six pays, and is a fairly representative account.

JAMES MAGUIRE,

South Clifton.

Miners' Check-weighman.

NOTE.—See Geo. Henderson's evidence. Questions 1668-1674.

CORRIMAL COLLIERY.

No. 6 token : On 7th August, 1894, had a Tommy weighed 8 cwt. 2 qr. ; also a Kembla skip weighed on 29th August, 1894, 8 cwt. 1 qr. This number was no more weighed till 21st December, 1894, a Kembla skip ; a Tommy not being weighed till 31st January, 1895.

Period—Kembla, four months ; Tommy, nearly six months.

No. 11 token : Tommy, 5th November, 1894 ; Kembla, 29th November, 1894 ; Tommy, 29th March, 1895 ; Kembla, 19th April, 1895.

Period—Over four months in both skips.

No. 55 token : A tommy skip weighed on 13th March, 1894 ; weighed no more till 13th November, 1894—this is a period of eight months ; and then on the 13th November the overman chalked the skip that was weighed.

It is a common occurrence for men to run over a month, and upwards of two months, without having a skip weighed.

On Saturday, 6th July, 1895, whilst the Company's weighman was busy up the yard helping to unload some trucks, he noticed a small skip coming down the incline, when all of a sudden he jumped down from that work and ran down the yard up to the weigh-screen and called it in to be weighed. These men were in a deficient place, and made an agreement with the overman that they should have 6 cwt. per skip to fill all away together, but after having been weighed only 4 cwt. per skip the manager vetoed the arrangement made by the overman, to the men's loss.

On Sunday night, the 4th August, 1895, two men were brought out of their own place and put into a pillar to oblige the Company, by filling all the empty skips, and when the pay came they were deficient 2d. per ton for that night's work, whilst they were weighed in that coal which caused them to lose a quarter of a hundredweight off every skip filled during that fortnight.

For the two weeks ending 31st August, 1895, the pit worked seven days on coal ; during that time 4,287 skips of best coal and 489 skips of slack passed over the screens. Out of this number twenty-four skips were only weighed—an average of three skips per day. Two days on weighing.

From Friday, 30th August, 1895, till 14th September, 1895, the pit worked fourteen full days and twelve nights of from four to five hours' duration, when the miners were requested to run shifts to supply them with coal.

One young man (a day-man) after running one extra shift at night-time refused to do any more overtime, for which action he has received fourteen days' notice to quit the Company's service. For twelve full days and eleven nights during this time 7,396 skips of best coal and 1,056 skips of slack passed over the screens, and only 109 skips were weighed. Twenty-nine of this number were weighed during one midnight, leaving the balance of eighty skips weighed for twelve full days of ten hours each.

Twenty-two men out of a total of 122 have not had one skip weighed this fortnight.

F.

Extracts from Fifth and Final Report of Royal Commission on Labour in England, 1894.

EIGHT HOURS.

Page 70, paragraph 198.—Mining is confessedly an occupation exceptionally dangerous, disagreeable, and laborious ; it is also alleged that the hours now worked make it exceptionally unhealthy. It was not contended by witnesses before the Commission that the hours of labour in mines are long as compared with those of other industries,\* but only that they are unduly long, having regard to the character

Arguments in favour of legal restriction of hours of miners.

\*Mr. Pickard, however, stated at the Conference at the Westminster Palace Hotel (1891) between coal-owners and miners that the "hours which miners have to put in from the time they leave their homes to engage upon their work in any shift are, on the average, longer than in any other trade or occupation in the country" (See minutes of evidence, Group A., Vol. I., Appendix XVI., page 485). For the actual average hours worked by the hewers in the different districts from bank to bank (in no case more than 9½), or at the face, exclusive of meal times (in no case more than 8½), see the table given in the summaries of evidence, Group A., Part I., paragraph 19 (a). It must be remembered that the hewers do not, as a rule, work the six days of the week.

character of the work, and that eight hours a day of labour underground in an impure atmosphere, with the risk to which miners are exposed of catching chills in changing from the hot air of the mines to the cold and damp above, is as much as it is right to ask any man to work. Longer hours are (it is maintained) most injurious to health, they also increase the danger of a calling already dangerous enough. More accidents occur towards the end of shift than at the beginning, simply in consequence of the hewers becoming over-tired.

In further justification of the demand for special treatment for workers underground, it is asserted that the miners have, by an unmistakable majority, declared themselves in favour of an eight-hours' day by legal enactment, and in this respect stand or (if an exception is to be made with regard to the cotton operatives of Lancashire) stood, till lately, alone among the the great industrial bodies of the kingdom.

Paragraph 199.—These are the main reasons of a positive kind advanced in favour of statutory restrictions of the hours of labour in mines to a maximum of eight from bank to bank. The economical arguments put forward by most advocates of the measure are only ancillary to these, and are not so much reasons in favour of restrictive legislation as answers to economic objections urged on the other side.

Paragraph 200.—It is, however, worthy of note that the representatives of the Lanarkshire and Ayrshire miners openly advocated an eight-hour day on the express ground that it would have the effect of reducing output, and thereby give "better wages, a better price, and bigger profits," as well as provide work for the unemployed. This appeared to be with them a principal consideration, at least as important as any direct benefit to be derived from a shorter spell of work. There is some ground for suspecting that the views thus frankly expressed by the West of Scotland miners have, in reality, not been without influence on the miners' leaders in other districts also. For instance, it is often argued on behalf of the miners, that only legislation can secure a uniform limit of hours throughout the country, and that uniformity is necessary in order to prevent the unfair competition of long-hour districts with short-hour districts. This argument assumes that districts continuing to work long hours would have an economic advantage over the districts which had adopted an eight-hours' day; but it is hardly consistent with the official view put forward by the Miners' Federation at the Westminster Palace Hotel Conference (1891), that a reduction of hours would not diminish output, and therefore would not increase the cost of production. Be that as it may, the evidence given before the Commission by witnesses representing the miners in districts other than the West of Scotland, and favourable to a legal eight-hours' day, certainly indicated that in their belief the output per man would be maintained in spite of reduced hours. The witness who appeared on behalf of the Merthyr and Aberdare districts formed, perhaps, a solitary exception. In his opinion an eight-hours' day, from bank to bank, would ruin the industry in those valleys; he was therefore in favour of an eight-hours' *working* day instead.

Argument as to benefits from reduction of output.

Paragraph 201. In support of the view that the output per man would be maintained, it was represented—

Arguments as to maintenance of output.

- (1) That so much depends in this occupation upon actual physical energy, that a man could probably hew as much, by more concentrated work in a less time, as he now does in the longer hours.
- (2) That under a system of shorter hours a mine would work more regularly through the week, instead of as is now usual, taking one day or two days off.
- (3) That legal reduction of hours, even if for the moment it resulted in diminished output, would probably lead to better organisation, to the introduction of improved machinery for extracting the coal, and to greater speed in winding it, so that the deficiency would speedily be made good.

Paragraph 202.—The case for limiting the hours of labour in mines by special enactment may be summed up thus:—Mining is an occupation exceptionally injurious to health, as well as dangerous to life and limb from accidents. Shorter hours would conduce to healthiness and diminish accidents. A legal eight-hours' day from bank to bank, is asked for by an undoubted majority of those employed in the trade, and might be established without economic loss to anybody.

Summary of arguments for legal restriction.

Paragraph 203.—If it be true that a decided majority of the miners are in favour of statutory restriction of hours for underground labour, the employers, on the other hand, seem almost unanimously opposed to it. To the arguments used by the advocates of special legislation they reply, that the case in favour of exceptional treatment for miners breaks down on examination; that shorter hours are not required for health, and would not diminish, but rather tend to increase, the dangers of the occupation; that the majority of miners (if indeed they are a majority) who favour an eight-hours' day from bank to bank, are mistaken as to its economic consequences; and that if they realised the true facts of the case, and the manner in which the proposed measure would affect them individually if strictly enforced, they would cease to demand legislation and prefer the safer, if slower, methods of claiming through their union a reduction in the hours of work whenever the conditions of trade in any district was such as to allow of it. A similar line was also taken by one or two "independent" miners from the Midlands; and (speaking especially for their own district) by the representatives of the men of Northumberland and Durham.

Arguments against legal restriction of hours of miners

Paragraph 204.—As regards the laborious and disagreeable character of a miner's work, it was urged that this was common to other industries as well, for which no exceptional treatment was demanded. Considerations of health and safety might no doubt justify a legislative intervention; but mining was not an unhealthy occupation, and shorter hours would not increase safety. The weight of evidence certainly seems to be against the idea that coal-mining is an unhealthy occupation, even when allowance is made for the probability that weakly men either avoid entering or soon abandon it. Dr. Ogle, who has given special attention to this subject, stated in his evidence that coal-miners were among the healthiest set of men in all the trades he had examined, and that the same thing was found to hold good on the Continent also. In England and Wales, according to the witness, "the death rates of coal-miners are surprisingly low. In spite of their terrible liability to accident, and their constant exposure to an atmosphere vitiated by coal dust, by foul air, and by an excessively high temperature, the comparative mortality of these labourers is considerably below that of all trades; nor is this only true of coal-miners in the aggregate, but it is true, with one single exception, of the miners in each great coal area, taken separately. \* \* \* \* The one exception to the rule is furnished by South Wales and Monmouthshire \* \* \* but even here, if deaths from accidents be left out of account, the rule holds good; the mortality of miners from all other causes together is below that of the general male population."

Examination of arguments to health.

As to accidents.

Paragraph 205.—The contention that the larger proportion of accidents in mines occur during the later hours of the shift, and that therefore the increase must be due to the physical and mental exhaustion of the miner, also seems to fail when brought to the test of figures. The statistics of accidents, whether arising from explosions or from falls of roof and sides, cannot fairly be interpreted to indicate a preponderance of accidents during the later portion of the shift. A good many witnesses indeed went so far as to say that the dangers of mining would be augmented rather than diminished by an eight-hours day, because the hewers would be in such a hurry to get the full tale of coal in order to make up their usual wages, that they would be tempted to neglect the necessary repairs, and because the speed of winding was already at the limit of safety, and any increase might itself lead to accidents.

View of employers as to economic effects.

Paragraph 206.—As from the economic effects of an eight-hours' day from bank to bank, a very general opinion was expressed on the part of the employers that the total output would, in most districts, be greatly reduced, chiefly as a result of the diminished hours for drawing and winding coal. The cost of production would be doubly increased, because, along with a reduced output, there would have to be an increase in the permanent repairing staff. The result would probably be that some of the collieries which now work under least advantageous circumstances would have to be closed. Even if prices rose in the first instance, they would eventually fall again, partly in consequence of the natural re-action of high prices on the demand for fuel for our home industries, partly because high prices caused by an artificial increase in the cost of production confined to this country would give advantage to foreign coal-owners, who compete with us in foreign markets. A large measure of the loss must ultimately fall on the men's earnings, but it was difficult to make them believe this.

Evidence of "independent" witnesses.

Paragraph 207.—A point especially insisted on by some witnesses from Derbyshire who were working miners, and two of them members of the union, though they appeared before the Commission in an independent capacity, was the ignorance of the miners as to the bearing of the proposed measure on their individual comfort and convenience. These witnesses declared that when the ballot was taken in that district on the question of a legal eight-hours' day, the men were confused as to the real issue, and did not understand that if the Bill became law they would be prevented from working a minute beyond the fixed hour, or from working longer for their own sakes in busy times in order to make up for slack times. Men work in different ways and at different rates of speed according to their respective capacities and temperaments, and it would be unfair on the slower workman to prevent him by law from working longer hours in order to make up for lack of speed. Moreover, the conditions of coal-mining do not allow of stopping work at a given moment, e.g., a hewer at the end of his day may see some necessary repair which he could do in 20 minutes, but which, if left to the next day, will take much longer.

Question of area of proposed restriction.

Paragraph 208.—Another point remains to be considered. In support of a statutory eight-hours' day for miners, the following argument is often used:—Even the opponents of the movement (it is said) admit that eight hours of labour underground is as much as is desirable in every twenty-four, and that an eight-hour day secured by trade-union effort would be a good thing. If it is a good thing when obtained by trade-union effort, how can it be a bad thing when secured by legislation?

This argument raises the important question, Is the proposed measure to be uniform in its operation, and binding on all districts alike throughout the country, or is room to be allowed for local exemption? An eight-hours' day (it is urged) may be an excellent thing in the abstract, and yet but a doubtful boon if, in practice, it takes the shape of loss of employment for some and reduced earnings for others. It is a good thing when secured by combination, partly because it could not be so secured and maintained unless the state of the trade in the particular district admitted of it. A legal eight-hours' day is objectionable just because it allows no latitude and no exceptions. Coal-mining presents a range and variety of conditions such as can be found in few other industries. One stall differs in facility of working from another stall, one seam from another seam, one colliery from another colliery. To apply one same hard-and-fast rule to the very different conditions which obtain, even within the same district, would give rise to anomalies and hardships; but if it is proposed to force a fixed limit of working hours on all districts alike, the difficulties become still more serious. At present there is a natural adjustment of hours to different circumstances in different districts. If the Legislature interferes with the natural adjustment, it will benefit some districts at the expense of others.

Special objection in Durham and Northumberland Division of opinion.

Paragraph 209.—It is in Durham and Northumberland that this objection finds its strongest expression. These districts carry on the work of coal-mining on a system peculiar to themselves. The hours of the hewers from bank to bank are decidedly less than eight, and shorter than in most other districts, but the hours of the boys and lads amount to ten on a full working day, though their work is, as a rule, comparatively light. The hewers work on a double-shift system, which adjusts itself to a simple long shift of winders and drawers; and the representatives of the miners' unions emphatically assert that, if the hours of the latter are reduced to eight, it will upset the system with which they are contented, and that no other system is practicable consistently with maintaining the prosperity of the industry. This was denied by one independent witness from Northumberland who placed a scheme of his own before the Commission.\* The coal-owners, however, confirm the view held by the great majority of the men, with the result that in these two counties employers and employed alike are opposed to a legislative reduction of hours. The men say they would gladly see the hours of the boys further diminished; but they maintain that, inasmuch as a lad working long hours at drawing, subsequently becomes a hewer and works on short shifts, the general effect of the system, looking at his whole career, is more advantageous to him than would be shorter hours for a few years with the risk of longer hours for the rest of his life, and that, as regards the workmen generally, an eight-hours' day by law would produce greater evils than it would remove.

Paragraph 210.—Thus, at the present time, the great body of miners in the country is divided into two camps on the question of a legal eight-hours' day; nor does there seem any immediate prospect of a reconciliation, even on the basis of district option, seeing that the spokesman of the Miners' Federation has declared, on behalf of those whom he represents, that their object is "a uniform eight-hour day for the underground toilers in the United Kingdom" and that anything less would be entirely unacceptable.

Page

\* Detailed accounts of this, as well as other schemes considered, but rejected by the majority of the men, will be found in the summaries of evidence, Group A., Part I., paragraph 31.

Page 104, paragraph 320.—To establish by law a maximum working day of a fixed number of hours applicable to all trades and occupations alike does not appear to us to be a proposal which bears serious examination.

Paragraph 321.—The proposal that any trade should be enabled to decide by vote its own maximum hours of labour, and obtain legal sanction to that decision appears to us to be more worthy of consideration. No schemes, however, have been produced which solve the practical difficulties of defining in all cases a trade, and of ascertaining its collective decision, especially in the case of the less well-organised industries. Even if these difficulties could be overcome, we do not see how the proposal could be adopted without danger of injustice to employers and to minorities of workmen, or without risk of economic injury in some cases to the country at large, in others to districts which have less natural advantages in competing with rival districts.

Paragraph 322.—A further proposal is that special Acts of Parliament shall be passed with regard to special trades, either directly fixing the maximum hours of labour in such trades, or giving power to special Boards or to Public Departments to regulate the hours in them. We have had to consider the first of these alternatives chiefly with reference to the coal-mining industry.

Paragraph 323.—The Miners' Federation, which covers the larger part of the English coal-mining districts, having refused to send any representatives to give evidence, we have only heard one side of the question so far as relates to the districts so controlled. We have, however, received evidence from both coal-owners and miners in Northumberland, Durham, Scotland, and Wales. Upon the evidence before us, we are not prepared to advise that a general rule fixing a maximum of eight hours "from bank to bank" of all persons employed underground in mines should be laid down by the Legislature for a number of districts varying so much in circumstances.

Paragraph 324.—We are decidedly of opinion that no sufficient ground exists for Legislative interference with the present arrangements as to hours of work in the districts of Durham and Northumberland where, as the evidence shows, these arrangements are approved of by the great majority of those employed.

Paragraph 325.—With regard to mines in other districts we do not think that a special case has, so far as the evidence in our possession goes, been made out for exceptional legislation upon the ground that the length of the hours now worked leads to an increase of accidents or to injury to health. The miners are moreover in almost every district a very powerful and highly organised body of workmen, and we do not think that it has yet been proved that they are unable to obtain by voluntary agreement with employers the hours which are best suited to the circumstances and interest of the industry in each district.

#### F 1.

EXTRACT from "Coal Pits and Pitmen," by Nelson Boyd, M. Inst. C.E., 1892.

THE limitation of hours of labour, or the eight hours' movement as it is called, is reasonable enough if agreed on by a general *consensus* of opinion in different trades, but it is open to grave doubt whether Parliament should be appealed to in order to fix the exact time a man ought to work at a certain occupation. One objection the men had to the education clauses was, that if the boys only worked eight hours a day the pit would be laid idle, and the industrious collier who wanted to make wages would be debarred from doing so by a clause in an Act of Parliament. This is not so long ago, and it is not easy to understand how it now comes to pass that the men wish to see the hours of work fixed and limited by an Act of Parliament. The matter is under consideration by the leading statesmen of the day, and belongs to the future. It is only alluded to here as a subject which for some years has been publicly advocated by a section of the workmen. It may, however, not be out of place to state as an opinion that Parliament is not exactly the fit tribunal to judge as to the precise time a man ought to continue at any particular kind of work, and draw a hard and fast line which takes from the workman all possibility of betterment of earnings if he felt able and inclined to extend his hours of labour.

It would appear more practical to refer the fixing of the hours of labour to a Board or Commission, who could appoint assessors possessing a practicable knowledge of the colliery or trade under consideration, and take evidence as to the limit of the hours of labour which ought to be determined on. As far as miners are concerned, there is an almost general opinion that eight hours' work underground is a sufficient strain on the physical powers of human beings.

If we turn from the colliers to the collieries we find a marked improvement in the safety of the underground workings.

The following table shows the number of lives lost per million tons of coal raised, and averaged by decades:—

10 years ending 1860, average 13.90 deaths per million tons raised.				
10	1870	10.70	"	"
10	1880	8.70	"	"
9	1889	5.80	"	"

According to the Parliamentary summaries, the death-rate per 1,000 persons employed have been as follows:—

1851 death-rate per 1,000 persons employed	= 4.56
1861	= 3.38
1871	= 2.89
1881	= 1.92
1889	= 1.85

These figures show a gradual diminution of the loss of life underground, but this improvement has not been realised at the expense of an increase of labour, for, if we take into consideration the mineral produced per person employed, we find that the productive power of the miner has not decreased.

Table

Table showing the number of tons of coal raised per man employed:—

1851 to 1860 average.....	= 280 tons
1861 „ 1870 „ .....	= 308 „
1871 „ 1880 „ .....	= 366 „
1881 „ 1890 „ .....	= 380 „

These figures are not absolutely correct, because the Parliamentary summaries under the later Acts comprise all mines classed under the Coal Mines Acts, such as iron-ore, fireclay, and shale, but they are sufficiently so to show that the productive power of the collier has not diminished.

In confirmation of the last table, the figures of Mr. Greenwell, in a paper read at the North of England Institution of Mining Engineers, can be quoted. He there states that in the year 1873 the production of coal per man amounted to 332½ tons, and in 1881 to 406½ tons.

The following table, taken from the Parliamentary summaries, shows that by far the greater number of deaths are caused by the falling of roof and sides. This table is divided into periods corresponding with the passing of the Acts of Parliament. From 1851 to 1855 and from 1856 to 1860 only coal-mines are included; but from 1861 to 1872 ironstone mines worked in connection with coal are comprised, and from 1873 to 1887 stratified ironstones, hematites, and all ores worked in connection with coal, as well as the mines in Ireland. The Act of 1887 includes mines of stratified ironstone, mines of shale, and mines of fireclay, but as the output of coal is greatly preponderating, the result may be expected as sufficiently approximate to accuracy.

AVERAGE NUMBER OF LIVES LOST.

Total employed .....	534,945	563,735	613,233	648,450
Ratio of employed to deaths.....	602	530	528	622

\* The returns since 1887 are not averaged. The previous years were averaged in periods of 10 or 15 years. The returns from 1888 inclusive are headed as being "Under the Coal Mines Regulation Act, 1887, 50 and 51 Vict. cap. 58."

These figures show most satisfactory results as far as deaths from explosions, and abundantly prove that the greatest danger in mining lies in the fall of roof and sides. The miscellaneous accidents underground are remarkable, and are caused in great part by the machinery now so extensively used for hauling.

It would be futile to hope for anything like a complete immunity from accident in a dangerous calling like coal-mining. Work has to be carried on under difficulties such as are not to be found in any avocation on the surface. The want of light, the confined space, the insecurity of the walls and roof of the working chamber, and the presence of an explosive gas in the air, are sufficient to account for a considerable loss of life, and the returns which the inspectors are able to make compare favourably, under the circumstances, with the experience of any other avocation where the element of danger exists, such as shipping, railways, or ironworks. To assert that this comparative safety is entirely due to the regulations of the Mining Acts would be going too far. The men themselves have contributed enormously to the safety of the mines, and this appears to be fully appreciated by all those who have studied the question. For instance, the Royal Commissioners who reported in 1886 point to the clause in the Act (1872) giving the men employed at a colliery power to inspect the workings from time to time as one of the best safeguards against accidents. With reference to this we have an expression of opinion from Sir George Elliot, M.P., who told a deputation of colliers, with reference to accidents, that he attributed the improvement in collieries in part to the men, and that "no technical management or good inspection could operate with anything like the strength and force which the workmen themselves were able to supply." This is, of course, all very well, but the workmen would never have had an opportunity of doing anything for the safety of the mines if they had not obtained the encouragement and protection of the legislature. Certainly no one can take the same interest, or have such a stake in a colliery, as the man who works in it at the risk of his life.

## G.

## VENTILATION OF COAL MINES.

(CORRESPONDENCE AND REPORTS.)

## Newcastle-Wallsend Colliery.

## SCHEDULE.

NO.	PAGE.
1. Mr. James Curley, Miners' General Secretary, to the Examiner of Coal-fields, calling attention to number of men working in one split in Newcastle-Wallsend Colliery. 8 January, 1883	84
2. The Examiner of Coal-fields to Mr. James Curley, in reply to No. 1, with result of Mr. Dixon's inspection. 16 January, 1883	85
3. Mr. James Curley to the Honorable the Secretary for Mines, enclosing Nos. 1 and 2, and pointing out defects in ventilation of Newcastle-Wallsend Colliery 31 January, 1883	85
4. Minute of the Under Secretary for Mines, with minutes. 2 February, 1883	86
5. The Examiner of Coal-fields, in reply to No. 4, with minutes and enclosures. 16 February, 1883	86
6. The Examiner of Coal-fields to Manager, Newcastle-Wallsend Colliery, notifying him that provisions of Coal Mines Regulation Act are not complied with. 8 March, 1883	86
7. The Manager, Newcastle-Wallsend Colliery, to the Examiner of Coal-fields, in reply to No. 6. 15 March, 1883	87
8. The Examiner of Coal-fields to Mr. J. Y. Neilson, acknowledging receipt of No. 7. 20 March, 1883	87
9. Minute of the Honorable the Secretary for Mines, re ventilation of Newcastle-Wallsend Colliery, with minutes. 26 February, 1883	87

## No. 1.

Mr. James Curley, Miners' General Secretary, to The Examiner of Coal-fields.

Sir,

Hamilton, 8 January, 1883.

I have the honor, by direction of the representatives of the Miners' Association, to invite your attention to the number of men working in one split or current of fresh air in the Lambton headings, at the Wallsend mine. This question originated at a monthly meeting of the Wallsend miners some time ago, concerning which there was much discussion and dissatisfaction expressed. The dissatisfaction referred to was founded not only upon the check inspectors' report, but the practical daily experience of the workmen. The subject was therefore referred to the Delegate Board.

And while admitting that temporary advantages are occasionally secured by calling your attention to apparent defects and want of compliance with the Coal Mines Regulation Act, the miners regret, through their representatives, that there is not more permanent and satisfactory ventilation throughout the mines.

I am, &c.,

JAS. CURLEY,  
Miners' General Secretary.

No. 2.

## No. 2.

## The Examiner of Coal-fields to The Miners' General Secretary.

Sir,

Coal-fields Office, Newcastle, 16 January, 1883.

See No. 1.

I beg to acknowledge the receipt of your letter of the 8th inst., written by direction of the Representatives of the Miners' Association, and inviting my attention to the number of men working in one split or current of fresh air in the Lambton headings at the Wallsend mine, a question which you inform me originated at a monthly meeting of the Wallsend miners some time ago, concerning which there was some discussion and dissatisfaction expressed.

In reply, I beg to state that I forwarded your letter to Mr. Inspector Dixon for his report, which I received yesterday, and from which it appears to me that the 4th General Rule, section 12 of the Coal Mines Regulation Act, 1876, is complied with in the Lambton headings in the Wallsend mine.

2. Mr. Dixon's report is as follows:—"I entered the front heading from the main tunnel, Bossfield's side of the mine. Here I measured the air, and found it entering the heading at the rate of 7,680 cubic feet per minute. This current of air supplies 66 men, 5 boys, and 3 horses: total, 74—that is, when the men are all in together; but as some of the front shift men had gone home, I found only 50 men, 5 boys, and 3 horses; total, 58. I measured the current of air again at the far end of the front heading, and found it to be 7,000 cubic feet per minute. This current of air now leaves the front heading and passes through a stenton, where it is met in the middle heading by a current of fresh air, about 8,000 cubic feet per minute, coming along the middle heading from the main engine bank. The two currents—that is, the 7,000 cubic feet of air from the front heading, and the 8,000 cubic feet in the middle heading—now mingle together and form one current of about 15,000 cubic feet of air per minute. This current of air passes through another stenton into the back heading workings, where it serves about 45 men, boys, and horses, after which it passes to the furnace."

3. With respect to the concluding portion of your letter, in which you call my attention to apparent defects and want of compliance with the Coal Mines Regulation Act, and say that the miners regret, through their representatives, that there is not more permanent and satisfactory ventilation throughout the mines, I have to request that you will as early as possible be so good as to specifically mention the collieries in this district which you refer to.

I have, &amp;c.,

JOHN MACKENZIE,  
Examiner of Coal-fields.

## No. 3.

## Mr. James Curley, Miners' General Secretary, to The Secretary for Mines.

Sir,

Hamilton, 31 January, 1883.

I have the honor to respectfully submit the enclosed correspondence for your consideration. In conjunction with the Chairman and Treasurer of the Coal-miners' Association, I may state that this course is adopted owing to the expressed opinion of the Government Examiner of Coal-fields regarding alleged deficient ventilation at the Wallsend Colliery, and more men working in a district or split of air than what is provided for by the Coal Mines Regulation Act of 1876. In connection with the correspondence, it will be observed that Mr. Inspector Dixon's report is given, and in reference to which the Government Examiner of Coal-fields states:—"It appears to me that the 4th general rule, section 12, of the Coal Mines Regulation Act, 1876, is complied with in the Lambton heading in the Wallsend mine." It may be presumed that this opinion is based upon Mr. Inspector Dixon's report, and if so, we respectfully submit that such an opinion is contradictory to the report, and is also at variance with the 4th general rule, section 12, of the Coal Mines Regulation Act, 1876, to which reference is made. A brief quotation will at once make this apparent:—"Every mine shall be divided into districts or splits of not more than seventy men, and each district shall be supplied with a separate current of fresh air." It will be observed that the Inspector's report makes reference to two separate currents of air, but unfortunately the "7,680 cubic feet" referred to, and that supplies 66 men, 5 boys, and 3 horses; total, 74. After it has done its work, instead of being carried by an overcast into the return, continues onward and "now mingles" with the second current, "8,000 cubic feet," and the two combined, "15,000 cubic feet," passes into another district and serves 45 men, boys, and horses, after which it passes to the furnace. Here, then, it is quite evident that the 8,000 cubic feet of air, or second separate current, is allowed to be polluted with 7,000 cubic feet of air that serves another district, and which the Inspector in his report states "now mingles together"—that is, the 7,000 and 8,000—"and form one current of about 15,000 cubic feet of air per minute." This being so, very naturally, there is a bulky, polluted, and most unwholesome atmosphere for these forty-five men, boys, and horses to work in. The 8,000 cubic feet of itself, if a separate current at all, is of itself amply sufficient to supply forty-five men, boys, and horses. This cannot have escaped the notice of either the Inspector or the Examiner of Coal-fields. The cost of an overcast to the Company to carry off the 7,000 cubic feet appears to be the sequel. And why this was not directed to be done, instead of the apparent erroneous conclusion arrived at by the Examiner of Coal-fields, we leave the Honorable Minister to judge.

Mr. Inspector Dixon, in the former part of his report, alludes to the total in one instance as seventy-four, and then again as fifty-eight, through some of the front-shift men having gone home. This we contend may possibly give rise to complications, and should, if possible, be avoided. The Inspector might have said it was owing to the time his inspection was made that it is certainly better to confine himself to the number of men working in a district, without the qualification of either front or back shift. This can be obviated if the inspections are made when both shifts are in, for it must be well known to the Inspector that the most of the miners are in the mines during the major part of the day.

In conclusion, having brought these matters under the notice of the Honorable Minister, we are confident that he will deem them of sufficient importance as to require immediate attention, and by giving an early reply will greatly oblige,—

Yours, &amp;c.,

JAMES CURLEY,  
Miners' General Secretary.

## No. 4.

## Minute of the Under Secretary for Mines.

Complaint *re* Ventilation at the Wallsend Colliery.

The complaint made by the Miners' General Secretary appears to be not that a sufficient quantity of fresh air is not brought into the mine, but that one of the currents, sufficient in itself both as to quantity and quality, is allowed to be polluted by mingling with contaminated air before it reaches the men for whom it is intended, and that consequently these men, contrary to the provisions of the Coal Mines Regulation Act, are not supplied with fresh air. The papers may be forwarded to the Examiner of Coal-fields for report; and the Miners' General Secretary may be informed that the complaint will receive due consideration.

H.W., 2/2/83.

Submitted. Approved.—J. P. Abbott, 3/2/83. The Examiner of Coal-fields.—H.W., B.C. 6/2/83.

## No. 5.

## The Examiner of Coal-fields on Minute dated 2 February, 1883.

To enable the Minister to more clearly understand this case, I forward a tracing\* showing where the men were at work, and a statement of the number and names of the front and back shift men in the Lambton headings on the 10th ultimo, the day Mr. Dixon inspected it, from which it will be perceived that the number of men getting coal was fifty-seven in the front shift and fifty-seven in the back shift; and each set of fifty-seven men were supplied with two currents of air of 7,000 and 8,000 cubic feet per minute, both of which were fresh intake air currents when they entered the Lambton heading district; and that the 7,000 cubic feet of air per minute current was of itself more than was required by the provisions of the Act for the fifty-seven men.

\* See Appendix  
Plan No. 10.

The hour at which the front and back shift men enter and leave the mine, and the time they are in together, is as follows:—About 2 a.m. sometimes a few of the front-shift men enter the mine; at about 4 a.m. more than half of the front-shift men are in their working places, and at about 6 a.m. the whole of them. At 8 to 9 a.m. the back-shift men go in to relieve the front shift, and they work together for about two and a half hours. The front-shift men are supposed to be all out by noon, and the back shift remain in until 5 p.m. Thus we find that for about ten and a half hours out of thirteen (say from 4 a.m. to 5 p.m.), on the 10th ultimo, only fifty-seven men were in the Lambton heading district, and for two and a half hours out of thirteen there were 114 men. I do not consider therefore that the spirit of the Act has been infringed in this instance; but if its enforcement to the letter is thought necessary, the men appear to have a remedy in their own hands when changing shifts, by the "front-shift men" leaving off work when the "back-shift men" enter.

J.M., 16/2/83.

NAMES and numbers of miners working Lambton heading on Mr. Inspector Dixon's last visit:—

## No. 6.

## The Examiner of Coal-fields to Mr. J. Y. Neilson.

Sir,

Coal-fields Office, Newcastle, 8 March, 1883.

In pursuance of the provisions contained in the 31st section of the Coal Mines Regulation Act, 1876, I hereby give you notice that on the 13th January last the 4th subsection of the 12th section of the said Act was not carried out in the Lambton heading districts at the Newcastle-Wallsend Colliery.

I have, &amp;c.,

JOHN MACKENZIE,  
Examiner of Coal-fields.

No. 7.

## No. 7.

Mr. J. Y. Neilson to The Examiner of Coal-fields.

Sir,

Newcastle-Wallsend Coal Co., Wallsend, 15 March, 1883.

Your favour of the 8th instant only came to hand yesterday. In reply to which I may state that although I entirely differ with you in your interpretation of the Coal-fields Regulation Act, I will at once proceed to make the necessary alterations to comply with your request.

I have, &amp;c.,

J. Y. NEILSON.

## No. 8.

The Examiner of Coal-fields to Mr. J. Y. Neilson.

Sir,

Coal-fields Office, Newcastle, 20 March, 1883.

I beg to acknowledge the receipt of your letter of the 13th instant, informing me that you will at once proceed to make the necessary alterations to comply with the request contained in my letter of the 8th idem.

I have, &amp;c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

## No. 9.

Minute of the Honorable The Secretary for Mines.

Ventilation of Wallsend Colliery.

I HAVE read the correspondence in reference to the complaint of the Miner's General Secretary, and I am forced to the conclusion that the 4th subsection of the 12th section of the Coal Mines Regulation Act of 1876 is not carried out in this mine.

The 3rd subsection of this clause of the Act states that "an adequate amount of ventilation shall mean not less (as a minimum) than 100 cubic feet of pure air per minute for each man, boy, and horse, which shall sweep undiminished along the airway past each working place."

The 4th subsection provides that "each district or split shall have not more than seventy men, and each district shall be supplied with a separate current of fresh air." I am satisfied that there being for two and a half hours 114 men in the mine, and during those two and a half hours there being an insufficient supply of fresh air in the terms of the Act, that there was not a compliance with the Act even in spirit. The remedy for this state of things is not in the hands of the men, but of the management, which is bound to supply the fresh air under the Act, as quoted. Where air which has served a district is then allowed to mingle with fresh air and serve another district, however great that supply may be, it is clearly not a compliance with the Act, which speaks of "pure air." This can only mean such air as is sent in fresh without having been used by the men. A copy of this minute may be sent to Mr. Curley, and the Examiner may be informed of it.

26/2/83.

Copy to Mr. Curley, 27 February, 1883. The Examiner of Coal-fields.—H.W., B.C., 27/2/83.

I forward for the Minister's information a copy of notice I have served on Mr. Neilson, and shall be obliged by your informing me what further action he may desire I should take in the matter.—J.M., 8/3/83. The Under Secretary for Mines, B.C., 8/3/83. Submitted.—H.W., 13/3/83.

The Examiner of Coal-fields may be asked to report if any further breaches of the law in the same respect happen, and then steps must be taken to prevent them in the future.—J. P. ABBOTT, 17/3/83. Copy of letter received from Mr. Neilson (the Manager) and my reply thereto forwarded herewith for the Minister's information. Will instruct Mr. Inspector Dixon to visit and report on the Lambton heading district.—J.M., 20/3/83. The Under Secretary for Mines, B.C., 20/3/83. Submitted.—H.W., 28/3/83. Seen.—J. P. ABBOTT, 31/3/83.

## Co-operative Colliery.

## SCHEDULE.

NO.	PAGE.
1. Mr. John Dixon, Inspector of Collieries, to the Manager of the Co-operative Colliery, notifying defective state of ventilation in Co-operative Colliery. 5 November, 1885 .....	101
2. The same to the Examiner of Coal-fields, reporting inspection of the above colliery. 5 November, 1885 .....	101
3. The Examiner of Coal-fields to Mr. James Fletcher, junr., Manager, Co-operative Colliery, notifying that he has failed to comply with Coal Mines Regulation Act. 24 November, 1885 .....	101
4. The same to the Under Secretary for Mines, forwarding reports from Mr. Inspector Dixon, re deficiency of ventilation at above colliery, with minutes. 24 November, 1885 .....	101
5. Check Inspectors' reports, re ventilation of Co-operative Colliery. 27 November, 1885 .....	103
6. Mr. James Curley, Miners' General Secretary, to the Honorable the Secretary for Mines, drawing attention to interview with Executive of Miners' Association, and enclosing copies of Check Inspectors' reports. 25 January, 1886 .....	105
7. The Under Secretary for Mines to Examiner of Coal-fields, to report on complaint. 30 January, 1886 .....	107
8. The Under Secretary for Mines to the Manager of the Co-operative Colliery, calling attention to Mr. James Curley's statement. 30 January, 1886 .....	107
9. The Manager, Co-operative Colliery, to the Honorable the Secretary for Mines, in reply to No. 8. 1 February, 1886 .....	107
10. The Examiner of Coal-fields to the Under Secretary for Mines, re complaint of defective ventilation at Co-operative Colliery. 3 February, 1886 .....	108
11. Report of joint inspection of Co-operative Colliery by the Examiner of Coal-fields, Inspector of Collieries, and Miners' Inspectors, with minutes. 3 February, 1886 .....	109
12. The Under Secretary for Mines to Mr. James Curley, that complaint appears groundless. 25 February, 1886 .....	110
13. The same to the Examiner of Coal-fields, that Mr. Curley has been informed that your reports have been considered satisfactory. 25 February, 1886 .....	110

No. 1.

## No. 1.

Mr. John Dixon, Inspector of Collieries, to Mr. James Fletcher, junr., Manager, Co-operative Colliery.

Sir,

Glebeland, 5 November, 1885.

I hereby notify you of the very defective state of the ventilation in certain districts in the Co-operative Colliery, as found by me on my inspection of said colliery yesterday (Wednesday), 4th instant, as follows:—

1. In the first split, brattice heading, the total current of air was only about 6,000 cubic feet per minute, for about 62 men, 3 boys, and 3 horses—total, 68.

2. In the third split, brattice heading, the total intake current of air was only 7,560 cubic feet per minute, for 76 men, 6 boys, and 6 horses—total, 88. There are too many men on this split, and the current of air is not well sustained, as in one working heading I only got a result of about 4,200 cubic feet per minute, and in the return from this split, 12,580 cubic feet per minute.

In No. 1 district the only available current of air for 56 men, 10 boys, and 7 horses was about 4,080 cubic feet per minute.

3. I have therefore to urge that you would give immediate attention to the above matters, with a view of having them remedied as soon as possible; and in my opinion the only way to effect a proper remedy would be to sink a shaft, and erect a furnace inside of the fault, which furnace would avail for many years to come.

I have, &c.,

JOHN DIXON,

Inspector of Collieries.

## No. 2.

Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.  
Co-operative Colliery Inspection.

Sir,

Glebeland, 5 November, 1885.

I have the honor to report inspection of the above colliery yesterday, Wednesday, 4th instant, as follows:—

In the 1st split, brattice heading, the current of air was only about 6,000 cubic feet of air per minute, for about 62 men, 3 boys, and 3 horses—total, 68.

In the 2nd split the intake current of air was about 7,980 cubic feet per minute, for about 52 men, 5 boys, and 4 horses—total, 61.

In the 3rd split the total intake current of air was only about 7,560 cubic feet per minute, for about 76 men, 6 boys, and 6 horses—total, 88. There are too many men on this split, and the overman (Mr. Davidson) informed me that this was caused by recent alterations made to relieve the 2nd split, where the ventilation had been defective. The current of air in this 3rd split was not well sustained in the working headings, for in one heading it was only about 4,200 cubic feet per minute, and in the return from this split the total current of air was about 12,580 cubic feet per minute.

In No. 4 split, at the top end of No. 3, the total current of intake air was about 7,800 cubic feet per minute for about 26 men, 2 boys, and 2 horses.

In the No. 1. district the total available current of intake air in the working headings was only about 4,080 cubic feet per minute, for about 56 men, 10 boys, and 7 horses, and at the same time the return current of air at the furnace for this district alone was about 20,000 cubic feet per minute.

The overman (Mr. R. Davidson) was with me the whole of the time, and I drew his attention to the above matters in every instance. In addition to this, I have notified the manager, Mr. J. Fletcher, junior, by registered notification, a copy of which I beg to forward along with this report.

Seeing the state of the ventilation in the brattice heading section of workings in the Co-operative Colliery on my inspection yesterday, I am more than ever convinced that the opinion I expressed in my report on 9th May last was a correct one, viz., that the brattice heading sections would never be properly ventilated, unless by having an up-cast shaft and furnace inside the fault; and on two occasions during this year I have urged on the manager the necessity of having this done before the summer months came, but as far as I know nothing has yet been done in the matter.

The main roads and wheeling roads were in good order, and a good supply of timber at the various stations ready for use.

I have, &c.,

JOHN DIXON,

Inspector of Collieries.

## No. 3.

The Examiner of Coal-fields to Mr. James Fletcher, junior, Manager, Co-operative Colliery.

Sir,

Department of Mines, Sydney, 24 November, 1885.

In view of a recent report of Mr. Inspector Dixon on the ventilation of the Co-operative Colliery, and in pursuance of the provisions contained in the 31st section of the Coal Mines Regulation Act, 1876, I hereby give you notice that you have failed to comply with subsections 2 and 3, section 12 of the said Act.

I have, &c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

## No. 4.

The Examiner of Coal-fields to The Under Secretary for Mines.

Sir,

Mines Department, Sydney, 24 November, 1885.

I beg to forward reports, received from Mr. Inspector Dixon, respecting a deficiency of ventilation at the Co-operative Colliery, and copy of a notice I have served upon Mr. James Fletcher, junr., and shall feel obliged by your informing me what further action the Minister desires me to take in the matter.

I have, &c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

The Examiner may take the necessary steps to enforce the penalty provided in this case, unless the owners comply with the law before such proceedings have been commenced.—H. W., 30/11/85.

Submitted. Approved.—G. T., 1/12/85. The Examiner of Coal-fields.—H. W., U.S., B.C., 2 Dec., 1885. Mr. Inspector Dixon for report as to whether the law is now complied with.—J. M., 22/12/85. Further report forwarded.—J. D., 23/12/85.

Mr. Inspector Dixon's report, forwarded herewith, from which it will be seen that the matters complained of have been remedied, and that there is only a slight deficiency of the required current of air in No. 6 split, which, in all probability, will be rectified in the course of a week, as the overman informed him it was the intention of the manager to have the furnace repaired during the week end, so as to get a better result throughout the split. Also that there are several shiftsmen constantly employed in this colliery at present in connection with the ventilation, and tenders have been called for the sinking of another shaft for the fault section of workings.—J. M., 24/12/85.

Under Secretary for Mines—B. C., 24/12/85. In view of this report further proceedings do not appear to be necessary.—H. W., 4/1/86. Submitted. Approved.—R. M. V., 9/1/86.

[Enclosure to No. 4.]

Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Co-operative Colliery Inspection.

Sir,

Glebecland, 23 December, 1885.

I have the honor to report inspection of the above colliery to-day, Wednesday, as follows:—

1st split.—In this split the current of air was about 10,000 cubic feet per minute, for about 62 men, 5 boys, and 3 horses—total, 70. The current of air was well sustained throughout the split.

No. 2 split.—The current of air in this split was about 9,200 cubic feet per minute, for about 57 men, 8 boys, and 4 horses. The main current of air in this split was fairly well sustained, being about 8,610 cubic feet per minute at 36 bord, 6,000 cubic feet per minute at 44 bord, 6,975 cubic feet per minute at 63 bord, 8,400 cubic feet per minute at 68 bord.

No. 3 split.—In this split the current of air at the narrow bord was about 6,930 cubic feet per minute, for about 42 men, 4 boys, and 2 horses—total, 48. The current of air at 50 bord was about 4,630 cubic feet per minute at the stenton, 5,860 cubic feet per minute, and at the last bord about 5,500 cubic feet per minute.

No. 4 split.—The current of air in this split was about 9,000 cubic feet per minute, for about 52 men, 6 boys, and 3 horses—total, 61.

No. 5 split.—In the intake near shaft the current of air was about 5,040 cubic feet per minute for about 38 men, 4 boys, and 2 horses—total, about 44. The above current of air was well sustained past the first few working places, and I saw shiftmen at work building stoppings in order to conduct the current of air throughout the working headings.

No. 6 split.—The intake current of air in this split was about 7,300 cubic feet per minute for about 64 men, 6 boys and 4 horses—total, 74. The above result shows a slight deficiency in the total current, but I beg to state that in all probability the current of air for this split will be very much increased in the course of a week, as the overman, Mr. Davidson, informed me that it was the intention of the management to have the furnace repaired during the week end, so as to get a better result throughout the split.

There are several shiftmen constantly employed in this colliery at present in connection with the ventilation, and tenders have been called for the sinking of another shaft for the fault section of workings.

I have, &c.,  
JOHN DIXON,  
Inspector of Collieries,

[Enclosure to No. 4.]

Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Sir,

Glebecland, 21 November, 1885.

For your information, I beg to state that on Thursday evening last, 19th instant, I received a telegram from Mr. H. Winchester, of the Coal-fields Office, informing me that Mr. A. Cook, secretary to the Co-operative miners, had wired concerning alleged deficient ventilation in that colliery, and that the miners had ceased work in consequence. I may here state that no particular part of the workings was specified as being defective in ventilation, and I did not see the Check Inspectors' last report, as I am not aware that it was entered in the book kept at the colliery office for that purpose when I was at said colliery yesterday.

However, acting on the message from Mr. Winchester, I went to the Co-operative Colliery yesterday (Friday), and judging that the splits complained of would be in the part of the workings known as "over the fault," I made an inspection of those splits and beg to report as follows:—

No. 1 split.—The total intake current of air for this split was about 6,620 cubic feet per minute. This current of air is coursed along the front heading, and at the far stenton between the two headings. I found it to be about 6,290 cubic feet per minute, and at No. 24 bord, in the back heading, the current of air was about the same as in the stenton. This split when at work contains about 67 men, 4 boys, and 2 horses—total, about 73,—thus showing a deficiency in the intake current of air for the above number of men, &c. (on the minimum quantity of air required by the Act), of about 700 cubic feet per minute. This is one of the splits complained of by me in my report of 5th instant, and of which I notified the manager, Mr. J. Fletcher, on the same day.

In No. 2 split the current of air was about 8,610 cubic feet per minute at the intake, and in the cut-through between Jarvie's bord and the Gannon bord it was about 6,600 cubic feet per minute. I saw men at work in this split erecting screen, &c., and when completed the ventilation will be sustained in the working headings throughout the split. When at work there are about 65 men, 7 boys, and 5 horses—total, 77 in this split.

No. 3 split.—In this split the total intake current of air was about 8,100 cubic feet per minute, but at 53 bord the current of air was reduced to about 4,320 cubic feet per minute. About 42 men, 4 boys, and 4 horses—total, 50 men, &c.—belong to this split.

In No. 4 split the total intake current of air was about 8,250 cubic feet per minute, and at No. 86 bord it was about 8,000 cubic feet per minute, and well sustained throughout the split. There are about 52 men, 4 boys, and 3 horses—total, 59 men, &c.—in this split when the mine is working.

I here beg to state that the last-mentioned split has been formed since my inspection on 4th instant, and notification of 5th instant, in order to relieve the 3rd split, which was then overcrowded.

Concerning the quality of the air supplied in the above splits, I can only say that I have no instrument wherewith to test it, and may add that each of the above-mentioned splits is supplied with air direct from the surface—in two of them from air shafts, in one from a little tunnel, and in another from the main tunnel.

On my inspection yesterday I noticed several men at work in various places erecting stoppings, putting up screens, &c., and at one place a gang of men were at work making an overcast. All this work was being done to further benefit the above-mentioned splits.

In conclusion, I beg to state that I have notified the manager (Mr. J. Fletcher, junr.) concerning the deficiency in No. 1 split, and also of the loss of air in the 3rd split.

I have, &c.,  
JOHN DIXON,  
Inspector of Collieries.

No 5.

## No. 5.

## Check Inspectors' Reports.

Plattsburg, 27 November, 1885.

THE last three inspections on the state of the ventilation in the Co-operative Collicry are as follows:—

26 JUNE, 1885.

Thermometer on top 60°.

Intake in tunnel, 17,094 cubic feet. Thermometer 58°.

No. 1 (timber shaft) intake.—No record; shaft in disuse.

*No. 1 Split.*

Intake at shaft, 7,920 cubic feet. Thermometer 64°

At No. 4 bord the current was 3,276 cubic feet. Thermometer 64°.

At No. 10 bord the current was 2,600 cubic feet. Thermometer 65°.

At No. 18 bord the current was 2,600 cubic feet. Thermometer 68°.

Return from No. 1 split, 8,015 cubic feet. Thermometer 70°.

Return from No. 2 split (in the cross-cut), 4,560 cubic feet. Thermometer 70°.

There are 49 men, 3 horses, and 5 boys working on this split of air.

*No. 2 Split.*

Back heading intake, 2,600 cubic feet. Thermometer 72°.

At Stenton, 2,050 cubic feet.

At No. 3 bord the current was 3,465 cubic feet. Thermometer 72°.

There are 50 men, 8 boys, and 10 horses working on this split of air.

*No. 3 Split.*

At No. 45 bord the current was 3,125 cubic feet. Thermometer 73°.

At Forester's narrow board the current was 7,800 cubic feet. Thermometer 73°.

At No. 55 bord (in the back heading) the current was 4,242 cubic feet. Thermometer 73°.

At Stenton the current was 6,240 cubic feet. Thermometer 74°.

Intake from narrow bord, 3,042 cubic feet. Thermometer 72°.

There are 66 men, 9 boys, and 5 horses working on this split of air. The return at the furnace was 12,168 cubic feet.

*No. 4 Split.*

Intake from shaft, 10,000 cubic feet. Thermometer 69°.

Intake from No. 3 shaft, 8,244 cubic feet. Thermometer 70°.

At the return the current was 11,700 cubic feet. Thermometer 72°.

There are 34 men, 6 boys, and 4 horses working on this split.

*No. 5 Split.*

At No. 92 bord the current was 5,720 cubic feet. Thermometer 72°.

From No. 92 to No. 98 bord the anemometer would not work.

At No. 101 bord the current was 4,500 cubic feet. Thermometer 75°.

Stoppings badly required in this split.

There are 30 men, 10 boys, and 8 horses working on this split.

Return at the big furnace was 44,330 cubic feet. Thermometer 76°.

Furnace in good working order.

27 JUNE, 1885 (Second Day).

Henderson's Tunnel—Intake, 11,655 cubic feet. Thermometer 61°.

*No. 6 Split.*

Intake from fall in, 6,300 cubic feet. Thermometer 60°. Intake from shaft, 6,480 cubic feet.

A door is badly required at the first cut-through.

At No. 112 bord the current was 5,656 cubic feet.

At the cut-through from narrow bord the current was 5,376 cubic feet.

At No. 131 bord the current was 5,616 cubic feet.

At No. 136 bord the current was 8,008 cubic feet.

Return from Little Furnace 27,630 cubic feet.

There are 58 men, 12 boys, and 8 horses working on this split.

Furnace in good working order, and there seemed to be a good supply of timber on the various flats.

GEORGE COOPER, }  
 JOHN HOUSTON, } Inspectors.

24 JULY, 1885.

Thermometer on top 58°.

The tunnel intake, 13,650 cubic feet. Thermometer 59°.

*No. 1 Split.*

At No. 4 bord the current was 2,840 cubic feet. Thermometer 62°.

At No. 21 bord the current was 2,400 cubic feet. Thermometer 68°.

There are 44 men, 5 boys, and 3 horses working on this split.

Return from No. 1 split 8,000 cubic feet. Thermometer 69°.

Cross-cut return, 9,750 cubic feet. Thermometer 72°.

At No. 23 bord the current was 7,800 cubic feet. Thermometer 72°.

At No. 29 bord the current was 3,200 cubic feet. Thermometer 73°.

At.

At Wonder's cross-cut the current was 7,280 cubic feet. Thermometer 73°.  
 At No. 34 bord the current was 7,386 cubic feet. Thermometer 73°.  
 At No. 42 bord the current was 3,930 cubic feet. Thermometer 73°.  
 At No. 49 bord the current was 6,006 cubic feet. Thermometer 72°.  
 At No. 56 bord the current was 2,803 cubic feet. Thermometer 72°.  
 There are 84 men, 8 boys, and 10 horses working on this split.  
 Intake, 6,760 cubic feet. Thermometer 70°.  
 No. 3 split (over the fault) 4,788 cubic feet. Thermometer 72°.  
 At No. 65 bord the current was 2,520 cubic feet. Thermometer 74°.  
 Cruickshank's narrow bord intake 9,360 cubic feet. Thermometer 73°.  
 At No. 74 bord the current was 3,900 cubic feet. Thermometer 74°.  
 At No. 77 bord the current was 2,080 cubic feet. Thermometer 74°.  
 At Stenton to back heading the current was 7,200 cubic feet. Thermometer 74°.  
 The anemometer would not work in the cut-through at Thomas' bord. Very hot and smoky.  
 At No. 89 bord the current was 3,120 cubic feet. Thermometer 74°.  
 At No. 93 bord the current was 5,200 cubic feet. Thermometer 74°.  
 There are 70 men, 7 boys, and 4 horses working on this split.  
 Return for big furnace was 50,765 cubic feet. Thermometer 74°. The furnace was in good working order.

25 JULY (Second Day).

Intake from fall in, 3,824 cubic feet. Thermometer 58°.  
 Intake from air shaft, 4,680 cubic feet. Thermometer 58°.  
 At No. 136 bord the current was 5,440 cubic feet. Thermometer 68°.  
 Over the fault, 2,940 cubic feet. Thermometer 71°.  
 At No. 142 bord the current was 6,656 cubic feet. Thermometer 71°.  
 At No. 148 bord the current was 5,766 cubic feet. Thermometer 71°.  
 There are 44 men, 10 boys, and 7 horses working on this split.  
 Little furnace, 25,875 cubic feet. Thermometer 70°.  
 Intake at Henderson's tunnel, 9,658 cubic feet. Thermometer 64°.

*Over the Fault.*

At No. 96 bord the current was 4,075 cubic feet. Thermometer 65°.  
 At No. 100 bord the current was 5,025 cubic feet. Thermometer 65°.  
 At No. 113 bord the current was 3,960 cubic feet. Thermometer 69°.  
 At No. 117 bord the current was 3,150 cubic feet. Thermometer 70°.  
 There are 42 men, 7 boys, and 5 horses working on this split.  
 Return for furnace, 8,970 cubic feet. Thermometer 72°.  
 Return for No. 3 split, 11,700 cubic feet. Thermometer 72°.

*No. 5 Split.*

At No. 118 bord the current was 3,936 cubic feet. Thermometer 72°.  
 At Nos. 122 and 123 and on to the door the anemometer would not work.  
 There are 26 men, 8 boys, and 6 horses working on this split.

GEORGE COOPER, }  
 JOHN HOUSTON, } Inspectors.

26 OCTOBER, 1885.

*No. 1 Split.*

This split is aired from No. 1 timber shaft and main tunnel.  
 At the time of our inspection there was not sufficient air coming down the main shaft or passing by the first thirteen (13) bords to work the anemometer, but the working places were cool, fresh, and clear. Thermometer ranging from 68° to 69°.  
 At No. 14 bord (over the fault) there was a current of 2,805 cubic feet. Thermometer 69°.  
 At the Stenton (near the face of the heading) the current of air was 5,742 cubic feet. Thermometer 69°.  
 At No. 24 bord the current was 4,510 cubic feet. Thermometer 70°.  
 At the return for this split at No. 23 bord the current was 5,760 cubic feet. Thermometer 72°.  
 The air passing the last six or seven bords in this split was thick and sluggish.  
 There are 64 men, 4 boys, and 3 horses working on this split.

*No. 2 Split.*

This split is aired from the main tunnel. The intake current at No. 2 Jenny Flat was 7,260 cubic feet. Thermometer 70°.  
 The current at No. 68 bord was 4,000 cubic feet. Thermometer 72°.  
 At No. 57 bord the current was 5,900 cubic feet. Thermometer 73°.  
 At No. 53 bord (in the back heading) the current was 5,376 cubic feet. Thermometer 73°.  
 The current at No. 47 bord was 4,025 cubic feet. Thermometer 73°.  
 At No. 39 bord the current was 2,310 cubic feet. Thermometer 74°. The air at this place was very irregular; we had to wait for some time before we could get the anemometer to work.  
 The current of air in the return for this split (in the back cross-cut) was 8,712 cubic feet. Thermometer 72°. The air from No. 47 bord back to the return needs improving very much. At the time of our inspection it was very hot and smoky; also from No. 63 to 68 bords the air needs improving. We were shown two doors that had just been fixed for the purpose of splitting the air at No. 47 bord. The fixing of these two doors should improve the air in this split.  
 There are 78 men, 9 boys, and 4 horses working on this split.  
 The return at the furnace for Nos. 1 and 2 splits was 33,900 cubic feet. Thermometer 74°.

*No. 3 Split.*

This split is aired from the main tunnel and Morgan's narrow bord; the current of air at the intake was 7,486 cubic feet. Thermometer 73°.

From No. 80 to No. 88 bords the anemometer would not work, as the current was so slight.

At No. 88 bord the current was 6,860 cubic feet. Thermometer 74°.

At No. 93 bord, after waiting for a considerable time, we recorded a current of 4,255 cubic feet. Thermometer 74°.

At No. 96 bord there was a current of 5,550 cubic feet. Thermometer 74°.

At No. 101 bord the current was 5,445 cubic feet.

At No. 105 bord (next to the return for this split) there was a current of 8,897 cubic feet. Thermometer 74°.

The air all through this split was hot and smoky. The doors in this split require to be well attended. There are 54 men, 12 boys, and 6 horses working on this split.

*No. 4 Split.*

This split is aired from No. 2 timber shaft. Current of air at the intake was 5,280 cubic feet. Thermometer 67°.

The current of air at No. 110 bord was 3,210 cubic feet. Thermometer 67°.

The air in the remaining portion of this split was not confined for us to measure it; but the working places were cool and clear, the thermometer ranging from 67° to 70°.

There are 40 men, 2 boys, and 2 horses working on this split.

The current of air at the return of the furnace was 7,920 cubic feet. Thermometer 71°.

This furnace also draws the air from No. 3 split, the return from which near the furnace was 10,300 cubic feet.

*No. 5 Split.*

This split is aired from No. 3 timber shaft, Henderson's tunnel, and the fall-ins. The air not being confined we could not measure it near the working places till we came to—

No. 133 bord, where the current was 2,587 cubic feet. Thermometer 70°.

At No. 140 bord the current was 2,100 cubic feet. Thermometer 70°.

The current of air passing by the working places in the remaining part of this split was so slight that it could not turn the anemometer. Thermometer ranging from 70° to 72°.

The current of air at the furnace was 19,135 cubic feet. Thermometer 70°. There are 64 men, 6 boys, and 3 horses working on this split.

It is necessary that the air in this split should be confined and conducted by the working places as the men in the remaining portion of this split are badly off for air. There appeared to be a good supply of timber at the various flats. The travelling roads would be all the better for a cleaning, as there are some places nearly impassable for water and sludge.

The total currents of air at the three (3) furnaces were 71,255 cubic feet per minute.

JOSEPH MIDDLEBY, }  
AMRAM LEWIS, } Inspectors.

**No. 6.**

The Miners' General Secretary to The Honorable the Secretary for Mines.

Sir,

Hamilton, 25 January, 1886.

I have the honor to respectfully refer you to the interview which took place on the 15th instant, by the Executive of the Miners' Association, and the subjects then brought officially under your notice by communication.

In furtherance of the object of the deputation, I am instructed by the Executive of the Mining Association to forward copies of check inspectors' reports made at several collieries for your perusal; and am requested to add that since the interview took place certain of the Co-operative miners have had to come out of the mine, not being able to work in consequence of alleged defective ventilation. This occurred on Tuesday, 19th instant.

Trusting that the subjects brought under notice on the 15th instant will receive immediate attention,—

I have, &c.,

JAMES CURLEY,  
Miners' General Secretary.

*[Enclosure to No. 6.]*

Lambton Colliery, 28 and 29 July, 1885.

We, the undersigned, having examined the workings and travelling roads of the above colliery, report as follows:—

*New Tunnel—Farish Flat.*

There are 62 men, 6 boys, 6 horses at this flat. Intake of air is 10,920 feet per minute; air passing the ends of 5 bords, from No. 1 to No. 5, is 6,840 feet per minute; air passing the ends of 7 bords, from No. 5 to No. 12, is 2,520 feet per minute, thermometer 68°; air passing the ends of 9 bords, from No. 12 to No. 21, is 3,240 feet per minute, thermometer 67°; air passing the ends of 5 bords, from No. 21 to No. 26, is 6,000 feet per minute, thermometer 67°; air passing the ends of 5 bords, from No. 26 to No. 31, is 4,290 feet per minute, thermometer 68°.

We also wish to call your attention to the cut-through that the men travel in, which is full of water, and requires something doing to it.

*Far Flat No. 1.*

There are 46 men, 6 boys, 5 horses at this flat. Intake of air, 7,560 feet per minute; air passing the ends of bords from No. 18 to No. 10 so slack that we were unable to test the quantity, thermometer 75°; air passing the ends of 7 and 8 bords, 2,840 feet per minute; there, 5 pillars with 20 men in them, we found the air to be very much heated, and were unable to test the quantity, thermometer 75°.

Far

*Far Flat No. 2.*

There are 42 men, 4 boys, 4 horses at this flat. Intake of air is 5,280 feet per minute; air passing the ends of 10 places on right hand side of bank so slack that we were unable to test the quantity, thermometer 70°; air passing the ends of 10 bords on left-hand side of flat, 2,640 feet per minute, thermometer 69°.

*Straight-down Flat.*

There are 60 men, 7 boys, 6 horses at this flat. Intake of air, 7,160 feet per minute; air passing the ends of 5 bords on right-hand side of flat is 2,400 feet per minute, thermometer 69°; air passing the ends of 4 bords on right-hand side of narrow bords is 2,400 feet per minute, thermometer 70°; air passing the ends of 5 bords on right-hand side of narrow bord cut-through higher up, 2,310 feet per minute, thermometer 71°; air passing the ends of 11 bords in Dent's heading, 3,465 feet per minute, thermometer 74°; air passing the ends of 6 bords on left-hand side of narrow bord, 2,800 feet per minute, thermometer 74°.

*South Pit Flat.*

There are 34 men, 3 boys, 3 horses at this flat; air passing the ends of Nos. 1 and 2 bords, 1,960 feet per minute; air passing the ends of 5 bords, from No. 2 to No. 7, so slack that we were unable to test the quantity; intake of air on right-hand side of bank, 2,640 feet per minute; air passing the ends of 10 bords here, 3,800 feet per minute, thermometer 70°.

*Middle Pit Flat.*

There are 54 men, 7 boys, 7 horses at this flat. No. 1 intake of air at New Chum, 8,320 feet per minute; air passing the ends of 4 bords, from No. 2 to No. 5, is 4,320 feet per minute, thermometer 65°; air passing the ends of 9 bords, from No. 6 to No. 14, is 4,512 feet per minute; air passing the ends of 4 bords, from No. 14 to No. 18, 2,871 feet per minute, thermometer 70°.

Intakes.	Returns at Furnace.
10,920	42,120
7,560	32,340
5,280	42,840
7,160	23,100
2,640	
8,320	
Total.....	140,400
Total.....	41,880

Travelling roads and furnaces in good order, with the exception of No. 1 return at furnace, which is partly blocked up.

WALTER KERR, }  
E. CHARLTON, } Check Inspectors.

## [Enclosure to No. 6.]

Lambton Colliery, 24 and 25 August, 1885.

We, the undersigned, having examined the workings and travelling roads of the above colliery, report as follows:—

*New Tunnel—Farish Flat.*

There are 62 men, 6 boys, 6 horses at this flat. Intake of air, 7,140 feet per minute.  
Air passing the ends of 5 bords, from No. 1 to No. 5, is 3,300 feet per minute; thermometer 61°.  
Air passing the ends of 10 bords, from No. 5 to No. 15, was so slack that we were unable to test the quantity; thermometer 64°.  
Air passing the ends of 6 bords, from No. 16 to No. 21, is 1,470 feet per minute; thermometer 68°.  
Air passing the ends of 10 bords, from No. 21 to No. 31, is 5,320 feet per minute; thermometer 70°.

*Far Flat, No. 1.*

There are 46 men, 6 boys, 5 horses at this flat. Intake of air, 5,005 feet per minute.  
Air passing the ends of 5 bords, from No. 18 to No. 14, so slack that we were unable to test the quantity; thermometer 71°.  
Air passing the ends of 7 bords, from No. 14 to No. 7, is 4,800 feet per minute; thermometer, 72°. We found the air to be more improved at the Pillars than last time.

*Far Flat, No. 2.*

There are 44 men, 4 boys, 4 horses at this flat.  
Air passing the ends of all the bords on right-hand side of flat was so slack that we were unable to test the quantity; thermometer 70°. Intake of air on the bank, 3,960 feet per minute.  
Air passing the ends of 10 bords on left-hand side of flat, 1,800 feet per minute; thermometer 67°.

*Straight-down Flat,*

There are 60 men, 7 boys, 6 horses at this flat. Intake of air on the bank, 3,960 feet per minute.  
Air passing the ends of 5 bords on right-hand side of bank was so slack that we were unable to test the quantity; thermometer 72°.  
Air passing the ends of 5 bords on right-hand side of narrow bord, 1,800 feet per minute; thermometer 72°.  
Air passing the ends of 5 bords in top cut-through, 2,210 feet per minute; thermometer 72°.  
Air passing the ends of 11 bords in Dent's heading, 4,050 feet per minute; thermometer 74°.  
Air passing the ends of 5 bords on left-hand side of narrow bord, 3,300 feet per minute; thermometer 75°.

*South Pit Flat.*

There are 35 men, 4 boys, 4 horses at this flat. Intake of air on right hand side of flat, 3,630 feet per minute.  
Air passing the ends of all the bords on right-hand side of flat, 3,630 feet per minute; thermometer 69°.  
Air passing the ends of all the bords on left-hand side of flat so slack that we were unable to test the quantity; thermometer 74°.

We also wish to draw your attention to the want of timber at the South Pit, and also to the want of manholes in that portion of the bank from the old flat to the new one.

*Middle Pit Flat.*

There are 60 men, 6 boys, 6 horses at this flat. No. 1 intake of air, 6,490 feet per minute; No. 2 intake of air, 6,720 feet per minute.

Air passing the ends of 7 bords, from No. 1 to No. 7, is 3,360 feet per minute; thermometer 68°.  
Air passing the ends of 12 bords, from No. 7 to No. 19, is 3,300 feet per minute; thermometer 69°.

Intakes.	Returns at Furnace.
7,140	41,760
5,005	36,770
3,960	33,330
3,960	24,360
3,630	
6,490	
5,720	
Total.....	135,280

Total.....35,905

Travelling roads and furnace in good order.

WALTER KERR, }  
E. CHARLTON, } Check Inspectors.

[Enclosure

## [Enclosure to No. 6.]

Lambton Colliery, 23 and 24 September, 1885.

We, the undersigned, having examined the workings and travelling roads of the above colliery, report as follows:—

*New Tunnel, Farish Flat.*

There are 62 men, 6 boys, 6 horses at this flat. Intake of air for same, 5,460 feet per minute.  
 Air passing the ends of 5 bords, from No. 1 to No. 5, is 2,340 feet per minute.  
 Air passing the ends of 8 bords, from No. 6 to No. 13, is 2,730 feet per minute; thermometer 69°.  
 Air passing the ends of 8 bords, from No. 13 to No. 21, is so slack that we were unable to test the quantity; thermometer 70°.  
 Air passing the ends of 10 bords, from No. 21 to No. 31, is 2,400 feet per minute; thermometer 69°.

*Far Flat No. 1.*

There are 50 men, 3 boys, 3 horses at this flat. Intake of air for same, 4,680 feet per minute. We inspected all the pillars and found the air to be workable; thermometer 74°.

*Far Flat No. 2.*

There are 54 men, 6 boys, 6 horses at this flat. Intake of air for same, 4,800 feet per minute.  
 Air passing all the bords on right-hand side of flat so slack that we were unable to test the quantity; thermometer 71°.  
 Air passing the ends of 10 bords on left-hand side of flat, 1,650 feet per minute; thermometer 69°.  
 Air passing the ends of 5 bords on right-hand side of Straight-down Flat, which is attached to Far Flat, was so slack that we were unable to test the quantity; thermometer 70°.

*South Pit Flat.*

There are 40 men, 6 boys, 6 horses at this flat. Intake of air for same, 4,650 feet per minute.  
 Air passing the ends of 5 bords, from No. 11 to No. 7, is 4,650 feet per minute; thermometer 72°.  
 Air passing the ends of 6 bords, from No. 7 to No. 1, so slack that we were unable to test the quantity; thermometer 72°.  
 Intake of air on left-hand side of bank, 2,790 feet per minute.  
 Air passing the ends of 8 bords, from No. 19 to No. 10, is 2,790 feet per minute; thermometer 72°.

*Middle Pit Flat.*

There are 56 men, 6 boys, 6 horses at this flat. No. 1 intake of air, 4,680 feet per minute; No. 2 intake of air, 5,985 feet per minute.  
 Air passing the ends of 7 bords, from No. 1 to No. 7, 2,695 feet per minute; thermometer 67°.  
 Air passing the ends of 12 bords, from No. 7 to No. 19, 2,475 feet per minute; thermometer 69°.  
 We once more wish to draw your attention to the want of manholes on the South Pit Bank from the old flat to the present flat. We further want to draw your attention to the different parts of the roof which want attending to, as we think they are not safe.

Intakes.	Returns at Furnace.
5,460	- 45,360
4,680	38,220
4,800	34,965
4,650	25,200
2,790	
4,680	
5,985	
Total.....	143,745

Total.....33,045

Travelling roads and furnace in good order, with the exception of the air-course in front of the furnace, which is very much blocked up with coal and requires clearing away, and that portion of the South Pit Bank which we drew your attention to.

WALTER KERR, }  
 ED. CHARLTON, } Check Inspectors.

## No. 7.

The Under Secretary for Mines to The Examiner of Coal-fields.

Sir,

Department of Mines, Sydney, 30 January, 1886.

I am directed by the Secretary for Mines to inform you that a letter has been received from Mr. James Curley, Secretary of the Miners' Association, to the effect that the miners at the Co-operative Colliery had to come out of the mine on the 19th instant, not being able to work in consequence of defective ventilation, and I am to request that you will report on the matter without delay.

I have, &c.,

HARRIE WOOD,  
 Under Secretary.

## No. 8.

The Under Secretary for Mines to The Manager, Co-operative Colliery, Wallsend.

Sir,

Department of Mines, Sydney, 30 January, 1886.

I am directed by the Secretary for Mines to call your attention to a statement made by James Curley, Secretary of the Miners' Association, in a letter to this Department of the 25th instant, to the effect that the miners at the Co-operative Colliery, Wallsend, had to come out of the mine on the 19th instant, not being able to work in consequence of defective ventilation.

I have, &c.,

HARRIE WOOD,  
 Under Secretary.

## No. 9.

Mr. James Fletcher, jun., Manager, Co-operative Colliery, to The Honorable the Secretary for Mines.

Sir,

Wallsend, 1 February, 1886.

Your letter of 30th ultimo, informing me that Mr. Curley, Miners' General Secretary, had written to you on the 25th ultimo, that the miners employed at the Co-operative Colliery, Wallsend, had to come out of the mine on the 19th instant, not being able to work in consequence of defective ventilation, is duly to hand, and contents noted.

I

I do not say that Mr. Curley wrote intentionally to mislead you, but I venture to affirm that the wording of his letter could have no other effect than to convey the idea that the whole of the miners employed at this colliery had to leave the pit in consequence of defective ventilation. I am so much accustomed to hear of late of misleading statements being made that they would have to be extravagant indeed to surprise me. Mr. Curley, in his official capacity, could not of his own knowledge know anything but what was communicated by some or other of the miners here employed, and it is but another proof that men holding important positions should act with the greatest of caution on *ex parte* statements before making such serious charges against this or any other colliery.

It is true that some fourteen or fifteen men left their work in consequence of the air being slack in that particular part of the pit where they were working. The cause of the deficiency of air was discovered by the underground manager by 7 o'clock a.m., the time the drawing of coal commences, and was remedied in less time than it takes to write this. Briefly stated, the cause was the leaving of an air-door open which allowed the air to go direct to the furnace without passing over the men in this particular district, or any part of the pit, as the air passed through the doorway in question and went direct to the ventilation shaft. I may mention that this door was placed there as a convenience for the men, so that they might travel to and from their work in a shorter distance than by keeping the main road. It also served for the colliery officials to pass through when examining the airways.

Every practical coal-miner knows that air-doors are erected to check currents, and that the leaving of them open disarranges the whole of the ventilation in their locality; but notwithstanding this fact being universally understood, the miners in passing through this door, instead of closing it behind them, left it open, which I believe was done wilfully and designedly, with a view of creating a misunderstanding between us and the men.

When the defective state of the ventilation was detected by the underground manager and other colliery officials, they immediately examined the airways and ventilating furnace, and finding everything right with both they were at a loss to account for the slackness of air, never for one moment dreaming that the door in the travelling road for the men's convenience had been left open, and it was only by following up the return column of air that the cause was detected. This was at once explained to the men, who were about to go home, and they were assured that the air would shortly be all right, and within half an hour of their leaving and the door being closed the air was as good as it was before and is since.

It was no secret amongst the men that the door being left open caused the defective ventilation, and I have no hesitation in saying that Mr. Curley's informant knew it as well as we did.

At every air-door on the main roads of our mine a boy is kept specially to open and shut it each time a person or horse passes through, but the door in question only being there for the convenience of the men, and not on a main road, no boy was kept to attend it. Whoever left it open committed a gross abuse of a privilege established for their convenience; and to prevent a like occurrence it has since been nailed up.

We have several miles of airway in our mine, and no matter how careful we are, falls from the roof and similar accidents may occur which temporarily interfere with the ventilation, and to provide for this the airways are examined every day, either by the regular officials, or persons told off for that particular duty. If, however, the miners themselves, who are equally interested with the management in keeping up a proper supply of air, will either negligently or designedly leave air-doors open it is a difficulty of far greater magnitude than keeping the airways in proper order, notwithstanding their great length.

We have 340 to 350 miners employed in this colliery, and as only fourteen or fifteen of that number left their work on the day referred to by Mr. Curley, it is, I think, substantial proof that the deficient ventilation was confined to the district I refer to, and not the whole of the mine, as must be inferred by Mr. Curley's letter.

Where the Coal-fields Regulation Act is not carried out faithfully I do not, for one, complain at the miners seeking the Minister's assistance to insist on its being done, but I do complain of statements being made to the Minister calculated to mislead, when the miners themselves knew exactly the cause; and, further, that the cause was not brought about by any act or neglect of the management, but by the negligence or design of members of their own body.

I trust the explanation here given will put the matter brought under your notice by Mr. Curley in its proper light; and to still further prove the statements here made, I shall feel extremely obliged if you will instruct Messrs. Mackenzie and Dixon to visit the colliery and ascertain for themselves by actual experiment whether leaving open the air-door referred to will not bring about the result of which Mr. Curley complains.

I am, &c.,

JAMES FLETCHER, JUNIOR,

Manager.

## No. 10.

### The Examiner of Coal-fields to The Under Secretary for Mines.

Examiner of Coal-fields' Report on a complaint made to the Honorable the Secretary for Mines by the Miners' General Secretary, respecting alleged defective ventilation at the Co-operative Colliery, on 19th January, 1886.

Sir,

Coal-fields Office, Newcastle, 3 February, 1886.

In compliance with the instructions of the Honorable the Secretary for Mines, conveyed to me in your letter of the 30th ultimo, with respect to a letter he has received from Mr. Curley, Secretary of the Miners' Association, to the effect that the miners at the Co-operative Colliery had to come out of the mine on the 19th ultimo, not being able to work in consequence of defective ventilation, and asking me to report on the matter without delay,—I have the honor to state that I went to the colliery, accompanied by Mr. Inspector Dixon, yesterday, and report as follows:—

1. On arriving at the colliery I went in the mine with Mr. Inspector Dixon, Robert Davidson (overman), and John Houston (deputy), where I was met by the "Miners' Inspectors," who happened to be there for the purpose of making their monthly inspection, and who came and asked if I had any objection to their accompanying me, or would I let them check their anemometer with the Government one.

I replied I was only there that day inquiring into and ascertaining the cause of a deficiency of ventilation on the 19th ultimo, which Mr. Curley had complained of, at the request of the Executive of the Miners' Association. But after this was done, having before entering the mine seen the latest report made by them in the "book" kept at the colliery office for that purpose, I and Mr. Dixon, accompanied by them, would measure the quantity of air at the same places where they had measured it and reported a deficiency of ventilation.

*Inquiry and Report.*

1. John Houston (deputy), of the Co-operative Colliery, said as follows:—On the morning in question I was in No. 1 split at about 7 a.m., when some of the men then coming into that split said, "Houston, what is the matter in the cross-cuts; there are some of the men going away home on account of the air?" I replied that is the first I have heard of anything the matter with the air this morning, but will make my way there immediately. On going, with a view to making my way to the furnace, thinking there might be a fall in the return, I entered into it from No. 1 split, and when coming up the return and arriving at the door that enters into the cross-cut return, I immediately saw what was the matter, as the door was standing about three-parts open with a stone against it, keeping it open. That the door must have been opened by some of the men coming into work in No. 2 or 3 splits. Could not say whether the door had been propped open purposely, or a stone had fallen against it as some one had passed through it.

2. Robert Davidson (overman), of the Co-operative Colliery, stated:—When going to the mine from my breakfast I met Daniel Rees, John Rees, Samuel Rees, Daniel Rees (junior), William Gilpin, Alfred Upton, Thomas Lewis, Henry Forrester, Ezekiel Williams, and Alfred Patterson at the tunnel mouth, and asked them what was the matter. They replied "the air was bad." I told them I would go down immediately and see what was the matter, and that I could not understand how the air could be bad unless a door had been left open. They said they did not know. I then went to the bord where they had been at work and found the air as good as usual and nothing possible to complain of. Then I sent for the deputy (John Houston), who came and told me it was all right, and that he had found out where the fault was, "by a door being propped open by a stone," and that he believed it had been propped open on purpose. I then went to other miners who did not leave off working, and were still at work, in the same split, who said "their air was all right."

The "back shift" (second daily set of miners) never came to work that day, although the air was as good as ever in half an hour after the "front shift" had left the mine.

3. I got Houston to show me and Mr. Dixon how he found the door, and after taking the stone away which he put against the door to illustrate it I passed through it to see if it was possible that a stone could fall down and rest against the door in such a manner, whilst the door, which was a self-acting one, closed of its own accord. My opinion, and Mr. Dixon's, is that from the way the stone was placed, as shown us by Houston, it was most probably put there intentionally.

4. I annex a tracing (see Plan No. 11) showing the method adopted for the ventilation of the portion of the mine complained of, also the bords (lettered A) where the men left off work and those in which the men remained at work (lettered B) in the same split of air; and where the door (D) in red) was found open in the stenton between the intake and return air-ways. The arrows shown in blue denote how the intake air enters the split outside of the said door and circulates through the northern side of the split, crossing the heading almost opposite the door, near the top of which heading a temporary screen is fixed, from which it will be seen that when the door referred to (D) was opened the current (→) would sweep through the screen down the heading and through the open door into the main return airway, instead of circulating into the heading and bords where the men left off work, and that when the door is open the air would travel through it to the furnace, as it would be the shortest route.

5. In conclusion, I have only to state that the overman says the door was put where it is for the men's convenience in travelling in and out of this part of the mine, and that each person passing in and out was supposed to see it was closed, and that if it had been shut on the day in question the alleged defective ventilation would not have occurred. Also that the defect was rectified within half an hour of certain miners leaving the mine—they and others having been made acquainted with it immediately afterwards. Notwithstanding this, the complaint was made to the Minister after a lapse of five days, during which time the same miners had been at work in the places where they left off work. One of the miners who left off work with his three sons on the morning in question was Mr. Daniel Rees, of the Miners' Executive Committee, and District Chairman of the Hunter River Miners' Association.

I have, &c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

From this report it appears there was no ground for the complaint of defective ventilation on the 19th January.—H.W., 8/2/86. Submitted. Approved.—R.N.V., 19/2/86. Mr Curley informed 25 February, 1886.

No. 11.

Report of a joint Inspection of Nos. 2 and 3 splits in the Co-operative Colliery made by the Examiner of Coal-fields, Inspector of Collieries, and Mr. Middleby and Mr. Lewis (Miners' Inspectors), on Tuesday, 2nd February, 1886.

Sir,

Coal-fields Office, Newcastle, 3 February, 1886.

The following are the results of measurements taken at the request of the Miners' Inspectors for the purpose of ascertaining what quantity of air was circulating in the Nos. 2 and 3 splits in which they had reported, in the book kept at the colliery office for that purpose, a deficiency of ventilation on the 6th and 7th of January last.

The measurements were taken at the same time, and the anemometers placed side by side.

No. 2 SPLIT.

At No. 80 bord the result was about 7,716 cubic feet of air per minute, the reading of both instruments in this instance being nearly the same.

At No. 71 bord the result was about 5,082 cubic feet of air per minute, and by the Miners' Inspectors' instrument about 3,880.

At

At No. 41 bord the result was 7,049 cubic feet by the Government instrument, and 6,829 by the Miners'; and at 38 bord 6,600 by the Government anemometer, and 5,500 cubic feet per minute by the Miners'.

The largest current of air measured in this No. 2 split was about 7,716 cubic feet per minute for about 56 miners, 2 wheelers, 2 drivers, 3 trappers, and 2 horses—total 65, giving about 118 cubic feet of air per minute for each man, boy, and horse.

The Miners' Inspectors at Co-operative Colliery, however, have lately adopted the plan of measuring the current of air in several places in each split, then adding the measurements together and striking an average for the result, and even by this method the result would be a little over 101 cubic feet of air per minute for each man, boy, and horse in the split.

#### No. 3 SPLIT.

The greatest current of air was got at the No. 65 bord end, being about 6,840 cubic feet per minute. The two anemometers registered about the same on this occasion, and in the far stenton in this split the current of air was about 5,800 cubic feet per minute, the instruments again giving nearly the same reading. At 52 bord, however, the current of air was about 6,435 cubic feet per minute by the Government anemometer, and about 6,184 by the Miners'.

The largest current of air in this split was about 6,840 cubic feet per minute for about 48 men, 5 boys, and 3 horses—total 56 men, &c., giving about 122 cubic feet of air per minute for each man, boy, and horse in this No. 3 split, and by the Co-operative Miners' Inspectors' method of average would give about 113 cubic feet of air per minute for each man, boy, and horse in the split.

It will thus be seen that the provisions of the Coal Mines Regulation Act are here complied with.

I have, &c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

The result of the investigation appears to be satisfactory, and may be communicated to the Miners' Secretary.—H.W., 8/2/86. Submitted. Approved—R.N.V., 19/2/86.

#### No. 12.

The Under Secretary for Mines to The Miners' General Secretary, Hamilton.

Sir,

Department of Mines, Sydney, 25 February, 1886.

Referring to the complaint made by you respecting alleged defective ventilation at the Co-operative Colliery on the 19th ultimo, I am directed by the Secretary for Mines to inform you that, from the report of the Examiner of Coal-fields, there appears no ground for complaint as to the ventilation of the colliery on the day named.

I have, &c.,

HARRIE WOOD,

Under Secretary.

#### No. 13.

The Under Secretary for Mines to The Examiner of Coal-fields.

Sir,

Department of Mines, Sydney, 25 February, 1886.

Referring to the reports sent in by you—the one on a complaint by the Miners' General Secretary respecting alleged defective ventilation at the Co-operative Colliery, and the other as to the quantity of air circulating in Nos. 2 and 3 splits in the same colliery,—I have the honor to inform you that it has been intimated to Mr. Curley, the Miners' General Secretary, that both reports furnished by you as to the ventilation of the abovenamed colliery are considered satisfactory.

I have, &c.,

HARRIE WOOD,

Under Secretary.

## No. 1.

Mr. John Wright to Mr. J. Dixon, Inspector of Collieries.

Sir,

Wickham, 9 November, 1885.

I am instructed by the Committee of our body to write to you calling your attention to the air in the Maryville Colliery, as there have been a great many complaints.

I have, &amp;c.,

JOHN WRIGHT,

Secretary.

## No. 2.

Mr. John Dixon, Inspector of Collieries, to Mr. H. Harper, Colliery Manager, Newcastle.

Sir,

Glebeland, 25 January, 1886.

I hereby have to notify you of the very defective state of the ventilation in the Maryville Colliery, as found by me on my inspection of said colliery to-day (Monday), inasmuch as the total current of air in the main return air-way near pit bottom was only about 1,885 cubic feet per minute, being over 3,000 cubic feet of air per minute short of the quantity required by sub-section 3, section 12, of the Coal Mines Regulation Act, 1876, for the number of men, &c., at work in the Maryville Colliery at the time of my inspection.

2. On my inspection this morning I noticed that the top coal had been cut up and, to some extent, worked in three bords. Therefore, in pursuance of the provisions contained in the 25th section of the Coal Mines Regulation Act, 1876, I hereby notify you that, in my opinion, owing to the soft nature of the strata above the seam at the Maryville Colliery, it is a dangerous practice to work the top coal at the present time, more especially as there is only one shaft, and consequently only one way of escape for the persons employed below in the event of a sudden inrush of water, sand, and gravel, which, in my opinion, may be liable to take place at any time after the removal of the top coal.

3. I have, therefore, to urge that the above matter may have your serious attention at once, with a view to the well-being and safety of all persons employed in the Maryville Colliery.

I have, &amp;c.,

JOHN DIXON,

Inspector of Collieries.

## No. 3.

Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Maryville Colliery Inspection.

Sir,

Glebeland, 1 February, 1886.

I have the honor to report inspection of the above colliery on Monday (25th January ultimo), as follows:—

At the time of my inspection there were about 37 miners, 1 small-coal filler, 1 deputy, 5 wheelers, 2 water-balers, 1 onsetter, and 2 horses; total, about 49 men, &c., employed below.

The total current of air for the above number of men, &c., was only about 1,885 cubic feet per minute. This result was got in the main return air-way near the shaft bottom immediately after descending the shaft on the day of inspection. After going through the workings (where I could not get a result with the anemometer), I came back to the bottom of the shaft again, and got exactly the same result as before. Although none of the workings are a very great distance from the pit bottom, yet, owing to the very limited quantity of air descending the shaft, the ventilation throughout the working headings was sadly defective, as the total quantity of air was over 3,000 cubic feet per minute below the requirements of the Coal Mines Regulation Act for the number of men, &c., employed below.

At the time of my inspection there was a good fire in the furnace at the surface, but it seemed to have little or no power over the up-cast column of air behind the brattice in the shaft. I here beg to remark that on the 12th December last the manager (Mr. Harper) promised me that he would raise the up-cast portion of the shaft above the level of the landing-stage. This promise he (Mr. Harper) fulfilled by raising the furnace stack some 16 feet higher, but without any apparent beneficial results to the ventilation of the mine.

2. On my inspection of the Maryville Colliery on Monday last I also noticed that three bords had been cut up, and part of the top coal worked in each of the three. In the No. 2 heading there were two men cutting a bord up; they had reached the roof at about 5 feet, but had not got the bord cut all across when I saw it; this bord was about 6 yards wide. In No. 3 heading I saw two men working top coal in a bord about 7 yards wide; the tops in this bord were also about 5 feet in thickness, and had been worked for about 10 yards in length down the bord. In the adjoining bord, being No. 6 bord, No. 3 heading, I also saw two men at work in the tops; this bord was about 7½ yards wide, and the tops had been worked for a distance of about 11 yards. The roof in this bord was wet, as water was coming through in several places.

3. Seeing that as yet there is only one shaft in connection with the Maryville Colliery, and that the strata overlying the seam of coal is of an extremely soft nature throughout, I am of opinion that it is a highly dangerous practice to work the top portion of the seam in the Maryville Colliery until the dip-coal is worked, and a second shaft sunk to afford another means of escape for the persons employed below.

4. In conclusion, I beg to state that on Monday last, the day of inspection, I notified the manager (Mr. Harper), by registered notification, concerning the defective ventilation, and the top coal workings in the Maryville Colliery, a copy of which notification I herewith beg to forward.

I have, &amp;c.,

JOHN DIXON,

Inspector of Collieries.

No.

## No. 4.

## The Examiner of Coal-fields to The Under Secretary for Mines.

Deficiency of Ventilation, &amp;c., at the Maryville Colliery.

Sir,

Coal-fields Office, Newcastle, 5 February, 1886.

I have the honor to forward, for the information of the Honorable the Secretary for Mines, a report I have received from Mr. Inspector Dixon, dated the 1st instant, with respect to a deficiency of ventilation at the Maryville Colliery, the ventilation of which had been previously complained of by the Inspector to the manager on 12th December last, when the latter promised to raise the up-cast portion of the shaft above the level of the landing-stage. This promise was fulfilled by raising the furnace stack 16 feet higher, but without any beneficial results to the ventilation of the mine, there being a deficiency on 25th ultimo of over 3,000 cubic feet of air per minute for the number of men, &c., employed underground.

2. Mr. Dixon also reports that three 6-yard bords had been cut up and part of the top coal worked in each of them. In No. 3 heading two men working top coal in a bord about 7 yards wide, and in another 7½-yard bord, the top coal had been worked for a length of about 11 yards where the roof was wet, and water was coming through it in several places; and that, seeing there is only one shaft in connection with the colliery, and that the strata overlying the coal-seam is of an extremely soft nature throughout, he is of opinion that it is a highly dangerous practice to work the top portion of the seam in the Maryville Colliery until the dip coal is worked, and a second shaft sunk to afford another means of escape for the persons employed below, in which I fully agree, and forward for the Minister's information a letter I wrote to Mr. Dixon on the subject, on the 21st October last, and a copy of a letter to Mr. Dixon, dated 28th October, from the manager, saying he was putting down a borehole, in view of ascertaining the most suitable position for putting down a shaft. The bore was completed a short time afterwards, and nothing further has been done with a commencement of the second shaft, which Mr. Dixon and myself have told him we considered absolutely necessary, taking into consideration the extremely soft nature of the strata overlying the coal-seam, and the probability of a much larger influx of water flowing into the mine than has occurred on three previous occasions. I also enclose copy of notice Mr. Dixon has served on the manager.

3. I shall be obliged by your informing me, as early as practicable, what further steps the Minister desires me to take in the matter.

I have, &amp;c.,

JOHN MACKENZIE,  
Examiner of Coal-fields.

Unless the defects be at once remedied the Examiner may take proceedings to enforce the observance of the provisions of the Act.—H.W., 11/2/86. Submitted. Approved.—R.N.V., 12/2/86. The Examiner of Coal-fields.—G.E.H., B.C., 13/2/86.

In regard to the matter of the second opening referred to in the within report, the Examiner should instruct the Inspector to serve notice, in terms of section 25 of the Coal Mines Act, upon the owners of the Maryville Colliery.—H.W., 4/3/86.

Submitted. The Inspector served notice upon the manager on 25th January last.—J.M., 8/3/86. The Under Secretary for Mines, B.C., 8/3/86.

From the fact that the owner has not complied with the notice it may be inferred that he objects, in which case the matter will have to be referred to arbitration; but the Minister might perhaps desire that the owner's attention be called to the notice before taking further proceedings.—H.W., 8/3/86.

Submitted. Approved.—J.F., 10/3/86.

[Enclosures to No. 4.]

The Examiner of Coal-fields to Mr. John Dixon, Inspector of Collieries.

Sir,

Coal-fields Office, Newcastle, 21 October, 1885.

Since my inspection and examination with you of the heading and bord which caved in a short time since, where two men were at work at the Maryville Colliery, the caving in having taken place immediately after the heading and bord, being driven by the two men, reached a face of sand and gravel, when a tremendous rush of water and sand ran therefrom into the workings, which wash-out, consisting of sand and gravel, is now barred back by a barrier reaching to the roof of the coal-seam.

2. In consequence of the disturbed nature of the country at this colliery, and others in the neighbourhood, and the liability at any time of similar washes of sand and gravel, I have thought seriously as to the necessity of the owners of the Maryville, Wickham, and Bullock Island, and Stockton Coal Companies being compelled to keep boreholes at least 10 feet ahead in all exploring headings driven north, east, south, or west of their working shaft.

3. Do you not think it is a dangerous practice, knowing the disturbed nature of the country in which the Maryville and Stockton Collieries are, for them to be worked as they now are by one shaft, and consequently only one means of escape for the men, boys, &c., working therein, and that a second shaft should be commenced at once; if so, you had better serve the colliery managers with registered notices to that effect under section 25 of the Coal Mines Regulation Act, 1876?

I have, &amp;c.,

JOHN MACKENZIE,  
Examiner of Coal-fields.

Mr. John Dixon, Inspector of Collieries, to Mr. H. Harper, Colliery Manager, Newcastle.

Sir,

Glebeland, 24 October, 1885.

Knowing the disturbed nature of the ground in connection with the Maryville Colliery, I have, in pursuance of the provisions contained in the 25th section of the Coal Mines Regulation Act, 1876, to notify you that I consider the practice of only having one shaft (and consequently only one means of escape) to be dangerous; and therefore have to urge that a second shaft in connection with the Maryville Colliery be commenced at once, and carried on without delay, so that a second opening from the surface to the present workings may be completed as soon as possible.

2. Seeing that in the Maryville Colliery there exists a danger of tapping, at any time, loose ground liable to contain a heavy feeder of water, I am directed to draw your attention to the necessity of keeping a borehole at least 10 feet ahead of the working face in every exploring place or heading driven north, south, east, or west.

3. I have, therefore, to urge that you would give your serious attention to the above matters at once, with a view of having them carried out without delay.

I have, &amp;c.,

JOHN DIXON,  
Inspector of Collieries.

Mr.

Mr. Henry Harper to Mr. John Dixon, Inspector of Collieries.

Sir,

Maryville Colliery, 28 October, 1885.

Your favour of the 24th instant came duly to hand, and your request I have carefully thought over.

With regard to the second shaft, I have already put down one bore to the westward of our pit, with a view of ascertaining the most suitable position for putting down a shaft. I am also putting in a bore ahead of some of my headings, wherever I think there is the slightest necessity of doing so. As far as we can ascertain there are other collieries adjacent who are worse off in this respect than we are; but we will endeavour to comply with the various suggestions as far as practicable.

I have, &c.,

HENRY HARPER.

Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Sir,

Glebeland, 29 October, 1885.

I have the honor to acknowledge receipt of your communication of 21st instant, concerning the disturbed state of the country in connection with the Maryville, Stockton, and Bullock Island Collieries, and the necessity for the second shaft at Maryville and Stockton, &c.

In reply, I beg to state that I most fully endorse your views respecting the above-named collieries, and, according to your instructions, have notified the managers, under the 25th section of the Coal Mines Regulation Act, 1876, to commence at once the second shaft at Maryville and Stockton, and to keep a borehole at least 10 feet ahead of the face in every bord or heading driven north, east, south, or west, in the Maryville, Stockton, and Bullock Island Collieries, copies of which notifications I herewith beg to forward.

I have, &c.,

JOHN DIXON,

Inspector of Collieries.

### No. 5.

Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Special inspection of the Maryville Colliery to see if the ventilation had been improved since my inspection of that colliery on 25th January, last month.

Sir,

Glebeland, 26 February, 1885.

I have the honor to report inspection of the above-named colliery on Wednesday last, 24th instant, as follows:—

Since my inspection on 25th ultimo, the manager (Mr. Harper) had caused a "fire-lamp" to be erected in the return air-way at the shaft bottom, in order to improve the ventilation of the mine; and although a slight increase in the main current of air had been effected by the fire-lamp, yet I regret to say that on the 24th instant the ventilation in the Maryville Colliery was not by any means up to the requirements of the Coal Mines Regulation Act, 1876, as the following results will show. At the time of my inspection there were about fifty men and boys and two horses at work in the mine. The first measurement of the air current was taken in the main return air-way, near the shaft bottom, at about 9:20 a.m., the total result being about 2,940 cubic feet of air per minute. After going through a portion of the workings, I again returned to the shaft bottom and measured the current of air at the same place as before. This was about 10:30 a.m., and the result was an improvement on the first measurement, being about 3,360 cubic feet of air per minute. The first and second measurements, as given above, were taken when the pump was working and exhausting into the up-cast behind the brattice in the shaft. The third measurement was taken about 11:30 a.m., when the pump was stopped, and the result was about 2,870 cubic feet of air per minute. For the fifty-two men, &c., employed in this colliery, on the day of inspection, the minimum quantity of air to comply with the Act ought to have been 5,200 cubic feet per minute. The first measurement, however, as taken by me shows a deficiency of about 2,260 cubic feet per minute; the second a deficiency of 1,840 cubic feet per minute; and the third a deficiency of about 2,330 cubic feet per minute.

In my previous report on this colliery I mentioned that top coal was being taken out in various places. I here beg to state that the same work is still being carried on; and since my inspection of 25th last month a top coal bord has given way, and the fall has extended to the surface. This is the bord I mentioned as having a wet roof.

On coming out of the mine on Wednesday last I saw Mr. Harper, and told him about the state of the ventilation in the Maryville Colliery, and he informed me that he was having a bore put down to test the ground with a view of commencing the second shaft as soon as possible.

I have, &c.,

JOHN DIXON,

Inspector of Collieries.

### No. 6.

Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Sir,

Glebeland, 27 February, 1886.

For your information I beg to forward a letter which I received from Mr. Harper, manager, Maryville Colliery, this (Saturday) morning, by which is inferred that the ventilation at said colliery has been made considerably better since my inspection on Wednesday last.

I shall be obliged for instructions on this matter, as to whether I am to make another inspection of the Maryville Colliery prior to taking action in Court.

I have, &c.,

JOHN DIXON,

Inspector of Collieries.

Submitted for further instructions.—J.M., 4/3/86. The Under Secretary for Mines, B.C., 4/3/86.

A further inspection should be made, and if the ventilation is not in accordance with the provisions of the Act, the Inspector should at once take the necessary proceedings. Authority to take proceedings, under the Coal Mines Regulation Act, may be issued to Mr. Inspector Dixon.—H.W., 4/3/86.

Submitted. Approved.—J.F., 4/3/86. The Examiner of Coal-fields.—H.W., 4/3/86. Mr. Dixon instructed.—J.M., 4/3/86. Under Secretary for Mines, B.C., 4/3/86. Proceedings taken on 6th April, 1886, and a verdict obtained.—J.D., 16/4/86. The Crown Solicitor may be asked to prepare a form of authority to enforce the provisions of the Coal Mines Regulation Act, and to recover any penalties under the said Act.—H.W., 4/3/86. Submitted. Approved.—J.F., 10/3/86.

No.

## No. 7.

The Under Secretary for Mines to The Crown Solicitor.

Sir,

Department of Mines, Sydney, 6 March, 1886.

I have the honor, by direction of the Secretary for Mines, to request that you will be so good as to prepare a form of authority to enforce the provisions of the Coal Mines Regulation Act, and to recover any penalties under the said Act.

I have, &amp;c.,

HARRIE WOOD,  
Under Secretary.

## No. 8.

Authority to prosecute for the recovery of penalties under the Coal Mines  
Regulation Act, 1876.

To all to whom these Presents shall come,—

## GREETING :

Whereas by the Coal Mines Regulation Act 1876 it is provided that all penalties imposed by the said Act may be recovered summarily before two or more Justices of the Peace at the suit of the Examiner Inspector or other officer authorized in that behalf by the Minister Now know ye that I the Honourable the Secretary for Mines for the Colony of New South Wales do by this writing under my hand in pursuance of the power and authority given to me in this behalf by the said Act authorize and empower of in the said Colony to sue for and recover all every and any penalties and penalty imposed by the said Act And for that purpose to make and exhibit before any two or more Justices of the Peace for the said Colony all and every such informations or information charging any person or persons with a breach or breaches of the provisions of the said Act in respect of which breach or breaches a penalty or penalties is or are imposed by the said Act as the said may think fit And to proceed to judgment upon such information or informations or the same to withdraw and discontinue And for the purposes of suing for such penalties to employ any counsel solicitor or attorney And to take all proceedings necessary to recover, and obtain payment of the said penalties And I declare that this authority shall continue in force until a revocation hereof in writing under the hand of the Minister for Mines for the said Colony for the time being shall be received by the said And that same shall not be deemed or taken to be revoked by the appointment of another person or other persons to prosecute for the recovery of penalties under the said Act.

In witness whereof I have hereunto set my hand at Sydney in the said Colony this  
day of in the year of Our Lord one thousand eight hundred and  
eighty-

Telegram from Mr. John Dixon, Inspector of Collieries, to The Examiner of  
Coal-fields.

Hamilton, 8 March, 1886.

WERE working top coal in Maryville Colliery on my inspection in February. Pit not at work on Friday last; have forwarded last two reports on this colliery to Coal-fields Office, Newcastle.

JOHN DIXON,  
Inspector of Collieries.

## No. 11.

The Under Secretary for Mines to The Manager of the Maryville Colliery.

Sir,

Department of Mines, Sydney, 13 March, 1886.

I have the honor, by direction of the Secretary for Mines, to invite your attention to the notice which was served on you in terms of section 25 of the Coal Mines Act, in respect to the ventilation of the Maryville Colliery.

I have, &amp;c.,

HARRIE WOOD,  
Under Secretary.

## No. 12.

The Manager, Maryville Colliery Company (Limited), to The Secretary for Mines.

Sir,

Newcastle, 19 March, 1886.

Referring to yours of the 13th instant, I am doing all that possibly can be done to carry out the provisions of the Coal-fields Act in the face of the most trying circumstances, to which, if it becomes necessary, I can refer you in detail.

So far I have had no complaint from the men under my charge.

I

I am glad to notice through the Press that you contemplate ordering a first-class anemometer from England, as such an instrument will enable the Inspectors to do justice to the masters as well as the men.

I have, &c.,

HENRY HARPER.

Submitted.—H.W., 20/3/86. The report of the officers must be acted upon.—J.F., 20/3/86. The Examiner of Coal-fields, Newcastle.—G.E.H., *pro* U.S., B.C., 22/3/86.

### No. 13.

Mr. John Dixon, Inspector of Collicries, to The Examiner of Coal-fields.

Sir,

Glebeland, 16 April, 1886.

I do myself the honor to herewith return the papers in connection with the Maryville and Bullock Island Colliery cases, and at the same time to report that said cases came on for hearing at the Newcastle Court, before Mr. Mair, P.M., on Tuesday, 6th instant, and occupied the Bench nearly the whole of the day.

Messrs. Wallace and Sparke appeared for the prosecution, and Messrs. Thompson and Windeyer for the defence.

Much of the time during the day was taken up by Mr. Thompson's objections to the way in which the information had been laid; also to my authority to prosecute. On these points the arguments on both sides appeared most forcible, and, in my opinion, Mr. Wallace is deserving of great praise for the able manner in which he conducted both cases. For of one thing I am pretty certain, namely, had not Mr. Wallace been well posted up in the many objections which he no doubt anticipated could be taken to certain clauses in the Coal Mines Regulation Act, 1876, both cases would have fallen through. In the Maryville case I gave evidence as to the state of ventilation in that colliery on 24th February and 5th March last, and was cross-examined by Mr. Thompson at some length with a view of testing my knowledge of ventilation and the use of the anemometer, &c. The manager (Mr. Harper) was called for the defence, but failed to make a case, the consequence being that he (Mr. Harper) was fined the sum of £5 with costs of Court, and £2 2s. professional costs.

In the Wickham and Bullock Island case the information was laid against the owners, some of whom were present to answer the charge of neglecting to observe the provisions of sub-section 1, section 12, of the Coal Mines Regulation Act, 1876, which sub-section provides for the completion of at least two distinct openings to the day or surface intercommunicating with each other, by means of either of which openings all persons employed in the colliery might at all times pass in or out, &c.

On the reading of the information, Mr. Thompson raised a primary objection that action had not been taken within the eighteen months prescribed by the Act, and that the incorporation of the Company had not been proved. His Worship said he would reserve his decision on these points till after the hearing of the evidence. I was then called upon to give evidence as to the time when bords were first turned away in the Wickham workings, &c., after which, the manager, Mr. Gardiner, was called for the defence. This defence was that there were the usual means of getting in and out of the colliery—an engine and wire ropes. In cross-examination, however, the manager admitted that the slides were being taken out of the pit, and that the steam was not kept up at the Wickham shaft, and that it would take three or four hours to get steam up, &c.

This evidence closed the case, and the Magistrate in summing up remarked that there were some difficult points to decide, but on the whole he felt justified in finding defendant guilty. He thought, however, that a moderate fine would meet the case, and returned a verdict against defendants for £10 Court costs, and £2 2s. professional costs.

I have, &c.,

JOHN DIXON,

Inspector of Collicries.

Forwarded for the information of the Honorable the Secretary for Mines—J.M., 6/5/86. The Under Secretary for Mines.—B.C., 6/5/86. Submitted.—H.W., 10/5/86. Seen.—J.F., 14/5/86.

## Wickham and Bullock Island Colliery.

### SCHEDULE.

NO.	PAGE.
1. The Examiner of Coal-fields to the Under Secretary for Mines with reference to defective ventilation at the Wickham and Bullock Island Colliery, with minutes and enclosures. 9 March, 1886. ....	115

### No. 1.

The Examiner of Coal-fields to the Under Secretary for Mines.

Sir,

Mining Department, Sydney, 9 March, 1886.

I have the honor to forward a report received from Mr. Inspector Dixon with respect to sub-section 1, section 12, of the Coal Mines Regulation Act, 1876, not being complied with at the Wickham and Bullock Island Colliery; also copy of a notice served on the manager, and shall be obliged by your informing me what further action the Minister desires me to take.

I have, &c.

JOHN MACKENZIE,

Examiner of Coal-fields.

Has

Has the working of bords, stalls, or longwall workings been commenced more than one year and six months since?—H.W., 9/3/86. Yes.—J.M., 9/3/86. Unless within one week steps are taken to remedy the defect, proceedings may be taken to enforce the fine—H.W., 9/3/86. Submitted. Approved.—J.F., 9/3/86. The Examiner of Coal-fields.—H.W., B.C., 9/3/86. Mr. Inspector Dixon to take the necessary proceedings if matter complained of is not remedied within one week.—J.M., 10/3/86. Proceedings taken 6th April, 1886, and verdict obtained.—J.D., 16/4/86.

[Enclosure to No. 1.]

Mr. John Dixon, Inspector of Collieries, to the Examiner of Coal-fields.  
Wickham and Bullock Island Colliery Inspection.

Sir,

Glebeland, 6 March, 1886.

I have the honor to report inspection of the abovenamed colliery yesterday, 5th instant, as follows:—

The number of men, &c., employed below on the day shift is about eighty-two, being about sixty miners, eight wheelers, four horses, ten shiftmen, and water balers. The total quantity of intake air from the Wickham shaft at the time of inspection was about an average current of 8,500 cubic feet per minute. The majority of the working places were well ventilated, but in Dunn's heading, where there were six men at work, the air was very slack. I noticed, however, that cuts-through were being driven from bord to bord, and, when holed, the matter of complaint would be remedied.

A good road has now been made between the two shafts, and an incline plane is being formed, in order to run the coal down from the workings on the Wickham side of the colliery. I went to the bottom of the Wickham shaft and looked up, and from the appearance of the shaft I arrived at the conclusion that a considerable amount of work would have to be done in it before it could be rendered safe for men to pass in or out, according to the requirements of the Coal Mines Regulation Act, 1876.

Seeing that sub-section 1 section 12 of said Act was not complied with at the Wickham and Bullock Island Colliery, I notified the manager (Mr. Gardiner) to that effect yesterday, a copy of which notification I beg herewith to forward, and shall be obliged for further instructions on this matter.

Throughout the workings there seemed to be a good supply of timber on hand ready for use.

I have, &c.,

JOHN DIXON,  
Inspector of Collieries.

[Enclosure to No. 1.]

Mr. John Dixon, Inspector of Collieries, to Mr. A. Gardiner, Colliery Manager, Wickham.

Sir,

Glebeland, 5 March, 1886.

During my inspection of the Wickham and Bullock Island Colliery this day (Friday) I noticed that although there were two separate and distinct openings to the day or surface from such mine, intercommunicating with each other, yet there was only one opening available for the persons employed in the colliery to pass in or out. I therefore hereby notify you that sub-section 1 section 12 of the Coal Mines Regulation Act, 1876, is not complied with at the Wickham and Bullock Island Colliery, inasmuch as said sub-section provides for two separate and distinct openings to the day or surface, "by means of either of which openings all persons employed in the colliery may at all times whatsoever pass in or out."

2. I have therefore to urge that you would attend to the above matter at once, with a view to having it remedied as soon as possible.

I have, &c.,

JOHN DIXON,  
Inspector of Collieries.

## Burwood Colliery.

### SCHEDULE.

NO.	PAGE.
1. The Examiner of Coal-fields to the Under Secretary for Mines, enclosing reports from Mr. Inspector Dixon, respecting a deficiency of ventilation at the Burwood Colliery; also copy of notice served on the manager, with minutes. 14 January, 1886 .....	116
2. Mr. Samuel Birrell, Manager, Burwood Colliery, to the Examiner of Coal-fields, that he had reduced the number of men in mine, with minutes. 19 January, 1886 .....	117
3. The Under Secretary for Mines to the same, in reply to No. 1. 25 February, 1886 .....	118

### No. 1.

The Examiner of Coal-fields to the Under Secretary for Mines.

Sir,

Coal-fields Office, Newcastle, 14 January, 1886.

I have the honor to forward reports I have received from Mr. Inspector Dixon respecting a deficiency of ventilation at the Burwood Colliery, and copy of a notice I have served upon Mr. Samuel Birrell, and shall be obliged by your informing me what further action the Minister desires me to take in the matter.

2. Mr. Dixon informs me to-day that Mr. Birrell has made a commencement with building up the top of the furnace shaft.

I have, &c.,

JOHN MACKENZIE,  
Examiner of Coal-fields.

Proceedings should be taken to enforce the provisions of the Act, unless the defects be remedied before such proceedings can be taken.—H.W., 21/1/86. Submitted. Approved.—R.N.V., 25/1/86. The Examiner of Coal-fields.—H.W., U.S., B.C., 30 January, 1886. Mr. Inspector Dixon for report as to whether the defects are remedied.—J.M., 1/2/86.

I inspected the Burwood new tunnel to-day, Monday. The stalk on the furnace shaft has not yet been made higher, the bricks and mortar are on the ground, but the manager, Mr. Birrell, informed me that he could not get a bricklayer, although offering a great price for the work. However, the current of air to-day was about 5,580 cubic feet per minute for forty-two men, six boys, and three horses; total, fifty-one men, &c. The current of air in the new pit was about 7,200 cubic feet per minute for a total of sixty-two men, &c.—J.D., 1/2/86.

The Act is now complied with.—J.M., 2/2/86. The Under Secretary for Mines, B.C., 2/2/86. Under the circumstances now reported no proceedings need be taken.—H.W., 17/2/86. Submitted. Approved.—R.N.V., 18/2/86. Inform Examiner.—H.W., U.S., 18/2/86.

[Enclosure

## [Enclosure to No. 1.]

Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.  
Burwood New Pit Inspection.

Sir,

Glebeland, 10 December, 1885.

I have the honor to report inspection of the abovenamed pit workings to day (Thursday) as follows :—  
On the day shift in the New Pit workings there are about forty men, six wheelers, and two horses employed. About twenty of the miners are employed in ordinary 8-yard bords, and the others engaged in narrow work. When I inspected this place on the 28th of October last, there were only about fourteen men employed below, and the ventilation was good; but on my inspection to day, I regret to say that I found the ventilation very defective throughout the workings, as the total current of air was only about 2,750 cubic feet per minute for a total of about forty-eight men, &c., being a deficiency of over 2,000 cubic feet of air per minute.

The shaft is bratticed from the surface to the bottom, and from the upcast side of the shaft at the surface there is a wooden box 16 inches by 10 inches, by which a portion of the return air is conducted to the boiler stalk.

In addition to the above there is a small exhaust fan employed at the surface, and connected to the upcast by a box 10 inches square.

The manager (Mr. Birrell) was with me throughout the whole of the workings. I drew his attention to the defective ventilation, and he (Mr. Birrell) stated that he intended putting the exhaust steam from the pump into the upcast part of the shaft, and if that did not produce the required quantity of air he would connect the whole of the upcast with a spare boiler and stalk, and promised me that he would do his very best to remedy the matter as soon as possible.

I regret to state that slight signs of inflammable gas have been found in one of the headings in this pit, and two men were slightly burned by it early on Monday morning last. The manager (Mr. Birrell) reported the matter to the Coal-fields Office, and after investigating it to-day I found that neither of the men had been laid off work by the accident, and that it was not at all serious. The underground overman (Mr. Horsfield) was one of the men, and from him I gathered the following particulars concerning the explosion :—It appears that a shift of men commenced work at about 12 p.m. on Sunday night last, and about half-an-hour after one of the men, named Townsend, came to bank and reported to the overman that his heading had fallen in near the face and for some distance back. The overman went down the pit with the miner, and both went into the heading. The overman (Mr. Horsfield) gave orders for the removal of the fallen stuff, and was about to leave the heading when a slight explosion of gas took place, which burnt Horsfield a little on the forehead and Townsend very slightly on the hands.

I am informed that this is the first time that gas has been found in this pit workings; and I tried the same place to-day with a safety lamp, and could not detect the slightest trace of gas anywhere.

I cautioned the manager (Mr. Birrell) to strictly adhere to the 14th special rule, which provides for the deputy making an examination of the working-places before the miners are allowed to start work. This he (Mr. Birrell) promised to have carried out in future, and gave orders in my presence to that effect. In my opinion a more vigorous ventilation is required to ensure safety.

I have, &c.,  
JOHN DIXON,  
Inspector of Collieries.

Make another inspection early next month, and report whether the matters complained of have been remedied.  
J.M., 12/11/85.

Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.  
Burwood Colliery Inspection.

Sir,

Glebeland, 9 January, 1886.

I have the honor to report inspection of the above colliery on Thursday last, 7th instant, as follows :—  
In the New Tunnel the total current of air was about 5,600 cubic feet per minute for about sixty-six men, six boys, and three ponies; total, 75. The above result shows a deficiency of about 1,900 cubic feet of air per minute on the minimum quantity required by the Coal-fields Regulation Act, 1876. I drew the attention of the manager (Mr. Birrell) to this matter, and in reply he stated that he had been compelled to stop the "old tunnel" for a short time, and, not wishing to throw any of the men out of work, had to put six pairs, or twelve of the "old tunnel" miners into the new tunnel. He (Mr. Birrell) further stated that he was prepared to do anything to benefit the ventilation, and as I advised him to have the top of the furnace shaft built about 20 feet higher than at present he promised to have it done as soon as possible, which will be about three weeks or so.

*New Pit.*

In relation to this place, I am pleased to be able to state that since my inspection of 10th December (last month) I found a marked improvement in the ventilation. The total number of men, &c., employed in the New Pit is about 163. There are three shifts, and the greatest number employed on one shift is about sixty-four men, &c. This was about the number at work on the day of inspection, and the total current of air circulating in the mine was about 6,510 cubic feet per minute.

In both tunnel and pit I found the working places well timbered, and a good supply of timber on hand ready for use.

I have, &c.,  
JOHN DIXON,  
Inspector of Collieries.

The current of air in this new pit (lately sunk) has been increased from 2,750 cubic feet per minute, on 10th December, to 6,510 cubic feet on 9th January, 1886; vide Mr. Inspector Dixon's reports of 10th December, 1885, and 9th January, 1886.—J.M., 16/1/86.

The Under Secretary for Mines, B.C., 16/1/86.

The Examiner of Coal-fields to Mr. Samuel Birrell, Manager Burwood Colliery.

Sir,

Coal-fields Office, Newcastle, 14 January, 1886.

In view of a recent report received from Mr. Inspector Dixon on the ventilation of the Burwood Coal Company's "New Tunnel" workings, and in pursuance of the provisions contained in the 31st section of the Coal Mines Regulation Act, 1876, I hereby give you notice that you have failed to comply with sub-sections 2 and 3, section 12, of the said Act.

I have, &c.,  
JOHN MACKENZIE,  
Examiner of Coal-fields.

## No. 2.

Mr. Samuel Birrell, Manager, Burwood Colliery, to The Examiner of Coal-fields.

Sir,

Burwood Colliery, 19 January, 1886.

I have reduced the number of men so as to comply with the Coal Mines Act of Parliament.

I have, &c.,  
SAMUEL BIRRELL,  
Colliery Manager.

Mr. Dixon for report as to whether the provisions of the Act are now complied with.—J.M., 20/1/86. The provisions of the Act are now complied with.—J.D., 1/2/86.

## No. 3.

The Under Secretary for Mines to The Examiner of Coal-fields.

Sir,

Department of Mines, Sydney, 25 February, 1886.

Referring to your communication of the 2nd instant, to the effect that the provisions of the Act were being complied with in respect of ventilation at the Burwood Colliery, I am therefore directed by the Secretary for Mines to inform you that, under the circumstances now reported, no proceedings need be taken.

I have, &amp;c.,

HARRIE WOOD,  
Under Secretary.

## Newcastle Coal-mining Company's Colliery.

## SCHEDULE.

NO.	PAGE.
1. Copy of Check Inspectors' Report, with respect to ventilation at Newcastle Coal-mining Company's Colliery, 12 January, 1886.....	118

## No. 1.

## Check Inspectors' Report.

Newcastle Coal-mining Company's Colliery, 11 January, 1886.

WE, the undersigned, having examined the workings and part of the travelling roads, &c., of the above-named colliery, report as follows:—

*No. 8 Intake.*

Amount of air passing in is 6,192 cubic feet per minute; thermometer 68°.

*No. 8 Heading.*

14 men, 2 boys, 1 horse. Air passing 7 bords is 4,896 cubic feet per minute, or 287 cubic feet per minute for each man, boy, and horse; thermometer 75°.

*No. 7 Heading.*

24 men, 2 boys, 2 horses. Air passing 12 bords is 4,400 cubic feet per minute, or 157 cubic feet for each man, boy, and horse; thermometer 74°.

*Nos. 6 and 5 Headings.*

57 men, 8 boys, 5 horses. Amount of air passing through these headings is 7,200 cubic feet per minute, or 102 cubic feet per minute for each man, boy, and horse; thermometer 75°.

*No. 1 Heading.*

46 men, 6 boys, 3 horses. Air passing 23 bords is 4,320 cubic feet per minute, or 78 cubic feet per minute for each man, boy, and horse; thermometer 75°.

*No. 1 Return at Cut-through.*

Amount of air passing through is 5,145 cubic feet per minute; thermometer 75°.

*No. 2 Heading.*

28 men, 3 boys, 3 horses. Air passing 14 bords is 3,241 cubic feet per minute, or 95 cubic feet per minute for each man, boy, and horse; thermometer 74°.

*No. 1 Overcast.*

Amount of air passing over from Nos. 5 and 6 headings is 9,635 cubic feet per minute; thermometer 73°.

*No. 10 Fault.*

Amount of air passing is 15,680 cubic feet per minute; thermometer 70°.

*No. 10 Front Heading.*

18 men, 1 boy, 1 horse. Air passing 9 bords is 3,045 cubic feet per minute, or 152 cubic feet per minute for each man, boy and horse; thermometer 75°.

*No. 10 Middle Heading.*

26 men, 1 boy, 1 horse. Air passing 13 bords is 2,592 cubic feet per minute, or 92 cubic feet per minute for each man, boy and horse; thermometer 76°.

*No. 10 Back and No. 11 Headings.*

28 men, 2 boys, 2 horses. Air passing 14 bords is 5,768 cubic feet per minute, or 180 cubic feet per minute for each man, boy, and horse; thermometer 76°.

*No. 12 Heading.*

20 men, 2 boys, 2 horses. Air passing 10 bords is 5,400 cubic feet per minute, or 225 cubic feet per minute for each man, boy, and horse; thermometer 73°.

*At Furnace Shaft.*

Total amount of air passing up the shaft is 63,080 cubic feet per minute; thermometer 77°.

Remarks.

*Remarks.*

We found the air very slack in the first three or four bords in No. 8 front heading; but the Deputy was busy putting up a canvas door on the mouth of the back heading which will drive a greater current of air to the men there. Complaints were being made to us in several flats with regard to the miners being unable to get timber brought in to them when required. Also, complaints were made about the door being left open the greater part of the day by the wheelers and drivers, thereby causing the air to be slack with some of the men. We would especially draw the manager's attention to these matters, and also to many—but through being left open between the two narrow bords in No. 6 flat, also between Nos. 10 and 11 headings, as some of the canvas doors were torn to pieces; found a good supply of timber on each flat.

Burwood, 12 January, 1886. EDWARD BUXTON,  
WILLIAM R. HARRISON, } Check Inspectors.

## Mount Kembla Colliery.

### SCHEDULE.

NO.	PAGE.
1. The Examiner of Coal-fields to the Under Secretary for Mines forwarding reports, &c., showing a deficiency of ventilation at Mount Kembla Colliery, with minutes. 19 January, 1886 .....	119
2. The same to the same re deficient ventilation at Mount Kembla Colliery, with enclosures. 21 January, 1886. . . . .	120
3. (Telegram) Mr. Inspector Rowan to the Examiner of Coal-fields, reporting defective ventilation not remedied, and asking whether legal proceedings shall be taken at once. 29 January, 1886 .....	120
4. (Telegram) The Examiner of Coal-fields to Mr. Inspector Rowan, in reply to No. 3. 30 January, 1886 .....	120
5. (Telegram) The Examiner of Coal-fields to the Under Secretary for Mines, reporting action taken by him with reference to defective ventilation at Mount Kembla Colliery, with minutes. 30 January, 1886.....	120
6. Mr. Inspector Rowan to the Examiner of Coal-fields, reporting result of legal proceedings against the manager of Mount Kembla Colliery, with minutes. 12 February, 1886 .....	121

### No. 1.

The Examiner of Coal-fields to The Under Secretary for Mines.

Sir,

Coal-fields Office, Newcastle, 19 January, 1886.

I have the honor to forward reports I have received from Mr. Inspector Rowan, showing a deficiency of ventilation in the Nos. 1, 2, and 4 divisions, and the Nos. 2 and 3 west headings at the Mount Kembla Colliery, near Wollongong.

2. It appears that Mr. Green, the colliery manager, is driving a heading to improve the ventilation, which he expected would be completed in ten days from the 8th instant; but the inspector says he is of opinion it will be of little or no benefit, and that upon his offering suggestions to the colliery manager he was told that he could only act through Dr. Robertson, the directing manager. Such should not be the case in a matter of this nature.

3. I have wired Mr. Rowan to make another inspection to-morrow (*vide* copy of telegram herewith), and shall be obliged by your informing me what further action the Minister desires me to take in the matter, besides causing the notice to be served on the manager (copy enclosed).

I have, &c..

JOHN MACKENZIE,

Examiner of Coal-fields.

Proceedings must be taken unless the owners remedy the defects before such proceedings can be commenced.—H.W., 21/1/86. Submitted. Approved.—R.N.V., 22/1/86. The Examiner of Coal-fields.—H.W., U.S., B.C., 23/1/86. Mr. Inspector Rowan to take proceedings at once, as he wires me on the 29th that defects are not remedied.—J.M., 30/1/86. Proceedings were taken on 11th February by Mr. Inspector Rowan, and the manager fined £5 and professional costs. Report herewith.—J.M., 15/2/86. Under Secretary for Mines, B.C., 15/2/86.

### [Enclosures to No. 1.]

Mr. James Rowan, Inspector of Collieries, to The Examiner of Coal-fields.

Sir,

Wollongong, 11 January, 1886.

For your information, I have the honor to inform you that on the 8th instant I inspected Mount Kembla Colliery. About 124 men and horses are employed underground, and supplied with about 9,000 cubic feet of air per minute, in four separate currents. No. 1 east division of workings, 36 men and horses are employed, and supplied with 2,500 cubic feet of air per minute. No. 2 east division, 18 men and horses are employed, and supplied with 1,500 cubic feet of air per minute. No. 4 division, 40 men and horses are employed, and supplied with 3,000 cubic feet of air per minute. In the No. 1 east division of workings the air was very weak as it approached the working faces; also, in No. 4 the ventilating current was very weak. In the centre and extreme end of the workings a slight current was going, but insufficient to put the air-meter in motion; the bords were also warm and uncomfortable. In the Nos. 2 and 3 west headings, 34 men are employed, and supplied with 2,000 cubic feet of air per minute, by means of two regulating doors from the main current, besides, a rush of air aids the ventilation, by the doors being opened to allow the full and empty sets to pass in and out.

I drew the manager's (Mr. Green's) attention to section 12, subsection 3, of the Coal Mines Regulation Act. Mr. Green pointed out a heading, which he was driving with three shifts of men, to improve the ventilation of the colliery, and which he expected would be finished in about 10 days from the date of my inspection. This air-course referred to will come on the mountain side about 300 yards east of the tunnel.

I may state I am of opinion that little or no benefit will result from this new air-course, except a furnace be built in connection with it—that is to say, a furnace built at the mountain side where the heading will be driven through, and to bring all the ventilating current down the main tunnel.

This new furnace, with the present one, would have the combined power of ventilating the east and west sides of the colliery; or otherwise to sink an air-shaft in the interior of the workings, as it is quite evident either of these or some other motive power is required to assist the present system of ventilation. On putting these suggestions before Mr. Green he stated he could only act through Dr. Robertson, the directing manager.

I have, &c.

JAMES ROWAN,

Inspector of Collieries.

Telegram

Telegram from The Examiner of Coal-fields to Mr. James Rowan, Inspector of Collieries.

Newcastle, 13 January, 1886.

THINKING that little or no benefit will result from Kembla new air-course, why don't you serve Mr. Green with registered notice for non-compliance with Act, sending me copy of same?

JOHN MACKENZIE,

Examiner of Coal-fields.

Mr. James Rowan, Inspector of Collieries, to Mr. W. B. Green, Manager, Mount Kembla Colliery.

Sir,

Wollongong, 13 January, 1886.

In reference to my inspection, made on the 8th instant, at Mount Kembla Colliery, I beg to inform you that I found the ventilation to be in a defective condition in No. 1 cast and No. 4 division of workings. In the centre and extreme end of these workings I failed to get a register with the air-meter.

2. In accordance with the provisions contained in the 25th section of the Coal Mines Regulation Act, 1876, I hereby give you notice that you have failed to comply with section 12, subsection 3, of the Coal Mines Regulation Act. I have therefore to request you to remedy this matter forthwith.

I have, &c.,

JAMES ROWAN,

Inspector of Collieries.

Telegram from the Examiner of Coal-fields to Mr. James Rowan, Inspector of Collieries.

Newcastle, 19 January, 1886.

YOUR Kembla report says Mr. Green expected heading being driven to improve ventilation would be finished in about ten days, which would be 18th instant. Make another inspection to-morrow, and wire me if it is finished, and if subsection 2 and 3 of Act are now complied with.

JOHN MACKENZIE,

Examiner of Coal-fields.

### No. 2.

The Examiner of Coal-fields to The Under Secretary for Mines.

*Re* Kembla Colliery deficient ventilation.

Sir,

Coal-fields Office, Newcastle, 21 January, 1886.

I herewith beg to forward a telegram and letter received from Mr. Inspector Rowan this day, from which it will be seen that there was no improvement in the ventilation yesterday.

I have, &c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

[Enclosures.]

Mr. W. B. Green, Manager, Mount Kembla Colliery, to Mr. James Rowan, Inspector of Collieries.

Sir,

Mount Kembla Colliery, 16 January, 1886.

I herewith beg to inform you that we have now got the drive holed outside on the north side of our "main tunnel," and that we have also shifted our return airway to escape the water that you spoke to me about when you last visited the colliery. And I may state that all will be done that can be done on my part to improve the ventilation of the colliery in those places you complain of in your letter to me, date the 13th January.

I have, &c.,

W. B. GREEN.

Telegram from Mr. James Rowan, Inspector of Collieries, to The Examiner of Coal-fields.

Wollongong, 20 January, 1886.

*Re* Kembla Colliery.—The new air-course driven through to the mountain side: no improvement in ventilation. Section 12, subsection 3, of the Act not complied with in the No. 1 and two last, also No. 4 division of workings.

JAMES ROWAN.

### No. 3.

Telegram from Mr. James Rowan, Inspector of Collieries, to the Examiner of Coal-fields.

Wollongong, 29 January, 1886.

MOUNT Kembla Colliery reinspected; defective ventilation not remedied. Shall legal proceedings be taken at once? Do you advise any solicitor in particular?

JAMES ROWAN,

Inspector of Collieries.

### No. 4.

Telegram from the Examiner of Coal-fields to Mr. James Rowan, Inspector of Collieries.

Newcastle, 30 January, 1886.

INSTITUTE proceedings against Mr. Green for Kembla deficient ventilation at once, and employ whichever solicitor you think best. Great care is required in the way the information is drawn out.

JOHN MACKENZIE,

Examiner of Coal-fields.

### No. 5.

Telegram from the Examiner of Coal-fields to The Under Secretary for Mines.

Newcastle, 30 January, 1886.

INSPECTOR Rowan wired yesterday that defective Kembla ventilation not yet remedied, shall he take proceedings at once, and what solicitor do I advise? Have replied that he must take proceedings at once, and the solicitor he thinks best.

J. MACKENZIE,

Examiner of Coal-fields.

The Examiners action may be approved.—G.E.H. (for the U.S.), 30/1/86. Submitted.  
Approved.—R.N.V., 1/2/86.

No.

## No. 6.

Mr. James Rowan, Inspector of Collieries, to The Examiner of Coal-fields.

Sir,

Wollongong, 12 February, 1886.

In accordance with your instructions of the 30th ultimo, I have the honor to inform you that legal proceedings have been instituted against W. B. Green, manager of the Mount Kombla Colliery, for neglecting to have an adequate amount of ventilation sent into the mine.

The case was tried at Wollongong Petty Sessions on the 11th instant, before A. A. Turner P.M., and a Justice of the Peace; C. Russell, solicitor, for the defence, and F. Woodward for the prosecution. W. B. Green, manager of the Mount Kombla Colliery, was charged, under section 31 of the Coal Mines Act, for a breach of section 12, subsections 2 and 3. W. B. Green in answer to the charge pleaded "guilty in part."

In leading the prosecution I produced a sketch of the Mount Kombla Colliery showing the various districts where the ventilation was defective, giving dates and the result of each day's inspection, viz., the 8th, 20th, and 29th ultimo; also showed the air-meter by which the air currents were tested. Also three miners gave evidence as to the defective state of the ventilation, and that no improvement had taken place up to the 10th instant.

Defendant's counsel urged, much upon my assent, to the bad ventilation being caused by the condition of weather outside, also the blasting had increased through the workings of late on account of extra hard coal, &c., &c.

These arguments being reviewed before His Worship for the prosecution, showed the more need of a strict adherence to sections 2 and 3 of the Act.

The defendant's counsel, in summing up for his client, pleaded guilty to the whole charge, and strongly begged for a mitigation of the penalty on account that the manager had made strenuous efforts to improve the ventilation by the new air-course, although it had failed to produce the desired effect. Also produced a letter from Dr. Robertson, the directing manager for the Company, that a furnace would be built at the mountain side of the new air-course, and a fan also erected if necessary; and W. B. Green pledged himself to have the colliery as well ventilated in a few weeks as any other colliery in the district.

After a patient hearing of the case His Worship imposed a fine of £5 with all professional costs.

I have, &c.,

JAMES ROWAN,

Inspector of Collieries.

Forwarded for the information of the Hon. the Secretary for Mines.—J.M., 15/2/86. The Under Secretary for Mines.—B.C., 15/2/86. Submitted for the information of the Minister.—H.W. 17/2/86. Seen.—R.N.V., 18/2/86.

### No. 1.

#### Twenty-fourth Check Inspectors' Report of the A.A. Co.'s Collieries, at Newcastle, N.S.W.

COMMENCED this inspection of the above collieries on Monday, 1st December, 1884, starting at the Hamilton pit.

Measured the air passing into Cope's heading, and found by the anemometer 7,980 cubic feet per minute passing. The most of this air returns on to the main column by way of the Church heading.

Measured the air passing along the engine plane, with the result of 26,970 cubic feet per minute, which, added to the quantity passing into Cope's heading, makes a total of 34,950 cubic feet per minute passing into the workings of this pit.

We also measured the air passing into Bullerwell's heading at the bottom end of intake, and got for result 1,700 cubic feet per minute. There are 20 men, 2 wheelers, and 2 horses in this heading: 70 cubic feet per minute for each man, horse, and wheeler. Between the top end and bottom of this intake a deal of air escapes through the stoppings. Visited Gardiner's heading, and measured intake with result 5,544 cubic feet per minute. Cut-throughs want stopping in Collins's bord and also in No. 1 bord: 23 men, 1 boy, and 1 horse.

Stark's heading, 15 men, 1 boy, and 1 horse. The air coming into Gardiner's heading supplies it and also Stark's, thus giving to each man, horse, and boy, 132 cubic feet per minute.

Grant's heading, 4 men; Taylor's heading 12 men, 1 boy, and 1 horse; Donnison's heading, 22 men, 2 boys, and 2 horses; Sindle's heading, 6 men; Robinson's heading, on No. 1 bord the sheet is badly broken, and also the third bord wants a canvas hung: 12 men, 1 boy, 1 horse. In Tracey's heading there are 24 men, 2 boys, and 2 horses. The air in the five last-mentioned headings is very good. Men about the flats and pit bottom, 11.

Total quantity of air passing into this pit, 34,950. Total number of men, wheelers, and horses, 156, 11, and 11 respectively, thus giving to each 196 cubic feet per minute.

The

The several flats were well supplied with timber and travelling roads in good condition. Having completed our inspection of this pit we returned by way of the Old Galley horse-road to No. 2 pit bottom. Thermometer ranged from 79° to 71° Fahrenheit.

*No. 2 Pit.*

Measured the air at measuring place on engine plane, and found 37,170 cubic feet per minute passing. Air passing into No. 1 district from the above column, 24,500 cubic feet per minute. Visited the whole of the workings in this district. In the elbow there are 6 men, 1 boy, and 1 horse. In the second left-hand there are 40 men, 5 boys, and 5 horses. Sheet wanted on Wilson's bord; also on Riley's bord. Sheet wants repairing on Pascoe's bord. In the third left-hand there are 17 men, 2 boys, and 2 horses. There were complaints in this heading for want of timber. In fourth left-hand there are 28 men, 3 boys, and 3 horses. Sheet and stopping want attending to. In fifth left-hand, 12 men, 1 boy, and 1 horse. In sixth left-hand, 8 men; and in cross-cut and horse-road, 10 men, 1 boy, and 1 horse. In the sixth right-hand, 2 men. In fifth right-hand, 17 men, 1 boy, and 1 horse; and in fourth right-hand, 28 men, 2 boys, and 2 horses. The air in this heading is very dull. Sheet on Griffiths' bord wants attending to. We tried to measure the air in this heading in an area of 28 square feet, but got no result. In third right-hand there are 16 men, 2 boys, and 2 horses; in second right-hand, 9 men, 2 boys, and 2 horses; and in first right-hand, 2 men, 1 boy, and 1 horse.

The number of men, boys, and horses in this district is 195, 21, and 21 respectively.

Quantity of air, 104 cubic feet per minute.

We directed the overman's and other officials' attention to the several deficiencies, which they promised to rectify as speedily as possible.

*No. 5 District.*—Measured the air coming from Hamilton pit, by way of Griffith's narrow bord, with a result of 12,948 cubic feet per minute.

Quantity of air passing into No. 5 district, 18,972 cubic feet per minute.

In the first left-hand back horse-road there are 16 men, 3 boys, and 3 horses; second left-hand, 8 men, 1 boy, and 1 horse; first right-hand, 13 men, 2 boys, and 2 horses; back cross-cut, 6 men, 1 boy, and 1 horse; front cross-cut, 6 men. In the fourth right-hand, 14 men, 2 boys, and 2 horses; and in third right-hand, 21 men, 2 boys, and 2 horses. The air, at the time of our visit, was in a very bad state in the two last-mentioned headings, which we drew the attention of the deputy to. He promised to try and better it at once. In second right-hand there are 16 men, 2 boys, and 2 horses; in first right-hand, 20 men, 2 boys, and 2 horses. Canvas wants attending to. Men about the flats, 12.

Grand total in this district, 132 men, 15 boys, and 15 horses. Total quantity of air, 18,972, which gives to each 125 cubic feet per minute.

Visited No. 6 district. Measured the air passing, with result of 6,118 cubic feet per minute. There are 7 men, 1 boy, and 1 horse.

Visited fan shaft, the travelling road to which we found in very good condition.

Various flats throughout the pit we found well supplied with timber. Travelling roads in very good condition.

9th December, 1884.

GEO. JONES,  
JAMES THOMPSON, } Check Inspectors.

*No. 2.*

## Twenty-fifth Check Inspectors' Report of the A.A. Co.'s Collieries at Newcastle, New South Wales.

This inspection was commenced on 20th April, 1885.

*Hamilton Pit.*

Air passing into Cope's heading, 7,059 cubic feet per minute. Measured the air passing along engine plane with following result, viz., 34,914 cubic feet per minute, which, supplemented by the air passing into Cope's heading, makes a grand total of 42,000 cubic feet per minute passing into the workings of this pit.

Air passing into Bullerwell's heading, 11,000 cubic feet per minute; 22 men, 2 boys, and 2 horses in this heading. Canvas required on Christensen's bord, and also the canvas on Collins's bord wants repairing. We also visited Turnbull's heading, in which there are 14 men. In Gardiner's heading there are 30 men, 2 boys, and 2 horses. Canvas and stopping want attending to in Firth's bord. In M'Auliffe's and Stark's headings there are 6 men, 1 boy, and 1 horse collectively.

Visited the workings on the right-hand side of the horse-road, and found in Donnison's heading 16 men, 1 boy, and 1 horse; in Harding's heading, 14 men, 1 boy, and 1 horse; and in Murphy's heading, 6 men; in Robson's heading there are 23 men, 1 boy, and 1 horse; in Tracey's heading, 32 men, 2 boys, and 2 horses; and in Thomas's heading, 2 men.

The powder smoke in most of these headings hangs very bad, but at the time of our visit a number of men were employed making an overcast which when finished will divide these workings into two splits.

Total number of men, boys, and horses in this pit, 190, 12, and 12 respectively. Total quantity of air, 196 cubic feet each.

There were no complaints, for timber and travelling roads were in good condition.

*No. 2 Pit.*

Commenced an inspection of this pit on Tuesday, 21st April, 1885.

Measured the air passing below engine bank, and got for result 43,360 cubic feet per minute.

*No. 1 District.*—Air passing in, 31,920 cubic feet per minute. We tried to get a measurement at the intake to No. 3 flat, but the area being so large the instrument would not revolve. In this flat there are 44 men, 7 boys, and 7 horses. In the fourth left-hand heading there are 20 men, 2 boys, and 2 horses. At the top end of the heading the air was very slack. The canvas on Walker's and Dawes' bords wants repairing, as in their present state they allow a large quantity of air to escape that should go round the heading. In the split heading there are 12 men, 1 boy, and 1 horse; in the fifth left-hand there are 14 men,

men, 1 boy, and 1 horse. The air returning from the two latter headings mixes with the air coming into No. 3 flat, but the overman informed us that he intended having an overcast put in across the No. 3 road, so that the air returning from the fourth and fifth left-hands will pass into the main return without interfering with any other. In the sixth left-hand, 11 men, 1 boy, and 1 horse; in cross-cut, 6 men; and in seventh right-hand, 6 men, 1 boy, and 1 horse. The air was very dull at the time of our visit in this latter heading. In the sixth right-hand, 10 men, 1 boy, and 1 horse; failed to get a measurement in the return from this heading. In the fifth right-hand, 16 men, 1 boy, and 1 horse; could get no result in this heading. In the fourth right-hand, 34 men, 2 boys, and 2 horses; this heading is supplied with air from its entrance, and also by the fifth right-hand. We tried to measure the air passing down this heading, but got no result.

Taking into consideration measurements taken in similar areas to those obtainable in this heading, and the number of men, we are of the opinion that there is a great deficiency of air. A narrow bord has been driven down from the third right-hand, a distance of about 114 yards, for the purpose of easing the friction on the air, but the heading is not down far enough to meet it. We would respectfully urge on the management to push on this heading with all possible despatch, as the men complain bitterly of the bad air.

In the third right-hand there are 14 men, 2 boys, and 2 horses. In the second right-hand, 5 men; and first right-hand, 2 men. These three headings are aired from No. 5 district.

Total number of men, boys, and horses in this district is 193 men, 18 boys, and 18 horses. Total quantity of air, 31,920, equal to 140 cubic feet each.

*No. 5 District.*—Measured the air coming from Hamilton pit by way of Griffith's narrow bord, with the following result—13,552 cubic feet per minute. Measured the air passing into this district, and found 18,650 cubic feet per minute.

*Back Horse-road.*—First left-hand, 4 men; second left-hand, 8 men, 1 boy, and 1 horse; third left-hand, 4 men; third right-hand, 2 men, 1 boy, and 1 horse. In first right-hand, 16 men, 2 boys, and 2 horses; and in second right-hand, 2 men, 1 boy, and 1 horse. The air in most of these headings was very dull.

*Back Cross-cut.*—First left-hand, 6 men; and 10 men, 1 boy, and 1 horse in cross-cuts. In the fifth right-hand there are 14 men, 2 boys, and 2 horses; in fourth right-hand, 20 men, 2 boys, and 2 horses. This heading is one of the main intakes for the No. 5 district, but the current being so slow we failed to get a measurement. In the third right-hand there are 24 men, 2 boys, and 2 horses. This heading with the fourth are the only two splits in this district, but we failed to get a measurement in either of them. Failing to get a result at the intakes, we tried the return from the third right-hand in a 19-feet area, and got for a result 2,508 cubic feet per minute. In the second right-hand there are 16 men, 2 boys, and 2 horses; and in the first right-hand, 14 men, 1 boy, and 1 horse. These headings are aired from the third right-hand, consequently the air is very bad. There were no complaints for want of timber, and the travelling roads were in very good order. Number of men, boys, and horses aired from this district, 171, 19, and 19 respectively; quantity of air for each, 89 cubic feet per minute.

*No. 6 District.*—10 men, 1 boy, and 1 horse; quantity of air passing in, 6,000 cubic feet per minute; grand total quantity of air passing into workings of this pit, inclusive of air coming from Hamilton pit, 56,912 cubic feet per minute. Total men, boys, and horses, 448, 32, and 32 respectively; quantity of air for each, 127 cubic feet per minute.

We would most respectfully request men to refrain from committing nuisances in the airways, as it has a great tendency to render the air impure.

We, the undersigned, hereby certify that the foregoing is correct.

24th April, 1885.

GEO. JONES, }  
JAS. THOMSON, } Check Inspectors.

### No. 3.

## Twenty-sixth Report of the ventilation of the A.A. Co's Collieries at Newcastle, New South Wales.

We commenced an inspection of Hamilton pit on 30th July, 1885.

Measured the air passing into Cope's heading with following result, 8,190 cubic feet per minute; most of this air returns again on to the main column by way of Church heading. Measured the air passing along engine plane, at measuring place below engine bank, and found 29,148 cubic feet per minute passing.

*Bullerwell's Heading.*—Quantity of air passing, 8,400 cubic feet per minute. There are 20 men, 1 boy, and 1 horse in this heading; in Turnbull's heading, 12 men; in Sneddon's heading, 4 men, 1 boy, 1 horse; visited Gardiner's heading; there are 30 men, 4 boys, and 4 horses; in Stark's and M'Auliffe's there are 4 men, 1 boy, and 1 horse, collectively; in Harding's heading there are 6 men; in Donnison's, 12 men, 2 boys, and 2 horses; in Johnston's, 12 men, 1 boy, and 1 horse; in cross-cut, 14 men, 1 boy, and 1 horse; and in Murphy's heading, 10 men, 1 boy, and 1 horse; canvas wants replacing on Dixon's bord; the air at the time of our visit in the latter heading and the cross-cut was very bad; visited Robson's heading, where there were 20 men, 1 boy, and 1 horse; also Tracey's heading, where there were 36 men, 2 boys, and 2 horses; these two headings are aired from one intake; we measured the air passing along Tracey's heading and found 11,000 cubic feet per minute.

There are 15 men about the roads and flats; total quantity of air passing in this pit, 37,330 cubic feet per minute, which, divided amongst 190 men, 19 boys, and 19 horses, gives a result of 164 cubic feet per minute.

Travelling roads in very good order and no complaints for timber.

We saw very little to complain of in the ventilation of this pit, with the exception of those places mentioned.

### No. 2 Pit.

Quantity of air passing at measuring place, 47,250 cubic feet per minute; air passing into No. 1 district, 25,000 cubic feet per minute; visited the various headings in No. 3 district; we tried to measure the air passing into this district, but could get no result; there are 59 men, 7 boys, and 7 horses in this split; although getting no result in this split, still we are of the opinion that there is a great deficiency,

in fact less than one-half of the minimum quantity required; in the higher portions of this split the heat was intense, the thermometer ranging from 79° to 84° Fahrenheit; in the 4th left-hand there are 30 men, 3 boys, and 3 horses; canvas wants repairing on the 1st bord; in the 5th left-hand, 16 men, 2 boys, and 2 horses; canvas wants hanging on Oswald's bord; measured the air coming in this heading and found 2,312 cubic feet per minute, which, divided between these two headings, falls far short of the required quantity; in the 6th left-hand there are 16 men, 2 boys, and 2 horses; thermometer, 81° Fahrenheit at face of the heading; in cross-cut, including horse-road, 10 men, 1 boy, and 1 horse. This side being concluded, we visited the several headings on the right-hand side, where, in the 7th heading, there were 6 men; in the 6th, 16 men, 1 boy, and 1 horse; canvas was required on Reid's bord; in the 5th right-hand there were 22 men, 1 boy, 1 horse; and in the 4th right-hand, 32 men, 2 boys, and 2 horses; canvas wants attending to on John Duke's bord; we found little improvement in this heading to that we reported on our last visit, and our opinion is that it will never be any better so long as skips are allowed to block up the entrance. Our reason for affirming this is from experiments made on the main road opposite. We tested the instrument at 5 feet from the floor, and the air passing there was not sufficient to work the fan, but on testing it at 1 foot from the floor the air passing there caused it to revolve very rapidly.

In the 1st, 2nd, and 3rd right-hand headings there are 18 men, 2 boys, and 2 horses, collectively; these headings are ventilated from No. 5 district; there are 221 men, 20 wheelers, and 20 horses, inclusive of those about the roads, flats, &c.; total quantity of air, 25,000 cubic feet per minute, which, divided amongst the above, gives 95 cubic feet each; travelling roads in very good order, and no complaints for timber.

*No. 5 District.*—Measured the air at intake, with following result:—20,100 cubic feet per minute, but upon again measuring it in the drift we only got 14,500 cubic feet per minute, so that the difference must be allowed to leak between the two places into the returns. We visited the first split in this district, which comprises the first, second, and third right-hand headings. The air in the first right-hand was very bad, but in the other headings mentioned it was very fair, especially in the third. We failed to get a result in this split, but that was owing to the area being so large. There are 58 men, 5 boys, and 5 horses in this split. In the fourth right-hand the canvasses on the first and second bords want replacing with stoppings. There are 20 men, 2 boys, and 2 horses in this heading. The air at the far end was very bad. In the fifth right-hand there are 18 men, 3 boys, and 3 horses; and in the sixth right-hand, 10 men, 1 boy, and 1 horse.

Front cross-cut, 4 men; third left-hand, 4 men, 1 boy, and 1 horse; second left-hand, 10 men, 1 boy, and 1 horse. Canvas required on Davis's bord.

*Back Horse-road.*—Third right-hand, 8 men, 1 boy, and 1 horse. Canvas wanted on the heading. Second left-hand, 10 men, 1 boy, and 1 horse. Second bord wants canvas hung. Second right-hand, 4 men; first left-hand, 6 men; and in first right-hand, 10 men, 1 boy, and 1 horse. Total number of men, inclusive of those about the roads and flats, 177; boys, 19; and horses, 19. Total quantity of air passing in being 20,100, gives to each 93 cubic feet per minute.

Visited No. 6 district, where there are 9 men, 1 boy, and 1 horse; quantity of air passing in, 4,000 cubic feet per minute. On the whole, we found a marked improvement, but we saw room for still greater improvement, especially in the first and fourth right-hand headings.

Total quantity of air passing into the workings of this pit, 58,000 cubic feet per minute, which, divided amongst 412 men, 40 boys, and 40 horses, gives to each 118 cubic feet per minute.

We found the travelling roads in good order, except one place in Griffiths' narrow bord, to which we would direct the overman's attention. The place in question was in the roof, a short distance from the entrance to No. 5.

We, the undersigned, hereby certify that the foregoing is a true report.

8th August, 1885.

GEO. JONES, }  
JAS. THOMSON, } Check Inspectors.

#### No. 4.

### Twenty-seventh Check Inspectors' Report of the Australian Agricultural Collieries, at Newcastle, N.S.W.

We commenced this inspection on Monday, January 4th, 1886, starting at the Hamilton Pit. Measured the air passing into Cope's heading, and got for result 10,760 cubic feet per minute. Measured the air passing along the engine plane, below engine bank, and got for result 31,500 cubic feet per minute.

Measured the air passing into Bullerwell's heading, with result of 10,475 cubic feet per minute. There are 4 men in this heading, 4 men in Wilson's heading, and 2 men working in the cross-cut. There are 12 men, 1 boy, and 1 horse in Sneddon's heading, and 18 men, 1 boy, and 1 horse in Turnbull's heading. The air in this latter heading was very slack. In Gardiner's heading there are 22 men, 4 boys, and 4 horses. Visited Harding's heading, where there are 18 men, 2 boys, and 2 horses. In Bishop's heading, 4 men, and in the cross-cut, 18 men, 2 boys, and 2 horses. The canvas on the first bord was so badly torn that we found by the air-meter that about 1,000 cubic feet per minute was escaping that should travel around the face of the cross-cut. In Johnson's heading there are 6 men. The air in this heading was very bad at the time of our visit. With reference to the torn canvas in the cross-cut, we directed the deputy's attention to it, and he promised us he would attend to it as early as possible. In Murphy's heading there are 14 men, 1 boy, and 1 horse. Visited Robson's heading, in which there are 26 men, 2 boys, and 2 horses; and also Tracey's heading, where there are 30 men, 2 boys, and 2 horses—making a total of 56 men, 4 boys, and 4 horses. The air in this split was very good. We were pleased to notice in travelling along the engine plane in this pit that the greater part of the old stoppings had been replaced by brick stoppings.

The total number of men, boys, and horses in this pit is 102, 26, and 26 respectively. Total quantity of air, inclusive of air passing into Cope's heading, which returns on to the main column, is 42,260 cubic feet per minute.

There were no complaints for timber, and the travelling roads were in very good condition.

No.

*No. 2 Pit.*

Measured the air coming down this pit, and got for result 40,000 cubic feet per minute. Quantity of air passing into No. 1 district from this column is 31,000 feet per minute. Visited various headings in No. 3 flat of this district. Measured the air coming in, and found by the air-meter 7,500 cubic feet per minute. In this flat there are 82 men, 14 boys, and 14 horses. The quantity of air is only 68 cubic feet per minute each. In the fourth and fifth left-hand headings in this district there are 20 men, 2 boys, and 2 horses. Quantity of air, 2,200 cubic feet per minute. In the sixth left-hand, 10 men, 1 boy, and 1 horse. In the sixth right-hand there are 16 men, 1 boy, and 1 horse. The air in this heading was very slack. Quantity of air, 1,400 cubic feet, thus giving to each 78 cubic feet per minute. In the horse-road, eighth right-hand, and seventh there are 34 men, 3 boys, and 3 horses. Quantity of air, 4,300 cubic feet per minute, which gives to each man, horse, and boy 107 cubic feet per minute. In the fifth right-hand, 20 men, 1 boy, and 1 horse. The air was very dull in this heading. In the fourth right-hand 18 men, 3 boys, and 3 horses; and in the second right-hand, 2 men; about the roads, 10; making a total of 212 men, 25 boys, and 25 horses. Quantity of air, 31,000 cubic feet, giving to each of the above 118 cubic feet per minute.

*No. 5 District.*—Quantity of air passing into this district, 23,780 cubic feet per minute.

*Back Horse-road.*—First left-hand, 18 men, 1 boy, and 1 horse. There are 22 men, 1 boy, and 1 horse in the fourth right-hand heading of No. 1 district which are aired from this district. In the horse-roads there are 4 men, and 2 men lifting bottoms; and in the first right-hand there are 6 men, 1 boy, and 1 horse.

*Back Cross-cut.*—First left-hand, 10 men, 1 boy, and 1 horse. Second left-hand, 6 men; cut-through wants cleaning out. In third left-hand, 4 men, and 6 men in the cross-cuts. In the seventh right-hand there are 6 men, 1 boy, and 1 horse. The air is very dull in this heading. In the sixth right-hand there are 14 men, 1 boy, and 1 horse. In the fifth right-hand there were two of the canvasses badly torn, which we called the attention of the deputy to. There are 22 men, 1 boy, and 1 horse in this heading. In the fourth right-hand there are 20 men, 1 boy, and 1 horse. These three headings comprise one split. Measured the air returning from these headings, over overcast, 8,250 cubic feet per minute. Several of the canvasses in these headings were allowing a considerable quantity of air to escape which should travel around the top end of the heading; but the system now being pursued by the management will prevent a recurrence of this, as they are substituting stoppings for the canvas, which is the only effectual remedy. In the first, second, and third right-hand headings there are 62 men, 6 boys, and 6 horses. The air in the upper parts of this split was very hot.

Total number of men, boys, and horses, inclusive of those about the roads and flats, is 215, 15, and 15 respectively. Total quantity of air, 23,780 cubic feet per minute, which gives to each 97 cubic feet per minute. In No. 6 district there are 12 men, 1 boy, and 1 horse.

We travelled the returns from No. 5, which we found in splendid condition, the management having of late expended a considerable sum in improving them. Total number of men, boys, and horses in the whole of this pit is 453, 41, and 41 respectively. Total quantity of air, inclusive of 14,700 cubic feet per minute coming from Hamilton pit by way of Griffiths' narrow bord, is 54,700 cubic feet per minute, giving to each man, horse, and boy 102 cubic feet per minute.

There were no complaints for timber, and the travelling roads were in very good condition.

Before concluding this report we wish to thank the officials for their courtesy, and also their readiness in supplying any information that we required during this inspection.

12th January, 1886.

WM. AITCHESON, } Check Inspectors.

## Ferndale Colliery.

### SCHEDULE.

No.	PAGE.
1. Copies of Check Inspectors' Reports on Ventilation of Ferndale Colliery. 1 December, 1885 .....	125

### No. 1.

#### Copies of the three last Check Inspectors' Reports.

Ferndale Lodge, 1 December, 1885.

#### No. 1 REPORT.

10 April, 1885.

WE, the undersigned, having examined the several workings and airways, &c., of the Ferndale Colliery, report as follows:—

Intake of air on engine bank, 9,250 cubic feet per minute; thermometer, 68°. Intake from the old furnace shaft, 1,800 cubic feet per minute; thermometer, 63°. Air passing from old furnace shaft to No. 1 heading, 1,800 cubic feet. Air passing from engine bank to No. 1 heading, 4,600 cubic feet. The top part of No. 1 heading the anemometer gave 2,550 cubic feet of air per minute for 19 men, 4 boys, and 2 horses, being 102 cubic feet per minute for each man, boy, and horse; thermometer, 71°. Middle part of No. 1 heading: Air passing from narrow bord at cut-through, 4,138 cubic feet per minute for 29 men, 4 boys, and 2 horses, being a fraction over 118 cubic feet per minute for each man, boy, and horse; thermometer, 71°. Lower part No. 1 heading, at cut-through from narrow bord, the anemometer gave 2,844 cubic feet of air per minute; thermometer registering 74°. After passing seven bords, anemometer gave 4,260 cubic feet of air per minute. There are 22 men, 5 boys, and 2 horses employed here. There is a vast improvement in this part since our last inspection. We never visited No. 3 heading, but at the cut-through from No. 8 narrow bord the area was so large that there was not sufficient air to move the anemometer. The cut-throughs have been cleared, and there were no complaints about the air; there were 8 men, 2 boys, and 1 horse working there; thermometer, 74°. No. 4 heading: 2 men, with a fair

supply of air. No. 5 heading: Intake from engine brow, 575 cubic feet of air per minute. There were 6 men, 2 boys, and 1 horse employed here, giving each 64 cubic feet of air per minute; thermometer, 72°. Returns from No. 4 heading gave 3,032 cubic feet per minute. Returns from main flat, 5,402 cubic feet per minute, but all the returns cannot be taken here. Each was well supplied with timber.

JOSEPH BOWDITCH, }  
WILLIAM LLOYD, } Check Inspectors.

#### No. 2 REPORT.

Ferndale Colliery, 2 July, 1885.

WE, the undersigned, having examined the several workings, airways, &c., report as follows:—

Intake of air on the engine bank, 14,450 cubic feet per minute; thermometer, 61°. Intake from old furnace shaft, 1,800 cubic feet per minute; thermometer, 61°. Air passing from engine bank into No. 1 heading, 6,346 cubic feet per minute; thermometer, 68°. At the top part of No. 1 heading the anemometer registered 4,070 cubic feet per minute; thermometer, 72°. This gives 185 cubic feet of air per minute to each man, boy, and horse,—15 men, 5 boys, and 2 horses. At the cut-throughs from No. 27 narrow bord, the anemometer registered 5,730 cubic feet per minute; thermometer, 71°. At the two cut-throughs from No. 13 narrow bord, the current of air had increased to 6,320 cubic feet per minute. This current of air has to supply 59 men, 13 boys, and 6 horses, giving a fraction over 83 cubic feet per minute for each. There were 29 men, 8 boys, and 4 horses, from No. 27 to No. 13 bords inclusive, and 23 men, 5 boys, and 2 horses, from No. 12 to No. 1 bords, both inclusive, and 4 men in two bords in No. 3 and No. 4 headings, and 1 man pumping, making in all 57 men, 13 boys, and 6 horses supplied from the above current. In Nos. 1 and 2 bords the air was very slack; the thermometer registered 78°. The bord in No. 3 heading is in before the air nearly 60 yards without a cut-through; thermometer registered 76°. Our attention was called to the road in No. 19 bord being dangerous for the boys wheeling there, but a cut-through being nearly holed through will remedy that in a day or two. At No. 5 heading the air passing through cut-through showed 744 cubic feet per minute. We were told that the other cut-through was closed, but on passing next morning I found a large current of air passing through; 9 men, 1 boy, and 1 horse are employed here. Returns from No. 4 heading, 3,485 cubic feet per minute; returns from furnace shaft, 10,030 cubic feet per minute; total returns, 13,515 cubic feet per minute, but in consequence of the manner it splits up here we were unable to get all the returns correctly. There was a plentiful supply of timber in the headings.

JOSEPH BOWDITCH, }  
CHARLES WILLIAMS, } Check Inspectors.

#### No. 3 REPORT.

Ferndale Colliery, 28 October, 1885.

WE, the undersigned, having examined the several workings, airways, &c., of the above colliery, report as follows:—

Intake at engine bank, 12,960 cubic feet per minute; thermometer, 68°. Intake from old furnace shaft, 2,812 cubic feet per minute. From engine bank to No. 1 heading, 5,964 cubic feet per minute. Top part of No. 1 heading, anemometer registered 4,890 cubic feet per minute for 27 men, 6 boys, and 4 horses, being a fraction over 132 cubic feet per minute for each man, boy, and horse; thermometer, 72°. At the cut-through at the top, Gannon bord, the anemometer registered 4,050 cubic feet per minute for 18 men, 4 boys, and 2 horses, being 168½ cubic feet for each man, boy, and horse; thermometer, 75°. At the cut-through in No. 17 bord the anemometer registered 2,450 cubic feet per minute for 15 men, 4 boys, and 2 horses, being 116½ cubic feet per minute for each man, boy, and horse; thermometer, 78°. At the cut-through at the lower Gannon bord the anemometer registered 3,870 cubic feet per minute for 22 men, 6 boys, and 3 horses, a fraction over 124½ cubic feet per minute for each man, boy, and horse; thermometer, 75°. There were two men working off the right-hand of No. 8 heading, but the area being so large there was not sufficient air to move the anemometer. No. 5 heading, intake from engine bank, 1,633 cubic feet per minute for 8 men, 2 boys, and 1 horse, giving a fraction over 148½ cubic feet per minute for each man, boy, and horse; thermometer, 72°. Return from No. 4 heading, 2,940 cubic feet per minute. At the main flat, 8,525 cubic feet per minute, but all the returns cannot be taken here. Each place was well supplied with timber.

2.	Mr. T. Croudace, Manager, Lambton Colliery, to the Examiner of Coal-fields, admitting Mr. Inspector Dixon's complaint as justifiable, and promising improvements as to ventilation, with minutes. 7 October, 1885 .....	127
3.	Mr. Inspector Dixon to the Examiner of Coal-fields, enclosing letter from Mr. Croudace, re ventilation in Lambton Colliery. 8 October, 1885 .....	128
4.	The Examiner of Coal-fields to Mr. Croudace, in reply to No. 2. 8 October, 1885 .....	128
5.	Mr. Melville, M.P., to the Honorable the Secretary for Mines, asking questions re Lambton Colliery, with Minister's replies thereto. 4 February, 1886 .....	128

#### No. 1.

The Examiner of Coal-fields to the Under Secretary for Mines.

Sir,

Coal-fields Office, Newcastle, 6 October, 1885.

I have the honor to forward for the information of the Honorable the Secretary for Mines a report from Mr. Inspector Dixon and copy of a notice I have served upon Mr. Croudace, the Manager of the Lambton Colliery, for failing to comply with sub-sections 2 and 3, section 12, of the Coal Mines Regulation Act, 1876.

I have, &c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

Unless

Unless within fourteen days from the date of the notice sent to the manager some effective steps are taken to remedy the matter complained of, steps may be taken to recover the penalty.—H.W., 9/10/85. Submitted. Approved.—F.A.W., 12/10/85. The Examiner of Coal-fields.—G.E.H. (for the U.S.), B.C., 14/10/85. Mr. Dixon, for a further report to be made, 24th October, as to whether the matters complained of are remedied.—J.M., 16/10/85. The Lambton miners being now on strike, further inspection is useless until work is resumed.—J.D., 23/10/85. The men are still out on strike, therefore nothing further has been done in the matter.—J.M., 30/1/86. The Under Secretary for Mines, B.C., 30/1/86. The Examiner of Coal-fields.—G.E.H. (for the U.S.), B.C., 8/2/86.

[Enclosure to No. 1.]

Mr. John Dixon, Inspector of Collieries, to the Examiner of Coal-fields.

Sir,

Glebeland, 5 October, 1885.

I have the honor to draw your attention to the defective ventilation in that portion of the workings in the Lambton Colliery known as the right-hand side of the No. 2 far flat main tunnel. In this part of the mine there are eight working bords, two men in each, and two working headings with three men in each, making a total of twenty-two men, besides two wheelers and two horses.

When on the 15th August last I reported this same place, there were about twenty men employed in it. At that time I found the ventilation defective, and drew Mr. Croudace's attention to the matter, and he (Mr. Croudace) at once promised to have it remedied. However, on the 23rd ultimo (Monday last) I again made an inspection of the place complained of, and regret to report that I found matters in a similar position to that reported by me on 15th August. But as the ventilation in the whole of the far flat section was a little deranged on Monday last, owing to a very large fall of roof in the pillar workings in No. 1 far flat, I thought it best to go back again at the end of the week, when the No. 1 part of the workings would be properly settled. Consequently, on Saturday last, 3rd instant, I made another inspection, and found that the No. 1 far flat was in no way interfering with the intake at No. 2 far flat, but the same state of affairs prevailed in the split complained of, and I could not detect the slightest difference from what I found on the Monday. The only time when I could find trace of an intake current of air was when the empty train was running into the flat; then, on the loaded train going out, the current of air would rush back—then, to all appearances, come to a standstill. In every working place the powder smoke was hanging thick, owing to there being no current of air to carry it away. I may here remark that a new overcast was being built, which, when completed, would connect the part complained of with another return, and may possibly be of benefit. I notified the Manager (Mr. Croudace) by registered letter on Saturday last, a copy of which I herewith beg to forward, and desire to be instructed as to further proceedings in relation to the matter complained of.

I have, &c.,

JOHN DIXON,

Inspector of Collieries.

Mr. John Dixon, Inspector of Collieries, to Mr. Thomas Croudace, Colliery Manager, Lambton.

Sir,

Glebeland, 3 October, 1885.

Referring to our several conversations concerning the deficient ventilation in the workings at the right-hand side of No. 2 far flat in the Lambton Colliery, and your repeated promises to have the matter remedied, and notwithstanding the fact that sufficient time has elapsed to have had the matter put right since you were first notified, I regret to state that on Monday last, 23rd ultimo, and to-day (Saturday), I found the abovenamed split in a deplorable state.

In this split there are eight working bords, besides the two headings, two wheelers, and two horses, making a total of twenty-six men, &c. For this number (at the time of my inspection) there was no perceptible steady current of air, and as a consequence, the powder smoke was hanging in dense clouds in every working place. The only time that there appeared to be any air entering the split was when the empty train was running into the flat; but the loaded train going out overcame this to such an extent that the current of air would return with the same velocity as it entered the split.

2. I have therefore to request that you would give attention to this matter at once, with a view of having it remedied as speedily as possible.

I have, &c.,

JOHN DIXON,

Inspector of Collieries.

The Examiner of Coal-fields to Mr. T. Croudace, Manager, Lambton Colliery.

Sir,

Coal-fields Office, Newcastle, 6 October, 1885.

In view of a recent report of Inspector Dixon's on the ventilation of the Lambton Colliery (No. 2 far flat), and in pursuance of the provisions contained in the 31st section of the Coal Mines Regulation Act, 1876, I hereby give you notice that you have failed to comply with sub-sections 2 and 3, section 12, of the said Act.

I have, &c.,

JOHN MACKENZIE,

Examiner of Coal-fields

No. 2.

Mr. T. Croudace, Manager, Lambton Colliery, to The Examiner of Coal-fields.

Sir,

Lambton Colliery, Lambton, 7 October, 1885.

In reply to yours of yesterday, I can only say that Mr. Dixon's complaint is quite justifiable, and that he has complained two or three times about the same place.

I am making alterations to-day, which I will not be able to complete for a fortnight, but I hope even by Friday to have it materially improved.

I have, &c.,

THOMAS CROUDACE.

The above communication, *re* Lambton Colliery deficient ventilation, has been received by me to-day, and I enclose you copy of my reply for the information of the Honorable the Secretary for Mines.—J.M., 8/10/85. The Under Secretary for Mines, B.C., 8/10/85.

Under the circumstances, proceedings may be stayed till the expiration of the fortnight.—H.W., 22/10/85. Submitted. Approved.—J. P. ABBOTT, 31/10/85. The Examiner of Coal-fields.—H.W., B.C., 3/11/85. Seen and noted.—J.M., 3/11/85.

## No. 3.

Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Sir,

Glebeland, 8 October, 1885.

For your information, I beg to forward enclosed letter, received this morning from Mr. Croudace, *re* No. 2 far flat, &c.

I also beg to state that I have been notified to-day concerning the accident to John Hinds in Minimi on Monday last, also an accident to a boy in Brown's Colliery yesterday, and in consequence of such notification I intend going to Minimi to-morrow (Friday).

I have, &c.,

JOHN DIXON,  
Inspector of Collieries.

[Enclosure to No. 3.]

Mr. Thomas Croudace, Manager, Lambton Colliery, to Mr. John Dixon, Inspector of Collieries.

Sir,

Lambton Colliery, Lambton, 7 October, 1885.

I have to acknowledge receipt of yours of 3rd, complaining of deficient ventilation at No. 2 far flat. In justice to you, and not wishing in the least to shield myself, I must admit that this is neither the first nor the second time that you have complained, and that I have promised to have it put right; but, as you know, there have been many other matters to attend to. I inspected the district complained of yesterday, and found it very bad—worse than I have ever seen it; but, upon closer inspection, I found two or three important in-bye stoppings completely blown down by the recent heavy fall from the pillars which occurred when you were there one day last week. I am now pushing ahead such alterations as I hope will improve it by Friday, and very materially improve it in about a fortnight, when we get a long wall holed over into back cross-cut.

I am so confident of having it improved by Friday that I would ask you to come up and inspect it.

I have to thank you for the tolerant manner in which you have dealt with this complaint, and trust you will not consider my neglect in any way intentional.

I have, &c.,

THOMAS CROUDACE.

## No. 4.

The Examiner of Coal-fields to Mr. T. Croudace, Manager, Lambton Colliery.

Sir,

Coal-fields Office, Newcastle, 8 October, 1885.

I beg to acknowledge the receipt of yours of the 7th instant, informing me that Mr. Inspector Dixon's complaint is quite justifiable, &c., and that you are making alterations, which will not be completed for a fortnight, but hope by Friday next to have matters materially improved.

Trusting such will be the case,—

I have, &c.,

JOHN MACKENZIE,  
Examiner of Coal-fields.

## No. 5.

Mr. Melville, M.P., to The Secretary for Mines.

Department of Mines. Legislative Assembly.

Question for this day. Proof, No. 19. Thursday, 4 February, 1886.

QUESTION NO. 4:—

MR. MELVILLE to ask THE SECRETARY FOR MINES,—

- (1.) Has Mr. Mackenzie at any time made any complaints concerning the ventilation of the Lambton mine, of which Mr. Croudace is manager?
- (2.) Were such complaints, if any, made during Mr. Croudace's management?
- (3.) If such complaints were made, what steps were taken to remedy them, and what time elapsed between the making of complaints and the remedying of them?
- (4.) Has Mr. Mackenzie at any time called the Minister's attention to the extensive falling in of the surface of the Newcastle Pasturage Reserve, under which the Lambton Company, of which Mr. Croudace is manager, are mining for coal?
- (5.) When and on what dates did Mr. Mackenzie report that the main Northern Road, near Tighe's Hill was being undermined?
- (6.) How long afterwards was such undermining stopped?
- (7.) Who was the owner of the coal so taken?
- (8.) Was any sum of money placed upon the Estimates for the repair of such road by the Minister for Mines, and what amount?

ANSWERS:—

- (1.) Yes.
- (2.) Yes.
- (3.) Immediate steps.
- (4.) No.
- (5.) The information asked for was fully dealt with in Mr. Mackenzie's report to Mr. Secretary Abbott, dated 12th June, 1884.
- (6.) No coal was got after June, 1884.
- (7.) The Crown.
- (8.) No.

## Wallsend Colliery.

## SCHEDULE.

NO.	PAGE.
1. Mr. James Curley, Miners' General Secretary, to the Honorable the Secretary for Mines, inviting attention to copy of Check Inspectors' Report <i>re</i> defective ventilation at Wallsend Colliery, with minutes. 1 December, 1883 .....	129
2. The Under Secretary for Mines to the Miners' General Secretary, in reply to No. 1. 11 December, 1883 .....	129
3. Mr. James Curley to the Honorable the Secretary for Mines, inviting attention to different subjects in connection with Wallsend Colliery, with minutes and enclosures. 22 November, 1883 .....	129
4. The Examiner of Coal-fields to the Under Secretary for Mines, enclosing Mr. Inspector Dixon's report <i>re</i> Wallsend Colliery, with minutes. 15 January, 1884 .....	130
5. The Under Secretary for Mines to Mr. James Curley, enclosing copy of Mr. Inspector Dixon's report on Wallsend Colliery. 28 January, 1884 .....	131

## No. 1.

Mr. James Curley, Miners' General Secretary, to The Secretary for Mines.

Sir,

Hamilton, 1 December, 1883.

I have the honor, by direction of the Executive Committee of the Miners' Association, to invite your attention to copy of Check Inspectors' report, made at Wallsend Colliery, on November 5th, 6th, and 7th respectively, and which was forwarded to you on the 27th November. This report, in connection with previous ones, goes to show that the provisions of the Act are not complied with in matters of detail. The proper conducting of the air and its necessary distribution will at once appear evident to the most casual observation; for instance, in some parts of the mine there is over double the quantity of air required by the Act, and in other districts no record can be obtained, as there is not sufficient air to work the anemometer, while in others 50 or 60 cubic feet per minute is all that is passing. This is most unsatisfactory, and it is to be regretted that a remedy is not urged by either the Inspector for Colliceries or the Examiner for Coal-fields. And it is further to be regretted that more uniformity is not obtained in establishing a systematic method of ventilation in the several mines throughout the district. The health of miners is far too often impaired and seriously injured owing to such a cause, all because there is a manifest indifference regarding the carrying out of some simple detail, such as the erection of stoppings at old bord ends, the erection of a door, or it may be that an engine-rope works through a wood stopping, and it is splintered for want of a small pipe to confine the action of the rope, and thousands of feet of air lost to the miners, and otherwise by not erecting an air-crossing where required.

Having again brought this subject under the Honorable Minister's attention, the miners trust he will urge a more uniform compliance with the provisions of the Coal-mines Regulation Act, 1876, not only at the Wallsend Colliery, but the Newcastle Company's Colliery as well, where recent complaints have been made.

I have, &c.,

JAMES CURLEY,

Miners' General Secretary.

May be referred to the Examiner for report.—H.W., 6/12/83. Submitted. Approved. Acknowledge.—J. P. AMBOTT, 7/12/83. The Examiner of Coal-fields.—H.W., B.C., 11/12/83. Mr. Inspector Dixon for report.—J.M., 21/12/83. Returned. The Examiner of Coal-fields.—J.D., 27/12/83.

## No. 2.

The Under Secretary for Mines to Mr. James Curley, Miners' General Secretary.

Sir,

Department of Mines, Sydney, 11 December, 1883. See No. 1.

I am directed by the Secretary for Mines to acknowledge receipt of your letter of the 1st instant, on the matter of enforcing a more uniform compliance with the provisions of the Coal-mines Regulation Act, 1876, and to inform you that a report will be obtained upon the subject without delay.

I have, &c.,

HARRIE WOOD,

Under Secretary.

## No. 3.

Mr. James Curley, Miners' General Secretary, to The Secretary for Mines.

Sir,

Hamilton, 22 November, 1883.

I have the honor, in conjunction with the Chairman and Treasurer of the Miners' Union, to invite your attention to the undermentioned subjects, which are deemed of sufficient importance for interview, and which has been asked for in a letter to Messrs. N. Melville and A. A. P. Tighe, M.S.P.:—

1st. Recent Check Inspectors' report at Wallsend Colliery, showing very defective ventilation.

2nd. Correspondence from Examiner of Coal-fields, dated October 18th, 1883.

3rd. A means of egress from mines other than the furnace shaft in case of accident to the main down-cast shaft.

I have, &c.,

JAMES CURLEY,

Miners' General Secretary.

This probably refers to the deputation recently received by the Minister.—Noted to await further communication.—H.W., 1/12/83.

[Enclosures

## [Enclosures to No. 3.]

## Special Inspection—Check Inspectors' Report.

Mr. T. Bonsfield's District.

	Wallsend Colliery, 5 and 6 November, 1883.
Engine Bank, intake air-current ... ..	31,490 cubic feet per minute.
Swamp Oak " " " " " " " " " "	11,500 " "
Chinaman's Shaft, Chinaman's Split intake air-current ... ..	5,520 " "
" " Magpie and Donnolly's intake air-current ... ..	9,690 " "
B Pit, intake air-current ... ..	9,500 " "
	67,700

B Pit, Chinaman's Flat, Nos. 111 to 116.—The air is very slack, and with 9,500 cubic feet registered at the intake we could only find 585 cubic feet per minute near the faces for the supply of 8 men, 1 boy, and 1 horse, giving each 53 cubic feet per minute; thermometer, 78°.

Chinaman's Flat, from No. 117 to 130.—Air-current, 5,520 cubic feet per minute for 22 men, 1 boy, 1 horse, giving each 230 cubic feet per minute; thermometer, 68°.

Magpie and Donnolly's Flats, from Nos. 130 to 176.—The air-current is 9,690 cubic feet per minute for 62 men, 5 boys, 4 horses at Magpie, and 24 men, 2 boys, 1 horse at Donnolly's, giving each a fraction over 93 cubic feet per minute, the last numbers at Donnolly's ranging from 70' to 76'.

Lambton back and part of front headings, from Nos. 177 to 215.—Air-current, 11,040 cubic feet per minute. This split includes Nos. 265 and 266, making 80 men, 10 boys, 5 horses, the air-current giving each a fraction over 116 cubic feet per minute; thermometer, 76°. The air from No. 171 to 189 would not register, as the anemometer would not work on the heading.

Lambton front heading, from No. 216 to 255.—Air-current, 6,000 cubic feet per minute for 78 men, 8 boys, 4 horses giving each 66½ cubic feet per minute; thermometer 72°.

Up-casts, Main Furnace ... ..	48,384 cubic feet per minute.
" No. 1 Split ... ..	16,020 " "
" No. 2 " " " " " " " " " "	19,080 " "
Total Up-cast ... ..	83,484 " "

Mr. W. Willis's District.

7 November, 1883.

No. 2 Tunnel, from No. 1 to 34.—The air-current is too unsteady to work the anemometer; thermometer, 72°. There were some complaints about short supply of timber.

Front heading intake.—Air-current, 15,750 cubic feet per minute for Nos. 59 to 85, making 54 men, 8 boys, 6 horses, giving each a fraction over 231 cubic feet. From 75 to 85 the air is very slack, but the management is busy sinking a shaft, which will give the required ventilation; thermometer, 74° to 76°.

Cemetery Flat, from No. 86 to 104.—The air-current is 2,975 cubic feet per minute for 38 men, 4 boys, 2 horses, giving each 67½ cubic feet per minute; thermometer 73°. We suggest a stopping be put in the stenton opposite No. 104 bord end.

Old water pit, Nos. 105, 106, and 107.—There was no regular air-current, and old water pit Nos. 108, 109, and 110 there was no regular air-current.

Travelling road intake.—The air-current is 8,280 cubic feet per minute for Nos. 35 to 38, making 48 men, 4 boys, 2 horses, giving to each 153½ cubic feet per minute.

Up-cast tunnel furnace, 33,620 cubic feet per minute. A good supply of timber on all stations excepting Little tunnel, previously referred to, and the travelling road is very dangerous between the door and the main horse-road in Mr. Willis's district.

J. SUMMERS, }  
J. LEVER, } Check Inspectors.

The Examiner of Coal-fields to Mr. James Curley, Miners' General Secretary.

Sir,

Coal-fields Office, Newcastle, 18 October, 1883.

In reply to your telegram of this morning, asking if I consider Dackenfield Colliery ventilation is now in compliance with the Coal Mines Regulation Act, I beg to inform you, from a report I have received from Mr. Inspector Dixon, dated 16th instant, and a telegram from Mr. Croft, in reply to one from me asking how many men, boys, and horses were at work in the mine to-day, that I am of opinion there must be more than an adequate amount of ventilation for the men, boys, and horses now at work there.

I have, &c.,  
JOHN MACKENZIE,  
Examiner of Coal-fields.

No. 4.

The Examiner of Coal-fields to The Under Secretary for Mines.

I FORWARD for the Minister's information a report I have received from Mr. Inspector Dixon with reference to the Miners' Executive and Mr. Curley's complaint, that the provisions of the Coal Mines Regulation Act are not complied with *in matters of detail* at the Wallsend Colliery, Newcastle Co., and others, where recent complaints have been made, I beg to state that nothing more can be done than has been done by myself and Mr. Dixon, and that it should not be expected that extensive mines like the Wallsend Colliery and others can *daily comply in detail* with the provisions of the Act, which require the erection of stoppings, doors, &c., to ensure an adequate amount of ventilation.

2. With regard to the charges made, of Mr. Inspector Dixon's neglect of duty in not urging remedies when he sees that the provisions of the Act are not complied with, I beg to say that I believe they cannot be substantiated, that the statement made is incorrect, and very great improvements have been made in the ventilation of the northern collieries since he received the appointment of Inspector of Collieries.

J.M., 15/1/84.

The Under Secretary for Mines.—B.C., 15/1/84.

[Enclosure to No. 4.]

Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Sir,

Glebeland, 24 December, 1883.

I beg to acknowledge receipt of correspondence forwarded by the Miners' General Secretary to the Honorable the Secretary for Mines, re the ventilation in the Wallsend and Newcastle Co.'s Collieries, &c.

In reply thereto, in reference to Wallsend Colliery, I have the honor to state that I made an inspection of that colliery during last month, and, with the exception of a few matters of detail, I found the ventilation good. A few days after the inspection I saw Mr. Neilson, manager, and drew his attention to those matters. I also notified him (Mr. Neilson) by letter and

and in reply he wrote me expressing surprise that I should deem such matters worthy of official complaint, and desires that at an early date an inspection of the whole of Wallsend Colliery be made by the Examiner, Inspector, Check Inspectors, and Manager, so that the exact state of the mine may be ascertained for the information of the Honorable the Secretary for Mines and the miners of Wallsend Colliery. I beg to state that I quite agree with the suggestion as being the only means to thoroughly sift the matter, and put an end to the complaints concerning the ventilation at that colliery. It is clear to anyone in the least degree acquainted with the working of a colliery, that in an extensive mine like Wallsend, with such an extraordinary output, and with such a length of air-ways, there will occasionally be a derangement of the ventilation, caused by circumstances over which there is no control; for instance, a heavy fall of roof, such as I saw in one part of the Wallsend workings on my last inspection; but as soon as I called the attention of the Manager to the matter, he caused a small shaft to be sunk, which at once effected a remedy. Seeing that such things do occur, it is highly necessary to inquire into the cause and extent of any defective ventilation before sweeping assertions are made concerning any colliery.

2. Newcastle Co.'s Colliery.—The place complained of in this colliery is, I suppose, the No. 6 district, where the ventilation was completely deranged by a heavy crush which took place a considerable time since. This No. 6 heading has had to be forewon in order to reach the No. 5 narrow bord. Lately there have been about 38 men, 2 boys, and 2 horses in this split.

It has been a most difficult place to ventilate, as a door had to be hung on the No. 1 main road, and one on the main road in No. 6, so that all possible pressure might be brought to bear on this split to ensure a sufficient quantity of air. On my several inspections of this district I have found a variation in the current, as the following results will show:—1st, 4,720 cubic feet per minute; 2nd, 4,130 cubic feet per minute; 3rd, 3,960 cubic feet per minute; and the last result obtained was during last month, 4,060 cubic feet per minute. But I observe by the report of the Check Inspectors for this month that they got a result of 5,670 cubic feet of air per minute, or 134 cubic feet per minute for every man, boy, and horse in the split.

It is expected that the No. 6 heading will be holed through into No. 5 narrow bord during this week; then the ventilation will be even better than it is at present.

Taking the Newcastle Co.'s Mine throughout, I am of opinion that the ventilation is first-class.

Regret is expressed by the Executive Committee that a remedy is not urged by me in cases of non-compliance with the Act.

In reply, I fearlessly state that during the time I have had the honor to hold the position of Inspector of Collieries, whenever I have seen anything wrong in any mine I have drawn immediate attention to the matter with a view to having it remedied at once, and have never passed by anything, even down to the smallest detail, in a mine which I thought likely to militate against the health or safety of anyone employed in the mine.

Standing as I do, with employers on one hand and the employed on the other, my study hitherto has been to steer a steady course in my official capacity, knowing neither master nor man, but honestly and conscientiously giving a report of each mine as I have found it on my several inspections.

In conclusion, I desire to say that notwithstanding the enormous output of coal from the collieries in this district, and the continual changes which are taking place owing to the large output, in my opinion the present state of said collieries will bear favourable comparison with any part of their past history, both regarding the quantity of air circulating and its distribution in the various parts of the workings.

I have, &c.,  
JOHN DIXON,  
Inspector of Collieries.

Submitted.—H.W., 18/1/84. If it is the practice to do so, a copy of this report may be sent to Mr. Curley.—J. P. ABBOTT, 19/1/84. In view of the precedent on 82-7,586, the copy may be supplied.—H.W., 22/1/84.

No. 5.

The Under Secretary for Mines to Mr. James Curley, Miners' General Secretary.

Sir, Department of Mines, Sydney, 28 January, 1884.

I have the honor, by direction of the Secretary for Mines, to forward a copy of the report furnished by Mr. John Dixon, one of the Inspectors of Collieries, upon the ventilation at the Wallsend and Newcastle Company's Collieries. Sec No. 4.

I have, &c.,  
HARRIE WOOD,  
Under Secretary.

Duckenfield Colliery.

No.	SCHEDULE.	PAGE.
1.	Copies of Check Inspectors' Report in connection with ventilation of Duckenfield Colliery. 20 October, 1885 .....	131

Report of the Duckenfield Tunnel, taken on 20 October, 1885.

We, the undersigned, have examined the air-ways and workings of the Duckenfield Colliery, and certify our report as follows:—

Intake of air taken in the engine brow below first flat, 12,210 cubic feet of air per minute; intake of air from Fault heading shaft, 6,565 cubic feet of air per minute; 7 men in the Fault heading. West heading, No. 7 cut-through, 3,520 cubic feet of air per minute; 6 men in this cut-through. No. 2 cut-through, 4,480 cubic feet of air per minute; 4 men in this cut-through. No. 3 cut-through, 4,620 cubic feet of air per minute; 3 men in this cut-through. There are 4 wheelers, 2 horses, and 20 men in the West heading cut-throughs and Fault heading. Average heat in the bords in West heading district—Thermometer registered 71°. Return air from Fault heading and West heading to Furnace shaft, 23,760 cubic feet of air per minute. Dip Workings.—Split of air from the shaft at the foot of the engine brow to the B and D heading district: Result taken in B heading, 7,315 cubic feet of air per minute; 10 men in this heading. D heading, 5,940 cubic feet of air per minute; 10 men in this heading. D heading, No. 1 cut-through, 4,437 cubic feet of air per minute; 10 men in this cut-through. No. 2 cut-through, 3,812 cubic feet of air per minute; 7 men in this cut-through. No. 3 cut-through, 3,948 cubic feet of air per minute; 8 men in this cut-through. No. 4 cut-through, 4,770 cubic feet of air per minute; 4 men in this cut-through. No. 5 cut-through, 4,617 cubic feet of air per minute; 10 men in this cut-through. No. 6 cut-through, not sufficient air to take any result with anemometer (P.S.—The overseer informed us that he would put a door on No. 5 cut-through to remedy the air in this cut-through); 10 men in this cut-through. There are 69 miners, 12 wheelers, and 6 horses in the B and D heading district. Return air from this district, 15,105 cubic feet of air per minute.

Intake

Intake of air from engine brow shaft to the E heading district, 4,235 cubic feet of air per minute. No. 7 cut-through, not sufficient air to take any result with anemometer (P.S.—The overseer said in a few days he would put a door on No. 6 cut-through to remedy the air); 15 men in this cut-through. No. 6 cut-through, 3,780 cubic feet of air per minute; 17 men in this cut-through. No. 5 cut-through, 4,307 cubic feet of air per minute; 8 men in this cut-through. No. 4 cut-through; 2 men in this cut-through. Return air from E heading, 8,325 cubic feet of air per minute. There are 42 miners, 6 wheelers, and 3 horses in this heading.

M heading is supplied with the return air from E heading—2,827 cubic feet of air per minute; 12 miners, 1 wheeler, and 1 horse for this heading. Return air from dip workings to West heading furnace, 19,125 cubic feet of air per minute. Return from West heading district and dip workings at furnace, 53,560 cubic feet of air per minute.

We also find that there is a good supply of timber on the flats for the various sections.

JAMES SNEDDEN, } Check  
GEORGE NIX, } Inspectors.

### Report of the Back Creek Tunnel on 21 October, 1885.

WE, the undersigned, have examined the air-ways and workings of the Back Creek Colliery, as certify our report, as follows:—

Cross-cut pillars.—We find a sufficient supply of air travelling in this district. There are 10 miners, 2 wheelers, and 1 horse. Thermometer registered 68°. Intake of air in engine brow below turn for the No. 10 heading district, 24,890 cubic feet of air per minute.

First section in No. 10 heading.—Intake for No. 11 cut-through, 6,037 cubic feet of air per minute; 14 miners, 2 wheelers, and 1 horse in this cut-through. No. 8 cut-through, 5,759 cubic feet of air per minute; 20 miners, 2 wheelers, and 1 horse. No. 7 cut-through, 7,684 cubic feet of air per minute; 12 miners, 2 wheelers, and 1 horse. Return air from first section in No. 10 heading, 16,632 cubic feet of air per minute.

Second section in No. 10 heading.—No. 4 cut-through, 6,578 cubic feet of air per minute; 30 miners, 4 wheelers, and 2 horses in this cut-through. No. 3 cut-through, 12,358 cubic feet of air per minute; 20 miners, 2 wheelers, and 1 horse in this cut-through. Return air from No. 10 heading sections, result taken at furnace, 30,485 cubic feet of air per minute.

Intake.—First split of air from No. 12 shaft to A heading, 5,445 cubic feet of air per minute; 22 miners, 3 wheelers, and 1 horse in this district. Return air from A heading, 4,162 cubic feet of air per minute.

Engine brow, 3,465 cubic feet of air per minute; 3 miners, 1 wheeler, and 1 horse.

Second split of air from No. 12 shaft to No. 12 heading district—Result taken in No. 4 cut-through, 4,312 cubic feet of air per minute; 32 miners, 5 wheelers, and 2 horses for this current of air. Return air from No. 12 heading district, 6,138 cubic feet of air per minute. Return air from engine brow, A heading, and No. 12 heading, result taken at No. 4 furnace, 19,720 cubic feet of air per minute.

We also find a good supply of timber on the flats for the various sections.

JAS. SNEDDEN, } Check  
GEORGE NIX, } Inspectors.

## Australian Agricultural Company's Colliery.

### SCHEDULE.

NO.	PAGE.
1. Minute of the Honorable the Secretary for Mines that Messrs. Melville and Tighe, Ms.P., should be informed of his decisions on matters considered at a Deputation of Miners at Newcastle. 26 February, 1883 .....	132
2. Minute of same that the Examiner of Coal-fields should institute an inquiry as to supply of timber at the A.A. Company's Mine, with minutes. 26 February, 1883.....	133
3. The Under Secretary for Mines to Messrs. Melville and Tighe, Ms.P., in conformity with No. 1. 1 March, 1883...	133
4. The same to the same, that in reference to No. 2 the Examiner of Coal-fields reports an adequate supply of timber at the A.A. Company's Mine. 12 March, 1883 .....	133

### No. 1.

#### Minute of The Secretary for Mines.

##### *Re* Deputation of Miners at Newcastle.

A DEPUTATION of miners introduced by Messrs. Melville and Tighe, Ms.P., waited on me at Newcastle on Saturday, the 24th February, 1883, in reference to the matters mentioned in the annexed letter, and I desire that Messrs. Tighe and Melville should be informed of my decision in the several matters therein mentioned.

- 1st. Send them copy of my minute on the Wallsend Colliery.
- 2nd. The number of men allowed in a district to my mind is very clearly defined as being not more than seventy men.
- 3rd. The Examiner of Coal-fields will at once be asked to report upon the charge of the air being bad in the Lambton Commonage Coal Tunnel.
- 4th. The same as to scarcity of timber at the A.A. Company's Mine.
- 5th. The Examiner has also been asked to report as to two shafts at the Newcastle Coal-mining Company's Mine.

J. P. ABBOTT.

26/2/83.  
[Enclosure

## [Enclosure to No. 1.]

Mr. J. Curley and others to The Secretary for Mines.

THE undersigned deputation desire respectively, on behalf of the Coal Miners' Association, to bring under your notice for consideration the following subjects:—

- 1st. The apparent erroneous opinion of the Examiner of Coal-fields regarding the Act of 1876, and a recent inspection at the Wallsend Colliery.
- 2nd. The advisability of a definition as to the computed number of men in a district.
- 3rd. Report of Lambton miners' meeting which appeared in last Saturday's *Herald* and *Advocate*.
- 4th. Scarcity of timber at the A.A. Company's Mine and timber of proper lengths.
- 5th. Last year's Annual Mining Report disclosing great indifference both on the part of colliery management and Inspector.
- 6th. The question of two shafts at the Newcastle Coal-mining Company's Mine.

DAVID MITCHELL,  
JOHN McFADYEN,  
JAMES CURLEY.

## No. 2.

## Minute of The Secretary for Mines.

The Deputation of Coal-miners at Newcastle.

THE Examiner of Coal-fields will cause an inquiry to be made whether there is at all times a sufficient supply of timber kept at the A.A. Company's Mine, and of proper lengths.—J. P. ABBOTT, 28/2/83.

The Examiner of Coal-fields.—G.E.H. (for the U.S.), B.C., 28/2/83. Mr. Inspector Dixon for report.—J.M., 1/3/83.

The deficiency of timber in the A.A. Company's Mine was only in one district, viz.:—No. 1 in No. 2 pit, where very long props are required. Owing to the heavy rains up the river, this particular class of timber was rather scarce for about three weeks. However, there is now a good supply, for I was in No. 1 district on Tuesday last, and saw a good supply on the engine flat ready for the miners' use. I cannot hear of any complaint concerning the timber from any other part of the A.A. Company's Mine.—J.D., 2/8/83.

Examiner of Coal-fields.—B.C., 2/3/83. The Under Secretary for Mines.—J.M., B.C., 3/3/83. Submitted.—H.W., 5/3/83. Approved. Inform Messrs. Melville and Tighe, Ms.P.—J. P. ABBOTT, 10/3/83.

## No. 3.

## The Under Secretary for Mines to Messrs. N. Melville and A. A. P. Tighe, Ms.P.

Gentlemen,

Department of Mines, Sydney, 1 March, 1883.

Referring to the several matters brought forward by the deputation introduced by you to the Secretary for Mines, on the 24th ultimo, I am directed to forward a copy of Mr. Abbott's decision in the matter of the ventilation of the Wallsend Colliery.

2. I am directed to state that in Mr. Abbott's opinion the number of men allowed in a district is very clearly defined as being not more than seventy (70) men.

3. The Examiner has been asked to report upon the charge of the air being bad in the Lambton Commonage tunnel; also,

4. As to the scarcity of timber at the Australasian Agricultural Company's Mine; and

5. As to two (2) shafts at the Newcastle Coal Company's Mine.

I have, &amp;c.,

HARRIE WOOD,

Under Secretary.

## No. 4.

## The Under Secretary for Mines to Messrs. N. Melville and A. A. P. Tighe, Ms.P.

Gentlemen,

Department of Mines, Sydney, 12 March, 1883.

Referring to my letter of the 1st instant, I have the honor to inform you that it appears, from the report forwarded by the Examiner of Coal-fields, that the deficiency of timber in the Australian Agricultural Company's Mine occurred in No. 1 district, pit No. 2, where very long props are required, but that there is now a good supply, and there was no complaint as to the deficiency of timber from any other part of the mine when the Inspector visited it.

I have, &amp;c.,

HARRIE WOOD,

Under Secretary.

## Messrs. Browns' Colliery, Minmi.

## SCHEDULE.

NO.	PAGE.
1. Mr. James Curley, Miners' General Secretary, to the Hon. the Secretary for Mines, complaining of defective ventilation in the Messrs. Browns' Colliery, Minmi, with minutes and enclosure. 19 October, 1881 .....	134
2. The Examiner of Coal-fields to the Under Secretary for Mines, in reference to above complaint, with minutes and enclosures. 22 October, 1881 .....	135
3. The Under Secretary for Mines to Mr. James Curley, in reply to No. 1. 28 October, 1881 .....	136
4. Mr. James Curley to the Examiner of Coal-fields, complaining of the manner in which the inspection of the Minmi mine was made, with minutes and enclosures. 7 November, 1881.....	136

## No. 1.

## The Miners' General Secretary to The Secretary for Mines.

Sir,

Hamilton, 19 October, 1881.

I have the honor to bring under your notice the enclosed letter, which was delivered to the Government Examiner of Coal-fields on the 1st October, 1881, regarding the defective working of the Coal Mines Regulation Act of 1876, and referring to a number of accidents caused by explosions of gas at the Messrs. Browns' Colliery, Minmi. That there are just grounds for complaint will be admitted when I state that since the delivery of the letter herein mentioned another accident of a similar character has occurred at the same place, and in this instance has been officially reported, which, for some unexplained reason, has not been done in other cases equally serious.

There is, I may add, general complaint regarding defective ventilation at the principal mines in the district, not of the ventilation as a whole, but that in certain portions of the mines the ventilation is exceedingly bad, and believing it to be within the province of the Inspector of Collieries to effect some remedy in this direction, I would respectfully invite you to draw his attention to this very important subject, also the Examiner of Coal-fields.

Should you desire to have further information respecting this matter by deputation I shall be most happy to wait upon the Honorable Minister.

I have, &amp;c.,

JAMES CURLEY,

Miners' General Secretary.

The Examiner of Coal-fields for explanation.—H.W., B.C., 22/10/81. The Under Secretary for Mines,—The correspondence with reference to this case was forwarded for the information of the Honorable the Secretary for Mines with my communication of the 22nd inst.—J.M., B.C., 24/10/81.

## [Enclosure to No. 1.]

Messrs. J. Curley and others to The Examiner of Coal-fields.

Sir,

Hamilton, 30 September, 1881.

I beg respectfully to bring under your notice the defective working of the Coal Mines Regulation Act of 1876, and the apparent indifference of your Department in endeavouring to see that the provisions of the Bill are carried out. That the subject has assumed an important aspect you may infer when I state the miners of the district have placed myself and colleagues in a position to take all necessary steps towards a remedy. A series of questions have therefore been drafted to be placed in the hands of the Members for the county, upon which subject also the co-operation of the city Members will be invited, and an inquiry the most searching will thus be opened up, and will tend to show that on the part of the Inspector of Collieries there is a great indifference.

I have before me the Mines Report of 1880, wherein the admission is made that I have made previous complaints, with the assertion that they have been immediately remedied. What is the answer to this? Three miners have been burnt in the Minmi mine recently by explosions of gas. Two of these accidents were only three weeks or one month apart from each other, and at a time when no night furnacemen were employed. If atmospheric pressure has any influence (which you will admit) in generating gas and its accumulation in mines, surely in a climate like ours, of sudden atmospheric change, it is a first condition in ventilation that the apparatus be kept in motion. Minmi is not the only place where false economy requires your immediate attention, and, what is more, constant attention.

I will put the question thus, with your permission:—"It is better that accidents should be prevented by inspection, than that it should be said accidents, in the cases cited, are the inspectors."

The report of Inspector for Collieries requires attention, and, to those unacquainted with the Act, is very misleading. For instance, it is said of such a mine there are "280 men and horses, &c., in the mine, for whom 35,000 cubic feet of air per minute is introduced, which is in excess of the minimum quantity required by the Act."

The Inspector does not state whether the main current is divided into the requisite number of splits, and fresh air supplied to every section of seventy men, and it is certainly impossible to be so where the anemometer will not turn, which is recorded by the local inspectors in several recent examinations, some of which are in my possession.

In conclusion, we, the undersigned, request your immediate attention towards remedying the cause of complaint—defective ventilation—in some parts of the collieries in the district.

DAVID MITCHELL, Chairman.

J. M'FADYEN, Treasurer.

JAMES CURLEY, Secretary.

No.

## No. 2.

## The Examiner of Coal-fields to The Under Secretary for Mines.

Sir,

Coal-fields Office, Newcastle, 22 October, 1881.

I beg to forward herewith, for the information of the Honorable the Secretary for Mines, a letter received from the Chairman, Treasurer, and Secretary of the Hunter River District Coal-miners' Association, bringing under notice an alleged defective working of the Coal Mines Regulation Act, 1876, and the apparent indifference of this Department in endeavouring to see that the provisions of the Bill are carried out, with the Inspector's report thereon and a copy of my reply.

See Enclosures.

I have, &amp;c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

The Miners' General Secretary may be informed that the Examiner of Coal-fields having replied to the only specific charge made, and having asked for further information respecting the charges made in general terms, there does not appear to be any action for this Department to take until such information has been supplied.—H.W., 25/10/81. Submitted.—To be informed accordingly.—A.R., 26/10/81.

## [Enclosures to No. 2.]

## Messrs. Curley and others to The Examiner of Coal-fields.

Sir,

Hamilton, 30 September, 1881.

I beg respectfully to bring under your notice the defective working of the Coal Mines Regulation Act of 1876, and the apparent indifference of your Department in endeavouring to see that the provisions of the Bill are carried out. That the subject has assumed an important aspect you may infer when I state the miners of the district have placed myself and colleagues in a position to take all necessary steps towards a remedy. A series of questions have therefore been drafted to be placed in the hands of the Members for the county, upon which subject also the co-operation of the city Members will be invited, and an inquiry the most searching will thus be opened up, and will tend to show that on the part of the Inspector for Collieries there is great indifference.

I have before me the Mines Report of 1880, wherein the admission is made that I have made previous "complaints," with the assertion that they have been immediately remedied. What is the answer to this? Three miners have been burnt in the Miami mine recently by explosions of gas. Two of these accidents were only three weeks or one month apart from each other, and at a time when no night furnaceman was employed. If atmospheric pressure has any influence (which you will admit) in generating gas and its accumulation in mines, surely in a climate like ours, of sudden atmospheric change, it is a first condition in ventilation that the apparatus be kept in motion. Miami is not the only place where false economy requires your immediate attention, and, what is more, constant attention. I will put the question thus, with your permission:—"It is better that accidents should be prevented by inspection, than that it should be said accidents in the cases cited are the inspector." The report of the Inspector for Collieries requires attention, and to those unacquainted with the Act is very misleading. For instance, it is said of such a mine, there are "280 men and horses, &c., in the mine, for whom 35,000 cubic feet of air per minute is introduced, which is in excess of the minimum quantity required by the Act." The Inspector does not state whether the main current is divided into the requisite number of splits, and fresh air supplied to every section of seventy men; and it is certainly impossible to be so where the anemometer will not turn, which is recorded by the local Inspectors in several recent examinations, some of which are in my possession. In conclusion, we, the undersigned, request your immediate attention towards remedying the cause of complaint—defective ventilation—in some parts of the collieries in the district.

DAVID MITCHELL, Chairman.

JOHN M'FADYEN, Treasurer.

JAMES CURLEY, Secretary.

Urgent. The Inspector of Collieries for report. To be returned.—J.M., 4/10/81.

Being unable to understand the exact meaning of the statement in the letter, "The Inspector is indifferent, &c.," I can scarcely be expected to furnish a reply to it. As to the statement "That the Inspector's report does not state whether the main current is divided into the requisite number of splits, &c.," I reply that, although not so stated in the report, nevertheless such currents are divided into district currents; and the omission shall be made good in future.—T.L., 5/10/81.

## The Examiner of Coal-fields to Mr. James Curley and others.

Gentlemen,

Coal-fields Office, Newcastle, 22 October, 1881.

I have the honor to acknowledge the receipt of your letter of the 30th ultimo, bringing under notice an alleged defective working of the Coal Mines Regulation Act of 1876, and the apparent indifference of this Department in endeavouring to see that the provisions of the Bill are carried out.

2. In reply, I beg to inform you that as the only specific complaint brought forward in your letter had reference to the Miami mine, I recently made it my business to make a thorough examination of Brown's colliery, by inspecting all the places where the men were at work, measuring the quantity of air circulating through the different districts or splits and the men's working places, as well as the quantity of intake and return air travelling through the mine, and found that the main current was divided into the required number of splits, and not only was there a far larger quantity of air passing through the mine than the Coal Mines Regulation Act requires, but it was properly circulated, and the mine well ventilated.

I asked each miner at work, amongst other questions, whether he considered the air he was working in was good or bad, and if he had been working in any badly ventilated places during the year, and they said they had no reason to complain of the air they were then or previously working in; that they had worked where the air was slack and deficient, when their boards, &c., had been driven past where a "cut-through" was about being "put through."

I also inspected the bords and headings where Hunter, Gilder, Hull, Davies, Bothwell, Duggan, and Andrews were burnt by explosive gas, and made inquiries as to their injuries. Hunter, Gilder, Davies, and Bothwell being only slightly burnt, it was not considered necessary by the manager to report their accidents, and the men themselves did not consider they received "serious personal injury," or that it was necessary for the manager to have reported their injuries.

The manager informed the Inspector that Duggan and Andrews had been burnt by explosive gas, and that officer reports to me that upon visiting Duggan he found he was apparently only very slightly burnt, and did not consider he had received serious personal injury.

On the 6th instant I went to the Newcastle Hospital to see Duggan, and found that his back, arms, face, and one hand had been severely scorched; and although the Inspector, when visiting him, formed the impression that no serious personal injury had been received, the case has, in my opinion, proved to be one of that character.

Dr. Harris says, whilst at the hospital, his life was for some days in danger, and Duggan says for over two weeks he was in such pain that he could not lie on his back to sleep; but, from his own account of the occurrence, I conclude that had he exercised ordinary caution the accident would not have happened.

4. In the No. 10 heading, where the seam of coal generates the most gas, and there were 42 men, boys, and horses at work (in the two shafts), I found there were 10,080 cubic feet of air per minute circulating through the working-places, and was informed that there was seldom a less quantity travelling through this part of the mine. I saw Davies, who was slightly scorched by an explosion of gas about eighteen months since, and he told me he did not consider his was a case which it was necessary to report; that he was working in a 6-foot heading at the time, and about 30 yards before the current of air. In No. 12 heading, where Andrews was burnt, there were 4,950 cubic feet of air per minute circulating through it, and only two men working in it. Mr. Brown has since my first visit appointed a fireman, whose special duty it will be to go round all the places known to contain explosive gas before the men go to work.

Previously

Previously it was John Morgan's (the deputy's) duty to go round the dip workings, wherever fire-damp was likely to exist. And as the quantity of gas generated by the seam of coal is at present small in quantity, and there is a good current of air circulating, it appears to be unnecessary for the manager to do more than he has promised for the prevention of accident from such a source—a view supported by the miners themselves, of whom inquiry was made on the spot.

5. In conclusion, I may observe, that if you will be so good as to mention specifically the other collieries in this district to which you refer, as not carrying out the provisions of the Act, I shall take effective steps for ascertaining whether the law is complied with in each case, for the reports received from the Inspector of Collieries for some time have led me to suppose that there were no causes for complaint.

I have, &c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

### No. 3.

The Under Secretary for Mines to Mr. James Curley, Miners' General Secretary.

Sir,

Department of Mines, Sydney, 28 October, 1881.

See No. 1.

Referring to your letter of the 19th instant, in which you bring under notice a communication made to the Examiner of Coal-fields, touching the alleged defective working of the Coal Mines Regulation Act, 1876, and the accidents caused by explosions of gas at Messrs. Browns' Minmi Colliery, I have the honor, by direction of the Secretary for Mines, to inform you, that as the Examiner has replied to the only specific charge made and has asked for further information respecting such charges as have been made in general terms, there does not appear to be any action for this Department to take until such information has been supplied.

I have, &c.,

HARRIE WOOD,

Under Secretary.

### No. 4.

Mr. James Curley, Miners' General Secretary, to The Examiner of Coal-Fields.

Sir,

Hamilton, 7 November, 1881.

See No. 2

I have the honor to acknowledge the receipt of your communication dated 22nd October, and referring to the second clause therein, as to the answers given by the miners respecting the ventilation being of a generally satisfactory character; this was, as I am given to understand, when you were accompanied by Messrs. J. Brown, J. Croft, and G. Durie, all representing the management, while the miners were unrepresented by any of their number, exception being taken to Mr. J. Patrick, an experienced practical miner, now in the employ of the men as check-weigher, going down the mine in company with you, so that it is nothing unreasonable to conclude the inquiry and examination partook of a partial, one-sided, and unsatisfactory character, inasmuch that a sense of intimidation would under such circumstances be at once produced. This view of the case is supported by the fact that the delegate's two sons had been some days previous to this peremptorily discharged from their work in the fitting shops adjacent to and in connection with the colliery. Mr. W. M. Williams, the delegate, I know to be a man of exemplary character, while his sons had, by their industry, won the respect and esteem of the overseers in their department.

This is most inconsistent with the courtesy uniformly observed by the gentlemen representing the firm, whom I have met on several occasions at meetings between masters and men.

Admitting, however, the answers to have been given as stated, the evidence, judging from the number of accidents by explosions of gas and the time at which they occurred, it is quite evident that there has been grave indifference on the part of the management, and still more on the part of the Inspector for Collieries.

In clause 3 of your communication you state, "Hunter, Gilder, Hull, Davies, Bothwell, Duggan, and Andrews were burnt by explosive gas,"—"Hunter, Gilder, Davies, and Bothwell being only slightly burnt, it was not considered necessary by the manager to report their accidents, and the men themselves did not consider they received serious personal injury or that it was necessary for the manager to have reported their injuries." The opinion of both manager and men in reference to a report is perverse in the extreme, and probably was quite different on the dates when the accidents took place, and confirms what has been said regarding indifference. If the Inspector committed a mistake in the case of Duggan's accident, which you admit, neither the management nor men are more judicious (but the latter are not requested to report, and why you include them with the management I fail to understand). What is serious personal injury? When miners are knocked down and severely burnt by gas explosions, and incapacitated from following their employment for two or three weeks together. It must be serious personal injury when these accidents are concurrent and take place at intervals of a few weeks together. It is not the slight trifling matter represented. And more especially when you consider the time at which the accidents took place, when the men had been some hours at work, the air would then be in motion, however defective, and forced about by the skips in motion, and yet gas collected in sufficient quantity to explode, which explains two important facts—

1. That there was very defective ventilation at the time of these gas explosions, or
2. That there was that amount of gas collecting in the mine requiring vigilant attention, and, in case of an accident, rendering a report imperatively necessary.

The Colliery Inspector in Duggan's case showed not only indifference and a want of judgment, but is culpably negligent for not making an examination on the spot; and in reference to such examinations it would be more satisfactory if the miners were represented, and the press admitted. This would constitute something like an impartial Board of Inquiry. I cannot refrain from dissent regarding Duggan's want of caution as expressed by you. Did anyone warn him against going into his working-place on the morning of the explosion? No; and as he advanced into it the gas exploded about 15 yards from the working face. This was shortly after Hunter's accident. Duggan not only suffered serious personal injury, but, as you state, Doctor Harris considered his life was endangered; and yet the Colliery Inspector deemed this most serious case of such trifling importance that neither an inquiry was held nor an examination made. Is this in conformity with the Act? In attributing the accident to a want of ordinary caution there appears to be something strangely inconsistent, especially when you consider Hunter's, Gilder's, and other accidents in connection with it. Why not attribute it to careless management and indifferent inspection? The evidence in favour of this latter conclusion is overwhelming.

Both

Both Duggan's and Andrew's accidents were occasioned by gas explosions as they were advancing to the working face in the morning, which goes to show that no fireman had been in these places on the morning of the accidents, or he would have noticed the gas, and warned the miners against entering them, and thus have prevented all approach to danger.

Whatever may have been the state of the ventilation when the examination was made, or the quantity of air passing in the mine,—at the time of the whole of these seven accidents by gas explosions, the whole of which were more or less serious, there was not that quantity of air passing in the mine stipulated by the Act, wherein it is stated—(2) "An adequate amount of ventilation shall be constantly produced in every mine, to dilute and render harmless noxious gases to such an extent that the working places of the shafts, levels, stables, and workings of such mine and the travelling roads to and from such places shall be in a fit state for working and passing therein."

I enclose you a copy of statement which I have taken from William Hunter, in the presence of Mr. Patrick, which confirms what I have stated relative to the whole question:—

1. Indifference on the part of the management regarding the ventilation of the mine.
2. Negligence in not using more precaution to prevent accidents by gas explosions, and when such accidents did occur, in not reporting the same to the Examiner for Coal-fields.
3. Indifference on the part of the Colliery Inspector, who must have seen from the local press, that miners were burnt by gas explosions at Messrs. Browns' Colliery, Minmi, and when informed of the same by report from the management to apparently treat the matter with contempt, as in Duggan's case.
4. The incorrectness of the Inspector's reports, in the face of the facts brought under notice.
5. That there is room for improvement regarding the way in which the inquiries and examinations are made.

With regard to clause 5 of your communication, before I refer to it, I would draw your attention to a mine abandoned, but inundated by water, in close proximity to the Messrs. Browns' Collieries now in work, and would ask you respectfully whether the Inspector has reported this matter to you, and whether any steps are taken as a safeguard in the event of the old tunnel workings piercing the abandoned workings of the inundated mine, and if there are efficient appliances in case of escape on account of any unexpected accident arising from such a source of danger.

In conclusion, respecting clause 5, and the specific naming of the other collieries in this district, I would mention Wallsend, Borchole, and Lambton, and for any reference to the state of ventilation being defective in these mines in any particular portions thereof, would refer you to the recent local Inspectors reports as entered in the book at the respective Colliery Offices named.

I am, &c.,

JAMES CURLEY,  
Miners' General Secretary.

We the undersigned concur in the above statement.

DAVID MITCHELL, Chairman.  
J. M'FADYEN, Treasurer.

[Enclosure to No. 4.]

William Hunter states as follows:—On the morning when I was burnt by an explosion of gas, I working in No. 14 front heading. The heading was about 27 yards in past the cut-through; my mate was working in back heading, which was about 6 yards past the cut-through; we had been working in these places about three weeks. Before commencing to work in them, we heard from report by the men there was fire-damp in these places; my mate, Alfred Conway, went to Mr. Thomas, the manager, and told him that we knew nothing about fire, and what the men had told us concerning these places. This was on the Monday morning before commencing to work them. Thomas, in reply, said there was no fire in the place, and if there was Durie would tell them. Durie at no time warned us about fire-damp. He said if we brushed the place with our shirts we would take no hurt. On the morning on which the accident occurred I brushed the place as usual, and had been working about two hours and a half—from half-past 6 to 9 o'clock. I had been back from the face of the heading about 25 yards, for breakfast, only a few minutes, and on returning to the face I was brushing the place, and, when about 5 yards from the face, an explosion of gas took place. I was struck on the breast, and knocked down by the force of the explosion, and fell on my breast.

I thought it was a serious matter at the time, and was unable to follow my work for two weeks after.

I think the accident should either have been reported or steps taken to clear the gas from the places.

Mr. Durie came to see me and offered me a place to work elsewhere in the mine, and said I would go back there no more. Neither Mr. Lewis, the Colliery Inspector, nor Mr. Mackenzie visited me at the time I was off work. When I answered Mr. Mackenzie's questions Mr. J. Brown, J. Croft, and G. Durie were present, and I felt somewhat intimidated by their presence, and did not care to say anything reflecting on the management, for fear I should be dismissed.

I am a practical miner, having worked in mines for eight years. The day on which Mr. Mackenzie visited us in one of the No. 6 headings and said the air was good enough, there were very few men in that part of the mine, as the pit was filling slack and nearly all the men were cleared out.

WILLIAM HUNTER.  
JOHN PATRICK.  
JAMES CURLEY, Miners' General Secretary.

"Burley's Hotel," Minmi, 31 October 1881.

The Inspector of Collieries for explanation. Copy of my letter referred to in this communication forwarded herewith—J.M., B.C., 14/11/81.

In this statement I am blamed for indifference, but not knowing the meaning of the same as used herein, I am therefore unable to reply.

2. For the incorrectness of my report, to which I think that the result of the examination by the Examiner of Coal-fields is a sufficient answer.

3. For neglecting the accidents by explosions of fire-damp, to which I answer that I investigated each case brought under my notice.—T.L., 15/11/81.

No. 5.

The Miners' General Secretary to The Secretary for Mines.

Sir,

Hamilton, 8 November, 1881.

I have the honor to state that a further communication on the defective working of the Coal Mines Regulation Act, 1876, and recent accidents by explosions of gas at the Messrs. Browns' Colliery, Minmi, has been forwarded to the Examiner of Coal-fields.

A statement which I have taken from one of the miners burnt by explosive gas has also been forwarded, which confirms the allegations made respecting this important subject.

I have, &c.,

JAMES CURLEY,  
Miners' General Secretary.

Ask the Examiner what has been done in this matter.—H.W., 2/12/81.

No.

## No. 6.

Mr. James Curley, Miners' General Secretary, to The Examiner of Coal-fields.

Sir,

Hamilton, 28 November, 1881.

I have the honor to respectfully call your attention to the defective state of ventilation in connection with the drive at Raspberry Gully, South Waratah. The drive is in 500 yards, more or less. Air is conveyed to the workmen by means of troughs laid on the floor of the drive, and when a change of shifts takes place water sometimes accumulates in certain places of the drive, so as to almost overflow the pipes and air current within. Gas is occasionally visible, so that the danger to the life of the workmen must be very great at times. At the time when the inspector visited the drive recently, the workmen had been withdrawn a half shift the day previous.

I have, &c.,

JAMES CURLEY,  
Miners' General Secretary.

## No 7.

The Examiner of Coal-fields to Mr. James Curley, Miners' General Secretary.

Sir,

Coal-fields Office, Newcastle, 1 December, 1881.

See No. 6.

With reference to your letter of the 28th ultimo, calling my attention to the defective state of ventilation in connection with the drive at Raspberry Gully, South Waratah Colliery, I beg to inform you that, upon going to the colliery on the 29th ultimo, I found that Mr. Green (the colliery manager) was connecting the trough with the Charles pit down-cast shaft, for the purpose of ascertaining whether the furnace would ventilate the drive better than the fan has lately done, and, as the men had not been at work the previous day, I arranged to go on the 30th idem, and see how the new method answered. Upon arriving there on the 30th ultimo, I found that the shaft which the men had to go down was full of smoke from the furnace. I then discussed with Mr. Green the advisability of remedying this, either by making Charles pit the up-cast or putting a landing at the 6-foot seam, in the present up-cast or furnace shaft, so that the men could go to their work down Charles pit and from thence to the bottom of the furnace shaft free of smoke, &c. This Mr. Green will do immediately, and, when completed, inform me of, and whether the ventilation is improved.

2. With respect to the gas, Mr. Green informs me that the overman is instructed, whenever the men leave the face of the drive, to examine the tunnel and see that it is free from gas, and safe to work in, before the men resume their work; and that whenever gas has been seen it has accumulated during the stopping of the "fan," from 2 o'clock on Saturday night to 6 o'clock on Sunday morning.

I have, &c.,

JOHN MACKENZIE,  
Examiner of Coal-fields.

## No. 8.

The Under Secretary for Mines to The Examiner of Coal-fields.

Sir,

Department of Mines, Sydney, 8 December, 1881.

I have the honor to inform you that a letter has been received from Mr. James Curley, the Miners' General Secretary, to the effect that a further communication has been made to you respecting the alleged defective working of the Coal Mines Regulation Act of 1876, and the recent accidents by explosions of gas at the Messrs. Browns' Colliery, Minmi, and I accordingly request that you will be so good as to state what has been done in the matter.

I have, &c.,

HARRIE WOOD,  
Under Secretary.

Copy of Mr. Curley's letter, &c., forwarded herewith. Have visited the collieries complained of, and shall reply to his letter early next week. I also forward copies of letters respecting the Raspberry Gully drive.—J.M., 10/12/81. The Under Secretary for Mines.—B.C., 10/12/81.

## No. 9.

The Examiner of Coal-fields to The Under Secretary for Mines.

Sir,

Coal-fields Office, Newcastle, 14 December, 1881.

See No. 8.

Adverting to your letter of the 8th instant, with reference to a letter received from Mr. James Curley, the Miners' General Secretary, and my blank cover communication of the 10th idem, I have the honor to forward you, for the information of the Honorable the Secretary for Mines, a copy of my reply to Mr. Curley and others' letter.

I have, &c.,

JOHN MACKENZIE,  
Examiner of Coal-fields.

It does not seem necessary for the Department to take any further steps in this matter, unless further moved by the Miners' General Secretary, who is in possession of Mr. Mackenzie's report, copy of which is herewith.—H.W., U.S., 19/12/81. Await further communication.—A.R., 20/12/81.

[Enclosure to No. 9.]

The Examiner of Coal-fields to Mr. J. Curley and others.

Sir,

Coal-fields Office, Newcastle, 13 December, 1881.

In acknowledging the receipt of your letter of the 7th ultimo, referring to the second paragraph of my communication of the 22nd October last, with regard to the answers given to me by the miners at the Minmi Colliery, respecting the ventilation, and complaining that the inquiry and examination held on the occasion was of a partial, one-sided, and unsatisfactory character, owing to the men having been unrepresented, I beg to inform you that Mr. John Brown, the colliery manager, having objected to allow Mr. J. Patrick (who, I was informed, was the only person paid by the men at that colliery), to accompany

accompany me during my visit, I had no alternative but to make the examination without him, although I may state that the colliery manager was entitled, if he thought fit, to prevent Mr. Patrick from entering the mine. As stated in my letter of 22nd October last, the mine was, at the different days I examined it, well ventilated, whatever it may have been previously; and, as I also informed you, the reports from the Inspector of Collieries had for some time led me to suppose there were no causes of complaint.

2. With respect to your remarks about persons injured by explosive gas at the same colliery, I am of opinion that it would be better and more satisfactory if all such injuries, whether serious or not, were reported to the Examiner of Coal-fields by the owner or manager of the mine, although the Act does not make it imperative that such should be done.

I am also inclined to think that the presence of explosive gas, and the injuries received therefrom, were treated too lightly by the manager previous to my visiting the colliery on 4th October last, since which time a "fireman" has been appointed, whose special duty is to go around all the places known to contain explosive gas, before the men go to work. Duggan told me he was about 30 yards in his bord, past the district air current, and about 5 yards from the face, not 15 yards, when the gas fired, and where I was shown his lamp was found was about the distance stated by him to me.

3. Upon making inquiries at the mine, and examining Messrs. Browns colliery plans, I find that the nearest drives going towards the Minmi old abandoned workings inundated with water, are 35 chains, at least, distant from them, and consequently cannot be in close proximity thereto.

4. The proposal in the fourth paragraph of your letter, that the miners should be represented and the Press admitted at official examinations of collieries, is not provided for in the Act, and cannot, therefore, be complied with.

5. Adverting to the reference made in the concluding paragraph of your letter to the Wallsend, Borehole, and Lambton Collieries, I beg to inform you that I have recently made it my business to make a thorough examination of the Newcastle Wallsend Colliery, by inspecting nearly all the places where the men were at work, measuring the quantity of air circulating through the different districts (or splits) and the men's working places, as well as the quantity of intake and return air travelling through the mine.

6. On the first day, I was accompanied by William Willis (overseer), and John Naismith and David Beveridge (the men's check inspectors), whom the colliery manager permitted to accompany me through Mr. Willis' district.

In the engine bank road there were 21,600 cubic feet per minute of intake air travelling down it, and 13,860 cubic feet per minute of intake air circulating along the travelling road.

In the No. 1 district (or split) where the air enters it, near the travelling road heading, there were 5,910 cubic feet per minute of intake air for the supply of 70 men, boys, and horses at work; between Nos. 15 and 16 bords it measured 6,000, and between 18 and 19 bords 4,940 cubic feet per minute, thus showing the irregularity of the current of air circulating through this split, and that there is not the quantity of air circulating through it which the Coal Mines Regulation Act provides for, but Mr. Neilson expects that when the water shaft, now in course of being connected with the workings in this district is completed, the ventilation will be improved and exceed the requirements of the Act.

In the No. 2 district (split) there were only 11,040 cubic feet of intake air per minute coming down the "air shaft," for 133 men, boys, and horses at work there, and only 5,670 cubic feet per minute travelling along the air-way past the last working place in the split, which is far less than the Act requires. Mr. Neilson (the manager) informed me that there was and had been for some time cause for complaint with respect to a deficiency of air in this split, but anticipated that when the new "water shaft" in course of sinking is in a few days completed, it will add to the quantity of air at present supplied to men in this part of the mine. On the second day I was accompanied by Mr. Neilson (the manager), Thos. Boasfield (overseer), and John Naismith and David Beveridge (the men's check inspectors), who Mr. Neilson again permitted to accompany me through Mr. Boasfield's district, where I found there was the requisite quantity of air circulating through the different "splits," and the provisions of the Act complied with. The Lambton heading (or No. 1 district) having 6,031, 1,377 and 9,800, equal to 17,208 cubic feet of air per minute (by three intakes) for 141 men, boys, and horses working therein, and with respect to a complaint the men's check inspectors drew my attention to, which I examined, where six miners were working in bords where the air was supposed to have passed over "stagnant water." I am of opinion that as the manager is daily drawing large quantities of water away from it, and it is continually receiving fresh supplies, that the 4th general rule in section 12 of the Act, does not apply to it, and I would further add that I could not perceive any bad smells coming from it or the air passing over it. The quantity of return air passing through the furnace shaft was—

No. 1 Split .....	30,564	cubic feet per minute.
No. 2 Split .....	12,960	" "
No. 3 Split .....	34,280	" "
Total.....	77,804	

7. On my visit to the Borehole Colliery, where I met by appointment the colliery manager (Mr. Turnbull), and William Lee, and Samuel Selby (the men's check inspectors), and looked over their last reports. I found that the only places they had to complain of were in the south-east side of the south-east headings, and that since the Report dated 27th June last, W. H. Britton and Henry Turner had been appointed check inspectors in the place of Lee and Selby. The day previous to my visit Britton and Turner had come out of the mine and asked the manager if he would go down the pit and see if something could not be done to improve the ventilation where men were working in the south-east side of the south-east headings, as the air was heavily charged with "black-damp," so much so that in many places the men could not keep their lights burning. Mr. Turnbull immediately accompanied Britton and Turner to the places complained of, and after discussing the matter, he made such alterations, as not only gave the men a larger quantity of air, but also that of a better quality. Owing to the large quantity of "black-damp" which is given off and accumulates in this part of the A.A. Company's workings, when a hot north or north-west wind is blowing it makes it very difficult for the manager to always keep the ventilation in this district up to the requirements of the Act. When I examined this district with Mr. Turnbull and the check inspectors (Lee and Selby) the day after the alteration had been made, I found that the men were quite satisfied, and the places well ventilated.

8. I have been to the Lambton Colliery, and Mr. Croudace has marked for my guidance, &c., on the coal-fields record tracings, the different splits, doors, &c., and the way the air travels through and ventilates the mine, and also informed me that he was then busy making alterations and improvements in the ventilation. The check inspectors reports were lent me for my perusal, and to take copies of them if I wished to do so, and Mr. Croudace told me that he should have no objection to allow the check inspectors to accompany me in my examinations.

Upon seeing Mr. Jackson, on Saturday last, I find that the Lambton Colliery is not likely to be working this week, and I must therefore leave my examinations of it until my return from the western and southern districts, and completion of my

I have, &c.,  
JOHN MACKENZIE,  
Examiner of Coal-fields.

#### No. 10.

Mr. H. Winchester to Mr. J. Y. Neilson, Manager, Wallsend Collieries.

Sir,

Coal-fields Office, Newcastle, 20 December, 1881.

With reference to your communication of the 19th instant, I beg to inform you that the Examiner of Coal-fields, who is now absent from Newcastle, anticipating your request, instructed me to furnish you with a copy of his report, if applied for, and accordingly have the honor to enclose the same herewith.

I will forward your letter to Mr. Mackenzie without delay.

I have, &c.,  
HERBERT WINCHESTER.

## No. 11.

Messrs. J. and A. Brown to Mr. James Curley, Secretary, Miners' Association.

Sir,

Newcastle, 23 December, 1881.

We are much astonished to find that you have written to the Examiner of Coal-fields in the following terms:—"I would draw your attention to a mine abandoned but inundated by water in close proximity to the Messrs. Brown's Collieries now in work, and would ask you respectfully whether the inspector has reported this matter to you, and whether any steps are taken as a safeguard in the event of the old tunnel workings piercing the abandoned workings of the inundated mine, and if there are appliances in case of escape on account of any unexpected accident arising from such a source of danger."

As the above statement is both malicious and untrue we would ask you to immediately furnish us with an explanation with respect to the same, and a withdrawal of the statement to the Examiner of Coal-fields.

In the event of this not being done we shall deal with the matter in whatever summary manner we may be advised.

We have, &c.,  
J. & A. BROWN.

## No. 12.

Mr. James Curley, Miners' General Secretary, to N. Melville, Esq., M.P.

Hamilton, 28 December, 1881.

CAN Minister Mines meet deputation Miners' Association on Friday. Arrange same and meet in Mines Office; reply paid.

JAMES CURLEY.

PRESENTED by Mr. Melville, M.P. In the absence of the Secretary for Mines I informed Mr. Melville that the deputation would be received on Friday at 11:30 a.m.—G.E.H. (for the U.S.), 29/12/81.

Submitted.—G.E.H. (for the U.S.), 31/12/81.

## No. 13.

Minute of the Hon. The Secretary for Mines.

Re Deputation from Miners' Association, Hamilton and Newcastle.

INFORM the Examiner of Coal-fields that it is reported that a letter having been forwarded to him by the Secretary of the Miners' Association, he forwarded an extract from the letter to the proprietors of the coal mine (Messrs. Brown), regarding which the complaint was made. Inform further that in consequence of this action on the part of the Examiner the proprietors have threatened to take summary action against the Secretary of the Miners' Association.

The Minister requires a report from the Examiner on the subject.

A.R., 4/1/82.

The Examiner of Coal-fields.—B.C., 4/1/82., H.W.

## No. 14.

The Examiner of Coal-fields to The Under Secretary for Mines.

MESSRS. J. and A. Brown's letter to me and my reply forwarded herewith, also letter from J. Y. Neilson and my answer thereto.—J.M., 11/1/82. The Under Secretary for Mines.—B.C., 11/1/82. Submitted.—H.W., 16/1/82. Read.—A.R., 16/1/82.

[Enclosure to No. 14.]

Messrs. J. and A. Brown to The Examiner of Coal-fields.

Sir,

Newcastle, 29 November, 1881.

Referring to your semi-official conversation with our Mr. Alexander Brown, relative to the near approach of our present workings at Brown's Colliery to some of the old Minni pit workings, and the probable consequences which might arise owing to any careless working, and of which careless working you had been informed by some person in authority, we should be very glad to know the name of your informant, as Mr. Brown when at the mines, made it his special business to inquire into the truthfulness or otherwise of the assertion, and we are glad to say, found it as uncalled for as it was untrue.

We have, &c.,  
J. & A. BROWN.

The Examiner of Coal-fields to Messrs. J. and A. Brown.

Gentlemen,

Coal-fields Office, Newcastle, 7 December, 1881.

Referring to your letter of the 29th ultimo, asking me if I would tell you who it was informed me of the near approach of Brown's Colliery workings to some abandoned workings full of water in that neighbourhood, I beg to say that, in a communication received from Mr. Curley, the Miners' General Secretary, he states as follows:—"I would draw your attention to a mine abandoned but inundated by water in close proximity to the Messrs. Brown's Collieries now in work, and would ask you respectfully whether the inspector has reported this matter to you, and whether any steps are taken as a safeguard in the event of the old tunnel workings piercing the abandoned workings of the inundated mine, and if there are efficient appliances in case of escape on account of any unexpected accidents arising from such a source of danger."

I have, &c.,  
JOHN MACKENZIE,  
Examiner of Coal-fields.

Mr. J. Y. Neilson, Manager, Wallsend Collieries, to the Examiner of Coal-fields.

Sir,

Wallsend, 19 December, 1881.

I notice in to-day's issue of the *Newcastle Chronicle* a report of a Wallsend miners' meeting, wherein it is reported as follows:—

"Mr. Curley stated he had received a very lengthy report from Mr. Mackenzie, Examiner of Coal-fields, respecting the ventilation and stagnant water in the Wallsend workings, and on many things, &c.; and he, Mr. Curley, concludes by stating, if the meeting desired it, he would bring the report, and read it to the Committee."

In

In reference to the above, I think you will have a perfect recollection of the Wallsend check inspectors asking to make a special report, you stating that it was a special report, and you could only report to your superior officer or head of your Department; and they, the check inspectors, had only been allowed to accompany you round the works by the courtesy of the manager, who wished to give you (the Examiner) every information. You then asked me if I was going to make any special report. I at once replied, "Not until I see your official report."

Assuming the report in paper is correct, I do think that you have not acted in strict good faith, inasmuch as you have favoured the accuser with a report, and left the accused in ignorance of your conclusions; and to say the least, it is a most unfair and inequitable arrangement, and a position which you have taken without mature thought; and I shall be glad if you will give me the same copy of your report as you have given Mr. Curley, as I must now report this matter in full to my directors on the 21st inst., when I have no doubt but that they will be as much surprised as I have been to find that their Miners' Secretary has been furnished with information that has been withheld from the masters, the latter being equally interested and more responsible.

I am, &c.,  
J. Y. NELSON,  
Colliery Manager.

The Examiner of Coal-fields to Mr. J. Y. Neilson, Manager Wallsend Collieries.

Sir,

Lidsdale, 31 December, 1881.

I am very much surprised at your letter forwarded to me here, and in reply thereto, beg to state that I did exactly what I told you I should do, viz., reply to Mr. Curley's letter, and send you a copy of it (if you wrote for one), which I left instructions with Mr. Winchester to do in my absence; also, send a copy to the Honorable the Secretary for Mines.

I have, &c.,  
JOHN MACKENZIE,  
Examiner of Coal-fields.

## Stockton Colliery.

### SCHEDULE.

NO.		PAGE.
1.	The Examiner of Coal-fields to the Under Secretary for Mines, forwarding complaints by Mr. James Curley, and Mr. Inspector Dixon's report on the defective ventilation in Stockton Colliery; also, copy of notice served on the colliery manager, and minutes. 11 September, 1885 .....	141

The Examiner of Coal-fields to The Under Secretary for Mines.

Sir,

Coal-fields Office, Newcastle, 11 September, 1885.

I have the honor to forward for the information of the Honorable the Secretary for Mines, a letter received from the Miners' General Secretary, and a report from Mr. Inspector Dixon, with respect to defective ventilation in the workings of the Stockton Colliery; also, copy of a notice I served upon the colliery manager, after having made an examination of the mine with Mr. Dixon, on the 9th instant.

2. I shall be obliged by you informing me what further action the Minister desires me to take in the matter. Whilst I was at the colliery on the 9th instant, a man came to make a commencement at putting a brattice down side of shaft, for the purpose of improving the ventilation, and complying with the requirements of the Coal Mines Regulation Act, 1876.

I have, &c.  
JOHN MACKENZIE,  
Examiner of Coal-fields.

Unless effective measures be adopted for improving the ventilation before he has time to initiate proceedings, he should proceed in terms of the Act to enforce compliance with its provisions.—H.W., 22/9/85. Submitted Approved—J. P. ABBOTT, 25/9/85. The Examiner of Coal-fields.—G.E.H. (for the U.S.), B.C., 28/9/85. The bratticeing down the side of shaft is now completed, and subsection 3, section 12, of the Coal Mines Regulation Act, 1876, is now complied with.—J.M., 30/9/85. The Under Secretary for Mines.—B.C., 30/9/85. No further action appears to be necessary.—H.W., 3/10/85.

[Enclosures.]

Mr. James Curley, Miners' General Secretary, to The Examiner of Coal-fields.

Sir,

Hamilton, 7 September, 1885.

I am instructed by the miners working at the Stockton Colliery, to respectfully draw your attention to the state of the ventilation, with a view that some improvement be effected.

I may add that the miners refused to enter the mine to-day, owing to alleged defective ventilation.

I have, &c.,  
JAMES CURLEY,  
Miners' General Secretary.

Mr. Inspector Dixon for report as early as possible.—J.M., 8/9/85. Seen and reported on.—J.D., 8/9/85.

Mr. John Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Sir,

Glebeland, 8 September, 1885.

According to your instructions sent by telegram, and also your verbal instructions when I saw you this afternoon, I went to the Stockton Colliery and made an inspection of the workings, and beg to report as follows:—

2. I got down into the workings a little before 4 o'clock p.m., and just at the time the miners were knocking off. There had been several shots fired prior to the men leaving their working places, and as a consequence I found the various headings almost filled with powder-smoke, and seemingly no current of air to clear the workings of said powder-smoke. I went through the various headings and bords and also into the return airway which has been holed into the shaft, but could nowhere find the current of air according to the Act, even for the twenty men employed below.

3. The cause of the above state of things is to be found in the fact that a tangye pump has been placed in the lower seam to force the water up the pit. It was found that owing to the steam having to be brought from the surface, the power was almost lost before reaching the pump, consequently the pump was not doing the work required, and the compressed air which had been used to ventilate the workings had to be used to work the pumps. When the the manager took the compressed

air from the workings and connected it to the pump, he endeavoured to make a provision for a supply of fresh air into the workings by connecting the back return airway with an 8-inch column of pipes into the shaft, and also connecting the pipes at the surface with the boiler stack. This arrangement, however, does not seem to act, and in my opinion is due partly to the contracted area of the pipes and partly to a portion of the surface connection being formed of canvas.

4. I saw the manager (Mr. Hardy), and urged on him the necessity of at once putting a quarter brattice in the shaft, which, in my opinion, would result in proper ventilation for the limited number of men employed. He (Mr. Hardy) informed me that it was his intention to put a brattice in, and that the timber for that purpose had been ordered several days since, but had not yet come to hand, and further added that to-morrow (Wednesday) morning, he would send a man on purpose and get the timber across if possible.

5. In conclusion, I beg to state, that it is about a week since the compressed air was put on the pump, but for the most part of last week the men were employed on the surface and there was very little work done below. The present arrangement to return the air was completed during yesterday (Monday) morning. I further beg to state that it is my intention to visit Stockton Colliery again to-morrow (Wednesday) morning, and I should very much like if you could make it convenient to accompany me and see the workings for yourself.

I have, &c.,

JOHN DIXON,  
Inspector of Collieries.

The Examiner of Coal-fields to Mr. Joseph Hardy, Colliery Manager, Stockton Colliery.

Sir,

Referring to the inspection made by Mr. Inspector Dixon, on the 8th instant, and that made by Mr. Dixon and myself on the 9th instant, I hereby give you notice that you have neglected to comply with sub-section 3, section 12, of the Coal Mines Regulation Act, 1876.

I have &c.,

JOHN MACKENZIE,  
Examiner of Coal-fields.

## Great Western Zigzag Colliery.

### SCHEDULE.

No.	PAGE.
1. The Examiner of Coal-fields to the Under Secretary for Mines, forwarding correspondence, and a copy of notice served on the Manager of the Great Western Zigzag Colliery—Enclosures and Minutes. 8 April, 1884 .....	142
2. The same to the same forwarding Mr. Inspector Rowan's Report, and other enclosures on above Colliery. 7 May, 1884 .....	143

### No. 1.

The Examiner of Coal-fields to The Under Secretary for Mines

Sir,

Coal-fields Office, Newcastle, 8 April, 1884.

I beg to forward for the information of the Honorable the Secretary for Mines, correspondence, &c., and copy of a notice I have served on Mr. Wilson, of the Great Western Zigzag Colliery, Eskbank, for non-compliance with sub-sections 2 and 4, section 12, of the Coal Mines Regulation Act, 1876.

2. Mr. Wilson I have found to be an excellent promiser but a very bad performer in remedying any matters complained of when he was Manager of the Vale of Clwydd Colliery, and I shall be obliged by your informing me what further action the Minister desires me to take in the matter.

I have, &c.,

JOHN MACKENZIE,  
Examiner of Coal-fields.

[Enclosures to No. 1.]

Mr. James Rowan, Inspector of Collieries, to the Examiner of Coal-fields.

Sir,

Eskbank, 9 February, 1884.

I have the honor to report for your information that I have inspected the Zigzag Colliery, and regret to state I found the ventilation not in a satisfactory condition.

I tested the ventilation in several parts of the mine, but did not get a register with the anemometer; there were slight currents of air passing at intervals caused by the action of the ascending and descending cages, but no proper method of ensuring a constant current of air through the workings. I called the manager's (Mr. Wilson's) attention to the upcast side of the shaft, where a small pumping engine and water tank are placed, not giving sufficient space for the ventilation to pass. I requested Mr. Wilson to remove the abovenamed tank and engine to the bottom of the shaft, or otherwise place them so as to allow a sufficient space for the ventilation to pass. Thus he promised to do.

I may state the above is a new colliery, commenced about two months ago, so the levels, and headings, &c., are not a great distance from the bottom of the shaft. Mr. Wilson desires a little time granted to enable him to make the necessary improvements in connection with the ventilation. He said in four weeks from date of inspection he would have the tank and engine removed from the upcast side of the shaft, and the ventilation made all right.

In conclusion, I beg to state, if the tank and engine referred to be removed, and a furnace or steam jet be placed at the bottom of the upcast, it will produce a plentiful supply of ventilation. About 30 men employed underground; distance from the bottom of the shaft to the working faces, about 90 yards.

I received no complaints from workmen.

I have, &c.,

JAMES ROWAN,  
Inspector of Collieries.

Seen, and Mr. Wilson written to, 14 February, 1884—J.M., 14/2/84.

The Examiner of Coal-fields to Mr. W. Wilson.

Sir,

Coal-fields Office, Newcastle, 14 February, 1884.

I beg to acknowledge the receipt of yours of the 12th instant, and forward you three copies of special rules.

2. In reply to paragraph 2, I have to request that you will have the matters complained of remedied in four weeks from the time of Mr. Inspector Rowan's inspection, in accordance with the promise you made him.

3. Have you removed the tank and engine to the bottom of the shaft or placed them so as to allow a sufficient space for ventilation to pass according to promise.

I have, &c.,

JOHN MACKENZIE,  
Examiner of Coal-fields.

Mr.

## Mr. W. Wilson to The Examiner of Coal-fields.

Sir, Zigzag Colliery, 12 February, 1884.  
I expected you to send me, according to promise, the colliery rules; kindly forward as soon as possible, as I am now in fairly working order; got about thirty miners employed.  
I have not got the air return quite up to the Act, as all the places are close to the shaft, but will have everything completed one month from date. I have, &c.,  
WM. WILSON.

## Mr. James Rowan, Inspector of Collieries, to The Examiner of Coal-fields.

Sir, Eskbank, 3 April, 1884.  
According to instructions received I have inspected the Zigzag Colliery, and regret to state I found the ventilation not satisfactory.  
The small engine and water tank referred to in my last report are removed a small distance back in the shaft where they were stationery, making a space about 9 square feet for the upcast ventilation to pass; also a small furnace has been built at the bottom of the shaft. I tested the air current in four different places in the main airway, but there was not a sufficient current going to work the anemometer; the only place I got a register was in the return airway immediately before the air current passed through the furnace; I got a register of 5,400 cubic feet of air per minute.  
I showed Mr. Wilson (manager) that nearly all the current was passing round the bottom of the shaft without going into the workings. On examining the working faces I found a large percentage of furnace smoke diffused through the workings caused by the mid-wall on the furnace side of the shaft being defective. I also examined the air stoppings, which consist of a mass of loose rubbish not sufficient to guide the ventilation into the working faces.  
In conclusion, I beg to state the mid-wall on the furnace side of the shaft is defective, and ought to be thoroughly repaired to prevent the furnace smoke from mixing with the downcast current of air, also that proper stoppings should be put in and the air current brought forward to the working faces. I am further of opinion that 9 square feet is not a sufficient space for the ventilation of the colliery to pass through. Nevertheless, if the mid-wall and stoppings are thoroughly repaired, this space may do in the meantime, seeing a new shaft has to be sunk to meet the requirements of section 12, sub-section 1, of the Coal Mines Regulation Act. I have, &c.,  
JAMES ROWAN,  
Inspector of Collieries.

## The Examiner of Coal-fields to Mr. W. Wilson, Great Western Zigzag Colliery, Eskbank.

Sir, Coal-fields Office, Newcastle, 8 April, 1884.  
In view of a recent report I have received from Mr. Inspector Rowan on the Great Western Zigzag Colliery, and in accordance with the provisions contained in the 31st section of the Coal Mines Regulation Act, 1876, I hereby give you notice that you have failed to comply with sub-sections 2 and 4, section 12, of the said Act. I have, &c.,  
JOHN MACKENZIE,  
Examiner of Coal-fields.

[Minutes on above.]

The Examiner should give the manager notice that he will, on a certain day to be fixed in the notice, visit the Colliery, and, if he finds that the rules have not been complied with, he will at once proceed to enforce the penalty.—H.W., 16/4/84.

Submitted. Approved.—J. P. ABBOTT, 17/4/84. The Examiner of Coal-fields.—T.C.B. (for U.S.), B.C., 18/4/84.

## No. 2.

## The Examiner of Coal-fields to The Under Secretary for Mines.

Sir, Coal-fields Office, Newcastle, 7 May, 1884.  
In compliance with the instructions of the Honorable the Secretary for Mines on my letter of 8th ultimo, conveyed to me under your blank cover of the 18th idem, I beg to enclose copy of a letter I wrote Mr. Wilson on 27th April last, and to state that Mr. Inspector Rowan having to visit the Colliery *re* hanging up of special rules, I instructed him to make a further report on the state of the ventilation.  
2. I beg to forward Mr. Inspector Rowan's report, from which it appears that the provisions of the Coal Mines Regulation Act, 1876, are now complied with at that Colliery. I have, &c.,  
JOHN MACKENZIE,  
Examiner of Coal-fields.

Seen.—H.W., 12/5/84.

[Enclosures to No. 2.]

## The Examiner of Coal-fields to Mr. W. Wilson, Great Western Zigzag Colliery, Eskbank.

Sir, Coal-fields Office, Newcastle, 27 April, 1884.  
I hereby give you notice that, on or about the 10th proximo, I shall visit the Zigzag Colliery, and if I find that the provisions of the Coal Mines Regulation Act, 1876, referred to in my letter of the 8th instant, are not then complied with at that colliery I shall at once proceed to enforce the penalty.  
2. I have also instructed Mr. Inspector Rowan, who is now in the West, to make another early inspection and report thereon. I have, &c.,  
JOHN MACKENZIE,  
Examiner of Coal-fields.

P.S.—Have received no reply from you to my letter of 9th April *re* hanging up of special rules.

## Mr. W. Wilson to The Examiner of Coal-fields.

Sir, Zigzag Colliery, 30 April, 1884.  
Yours of 28th to hand and contents noted. I have had copy of special rules hung up at the colliery and the miners' attention drawn thereto. The rules have been hung up over three weeks.  
Hope to see you next month. I have, &c.,  
W. WILSON.

## Mr. James Rowan, Inspector of Collieries, to The Examiner of Coal-fields.

Sir, Eskbank, 2 May, 1884.  
For your information, I have the honor to inform you that I have this day inspected the Zigzag Colliery *re* defective ventilation.  
2. Since my last inspection, on April 2nd, an improvement has been made in the ventilation, viz., several air stoppings are put in, the mid-wall overhauled, and the air current brought forward to the working faces.

3. I tested the air-current and got a register with the anemometer of 2,310 cubic feet of air per minute in one current. About eighteen men employed underground.

4. I may also state, a copy of the special rules are hung up in a conspicuous place at the mine, and the attention of the miners called thereto.

5. In conclusion, I beg to state, the spirit of the Coal Mines Regulation Act in the abovenamed colliery has been complied with.

I have, &c.,

JAMES ROWAN,

Inspector of Collieries.

Telegram from Mr. James Rowan, Inspector of Collieries, to the Examiner of Coal-fields.

Wollongong, 7 May, 1884.

ZIGZAG Colliery. The provisions of the Coal Mines Regulation Act complied with.

JAMES ROWAN.

## Katoomba Colliery.

### SCHEDULE.

NO.	PAGE.
1. Mr. G. Clark to the Honorable the Secretary for Mines, complaining of insufficient ventilation in Katoomba Mine, with minutes. 6 December, 1883 .....	144
2. Telegram from the Examiner of Coal-fields to Mr. James Rowan, Inspector of Collieries, instructing him to inspect Katoomba Mine .....	144
3. The Examiner of Coal-fields to the Under Secretary for Mines, for copy of complaint <i>re</i> Katoomba Mine, with minute. 14 December, 1883 .....	144
4. Mr. James Rowan, Inspector of Collieries, to the Examiner of Coal-fields—Report of inspection of Katoomba Mine. 15 December, 1883 .....	144
5. The same to the same, reporting re-examination of Katoomba Mine. 1 February, 1884 .....	145

#### No. 1.

Mr. G. Clark to The Secretary for Mines.

Sir,

Katoomba, 6 December, 1883.

Would you kindly inform the Chief Inspector of Mines to pay a visit to the mine of Katoomba, in regard to the air, as the place is in that sort of state that there is no air in it.

I have, &c.

GEORGE CLARK.

P.S.—I hope you will not let it be known as to who was the informer.—G.C.

The Chief Inspector for the Western District. Mr. Inspector Rowan's report hereon forwarded for the Minister's information.—J.M., 11/1/84. The Under Secretary for Mines, B.C., 11/1/84.

From the Inspector's report it appears the proper quantity of air is sent into the mine, and that steps were being taken to perfect the distribution. The Examiner should see that the work is carried on with proper expedition.—H. W., 17/1/84.

Submitted. Approved.—J. P. ABBOTT, 18/1/84. The Examiner of Coal-fields, B.C., 19/1/84.—H.W.

The work has been completed, and the defective ventilation remedied. *Vide* Mr. Inspector Rowan's report herewith.—J.M., 4/2/84. The Under Secretary for Mines, B.C., 4/2/84. Seen.—H.W., 6/2/84.

#### No. 2.

Telegram from The Examiner of Coal-fields to Mr. J. Rowan, Inspector of Collieries.

HAVING got telegram at "Imperial," dated 7th instant, from Mines, saying that complaint has reached that office that supply of air in Katoomba Colliery is insufficient, come and see me "Hayles' Hotel," Blackheath, six train to-morrow morning. Bring anemometer and your last report, so that you may inspect it that day, and see me Saturday after inspection.

JOHN MACKENZIE.

#### No. 3.

Telegram from the Examiner of Coal-fields to The Under Secretary for Mines.

Blackheath, 14 December, 1883.

Your letters, dated 6th, *re* Usher's appointment, and telegram of 7th, *re* Katoomba ventilation, only received by me when happening to be at Mount Victoria yesterday. Please forward me copy of Katoomba complaint and Mr. Usher's address, so that I may write him and appoint some day next week.

J. MACKENZIE.

Forward information asked for.—H.W., 14/12/83.

#### No. 4.

Mr. J. Rowan, Inspector of Collieries, to The Examiner of Coal-fields.

Sir,

Eskbank, Lithgow, 15 December, 1883.

By your instruction, I have carefully inspected Katoomba Colliery. I tested the air-current. Got a register of 3,000 cubic feet of air per minute in one current. This 3,000 cubic feet of air was well maintained through the workings, with the exception of two bords in the main cross-cut. Ventilation not very good.

Mr.

Mr. Hepburn, manager, showed me an air-passage he was driving and would be completed in about three days from date of inspection. This connection will bring the air-current up to the two bords above referred to. I went round every working face and inquired of every miner if he had any complaint to make about the ventilation. I received no complaint. About thirty men are employed in this colliery.

I have, &c.,  
JAMES ROWAN,  
Inspector of Collieries.

---

No. 5.

Mr. J. Rowan, Inspector of Collieries, to The Examiner of Coal-fields.

Sir, Katoomba, 1 February, 1884.

By your instruction I have re-examined Katoomba Colliery.

I may state, the manager has carried into effect the improvements promised on my last inspection, namely, the main cross-cut and heading are connected, and the air-current brought up to the two bords that were defective in ventilation.

I have, &c.,  
JAMES ROWAN,  
Inspector of Collieries.

---

Lambton Commonage Coal-mine.

SCHEDULE.

NO.	PAGE.
1. Minute of the Honorable the Secretary for Mines, that the Examiner of Coal-fields be asked whether there is a sufficiency of ventilation in Lambton Commonage Coal-mines, with Minutes. 26 February, 1883.....	145
2. The Under Secretary, Department of Mines, to Messrs. Melville and Tighe, Ms.P., that the Examiner of Coal-fields has been asked to report on the charge of air being bad in the Lambton Commonage Coal-mine. 1 March, 1883 .....	145
3. The same to the same, reporting that, in order to purify the air in Lambton Commonage Coal-mine, an air-shaft had been commenced. 12 March, 1883 .....	146

---

No. 1.

Minute by The Secretary for Mines.

*Re* Deputation of Coal-miners at Newcastle.

26th February, 1883.

THE Examiner of Coal-fields should be asked to report whether the ventilation in the Lambton Commonage Coal-mine is sufficient, and whether men have to come out of the mine owing to the impure air.

J. P. ABBOTT.

The Examiner of Coal-fields, B.C., 28/2/83.—G.E.H. (for the U.S.) The Inspector of Collieries is requested to ascertain whether the ventilation in the Lambton Commonage Coal-mine is now sufficient, and say if men have had to come out of the mine owing to the impure air. Also whether the defects complained of in his report to me of 24th January last, and which I wrote to the manager about on the 20th ultimo, have been remedied.—J.M., 1/3/83. The Inspector of Collieries.—B.C., 1/3/83.

On the 21st ultimo fourteen miners came out of straight heading, Lambton Commonage Tunnel, on account of the air being impure in that heading. On the same day an air-shaft was started and is now down about 50 feet. Men have been employed at it day and night. The ground gone through has been hard—nearly the whole of it has had to be blasted. It is expected that the shaft will be through into the workings to-morrow (Saturday), when the defect will be remedied. The ventilation was much improved to-day, owing to a good breeze on the surface blowing directly into the mouth of main tunnel.—J.D., 2/3/83. The Examiner of Coal-fields, B.C., 2/3/83.

The Under Secretary for Mines.—J.M., B.C., 3/3/83. Submitted.—H.W., 5/3/83. Approved.—J. P. ABBOTT, 10/3/83.

---

No. 2.

The Under Secretary for Mines to Messrs. N. Melville and A. A. P. Tighe, Ms.P.

Gentlemen, Department of Mines, Sydney, 1 March, 1883.

Referring to the several matters brought forward by the deputation introduced by you to the Secretary for Mines on the 24th ultimo, I am directed to forward a copy of Mr. Abbott's decision in the matter of the ventilation of the Wallsend Colliery.

I am also directed to state that in Mr. Abbott's opinion the number of men allowed in a district is very clearly defined as being not more than seventy (70) men.

The Examiner has been asked to report upon the charge of the air being bad in the Lambton Commonage Tunnel.

I have, &c.,  
HARRIE WOOD,  
Under Secretary.

No.

## No. 3.

The Under Secretary for Mines to Messrs. N. Melville and A. A. P. Tighe, Ms.P.

Gentlemen,

Department of Mines, Sydney, 12 March, 1883.

Referring to my letter of the 1st instant, I have the honor to inform you that it appears from the report forwarded by the Examiner of Coal-fields, that as regards the Lambton Commonage Tunnel some of the miners did, on the 21st ultimo, come out of the straight heading on account of the impure air in that heading.

That on the same day an air-shaft was commenced, which it was expected would reach the workings on Saturday last.

I have, &c.,

HARRIE WOOD,  
Under Secretary.

## Wallsend Colliery.

### SCHEDULE.

NO.	PAGE.
1. Mr. James Curley, Miners' General Secretary, to the Honorable the Secretary for Mines, calling attention to the defective state of ventilation at the Wallsend Colliery, with minutes and enclosures. 25 January, 1884 .....	146
2. The Under Secretary for Mines to Mr. James Curley, in reply to No. 1. 5 February, 1884 .....	147
3. Telegram from the Examiner of Coal-fields to the Under Secretary for Mines, for correspondence respecting complaint of ventilation at Wallsend Colliery, with minutes. 11 February, 1884 .....	148
4. Mr. James Curley to the Honorable the Secretary for Mines, re Mr. Inspector Dixon's report, with minutes. 13 February, 1884 .....	148
5. Mr. Inspector Dixon to the Examiner of Coal-fields, re Check Inspectors' reports, with minutes. 12 March, 1884 .....	148
6. The Under Secretary for Mines to Mr. James Curley, that all complaints should, in the first instance, be made to the Inspector. 20 March, 1884 .....	149
7. The Examiner of Coal-fields to the Under Secretary for Mines, enclosing copy of Mr. Inspector Dixon's report; also copy of notice served on Mr. J. Y. Neilson, Colliery Manager, with minutes. 18 April, 1884 .....	149
8. The same to the same, forwarding letter and telegram from Mr. J. Y. Neilson, in reply to notice served on him. 22 April, 1884 .....	151
9. The Under Secretary for Mines to the Examiner of Coal-fields, in reply to No. 7. 26 April, 1884 .....	151
10. The Examiner of Coal-fields to the Under Secretary for Mines, enclosing a further report from Mr. Inspector Dixon, also authority for inspection, with minutes. 8 May, 1884 .....	151
11. The Under Secretary for Mines to Mr. James Curley, that the Examiner of Coal-fields reports defects complained of have been remedied. 15 May, 1884 .....	152
12. The same to the Examiner of Coal-fields, that the Honorable the Secretary for Mines approves of Mr. Inspector Dixon's report. 5 August, 1884 .....	152

### No. 1.

Mr. J. Curley, Miners' General Secretary, to The Secretary for Mines.

Sir,

Hamilton, 25 January, 1884.

I have the honor, by direction of the Executive Committee of the Miners' Association, and at the special request of the Wallsend miners, to again respectfully invite your attention to the defective state of the ventilation at Wallsend Colliery. This subject was brought under notice by deputation on November 27th of last year, and again by letter on December 1st. Upon the 11th December a report was promised on the subject, but up to the present date no further allusion has been made to the question, other than a reference to the Glebe Colliery.

The Honorable Minister's attention is again drawn to the enclosed Check Inspectors' reports, numbered 1 and 2 respectively, and which are forwarded at the request of the miners concerned, who have expressed themselves with much surprise that no apparent action has been taken with a view to improve the ventilation of the mine. Trusting immediate attention will be given to the subject-matter of complaint.

I have, &c.,

JAMES CURLEY,  
Miners' General Secretary.

I wish to know what has been done.—J. P. ABBOTT, 28/1/84.

Acknowledge and inform Mr. Curley.—J. P. ABBOTT, 31/1/84.

[Enclosure No. 1.]

Check Inspectors' Reports.

Wallsend Colliery, 5 December, 1883.

Mr. T. Bonsfield's District.

	Cubic feet per min.
Intake Engine-bank .....	26,790
„ Magpie and Donnolly's .....	8,360
„ B Pit Travelling Road .....	12,880
„ Swamp Oak .....	9,500
	57,530

NOTE.—The figures following represent the velocity of air in cubic feet per minute, unless specified differently.

B. Pit, Chinaman's Flat, Nos. 111 to 117.—With 6 men extra, the air-current registered 540 in the same place where we got 585 last month, but we found a current, two cut-throughs from this, registering 1,984, making a total of 2,524 for 14 men, 1 boy, 1 horse, giving each 157½. Thermometer, 76°.

Chinaman's Shaft, from Nos. 117 to 130.—The air-current is very unsteady, and the anemometer would not work on account of improvements at present going on at the bottom of the shaft, and a door is required to convey the air to first numbers on this split, and this will account for about 5,000 cubic feet per man, regularly registered, not appearing among the intakes. There are 24 men, 1 boy, and 1 horse on this split. Thermometer, 71°.

Magpie

Magpie and Donnolly's Flat, from Nos. 130 to 176.—The air-current is 8,360 for 70 men, 5 boys, 4 horses at Magpie, and 22 men, 1 boy, 1 horse at Donnolly's, giving each 81½; but the men at Donnolly's receive only a small quantity of this air, as there are too many men on this split. Thermometer, 71° to 75°.

Lambton back and part of front headings, Nos. 179 to 215.—With 4 men extra, the air-current is 10,560 for 80 men, 7 boys, 4 horses, giving each 116¾. Thermometer, 76°.

NOTE.—There are too many men on this split, and we suggest a door be placed at the bottom of first heading, as the air is very bad from Nos. 180 to 190, and we think a general system of stoppering is necessary.

Lambton front heading, Nos. 216 to 256.—The air-current at main intake, off bank, is 6,240, which is supplemented with 520 at 246 cut-through, making 6,760 for 78 men, 7 boys, 4 horses, giving each 76½. Thermometer, 74° to 78°.

NOTE.—There are too many men on this split.

	Cubic feet.
Upcast Main Furnace.....	34,560
„ Left-hand split .....	14,400
„ Right-hand split .....	19,080
Total ..	68,040

Mr. W. Willis's District.

Wallsend Colliery, 6 December, 1883.

Little Tunnel, Nos. 1 to 35.—The air is very unsteady, and the air-meter would not work. There are complaints about the air supplying Nos. 1 to 16. Other parts of this station there was a fairly good current. Thermometer, 74° to 76°.

No. 1 Tunnel, Nos. 59 to 76.—The intake registers 11,340 for 38 men, 3 boys, 3 horses, giving each 257¾. Thermometer, 74°.

Brookstown Shaft, intake Nos. 77 to 90.—The air-current registered 12,250 for 30 men, 4 boys, 2 horses, giving each a fraction over 340. Thermometer, 76°.

Cemetery Shaft, Nos. 91 to 104.—The air-current is very unsteady, and after various tests we found 2,040 for 29 men, 3 boys, 2 horses, giving each 60 cubic feet per minute. Thermometer, 75°.

Old water pit, Nos. 105 to 110.—Anemometer would not work. Thermometer, 76°.

Furnace upcast, 33,210 cubic feet per minute. Travelling road intake, 5,220 for Nos. 35 to 59, making 48 men, 4 boys, 3 horses, and giving each nearly 95 cubic feet per minute. This is supplemented with two small shafts, which will no doubt give the requisite quantity. Thermometer, 70° to 74°.

The travelling road is in fair order, and a stopping has been put in the stenton opposite No. 104 bord end, and there are no complaints about the timber supply.

JOHN SUMMERS, }  
JAMES LEVER, } Check Inspectors.

Mr. W. Willis's District.

Wallsend Colliery, 9 January, 1884.

Little Tunnel, Nos. 1 to 24.—The air-current would not work the anemometer in any part of this branch of the works, and in the faces of Nos. 17 to 22 inclusive, the air is very light. Thermometer, 72° to 76°.

No. 1 Tunnel, Nos. 42 to 62.—The intake registered 10,880 cubic feet per minute for 40 men, 3 boys, 3 horses, giving each 236¾. Thermometer, 72° to 76°. And we would urge upon the miners to in no case interfere with the stoppings, as there is one between Nos. 48 and 49 broken through, simply to save a little travelling, at the expense of health; and we suggest any miner seeing another commit such acts to immediately report offender to Manager.

Brookstown Shaft, supplying Nos. 63 to 71.—The air-current is 9,500 cubic feet per minute for 22 men, 3 boys, 3 horses, giving each 351¾ cubic feet per minute. Thermometer, 73°.

Sneddon's Dog and Rat intake for Cemetery Flat, Nos. 72 to 90 inclusive.—The air-current is 3,740 cubic feet per minute for 36 men, 2 boys, 2 horses, giving each 93¾. Thermometer, 75°.

A trapper is needed at the far indoor, as the men in Nos. 83 to 90 inclusive, complain, with reason, about the air.

Old water pit, Nos. 91 and 92.—There is no air travelling near the men. Thermometer, 76°.

Travelling road intake for Nos. 25 to 42.—The air-current registered 9,000 cubic feet per minute for 32 men, 3 boys, 3 horses, giving each over 236 cubic feet per minute. Thermometer, 75°.

Furnace upcast, 36,900 cubic feet per minute. Total intakes, 33,120 cubic feet per minute.

Mr. T. Bonsfield's District.

11 January, 1884.

Engine-bank intake.—25,380 cubic feet per minute.

Lambton front heading, Nos. 195 to 238 included.—The air-current is 6,120 cubic feet per minute, and at No. 227 bord end this is supplemented with 1,160 cubic feet per minute for 88 men, 7 boys, 6 horses, giving each 72 cubic feet per minute. Thermometer, 73° to 77°.

NOTE.—We again refer to too many men being on this split.

Lambton back and part of front headings, Nos. 157 to 194.—The air-current registered 10,560 cubic feet per minute, for 74 men, 6 boys, 4 horses, giving each a fraction over 125 cubic feet per minute. Thermometer, 76° to 77°.

Swamp Oak intake, 9,250 cubic feet per minute.

Furnace Upcasts—	Cubic feet per minute.
Main Furnace .....	38,880
Left-hand Furnace .....	18,000
Right-hand „ .....	19,800
Total .....	76,680

Magpie and Donnolly's, Nos. 114 to 150 at Magpie, and Nos. 151 to 156 at Donnolly's.—The intake was 13,680 cubic feet per minute, giving each 138¾ cubic feet per minute for 84 men, 9 boys, 6 horses. Thermometer, 74° to 75°.

NOTE.—There are still too many men on this split.

Chinaman's Flat, Nos. 99 to 112.—The air-registered 3,780 cubic feet per minute for 28 men, 2 boys, 1 horse, giving each 122 cubic feet per minute. Thermometer, 72° to 74°.

Chinaman's B Pit Flat, Nos. 95, 96, 97, and 98.—The air-meter would not work, and after many attempts to find air supply we could not get anemometer to work, and the air at present is very bad, and requires immediate improvement. Thermometer, 77°.

B Pit, travelling road intake.—7,840 cubic feet per minute.

JOHN SUMMERS, }  
JAMES LEVER, } Check Inspectors.

No. 2.

The Under Secretary for Mines to Mr. J. Curley.

Sir,

Department of Mines, Sydney, 5 February, 1884.

I have the honor, by direction of the Secretary for Mines, to acknowledge receipt of your letter of the 25th ultimo, in which attention is again invited to the alleged defects in the ventilation of the Wallsend Colliery, and in reply thereto to invite your attention to my letter of the 28th ultimo, covering a report by Mr. Inspector Dixon on the matter. See No. 1.

I have, &c.,  
HARRJE WOOD,  
Under Secretary.

No.

## No. 3.

## Telegram from The Examiner of Coal-fields to The Under Secretary for Mines.

Newcastle, 11 February, 1884.

PLEASE forward me to-night all the correspondence with respect to Miners' Secretary's complaint, *re* Wallsend ventilation, with Inspector Dixon's report thereon.

JOHN MACKENZIE,  
Examiner of Coal-fields.

The Examiner of Coal-fields.—G.E.H. (for the U.S.), B.C., 11/2/84. Correspondence received to-day, and returned herewith.—J.M., 11/2/84. The Under Secretary for Mines, B.C., 12/2/84.

## No. 4.

## Mr. J. Curley, Miners' General Secretary, to The Secretary for Mines.

Sir,

Hamilton, 13 February, 1884.

See No. 2.

I have the honor to acknowledge receipt of letter, dated 5th February, referring to ventilation of Wallsend Colliery, and drawing attention to a report from Mr. Inspector Dixon on the subject. The Executive Committee cannot regard the report of the Inspector as being anything like satisfactory. It is alleged that the ventilation was good in November, with the exception of a few matters of detail. The Inspector has not specified what he refers to as details; and if too many men and deficient quantity of air in various splits are to be considered as such, the Committee are of opinion the official interference of the Mines Department is required in a different manner to the present report.

The Inspector places great stress upon the large out-put, length of airways, falls, &c., but these are surely no reason why the management are justified in being behind the requirements of the Act. They are only so many proofs why uniformity should be maintained. If the Wallsend Colliery out-put is enormous, the Company have ample means at command. There are also natural facilities in connection with the mine that make it comparatively easy to remedy defects caused by falls. The shaft specially mentioned by the Inspector in his report would probably be sunk in three days by two men. The Committee drew attention to the Check Inspectors' report, and what it revealed concerning the ventilation of Wallsend Colliery. Subsequent to this report by the Inspector, other reports have been referred to by the Committee, all supporting, in the most substantial manner, the allegations made by them in the presence of the Minister. The Committee are not open to the charge of making "sweeping assertions" without inquiry, and as no reference is made by the Inspector in his report to the Wallsend Check Inspectors' report it must be evident it stands without any attempt having been made on his part to impugn it. The Check Inspectors' reports do not deal with "occasional derangements of the ventilation," but the permanent standing violation of the Act. The Committee desire to state that it is their wish to see the suggestion of the Wallsend Manager, "with which Mr. Inspector Dixon quite agrees," carried into effect as early as possible, regarding a joint inspection of the Wallsend Colliery, to consist of the Examiner of Coal-fields, Inspector, Manager of Wallsend Colliery, and Check Inspectors of Wallsend, and of which they will expect notification.

It must, however, appear to the Minister that arranged inspections of this character are not likely to give satisfaction, and cannot take the place of ordinary inspections.

Wallsend miners, quite recently, have come out of the mine because there was not sufficient air for them to work in.

Reference is made to the Newcastle Company's Colliery, and the ventilation is described as being "first-class." A partial report of this mine was made by the Check Inspector on 30th January, 1884. This report has been forwarded to the Committee for consideration, and they observe that in No. 7 heading the anemometer would not register, although tried in three or four different places.

In a part of No. 6 district the air-meter would not work, owing to insufficiency of air. This district the Inspector speaks of as being difficult to ventilate, and if difficult to ventilate, and is not properly ventilated, yet it must also be very difficult for miners to follow their employment, and the sooner some permanent remedy is effected the better.

Mr. Inspector Dixon alludes to the past and present history of the mines in this district, and states "their present state will bear favourable comparison with any part of their past history, both regarding the quantity of air circulating and its distribution in the various parts of the workings." The Committee can only state that, judging of the present state from reports which have been brought under their notice, they cannot do other than express their disappointment and dissatisfaction that the provisions of the Coal Mines Regulation Act, 1876, are not more faithfully enforced.

Trusting the Honorable Minister will deem this subject worthy of consideration,—

I have, &amp;c.,

JAMES CURLEY,  
Miners' General Secretary.

The Examiner of Coal-fields.—H.W., B.C., 3/3/84. Mr. Inspector Dixon for further report.—J.M., 8/3/84.

## No. 5.

## Mr. J. Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Sir,

Glebeland, 12 March, 1884.

I have the honor to acknowledge receipt of papers *re* the ventilation in the Wallsend and Newcastle Companies' Collieries.

In reply thereto, I beg to state that the matters complained of in the Wallsend Check Inspector's reports of November 5th and 6th, 1883, on Willis' side of the workings have since been remedied. In looking over the same report, on Bonsfield's side, I notice they (the Check Inspectors) give a result of 6,000 cubic feet of air per minute, for a total of 90 men, boys, and horses. On the 28th November, same month, I got a result of 9,240 cubic feet of air per minute for a total of 89 men, &c.

In

In the Check Inspection for 30th January, the result for the same split is given at 7,020 cubic feet per minute for a total of 102 men, &c., and in the second split in Lambton headings, 8,640 cubic feet per minute for 115 men, &c.

On the 1st February, I got a result of 9,600 cubic feet of air per minute in the first split for a total of 100 men, &c., or about 96 cubic feet of air per minute for each man, boy, and horse. On the same day, in the second split, Lambton headings, the result was about 11,550 cubic feet of air per minute for a total of about 115 men, &c.

On the 18th February, I again inspected the above-mentioned splits, and in the first split the result was about 10,800 cubic feet of air per minute for a total of 77 men, &c., and in the second split about 10,850 cubic feet of air per minute for about 110 men, &c., being over 98 cubic feet per minute for each man, boy, and horse.

On the 4th December last I wrote to Mr. Neilson about the extra men in the Lambton heading splits, and urging him to have another split made at once. This work was completed, and another split made on the 20th of last month, and, also at my request, preparations are being made to form another split in the Magpie district, which, at the present time, has more men in one split than the Act allows; at the same time I beg to state that the last two results got by me in the Magpie and Donnolly's split showed the quantity of air to be more than the Act requires for every man, boy, and horse.

Regarding the statement made by Mr. Curley that "Wallsend miners quite recently have come out of the mine because there was not sufficient air for them to work in," I know nothing about this matter, as no complaint has been made to me officially or otherwise concerning it.

2. *Newcastle Company's Colliery.*—This colliery has again been referred to, and I again repeat my statement that according to the showing of the Check Inspectors in December last, the ventilation was first-class. I also made an inspection of the same colliery on the 22nd January last, and found the ventilation according to the Act in every working heading in the pit. I am therefore at a loss to account for the statements given by the Check Inspectors to Mr. Curley, as I believe the said inspection was made only about one week after mine.

3. In conclusion, I beg to state that in my opinion this method of doing business is not the correct one. What I mean is simply this, if the miners at any of the collieries have complaints to make concerning anything with which I have to do, I think it would be only common justice to me if they would communicate with me at once, either through the Lodge Secretary, General Secretary, or Executive Committee, which is composed of the three district officers. Then, if I failed to attend to the matter, the Honorable the Minister for Mines could be appealed to. I feel strongly on this point, and fail to see why I should not have the same fair play as an English Inspector, who, in every instance, is first appealed to in any matter concerning the health and safety of the miners, and, from my knowledge of the miners in this district, I believe they would endorse my views on this subject by a large majority.

I have, &c.,

JOHN DIXON,  
Inspector of Collieries.

As I only lately returned from Wollongong to attend to matters requiring immediate attention, including my annual report, I shall not be able to visit the Wallsend Mine at present. I therefore send the Inspector's further report in reply to Mr. Curley's letter of the 13th ultimo, and I cannot help observing that if these complaints were made in the first instance to the Inspector, as suggested by Mr. Dixon, a great deal of time and trouble would be saved to all parties.—J.M., 13/3/84. The Under Secretary for Mines, B.C., 13/3/84.

The attention of the Miners' General Secretary may be invited to the suggestion that all complaints on the part of the miners be made in the first instance to the Inspector, and if not attended to by him they should then be forwarded to the Minister.—H.W., 17/3/84. Submitted. Approved—J. P. ABBOTT, 18/3/84.

#### No. 6.

The Under Secretary for Mines to Mr. J. Curley, Miners' General Secretary.

Sir,

Department of Mines, Sydney, 20 March, 1884.

With reference to complaints as to alleged failure on the part of colliery owners in the Newcastle district to comply with any of the requirements of the Coal Mines Regulation Act, 1876, I have the honor to inform you that the Secretary for Mines is of opinion that in all such cases any complaints on the part of miners should, in the first instance, be made to the Inspector of Collieries, and that if such complaints be not attended to by that officer they should then be forwarded direct to this office.

I have, &c.,

HARRIE WOOD,  
Under Secretary.

#### No. 7.

The Examiner of Coal-fields to The Under Secretary for Mines.

Sir,

Coal-fields Office, Newcastle, 18 April, 1884.

I beg to forward, for the information of the Honorable the Secretary for Mines, a recent report of Mr. Inspector Dixon's on the Newcastle Wallsend Colliery, and copy of a registered notice I have served on Mr. J. Y. Neilson, the Colliery Manager, for non-compliance with sub-sections 3 and 4, section 12, of the Coal Mines Regulation Act, 1876, and shall be obliged by your informing me what further action the Minister desires me to take in matter.

I have, &c.,

JOHN MACKENZIE,  
Examiner of Coal-fields.

At the end of fourteen days from the date of his letter to the Manager, the Examiner should make another inspection, and if the defects have not been remedied he should take the necessary proceedings.—H.W., 22/4/84. Approved—J. P. ABBOTT, 24/4/84.

## [Enclosures to No. 7.]

Mr. J. Dixon, Inspector of Collieries, to the Examiner of Coal-fields.

Sir,

Glebeland, 15 April, 1884.

I have the honor to report inspection of the Wallsend Colliery, as follows:—

1. *Willis's District, 3th instant.*

In the little tunnel I found the air good; there are about 32 men employed in this place. Front heading, from 19 to 24, there are 10 men, supplied with a current of air of about 3,500 cubic feet per minute from the small shaft.

Please note.

From 24 bord to 32 the current of air was about 3,600 cubic feet per minute for 26 men, 2 boys, and 2 horses—total, 30. In the Brookstown shaft split there are about 28 men, 2 boys, and 2 horses—total, 32. For this number I got a result of about 3,150 cubic feet of air per minute, but at the same time found the current to be fluctuating, as there were times when the instrument would not work. There is, as a rule, a good result from this shaft, but at the time of my inspection the current of air seemed to be baffled.

*Cemetery Split.*

Please note.

In this split there are about 62 men. At the far end of the split a new shaft has been sunk, which is known as the Foundry Shaft. At the time of my inspection the current of air from this shaft was almost nil. Hence the major portion of the split was being ventilated from Sneddon's tunnel, at the rate of about 7,800 cubic feet per minute. It will be seen by the above that the current entering this split is more than the minimum quantity for the 62 men, yet I am strongly of opinion that it has too much to do in this split after serving upwards of 20 men, &c., in Sneddon's workings, and certainly think it would be better to shut the air off from Sneddon's and get a current from the Foundry Shaft for the whole of the Cemetery Split.

*Bonsfield's District, April 10th.—Lambton Front Heading, First Split.*

In this split there are about 72 men, 4 boys, and 4 horses—total, 80, supplied with a current of air of about 10,000 cubic feet per minute.

*Lambton Headings, Second Split.*

In this split there are about 34 men, 2 boys, and 2 horses—total, 38; supplied with a current of about 4,000 cubic feet of air per minute. This air was not well conducted into the top heading, as a screen on one of the headings had been knocked down by a train of skips on the previous evening, and had only been put up temporarily, but the overman promised to have it put right at once.

*Third Split, Lambton Headings.*

Please note.

The current of air in this split was about 10,710 cubic feet per minute for about 80 men, 4 boys, and 4 horses—total, 88. It will be seen that the current of air in this split is above the minimum quantity required by the Act, yet I would especially draw your attention to the fact that, although the men on this split were reduced to about 66 after the second or middle split was formed, yet I find that the manager has put more men in and brought the number up to 80. I certainly fail to understand this sort of work, in the face of all the vexation we have lately had in connection with the overcrowding of the splits in the Wallsend Colliery.

*Maggie Split.*

Please note.

In this split there are about 42 men, but the current of air was only about 3,000 cubic feet per minute.

*Donnolly's Split.*

Please note.

In this split there are about 70 men, supplied with a current of air of about 6,300 cubic feet per minute.

*No. 1 Split, Chinaman's District.*

In this district there are about 32 men, supplied with a current of air of about 16,800 cubic feet per minute. The three splits, as given above, are all ventilated from what is known as the Chinaman's Shaft, and, as a rule, there is a plentiful supply for every man, &c., employed in that part of the mine.

Please note.

Yet it will be seen that there is not an equal distribution of the air got from said shaft, as I found both Maggie and Donnolly's short, while a current of about 16,800 cubic feet per minute was going into Chinaman's, for 32 men. The overman was with me when I got the above results, and I requested him (Mr. Maddison) to see Mr. Neilson that evening if possible, and draw his attention to the state of things as I found them.

In the second split, Chinaman's or Cockroach, there are 8 men, 1 boy, and 1 horse. The current of air in this split is about 1,760 cubic feet per minute, which, in my opinion, is not an adequate amount to keep the working places sweet, as the current has a great distance to travel before it reaches the working places, and for part of the distance travels over water.

The travelling roads are in good order, and a good supply of timber at the various stations ready for use.

In concluding this report, I desire to state that I did not see Mr. Neilson concerning the above matters, neither have I written to him, but leave the matter entirely with you to act on this report as you may think best. At the same time, I am of opinion that a letter from you to the Manager would cause matters to be rectified at once, for most of the things complained of by me in the above report can be remedied in a few days.

I have, &amp;c.,

JOHN DIXON,  
Inspector of Collieries.

The Examiner of Coal-fields to Mr. J. Y. Neilson.

Sir,

Coal-fields Office, Newcastle, 13 April, 1884.

In view of a recent report I have received from Mr. Inspector Dixon on the Newcastle-Wallsend Colliery, and in accordance with the provisions contained in the 31st section of the Coal-mines Regulation Act, 1876, I hereby give you notice that you have failed to comply with sub-sections 3 and 4, sections 12, of the said Act, in the third split, Lambton headings, and in Maggie and Donnolly's splits.

Mr. Dixon's report on them being as follows:—

“*Third Split, Lambton headings.*—The current of air in this split was about 10,710 cubic feet per minute for about 80 men, 4 boys, and 4 horses—total, 88. It will be seen that the current of air in this split is above the minimum quantity required by the Act; yet I would especially draw your attention to the fact that, although the men on this split were reduced to about 66 after the second or middle split was formed, yet I find that the Manager has put more men in, and brought the number up to 80. I certainly fail to understand this sort of work, in the face of all the vexation we have lately had in connection with the overcrowding of the splits in the Wallsend Colliery.

*Maggie split.*—In this split there are about 42 men, but the current of air was only about 3,000 cubic feet per minute.  
*Donnolly's split.*—In this split there are about 70 men, and supplied with a current of air of about 6,300 cubic feet per minute.”

2. Mr. Dixon also informs me that he got unsatisfactory results in the ventilation in the Brookstown Shaft split, in which, as a rule, he had previously got good results.

3. That in the Cemetery split there are about 62 men. At the far end of the split a new shaft has been sunk, which is known as the Foundry Shaft, and that, at the time of his inspection, the current of air from the shaft was nil; hence the major portion of the split was being ventilated from Sneddon's tunnel, at the rate of about 7,880 cubic feet per minute. That it will be seen by the above that the current entering the split is more than the minimum quantity for the 62 men, but he was strongly of opinion that it has too much to do in this split, after serving upwards of 20 men, &c., in Sneddon's workings, and thinks it would be better to shut the air off from Sneddon's, and get a current from the Foundry shaft for the whole of the Cemetery split.

4. That on the second split (Chinaman's, or Cockroach) there are 8 men, 1 boy, and 1 horse. The current of air in the split being about 1,760 cubic feet per minute, which, in his opinion, is not an adequate amount to keep the workings sweet, as the current has a great distance to travel before it reaches the working places, and for part of the distance travels over water.

I have, &amp;c.,

JOHN MACKENZIE,  
Examiner of Coal-fields.

No.

## No. 8.

## The Examiner of Coal-fields to The Under Secretary for Mines.

Sir,

Coal-fields Office, Newcastle, 22 April, 1884.

I beg to forward, for the information of the Honorable the Secretary for Mines, a letter and <sup>See 7.</sup> telegram I have this day received from J. Y. Neilson, Esq., with respect to the notice I served upon him on the 18th instant, referred to in my letter to you of the 18th idem, with respect to his non-compliance with sub-sections 3 and 4, section 12, of the Coal-mines Regulation Act, 1876, at the Newcastle-Wallsend Colliery, and asking to be informed what further action the Minister desired me to take in the matter.

I have, &amp;c.,

JOHN MACKENZIE,  
Examiner of Coal-fields.

[Enclosures to No. 8.]

Mr. J. Y. Neilson to The Examiner of Coal-fields.

Sir,

Wallsend, 21 April, 1884.

Your favour of the 18th instant to hand, and contents duly noted.

In reference to your several queries, I shall reply at length in a few days, as your letter is so very strong, and your interpretation of the Act requires some consideration; and as I have a strong opinion of the justice of my position, and as the matter is likely to receive the serious consideration of other parties concerned, I will give you a detailed reply in a few days.

If you refer to the last Check Inspectors' Report on the mine you will find all things satisfactory, even to the miners.

I have, &amp;c.,

J. Y. NEILSON.

Telegram from Mr. J. Y. Neilson to The Examiner of Coal-fields.

Wallsend, 22 April, 1884.

This morning I have made a thorough examination of Lambton headings, and find that my orders have been entirely disregarded in respect to No. 3 split. I promise you the matter will be all put right in seven days. I leave for Sydney to-night, and will be at the "Great Northern Hotel" at 10 p.m., and would like to see you.

J. Y. NEILSON.

Telegram from The Examiner of Coal-fields to Mr. J. Y. Neilson.

Newcastle, 22 April, 1884.

Your telegram received respecting No. 3 split, and promise to have it put right in seven days. Regret that I am unable to comply with your desire to see you at "Great Northern" 10 to-night.

J. MACKENZIE,

Examiner of Coal-fields.

## No. 9.

## The Under Secretary for Mines to The Examiner of Coal-fields.

Sir,

Department of Mines, Sydney, 26 April, 1884.

Referring to your letter of the 18th instant, forwarding Mr. Inspector Dixon's report on the Wallsend Colliery, and copy of your letter to Mr. Neilson, the Manager of that Colliery, pointing out the defects in the 3rd split, Lambton headings, and in Magpie and Donnolly's splits, and I am directed to request you to be good enough, at the expiration of fourteen (14) days from the date of your letter to Mr. Neilson, to cause another inspection of the Colliery to be made, and if the defects referred to have not been remedied, you should take the necessary proceedings.

I have, &amp;c.,

HARRIE WOOD,  
Under Secretary.

## No. 10.

## The Examiner of Coal-fields to The Under Secretary for Mines.

Sir,

Coal-fields Office, Newcastle, 8 May, 1884.

Referring to your letter of the 26th ultimo, informing me that you were directed to request <sup>See No. 9.</sup> me, at the expiration of fourteen days from the date of my letter of the 18th ultimo, to cause another inspection to be made of the Newcastle-Wallsend Collieries, I have now the honor to forward, for the Minister's information, a further report from Mr. Inspector Dixon, dated the 5th instant, from which it will be seen that Mr. Neilson has remedied the defects complained of, and that the provisions of the Coal-mines Regulation Act are now complied with.

I have, &amp;c.,

JOHN MACKENZIE,  
Examiner of Coal-fields.

[Enclosure to No. 10.]

Mr. J. Dixon, Inspector of Collieries, to The Examiner of Coal-fields.

Sir,

Glebeland, 5 May, 1884.

According to instructions from you, I proceeded to Wallsend Colliery on Saturday last, 3rd instant, and made another inspection of the places complained of by me in my report dated 15th April last, and am pleased to be able to report that, for the most part, the matters complained of have been remedied, as the following will show :-

*Willis's District.*

1. In the Brookstown shaft split a steady current of air, of above the minimum quantity, is now supplied for the 32 men, &c., from a new shaft lately sunk to ventilate this split.

*Cemetery Split.*

2. The top end of this split is now ventilated from the Brookstown Shaft instead of from Sneddon's Tunnel. There are now only about 24 men on this split, part of which is ventilated from Sneddon's and part from the Foundry Shaft. I may here state that preparations are being made to shut the whole of Sneddon's air off and ventilate the whole of this split from the Foundry Shaft, as suggested by me, and I expect the arrangements to be completed this week. However, as it is, the matter complained of by me has been remedied, inasmuch as the air from Sneddon's tunnel is only supplying about 24 men in Cemetery split, instead of about 62, as before.

*Bongfield's*

*Bonsfield's District.*

3. Lambton heading, 3rd split.—The number of men on this split have now been reduced to 68 instead of 80 men as reported by me on 15th April last.

4. Magpie back heading.—In this split the current of air was about 6,000 cubic feet per minute for about 42 men, being about 3,000 cubic feet more than I got on my previous inspection.

5. Magpie front heading and Donnolly's cross-cut.—As there has been some alteration made at the entrance to this split since my previous inspection, I could not get the whole of the intake air in one volume. But, judging from the result which I got on the front heading (about 5,000 cubic feet of air per minute), and from the amount of scaling through the frame-work of one of the bearing-up doors, I am of opinion that the total quantity of air going into this split was over 7,000 cubic feet per minute, for about 68 men. The air scaling through the door would go on to 12 men. I expect that the frame-work of this door will be plastered to-day, and the whole of the current sent down the front heading then away through the whole of the split.

*Cockroach District.*

6. I found the current of air in this split to be about 1,920 cubic feet per minute for a total of 10 men, &c., being about 160 cubic feet per minute more than the quantity given in my previous report. Regarding this place, Mr. Neilson has decided to take the air from Chinaman's split to ventilate it, and shut the air off from the Ballarat Shaft, which air has hitherto been supplying the Cockroach split.

This decision is heartily approved of by the men working in the above split, and Mr. Neilson gave me his promise that this should be done in a week, or less, if possible.

I have, &c.,

JOHN DIXON,

Inspector of Collieries.

The Under Secretary of Mines to The Examiner of Coal-fields.

Sir,

Department of Mines, Sydney, 26 April, 1884,

Referring to your letter of the 18th instant, forwarding Mr. Inspector Dixon's report on the Wallsend Colliery, and copy of your letter to Mr. Neilson, the Manager of that Colliery, pointing out the defects in the third split, Lambton headings, and in Magpie and Donnolly's splits, I am directed to request you to be good enough, at the expiration of fourteen days from the date of your letter to Mr. Neilson, to cause another inspection of the Colliery to be made, and if the defects referred to have not been remedied, you should take the necessary proceedings.

I have, &c.,

HARRIE WOOD,

Under Secretary.

Mr. Inspector Dixon to make another inspection on May 3rd, and report whether the defects complained of have been remedied.—J.M., 29/4/84. Secn.—J.D., 29/4/84.

Will make another inspection on May 3rd, and report whether the defects complained of have been remedied.—J.D., 29/4/84. The Examiner of Coal-fields, 29/4/84.

## No. 11.

The Under Secretary for Mines to Mr. J. Curley, Miners' General Secretary.

Sir,

Department of Mines, Sydney, 15 May, 1884.

With reference to your letter of the 13th February last, respecting the defective ventilation in the Newcastle-Wallsend Colliery, I have the honor to inform you that the Examiner of Coal-fields has reported that the defects complained of have been remedied, and the provisions of the Coal Mines Regulation Act are now being complied with.

I have, &c.,

HARRIE WOOD,

Under Secretary.

See No. 4.

## No. 12.

The Under Secretary for Mines to The Examiner of Coal-fields.

Sir,

Department of Mines, Sydney, 5 August, 1884.

Referring to your letter of the 8th May last, covering a report from Mr. Dixon, an Inspector of Collieries, to the effect that the defects complained of in the case of the Newcastle-Wallsend Colliery have been remedied, I have the honor to inform you that the Secretary for Mines has approved of that report.

I have, &c.,

HARRIE WOOD,

Under Secretary.

See No. 10.

[Two plans, Nos. 10 and 11.]

## H.

*The Newcastle Agreement.*

MEMORANDUM of Agreement made the \_\_\_\_\_ day of \_\_\_\_\_, one thousand eight hundred and eighty-eight, between the Australian Agricultural Company, the Newcastle-Wallsend Coal Company, the Scottish-Australian Mining Company, Messieurs James and Alexander Brown (of Newcastle), William Laidley, Esq. (of Sydney), the Newcastle Coal-mining Company (Limited), the New Lambton Colliery, the Ferndale Colliery, the Burwood Coal-mining Company, the Stockton Coal Company, the Hutton Coal-mining Company, hereinafter called the Associated Masters of the one part, and the District Officers of the Miners' Association of the Hunter River District and the Delegates employed at the various collieries whose proprietors are parties to this agreement, of the other part.

WHEREAS it is considered expedient to enter into an agreement for the purpose of regulating the rate of wages to be paid at the collieries belonging to the abovenamed parties of the first part, for hewing coal and for other work usually done and performed by the miners, the hours of labour to be observed at the said collieries, and the mode of settling any dispute that may arise in reference thereto: Now, therefore, it is mutually agreed and declared by the Associated Masters of the one part, and the officers and delegates representing the miners working at the collieries comprised in the Associated Northern Collieries of the other part—

1. Subject to the provisions herein contained, the wages paid at the said collieries shall be regulated by the selling price of coal, and shall rise and fall with it; provided that the selling price shall be fixed from time to time by the Associated Masters.

2. The standard hewing price shall be 4s. 2d. per ton of clean round coal when the selling price of round coal is 11s. per ton; and the standard price for yard work shall be that paid at the various collieries abovenamed prior to 1st August, 1888, when the selling price of round coal was 11s. per ton—excepting in the case of 6-yard bords, the basis of payment for which is hereinafter specially provided for; and the standard price for filling small coal by the miners shall be that paid at the said various collieries prior to the said 1st August, 1888, when the selling price of small coal was 5s. 6d. per ton.

3. Wages shall rise and fall upon the scale hereinafter mentioned—provided that the said scale shall not operate below the point at which the several rates shall stand when the selling price of round coal is 9s. per ton, and of small coal 4s. 6d. per ton, which rates shall be the minimum wages paid for working what is hereinafter defined to be the standard seam.

(a) Hewing by the ton—1d. for every 3d. in the selling price of round coal.

(b) Yard work—1d. per yard for every 3d. in the selling price of round coal, in the case of the maximum rates paid for headings, and a proportionate rate in the case of other yard work for which lower rates are paid.

(c) Filling small coal, either in places wrought by the yard or in wide places 1½d. per ton for every 1s. in the selling price of small coal.

4. The standard seam to be worked for the standard hewing price hereinbefore provided in clause 2 of this agreement shall be defined as follows, viz.:—

Five feet of coal, including what are known as penny bands, shall be the minimum standard height; and in cases where the seam is less than the said minimum standard height, 1d. per ton for every inch by which the seam is less than the said minimum shall be paid in addition to the said standard hewing price—provided always that when refuse, commonly known as jerry, morgan, or myrtle, shall be met with, the same shall be separated from the coal, and thrown aside by the miners; and for the additional work so entailed, payment shall be made on the following scale, that is to say:—

Where the seam (including the ordinary penny bands) is less than 5 feet in height, any thickness of the said refuse up to 4 inches shall be worked and thrown aside free of charge; above 4 inches and up to 9 inches in thickness, ¾d. per ton for each inch in excess of 4 inches shall be paid in addition to the hewing price of coal; above 9 inches in thickness, ½d. per ton for each inch in excess of 9 inches shall be paid in addition to the said hewing price.

Where the seam (including the ordinary penny bands) is from 5 feet to 6 feet in height, any thickness of the said refuse up to 5 inches shall be worked and thrown aside free of charge; above 5 inches and up to 9 inches in thickness, ¾d. per ton for each inch in excess of 5 inches shall be paid in addition to the hewing price of coal; above 9 inches in thickness, ½d. per ton for each inch in excess of 9 inches shall be paid in addition to the said hewing price.

Where the seam (including the ordinary penny bands) is 6 feet and upwards in height, any thickness of the said refuse up to 6 inches shall be worked and thrown aside free of charge; above 6 inches and up to 9 inches in thickness, ¾d. per ton for each inch in excess of 6 inches shall be paid in addition to the hewing price of coal; above 9 inches and up to 18 inches in thickness, ½d. per ton for each inch in excess of 9 inches shall be paid in addition to the said hewing price; above 18 inches in thickness, ¼d. per ton for each inch in excess of 18 inches shall be paid in addition to the said hewing price.

5. The hewing wages, fixed and provided by any part of this agreement, shall include the cutting up on one rib of so much of the coal seam as lies above the morgan band, such cutting to be done after the most approved method of mining in the district; and in the case of any colliery at which such cutting has not heretofore been a practice, or has not been provided for by the special or local rules, no extra payment shall be due to the miners for cutting; but the same shall be done, notwithstanding, on its being required by the manager, overman, or deputy, unless brass occurs in the line of cutting to a total thickness (not including bands) of 1½ inch.

6. The hewing price for taking down tops shall be 3d. per ton less than the current standard hewing price.

For lifting bottoms the price shall be 2d. per ton less than the current standard hewing price, where the bottoms are 3 feet and upwards in thickness; and where the bottoms are less than 3 feet in thickness, the price shall be the current standard hewing price.

The hewing price for drawing pillars shall be 2d. per ton less than the price payable for hewing coal in the adjacent bords.

Yardage shall be paid for driving 6-yard bords at the rate of 2s. 6d. per lineal yard in a clean seam.

7. The daily hours to be observed at the said collieries for drawing coal, exclusive of the time required for men riding in the shaft, shall be eight.

8. All disputes which may arise between the parties hereto, whether concerning one individual colliery or more, shall be submitted for settlement to a referee, to be appointed as hereinafter provided, whose decision shall in all cases be final.

It is mutually agreed that no person having direct personal interest in the coal trade shall be eligible for such appointment.

9. For the purpose of carrying out the foregoing method of settlement of disputes, a referee shall be appointed by the favour of His Honor the Chief Judge in Equity. The referee shall hold office for a period of twelve months, but shall be eligible for re-appointment; and in the event of his death, or inability, or unwillingness to discharge the duties of his office, as well as upon expiry of his term of office, a successor shall be appointed in similar manner to that above provided for the first appointment. The referee shall appoint times and places for hearing and inquiring into disputes. He shall have power to call for any evidence, whether oral or documentary, as may appear to him to be necessary, or to reject evidence which may appear to him to be immaterial or superfluous. His rule shall decide the order of procedure, and generally he shall have all powers requisite for full inquiry and prompt settlement of all disputes arising between the parties hereto, and his award in regard to the subject matter of the dispute shall be observed by both of the disputing parties. Each party shall pay his own costs. The referee's salary shall not exceed forty guineas for each day of sitting in the Referee's Court. The amount of such salary shall be fixed by the said Chief Judge in Equity, and shall be contributed by both of the parties hereto in equal proportions, to be paid in advance or not, or partly in advance or not, and in such manner and with such directions as may be required by the referee. The failure to contribute to this salary

salary as required, or to observe the awards, orders, or directions of the referee, shall have the effect of enabling either party to thereupon put an end to this agreement. Each party to any matter of dispute brought before the referee for examination and decision shall have the right to nominate an assessor (no member of Parliament shall be eligible for nomination) to sit with the referee at any inquiry, for the purpose of affording him assistance upon any technicalities which may require the knowledge of experts; but it shall be clearly understood that the assessors' duty shall be simply that of advisers to the Court. It is expressly declared that they shall take no part in, or have power to interfere in any respect with, the conduct of the business before the Court, or with the control of its proceedings hereinbefore given to the referee.

It shall be optional with each party to a dispute to be represented before the referee by not exceeding four persons as managers of their case.

All inquiries under this clause shall be made, as far as practicable, in conformity with the provisions of the Act to make arbitrations more effectual (31 Vic. No. 15).

10. Consideration shall be paid only for the following services or deficiencies in the workings:—

- (a) Stone or roof coming down extraordinary.
- (b) Crossing faults.
- (c) Taking out water, as provided by the local rules at each colliery.
- (d) For an unusual quantity of water coming from the roof.
- (e) Cutting sumps, if ordered by the manager, overman, or deputy.
- (f) Soft or tender coal in close proximity to faults, and tender coal extraordinary in other places.
- (g) For sets of timber, where slabs are used as caps, the consideration shall be 1s. per set.
- (h) For filling dirt, 6d. per skip; and for removing dirt from pillar sides where necessary.

In the event of disputes arising as to the value of any of the services or deficiencies mentioned in the foregoing part of this clause, such dispute shall be settled by local arbitration; the arbitrators for such purpose being two persons, *employés* of the colliery, respectively appointed, one each, by the owner or manager and the miners at the colliery where such dispute may occur, and in the event of the arbitrators not agreeing they shall appoint an umpire, whose decision shall be final; but failing an appointment of an umpire by the arbitrators for seven days, he shall be appointed by the referee, whose fee for such appointment shall be £1 1s.

11. All established customs of the district, except such as are inconsistent with the provisions of this agreement, shall continue to be observed until altered by mutual consent of the parties hereto. This clause shall not be construed as prohibiting, at any of the said collieries, the establishment of the practice of cutting the coal above the morgan.

It shall not be permissible, on the grounds of custom, to lay a colliery idle on two days' notice on any but public holidays.

12. Local agreements shall be entered into at the various collieries between the manager and miners employed thereat, in accordance with this general agreement, for their mutual guidance.

13. In the event of any colliery commencing to work the coal by the long wall or any other system not generally adopted in the district, the rates to be paid for hewing coal, driving levels, packing, and all other work incidental to such system, in default of agreement between the manager and miners, may be fixed by local arbitration as provided in clause 10; or, failing settlement by that method, the said rates shall be fixed by the Referee's Court provided by clauses 8 and 9.

14. One ton of fire coal shall be supplied each month to each householder amongst the miners, but no ticket for fire coal shall have currency for longer than two months.

15. This agreement shall be terminable on infraction of its conditions by fourteen days' notice from either of the parties to the other, but otherwise shall continue in force until the 31st December, 1889; and thereafter it shall continue in force from year to year, unless on or before the 30th September, 1889, or any subsequent 30th September, notice shall have been given, in writing, of its discontinuance on the 31st December then next ensuing.

As witness the hands of the parties,—

Australian Agricultural Company (by their Agent and Attorney), Jesse Gregson, General Superintendent A.A.Co.

For the Newcastle-Wallsend Coal Company, F. W. Binney, Secretary.

For the Scottish-Australian Mining Company (Limited), A. Shannon, Manager.

James and Alexander Brown, for Duckenfield and Brown's Collieries.

For W. Laidley, James Fletcher, Co-operative Company.

Newcastle Coal-mining Company (Limited), Stewart Keightley, Manager.

New Lambton Colliery, Alexander Brown.

For Ferndale Colliery Company, George Hewison, Secretary.

For the Burwood Coal Company (Limited), Henry Stokes, Director.

For the Hetton Coal-mining Company (Limited), W. A. Steel, Managing Director.

Joseph Middleby, Co-operative Lodge.

Alfred George Hamilton, Wallsend Lodge.

Henry Hanlon, Lambton Lodge.

James Errington, Stockton Lodge.

John A. Davidson, Borehole Lodge.

Albert D. Jones, Glebe Lodge.

John Thwaites, Burwood Lodge.

William Ridings, Lambton C Pit Lodge.

John Jack, Hetton Lodge.

David Durie, Back Creek and Duckenfield Lodge.

Thomas Thomas, Ferndale Lodge.

Ralph Goundry, District Chairman.

William Hunter, District Treasurer.

James Curley, General Secretary.

## I.

*Reports of Examiner of Coal-fields and Inspectors of Collieries on the Stockton Colliery.*

Stockton Colliery Inspection, Stockton.

Sir,

Coal-fields Office, Newcastle, 15 December, 1893.

We have the honor to report inspection of the above colliery on Wednesday and Thursday, the 13th and 14th instant.

1. On the first day the mine was at work, and we commenced our inspection by visiting the forty-two men, four boys, and four horses at work in the Gardiner's heading district.

The quantity of air was 6,480 cubic feet per minute, which gave an average of 129 cubic feet each.

We noticed that a few bords in the south-west corner of this district, some of which are now being driven westward towards the Hunter River, have crossed a north and south fault with an upthrow of from 6 to 9 feet, going west.

The inclination of the seam adjacent to this fault is very irregular, and the roof is very soft, and in two of the bords recently abandoned very wet. All these places are well timbered with strong and substantial props and slabs.

2. We next visited the three brick and cement dams, which we found in apparently good condition. The feeder of water coming through the pipe in each dam is about the same as when the dams were built in February last, totalling upwards of 150 gallons per minute.

Leaving there we travelled through the remainder of this district. The bords and headings driven herein since work was resumed in March last have from 18 inches to 2 feet of the upper part of the seam left as a roof, and in spite of this a fall of sand roof (containing water) took place where one of the bords exposed one of the two dykes passed through by the main headings. This fall is now barricaded with props and slabs.

Proceeding along the main headings we found that more workings had been opened out beyond, and on the in-by side of the dykes. All are now abandoned, and thickly studded with timber.

The immediate roof here is the 18 inches or 2 feet of coal previously referred to, and it is extremely soft and wet.

3. The whole of the seam here has a very dirty and inferior appearance, and looks like as if nearing the outcrop.

4. On the following day we continued our inspection from this point right along the face of the eastern workings, known as Kelly's heading district. About a dozen bords nearest to the main headings and Gardiner's heading district are now abandoned, and, like the other abandoned places, very thickly timbered.

The inclination is very irregular, the roof wet, soft, and traversed by faults and dykes.

5. With regard to the workings in the company's M.P. 130, under the ocean, the method of working is the same as in other parts of the mine, viz., 6-yard bords and 6-yard pillars, which, as regards pillars, is in contravention to the conditions of the permit, which are as follows:—"The minimum width of pillars to be 8 yards," and left unwrought.

The permit also provides that "In one road of every pair of winning off or leading headings a bore shall be kept going 10 feet in advance, &c."

Of the two pairs of winning places driven under the ocean one pair had a borehole, but the other pair, which were stopped at a dyke, and very wet, had none.

The permit also provides that "the strata overlying the coal-seam shall be bored through, and proved a minimum thickness of 30 feet at the face of the leading headings or levels so soon as they have been driven 100 yards in advance of the working bords," but no hole of the kind has been put in to prove the thickness of the overlying strata.

The whole length of main engine plane and cross-cuts were in good condition, and there was a plentiful supply of timber on hand ready for use.

6. In conclusion, we beg to state that after most careful inspection and due consideration of all the conditions in connection with the underground workings of this colliery, we find nothing that would justify us in altering the opinion expressed by us and recorded in the book at the company's office on the 18th February last, and before leaving the office on the 14th instant we recorded the following report in a book kept for that purpose:—

Our inspection of the above colliery yesterday and to-day has revealed nothing that would justify us in altering the opinion expressed by us, and recorded in this book, on the 18th February, 1893.

Stockton Colliery, 14 December, 1893.

JOHN DIXON,  
WM. HUMBLE,  
Inspectors of Collieries.

We have, &amp;c.,

JOHN DIXON,  
WILLIAM HUMBLE,  
Inspectors of Collieries.

Stockton Colliery Inspection.

Sir,

Coal-fields Office, Newcastle, 9 January, 1893.

I have the honor to report inspection of the above colliery on the 5th and 6th instant.

The quantity of air in each split was as follows:—

*No. 1 Split* (Gardiner's heading district).—Fifty men, three boys, and three horses employed, and supplied with 6,200 cubic feet per minute, being an average of 110 cubic feet each.

*No. 2 Split* (Kelly's heading district).—Fifty-four men, four boys, and four horses employed, and supplied with 6,460 cubic feet per minute, being an average of 10½ cubic feet each. This current of air was not sustained for more than about half the distance of the split, the latter half of the men being without any perceptible current. In consequence of this, I have served the manager with notice to have a remedy effected without delay. [Copy of notice annexed.]

*No. 3 Split*.—Sixty-four men, three boys, and three horses employed, and supplied with 7,140 cubic feet per minute, being an average of 102 cubic feet each.

*No.*

*No. 4 Split.*—Twenty men, two boys, and two horses employed, and supplied with 3,600 cubic feet per minute, being an average of 150 cubic feet each.

3. On the first day of inspection I travelled the branch engine-plane leading up to the No. 45 top-drive district that collapsed some few months ago. I found it quite quiet, and in much the same condition as when I saw it last.

4. The district known as Gardiner's heading (No. 1 Split) is very wet, the roof of almost all the bords and headings "shedding" water freely. In several of the old bords a thickness of about 12 feet of roof-stone has fallen. Water is dropping heavily from the top of each cavity thus produced, but not more so than was the case when the falls took place almost a year ago.

5. On both days of inspection I noticed in the districts now at work several recently formed pillars that were only 4 yards in width instead of at least 6 yards, and that several bords were from 6½ to 7 yards wide. This mode of working where the overlying strata is upwards of 300 feet thick does not, in my opinion, leave sufficient coal in the pillars to permanently secure the roof, and if such mode is continued it may create another crush that might be speedily followed with disastrous consequences to all persons employed in the mine. I have, therefore, forwarded a letter to the manager, drawing his attention to the matter, and urging him to take steps without delay to prevent a recurrence of the same.

6. I also forwarded notifications to him concerning the insufficient number of refuge-holes, and the dirty condition of those now in existence by the sides of the new cross-cut engine-plane, and the absence of fencing to the fly-wheel of the Priestman's oil-engine, that is now pumping water from the No. 42 district, and copies of such are herewith annexed.

7. On the second day I travelled the abandoned workings of the No. 3 district near to the shaft. I found everything in fair order and condition.

8. Water to depth of about 12 inches is still on the engine-plane, about 450 yards from the shaft. A new pump is now being placed at the bottom of the upcast shaft, which is expected to be ready for work in a short time and to deal effectually with this and other waters that have been troublesome for a long time.

I have, &c.,

WILLIAM HUMBLE,

Inspector of Collieries.

John Mackenzie, Esq., Examiner of Coal-fields, Sydney.

Sir,

Wickham, Newcastle, 6 January, 1893.

On my inspection of the Stockton Colliery, to-day I found that a portion of the engine-plane (which is also a travelling road) situated between the junction formed by the straight up and the new cross-cut main roads, and the No. 42 flat was not provided "with sufficient places of refuge at the sides of such planes at intervals of not more than 20 yards, and such places of refuge shall be at all times kept clear," in accordance with the provisions contained in section 12, sub-section 2, of the Coal Mines Regulation Act, 1876.

2. In addition to the above, several places of refuge that are in existence were not "kept clear," but were partly blocked up with loose timber, stone, rubbish, &c.

3. This, you will observe, is a contravention of the above-quoted sections of the Act, to which I now draw your attention, and request you to effect a remedy without delay.

I have, &c.,

WILLIAM HUMBLE,

Inspector of Collieries.

D. McAuliffe, Esq., Manager, Stockton Colliery, Stockton.

Sir,

Wickham, Newcastle, 6 January, 1893.

On my inspection of the Stockton Colliery to-day, I found that the fly-wheel of the "Priestman's oil-engine," which is pumping water from the No. 42 district, was not fenced in accordance with the provisions of section 12, sub-section 17, of the Coal Mines Regulation Act, 1876.

2. This, you will observe, is a contravention of the above-quoted sections of the Act, to which I now draw your attention, and request you to effect a remedy without delay.

I have, &c.,

WILLIAM HUMBLE,

Inspector of Collieries.

D. McAuliffe, Esq., Manager, Stockton Colliery, Stockton.

Sir,

Wickham, Newcastle, 6 January, 1893.

On my inspection of the Stockton Colliery yesterday, I found that the district known as Kelly's heading was not adequately ventilated.

2. The intake current of air measured 6,460 cubic feet per minute, for fifty-four men, four boys, and four horses, but this current of air did not "sweep undiminished along the air-way past each working-place," as provided for by section 12, sub-section 3, of the Coal Mines Regulation Act of 1876.

3. The current of air was fairly well sustained until about the middle of the district was reached, but from this point to the last working-place, adjacent to the return, there was no observable velocity of air-current, certainly not one that could be measured by the anemometer.

4. This, you will observe, is not in accordance with the provisions of the above-quoted sections of the Act, to which I hereby draw your attention, and request you to effect a remedy without delay.

I have, &c.,

WILLIAM HUMBLE,

Inspector of Collieries.

D. McAuliffe, Esq., Manager, Stockton Colliery, Stockton.

Sir,

Wickham, Newcastle, 7 January, 1893.

On my inspection of the Stockton Colliery, on the 5th and 6th instant, I found that in each of the working districts there were several recently formed pillars only 4 yards instead of at least 6 yards in width, whilst many of the bords were from 6½ to 7 yards wide.

2. This irregular method of working (which leaves considerably less than 50 per cent. of coal as pillars) does not, in my opinion, provide sufficient and secure support for the roof, for you must bear in mind that during the last four years three distinct and separate parts of this same mine have collapsed from the same cause.

3. Taking into account the fact that in the districts now at work the overlying strata is upwards of 300 feet in thickness, some of which is known to be sand and other alluvial deposits saturated with the tidal waters of the ocean and the Hunter River, I consider that a continuance of this practice tends greatly to create another crush that might be followed by disastrous consequences to all persons employed in the mine.

4. Having thus drawn your attention to this very grave matter, I trust you will take immediate steps to prevent a recurrence of the same.

I have, &c.,

WILLIAM HUMBLE,

Inspector of Collieries.

D. McAuliffe, Esq., Manager, Stockton Colliery, Stockton.

Mr. Inspector Humble will please make another inspection of this colliery to see whether the matters complained of have been remedied.—J.D., 13/1/93. Mr. Inspector Humble, B.C.

On further inspecting this colliery to-day, I found that the matters complained of in paragraphs 2 and 6, viz.: Inadequate ventilation, an insufficient number of refuge holes on the engine-plane, and the absence of fencing to the fly-wheel of the "oil engine" had been remedied. With regard to the first, several additional stoppings and doors have been fixed, which carry the current of air along the innermost cut-through past each working place. The volume of air passing the last pair of men on this split to-day was equal to the volume entering, and on the middle of the split. 2nd. Places of refuge are now to be found at less 20 yards apart, several new ones having been made since the notice was served. All are now clear and in good order. 3rd. The fly-wheel of the "oil-engine" is now fenced with wood framing.—W.H., 16/1/93. Mr. Inspector Dixon.

The Examiner of Coal-fields.—J.D., 17/1/93. Mr. Inspector Dixon (for Mr. Humble, to state on his next inspection whether the matter complained of in paragraph 5 has been attended to by the Manager.—J.M., B.C., 18/1/93. Mr. Inspector Humble.—J.D., 19/1/93. I have not found any more pillars or bords similar to those complained of in paragraph 5 of this report.—W.H., 20/2/93. Mr. Inspector Dixon. The Examiner of Coal-fields—J.D., 21/2/93.

#### Stockton Colliery Inspection

##### Report on outburst of Water and Gas from the Roof of the Bottom Seam.

Sir,

Coal-fields Office, Newcastle, 21 February, 1893.

In consequence of receiving the following telegram—"Come over to Stockton Mine at once Mr. Dixon is here.—D. McAuliffe, Stockton"—on Friday evening, the 17th instant, I at once went to Stockton Colliery office, and there met Mr. Inspector Dixon, who had also been called there by a similar telegram a couple of hours previous to my arrival.

2. Mr. D. McAuliffe, the manager, then informed me that between 6 and 8 o'clock that morning a large feeder of water was observed coming on to the main flat of Gardiner's heading district from some part of the same district.

Search being made, it was soon found that this water and a considerable quantity of sand and clay were coming off at a fall of roof in one of the abandoned bords.

The flow continuing, without any perceptible diminution, the manager, about 2 o'clock in the afternoon, withdrew all workmen from the mine, except a few needed for "inquiry into the cause of danger and the removal thereof."

3. Shortly after this was done, James Leitch, the overman, approached the fall with his naked light, and was burnt on the face and arms by explosive gas. He is not, I understand, seriously burnt, and will, I hope, be alright again in a short time.

4. About 6 o'clock in the evening Mr. Inspector Dixon and myself, accompanied by Messrs. McAuliffe and McDonald, the manager and night-shift overman, descended the shaft with locked safety-lamps, and inspected the district. We found no gas of any kind, but a large volume of water (difficult to measure, or even estimate, but certainly not less than 150 gallons per minute) was still issuing from the top of the fall, bringing with it large quantities of sand and clay, that were rapidly silting up the adjacent bords and cut-throughs.

5. The explosive gas that burnt Leitch probably came off from the same orifice as the water, and immediately after the latter had made its first outburst.

It may have had its origin in the black-shale bed overlying the seam, where it was probably stored under great pressure, which would be instantly reduced when the water commenced to flow, thus allowing the gas by its expansion to exude and enter the workings; or, what is still more probable, the gas may have been held in solution by the water whilst under great pressure, and given off when such pressure was reduced.

6. On the following morning (Saturday) we again visited the colliery, and before descending the shaft entered the following report in a book kept in the office for that purpose:—

Stockton Colliery, 18 February, 1893.

We hereby certify that last night, the 17th of February, we carefully inspected with locked safety-lamps a portion of the Gardiner's heading district of the Stockton Colliery.

2. We found no explosive gas, but a large volume, together with sand and clay, was coming off at a fall of roof in one of the abandoned bords in that district.

3. The manager (Mr. D. McAuliffe) informed us that a few hours after the issue of water was first observed yesterday, he withdrew all workmen from the mine, except a few for the purpose of exploration, one of whom, James Leitch, the overman, was burnt by explosive gas when in the immediate vicinity of the fall.

4. We are, therefore, of opinion that, in accordance with the provisions of section 12 (sub-section 5) of the Coal Mines Regulation Act, 1876, no "workman shall, except in so far as is necessary for inquiry into the cause of danger, or for the removal thereof, or for exploration, be readmitted into the mine, or such part thereof, until the same is stated by the Examiner or Inspector to be safe.

7. Accompanied by Mr. McAuliffe we then descended the shaft and made another inspection of the district with locked safety-lamps. We found nine or ten men at work with safety-lamps, putting in dams, composed of slabs and sandbags, on each side of the fall, with a view of preventing the flow of detritus which, it was hoped by the manager, would ultimately choke the orifice, and probably stop the flow of water. Five or six more men were employed in the adjacent bords putting in extra timber to secure the roof.

We found no gas or sign of any, and very little change in the quantity of water flowing; if anything there was a decrease, but nothing to speak of.

The

The sand-bags had stopped to some extent, the flow of sediment, but a deal was still being brought away with the water.

It is the intention of the manager to continue putting in those dams, one in front of the other, until the flow of sediment is stopped, and then build brick dams in front of all.

8. The roof of almost all the workings in this district is very wet and soft. Several falls of black shale roof, from 8 to 12 feet in thickness, are to be found in the abandoned bords. From the top of these falls water, highly charged with oxide of iron, is dropping heavily. Several of my previous reports refer to them, and the workings of this and other districts then at work formed the subject of a letter dated 7th of January, 1893, that I addressed to the manager drawing his attention to the fact that several of the recently formed pillars were only 4 yards in width, instead of at least 6, and many of the bords from 6½ to 7 yards wide.

My report on my last ordinary inspection with copies of this and three more letters sent to the manager, I herewith forward to you with the present report.

9. The point of issue of the water now flowing is situated about 86 chains north of the present downcast and upcast shafts, and about 29 chains south-west of the sinking shaft now down about 130 feet.

The flow of water is undoubtedly coming from the thick alluvial deposits, consisting of water-bearing beds of sand and gravel, interstratified with beds of clay, which almost immediately overlie the coal-seam at this point.

10. The whole of this Gardiner's heading district is upwards of 100 feet above the level of the downcast shaft bottom, and the present feeders of water are therefore all flowing out-by to the lodgment some 400 or 500 yards from the shaft, where the large pump recently placed at the bottom of the upcast receives and forces it to the surface. The pumping-power appears to be capable of pumping the ordinary feeders and the extra water now coming off.

11. In conclusion, I beg to state that my opinion is that under the present condition of the mine it is not safe for work to be resumed.

John Mackenzie, Esq., Examiner of Coal-fields, Sydney.

I have, &c.,

WILLIAM HUMBLE,

Inspector of Collieries.

I accompanied Mr. Inspector Humble during those inspections, and fully agree with this report.—  
J.D. The Examiner of Coal-fields.

Report on Stockton Colliery inrush of water on 17th February, 1893.

Sir,

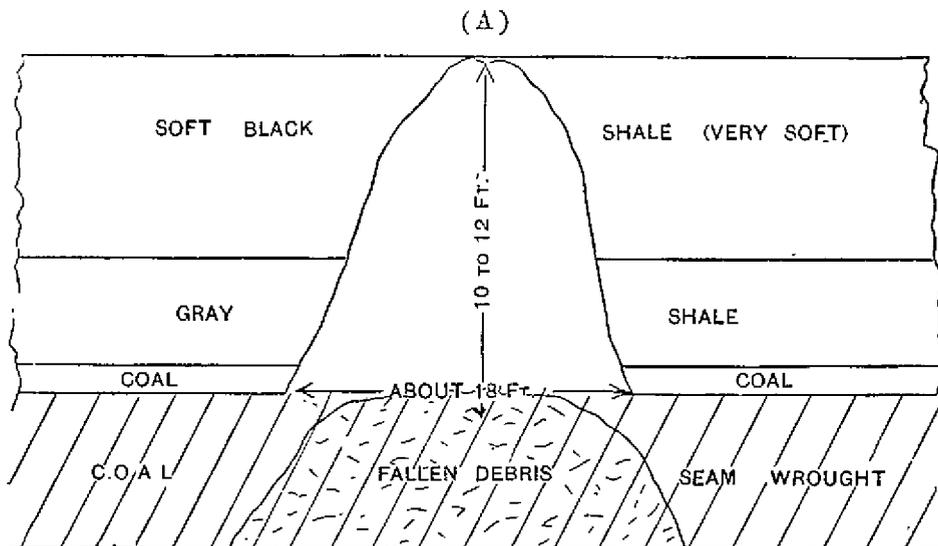

Coal-fields Office, Department of Mines, Newcastle. 21 February, 1893.

I have the honor to inform you that I went to the Stockton Mine yesterday, and accompanied by Messrs. Dixon and Humble, Inspectors of Collieries, and Mr. McAuliffe, the Company's colliery manager, proceeded to Gardiner's heading district, where the inrush of water took place near the face of a 6-yard bord, on Friday last, the 17th instant, and found about twenty workmen engaged in an attempt to stop the flow of sand, pebbles, &c., which was being carried down by the current of water from the fall.

2. The means being adopted to stop it were barriers of strong slabs supported by upright timber from roof to floor, filled in behind with large bags of sand, which sand came from the fall.

3. The barriers have been erected in three different places as near the fall as it was possible to get, and were then about 15 yards in length back from the fall. The work was still being carried on by the erection of slabs and filling in behind with bags of sand with a view to giving additional strength to the first barriers.

4. We next examined several old bords adjacent to the last fall and saw four other falls [*vide*

section of roof] 10 to 12 feet in height of soft shale, &c. The roof of these bords show signs of having been heavily watered, and some are now shedding water. The timber in some of them is giving way, and a large percentage of broken props is to be seen both on the road side and near the rib side, and consequently the roof is bending. Men are at work renewing the timber in the old bords in this district.

5. Messrs. Dixon and Humble are of opinion that the decrease in the flow of water is very slight, if any, since they saw it on the 18th instant (Saturday), viz., about 150 to 200 gallons per minute.

6. I and the Inspectors are of opinion from the shale conglomerate (10 inches in thickness) sand which we saw had been washed down into the bords and cut-through, that the water is probably coming from the large alluvial deposits on the Company's M.L. and the Hunter River adjacent thereto, which deposit (possibly thicker than what is usually supposed to overlie the Stockton coal seam) overlies the top of the 10-inch conglomerate resting on 10 to 12 feet of soft shale, &c., which is the roof of the coal seam worked.

7. In conclusion, I beg to state that I have seen Messrs. Dixon and Humble's report of 18th instant on the inrush of water, &c., which I fully agree with and forward you herewith. The men having been withdrawn by the manager, work cannot be lawfully resumed until I or an Inspector state that the mine is safe, which we cannot at present say.

I have, &c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

The Under Secretary for Mines and Agriculture.

P.S.—Annexed plan No. 12 denotes the place where the fall occurred, viz., at the western boundary of mineral lease No. 38 (Crown lease), which is the Hunter River high-water mark.—J.M.

#### Stockton Colliery Inspection.

Report on the influx of water, &c., and other matters in connection therewith.

Sir,

Wickham, Newcastle, 22 February, 1893.

I have the honor to report inspection of the above colliery yesterday and to-day.

2. Yesterday I visited the mine in the afternoon, and inspected the workings adjacent to the fall in Gardiner's heading district, from which the water is now flowing.

I found about twenty men employed putting in dams to stop or regulate the flow of water, and in putting extra timber into the adjacent bords and headings to secure the roof.

The quantity of water coming off was about the same as when I saw it on the day of the outburst, viz., about 150 gallons per minute, but the flow of sand and clay has been stopped by the sand-bag dams. I did not see the least sign of gas, but all the men employed at the dams were still working with safety-lamps.

3. To-day, in company with Mr. Dixon, I made further inspection, and found the amount of water about the same as yesterday.

About twenty-six men were engaged in connection with the timbering and dam-building, three of whom were bricklayers, who started this morning to build one of the three brick dams considered necessary by the management.

I found no sign of gas, but the men working at the dams adjacent thereto were still working with safety-lamps.

4. In the same district I found a large number of broken props in several old bords, situated about 4 chains northward of the fall from which the water is now flowing, and am of the opinion that, unless the roof is speedily secured, further falls will occur, which might liberate other large volumes of water.

I drew the attention of the manager and Mr. Scott, the company's surveyor, who had charge of the work this morning, to this grave matter, and they both stated that extra timber would be put in as soon as possible.

5. I was greatly surprised to find that, notwithstanding the withdrawal of the workmen by the manager on Friday last (17th instant), and the report entered by Mr. Inspector Dixon and myself in a book at the mine on the following day, wherein we stated that "in our opinion no workman shall, except in so far as is necessary for inquiry into the cause of danger, or for the removal thereof, or for exploration, be readmitted into the mine or such part thereof as was so found to be dangerous until the same is stated by the Examiner or Inspector to be safe," the manager had either ordered or permitted the readmission of five small-coal fillers and two wheelers into the mine, all of whom I found filling and wheeling small coal in this Gardiner's heading district to-day.

6. The manager stated that this small coal was necessary as fuel for the boilers on the surface which supply steam to the pumps and winding engine, and, therefore, in his opinion, it was part of the work necessary "for inquiry into the cause of danger and the removal thereof."

7. I am of the opinion that this small-coal filling is certainly not at present necessary work in this sense, because the company has some hundreds of tons of small coal stored in their box on the surface in close proximity to the boilers that could have been used for steaming and furnace purposes.

8. Therefore, I think that the management has committed a breach of section 12 (sub-section v) of the Coal-mines Regulation Act, 1876, by readmitting these five small coal-fillers and two wheelers into the mine that was found dangerous, and before it had been "stated by the Examiner or Inspector to be safe," but I should like to have your advice on the matter as soon as possible.

I have, &c.,

WILLIAM HUMBLE,

Inspector of Collieries.

The Examiner of Coal-fields.

I accompanied Mr. Inspector Humble during the second day of inspection, and fully agree with this report.—J.D., 23/2/93. The Examiner of Coal-fields.

#### Stockton Colliery Inspection.

Report on the influx of water, &c., in Gardiner's heading district.

Sir,

Wickham, Newcastle, 25 February, 1893.

I have the honor to report inspection of the above colliery on Thursday, Friday, and to-day, the 23rd, 24th, and 25th instant.

2. On the first day I found about thirty men employed, five of whom were bricklayers building two brick dams, the remainder being shiftmen and deputies at work putting extra timber into some adjacent old bords and building sand-bag dams near to the point of issue of the water.

3. The quantity of water flowing appeared to be slightly less than formerly. The two dams now in course of construction are provided with pipes which are built into them for the purpose of allowing the water and any gases present to issue therefrom.

It is proposed to affix taps to the water-pipes, so that the flow of water can be regulated or even stopped altogether if circumstances require it.

The dams are built with brick and cement, one in a 6-yard bord and the other in a 2-yard cut-through, the former being about 8 feet high and 10 feet thick, and the latter about 10 feet high and 4½ feet thick, secured in front by a few feet of arching.

4.

4. Safety-lamps are still being used by the men at the dams, but I found no sign of gas. I found no small coal-fillers at work as I did on the previous day.
5. On the second day, in company with Mr. Inspector Dixon, I made further inspection. Found water slightly diminished, and the dam building making very fair progress. Found a gang of men stowing debris in and around several of the falls of roof in adjacent bords with the view of preventing such from further collapse. Safety-lamps still in use, but found no sign of gas, neither did I find any small-coal fillers at work.
6. To-day, in company with Mr. Inspector Dixon, I made another inspection and found things pretty much the same as yesterday.
7. The number of men timbering the old bords has been augmented, as it has now been seen by the management that every old bord needs more or less new timber to secure the roof. The two brick dams were not quite finished this morning, as some trouble had been experienced in making them tight next the roof, especially the dams in the cut-through where the closing point is about 10 feet high and very soft roof. Unless something unforeseen comes in the way both dams will be finished either to-night or to-morrow, and a start made with the third one.
8. Found no gas of any kind—safety-lamps still in use. No small-coal fillers at work to-day. The last I saw of this kind of work being on Wednesday, the 22nd instant.

I have, &amp;c.

WILLIAM HUMBLE,

Inspector of Collieries.

John Mackenzie, Esq., Examiner of Coal-fields, Sydney.

I fully agree with this report.—J.D., 21/2/93. The Examiner of Coal-fields.

Stockton (No. 3) Sinking Shaft Inspection.

Sir,

Coal-fields Office, Newcastle, 23rd March, 1893.

I have the honor to report inspection of the above shaft on Tuesday, the 21st instant.

2. On my arrival at the shaft I found nine men employed in connection with the work, and the winding-engine busy taking out the water.

3. Mr. George Bell, the charginer, informed me that up to the time of my visit they had sunk about 127 feet 4½ inches of cylindrical tubing, 10 feet in diameter, the strata passed through being 120 feet of sand, 3½ feet of clay, and 1½ feet of sand, the bottom of the tubing then being some feet into a dark blue stiff clay.

The cylinders are forced down by a top weight of from 900 to 1,000 tons composed of sand-bags and other heavy materials.

Since the cutting tool in the bottom of the cylinders entered this stratum of stiff clay two divers have been employed to cut away the clay around the bottom of the shaft, and thereby help the descent of the tubing. These two men work two hours at a time and whenever their services are required.

As the top length of cylinders is about 4 feet 5½ inches below the level of the surface the total depth sunk in this shaft is 131 feet 10 inches.

Some of the water is now being taken out of the shaft, and when it is thought that a water-tight connection is effected between the bottom of the cylinders and the bed of the clay the shaft will be entirely unwatered and a borehole put down a short distance to prove the character of the deposits next to be sunk through.

4. The ropes, machinery, &c., appeared to be in good order and condition.

I have, &amp;c.,

WM. HUMBLE,

Inspector of Collieries.

John Mackenzie, Esq., Examiner of Coal-fields, Sydney.

Further Report on the condition of Stockton Colliery.

Sir,

Coal-fields Office, Newcastle, 2 March, 1893.

We have the honor to report that we, yesterday, made an inspection of that portion of the Stockton Colliery workings, of Gardiner's heading district, where a fall of roof occurred on the 17th ultimo and liberated a large quantity of water, sand, pebbles, clay, and shingle, and find that although water is still to some extent flowing from the fallen ground, the inrush of sand, &c., has been stopped by the close packing of bags of sand behind barricades of slabs and upright props, and the erection of brick dams, one of which is 13 feet in thickness, and the others 10 feet and 4 ft. 6 in. in thickness, respectively, the latter being strengthened by a few feet of arching.

These dams are built from floor to roof, and set in cement, and each is provided with a 6-inch iron pipe to allow the water to flow. Thus, in our opinion, the danger arising from this source has been removed.

But there are other circumstances in connection with this colliery, which, in our opinion, preclude us from stating that the mine is safe, which we beg to give as follows:—

1. Throughout the whole of the Gardiner's heading district, and the districts adjoining, comprising the innermost northern workings, water is freely shedding from the roof in nearly all the bords and headings, or cut-throughs.

This, to us, is an evidence that the rock cover, between the top of the coal seam and alluvial deposits, is thin, and not only thin but very much broken by the cleavage at right angles to the horizontal bedding, and by igneous dykes, which, in the main headings, have given, and are now giving off regular quantities of water.

This rock appears to us to be of a texture unable to resist any great pressure from the overlying alluvial deposits of sand, clay, gravel, &c., but would rather of itself add to the dead load over every excavation, whether bord or heading.

2. During our inspection yesterday of the old bords, in the workings above named, we noticed much of the timber, which had been set to support the roof, broken, and men were engaged renewing some of the broken timber in bords adjacent to the late fall.

In

In very many places the roof shows signs of weakness, and several falls of roof have already taken place, some of which have been secured.

Under such conditions further falls of roof in other bords and headings may at any time take place, which, in every instance, might be expected to liberate considerable quantities of water, &c., similar to the late fall.

3. Should any further fall of roof take place, and cause a large opening or cavity, the inrush of water might be so great as to almost at once find its way on to the main road; and seeing that at one portion of the main road, about 22 chains from the bottom of the shaft, there is a swelly or depression of about 5 feet below the level of the shaft bottom, this portion of the road would in all probability be speedily blocked by the volume of water, and all egress to the shafts cut off.

4. In addition to the above, we may here point out that another source of danger arises from the fact that the bottoms of the main and upcast shafts are both about 100 feet below the level of the innermost working districts, and consequently the approaches to both shafts (as they are not far apart) could be flooded before the innermost workings would fill with water.

This, in our opinion, is a matter for serious consideration in the absence of an opening to the day or surface in the immediate vicinity of the present rise workings, whereby the persons employed in the mine could find a ready means of exit in case of a panic caused by a large flow of water into the mine.

5. We further beg to state that, according to provings by boring on the Stockton peninsula, there cannot be a doubt of the existence of thick alluvial deposits all over the present workings of the Stockton Colliery, and as in our opinion such deposits are to a great extent water-logged, we consider this to be a continual menace to the safe working of the colliery.

6. In conclusion, we have also to inform you that before leaving the colliery the manager (Mr. McAuliffe) asked us whether the water-bailers could, on the following day, commence drawing the water out of the men's places, so that the men could commence getting coal. We replied that we could not write a report in the book at the colliery stating that the mine was safe. Also, that our report of that day's inspection would be made and forwarded to you next day.

We have, &c.,

JOHN MACKENZIE,  
Examiner of Coal-fields.

JOHN DIXON, and  
WILLIAM HUMBLE,  
Inspectors of Collieries.

The Under Secretary for Mines and Agriculture,  
Department of Mines, Sydney.

Stockton Colliery Inspection—Special Inspection to see if the Mine was at work.

Sir,

Coal-fields Office, Newcastle, 18 March, 1893.

We have the honor to report inspection of the districts known as Gardiner's and Kelly's headings yesterday.

Arriving at the colliery about 11 a.m., we found the mine at work drawing coal. Accompanied by the manager, we descended the shaft about 11:30 a.m., and found that, notwithstanding the fact of no report having been entered in a book at the mine "by the Examiner or Inspector stating it to be safe," the bulk of the miners had been readmitted into the mine for the purpose of getting coal.

We counted forty-seven men and boys coming out from the workings to the shaft, and found thirty-eight miners and water-bailers at work in the Gardiner's and Kelly's heading districts, all such being engaged in their ordinary employment.

We noticed that since the miners commenced work a few days ago some of the working places situated in the north-east corner of Gardiner's heading district are now confined to the bottom coal between 5 and 6 feet thick, the top coal, of about 2 feet in thickness, being left unwrought to form a roof. This is, we understand, a precaution adopted by the management to avoid further falls of roof similar to the one that took place on the 17th ultimo, which released large volumes of water, sand, clay, pebbles, &c.

The volume of water now issuing through the pipes built into the brick dams is about the same as when last we saw it, and the dams are in good condition.

Since our last inspection, made on the 1st instant, a deal of additional timber has been put into the abandoned bords adjacent to the fall of roof from which the water is issuing, and several of the smaller falls of roof have apparently been secured by barricades of timber and sand-bags.

We have, &c.,

JOHN DIXON,  
WILLIAM HUMBLE,  
Inspectors of Collieries.

John Mackenzie, Esq., Examiner of Coal-fields, Newcastle.

Stockton Colliery Inspection, Stockton.

Sir,

Coal-fields Office, Newcastle, 8 February, 1894.

We have the honor to report inspection of the above colliery on Tuesday and Wednesday, the 6th and 7th instant. In the No. 22 going bord district we found eighteen men getting coal and eight deputies, shiftmen, stonemen, &c., employed on other work. These, together with two boys and two horses, making a total of thirty, were supplied with 3,360 cubic feet of air per minute. In Kelly's heading district we found thirty men getting coal, and two deputies in attendance. These, together with two boys and two horses, making a total of thirty-six, were supplied with 6,720 cubic feet of air per minute.

Each working-place was well supplied with timber, and the roadways were in fair condition.

In a cut-through off the No. 22 going bord, and about 10 chains beyond high-water mark of the ocean, there is a vertical borehole, which James Leitch, the overman, informed us was 33 feet in height, passing through, in ascending order, 17 feet of shale, 10 feet of coal, and 6 feet of coaly bands and shale. This 10 feet of coal is probably the upper of the two sections of coal usually wrought at this colliery.

About 25 yards further in the same bord another vertical hole was being bored. It was then (the first day of inspection) up 23 feet in shale, and boring still progressing.

The face of this same going bord was being driven in sinder and igneous rock. An advance borehole was in the face.

No place at present is being driven in the barrier adjacent to and on the west side of M.P. 130, and all the workings beyond, *i.e.*, advancing seaward, are laid out on 8-yard pillars and 6-yard bords.

In addition to the districts at work, we also inspected the old workings at Kelly's, Wilson's, and Gardiner's heading districts, and that portion of the latter district in which men were recently employed, but in which no work was being done on the day of inspection.

We found the old workings practically unchanged since our inspection in December last.

There appears to be about the same quantity of water flowing from the pipes through the three brick dams, and the quantity of water shedding from the roof in those districts is much the same as on prior inspections.

Since our previous inspection a portion of the old workings in the No. 3 District, amounting to an area of about 7 acres, has fallen and caused a subsidence of the surface at the junction of Maitland-street and Fullerton Cove Road.

We travelled the outskirts of a considerable portion of this fallen ground, and did not hear anything indicative of further disturbance, neither did we see any sign of water coming from the fallen ground.

To-day we walked over the surface where the subsidence has taken place. The greatest depression appears to be at the junction of the two streets, many of the kerbstones being split and disjointed, and in several places the asphalt guttering was fractured. The retaining-walls, stone steps, and fences of several houses in both streets bore evidence of disarrangement, the two former being fractured, and the latter thrown from their original upright position.

Before leaving the colliery to-day, we entered the following report in a book at the Colliery:—

Stockton Colliery, 8 February, 1894.  
Our inspection of the above colliery on Tuesday and Wednesday, the 6th and 7th instant, has revealed nothing that would justify us in altering the opinion expressed by us, and entered in this book on the 18th February, 1893, and referred to by us on the 14th December, 1893.

JOHN DIXON,  
WILLIAM HUMBLE,  
Inspectors of Collieries.

We have, &c.,

JOHN DIXON,  
WILLIAM HUMBLE,  
Inspectors of Collieries.

John Mackenzie, Esq., Examiner of Coal-fields, Sydney.

Stockton Colliery Inspection, Stockton.

Sir,

Coal-fields Office, Newcastle, 6 April, 1894.

We have the honor to report inspection of the above colliery on Monday and Wednesday, the 2nd and 4th instant.

The quantity of air in each split was as follows:—

No. 1 split.—Thirty-two men, three boys, and three horses employed, and supplied with 4,800 cubic feet per minute, being an average of 126 cubic feet each.

No. 2 split.—Thirty-two men, two boys, and two horses employed, and supplied with 3,750 cubic feet per minute, being an average of 104 cubic feet each.

No. 3 split.—Forty men, three boys, and three horses employed, and supplied with 5,100 cubic feet per minute, being an average of 110 cubic feet each.

The wheeling-roads and working-places were in fair condition, and a good supply of timber was on hand ready for use.

On the first day of inspection we travelled the working-places of the No. 2 and No. 3 splits known as Kelly's heading, and No. 22 going bord districts. About one-third of the working-places in these two districts have now crossed the high-water mark, and are being driven under the ocean in an eastward direction. The bords are 6 yards wide, and the pillars 8 yards wide. On our last inspection the No. 22 going bord was being driven in troubled and cindered ground of the lower seam.

Since then this work has been abandoned, and about 60 yards back from the face a sloping drive has been driven through about 21 feet of strata to open out the upper seam. Just as this seam was reached an igneous dyke was met with, and at the time of our inspection two headings were starting about parallel with the dyke, to prove the coal on each side of the drive. From the lower seam in these two districts the manager and overman informed us that nine vertical boreholes have been put up into the roof to heights from 30 to 44 feet. In seven of these the upper was found, but in almost every case it was more or less cindered and interfered with by igneous dykes. In the No. 43 going bord driven in the lower seam we found three men employed boring a vertical hole in the roof close to the face, which was then idle and standing at an igneous dyke. The men informed us that they had bored this hole up 30 feet through shale-rock, without, however, finding any upper seam.

The innermost 15 yards or so of this bord is very very wet, the water "raining" from the roof heavily, resembling very much a tropical shower on the surface.

The yield of water from this small area of roof is not less than 15 gallons per minute.

On the second day of inspection, we visited the thirty-two men working in the south-east corner of Gardiner's heading district, and travelled the old workings of this, Kelly's, and Wilson's heading district. The amount of water coming from the pipes inserted in the three dams is unchanged, and with the exception of several broken props in the abandoned bords of each district things are much the same as when we saw them in February last. But this exception, in our opinion, is an important one, as the roof of every bord and heading appears to be resting almost entirely on the timber, which is constantly exposed to the deteriorating influence of moisture, vitiated air corrosion, and great weight.

The probable rapid decay of this timber, followed by large falls of roof, was an important element that influenced our opinion in February, 1893, because, judging from the dimensions of the fall that took place at that time and admitted large volumes of sand and water, we believe that all the abandoned portions of Gardiner's and Wilson's heading districts have not more than about 20 or 25 feet of soft porous shale between the roof of the seam and the overlying water-logged sand-beds.

Messrs. Leitch and Scott, the overman and surveyor, accompanied us and saw this broken timber, who will no doubt take steps to renew the same.

Before

Before leaving the colliery on the second day we entered the following report in the book kept at the colliery office:—

Stockton Colliery, 4 April, 1894.  
Our inspection of the above colliery on Monday and Wednesday, the 2nd and 4th instant, has revealed nothing that would justify us in altering the opinion expressed by us and entered in this book on the 18th February, 1893, and referred to by us on the 14th December, 1893, and the 8th February, 1894.

JOHN DIXON,  
WM. HUMBLE,  
Inspectors of Collieries.

Since our last inspection the large pump that was then being fixed at the shaft bottom has been started.

It has been supplied by Evans and Co., of Wolverhampton, and has two 28-inch steam cylinders, two 10-inch water rams and 4-foot stroke.

The suction and rising main columns of pipes are each 12 inches in diameter, through which the water is brought from the lodgment in U heading district and forced to the surface. The manager expects that when it has got fairly to work it will deliver 45,000 gallons per hour, or 750 gallons per minute.

We have, &c.,  
JOHN DIXON,  
WILLIAM HUMBLE,  
Inspectors of Collieries.

John Mackenzie, Esq., Examiner of Coal-fields, Sydney.

*Copy of particulars entered in a book at the Stockton Colliery Office by the Inspectors.*

Stockton Colliery, 18 February, 1893.

WE hereby certify that last night we carefully inspected, with locked safety-lamps, a portion of the Gardiner's heading district, of Stockton Colliery.

2. We found no explosive gas, but a large volume of water, together with sand and clay, was coming off at a fall of roof in one of the abandoned bords in that district.

3. The manager (Mr. D. McAuliffe) informed us that a few hours after the issue of water was first observed yesterday, he withdrew all workmen from the mine, except a few for the purpose of exploration, one of whom, James Leitch, the overman, was burnt by explosive gas when in the immediate vicinity of the fall.

4. We are, therefore, of opinion that in accordance with the provisions of section 12 (subsection 5) of the Coal Mines Regulation Act, 1876, no "workman shall, except in so far as is necessary for inquiry into the cause of danger or for the removal thereof or for exploration, be readmitted into the mine or such part thereof as was found to be dangerous until the same is stated by the Examiner or Inspector to be safe."

JOHN DIXON,  
WILLIAM HUMBLE,  
Inspectors of Collieries.

J.

EXTRACT from letter to the Registrar-General of Births, Deaths, and Marriages in England on the mortality in the registration districts of England and Wales during the ten years 1871-80; by WILLIAM OGLE, Esq., M.D.:—

General Register Office, Somerset House,  
28 February, 1895.

MORTALITY OF MALES ENGAGED IN DIFFERENT OCCUPATIONS.

IN each of the two former decennial supplements an attempt was made to estimate the comparative mortality of males engaged in different professions and trades. The numbers of males engaged in each occupation and their ages were taken from the Census returns; while the numbers of deaths at each age-period were abstracted from the death-registers. The calculations in the supplement for 1851-60 were based upon the Census numbers for 1861, and the deaths in 1860 and 1861; in the supplement for 1861-70, upon the Census numbers for 1871, and the deaths in the same year. The attempt has been renewed on the present occasion, and on a larger scale, the deaths in combination with ages and occupations having been abstracted for three entire consecutive years, namely, 1880, 1881, and 1882. In order to ensure as great accuracy as was possible, the deaths in these three years were abstracted by the same clerks, and on occupation sheets of the same form, as had served for the abstraction of the living in the Census of 1881, and the same rules as to the details of the process were observed in each case.

The inquiry was limited, as on the previous occasions, to males, and for the same reason; namely, that the uncertainty attaching to the statement both of occupation and of age is very much greater in the case of women than of men. Males under 15 years of age were also excluded; inasmuch as the influence of occupation, which was the object of inquiry, is practically inappreciable at that early period of life.

The total number of males, 15 years of age or upwards, living in England and Wales at the date of the Census was 7,911,436, and the total number of deaths of males at those ages abstracted from the registers of the three years, of which the Census year was the centre, was 418,214. With so wide a basis of observation as this, and with the precautions that were taken to ensure, as far as possible, uniformity in the abstraction of the living and the dead, a very high degree of trustworthiness may fairly be claimed for the results. There are, however, numerous difficulties and causes of error that practically interfere with what might at first sight appear to be a simple though highly laborious process; and some of these difficulties and causes of error it is important to set forth, so that each person who interests himself in the results may be able to form an estimate as to the amount of confidence he should place in them.

In the first place then, although the aggregate numbers, both of the living and the dead, that were abstracted were, as we have seen, very great, yet the numbers of persons in many of the individual trades, and still more the numbers at each age-period in such trades, were but small.

The amount of confidence in the results is, of course, *ceteris paribus*, proportionate to the number of observations, which depends on the number of persons engaged in the occupation. The figures therefore which relate to small trades, or to age-periods where the numbers are few, should be received with due hesitation.

A second and still more serious difficulty and cause of error is due to the vagueness with which the occupation is oftentimes stated both in the returns made for the Census and in the death-registers, and especially in the latter. As the same rules for dealing with doubtful cases were adopted, as already mentioned, in abstracting the living from the Census returns and the dead from the death-registers, it might be supposed that this cause of error would be practically immaterial, as indeed it would be, were the vagueness of statement similar in amount and character in the two cases. But there is reason to believe that the vagueness of statement as to occupation was much more considerable in the death-registers than in the Census returns, inasmuch as special precautions had been taken in the case of the Census to ensure great precision in the statement of trade or profession, while no such special precautions had been taken in the case of the death-registers.

In order to obviate to some extent the evils arising from this vagueness, and also at the same time to increase the numerical basis of the calculation, occupations that are likely to be confounded with each other to any considerable extent have been grouped together, and in some cases it has been found necessary to do this, even when an occupation is of such a definite character that apparently it is not likely to be confounded with another. For instance, no occupation would seem at first to be more definite than that of a coal-miner; and as there were at the date of the Census no fewer than 355,363 male coal-miners over 15 years of age, it might naturally be supposed that here at any rate was an industry in which the death-rate could be calculated with much certainty. But it was soon discovered that a very considerable number of coal-miners who die are simply described in the death-registers as miners without further specification; and consequently it became necessary to group all miners together; or rather to divide them, as will be explained further on, geographically, and not directly by the character of the minerals. Again, in the death-registers there is often a confusion between general and agricultural labourer, and in consequence it was found necessary to group these together; while, in order to diminish the disturbing influence of the intermixture of general with agricultural labour, the calculation was based on the returns and registers for ten\* selected counties, in which the great mass of labour was agricultural.

Similarly, hosiery-manufacture and hosiery-selling were found to be practically indistinguishable in the death-registers, and have been therefore grouped together, the effect of the intermixture being reduced, so far as possible, to a minimum, by basing the calculation on the returns and registers for the counties of Leicester and Nottingham, which are the main seats of the hosiery manufacture.

A similar process of grouping, with or without limitation to a special selected area, has been adopted in several other cases, as will be seen hereafter; while in those cases, where it was thought probable that the vagueness of statement as to occupation had seriously affected the results, these have been entirely discarded, and no statements as to the death-rates in such industries are given in the tables.

We come now to a difficulty of a different kind, and of a still more serious character, inasmuch as it appears to be one for which there is no remedy, and which must always occasion a great flaw in all calculations of the death-rates in different industries. There are many trades and occupations which require a considerable standard of muscular strength and vigour to be maintained by those who follow them; such occupations, for instance, as those of a blacksmith, of a miner, and the like; and, so soon as from any cause the health and strength of a man fall below this standard, he must of necessity give up the occupation and either take to some lighter kind of labour or, if his health be too much impaired for this, retire altogether from work. And even in those industries, where no excessive amount of muscular strength is required, there must nevertheless be always a certain line below which continuance in the business becomes an impossibility.

The weaker individuals, and those whose health is failing them, are thus being constantly drafted out of each industrial occupation, and especially out of those which require much vigour; and the consequence is that the death-rates in these latter occupations are unfairly lowered, as compared with the death-rates in occupations of an easier character, and still more as compared with the death-rates among those persons who are returned as having no occupation at all. A very considerable proportion of those who are forced to give up harder labour take to odd jobs of a more or less indefinite character, and are returned both on the Census schedule, and eventually in the death-registers, as general labourers, as messengers, or as costermongers, street-sellers, &c.; and thus it comes about that the death-rates of general labourers, of messengers, and of street-sellers, as shown in the table, appear to be of appalling magnitude, as also do those of persons returned as having no occupation. Under these headings, however, are comprised the broken down and the crippled who have fallen out of the ranks from all the various industries, as well as those who have been throughout life debarred by natural infirmities or other causes from following any definite occupation.

Another very serious flaw in these death-rates, when taken as measures of the relative healthiness of different industries, is due to the fact that these several industries do not start on equal terms as regards the vitality of those who follow them. A weakling will hardly adopt the trade of a blacksmith, a miner, or a railway navvy, but will preferentially take to some lighter occupation, such as that of a tailor, a weaver, or a shopman. This defect in the death-rates, as measures of comparative healthiness of occupations, tells in the same direction as the defect previously noticed; it gives an unfair advantage to such industries as demand much strength or activity in those that follow them. Such industries are in fact carried on by a body of comparatively picked men; stronger in the beginning, and maintained at a high level by the continual drafting out of those whose strength falls below the mark.

It is plain, then, that much caution must be used in drawing inferences from the death-rates in different industries. The data are sometimes scarcely sufficient in amount or precise enough in character for full confidence to be placed in the rigid accuracy of the rates based upon them; and, secondly, the differences presented by the rates, even when the accuracy of these is indisputable, are not invariably due to differences in the comparative healthiness of the occupations, but, often at any rate, to differences in the constitution of the groups of workmen severally engaged in them.

Still, after the fullest weight has been allowed to all the defects which have now been mentioned, there can be no reasonable doubt but that the death-rates do in reality furnish valuable indications of the comparative salubrity of different industrial occupations. Small differences between them must, it is true, be ignored, as falling within the limits of possible disturbing influences; but large differences, such as are presented in numerous cases, must be accepted as betokening real and substantial differences of healthiness.

In

\* These counties are Hertfordshire, Oxfordshire, Bedfordshire, Cambridgeshire, Suffolk, Wiltshire, Dorsetshire, Devonshire, Herefordshire, and Lincolnshire.

In the following table (Table J.) the third and fourth columns of figures give the mean annual death-rates for two age-periods for 1880-1-2. The first and second columns give for comparison the corresponding death-rates, as calculated from the data in the two previous decennial supplements.

The fifth column of figures, which is headed Comparative Mortality Figure, requires some little explanation. There was in 1880-1-2 an annual mortality in England and Wales of 1,000 deaths per 64,641 males between 25 and 65 years of age; and of such 64,641 males, 41,920 were under, and 22,721 were over, 45 years of age. The figures in column five are the numbers of deaths that would have occurred in the several occupations out of 64,641 males, of whom 41,920 were under, and 22,721 were over, 45 years of age. For instance, 41,920 barristers and solicitors in the earlier age-period, and 22,721 in the latter period would, with death-rates respectively of 7.54 and 23.13 per 1,000, give 842 deaths. This figure is therefore set in the fifth column against the heading "Barrister, Solicitor," and represents the mean mortality of males in that profession between 25 and 65 years of age, as compared with the mortality of all males of similar ages in England and Wales, this latter being taken as 1,000.

TABLE J.—Death-rates of males, 25-65 years of age, in different occupations, in 1860-1-1871 and in 1880-2; and their comparative mortality figures in 1880-2.

Reference Number.	Occupation.	Mean annual death-rates per 1,000 living.				Comparative mortality figure, 1880-1-2.

\* This rate is based on less than 5,000 years of life.

† In 1871 only.

‡ These rates are based on a return made to the Commissioners appointed to inquire into the condition of all miners in Great Britain, of the miners living at the census of 1861, and of the deaths registered in the three years, 1860-2, in certain mining districts in the respective counties. See appendix B, to report of Commissioners, p. 164.

The death-rates in the several industries will come under special consideration later on; but there are certain general remarks to be made as to the preceding Table which it will be convenient to introduce here.

It will be seen that there are vast differences as regards mortality between the several industries, the comparative mortality figure being three or four times as high in some industries as in others; and it will also be noticed that those industries in which the death-rates were exceptionally high or exceptionally low in the three years 1880-1-2 showed, as a rule, similarly exceptional rates in the earlier experience.

Again, it will be noted that the death-rate at the first of the two age-periods, 25-45 years, has in almost every case declined. There are in the Table altogether 73 industries, for which rates are given both for 1880-2 and also for earlier experience. In 65 of these 73 industries the death-rate in the 25-45 age-period has fallen, in one it has remained stationary, and in only 7 has it gone up. In the second age-period, 45-65 years of age, the case is very different. Only in 35 industries has there been a fall, while in the remaining 38 the rate has risen. That some such difference as this should be found to exist between the two age-periods might have been anticipated, for it is in strict accordance with the fact already discussed, and shown, moreover, in the first line of figures in Table J, namely, that there has been a fall in the death-rate of all males independently of occupation in the earlier age-period, and a not inconsiderable rise in the later.

Another feature in the Table that requires notice is the fact that in more than three-fifths of the industries to which it relates the death-rates are below those of "All Males"—that is to say, the comparative mortality figure is below 1,000. The comparative mortality figure of "All Males" is, however, a very unsatisfactory standard by which to estimate healthiness, for among "All Males" is of course included an enormous number of persons who are permanently enfeebled in health and unfit for work of any kind. Even, however, if we exclude all such persons as are unemployed, and take the death-rates of those persons only who were returned at the Census as following some occupation, we still have a comparative mortality figure (967), which is higher than the figure in more than half the industries. It appears, therefore, that the comparative mortality figure of "Occupied Males" is very considerably raised by the inclusion of a minority of occupations with excessively high rates. Thus neither "All Males," nor "Occupied

"Occupied Males" furnish a good basis for comparison. The standard for comparison should be one of excellence; it should be taken either from the healthiest occupation, or, if a geographical basis be preferred, from the healthiest districts. If the former be preferred, as I think it should, we may take as our standard the mean of the mortality figures for farmers, agricultural labourers, and gardeners, which would be 644; if the latter be selected, we may take the figure for males in all those districts in which the mean annual death-rate for persons (males and females) of all ages in 1871-80 was under 17.00, which we call the "Selected Healthy Districts." These give a comparative mortality figure of 804; but it must be remembered that in this are included the deaths of those sick and unoccupied males who live in the selected districts. The excess of the comparative mortality figure of an industry above these standards measures its departure from the healthiness attainable, under present conditions, in this country.

Having ascertained and set forth in Table J what is the comparative mortality from all causes in the various industries, the next step is to distribute this mortality to the registered diseases or causes by which it was occasioned—that is to say, to ascertain what is the comparative mortality in the several industries from each separate disease or group of diseases.

To do this thoroughly it would be necessary to go through the death-registers for the three years 1880-2, and abstract all the deaths of males by ages, occupations, and causes of death in combination, a task of such complexity and magnitude as to be practically impossible, and which, therefore, has not been attempted. It appeared possible, however, to obtain adequate data by a shorter plan, laborious enough, but still practicable, namely, by abstracting from the registers a considerable sample of the causes of deaths in each industry, and dividing out the total mortality in the industry to the several causes by the proportions existing in the sample. For, supposing the sample to be of sufficient size and to be fairly taken, there seemed no reason why it should not be considered truly representative of the bulk. This plan, therefore, was adopted.

The first question in regard to the sample is how large it should be. To this question no more definite answer can be given than that the larger the sample the better. It was, however, determined that 500 deaths with causes should be considered a minimum, and that when the number of deaths abstracted in any one industry fell short of this they should not be used as a basis for calculation. It will be seen in Table K [see page 173], which gives the result of the abstraction, that in most cases this minimum was not only reached but considerably exceeded. In some industries, however, it was found impossible to get 500 recorded deaths of males between 25 and 65 years of age, without running through the registers for more than three years; in these cases, therefore, either the minimum was not reached and rates were not calculated, or the search was extended to the registers of additional years.\*

More important than the mere size of the sample is its freedom from local peculiarities, which might detract from its representative value. It is very possible, for instance, that if 1,000 deaths, say of tailors, were abstracted with the registered causes in the North of England, and a second 1,000 similarly abstracted in the South, the distribution of the two samples by causes might be very different—there might, for instance, be a much larger proportion of diseases of the respiratory system in the Northern than in the Southern sample; and such differences would most certainly be found to exist, if one sample were taken from large towns and a second from rural districts. It was necessary, therefore, in order to ensure the sample being a fair one, that it should be taken from a considerable number of districts in different parts of the country, and especially necessary that town and country should in each case be represented in the sample in proper proportions, which proportions had first to be ascertained separately for each industry.

There are some industries, of course, from which the element of locality is inseparable, as they are only carried on in more or less circumscribed areas. Such for instance is the cotton industry of Lancashire, the hosiery manufacture of Leicestershire and Nottinghamshire, the manufacture of cutlery and files, practically confined to the West Riding, and other similar local industries. It is conceivable that if the cotton manufacture were carried on in some other totally different part of England, the mortality from all and several causes in that industry might be different from what it is at present; but, as things stand, whatever influence on mortality may belong to the geographical position of Lancashire attaches inseparably to the cotton industry. To meet this, as far as possible, the mortality figures for Lancashire are given in the same Table as contains the mortality figures for the cotton industry, and similarly with the other chief local industries, so that instead of comparing the mortality of such an industry with that of All England, it may be compared, if such be desired, with that of the county in which it is carried on.

Another disturbing element which might interfere with the value of the sample for comparative purposes, and which it was therefore necessary to exclude, was seasonal influence. The causes of 500 deaths in any industry in winter would doubtless be different from those of 500 deaths taken in summer. This possible source of error, however, was easily guarded against. Whatever districts were chosen as suitable areas for examination, their death-registers were invariably gone through for the three complete years 1880-1-2, so that the seasons of the year were all equally represented, and the samples in all the industries were so far strictly on an equality. In the few cases where the registers for more than three years had to be searched, as before mentioned, the additional registers used were also registers for complete years, the years taken being 1879 and 1883.

The number of minute precautions that it was found necessary to observe in order to secure the fair character of the samples added very considerably to the difficulty of the task. It is believed, however, that their adoption has made the samples truly representative of the bulk. The samples themselves are given in Table K while in Table L the comparative rates of mortality based on these samples are given. [See tables, pages 173 and 174.]

*Miners* (No. 85-93).—Mining constitutes so important an industry in this country, one in every 19 males between 25 and 65 years of age being a miner, that the mortality under this heading requires special attention. At the Census of 1881, great pains were taken to secure accurate returns of miners, distinguished from each other by the character of the minerals or metals with which they were engaged, and it was hoped that it would thus be possible to estimate the death-rate of each group of miners more closely than could be done with the vaguer data of former Censuses—that is to say, to estimate the death-rates of coal-miners, tin-miners, ironstone-miners, copper-miners, &c., separately; but, after all, it was unfortunately found that this was impossible, owing to the very imperfect manner in which the speciality of occupation of deceased miners is stated in the death registers. This was found to be especially the case

\* This was done in the case of fishermen, file makers, hosiery manufacture, ironstone miners, and miners in Cornwall.

case with those deaths which are caused by accident, and on which inquests are held. The coroners in their certificates very commonly neglect to distinguish one kind of miner from another and simply describe the deceased as "miner" without further specification. As at least a fifth of the deaths of miners are due to accident of one kind or another, it is plain that this negligence on the part of coroners renders the separate estimation of the mortality of the several kinds of miners an impossibility.\*

The best practicable substitute that offered itself was to divide out the miners geographically, and estimate their death-rates by counties or other convenient areas; and this may be accepted as a rough approximation to a division of the miners by the nature of the material in which they work; for in the West Riding, in Durham with Northumberland, in Derbyshire with Nottinghamshire, in Monmouthshire with South Wales, in Lancashire, and in Staffordshire respectively, more than 90 per cent. of the miners are coal-miners; in the North Riding and in the districts† that have been grouped with it, 90 per cent. are ironstone-miners; while in Cornwall, 79 per cent. are tin-miners, the remainder being almost all lead and copper-miners. The first group of counties, therefore, may be taken to represent coal-miners; the North Riding, with the associated districts, to represent ironstone-miners; while Cornwall will represent tin-miners. The lead-miners and the copper-miners must be left without estimated death-rates.

*Coal-miners* (No. 85-90).—The death-rates of coal-miners are surprisingly low. In spite of their terrible liability to accident, and their constant exposure to an atmosphere vitiated by coal-dust, by foul air, and by an excessively high temperature, the comparative mortality figure of these labourers is considerably below that of all males; nor is this only true of coal-miners in the aggregate, but it is true, with one single exception, for the miners in each great coal area taken separately. It holds good for Durham with Northumberland, for Lancashire, for Derbyshire with Nottinghamshire, for the West Riding, and for Staffordshire. In each of these areas, as is shown in Table L [see table, page 174], the comparative mortality figure of all males within the area is higher than that of the miners. The one exception to the rule is furnished by South Wales with Monmouthshire; here the mortality figure for the miners is slightly higher than that of all males within the same area; but even here, if deaths from accident be left out of account, the rule holds good; the mortality of the miners from all other causes together is below that of the general male population.

Again, if in each case we exclude accidents, it will be found that the mortality of the coal-miners only slightly exceeds that of the most healthy class of men in our table, viz., the agriculturists—that is to say, farmers, the agricultural labourers, and the gardeners.

This low mortality of coal-miners is not now noted for the first time. "Whilst lead and copper and tin-mining," wrote Dr. Greenhow‡ in 1858, "are certainly dangerous to health, coal-mining appears to be at least not unhealthy."

It has of course to be borne in mind that miners are a body of picked men. No very weakly man is likely to take to the occupation, and moreover, as much strength is necessary, many men who become weakly must abandon this form of labour for lighter work. On the other hand, the general male population, with which miners have just been put in comparison, comprises the sick and weakly of all sorts, and the men who have fallen out of the ranks of all industries. This objection, however, ceases to be of much weight if we compare coal-miners with such other labourers as quarrymen or blacksmiths, who also require to maintain a high standard of vigour; and a glance at the table shows that, again excluding accidents, the mortality of the coal-miners is considerably below that of these two groups of workers. Making, then, all due allowance for the picked character of coal-miners, their extremely low mortality figure cannot but remain a matter of surprise.

Turning to Table L [see table, page 174], which gives the comparative mortality figures for the several causes, it will be seen that under the heading "Accident" the mortality of the coal-miners is of appalling magnitude, there being no other industries in the table at all comparable to coal-mining in this respect, excepting other forms of mining, stone and slate quarrying, and fishing.

Under all the other headings, however, the mortality figure for coal-miners, taking the mean of the figures for the six great coal areas (No. 85 to 90), is far below the average with one important exception; viz., "Diseases of the Respiratory Organs." The mean mortality of coal-miners under this heading is 202, while the figure for all males in England and Wales is 182. Moreover, there can be no doubt that the mortality of coal-miners under this heading is considerably understated, owing to a number of deaths which are not of veritably tubercular character being designated by the popular term "miners' phthisis," and so being transferred from the heading "Diseases of the Respiratory Organs" to the heading "Phthisis." It must, therefore, be admitted that coal-miners, in spite of their being picked men, and in contrast with their low mortality from other diseases, suffer from diseases of the respiratory organs to a greater extent than those engaged in most other industries. What is the precise excess above the average cannot be stated, because of the confusion already noticed between phthisis and diseases of the respiratory organs; but it is plain that the excess is but small as compared with that which occurs in occupations where the workmen are exposed to the inhalation of other kinds of dust than that of coal; for instance, in the quarrying of slate and stone, in the manufacture of pottery, or in the making of cutlery and files.

This comparative innocuity of coal-dust, as compared with stone-dust or with metallic-dust, is probably to be explained by the microscopical character of its particles, which are comparatively free from sharp points and corners,|| and therefore do not cause such acute irritation to the lungs when inhaled.

The understatement of the mortality of miners from diseases of the respiratory organs implies, of course, a corresponding overstatement of their mortality from phthisis; but the mortality figure under this heading is already extremely low, the mean figure for the miners in the six coal areas being only 126, and being only raised even so high as this by the inclusion of South Wales and Monmouthshire, where the miners, for some local reason, have a higher mortality generally than the miners in the remaining coal districts. To what extent this figure of 126 should be still further reduced, on account of the inclusion of non-tubercular cases of miners' phthisis, it is impossible to say, but in all probability the reduction would bring the figure down at least to the level of the figures for farmers and for fishermen, which are the lowest in the table.

It

\* Complaint as to the unsatisfactory certificates given by coroners in mining districts was also made by the Commissioners on Condition of Miners (1864) in their Report (p. xxi). The complaint then made was that the nature of the accident which caused death was not stated in the verdict, but merely "accidental death."

† Namely, the districts of Uiverston and Ilarrow, with the sub-districts of Ilarrington and Egrenont in Whitehaven.

‡ "Papers relating to the Sanitary State of the People of England." Board of Health, 1858, p. 65.

|| Hirt, i, 144.

It is much to be regretted that there should be this confusion in the case of miners between phthisis and other affections of the respiratory organs, because it prevents a definite answer being given to the question whether coal-miners enjoy any special immunity from tubercular disease. If the figures as they stand in the table were correct—if, that is to say, no transference had to be made from the heading "Phthisis" to the heading "Diseases of the Respiratory System"—then, low as the mortality from the former would be, it would not be much lower in proportion to the average for all males than the mortality under other headings. For instance, the mortality figure of coal-miners from phthisis in the table is some 43 per cent. below the average for all males, but so also, or nearly so, is their mortality from diseases of the nervous system. The conclusion, therefore, as to phthisis would simply be that the low mortality of coal-miners from this malady is part and parcel of their general healthiness and exemption from disease of all kinds. But if, as is most probable, a large transference should be made from the heading phthisis to the heading diseases of the respiratory system, then the inference from the figures would be quite different. We should have to conclude that coal-miners add to their low mortality from all diseases a special immunity from phthysical affections; and that there is some condition or other in their life, possibly the inhalation of coal-dust, that renders them comparatively proof against tuberculosis.

At any rate, be the explanation what it may, there can be no possible doubt that the mortality of coal-miners from phthisis is remarkably low, especially when their liability to irritation of the lungs from dust, and the alternations of temperature and other conditions to which their work subjects them, are taken into account.

And this statement is in strict harmony with the observations of those medical practitioners who in this and in other countries have had opportunity of studying the ailments to which coal-miners are subject. "The miners of Durham and Northumberland," says Dr. R. Wilson, "are not prone to phthisis."\* "Il est incontestable," says Dr. Boens Boisseau, † "que la phthisie pulmonaire est moins fréquente dans la classe des charbonniers que dans la plupart des autres classes laborieuses"; and Dr. Schoenfeld, who, like Dr. Boisseau, practised in the Belgian colliery districts, speaks of this immunity of coal-miners in even stronger terms. Similar conclusions have been arrived at in Germany‡ from the data furnished by the coalfields of Upper Silesia.

This general concurrence of evidence, English, Belgian, and German, leaves no room for doubt, but that for some reason or other the mortality of coal-miners from phthysical disease is excessively low as compared with that of other workers. But the question can scarcely be said to be as yet answered beyond all civil or doubt, whether the reason for this apparent comparative immunity consists merely in the picked character of the men engaged in coal-mining or in some special preservative condition attaching to their industry. The latter is the view adopted by foreign writers, such as Hirt; and, inasmuch as the most notable of the special conditions under which coal-miners work is the inhalation of coal-dust, their apparent immunity has been usually attributed to this cause, though some writers have exceptionally sought an explanation in other conditions of the miner's life, such as the warmth and moisture of the atmosphere in which he works. "It is in the highest degree probable," says Dr. Hirt, "that coal dust possesses the property of hindering the development of tuberculosis, and of arresting its progress."

Not impossibly it may eventually turn out that this is really the case; but it must be admitted that the data at present forthcoming are hardly sufficient to establish the conclusion beyond all possibility of fair doubt, and there are certainly some facts which must make us at any rate for the present hold our judgment in suspense. In the first place there is the uncertainty, already expressed, whether the immunity of coal-miners from phthisis is really greater than their immunity from other disease, and not merely a part of their general healthiness. Secondly, the figures in Table L (*see* p. 174), which relate to the North Riding miners are hardly consistent with the view that the supposed immunity of coal-miners is due to coal-dust. For the miners in the North Riding, and in the other districts that have been grouped with it, work almost exclusively in ironstone, and are in no wise exposed to the inhalation of coal-dust or coal-gas or other product of coal mines. Yet their mortality from tubercular disease is also extremely low, and though somewhat higher than that of most coal-miners, is actually lower than that of the coal-miners in South Wales and Monmouthshire. The low mortality of these ironstone miners, which is not limited to phthisis but extends to the other headings in the Table, can hardly be referable to any other cause than the picked character of these miners; and the natural inference certainly would be that the similarly low mortality of the coal-miners was due to a similar cause. Again, if coal-dust really possess the supposed preservative influence, we should expect that coal-heavers, who, though in a less degree than coal-miners, are also exposed to the inhalation of such dust, would also present an exceptionally low mortality from phthisis, but the figures in Table K. (No. 96) (*see* page 173), scarcely answer to this expectation. The comparative mortality figure for coal-heavers (*see* Table J.) is 968, and, judging from the 230 deaths of which the causes were abstracted, the mortality of this group of coal workers from phthisis was very little below the average of all males. Departing for once from the general rule laid down previously, that morates for individual diseases should be calculated on less than 500 deaths with known causes, the phthisis rate for coal-heavers would be 210, while the rate for all males is 220, and the mean of the six figures for coal-miners is 126.

Another element in the question must not be altogether neglected. Whenever the mortality from any one cause in any industry is in abnormally great excess, the mortality from other causes must be to a certain extent thereby reduced. A man who is killed by an accident cannot also die of phthisis or other disease. Now, among miners the mortality from accident is appallingly high; and the mortality from all other causes must be by that fact more or less reduced.

On the whole, then, we must be content to leave the question of the supposed protective action of coal-dust undecided. The most that we can say with certainty is that the inhalation of coal-dust does not seem to increase the liability to phthisis, and that both in this respect and in respect to its effect in producing disease of the respiratory organs it contrasts favourably with many other kinds of dust.

The mortality of coal-miners from alcoholism, or from the diseases which are specially connected with habitual alcoholic excess, is low. This is in accordance with the description of their habits given by

various

§ To the authorities already cited may be added the following: Levy (*Traité d'Hygiène*, ii, 913), who says that "la phthisie pulmonaire est rare chez les mineurs," and who cites to that effect Hervier, *Gaz. Méd. de Lyon*, 1869, iii, 516; François, *Bulletin de l'Acad. de Belgique*, 1857, c. xvi; and Ribmault, *Hygiène des Ouvriers Mineurs dans les exploitations houillères*. Paris, 1861 p. 200.

various observers; for though "many of them indulge periodically in great excesses," says Dr. Wilson,\* "the régime of a colliery is so strict that, however much they may exceed on receipt of their wages, they must resume work at the proper time, and thus habitual drunkenness is prevented, and consequently the specific diseases induced by alcohol are extremely rare."

The mortality of the coal-miners differs considerably in different areas, and arranging these in the order of mortality, beginning with the lowest, the sequence is as follows: Derbyshire with Nottinghamshire, 734; the West Riding, 772; Durham with Northumberland, 873; Lancashire, 929; Staffordshire, 929; South Wales with Monmouthshire, 1,081. Possibly some of these differences might vanish if a larger basis were taken than the mortality of only three years; but, as regards the three areas concerning which alone we have previous experience, the order remains unchanged from the previous record, for in 1860-2 the mortality of miners was higher in South Wales and Monmouthshire than in Staffordshire, and in Staffordshire than in Durham and Northumberland. In each of these three areas the mortality of the miners decreased very considerably in the interval between 1860-2 and 1880-2 in the earlier age-period, 25-45 years, but in the second age-period, 45-65 years, it rose both in Durham with Northumberland and in South Wales with Monmouthshire, while it fell only in Staffordshire.

So large a share of the mortality of coal-miners is attributable to accident that it may be well to give a summary view of the deaths thus occasioned. In the ten years 1871-80 the total number of deaths ascribed to accidents in coal-mines was 9,678, and these deaths were distributed by ages and causes in the manner shown in the following table.

TABLE M.—Deaths from Accidents in Coal-mines 1871-80.

	Under 15	15—	20—	25—	35—	45—	55—	65 and over.	All ages.	Per 1,000 accidental deaths.
Crushing, fall of coal, stone, &c. ....	291	605	688	1,120	871	667	344	102	4,688	485
Fall in shaft, pit .....	53	83	91	211	152	100	67	27	784	81
Machinery, explosion of boiler .....	23	31	13	23	21	16	9	4	140	14

Drowning .....	8	13	11	28	13	14	3	2	92	10
Blasting .....	4	15	27	66	41	15	10	2	180	19
Fire-damp .....	128	331	336	606	358	221	82	22	2,084	215
Choke-damp, suffocation .....	19	50	45	88	49	29	11	3	294	30
Otherwise, or not stated.....	13	13	6	7	16	2	6	3	66	7
	952	1,448	1,337	2,300	1,638	1,178	617	208	9,678	1,000

Nearly half the deaths, it will be seen, are caused by falling in of the sides or roofs, and a quarter by fire-damp or by choke-damp. After these forms of accident, which are shared equally by miners of all ages, that is to say, shared pretty nearly in proportion to the numbers employed at the several ages, come accidents from the waggons and tubs in which the coals are carried from the underground workings to the shaft; this form of accident falls especially on the young lads who are engaged in "tramping and hurrying" the coals. The remaining and less common forms of accident, viz., falls in the shaft, accidents with machinery and boilers, explosions of blasting powder, and drowning from the irruption of water into the mine, affect miners of all ages alike. Putting, however, all causes together, it is plain that the lads and younger miners suffer considerably more from accident than do the elder workmen, and consequently that the figures in Table L. (*see* page 174), which are based on the mortality of males between 25 and 65 years of age, understate the liability to fatal accident of coal-miners in the aggregate and independently of age.

*Ironstone Miners* (No. 92).—The miners in the North Riding and in certain selected districts have been grouped together to represent ironstone-miners, being almost exclusively engaged in that form of mining. Their mortality is very much the same in its general features as that of coal-miners. For in both groups of miners the mortality is somewhat in excess under the heading Diseases of the Respiratory Organs, while it is considerably below the average under all the other main headings, with, of course, the exception of Accident. Here the mortality figure for ironstone-miners is even higher than that for coal-miners. This seems strange, inasmuch as there is neither fire-damp nor choke-damp in the iron-mines. Possibly the apparent anomaly would disappear if a larger basis were taken, for accident is, of course, a very fluctuating element in the death-rate; but it must not be forgotten that the main cause of mining accidents, namely, the falling-in of roofs and walls, is shared alike by iron-miners and coal-miners. The low mortality of ironstone-miners from disease can scarcely be attributed to other causes than the picked character of the men who alone are able to undertake such hard labour.

*Cornish Miners* (No. 93).—The mortality of the Cornish miners, who may practically be considered to be tin-miners, for the proportion of lead and copper miners to the whole is but small, contrasts in a most extraordinary degree with that of coal-miners or of ironstone-miners. So strange indeed seemed the contrast, that it was thought expedient to go a second time through both the Census returns and the death registers to see whether some great error had not been made in the abstraction. It was found, however, that the figures had been correctly given. While the mortality of the other miners is, as has been shown, lower than that of males generally in the corresponding areas, the mortality of the Cornish miners is more than

\* On the Coal-miners of Durham and Northumberland. Report of British Association, 1893, p. 126.

than double that of Cornish males in the aggregate. For while the comparative mortality figure for all Cornish males is 887, that for Cornish miners is no less than 1,839, and is almost the highest in the Table. Moreover the death-rates have risen very considerably since the previous record, and at each of the two age-periods. This exceptional rise may very probably be explained in the following manner. In the decennium, 1871-80, the mining industry in Cornwall was in a state of decadence; and the miners in that county at the Census of 1881 were 44 per cent. fewer than they had been in 1871. A similar falling off, moreover, but on a smaller scale, had also occurred in the previous decennium, the miners in 1871 being 27 per cent. fewer than in 1861. These successive decreases in the number of the miners in Cornwall were due to their emigration into countries where mining was more prosperous, and offered better chances of employment; and it is only reasonable to suppose that the miners who had the energy to emigrate would be the more vigorous and healthy, while those who remained behind would be the comparative weaklings.

Thus the very opposite process has been going on among the Cornish miners to that which has been going on among coal-miners. The latter, as before explained, have been kept at a high standard of healthiness by the constant elimination of the least vigorous; the former have been undergoing deterioration by the constant emigration of the strongest.

The notable increase of the death-rates of Cornish miners in the interval between 1860-2 and 1880-2 may be explained with much probability by the foregoing hypothesis; but, after allowing all due weight to these considerations, it is still unquestionable that mining in Cornwall is for some reason or other very considerably more unhealthy than mining in other parts; for the death-rates of the Cornish miners in 1860-2 (which rates it may be noted were almost identically the same as those of 1849-53, though much lower than those of 1880-2) were vastly in excess of the death-rates of the coal-miners; and yet these rates apply to a period when the decadence had not yet set in. Allowing all the increase in the mortality since 1860-2 to be explained by emigration of the strongest, and taking the death-rates at that date to be the normal rates for Cornish miners, their comparative mortality figure would still be 1,449, while that of the miners in the six colliery areas is only 886.

The great bulk of the excess of mortality among the Cornish miners comes under the headings phthisis and diseases of the respiratory organs. The mortality figures from these two causes amount together to no less than 1,148, while the figure for all males in Cornwall is only 368, and the figure for the least healthy group of miners outside Cornwall, namely, the miners of South Wales and Monmouthshire, is only 459. The Cornish miners suffer therefore from these diseases more than three times as much as Cornish males in the aggregate, and more than twice as much as the miners in any other great mining area. In the whole list of industries in Table L. (*see* page 174) there is only one that at all approximates to these Cornish miners in this respect, namely, the earthenware and china manufacture. Here the mortality figure from the two causes is 1,118, while that of the Cornish miners, as already stated, is 1,148. It is under the heading Phthisis that the mortality of these Cornish miners is most appallingly in excess; the mortality attributed to this one cause alone is actually greater than the mortality of either farmers or gardeners from all causes together. In the case of miners, however, as also in the case of earthenware makers, the word phthisis has to be looked on with suspicion, owing to the unfortunate use of the terms "miner's phthisis" and "potter's phthisis" for non-tubercular affections, so that it is safer in these industries not to separate phthisis from diseases of the respiratory organs. Still, it is curious to note that, if we compare the figure for the potters with those for the Cornish miners, the relative proportions of the phthisis and the respiratory mortalities are almost exactly inverted, while the sum of the two is practically the same in each case. The Cornish miners, therefore, are more liable than the pottery makers to tubercular disease, or to diseases likely to be confounded with tubercular disease of the lungs, while they are less liable to other affections of the respiratory organs.

Of the total mortality of the Cornish miners nearly two-thirds is attributed to phthisis and respiratory diseases; and practically the same proportion marked their mortality\* both in 1849-53, and in 1860-62. Under the headings Diseases of the Nervous System and Diseases of the Organs of Circulation their mortality, though higher than that of other miners, and also higher than that of all males in Cornwall, shows no such enormous excess as that under the two headings already considered, and is less than the mean mortality for England and Wales. Neither do these Cornish miners show any excess of mortality from alcoholism or its consequences; a fact which tallies with the account of their habits given long since by the Royal Commissioners, who stated that "as a class they are well conducted and temperate; large numbers have taken the pledge and kept it, and whatever may be the causes of the diseases to which they are liable, the habit of intoxication cannot be assigned as one of them."† Under the heading Diseases of the Digestive Organs the mortality figure is unusually high; possibly this may be connected with the nature of their diet, which according to the Report of the Royal Commissioners was considered by the doctors to be unwholesome for men, whose digestions are already weakened by working in foul air and in high temperature.

The mortality from accident falls far short of that of other miners, and even than that of quarrymen or of fishermen. As compared with all other occupations, however, it is very high, the figure being 117, while that for cab-drivers, which comes next highest, is only 84.

*Influence of Fresh or Foul Air.*—The difference between an out-of-door life in fresh country air and an indoor life in a town is readily shown by comparing the mortality of agriculturists or fishermen with that of shopkeepers, or, going a step further in the scale of vitiated atmosphere, with the mortality of tailors, hatters, printers, and bookbinders. The agriculturists on the average have a comparative mortality figure of 644, the shopkeepers of 877, and the tailors, hatters, printers, and bookbinders of 1,088. The damage done by living in the vitiated atmosphere, though it is not confined to any one set of organs, nevertheless specially affects the organs of respiration. The mortality from diseases of these organs and from phthisis, taken together, is 198 for the fishermen and averages 237 for the agriculturists, while for drapers and grocers it averages 357, and for tailors and printers 549. Moreover, drapers live habitually in a more vitiated air than do grocers, and printers in a more vitiated air than do tailors, and the mortality in these several trades corresponds in each case to these differences. If we arrange the several industries in the order of purity of air, the order will also be that of mortality from phthisis together with diseases of respiratory organs, beginning with the lowest.

	Phthisis.	Diseases of Respiratory System.	The two together.
Fishermen .....	108	90	198
Agriculturists .....	115	122	237
Grocers .....	167	116	283
Drapers .....	301	129	430
Tailors .....	285	186	471
Printers .....	461	166	627

*Influence of Dust.*—The effect of exposure to inhalation of dust, speaking generally, is of course to increase the mortality from diseases of the respiratory organs and phthisis, but the effect differs very greatly, not only according to the amount but according also to the character of the dust, that which consists of hard and of sharp-pointed particles naturally doing more mischief to the air-passages than that of which the particles are soft or rounded. It is, however, unfortunately impossible to estimate accurately the comparative effects of different kinds of dust, independently of all other conditions, because the several industries concerned differ from each other materially in many other important respects besides the nature of the dust to which those who are engaged in them are exposed; some, for instance, being carried on in the country, others in towns, some in the open-air, others in the close and heated atmosphere of factories or in underground passages and the like. Nevertheless, if we arrange those dust-inhaling occupations, for which Table L. (*see* page 174) gives the necessary data, in the order of their mortalities from phthisis and diseases of the lungs, we have some valuable indications of the differences between different dusts in the production of such diseases. Of all occupations the one which is most completely free from exposure to dust is that of fishermen, and consequently the mortality figures for this industry have been added to the Table as a standard for comparison.

TABLE O.—Comparative Mortality of Males in certain Dust-Inhaling Occupations from Phthisis and Diseases of the Respiratory Organs.

Earthenware Manufacture.....	473	645	1,118
Cornish Miner .....	690	458	1,148
Fisherman.....	108	90	198

It will be noted that in every one of these dust-inhaling occupations, the mortality from phthisis and from diseases of the respiratory organs is higher than among fishermen. Of the various dusts the least injurious, to judge from the Table, is coal-dust; for, though the mortality of coal-miners from diseases of the respiratory organs is higher than that of several other industries in the list, their registered mortality from phthisis is by far the lowest, and indeed not so very much higher than that of fishermen; and, therefore, as has been explained at length in a previous page, it is believed by many that coal-dust acts as a preservative from this form of disease.

The dust of ordinary wood does not appear to be very baneful, for carpenters and joiners stand nearly on a level with coal-miners as regards the mortality from the two causes taken together; the mortality figures, however, for the two causes when taken separately are almost exactly inverted, the carpenters having a higher rate than the coal miners from phthisis and a considerably lower rate from diseases of the respiratory organs. Carpenters and joiners, however, work to a great extent in the open air, and very possibly the mortality figures for cabinet-makers, or for wood turners, who work indoors in a much thicker atmosphere of wood-dust, might tell a different tale; nor is this improbable, seeing that their comparative mortality figure from all causes together is considerably higher than that of carpenters (*see* Table J). Moreover, many of the harder woods which are used by cabinet-makers are said to give off a much more injurious dust than the ordinary timber used by carpenters and joiners.

Bakers

Bakers and confectioners, who inhale the dust of flour, have a considerably higher mortality from diseases of the respiratory organs than carpenters, but it may be doubted whether this is due to the flour-dust so much as to the heated atmosphere of the bakehouse. For, though much flour-dust may be inspired into the mouth of the baker, it is extremely doubtful whether much or any of it would get as far as the air passages and not be arrested on the way by inter-mixture with the saliva and adherence to the wet surface of the tongue and pharynx. The mortality of bakers from phthisis is scarcely higher than that of carpenters, which accords with the observation of Hirt\* that the inhalation of flour-dust rarely conduces to that disease.

More injurious than either coal-dust, wood-dust, or the dust of flour, appear to be the filaments and fluff and other dusts that are given off in textile factories; the mortality both from phthisis and from diseases of the respiratory organs being higher among workers in cotton and workers in wool than among persons exposed to either of the previously mentioned kinds of dust. The workers in cotton factories are worse than the workers in wool; the comparative mortality from the diseases in question being 543 for the former, and 462 for the latter. It must be remembered, however, that the air in the weaving sheds of cotton factories contains not only flocculent matter, but also a large amount of dust from mineral substances of various kinds used in sizing, and that the inhalation of mineral substances, judging from industries presently to be considered, is much more injurious than the inhalation of textile filaments.

The deleterious effects of dust upon the air-passages is increased both in the cotton and in the wool factories, and especially in the former, by the high temperature in which the work is carried on, and it is impossible to say how much of the lung mortality is due to the latter cause and how much to the dust.

But all the dusts as yet mentioned seem to be insignificant in their injurious action when compared with the dust of stone and the dust of metal. There are two industries in the Table, those of cutlers and file-makers, in which the workman is exposed to metallic dust. In the former the comparative mortality from the diseases in question is 760, and in the latter it is 783; and, doubtlessly, had not the subsidiary operations, such as hafting, been included in the cutlery manufacture, the mortality figure for cutlers would have been still higher. Even as it is, it is almost four times as high as that of fishermen.

Still more appalling seems the effect on the air-passages of stone-dust. There are four industries in the Table that are exposed more or less to this source of disease. Two of the four, namely, masons with builders and bricklayers, and quarrymen, work mainly in the open air, and though their mortality from lung diseases is very high, being between two and three times as high as that of fishermen, yet it is nothing as compared with that of Cornish miners and pottery-makers, who work in more confined space, and consequently inhale the stone-dust in much larger amount. For these workers the lung mortality is from five to six times as high as that of fishermen.

\* Op cit., pp. 142 and 214.

#### INSPECTOR ROWAN'S Reports in reference to the Bulli Colliery.

Sir,

Wollongong, 2 September, 1886.

For your information, I have the honor to inform you that I have inspected the Bulli Colliery on August 5th and 9th instant:—

*Bulli old Tunnel.*—About 130 men and horses are employed, and served with 12,500 cubic feet of air per minute in three different splits.

*Hill End district.*—Thirty-six men and horses employed, and supplied with 3,600 cubic feet of air per minute. The miners in this division are working with safety-lamps, as the coal gives off a small portion of fire-damp. Strict discipline is exercised by the management to ensure safety, viz., the bords are examined every morning by a competent person, and the same reported to be safe before the miners commence work. Four danger signals are placed at a respectable distance from the working faces, cautioning persons not to pass said boundaries with a naked light. I carefully examined every bord with a safety-lamp, but in no case did the fire explode in the lamp. I also asked the miners if they considered every care was taken; they said they believed so, and that the deputy made several inspections during the day.

*Hill End, West.*—About forty-six men and horses employed, and served with 5,500 cubic feet of air per minute.

*Slacky heading.*—About thirty men and horses employed, and served with about 3,400 cubic feet of air per minute. I went through a large portion of the waste workings, which from the return air-course, for the Hill End district, heavy falls of roof have taken place. I pointed out the defective condition of this return air-way. The manager showed me a new return air-way he was making through a portion of the waste workings and solid coal, which is expected to be finished in a few weeks, as he was driving it from each side, with two shifts of men. This air-course will come along all the working-faces, and will be the future permanent air-course for the colliery.

I have, &c.,

JAMES ROWAN,

Inspector of Collieries.

The Examiner of Coal-fields.

Sir,

Wollongong, 25 October, 1886.

For your information, I herewith forward report of my inspection made at Bulli Colliery on the 20th instant.

On making my inspection of the workings I found that heavy falls of roof had taken place in the return air-ways, also in Harris's heading. In this heading, where about forty men were employed, the manager has lifted all the plant, as there was no possible way of keeping the roads in order.

This, Harris's heading, has a very bad class of roof, and requires a constant staff of way-men to keep it in order. The manager informed me at the commencement all the day-men and deputies struck work with the miners, leaving him without a man; even the underground furnace-man left, and it was with difficulty he could find another to fill his place. I mentioned in my last report that a new air-course was in course of construction, which by this time would have been finished, but that also was at a standstill for want of workmen.

The new furnace which is being built about 43 chains from the entrance of the tunnel is almost finished, which will be a great boon for the ventilation of the colliery.

I have, &c.,

JAMES ROWAN,

Inspector of Collieries.

The Examiner of Coal-fields.

Sir,

Sir,

Wollongong, 22 December, 1886.

I beg to state that I have inspected Bulli Colliery on the 20th instant.

The miners are still on strike. Five men employed underground doing general repairs. I examined the Hill End division of workings. This is the division of workings that used to generate fire-damp, and where the men when working had locked safety-lamps. I examined this portion with a safety-lamp, and found the same clear from fire-damp or any other foul gases. I could not pass through the other two divisions of workings on account of heavy falls of roof, especially in the return air-ways. I drew Mr. Ross, the manager's attention to the condition of the return air-ways. He stated he could not get men to work to keep the air-ways in order, and they were constantly falling. (See October report on the Bulli Colliery.) But it would be his first business to put the air-ways in order, when the strike was settled. The new ventilating furnace is now finished, and in working order.

I have, &amp;c.,

JAMES ROWAN,

Inspector of Collieries.

The Examiner of Coal-fields.

Sir,

Wollongong, 2 March, 1887.

For your information, I have the honor to inform you that I inspected Bulli Colliery, on the 17th instant.

*Hill End District*:—Fifty men employed, four of them working in narrow headings with safety-lamps, owing to the coal giving off a small per cent. of fire-damp. I carefully examined this division of workings and found the ventilation good in every bord, 12,000 cubic feet of air being brought up to within 20 yards of the furthest in working-face. On examining the return air-way I found that heavy falls of roof had taken place. The falls were so heavy I could not make a passage through. I drew the manager's attention to this matter. He stated that he had three shifts of men working, making a new air-course, and the same would be kept working until a proper recognized air-way was made from the working-faces to the ventilating furnace. As I have formerly reported, a number of these falls took place during the recent strike.

Harris's heading, where forty men were employed previous to the strike, is so completely crushed, caused by the bottoms heaving in this district. The bords will require to be cut out anew with a pair of headings.

I have, &amp;c.,

JAMES ROWAN,

Inspector of Collieries.

The Examiner of Coal-fields.

TABLED LIST of Non-fatal Accidents in the Southern and Western Districts of New South Wales Collieries investigated by the Inspector of Collieries during the half-year ending 30th June, 1894:—

## SELECT COMMITTEE ON WORKING OF COLLIERIES.

## REPORT.

THE SELECT COMMITTEE of the Legislative Assembly, appointed on the 13th March, 1894.—“with power to send for persons and papers to inquire into and report on the Working of Collieries,”—have agreed to the following Report:—

Your Committee having examined the witnesses named in the List,\* and carefully considered the evidence given before the Committee, find the following:—

1. That it is absolutely necessary that an amended Act regulating the working of collieries should be passed without delay, and, amongst others, containing the following provisions:—
2. That a fixed minimum quantity of air—not less than 150 cubic feet of air per man, boy, and horse per minute—should be provided, for the following reason: That in the majority of collieries working at the present time, where there is little or no inflammable gas met with, the absence of a fixed minimum quantity of air would leave the matter at the discretion of the manager, which would lead to disputes, and, perhaps, subsequently to strikes.
3. That provision should be made for conducting the air to the working-face, so that the men working there may be kept safe from the different gases with which they have to contend, and which prove so detrimental to health.

4.

\* List of witnesses: R. Baxter, J. Campbell, H. O. MacCabe, J. Owens, W. Thomas, J. Thornton, J. Welford, H. Wood.

4. That a difference of opinion exists among the witnesses as to the better methods for conducting the air, viz., by lessening the distance between the cut-throughs or by brattice. But your Committee consider that the better way to conduct the air to the working-faces is by means of brattice, which is the cheapest and most approved scientific method.
5. That your Committee consider that the number of men in a split should not exceed sixty, as such provision is highly essential for the health of the workmen.
6. That the majority of witnesses were in favour of legalising eight hours per day for men working underground; and so far as hewers are concerned, the evidence goes to show that eight hours is the time worked at present in the great majority of mines. Your Committee therefore believe that it would be no great hardship to embody an "eight-hours" clause in any Bill for the better regulation of coal-mines and collieries.
7. That your Committee are of opinion that the system known as the "Standard Weight System" is unjust, and ought to be abolished, and that the miners should be paid for the total weight of coal obtained by them.
8. That your Committee consider it necessary that managers, under-managers, and engine-winders should be required to pass an examination to qualify them for "certificates of competency" before they are appointed to any of the before-mentioned positions; but provision should be made to allow those who have served as managers, under-managers, and engine-winders, respectively, "certificates of service" as provided for in the English Coal-mines Acts of 1872 and 1887.
9. That a uniform code of signals should be used at all collieries.

In conclusion, your Committee beg to recommend the adoption of the English Coal-mines Regulation Act of 1887 (50 and 51 Vic., chap. 58), with the amendments suggested in this Report, believing it to be for the better protection of the miner's health and life, the owner's property, and the welfare of the community in general.

No. 3 Committee Room,  
Sydney, 5th May, 1894.

JOHN L. FEGAN,  
Chairman.

N.

TABLE showing quantities of Mineral wrought under the English Coal Mines Regulation Acts of 1872 and 1887, number of Fatal Accidents and Deaths, Tons of Mineral wrought per Fatal Accident and per Death, Number of Mines at Work, and Number of Persons Employed above and below ground.

Year.	Tons of Mineral Wrought.					Separate fatal accidents.	Lives lost by the accidents.	Tons of Mineral Wrought.		No of mines.	Persons employed.			Total above and below.
	Coal.	Fireclay.	Ironstone.	Shale, &c.	Total.			Per fatal accident.	Per lives lost.		Under-ground. Males.	Above ground.		
												Males.	Female.

N 1.

WEALTH AND PROGRESS OF NEW SOUTH WALES, 1893 (COGLAN).

(Extract, page 77.)

ACCIDENTS IN COAL-MINES.

There were 7 persons killed and 76 persons injured in New South Wales coal-mines during 1892, making a total of 83 accidents—the number of fatal accidents being smaller and that of non-fatal accidents larger than in any of the previous ten years. For the ten years ending with 1892, the average annual loss of life in the British coal-mines was 1.8 per thousand, or at the rate of 179,696 tons of coal raised for every fatal accident. In the New South Wales collieries, for the same period, the rate was 3.0 fatal accidents per thousand miners employed, and only 121,657 tons of coal were raised for every life lost. This very high average of fatal accidents in this Colony results from the Bulli disaster in 1887, when 81 miners lost their lives. The circumstances surrounding the mining industry in New South Wales would warrant the expectation of a much lighter average.

## NEW ZEALAND LABOUR LAWS—Pages 274–5.

*Owner to make Quarterly Contribution to Coal-miners' Relief Fund.*

69. The owner of every coal-mine, whether situate on private lands or on Crown lands, in addition to the conditions for the payment of any royalty, shall contribute to a fund for the necessary relief of coal-miners who may be injured whilst working in coal-mines, and for the relief of the families of coal-miners who may be killed or injured whilst so working, and for the purpose of such fund shall, in the months of January, April, July, and October in every year, pay a sum equivalent to one half-penny per ton on the output of the bituminous coal and one farthing per ton on lignite in any coal-mine sold during the preceding three months respectively ending on the last day of the previous months of December, March, June, and September, into the Post Office Savings Bank which is nearest to the said mine, to the credit of an account called "The Sick and Accident Fund" in connection with the Miners' Association of the district where such mine is situated. In case there is no Miners' Association, the same shall be paid into the Post Office Savings Bank which is nearest to the said mine to the credit of the Minister of Mines and the Public Trustee, in an account to be called "The Coal-miners' Relief Fund."

All moneys so paid into the said Sick and Accident Fund shall be operated upon only by the persons appointed in that behalf by the Miners' Association of the district, in accordance with regulations to be from time to time made by the Governor, and all moneys so paid into the Post Office Savings Bank shall be operated on only by the aforesaid Minister and Public Trustee jointly for the purposes of the said relief.

Any inspector of mines is hereby authorised and empowered, at any reasonable time, to examine from time to time the books of any owner of a coal-mine for the purpose of ascertaining the quantity of coal raised from such mine during any period or periods, and also to ascertain from the proper officer having control of the Sick and Accident Fund of the Miners' Association of the district, and from the proper officer at any Post Office Savings Bank as aforesaid, the amount paid to the credit of the aforesaid fund by any owner of a coal-mine from time to time, and to compare the amount so paid by any such owner in respect of any quarter of a year with the quantity of coal sold during such quarter as appearing in the books of such mine.

If on such comparison it shall appear that any such owner has not paid into the aforesaid Sick and Accident Fund or Relief Fund any amount as hereby prescribed, or only a part thereof, such owner shall be deemed guilty of an offence against this Act, and shall be liable to a penalty of two pounds sterling in respect of each and every pound sterling or fraction of a pound sterling which he should have paid into the said Sick and Accident or Relief Fund respectively, and all penalties recovered under this section, less the expenses incident to the recovery of the same, shall be paid by the inspector of mines into the aforesaid Sick and Accident or Relief Fund respectively, and shall form part thereof.

Every owner of a coal-mine who refuses, obstructs, or prevents, or causes the refusal, obstruction, or prevention of the production of the books of the mine, and the free examination of such books for the aforesaid purpose by any inspector of mines, on his request for such production, shall be deemed guilty of an offence against this Act, and shall be liable to a penalty not exceeding fifty pounds for every day during which such refusal, obstruction, or prevention continues.

In any action brought by a workman against the owner for injuries, the amount to which such workman may be entitled from the said fund shall be taken into consideration in assessing the damages.

"Owner" in this section includes any one or more owners and any company whether incorporated or not.

## O 1.

## BRATTICING.

ESTIMATED cost of Bratticing to a point 15 yards from the face. The bord is assumed to be as now—that is, 8 yards wide and 35 yards long between headings.

1 square yard of brattice costs  $7\frac{1}{2}$ d.

- (1) Cubic yards of coal in a bord, 4 feet high = 373.

Allowing one-quarter for small coal, dirt, &c., leaves 280 cubic yards of large coal.

Taking 18 cwt. as the weight of 1 cubic yard of coal, we get  $\frac{280 \times 18}{20} = 252$  tons of large coal.

The brattice (inclusive of door at bord end), to be 15 yards from the face, will require (say) 24 lineal yards of canvas, 4 feet deep—

$$\frac{24 \times 3 \times 4}{9} = 32 \text{ square yards.}$$

$$32 \times 7\frac{1}{2}\text{d.} = 240\text{d.}$$

Therefore the cost of brattice, per ton =  $\frac{240}{252} = .95\text{d.}$

The cost of fixing will be very small, because the timber now used by the miner to support the roof will be utilised for brattice supports. Therefore, this cost will scarcely ever exceed .4d. or .5d. per ton. (In one mine where brattice is now used the cost of fixing is .3d. per ton.)

Assuming it, however, to be .5d.

Then, total cost for bord, 4 feet high =  $\frac{95}{145}$  pence per ton.

- (2) Cubic yards of coal in a bord 5 feet high = 467.

Allowing one-quarter for small coal, dirt, &c., leaves 350 cubic yards of large coal.

1 cubic yard of coal = 18 cwt. and gives  $\frac{350 \times 18}{20} = 315$  tons of large coal.

24 lineal yards of brattice, 5 feet deep, = 40 square yards, @  $7\frac{1}{2}$ d., amounts to 300d.

Then cost of brattice =  $\frac{300}{315} = .95\text{d.}$  per ton.

Cost of fixing ... .. = .50d. ,,

Total cost ... .. = 1.45 pence per ton.

## P.

## CHECK-INSPECTORS' REPORT.

*(Newcastle Paper.)*

Mr. F. Miles read the check-inspectors' report. In the Jubilee part of the colliery, No. 3 split, the report stated that the amount of air travelling only gave an average of 35 cubic feet per minute.

The reading of this statement caused considerable surprise, and at first it was thought a mistake had been made. It was explained that the air current had since been improved. The report also dealt with several other places where no register could be obtained. With reference to the air current in the little tunnel, the overman says that he could not do anything. They (the inspectors) could do no more, and it was self-evident that the Government inspectors would do nothing. The report was adopted.

## Q.

## EXTRACT from Report of Royal Commission on Collieries adjacent to Ferndale.

THE width of the bords and the area and arrangement of pillars, while they ought in all cases to be graduated to suit circumstances, such as depth, character of roof, floor, or particular conditions overhead—in the case of collieries working under the ocean at the limited depths referred to (and without reference to the ordinary circumstances that should regulate the width and thickness or area of bords and pillars), may fairly be considered in a special light. The impossibility of calculating the conditions of the superincumbent strata and the forces that repose in the ocean, makes it necessary, in the opinion of the Commission, to increase the ordinary margin considered sufficient for the safety of a mine. As no attempt, under these circumstances, could be made to work out or recover pillars, it becomes necessary to consider the coal pillars as so much mineral won, or impossible to recover for this reason. The size of pillars must be such as to afford ample support *after* exposure to the crumbling effect of the air over many years.

The Commission are therefore of opinion that the thickness of pillars should be materially increased beyond that generally considered necessary in the district. The strength of these pillars may be increased by a judicious arrangement of cut-throughs and roads, so as to have as few roads intersecting or branching from a main road at one place as possible. Zig-zagging pillars, with respect to cut-throughs, may be advisable. The width of bords in the district is 8 yards. In the case of collieries working under the above conditions, this width would, in the opinion of the Commission, court disaster. The width of bords should be materially reduced, and the greatest care taken to secure the roof with timber. In these general opinions the Commission are supported by almost every witness who submitted himself for examination. While many of these gentlemen condescended upon specific widths of bords and thickness of pillars, the Commission prefer, in the absence of particular and detailed information, to enunciate general opinion only, and to repeat that while these should be graduated or fixed by a knowledge of all the circumstances, yet it might be advisable to state that in the case of ocean leaseholds a minimum thickness of (say) 8 yards for pillars, or maximum width of 6 yards for bords, might be insisted upon, leaving the management free to exercise their discretion in altering these (by increasing the maximum thickness or decreasing the minimum width) so as to increase the general safety.

Knowing the tendency that "faults" possess of weakening the roof, and of permitting the passage of water through the broken material that is frequently found along their line, or through open joints in their substance, it would be well in discovering a fault or fissure in a bore to take precautions against possible danger from this source before opening it up by the drive.

In the case of some of these ocean leaseholds it may be impossible; but when possible, the coal underlying the ocean should be attacked only after a large "goaf" has been made by extensive coal-workings under the main land. This, in addition to special and unusual facilities being provided for the escape of men by the shafts, would afford a measure of security difficult to over-estimate.

The Commission, aware of the impossibility of preventing accidents by Act of Parliament, and the danger of absolute rules, are confident, in pointing out some of the general lines in which protection to life and property can best be secured, and allowing ample scope for skilful management, that greater benefits will probably result than by recommending regulations of a hard and fast and unbending nature, that would be found in practice to be unworkable, to bear with especial severity on individuals, and to induce results detrimental to an important industry.

It is obvious that if coal-mining is to be conducted under the precarious conditions narrated, it must of necessity be guided by managers thoughtful, experienced, and skilful, and under regulations and discipline that will eventually, by appealing to the reflective faculties of the workmen, impress and identify them with a sense of their individual and collective responsibility. It is possible that the chief security may be found to rest in the skill and thoughtful care of those engaged in these avocations.

## Q 1.

LETTERS from Examiner of Coal-fields to the Under Secretary for Mines upon tidal and ocean leaseholds.

## Leases to mine under the ocean or tidal waters.

The Examiner of Coal-fields may be asked to say whether the conditions as to 6-yard bords and 6-yard pillars should be inserted in all leases under the ocean or tidal waters, and whether any general rule should be laid down in regard to the thickness of coal to be taken out or to be left in overhead.—H.W., 3/1/87. Examiner of Coal-fields, B.C., 5/1/87.

My recommendations for special conditions to be inserted in ocean and tidal water leaseholds in the county of Northumberland are forwarded herewith.—J.M., 7/1/88. Under Secretary for Mines, B.C., 7/1/88.

*Tidal*

*Tidal Leaseholds.*

Sir,

Coal-fields Office, Newcastle, 7 January, 1888.

Referring to your blank-cover communication of the 5th instant (234), I beg to recommend that in tidal leaseholds a minimum thickness of 6-yard pillars and maximum width of 6-yard bords, or any other excavations or mine works, should be insisted on, leaving the management free to exercise their discretion in altering these (by increasing the maximum thickness or decreasing the minimum width), so as to increase the general safety; and also,—

2. That the 6-yard pillars be left unwrought.
3. The thickness of coal to be wrought out not to exceed 7 feet, without the Minister's permission be obtained for working or excavating any greater thickness of the coal-seam, after it has been opened out and the character of the overlying strata proved by the lessee.
4. All headings and bords to be driven by plumb-lines.
5. All coal-workings to be accurately surveyed every three months, and the coal taken out during the previous three months to have the dates of such surveys affixed on the plan in ink, and every year's workings to be represented on the plan by some conspicuous colour.
6. The colliery plans to contain a faithful and honest record of all faults, dykes, fissures, and occurrences that are met with in the mine, and the workings delineated thereon as they are, and not as they are intended to be.
7. In one road of every pair of winning-off or leading headings, or levels, a bore to be kept going 10 feet in advance, for the purpose of foretelling the presence of any fissure, washout, open joint, fault, dyke, or otherwise; and all winning-off headings shall be driven at least 50 yards in advance of the working bords.
8. Owing to the tendency that faults, dykes, washouts, &c., possess of weakening the roof, and of permitting the passage of water through the broken material that is frequently found along their lines, or through open fissures or joints, the lessee must, on discovering a fault, washout, dyke, or fissure in a bore at the face or side of leading headings or levels, take all necessary precautions against possible danger before opening it up by the drive.
9. That the most accurate and trustworthy information be obtained by the lessees as to the thickness and character of the strata and estuary deposits overlying the coal-seam before commencing to work it.

In conclusion, I have the honor to state that the above conditions embody the Royal Commission on Collieries' recommendations for tidal water leaseholds.

I have, &amp;c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

The Under Secretary for Mines.

*Ocean Leaseholds.*

Sir,

Coal-fields Office, Newcastle, 7 January, 1888.

Referring to your blank-cover communication of the 5th instant (No. 234), I beg to recommend that in ocean leaseholds a minimum thickness of 8-yard pillars and maximum width of 6-yard bords, or any other excavations or mine works, should be insisted on, leaving the management free to exercise their discretion in altering these (by increasing the maximum thickness or decreasing the minimum width) so as to increase the general safety; and also,—

2. The 8-yard pillars to be left unwrought.
3. The thickness of coal to be wrought out not to exceed 6 feet.
4. All headings and bords to be set out and driven by plumb-lines.
5. All coal-workings to be accurately surveyed every three months, and the coal taken out during the previous three months to have the dates of such surveys affixed on the plan in ink, and every year's workings to be represented on the plan by some conspicuous colour.
6. The colliery plans must contain a faithful and honest record of all faults, dykes, fissures, and occurrences that are met with in the mine, and the workings delineated thereon as they are, and not as they are intended to be.
7. In one road of every pair of winning-off or leading headings or levels a bore to be kept going 10 feet in advance, for the purpose of foretelling the presence of any fissure, washout, open joint, fault, dyke, or otherwise, and all winning-off headings shall be driven at least 100 yards in advance of the working bords.
8. Owing to the tendency that faults, dykes, washouts, &c., possess of weakening the roof, and of permitting the passage of water through the broken material that is frequently found along their lines, or through open fissures or joints, the lessee must, on discovering a fault, dyke, or fissure in a bore at the face or side of leading headings or levels, take all necessary precautions against possible danger before opening it up by the drive.
9. When possible, the coal under the ocean should be attacked only after a large "gap" has been made by extensive coal-workings under the mainland. This is to be in addition to special and unusual facilities being provided for the escape of men by the shafts, will afford a measure of security difficult to over-estimate.
10. That the most accurate and trustworthy information be obtained by the lessees, not only of the depth and character of the sea bottom, but also of the strata overlying the coal-seam, which strata shall be bored through, and proved a minimum thickness of 30 feet, at the face of the leading headings or levels so soon as they have been driven 100 yards in advance of the working bords, and after the first borehole has been completed, other boreholes to be so put up in advance of it at the face of the headings or levels, at distances not to exceed 20 yards.

In conclusion, I have the honor to state that the above conditions embody the Royal Commission on Collieries' recommendations for ocean leaseholds.

I have, &amp;c.,

JOHN MACKENZIE,

Examiner of Coal-fields.

The Under Secretary for Mines.

P.S.—The Royal Commission on Collieries have expressed, as their opinion, that they do not see any practicable method where mining operations can, with safety, be conducted under some of the ocean leaseholds, which it may perhaps be as well to remind you of.—J.M.

The conditions recommended by the Examiner may be embodied in leases of land under the ocean or under tidal waters, as the case may be. The Examiner may be asked which leaseholds are referred to by the Commission as unsafe to work.—H.W., 10/1/88. Submitted. Approved.—F.A., 12/1/88. Examiner of Coal-fields, B.C., 17/1/88.

Stockton Ocean Lease of 680 acres (*vide* pages 53, 59, and 67 of Royal Commissioners on Collieries' Third Report) is the one referred to as impracticable to work. Referring to Frank and Garrett's leasehold of 2,516 acres (*vide* page 63) they say nothing short of boring to the actual coal-seams will afford the necessary information with accuracy required. "Hetton Lease.—That the most accurate information of the deposits overlying the coal should be ascertained at several points over this leasehold before any scheme of winning a thick coal-seam is elaborated or begun." This has not been done, although the coal-seam is being opened out and won. "Morewether's Ocean Leasehold."—That (*vide* page 67) "referring to the contemplated winning of a thick coal-seam under all tidal waters or the ocean, they desire in concluding their report on the condition of collieries adjacent to Ferndale, to summarise briefly the points, that they as practical men, connected in their various capacities with mining pursuits, believe should be observed, viz. :— That the most accurate and trustworthy information should be obtained, not only of the depth of water and character of the sea bottom, but (in collieries mining under the Delta) of the thickness and character of the deposits that overlie the rock; some of which, such as clay, it has been seen add so materially to the security and safety of the mines. From a sincere desire to ensure safety and security to mining works, the Commission, looking to the thickness of the strata overlying the coal-seam in the case of these leaseholds (ocean), where, it is probable, no surface deposits exist, and the rock itself may form the bed of the ocean, consider that, as the workings would be extended, so to speak, towards the unknown (although it may appear arbitrary, and to some extent may restrict operations), a minimum thickness of strata should, indeed must, intervene between the top of the coal and the bed of the ocean. In the case of the undoubted proof of plastic clay overlying the rock had due consideration should be given to that circumstance. To the north of Stockton the surface deposits are, so far as proven, of so ominous a nature that, unless carefully conducted operations reveal improved conditions, the Commission do not at present see any practicable method whereby mining operations can with safety be conducted under the ocean at that part of the district." "The Commission are fully aware that, so far as they know, no restrictions such as these indicated have been as yet considered necessary in Great Britain or her Colonies, but they are likewise unaware of coal-mining being prosecuted under similar circumstances. The peculiar conditions of the coal-fields under consideration is, in their opinion, a justification for calling attention thus early to the sources from whence danger may be apprehended. The Coal Mines Regulation Act enforces certain precautions being observed approaching suspected danger. The Commission cannot distinguish any reason why these precautionary measures should not be extended with a view to avert danger from a source novel to Colonial coal-mining, and not contemplated when the Act of 1876 was passed."—J.M., 19/1/88. Under Secretary for Mines, B.C., 19/1/88.

The attention of the owners of the collieries or lands referred to may be invited to the portions of the report referred to, and they may be invited to show that the coal-seam proposed to be worked can be worked without danger.—H.W., 20/1/88.

Submitted. Approved. Nothing further should be done towards granting the leases until all the precautions recommended by the Commission and approved by the Examiner of Coal-fields have been attended to.—F.A., 23/1/88.

## Q 2.

Report of Members of the Royal Commission on Collieries Adjacent to Ferndale *re* Wickham and Bullock Island Colliery Shaft.

To the Chairman and Members of Royal Commission,—  
Gentlemen,

Newcastle, 12 August, 1886.

We, the undersigned, chosen by you to examine the Bullock Island Colliery shaft, beg to state that we did so on the 11th instant.

We measured the seam at the bottom of this shaft, and found it to be (including coal and bands) 18 feet 9 inches in thickness, and the rock immediately above this seam, which Mr. Menekin said was 25 feet thick, we found to be 27 feet 6 inches.

The manager informed us that the cast-iron cylinders were set into this rock, but he could not say how far.

We examined each of the cylinders in this shaft, and found that the thirty-first cylinder from the surface was split longitudinally, crossing all the joints, and extending all round the shaft in this particular cylinder. This break was wedged up some of the way, and made water-tight with wedges  $\frac{5}{8}$  of an inch in thickness at the head.

We also found that the thirty-fifth cylinder was split in a longitudinal direction, and extended about two-thirds of the way round the shaft and crossing the joints of the segments. This break was also wedged up with wedges  $\frac{5}{8}$  of an inch in thickness at the head, and made almost water-tight.

These broken cylinders are situated in the clay stratum, there being about 29 feet of clay above first broken cylinder, and about 41 feet above the second broken cylinder.

We have, &c.,

WILLIAM TURNBULL,  
JAMES CURLEY,  
Members of Royal Commission.

## Q 3.

H.—MINERAL LEASE.

Appn. No. at

THIS INDENTURE, made the            day of            , in the year of our Lord one thousand eight hundred and            , between Her Most Gracious Majesty Queen Victoria, of the one part, and (hereinafter called the lessee), of the other part, witnesseth:—That in consideration of the sum of            paid by the said lessee on the            day of            18            and of the rents and royalties hereinafter reserved, and of the covenants and provisoes hereinafter contained, Her Majesty doth by these presents grant

grant and demise unto the lessee, his executors, administrators, and transferees, all that piece or parcel of land, containing by admeasurement and more particularly described and delineated in the Schedule hereto or in the plan hereunto annexed, and numbered , and all those mines, veins, seams, or deposits of , in and under the said land (hereinafter called the said mine), together with all and singular the shafts, levels, drifts, works, ways, fixtures, erections, liberties, easements, advantages, and appurtenances which are now or at any time during the term hereby granted may be held, occupied, or enjoyed therewith, for the purpose of mining under the said land for , and also with full power for the said lessee, his executors, administrators, and transferees, and his and their agents and workmen (including contractors, tributors, and so forth), to dig, sink, drive, make, and use excavations, pits, shafts, levels, tunnels, watercourses, and other works necessary for winning and raising the in or under the said land, and to take and appropriate the same during the term hereby granted, for effectually carrying on the works of the said mine: To hold the said land, mine, and premises, with the appurtenances (subject nevertheless to such rights and interests as may be lawfully subsisting therein at the date of these presents), unto the said lessee, his executors, administrators, and transferees, from the date hereof, for the term of years, for the purpose of mining therein, for working or winning the said , and for no other purpose,—yielding and paying therefor unto Her Majesty, Her Heirs and successors, yearly and every year during the said term, the yearly rent of in advance, or in lieu thereof a royalty equal to sixpence per ton on all raised during the year, the first year's rent having been paid as aforesaid on the day of the next payment, being the rent of the said land at the rate of per acre per annum to the day of 18 , shall be made to the Colonial Treasurer in Sydney, on or before the day of 18 , and thereafter on or before the day of in each and every year, the yearly rent aforesaid shall be paid to the Colonial Treasurer aforesaid, clear of all rates, taxes, and assessments to which the said land, mine, and premises are now, or at any time during the said term may be, subject or liable: Provided that if the royalty upon the raised during any year of the said term, computed at the rate aforesaid, shall exceed the rent paid for such year, such royalty, after deducting therefrom the rent paid for such year, shall be paid to the Colonial Treasurer at the expiration of the year or within one month thereafter; but if such royalty in any year amount to less than the rent paid for such year no royalty shall be demanded in respect of the raised during that year: Provided always, and it is hereby agreed, that if the said yearly rent or royalty shall be in arrear for thirty days after the same shall have become payable, whether such rent or royalty shall have been legally demanded or not, any officer appointed or authorised thereto by the Secretary for Mines may, by himself or his agent, enter upon the said land, and seize and distrain all minerals, metals, and ores actually got and raised from the said mine; and all machinery, apparatus, tools, waggons, carts, carriages, engines, plant, and all other goods, chattels, and effects whatsoever, in and about the said land and premises, and in every distress thus made may take away, sell, and dispose of as in cases of distress for rent reserved in common leases; and out of the moneys arising thereby retain so much as shall be sufficient to satisfy the said arrears, and which shall at the time of such sale be unpaid, and all expenses incurred by him or them in or in respect of such seizure, distraint, removal, and sale; and if there be any surplus such officer shall pay the same to the said lessee, his executors, administrators, or transferees; and the acceptance or receipt of rent or royalty by or on behalf of Her Majesty, after breach of any covenant hereinafter contained, shall not be or be deemed a waiver of the right of Her Majesty, or of the Secretary for Mines, or other officer on behalf of Her Majesty, to enforce observance of such covenant. And if the said lessee, his executors, administrators, or transferees, shall mine for or win from the said land, mine, and premises any gold, or any earth, rock, stone, quartz, clay, sand, gravel, or soil containing gold, or any mineral or metal with which gold is associated or combined, without the express sanction first had and obtained of the Secretary for Mines for the time being, the Governor, with the advice of the Executive Council, may declare these presents void, and thereupon all the right, title, and interest of the lessee, his executors, administrators, and transferees under these presents shall cease and determine both at law and in equity. And the said lessee do hereby, for himself, his heirs, executors, administrators, and transferees, covenant with Her Majesty, her heirs and successors, in manner following, that is to say:—

1. That the said lessee, his executors, administrators, and transferees, shall and will during the said term pay unto Her Majesty, her heirs and successors, the rent or royalty hereby reserved, at the times and places hereinbefore appointed for payment thereof, clear of all deductions.

2. And shall and will, after the expiration of from the date of delivery hereof, upon and during all lawful working days, except when prevented by inevitable accident, or during the execution of repairs, work the said land, mine, and premises, or the land, mine, and premises adjoining thereto and proposed to be worked in connection therewith, in the best and most effectual manner, and to the best advantage, without interruption; and shall and will with reasonable expedition make and construct all necessary works with a view to diligently explore and search for in and under the said land, mine, or premises, in accordance with the special conditions following, that is to say:—

- a. The minimum width of pillars to be left shall be six yards, and the maximum width of bords or other excavations shall be six yards; but the lessee or the manager of the colliery is free to exercise his discretion in altering the above by increasing the minimum width of the pillars or decreasing the maximum width of the bords or other excavations so as to increase the general safety.
- b. That the six-yard pillars shall be left unwrought.
- c. All headings and bords to be driven by plumb lines.
- d. All coal workings to be accurately surveyed every three months, the plan thereof to show the area worked out during the previous three months, and every year's workings must be indicated thereon by some distinctive colour. The dates of each survey must be noted on the plan.
- e. The colliery plans to contain a faithful and honest record of all dykes, fissures, and occurrences that are met with in the mine, and the workings delineated thereon as they are, and not as they are intended to be.
- f. In one road of every pair of winning-off or leading headings a bore shall be kept going ten feet in advance, for the purpose of foretelling the presence of any fissure, wash-out, open joint, fault dyke, or otherwise, and all winning-off headings shall be driven at least fifty yards in advance of the working bords.

land, and to remove therefrom such machinery, plant, and apparatus as shall have been erected and fixed upon such land, and such earth, rock, ore, mineral, or metal as shall have been won from and raised to the surface of such mine.

11. And shall not nor will use or occupy, or permit to be used or occupied, the said land, or any part thereof, for other than mining purposes.

12. And shall not nor will mine in the said mine, land, and premises, for any mineral, metal, or ore other than without the express sanction of the Secretary for Mines.

13. And shall not nor will transfer, underlet, or part with possession of the said land, mine, and premises, or any part thereof, or mortgage, charge, or encumber the same, without the license first had and obtained of the Secretary for Mines for the time being: Provided always that no such license shall be necessary in cases where, by operation of law or otherwise, a sale of the said land, mine, and premises, or any part or parts thereof, is made by any person or persons entitled to sell the same for the benefit of the creditors or a creditor of the lessee or his transferees, or in cases where the lessee or his transferees desire to let the said mine and premises, or any part thereof, to be worked on tribute.

14. And shall not nor will close up or obstruct any adit or adits to or from any contiguous mine or mines, whereby fresh air is admitted or ventilation promoted.

15. And shall not nor will plead acceptance of rent or royalty by or on behalf of Her Majesty as a waiver of the right of Her Majesty, or of the Secretary for Mines, or other officer on behalf of Her Majesty, to enforce observance of the covenants herein contained, or of the right of the Governor, with the advice of the Executive Council, to declare these presents void for breach of any such covenant: Provided always and it is hereby agreed and declared in manner following:—

16. That it shall be lawful for Her Majesty, Her Heirs, Successors, and Assigns, to make and use in, on, or under the said land, any levels, drifts, leads, shafts, watercourses, adits, roads, ways, and passages for freeing and keeping free any other lands or mines from water, or for conveying water to any other lands or mines for mining purposes, or for supplying any other mines with fresh air, or for effectually working any other mines, or for any public purpose whatsoever, causing as little damage, obstruction, or interference as possible to or with the said mine and the works thereof. And if, at any time during the term hereby created, any part or parts of the land hereby demised, shall be required for any public purpose, it shall be lawful for the Governor for the time being, with the advice of the Executive Council, on giving three months' notice of his intention so to do, to cause to be set out the part or parts of the said land which shall be so required; and as soon as the same shall be so set out, such part or parts of the said land shall cease to be included in the land hereby demised, and the lessee, his executors, administrators, or transferees shall not be entitled to any abatement of rent or royalty, or any compensation whatever in respect thereof.

17. And if the said lessee, his executors, administrators, or transferees shall prove to the satisfaction of the Secretary for Mines for the time being that the said mine is unworkable or cannot be profitably worked, from any cause whatsoever, or that the lessee, his executors, administrators, or transferees is or are unable, by reason of sickness or other sufficient cause, to work in such land or mine, or that the supply of water is insufficient to allow the working of the said land, mine, and premises to be profitably carried on, the said Secretary for Mines may grant permission to suspend work therein, for any period not exceeding six months without the lessee, his executors, administrators, or transferees incurring in respect thereto any forfeiture or penalty for breach of any covenant herein contained.

18. And, lastly, that if the lessee, his executors, administrators, or transferees shall at any time during the said term fail to use such land *bonâ fide* for the purpose for which it has been demised, or if and whenever the said rent or royalty shall be in arrear for thirty days after the time appointed for payment thereof, whether the same shall have been legally demanded or not, or if and whenever there shall be a breach of or non-compliance with the covenants and provisoes herein contained by the lessee, his executors, administrators, or transferees, and the lessee, his executors, administrators, or transferees shall not have obtained from the Secretary for Mines for the time being permission to suspend work as aforesaid, in case the breach shall have been for non-compliance with the covenants for the employment of workmen or miners, or for the working of the mine, the Governor, with the advice of the Executive Council, who alone and finally shall judge and determine the matter upon the evidence or reports submitted by the Secretary for Mines for the time being, may declare these presents void; and upon publication in the *Government Gazette* of notice of such declaration, all the right, title, and interest of the lessee, his executors, administrators, and transferees under these presents shall cease and determine both at law and in equity; and the production of a copy of the *Government Gazette* containing a notice, purporting to be signed by the Secretary for Mines, declaring the lease void, shall be conclusive evidence in all Courts whatsoever in the Colony of New South Wales or a breach of or non-compliance with the covenants and provisoes herein contained sufficient to authorise and sustain such declaration having been lawfully made, and that the interest created hereunder has been lawfully determined; and thereupon it shall be lawful for Her Majesty, Her Heirs and Successors, or Her or their agents or officers, or for any bailiff or other person duly authorised thereto, or for any holder of a mineral license who has the permission of the Secretary for Mines for the time being, without any previous demand whatsoever, to enter forthwith into and upon the said land and premises hereby granted, and the same to repossess and enjoy as fully and effectually to all intents and purposes as if these premises had not been made, and the said lessee, his executors, administrators, and transferees to expel and remove, without any legal process, and as effectually as the Sheriff might do in case judgment in ejectment had been obtained and a writ of *habere facias possessionem* had been issued on such judgment; and in case of such entry and any legal proceeding taken in respect thereof, the defendant or defendants in any such proceeding may plead leave and license in bar thereof; and these presents shall be conclusive evidence of such leave and license by the lessee, his executors, administrators, and transferees, or other the person or persons, plaintiff or plaintiffs in such proceedings, for such entry or other matters complained of in such proceedings.

In Witness Whereof, His Excellency the Honourable SIR FREDERICK MATTHEW DARLEY, Knight, Lieutenant-Governor of the Colony of New South Wales and its Dependencies, hath, on behalf of Her Majesty the Queen, caused the Seal of the said Colony to be affixed to this Grant, and also set his Hand, at Government House, Sydney, in the said Colony, the day and year first above written, and the lessee ha also set h hand and seal  
the day of 189

Signed, sealed, and delivered by the within named in the presence of

## R.

Extract from the evidence of John Lionel Fegan, Esq., M.L.A., given before the Select Committee of the Legislative Council, 16th May, 1893; Hon. W. H. PIGOTT, Esq., M.L.C. Chairman.

173. *Chairman.*] Is there anything further that you wish to say about the Bill? Yes; I wish to refer to sub-clause 1 of clause 6, in reference to the standard weight. There has been a great deal of friction in some places in reference to this matter. All that we ask in this clause is that the miner shall get paid for the coal that he hews, and as far as weighing is concerned, that would be a matter between the employers and the employees. That is what this clause means.

174. *Mr. Combes.*] In your opinion weighing the coal should be a matter between employer and employees? I believe that as under the British Act all coal should be weighed, but nevertheless as we have an agreement in the northern district between the employers and the employees it should be left in their hands. This clause gives that power.

175. *Mr. Vickery.*] What do you mean by standard weight? In certain collieries if a skip goes over a certain weight the miner does not get paid for that skip. In other collieries the men are fined for filling skips to more than the standard weight fixed by the employers.

176. *Mr. Combes.*] You say that the whole skip is taken from them? Yes; the whole skip is taken. They put up a bar near the weigh-bridge, and if the skip gets caught under that bar the coal tumbles off the top, and the miner loses that skip. That is done in some collieries.

177. *Chairman.*] Can you name the collieries in which that practice prevails? I do not think it fair to name them.

178. It is a very serious allegation? Nevertheless it is so.

179. *Mr. Vickery.*] Seeing that the Committee know of no colliery at which there is a rule of that sort, do not you think we ought to have the same? I have been informed that at the Newcastle Wallsend Colliery this practice has been in vogue, and I remember that some time since we had almost a strike at the Glebe Colliery on the same question. The men, rather than give in, commenced to fill their skips level with the top board of the skip, but that did not satisfy the managers who at once demanded that the skips should be filled. The men have no voice in fixing the height of the bar—it is entirely in the employers' hands, and consequently the men lose many cwt. of coal.

180. *Mr. Combes.*] Do you say from your own knowledge that the men have no voice in it? Yes.

181. It may be usual in the district that a bar should be fixed 2, 3, or 4 inches above the skip? The employers fix it—the men have no say in the matter.

182. *Mr. Vickery.*] Are not the skips built to carry a certain average weight of coal? Certainly.

183. Do you think it is right for the miners, for some purpose of their own, to pile up the skip beyond the average weight? No; I do not think it right.

184. Do you think that some fine ought not to be imposed for it? Certainly not.

185. Their object is to gain an unfair average of weight by piling, perhaps, a ton into a skip that was built to carry 15 cwt. Then all the rest are paid according to that average, and there is danger in some mines, where the ceiling is not high, from the skips piled up having coal knocked off and blocking the road, causing other skips to run off the road;—is it not right, therefore, that some punishment should be imposed upon a man who piles up the skip? If your statement of the case were correct it ought to be; but it is not correct. A pair of men send from ten to twelve skips a day, or (say) from six to ten skips a day, and perhaps they get weighed for three or four days running. Therefore, it gives the employer an advantage, seeing that it is entirely in the employer's hands to call for a skip to be weighed. The employee has not the same opportunity that the employer has, because the check-weigher has no right to call for the weighing of a skip before it is on the weigh-bridge. [*At this stage Mr. Hoskins vacated the chair, which was taken by Mr. Pigott.*]

186. *Mr. Vickery.*] Do you say that the miners' check-weigher never calls for a skip to be weighed? He does not. I do not think he has power.

187. As far as I know, he does? As far as I have been informed, and I have worked in the mines, they do not. It is the owner's weigher who calls for a skip to be weighed.

188. *Mr. Jacob.*] Do you say that this clause will prevent that grievance? This clause will prevent that grievance. I may say that I have worked in the Bullock Island Colliery where they have nothing of the sort, and everything has gone on satisfactorily as the employers and employees would like.

189. *Mr. Vickery.*] Of course, the miner has to be paid according to the weight of the coal got? Yes.

190. And if he fills in a lot of small coal he has no right to be paid? He will not get paid, it goes through the screen.

191. *Mr. Hoskins.*] Is this clause to enable the miners to have the coal weighed at the demand of the check-weigher? It is impossible otherwise to kill the system in existence in a small minority of collieries.

192. In what way will it kill that system? Clause 6 says: "All the mineral gotten by them shall be truly weighed at a place as near to the pit's mouth as is reasonably practicable: Provided that nothing in this section shall preclude the owner, agent, or manager of the mine from agreeing with the persons employed in the mine that deduction shall be made in respect of stones or substances other than the mineral contracted to be gotten." That makes provision for stone and any refuse of any description.

193. *Mr. Jacob.*] Might I ask you to refer to the third sub-clause. It is proposed that that should be struck out—

That nothing in this Act shall be held to authorise or give any power to any owner or manager of a mine to pay miners by the method known as the standard weight system, and from and after the passing of this Act that system shall be and is hereby abolished.

It is stated that that is a provision which has been inserted for the first time;—do you think it desirable to have it in the Bill? I believe it is, though it is not in the English Act.

194. But you think it ought to be in our Act? The standard weight is a thing which never cropped up anywhere else. Under the English Act every skip of coal has to be weighed. I have known a colliery drawing 2,000 tons of coal a day, of which every skip passed over the machine; but we are not asking for that here.

195. *Mr. Combes.*] If every skip passes over the screen, they get less for the coal, and it all comes to the same thing? What we know by the standard weight is this bar. We want to have that knocked off, and a man to get paid for what he sends up, on the average. What is called the bar is the standard weight.

196. *Mr. Vickery.*] The bar is the standard? Yes.

197.

197. *Mr. Jacob.*] And this sub-clause is to prevent that? Yes.
198. *Chairman.*] Do I understand you correctly to say that every skip should be weighed? Yes, if no agreement exists.
199. What is the meaning of these words, "unless otherwise mutually agreed upon, all the minerals got by them shall be truly weighed"? It says unless otherwise mutually agreed upon.
200. Assuming that there has been no mutual agreement, is it desirable that every skip should be weighed? Certainly.
201. Do you not think that in the working of a mine where a very large number of skips are sent out every few minutes, the weighing of each skip would be impossible? No, certainly not; because the working of the mines in England goes to prove that such is not the case—that is, in mines where they send up more coal than is sent up by any mines here, and the skip is weighed.
202. Do you know what has been the practice in the Wallsend Mine for the last thirty years? Yes; I know what has been the practice, though I cannot go back thirty years. From what I have heard, the practice has been to weigh one skip out of a certain number. Each pair of men have a number from No. 1 up to as many as there are in the mine. After No. 1 is weighed, perhaps a skip belonging to that number does not get weighed again for a week or a fortnight, and the weight of that skip is the weight paid for.
203. Is not this the practice at most, if not all, the mines, assuming that forty skips have been run out, that one out of every eight skips is weighed as it comes to the screen, and that that is taken as the weight of each skip? It is taken as the weight of that number; that is the custom of all the collieries in the northern district.
204. You desire that to be altered by law? Personally, I desire to see every skip weighed, but we have an agreement, and I am willing to bow to that agreement.
205. Yes; but you are providing by this section that, where there is no agreement, the mine-owner shall be compelled, if the men desire it, to weigh every skip of coal? Certainly; according to law, the same as you get your groceries weighed pound by pound, so that every skip should be weighed.
206. Assuming that forty skips are taken out of the mine every seven minutes during the day, do you think it possible to weigh every skip and still continue to work the mine? I know very well that it can be done, and in England every skip is weighed.
207. *Mr. Combes.*] I know, and you know, that it cannot be done except at very considerable expense? I admit that it is expensive at first, but I believe that afterwards it pays. At the same time we have an agreement in the northern district, and we are willing to abide by that agreement; but if there is no agreement between the employers and the employees you are surely not going to hand over one class to the other.
208. *Chairman.*] I am not asking you what may be done in the event of an agreement, but if they do not agree, are we to understand that what you desire is that whereas one skip in eight is weighed, in future every skip shall be weighed as it comes to the screen? My answer is that if there is no agreement between the parties the law should see justice done between them.
209. What you mean by justice done is that every skip shall be weighed? Yes; whilst the men are paid by the ton every skip should be weighed.
210. *Mr. Combes.*] What I understand is that if the employers and the employees agree as to the weight of the skip, you are in favour of that arrangement? Yes.
211. *Chairman.*] I would ask whether you are aware that the system to which I have referred has been in operation for nearly thirty years, and no difficulty has arisen? I cannot say more than I know.
212. Are you aware of any difficulty having arisen in weighing the skips as heretofore carried out by the Wallsend Colliery? I have not come here to represent the Wallsend Colliery. I speak of collieries that I know, and I say that there has been friction between the employers and the employees as to the weighing.
213. Can you say which mine? I can remind you of Catherine Hill Bay Mine. We had a strike there in reference to the weight.
214. What is the system there? The system there was day-shift work. A number of men were brought out from England to do the work, and when their time expired they wanted to work either on piece or contract, and they wanted the skips filled altogether and weighed altogether. There was friction at that colliery. On the other hand, there were some collieries working on what is termed tribute shift work. When there are a certain number the Act requires that the skips shall be weighed if so demanded by the employees. We have had friction time after time about the weighing of coal.
215. *Mr. Vickery.*] You object to the arrangement made that the men should be paid by the skip and not by weight; you insist on every skip being weighed? Unless the employers and the employees agree to something definite.
216. You know that when they are opening up a mine they have not got weighing machines? The Bill provides for that.
217. You know that in new mines they have not got weighing machines, and therefore they have to pay by the skip-full? Yes.
218. And you object to that? No; there is this provision in the clause—

Where it is proved to the satisfaction of the Minister, in the case of any mine or class of mines employing not more than twenty persons under ground, to be expedient that the persons employed therein should, upon the joint representation of the owner or owners of any such mine or class of mines and the said persons, be paid by any method other than that provided by this Act, such Minister may, if he think fit, by-order allow the same either without conditions or during the time and on the conditions specified in the order.

#### R 1.

AMBULANCE WORK: BY R. LAWTON ROBERTS, M.D.

*Ambulance Lectures—Introductory.*

Pages 4 and 5.—I have told you what medical men think about the Ambulance Association; but you have only to consider the events of everyday life, and the risks attending the various occupations by which men earn their daily bread, in order to understand for yourselves the necessity that exists for every one to be able to give aid in cases of serious injury or sudden and alarming illness. In military campaigns enormous numbers of sick and wounded troops are constantly demanding immediate attention and proper conveyance

conveyance from the scene of action to places where they will be subjected to skilled treatment; and it is perfectly impossible for the medical men present to give succour to all requiring it, when there are perhaps several thousands requiring their services at the same instant. Turning to civil life, it is stated that in the year 1833 no less than 1,230 persons were killed and 8,123 injured by accidents on the different railways of the United Kingdom; that "during ten years the fatal accidents in London streets from vehicles amounted to 2,195, while the injuries were 28,071"; that "in collieries and mines the annual loss of life is at least 1,000"; that "no less than 100,000 accidents, large and small, occur in the mines in this country in one year"; that about 3,000 people are drowned annually in our rivers, lakes, canals, and other inland waters alone—not counting similar losses at the seaside and the mouths of rivers; and that in the twelve months ending October, 1884, in factories alone 8,501 various bodily injuries, not fatal, were caused by machinery.

But I need not dwell longer on statistics, you have only to consider your own experiences.

There are some among you who work in coal-pits, and others in brickworks, ironworks, and chemical works; and you know how, in spite of the utmost care, accidents will every now and then occur. One man gets burnt, it may be by hot metal, an explosion of gas, or some powerful chemical agent, as oil of vitriol or carbolic acid; another gets scalded by hot-water or steam; another falls suffocated by some poisonous gas; and another gets badly hurt, a large blood-vessel being opened, perhaps, or a bone fractured. You know also that it is impossible always to obtain *at once* skilled assistance in cases of emergency. A medical man in active practice is a very busy and hard-worked individual, and he can seldom be got hold of at a minute's notice.

I say that you are, from your experience, perfectly aware of all this, and therefore, you are in a position to appreciate fully the desirability of becoming acquainted with the readiest methods of giving *immediate* help to a suffering comrade until the arrival of your doctor; and also of carrying him, if necessary, to his home or the nearest hospital in such a way that his suffering will not be rendered more acute nor his injury aggravated by the process of removal.

## HAMILTON PIT DISASTER, 1889.

## Notification from Colliery Manager to Examiner of Coal-fields.

John Mackenzie, Esq., Examiner of Coal-fields,—

Sir,

A.A. Company, Hamilton, 22 June, 1889.

Mr. Turnbull desires me to inform you that a heavy fall of roof has occurred in Hamilton pit cross-cut. There are about fourteen men entombed, and no likelihood of getting them out at present.

HY. COX,

Clerk.

Mr. Inspector Dixon for the usual report in compliance with sections 28 and 29 of Coal Mines Regulation Act (1876), as soon as the circumstances in connection with this sad accident will admit of its being made.—J.M., 24/6/89. Mr. Dixon, Inspector of Collieries. B.C., 24/6/89. Returned with report.—J.D., 6/8/89.

## S 1.

## FINDING AND RIDER OF JURY, HAMILTON PIT DISASTER, 1889.

Department of Justice,

Inquest No. 817, Sydney, New South Wales, 31/7/89.

New South Wales }  
to wit. } County of Northumberland.

INQUISITION held at the dwelling-house of William Taylor, known as the sign of the "Glebe Hotel," at Merowether, in the district of Newcastle, in the Colony of New South Wales, this 2nd day of July, and adjourned to the Council Chambers, Watt-street, Newcastle, on the 9th, 10th, 12th, 15th, 17th, 18th, 23rd, and 25th July, 1889, and concluded on the 26th day of July, 1889, before me, George Cannon Martin, one of the Coroners of our Sovereign Lady the Queen, for the Colony aforesaid, on view of the body of Herbert Pettit, then and there lying dead.

Upon the oaths of Frederick Alcock, John Ash, William Thomas Brain, Michael Joseph Moroney, Henry Cree, Edward Stallard, George Hale, William Powell, Samuel Hughes, Joseph Bowtell, Joseph Britton, James Robinson, twelve good and lawful men, of the district of Newcastle aforesaid, who having been sworn and charged to inquire (on the part of our said Lady the Queen) when, where, how, and by what means the said Herbert Pettit came to his death, do, upon their oaths, say that—We find that the said Herbert Pettit was found dead in the Hamilton pit, owned by the Australian Agricultural Company, at the Glebe, in the district of Newcastle, in the Colony of New South Wales, on the 2nd day of July, 1889; we further find that his death was caused by a fall of stone and coal in the aforesaid pit, which said fall occurred on the morning of the 22nd day of June, 1889. This fall entirely covered the said Herbert Pettit, whilst he was at his duties in the said pit, and though great exertions were made by Edward Blackburn to rescue the said Herbert Pettit, they were without avail, and the said Edward Blackburn had to leave the said Herbert Pettit to preserve his own life. For this action of Edward Blackburn the jury desire to record their highest praise and commendation.

## Rider.

From the evidence we are of opinion that the late terrible accident was caused through the weakness of the pillars. We recommend, for the sake of life and property, that a clause should be inserted in the new Mining Bill to the effect that in future all pillars on each side of all main ways be of 16 yards, and that the pillars in the headings be 8 yards wide, and that the bords be turned away 6 yards wide, and drove in 6 yards before opening out to 8 yards wide.

We further recommend that more Government Inspectors with greater power be appointed, as we are of opinion that two inspectors are totally inadequate for the proper supervision of the large number of coal-mines now opened or being opened in this district.

We

We consider that — the overman neglected his duty in not calling the men out when it was reported to him that the pit was working so badly.

In witness whereof, as well the said Coroner as the jurors aforesaid, have to this Inquisition set their hands and seals, this day and year aforesaid.

GEORGE C. MARTIN, Coroner.  
FREDK. ALCOCK, Foreman.

MICHAEL JOSEPH MORONEY,  
HENRY CREE,  
JOHN ASH,  
SAMUEL HUGHES,  
GEORGE HALE,  
EDWARD STALLARD,  
JOSEPH BOWTELL,

JOSEPH BRITTON,  
JAMES ROBINSON,  
WILLIAM THOMAS BRAIN,  
his  
WILLIAM + POWELL,  
mark  
Witness to mark—GEO. C. MARTIN.

Jurors.

With the view of giving effect to the opinion of the Jury, the depositions and other papers in this case might be forwarded to the Under Secretary for Mines for his information, and for such further action as may be deemed to be necessary. Papers to be returned. Submitted.—H.F. 31/7/89. Approved.—A.G., 1/8/89. The Under Secretary for Mines, B.C., 2/8/89.

## S 2.

Department of Mines, New South Wales, 8 August, 1889.

REPORT upon a "crush" which took place in the A. A. Company's Hamilton pit on the morning of Saturday, 22nd day of June last, extending over an area of about 50 acres of coal-land, and in consequence of which five miners, one deputy, four shiftmen, and one wheeler lost their lives. The body of H. Pettit, one of the shiftmen, was recovered on 2nd July, last month, and the bodies of J. Peate, junr. (miner), and T. Banfield (wheeler) were discovered yesterday (Friday), 2nd instant, the others are still entombed in the mine.

Sir,

Merewether, 3 August, 1889.

It is with regret I have to report a very serious loss of life, caused by a "crush" which took place in the A. A. Company's Hamilton pit on the morning of Saturday, 22nd June last. On that morning about 9 a.m., I was informed by a person passing my residence that the roof had fallen in the cross-cut district in the Hamilton pit, and that all the workmen were shut in. Being within a short distance of the Hamilton pit, I immediately descended the shaft, and without delay made my way into the cross-cut district, where I found a deputy from the No. 2 pit (George Embleton, senr.) at work putting up timber at a point between Robson's and Murphy's headings on the main cross-cut road, about 13 chains beyond the entrance to the cross-cut. At this point the roof was not much fallen, but was literally moving overhead. Seeing a large fall of roof in front of us, the deputy and I twice endeavoured to reach it, in the hope that we might find an opening to enable us to pass through in search of the persons entombed beyond; but on each occasion we were driven back, and found that it was futile to attempt to get over the fall, and I advised Mr. Embleton to come a certain distance down the cross-cut, and with his men commence to timber in over, so as to work in as much safety as possible.

In the course of a few minutes several shiftmen arrived from the No. 2 pit, and work in the direction of the large fall was begun. Search parties were also organised to travel all the available old workings adjacent to the cross-cut headings, in order to rescue any person who might have escaped from the vicinity of the fall in the cross cut workings. Such search was kept up for several days after the disaster occurred, until it was placed beyond all doubt that no person had wandered into the old workings.

2. The Hamilton pit is situated near the Globe, and is about  $1\frac{1}{2}$  miles south-west of Newcastle, and about 45 chains south-east of the A. A. Co.'s No. 2 pit. There are several connections between the workings of the No. 2 and Hamilton pits, and one main road, known as the old galley horse-road, extends from the bottom of the No. 2 pit to the Hamilton pit cross-cut workings, a distance of about 87 chains in a south-westerly direction. The Hamilton pit is about 190 feet deep, and the main engine road into the workings is about 47 chains in length from the pit bottom to the entrance to the cross-cut in a south-westerly direction. The cross-cut where the "crush" took place was commenced about six years ago, and driven at a bearing of south  $88^\circ$  west, for a distance of about  $40\frac{1}{2}$  chains. On the right of the cross-cut main road, headings were from time to time turned away and driven in the direction of the old galley horse-road, four of which headings, viz., Thomas's, Tracy's, Robson's, and Murphy's, penetrated the galley horse-road: Thomas's at about 30 chains from cross-cut, Tracy's at about  $26\frac{1}{2}$  chains, Robson's about  $23\frac{1}{2}$  chains, and Murphy's at about  $20\frac{1}{2}$  chains. Johnson's heading was driven to the right of main cross-cut to within about a chain of the galley horse-road, and Hayes's heading on the same side of cross-cut was stopped at a point about 5 chains short of the galley horse-road. On the left of the main cross-cut, bords were turned away narrow for a few yards and afterwards widened out to the ordinary width (about 8 yards), and brought into Deakin's, Donnison's, and Harding's headings, towards the boundary of the Newcastle Coal Mining Co.'s Colliery. In course of time, as the cross-cut workings extended, other headings were formed on the left side, viz., Bishop's, Martin's, and Burt's, and from these headings bords were also driven towards the Newcastle Co.'s boundary. The system of working the coal in the cross-cut district is known as the bord and pillar system, with 8-yard bords and 4-yard pillars, and the full height of coal wrought was from 7 feet to 9 feet. About sixteen months ago the work of extracting pillars was commenced at a point about  $10\frac{1}{2}$  chains back from the face of the cross-cut. In this  $10\frac{1}{2}$  chains the coal was found to be rather impure, and much thinner than the general run of the seam in the other portions of this district, and with the exception of the back and front cross-cuts only two bords were turned away and driven for a short distance in this area, and the work of extracting pillars only commenced where the coal was deemed marketable.

In course of time the work of extracting pillars was also begun in Hayes's, Johnson's, Murphy's, and Robson's headings on the right of cross-cut, also to some extent in Bishop's, Martin's, and Burt's headings on the left of the cross-cut. For some time prior to, and at the time the "crush" took place there were only about eleven working-places in the cross-cut pillars. On the day of the disaster (being the last day in the cavel, or what is known as "shifting tool day") some of the miners stayed at home; eighteen however, went into work in the cross-cut district on that morning. Of this number, six returned on hearing the disturbance in the roof in their working-places, seven were afterwards rescued, and five were entombed with the fall. The names of the miners who would not remain at work are D. Inglis, J. Chappel, H. Bell, R. Pringle, J. Acton, and W. Thomas, and of those who came out alive after the crush took place are R. McDougall, D. Moore, F. Ford, E. Sullivan, Wm. Galloway, R. Thompson, and G. Duncan. The names of the miners who lost their lives are Jabez Roberts, D. Procter, D. Masson, J. Peate, senior, and L. Peate, junior (father and son). The body of the younger Peate has since been recovered. These two latter had cavelled into this district and took their tools in and commenced to work their new place on that fatal morning, instead of the following Monday, which would have been (according to custom) the proper day to commence the new cavel. In addition to the miners who went to work in the cross-cut district on that morning, there were three wheelers, D. Regan, M. Ryan, and T. Banfield. The two former escaped, but the latter was caught in the "crush" on the cross-cut flat, jammed between the skips, and his body was not recovered until Friday, 2nd instant. The body of L. Peate, junior, was also discovered on the same flat, and jammed between a loaded timber trolley and a full skip, and strange to say, the two young men (Banfield and Peate) who had been comrades in life were found lying close together feet to feet in death. On the morning of the disaster there were also in the cross-cut district one deputy (James Hodson) and seven shiftmen, viz., J. Beaumont, J. Meadows, B. Roarty, A. Grant, R. Bourke, G. Dudley, and J. Blackburn. These shiftmen belonged to the cross-cut district, but just prior to the fall taking place, some shiftmen from the Church heading district went into the cross-cut district, and were at the out end of the cross-cut main flat near the entrance to Murphy's heading when the disaster happened. These were G. Turnbull, J. Blakemore, W. Wilson, H. Pettit, and G. Jackson. These latter, along with Roarty, Dudley, Blackburn, Ryan, Regan, and Bourke, made their escape, but the deputy (Hodson) who along with Beaumont, Grant, and Meadows were on Murphy's heading flat, endeavouring to get the rails and Tangye pump out, were caught in the fall and are at the present time entombed in the mine. One of the shiftmen from the Church heading (H. Pettit) was buried by a fall of coal whilst sitting at breakfast with some of the other shiftmen on the main cross-cut near the entrance to Murphy's heading, and his body was not recovered until the 2nd July, last month, ten days after the "crush" took place. From the time abovementioned, when I saw Deputy Embleton at work timbering the main cross-cut on the morning of the 22nd June (the day of the disaster), rescue work was carried on continuously along the cross-cut in the direction of the flat. The brave men who formed this party in the several shifts faced untold dangers every hour, but with unflagging energy they persevered until the body of poor Pettit was discovered on the 2nd July. After the finding of this body all work was suspended until 4th July, same month, when a party of six men again resumed work and passed through the in-end of the large fall, where, in a comparatively open space on the cross-cut flat, the pony "Sharpo" was found alive. When the flat was reached on this occasion, a thorough search was made in every direction where it was possible to gain an entrance; but no sign was found of any body except that of the pony. This search was made more especially in the hope of finding the body of J. Peate, junior, as it was about this part of the flat where he was last seen alive by B. Roarty and others. Not being able, however, to find the body at the spot indicated by Roarty, it was then surmised that the poor young fellow had run in over along the flat towards where he had left his father at work early in the morning. Subsequent events have proved the truth of this surmise, as his body was found at a spot nearly 40 yards further along the cross-cut flat than where it was at first expected he would be discovered.

3. The escape of the seven miners, McDougall, Moore, Ford, Sullivan, Galloway, Thompson, and Duncan, several hours after the "crush" took place certainly amounts to the "marvellous," as at the time of the fall they were all in beyond the main cross-cut flat, and by the extreme force of the wind caused by the fall they were left in darkness, as their lights were extinguished. None of this party appear to be able to state the exact route taken by them during their attempt to escape (and this is not to be wondered at as the physical aspect of the whole section of cross-cut workings would at that time be changed). But by statements made by the survivors, it would appear that the route in the first instance was along the cross-cut flat out over to the place near the entrance to Murphy's heading, where the pony "Sharpo" was found alive, for some of the members of this party built a chock with round timber on the top of an empty skip, and it was alongside of this chock that the pony was found by the rescue party. From this point it is evident that Ford and the others found their way into Murphy's heading around the then fallen coal and stone on the cross-cut at the entrance to this heading. Travelling this heading for some distance (for they had at this time obtained a light) they evidently found entrance to an old bord on the right of Murphy's heading, and thus keeping as near as possible on the line of bords they would of necessity cross Robson's, Tracy's, Thomas's, and Hodson's headings, into what is known as the Fault or Long heading. When the party reached Hodson's heading they knew it by the rope, as this heading was the engine plane into the galley workings. This heading, however, appears to have been fallen on right and left of where they entered, and as no egress could be found from this heading except by following down an old bord into the long heading, this was done, and on reaching this (long heading) one of the number (Ford) knew it by certain work he had performed in it some years ago, and he told his comrades that they were now near the main road in the Hamilton pit. Soon after this they came to a stopping built of refuse, and whilst endeavouring to pull this stopping down (which was inside of a brick stopping) they were heard by a person named Wm. Grant, who was in the main road at the time. He (Grant) and one of the rescue party, named Ralph Paul, at once knocked a hole through the brick stopping, and a few minutes later, to the great joy of both rescued and rescuers, the poor fellows were got through the opening in the stopping, and found themselves once more in safety, after having battled for hours with what must have appeared to them at times as almost certain death.

4. The shiftmen, A. Turnbull, Dudley, Blackburn, Milson and others, who were with H. Pettit on the cross-cut, near Murphy's heading end at the time the "crush" took place, had also a narrow escape, for when a portion of the roof fell in the vicinity of Murphy's heading end, these men were to all appearance shut in. But fortunately a small opening over the then fallen roof was discovered, and they were

were thus enabled to make good their escape. One of this party (Blackburn), under most trying circumstances, made a gallant effort to rescue Pettit, but eventually was compelled to desist, and rush out in order to save his own life.

5. On the afternoon of the day on which the body of Herbert Pettit was brought to the surface, Tuesday, July 2nd, 1889, an inquest on said body was commenced before the District Coroner, Mr. G. C. Martin, J.P., and a jury of twelve, at "Taylor's Hotel," Glebe. The gentlemen who formed the jury were Messrs. Frederick Alcock, John Ash, Michael Moroney, W. T. Brain, of Newcastle; Messrs. J. Bowtell, S. Hughes, Joseph Britton, William Powell, James Robinson, Edward Stallard, S. Cree, and George Hale, of Morewether.

Only two witnesses were examined on the first day, and at this stage the inquest was adjourned for a week.

The adjourned inquest was held in the Council Chambers, Newcastle, on Tuesday, 9th July, 1889, and continued on 10th, 12th, 15th, 17th, 18th, 23rd, 25th, and concluded on 26th July, same month.

After the first day, Mr. William Sparke, solicitor, watched the proceedings on behalf of the Government, Mr. H. J. Brown, solicitor, on behalf of the A.A. Company, and Mr. James Curley (Miners' General Secretary) attended each sitting except one, on behalf of the Miners' Association, and during his absence, on one occasion, Mr. James Thompson (District Chairman) acted in his stead. After the first day I attended nearly the whole of the time, and heard nearly all the evidence that was given.

6. From the evidence adduced at the inquiry, it would appear that there was no very great extent of goaf where pillars had been extracted in the cross-cut district, and that no great fall of roof had taken place in any part of the goaf prior to the final crush on 22nd June; neither does there appear to have been any serious apprehension of a large fall up till that morning. From evidence of survivors it would appear that Deputy Hodson had visited the working-places prior to the men going to work, and as he marked the date on the working faces it appears to have been taken as conclusive evidence by some that the pillar-workings were safe. Notwithstanding this, however, we find that when some of the miners went into the cross-cut workings, especially into Murphy's and Johnson's headings, between 6 and 7 a.m., they discovered most unmistakable signs of a serious disturbance in the roof.

Joseph Acton states:—He went down the pit at about 6.30 a.m. on the morning of the disaster, and went into Murphy's heading with a miner named Chapple, and when on Murphy's heading flat he heard the roof working. He (Acton) did not stay to work, but returned towards the pit bottom between 7 and 8 a.m., and on the road out he saw Hodson and J. Sharp (overman), and informed them of what he had heard in the vicinity of Johnson's and Murphy's headings. At and during this interview he stated to the overman "that she would ease herself in Murphy's heading," and with this view he (Sharp) appeared to coincide. Acton appeared to be so convinced that a large fall was about to take place that, besides speaking to the overman and deputy concerning the matter, he warned some of the miners whom he met going in to work in the cross-cut district, as he was coming out.

David Inglis, a miner employed in Murphy's heading, states that he passed along Murphy's heading about 7 a.m. on the morning of the "crush," and at that time the roof was thundering most awfully in the direction of Johnson's heading, and coal was being crushed from the pillar ends in Murphy's heading to such an extent as to make it necessary to clear the road on the flat, so that the wheeler might take the loaded skips out to the cross-cut. He (Inglis) distinctly says that at about 7.15 a.m. the roof was *working badly* in Murphy's heading and was starting to *boom* at the pillars, and whilst helping the wheeler to get some skips off the flat in this heading he (Inglis) says that he saw the overman and the deputy (Hodson), with Meadows, Beaumont, and Grant (shiftmen) come into the flat, and adds that they went straight up past and never spoke. About this time a wheeler named Ryan ran down to the Murphy's heading flat and told Inglis that the roof was working badly up towards the cross-cut. He (Inglis) then began to look for his tools with a view to getting out as quickly as possible, and just at this time, he adds that the overman and deputy passed out over along Murphy's heading towards the cross-cut. From the whole tenor of the statement made by Inglis, it would appear that from the time he entered Murphy's heading on that particular morning, he seemed to think that a very large fall of roof was near at hand, but although he noticed signs of crushing on some of the pillar ends along Murphy's heading flat on the Thursday before the final "crush" took place, he does not appear to have apprehended danger until the Saturday morning. He (Inglis) further states that, in his opinion, the roof on this occasion gave five or six hours warning, and even after he first heard it on that morning, there was ample time to *warn all the men and get both men and beast out safely*.

Another miner named Robert Pringle, who was working a pillar in Robson's heading, went down the Hamilton Pit about 6.20 a.m. on the morning of the disaster, and lost no time in getting into the cross-cut district. When going through the fault on the main road he saw the deputy, Mr. Hodson, who informed him "that his working-place was quite safe." He (Pringle) found everything quiet until he got to the far end of Murphy's flat, where he saw that one of the pillars was nipping. He stopped to examine it, and thought the roof was quiet, and then went on into his working-place, where he worked for some time preparing a shot in order to blast some coal down. He (Pringle) was warned by Chapple and Thomas, who visited him in his working-place, and told him that their place was working in Johnson's heading, and that he (Pringle) had better come away as there would be no skips for him that day. He, however, still went on with his work, and was in the act of fixing the fuse to fire his shot when he heard the roof give three heavy bumps above his head, and then he retreated as quickly as possible. He (Pringle) took some of his tools on to Murphy's heading flat, and just as he got there he passed James Sharp (overman) and some shiftmen; at this time he remarked to Sharp, "My God, Jimmie, did you hear those thuds?" meaning bumps in the roof, and Sharp replied, "Oh, yes, I hear it." He (Pringle) did not leave the flat for a few minutes, but sat down to have some breakfast, and one of the shiftmen passed out at the time (this was Beaumont). Pringle spoke to him, and just then the roof gave three more very loud bumps, and Pringle remarked, "My word, George, these are loud enough," and Beaumont replied, "Yes." The shiftmen were at this time taking rails out in a trolley, and Pringle advised Beaumont to clear away out of danger. He (Pringle) then left Murphy's heading flat, and proceeded towards the cross-cut, but before leaving he cried out to Beaumont, "Take care of yourself, George, she'll soon come."

Robert McDougall went down the Hamilton Pit about 6.20 a.m. on the morning of the "crush," and into his working-place (a pillar) in Hayes's heading on the right side of the cross-cut. He and his mate filled two skips, and then they heard the roof above them working to such an extent that they ran away towards the flat on the cross-cut as quickly as possible, but found that the flat was falling before them.

D. Moore,

D. Moore, another miner, reached the cross-cut flat at about 6:30 a.m. on the morning of the disaster, and heard a very heavy "bump" in the roof in the direction of Johnson's heading at the far end of the cross-cut flat on the right; he stood and listened, but heard no more at that time. He then went on to Hayes's heading, where he heard the roof working; but the rock was not making much noise, the pillars appeared to be squeezing. He (Moore) and his mate (Proctor) then cleared some stone off the coal in their working-place. This stone had fallen during the night. At this time Moore heard the roof working further along Hayes's heading, and bits of shaly rock were falling. Shortly after this Moore told his mate (Proctor) that he would go out, as he did not think it good enough, and that he would not do any more. He (Moore) then gathered up his tools and came away; but his mate did not appear to take much notice of the disturbance in the roof, and remarked, "It will settle, I will have my breakfast,—let her come!"

F. Ford, another miner, who was working in a pillar up the cross-cut, and a little to the left of main cross-cut road beyond the flat, states that he went down the Hamilton Pit a little after 6 a.m. on the day of the "crush," and everything seemed quiet in the vicinity of his working-place; but a little after 8 a.m. the roof began to rattle like thunder, and he eventually had to run for his life. Wm. Galloway went into Martin's heading on the morning of the disaster about 6:25 a.m., and found the roof in that heading in a disturbed state, and thought there was danger. He (Galloway) went to look for the overman (Mr. Sharp), and found him on the cross-cut flat, and told him the place was working. Sharp replied, "Let her come in, I cannot help it." This is denied by the overman (Sharp), but corroborated by a miner named John Steavenson, who was in the cross-cut flat at the time.

The overman (James Sharp) states that he did not notice anything amiss in the mine on the day before the disaster, and went round the cross-cut district early on the Saturday morning; he was in Murphy's heading, and heard one bump only; it was in the coal, and did not sound in any way alarming. He (Mr. Sharp) further states that on that morning he neither saw nor heard anything to make him uneasy, and saw no reason to withdraw any man from the mine that morning except perhaps from that part near Murphy's and Johnson's headings.

After hearing Acton state that his place was working, he (Mr. Sharp) told the deputy (Mr. Hodson) that he believed she was going to come, but gave no instructions to have the rails and other property brought out; but ordered preparations to be made as he thought the roof *might* come in; but he added that he gave no orders to the under officials to warn the men in the district where he feared a "creep." There is no direct evidence to show the state of Bishop's heading on the morning of the disaster; but B. Roarty states that J. Peate, jun., told him that he had left his father in this heading, and had informed him (J. Peate, sen.) that he would not work in that place any more. Several other witnesses were examined at the inquest, and nearly all of the miners who had been in the various headings bore testimony to the disturbed condition of the roof from about 6:30 a.m. to about 8:45 a.m., the supposed time of the final crush on the morning of Saturday, 22nd June, 1889.

7. After all the evidence had been taken during the several sittings of the Coroner's Court, the Coroner (Mr. G. C. Martin, J.P.) addressed the jury, and reviewed the evidence at some length.

The jury was locked up at twenty minutes to 11 o'clock, and at about a quarter-past one the following verdict was agreed to:—

*The Verdict.*

"We find that the said Herbert Pettit was found dead in the Hamilton Pit, owned by the A. A. Company, at the Glebe, in the district of Newcastle, in the Colony of New South Wales, on the 2nd day of July. We further find that his death was caused by a fall of stone and coal in the aforesaid pit, which said fall occurred on the morning of the 22nd day of June, 1889. This fall entirely covered the said Herbert Pettit whilst he was at his duties in the said pit, and though great exertions were made by Edward Blackburn to rescue the said Herbert Pettit, they were without avail, and the said Edward Blackburn had to leave the said Herbert Pettit, to preserve his own life. For this action of Edward Blackburn the jury desire to record the highest praise and commendation."

The following rider was also added:—"From the evidence, we are of opinion that the late terrible accident was caused by the weakness of the pillars. We recommend, for the safety of life and property, that a clause be inserted in the new Mining Bill to this effect—that in future all pillars on each side of all main ways be 16 yards, and the pillars in the headings be 8 yards wide, and that the bords be turned away 6 yards wide and driven in 6 yards before opening out to 8 yards wide. We further recommend that more Government inspectors, with greater power, be appointed, as we are of opinion that two inspectors are totally inadequate for the proper supervision of the large number of coal-mines now opened or being opened in this district. We consider that ——— (the overman) neglected his duty in not calling the men out when it was reported to him that the pit was working so badly."

8. With the "verdict," as returned by the jury on this occasion, I most fully agree, and also agree with the recommendations contained in the "rider" for the safety of life and property.

9. In conclusion, I beg to state that, in my opinion, the overman (———) who was in charge of the Hamilton Pit (and in the absence of the manager was the agent for the A.A. Company at the time of the disaster) ought to have warned the miners and wheelers to cease work and go out of the pit, after it was reported to him that the roof was working in the headings on both sides of the cross-cut. According to the evidence, such report was made to Mr. ———, and as this was what is generally known as the "first fall" after pillar extraction, and as no person can tell where a fall of this description will make a break, the calling out of the men and boys was rendered all the more imperative. I am also of opinion that (according to what I have seen since the disaster occurred) the standing pillars were too weak to withstand the pressure brought to bear upon them by the enormous weight of the superincumbent strata.

I herewith beg to forward a sketch of the Hamilton Pit cross-cut district, showing the position of the various headings, &c. (See Plan No. 5.)

John Mackenzie, Esq.,  
Examiner of Coal-fields.

I have, &c.,  
JOHN DIXON,  
Inspector of Collieries.

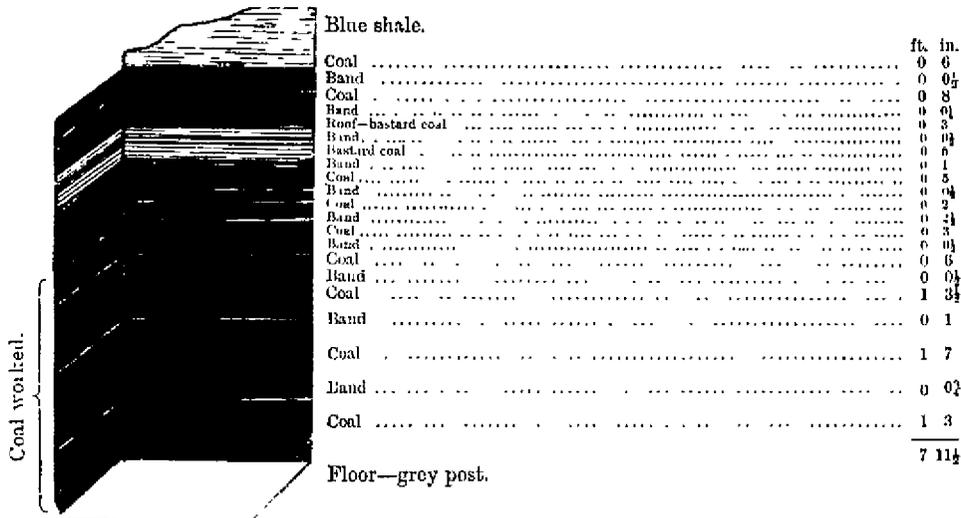

I fully concur with the verdict and rider of the Jury; also with the conclusions arrived at by Mr. Dixon from evidence given at the inquiry, &c., that the overman (———) is to blame for not having warned the miners and wheelers to cease work and go out of the pit after it had been reported to him by several persons at work in the cross-cut district that the roof was working in the headings on both sides of the cross-cut.

I am also of opinion that the standing pillars were too weak to withstand the pressure brought to bear upon them by the weight of the superincumbent strata; and that if the pillars had originally been left of a larger area than the so-called 4-yard pillars common to the system usually adopted in working the Borehole coal-seam in the Newcastle District, or a modification of the district custom had been introduced whereby almost all of the pillars could be extracted as soon after they are formed as possible, it might have prevented extra deterioration and loss of coal from a "crush" such as that which has so recently taken place at the A. A. Company's Colliery, and on previous occasions at the A. A. Company's, Newcastle-Wallsend, Co-operative, Lambton and Newcastle Coal Companies, &c.—J.M., 7/8/89. Under Secretary for Mines, B.C., 7/8/89. Submitted.—H.W., 9/8/89.

T.

SECTION showing the thickness and character of the Borehole Coal-seam sunk through and worked at the Monk-Wearmouth Colliery (now Seaham Colliery), situated 1 mile from the West Wallsend Colliery, near Minni, in the county of Northumberland, taken by the Examiner of Coal-fields and Mr. Inspector Dixon. The colliery is recently opened out, and is situated about 6 miles from the Homebush and Waratah Railway, near Cockle Creek. 1,227 tons of coal, valued at £593, were raised in the year under notice.

(Annual Report of the Department of Mines for the year 1889.)

V.

Messrs. Sparke and Millard's (solicitors) opinion as to the Liability of the Stockton Coal Company, or the Stockton Estate, for damage done to the streets under the control of the Council by Subsidences.

The Council Clerk, the Borough of Stockton, Stockton,—

Dear Sir,

Newcastle, N.S.W., 9 August, 1894.

We have been considering the questions submitted by you as to the liability of the Stockton Coal Company, or the Stockton Estate, for damage done to the Streets under the control of the Council by subsidences.

We must apologise for not answering before, but we were in hopes of discussing the matter with the Mayor.

It has generally been accepted in this Colony that no action lies on the part of a Municipal Council for damage done to streets by subsidences caused by undermining, but that action can be taken by the Attorney-General if the subsidence amounts to a nuisance.

We do not entirely agree with this view, and we find a case in the reports (*Benfieldside Local Board v. Consett Iron Company*, 3 Ex. D. 54, 47 L.J., ex 491) in which an action for damage caused by undermining was brought by a Local Board in whom the control of roads was vested.

But as it seems probable that the undermining by which the damage was eventually caused was performed before the incorporation of the Borough, and the Borough took over the streets in their undermined condition, we do not think that it would be advisable for the Council to take the responsibility of bringing an action.

If the subsidences amount to a nuisance or nuisances the Attorney-General should be applied to to take action.

We notice that you mention that damage has been caused to private property as well as to the public streets.

Though we presume you are not specially interested in this question, we may remark that an action could probably be at the suit of a private individual for damage done to his property by reason of subsidence from undermining.

Yours, &c.,

SPARKE AND MILLARD.

Inspection—Stockton Colliery.

Department of Mines, New South Wales.

Sydney, 5th October, 1893.

On the 17th February last the Manager of the Stockton Colliery withdrew the men from the mine, presumably in terms of General Rule 5, and on the following day an inspection was made by Inspectors Dixon and Humble, who were unable to report the mine safe. Nevertheless, the Manager subsequently set the men to work again in the mine, and it is thought they have continued since to work therein; but as proceedings have on two separate occasions been taken against the Manager, and on each occasion a penalty was recovered, it is submitted that the law has been thereby sufficiently vindicated, and that no further action need be taken in regard to that offence.

Section 24 of the Coal Mines Regulation Act provides that the Examiner or an Inspector shall have power, at least once in eight weeks, to make an examination and inquiry respecting the state and condition of any mine. From this it is presumed that the Act does not make it compulsory upon the Examiner or Inspector to make an inspection within a given period, but it is felt that if an accident involving loss of life should occur in any mine which has not been inspected at least once in eight weeks, the Examiner or Inspectors would be blamed, and, therefore, as no recent inspection of the Stockton Mine has been made, it may be proper that it should now be inspected, if it is possible to do so without incurring the risk of having to withdraw the workmen.

Before making such inspection it is desirable, in order to avoid incurring the risk aforesaid, that the following questions be settled:—

- (1.) If a mine, or any part of a mine, is found by the Examiner or Inspector to be dangerous, does (under General Rule 5) the obligation to withdraw the workmen from the mine rest upon the Examiner or Inspector, or have those officers simply to report the condition of the mine, and record such report in a book to be kept at the mine for that purpose, leaving the Manager to withdraw the workmen?
- (2.) Is the Examiner or Inspector required, under General Rule 5, or Section 25, to anticipate danger? In other words, is he required to take notice of any matter or thing which does not threaten immediate danger, but which tends to danger in the more or less remote future?

HARRIE WOOD.

Attorney-General's Department, N.S.W.

Department of Mines, New South Wales, 14,850, 5/10/93. 93. 10,876. Crown Solicitor, 26/7/93. Submitted—W.S., 4/10/93. I should be glad if my honorable colleague, the Attorney-General, would be good enough to favour me with his opinion on the two questions.—W.W.S., 4/10/93. The Crown Solicitor—H.W., B.C., 5/10/93.

*Subject*: Inspection—Stockton Colliery.

Crown Solicitor's Office, Sydney, 4 December, 1893.

- (1.) If a mine or any part of a mine is found by the Examiner or Inspector to be dangerous, does (under General Rule 5) the obligation to withdraw the workmen from the mine rest upon the Examiner or Inspector, or &c., &c.?
- (2.) Is the Examiner or Inspector required under General Rule 5 of Section 25 to anticipate danger?

Sir,  
I have the honor to return herewith the papers relating to the above matter which were forwarded to me from your Department on the 5th day of October, 1893, and to state that I have submitted them to Mr. Attorney-General Barton, a copy of whose advising thereon will be found upon the other side of this letter.

I have, &c.,

ERNEST A. SMITH,  
Crown Solicitor.

The Under Secretary, Department of Mines.

Copy Opinion of the Honorable the Attorney-General.

1. Although the Coal Mines Regulation Act does not expressly mark out the person on whom the obligation rests of withdrawing the workmen when the mine becomes dangerous, there is scarcely room for doubt that the person intended is the person in charge of the mine, or the particular part. By General Rule

Rule 5, what the Examiner or Inspector is to do is clearly defined, and what is to be done by some *other* person—namely to withdraw the workmen from the mine or part where the mine or such part is found to be dangerous—is indicated with equal clearness. As the Statute confers no express power on the Examiner or Inspector to withdraw the men, and as the men are to be withdrawn, the necessary presumption is that this act is to be done by the person who, ordinarily, has alone the power to do it. If the “owner” or “agent,” being in charge, does not in such circumstances withdraw the men, he ought to be prosecuted under section 31. If the offence is committed by the person in charge, not being the “owner” or “agent,” it is within section 34. s. 12, Subs. (5)

2. The second question involves a matter of degree rather than of principle, and is therefore not an easy one to answer satisfactorily. I am not clear that it is a question of law at all. It would be hard to enlarge the scope of the 5th General Rule. If the Examiner or Inspector finds the mine to be dangerous, every workman is to be withdrawn. Section 25 in no way limits the operation of this Rule. It provides a course of procedure by way of *remedy* if in any respect any mine or any part thereof is dangerous or defective. If danger is *impending* it is futile to say the mine is not dangerous, and therefore I think that the Examiner or Inspector is required to act in anticipation of an impending danger. But the danger must not be too remote. In a sense, every mine is dangerous; but the danger here aimed at is a danger of injury sensibly within reasonable probability.

EDMUND BARTON, A.G., 28/11/93.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

ROYAL COMMISSION ON COAL MINES REGULATION BILL.

(STATEMENT OF PRESIDENT REGARDING SITTINGS, FEES, &c.)

*Printed under No. 10 Report from Printing Committee, 23 July, 1896.*

[Laid upon the Table of this House in answer to Question No. 2 of 16th July, 1896.]

Question.

(2.) FEES PAID TO MEMBERS OF THE ROYAL COMMISSION ON COAL MINES REGULATION BILL:—  
MR. CHAPMAN asked THE COLONIAL SECRETARY,—

- (1.) What fees were paid to the members of the Royal Commission on the Coal Mines Regulation Bill at per sitting, and total amount?
- (2.) Is it a fact that at the first meeting a resolution was carried defining the hours of each sitting?
- (3.) If so, is it a fact that in a number of instances the Commissioners charged and were paid for two sittings which were held within the hours fixed by the resolution defining the hours of sitting?
- (4.) If so, will he take steps to obtain a refund of these overcharges?

Answer.

F. E. Rogers, Q.C., President, 54 sittings, at £12 12s.	...	...	£680 8s.
James Curley, member, 54 sittings, at £7 7s.	...	...	£396 18s.
Jesse Gregson, member, 54 sittings, at £7 7s.	...	...	£396 18s.

The President, Royal Commission on Coal Mines Regulation Bill, to The Chief Secretary.

Dear Sir,

Wigram Chambers, 20 July, 1896.

In answer to your letter of the 17th instant, enclosing a copy of certain Questions asked in the Legislative Assembly relative to the fees paid to the members of the Royal Commission on the Coal Mines Regulation Bill, I have to furnish the following information:—

At the first meeting of the Commission it was found that the members would be able, consistently with the convenience of the Commissioners from Newcastle, to meet at 2.30 p.m. on Mondays, and at 10 a.m. on Tuesdays and Wednesdays. It was therefore arranged that the Commission should sit on Mondays from 2.30 p.m. to 5 p.m., or later, and that on Tuesdays and Wednesdays the Commission should sit from 10 a.m. to 1 p.m., and again from 2 p.m. to 5 p.m., or later, on Tuesdays, if necessary; and, to the best of my recollection, the Commission generally sat till considerably after 5 p.m. on Mondays and Tuesdays, but only till 5 p.m., or a little after, on Wednesdays, as the Commissioners from Newcastle desired to return to that city by the evening train.

After about five weeks the Commission found it possible to meet on Mondays also at 10 a.m., and therefore, in order to expedite business, it was decided to have two sittings on that day of the same duration as those on Tuesdays.

In all cases heretofore, as far as I am aware, three hours have been the ordinary duration of a sitting of a Royal Commission, and it will be seen that each of the morning and afternoon sittings of the Commission on the Coal Mines Bill extended to at least that average duration. It would have been much more convenient for me if only one sitting had been held on each day; but, if this course had been followed, the delay in presenting the report would necessarily have been considerable. The remuneration offered by the Government was calculated at so much for each sitting, and this could only be regarded as referring to a sitting of ordinary duration, terminated by an adjournment, quite irrespective of the fact that more than one sitting took place on one day.

Considering the importance and the difficulty of the inquiry, I cannot for a moment admit that the remuneration received by the Commissioners was at all beyond what was just and reasonable.

I am, &c.,

F. E. ROGERS.

1896.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

**COAL MINES REGULATION BILL.**

(PETITION FROM ANDREW DRUMMOND, MAYOR OF WALLSEND, AND ADAM COOK, MAYOR OF PLATTSBURG, IN FAVOUR OF AN AMENDMENT IN)

*Received by the Legislative Assembly, 3 September, 1896.*

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the Municipal Councils of Wallsend and Plattsburg,—

HUMBLY SHOWETH :—

1. That for many years mining under roads, streets, and property has been carried on within the boroughs of Wallsend and Plattsburg and the district of Newcastle, causing considerable damage to the public roads and streets, depreciating the value of property, and endangering the lives of the colonists and citizens.

2. That during the years 1883-4-5 the Borough Council of Wallsend, at the instigation of the Attorney-General, took legal proceedings in the Supreme Court of New South Wales to obtain an injunction to prevent Messrs. Andrew and Alexander Sneddon from mining under certain streets in Brookstown, borough of Wallsend. The cost of this equity suit amounted to £1,075 10s. 2d., with the unsatisfactory result that mining under these streets was to be carried out under the supervision of Mr. Thomas Croudace, manager, Scottish Australian Coal-mining Company, Lambton, with the view to the permanent safety of the surface of these streets. This supervision, however, was not strictly carried out, as subsequent pitfalls took place, and the Council were not in a position to enter into further costly litigation.

3. Most extensive mining operations under the roads, streets, and property of the borough of Plattsburg are now being carried on by Mr. Andrew Sneddon, and in fact this applies throughout the Newcastle district, as proved by the extensive pitfalls and subsidence of the streets and property, as published in the *Newcastle Morning Herald and Miners' Advocate*, Monday, 31st August, 1896.

4. That with a view to prevent expensive and fruitless litigation, and to conserve the interests of the property-holders, the safety of the public roads and streets, the Municipal Councils of Wallsend and Plattsburg humbly pray that your Honorable Assembly will be pleased to cause the following provision, which has been approved of by the Municipal Association of New South Wales, to be inserted in the Coal Mines Bill now under consideration by your Honorable Assembly :—

“That in order to permanently secure the safety of all public roads, streets, lanes, or buildings adjacent thereto, within the boundaries of any municipality, it shall be the duty of the Minister for Mines, his examiner, or inspectors, to at least once in every six months inspect all mining under such roads, streets, lanes, or buildings, and to take such steps as the Minister or his officers may deem necessary to ensure the permanent safety of such roads, streets, lanes, or buildings.”

And your Petitioners, as in duty bound, will ever pray.

Given under the Corporate Seal of the said petitioning Corporations this 3rd day of September, 1896,—

ANDREW DRUMMOND,  
Mayor of Wallsend.

ADAM COOK,  
Mayor of Plattsburg.

1896.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## MINING ON PRIVATE LANDS ACT.

(APPLICATION BY JOSEPH DEMPSEY FOR MINING LEASE AT BYNG.)

*Printed under No. 27 Report from Printing Committee, 13 November, 1896, A.M.*

### Application of Joseph Dempsey, "Mining on Private Lands Act."

#### *Précis.*

On 20th August, 1894, the executors of late T. G. Webb applied for lease of 375 acres, including 10 acres which was being worked by one Bennett Treloar and H. C. Webb under agreement with the executors.

On 19th October, 1895, Dempsey applied for 20 acres, including the above 10 acres.

On 21st October, 1895, the Warden reported as follows:—

"I have the honor to state, for the information of the Minister, that immediately Dempsey lodged the accompanying application with the Registrar he came to me and applied for an injunction suspending the mining operations on the 10-acre portion, held and worked by Treloar and party, as he had included it in the 20-acre piece he had pegged out and applied for to lease. I refused his request, adding that he had no right to interfere with any holding that was being worked. It was not for him to say whether the occupier's title was good or bad. The Minister would have to determine that ere he would have any right on the ground at all. 'Jumping' is not permitted by the present Act."

On the 5th September, 1895, Treloar wrote to the department asking for the lease to be granted to Webb, and thus secure the ground for himself and mates.

On the 21st October, 1895, the Warden's Clerk reported as follows:—

"I have the honor to inform you, *re* the annexed application No. 33, for lease of 20 acres under the 'Mining on Private Lands Act,' applied for by C. Dempsey, at Byng, being portion 2, parish of Byng, county of Bathurst, which overlaps the whole of the 10 acres mined by Treloar and party, now on good gold, and who were in occupation of this land long before this Act came in force; that Dempsey, when making his application, did not tell me that such was the case. Mr. Warden Lane was the first to draw my attention to the fact, as Dempsey had so informed him, nor does the plan show anyone in occupation of this land, therefore I consider it my duty as Warden's Clerk to give you this information that you may take such action as you may deem necessary."

On the 21st of October, 1895, the executors again applied, but for 10 acres only, being the area worked by Treloar and party. This application was made as the executors thought the first application was informal.

On the 11th November, 1895, the papers were referred to the Crown Solicitor for advice as to the course of procedure that should be adopted in view of the conflicting applications.

On 3rd February, 1896, the Crown Solicitor advised the department. The following is an extract from his letter:—

"Section 22, however, provides that 'nothing herein contained shall be construed as rendering it obligatory on the Governor to grant a lease to any person applying for the same, notwithstanding that he may have complied with the provisions of this Act and the regulations thereunder, but in case his application shall be refused, he shall be informed of the reason for such refusal.' In the present case there are some very strong equitable reasons for refusing Dempsey's application, the principal being that he is practically trying to 'jump' a mine, and in my opinion his application should be refused. The state of things that would be brought about by granting Dempsey's application would, in my opinion, be contrary to the whole spirit of the Act, and where it is seen that a person by reason of his ignorance of the law is in danger of losing his mine by reason of some other person trying to take advantage of such ignorance, I think it only right that the Governor should step in and see that the Act is administered in an equitable spirit.

"I have, &c.,

"GEO. COLQUHOUN,

"Crown Solicitor."

On the advising the Crown Solicitor the Minister decided in the following terms:—"Action may be taken in accordance with the Crown Solicitor's opinion."—S. SMITH, 7/2/96.

Up to this time no notice of any proceedings being brought by Dempsey in the Warden's Court was received by the department.

On the 6th June, 1896, Dempsey's application was submitted to the Executive Council for refusal, the grounds for refusal being that the land applied for was occupied under agreement. Notice was sent to Dempsey on the 3rd July, 1896, of the refusal of the application, setting out the reason therefor, namely, that portion of the land applied for was occupied under agreement by other persons.

On 12th June, 1896, the Warden wrote to the department asking for authority to hold inquiries as to certain matters then in dispute, amongst them being *Webb v. Dempsey*, and he mentioned that Mr. Kearney, solicitor for Dempsey, had applied for a summons against Webb and others for trespass.

The Warden was informed on 17th June of the position of the different cases, and as to Dempsey's application, that it was in course of refusal.

The Warden's letter was the first intimation of any trespass case being brought by Dempsey; and it will be seen that the Minister decided to refuse Dempsey's application some four months before the trespass case was brought under his notice.

On 22nd June, 1896, the papers were sent to the Warden, with instructions to return them when the case was over.

The case of *Dempsey v. Webb* was called on before the Warden, but he adjourned it *sine die*.

No instructions were given to the Warden to adjourn the case.

On 25th June, 1896, Dempsey's solicitor notified the department that he intended to apply for a *mandamus* to compel the Warden to hear the case.

The *mandamus* was subsequently obtained.

The question as to whether the lease should be issued to the original applicants, pending the hearing of Dempsey's case against Webb, was referred by the Minister to the Attorney-General.

On 10th November instant the Attorney-General advised as follows:—

"The fact of there being a trespass case pending cannot in any way affect the right of the department to issue a lease, and the Minister can do this, of course leaving the parties to settle their rights in the Civil Courts.—J.H.W., 10th Novr., 1896."

1896.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## PITFALL AT MEREWETHER, NEWCASTLE.

(RETURN RESPECTING.)

*Printed under No. 9 Report from Printing Committee, 16 July, 1896.*

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated 25th June, 1896, That there be laid upon the Table of this House,—

“Copies of all papers and reports concerning the pitfall that took place at Merewether, Newcastle, in February last.”

(Mr. Edden.)

## Mr. Colliery-Inspector Dixon to The Examiner of Coal-fields.

Report on fall of roof and subsidence of surface in connection with the extraction of pillar coal in the No. 3 District of the A. A. Company's No. 2 Colliery.

Sir,

Merewether, 29 February, 1896.

I have the honor to report that on Tuesday, the 18th instant, a fall of roof took place in the goaf in connection with the pillar workings in the No. 3 District, A. A. Company's No. 2 Colliery.

2. I inspected the scene of the fall in the No. 3 District on the following morning, and found that it had crossed the horse-road in the goaf, and extended to the left side, and evidently following the line of extracted pillars, in the direction of the A. A. Company's southern boundary.

3. The No. 3 horse-road branches from the main south-east engine plane at a point about 7 chains from the No. 2 pit bottom, and continues in the direction of a little to the west of south. The greater portion of this road was driven over twenty-three years ago, and it is fully that time since headings and bords were wrought to right and left of said road. The work of pillar extraction has been carried on in this district since 1891, and was commenced in a portion of the 400-acre block leased from Mr. Merewether's Burwood estate. On 20th June, 1892, a heavy fall of roof took place within the area of this block, and caused a subsidence of the surface; but the recent fall took place within the A. A. Company's boundary of their own land. The scene of fall is about 45 chains from bottom of pit, and about 38 chains from main south-east engine plane.

4. Only about twelve miners were employed in this section on one shift, and on the morning of the day on which the fall occurred the roof was found to be in a disturbed condition, and all the men were at once withdrawn. This was about 10 a.m., and as the principal fall did not take place till about 4 p.m., there was no risk incurred by any person, and the men were at work as usual on the following day.

5. No pillar extraction has been carried on nearer than about 2 chains to the southern boundary. I am only able to give an approximation of the fallen area, as I could not get round the fall on every side. But from observations below and on the surface, I am of opinion that the fall in the old workings is not of much greater extent than about  $\frac{1}{4}$  acre. A much greater area, however, is shown on the surface, on what is known as the “Wallaby Flat,” owing, no doubt, to the fact that for a considerable depth the deposit is quicksand, and at the time of the fall this sand would naturally gravitate towards the lowest level, and show cracks and crevices for a considerable distance. About 2 chains to the north of the “south boundary” the Glebe Hill, which is composed of sandstone and conglomerate rock, rises almost abruptly, and from the flat to top of hill is about 100 feet of rise in about 10 chains. The total thickness of cover over the coal-seam on the flat is about 180 feet, and the total thickness of cover over the

232—

coal

[605 copies—Approximate Cost of Printing (labour and material), £1 12s. 9d.]

coal at Glebe Hill is about 280 feet. From the fall on the flat distinct cracks and crevices can be plainly traced across the Adamstown to Merewether Road, and within a few feet of the north-side fence of public school; thence through several allotments and under dwelling-houses, and through Macquarie-street, which runs along the ridge. The most clearly defined fissure is on the flat, and runs almost due east and west through the bottom of an old clay-hole, and from 2 to 2½ chains to the north of the Adamstown Road.

6. The public school is on the hill, on the west side of Henry-street, and, although the ground is cracked to north and east of school, no damage has been done to the building or teacher's residence.

Water-main.—A 13-inch diameter main, belonging to the Hunter River Water Board, is laid in Henry-street; and it would appear that several of the pipe-joints have been strained and caused to leak for a distance of about 3 chains, from the flat across the main road and into Henry-street.

A bakehouse on the corner of Adamstown Road and Henry-street is cracked in several places, and the oven (brick) has been damaged on sides and floor.

At the top end of Henry-street, opposite the public school, a dwelling-house (weatherboard), the property of B. Barkwell, has been damaged to some extent by the brick chimney being riven from the house a few inches and the hearthstone dislocated, besides damage to brickwork under the front verandah.

From this property to Hughes-street, which intersects Macquarie-street, surface cracks are plainly seen; and at the junction of Hughes and Macquarie Streets the troubled ground is seen, and an underground tank on the allotment, owned by a person named Mr. Charles Dickinson, has been fractured and the water let off.

A four-roomed weatherboard house and kitchen, owned by Mr. John Gray, is strained to some extent, and a splendid underground tank fractured and the whole of the water wasted.

Through Mr. Wilks' ground the cracks in rock are most distinct, and a spacious underground tank was rent and the whole of the water wasted.

In the allotments owned by Mr. John Perry the underground tank is split, and the whole of the water lost.

The same feature is seen in two allotments owned by Mr. G. Jones, where on each allotment the underground tank is rent and water lost.

The four-roomed house (weatherboard) and kitchen owned by Mr. John Wood is considerably out of plumb, by the surface having rent near the back of the house, and the small pipe leading from the water-main to house was broken and water supply cut off.

In Mr. Tom Harvey's yard the surface rock was very much split, but the only damage done to the house (six-roomed weatherboard) was to loosen some of the upright stone pillar supports.

Mrs. Palmer's allotment—the four-roomed weatherboard house on this land has sustained some damage, as the brick chimney is much disturbed and the whole house has a distinct lean towards the west. A nice new weatherboard house, owned by Mr. James Blakemore, had a shock which wrenched the verandah from the front of house.

Mr. M. Watson's four-roomed weatherboard house is also damaged, as the chimney is fractured and metal oven injured; the underground tank is split, and all the water lost.

In the allotment owned by Mr. J. Higgins the rock is very much rent. The house is four-roomed weatherboard, and appears to have been listed towards the west. The brick chimney was set away in the top from the house, and the connecting pipe with the water-main broken.

7. In conclusion, I beg to state that the pillars of coal left under the public school and grounds are supposed to be at least 8 yards in width, and, in my opinion, the recent subsidence on the flat has dragged a portion of the "Glebe Hill" in the form of a landslip. As more pillar coal is extracted the surface will doubtless subside on the flat, but in all probability the next fall will be at a point too far removed from the "hill" to do any further damage.

I have, &c.,

JOHN DIXON,

Inspector of Collieries.

1896.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

HETTON COLLIERY, NEWCASTLE.

(REPORTS ON SOME FALLEN BORDS IN.)

*Printed under No. 13 Report from Printing Committee, 18 August, 1896.*

[Laid upon the Table of the House in answer to Question, without notice, of 5th August, 1896.]

Question.

CREEP AT HETTON COLLIERY:—Mr. EDDEN *asked* "Has the Secretary for Mines and Agriculture any objection to lay on the Table of the House a copy of any official report he has received relating to the alleged creep in the Hetton Colliery?"

Answer.

Mr. Colliery-Inspector Humble to The Examiner of Coal Fields.

Sir,

Coal Fields Office, Newcastle, 23 July, 1896.

I have the honor to report inspection of a portion of the above colliery yesterday, viz., some fallen bords and headings, in the district known as M'Crae's, on the dip side of the shafts.

With the exception of a very small portion, the whole of the available coal (bottoms  $5\frac{1}{2}$  feet, big tops, and top band  $8\frac{1}{2}$  feet), has been taken from each bord in this district, the top band coal being, however, left in in each heading and cut through.

The system of working is 6-yard bord and 6-yard pillar. This width of bord is in the bottom coal only, contracting in subsequent working until, when the top band coal is extracted, the bord is not more than 5 yards width at the roof.

Between the bottom and top coal is a band of "Morgan" stone  $5\frac{1}{2}$  feet thick, which after the bottom coal is wrought, is allowed to fall on the floor, there to be used as a floor in the subsequent working of the top coal.

This stone, together with other refuse, completely covers up the bottom coal portion of each pillar, thereby increasing its strength and resistance to subsequent pressure and crushing.

It appears that during the recent stoppage of work here due to the strike, the management decided to draw out the rails and what timber remained in each bord of this district, as it was thought the remaining coal could be more economically got by another shorter route. This was done and the bords abandoned.

A thickness of a few feet of roof usually falls behind, as the top hand coal is being extracted, the miners being protected by timber regularly set, drawn, and reset as the working face moves back towards the heading.

Almost every bord was in this condition when the decision was come to to abandon the district.

At the time of this abandonment (so the manager and overman inform me), further falls of roof took place. The area affected is approximately 6 acres; but so far as I could see the pillars showed very little sign of extra weight.

Accompanied by the manager and overman, I travelled through several of these bords, walking and creeping over the fallen roof, which consists of 4 feet of coal and clay bands, and 9 or 10 feet of hard shale. In no case did I see more than about 13 or 14 feet of roof down, and this thickness not only buries the adjacent pillars, but almost fills up the whole space in each bord.

As the volume of rock when broken is about twice that of the rock *in situ*, I do not think it possible for much further falling to take place in any of these bords; certainly not more than a few feet before the whole available space is filled, as there is only "creeping room" now in many of them.

Before going further you will perhaps permit me to say here that the drawing of the timber, which is only intended to protect the men whilst working, and not to keep up the roof for all time, had little or no effect on the ultimate falling of roof in those bords. If the timber had been left undrawn, the roof would soon have broken over or around it, or have fallen directly the timber decayed. This being so, the props, or as many as can be safely drawn, are taken from each bord directly work finishes therein.

This portion of the colliery is under the Hunter River and Harbour of Newcastle.

According to Mr. Mining-Surveyor Thomas' levels of this colliery, taken, I believe, in 1892, the depth from high-water mark to the floor of this coal seam at this point is 280 feet.

Allowing 30 feet for depth of water in the harbour, and 20 feet thickness of workable coal and "Morgan's" stone, we have 230 feet of strata overlying the coal seam at this point, a thickness amply sufficient, in my opinion, to allay any fear of water in dangerous quantities from the harbour finding its way into the mine.

During my travel round and through these fallen bords yesterday I saw no sign of water, nor did I hear any working of the roof indicative of further falls.

Although I do not apprehend danger from this fall, I was very glad to hear Mr. Mathieson, the manager, say he had quite recently taken steps to make the pillars  $7\frac{1}{2}$  yards instead of 6 yards wide in the adjoining and more northerly district, where we know the seam is nearer the surface, the strata not so thick, and in all probability not so good and substantial a covering to the coal seam as it is where the fall has taken place.

I have, &c.,

WILLIAM HUMBLE,  
Inspector of Collieries.

Forwarded for the information of the Minister,—J. MACKENZIE, 27/7/96. Under Secretary for  
Mines and Agriculture.—H.B.S., for U.S., 29/7/96. Secy.—S. SMITH, 30.

### Mr. Colliery-Inspector Humble to The Examiner of Coal Fields.

#### Further Report on some Fallen Bords in Hetton Colliery.

Sir,

Coal Fields Office, Hamilton, Newcastle, 5 August, 1896.

Supplementary to my report of the 23rd ultimo on a fall of roof in some abandoned bords and headings in M'Crae's district, Hetton Colliery, I have the honor to report further inspection of the said workings to-day.

Accompanied by myself and Messrs. Mathieson and Wellford, the manager and overman, I travelled through and all round this area of fallen ground. In one place only did I see a fall I could not get over, and this was because the bulk of the *debris* was top band coal, which had not been extracted from one of the headings. In every other place I saw there was at least sufficient space above the fallen rock to creep through, thus proving that there has been no general movement of the overlying strata as usually occurs when a "crush" or "creep" takes place, breaking down pillars and other supports.

It is simply a series of local falls in each bord, without materially affecting the intervening pillars. Those pillars exhibit very little sign of unusual weight, and this only on the outskirts of the fallen area.

The majority of them are completely covered and immensely strengthened by the fallen roof in each bord, which acts as a stay or buttress to prevent lateral movement or crushing of the same. I saw no sign of water, and heard nothing indicative of further movement in the roof. Every place was quite dry and perfectly quiet.

As stated in my report of the 23rd ultimo, this fall took place during the stoppage of work caused by the last strike of miners in the Newcastle district. Subsequently a rumour spread amongst the men that the mine was "on the creep," and attained such magnitude as threatened to deprive the mine of its full complement of men, many of them leaving and going to work elsewhere.

In order to stop this exodus, which would probably have ended in a panic, Mr. Mathieson wrote to the Miners' Lodge officials, requesting the appointment of some of their number to inspect the mine, and see things for themselves.

The outcome of this was the appointment of three members of the lodge, namely, Messrs. Saml. Ingram, John Mackay Gray, and Benjamin Davis, who inspected the mine on the 29th, 30th, and 31st ultimo, and entered the result of their inspection in a book in the colliery office.

The following is a copy of such report, which speaks for itself, and fully confirms the substance of my report of the 23rd ultimo on the same matter.

[Extract from the *Newcastle Morning Herald*, Tuesday, 4th August, 1896.]

#### HETTON COLLIERY.—CONDITION OF THE WORKINGS.—REPORT BY MINERS' COMMITTEE.

The following report by Messrs. Samuel Ingram, John Mackay Gray, and Benjamin Davis, miners, has been furnished to the miners of the Hetton Lodge:—

Gentlemen,—We, the undersigned, appointed by your lodge, have made the following inspection of the workings of the Hetton Colliery:—

On Wednesday, July 29, we visited the fall which took place in the workings in Trouton's No. 1 heading, behind Goundry's Flat. We went in on the old fifth left-hand, and went down to the furthest bord, where the top band was not taken out. From there we went right through the cut-throughs to the pillar alongside the horse-road. Going down to Goundry's Flat, we went down to Trouton's No. 1 heading in No. 3 bord. We could get no further, owing to the stones being blocked up to the roof. We then went back to M'Crae's heading, where the cut-through was stopped up. We opened the stopping, and went into No. 9 bord. From Goundry's Flat up Trouton's heading we found a facing of top band, about 4 feet thick, standing with two props under it. At the back side of this was blocked up. On the right side we went to

to the face of the working bord, which was standing at both sides of the stone dyke. We crossed the pillar in the heading, and went into the next bord, which was standing, with the exception of about 18 inches of dirt that had fallen between the props. All the props were standing. We crossed about halfway over the next or third pillar, and then knocked off.

On Thursday, July 30, we commenced where we had left off the previous day. We worked along for about 4 yards further, when we came to where the fall had broken off, so that we could get no further without sinking down for a distance of about 4 feet, to enable us to get under the standing roof. In the meantime the management had caused a road to be made through the stopping put in in Trouton's No. 1 heading, and a road cleaned over the dirt that had been stowed in that enabled them to come to within 2 or 3 yards from where we were working, where the fall had broken itself off. We then went again into the old fifth left-hand down the furthest bord, where the top band was not taken out through the cut-throughs until we came to No. 7 bord. We went down that bord to Trouton's No. 1 heading to the very point where we had found that the fall was broken off in the rock. We went down Trouton's No. 1 heading through the hole made in the stopping on to Goundry's Flat. So that enabled us to go all round the fall right through it, in No. 3 bord, also right through it in No. 7 bord, and about half-way through it in No. 9 bord, when we were blocked by the dirt being too near the roof, and we could not get through.

On the top of the coal in the Hetton Colliery the roof consists of bands of splint with clay partings varying in thickness from about 2 ft. 6 in. to a thickness of about 4 feet, that is, between the top of the coal and the rock. The highest point we found in the fall is not more than 8 feet from the top of the coal, that is to say, about 4 feet of the rock broke down, and only that in isolated places. The greatest fall that we found was leading from M'Rae's heading to Trouton's No. 1 heading. That was from No. 9 bord to where we found that the fall was broken off. That was a distance of about 22 yards long on the heading, and about 4 feet of the rock broke down for this distance, or a fall of about 8 feet high from the top of the coal. The general height of the fall is from 5 to 6 feet from the top of the coal, or to a parting about 20 inches or 2 feet in the rock.

We wish to report in travelling through the fall that we found the whole of the pillars standing intact, and no place more than 6 yards wide. The distance from this fall to high-water mark varies from 51 ft. 6 in. to 59 ft. 6 in. deeper than the top of the coal at the bottom of the shaft. That is to say, from high-water mark to shaft bottom is 230 feet. The nearest portion of the fall to the pit bottom is 281 ft. 6 in. from high-water mark, and the furthest point 289 ft. 6 in., according to the level plan shown us by the management. This includes the second day's inspection.

At the request of the management on Friday, July 31, we made an inspection of the whole of the old workings of the colliery. We commenced in the second left-hand heading, and travelled to the furthest point of the old workings. In this heading we found in the bords where the band had been taken out little or no rock had fallen, and all the pillars were standing intact. From there, we went to the return air-way from Eldson's narrow bords. We then went to the top end of the fifth left-hand. We found in the bords where the bands had been taken out rock down in isolated places to a distance in the highest point of not more than 3 ft. 6 in. All the pillars were standing intact. We then travelled to Steele's No. 1 heading, through the bords where the band had been taken out. The highest point where the rock had fallen in these bords was about 2 ft. 6 in., and only this in isolated places. All the pillars were standing intact. We then went to Trouton's No. 4 heading, where nothing but bottom coal is worked. We then went to M'Rae's heading. We found in the bords where the band had been taken out that little or no rock had fallen, the highest point being about 18 inches of rock. The pillars were all standing intact. We then went to Nos. 11 and 10 headings, where the seam is worked on top of "Morgan." Top all standing with very little falls, and all the pillars standing intact. From there through the old workings of Nos. 9 and 8 headings little or no rock down and all the pillars standing intact. We then went to Nos. 6 and 5 headings; little or no rock down and all the pillars standing intact. We then came to the engine bank and entered No. 1 right-hand heading and travelled the old workings into Hutchinson's No. 1 heading. The highest part of the fall in No. 1 right was about 6 feet of rock, and for a distance of about 4 yards other parts varying from 1 ft. to 2 ft. 6 in.; all the pillars standing intact. We then travelled from Hutchinson's No. 1 to Tighe's headings. We found one fall up to a height of about 6 feet in the rock up to a sharp point (or what is generally known as a horse back) for a distance of about 10 yards long; also, for a distance of about 20 yards the rock was down to a height of about 4 feet. Other parts nothing unusual; all the pillars standing intact. From there to Hutchinson's No. 2 heading, several falls isolated, in some cases 5 feet or 6 feet high, also along to the dyke at the extreme end of Hutchinson's No. 2; little or no rock down in this part and all the pillars standing intact. From there we travelled into the fourth right-hand heading. We found little or no rock down, and all the pillars standing intact. We then travelled the old workings on the right-hand back of shaft; very few bords of band worked; little or no rock down and all the pillars standing intact. We then travelled the workings on left side back of shaft; no band taken out, and all the pillars standing intact.

We wish to report, in travelling through the old workings, that we found the whole of the pillars standing solid, and apparently no weight on them. We wish to further report that during the 3 days of our inspection we have received very great assistance from the manager and his overman,—not to lead us to where they wanted us to go, but to guide us to the several places where we wanted to go. We hereby certify that the above is a correct report of our inspection of the workings of Hetton Colliery.

As stated in my report of that date (23rd ultimo) these fallen bords, &c., are under the harbour of Newcastle, and according to levels made by Mr. Mining-Surveyor Thomas in 1892-93, the thickness of strata overlying the coal seam at this point is about 230 feet, not more than 13 or 14 feet of which has fallen and almost blocked up the entire space in each bord—so much so indeed, that, in my opinion, not more than 3 or 4 feet more can possibly fall before the bords and headings are completely choked up, when of course, no further fall can take place. I do not apprehend any danger from this fall to the men employed in the mine.

With reference to Mr. Curley's letter you sent me (and which is annexed hereto) there appears to be two points only requiring consideration:—

- (1.) The suggested examination to see how far pillars may have been encroached upon, and
- (2.) The suggested additional safeguard of having the width of bords at each end reduced to 6 or 8 feet.

My answer to the first is: that while no one acquainted with practical work in coal mines would venture to say, that pillars of 30 or 35 yards in length can be formed of uniform width throughout to vie with the proverbial "mathematical straight line," a reference to the plan of Hetton Colliery workings made in 1892-3, and since then added to, by Mr. Mining-Surveyor Thomas, who made exhaustive and thorough surveys of the whole of the mine (of which the bords and headings in M'Crae's district form a part and were included in his first survey) to ascertain the boundaries and especially the width of bords and pillars, it will be seen that the conditions of the Company's lease from the Crown, stipulating that the bords shall not exceed 6 yards in width, and pillars shall not be less than 6 yards wide, have been so closely adhered to as can reasonably be expected in practical work.

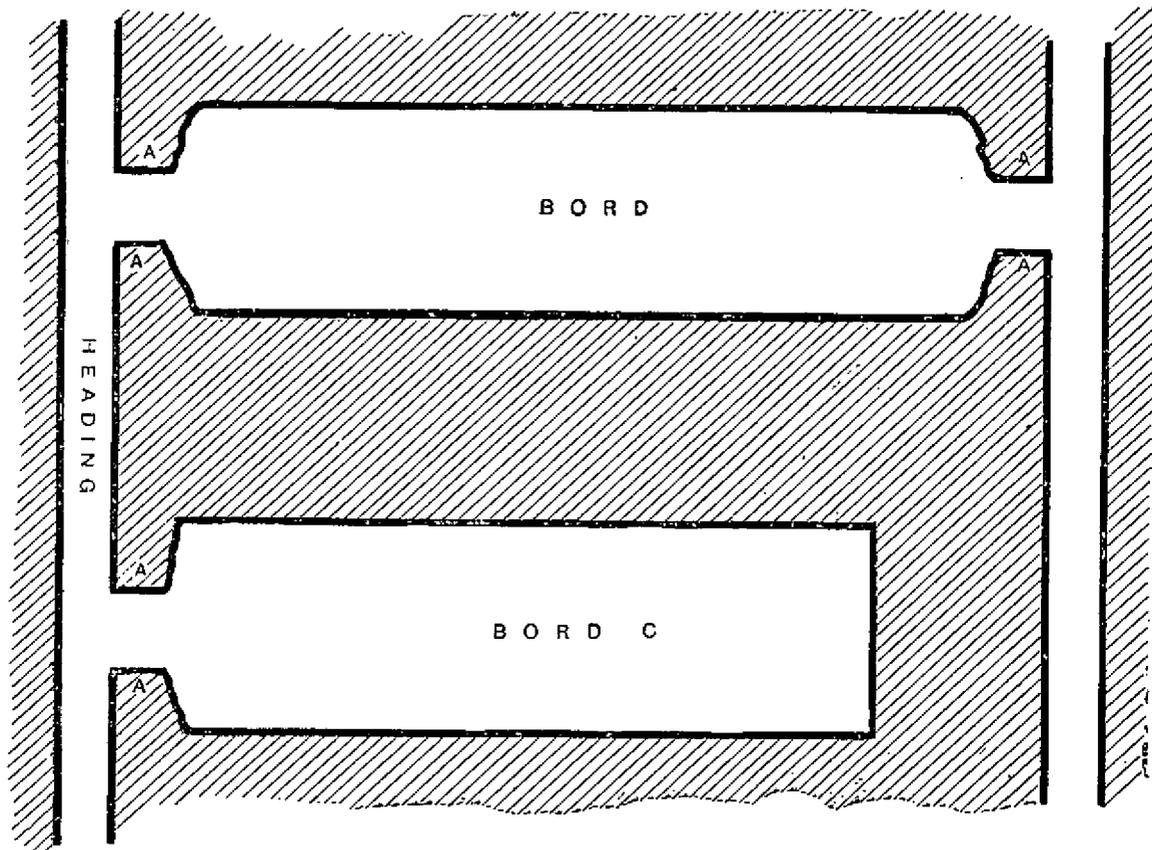

The bords are driven by line, and with ordinary care can never go far wrong, but even if a bord should deviate and encroach, say, on the right-hand side pillar, the adjacent pillar on the left is thereby added to to the extent of the encroachment. Thus the total strength of a series of pillars in a district, as a support to the roof, is unaltered.

(2.) Nothing has transpired at this colliery that, in my opinion, warrants us in calling upon the Company to modify the system of working.

The bords are now 6 yards wide throughout and while there can be no doubt that if such were started and terminated 6 or 8 feet wide, it would be an additional source of strength, but, in this mine the benefits would not be so large as appears probable to many.

With

With a hard coal free from joints, cutters, &c., it undoubtedly would be so, but this Hetton coal (particularly the top coal) is traversed by these lines of fracture to such an extent that the coal proposed to be left at each end of the bord (vide A on sketch)—projecting as it does from the corner of each pillar—

would be subject to the deteriorating influences prevailing more or less in all mines, which tend to the rapid weathering and crumbling of all exposed surfaces, particularly angular pieces, such as these would be.

Thus the benefit to be derived from this practice in hard strong coal free from joints, &c., would not, in my opinion, amount to much in this mine. Further, I do not consider the stability of its roadways—and therefore the safety of the workmen—depends upon such a comparatively small matter.

Another point to be considered is the ventilation of the bord while being driven.

Reducing the width of entrance from 18 feet to 6 or 8 feet would materially retard the flow of air, by diffusion or otherwise, into where the men require it.

It is well known that air flowing along a heading does more benefit to a bord with a wide entrance than with a narrow one. A reference to bord C on sketch will lend colour to the saying that to ventilate a wide bord with a narrow entrance is like "trying to ventilate a bottle," the wide part of the bord and a narrow entrance resembling a bottle laid on its side.

Again, if it were compulsory for the air current to be carried to the working face, this width of 6 or 8 feet would have to provide space for the skip road and air current, and as the skip must have a definite width to turn gradually from the heading into the bord, amounting in some cases to 7 or 8 feet, the result would be that the airway behind the brattice would be contracted to such an extent as to interfere with the satisfactory ventilation of each bord.

I have, &c.,  
WILLIAM HUMBLE,  
Inspector of Collieries.

I accompanied Mr. Inspector Humble during the whole of this inspection, and I fully agree with this report in every particular.—J. DIXON, 8/8/96. The Under Secretary for Mines and Agriculture.

[Enclosure.]

Trades Hall, Newcastle, 29 July, 1896.

Dear Sir,

May I draw your attention to current rumours respecting an alleged creep at the Hetton Colliery, upon which I have been questioned more than once, and to which I drew Mr. Inspector Humble's attention in conversation with him on Saturday night, the 18th instant, while on the Newcastle Station platform.

These rumours are gaining publicity and are alleged to have some foundation as you will notice from a paragraph appearing in the Press to-day.

You are fully cognisant of the situation of this colliery, and the need of careful exact mining conditions. The top band I understand is worked to the rock. How far there may or may not be encroachments on pillars at the terminations of bords, I would suggest should be a matter for examination. What has also occurred to me as an additional safeguard with this and other collieries so situated, is the width at which bords should be commenced and terminated. A width of 6 or 8 feet would better define locally any fall which might take place.

This view of the question is suggested from what I have noticed when working as a practical miner, when a fall in a bord travelled over the heading, &c.

I mention the matter as a subject worthy of your consideration.

May I ask in conclusion that this alleged creep at the Hetton Colliery receive your immediate attention.

I have, &c.,  
JAMES CURLEY,  
General Secretary.

The Examiner of Coal Fields.

*J. Dixon*
