1896.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

DEPARTMENT OF MINES AND AGRICULTURE.  
(ANNUAL REPORT OF THE STOCK AND BRANDS BRANCH FOR THE YEAR 1895.)

Printed under No. 13 Report from Printing Committee, 18 August, 1896.

The Chief Inspector of Stock to The Under Secretary for Mines and Agriculture.

Sir, Department of Mines and Agriculture, Stock and Brands, Sydney, 31 July, 1896.  
On the 4th February last I submitted a Progress Report for the year ending 31st December, 1895, giving the approximate number of the horses, cattle, and sheep then in the Colony; and I have now the honor to submit for your consideration my complete Report for that year on the working of this Branch, which is, as usual, based very much upon Inspectors' estimates—owners still showing very little inclination to furnish data. It will be seen that the actual number of horses, cattle, and sheep in this Report exceed those in the Progress Report.  
I have, &c.,  
ALEX. BRUCE,  
Chief Inspector of Stock.

INSPECTION OF OFFICES.

During the year the Offices of the Inspector of Stock at Dubbo, Hume, Maitland, and Narrabri were visited, and the books, &c., inspected.

INSPECTORS' WORK.

The Colony is now divided into sixty-five Sheep Districts, and there are fifty-one Staff Inspectors employed, who have made the following inspections during the year 1895:—

Stock, including horses, cattle, and sheep	...	...	...	27,561	inspections.
Reserves	...	...	...	4,771	"
Public Pounds	...	...	...	487	"
Commons	...	...	...	658	"
Dogs	...	...	...	1,217	"
Pigs	...	...	...	2,050	"
Under Pastures and Stock Protection Act	...	...	...	4,580	"
Under Public Watering-places Act	...	...	...	1,932	"
„ Diseased Animals and Meat Act	...	...	...	714	"
Total	...	...	...	43,970	

being an average of 862 inspections by each Inspector.

The total number of stock inspected was,—145,432 horses, 792,545 cattle, and 25,302,937 sheep. This shows a decrease of 6,775 horses, 523,166 cattle, and 1,235,409 sheep inspected during 1895, as compared with the previous year.

Homebush Sale-yards.

As usual, the whole of the stock arriving at these yards were carefully inspected on each sale-day by an Inspector of Stock and the Government Veterinarian, and a considerable number were condemned as unfit for human consumption. The numbers of stock submitted to auction were as follows:—

Cattle, 125,805 head.  
Sheep, 2,953,156 head,—

a weekly average of 2,438 cattle and 56,791 sheep. Compared with 1894, this is an increase of 147 cattle and of 3,912 sheep per week. These inspections occasionally lead to the detection of stolen stock, as the Inspector's duty requires him to compare the brands and marks on the stock with those in the permits and travelling-statements accompanying them. These documents are filed in this office for reference. They are referred to by persons inquiring about stock supposed to have been stolen, and the identification of the owners of animals condemned at the Abattoirs.

Inspectors' Mileage.

During the past year the staff travelled over a distance of 192,624 miles while on duty, an average of 3,777 each per annum.

\* 326—A

Prosecutions.

[1,550 copies—Approximate Cost of Printing (labour and materials), £39 17s. 9d.]

*Prosecutions and Convictions obtained.*

Under what Act.	No. of Prosecutions.	No. of Convictions.
Diseases in Sheep Acts ... ..	81	71
Imported Stock Acts... ..	2	2
Registration of Brands Acts ... ..	2	1
Pastures and Stock Protection Acts ... ..	254	202
Public Watering-places Act... ..	34	30
Impounding Acts ... ..	4	4
Diseased Animals and Meat Act ... ..	14	13
<b>Total</b> ... ..	<b>391</b>	<b>323</b>

The cases under the Pastures and Stock Protection Acts were principally against owners who had failed to make returns of their stock at the proper time.

Altogether, the number of prosecutions was less than in 1894.

**HORSES.**

The number of horses in the Colony during the thirty-five years previous to and including 1895 was as follows:—

Year.	No.	Year.	No.	Year.	No.
1861 ... ..	251,497	1873 ... ..	328,408	1885 ... ..	344,697
1862 ... ..	233,220	1874 ... ..	334,462	1886 ... ..	361,663
1863 ... ..	273,389	1875 ... ..	357,697	1887 ... ..	390,609
1864 ... ..	262,554	1876 ... ..	366,703	1888 ... ..	411,368
1865 ... ..	284,567	1877 ... ..	328,150	1889 ... ..	430,777
1866 ... ..	282,587	1878 ... ..	336,468	1890 ... ..	444,163
1867 ... ..	278,437	1879 ... ..	360,038	1891 ... ..	459,755
1868 ... ..	280,201	1880 ... ..	395,984	1892 ... ..	481,416
1869 ... ..	280,818	1881 ... ..	398,577	1893 ... ..	481,399
1870 ... ..	280,304	1882 ... ..	328,026	1894 ... ..	500,068
1871 ... ..	337,597	1883 ... ..	326,964	1895 ... ..	482,459
1872 ... ..	304,100	1884 ... ..	337,172		

being a decrease of 17,609 horses on the number returned for the previous year, which is accounted for by drought, and low prices.

The number of horses as returned in each Sheep District of the Colony will be found in Appendix A hereto, as also the number of cattle, sheep, and pigs.

*Breed of Horses.*

Under this head the Inspectors' returns give the different breeds of horses as follows:—

	Ordinary.	Thoroughbred.	Total.
Draught ... ..	128,580	22,037	150,617
Light harness ... ..	109,793	17,848	127,641
Saddle ... ..	172,761	31,440	204,201

Grand Total ... .. 482,459

*Australian and Foreign Horses Introduced and Imported.*

*Australian Horses—From other Australian Colonies.*—By sea: 250 stud horses and mares, and 228 ordinary horses and mares; total, 478. Overland: 20 stud horses, 12 stud mares, and 3,701 ordinary horses and mares; total, 3,733.

*Foreign Horses—From Foreign Countries (including Great Britain and Ireland).*—During the year 11 horses were imported into the Colony from England and other countries, and were subjected to the prescribed quarantine of fourteen days in Sydney (except in the case of two lots which arrived without the necessary certificates, when an additional term of fourteen days was imposed, in accordance with Sub-Clause 3 of Regulation No. 33 under Imported Stock Acts) before being allowed to go inland. Particulars as to number and breed of these horses are as follows:—

Name of Importer.	Address.	Where Imported from.	Breeds.								Total.
			Thoroughbred.		Arabs.		Hackneys.		Clydesdales.		
			Horses.	Mares.	Horses.	Mares.	Horses.	Mares.	Horses.	Mares.

*Horses fit for Sale, and number Exported, Improvement, &c.*

In the several districts of the Colony Inspectors' reports show that there are 25,270 draught, 25,810 light harness, and 41,222 saddle horses fit for market, while of this number 23,479 are considered suitable for requirements of India and China.

During the year 3,009 horses were exported, principally to Victoria, New Zealand, India, Queensland, and South and Western Australia. Reports from forty districts say that the horses are improving in quality.

In twenty districts there is no improvement in the quality of the horses, while in five districts they are reported as deteriorating.

*Tax on Stallions.*

A tax on stallions has been frequently asked for by owners, and in the interest of horse-breeding generally I think this is highly desirable. A circular was addressed to the several Boards of Directors throughout the Colony recently, and their replies, so far as received, are as follows:—

- Thirty are in favour of registration, and six against.
- Six are in favour of a veterinary examination, and nineteen against.
- Thirty favour a fee being charged for such examination, and two are against such a charge.
- The amount of the registration fee recommended varies from £1 to £20.
- Eighteen Boards recommend that the fees should be handed over to Agricultural Societies, and seven Boards are in favour of the Pastures and Stock Protection Boards receiving the amounts.

*Blindness in Horses on the Darling.*

This ailment has been a source of *very great inconvenience*, and in some cases caused heavy loss.

The reports from the Wentworth district show that 401 horses have been affected, 20 remained blind both by day and by night, and 53 are still blind by night. The disease still continues in the South-western and Western portions of the Colony, and although the Department has been investigating the matter almost continuously during the past two years with satisfactory results the owners themselves have not rendered that assistance which it was expected they would have done to combat the disease.

In May, 1893, Mr. Veterinary-Surgeon Robinson visited the Ivanhoe district, and after a stay of several weeks, during which he made personal inquiry with regard to the nature of the disease in the country on which it showed itself, and had several *post-mortem* examinations, he came to the conclusion that the ailment was parasitical, and prescribed accordingly.

His prescriptions, which are here given, consist of a vermifuge and tonic, were tried, but for some reason or other failed to effect a cure in the cases in which they were then administered, and it was taken for granted that the diagnosis of the ailment was not correct.

As, therefore, the Department was anxious to discover what the disease really was, and if possible to find a preventive, Mr. Veterinary-Surgeon Scott was sent in December, 1894, to the Wentworth district, in which it was most generally prevalent, to make further investigation and report, but I regret to say with no practical result, for after a prolonged inquiry, during which he visited a good many stations on which horses were affected, examined a considerable number of horses suffering from the ailment, made several *post-mortem* examinations, and after he had the eye, brain, and optic nerves of a diseased horse examined by Dr. Tidswell, Microscopist to the Board of Health, Mr. Scott came to the conclusion that the disease was a partial or total paralysis of the optic nerve, the result of feeding on swampy lake land and run flats, which have become infested by a specific organism of a malarial nature, which has been generated in the low lands subject to the inundation by the Darling River; but he made no recommendation as to treatment.

Both these reports have already been given to the public, and were published in my last Annual Report, together with the remarks of Mr. Chief Veterinary-Surgeon Stanley, on them, which are to the effect that although there was nothing in the reports on which he could form an opinion, he was disposed to think the disease was diathetic; probably some toxic agent which had been introduced or developed by the flood-waters, or some fungi or some deposit of mineral salts, or some growth of noxious herbage or the toxine of parasitic worms.

He advised keeping the horses off the contaminated country during the season of the year which favours the disease; and in the case of recently-affected animals, he recommends purgative medicine, followed by tonics and a complete change of pasture.

As, therefore, the real nature of the disease was still in doubt, and as it appeared from further information which had been received questionable whether the vermifuges prescribed by Mr. Robinson, M.R.C.V.S., had got a sufficiently long and careful trial, the Department forwarded to Mr. Inspector Morgan, of Wentworth, and Mr. Tully, of Wilcannia, supplies of the vermifuge prescribed by Mr. Robinson, and of the necessary materials for an arsenic drench, with instructions to procure a few affected horses and give them at stated hours the vermifuges, so many of Mr. Robinson's prescription and so many of the arsenic drench. Mr. Morgan was enabled to carry out the test in an effective manner, and the result is very satisfactory, his reports unmistakably showing that the treatment was effective, if ordinary care and attention is paid to the carrying out of the directions given for their treatment, and especially if the treatment is taken in time.

*Treatment.*

The following is the treatment, from which favourable results have been obtained:—

*Vermifuge.*

Arsenic.—5 grains, carefully mixed in say 3 lb. bran, and give three doses to each horse at intervals of one week between each dose—each horse to receive 5 grains in each dose; or

Turps and	{ 3 draughts for each horse at intervals of one week between }	1 pint linseed oil.
Linseed Oil { each draught.		

*Tonic.*

To follow the vermifuge if the disease has been allowed to make considerable progress:—

Black antimony	...	...	...	...	...	2 drams.	} 1 dose.	Dose
Tart emetic	...	...	...	...	...	1 "		
Sulphate of iron	...	...	...	...	...	3 "		
Common salt	...	...	...	...	...	½ oz.		
Powdered sulphur	...	...	...	...	...	½ "		

Dose to each horse at intervals of three days for three weeks, to be given in chaff or bran damped.

In the localities in which the horses are attacked, licks of salt and sulphur should be provided for them in troughs in the paddocks, and the horses could be attracted to the licks by a little bran and chaff

#### *Australian Stringhalt in Horses.*

Extract from Report by Mr. Chief Veterinary-Inspector Stanley, as published in Appendix B to Annual Report for year 1886:—

##### Susceptibility.

Horses of all ages and classes are equally liable to attack; brood mares perhaps suffer most; cobs and ponies seem the least susceptible, and young animals suffer less than the aged, whether horses are working, unbroken, or for breeding purposes, makes no difference, and strange horses contract the disease quicker than local ones. The recovery of horses brought into the stable or taken on board ship for a voyage is well known, and proves that feed and situation are important elements in connection with recovery. That it is not a poison, either mineral or vegetable, or sand in the stomach, is proved by history, symptoms, progress, and *post-mortem* examinations. Foals never show it whilst sucking their affected mothers.

That it is not rheumatism, or the result of over-driving, a sudden chill, exposure to rain or cold wind, must be apparent, because such influences have for ever existed everywhere, and this disease is of recent introduction, and its geographical extent can be clearly defined, at least in this Colony.

##### Treatment.

The curative treatment is to expel the parasites by the administration of anthelmintics, and dose after dose may be required for this purpose. It is necessary to remember that brood after brood have to be poisoned; and that when they are ensconced in a living being, whose tissues are also liable to suffer from the introduction of drastic drugs, it is impossible to effect our object without perseverance; and to prevent reinfection it is advisable to move the patients to a sound paddock, or better still, into a yard or stable, to feed liberally, and also constantly supply salt with their food.

##### Prevention.

Preventive measures, I consider, are very important: with this object avoid putting an affected animal into a paddock at all favourable for the development of worms. Infected paddocks should not be used by horses, even temporarily; half an hour's grazing may effect them, especially during the spring and autumn. The first grass after summer will scour animals, and has been known to cure them, because at that season the parasites are prepared for exit. Microscopical examination shows this, for many males are encysted and dead, and females pregnant with fully-developed eggs; some are viviparous; and it is to be noted that this is the time the paddocks get contaminated, and suitable soils may retain the ova for an indefinite period; so that one affected animal introduced, though he may be eventually cured, means later on (all circumstances being favourable) a hot-bed of infection for future tenants of the paddock.

An interesting case came under my notice of a recovery, almost as sudden as the attack; it occurred accidentally. The owner jumped on the affected horse, which had only been attacked a few days, to help to yard an obstreperous beast; and warned with the excitement, he worked hard and fast, and afterwards he was astonished to find his horse had recovered. The explanation is that the excitement increased the peristaltic action of the horse's bowels, and purged him, and so expelled the parasites; and subsequent stable-feeding established a cure. The obscurity of the subject and its importance has entailed my giving much detailed information, which has increased considerably the length of this report.

My thanks are due to those gentlemen who assisted me in the inquiry, by generously giving their horses for observation, and subsequent *post-mortem* examination, as this proved to be of great importance in making the investigation.

The disease appeared recently in the Goulburn and Braidwood districts, and copies of the reports of Veterinary Surgeon Robinson appear as Appendix B.

With the exception of the foregoing ailments, the horses have suffered but slightly from other diseases.

#### *Mortality among Horses and Sheep in Hay and Narandera Districts.*

As horses and sheep were recently reported as dying from an unknown cause in these districts, Mr. Veterinary-Surgeon Stewart was despatched to investigate the cause, and his report, with analysis by the consulting chemist to the Department, is given as Appendix C. The cause of the deaths is attributed to the horses and sheep eating the carcasses of poisoned rabbits, or in some instances perhaps picking up the phosphorised pollard bait laid for the rabbits. Of other diseases, *Anthrax* was reported in two districts, *Australian Stringhalt* in four districts, Strangles in twenty-two districts, Prurigo (horse mange) in four districts, Influenza in two districts, and Ophthalmia in four districts. (For treatment recommended for Influenza, see Appendix D.)

The estimated losses in horses during the year from various causes, principally drought, amount to 13,492.

#### CATTLE.

The returns of cattle in the Colony during the thirty-five years ending 31st December, 1895, stand as follows:—

Year.	No.	Year.	No.	Year.	No.
1861	2,271,923	1873	3,794,327	1885	1,317,315
1862	2,620,383	1874	2,856,699	1886	1,367,844
1863	2,032,522	1875	3,134,086	1887	1,575,487
1864	1,924,119	1876	3,131,013	1888	1,622,907
1865	1,961,905	1877	2,746,385	1889	1,741,592
1866	1,771,809	1878	2,771,583	1890	1,909,009
1867	1,728,427	1879	2,914,210	1891	2,046,347
1868	1,761,411	1880	2,580,040	1892	2,147,074
1869	1,795,904	1881	2,597,348	1893	2,155,500
1870	2,195,096	1882	1,859,985	1894	2,290,112
1871	2,014,888	1883	1,640,753	1895	2,023,768
1872	2,287,660	1884	1,425,130		

From the above it will be seen there was a decrease of 266,344 cattle during the year 1895, and an increase of 706,453, as against the decennial year 1885.

The number of cattle in each of the Sheep Districts of the Colony will be found in Appendix A.

91,242 cattle were introduced from other Colonies during the year, and 41,555 exported.

*Breeds*

		1	3	1	.....	2	3

*Increase and Decrease of Cattle in the several Districts.*

According to the number of cattle, as shown in Appendix A, there was an increase in ten districts owing to increased dairying, more owners, more introduced than sent away, breeding, and introduction from Queensland; while in the remaining fifty-five districts they have decreased, which is attributed to the following causes:—(1) The severe drought which prevailed nearly all over the Colony; (2) Less breeding and fewer store cattle introduced, consequent on the drought; (3) Sales; and (4) Owners stocking up with sheep.

*The "Cast" of Fat and Store Cattle.*

The estimated "cast" of fat cattle to be sent to market during the coming year is 282,238, and store cattle, 203,483. From fourteen districts the fat cattle are principally sent to Victoria; from two districts they are principally sent to South Australia and Tasmania; and the remaining districts supply the markets of Sydney, Maitland, Mudgee, Bathurst, Orange, Goulburn, Tamworth, Albury, Western Australia, and New Caledonia. The principal markets for store cattle are Muswellbrook, Maitland, Goulburn, and Wagga Wagga.

*How kept.*

The number of cattle kept wholly in paddocks is returned as 1,644,844; on open runs, 242,093; and the balance, 136,831, are depastured both ways.

*Improvement and Deterioration.*

In thirty-seven districts the cattle are said to be improving; in twenty-three districts they are stationary; and in five districts deteriorating. The principal reasons given for the improvement are—introduction of good stud stock; more attention and care in selection and breeding of stock, more particularly those for dairying purposes; also in culling and keeping in paddocks. The reason given for deterioration is inattention to breeding, many owners breeding from all sorts without respect to breed or quality, and using the same blood for years.

*Their Diseases and Ailments.*

**Pleuro-pneumonia.**—Inspectors' reports show that this disease existed in twenty-one districts, and that the cattle on ninety-three runs were affected; while the other districts are reported to be free from the disease.

This

This disease may now be said to be stamped out in Great Britain and Ireland. Not a single case was discovered among Home cattle during the past year. A number of cattle which had been exposed to the risk of infection was slaughtered by order of the Board of Agriculture.

*Cumberland Disease.*—From six districts the number of cattle reported to have died from this form of anthrax is 307.

*Symptomatic Anthrax or Blackleg* is reported to have carried off 434 head in one district.

*Cancer and Actinomycosis.*—1,148 cattle are reported to have died in thirty-five districts from these diseases.

*Tuberculosis.*—Cattle to the number of 3,567 are reported as having died from this disease in thirty-four districts.

*Red Water.*—From three districts 85 deaths are recorded. The disease is prevalent in certain localities in the coast country at particular seasons, more so in spring.

*Ophthalmia* occasionally assumes an epidemic form, and the number of cattle attacked is in some cases considerable, causing much temporary inconvenience to stock from blindness. Outbreaks have been reported from six districts, and the deaths numbered 50.

*Poisonous Plants.*—From nine districts deaths to the number of 290 are reported through eating supposed poisonous plants, but they were, it is believed, due in most cases to hoven.

*Foot and Mouth Disease.*—From latest accounts received Great Britain and Ireland have been free from this scourge for the past year, and probably will remain so, as importation is prohibited from all countries in which foot and mouth disease exists. It has never obtained a footing in this Colony.

#### *Diseased Animals and Meat Act.*

The number of cattle condemned under this Act was 3,314.

#### SHEEP.

The number of sheep in the Colony during the thirty-five years ending 31st December, 1895, stands as follows:—

Year.	No.	Year.	No.	Year.	No.
1861	6,119,169	1873	18,990,595	1885	37,820,306
1862	6,558,896	1874	22,797,416	1886	39,169,304
1863	7,169,126	1875	25,353,924	1887	46,965,152
1864	9,082,463	1876	25,269,755	1888	46,503,469
1865	9,650,106	1877	21,521,662	1889	50,106,763
1866	11,644,593	1878	25,479,484	1890	55,986,431
1867	15,066,377	1879	30,062,910	1891	61,831,416
1868	16,000,090	1880	35,398,121	1892	58,080,114
1869	16,848,217	1881	36,591,946	1893	56,980,688
1870	16,218,825	1882	36,114,814	1894	56,977,270
1871	16,766,012	1883	37,915,510	1895	47,617,687
1872	17,873,696	1884	31,660,321		

For number of sheep in the several Sheep Districts see Appendix A.

#### *Increase and Decrease.*

This shows a decrease for the whole Colony of 9,559,583.

The number of sheep imported during the year was 420,374, and the number exported 999,773, an increase in the exports over the imports of 579,399 sheep.

In Appendix D there is a statement kindly furnished by the Government Statistician which accounts for lambs, and shows why instead of an increase on the total number of sheep there is a large decrease.

The increase of English and crossbred sheep for the year is 764,874.

*Australian*

*Australian and Foreign Sheep Introduced and Imported.*

*Australian Sheep Overland from other Colonies.*—Stud sheep, 3,276; ordinary, 405,783; total, 409,059.

*By Sea from other Colonies.*—12,646 stud sheep were introduced from the other Australian Colonies by sea; particulars of those sold at the annual stud sales are given in Appendix E.

The prohibition against the introduction of stock from Western Australia is now in force only so far as relates to sheep, and it is so on account of the existence of scab, although only in a few flocks in that Colony.

*Foreign Sheep.*

No foreign sheep were introduced during the year.

*The "Cast" of Fat and Store Sheep.*

The annual "cast" of fat sheep for the ensuing season is estimated at 5,118,425, and store sheep, 4,554,849.

<i>How Sheep are kept.</i>						
Paddocked ...	...	...	...	...	...	47,031,112
Shepherded ...	...	...	...	...	...	300,632
Both ways ...	...	...	...	...	...	285,943
						47,617,687

*Condition of the Flocks.*

In forty-four districts the sheep are said to be improving, the principal reasons given being more attention to breeding, paddocking, introduction of high-class rams and ewes, more careful classing and culling.

In fourteen districts they are said to be stationary, and in seven districts they are deteriorating.

*Lambing.*

From a return of the autumn, winter, and spring lambings obtained from the Inspector for each Sheep District, the average percentage of lambing for the whole Colony is estimated at 50½ per cent., *i.e.*, calculating the number of lambs marked on the number of ewes put to the rams. The autumn lambing was the highest, averaging 54½ per cent., while the winter and spring lambings averaged 30 and 40½ per cent. respectively. The estimated number of ewes put to the ram during the year was 16,015,634, and the number of lambs returned as marked during the autumn, winter, and spring lambings was 8,094,325, giving the average percentage of lambs for the whole Colony at 50½ as stated above. The total number of lambs returned on 31st December was 7,304,973, giving an actual percentage of 45½, or a decrease of about 4½ per cent. on the number returned for the different lambings, which is accounted for by continued losses from the drought after the marking was completed.

*The Clip.*

*Average per Sheep.*

*Lambs.*—The number of lambs shorn in the grease was 4,731,387; the number washed, 147,893; total lambs shorn, 4,879,280.

*Sheep.*—The number of sheep shorn in the grease was 38,925,708; creek-washed, 23,006; and scoured, 1,357,663; total sheep shorn, 40,806,377.

The average weights of the clip are estimated as follows:—

	<i>Lambs.</i>	<i>Sheep.</i>
	lb. oz.	lb. oz.
Grease ...	1 14½	5 11½
Creek-washed ...	1 5	3 1
Scoured ...	.....	3 5

*Total Clip.*

Total clip in the Colony for the year 1895, according to the number of sheep, would be:—	
38,925,708 sheep shorn in the grease; average clip, 5 lb. 11½ oz. per sheep =	222,606,391 lb.
23,006 " creek-washed " " 3 " 1 " " =	70,456 "
1,357,663 " scoured " " 3 " 5 " " =	6,153,503 "
4,731,387 lambs shorn in the grease " 1 " 14½ " per lamb =	8,945,279 "
147,893 " washed " 1 " 5 " " =	194,109 "
	237,969,743 lb.

The estimated total weight of the clip as shown above is less than that of the previous year by 51,079,258 lb., owing principally to the large decrease in the number of sheep and lambs shorn. The average clip per fleece for sheep and lambs is also lower, owing to the severe season and low condition of the sheep.

*Condition of Clip.*

In fourteen districts the clip is reported as entirely sound and containing a good supply of yolk; twenty-eight districts fairly sound; and in remaining districts weak, owing to absence of yolk. On the whole the clip was very clean. The value of the wool, in a few districts, was affected by grass-seed and burrs.

*Exportation of Clip.*

The clip grown in the Colony of New South Wales is shipped principally to England, America, France, and Germany, and considerable portions of it is so from the ports of the three neighbouring Colonies, as well as from Sydney and Newcastle. The portions of our clip thus shipped from the other Colonies is often mistaken as the produce of those Colonies, more particularly for that of Victoria and South Australia. The

The following is an estimate of the clip sent to Sydney, and also the proportion sent across the Borders and to Melbourne, Adelaide, and Brisbane for the years 1894 and 1895 :—

Port of Shipment.	1894.			1895.		
	Greasy.	Washed.	Total.	Greasy.	Washed.	Total.
	lb.	lb.	lb.	lb.	lb.	lb.
Sydney .....	215,535,980	6,292,052	221,828,032	182,052,232	2,541,427	184,593,659
Melbourne .....	51,636,602	1,488,132	53,124,734	40,860,575	624,215	41,484,790
Adelaide .....	10,227,016	3,594,250	13,821,266	8,451,158	3,252,328	11,703,486
Brisbane .....	274,969	.....	274,969	187,705	103	187,808
	277,674,567	11,374,434	289,049,001	231,551,670	6,418,073	237,969,743

This shows a decrease in the quantity of wool shipped during the year from the Ports of Sydney and Newcastle of 37,234,373 lb., as compared with that shipped in 1894.

#### Classing of Clip.

In thirty-five districts the clip is reported as having been well classed. In the other districts it is not considered to have been so, the reasons given being, owners consider it does not pay, that prices obtained are no better, also want of convenience, sheds not large enough to warrant expense, and the difficulty of obtaining competent wool-sorters.

#### Wool-presses.

A great number of different kinds of presses are used; those most in favour are Ferrier's Patent and Williams' and Robinson's; rack screw and pinion presses are used. There is still room for improvement in the mode of pressing, especially by the owners of small clips.

#### Woolpacks.

The woolpacks used are mostly Calcutta and Dundee, of various sizes, from 4 ft. 6 in. x 2 ft. 2 in. to 5 ft. 3 in., and the weight from 10 to 12 lb.

On forty-two holdings the wool is dumped before leaving.

#### Sheep-brands and Marks.

During the year 1895 the number of Sheep Brands and Ear-marks recorded, transferred, and cancelled were as follows :—

Recorded.		Transferred.		Cancelled.	
Fire Brands	... 192	Fire Brands	... 76	Fire Brands	... 58
Tar do	... 980	Tar do	... 146	Tar do	... 156
Ear-marks	... 699	Ear-marks	... 133	Ear-marks	... 120
Total	... 1,871	Total	... 355	Total	... 334

#### Ear-marking and Tattoo-marking.

In all districts the system of ear-marking sheep is now generally carried out, and the system of tattoo-marking is mostly used by owners of stud-sheep, not as yet to any great extent in the case of ordinary flock sheep, but where tried it has been found to be a good preventive of sheep-stealing.

#### Destruction of Wool by Tar and Paint Brands.

Buyers still complain of the destruction to wool by the use of the above materials for branding purposes, but they have been unable to suggest any remedy, although invited to do so, as there is a general consensus of opinion that any brand that will stand for twelve months destroys the wool to a certain extent.

#### DISEASES IN SHEEP.

*Scab.*—The flocks in this Colony and in the colonies of Queensland, Victoria, South Australia, New Zealand, and Tasmania are free from scab. It exists, but to a very slight extent, in Western Australia, but it is hoped that colony will soon be declared clean. The importation of sheep from Western Australia into this Colony is still prohibited.

*Anthrax.*—This disease appeared in several districts during the year, and owners are now availing themselves of the facilities offered for vaccinating their sheep, which has been the means of lessening the great mortality previously suffered by them. A statement (Appendix F) is attached showing the vaccinations made.

*Foot-rot.*—Thirty districts report foot-rot among the sheep, but only to a slight extent; the past season not being favourable to its spread. Remedies for foot-rot will be found as Appendix G.

*Fluke.*—Owing to the dry season this disease also was not so troublesome as in previous years, and is only reported from twenty-eight districts without any serious losses.

To prevent its spread owners are again urged to free their land from surface water by running plough furrows where practicable and helping them with the spade. The preventives used by owners were salt, tar, and turps, sulphate of iron and Liverpool salt, and salt and sulphur.

*Parasitic Worms.*—Thirty districts report the sheep as having been infested with worms last year to the extent of about 16 per cent.; in twelve districts the sheep were infested with stomach, lung, and tape worms; two districts with tape and lung-worms; five districts with stomach-worms; and one district lung-worm only.

The following results have been gathered regarding the efficacy of the various Drenches and Licks used for Sheep for Worms :—

#### Drenches.

*Arsenic.*—For the stomach and tape worms the arsenic and soda drench is still reported as the most effective, and has been by far the most generally used. It has, however, been recommended that potash, as being less severe on the lining of the stomach, should be substituted for soda in its preparation.

The arsenic and soda drench is reported by several of the Inspectors as having been also efficacious for lung-worms. No authenticated information has been received of this drench affecting the health of the sheep or injuring the wool.

*Turpentine.*—Turpentine, with various mediums, has been very generally given for stomach, tape, and lung worms, with good results, when repeated.

*Fumigation with Sulphur* is reported to have been tried in one case for lung-worms with the best results.

*Sulphate of Iron, Horehound, Sulphur, Salt and Iron* are reported to have been given, but not with satisfactory results.

*Hayward's Specific* has given very good results for lung-worms; but the reports as regards stomach and tape are conflicting.

*Pottie's, Weaver's, and Quibell's Drenches* are reported to have been used in several districts with fairly satisfactory results.

While it can be said that a decided improvement follows the administration of most of the drenches generally used, it is a fact that even in the case of the most effective the *post-mortem* examinations disclose that generally where the sheep are at all badly infested some worms are still alive; and this again, it is believed, arises from the owners delaying too long in drenching, and allowing the worms to have too great a hold on the sheep before they are drenched. The consequence is that some worms are left, which keep the sheep from thriving, and, with the introduction of fresh eggs from the water and pasture—if the weather is at all favourable for the development of the worms—in the course of a few months make the sheep as bad as they were before they were drenched. To make the cure effective, therefore, sheep which have been badly infested should, on receiving one drench, be kept as near the drenching yards as possible, and receive a second drench in the course of twelve or fourteen days after the first.

But, while licks and drenches should be provided and given at as early a date and as often as required, owners should give their earnest attention to the removal of what may be termed the contributing causes of the pest by avoiding overstocking, attending to the proper nourishment of the lambs and weaners, burning off old pasture, and getting rid by draining of surface and stagnant water, as suggested in Vol. II, part 2, of the *Agricultural Gazette*.

#### Licks.

It is reported that the following licks have been used with good results:—

Salt and sulphur.	Salt, sulphate of iron, and Hayward's specific.
Salt and sulphate of iron.	Salt, tar, and turpentine.
Salt and turpentine.	Pottie's Preventive Lick.
Salt, sulphate of iron, and turpentine.	Salt and lime.
Salt, sulphur, and sulphate of iron.	

It is scarcely necessary to point out that a lick, if it is efficacious in warding off an attack of worms, is far preferable to a drench; and as owners in all but the true saltbush country are now aware that it pays them well to give their sheep a liberal supply of salt, it would add very little to the trouble or expense to give once a month with the salt some of the other ingredients here mentioned which they found from experience was to any extent effective in protecting their sheep from the worm-pest.

#### Lung-worms in Lambs.

During the past year lung-worms in lambs, notwithstanding the dryness of the season, were troublesome in several districts, and many lambs were lost in consequence.

This occurred only on the overstocked pastures,—where light stocking was carried out the percentage was good and the lambs robust.

Dr. Cobb, Pathologist to the Department, is still continuing his investigations in regard to the life history of worms and other parasites in sheep, and the work is carried on at intervals between seed time and harvest time, at which periods he is engaged at the Experimental Farm at Wagga Wagga. It is also carried on simultaneously with other work connected with the Department of Agriculture, hence the reason for the delay in the preparation of his full report. Considering the time spent on this work during the past year, much progress has been made.

He also prepared, at my request, a report on fluke in sheep in advance of his full report. This report embodies the investigations which resulted in the first discovery of the Australian intermediary host of the sheep fluke, briefly announced in the newspapers in the various colonies some months ago, and reproduced throughout the world.

This advance report will appear in an early number of the *Agricultural Gazette* with illustrations.

The following statement shows the work done by Dr. Cobb:—

1. Copy ready for printing, amount equal to over 150 pages, as printed in the *Agricultural Gazette* of New South Wales.
2. Wood-engravings, already cut and ready for the printer, about 210 figures.
3. Drawings and sketches prepared, over 450.
4. Plates embodying about 100 figures.

He adds that the engravings are of a superior nature, the drawings being the result of the most careful and assiduous labour. It is his opinion that as an aid to the practical recognition of the various parasites, and their effects in causing disease, and of their own structure, these drawings have never been equalled.

It is his intention to devote the coming months of this winter to completing the full report, which will deal with:—

1. Parasites in general, popular discussion, containing many new ideas.
2. Life histories of various parasites of sheep and other stock.
3. Distribution of various species of parasites.
4. Preventive measures.
5. New species of parasites, &c.

*Sheath*

*Sheath Disease in Wethers on the Lower Macquarie.*

A disease affecting the sheaths of a number of wethers upon a run in the Coonamble district was professionally examined in October, 1894, by Mr. Veterinary-Surgeon Scott, instructed by this Department, whose report thereon I append in the form of Appendix H.

As the disease has since shown itself in other parts of the Colony, the treatment then recommended, and which proved to be successful, is republished for the information of owners. (See Appendix H.)

PIGS.

On 31st December, 1895, the number of pigs in the Colony stood at 221,597, being a decrease of 51,698 on the returns for the previous year.

Thirteen pigs were introduced by sea from the other Australian colonies.

The prohibition which has been in force against the introduction of pigs from New Zealand in consequence of an outbreak of swine fever in that colony has been renewed for a further period of twelve months, as it is considered advisable that a period of at least that time should elapse after the disease had disappeared before the prohibition is removed on account of the extremely infectious and deadly nature of the disease.

One hundred and fifty-four pigs were exported from Sydney during the year.

One ship's pig was placed in quarantine during the stay of the vessel to which it belonged in port, and ninety-one were killed on board, as the owners would not quarantine them.

According to latest reports swine fever is still very prevalent in the United Kingdom.

DOGS.

Eighteen dogs which arrived from England and other places outside the Australian colonies passed through quarantine during the year.

Sixty "ships' dogs" were quarantined during the stay of vessels in port, and fourteen "ships' dogs" were destroyed.

All "ships' dogs" and other stock on board foreign vessels for the use of the passengers and crew are now quarantined during the stay of the vessel to which they belong in port, whether in Sydney or at Newcastle.

Four hundred and thirteen colonial dogs were introduced at the Port of Sydney from the other colonies, and 302 dogs were inspected prior to exportation.

*Diseases in Dogs.*

Rabies is reported to be increasing at an alarming rate in Great Britain and Ireland. The number of cases reported for 1895 was nearly three times that for 1894. In Paris the disease is also on the increase.

TRAVELLING STOCK (*Reserves, Roads, Tanks, Wells, &c.*)

*Trespass on Reserves.*

In thirty-four districts the travelling stock and camping reserves are reported as having been trespassed upon, generally only to a slight extent, and in thirty-one districts they are reported as being free from trespass.

From seven districts it is reported that 120 horses, 450 cattle, and 1,034,708 sheep have travelled through during the year in search of grass and water. From five districts the number of loafing sheep is given at 143,420.

Constant complaints are being received of the want of grass on the Travelling Stock Reserves, more especially in the Central and Eastern Divisions of the Colony. There they are in most cases under lease, and are fenced off from the adjoining land or are enclosed in paddocks containing very little else but the reserved land, and the tenant as a rule either "skins" the reserves or sublets them to others who do so. The result is that legitimate travelling sheep suffer severely by the way for want of grass, and if they are prime fat when they start, and travelling on foot to market for even a moderate distance, by the time they reach their destination they are second, or it may be if the weather is at all unfavourable only third rate mutton.

If, again, they are stores, which they more frequently are, they would, although in first-class store condition when they started, be little else than "bags of bones" by the time they reached the run for which they were purchased, and besides losing a considerable percentage by the way, will take quite twice the time to fatten they would have done if they had had a fair share of feed by the way. The wool also suffers, and frequently in such cases shows a decided break in the fibre, caused by the starvation.

Although it would be impossible to arrive at the correct estimate of the loss owners now sustain through the want of grass for their stock on the travelling stock and camping reserves while travelling to market or to the mountains in times of drought, and the portion of that loss which can be fairly charged to the leasing of Travelling Stock and Camping Reserves, I think it is possible, by taking on the one hand the number of sheep and cattle reported as being on the road and allowing a moderate amount per sheep for depreciation through the want of grass on the reserves, and taking, on the other hand, the rent received from those who now lease these reserves from the Government, to show that the amount thus received is a mere trifle compared with the loss arising from the letting of reserves, to say nothing of the suffering of the stock from starvation.

By the returns from the Inspectors' of Stock of the sheep traffic (I will deal only with that in detail), last year amounted to 15,743,959 in the Central Division and to 3,672,785 in the Eastern. But as a good many of these sheep would be reported by more than one Inspector, a deduction will have to be made on these amounts, and in order to keep this estimate well within the mark, I will make a deduction of two-thirds in the case of the sheep reported in each of these divisions, which would in that way make the traffic 5,247,986 in the Central and 1,224,261 in the Eastern Division. Then,

Then, supposing that the depreciation through the want of grass on the reserves amounted to 4d. per sheep (it would frequently, in the case of fat sheep, be 1s.), and that the share of the 4d. set down for depreciation attributable to the letting of the reserves is 2d. per sheep, that would make the depreciation in the Central Division amount to £43,733, and in the Eastern Division to £12,202, or together to £55,935.

Then, again, taking the land comprised in these reserves in the Central Division at, say, 2,235,499 acres, and in the Eastern Division at, say, 843,536 acres, the annual rent derived from the reserves in the Central Division at, say,  $\frac{1}{4}$ d. per acre would be £6,985, and that from the Eastern Division £3,535, or together £10,520.

These calculations, supposing for the moment they are approximately correct, show that the Government collect £10,520 for the rent of reserves, but by doing so a loss of £55,935 is inflicted on our sheep-owners.

To this has to be added the loss on cattle and horses travelling in these Divisions which, counting one head of large stock equal to ten sheep, could not be estimated at less than £25,000.

It has too to be borne in mind that teamsters and travellers are also severe losers through the letting of these reserves.

The mere withdrawal of the reserves from lease, without providing the means for protecting them from trespass, might not, perhaps, bring about all the improvement that is desired, but if they were withdrawn and no rent required to be paid to the Lands Department a small charge, such as the owners would not feel, might be levied from travelling stock, which would not only enable the Department to employ a sufficient staff to protect the reserves, but would also provide the necessary outlay for clearing the reserves of burrs and other noxious weeds, a matter which is urgently required.

#### *Marking of Travelling Stock and Camping Reserves.*

Fair progress has been made with regard to the marking of Travelling Stock and Camping Reserves, the system of which is shown as Appendix L, there being at present about 900 miles surveyed and about 400 miles in course of survey. The routes marked are:—

1. From Boggabilla, *via* Yetman, Warialda, and Cobbadah, to Breeza.
2. From Moree, *via* Millie, Narrabri, Boggabri, Breeza, and the Liverpool Range, to the Bulga Mountains.
3. From Walgett, *via* Coonamble, Mendooran to Uarbry.
4. From Coolah, *via* Uarbry, to Rylstone.
5. That portion passing through Terry-hie-hie holding.
6. From Boggabri, *via* Turrabeile or Cox's Creek, to Coolah.
7. Mungundi to Moree.

And those in course of marking are:—

1. Along the Mara Creek from the Barwon River upwards.
2. Along the Bogan to Travelling Stock Reserve on the Murda Creek.
3. From Breealong to Dubbo.

With a view of making these surveys of practical benefit to drovers, stock-owners, and others, lithographs are being prepared showing sections of the roads in lengths of between 20 and 30 miles.

Lithographs of the roads, Boggabilla to Cobbadah, in six (6) sections; Moree to Cobbadah, *via* Gurley Holding, in one (1) section; Walgett to the Castlereagh, in one (1) section; and Liverpool Range to Putty, in five (5) sections, are now on sale at the Head Office, and also at the local Stock Office, at 2s. per section.

#### *New Stock Roads required.*

In eleven districts new roads are required for travelling stock, and to obtain these action has been already taken in seven districts.

#### *New Stock Reserves required.*

In seven districts new reserves and alterations of existing ones for travelling stock are required. In fifty-eight districts there are sufficient reserves; but in a great many cases the reserves are leased under annual lease, and are, therefore, kept very bare of feed.

#### *New Wells, Tanks, or Dams.*

In twenty districts the inspectors report that new wells, tanks, or dams should be constructed by the Government at places which they indicate.

### REGISTRATION OF HORSE AND CATTLE BRANDS.

#### *Brands registered.*

The number of horse and cattle brands registered up to 31st December, 1894, was 75,097. The number of brands registered during the year 1895 was—Horse brands (alone), 156; cattle brands (alone), 204; and horse and cattle brands, 1,143; making a total of 1,503.

This shows a decrease of 333 in the total number of brands registered during the year as compared with 1894. There is an increase in the number of brands transferred, and a decrease in the number of brands cancelled.

#### *Brands transferred.*

The brands recorded during the year 1895 as transferred were—Horse brands, 32; cattle brands, 46; horse and cattle brands, 62; total, 140, being an increase of 32 on previous year. *Brands*

## 13

*Brands cancelled.*

The brands cancelled (horse and cattle) in 1895 were 120.

*Addresses changed.*

The number of addresses of owners changed in 1895 was 70.

*Compliance with the Act.*

In all the districts the provisions relating to registration and the other requirements of the Act are reported as being fairly carried out.

*Benefits of the Act.*

The inspectors, in alluding to the benefits of the Act, report that it prevents duffing, stock-stealing, facilitates identification, assists in recovering lost stock, and otherwise is a great convenience and protection to stock-owners.

There is a great necessity for an amendment of the Registration of Brands Act, in order that the existing brands, where required, may be reregistered, as a very large percentage of brands now stand on the Register in the names of proprietors long since deceased, or who have left the Colony, or given up using them. As the law now stands there is no provision made for the cancellation of these brands, and they are, therefore, practically locked up, and these include some of the best brands, they having been taken up when the present Act was passed.

Another advantage to be derived by the proposed reregistration would be a compilation of the Brands Directory in revised form, which now comprises eleven volumes. The searching for a brand by poundkeepers and the public is, therefore, no easy task, and the publication of all the brands in one Directory is a matter of absolute necessity, and asked for by inspectors and poundkeepers generally. Besides this the original stock of the Directory for the period from the passing of the Act up to 1886 is almost exhausted, and to reprint it will entail a large expenditure, the usefulness of which will be to a large extent lost owing to its not being up to date.

## POUNDS.

*Number and Inspection.*

At the end of the year there were 235 pounds in operation in the Colony; 35 have been closed for want of poundkeepers, and there are sites set aside for the establishment of 158 more as occasion requires. The whole of the pounds are inspected periodically by the various stock inspectors.

*State of Yards.*

Thirty-two of the pound-yards are reported to be old; some require renewing, being unfit for the safe custody of stock; while others need repairs. The remainder are said to be in a fair and good condition.

*Keeping and Depasturing Pound Stock.*

The provision made for the proper sustenance of impounded stock, according to the reports received, is satisfactory. As a rule, poundkeepers have now paddocks for the stock.

*Management of Pounds.*

The poundkeepers are reported to be performing their duties, upon the whole, in a satisfactory manner, and the appointment of inspectors of stock as inspectors of pounds has had a very beneficial effect.

## NOXIOUS ANIMALS.

*The Districts in which the Pastures and Stock Protection Act is in force.*

The Act has been brought into operation in all the districts, and during the year work has been done to the extent shown in Appendices I and J.

*Receipts and Expenditure under the Act.*

The amount of assessment paid by stock-owners in 1895 was £39,638 14s. 0d.; and the amount expended £45,912 10s. 2d., the difference being accounted for by the subsidy granted by the Government to the Boards, and large amount to credit of some of the Boards at commencement of the year. Eight districts are reported to be in debt to the amount of £878 17s. 0d.

In seven districts full rates were levied, in fifty-two districts less than full rates, while in six districts no rates whatever were levied.

During the year the bonuses paid by the Boards for scalps ranged as follows:—For kangaroos, from 2d. to 6d.; kangaroo rats, 1d. to 4d.; wallaroo, 2d.; wallaby, from 1d. to 4d.; paddymelon, from 1d. to 4d.; bandicoot, 1d. and 3d.; hares, from 1d. to 6d.; native dogs, from 10s. to 40s.; pups, 2s. 6d. to 10s.; opossums, 1d. and 2d.; wild pigs, 3d., 6d., and 1s.; eagle-hawks, 2d. to 5s.; emus, 6d.; crows, 1d. to 6d.; foxes, 10s. and 20s.; and flying foxes, 1d. and 1½d.

*Increase and decrease.*

Kangaroos are reported to be increasing in ten districts, wallabies in fourteen districts, native dogs in eight districts, hares in twelve districts, and wild pigs in three districts. In twenty-five districts kangaroos are reported to be decreasing, wallabies in sixteen districts, native dogs in eighteen districts, hares in thirteen districts, and wild pigs in two districts.

*Number*

*Number destroyed.*

The number of kangaroos destroyed during the past year was 155,908; of kangaroo rats, 467,475; of wallabies, 1,393,253; of wallaroo, 8,633; of wombats, 477; of bandicoots, 5,757; of paddymelons, 42,980; of wild pigs, 43,965; of hares, 700,917; of foxes, 66; of native dogs, 11,383; of opossums, 8,528; of eagle-hawks, 5,052; of crows, 51,921; of emus, 6,619; and of flying foxes, 831.

*Steps taken for their destruction.*

In the majority of the districts hunting with dogs, drives, shooting, trapping, and poison have been adopted with satisfactory results. In forty districts poison has been used, mostly for dogs, with fair to best results, and from five districts it is reported that the results have not been satisfactory, the dogs being too cunning to take baits.

## AMENDMENTS SUGGESTED IN THE ACT BY THE BOARDS.

The agitation for the passing of the Stock and Pastures Bill still continues, and among other amendments in the law asked for it is suggested that uniform rates of assessment and bonuses should be fixed; that assessments should be paid at the time of making returns; that farmers and fruitgrowers should contribute to the funds raised under the Act; that all assessment be paid into a general fund; that the Government should contribute a higher rate of subsidy to the funds of the Boards; that Section 6 of the Pastures and Stock Protection Act Amendment Act of 1881 be amended; that Superintendents should have equal voting power with owners; that the suspension of the provisions of the Act in any district should be allowed on petition; that the Boards should have the administration of the Rabbit Act; and that a measure should be passed dealing with noxious weeds and plants.

## LOSSES FROM NATIVE AND TAME DOGS.

The losses through native dogs for the year are estimated at 115,589 sheep, valued at £25,591; and from tame dogs 54,613 sheep, valued at £11,966; making a total loss of £37,557. A stricter enforcement of the law with respect to stray dogs, and the registration of dogs, is urgently required.

## COMMONS.

There are now 307 Commons in the Colony, the average acreage of which is about 4,000 each.

*Number of Commoners, Stock, &c.*

The average number of Commoners to each Common is estimated at eighty-nine, and the average number of stock kept on each Common at 148.

Two Commons are reported to be used for other purposes than that for grazing Commoners' stock. Many of the Commons are unfenced, consequently are trespassed upon by travelling stock.

## THE LIVE STOCK EXPORT TRADE.

This trade which at first bid fair to assume some importance has it may be said turned out a failure principally from the following causes:—

- (1). The cattle after the first few shipments were ordinary bush cattle not broken to be tied up and unaccustomed to cultivated food.
- (2). Through effect of the drought very few prime cattle were to be had, and instead of prime well-bred young cattle a great deal of comparatively old, large boned second rate cattle were shipped.
- (3). Instead of being well rested, watered, and fed after long journeys by rail they were put on board in a starved and fevered state direct from the trucks.
- (4). In loading them the cattle were in many cases very roughly handled, and there is no doubt numbers of them seriously injured themselves before they were tied up in their places.
- (5). The space given them was in a good many cases insufficient for the proper accommodation, care, and cleanliness of the stock.
- (6). But the principal reason for want of success and discouragement as regards the trade in future is the low price which the beef and mutton of cattle and sheep slaughtered at the port of debarkation (which it must all now be) in England brings. The very best American is now sold at from 4d. to 5d. per lb.; and this has arisen from enormous increase in the importation of stock, principally cattle from the United States, Canada, and the Argentine, but mainly from the Argentine.

The greater portion of the defects here noticed could no doubt be remedied, but if a very considerable rise in the price of this class of beef and mutton does not take place in England there is little or no prospect of Australia with the long voyage, comparatively high freight, and heavy expense for forage and insurance ever being able to compete with Canada or the Argentine, or even the United States.

## EXPORT OF CHILLED MEAT TO LONDON.

Several attempts have been made to put chilled instead of frozen beef on the London market. One of these attempts, that by the "Doric," from New Zealand, with the aid of Dr. Shield's thermostat, was fairly successful, both as regards the condition of the meat and the price it realised; but it is now found that it was so only by lowering the temperature until the meat was partially frozen some eight or ten days before it reached England. In this way, when the beef was landed the greater part of each quarter of the meat was still chilled while it had, so to speak, a shell of frozen tissue round it, which prevented taint, but which was thawed by the mere exposure in the temperature of the day, thereby enabling the meat to be offered and sold as chilled.

It is believed that with the aid of the thermostat the same course could be again followed with like success, but what with the additional cost of freight ( $\frac{1}{2}$ d. per lb.) for chilled compared with frozen meat (the chilled meat must be hung and cannot be stacked, thereby occupying a great deal more space), the moist appearance of the meat, and the additional risk—the attempt has not been renewed with a thermostat. It was tried without in a shipment from Queensland, but it proved a failure. It is hoped, however, that further attempts will be made and that they will be still more successful, as our meat is placed at a great disadvantage in competition with American, through its being hard frozen instead of chilled.

THE following is a Statement of the Boiling-down, Chilling, Freezing, and Preserving Works in the Colony and of their Capacity, and the Work done during 1895.

In course of erection.

Sheep treated since 1st July.  
When works completed capacity 1,000.

Leased for seven years by the Pastoral Finance Co.

Merely a station plant.

\* Including lambs.

Has storage capacity for about 20,000 sheep.

Has storage capacity for 75,000 sheep, or equivalent in beef.

## WHAT ARE THE BEST SHEEP TO EXPORT AND HOW SHOULD THEY BE FATTENED.

## I. MISTAKEN IMPRESSION REGARDING DEMAND FOR MERINO MUTTON IN ENGLAND.

I think it necessary before going more directly into the discussion of these questions to remove the wrong impressions arising from statements which have appeared oftener than once in the Press to the effect that as the operatives in Lancashire and the Midland Counties of England preferred small Merino sheep to the Crossbred, it was not therefore necessary to cross our Merinos with the English sheep to obtain paying prices for our mutton in England.

It is no doubt the case that under certain circumstances the preference mentioned is shown and that small sheep sell generally better in the Midland Counties than elsewhere, but to say as one of the writers to whom reference is here made does "that this is a revelation which upsets the belief so strongly held that the sheep of this Colony (evidently meaning the Merinos) are not as valuable weight for weight for food supply as the Crossbred is a very great mistake."

As to the preference referred to, I would explain that as these operatives cannot afford the price paid for first-class frozen mutton they do not purchase it. They content themselves as a rule with second-class Merino mutton which has little fat, and therefore more economical giving as it does a larger proportion of red meat for the money, and this class of mutton when procurable by the retail butcher at a comparatively low price (one, however which cannot possibly pay the breeder) suits both him and the operatives. But at times a scarcity occurs of this class of mutton on which the price goes up; and as it would not then leave the butcher a sufficient margin of profit to buy this class of mutton, he purchases third rate heavy coarse over fat Crossbred New Zealand mutton which is all, but pure Lincoln or Leicester weighing per sheep perhaps 80 lb. to 90 lb. It would never pay him to buy first-class Crossbreds. He would scarcely even venture to purchase second-class; for in that case he would be supplying his customers with a superior article to that with which they were usually served, and they would not afterwards be content with second-class Merinos.

This being the case it is not hard to understand why the Lancashire Operatives prefer the small comparatively lean Merino mutton to the coarse fat New Zealand Crossbreds, especially as the extra fat which these sheep carry is in a large measure sheer waste.

To conclude as some of these writers do that even the prime 50 lb. Merino wether not to speak of second-class Merinos would bring as good a price per lb. as the 55 lb. to 60 lb. or even the 62 lb. Crossbred is altogether a mistake, and they had only to consult the weekly circulars issued during the last six or eight years by such firms as Nelson Bros. and Wedell & Co., London, to see that during that time, there has been a steady settled difference (which still exists) of more than 1d. per lb. in favour of the Crossbred. This explains the fact that while in New South Wales our sheep-owners have had hard work during recent years to make an average of from 8s. to 9s. for their 3 to 4 year old prime wethers, their fellow owners in New Zealand have been getting an average of from 16s. to 18s. for theirs at less than 2 years old. It is true that the quotations for Australian frozen mutton have within the last few years been coming somewhat closer to the New Zealand Crossbreds than formerly; but this it is believed is due less to the increased value of the Merino mutton than to the fact that both this Colony and Victoria have been sending away a good many Crossbreds, which have not been quoted as such, and being mixed up with the Australian Merinos have, through realising higher prices, helped to raise the general average of Australian mutton.

To do justice to our Australian Crossbreds and let breeders know what each class of sheep really brings in the London market, they should be quoted separately from the Merinos as they are as a rule first crosses and should when in really good condition be very prime both as regards the quality of the mutton and the weight, running as they would between 55 lb. and 60 lb. (the most desirable sizes) and being a combination of the valuable qualities of the Merino and English mutton sheep, a cross which without doubt makes better mutton than a great deal of the New Zealand, where the sheep now have a very large proportion in them of the English blood and comparatively little Merino, and therefore in many cases make coarser and less sweet mutton than first crosses.

Referring again to the statements here alluded to it is not questioned that the demand existed, but I think it will be gathered from the evidence which as here afterwards adduced as to the price of Merino mutton in England during the first six months of the present year that it could not possibly have been a paying one so far as our sheep-owners are concerned; and that of course is the real question.

## II. CROSSBRED AND MERINO MUTTON CONTRASTED.

## 1. Average English prices from 1st January to 30th June last.

What I have stated with respect to the Merinos and Crossbreds will be more clearly seen by ascertaining the prices quoted for the two sorts of sheep during the first six months of the present year in the English market (which is, of course, the real test, the price of sheep for export regulating the market). Taking prime Merinos to weigh, say 50 lb., and prime Crossbreds 60 lb.—allowing the average prices quoted during the six months for the mutton of each kind of sheep, and adding a reasonable amount for the skins—supposing them to be full fleeced.

The following statement shows how this matter stands:—

	Crossbred.	£	s.	d.	£	s.	d.
Prime fat 2-year-old wether ... ..	60 lb., @ 3½d.	=	0	18	1		
Skin—full fleece ... ..	...		0	4	6		
	Merino.					1	2
Prime fat four-year-old Merino wether ...	50 lb., @ 2½d.	=	0	10	5		
Skin—full fleece ... ..	...		0	4	6		
						0	14
							11
Difference in favour of Crossbred ... ..						0	7
Add—As it takes four years before the Merino wether is sold as fat, and only two years to get the Cross-bred prime, that breed has to be credited with a second return in mutton, <i>i.e.</i> , 60 lb., @ 3½d.		=	0	18	1		
Add also return for skin of second Crossbred ... ..			0	4	6		
Total money difference in favour of the Crossbred ... ..			£	1	10	3	

## 2. *Can any Rise in Price of Merino Wool alter the result here arrived at?*

There has been a considerable advance lately in the price of Merino wool, and it is hoped that it will continue to rise. But while this is the case there has also been an advance on Crossbred, and there is very little difference as yet in the value of what may be termed "good" Merino and "good" Crossbred wool.

Still it is believed that what with the all but universal use of English rams in the Argentine, the large increase of crossbreeding in the United States, and the heavy losses from the late drought of Merino sheep in this and the other Australian Colonies, the supply of Merino wool will next season be short, and the price of that class of wool is bound to rise, more especially if, as it is expected, there is to be a change in the fashions and finer fabrics worn by the ladies. But, notwithstanding this, and although there should next wool season be a rise of 2d. or 3d. per lb. on the Merino wool, and nearly that difference between the price of Merino and Crossbred, that would not put Merino sheep on country adapted for the Crossbred on anything like a level with that class of sheep, for even supposing there was the extreme difference of 3d. per lb. between the two kinds of wool, and the Merino fleece weighed 7 lb., that would not amount to half the cash difference which it has been shown exists in the return from the two sorts of sheep, leaving out of view the important indirect advantages of the Crossbred, afterwards referred to in this paper.

## 3. *The Advantages of the Crossbreds.*

Stated shortly they are:—

- (1) Prime Crossbred mutton is worth in England more than 1d. per lb. than prime Merino, and that on a 60-lb. wether is 5s. at least.
- (2) Taking the age when a Merino wether is usually sold, *i.e.*, four years, the Crossbred, by being prime at two years or under, in that time gives a return of about 120 lb. prime mutton and two skins, and the Merino only 50 lb. and one skin.
- (3) The Crossbred suffers much less in a low or glutted market than the Merino.
- (4) The breeding of Crossbred fat lambs pays very much better than breeding Merino lambs.
- (5) The by-products of the Crossbreds are much more valuable than the Merinos; and
- (6) By breeding Crossbreds, and supplementing the natural pasture with cultivated food, a successful rotation of crops can be established, and the deterioration and exhaustion of the soil now going on by continual cropping without manure prevented.

## 4. *Objections to Crossbreds.*

- (1.) They are hard to keep in their paddocks.

The objection most frequently brought against the Crossbreds is that they are hard to keep within the fences; but this is by no means an insuperable obstacle to crossbreeding; and if the New Zealand graziers and farmers could overcome that difficulty as they have done there is no reason why ours should not master it too seeing the inducement is so great. A fairly constructed 8-wire fence, with posts 10 feet apart, and a batten, or steel droppers, between the posts makes a perfectly secure fence for Crossbreds; and the difference in the cost between that and a good ordinary Merino sheep-proof fence would be more than recouped in one year by keeping Crossbreds, while a fence such as this erected for Crossbreds would last much longer than an ordinary fence.

- (2.) Crossbreds require cultivated food, which it would not pay to grow.

To secure the full extent of the advantages here claimed for the Crossbred it will of course be necessary, except where the natural pasture is very good, to supplement it with cultivated food; and it may be argued that the expense of this would counter-balance the advantages. But it will not be difficult to show that although the providing of cultivated food for the Crossbreds (Merinos would not give a sufficient return to cover the cost) would entail both labour and expense, Crossbreds will not only pay the expense and leave a profit, but will also enable the owners of the land put under crop to adopt a rotation which, while it yielded a fair return year by year for their work and outlay in the shape of large numbers of prime fat sheep, will also, as already stated, put them in a position to maintain and even improve the fertility of their land, and I will, I think, be able to show that this is the case.

## III. THE NECESSITY FOR A PROFIT-GIVING ROTATION OF CROPS.

### 1. *It is required both for Tillage and Stock-raising.*

The greatest want (the missing link), so far as stock-raising and tillage are concerned—and these are beyond all question the great producing interests of the Colony—is a profit-giving rotation of crops, for not only is this absolutely necessary to save our cultivated land from sterility and the owner from ruin, through continuous cropping without manuring, but it is equally necessary in order to insure the two most essential requirements in a remunerative and permanent export trade in meat, *i.e.*, the meat must be of prime quality, and a steady and constant supply must be insured.

It may perhaps be said that in some seasons it would be impossible to comply with these requirements. This is granted to a certain extent; but unfavourable seasons only occasionally occur, and we are a very long way from the position in which such an excuse for not making proper provision in the direction indicated can be accepted.

### 2. *Farming as it has been conducted and the result.*

Where a reliable rotation, which includes the proper cultivation of the land, and the application where necessary of a fair quantity of manure, had not been followed, and the land has been under tillage for a good many years, it will not only not grow wheat to a profit, but the crop of oaten hay, which it now likely produces, is low both in quantity and quality, and will, if the present wasteful and ruinous system of cropping year after year without manure or cleaning be continued, become worse and worse through the deterioration of the soil and the large percentage of useless weeds that grow with the hay.

This style of farming—if it can be called farming—has all but ruined thousands of acres in the Campbelltown and Camden districts, where land which at one time yielded 20, 30, and even in some cases 40 bushels of wheat to the acre, now only gives an average return of perhaps half a ton of inferior oaten hay. Nor is there any wonder that this is the case, when we recollect that the land has been cultivated more or less every year for perhaps forty years, and seldom or never has any manure been applied to it, nor has it even been properly tilled.

The same sort of farming utterly impoverished millions of acres in the Eastern States of America, where, although scientific skill and capital have been again and again applied to it, and all sorts of manures been tried, the land cannot now be restored to anything approaching its original fertility.

### 3. *An imperfect system of Fallow adopted in some cases.*

It is true that in these Colonies farmers in a good many instances, in order to prevent their land from being entirely ruined by continuous cropping, and as a substitute for manure, plough it up in spring, and allow it to remain fallow for two or three years. But soon after it is ploughed the land in ordinary seasons gets overgrown with weeds, which have to be got rid of by crowding the land with sheep; the sheep eat out the weeds, and in this way and with two or three years' rest, the land has so far recovered, when it is again broken up, and another, or perhaps two other, crops of wheat are taken, after which it is again fallowed and the same process repeated. Any one, however, will see that this is a slovenly and wasteful style of farming, though better than keeping on year after year with continuous cropping, and one that must eventually lead to the complete deterioration of the land; while if it were properly cultivated, a moderate quantity of manure used where necessary, and a reliable rotation, such as that practised in New Zealand, of roots or other green crop, followed by cultivated grasses, were adopted, or if the land were laid down in lucerne, not only would its fertility be preserved, but it would give very much better returns than it now does under the system I have here condemned.

### 4. *The proper cultivation of the Soil and production of food for Stock.*

What is wanted, therefore, more particularly in districts where crop after crop has for years been taken off the same land without cleaning or manure, is that a suitable rotation should be adopted and that a stop should be put as speedily as possible to this wasteful and lazy system of tillage, whether the occupier of the land be the proprietor or not. This caution is specially addressed to those landlords who, for the sake of the comparatively high rents they have been receiving, are allowing their tenants to ruin the land. They should insist upon a proper rotation though its enforcement should at first be attended with a somewhat diminished rent.

It would be well too that all those owners of land who are now allowing it to be cropped on terms should keep in view—as some of them are doing—the danger of cropping it year after year without a proper rotation; and if it cannot be let with that condition, they should take it again into their own hands and adopt a safe rotation of crops.

### 5. *How the Food is to be grown and where.*

(1) By the adoption of the system now all but universally followed in New Zealand of growing roots, green crops and English grasses and feeding them off on the ground with sheep: or (2) by taking (say) two crops of wheat off new land keeping it thoroughly clean and laying it down with lucerne: or (3) by following systems (1) and (2), but assisting the crops with moderate quantities of manure.

Course (1) would be best adapted for districts such as New England, Bathurst, Orange, Goulburn, Braidwood, Queanbeyan, Monaro, Yass, Tumut, and the Upper Murray, that is in the colder and more temperate portions of the Colony, and while course (2) would also be suitable for the alluvial land in the warmer portions of the districts mentioned, this course would, however, be specially adapted for the drier and warmer portions of the Colony where the subsoil is favourable. Lucerne growing has proved a great success in the country between the Billabong and the Murray. Course (3) again might be followed in any portion of the Colony where the land will pay to cultivate.

If course (1) or (2) were adopted by owners especially in the Eastern side of the Colony where the country was adapted for it, they would be put in a position not only to breed and fatten large numbers of Crossbred sheep and lambs, and make them thoroughly prime at an early age, but they would also be able to do a great deal more than they now can in keeping up a steady supply of first-class sheep and lambs for export, a most essential matter for the success of the Export trade in meat.

Above all it would put our farmers and selectors in a position to breed and fatten Crossbred lambs which, as a rule, pay better than sheep, and in the long run it would in most cases pay them best to consume their crops on the ground, with sheep which would thus manure it, and save it from being run out; or they might devote themselves entirely to buying store sheep and fattening them which under ordinary careful management would leave a good profit where the sheep are really made prime.

### 6. *The cultivation of the land in the upland districts would reduce the prevalence of Fluke, Worms, and Foot-rot.*

Besides the reasons already adduced for the adoption of a reliable system of rotation, there is still another most important consideration for its adoption in the upland and colder portions of the Colony: it is that the cultivation of the land would effectually free it of surface water, and besides growing nutritious food for the sheep, would thus remove what are now the seed-beds of fluke, worms, and foot-rot, and be the means of saving many thousands of pounds now annually lost to the Colony through the excessive, and to a large degree preventable, prevalence of these ailments. This will be evident when it is recollected that on a great deal of the land best adapted for tillage in the higher lying and colder portions of the Colony the sheep are notoriously subject to these diseases, and they are so mainly through the extensive tracks of really good land there having the hollows and gullies more or less covered with surface water, to which the sheep are enticed by the freshness and verdure of the grass, but where they not only get innutritious food, but with that the germs of the diseases to which allusion has been made.

## IV. STOCK-RAISING AND TILLAGE MUST BE COMBINED IF A PAYING TRADE IN FROZEN MUTTON IS TO BE ESTABLISHED.

### 1. *The importance of paying Export Trade to our Sheep-owners.*

While calling attention to the advantages of breeding Crossbreds for export where the climate, land, and circumstances admit, I do not forget that Australia—and especially the New South Wales portion of Australia—is the great Merino wool-producing country of the world; that by far the larger portion of it is better adapted for Merinos than for Crossbreds; and that there is every prospect of Merino wool advancing in price, while there is a likelihood of Crossbred being lower. But, although this is the case, it has to be borne in mind that frozen mutton can now (which it could not be some twelve or thirteen years ago) be nearly as easily put on the English market as wool, and that therefore it is a matter of the highest importance that our sheep-owners, with a surplus—in ordinary favourable seasons—of some four or five million sheep, should obtain a paying price for their frozen mutton. We have, however, to confess that, although our neighbours in New Zealand have for the last twelve or thirteen years been obtaining very remunerative prices for their mutton, we as a rule, so far as our sheep-owners are concerned, have been exporting at a loss, and the reason is plain: We have not been shipping Crossbreds,

Crossbreds, the only kind of mutton which, as a rule, makes paying prices in the English market; and this again has arisen through our sheep-breeders in country adapted for Crossbreds clinging to the Merino for the sake of the wool and neglecting the production of mutton, which it is now quite apparent to those who have given the subject any consideration could be carried on in the portions of the Colony I have indicated with nearly, if not quite, as much success as in New Zealand; and if the agricultural settlement of the Colony is to be a success not only in the production of export mutton, but also of dairy produce, cultivated food must be grown to an extent not hitherto attempted. In other words, the marriage of stock-raising and tillage must take place, a consummation which the Hon. the Minister is so earnestly endeavouring to bring about.

2. *The highest authorities on the Meat Trade in favour of Crossbreds.*

In support of the views here advocated, more especially as to many parts of this Colony being well adapted for the production of Crossbred mutton, and the advantages which would accrue to those of our breeders who take to the business in a careful and systematic manner, I cannot do better than quote from the excellent practical paper prepared by Mr. W. A. Benn, manager of the Aberdeen Chilling and Freezing Company, and read by Mr. Fetherstonhaugh at the Pastoralists' Conversazione, held at the Exchange on 9th July last. There is no higher authority in the Colony than Mr. Benn, and his statements were fully endorsed by Mr. Fetherstonhaugh. The quotation is to the following effect:—

"New Zealand is a country absolutely incapable of maintaining any exports or even of providing for local requirements in the way of fat stock without artificial feed. It is a fact that all the stock exported are fed on roots, fodder, and cultivated grasses, which entail a cost to graziers of 20s. per acre per annum for cultivation. Consider also that the fee-simple of the land is not less on an average of £6 per acre, large areas being worth £10 per acre; and reckoning interest at five per cent. only, we have the fact that it pays the New Zealand grazier to expend not less than 25s. per acre annually to carry an average of about three sheep to the acre. Contrast this position with that of the New South Wales grazier, to whom Providence is so generous that in good seasons, which far outnumber the bad ones, he has absolutely no expense under the two heads mentioned, beyond a small interest charge on land costing, on an average, not more than 40s. per acre, and who, as a rule, prefers to trust in Providence for feed instead of conserving the water and the feed which go to waste in a good season."

Contrasting again the Merino and Crossbred, Mr. Benn said—"In New Zealand the Merino wether does not figure as an export, but supplies the local market with a lower class of mutton than could be supplied from prime Crossbreds fit for export. Merino wethers do not make, on an average, as much in New Zealand at the Metropolitan Markets as they do at Homebush. In fact the market reports show that on the same sale day Crossbreds will make 14s. to 15s. for 55 lb. to 60 lb. sheep (for years they made from 15s. to 18s.), while Merino wethers of very little less weight only make 7s. to 9s., thus clearly emphasising the fact that the exporters of New Zealand do not reckon on realising within one penny per lb. or more for Merino mutton in the home market as compared with what they can fairly calculate on getting for good Crossbreds."

3. *The change from Merino to Crossbred should be gradual.*

In bringing the advantages of the Crossbreds under notice, it is not recommended that those owners, even where the land is well adapted for crossbreeding, should at once put English rams to their Merino ewes. The change should be a gradual one, for fresh paddocks will have to be fenced off—the existing fences will have to be made crossbred proof—and other arrangements will have to be carried out with the view to the efficient working of the new system which it is proposed to adopt. Besides, all owners with considerable numbers of sheep taking to crossbreeding would still have to keep a portion of their Merinos to enable them to keep on breeding first crosses, for the first cross is the very best mutton that can be produced, and mutton that if care be taken to have it prime at an early age (under two years if possible) when put on the market will eventually bring as high a price as Canterbury, the best New Zealand mutton, combining as it does the best qualities of the English and Merino mutton, while at about two years old it would be just the weight which is required in first-class sheep.

As to the number of this class of sheep which the Colony should produce, that, I think, is easily answered: We should breed and fatten sufficient Crossbreds to meet the requirements of our export trade in frozen mutton, as we should export few or no Merinos, for when exported they, in nine cases out of ten, have left next to nothing to the sheep-breeder for his share in the transaction.

To be in a position again to provide a sufficient number of Crossbreds for export—this might be brought about in the course of a few years if the owners of properties adapted for crossbreeding, carrying (say) 10,000 sheep and upwards were to begin in a tentative way by putting English rams to the full-mouthed ewes, and taking the last crop of lambs from them as Crossbred; and if holders of smaller sheep, properties and selectors were to take to keeping Crossbreds, and especially to breeding Crossbred lambs, they would, by supplementing the natural pasture with cultivated food, make much better returns (the trouble of keeping Crossbreds within the fences notwithstanding) than they are now doing with Merinos. In this way we would, before long, be able to put on the English market annually a million of Crossbreds; for owners would, as a rule, fatten maiden ewes as well as wethers, and would not, unless where they were turning their attention the longer to the breeding of fat lambs, breed from the Crossbred ewes. Then the export of a million would in a very few years, with the increase in the carrying capacity of the Colony through the extension of the area under cultivation for stock, increase to a million and a half and before long to two millions, at which number the proportion of Crossbreds to the cast might be put at (say)  $\frac{1}{4}$ th of the whole, as shown by the following statement, supposing that the sheep would again number 60,000,000.

4. *Tentative Statement of the Sheep in the Colony three years hence, and their cast and its disposal.*

The cast (say) on 60,000,000 sheep (say)	...	...	...	...	...	10,000,000
Merinos slaughtered for food in the Colony	...	...	...	...	3,000,000	
"    canned	...	...	...	...	1,250,000	
"    taken to other colonies	...	...	...	...	600,000	
"    and Crossbreds (boiled down)	...	...	...	...	1,250,000	
"    "    losses through deaths, &c.	...	...	...	...	1,650,000	
Merinos exported frozen	...	...	...	...	250,000	
Crossbreds	...	...	...	...	2,000,000	
					-----	10,000,000

While

While Merinos as a rule do not pay to freeze, there will, of course, be times when prime sheep of this class would do so, and will no doubt be shipped. For canning, however, the Merino is preferable to the Crossbred, and there will be a better demand for Merinos for that purpose and for home and colonial consumption when the markets are relieved to the extent they will then be by the extensive shipments of frozen Crossbreds.

#### BRANDING MEAT FOR EXPORT.

A very simple, practical, and effective system of marking meat for export has been patented by Robert Prendergast, Merioola, Ocean-streef, Woollahra, in all the colonies.

It consists of a block in which knives about the size of a pen-knife are set in any shape (either in that of letters, signs, characters, or numerals) according to the brand which is required to be made, on the same principle as the needles are set in a Tattoo brand. This block is fixed in a light iron frame with a spring at the back, and is operated with on the meat before it is set by putting the frame on the portion of beef or mutton to be marked (the portion with red outer cuticle) and giving a short handle attached to the block, and standing out from the frame, a smart knock with the hand. This has the effect of driving the block, or at least the knives on the block, out beyond the frame, and by cutting into or pricking the beef or mutton the points of the knives make the desired brand on the red cuticle of the meat, and as the cuts open up as the setting goes on, a very legible clean brand which cannot be faked is left.

A very legible impression can also be made with the patent electric branding machine, but that, of course, is much more expensive.

It would, I believe, be a very great advantage to our stock-owners if our beef and mutton were all legibly and indelibly branded, for not only would our meat then be sold for what it really is, and consumers would, if it were as prime as it should be, come to understand that Australian meat is not the poor article which interested parties in England represent, and better prices would be obtained; but owners knowing that their meat would be marked, would be careful to make their cattle and sheep really prime before sending them to the works for slaughter and shipment.

#### DEFROSTING (ARTIFICIALLY THAWING) FROZEN MEAT.

Comparatively little has, during the year, been heard of this process in England before placing the meat on the market, but the reports which have been received from reliable sources speak favourably of it, and if the defrosting can be carried out at as low a figure as that quoted by Mr. Postle (whose patent and the test made with respect to it was noticed in my last annual Report),  $\frac{1}{2}$ d. per lb., there is every reason to believe that when proper arrangements are made at the stores at which the frozen meat is kept in England it will pay well to defrost first-class beef and mutton.

One reason for so little having been done in defrosting during the past year is perhaps the low prices which both Australian beef and mutton have been making in England, and perhaps also the scarcity (caused by general drought) of really first-class meat.

With the improvement in our pastures we have had an increase of Crossbred sheep, and with more care in making them really prime, and proper arrangements for thawing in connection with the stores in which our frozen meat is placed on being landed, there is a good prospect of a great deal more benefit being derived by our stock-owners by defrosting than they have yet obtained from that process.

#### MISCELLANEOUS.

##### *Cultivated Grasses.*

In twenty-nine districts cultivated grasses have been sown for pasture during the year, the most successful being lucerne, prairie, and rye.

##### *Number and Division of Runs.*

The number open or unenclosed runs in the Colony is 3,284; the number enclosed is 37,645; the number partially sub-divided is 14,954; and the number properly sub-divided is 21,630.

##### *Improvements, Fencing, Dams, Tanks, and Wells.*

The number of miles of fencing throughout the Colony is estimated as follows:—772,688 miles without wire netting, at an average cost of (say) £39 2s. 3d. per mile, amounting to £30,223,750, and 48,410 miles with wire netting, average cost at (say) £67 16s. 4d. per mile, amounting to (say) £3,282,994.

The number of dams used for stock purposes is estimated at 64,418, at an average cost of (say) £101 7s.; number of tanks, 41,811, average cost of each, £155 4s. 6d.; and the number of wells used is estimated at 4,198, at an average cost of £184 3s. each.

Cost of fencing, £33,506,744; cost of dams, £6,528,322; cost of tanks, £6,490,106; cost of wells, £772,106; making a total of £47,297,278, as representing the amount expended by way of improvements, &c.

##### *Plants and Weeds.*

##### Prevalence.

In fourteen districts *trefoil burr* grows to a very large extent; in eight districts, to a considerable extent; in twenty districts, to a slight extent; and in twenty-three districts there is none reported.

In twenty-nine districts *variegated thistle* is reported to a slight extent; in nine, to a considerable extent; in ten, to a very large extent; and seventeen districts are reported as free from it.

In twenty-eight districts *black thistle* is reported to a slight extent; in twelve, to a considerable extent; in seven, to a very large extent; and eighteen districts are reported to be free from it.

In eight districts the land is reported as being infested to a very large extent with *Bathurst burr*; in sixteen districts, to a considerable extent; in twenty-nine districts, to a slight extent; and in twelve districts the land is not infested.

In twenty-four districts other noxious weeds grow to a slight extent; in ten districts, to a considerable extent; in seventeen districts, to a very large extent; and in fourteen districts there is none reported.

## Legislation for Noxious Weeds.

Legislation is urgently required for dealing with noxious weeds and plants, more especially the Bathurst burr, the prevalence of which is inflicting very serious loss on travelling stock.

## Cost of clearing Commons, Reserves, &amp;c., of Weeds.

The cost of clearing the Commons of noxious weeds throughout the Colony is estimated by inspectors at £71,288; the police paddocks, £4,134; the travelling stock reserves and droving roads at £221,115; amounting in all to (say) £296,537.

## PREVENTION OF SCAB IN SHEEP ACCOUNT.

A detailed statement of receipts and expenditure by the Department in connection with the above Fund for year 1895 will be found in Appendix K hereto, and will be published annually in the same form.

## APPENDIX A.

Sir,

## APPENDIX B.

Sydney, 10 June, 1896.

I have the honor to report that, in accordance with your request, I left Sydney on the 26th May last for Inveralochy to examine into and report upon an outbreak of disease amongst the horses on the Inveralochy Estate, the property of Mr. W. Douglas.

The most prominent symptoms observed while the animals were at rest were a tucked-up appearance of the flank, coupled with knuckling over of the hind fetlocks, followed on enforced progression by a spasmodic action of the motary muscles, in many cases of all four limbs, inducing a peculiar gait similar (in some points) to a local nervous affection very prevalent in England commonly called "Stringhalt," but quite dissimilar in anything but jerky action, which seldom affects more than one limb, frequently due to local injury during castration. The animal's usefulness is not interfered with.

In this affection a decided wasting of the muscles of the thigh is observed, and in forced exercise especially marked in one or two year olds; the breathing is catchy and painful; the animal's condition being poor and unthrifty; extreme nervous debility and loss of muscular power are marked features. On *post-mortem* examination of a filly placed at my disposal by Mr. Douglas, there was an absence of abnormality or disease in brain and spinal cord or internal organs, with the exception of the liver, stomach, and portion of small intestines, the former somewhat congested and in the latter distinct evidence of inflammation of a sub-acute character, evidently the result of the presence of immense quantities of "nematoda," found both free and enclosed in cystic tumours, varying in size from a pea to a walnut.

I am of decided opinion that the cause of the disease is to be found in the intense irritation caused by these parasites producing perverted action and interference with digestion, bringing about extreme debility and nervous prostration.

The remedy I recommend is a more generous diet, and, when practicable, total change of pasture, together with the administration of anthelmintics and tonics as recommended by me in the Ivanhoe horses in 1893, viz.:-

Common salt	...	...	...	...	...	...	2 lb.
Powdered sulphur	...	...	...	...	...	...	2 "
Black antimony	...	...	...	...	...	...	1 "
Tartar emetic	...	...	...	...	...	...	$\frac{1}{2}$ "
Sulphate of iron	...	...	...	...	...	...	1 "

Dose:—Two tablespoonfuls for each horse, mixed in the feed, equal to 1-oz. doses.

The above can be varied by the administration of the following draught:—

Linseed oil	...	...	...	...	...	...	1 pint
Spirits of turpentine	...	...	...	...	...	...	2 oz.

for each animal every alternate day.

This disease is somewhat similar in effect to the disease in the district of Ivanhoe before referred to, only differing in external symptoms, such as loss of eyesight and paralysis, easily attributable to climatic influences and surroundings.

The country upon which these animals graze is of an undulating character and sandy nature, which, after seasons of drought, becomes barren of vegetation necessary for the sustenance of the animals, thus rendering the subject a favourable host for the ravages of the parasite, the embryo of which prevails in country of special character, and under the unfavourable seasons and circumstances before mentioned.

I have, &amp;c.,

A. E. G. ROBINSON, M.R.C.V.S.

To the Chief Inspector of Stock, Sydney.

Sir,

Sydney, 11 June, 1896.

In compliance with your further instructions, after completing my investigations at Inveralochy I proceeded to Braidwood and examined a number of horses on the premises of Messrs. Hassall, Roberts, & Royd, exhibiting symptoms similar to the Inveralochy horses, viz.:-

Emaciation; tucked-up appearance of the flanks; wasting or atrophy of the muscles of the thigh; accelerated breathing; and spasmodic tetanic contraction of both hind limbs, assimilating in some respects to stringhalt, but altogether different from that affection, which seldom affects more than one limb, never interferes with the animal's usefulness, and is frequently the result of injury during castration, and purely local.

*Post-mortem* appearances I found the same as Inveralochy horses, viz.:-

Sub-acute inflammation of stomach and small intestines; myriads of free and encysted nematoda worms, the cysts varying in size from a pea to a walnut.

The cause of the affection is undoubtedly due to the presence of these parasites, which, by incessant irritation, prostrate the nervous system, retard the proper assimilation and digestion of the food, thus producing subsequent muscular degeneration.

Treatment should consist in the administration of anthelmintics and tonics, removal, if possible, from the infected paddock to a better diet. As an anthelmintic and tonic the following mixture is to be recommended, viz.:-

Common salt	...	...	...	2 lb.
Powdered sulphur	...	...	...	2 "
Black antimony	...	...	...	1 "
Tartar emetic	...	...	...	$\frac{1}{2}$ "
Sulphate of iron	...	...	...	1 "

Doses divided into ounce doses and given in the feed, which may be varied by the administration of a draught every alternate day, composed of linseed oil (raw), 1 pint, and spirits of turpentine, 2 oz.

I would also recommend, where practicable, a top-dressing to infected paddocks of rough common salt or lime.

The country upon which these animals graze appears favourable to the development of low-life organisms, and is of an undulating character, having a sandy soil incapable of producing after severe drought vegetation necessary for the sustenance of the animals, thus inducing a condition of body favourable to the ravages of the parasites, and subsequent destruction of the vital forces.

In my opinion it is preventable by the exercise of intelligent care during an unfavourable season.

I have, &amp;c.,

A. E. G. ROBINSON, M.R.C.V.S.

The Chief Inspector of Stock, Sydney.

APPENDIX

## APPENDIX C.

REPORT on investigations made with reference to the mortality in Horses and Sheep which occurred at Wyvern, Groongal, Bringagee, and Benerembah Stations during the months of January and February, 1896.

## HISTORY.

*In the Horse.*

THE mortality was first noticed among the horses at Wyvern Station, a heavy draught horse being the victim. This horse was seen at 7:30 a.m., and appeared to be in good health, but at midday he was noticed to be down and in great pain. He died at 4:30 p.m. on the same day.

The mortality next occurred at Bringagee, in the "horse-paddock," where a saddle-horse was found dead. Since then, up to the end of February, Bringagee has lost 20 horses; Wyvern, 24; Benerembah, 10; and Groongal, 2. Thus the total number of horses that have succumbed is 56.

*In the Sheep.*

The mortality commenced at Bringagee, in a herd—some 700 head—of half-bred ewes running with the rams in the Park Hall paddock, where, on being driven, three of the rams and four of the ewes refused to move, and appeared to be in great pain. These seven sheep were carted to the home station, and died within twelve hours. The herd was then moved into the paddock immediately north—Craigend—and during the following two days no less than thirty (30) more died. The remainder were then removed to the No. 4 paddock, facing the river. This appears to have checked the mortality, as only twenty (20) more died within the following ten days. Among the rams, which had been separated from the ewes and placed in the Nyang paddock, twenty (20) Lincoln, and five (5) Merino died. The dead rabbits in this paddock were then collected and destroyed, the result being only two more rams died within a few days afterwards, and none since.

At Benerembah the mortality commenced in the middle of January. Some fifty (50) rams that had been running with the horses, who were also affected, died, thirty (30) of the number dying within three (3) days. Benerembah lost between sixty and seventy head.

Groongal lost about thirty (30) rams; while Wyvern lost but seven (7) sheep.

Roughly speaking, about two hundred (200) sheep, the majority of which were rams, succumbed.

## SYMPTOMATOLOGY.

*In the Horse.*

Attention is first directed by the animal standing isolated in a sheltered position, when such is available, disinclined to eat or to move.

In from six to twelve hours the animal begins to present a tucked-up appearance, and stands with head lowered and coat slightly "staring." On being made to move, he does so reluctantly, carrying the body rigidly and stepping with uncertain gait. If quietly approached in this stage, and on waiting until the excitement which your approach naturally causes subsides, the temperature is found to be elevated 1.5° to 2° F. above normal, pulse full and hard, mucous membranes injected, and the respiratory acts which are almost entirely costal are from 4 to 10 in excess to the normal number per minute. The animal is disinclined to eat, but will drink readily.

In another six to twelve hours the horse is experiencing an abdominal pain, which ranges from sub-acute to acute. He looks round to the region of stomach or flank, as the case may be, and paws; occasionally he gets down and rolls. The temperature now reaches 103° F. to 105° F., pulse 76 to 80 per minute and full, respiratory acts 28 per minute and markedly costal. The engorged capillaries of the eye stand out very prominently on the yellowish-tinged sclerotic. The sub-maxillary glands may be swollen. The animal now moves very uncertainly. At this stage constipation was very marked in some cases, while in others priapism was noticed.

In cases No. 2 and No. 4 ineffective attempts were made to micturate, due no doubt to cystitis. In cases No. 2 and No. 4 muscular tremor was also present in muscles at front of chest (pectorals), fore-arms, and thighs, and was concomitant with muscular rigidity affecting particularly those of the neck and back. The animal will now neither eat nor drink.

The next stage is one of collapse. The horse goes down and is unable to get up again. The temperature falls below normal, pulse 42 soft and full, respirations 30, mucous membranes deeply injected. The sclerotic becomes more yellowish in colour. The animal may now be handled without causing any excitement, and without any resistance being offered. All natural functions gradually become suspended; the animal sinks and dies some ten hours after having gone down.

*In the Sheep.*

As in the horse, the first symptom noticed is isolation and disinclination to move. They persistently lie on their sternum or breast-bone. Later on they show evidence of abdominal pain, sub-acute and acute. The leading symptoms are those of gastro-intestinal irritations. Their flanks have a hollow, sunken appearance. They are constantly gnashing the teeth and regurgitating; occasionally frothy mucus flows from the mouth. The sclerotic presents more of a cyanotic appearance. In time the sheep become extremely prostrated; lying on their breast-bones, with nose protruding and lower jaw resting on the ground; breathing heavily, in some cases actually panting, and show but little inclination to either eat or drink. The stage of collapse was not so well marked as in the horse. In one case a diarrhoea of a severe nature set in prior to death.

In both the horse and sheep there were various degrees of severity in each individual attack, running from mild and moderate to recovery, and from extreme to death, and the above symptoms were presented in direct proportion to the severity of the attack. Many of the sheep were simply "found dead."

## POST-MORTEM APPEARANCES

*In the Horse.*

Decomposition sets in rapidly; vessels engorged with dark-coloured blood, which did not readily coagulate; serous cavities all contained a small quantity of serous effusion; throat—pharynx inflamed; œsophagus or gullet apparently normal; stomach usually contained a large quantity of fluid, and but little solid matter. Its mucous membranes showed circumscribed erosions and slight ulcerations, or in milder cases patchy inflammation; intestines—the small intestines were inflamed and their lymphatic glands swollen, dark in colour and softened. The anterior portions of large intestines were inflamed, but the inflammatory signs

signs gradually disappeared as the bowels were traced backwards. The contents of the anterior bowels were either fluid or soft, and contained a number of worms (mostly *Str: Tetra-canthus* and *Asc: megalcephalus*), but the contents of the posterior bowels were dry and hard, and the pellets of feces in the rectum were thickly coated with mucous; liver—usually congested, but in some cases fatty; spleen—normal; kidneys—inflamed and softened; bladder—inflamed and distended with albuminous urine; lungs—congested and occasionally sub-pleural and inter-lobular oedema was present; heart—normal, and filled with soft dark blood clots; brain—meninges showed capillary engorgement.

*In the Sheep.*

Somewhat similar post-mortem appearances were found, with the following exceptions and additions:— Patchy inflammation in the 1st, 2nd, and 3rd stomachs were present in one or two cases, but, as a rule, these stomachs were normal. The 4th stomach was invariably inflamed, especially along the greater curvature. The small intestines were extensively inflamed, and the accompanying mesenteric glands softened and swollen and dark in colour. In the large intestines the inflammation extended further back than in the horse. In some cases the throat was very much inflamed.

In order to place beyond doubt that the mortality was not due to any contagious or infectious disease, the following researches and experiments were carried out, great care being taken to prevent any accidental contamination, and every antiseptic precaution was exercised in experiments B and C where inoculations were made.

- (A.) The blood from the veins, interior of heart, and from the spleen was prepared and stained and subjected to a careful microscopic examination without result.
- (B.) The blood (3 j = 1 drachm) from one of the most severe cases was injected into the peritoneal cavity of a healthy rabbit. On *post-mortem* examination some forty-eight hours afterwards, no departure from normal was found, not even an inflammatory area about the seat of inoculation.
- (C.) Two healthy wethers were inoculated on the inner aspect of the thigh with 3 j each of blood from a ram showing characteristic symptoms, without either of the wethers suffering any inconvenience or ill-health whatsoever.
- (D.) (1) Carcasses of rabbits collected from (a) paddocks where strychnine was used, and (b) paddocks where phosphorised pollard was used, in exterminating these pests; together with (2) a portion of the ingesta from the stomach and (3) portion of urine of brown colt (case No. 4) where strychnine was suspected, and (4) portions of the bowels with their contents intact of sheep in cases where phosphorus was suspected, were forwarded to the Chief Inspector of Stock for analysis.

DIAGNOSIS.

It is my opinion that the mortality was caused by the horses and sheep either eating the carcasses of poisoned rabbits, or in some instances eating the phosphorised pollard baits laid for the rabbits, the actual cause of death being gastro-enteritis, due to a poisonous irritant, namely, either phosphorus in some cases, or the septic ptomaines of putrefaction. In some cases, as in No. 4, symptoms of strychnine-poisoning were concomitant with those of gastro-enteritis.

REMARKS.

All the stations where the mortality occurred are badly rabbit-infested. To exterminate these pests poison is used in two forms: (1) Troughs containing the muriate of strychnine dissolved in water are laid in those paddocks where the usual water supply for the stock can be fenced in. The stock is removed, and these troughs laid outside the fenced-in tanks. (2) Phosphorus in combination with the sulphide of carbon mixed with pollard is laid in furrows in the form of pellets.

Owing to the drought we experienced last summer, the rabbit-poisoning operations were commenced as early as December, 1895. The drought continuing through the months of January and February, '96, all the natural fodder (grass, &c.) became scorched and dried up. The stock feeding on the dry fodder for some time developed a morbid or depraved appetite, and began to eat the dead rabbits, of which, on the authority of the managers of the stations and the Stock Inspectors for the districts, they partake freely. During a *post-mortem* examination on a ram that died showing characteristic symptoms, a piece of rabbit skin with fur attached was found in the first stomach.

In my opinion the chief sources of danger are to be found in:—

- (a) Overlooked pellets of phosphorised pollard lying about the paddock.
- (b) The entrails and their contents of dead rabbits.
- (c) The carcasses of rabbits that died in the troughs containing strychnine.

JAS. DOUGLAS STEWART, M.R.C.V.S.

An examination of the organs of different animals for strychnine and phosphorus gave the following results:—

- Portion of ingesta from stomach of brown colt contained traces of strychnine.
- Stomach and portion of large bowel of sheep, no strychnine.
- Internal organs of rabbit, no strychnine.
- Urine from No. 4 contains strychnine.
- Fluid from stomach of No. 4, no strychnine.
- Contents of small intestines of No. 4, no strychnine.
- Intestines of sheep containing ingesta, no strychnine.

The internal organs of rabbit were examined for phosphorus and for phosphorus acid. Neither was present, showing that if phosphorus had been administered it is now oxidised past certainty of detection. The other samples were consequently not examined for phosphorus.

10th June, 1896.

F. B. GUTHRIE.

APPENDIX D.

INFLUENZA IN HORSES.

(By E. Stanley, F.R.C.V.S., Government Veterinarian.)

*Character.*

It is a contagious equine fever, due to germinal matter invading the system, producing disastrous changes in the blood, which interfere with nutrition, excite congestion, and occasionally inflammation of important organs or tissues.

*Cause*

*Cause.*

The germs of this disease are always lurking about, and epidemics are due to exceptional climatic changes that have a lowering effect on the health of horses, and at the same time favour the vitality of the disease germs.

The worst cases are amongst hard-working horses in overcrowded sheds, with bad sanitary surroundings; next come fat horses, and the least susceptible are horses that are in good working condition, cleanly kept, and well cared for; if such have the disease at all it is in a mild form, and they speedily recover.

*Symptoms.*

In the onset loss of appetite, drowsy headache, pain in the limbs, general weakness; in many cases the eyelids are swollen, tears trickle down the face; there may be discharge from the nostrils, and occasionally coughing; the eye will be found scarlet and orange colour, the tongue furred, breath offensive, the heart beats feebly but quick, the pulse is small and weak, the dung is soft, and the urine high-coloured; there is a general rise of the bodily temperature.

As the disease progresses the symptoms will depend on its course, which is very variable, as the numerous names given to the disease indicate. The vital forces in many cases overcome the toxic effects and excrete the poison from the system; it is to assist this process that we have recourse to treatment.

*The Treatment.*

This should consist of rest, pure air, shelter from sun, rain, or wind, bran mashes, and cut green food with drachm doses of chlorate of potash, carbonate of ammonia, or nitrate of potash given in the drinking water; if the case has been taken early enough, and the surroundings are good, the fever will abate, and recovery be complete in a very few days.

Unfortunately many horses are worked at the commencement of the illness; then they are completely knocked up, and they present a variety of bad symptoms, owing to the mischief being located in individual organs, such as those of respiration, or the bowels, liver, spleen, lymphatic glands, or cerebro-spinal system. The location can only be diagnosed by the educated veterinarian, and every case should be treated to suit the nature and stage of the illness; dropsical swellings are a favourable indication, but time and patience must be allowed for recovery. No case is cured until the horse is playful at exercise.

## APPENDIX G.

## FOOT-ROT.

DRESSINGS recommended by Mr. E. Stanley, Government Veterinarian. (For further details see *Agricultural Gazette*, July, 1891):—

*Arsenic Dressing.*

Arsenic, from 1 to 2 oz.  
Potash, „ 2 to 4 „  
Water, 1 gallon.

To be used in troughs for the sheep to walk through. The mixture to be boiled slowly for half-an-hour at least, till the arsenic is thoroughly dissolved.

*Sulphate of Copper (Bluestone) Dressing.*

Sulphate of copper, from  $\frac{1}{2}$  lb. to 1 lb., dissolved in a gallon of water, may be used instead of arsenic  
The following healing dressings may be used by hand after the above caustic applications:—

*Tar Dressings.*

Stockholm tar, 20 parts; carbolic acid, 1 part; or,  
Stockholm tar, 8 parts; bluestone in powder, 1 part; or,  
Oil of tar, 10 parts; carbolic acid, 1 part; olive oil, 1 part.

*Lime Dressing.*

Quick-lime, sprinkled on a dry surface, and the sheep walked through it frequently, will be found very beneficial. Before any dressings are used, the whole of the loose horn should be pared carefully from the diseased feet. It is of the greatest importance that the sheep's feet should, on the dressing being applied, be kept thoroughly clean and dry for at least three hours afterwards. They should, therefore, on leaving the troughs, or being dressed, be passed directly on to a battened or wooden floor, if it can be got, and where neither of these is obtainable, they should be passed into a dry yard, in which there is a good coating of straw, cut grass, or dry bark taken from trees which have been rung, or, in fact, any other thing which will keep their feet clean and dry.

The following are the remedies reported by the Inspectors to have been used and the results:—

Application.	Result.	Application.	Result.
Arsenic in troughs .....	Good.	Carbolic sublimate and bluestone .....	Good.
„ bluestone and carbolic acid .....	Not given.	Carbolic acid .....	Good.
„ and bluestone.....	Good.	„ and oil and butyr of antimony .....	Good.
„ and lime .....	Fair.	„ acid bluestone and arsenic .....	Not given.
„ and saltpetre .....	Not given.	Kerosene.....	Good.
Bluestone and corrosive sublimate .....	Satisfactory.	„ and bluestone.....	Good.
„ and arsenic .....	Good.	Lime and tar .....	Not given.
„ and kerosene .....	Good.	„ and arsenic .....	Not given.
„ and lime .....	Good.	Sulphur and bluestone .....	Good.
„ and sulphur .....	Good.	Saltpetre and arsenic.....	Not given.
„ arsenic and carbolic acid .....	Good.	Tar and turpentine .....	Not given.
Butyr of antimony .....	Good.	„ and quick-lime .....	Good.
„ „ carbolic acid and oil..	Satisfactory.	„ and bluestone.....	Good.
Corrosive sublimate .....	Not given.		

*Specifics.*

Cooper's Dip .....	Satisfactory.	Pottie's Specific .....	Not stated.
Hayward's Dip.....	In some cases.	Quibell's Foot-rot Cure .....	Good.
Little's Dip .....	Satisfactory.	Graham's Foot-rot Powder .....	Not very satisfactory.

## APPENDIX H.

*Sheath Disease in Wethers.*

Sir,

Victoria Barracks, Sydney, New South Wales, 29 October, 1894.

I have the honor to inform you that on the completion of my duties at Bourke I proceeded to the Lower Macquarie, arriving there on Sunday, 21st instant.

*Inspection.*—On Monday I inspected over 400 (four hundred) wethers that were more or less affected with disease. I also minutely examined and operated upon 20 (twenty) of the worst cases, with a view to ascertaining the nature of the complaint and the best treatment to adopt. Ten of the latter which were too far gone for treatment I directed to be killed, preserving for your inspection the ulcerated organs of generation, as also the sheaths and their contents. I photographed one sheath before and after it was operated upon, showing the immense size to which it grows as a result of the inflammatory changes.

*Inoculation.*—On Tuesday and Wednesday I operated upon another lot of affected sheep by simply squeezing as much matter as possible out of the sheath and injecting a solution of sulpho carbonate of zinc, 1 to 30 strong. I redressed the cases I operated on with injections of Jey's Fluid, 1 to 40, and carbolic

carbolic oil, 1 to 10 strong, and I inoculated six healthy wethers on the outside of the point of the sheath with some of the pus from one recently killed. On Friday, assisted by Mr. Hunter, I inspected and redressed the worst cases, and found those which I operated on (by laying the sheath open and washing it out with the fluid) were on the road to recovery. On Friday before starting for Sydney I inspected those I inoculated, but did not notice any change. I left word with Mr. Hunter to have them inspected every day, and report to me if they showed signs of developing the disease. I inoculated with a view to determining whether the disease is of a contagious nature or not.

*History of Disease.*—The history of the disease according to the information afforded by Mr. Hunter is as follows:—It was first noticed three or four years ago, and has meantime gradually become more pronounced and prevalent. It exists to a more or less extent on “Combardillo” and “Glenroy” Stations. It appears to be chiefly confined to 4-tooth wethers, rams being exempt. Several reasons are locally assigned for its origin. It is presumed by some to be due to contagion, and by others to grass seeds and flies; but in my opinion it is caused by the abnormal and gradually-increasing growth of the belly-fleece. The wool is kept continually wet in this part by the urine, consequently there is an accumulation of droppings and dirt, acting as a source of irritation to the point of the sheath, which eventually passes through the various stages of inflammation and mortification.

*Disease, 1st Stage.*—The first symptoms are slight redness and swelling at the point of the sheath, together with a little moisture on pressure. This condition may last for five or six weeks, becoming gradually worse, until it arrives at what may be called the second stage, which was the form of the disease I chiefly noticed.

*2nd Stage.*—The orifice becomes progressively smaller, the point of the sheath much congested and covered with purulent substance, the whole sheath is immensely enlarged, resembling a cow's swollen teat, although not nearly as painful or hot to the touch. When the sheath is seized by the hand and forcibly squeezed, a quantity of thick, dirty, slate-coloured, high-smelling matter is ejected from the orifice. The long hairs at the point easily break away, the wether gradually loses condition, looks anxious and restless, continually strains and tries to micturate, and indicates its painful condition by alternately lying down and getting up. On inserting a “Symes” abscess knife into the gradually-closing orifice, and laying the sheath open by a bold sweep, backwards and upwards from the point, a quantity of thick pus (too thick to escape on manual pressure from the small natural aperture) mixed with urine is freed from the interior walls. On examining the point of the worm or thread, I found it to be in some cases half eaten away, and in others, showing merely a small ulcer at the point. [*Vide specimens.*]

*3rd Stage.*—In the third or last stage the orifice was all but closed, and the abovementioned symptoms were much more intensely marked. On compressing the sheath nothing came away except highly-coloured urine, which had been evidently imprisoned; hard, dirty excrescences like soft corns appeared around the top and were easily removed. On laying open the enlarged sheath of several of the worst (some I found to be four inches long), a few tablespoonfuls of thick, inspissated, dirty, slate-coloured matter, of a cheesy consistency, slipped gradually out of its case. In a few instances the whole interior of the sheath (like the finger of a glove) came away. [*Vide specimen.*] The penis is ulcerated and gangrenous, and the sheep succumbs from its inability to micturate, combined with mortification of the part.

*Diagnosis.*—To summarise, the disease may be termed an aggravated form of “Balinitis” (or dirty sheath) which, unless duly attended to, results in retention of urine, gangrene of the penis, and death.

*Curative Treatment.*—I found the simplest and most expedient manner of treatment to be as follows:—The sheep should be held by an assistant in a sitting posture, on the top of a P. and R. fence, with the belly facing the operator. The operator seizes the sheath with the left hand, inserts a “Symes” abscess knife into the point, makes an incision downwards and lays the sheath completely open. Syringe the sheath well with Jey's Fluid, diluted 1 to 40, from a bucket suspended at hand, and when clean inject about a spoonful of carbolic oil, 1 to 10. The wound should be redressed in 48 hours, and inspected a few days later.

*Preventive Treatment.*—Sheep with long belly-fleeces should be dipped after shearing. That portion of the belly-fleece which grows over the sheath should be clipped a few months before shearing and washed with Jey's Fluid.

I have, &c.,

WILLIAM SCOTT, M.R.C.V.S., Lond.

To the Acting Chief Inspector of Stock,  
Stock Department, New South Wales.

## APPENDIX K.

# REPORT

OF THE

## INTERCOLONIAL STOCK CONFERENCE,

HELD IN

SYDNEY, AUGUST, 1896.

---

---

*Printed under No. 24 Report from Printing Committee, 29 October, 1896.*

---

---

SYDNEY: CHARLES POTTER, GOVERNMENT PRINTER, PHILLIP STREET.

1896.

# REPORT

OF THE

## INTERCOLONIAL STOCK CONFERENCE,

HELD IN SYDNEY, AUGUST, 1896.

---

IN pursuance of the agreement arrived at by the Governments of New South Wales, Victoria, South Australia, and Queensland, the representatives appointed held meetings in the Executive Council Chambers, Sydney, on the 12th, 13th, 14th, and 15th August, 1896.

The Colonies of Tasmania and New Zealand, although not Ministerially represented, sent Departmental officers to confer with those of the other Colonies. It was determined that a statement prepared by the Stock Department of New South Wales containing a series of questions should be placed before the officers of the various Colonies in attendance, who were asked to meet in separate conference and report to the Ministerial representatives.

The officers met accordingly, and submitted their replies as under:—

1. Q.—In what Colonies does the disease exist?

A.—Queensland, the northern territory of South Australia, and it has been reported in Western Australia.

2. Q.—What is Tick Fever?

A.—It is not only the opinion of Mr. Pound, the Director of the Stock Institute, Brisbane, and Dr. Hunt, of Hughenden, after careful investigation and test, but also that of Dr. Salmon, the Chief of the Bureau of Animal Industry at Washington, in the United States, to whom full particulars of the Queensland tick and its life-history and effect were forwarded, that the “Tick Fever” of Queensland is identical with “Texas Fever” of America.

As this is the case, and as a thorough and exhaustive investigation was, during the years 1889, 1890, 1891, and 1892, carried out by the ablest scientists in the United States, under Dr. Salmon’s direction, as to the nature, causation, and prevention of Texas Fever, no better description of the disease now prevalent in Queensland can be given than that contained in the report giving the result of these investigations, and published by the United States Department of Agriculture, Bureau of Animal Industry, Bulletin No. 1, of 1892. It is to the following effect:—

#### *Conclusions.*

(1.) Texas Fever is a disease of the blood, characterised by destruction of the red blood corpuscles. The symptoms are partly due to the anæmia produced, partly to the large amount of debris in the blood, which is excreted with difficulty, and which causes derangement of the organs occupied with its removal.

(2.) The destruction of the red corpuscles is due to the micro-organism or micro-parasite which lives within them. It belongs to the Protozoa, and passes several distinct phases in the blood.

3. Q.—Is Tick Fever a Bovine Disease only ?

A.—Yes ; so far as experimental evidence goes.

4. Q.—Is the Disease indigenous, or was it introduced ?

A.—We have not sufficient information at our disposal to enable us to form an opinion.

5. Q.—When attention was first drawn to the Disease ?

A.—Attention was first drawn to the disease about eighteen years ago, on the road between Queensland and Northern Territory, near the Roper River.

6. What is the history of the Introduction and Spread of Tick Fever in Australia ?

The first intimation of Tick Fever being in Queensland was received in 1891. The disease was carried there by cattle from the northern territory of South Australia, but its introduction was not then regarded in a serious light by cattle owners. In the latter end of 1894, however, through the introduction of other infected cattle, and the spread of the disease from those first introduced, owners became alarmed, and, official communication of the fact being then made for the first time to the Queensland Government, Mr. Pound was sent to investigate and report. He found that the disease at first spread slowly in Northern Queensland, but that latterly it did so in a comparatively rapid manner.

The bullock teams and drift of stock from the Northern Territory and the western portion of Northern Queensland to the boiling and extract works on the Albert and Norman Rivers had carried the infection both in a southerly and easterly direction to a good many herds in that part of Queensland, inflicting very serious loss ; but, as a rule, the losses were not so heavy in the country at some distance back as on the coast.

Before long the infection was carried to the east coast, and there the losses have frequently been very heavy, nor are they as yet, it would seem, over, while it is doubtful if the disease is not still spreading, and the whole of the coast country, from Rockhampton to Thursday Island, cannot be otherwise termed than more or less infected or suspected.

The infection was also carried from the gulf country in another direction by infected cattle travelling from the country on the Flinders, by Kynana and Winton, to Longreach, whence after some delay they were sent on to Barcaldine and trucked to Rockhampton for Lakes Creek ; and, although no deaths are reported among the cattle infected by those from the Flinders, ticks have been found on some of them, and the question whether or not the disease will spread from this centre of infection will not be settled until it is seen whether the warm weather of spring and summer does not call the ticks into activity.

7. What is the extent of the Disease in Queensland ?

The extreme north and south points known to have been infected with tick fever in Queensland are Thursday Island in the north, and Longreach in the south, and the extreme east and west points may be said to be Townsville on the east, and the Nicholson River on the South Australian border on the west. That is to say, the disease has spread from the Gulf of Carpentaria as far south as the Tropic of Capricorn and as far north as Thursday Island, but only to certain localities in that portion of the Colony. If the whole of that portion were infected, that would mean that about one-half of the Colony was so ; but while tracts of country along the south and part of the east sides of the gulf, and on the eastern seaboard of the Colony are infected, and areas between the infected country on the gulf and that on the eastern seaboard, suspected of being infected, it is believed that at least one-half of that portion of the Colony north of the Tropic of Capricorn is still free from the infection.

8. What is the period of incubation of the Disease ?

The period of incubation has been ascertained by sub-cutaneous injection into healthy cattle of the blood of cattle suffering from the disease. When the blood has been injected the fever temperature appears within a few days, and outward signs of illness are manifested on, or even before, the sixth day, and the external symptoms appear from six to ten days.

## 9. What are the most noticeable Symptoms?

### (1.) *Acute Type.*

This type is the disease of the hot summer months, and appears suddenly and among all the animals exposed to the infection, and of course can be observed sooner by taking the temperature with a thermometer than any way else, the temperature in the case of disease ranging from 105 to 108 Fahr. When very high it can be detected by touching the skin. Next to the temperature the colour (red or yellow) of the urine is noticeable. Constipation is another symptom, and loss of appetite and cessation of rumen usually take place from three to five days; and, in the case of milch cows, cessation of the flow of milk followed by loss of sight, swaying of hind-quarters, and trembling of the muscles, especially of hind-quarters, and thinness of the blood follow.

This type of the disease usually runs its course in a few days, the animals dying or surviving according to the virulence or otherwise of the disease. A good many of those that do survive do not regain their original vigour, while the others do so in a few weeks.

### (2.) *Mild non-fatal or Chronic Type.*

This type of Texas fever which, in America, is only to be met with in the autumn, is hard to distinguish from other ailments, as the only outward symptoms are slight loss of appetite and dullness, while the temperature very seldom rises above 105 in the evening, and the destruction of the blood corpuscles goes on slowly. It will be noticed that the season of the year and temperature has a good deal to do with the type of the disease, the mild form being in the cooler season of the year.

### (3.) *The effect of the Disease on Calves and the result.*

During the discussions which have taken place with respect to this disease, statements have over and over again been made that cattle in the Gulf country, although covered with ticks, do not now die, while it is reported on equally reliable reports that ruinous losses have sooner or later followed the first infection of herds in other portions of that part of Queensland, and more especially on the coast country on the eastern side of the Colony. This, to those who are unacquainted with the explanation, must appear very contradictory; and the explanation is simple and lies in the fact that calves and young cattle, although attacked by the disease when infested with ticks, very seldom die; and as they are not, as a rule, subject to another attack, or at any rate to another attack which proves fatal, they grow up immune, and although perhaps inconvenienced by the ticks they seldom or never exhibit any serious symptoms of fever. While, however, this is a fortunate matter for the owners of cattle already infested, it in no way removes the obligation on those charged with the protection of our flocks and herds to do everything possible to stay the spread of the disease, especially as it is questionable with our Australian climate whether, when land is once infested, it can ever after be eradicated.

## 10. What are the most noticeable *Post-mortem* appearances?

### (1.) *The Spleen.*

One of the most noticeable *post-mortem* appearances in Texas Fever is the enlargement of the spleen to two or even four times its natural weight, through engorgement with red blood corpuscles or their remains in the form of irregular lumps of yellowish pigment. This destroys the structure of the spleen, and of course completely arrests its functions.

### (2.) *The Liver.*

Though not so noticeable as that of the spleen, the destruction of the liver is perhaps a more important matter, through its enlargement, congestion, bile ingestion, and fatty degeneration. The increase of weight ranges from 3 lb. to 5 lb. heavier than a healthy liver, and when deceased the liver is paler than a healthy one and has a peculiar mottled appearance.

### (3.) *The Bile.*

That found in the gall bladder (of which there is usually a considerable quantity—one half-pint to a quart) has exchanged its limpid fluid appearance for an almost semi-solid mass.

(4.)

(4.) *The Kidneys.*

In a good many cases the kidneys are in a sero-sanguinolent condition of the connective tissue and the fat about the kidneys; and in acute cases they are enlarged and of a brown colour.

## 11. What is the Cattle Tick, and what is its Life History?

Among the conclusions come to, as the result of the investigations instituted by the Department of Agriculture in the United States, with respect to Texas Fever, No. 5, is to the effect that the disease in nature is transmitted from cattle which come from the permanently infected territory to cattle outside this territory by the Cattle Tick (*Ixodes boris*), of which the following is a brief description, taken principally from Mr. Director Pound's report:—

(1.) *The Ticks on Cattle.*

The mature female tick, as seen on the animal's skin, has an oblong oval-shaped body resembling the seed of the castor-oil plant, and is of a dull leaden colour due to the blood red contents of the body showing through the distended semi-transparent cuticle. It rarely exceeds twelve millimetres ( $\frac{1}{2}$ -in.) in length, and seven millimetres (a little less than  $\frac{3}{16}$ th inch) in breadth, and possesses four pairs of legs situated on the anterior lateral portion of the body. It attaches itself to its host by means of peculiarly constructed mouth organs collectively known as the rostrum, in the centre of which is a barbed dart furnished on either side with several rows of teeth set obliquely, which enables the creature to adhere to the skin more firmly.

The male tick is usually found attached to the skin of its host immediately underneath the anterior part of the female. Its body is of a dark brown colour and somewhat triangular in shape, and when full grown is only about one-fiftieth part of the size of the fully developed female, and never being in an engorged state, is very much more active and also stronger than the female.

(2.) *The Ticks when they leave Cattle.*

As the female tick engorges herself with blood she becomes fecundated by the male, and having arrived at maturity, releases her hold from the skin by withdrawing the barbed mouth organs, and falls to the ground; on recovering herself she walks away to some secluded spot where she remains quiescent for about eight or ten days, during which time the contents of the abdomen are undergoing important changes prior to oviposition (the process of egg-laying), the period of which generally takes from seven to fourteen days. As a rule the fully matured ticks lay from 1,600 to 2,000 eggs, which are agglomerated in a dense mass. As oviposition proceeds she gradually gets smaller or shrivels up and ultimately dies beside what will be subsequently her own progeny. What becomes of the male tick is not known. He may go in search of another female, but he most likely dies.

(3.) *The Incubation of the Tick.*

The period of incubation in a temperature ranging between 90 and 110 Fahr. was from fourteen to twenty-six days, but when the temperature is lower the incubation period is longer—as long as three or four weeks, or even longer.

When the young tick emerges from the shell it has only six legs, and is of a light brown colour, but gradually assumes a much darker shade. In this stage the young ticks are extremely active. They are very tenacious of life, surviving in a very low temperature, and living in well stoppered bottles seventeen weeks without food or water, or even fresh air.

No further development takes place in these ticks until they gain access and adhere to some animal and get nourishment from the blood, when in the course of seven or eight days they have their first moult, growing, and changing their colour, which becomes darker, and now having four instead of three pairs of legs. Then in seven days more the second moult takes place, and the tick is sexually mature. From this time till about the twenty-first to the twenty-second day, the female increases in size till she is fifty times the size of the male. She is then fully engorged and fecundated, and drops off to lay her eggs as already explained.

(4.) *Where the Young Ticks settle on Cattle.*

In some instances the cattle ticks are present in extraordinary numbers; at times fairly equally distributed over the whole of the animal's body, and at other times crowded on particular portions of it. As many as 40,000 were found on one animal, and then the whole were not counted. The ticks as a rule prefer the thin soft portions of the skin, for instance, along the belly, on and around the udder or scrotum, on either side of the neck, in and outside the thighs, and on the twist.

(5.) *The effect of the Ticks on the Cattle.*

Dr. Salmon says that it has been demonstrated that ticks carry the infection of Texas Fever, the micro-organism; they introduce it into the tissue of susceptible cattle, and produce the disease. There is thus a complicated infection in which two very different kinds of parasites play an important part. He further says, another discovery not less marvellous has been made—that the micro-organism, which constitutes the contagion, is transmitted through the egg to the young tick, and it is this, and not the adult tick carried by the Southern (the infested) cattle, which finds its way upon susceptible animals and causes the disease: That is to say,—if cattle infested with ticks are brought into contact with sound cattle, it is not these ticks, but their progeny, which infest the sound cattle, and transmit the micro-organism which sets up the fever. On the micro-organism being introduced into the tissues of susceptible cattle it takes possession of and multiplies in the blood corpuscles and disintegrates and destroys them. This, of course, in the mild type of the disease, leads to poverty in the blood, and the cattle become poor and weak. In the acute type again fever follows, which frequently results in death. All this is fully confirmed by Mr. Pound and Dr. Hunt's investigations in Queensland.

12. What steps have been taken by Queensland to arrest the Disease, and with what Result?

(1.) *Quarantining Infected Stock.*

In October, 1894, the whole of the Gulf country and Cape Peninsula west of the 144th meridian was placed in quarantine, but it was soon found that the ticks had already spread beyond the limit notified towards the eastern sea-board. On this being found to be the case, a fresh quarantine was in November, 1895, notified across the Colony from east to west, following generally the 21st parallel; but although this has to a certain extent stayed the spread of the disease, it has not proved thoroughly effective.

(2.) *Fresh Legislation.*

The defects of the law were from the first fully recognised. Additional inspectors were appointed, and a very effective and comprehensive measure has been carried through Parliament for dealing with this and other diseases in stock. Under this, with a full staff of inspectors, the true state of the stock in the different localities will be ascertained, the infected runs and holdings will be placed in quarantine, and the provisions regulating the dipping and movement of stock will be strictly enforced. Besides this, the Government is constructing dips on the principal stock routes, and in connection with their northern and central railway system. A large number of local authorities have also with the assistance of the Government erected dips within their areas, and undertaken to manage them.

(3.) *Dipping for the Destruction of the Tick.*

On information being received some eight or ten months back from America that dipping with oil had proved successful in destroying the tick on cattle, dips were constructed in several parts of Queensland, and a considerable number of cattle were dipped.

There is good reason for believing that, where a sufficient quantity of the right sort of oil is put into the dip, and the process properly carried out, the ticks on the stock will all be destroyed. But while this is the case, the experience so far as yet gained does not go to show that the oil dip will act as a preventive for any length of time, as well as destroy the tick, for young ticks have been found on cattle which were dipped only a fortnight before, and had been carefully examined a day or two after the dipping, and found entirely free from living ticks. This is the weak point in the dipping process, and every endeavour should be made to discover  
some

some ingredient to use with the oil or other effective medicament which will adhere for some considerable time to the hair, and be so distasteful to the tick as to keep it from coming on the cattle until the effect of the ingredient in this respect has ceased. It is this property in sulphur that makes dips in which sulphur is used so effective in the cure of scab, for the smell of the sulphur in warm weather can be perceived three months after the dipping. Notwithstanding this weak point in the oil dip, the defect only applies in the case of cattle which have to be put back again on tick-infested runs. In that of cattle, from suspected or doubtful country which their owners desire to travel into clean, it is believed that if they are carefully examined and show no signs of infection and are effectively dipped, they might be allowed to enter, and Queensland cattle about to enter New South Wales might, in order to remove all doubt, be treated in this way. Even as regards cattle on infected runs, it is believed that the process will frequently be turned to good account by watching the seasons and giving repeated dippings when they will have the greatest effect. This will be especially the case as regards dairy cattle and store bullocks put on to fatten.

The Colony is now divided into three zones.

- (1.) That north of a line generally following the 21st parallel, south of which no cattle or horses can pass under any conditions.
- (2.) The central zone lying between the 21st and 24th parallels.
- (3.) The portion lying between the 24th parallel and the boundary with New South Wales.

(1.) *The Northern Zone.*

In respect of cattle or horses in this zone—

- (1.) None shall pass south of the southern boundary.
- (2.) No stock in the infected portions shall leave such portions unless for immediate slaughter, and then only within that zone.
- (3.) If it is intended that cattle or horses from any portion of the zone are to be travelled through any other portion not declared infected, they must be properly dipped immediately before entering on the uninfected country.
- (4.) When any of such stock are to be carried by train the trucks will be thoroughly disinfected.
- (5.) At the point of slaughter such stock will not be permitted to be in contact with other cattle.

(2.) *The Central Zone.*

- (1.) This zone has been patrolled by reliable officers specially selected for the purpose, and the infested centres delimited and mapped out.
- (2.) The eastern centre of infection at North Rockhampton has been proclaimed an absolute quarantine.
- (3.) The western centre of infection, as shown on the map, is declared an infected area.
- (4.) No cattle or horses can leave the infected areas except for immediate slaughter within the zone, and under the same precautionary conditions as are observed in the northern zone.
- (5.) No such stock to be admitted south from the clean portions of this zone until after having been dipped at a point on the line of Central Railway, about 30 miles north of the southern boundary of the zone.

(3.) *The Southern Zone.*

In this zone the Board of Stock Commissioners have already dealt with the subject of controlling cattle traffic, by—

- (1.) Determining the points along the northern line of rabbit fence at which only stock from south of the 24th parallel can pass.
- (2.) By enforcing inspection of such stock at those points.
- (3.) By defining stock routes from those points, both on the map and by letter-press descriptions, by which only cattle may travel to the Border.

13. What steps have been taken by the other Colonies ?

1. NEW SOUTH WALES.

(1.) *Proclamation and Crossings.*

4th February, 1896.—A proclamation was issued under the “ Customs Regulation Act, 1879,” prohibiting the introduction of horses and cattle from that part of Queensland north of the Central Railway Line, and only allowing the introduction of them from south of that line on inspection at the crossing-places at—

Ballandeen (Wallangarra),  
Mungindi,  
Brenda,  
Barringun,  
Hungerford,  
Wompah.

Additional crossing-places have since been notified at Tullabudgera, Mount Lindsay, Acacia Creek, White Swamp, Boggabilla, Hebel, Parragundy, Adelaide Gate.

(2.) *Inspectors and Inspections.*

*Inspectors.*—The Inspectors of Stock at Glen Innes, Warialda, Walgett, Brewarrina, Bourke, and Wanaaring were appointed Customs Officers for the purpose of enforcing the prohibition; and the following gentlemen have been appointed Acting Inspectors and Customs Officers to assist the Staff Inspectors:—

C. D. Whitty, Tullabudgera.  
P. B. Chauvel, Mt. Lindsay.  
J. E. Smith, Wallangara.  
Jas. Skinner, Boggabilla.  
James McNall, Barringun.  
John Ducat, Wompah.  
J. A. Robertson, Hebel.  
L. Gillespie, Acacia Creek.  
J. R. McGovern, Brenda.  
S. R. Scott, Mungindi.  
Peter Jeffrey, Mingoola Station.

Mr. Jeffrey only inspects stock leaving Maidenhead and Bonshaw Stations, which stations have country adjoining in Queensland, and they are worked as one under Bond.

Thus there are seventeen inspectors now employed on the Border in seeing that the regulation is enforced, and, in addition, the Collector of Customs and the Inspector-General of Police have instructed their officers on the Queensland Border to assist.

*Action before Crossing.*—Before any cattle or horses are allowed to cross they must give seven days' notice to the inspector at the crossing-place, and produce a declaration by the owner, and a certificate by an inspector in Queensland, that such cattle are not infected.

(3.) *Fresh Legislation.*

On the passing of the Imported Stock Act Further Amendment Act of 1896 proclamations were issued declaring “ Tick Fever or Texas Fever ” in cattle, horses, or camels to be an infectious or contagious disease for the purpose of that Act, and Queensland was declared to be an infected colony.

(4.) *Erection of Yards for closer inspection.*

It is proposed to erect yards at the principal crossing-places for the closer inspection of stock, and to place them in a crush for that purpose when necessary.

In the meantime the Queensland Government has granted the use of the pound-yards on their side of the Border for this purpose.

(5.) *Regulations, &c., Hides.*

On 4th July regulations were published prohibiting the introduction of hides or skins of cattle, horses, or camels, unless they had been thoroughly salted in a proper pit for one week, and that they were accompanied by a certificate from an inspector that the requirements of the regulation had been complied with.

If accompanied by this certificate the Customs Officers allow the hides to be landed, subject to inspection at the stores to which they may be sent.

## 2. VICTORIA.

Introduction into Victoria of unsalted hides of cattle prohibited.

Regulation 30th June last, admitting hides from Queensland if accompanied by a certificate from an Inspector of Stock at the port of shipment that the hides have been thoroughly and effectively salted.

Queensland cattle, horses, sheep, and dogs by sea prohibited from 14th July proximo.

## 3. TASMANIA.

Proclamation, 6th July, 1896, absolutely prohibiting for 12 months the importation of any horses, cattle, and hides from Queensland.

## 4. NEW ZEALAND.

Order in Council, 20th April, 1896, prohibiting the importation of cattle, sheep, fresh meat (with the exception of frozen meat), bones, horns, hoofs, hairs, skins, offal, or other part of such animals into New Zealand.

## 5. SOUTH AUSTRALIA.

1. Proclamation 17th June, 1896, prohibiting for 12 months the introduction into that part of South Australia south of the 26th parallel of latitude, cattle or horses from Queensland, unless they have been examined by an inspector.

2. Prohibiting for the same time the removal of cattle or horses (except working horses which have been dressed) from that portion of the Northern Territory north of a line commencing at a line at the 450th mile post on the eastern boundary, between the Northern Territory and Queensland, and thence to the western boundary between the Northern Territory and Western Australia to the point where the southern boundaries of leases 1,809 and 1,811 meet the boundary of Western Australia.

3. Prohibiting for twelve months the introduction into any part of South Australia, south of the 26th parallel of latitude, cattle or horses from that portion of the Northern Territory north of the said parallel, and south of the aforesaid line mentioned in No. 2, unless under a permit from an inspector.

4. Prohibiting for a period of twelve months the introduction into any part of South Australia south of the 26th parallel of south latitude, of cattle, horses, or hides, from Queensland or any part of the Northern Territory, unless such hides have been previously salted or dressed.

## 14. What is the effect of dipping?

Dipping is being carried out in Northern and Central Queensland at the present time of the year, when it is favourable for the cattle and unfavourable for the tick. This should be continued with increased activity during the summer months. It is noticed that cattle after being dipped appear much quieter and healthier than those undipped. The undipped cattle stand for hours in the lagoons, care very little for food, and become emaciated. As to the oil being efficacious in killing the tick, that is proved beyond all doubt.

## 15. What is the best kind of oil or other medicaments?

Apollo oil and cotton-seed oil have been found most efficacious in Queensland up to the present time, yet the question requires further research.

## 16. What is the best form of dip?

The form of dip proposed is about 4 feet wide at the top and 2 ft. 6 in. at the bottom and about 30 feet long and 7 feet deep. Some of the dips are made with perfectly vertical ends with a tip-board as before described, but the sloping entrance is preferred.

Q—When should dipping be used by owners?

(1.) A.—When the first symptoms of the disease are observed in a herd, whatever the size of the run may be, the infected and suspected portion of the herd should be dipped, as in that way the disease may be stopped.

(2.) When the disease appears in a paddock in which cattle are being fattened, they might be dipped; and, if the disease again appear, dipped again; and in this way they would likely be protected till they are fit for market, although the dippings might throw them back somewhat in condition.

(3.)

- (3.) Even when the disease had obtained a strong footing in a large herd, if the cattle are running in paddocks and can be mustered, it would be advantageous to dip.
- (4.) In the case of dairy and other small herds it will always be advantageous to dip.

Q.—Should dipping for tick be made compulsory?

A.—Yes, in such cases as the following :—

- (1.) In the case of cattle in a quarantine area, travelling from an infested run, through suspected, but not declared infected, country to market, the dipping to be on the owner's own run (unless a public dip is near).
- (2.) In the case of cattle travelling from doubtful country into clean country.
- (3.) In the case of cattle which have travelled through infected country.
- (4.) In the case of cattle which have come into direct or indirect contact with infected or suspected stock.

17. What result has followed Inoculation?

No satisfactory experiments in inoculation have been made, and the information concerning the disease is that an animal enjoys no certain immunity from a previous attack.

18. Should hides be pit or dry salted?

The opinion is that dry-salting is preferable to brine or pit salting.

Dry-salting of hides should be accompanied by a certificate from a competent officer that they have been thoroughly and effectively salted for a period of not less than seven days, and a declaration to the same effect from the owner.

19. Are there any instances in which the Tick infests the cattle without being followed by symptoms of Red-water or the disease known as Tick Fever?

Symptoms are always shown in the early or first attack of the tick, namely, fever and red-water. But in chronic cases of tick infection the acute symptoms may not be noticeable, although the micro-organism is always present in the blood.

20. What is the length of time the Tick will live without finding a host?

The maximum time known to elapse between the dropping to the ground of a female tick and the subsequent attachment of the progeny to a fresh animal, according to Mr. Pound's Australian experience, is one year at least, and the minimum time one month.

21. How long will the Tick live on the untreated hide?

From a series of carefully-conducted experiments by Mr. Pound, it has been proved that the tick will live on untreated hides from five to twenty days.

22. How is the risk of Infection communicated?

Queensland observations show that ticks may be spread by any moving or movable object, including domestic and wild animals and birds, these acting as intermediary agents for the conveyance of the larval tick. The extent of the consequent risk cannot be reliably stated at present, but it is probable that it is not very great.

#### CONCLUSIONS.

The Conference after full consideration of these questions and replies resolves :—That the disease is identical with what is known as the Texas fever in America, and is caused by ticks. And that although the authorities there have given very careful consideration by means of exhaustive experiments and otherwise, no satisfactory method of eradication or remedy has yet been discovered. The want of definite knowledge points to the necessity for the various Governments jointly undertaking the expense of continuing experiments in the Colony of Queensland as to the nature of the disease, and the most effectual measures to be taken to combat it. The Conference considers that the duty of making these experiments should

should be entrusted to Dr. Cobb, of New South Wales, Dr. Cherry, of Victoria, Dr. Whittell, of South Australia, and Mr. Pound, of Queensland, and agree to recommend this course for the adoption of their respective Governments.

The Conference is of opinion that until the investigations above referred to are completed by the experts, it is desirable that measures should be taken to arrest, as far as possible, the spread of the disease. It is acknowledged that the Colony of Queensland has already, since the discovery by them of the baneful effects of this plague, done their utmost (both by legislative and administrative action) to prevent the spread of the disease, and to discover a remedy for it; but the Conference feel it is incumbent upon all the Colonies to take further precautions to prevent the evil spreading beyond its present limits. With a view to giving effect to this the representatives of New South Wales, Victoria, and South Australia expressed their wish that, in the interests of Australia generally, the Colony of Queensland would see its way to extend the prohibitory line to (as shown on the map) a point well in advance of any known ticks, and, after full consideration, the representative of Queensland agreed to recommend his Government to also absolutely prohibit the movements of cattle from the central or suspected zone southwards, pending further information and results, and until the experience gained of the progress of this disease during the spring and summer months of this and next year should be gained.

As there is a possibility of the disease being carried to other Colonies by hides, a question has arisen as to whether dry-salting or immersing in brine is the more effectual way of destroying the ticks upon them; the Conference arrived at the conclusion that dry-salting, if properly performed, is absolutely safe. They, therefore, concur in recommending that hides dry-salted should be allowed to be imported into the various Colonies if accompanied by a certificate from an inspector in Queensland to the effect that dry-salting has been properly performed as recommended by the official experts.

The Conference agree to recommend to their Governments that a reward of £5,000 be offered to any person who shall first discover and make known a satisfactory preventive or remedy for the disease known as tick fever.

The Conference desire to place on record its appreciation of the prompt action of the Government of Queensland in sending a Commission of Experts to America to investigate the Tick Fever and its relation to Texas Fever, and to ascertain whether it was practicable to apply the remedies adopted there to the varying conditions of Australia, and desire to make public an advanced report received by the Queensland Government from Dr. Hunt, the Queensland special delegate at Washington, to the effect that the diseases—Texas Fever and Australian Tick Fever—are identical, but that the Bureau of Animal Industry, at Washington, are doubtful about the benefits of dipping or inoculation, and that the loss of cattle born in infected areas is trivial.

The Conference acknowledge the valuable assistance rendered them by Professor Wallace, of the University of Edinburgh, a passing visitor to Australia, who generously placed his experience and scientific abilities at the service of the Conference.

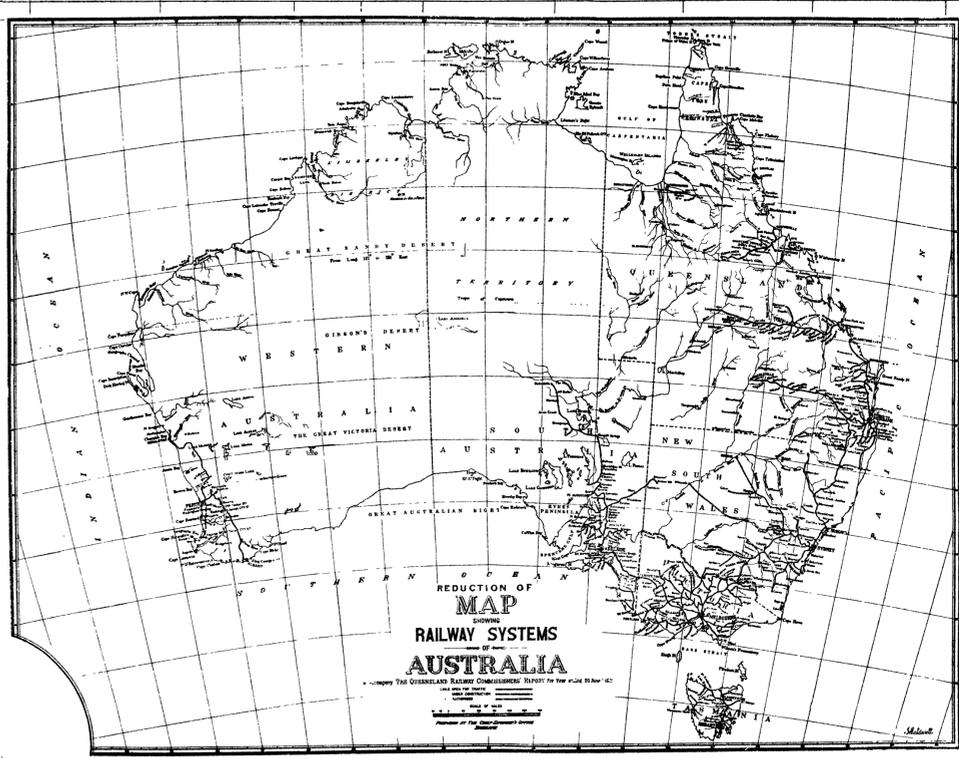

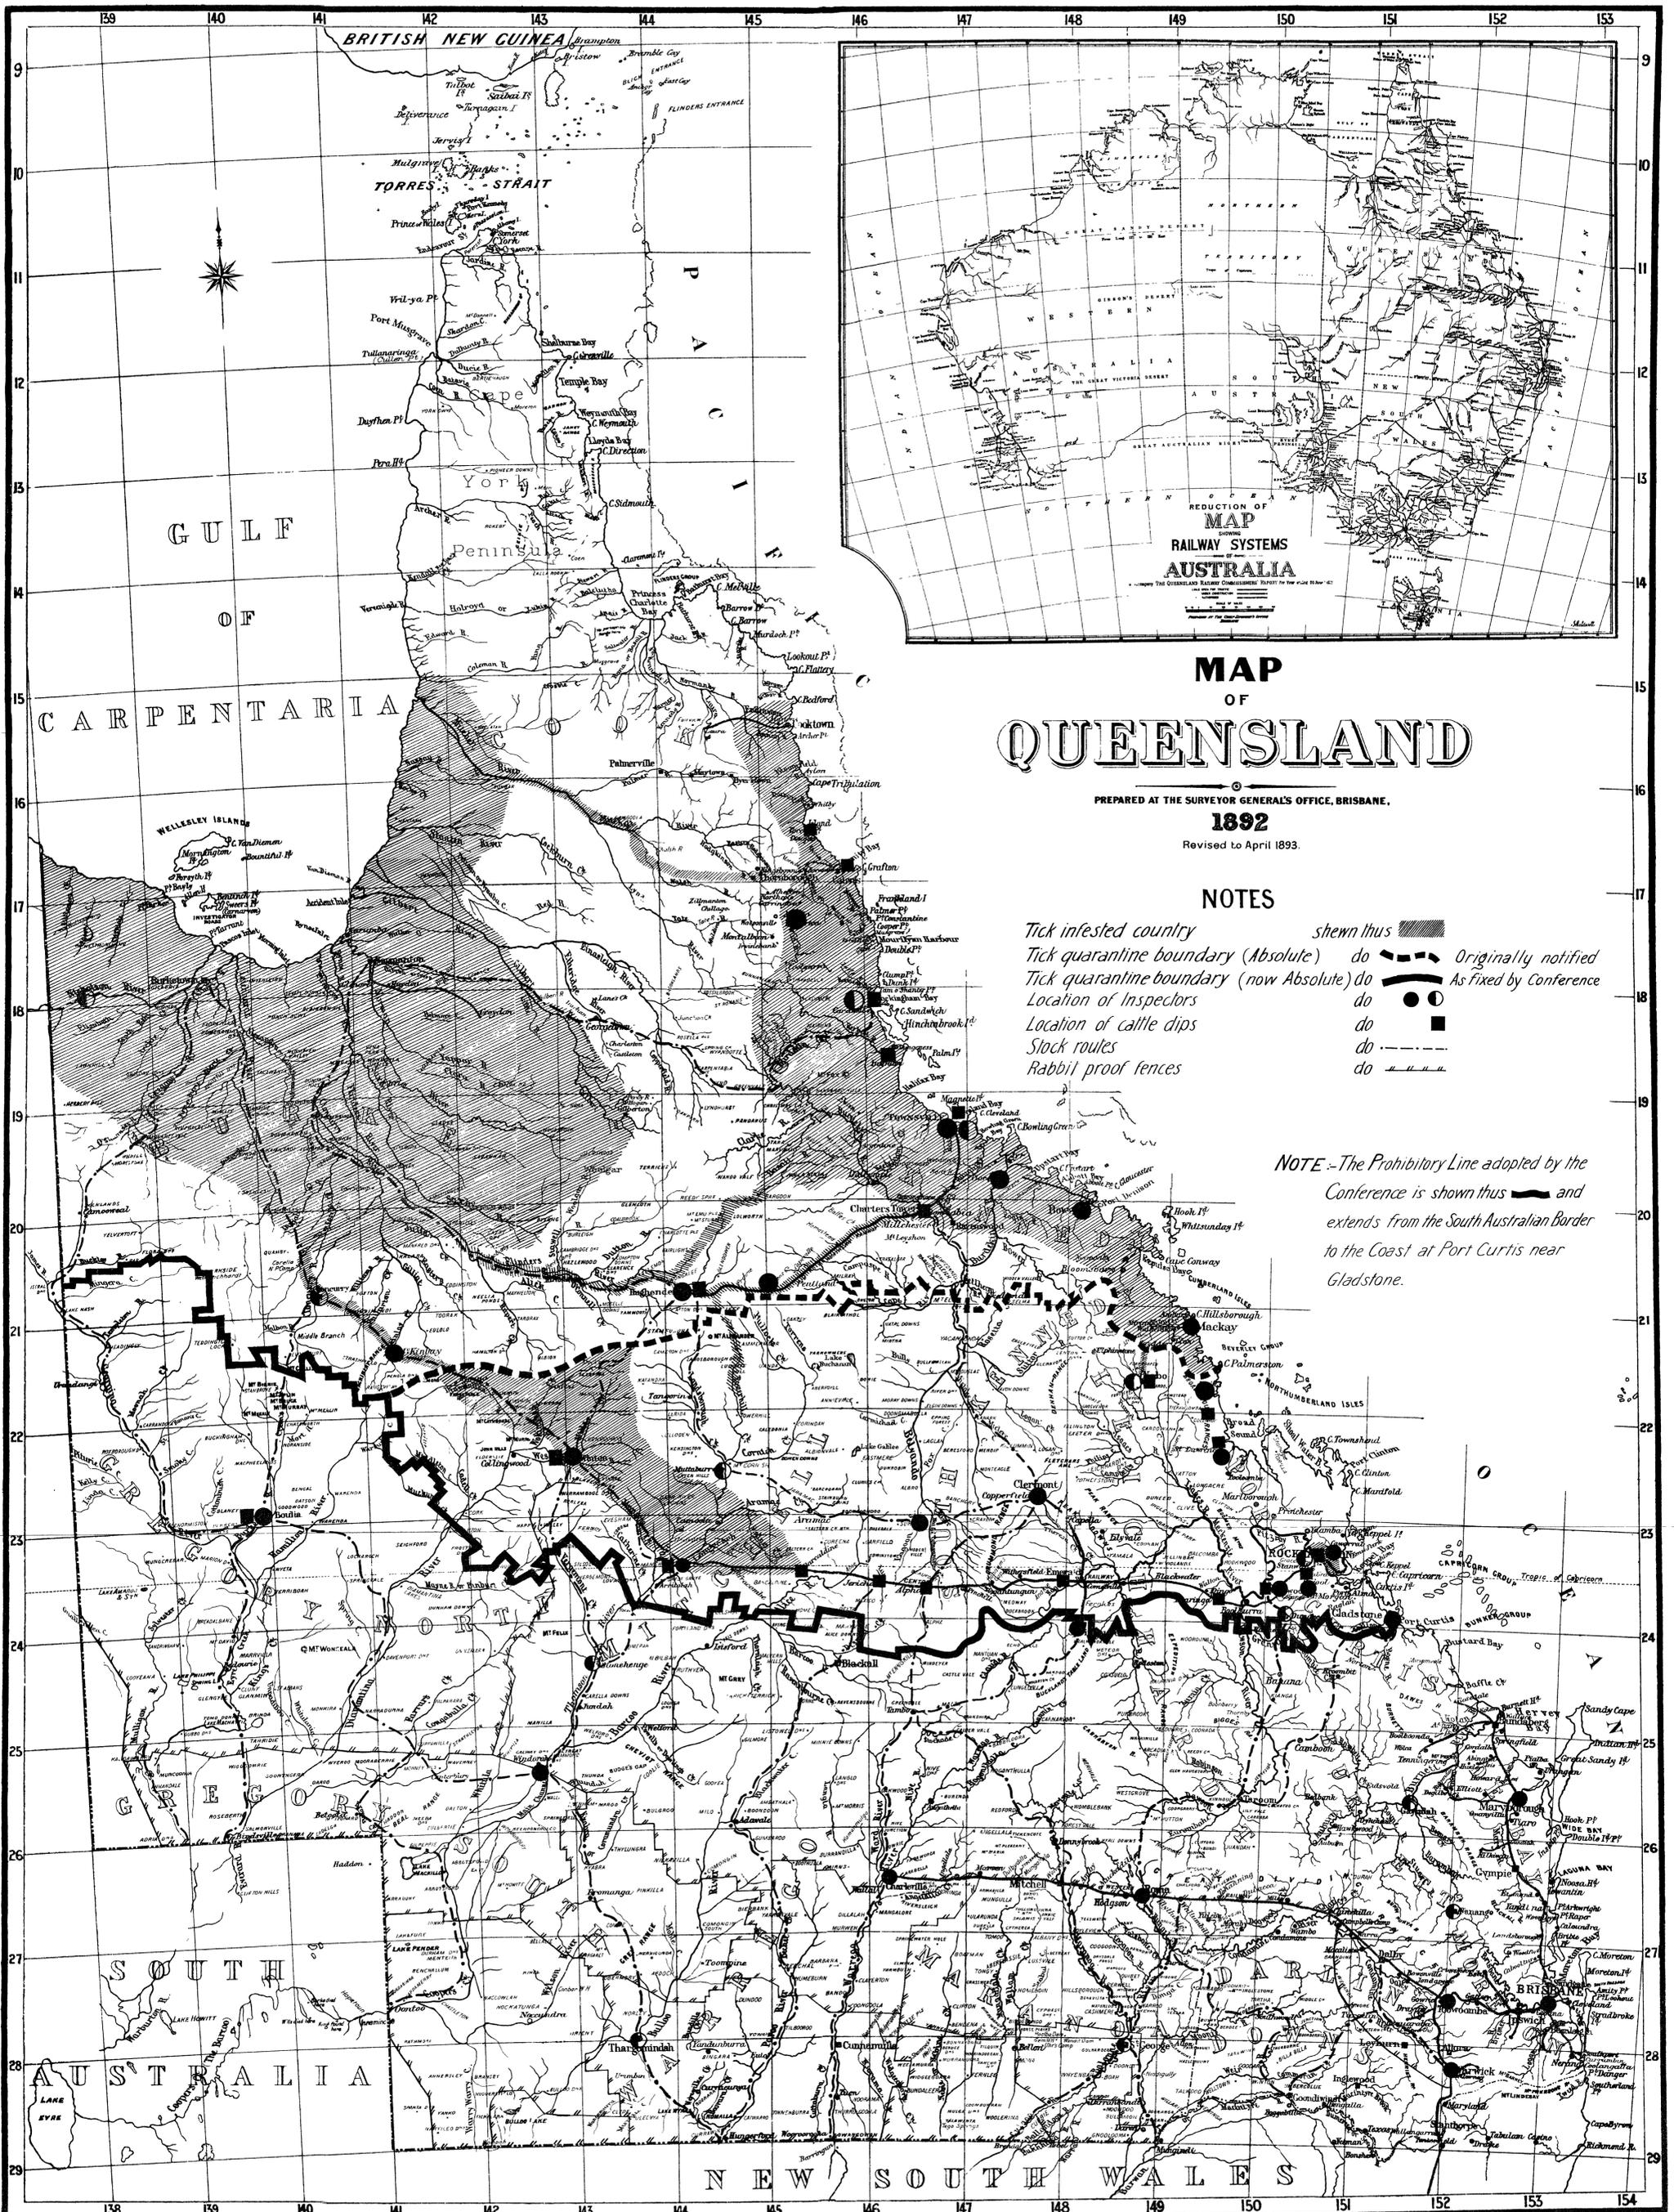

In the absence of any representative from West Australia, no definite information could be obtained as to whether the disease is spreading in that Colony. It is recommended that the Government of West Australia be asked to say to what extent the disease exists, and what steps are being taken to deal with it.

The members of the Conference availed themselves of the opportunity to discuss the advisableness of adopting an improved system of branding of stock, with the object of preventing the loss in the value of the hides, amounting, it is stated, to £300,000 per annum, now sustained by owners, and decided to recommend to the Governments of the Colonies represented, that measures for this object should be introduced into the several Legislatures at the earliest possible date.

The members of the Conference desire to place on record their appreciation of the manner in which the Hon. Sydney Smith presided over the Conference, and to express their thanks for the courtesy extended to them.

SYDNEY SMITH.

# TICK CONFERENCE.

## REPORT OF PROCEEDINGS.

Meeting of Experts held in Executive Chamber, Chief Secretary's Office

12th, 13th, and 14th AUGUST, 1896.

### Present:

<i>New South Wales:</i>	{ A. BRUCE, Chief Inspector of Stock. E. STANLEY, F.R.C.V.S., Chief Veterinary Inspector. N. A. COBB, Ph.D., Pathologist to Department of Agriculture.
<i>Queensland:</i>	{ P. R. GORDON, Chief Inspector of Stock. C. J. POUND, F.R.M.S., Director of the Stock Institute.
<i>Victoria:</i>	{ G. PENTLAND, Chief Inspector of Stock. Professor WALLACE. S. S. CAMERON, M.R.C.V.S., Health Department, Victoria.
<i>South Australia:</i>	C. J. VALENTINE, Chief Inspector of Stock.
<i>Tasmania:</i>	T. A. TABART, Chief Inspector of Stock.
<i>New Zealand:</i>	J. A. GILRUTH, M.R.C.V.S., Government Veterinarian.

THE experts met at 3:30 p.m.

The PRESIDENT (Mr. Sydney Smith), in opening the meeting, said:—Gentlemen, the representatives of the various Colonies met this morning, and determined upon a mode of procedure with regard to the tick fever question. A number of suggestions were submitted and discussed, and it was determined by the members of the Conference that these suggestions and opinions be referred to yourselves for discussion, and that you should supply the information asked for in the statement now before you, with the view to enabling the delegates to place definite recommendations before their respective Governments. There are one or two additions which the members of the Conference thought fit to make in connection with this matter, which I will read to you. They are—

- (1.) Are there any instances in which the tick infest the cattle without being followed by symptoms of red-water, or the disease known as tick fever?
- (2.) What is the length of time the tick will live without finding a host?
- (3.) How long will the tick live on the untreated hide?

I need hardly say that I welcome you, and believe that the deliberations of your meeting will result in benefit to the Colonies, which is so necessary in connection with the tick disease at the present time. I feel certain you will give the matters before you your earnest attention, and I am sure you will be able to submit to the delegates a resolution as to the course to be recommended for the various Governments to pursue. I think the Conference may now leave you to discuss these questions among yourselves, and possibly you may be prepared to submit a joint report to them to-morrow morning. It is possible that all the experts may not agree on the different questions, and we should like to have the reasons of any of the gentlemen who so differ, because it is only by getting all information on the matter that we can hope to arrive at proper decisions. It would be best for you, gentlemen, to elect a Chairman. The members of the Conference will now adjourn until to-morrow morning, at 11 o'clock, when the experts will, I hope, be able to furnish information on the matters they will have dealt with. We are anxious to get the best information on the subject, which it is felt sure you will give us. Unfortunately, very few experiments have been carried out in the matter, and we have very little definite information to go upon. However, I feel sure that your discussion cannot result in anything but valuable information being given to the Conference.

On the motion of Mr. PENTLAND, Mr. Bruce was elected to the Chair.

Mr. BRUCE said he thought that before commencing business there were several matters to be considered which would, if settled, greatly facilitate the proceedings. One important matter was the voting power of each Colony. He thought each Colony should have two votes, otherwise he thought it would be very unfair to Tasmania, New Zealand, and South Australia, who had only one delegate each. New South Wales had three delegates.

Mr. PENTLAND proposed that each Colony should have two votes.

Mr. TABART seconded the motion.

Dr.

Dr. COBB said he would like to offer an amendment and an explanation of that amendment. At the Rust in Wheat Conferences that had been held, the number of delegates from each Colony had been unequal, but the voting had been satisfactory; and it seems to him that they, as a Board of Advice to the different Governments, might give their votes individually. He would, therefore, suggest that voting be by individuals rather than by Colonies.

Professor WALLACE supported the amendment. There was a great deal in its favour. They were all present on equal terms, and he thought they should lose sight of the fact that they belonged to any one Colony.

Mr. BRUCE said the question of the disease affected the different Colonies, and they should have equal voting power.

Professor WALLACE thought it would be rather a difficult matter to decide which expert of a Colony should not vote.

Mr. PENTLAND suggested that each Colony should have three votes instead of two. He thought that would equalise matters.

After some further discussion, it was decided to equalise the voting power by giving each Colony two votes.

Mr. BRUCE then suggested that the time allowed for speaking should be fixed.

On the motion of Mr. PENTLAND, seconded by Mr. VALENTINE, it was decided that five minutes be allowed each speaker.

The meeting then proceeded to discuss the different questions as on the business paper.

## SUBJECTS REMITTED TO COMMITTEE OF EXPERTS FOR CONSIDERATION AND REPORT TO THE CONFERENCE.

### 1. In what Colonies does the Disease exist?

*Answer*:—Queensland, the northern territory of South Australia, and it has been reported in Western Australia.

### 2. What is Tick Fever?

Mr. BRUCE: Mr. Pound agrees with the views of the American authorities.

Dr. COBB said it must be borne in mind that he was not speaking from actual investigation. He was taking statements that had been set down by the different investigators as facts. It must not be thought that he was going to enter into an elaborate discussion of a theory that had no practical value. The theories that were propounded with regard to this fever were of a most important nature. It seemed to him that insufficient attention had been given to the nature of this so-called micro-organism. It was a very startling theory that had been formed. The tick produces certain effects in animals, and when the blood of these animals is examined the corpuscles are found to contain certain things, and it has been concluded by some, and, he thought, the majority of these investigators, that these so-called micro-organisms are really the cause of the fever. The blood has been taken from infected animals and put into the blood of healthy animals by subcutaneous injections, and these cattle show the fever and their blood also shows the micro-organisms. The theory is that the disease is transferred by ticks. Then the investigators said that they had found these so-called micro-organisms in ticks, and if infected cattle were taken into clean country and the ticks fall off and lay their eggs, which produce young ticks, these ticks if placed on healthy animals in this healthy country would produce the disease. Therefore the investigators were driven to the conclusion that these so-called micro-organisms could be transmitted through the tick's egg into its progeny. That was going a long way, because that is a very uncommon thing in connection with other diseases. The logical conclusion of the opinions of these investigators was that any tick and every tick passed the micro-organism through every one of its eggs—through every one of its young. Now he might say that before this theory were adopted and acted upon, we should consider it carefully. We must act upon conclusions that we can draw from facts. The American laws are based upon these deductions, and it seemed to him that before we accept any theory and base action upon it, we should see whether there is any other supposition that is less violent—that is, less in contradiction to scientific experiments. His object in speaking in this way was to call Mr. Pound's attention to facts that he might perhaps have not taken sufficiently into consideration, because it seemed to him, as a man trained for this sort of investigation work, that Mr. Pound, in carrying out these investigations in the Colony in which the disease had manifested itself, had omitted this important investigation. The lines are—that ticks should be carefully examined, and many of them, too, in order to ascertain the exact nature of these so-called micro-organisms. In his opinion it is not beyond possibility that it was not a micro-organism at all. It was within the bounds of possibility that such a so-called micro-organism may actually be physiologically a part of the tick, and is shed from the inner coating of the stomach of the tick for the purpose of digesting the blood corpuscles. Being free cells, the multiplication might possibly take place in other places than in the stomach. He did not advance this as a theory, but he just mentioned this to show that other theories were possible.

Dr. COBB wished it to be well understood that he did not advance the theory explained by him, but merely mentioned it to show that theories other than the American are possible, which was, he thought, perhaps too violent.

Mr. POUND thought these organisms were mutual parasites of ticks, and are always present. As a result of Dr. Hunt's investigation, it was contended that the bodies found in the ticks were analogous to the organisms found in the blood of the infected animal, which was the point on which he (Dr. Hunt) advanced his theory.

Mr. WALLACE considered the matter brought forward by Dr. Cobb most important, but he thought the theory advanced by the American experts the only reliable one. Their work went to show that the parasite is conveyed from the tick to its egg, and from the young tick to the animal. The American experts are not clear about the fully developed organism being found in the tick. It is in an arrested form, or an imperfect form, and he did not think it was in the form that would pass into the animal's body. He thought so far as he could make out that the organism must pass as a spore from the tick into the animal. The spore, he did not think, had yet been seen or demonstrated. They had

had not seen it in the egg, nor could they say in what way it passed. They did know it had never been conveyed from the tick to the animal by injecting the juices of the tick into a healthy animal. He referred to South Africa, where in certain areas ticks have never conveyed diseases. The ticks may have come here in an infected condition, he would not say diseased condition, and it would be possible for them to infest the country. He thought their inclination should be rather to support—subject to further experiments—the ideas expressed by the Texan authorities, viz., that directly the tick has to do with conveying the disease to cattle.

Mr. POUND: Dr Cobb's remarks suggested that these organisms which are found in the blood of infected animals were cell elements of the tick, and the tick injected them into the animal for a certain purpose. That theory had been advanced some months ago by Dr. Hunt; but Dr. Hunt concurred with him in withdrawing it. They had taken a definite quantity of blood from a diseased animal, and injected it intravenously into a healthy animal, and produced a typical form of disease in the absence of tick. Before Dr. Hunt left they had carried it on through fourteen successive generations, and in every case the injection caused acute disease. From the investigations he had conducted he scarcely thought it could be said that these organisms were a physiological part of the tick. With regard to Professor Wallace's reference to the American reports, he said that this organism could not be the cause of disease, but only asserted that the cause might be some poison. Now that was impossible, because if the blood were taken and passed through several generations, the poison would be so diluted as to lose its effect. He was speaking of some chemical property of the tick. Did Professor Wallace mean the poison of the organism?

Professor WALLACE: The poison may not be the cause, but only an associate of the organism. It is quite evident you think there is a possibility of it.

Mr. POUND thought it would settle the point once and for all to pass the blood from an infected animal through a Pasteur-Chamberlain filter, and then inject it into another animal. It appeared at the present time that the disease was purely a mechanical process. He disagreed with Dr. Hunt, who said he found identically the same organisms in the blood examined. His principal reason for saying so was that the bodies found in the young ticks were not distinctly motile. But the bodies found in infected animals were decidedly motile and possessed flagella. Now, he thought it was a very difficult thing to draw a distinct line of demarcation between motility and molecular action in such small organisms. He had tried a number of experiments by mashing the ova, larval ticks, and adult male and female ticks, from infected animals, with salt solution, and injecting it into the jugular veins of healthy cattle, and had always found the same negative results. Dr. Hunt also conducted similar experiments with the same results, and he had read that the same thing occurred in connection with experiments carried out in America. Dr. Cobb might think that they had not investigated the bodies of the tick, but that had been done, and it was intended to continue such investigations.

Mr. VALENTINE: What is tick fever? that is the question we have to settle.

Mr. PENTLAND: I think that, as Mr. Valentine has said, our object is to get together all the information we can as to the nature of the disease and how it is transmitted.

Mr. GORDON: Well, it is only fair to Dr. Hunt and Mr. Pound to take their description.

Mr. PENTLAND: We have the American description, but Mr. Pound's description is more favourable.

Mr. POUND (in reply to Professor Wallace): Reports from South Africa, which I have received, are not based, so far as I can see, on scientific investigation at all. In recent letters from South Africa (Natal) they distinctly disagree with us with regard to the disease being caused by the tick.

Professor WALLACE: Natal is not the place at all.

Mr. STANLEY did not think red-water and ticks are so intimately associated as is reported. His opinion was that cattle when in a debilitated state from red-water disease might succumb sooner when attacked with ticks, but their deaths would be due to the combined causes—red-water and ticks.

Mr. POUND contended that red-water could not be got without ticks in Northern Queensland. Whenever ticks were introduced on to an animal, typical red-water symptoms made their appearance.

Professor WALLACE: Quoting from Dr. Hutchens' report:—*Red Water*.—"I think it would be a good thing if this report were spread abroad. It is very brief and contains a good definition of what this disease really is."

Mr. POUND: That has recently appeared in the *Sydney Mail* and other important papers throughout the Colonies, fully illustrated, and giving full details of the disease, the life-history of the cattle tick, and everything about it.

The CHAIRMAN: We wish to lay something with regard to the main question before the Minister in the form of a resolution.

Professor WALLACE: It seems to me that all that is asked in connection with this question are the symptoms, and 1 and 2 take in the whole matter. I would suggest that this report (Dr. Hutchens') be written out as a reply to the question.

It was resolved, on the motion of Mr. VALENTINE, that the answer to Question No. 2 be, "The following conclusions arrived at by the experts of the American Department of Agriculture and confirmed by the experiments of Mr. Pound and Dr. Hunt."

It is not only the opinion of Mr. Pound, the Director of the Stock Institute, Brisbane, and Dr. Hunt, of Hughenden, after careful investigation and test, but also that of Dr. Salmon, the Chief of the Bureau of Animal Industry at Washington, in the United States, to whom full particulars of the Queensland tick and its life-history and effect were forwarded, that the "Tick Fever" of Queensland is identical with "Texas Fever" of America.

As this is the case, and as a thorough and exhaustive investigation was, during the years 1889, 1890, 1891, and 1892, carried out by the ablest scientists in the States, under Dr. Salmon's direction, as to the nature, causation, and prevention of Texas Fever, no better description of the disease now prevalent in Queensland can be given than that contained in the report giving the result of these investigations, and published by the United States Department of Agriculture, Bureau of Animal Industry, Bulletin No. 1, 1892. It is to the following effect:—

#### Conclusions.

1. Texas Fever is a disease of the blood, characterised by destruction of the red blood corpuscles. The symptoms are partly due to the anæmia produced, partly to the large amount of debris in the blood, which is excreted with difficulty, and which causes derangement of the organs occupied with its removal.

2. The destruction of the red corpuscles is due to a micro-organism or micro-parasite which lives within them. It belongs to the Protozoa, and passes several distinct phases in the blood. 3.

### 3. Is Tick Fever purely a Bovine Disease?

Mr. POUND: Strictly bovine.

Dr. COBB: Would you mind recounting the details of the experiment with horses?

Mr. POUND: I remarked that it had often been argued that horses suffer from this disease. It was perfectly true that horses become covered with ticks. For the experiment in question they took 20 c.c. of blood from an infected beast, and injected 10 c.c. into the blood of a bullock, and 10 c.c. into the blood of a horse. The bullock developed all the symptoms of the disease; while the horse showed no change from normal condition. The blood of these animals was repeatedly examined for several days at regular intervals of a few hours, and the examinations were continued at intervals for seven or eight days. The organisms were present in the bullock, but absent in the case of the horse. He thought the results of these and other experiments proved pretty conclusively that the disease was strictly bovine.

*Answer*:—Yes, from results based on experimental evidence.

### 4. Is the Disease indigenous, or was it introduced?

Mr. POUND pointed out that there were certain species of ticks indigenous to certain parts of Australia, and he produced a species of tick which, so far as is known, is indigenous to the western parts of Queensland. From this fact he could not see why the tick associated with the disease under notice should not be indigenous to the Northern Territory.

Mr. STANLEY moved that answer to Question 4 be, "We do not know."

Seconded by Mr. PENTLAND.

Carried.

### 5. When was attention first drawn to the Disease?

Mr. VALENTINE could not exactly say what year attention was first drawn to the disease, but it was about 1878 when first heard of. In reply to Mr. Pound, he said that plenty of ticks were found when the first cattle were taken to the Northern Territory by Dr. Brown, about nineteen years ago, but there was no red-water.

Mr. POUND referred to a drover who showed him his note-book, wherein was an entry, made some fourteen years ago, of his cattle dying, upon which were ticks, but at the time he had no idea that they had anything to do with the disease from which the cattle died; but from recent events he was inclined to think that the ticks were in some degree responsible for the deaths.

Mr. VALENTINE moved,—“That attention was first drawn to the disease about eighteen years ago, on the road between Queensland and Northern Territory, near the Roper River.”

Seconded by Mr. PENTLAND.

Carried.

### 6. Its introduction and spread in Queensland.

Mr. GORDON said that he knew the information set down in Mr. Bruce's paper to this question to be absolutely correct, and it was thereupon accepted. It reads as follows:—

The first intimation of tick fever being in Queensland was received in 1891. The disease was carried there by cattle from the northern territory of South Australia, but its introduction was not then regarded in a serious light by cattle-owners. In the course of a year or two, however, through the introduction of other infected cattle, and the spread of the disease from those first introduced, owners became alarmed, and Mr. Pound was, as stated, sent by the Government to investigate and report. He found that the disease at first spread slowly in Northern Queensland, but that latterly it did so in a comparatively rapid manner.

The bullock teams and drift of stock from the Northern Territory and the western portion of Northern Queensland to the boiling and extract works on the Albert and Norman Rivers had carried the infection both in a southerly and easterly direction to a good many herds in that part of Queensland, inflicting very serious loss; but, as a rule, the losses were not so heavy in the country at some distance back as on the coast.

Before long the infection was carried to the east coast, and there the losses have frequently been very heavy, nor are they as yet, it would seem, over, while it is doubtful if the disease is not still spreading, and the whole of the coast country, from Rockhampton to Thursday Island, cannot be otherwise termed than infested or suspected.

The infection was also carried from the gulf country in another direction by infected cattle travelling from the country on the Flinders, by Kyunah and Winton, to Longreach, where after some delay they were sent on to Barcaldine and trucked to Rockhampton for Lakes Creek; and although no deaths are reported among the cattle infected by those from the Flinders, ticks have been found on some of them, and the question whether or not the disease will spread from this centre of infection will not be settled until it is seen whether the warm weather of spring and summer does not call the ticks into activity.

### 7. The extent of the Disease in Queensland.

The extreme north and south points known to be infected with tick fever in Queensland are Thursday Island in the north, and Longreach in the south, and the extreme east and west points may be said to be Townsville on the east, and the Nicholson River on the South Australian border on the west. That is to say, the disease has spread from the Gulf of Carpentaria as far south as the Tropic of Capricorn and as far north as Thursday Island, but only to certain localities in that portion of the Colony. If the whole of that portion were infected, that would mean that fully one-half of the Colony was so; but while large tracts of country along the south and part of the east sides of the gulf and on the eastern seaboard of the Colony are decidedly infected, and considerable areas between the infected country on the gulf and that on the eastern seaboard, suspected of being infected, it is believed that at least one-half of that portion of the Colony north of the Tropic of Capricorn is still free from the infection, and that, therefore, not more than perhaps one-fourth of the Colony is infected or suspected of being infected.

Mr. GORDON referred to the map of Queensland which was on view, whereon were shown the clean and infected districts, &c. He referred to the Act recently passed by the Queensland Government to cope with the pest, copies of which were handed to the gentlemen present. The Act, he remarked, was a very stringent one, and was thought quite sufficient to meet all requirements.

8. Incubation of the Disease. 9. Most noticeable Symptoms:—(1) Acute Type; (2) Mild Non-fatal Type; (3) The effects of the Disease on Calves and the deductions therefrom. 10. Most noticeable *Post-mortem* Symptoms:—(1) The Spleen; (2) The Liver; (3) The Bile; (4) The Kidneys. 11. The Cattle Tick and its Life History:—(1) The Ticks on Cattle; (2) The Ticks when they leave the Cattle; (3) The Incubation of the Tick; (4) Where young Ticks settle on Cattle; (5) The effect of the Ticks on the Cattle.

Dr. COBB moved,—“That the notes furnished by Mr. Bruce on these questions be accepted as they stand.”

Mr. TABART seconded.

Carried.

### 8. Incubation of the Disease.

The period of incubation has been ascertained by subcutaneous injection into healthy cattle of the blood of cattle suffering from the disease. When the blood has been injected the fever temperature appears within a few days, and outward signs of illness are manifested on, or even before, the sixth day, and the external symptoms appear from six to ten days.

### 9. Most noticeable Symptoms.

#### (1.) *Acute Type.*

This type is the disease of the hot summer months, and appears suddenly and among all the animals exposed to the infection, and of course can be observed sooner by taking the temperature with a thermometer than any way else, the temperature in the case of disease ranging from 105 to 108 Fahr. When very high it can be detected by touching the skin. Next to the temperature the colour (red or yellow) of the urine is noticeable. Constipation is another symptom, and loss of appetite and cessation of rumen usually take place from three to five days; and in the case of milch cows cessation of the flow of milk followed by loss of sight, swaying of hind-quarters, and trembling of the muscles, especially of hind-quarters, and thinness of the blood, follow.

This type of the disease usually runs its course in a few days, the animals dying or surviving according to the virulence or otherwise of the disease. A good many of those that do survive do not regain their original vigour, while the others do so in a few weeks.

#### (2.) *Mild Non-fatal or Chronic Type.*

This type of Texas fever which, in America, is only to be met with in the autumn, is hard to distinguish from other ailments, as the only outward symptoms are slight loss of appetite and dullness, while the temperature very seldom rises above 105 in the evening, and the destruction of the blood corpuscles goes on slowly. It will be noticed that the season of the year and temperature has a good deal to do with the type of the disease, the mild form being in the cooler season of the year.

#### (3.) *The effect of the Disease on Calves and the result.*

During the discussions which have taken place with respect to this disease, statements have over and over again been made that cattle in the Gulf country, although covered with ticks, do not now die, while it is reported on equally reliable reports that ruinous losses have sooner or later followed the first infection of herds in other portions of that part of Queensland, and more especially on the coast country on the eastern side of the Colony. This, to those who are unacquainted with the explanation, must appear very contradictory; and the explanation is simple, and lies in the fact that calves and young cattle although attacked by the disease when infested with ticks very seldom die; and as they are not, as a rule, subject to another attack, or at any rate to another attack which proves fatal, they grow up immune, and although perhaps inconvenienced by the ticks they seldom or never exhibit any serious symptoms of fever. While, however, this is a fortunate matter for the owners of cattle already infested; it in no way removes the obligation on those charged with the protection of our flocks and herds to do everything possible to stay the spread of the disease, especially as it is questionable with our Australian climate whether when land is once infested it can ever after be eradicated.

### 10. Most noticeable *Post-mortem* Appearances.

#### (1.) *The Spleen.*

One of the most noticeable *post-mortem* appearances in Texas Fever is the enlargement of the spleen to two or even four times its natural weight, through engorgement with red blood corpuscles or their remains in the form of irregular lumps of yellowish pigment. This destroys the structure of the spleen, and, of course, completely arrests its functions.

#### (2.) *The Liver.*

Though not so noticeable as that of the spleen, the destruction of the liver is perhaps a more important matter, through its enlargement, congestion, bile ingestion, and fatty degeneration. The increase of weight ranges from 3 lb. to 5 lb. heavier than a healthy liver, and when diseased the liver is paler than a healthy one and has a peculiar mottled appearance.

#### (3.) *The Bile.*

That found in the gall bladder (of which there is usually a considerable quantity—one half-pint to a quart) has exchanged its limpid fluid appearance for an almost semi-solid mass.

#### (4.) *The Kidneys.*

In a good many cases the kidneys are in a sero-sanguinolent condition of the connective tissue, and the fat about the kidneys; and in acute cases they are enlarged and of a brown colour.

## 11. The Cattle Tick and its Life History.

Among the conclusions come to, as the result of the investigations instituted by the Department of Agriculture in the United States, with respect to Texas Fever, No. 5, is to the effect that the disease in nature is transmitted from cattle which come from the permanently infected territory to cattle outside this territory by the Cattle Tick (*Ixodes bovis*), of which the following is a brief description, taken principally from Mr. Director Pound's report:—

### (1.) *The Ticks on Cattle.*

The mature female tick, as seen on the animal's skin, has an oblong oval-shaped body resembling the seed of the castor oil plant, and is of a dull leaden colour due to the blood red contents of the body showing through the distended semi-transparent cuticle. It rarely exceeds twelve millimetres ( $\frac{3}{4}$  inch) in length, and seven millimetres (a little less than  $\frac{3}{8}$ th inch) in breadth, and possesses four pairs of legs situated on the anterior lateral portion of the body. It attaches itself to its host by means of peculiarly constructed mouth organs collectively known as the rostrum, in the centre of which is a barbed dart furnished on either side with several rows of teeth set obliquely, which enables the creature to adhere to the skin more firmly.

The male tick is usually found attached to the skin of its host immediately underneath the anterior part of the female. Its body is of a dark brown colour and somewhat triangular in shape, and when full grown is only about one-fiftieth part of the size of the fully developed female, and never being in an engorged state, is very much more active and also stronger than the female.

### (2.) *The Ticks when they leave Cattle.*

As the female tick engorges herself with blood she becomes fecundated by the male, and having arrived at maturity, releases her hold from the skin by withdrawing the barbed mouth organs, and falls to the ground; on recovering herself she walks away to some secluded spot where she remains quiescent for about eight or ten days, during which time the contents of the abdomen are undergoing important changes prior to oviposition (the process of egg-laying), the period of which generally takes from seven to fourteen days. As a rule, the fully matured ticks lay from 1,600 to 2,000 eggs, which are agglomerated in a dense mass. As oviposition proceeds she gradually gets smaller or shrivels up, and ultimately dies beside what will be subsequently her own progeny. What becomes of the male tick is not known. He may go in search of another female, but he most likely dies.

### (3.) *The Incubation of the Tick.*

The period of incubation in a temperature ranging between 90 and 110 Fahr. was from fourteen to twenty-six days, but when the temperature is lower the incubation period is longer, as long as three or four weeks or even longer.

When the young tick emerges from the shell, it has only six legs, and is of a light brown colour, but gradually assumes a much darker shade. In this stage the young ticks are extremely active. They are very tenacious of life, surviving in a very low temperature, and living in well stoppered bottles seventeen weeks without food or water, or even fresh air.

No further development takes place in these ticks until they gain access and adhere to some animal and get nourishment from the blood, when in the course of seven or eight days they have their first moult, growing, and changing their colour, which becomes darker, and now having four instead of three pairs of legs. Then in seven days more the second moult takes place, and the tick is sexually mature. From this time till about the 21st to the 22nd day, the female increases in size till she is fifty times the size of the male. She is then fully engorged and fecundated, and drops off to lay her eggs as already explained.

### (4.) *Where the Young Ticks settle on Cattle.*

In some instances the cattle ticks are present in extraordinary numbers; at times fairly equally distributed over the whole of the animal's body, and at other times crowded on particular portions of it. As many as 40,000 were found on one animal, and then the whole were not counted. The ticks, as a rule, prefer the thin soft portions of the skin; for instance, along the belly, on and around the udder or scrotum, on either side of the neck, in and outside the thighs, and on the twist.

### (5.) *The effect of the Ticks on the Cattle.*

Dr. Salmon says that it has been demonstrated that ticks carry the infection of Texas Fever, the micro-organism; they introduce it into the tissue of susceptible cattle, and produce the disease. There is thus a complicated infection in which two very different kinds of parasites play an important part. He further says, another discovery not less marvellous has been made—that the micro-organism, which constitutes the contagion, is transmitted through the egg to the young tick, and it is this, and not the adult tick carried by the Southern (the infested) cattle, which finds its way upon susceptible animals and causes the disease: That is to say, if cattle infested with ticks are brought into contact with sound cattle it is not these ticks but their progeny (see conclusion 6) which infest the sound cattle, and transmit the micro-organism which sets up the fever. On the micro-organism being introduced into the tissues of susceptible cattle it takes possession of and multiplies in the blood corpuscles and disintegrates and destroys them. This, of course, in the mild type of the disease, leads to poverty in the blood, and the cattle become poor and weak. In the acute type again fever follows, which frequently results in death. All this is fully confirmed by Mr. Pound and Dr. Hunt's investigations in Queensland.

## 12. Steps taken by Queensland to arrest the Disease, and the result.

(1.) *Quarantining Infected Stock*; (2.) *Fresh Legislation*; (3.) *Dipping and Erection of Dips*.

Mr. GORDON's remarks:

### *What Queensland has done.*

Under the new Act the Colony is divided into three zones—

- (1.) That north of a line generally following the 21st parallel, south of which no stock can pass under any conditions.
- (2.) The central zone lying between the 21st and 24th parallels.
- (3.) The portion lying between the 24th parallel and the boundary with New South Wales.

#### (1.) The Northern Zone.

In respect of stock in this zone—

- (1.) None shall pass south of the southern boundary.
- (2.) No stock in the infected portions shall leave such portions unless for immediate slaughter, and then only within that zone.
- (3.) If it is intended that stock from any portion of the zone are to be travelled through any other portion not declared infected, they must be properly dipped immediately before entering on the uninfected country.
- (4.) When any of such stock are to be carried by train the trucks will be thoroughly disinfected.
- (5.) At the point of slaughter the stock will not be permitted to be in contact with other cattle.

#### (2.) The Central Zone.

- (1.) This zone has been patrolled by reliable officers specially selected for the purpose, and the infested centres delimited and mapped out.
- (2.) The eastern centre of infection at North Rockhampton has been proclaimed an absolute quarantine.
- (3.) The western centre of infection, as shown on the map, is declared an infected area.
- (4.) No stock can leave the infected areas except for immediate slaughter within the zone, and under the same precautionary conditions as are observed in the northern zone.
- (5.) No stock to be admitted south from the clean portions of this zone until after having been dipped at a point on the line of Central Railway, about 30 miles north of the southern boundary of the zone.

#### (3.) The Southern Zone.

In this zone the Board of Stock Commissioners have already dealt with the subject of controlling cattle traffic, by—

- (1.) Determining the points along the northern line of rabbit fence at which only stock from south of the 24th parallel can pass.
- (2.) By enforcing inspection of the cattle at those points.
- (3.) By defining stock routes from those points, both on the map and by letterpress description, by which only cattle may travel to the border.

Mr. PENTLAND: Seeing that this intermediary zone is of similar character to the country that is known to be infested, and is of such a vast extent that, unless officers were stationed at reasonable distances throughout it, it is impossible to say to what extent this territory might be infested with ticks. All cattle within this intermediary zone should be absolutely prohibited from leaving unless it could be proved beyond any doubt that they were absolutely free from ticks. In short, no cattle should be allowed to come south of the intermediary zone under any circumstances, seeing that it is already infected.

Mr. GILBERT asked Mr. Gordon whether there was anything on the territory corresponding to the red and blue lines on the map—that is to say, whether the country was fenced along the lines indicated.

Mr. GORDON replied that it is not all fenced. The topographical features of the country prevent free movement of stock.

Mr. POUND explained that along a certain railway line that was proposed as a boundary there were 10 miles of line unfenced, and he failed to see what was to prevent infected cattle crossing to the southern side of that line. He thought that every precaution should be taken to prevent this.

Mr. GORDON explained that the character of the country indicated by Mr. Pentland was altogether unfavourable for ticks. He thought his Government would gladly accept any advice that could be offered with regard to remedial measures, &c., but scarcely thought they would care for anyone to dictate as to what areas within their own Colony should be placed under quarantine.

Mr. PENTLAND: In my opinion there is no difference between the two classes of country. The risk is so great that every possible precaution should be taken to guard against any further spread.

Mr. GORDON: Mr. Tozer has assured the Ministers of the other Colonies about this matter, and they have accepted his statements in good faith. It was not intended, however, that this Conference should discuss this topic.

A considerable discussion took place as to the subjects of a definite resolution.

Professor WALLACE: There is no such thing as absolute immunity from attack. If cattle that have been suffering from the mild form are removed to clean country, and returned to the infested country eight or nine months afterwards, they will take the fever as readily as beasts that have never been before attacked by ticks. A good deal of danger is run in the case of working bullocks that travel from place to place through infested districts.

Mr. POUND: I refer to cattle that remain in the district.

Mr. PENTLAND moved,—“That this meeting regrets that the intermediate infected area between the 21st and 24th parallels has not been included in the zone known as the absolutely restricted area, which lies to the north of the 21st parallel.”

Mr. TABART seconded, and he pointed out that cattle infested with tick while in transit would in all probability infect the railway line, which is unfenced, and cattle grazing backwards and forwards would pick up tick in that way; and very likely this had already been done.

The Chairman ruled that the matter could not be discussed.

Mr.

Mr. PENTLAND: I think you might take the opinion of the meeting as to our power to deal with it. I do not think that, as a conference of experts and practical men, it should be necessary for us to submit a matter of this kind to the Minister. We have surely sufficient common sense and practical experience to enable us to draw up a definite recommendation that will tend to safeguard the interests of all the Colonies without bearing too hard upon Queensland.

Mr. VALENTINE: I quite agree with Mr. Pentland.

Professor WALLACE: I move as an amendment,—“That this meeting consider the steps that should be taken for the suppression of the disease.”

Amendment lapsed—no seconder.

Dr. COBB: We simply wish to give an expression of opinion.

Mr. PENTLAND: We just want to express as an opinion, not as a resolution, that certain country should be included in the restricted area.

Professor WALLACE moved,—“That the meeting under No. 12 be permitted to consider the regulations established by Queensland for the suppression of the disease, the object being to discuss infected areas.”

Mr. GILRUTH seconded, and the motion was carried.

Discussion on Mr. Pentland's motion was then resumed.

Mr. VALENTINE did not think the motion necessary, as there was no danger from the catt travelling over the unfenced railway line referred to. He would suggest that the areas known to be infected be included in the prohibitory zone. If the Queensland inspectors find that there are other areas infected other than those at present set down on the map, the Queensland Government would immediately proclaim them to be infected areas, and at once include them in the prohibitory areas. They could only be guided by the Queensland inspectors, who would, they were well aware, stop the spread of the tick disease as much as they possibly could.

Mr. PENTLAND pointed out that the object of his motion was to stop all cattle from travelling below the line running along the 24th parallel.

Mr. VALENTINE moved, as an amendment,—“That the infected areas in the central zone be dealt with in the same manner as in the prohibitory zone, and stock from the uninfected portion of the central zone be allowed to cross the 24th parallel on inspection and dipping.”

Professor WALLACE said he would second Mr. Valentine's amendment if he would agree to the area east of the Boomer Mountains and that west of the Great Dividing Range being included in the infected area.

Mr. GORDON here lodged the following protest:—

We protest against this resolution being put to the Conference, for the reason that the Government of Queensland being acquainted with all the circumstances connected with the spread of the pest, the topographical features of the Colony, the geological formations favourable and unfavourable to tick life, and the vegetation favourable to tick, and that Queensland is, and has been, doing all that is deemed necessary to protect the herds in the southern part of the Colony, and by so doing are doing their utmost to protect the herds of their neighbours.

Mr. VALENTINE did not think so large an area should be included as infected as suggested by Professor Wallace, but thought that so long as a certain area of uninfected country surrounded each infected area the matter would be sufficiently met.

Mr. GORDON, in reply to a question, said that it was the practice to take infected stock from infected country (tinted central portion of the Colony map) and send them along the unfenced railway line for slaughter without being dipped.

Mr. PENTLAND thought the portion of the Colony to the east of the Boomer Range was the most dangerous part to guard against.

Mr. GORDON pointed out that all the herds in that part had been inspected. The country shown by pink tint, at Rockhampton, on centre of map was, he thought, the most dangerous.

Mr. PENTLAND was of opinion that the district should be constantly inspected, and, moreover, they should not trust to lots of boys, whom the stations now employed, but reliable men.

Mr. Pentland's motion, which had been seconded by Mr. TABART, was then put to the meeting. The voting was even in number, but as three of the Colonies, Queensland, New South Wales, and South Australia, were against and two for, viz., Victoria and Tasmania, the motion was negatived. New Zealand did not vote.

A discussion then took place on the following report by Mr. Bruce. On the motion of Mr. TABART, seconded by Mr. GILRUTH, it was taken as it stood, with the addition of Mr. Gordon's earlier remarks:—

#### (1.) *Quarantining Infected Stock.*

In October, 1894, the whole of the Gulf country and Cape Peninsula west of the 144th meridian was placed in quarantine, but the ticks shortly spread beyond the limit notified towards the eastern seaboard. On this being found to be the case, a fresh quarantine was in November, 1895, notified across the Colony from east to west, following generally the 21st parallel; but although this has to a certain extent stayed the spread of the disease, it has not proved thoroughly effective, for teamsters and drovers have on several occasions broken the quarantine and carried the infection to clean country, where the owners again have concealed the existence of the disease; and these breaches of the law have occurred through the Act under which the quarantine was proclaimed being defective and the staff of inspectors insufficient.

#### (2.) *Fresh Legislation.*

The insufficiency of the staff and the defects of the law were from the first fully recognised. Additional inspectors were appointed, and a very effective and comprehensive measure has been carried through Parliament for dealing with this and other diseases in stock. Under this, with a full staff of inspectors, the true state of the stock in the different localities will be ascertained, the infested runs and holdings will be placed in quarantine, and the provisions regulating the dipping and movement of stock will be strictly enforced. Besides this, the Government is constructing dips on the principal stock routes, and providing the oil for dipping, not only for these dips, but for those erected by owners.

(3.)

(3.) *Dipping for the Destruction of the Tick.*

On information being received some eight or ten months back from America that dipping with oil had proved successful in destroying the tick on cattle, dips were constructed in several parts of Queensland, and a considerable number of cattle were dipped.

As a rule, when the dipping was properly carried out, the ticks were destroyed, but in a good many instances the work was not properly done—too little oil was in these cases used, and there was neglect in other respects. There is, therefore, good reason for believing that, where a sufficient quantity of the right sort of oil is put into the dip, and the process properly carried out, the ticks on the stock will all be destroyed. But while this is the case, the experience so far as yet gained does not go to show that the oil dip will act as a preventive for any length of time, as well as destroy the tick, for young ticks have been found on cattle which were dipped only a fortnight before, and had been carefully examined a day or two after the dipping and found entirely free from living ticks. This is the weak point in the dipping process, and every endeavour should be made to discover some ingredient to use with the oil or other effective medicament which will adhere for some considerable time to the hair, and be so distasteful to the tick as to keep it from coming on the cattle until the effect of the ingredient in this respect has ceased. It is this property in sulphur that makes dips in which sulphur is used so effective in the cure of scab, for the smell of the sulphur in warm weather can be felt three months after the dipping. Notwithstanding this weak point in the oil dip, the defect only applies in the case of cattle which have to be put back again upon tick-infested runs. In that of cattle again, from suspected or doubtful country which their owners desire to travel into clean, it is believed that if they are carefully examined and show no signs of infection and are effectively dipped, they might be allowed to enter, and Queensland cattle about to enter New South Wales might, in order to remove all doubt, be treated in this way. Even as regards cattle on infected runs, it is believed that the process will frequently be turned to good account by watching the seasons and giving repeated dippings when they will have the greatest effect. This will be especially the case as regards dairy cattle and store bullocks put on to fatten. There is a prospect, too, that a suggestion made by Dr. McDonald, of Ingham, will bear fruit. It was that two or three dippings of cattle as they are infested and reinfested will on each occasion check the virulence of the disease, and in this way prevent it from going beyond a mild attack, thereby rendering the animal immune.

The following report by Mr. Bruce on the steps taken by various Colonies to arrest the spread of the disease was then read:—

## 13. Steps taken by various Colonies.

## 1. STEPS TAKEN BY NEW SOUTH WALES.

(1.) *Proclamation and Crossings.*

4th February, 1896.—A proclamation was issued under the "Customs Regulation Act, 1879," prohibiting the introduction of horses and cattle from that part of Queensland north of the Central Railway Line, and only allowing the introduction of them from south of that line on inspection at the crossing-places at—

Ballandeen (Wallangarra),	Barringun,
Mungindi,	Hungerford,
Brenda,	Wompah.

Additional crossing-places have since been notified at Tullabudgera, Mount Lindsay, Acacia Creek, White Swamp, Boggabilla, Hebel, Parragundy, Adelaide Gate.

(2.) *Inspectors and Inspections.*

*Inspectors.*—The Inspectors of Stock at Glen Innes, Warialda, Walgett, Brewarrina, Bourke, and Wanaaring were appointed Customs Officers for the purpose of enforcing the prohibition; and the following gentlemen have been appointed Acting Inspectors and Customs Officers to assist the Staff Inspectors:—

C. D. Whitty, Tullabudgera.	J. A. Robertson, Hebel.
P. B. Chauvel, Mt. Lindsay.	E. Gillespie, Acacia Creek.
J. E. Smith, Wallangarra.	J. R. McGovern, Brenda.
Jas. Skinner, Boggabilla.	S. R. Scott, Mungindi.
Jas. McNall, Barringun.	Peter Jeffrey, Mingoola Station.
John Ducat, Wompah.	

Mr. Jeffrey only inspects stock leaving Maidenhead and Bonshaw Stations, which stations have country adjoining in Queensland, and they are worked as one under Bond.

Thus there are seventeen inspectors now employed on the Border in seeing that the prohibition is enforced, and, in addition, the Collector of Customs and the Inspector-General of Police have instructed their officers on the Queensland Border to assist.

*Action before Crossing.*—Before any cattle or horses are allowed to cross they must give seven days' notice to the inspector at the crossing-place, and produce a declaration by the owner, and a certificate by an inspector in Queensland, that such cattle are not infected.

(3.) *Fresh Legislation.*

On the passing of the Imported Stock Act Further Amendment Act of 1896 proclamations were issued declaring "Tick Fever or Texas Fever" in cattle, horses, or camels to be an infectious or contagious disease for the purpose of that Act, and Queensland was declared to be an infected colony.

(4.) *Erection of Yards for closer inspection.*

It is proposed to erect yards at the principal crossing-places for the closer inspection of stock, and to place them in a crush for that purpose when necessary.

In the meantime the Queensland Government has granted the use of the pound-yards on their side of the Border for this purpose.

(5.) *Regulations, &c., Hides.*

On 4th July regulations were published prohibiting the introduction of hides or skins of cattle, horses, or camels, unless they had been thoroughly salted in a proper pit for one week, and that they were accompanied by a certificate from an inspector that the requirements of the regulation had been complied with.

If accompanied by this certificate the Customs Officers allow the hides to be landed, subject to inspection at the stores to which they may be sent.

The reason for preferring pit-salting to dry-salting are given in the accompanying letter:

Department of Mines and Agriculture, Stock, and Brands,  
Sydney, 30 July, 1896.

Sir,

In reply to your letter of the 28th inst., I beg to state that, if brine of sufficient strength is certain to kill the ticks, then I think there can be no question but pit-salting or pickling is by far the most certain mode of destroying the ticks, inasmuch as the strength of the pickle is the only thing that requires watching, and that can be readily ascertained, for brine will be certain to find its way to every part of every hide in the pit with ordinary care, or even without much care; while in the case of dry-salting, if great care is not exercised, some portions of the hides will be missed. Indeed, we have already found in our examination of the hides, that this happens in not a few cases, and the strong smell of taint, which is at times felt from hides, clearly points to imperfect salting.

We were much alarmed a day or two ago by finding the ticks on a hide of this sort plump and full, but which, although tested, failed to make any movement.

No doubt your Meat Companies and butchers object to going to the trouble and expense of constructing pits, but there can, I think, be no question which is the safer process; and it would be a serious thing for both Colonies if a consignment of hides, with the ticks, were to be sent to Sydney.

I have, &c.,

ALEX. BRUCE,

Chief Inspector of Stock.

P. R. Gordon, Esq.,  
Chief Inspector of Stock, Brisbane.

## 2. STEPS TAKEN BY VICTORIA.

Introduction into Victoria of unsalted hides of cattle prohibited.

Regulation 30th June last admitting hides from Queensland if accompanied by a certificate from an Inspector of Stock at the port of shipment that the hides have been thoroughly and effectively salted.

Queensland cattle, horses, sheep, and dogs by sea prohibited for three months from 14th July proximo.

## 3. STEPS TAKEN BY TASMANIA.

Proclamation, 6th July, 1896, absolutely prohibiting for twelve months the importation of any horses, cattle, and hides from Queensland.

## 4. STEPS TAKEN BY NEW ZEALAND.

Order in Council, 20th April, 1896, prohibiting the importation of cattle, sheep, fresh meat (with the exception of frozen meat), bones, horns, hoofs, hair, hides, skins, offal, or other part of such animals into New Zealand.

## 5. STEPS TAKEN BY SOUTH AUSTRALIA.

1. Proclamation, 17th June, 1896, prohibiting for twelve months the introduction into that part of South Australia south of the 26th parallel of latitude, cattle or horses from Queensland, unless they have been examined by an inspector.

2. Prohibiting for the same time the removal of cattle or horses (except working horses which have been dressed) from that portion of the Northern Territory north of a line commencing at a line at the 450th mile-post on the eastern boundary, between the Northern Territory and Queensland, and thence to the western boundary between the Northern Territory and Western Australia to the point where the southern boundaries of leases 1,809 and 1,811 meet the boundary of Western Australia.

3. Prohibiting for twelve months the introduction into any part of South Australia, south of the 26th parallel of latitude, cattle or horses from that portion of the Northern Territory north of the said parallel, and south of the aforesaid line mentioned in No. 2, unless under a permit from an inspector.

4. Prohibiting for a period of twelve months the introduction into any part of South Australia south of the 26th parallel of south latitude, of cattle, horses, or hides from Queensland or any part of the Northern Territory, unless such hides have been previously salted or dressed.

Steps taken by New South Wales to arrest the disease: Mr. Bruce's report was agreed to, on Mr. GORDON's proposition.

Part II (steps taken by Victoria) accepted, on Mr. PENTLAND's proposition, seconded by Mr. TABART.

Part III (steps taken by Tasmania) agreed to, on Mr. TABART's proposition, seconded by Mr. PENTLAND.

Part IV (steps taken by New Zealand) agreed to, on Mr. PENTLAND's proposition, seconded by Professor WALLACE.

Mr. GORDON, however, drew attention to the regulations recently passed in New Zealand, prohibiting the import of bones from Queensland, which, he thought, was hardly necessary.

Part V (steps taken by South Australia) agreed to, on Mr. VALENTINE's proposition, seconded by Mr. PENTLAND.

## 14. Dipping.

(a) *The best form of Yards.*

Mr. BRUCE: Unless the Queensland delegates have some plans of yards to submit, I do not think we can do anything in this matter.

Mr. VALENTINE: I think we should leave it to Mr. Gordon to submit a plan.

Mr. BRUCE: Yes; I think we should ask Mr. Gordon to submit a plan to-morrow morning.

The meeting agreed to this proposal.

(b)

(b) *The best kind of Oil and other Medicaments.*

Mr. GORDON: I am not in a position to say which of the oils that have been used in Queensland is the best. We have been using cotton-seed oil, a certain oil from New South Wales (which, however, destroys the hides), the Black Virginian oil, which is destructive to ticks, and the Apollo oil, which is also destructive to the ticks. I am not prepared to give any definite information on this point.

Mr. POUND: The oils that are best for destroying the tick are the Apollo oil and cotton-seed oil. The Apollo oil destroys ticks in twenty-four hours, and acts as a preventive for probably a fortnight. In the case of cotton-seed oil, it took a longer period to kill the tick, but it also acted as a preventive for a longer time. It might take nine days for the ticks to die with the cotton-seed oil, but the cattle would not be reinfected for fully three weeks afterwards. All things considered, I look upon the cotton-seed as the best oil. It was the first oil recommended for use in America. Any kinds of oil that I have tried in the laboratory have proved successful in killing the tick in all stages. Then there are various dipping fluids. There are a number of dipping fluids, the basis of which are carbolic acid at the strength of about 1 in 75, the results of which are instantaneous on the larval tick, but require an immersion for a longer period for adult ticks. The important thing in all these dips, which are of a watery nature, is that if you plunge the animal into it, of course, it comes out immediately, and the fluid dries and the ticks still remain alive. I put a number of fully developed female ticks into one of these carbolic solutions for different periods up to sixty minutes. Those that remained up to sixty minutes were still alive, and in the course of a few days commenced to lay their eggs.

Mr. BRUCE: Do you know of any other oil?

Mr. POUND: I have tried thirty or forty different oils in my laboratory, but as to how long they act as a preventive can only be determined by dipping in the infected districts. The people who supplied the oil for testing purposes only sent a very small quantity suitable for laboratory experiments.

Mr. PENTLAND: How much per head does it cost to dip with oil?

Mr. GORDON: The Black Virginia costs 1s. 8d., and the cotton-seed oil 4d. per head.

Mr. POUND: Might I explain a dip. It is filled with water (about 7 feet), and an inch layer of oil is placed on the top. At one end, where the bullock enters, is a platform with a tip-board. The bullock walks on the tip, and is at once thrown into the dip. The only disadvantage about this method is that sometimes the tipping of the bullock causes him to fall, dragging his hind quarters over the edge of the tip-board, which might result in permanent injury to the animal. To avoid this at some places—Longreach, for instance—the dips instead of having a tip-board, have the slanting entrance which suddenly terminates. This causes the animal to become immediately immersed. As I said before, the oil being on top of the water when the bullock plunges in, it naturally follows that that fluid touches every part of him.

Mr. PENTLAND: What about the second beast that is dipped? Is not the oil displaced by the first in splashing?

Mr. POUND: As the animals keep on being dipped the water and oil is churned up, and the result is that the water becomes filled with globules of oil so that the dipping is still efficacious. After the dipping is finished the globules of oil collect and form a layer on the top of the water as before the dipping commenced. I have seen 350 bullocks efficaciously dipped at the one time by repeatedly adding the oil.

Mr. PENTLAND: I think we should be able to dip more cheaply. If an effective dip can be made of lime, sulphur, and soap, as recommended by Professor Wallace, it would be the very thing that is wanted.

Mr. POUND: I have never tried the sulphur and soap, but I have tried dry sulphur. Mr. Bruce and I did so on some calves, but the ticks simply matured.

Mr. BRUCE: Cooper's dip is very largely advocated. It seems to my mind that nothing but the oil would be effective.

Mr. PENTLAND: The sulphur, as we are all aware, remains a considerable time in the fleece of sheep. This is a great consideration. The oil remains on the hides only a short time, and if the sulphur can be mixed with something so that it would remain in the hide of the beast, it would render the cattle immune from attack when travelling. If the sulphur can be retained in the skin so as to last a longer time, there would be a less liability of infection taking place.

Mr. POUND: In the case of sheep, of course, the condition of the sheep's wool will enable it to retain the sulphur until the sheep is shorn. Cattle will not retain the sulphur for any length of time. Another thing is that cattle are continually shedding the cuticle of the skin, that is to say, "sloughing."

Professor WALLACE: I should say that cotton-seed oils have been proved to be the most efficacious. I got my idea of using soap in dips from the fact that soap is efficacious for destroying insects on trees. I would suggest that the answer to the question should be, "Apollo oil and cotton-seed oil have been found most efficacious in Queensland up to the present time, yet the question requires further research."

Mr. PENTLAND suggested that Professor Wallace's mixture should be included in the answer as a suggestion.

*Prof. Wallace's Mixture.*—25 lb. sulphur to 18 lb. lime boiled in 20 gallons of water for 20 minutes, 2 oz. of soap to be dissolved in every gallon of water, and the solutions mixed in proportions to be determined.

The meeting agreed to the above suggestion.

Mr. BRUCE: Did I not understand Mr. POUND to say he did not think there was any use in using sulphur on cattle?

Mr. POUND: I say try everything possible.

Mr. GORDON said that the Queensland Government had received many suggestions of dips, which on being tested in most cases proved failures.

Mr. Cameron (Government Veterinarian, of Victoria) arrived and took a seat at the table.

Mr. POUND made the following explanation regarding dipping:—

"Dipping is being carried out in Northern Queensland at a time of the year when it is favourable for the cattle and unfavourable for the tick. It would be more satisfactory if dipping were carried out in the summer months. I may mention that it is noticed that cattle after being dipped appear much quieter

\* NOTE.—Prof. Wallace gives this recipe merely as a basis upon which to determine the strength to be applied. This will vary under different conditions.

quieter and healthier than those undipped. The undipped cattle stand for hours in the lagoons, care very little for food, and become emaciated. As to the oil being efficacious in killing the tick, that is proved beyond all doubt. There is a wire in this morning's paper from Ingham, which reads as follows:—

Brisbane, Wednesday.

An Ingham telegram states that there are still a great many cattle dying from ticks throughout the district, but only 1 per cent. of the herds that have been regularly dipped has succumbed.

A Barcaldine telegram states that the district stock inspector reports that the traffic in stock for the south is almost paralysed."

Mr. PENTLAND: After cattle have been dipped the ticks drop off. When they drop off the yards in which they are dipped become infested, naturally. Should not the yards be disinfected at the same time?

Mr. POUND: Mr. Pentland misunderstands my views. If you dip cattle the oil will certainly kill the ticks, although they may drop off. If a single drop of oil touches a tick it kills it.

Mr. VALENTINE: Then you consider the dipping is perfectly efficacious?

Mr. POUND: The dipping is efficacious in destroying every tick on the animal.

Mr. VALENTINE: If you dip a beast, and then take it on to clean country, there would not be the slightest danger of its becoming a source of infection to that country?

Mr. POUND: There would be no danger of infection.

Mr. BRUCE: That is what we want to know.

Mr. BRUCE: Does not the oil spread when it touches the tick?

Mr. POUND: If a drop of oil touches a tick it spreads all over its body by capillary attraction.

Dr. COBB: I see that we must rely to a very great extent upon Mr. Pound, who seems to be the only one present who has properly investigated the tick in Australia. I would like to ask Mr. Pound for a definite statement, not only whether ticks are killed by dipping, but whether he is reasonably sure that no eggs or young can possibly hatch from ticks that are fairly matured and that have dropped from cattle that have been dipped.

Mr.

Mr. POUND in answering this question exhibited specimens of ticks dipped in Apollo and cottonseed oil and a weak solution of the former. The three oils destroyed all vestige of life.

Dr. COBB: I do not think Mr. Pound has quite understood my question. Suppose a beast is to be dipped which is covered with ticks in all stages. Suppose one of these is a gravid female. Now, I would like to hear whether Mr. Pound can say that none of the eggs which exist in this tick can possibly hatch.

Mr. POUND: It must be understood that while a tick is attached to an animal there is no ova.

Mr. PENTLAND: I would like some opinion on another point. If the cattle are dipped, what does Mr. Pound recommend to be done? Should they be removed to clean pasture, or should they be put back on their own pasture?

Mr. POUND: In most cases there is no clean pasture within hundreds of miles from where cattle should be dipped.

Mr. BRUCE: Which are the hardest to kill with the oil, the young tick or the comparatively full-grown tick; which would die first?

Mr. POUND: In either case they are destroyed very readily. In some dipping fluids the young ticks will die quickly and the older ticks are not so readily killed, and in other dipping fluids the order of things is reversed. In the case of oil, however, it effectually destroys all tick-life and ova in twenty-four hours.

Professor WALLACE was of opinion that dipping is more a temporary relief from the inconvenience of animals on which ticks are very abundant than as a preventive of the disease, and is a matter for the stock-owner to consider in his own interests, and should not be made compulsory except in the case of infected or suspected cattle going to travel in clean country.\*

(c) *The best form of Dip.* (d) *The mode of Dipping.*

Dr. COBB: I think we might hasten over (c) and (d) and request Mr. Pound or Mr. Gordon to prepare a report for the Conference to consider and, if thought desirable, adopt.

Mr. POUND: The form of dip that I would propose is about 4 feet wide at the top and 2 ft. 6 in. at the bottom and about 30 feet long and 7 feet deep. Some of the dips are made with perfectly vertical ends with a tip-board as I before described, but I prefer the sloping entrance.

Professor WALLACE: I would suggest that these minor questions be passed over and more attention given to the greater questions to be discussed. The time is very short.

Mr. BRUCE: I do not see how we can depart from the business-sheet.

Mr. PENTLAND: There is one thing that struck me in reference to dipping. I have heard that in some dips the heads of cattle have not been properly dipped. Is that your experience, Mr. Pound?

Mr. POUND: Every dip I have seen has properly immersed the cattle.

Mr. PENTLAND: I am very glad to hear that such is the case. I heard that it was not so.

Dr. COBB: Having withdrawn my vote, I have not the power to make a motion; but if I had I would move that questions (c) and (d) be handed over to the Queensland delegates to submit a statement to-morrow morning. That would save much time. I offer this as a suggestion.

The meeting decided to adopt that course.

(e) *When should Dipping be used by Owners?*

Mr. GORDON: No stock should be allowed to go through suspected districts without being dipped along the road.

Mr. POUND: I have been informed that one station where, although a tick has never been seen, the owner is constantly dipping his cattle. Numbers of other stockowners have erected dips and commenced dipping straight away though their stock has never been troubled with the tick.

Mr. TABART: A stockowner in Tasmania informs me that he dipped 4,000 or 5,000 head of cattle most successfully, but on large stations covering perhaps some hundred square miles of country, I think dipping is most impracticable. I will take an instance of possibly 40,000 head of cattle. Suppose you can

\* This note was made by Professor Wallace during some discussion on the subject of compulsory dipping, but was afterwards withdrawn on the Conference agreeing to the decision given above.

can muster 30,000 head, how are you to get the balance of 10,000 within a reasonable time to complete the operation. It is out of the question to think of mustering the whole herd for the purpose of dipping.

Mr. BRUCE: The owner may have three or four dips.

Mr. POUND: I might say that dipping cannot be carried out in every case. For instance, in the North-western Territory of Queensland, where we often find wild cattle, 2 or 3 years old, which are difficult to muster.

Dr. COBB: Of course we have to keep in mind that we have to make recommendations to the Ministers. We have either to recommend or not to recommend private owners to dip. Then there is another point. We have either to recommend or not to recommend to the Government to compel private owners to dip.

Mr. BRUCE: That comes under the next question.

Mr. POUND: I would recommend that all owners in coastal country be compelled to dip their cattle.

Mr. VALENTINE: We should also recommend how often the dip should be used.

Mr. PENTLAND: It seems to me that dipping is no good, because cattle put on the infested country, after having been dipped, are reinfested. Then you have to dip again; so that you have a stockowner in continual turmoil. I think remedial measures should come under the heading of Inoculation.

Professor WALLACE: Dipping, to my mind, is no good whatever for eradicating the disease. Dipping can only be of value in a country where the ticks are so numerous that they injure the animals. But I think when we have got the tick on a station we should allow it to spread as fully as possible, so as to stop the death of the cattle by red-water. In other words, to check the development of ticks after they have established themselves only delays the time when immunity from the disease may be naturally expected.

Dr. COBB: At 4d. each once in three weeks, it will cost us 5s. a year per animal, to say nothing about the cost of constructing the dip.

Mr. POUND: I would recommend that owners of small lots of cattle on selections should dip their cattle. There is no trouble in mustering cattle on small selections. I would recommend dipping in these cases as an amelioration. One attack of disease does not prevent an animal from suffering from a second acute attack.

Professor WALLACE: Ticked cattle are immune to disease in a tick-infested district; but transport them to clean country, and then take them back again to tick country, and they will take the disease.

The meeting recommended continual dipping in practical country, and added the following opinions on the recommendation of Mr. Pound:—

*When should Dipping be made use of by Owner?*

- (1.) When the first symptoms of the disease are observed in a herd, whatever the size of the run may be, the infected and suspected portion of the herd should be dipped, as in that way the disease may be stopped.
- (2.) When the disease appears in a paddock in which cattle are being fattened, they might be dipped; and, if the disease again appear, dipped again; and in this way they would likely be protected till they are fit for market, although the dippings might throw them back somewhat in condition.
- (3.) Even when the disease had obtained a strong footing in a large herd, if the cattle are running in paddocks and can be mustered, it would be advantageous to dip.
- (4.) In the case of dairy and other small herds, it will always be advantageous to dip.

*Should Dipping be made compulsory?*

The meeting arrived at the following determinations, being the views expressed by Mr. Pound:—

Yes, in such cases as the following:—

- (1.) In the case of cattle in a quarantine area, travelling from an infested run, through suspected, but not declared infected, country to market, the dipping to be on the owner's own run (unless a public dip is near), at his own expense.
- (2.) In the case of cattle travelling from doubtful country into clean country, the expense to be borne as in No. 1.
- (3.) In the case of cattle which have travelled through infected country, the expense to be borne as in No. 1.
- (4.) In the case of cattle which have come into direct or indirect contact with infected or suspected stock, the expense to be borne as in No. 1.

## 15. Whether Hides should be Pit or Dry Salted?

Mr. GORDON said that in the regulations about to be framed in Queensland provision will be made that no hides shall come down from the north unless they have been dry-salted, and a certificate produced from the Inspector that they have been properly salted, and a declaration from the owner that they have been seven days in salt.

Mr. POUND said that experiments had been carried out to see how long salt solutions would take to destroy ticks. It had been suggested to dip infected cattle in sea-water, and he carried out the experiment of placing ticks in sea-water, which contains about 3.5 salt, with the result that they lived twenty hours, and in a saturated solution containing 36 per cent. salt they lived four hours. He had had a lot of experience in watching hides from Rockhampton, Townsville, Alligator Creek, Normanton, Burketown, and other places, with the result that in all hides properly dry-salted the ticks were destroyed in twenty-four hours. The hides, he explained, are salted on the flesh side first—approximately 10 lb. of salt per hide—and they remain in that position for about three days, when they are turned over and resalted, and remain in that position also for three days. No hides were sent away for export until having undergone this process for six or seven days. When it was considered that tick-infested hides have been coming down from the Gulf ports for several years, it was clear indication that the dry-salting process was quite sufficient. Even if hides were indifferently dry-salted, the capillary attraction from one hide to another would cause the salt to penetrate every part.

Professor

Professor WALLACE moved,—“That it is the opinion of this meeting that dry-salting is preferable to brine or pit salting.”

Seconded by Mr. GILRUTH.

Carried.

Mr. PENTLAND said would it not be as well, in giving certificates, to state the quantity of salt as against the weight of the hide. Sufficient might not be used in some cases.

Mr. POUND said that in every case in Queensland salt had always been used in excess.

Mr. GORDON authenticated Mr. Pound's statement.

Mr. POUND pointed out that owing to the additional weight the salt gave the hide it was always to be found that the butchers and meat companies used it to excess.

Mr. PENTLAND moved,—“That dry-salting of hides be accompanied by a certificate from a competent officer that they have been thoroughly and effectively salted for a period of not less than seven days, and a declaration to the same effect from the owner.”

Seconded by Mr. TABART.

Carried.

Professor WALLACE moved,—“That ticked hides should be binned with the hairy side in, and hides free from ticks with the hair outside, and a penalty be inflicted upon anyone who exposes for sale hides not folded according to the above proposals.”

Seconded by Mr. GORDON.

Professor WALLACE said that his first object in proposing this motion was to fall in with the objection raised by many people and prevent the tick dropping from the hides. His second object was to enable the tick-infested hide to be distinguished from the clean hide at once.

The CHAIRMAN thought it would be a help to the Inspector to be able to at once sort out the tick-infested hides, as it was a difficult matter to look over 500 or 600 hides. It would be a great help to him if the tick-infested hides were folded up in a certain manner.

Mr. VALENTINE pointed out that if a man suspected tick in his hides he would not fold them up in a certain way, thus depreciating his property.

Professor Wallace's motion was then put and negatived.

## 16. Licks and Drenches.

Mr. STANLEY: This disease is scarcely known in salt-bush country. I have not the slightest hesitation in saying that the only medicinal remedy that we may look for as being practicable for animals will be in the shape of licks, and in all probability these must be of a saline nature that will make the condition of the animal such that the tick organism will not be able to easily subsist upon its blood.

Mr. POUND: Dr. Hunt and myself have conferred upon this matter, and we thought after the reports we had received from South Africa with regard to the treatment of the disease there that is somewhat similar in nature to this, that it would be well to try experiments with arsenic administered with salt. We know that in Queensland the cattle are passionately fond of salt. It is quite correct that in the salt-bush country the disease is not of the same virulent nature as in the coast country, where the grasses are favourable for the ticks.

Mr. PENTLAND: What conditions are most favourable for the disease?

Mr. POUND: The coast country grasses afford the tick the best protection, and hence the virulence of attack in such districts.

Mr. GILRUTH: Have you found in your experiments that any particular animal showed any more immunity than any other?

Mr. POUND: No; I cannot say that. We have found ticks upon many animals, but the effects of it are not the same as on bovines.

Professor WALLACE: The coast country where grass prevails is the most favourable for ticks, and dense salt-bush country is free from ticks, but I have no faith in salt. One thing has been found most successful in connection with horses in South Africa, and that is sulphur. Carbolic acid has been found useful for the treatment of ticks after they are developed. Arsenic, on the other hand, is likely to be very useful, but extremely dangerous, because some cattle might take the lick too freely. Sulphur, to my mind, is the great enemy of all parasites, and it will be the safest remedy internally. Externally, rubbed along the back, it has been found most efficacious in clearing off the ticks.

Mr. POUND: Mr. Bruce and myself had a cow and a calf under observation. We rubbed that calf well with sulphur, and allowed it to run on an infested place. It soon became infested with ticks, and when we examined the skin we found that they simply revelled in the sulphur as if it were a shower-bath. From my experience, I do not think sulphur does the slightest good.

Mr. GORDON: In my experience, country of a saline, cretaceous nature is altogether unfavourable for ticks.

Mr. POUND: It is not so much a question of cattle eating salt or anything else, so much as the nature of the country and the harbour it affords them that effects the ticks.

It was decided, on the motion of Mr. GORDON, seconded by Professor WALLACE, that the reply to Question 3 should be that experiments with licks and drenches are desirable.

## 17. Risk of Infection.

Mr. GORDON: We have a little island about 3 miles from the coast. There has been no traffic for years with horses or cattle, but the tick are present on that island now. They have been carried over perhaps by blackfellows' dogs or in some way, but we have no evidence as to the manner in which they got there.

Mr. POUND: I have conducted a good many investigations with respect to the way in which ticks are carried from place to place. Briefly put, I found ticks on wallabies, kangaroos, ibis, cranes, and other birds, but always in the larval stage. Although I cannot say definitely that these animals and birds are the actual agents, I think I can safely say that they act as agents of distribution. We have very good evidence that ticks can be carried by agents other than cattle.

Dr.

Dr. COBB: Mr. Chairman and gentlemen,—In speaking to this question I beg to ask your indulgence if I apparently depart from the subject under discussion. The reason I ask your indulgence in this respect is that I have several times during the Conference been summoned away to attend my Minister, and have thus unavoidably missed the discussion of several important topics. Some of the remarks I shall make would have been made earlier if I had had the opportunity.

The outcome of this Committee's work must be one of three things, viz. :—

- 1, It will recommend that the spread of the ticks be delayed as much as practicable; or,
- 2, It will recommend that the tick be allowed to spread unhindered, or even encouraged to spread; or,
- 3, It will make no specific recommendation on this head.

If it makes no recommendation, the action will be construed to mean that the Committee does not know which of the first two courses should be followed, or, in other words, that the Committee does not know its business. I am sure that this latter is not the case; therefore, the matter sifts down to the action the Committee recommends with reference to the spread of the tick.

It has been suggested that the country should be "ticked up" as soon as possible; that is, that the tick should be encouraged, or at least allowed, to spread as far as it will, as fast as possible. This course of action seems to me to be against common sense, and inconsistent with the practice in other diseases. So far as we know, there is no possibility of preventing the spread of this tick into all localities favourable to its growth. All the investigations tend to show that this is so. We have seen that the larval ticks are carried about from place to place by agencies entirely beyond human control. They are blown about by the wind; they are carried from place to place by wild animals and birds. These birds and other agencies pay no attention to human quarantine lines. I repeat, the larval ticks are carried from place to place by agencies beyond human control, and that, therefore, ultimately the tick will spread into every locality suitable to its growth.

Now, what do we do in other cases of a similar nature? Take tuberculosis. This is also a disease carried about by agencies beyond human control. We know that in all probability tuberculosis will spread to every place suitable to its growth. What do we do? We do not say, "Let it spread." We do not say, "Encourage it to spread," in the hope of ultimately getting cattle, &c., that are immune. No; on the contrary, we do everything we can to prevent it. I am indirectly interested in cattle stations now free from tick. When my advice is sought with regard to these stations, I say, "Keep the ticks out; put off the evil day as long as you can." It seems to me this is the course dictated by common sense and consistency. I have absolutely no sympathy with Professor Wallace's suggestion that we should "tick up" the country as soon as possible, or let it "tick up" any faster than we can help. What a monstrous position we should be in, after having encouraged the spread of this tick, if next year a means should be discovered to prevent its spread.

This is the reason why I am most strongly of the opinion that we should recommend that everything practicable should be done to prevent the spread of the cattle tick.

Now, this Committee have affirmed that the cotton-seed oil dip is effective in killing all the ticks on a beast if properly carried out, and for this reason it seems to me inconsistent to talk about recommending the prohibiting of the passage of cattle from infested or suspected areas on to clean country. If the dip is effective, what is the objection to allowing cattle to leave the boundary of infested country to go on to clean country immediately after being properly dipped,—especially when we consider the fact that ticks must constantly be leaving this same infested country on the wings of birds and in the fur of wallaby and kangaroos? Remember that we have evidence that this is a common thing. It seems to me, therefore, that the ultimate outcome of all this discussion will be the conclusion that it is safe and practicable to allow cattle to proceed from infested or suspected country on to clean or suspected country, providing they are properly dipped on the border just before proceeding, and further, providing they are again dipped at a further stage of their journey within the time it takes ticks to mature. I add this latter precaution because I recognise that ticks are bound to accumulate about the dips, especially if the dips are in localities favourable to the growth of the tick; and I may here remark that I hope all the Queensland and New South Wales dips have been erected in such localities. If they have not, it is a radical mistake. The larval ticks having accumulated about the dip, it is possible that some few of these might find a foothold on the dipped cattle. A second dipping within the period these require to mature, and after the cattle had travelled a certain distance, to be regulated by law, would act as a precaution against the spread of the tick through their agency.

It must be borne in mind that suspected country must always in the stock regulations be looked upon as both infested and clean, simply because we do not know which it is. If clean, we do not wish to infest it; if infested, we must not allow cattle to leave it without being dipped.

Of course the moment, no matter how soon, dipped cattle enter either infested country or suspected country, they must by that very fact come again under the dipping regulation, and must not be allowed to leave for either clean or suspected country without dipping.

I think it would be unwise to interfere with the cattle trade to a greater extent than this in light of our present knowledge.

The dipping must, of course, be properly done. This is not difficult or excessively expensive; and, when we consider the efficacy of modern quarantine methods, there can be no doubt that these colonies can provide the machinery for the success of these regulations.

Professor WALLACE: I quite agree with everything that Dr. Cobb says about the probable spreading of the tick, but I entirely disagree with Dr. Cobb about the dips. I think infected cattle should—dips or no dips—be absolutely restricted from leaving infested areas.

Mr. PENTLAND: I contend that although Dr. Cobb is right in certain respects, the gravity of the risk of infection is so great that the most rigid restrictions should be placed upon the removal of cattle from infested areas, or any area that is not absolutely known to be free from ticks.

Mr. POUND: There is really no possibility of cattle, after being properly dipped, picking up ticks again within (say) three weeks at least. There are, I may say, thousands of cattle being dipped in Queensland now. There is one thing I have noticed that might be a cause of ticks spreading. I have found ticks on roley-poley, and it is well known how the tussocks of this grass roll across a paddock before the wind.

Mr. GORDON: Ticks may be carried to other Colonies on the straw used for packing, bananas, &c.  
After

After discussion it was resolved,—“That Queensland observations show that ticks may be spread by any moving or movable object, including domestic and wild animals and birds, these acting as intermediary agents for the conveyance of the larval tick. The extent of the consequent risk cannot be reliably stated at present, but it is probable that it is not very great.”

#### ADDITIONAL QUESTIONS SUBMITTED TO THE COMMITTEE BY THE CONFERENCE.

1. *Are there any instances in which the Tick infest the Cattle without being followed by symptoms of Red-water or the Disease known as Tick Fever?*

Symptoms are always shown in the early or first attack of the tick, namely, fever and red-water. But in chronic cases of tick infection the acute symptoms may not be noticeable, although the micro-organism is always present in the blood. Proposed by Mr. STANLEY, seconded by Mr. POUND. Carried.

2. *The length of time the Tick will live without finding a Host.*

The maximum time known to elapse between the dropping to the ground of a female tick and the subsequent attachment of the progeny to a fresh animal, according to Mr. POUND'S Australian experience, is one year at least, and the minimum time one month. Moved by Mr. GILBERT, seconded by Mr. POUND. Carried.

#### *Length of Time.*

Mr. POUND: Before we received this report from America I may say that ticks were kept alive for seventeen weeks. An argument put forth was—Why should not these ticks subsist upon the egg-shells? We removed the egg-shells, and the ticks had, therefore, nothing at all from which they might obtain nutriment. These ticks in the bottle were put in on the 12th May, and they have, therefore, lived four months. If we take a number of ticks they will live together in a colony, as it were, longer than if they are isolated. It is only when they are in large numbers that they are able to exist without food. Seventeen weeks is the longest I have seen them live. In American reports I have seen it stated that ticks have lived without food for six months. It must not be forgotten that ticks will only exist in this way under what may be termed favourable conditions. We must not overlook the fact that temperature and moisture have something to do with the prolonged existence of larval ticks. My remarks do not, of course, apply to mature ticks.

Mr. PENTLAND: How long will ticks live in pastures?

Mr. POUND: We have conducted experiments by placing ticks in test tubes. Some of the ticks are exposed to sunlight and moisture, while others were kept as controlling tests in a place where the ticks were protected from such influences. We found that they could not stand the sunlight and moisture; they soon succumbed to it.

Mr. GILBERT: I think that in speaking about the tick we must also take into consideration the egg. I think the question we are discussing means how long does it take from the time of the female falling off, the laying of the egg, the incubation, &c., till the time the young tick finds another host?

Mr. POUND: In our answers we must not overlook the fact that there are certain conditions which are favourable to long endurance of tick-life. Now, in the summer time, the egg-laying process will last six or seven days. Three weeks after that the young ticks emerge, and then they will remain alive in bottles for three or four weeks. But, in the case of ticks that are removed from the animal in midwinter, such ticks do not commence laying their eggs until twelve days after being put in the bottle, and, so far as I can see, the process of oviposition will last some months. I have some eggs that were laid last February. They were kept in a cool cellar, and when we take any of those eggs out and place them in a warm temperature they will hatch in a few days; while, in this colder weather, they will take a good deal longer.

Professor WALLACE: The sheep tick can live for nearly twelve months. The Americans found that young ticks will live for four and a half months without blood or other nourishment.

Mr. GILBERT: In the experience of Mr. POUND, the period that may elapse between the tick leaving its host and its progeny finding another host is, under certain circumstances, twelve months.

Mr. POUND detailed certain trials he had conducted, for the purpose of showing how necessary it is to thoroughly salt hides that are taken from an infected beast. In the first case, he noticed that certain small butchers who killed a bullock now and then were rather economical with the salt, and he took a piece of one of these imperfectly-salted hides, which he kept under close examination. This was on the 21st May, and on the 12th June the ticks were still alive. He reported this matter to his Government, so that a caution could be published in the papers. In the second case a piece of unsalted hide covered with ticks was taken. In a few days it became decomposed, but soon, in the hot, dry weather, it dried up. On the fifteenth day he removed some ticks, and again on the twenty-second day. Strange to say, four days after the removal of each of these series of the ticks, they commenced to lay their eggs. He thought these experiments proved conclusively that imperfectly-salted hides can act as a vehicle for the transmission of ticks.

Mr. PENTLAND: The time which a tick will live on an untreated hide will be from five to twenty days.

This was submitted as a reply to Question 3.

3. *How long will the Tick live on the untreated Hide?*

Proposed by Mr. PENTLAND, and seconded by Mr. STANLEY,—“From a series of carefully-conducted experiments by Mr. POUND, it has been proved that the tick will live on untreated hides from five to twenty days.”

*Answer:—Yes.*

#### *Licks and Drenches.*

After discussion, Mr. GORDON moved, and Professor WALLACE seconded,—“That experiments with licks and drenches are desirable.”

Motion carried.

### INOCULATION.

Mr. POUND said that Dr. HUNT had carried on a series of carefully-conducted experiments, with a view of ascertaining whether by some method of inoculation cattle could be protected from tick fever. Seven inoculated animals with an equal number of controlled or healthy animals were placed in a tick infested district. After five or six weeks they were covered with ticks, and one of the controlled or uninoculated animals died, which looked very promising; but within another week one of the inoculated animals died. Consequently, after waiting several months, we can only say that our observations in this direction are not altogether unsatisfactory, but very inconclusive. It has frequently been stated that inoculation with pleuro virus will prevent cattle from suffering from tick fever. A certain station within the tick-infested district in the Gulf country inoculated some 2,000 bullocks, and then travelled them through tick country to the south. It was pointed out by the owners that the very small death-rate was due to the fact that the cattle were inoculated with pleuro virus. I maintain that we cannot draw any conclusions from these observations, inasmuch as there were no controlled animals. What should have been done was to have inoculated half the mob, and allowed them to travel with the uninoculated precisely under the same conditions, then we should be in possession of some reliable information bearing on this question.

On the motion of Mr. STANLEY it was decided that no satisfactory experiments in inoculation have been made, and the information forthcoming concerning the disease is that an animal enjoys no certain immunity from a previous attack.

---

### DEPUTATION.

During the forenoon a deputation, consisting of gentlemen representing the tanning industry waited upon the Expert Committee to explain their views with regard to the treatment of hides for export. They stated that the tanners are unanimously in favour of dry-salting in preference to pit-salting, as the latter, on account of the moisture it contained, not only damaged the hides but greatly deteriorated the value of the leather.

A suggestion, by Professor WALLACE, that ticked hides should be "bibled" wrong side out, and clean hides *vice-versa*, and that a penalty be imposed on shippers who did not observe such regulations, was received by the deputation with approval.

The Chairman, on behalf of the Committee, thanked the deputation for the information given.

1896.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

LEPROSY IN NEW SOUTH WALES.

(REPORT ON, FOR THE YEAR 1895.)

*Printed under No. 26 Report from Printing Committee, 11 November, 1896.*

The Secretary to the Board of Health to The Under Secretary for Finance and Trade.

Sir, Board of Health Office, 127, Macquarie-street, Sydney, 30 September, 1896.

I have the honor, by direction of the Board of Health, to forward you herewith a report on Leprosy in New South Wales for the year 1895, and to suggest that it should be laid before the Houses of Parliament.

I have, &c.,

CLARENCE A. SIMMS,

Secretary.

On 1st January, 1895, forty persons remained under detention at the lazaret. [See *Appendix A.*]

During the year ten persons were reported to the Board under the Leprosy Act, 1890, as being suspected lepers. Three of them were eventually admitted to the lazaret under warrants which were issued by the Board after careful investigation.

Five patients died during the year—one was a native of India, one of New Caledonia, one of China, one was a native of Ireland, and one was a native of New Zealand of European descent.

One patient was discharged in accordance with the powers granted to the Board under subsection 2 of section 4 of the Act. He had been admitted in 1888 at the age of 14, and from the time he fell under observation his symptoms steadily receded until, as far back as two or three years ago, little remained but some deformities. These were evidence not of active disease, but of disease which had existed and which had caused mutilations during the bygone term of its activity. In view of his apparent recovery his relatives had for some time back made repeated applications for his release. These the Board felt unable to grant until they had satisfied themselves, both by lapse of time and repeated examinations, that no danger to the public health could result. This conclusion being at last warranted in their opinion, and the patient's relatives having shown to the satisfaction of the Board that they were able to and would suitably provide for his care and keep, the Board authorised his discharge.

Thus the number remaining in the lazaret on 31st December, 1895, was 37 persons; 16 of them were whites, of whom 4 were females; the remaining 21 were members of various coloured races.

In Appendix B appears a complete statement of the sex, nationality, occupation, age at and date of admission, residence, and date of decease of all persons admitted to the lazaret from the beginning. The Roman numerals have reference to further details given in Appendix C, which is mentioned again below.

From the Appendices named it will be seen that the total number of persons admitted since 1883, when patients first began to be received (though the notification of leprosy and the detention of lepers were first provided for by law only at the end of 1890), is 58. Distributed under nationalities the account stands as follows:—Natives of New South Wales, 15, of whom 4 have died and 1 has been released; of Queensland, 1; of England, 2; of Ireland, 2, of whom 1 has died; of New Zealand, 1, deceased; of Fiji, 1; of Germany, 1; and all these were whites of European descent. There were also 29 natives of China, of whom 11 have died; of India, 2, of whom 1 has died; of the West Indies, 1, discharged in 1885; of Java, 1; of the New Hebrides (Tanna), 1; of New Caledonia, 1, deceased; and all of these were coloured people.

In the third Appendix (C) are given, as usual, aetiological notes of the cases of new patients received during the year. To these are now added for the first time histo-pathological notes and some photo-micrographs. Its contents have great interest in relation to many important questions concerning this disease which still remain incompletely answered; but, as they are strictly technical in character they are not attached hereto, and, as before, will be issued only to medical men specially interested in the subject and to the libraries of learned societies.

Every opportunity has been given to members of the medical profession to visit the lazaret for the purpose of seeing such patients as were formerly under their care, and for study of the disease.

The following statements show the total expenditure for the year 1895 and the source from which the moneys have been paid :—

STATEMENT of the total Expenditure of the Leper Lazaret (male and female) at Little Bay during the year 1895, showing from what sources the amounts have been paid :—

EXPENDITURE.			HOW PAID.		
	£	s. d.		£	s. d.
To working expenses, as per attached statement	2,824	4 11	From vote for the maintenance of Lepers by the Board of Health	2,067	18 5
„ cost of alterations to coal-shed	66	14 0	From vote for stores by the Controller-General of Stores	441	16 1
„ erection of bedroom for Chinese	39	5 0	From votes under control of Government Architect	264	4 7
„ erection of microphones	23	10 0	From vote of the Coast Hospital by services and stores transferred	329	2 10
„ fees for medical examination of lepers, proved and suspected	25	4 0			
„ painting buildings	124	4 0			
<b>Total</b>	<b>£3,103</b>	<b>1 11</b>	<b>Total</b>	<b>£3,103</b>	<b>1 11</b>

STATEMENT showing the Working Expenses of the Leper Lazaret (male and female) at Little Bay for the year 1895 :—

	£	s. d.
Salaries	701	17 2
Provisions	1,112	13 1
Fuel	146	9 0
Drugs, disinfectants, &c.	286	17 11
Fruit	69	10 6
Tobacco, cigars	72	0 0
Drapery, bedding, uniforms, &c.	157	16 8
Furniture, ironmongery, brush, glass, and crockery wares	87	19 11
Books, papers, &c.	2	7 9
Material for repairs	35	18 11
Wines, beer, and spirits	100	19 10
Sundries	49	14 2
<b>Total</b>	<b>*£2,824</b>	<b>4 11</b>

\* Being equal to an average of 272 Os. 11d. per inmate per annum.

It has been the earnest endeavour of the Board of Health to mitigate the sufferings of these unfortunate patients. Their wants have been carefully attended to by an experienced wardman in charge, and by attendants and nurses, under direct supervision of the Medical Superintendent and Matron of the Coast Hospital.

Sydney, 7th November, 1896.

J. ASHBURTON THOMPSON,  
President.

## APPENDIX.

\* These are all natives of New South Wales, of European descent. † Date of report. These patients were afterwards removed to Little Bay. ‡ Of European descent. § This patient was transferred to a Hospital for the Insane on 2nd April, 1885, where also his death occurred. ¶ This patient was discharged on the 29th December, 1885 (see note \* to Appendix A). Notes. (a) The only additional cases of leprosy in New South Wales which have been reported to the Board of Health are P.S., et. 33, died in the Richmond River District in March, 1887, and G.R., et. 28, whose death, certified by his medical attendants, was reported by the City Coroner on the 18th July, 1889. Both of these persons were of European parentage. (b) On comparison with the reports for previous years differences in ages or dates of admission of some coloured patients will be observed. Those now given are the correct ages and dates.

1896.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

DR. TAYLOR, SUPERINTENDENT, LITTLE BAY  
LAZARETTE.

(RETURN RESPECTING.)

*Printed under No. 11 Report from Printing Committee, 30 July, 1896.*

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated 1st July, 1896, That there be laid upon the Table of this House,—

“Copies of all correspondence between Dr. Taylor, Superintendent, Little Bay Lazarette, and Dr. Anderson Stuart, President of the Board of Health, in reference to the censure passed by the latter upon the former for alleged failure to report a case of leprosy.”

(*Mr. O'Reilly.*)

No. 1.

Memorandum from The President, Board of Health.

Board of Health Offices, 127, Macquarie-street, Sydney, 16 May, 1896.

THE following memorandum refers to charges brought against the Board's administration of the Leprosy Act in the columns of Sydney newspapers. The articles in question are attached hereto. (*Enclosure No. 20.*)

The Board has good reason to believe that some, at least, of the statements on which these articles are founded were furnished by Mr. George Henry Taylor, the Medical Superintendent of the Coast Hospital, and in charge of the Lazarette at Little Bay.

For a public officer to make information acquired in his official capacity the basis of an attack upon his superiors is obviously improper, and contrary to Article 74 of the Public Service Regulations.

The principal statements reflecting upon the Board's administration are to the effect that there are at present confined in the Lazarette two patients whom the Medical Superintendent considers ought to be at large. These statements manifestly refer to the cases of H.J.T. (a white man) and G.Y. (a Chinaman).

H.J.T., aged 52, was admitted on the 10th October, 1894, on certificates signed by Drs. Ashburton Thompson and W. H. Goode. While in the hospital his disease appears to have been on the whole stationary, although showing slight signs of advance in some respects, and it appeared to the Board, on the recommendation of its officers, that in this case it would not be unreasonable to consider the propriety of allowing H.J.T. to leave the hospital and return to his family. This question was carefully considered by the Board at several meetings held in June, July, and August, 1895. Inquiries were made through the police and through private persons as to the prospects of his being able to live in comfort if discharged from the Lazarette, and the officers of the Board had many interviews with members of his family on the same subject. As a result, it was found that the circumstances of his family entirely prevented them from maintaining the patient, and his physical health would certainly prevent him from maintaining them, if detained in any place which might in accordance with law be proclaimed as a private lazarette. It was further reported to the Board that the mere rumour in the district where they lived of their father being a leper was sufficient to lead to the exclusion of the members of his family from such employment as had hitherto been open to them. As a consequence, the Board made representations to the Chief Secretary, with the result that an allowance has been made by the Government to his family for their support. There can be little doubt that, under the circumstances, the Board came to the correct conclusion when it decided that, both in the interests of himself and his family, it was best for this man that he should remain in the Lazarette.

It

275—A

[605 copies—Approximate Cost of Printing (labour and material), £23 1s. 0d.]

It may be observed in passing that Mr. Taylor was acting as Medical Superintendent of the Coast Hospital at the date that H.J.T. was admitted, but he does not seem then to have reported to the Board his difference of opinion from the certifying gentlemen. Yet on the 7th February, 1896, he made this statement:—

The man T. is married and has eight children. He enjoys robust health, and although he has certain symptoms of nerve leprosy, I emphatically state that they are not sufficient to warrant his detention in the Lazarette, nor were they sufficient to warrant his being certified as suffering from leprosy. (*Enclosure No. 15.*)

Dr. Ashburton Thompson, on the 21st June, 1895, says as follows (*Enclosure No. 9*):—

On the whole, it will be seen that there is no change in T.'s condition from that described at first and subsequently.

Further, on the 5th March, 1896, Dr. Ashburton Thompson re-examined the patient, and next day he reports as follows (*Enclosure No. 10*):—

The general outcome of the above notes shows that H.J.T. remains in the state described last June, and there has been the improvement in general health usually (or often) observed in lepers after admission under regular dieting and treatment. Some improvement in minor local respects, such as is common in a disease whose manifestations are subject to fluctuations; and advance in the trophic affection of the right hand, as well as increased (or at all events now manifest) wasting of the muscles of the left. Lastly, and merely for the sake of form, I reaffirm the opinion originally expressed by me on 5th October, 1894.

For reasons which will appear in dealing with the case of G.Y., the Board felt bound to be guided more by the opinion of Dr. Thompson and of Dr. Goode than by that of Mr. Taylor.

The second case is that of G.Y., who was admitted on the 31st of December, 1892. This patient is a Chinaman, apparently of advanced age, and stone deaf. When admitted he presented signs of leprosy, which justified the medical officers employed by the Board (Drs. Thompson and Goode) in signing certificates for him. Since that date the disease appears to have been, on the whole, quiescent, although some signs of the disease have become more marked.

If this man were able to support himself, or if his friends were able to support him, there can be no doubt that it would not be unreasonable to permit him to avail himself of the provisions of the Act by leaving the Lazarette and living the remainder of his days in a suitable isolation, if such could be provided for him. But he is a Chinaman, feeble and bent, absolutely deaf, and unable to earn his livelihood. He has no known relatives in the Colony, and there is no one who could be called upon to support him. It therefore seemed to the Board that, taking all the circumstances into consideration, the ordinary dictates of humanity would be more consulted in the case of G.Y. by retaining him in the Leper Hospital than by turning him adrift as a helpless pauper.

It is true that Mr. Taylor, in his paper of 7th February, 1896 (*Enclosure No. 15*), referring to the case of G.Y. (*alias* A.G.), makes the statement that the man, in his opinion, is not a leper. Mr. G. H. Taylor was on one side, and Dr. Thompson and Dr. Goode on the other. For Dr. Thompson certified to his being a leper in December, 1892, and on the 6th March, 1896, he says as follows:—"For the sake of form merely I reaffirm the opinion expressed by me several years ago." It is clear, therefore, that Dr. Thompson and Dr. Goode were of opinion in 1892 that G.Y. was a leper, and that in March, 1896, Dr. Thompson was of the same opinion.

It therefore became the duty of the Board to decide which view it should accept, and it (as it believes most reasonably) decided to give the preference to the opinion of Drs. Ashburton Thompson and Goode, for the following reasons:—

Dr. Ashburton Thompson has been the Principal Medical Officer of the Board of Health for more than ten years. He is a man of the highest professional qualifications in public health. He has been in every case referred to him found worthy of confidence by the Board. Moreover, he has devoted a special amount of attention to the study of leprosy. He has studied it in Norway, he is now engaged in similar investigations in Honolulu, and he has written a number of valuable papers on the subject, for one of which he last year received a special prize from the Leprosy Investigation Committee of London. Dr. W. H. Goode, the other certifying officer, is a gentleman of great professional experience, acquired in various parts of the world. He is a prominent professional man, he has been employed by the Board in a large number of cases as the representative of the medical profession, independent of official duties, and he has been for about nine years Lecturer on Public Health in the University of Sydney.

It did not seem to the Board that Mr. Taylor's claims to its confidence were equally strong. By his own admission (7th February, 1896—*Enclosure No. 15*) his experience of leprosy was but small when he became Medical Officer to the Coast Hospital, on the 9th June, 1894 (less than two years ago). Nevertheless, Mr. Taylor is so satisfied with the progress he has made in the knowledge of this disease since he became Medical Officer to the Coast Hospital that he ventures to make the following statement (7th February, 1896—*Enclosure No. 15*):—"I consider that if I am unable to give a definite diagnosis neither Dr. Goode nor Dr. Thompson could do so." This, of course, is a matter of opinion, but the facts within the knowledge of the Board do not justify its members in concurring with Mr. Taylor. As an example may be brought forward the case of T.O'R. This was a person who died in the Coast Hospital on 9th November, 1895. On the previous day Mr. Taylor reported of this man (*Enclosure No. 1*), "T.O'R. is dying here from pleurisy. He has an obscure nerve disease which may possibly be leprosy in its nature."

In consequence of further communications which took place Mr. Taylor took occasion to say (7th February, 1896—*Enclosure No. 15*), referring to the same person, "I was exceedingly proud of my case, which I consider to be the earliest one of tubercular leprosy ever detected."

In accordance with the Board's practice in such cases, it was directed that a careful examination should be made of those organs and tissues which had been removed from the body of T.O'R. by Mr. Taylor at the *post-mortem* examination. This duty was entrusted, as usual, to Dr. Tidwell, the medical officer in charge of the Biological Laboratory, and the results appear to be sufficiently remarkable. This will appear from the following extract from Dr. Tidwell's report (*Enclosure No. 21*):—

It will be observed that the leprosy bacilli were found in every tissue examined. Since these comprise the skin, nerves, spleen, and testis, it is safe to assume that they were distributed throughout the whole of the body, and that incalculable numbers were present. The extensive fibrous changes observed in the nerves, and especially in the testis, show that the disease had existed for a considerable time. The enormous number of bacilli, their wide distribution, and the extensive pathological changes produced by them, warrant the conclusion that this patient was fairly riddled with leprosy.

As to the accuracy of these statements of Dr. Tidswell there can be no mistake, for, as usual, he took a series of microphotographs of sections of all the important organs observed. These figures are appended to his report (*Enclosure No. 4*).

T. O'R. was an inmate of the Coast Hospital from the 31st of May to the 1st July, 1895, and from the 3rd October in the same year to the 9th November, on which day he died. From the 19th October to the day of his death he was under the special observation of Mr. Taylor (*Enclosure No. 15*).

Mr. Taylor was only able, on the 8th November, to report that he had "an obscure case of nervous disease which may possibly be leprosy in its nature." It appears also from his paper of the 7th February (*Enclosure No. 15*) that on or about the 19th October he was able to discover certain symptoms which, although vague, appeared to point to leprosy. He, however, "carefully examined him from day to day" without being able to come to any definite conclusion until the evening of the day before the man died, when, by the discovery of the bacillus, he satisfied himself that the patient was a leper.

It appears to the Board that it was reasonable to expect that, seeing that Mr. Taylor began to suspect T.O'R. of being a leper on the 19th October, he ought either to have been able to satisfy himself within a reasonable time as to the accuracy or otherwise of his suspicions, or, on the other hand, to have applied for such further assistance as would have enabled him to come to a definite result. The Board has never failed to furnish Mr. Taylor with any further assistance he might require.

On 20th January, 1896, Mr. Taylor published a paper in the *Australasian Medical Gazette*, in which he claimed to have made pathological discoveries in leprosy which would revolutionise the ideas commonly entertained by the profession as to this disease. In view of the importance of the statements made, the Board requested Mr. Taylor to favour its officers with an opportunity of inspecting some of the preparations upon which he founded his conclusions. Mr. Taylor replied (*Enclosure No. 23*) that he had not thought proper to preserve these valuable specimens, but had washed the slides after examining them, and so destroyed the evidence upon which he founded his conclusions. It cannot be said that this answer tended to increase the confidence of the Board in the value of Mr. Taylor's observations.

The Board regrets to draw attention to these actions of Mr. Taylor. From the records, also, it will be seen that in other respects the Board has not been satisfied with this gentleman's conduct. An example of this may be seen by referring to the attached reports of Drs. Thompson and Tidswell, dated the 28th and 29th January respectively (*Enclosure No. 16*).

The Board feels also bound to mention that for this and other reasons it became the duty of the Medical Adviser to censure Mr. Taylor in accordance with the terms of a resolution of the Board, and that on Mr. Taylor's appealing from this decision to the Minister the Minister confirmed the action of the Medical Adviser.

The other points contained in the strictures of the newspapers do not seem to refer specifically to the Board's administration, but rather to take the form of a criticism of the existing law. The Board can have no possible objection to the appointment of official visitors as in lunacy, if the Government think it advisable: but the Board does not see that at present any necessity has arisen for such appointments, and as it has always desired to conduct the medical establishments with as great regard to economy as possible, the Board has not felt it necessary to make such recommendations. If, however, the Government think that the public confidence can in any way be increased by the appointment of additional inspecting officers, it is not for the Board to raise any objection.

One statement in the newspaper is to the following effect:—"The medical officers by whose advice the Board of Health acts in these matters, however, take a different view from that taken by Mr. Taylor, they certifying that both of the men whose leprosy the Superintendent questioned were suffering from the disease in a contagious form. (*Daily Telegraph, 8th May, Enclosure No. 20.*) Careful investigation has been made, but this statement cannot be traced to any responsible officer of the Board. It certainly should not be taken as expressing the opinion of the Board of Health.

A. STUART, M.D.,  
President.

I hereby certify that this is the memorandum adopted by the Board of Health at a duly constituted meeting held on the 12th day of May, 1896.

C. A. SIMMS,  
Acting Secretary.

#### No. 1A.

The Medical Superintendent, Coast Hospital, Little Bay, to The Medical Adviser to the Government.

Coast Hospital, Little Bay, 8 November, 1895.

TIMOTHY O'ROURKE, *æt.* 70 years, is dying here from pleurisy, &c. He has an obscure nerve disease which may possibly be leprosy in its nature.

Dr. TAYLOR,  
Medical Superintendent.

Urgent. Dr. Thompson and Dr. Tidswell.—A.S., 8/11/95. Dr. Taylor,—Please report when this patient is dead.—C.A.S., 8/11/95. O'Rourke died 8.50 Saturday morning. Portions of various organs forwarded to Board of Health.—G. H. TAYLOR, 11/11/95.

Memo. from The Board of Health to Dr. A. Thompson.

Sir,

Timothy O'Rourke died this morning seven minutes to 9 o'clock. Am directed by the President to inform you and Dr. Tidswell. Have informed the latter, who would like to know whether you are going out to C.H., and when. President directed *post-mortem* to be delayed till to-morrow.

I have, &c.,  
H. HUNTER.

From C.H. to Professor Stuart.—Timothy O'Rourke died seven minutes to 9 o'clock this morning.

Sir,

Sir, Board of Health Offices, 127, Macquarie-street, Sydney, 13 November, 1895.

I have the honor to inform you that I have examined sinear preparations of the specimens of spleen of Timothy O'Rourke, forwarded by Dr. Taylor from the Coast Hospital.

Stained by the Ziehl-Neelson method, the specimens show numerous bacilli retaining the fuchsine stain after the acid treatment. They are hence either leprosy or tubercle bacilli. It is very difficult to distinguish between the two by microscopical examination alone. In this case, however, the bacilli are contained for the most part in cells, either entirely filling the cells, or occurring in them in groups. The cells have the character of the "Lapra cells" of Virchow. Further, the bacilli are extremely numerous, but there is no sign of caseation. From these appearances there can be no reasonable doubt that the bacilli in question are bacilli lepræ.

I have, &c.,  
FRANK TIDSWELL.

The Acting Secretary, Board of Health, to G. H. Taylor, Esq., J.R.C.P., Ed., L.R.C.S., Ed.,  
Coast Hospital, Little Bay.

Sir, Board of Health Offices, 127, Macquarie-street, Sydney, 20 November, 1895.

I am directed by the President of the Board of Health to say that, as it appears from your report of the 18th instant that the diagnosis of leprosy was duly established in the case of Timothy O'Rourke, it is necessary that you should explain why you failed to comply with the provisions of section 3 of the Leprosy Act of 1890 (54 Victoria No. 20).

I have, &c.,  
C. A. SIMMS,  
Acting Secretary.

The Superintendent, Coast Hospital, Little Bay, to The President, Board of Health.

Sir, Coast Hospital, Little Bay, 22 November, 1895.

I have the honor to report to you that the case of Timothy O'Rourke was recorded by me with great difficulty. The old man regarded my frequent examinations as a joke, and his answers were generally unreliable. Although I suspected the case to be one of leprosy, I did not feel myself justified in reporting it to the Board of Health until the evidence was complete and conclusive. This, to my mind, it never was until I found the bacillus in the infiltrated condition of the eyebrows. I did not at first attach much significance. It was after I had carefully worked out the details of the case that the possible importance of this condition occurred to me. When I reported the case to the Board of Health the man, in my opinion, was certain to die within a few days and I stated in my message that he had an obscure nerve disease, possibly leprosy in its nature. At that time I had prepared specimens of serum from the less infiltrated eyebrow, but had not examined them. Upon examination in the evening, I found, as stated in my report, the bacillus of leprosy in great numbers. Thus, I think, very naturally cleared up what was before a distinct doubt in my mind as to the nature of the nerve affection. The man died upon the following day (Sunday). I have reread my notes upon the case, and can see how a medical man, after reading my report, without having examined the case, should fail to appreciate the difficulty I had in forming an opinion. The difficulty, however, existed, and my experience of nerve leprosy is such that I am extremely cautious in forming an opinion, a mistake in which appears to be criminal in the injustice done to the patient.

I have, &c.,  
G. H. TAYLOR,  
Superintendent.

#### No. 2.

The Acting Secretary, Board of Health, to The Medical Superintendent, Coast Hospital, Little Bay.

Sir, Board of Health Offices, 127, Macquarie-street, Sydney, 14 November, 1895.

I am directed by the President to request you to be good enough to furnish, by the morning of Tuesday, the 19th instant, a connected account of the history and case of Timothy O'Rourke, together with your notes of the *post-mortem* examination of his body, and to cause copies of all written records made concerning this patient at the Coast Hospital to be attached to your connected account.

I have, &c.,  
C. A. SIMMS,  
Acting Secretary.

As it appears from Dr. Taylor's report that the diagnosis of tubercular leprosy was duly established in the case of O'Rourke, ask Dr. Taylor to state why he failed to comply with the provisions of the Leprosy Act of 1890, clause 3.—A. STUART, President, 20/11/95.

These records do not seem to be complete. Dr. Taylor was asked to send "all written records," and only the bed-card and a temperature chart—one of which is undated even—have been sent.—A. STUART, 22/11/95.

The Superintendent, Coast Hospital, Little Bay, to The President, Board of Health.

Sir, Coast Hospital, Little Bay, 18 November, 1895.

I have the honor to forward you the following particulars *re* Timothy O'Rourke, asked for in your letter of 14th instant.

This man, who gave his age as 71 years, was admitted into the Coast Hospital on the 30th May of this year, and placed by me under the medical care of Dr. Fordyce. At that time he complained of an abscess in his left thigh. Improving a little under the treatment, he was discharged on the 1st July.

Readmitted on the 2nd October, and placed by me under the medical care of Dr. Shaw. The time between the 1st July and the date of his readmission, the patient stated, he had spent in one of the Government Asylums. He still had a discharge from a small sinus in his left thigh, and complained of nothing beyond this. Upon 19th October, Dr. Shaw being absent from the hospital upon leave, I took medical charge of his wards, and, examining O'Rourke, and finding symptoms suspicious of leprosy, I had him

him transferred to one of the wards I take under my medical care. From that date until the hour of his death I examined him carefully from day to day. I mention these facts in order to explain to you how very obscure the case was, and to point out to you that this is a very reasonable excuse for it not having been suspected at an earlier date. The man had an appearance of robust health for his years. His face was bronzed, and he looked like a hardy old sundowner. He stated that he was a native of Ireland; had been twenty-five years in the Colony; was a widower, with several children, none of whom he had seen or heard of for many years. Until two years ago he enjoyed vigorous health, and worked as a labourer. At that time he commenced to suffer from rheumatic pains in his hands and legs. About six weeks prior to his admission to the hospital a swelling appeared on his left thigh, the skin over which broke down, and a quantity of pus escaped. He complained of nothing else. Upon examination, I found the hair upon his face and scalp to be thick and healthy. There was slight infiltration of the skin of both eyebrows, the capillaries appearing here and there as minute red lines. The ears, nose, and lips were normal. Skin over chest and back loose and wrinkled, and indistinctly there could be seen slight discolorations of small areas of skin, but in no place were they well marked, and the wrinkled and lustreless condition of the skin made their detection a difficult matter. The patient was unconscious of their presence. The skin over back of both forearms showed slight desquamations; that of hands and lower limbs appears to be normal. Finger-nails thinner than normal, with longitudinal furrows upon them; toe-nails normal; sight unusually good in so old a man; hearing good; tongue clean; mucous membrane of mouth and throat healthy; muscular system well developed, excepting some atrophy of dorsal interossei and thumb muscles of left hand; left ulnar nerve slightly enlarged and hardened at notch, tender to pressure, with sensation referred to ring and little fingers; about one-quarter of an inch above the notch a fusiform enlargement of the nerve could be detected; left radial nerve enlarged, hardened, and tender; right ulnar and radial nerves apparently normal; perineal nerves on each side enlarged, hardened, and tender; there was slight anæsthesia of left hand with well-marked analgesia, the anæsthesia being most evident over little finger; slight anæsthesia and well-marked analgesia on both feet, and in a less degree over both lower limbs below knee; thermal anæsthesia over both hands and feet. No alteration in sensation could be discovered in the discoloured areas of skin over back and chest, as compared with the normal skin; under the action of pilocarpine administered subcutaneously the hands and feet remained perfectly dry. Slight perspiration was noticed upon the body irregularly distributed, and having no relation to the discoloured patches of skin. The heart was slightly hypertrophied; the lungs fairly healthy; area of hepatic dulness slightly increased. Spleen enlarged; a trace of albumen in urine; reflexes normal. Inguinal glands enlarged more so in left side than right; axillary glands in left side slightly enlarged. After repeated examinations of serum expressed from left eyebrow, with a negative result, I was able to find the bacillus of leprosy in great numbers in the serum of right and less infiltrated eyebrow. This patient was therefore suffering from tubercular leprosy in a very early stage. I think, also, that the affection of his nerves was leprosy in its nature. Upon the 3rd November he became suddenly ill, with symptoms of acute and extensive pleurisy, and he died on 9th November.

I have, &c.,

G. H. TAYLOR,  
Superintendent.

Coast Hospital, Little Bay, ———, 189 —.

*Post-mortem* on Timothy O'Rourke, died at 2:30 p.m. on Sunday, 10th instant. Right pleura covered with recently effused lymph. There were no traces of old adhesion, and the left pleura was healthy. Both lungs deeply congested, in other respects healthy. Pericardium normal, coronary vessels slightly atheromatous. Left ventricle hypertrophied. Small patch of atheroma immediately above aortic valves. Liver slightly enlarged, and apparently fatty. Spleen enlarged. Left kidney enlarged and almost entirely replaced by large cysts. Right kidney enlarged and slightly cystic. Skin upon outer side of left side thigh just above knee discoloured and thickened; tissue beneath found to be dense and infiltrated, and channelled by several minute sinuses. Left inguinal and axillary glands slightly enlarged. Left ulnar nerve enlarged at notch, and a little above this, expanding into a fusiform enlargement of about an inch in extent. Left radial nerve enlarged and thickened. Both perineal nerves enlarged and thickened. Nothing abnormal about larynx. I found the bacillus of leprosy in the spleen, but not in great number.

G. H. TAYLOR,  
Superintendent.

Coast Hospital.

Ward No. IV.—Case, abscess in left thigh.

NAME, Timothy O'Rourke; age, 71; occupation, labourer; religion, Roman Catholic; residence, 17, Swan-street, City. Date of admission, 30th May, 1895; discharged 1st July—better.

No. 3.

The President, Board of Health, to The Medical Superintendent, Coast Hospital,  
Little Bay.

Sir, Board of Health Offices, 127, Macquarie-street, Sydney, 10 January, 1896.

I have to communicate to you that in connection with the case of Timothy O'Rourke, who died of leprosy in the Coast Hospital on 9th November, 1895, it appears to me that your conduct is not satisfactory in that you failed to inform me that there was a case which might reasonably be suspected to be leprosy at a time when your notions in regard to the case were quite as definite as they were when you reported the cases of Turner and Buckman. In order that you may see your position in the matter, I quote from three of your previous reports, as follows:—

Concluding sentence in your letter dated 22nd November, 1895, in regard to O'Rourke's case:—

This difficulty, however, existed, and my experience of nerve leprosy is such that I am extremely cautious in forming an opinion, a mistake in which appears to be criminal in the injustice done to the patient. (But your description is clearly of old-mixed leprosy.)

Compare this with the following:—

22 January, 1895.

I have the honor to inform you that a man named John Turner, aged 69 years, was admitted here on the 21st instant. He had been there previously on two occasions suffering from what I took to be Raynaud's disease. His present condition is suspicious of lepra, and although I could not certify him as suffering from that disease I should like to have Dr. Thompson's opinion.

[This patient was eventually certified by Dr. Goode and Dr. Thompson.]

22 April, 1895.

I have the honor to inform you that a man named James Buckman, 45 years old, admitted on the 11th of this month, has symptoms suspicious of lepra in a very early stage. The man is going into town this morning to see some friends, and states that he will return in the ambulance.

[Dr. Thompson certified this patient same date; Dr. Goode saw him twice, but would not certify.]

So that you not only acted before without that which you now call "extreme caution," but actually now know by experience that an erroneous opinion expressed by you would not necessarily lead to injustice to the patient, and that in virtue of the provisions of the Act itself, which were designed to avoid injustice, and which in the second case above caused the Board to give the patient the benefit of a very slight doubt.

From your second letter, dated 22nd November, it appears that your discovery of the *bacillus lepræ* occurred only on 8th November, the day before the man died. This was not by any means clear in your report of date 18th November, from which it would appear that you had discovered the *bacillus* before the 3rd November. No reasonable person could otherwise interpret the concluding paragraph, which is as follows:—

After repeated examinations of the serum expressed from left eyebrow, with negative result, I was able to find the *bacillus* of leprosy in great numbers in the serum of the right and less infiltrated eyebrow. This patient was therefore suffering from tubercular leprosy in a very early stage. I think also that the affection of his nerves was leprosy in its nature. Upon the 3rd November he became suddenly ill with symptoms of acute and extensive pleurisy, and he died on the 9th November.

Until your statement of 22nd November arrived your message of 8th November appeared positively misleading. It ran as follows:—

Timothy O'Rourke, æt. 70 years, is dying here from pleurisy, &c. He has an obscure nerve disease which may possibly be leprosy in its nature.

Finally, I may point out that you have not even yet complied with the requirements of the Leprosy Act, and, technically, you are actually guilty of a contravention of the Act.

I felt it to be my duty to submit the matter to the Board of Health, and after careful consideration the Board expressed the opinion, "had Dr. Taylor made a full report, as he should have done in the first instance, all subsequent difficulties would have been avoided," and desired me, in my capacity as Medical Adviser, "to suitably reprimand you." This reprimand I now convey.

I desire now to refer to yours of 27th November, 1895, replying to mine of the 25th idem, in which you conjecture that there was some objection to your being supplied with laboratory apparatus, which would enable you to examine the nerves from one side of Kali Johai. I think you ought to have obtained permission before giving away those nerves; but having given them it would have been better if you had at once said to whom you had given them, instead of reporting to me that you had given them to "a friend."

I fail entirely to see what grounds you had for any such conjecture. On 17th September you asked for the apparatus. On 18th September I asked Dr. Tidswell to procure the articles for you. On 1st October certain of the articles were received here and transmitted to you; the remainder were such as could not be immediately procured in Sydney, and included a Swift's and a rocking microtome, which you specified. These had to be made, and were at once put in hand. A Cathcart's, Zeiss's, Thomas's microtomes could all have been purchased in Sydney and delivered at once, but you asked for a Swift's, and that had to be made, and was made in a most satisfactory manner, and sent to you as soon as finished.

I fail to see any ground for your conjecture, and your statement is, in my opinion, unfounded and misleading.

Finally, the nerves when returned were found to have been improperly preserved, and consequently much damaged—probably spoiled; thus the work already done on the other nerves of the other side was largely thrown away, and the comparison of the two sides—of importance in this case—was thus rendered impossible.

I must now refer to the case of Ah Lee. In your report of 28th December, 1895, you say, "Ah Lee died at 5 a.m. this day. From the condition of his body I advise that the *post-mortem* be held to-morrow." Now, considering that it is always desirable to make a *post-mortem* examination as early as possible after death, your advising excited comment, and considering that "to-morrow" was a Sunday it was, fortunately, decided by Drs. Thompson and Tidswell to neglect your advice, and go out on Saturday afternoon. On arriving at the Coast Hospital it was found—you yourself explaining—that your advice was given because you wanted to go into town that day. For this reason two high professional officers were to be inconvenienced by going to the Coast Hospital on such work on a Sunday, and the body was to lie a day longer.

Now,

Now, I wish to bring home to you that had you said it would be "more convenient" for you to have the *post-mortem* on the Sunday I would have had less to say, but that when you "advise" this it is quite a different matter. When a professional man and an officer of this Department "advises" one attaches a certain value to his advice, and I must say that when I find you "advising," as in this case, for your own convenience solely, it weakens considerably my reliance upon your *bona-fides*.

Finally, I regret extremely that I should have to send you such an admonition, for the earlier part of your career at the Coast Hospital was most satisfactory, and it is a pity that it has not so continued. I trust that you will reconsider the position which you have of late chosen to assume, and revert to your earlier attitude.

A. STUART, M.D.,  
President of the Board of Health and Medical Adviser to the Government.

No. 4.

The Medical Superintendent, Coast Hospital, Little Bay, to The President,  
Board of Health.

Sir,

Coast Hospital, Little Bay, 15 January, 1896.

I have the honor to acknowledge your communication dated 10th January, in which you convey a censure upon me, in respect to the case of Timothy O'Rourke, who died under my care upon the 9th November, 1895.

I respectfully submit that I consider your censure to be undeserved, and ask you, as my superior officer, to forward a copy of your letter of censure, together with my reply, to the Minister at the head of this Department. In reply to the statements you make I forward the following explanation:—

You state that Timothy O'Rourke died of leprosy. In my opinion he died of pleurisy; and as at the *post-mortem* examination of his body, held thirty hours after death, my diagnosis was confirmed, and as I also found cystic disease of both of his kidneys, I certified the cause of his death to be from a combination of these diseases; you then state that "your notions in regard to the case were quite as definite as they were when you reported the cases of Turner and Buckman." I differ with you in regard to this statement.

Turner had symptoms of leprosy in an active stage; he had necrosis of the bone of his toes—well-marked discoloration of certain areas of his skin, in some of which there was alteration of sensation; he had also eruptions of bullæ. The difficulty of diagnosis in his case was due to the character of the necrosis, which did not resemble that usually found in nerve leprosy, and also the character of the skin discoloration, which resembled that usually associated with the tubercular form of the disease.

In the case of Buckman there were also active symptoms of leprosy; he had eruptions of bullæ and perforating ulcers. If you will kindly refer to the history of Buckman's case, written by Dr. Ashburton Thompson, you will find that at the end of his statement he highly commends my having been able to detect this case. Yet there were symptoms which, to a man with clinical experience in leprosy, would at once suggest the disease.

In the case of O'Rourke there were no active symptoms, and I think the fact that Dr. Shaw, who has acted as Medical Officer here during 2½ years, and Dr. Fordyce, who has been nine months upon duty here, and who had the case under their observation alternately for nearly one month each, seeing and examining him day by day, and entirely failing to observe any symptoms of leprosy, must impress you with the fact that the disease was obscure. Doctors Shaw and Fordyce are careful and observant officers, and their experience of leprosy is beyond that of ordinary practitioners. I enclose a report upon the case by these gentlemen.

You then state, "But your description is clearly of old mixed leprosy." I respectfully submit that this is an extraordinary statement. The only symptoms of tubercular leprosy the man had was a slight infiltration of the skin of both eyebrows, so slight that the hair upon them was apparently unaltered—so slight, that the nurses in the ward and the medical officer who had charge of the case failed to notice anything abnormal. The very slight discoloration in certain parts of the skin over his body did not appear to have any clinical significance, as sensation over them was normal, and after subcutaneous injection of pilocarpine no inference could be drawn. As to the nerve affection, the skin over his limbs was normal in appearance; there was no history or evidence of ulceration of skin, or necrosis of bone, no contraction of fingers, no atrophy of the shafts of bone, no paralysis of the muscles of the face, no eruption of bullæ—his only external lesion being an abscess in his left thigh, and this presented no special feature.

In writing an official report upon a case of this kind, and knowing that my report would be exposed to criticism, opinions can be stated and full clinical significance given to symptoms with more confidence after the *post-mortem* examination than before it. My report was written when I had certain knowledge that the patient was a leper. Not only had I found the bacillus in the serum expressed from the eyebrow, but I had also found it in the spleen, and therefore knew that the officer at the Board of Health could not fail to find it. Had I failed to find the bacillus my report would have been more guarded. You then state, "So that you not only acted before without 'extreme caution,' but actually now know by experience, &c."

I must refer you to my letter dated 12th June, 1895, which reads as follows: "I have the honor to inform you that in my opinion all cases of nerve leprosy uncomplicated by the tubercular form of the disease could be discharged from the Lazarette without danger to the public health. Henry Thompson has enjoyed excellent health since his admission to the Lazarette. The symptoms of nerve leprosy in his case are not as well marked as they were in the man Buckman, who left the Coast Hospital a week ago. A Chinaman, called George Yet, commonly known in the Lazarette as Ah George, I have not been able to observe any symptoms in this man's case during the last two years which would justify his detention in the Lazarette." This letter was written in answer to one of yours asking what patients could be released from the Lazarette without danger to the public health.

Ah Yet and Thompson are still confined here. Upon the 3rd August, 1895, you visited the Lazarette, accompanied by Dr. Tidswell. This date is fixed in my mind from the fact that upon that day the nerve leper, Kali Johai, died. I took you and Dr. Tidswell into the hut in which George Yet lives, showed you his legs and feet, and informed you that, in my opinion, the man did not suffer from leprosy.

You

You replied that he was an old Chinaman, and was happier in the Lazarette amongst his countrymen than he would be in the Benevolent Asylum. I also pointed out to you the man Thompson, who at that time was chopping wood, and stated that, in my opinion, he should be discharged. You did not examine him. After thinking over this matter it occurred to me that there was a want of justice in relation to the treatment of the men Thompson and Buckman, and an illegal injustice to the Chinaman Ah Yet.

I can confirm your statement as far as it went, but consider that I was fairly entitled to form the conclusion that if Ah Yet is not suffering from leprosy, and, in my opinion, he is not, he is illegally confined in the Lazarette; and secondly, if he is not suffering from leprosy, the gentlemen who certified him were wrong in their diagnosis. I think, therefore, that I was justified in stating that "my experience of nerve leprosy is such that I am extremely cautious in forming an opinion, a mistake in which appears to be criminal in the injustice done to the patient."

In the paragraphing of my original report there is a mistake, and for this, and this only, I apologise. On the 8th November I telephoned to you that "Timothy O'Rourke, aged 70 years, is dying here from pleurisy, &c. He has an obscure nerve disease which may possibly be leprosy in its nature." This was my opinion the day before the patient died. My original report was a complete one. My letter of 22nd November, beyond informing you of the exact date I found the bacillus, did not add to the value of the original report.

I consider, therefore, that, unless you still suspect me of being dishonest, the mistake in paragraphing was not a serious one. If you still suspect me, an inquiry at the Coast Hospital can very clearly disprove your suspicion. I have already written to you my explanation *re* the nerves taken from Kali Johai.

Concerning my letter of "conjecture," as I did not receive an answer to my request asking for the apparatus, and after waiting for many weeks and not having received what I wanted, I came to the conclusion that it was not to be granted to me. In this I now see that I was mistaken, and apologise for my mistake, at the same time my conjecture was an honest one.

The nerves were properly prepared when I handed them to Dr. Goode. I did not mention that gentleman's name in my first letter to you, as I did not wish to subject him to any annoyance.

With reference to Ah Lee, an urgent matter called me to Sydney upon the afternoon of the day he died (Saturday). I examined his body in the morgue, and considered that the *post-mortem* could be delayed until Sunday morning, when I would be able to perform the autopsy myself. As I am in medical charge of the Lazarette, and do all the medical and surgical work myself, I was anxious to perform the *post-mortem*.

In the case of O'Rourke, who died upon a Saturday morning, by your order the *post-mortem* was delayed until the afternoon of Sunday, in order that Drs. Thompson and Tidswell might be present. I consider that, as my superior officer, you would certainly give me, doing all the medical work at the Lazarette, the consideration that you extended to these gentlemen, and I therefore advised that the *post-mortem* should be performed upon Sunday. That you should infer from this that your reliance upon my *bona-fides* is considerably weakened I consider to be an unmerited aspersion upon my character.

Yours, &c.,

GEORGE HENRY TAYLOR,  
Medical Superintendent.

Case of Timothy O'Rourke.

Coast Hospital, 11 December, 1895.

THE patient Timothy O'Rourke was under my care from the 7th October till he was transferred to Ward 8. He was suffering from an abscess in his thigh: he never complained of anything besides. Frequently he said to me he was in splendid health excepting his leg. He appeared to me to be a very strong healthy man for his age.

I did not suspect him to be a leper, as there was no marked condition to suggest the idea of leprosy. It was not until Dr. Taylor drew my attention more particularly to him that I noticed some slight thickening of the skin of his eyebrows and some slight affection of his nerves. The wasting of the interosseal muscles he had in common with people of his age.

Of all the cases of leprosy I have seen this certainly was by far the least marked. Until the time of his death I had nothing to lead me to suppose he was an undoubted leper, and I believe that without the detection of the bacillus of leprosy it would have been impossible to certify him.

F. C. S. SHAW, M.B., Ch.M.,

Senior Resident Medical Officer.

The Case of Timothy O'Rourke.

Coast Hospital, 10 December, 1895.

HE was admitted into this hospital, 30th May, 1895, under my care; and was discharged apparently well 1st July, 1895. He was then examined by me in the routine manner. His circulatory system and respiratory system were apparently normal. His urine was normal. There was no eruption of any sort on his body. The only obvious lesion about his person was a chronic abscess on the inner side of his left thigh—just above the knee. His knee-jerks were present. For a man of his years he seemed exceptionally vigorous. With rest and treatment the abscess healed up and he was discharged. The next time he came in he was under Dr. Shaw's care. I saw him one day, but observed nothing beyond the fact that the abscess had broken down again. Some time after his admission I heard Dr. Taylor mention him as an interesting case. He transferred him under his own observation, and spent several days in going over his various symptoms. I went up personally to examine this case, and although then having the suspicion of a possible case of leprosy, after careful examination, I was not at all convinced that the signs and symptoms pointed to leprosy. Many of the symptoms seemed to me to be due to senile decay. Dr. Taylor discussed the case freely with Dr. Shaw and myself, but I never gathered that he had more than a suspicion that it might be leprosy. It was not until after the patient's death that I was aware he was a leper.

I have carefully examined many of the patients in the Lazarette. In these there were obvious signs of leprosy. In the case of O'Rourke there was no obvious external indication of his disease. In my opinion, only a person looking out for leprosy could have even suspected it; and careful and repeated examinations must have been necessary in this patient's case.

HENRY SINCLAIR FORDYCE, M.B., Ch.M.

## Minute by The Chief Secretary.

Chief Secretary's Office, Sydney, 22 January, 1896.

I SHALL be glad if the Medical Adviser to the Government will let me see the correspondence from the Superintendent of the Little Bay Hospital respecting the treatment of lepers, or any other subject connected with the institution.

J.N.B.

No. 6.

## The Medical Adviser to the Government to The Principal Under Secretary.

Sir, Board of Health Offices, 127, Macquarie-street, Sydney, 30 January, 1896.

In accordance with the request of the Medical Superintendent of the Coast Hospital these papers are forwarded to the Honorable the Chief Secretary. The Medical Superintendent's letter of the 15th January, as regards O'Rourke's case, refers to many different points, but they are almost all beside the question, which is not one so much of medicine as one of discipline. The fact remains that being an officer of the Government, and under my authority, and having a patient whom he suspected of leprosy, he did not at once communicate with me, as it was clearly his duty to do, in order that I might take the proper steps to comply with the Leprosy Act in having the patient examined by two medical men—usually Dr. Ashburton Thompson and Dr. Goode in such cases.

It is necessary to remark here that although the Leprosy Act does not require that suspected cases of leprosy shall be reported, so that a general practitioner need not report until he is tolerably sure (though at the risk of being told by a magistrate that he ought to have formed a positive opinion sooner, or, in a doubtful case, to have sought advice), yet it is manifest that similar reserve on the part of a subordinate officer of the Government cannot be passed over.

The reprimand in O'Rourke's case was conveyed to Dr. Taylor at the request of the Board of Health, most of whom are medical men, and all of whom are acquainted with the subject-matter of the Leprosy Act. Somewhat severe notice has been taken of this and of the other matters referred to in my letter to Dr. Taylor, as, on the whole, for some time past, this officer's conduct has not been so satisfactory as it should have been.

I have, &amp;c.,

A. STUART, M.D.,

Medical Adviser to the Government.

A copy of [this communication might be sent to Dr. Taylor, and he should be called upon for an explanation of his conduct.—C.W., 4/2/96. Approved.—J.N.B., 4/2/96. Done, 5/2/96.

No. 7.

## The Medical Superintendent, Coast Hospital, Little Bay, to The Principal Under Secretary.

Sir, Coast Hospital, Little Bay, 7 February, 1896.

I have the honor, in reply to your letter of the 5th instant, to furnish you with an explanation of my conduct in the case of Timothy O'Rourke, who died under my care at the Coast Hospital, upon the 9th November last.

You state "relative to your action in the case of one Timothy O'Rourke, who died of leprosy," I respectfully point out to you that he died of pleurisy, and that the leprous disease from which he also suffered was in a very early stage, and, in my opinion, had nothing to do with the cause of his death.

O'Rourke was admitted into the Coast Hospital under an order signed by the Government Medical Officer, Dr. Paton, upon the 31st of May last, and was then placed by me under the medical care of the Junior Medical Officer (Dr. Fordyce). He appeared to be a hardy old tramp, and complained of an abscess in his left thigh. Improving under treatment, he was discharged upon 1st July.

Readmitted upon 3rd October, under an order signed at the Hospital Dépôt by Dr. Paton, the Government Medical Officer, he was placed by me under the medical care of the Senior Medical Officer at the Coast Hospital (Dr. Shaw). He appeared to be in robust health for his years, but the abscess in his left thigh was discharging. Upon 19th October Dr. Shaw was absent from the hospital upon a holiday, and I therefore examined the case in his wards. As I make it a routine matter to examine every case under my care as carefully as I would do in dealing with a suspected case of leprosy, I was able to discover certain symptoms which, although vague, appeared to point to leprosy: I therefore transferred the patient to my care, and very carefully examined him from day to day. He resented these examinations, the meaning of which he was unable to understand, and it was an exceedingly difficult matter from his answers, which varied considerably at different times, to arrive at a conclusion as to how far the sensation in his hands and feet was abnormal. I was never certain on this point. Upon the 3rd November he became suddenly ill, with symptoms of acute pleurisy. Upon 8th November, as it was evident to me that he could not survive the illness, I considered it my duty to report the case to the Board of Health, in order that the various organs could be examined. At that time I was very doubtful about my opinion, and a definite diagnosis from the facts I had before me was quite impossible. I noticed some slight thickening of the skin of both eyebrows, and some time before death I had, upon three occasions, expressed some serum from them with a negative result. I made a final attempt on the day prior to his death, and was able in the evening to discover the bacillus of leprosy, and therefore knew that the man was a leper. When I arrived at the hospital upon the following morning the man was dead, and his body had been removed to the morgue.

I was exceedingly proud of my case, which I considered to be the earliest one of tubercular leprosy ever detected.

The case of O'Rourke was one of many cases I have had under observation, and one of many from whom I had expressed serum, in the wards of the General Hospital, in search of the bacillus of leprosy. From the care I take in the examination of such cases, and from my clinical experience in this disease, I consider that if I am unable to arrive at a definite diagnosis neither Dr. Goode nor Dr. Thompson could do so.

Professor

Professor Stuart, in his communication to you of the 30th January, states that "the Medical Superintendent's letter, of the 15th January, as regards O'Rourke's case, refers to many different points, but they are almost all beside the question, which is not so much as medicine as of discipline." I consider that the points referred to in my letter were in reply to definite statements made by my superior officer. He also states that "having a patient whom he suspected of leprosy, he did not at once communicate with me, as it was clearly his duty to do." I have never been informed that this is my duty; on the other hand, I considered that it is clearly my duty, on the experience I now have, not to report a suspect until I, who have the case under observation from day to day, am in a position to certify. This did not hold good during the first few months of my appointment at the Coast, as at that time my experience of leprosy was small. I also considered that I was acting in the interest of the Board of Health and of my patient in so doing, and for this reason:

If you will kindly refer to my letter of the 15th January, to which Professor Stuart draws your attention, you will read that I have reported to the President of the Board of Health that in the case of a Chinaman named George Yet, commonly known in the Lazarette as Ah George, "I have never been able during the last two years to observe any symptoms in his condition which would justify his detention in the Lazarette." And also "that a man named Thompson has symptoms not as well marked as in the case of Buckman," who was reported by me, and who was discharged.

Professor Stuart states that Buckman "was given the benefit of a very slight doubt." This very slight doubt did not extend to the unfortunate man Thompson, who is confined in the Lazarette. After this I brought the matter personally under the notice of Professor Stuart, during one of his visits to the hospital, the only notice of my appeal being that Thompson was examined by the Chief Medical Inspector. As far as I am aware, the Chinaman has never been examined during my period of service at the hospital, excepting by myself.

The man Thompson is married, and has eight children; he enjoys robust health, and, although he has certain symptoms suspicious of nerve leprosy, I emphatically state that they are not sufficient to warrant his being certified as suffering from leprosy. Under an order from the President of the Board of Health, I undertake the care of the patients in the Lazarette and do the medical and surgical work myself. I am therefore in this position—if I am expected to report a case, which, after days of careful examination I am unable to certify, the case may still be certified by the medical men who are sent by the President of the Board of Health. The case is then committed to the Lazarette, and thenceforward is under my care. I see the patient day by day, and each time I must feel that I have been instrumental in committing a human being to the most miserable existence I can conceive of, *i.e.*, life in the Lazarette. And I must also remember that the case, even if discharged, is branded for life. This would be my feeling in regard to the man Thompson had I reported his case in the first instance.

It is no mental hardship for the Chinaman. Ah George, to be in the Lazarette, but the man, in my opinion, is not a leper, and leprosy is regarded by the Board of Health as contagious.

The reprimand from the Board of Health was, "If Dr. Taylor in the first instance had written a full report, as he should have done, &c." This referred to an error in the paragraphing of my original report, in which it would have been clearer had I made a chronological record.

I must therefore infer that the fact of my not having reported the case at an earlier date was discussed by the Board, but that they did not confirm Professor Stuart's opinion of my conduct.

In conclusion, I submit that a survey of my career in the Government service, in which I have held several important positions, proves me to have ever been a conscientious, hardworking, and loyal servant of the Government, and I therefore appeal to the Minister for protection in this matter.

Reports upon O'Rourke's case by Drs. Shaw and Fordyce, Medical Officers at the Coast Hospital, are at the Board of Health. Perhaps you will kindly send for these, as they throw some light upon the subject.

I would also respectfully ask that Professor Stuart's letter of censure be contrasted with his statement to the Minister, and that my letter of reply be read in conjunction with this letter.

I have, &c,  
G. H. TAYLOR,  
Medical Superintendent.

Read, Meeting, 3rd March, 1896.

DIRECTED that an extract from Dr. Taylor's letter respecting the patients Yet and Thompson should be given to the Chief Medical Inspector, who should be requested to proceed to the Lazarette and furnish a further report. The rest of the report to be postponed until the President's return.

C.A.S.

Done, 4/3/96.

No. 8.

The Medical Adviser to the Government to The Principal Under Secretary.

Memorandum.

Board of Health Offices, 127, Macquarie-street, Sydney, 21 February, 1896.

I REGRET that Mr. Taylor still argues on the medical aspects of the case of O'Rourke, and that he refers to it alone. This case was merely one incident of a career, but as he admits that O'Rourke did suffer from leprosy it will not be necessary for me to refer more fully now to this matter than to point out that lepers die from all sorts of intercurrent affections, and that pleurisy may very easily have been the particular affection that carried O'Rourke off in the end. But that is neither here nor there. He *had* leprosy, and the fact was not reported. O'Rourke's case has assumed an excessive importance in this matter, because it brought Mr. Taylor into collision with the law of the land. As to the other grounds of dissatisfaction, Mr. Taylor offers no further explanation. In regard to Mr. Taylor's assertion of his being a good servant of the Government, that I was prepared to admit some six months ago, but my own subsequent experience, and the reports of Dr. Ashburton Thompson, Dr. Tidswell, and Quarantine Officer Payne, sent herewith for the Minister's information, will show that, as stated in my letter to Mr. Taylor, the latter part of his service in this Department has not been satisfactory. I do not see any other way out of the difficulty than by referring the matter for the consideration of the Public Service Board.

A. STUART, M.D.,  
Medical Adviser to the Government.

In

## 11

In a case of this kind the Public Service Board can only act after the officer has been suspended by the head of the Department, and they would suggest that the proper course in the present case is that it be dealt with departmentally.—C.L. The Under Secretary for Finance and Trade.

Dr. Taylor's conduct from the statements before me appears to deserve censure, but I cannot at present see my way clear to suspend him. The papers may be again referred to the Medical Adviser.—J.N.B., 17/3/96.

---

Memorandum.

Board of Health Offices, 127, Macquarie-street, Sydney, 22 January, 1896.  
THE President of the Board of Health and Medical Adviser to the Government directs me to transmit to Drs. Thompson and Tidswell the following minute, namely:—

“Certain matters having arisen which render it necessary to review the conduct of the Medical Superintendent of the Coast Hospital, I wish to have a written report from you as to Dr. Taylor's conduct towards you at the *post-mortem* examinations, which gave occasion for the memorandum which I subsequently issued relating to the procedure to be followed upon such occasions. Your reports were made to me orally, and I did not then ask for written reports, because I thought the matter would be speedily at an end; but as this expectation has not been realised, I think it well to have the matter written down.”

C. A. SIMMS,  
Acting Secretary.

Forwarded to the Chief Medical Inspector in the first instance.—C.A.S., 22/1/96. The Medical Officer in charge of the Biological Laboratory.—C.A.S., 29/1/96.

---

28 January, 1896.

THE transaction referred to occurred about five months ago (about 4th August, 1895), and I cannot pretend to remember details.

The main facts are, that although Dr. Taylor had been warned we should attend, and although we arrived at the usual time (soon after half-past 2), we found the microscopic inspection almost completed; the spinal cord was in process of being removed. And, secondly, Dr. Taylor's manner and behaviour were so exceedingly rude (by way, apparently, of resenting my presence) that I considered whether I should not exercise my powers as senior officer and then and there suspend him until you could be communicated with; but up to that day I had been in the habit of meeting him on perfectly friendly terms rather often—once a week—or at all events rather often. No cause of offence that I was (or am) aware of had been given or occurred, and I was really astounded and unable to guess at any colourable ground, reasonable or otherwise, for his then behaviour. Accordingly, and reflecting that in itself the thing was of little importance to me on the one hand, while on the other it was certain to be corrected, in as far as it was a gratuitous infringement of official discipline, I held my tongue and made no remark whatever.

Since that occurrence Dr. Taylor has confined his communication with me strictly to official matters, and his manner, though no longer aggressively rude, has been such as to show that he maintains the attitude of mind he assumed originally. I continue absolutely in the dark as to Dr. Taylor's motive, and as long as the conduct of business is not seriously interfered with I cannot pretend that I am very anxious to be enlightened.

J. ASHBURTON THOMPSON,  
Deputy Medical Adviser.

The Medical Adviser.

---

Sir, Board of Health Offices, 127, Macquarie-street, Sydney, 29 January, 1896.

In reply to your memorandum (22/1/96), I have the honor to submit the following written report, as therein desired.

On 3rd August, 1895 (Saturday afternoon), I proceeded, in company with the Chief Medical Inspector, to the Coast Hospital, in order to be present at a *post-mortem* examination on the body of the leper, Kali Johai. In obedience to your instructions to me, which you gave during a visit to the Lazarette a few days previously, and, in Dr. Taylor's presence, I took with me the necessary materials for obtaining specimens of the diseased tissues for histological examination.

On our arrival at the hospital we found that the *post-mortem* was practically concluded—that is to say, the usual examination of the internal organs had been completed, the body turned face downwards, and Dr. Taylor appeared to be engaged in removing the spinal cord. The various viscera, thoracic and abdominal, were lying, unsliced, on the table, and from these I immediately proceeded to obtain such specimens as I thought necessary. I then assisted the Chief Medical Inspector to dissect out some of the nerves from the right arm and leg. This being a case of nerve leprosy, it was a matter of some importance to compare the condition of the nerves on the two sides of the body. To do this satisfactorily it was essential that the portions of the nerves to be compared should exactly correspond, and be subjected to precisely the same treatment as regards hardening, section cutting, staining, &c., in the course of their preparation for microscopical examination. Having secured specimens from the right side, we turned to the left. At this point we were interrupted by Dr. Taylor, who stated, with unnecessary vehemence, that we must leave one side for him; we could have our side, he said, he wanted the other for himself. I was not altogether unprepared for this demonstration on Dr. Taylor's part, as he had been acting strangely all through. On our arrival he had gruffly returned our greetings, and subsequently had not condescended to notice our presence, beyond returning curt replies to a few questions directly addressed to him. Further, he had varied the usual procedure of a *post-mortem* examination by occasional indulgence in somewhat aggressive whistling and snatches of comic songs. No attempt was made to discuss the case we were dealing with, such as is usual at *post-mortem* examinations. Altogether, it was the most curious function of the kind I have ever been present at. At the time of Dr. Taylor's interruption I was uncertain as to my right to claim the tissues in question for examination in the biological laboratory, and as I wished to avoid an open quarrel, which seemed imminent, I left them *in situ*, as demanded by Dr. Taylor. Neither the Chief Medical Inspector nor I made any reply, nor had we said or done anything to provoke such rudeness. The arrival of some visitors (Sydney doctors) soon after relieved the state of

“tension”

"tension" to which Dr. Taylor's discourtesy had given rise. To one of these gentlemen Dr. Taylor transferred his attention, and shortly became involved in a rather heated argument. I completed the preparation of the specimens I had already secured, but I was so far disturbed by Dr. Taylor's conduct that I left undone several things which I went there with the full intention of doing.

During the drive back to Sydney not one word passed between the Chief Medical Inspector and myself as to Dr. Taylor's behaviour, and I heard no more of it until questioned by you on the subject.

As, I presume, sir, your request involves some expression of opinion of these occurrences, I feel bound to state that I consider Dr. Taylor's conduct was extremely rude, unseemly, and uncalled for. In the first place, it was very discourteous to have hurried through the *post-mortem* before our arrival. He had been duly informed of our intention to be present, and it would have been only common politeness to have waited for us. We arrived at the hospital before 3 o'clock.

As to his conduct in the *post-mortem* room, I was at first inclined to regard it as merely eccentric, or, at least, mere "swagger," for the benefit of his subordinates. This impression soon gave way to the feeling that Dr. Taylor was indulging in deliberate rudeness. To resent our taking the specimens referred to above was childish in the extreme, for, as you know, sir, there is enough tissue in the nerves in question to supply a college full of pathologists with specimens, let alone two persons. They might very easily have been shared between us, and would have been had not Dr. Taylor raised this selfish and misguided objection. That he should obstruct, where he was reasonable expected to assist, was a painful surprise to me.

I was, and I am still, practically a stranger to Dr. Taylor. Beyond speaking to him for a few minutes on the occasion of our formal introduction at the office, and again meeting him in your presence on the occasion of the visit to the Lazarette referred to above, I had not had any communication with Dr. Taylor, neither professional nor social. Being quite unconscious of having given any cause for it, I could not interpret Dr. Taylor's rudeness as directed against me personally, nor does this aspect of the case at all interest me. My official position in relation to these *post-mortem* examinations has since been distinctly defined by you. My duty is clear, and will be performed to the fullest extent of my ability. For myself I say no more. As to Dr. Taylor's relationship to the Chief Medical Inspector I know nothing, but I could not, and I cannot now, conceive of any cause of complaint against that gentleman which could justify the utter want of respect for his official position which Dr. Taylor exhibited. When it is remembered that the junior medical officers of the hospital were present, I cannot but consider that such behaviour bordered on an insult to the Chief Medical Inspector.

Putting aside the official aspect, it was indefensible from a purely ethical point of view. I was quite mystified as to the cause of Dr. Taylor's outburst at the time, and I do not understand it now. I have, in conclusion, to express my sincere regret in being obliged, as a matter of duty, to set down in black and white the above details concerning the very ungentlemanly conduct of an official and professional brother, though a stranger to me. Such conduct I would, for my own part, willingly forget. At the same time I wish to assert that I have endeavoured to make an honest, unbiassed statement, neither exaggerating nor abating one jot of my impressions of it.

The President.

I have, &c.,  
FRANK TIDSWELL.

Memorandum.

Board of Health Offices, 127, Macquarie-street, Sydney, 19 March, 1896.

THE enclosed paper is a copy of the memorandum alluded to in my minute of 22nd January, 1896. A copy was addressed to each of the three gentlemen separately, viz., Drs. Ashburton Thompson, Tidswell, and Taylor, but Drs. Thompson and Tidswell were previously told by word of mouth that it did not have any application to them. Dr. Taylor, on the other hand, was not so told. My intention was to deal as lightly as I could with Dr. Taylor, because up to this time (so far as I knew) his conduct had not been so bad as afterwards learned it really was, Drs. Thompson and Tidswell not having so fully disclosed to me the whole of the proceedings at the *post-mortem* examination on Kali Johai, as it afterwards became their duty to do.

A.S.

Sir, Board of Health Offices, 127, Macquarie-street, Sydney, 19 September, 1895.

I wish that where it is possible a *post-mortem* examination of the body be held in the case of every leper who dies in the Lazarette, and I wish the Chief Medical Inspector of the Board (Dr. Ashburton Thompson) and the Medical Officer in charge of the Laboratory (Dr. Tidswell) to have an opportunity of being present; and the Medical Superintendent of the Coast Hospital will therefore give timely notice to the office that such examination will be held. Further, when the death of such patients seems to be approaching the Medical Superintendent will give such timely report of the circumstance to the office that these officers may be warned to be in readiness. It, of course, is understood that the examination is not to be commenced until the above officers arrive—if they are coming—and their purpose in this regard will be communicated to the Medical Superintendent from the office by telephone. The Medical Superintendent will make all necessary arrangements for the examination being performed, and will either conduct the examination himself or direct one of his junior medical officers to do so.

He will afford every opportunity to the Chief Medical Inspector or the Medical Officer in charge of the laboratory of making observations on the morbid appearances as they arise during the examination, and as I wish the principal histological examinations to be made in the laboratory here, Dr. Thompson and Dr. Tidswell are to have such morbid specimens as they may desire.

Finally, it will be wise for everyone concerned to observe the amenities of official intercourse.

I regret that it should have been found necessary to issue the foregoing instructions, but circumstances have arisen which make this course unavoidable. In planning them I have kept in view the fact that the officers concerned are all under one head, and that all are public servants.

The arrangements are therefore conceived rather in the public interest than in satisfaction of professional ethics.

A. STUART, M.D.,

Medical Adviser to the Government, and President of the Board of Health.

George Henry Taylor, Esq., Medical Superintendent, Coast Hospital.

Board

Board of Health Offices, 127, Macquarie-street, Sydney, 19 March, 1896.

THE statement of Quarantine Officer Payne is an accurate statement of what occurred, and I am bound to say that the occurrence made an exceedingly bad impression on me. But here again I had not quite realised what sort of a man Dr. Taylor was, and instead of dealing with him on the spot, as I felt inclined to do, I simply said nothing and did nothing. But when subsequent events threw a different light upon Dr. Taylor's conduct, then I caused Payne to put down in writing a statement of what had occurred.

A.S.

17 February, 1896.

On the 7th October last I drove Professor Stuart to the Coast Hospital. By his order I left him at the sanatorium, and drove to the medical officers' quarters, to fetch Dr. Taylor. Arrived there, I said to Dr. Taylor, "Dr. Stuart is at the sanatorium, and I am sent to fetch you up to him." He entered the house, and I, turning the conveyance, waited for him, thinking he would appear immediately. After waiting a considerable time I asked the servant to repeat my message to Dr. Taylor. He then came out and got into the sociable. When we reached Dr. Stuart, that gentleman—whom we met coming up the hill—referred to the message, in connection, I suppose, with Dr. Taylor's delay in answering Dr. Stuart's summons. Dr. Taylor said that it had not been properly delivered to him. As I had repeated the very words of Dr. Stuart to Dr. Taylor I replied somewhat sharply, deeming my character aspersed by Dr. Taylor's remark, which implied that I had been at fault. This is an account of the circumstance, so far as it concerned myself. My remembrance of it is perfectly clear.

ARTHUR PAYNE.

### No. 9.

Dr. Tidswell to The President of the Board of Health.

[Photographs—please do not fold.]

Preliminary note on the pathological appearances of the tissues of Timothy O'Rourke.—From the Biological Laboratory.—Read, meeting of the Board of Health, this day, 3rd March, 1896.—C.A.S.

Sir,

Biological Laboratory, Board of Health, 24 February, 1896.

In reply to your verbal request of the 22nd instant, I have the honor to inform you that although the pathological examination of the tissues is not yet complete, I forward the following preliminary note on the appearances already observed, in order that the Board may be in possession of all the available information on the subject. A fully detailed report will be presented in due course.

I was not present at the *post-mortem* on O'Rourke, and so cannot speak as to the gross appearances of the tissues. The tissues I have examined were forwarded to the laboratory from the Coast Hospital by the President's instructions.

Within a few days after the *post-mortem* I reported that I had found large numbers of leprosy bacilli in the smear preparations of the spleen. I have since examined sections of the skin, ulnar nerve, popliteal nerve, spleen testis. Leprosy bacilli were present in all these organs—every section examined contained them.

The appended photomicrographs of the sections referred to are part of a series in course of preparation for the annual report. I do not propose at present to enter upon the consideration of the somewhat laborious technique involved in their production, but I may state that they have not been retouched nor manipulated in any way other than that required to produce an ordinary photograph. They actually represent the microscopic appearances. To facilitate inspection I have attached rough diagrams to certain of them. These were prepared from ferrotype prints of the same negative as the photomicrographs to which they refer. The stated amplifications are approximate only, pending some accurate measurements.

As the notes to the figures sufficiently explain the principal appearances observable, I need not describe them further. It will be seen from these photomicrographs that the pathological appearances indicate a widely-diffused and advanced state of the disease.

I have, &c.,

FRANK TIDSWELL.

Here follow eleven photomicrographs.

### No. 10.

The Acting Secretary, Board of Health, to The Chief Medical Inspector.

Sir,

Board of Health Offices, 127, Macquarie-street, Sydney, 4 March, 1896.

I am directed by the Board of Health to enclose you herewith an extract of a letter written by G. H. Taylor, Medical Superintendent of the Coast Hospital, in relation to the patients Georgie Yaw or Yet (otherwise Ah George) and Thompson, confined in the Leper Lazarette, and to request that you will have the goodness to proceed to Little Bay, examine the aforesaid patients, and submit a further report for the Board's information.

I have, &c.,

C. A. SIMMS,

Acting Secretary.

### No. 11.

The Earlier History of Georgie Yaw.

Case XXXIV.—Georgie Yaw, *æt.* 68; admitted 31 December, 1892.

*History.*—Native of Amoy; arrived in Australia in 1848; is a cook, and has travelled all over the country; has twice resided at Mudgee, and lately for the second time; was admitted from Waterloo, a suburb of Sydney; is extremely deaf. *State.*—Is a very big man; pallid; fairly well nourished; he presents no abnormality down to the great trochanters; behind both of these is a brownish discoloration, over which the skin is rough and slightly ulcerated at the centre; tests of sensation having been made elsewhere,

elsewhere, he intimated that these spots were as dead as the form he was then sitting on; on examination it turned out that a pin-prick gave him (apparently) sharp pain, but that the impression was not noticed for a second, or even longer. Everywhere below the knees sensation was very deficient, being present, though delayed, at a few points only. Legs and feet are slightly swelled, shiny, and deep brown in colour—the feet less than the legs; the cuticle roughened at parts. *Right foot.*—The small and great toes are about normal, but incline towards each other; between them the other three are crushed together; all are fattened and shortened, but the middle toe is shortest; over and attached to the first metacarpal bone is a tumour the size of a hen's egg of bony hardness; the little toe is deformed by a partial dislocation of the second phalanx, which rests upon and lies parallel with the second; the nails occupy a position rather behind the middle of the second phalanges. *Left foot.*—The three middle toes are shortened and crushed together, but not so much as those on the right foot; in this case the two halves of the metatarsus seem to have become bent downwards, so as to form a deep sulcus on the sole; by trying to straighten this out severe pain was caused; there is a similar but smaller tumour on this side, placed as on the right foot; nails as on the other side, but those of great toes normally placed. Sensation defective or delayed at many points of the trunk. Ulnars and peroneal nerves about normal. Pilocarpine (0.14 mg.) produced a moderate general sweat in about twelve minutes; on the back its distribution was irregular; two large patches of skin, one on left shoulder and the other across the loins, remain dry; the feet and legs and thighs remain dry; the feet sweated freely over some small areas (inner side of first metatarsal bones, a patch on the dorsum, &c.), but most of the surface remained dry. Four or five small achromatic areas about the size of a hazel nut on the right upper thorax appeared, which were invisible before.

J. ASHBURTON THOMPSON.

### No. 12.

#### The Chief Medical Inspector to The President, Board of Health.

Leprosy Act, 1890.—Report of present state of Georgie Yaw.

6 March, 1896.

I re-examined this patient yesterday.

This patient is a Chinese, stone deaf, and apparently at a much advanced age. His general health remains good—he is thinner than he used to be, and anaemic.

He has the deformities of the feet originally mentioned, and, no doubt, these are congenital. The dorsum of each foot and the lower two-thirds of each leg are deeply pigmented (dark brown), the skin thinned, cuticle desquamating slightly in scales—these pigmented areas are absolutely insensitive; when they were pricked out of the patient's sight, and before he found out what was being done, his face remained absolutely quiescent. Probably he did not notice that he had been touched.

He also still shows the two pigmented spots, one over and behind each trochanter, slightly ulcerated and pinkish in the middle—they are smaller than they were at first. At first these spots were quite anaesthetic, the patient having pointed this out. But now, when he saw the pin, he flinched much whenever he was pricked; however, he flinched just the same when the head was used, and it took a long time to convince him that the head had been used, and that it could not hurt him, though this was done at last. No hyperaesthesia was manifested when the fingers were used. This patient shows no other signs, but the pigmentation of the legs has all occurred since his admission.

For the sake of form, merely, I reaffirm the opinion originally expressed by me several years ago.

J. ASHBURTON THOMPSON,

Chief Medical Inspector.

Read, meeting of the Board of Health held this day, 10th March, 1896.

DIRECTED that the President should frame a reply and submit it to the next meeting. He was desired to state the position in some such terms as these: "Dr. Taylor was admonished because he did not with sufficient promptitude, and in accordance with the law, report a case of leprosy which was in his charge. In his defence he has imported, very improperly, matters to which he has no business to refer. He actually accuses the Board of having overlooked his reports concerning the two lepers to whom he refers. He has done this without proper knowledge and with great impropriety, because the Board had arrived at its decisions after full and careful consideration."

The President was further desired to append descriptive notes of the two cases in question, written briefly and concisely.

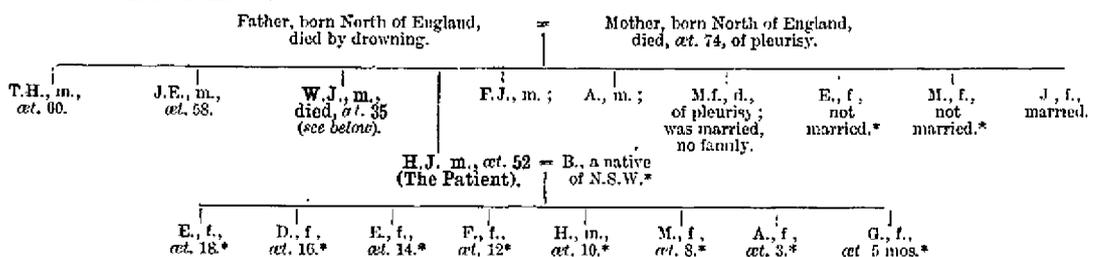

The papers were directed to be again circulated in the meantime.

### No. 13.

#### Earlier History of H.J.T.

Case XLV.—H.J.T., *æt.* 52, admitted 10 October, 1894.

His descent was as follows:—

\* These persons were examined by me, and were in apparent good health.

*History.*—Was born in the neighbourhood of Kempsey (31° 9' S. lat., 152° 50' E. long.), on the Macleay River, in a district which consists chiefly of extensive and fertile alluvial flats, bordered by low hills,

hills, and reaching to the sea-coast. Farming is the principal occupation there, and maize the principal crop.\* The flats are often flooded; there is no malaria. In 1891 the census population was 2,194 (municipality only). The district is rather isolated; it is accessible from Sydney by sea, as well as by rail and a long coach journey—from towns on the inland tableland by a long coach journey; but it is not on the way to any other place, and is a terminal point for travellers. There have always been a very few Chinese in the district, but individual Chinese never stayed long, the conditions being unfavourable to their usual pursuits. The patient had never left the district except for occasional visits to Sydney. He had no trade, but was a farmer, bush-labourer, &c., and much employed at saw-mills. He married a native of New South Wales in 1875. The following details were got from him, and were checked and corrected by his wife and by two sisters, who were all questioned separately.

*Clinical History.*—Had no illness at all during his life, but has met with many accidents, in several of which his head was injured, as, for instance, one from a cricket-ball, one or more from timber, and one from a horse accident; his left leg was broken during boyhood.

*History of Illness.*—About 1882-3 he began to have acute attacks of headache, having up to that time remained in his usual good health. They were said by the patient and his wife to have begun about sunrise and to have ceased about nightfall; probably he had five such attacks, of which the two first lasted a fortnight, the others a less number of days, and the five attacks were spread over about four or five years (1887-8.) In 1885 he met with some accident, while harrowing, which strained the right side of the body; his right hand and foot became rather numb, "powerless," and swelled; a doctor was consulted, who thought he was suffering from a strain followed by rheumatism; the effects—weakness, pain, and cramps, felt over the right side of the body—persisted for long. After eight or nine months, during which he continued to suffer as described, he visited a well-known practitioner in Sydney (since deceased), who, from the account now given, seems to have dispersed a ganglion which had formed on the right hand. From the time of this treatment the hand and foot resumed their normal state, except that both were a little numb. Soon after the accident, but whether immediately or later cannot be ascertained, his manner changed from what it had been and he became slow, either in speaking or in understanding, or in finding words to express himself; and this slowness still remains, although it is now so little marked that it might be taken for rustic dulness. Notwithstanding these symptoms, it seems that no sort of fit was ever suspected, either by his wife (a very intelligent woman) or other relatives, or by the two doctors who attended him. Since about 1885-6 he has often had attacks of drowsiness; the patient said they lasted two or three days at a time; his wife said that "during the last eight or nine years he could sleep whenever he lay down," which was "quite different from his former habit," and "he did not fall asleep while occupied; still, there were some days when it seemed he could not keep awake." After recovery from the strain he returned to work; he was chiefly engaged at a saw-mill, and he met with many accidents; he had some blows on the head from timber, a bullock injured his right hand, a horse knocked him down and trod on his right foot, so that it swelled again. However, according to his wife, he remained in good general health for about two years after returning from Sydney; he then (1888) skinned a putrid bullock, became exceedingly ill before he had finished, was supposed to have been in danger of dying the same night, and never afterwards enjoyed the same measure of good health he had immediately before. Towards the end of 1890 the second finger of his right hand was smashed by timber; he went to Sydney, was admitted to Prince Alfred Hospital, 27th January, 1891, where the finger was amputated at the metacarpo-phalangeal articulation, and discharged well, 18th February, 1891; a note in the hospital case-books was reported by the Medical Superintendent to refer "only to the necrotic state of the phalanx." All the fingers were hurt at the same time, but the others not much. During 1894 he had the third finger of the right hand crushed; it got nearly well, and then was crushed again; he again went to Sydney, and was treated as an out-patient at the same hospital on 18th May, 1894, when the finger was amputated. At this time a member of the staff suggested that he was suffering from leprosy, but others did not concur, and he returned home. After going to work again he got the forefinger of the right hand crushed; he was again admitted to the same hospital on 15th September, 1894, and was reported during his stay under the Leprosy Act. He said that although the numbness of hand and foot had persisted since the strain, "the hand never seemed right" after the first amputation; and the other fingers got "bad" in some way before each of the injuries just mentioned.

*State on Admission.*—Height, 5 ft. 7½ in.; weight (not taken); is grey, rather deaf, of low or slow intelligence; his memory is apparently defective, and probably not trustworthy—at all events, he does not readily remember matters which it seems he ought to be aware of; and he is thin, depressed, and out of health. He has lost the second and third fingers of the right hand, by amputation; the forefinger is swollen and stiff, and the third phalanx is partly absorbed; the interosseous muscles are wasted, and the metacarpus is flattened. The left hand is normal in appearance. The skin on the posterior and inner aspect of the right forearm is rough and desquamating slightly; there is a less degree of the same roughening over the back of the right wrist; there is a very slight reddening of these patches, but no pigmentation. Below the right knee is a slightly reddened, scarcely pigmented, patch of roughened skin, having irregular and fading edges, not elevated, not presenting any obvious sign of atrophy, about 2 inches wide and 3 inches long. About the middle of both legs in front are larger, much more markedly pigmented patches, over which the skin is not so rough, and is atrophied; that on the left shin is most atrophied, and the patient ascribes this patch to injury received during boyhood. The feet are normal, but bluish. Nervous system: The orbicular muscles of the face are under control. The right cubital nerve is decidedly enlarged, and more than normally sensitive; on pressure, sensation is referred downwards only, and correctly; it can easily be traced high up, and it has on it a fusiform swelling, which begins about 2½ inches above the notch, and extends for about 2 inches further upwards. The left cubital is traceable without difficulty; possibly it is a little larger and harder than usual; it is less sensitive to pressure than the right, and sensation is referred downwards only, and correctly. The right external popliteal is easy to find; it seems to be not as sensitive as usual; sensation on pressure is referred downwards only. The left nerve is more sensitive, and less easily found, though well defined; sensation on pressure is referred downwards only. Sensation: On the back of the right hand he cannot distinguish the head from the point of a pin, though blood is drawn; on the outer side of the right forearm he is doubtful whether he is touched or pricked, but perhaps sensibility to pain is a little acuter there; the three patches on knee and shins are quite analgesic judged as in the case of the hand; both feet as high as the ankle-joint are thoroughly analgesic. Sweat-glands:—12 mgr. of pilocarpine injected subcutaneously

\* Maize is not an article of human food in N.S.W., except in the towns and to the extent it is generally eaten (cornflour, maizena, &c.)

subcutaneously produced a moderate diaphoresis. Both hands and both feet remained absolutely dry. The posterior and internal aspect of the right forearm, the right wrist, and the three patches on the legs also remained dry.

A month later the swelling on the right ulnar nerve had become a little less, so that, although distinct, it could scarcely be described as fusiform; tenderness on pressure was also lessened, though still apparently above normal. All other signs remained as at first. Three months later still this swelling was no longer distinguishable; the skin of the right forearm had become about normal, the patch on the right knee had disappeared, the patch on the right shin had very nearly disappeared, and only that on the left shin persisted as at first. In general health he had very much improved, his weight being then 143 lb.; his intelligence (or quickness) had improved to a small extent. All other symptoms remained as before; the analgesia remained as well marked as at first at all points named, and, when touched with the finger on the left foot he started as though he had received the prick with a pin he was led to expect—the pressure sense remaining everywhere apparently perfect, as usual.

J. ASHBURTON THOMPSON.

No. 14.

The Chief Medical Inspector to The President, Board of Health.

Nerve Leprosy—H. J. Thompson re-examined.

21 June, 1895.

I RE-EXAMINED this patient yesterday at the Lazarette in company with the Medical Superintendent.

H.J.T.'s general health remains improved above what it was on admission to the extent described in my last note (*see Annual Report for 1894*). His intelligence or quickness also maintains the slight improvement then noted. I got, however, what seemed to me good evidence of the suspected impairment of memory. Reference having been made to extensive grazing of both legs received while bathing from being rolled over by a wave against the rocks, the patient said this happened "about a week ago, I should think"; but the Medical Superintendent said it must have been nearly three months ago, and, at all events, no trace whatever of the injury remained at the time of the present examination. Nor did the patient appear to remember, on being reminded, nor to be satisfied, that it was really so much longer than he had supposed.

The objective signs presented appeared to me to be the following:—The left leg was a little larger than the right, as far as about the ankle joint, and this enlargement was due to varicosity of the deeper veins. The superficial veins were also enlarged and prominent, and from this cause as well. Perhaps, as others, both extremities were markedly bluish from about the middle third of the legs downwards. From the same point downwards on both sides the skin was dry, harsh, shrivelled, and slightly desquamating at several points. It was also discoloured and dirty-looking, although clean. The nails of all toes were perfectly normal. The left leg affords evidence of a fracture during childhood at the junction of the middle and lower thirds. From this point downwards and inwards, as far as the anterior margin of the internal malleolus, a patch of skin extended which was variously discoloured in more or less obscured shades of red, yellow, brown, and blue. It was 3 or 4 inches across at its upper part, quite narrow below. The skin was shiny and thin here and there; at other parts rough, dry, and even desquamating, and normal nowhere. There was a similar but rather smaller patch on the right leg at about the same level, and extending rather less below. Both these patches were mentioned in my earliest description, and I judge they have now the appearance they had then. The metatarsi showed no flattening, and there was no muscular wasting. Over the right ligamentum patellæ were two or three oval and now reddish depressions. The roughened patch of skin present at my first examination, absent four months later, was absent still, and the marks now mentioned had not been before observed. Their appearance caused me to inquire whether he had ever had any blisters there, which he denied. He ascribed the marks to old damage inflicted by kneeling on the knee to use the cross-cut saw. They might be scars of blisters (never looked for before in this situation), temporarily reddened, but I do not think this origin of them can be affirmed, and on the left knee there were no similar signs.

From the right hand the two middle fingers have been amputated at the metacarpal joint. The metacarpus is decidedly flattened, and the interossei are wasted, but the thenar and the hypothenar eminences are either normal or but doubtfully diminished. The forefinger is thickened and cannot be flexed. The distal phalanx has almost quite disappeared by absorption; the nail was normal though curved forwards. The other nails were normal. The left hand, on the whole, was not distinctly abnormal in appearance. The metacarpus was not as firmly or markedly arched as usual, and the dorsal interossei were small. The thenar and hypothenar eminences were either normal or but slightly smaller than might be expected of the hands of a working-man. The skin on the dorsum of both hands was red, and in other respects did not present usual appearances. Still, I could not say that the latter were not such as might be seen after the hand of a working-man had for several months been protected from weather and work. The skin of both forearms was about normal, though slightly rough and harsh at points on the outer and extensor surfaces.

On the skin of the back, over the first dorsal vertebra, at another point towards the left shoulder, and at another point about the eighth rib, there were three rough, red, desquamating patches, about the size of a shilling, over which sensibility to pain (needle-point) seemed normal.

The oricular muscles of the face were under control. The right cubital nerve was decidedly enlarged, and very easily traceable high up the arm. Two or 3 inches above the notch a very slight enlargement could be detected about an inch long. It seemed about normally sensitive, and on pressure sensation was referred downwards to the fingers only. The left cubital nerve was hard, round, and smooth, not easily traceable far above the notch; it was not normal, but not probably abnormally bulky. It seemed about normally sensitive, and communicated downwards to the fingers only. Both perineal nerves were hard, smooth, and round, and could be discovered very easily. Yet they were probably not bulkier than usual. On pressure sensation was referred downwards only, and to the feet. These nerves were not normal.

An injection of pilocarpine was administered by the Medical Superintendent, and the following result was reported by him (on attempting this in my presence a fault was discovered in the syringe, and it was then too late to procure a fresh one):—"His skin did not react after injection of one-tenth of a grain of pilocarpine. After one-fifth of a grain the feet and right hand remained perfectly dry, also the skin over tibia of right foot (leg?). Skin over back and abdomen acted freely, slightly over chest and thighs."

thighs. Fingers of left hand remained dry, but there was a slight moisture over back of hand, more freely over palm. Face and neck, slight action. There was profuse salivation." It is a pity there should be no specific reference to the macular or quasi-macular spots above described.

Signs and symptoms elicited with the patient's aid were as follows; but in reading them it must always be borne in mind, first, that the patient is not mentally acute; secondly, that he has some notions regarding the value ascribed to evidence of loss of sensation in relation to leprosy, while his friends doubt whether he has that disease, and urge his release. Tactile sensibility—Light but firm strokes were drawn on the skin with a well-rounded graphite point; the skin was touched with a loop of stout thread; the point of a needle was lightly but firmly drawn along the skin for an inch at a time; the patient was requested to choose one of four coins of different sizes placed on a deal table; and all these tests were applied out of the patient's sight. All over both feet as high as the ankle-joints he said that he had been touched with the pencil both when he had and when he had not been touched; the dragged point of the needle was felt over the dorsum of both feet and a little way above the ankle-joint, but no conjecture as to the kind of feeling or the instrument by which it was caused could be got from the patient; in the same regions the thread was said to be felt, whether he were touched with it in reality or not. Being desired to select a threepenny bit from a group which included that coin, a sixpence, a shilling, and a penny, with his left hand, he chose the sixpence at the first trial, the threepenny bit at the second; being asked to pick up the threepenny bit placed by itself, he did find it and did pick it up, but both after much searching and fumbling. Localisation—Moderate but distinct prods with the pencil point already mentioned were correctly and promptly localised on the dorsum of both feet, and on all toes examined. Analgesia—At various points on both feet the point of a needle was said to be felt, and "like something sharpish"; blood was drawn several times. The head and point of a pin were variably applied to the same regions, and the blood was sometimes drawn with the latter. The slight blow was always felt. Over the right foot the two were distinguished, sometimes correctly; over the inner side of the dorsum of the left foot and downwards towards the plantar arch they were distinguished apparently correctly; elsewhere on the left foot sometimes correctly, sometimes not. At no point on either foot did either pin or needle cause, as it seemed, sharp pain or any reflex movement; and this contrasted strongly with the result of pricking portions of the back and shoulders—where the spots mentioned above seemed also to have normal sensation. Heat and cold—Tablespoons were taken out of markedly hot and cold waters, dried and applied, all out of the patient's sight. The parts tested were the dorsum of both feet, plantar surfaces of all toes, outer margin of both feet, points on both legs below the knees, dorsum of both hands, over wrist-joints, between the left finger and thumb on the dorsal aspect; the result was that everywhere response was very slow, and everywhere a sensation of heat was reported to both hot and cold touches. Both hot and cold touches were promptly and correctly identified immediately above the patella and upwards, and from 3 inches above wrist-joints and upwards; exception, on the inner side of dorsum of left foot towards plantar arch a cold touch was on one occasion correctly named. The back was tested at many points by blowing hot and cold, and perfectly normal sensations were every time promptly reported; the level was not below the scapulae.

Time did not allow of any further search on that occasion into different modes of sensation; but I noted additionally that there was no ataxy, all limbs remaining perfectly steady except when voluntarily moved; both knee-jerks were normal; there was no apparent muscular wasting, nor paralysis (except as to the former such as is remarked upon above of the metacarpal interossei). No fibrillary tremor could be seen in the muscles of the hands or feet. Walk was apparently normal. Attempts to elicit the superficial plantar reflex resulted in rather prompt withdrawal of the extremity generally.

On the whole, it will be seen that there is no change in Thompson's condition of any moment from what was described at first and subsequently.

J. ASHBURTON THOMPSON,  
Chief Medical Inspector.

### No. 15.

#### The Chief Medical Inspector to The President, Board of Health.

Leprosy Act, 1890.—Report of present state of H.J.T.

6 March, 1896.

I RE-EXAMINED H.J.T. at the Lazaretto yesterday. I have set down below the main points noted in my report dated 21st June, 1895, and have numbered them (1.); underneath each item is the result of the present examination numbered (2.)

- (1.) General health much improved, and good.
- (2.) Improvement maintained; general health good.
- (1.) Memory decidedly bad, judging from a test.
- (2.) Not ascertained.
- (1.) Intelligence or quickness improved since admission.
- (2.) Improvement maintained not advanced upon.
- (1.) Left leg, varicosity of deeper veins; both legs enlargement of superficial veins.
- (2.) The same.
- (1.) Skin of both legs from middle third downwards dry, harsh, &c.
- (2.) Improved, and do not answer to that description. They are both dry, and there is evidence of fine desquamation, not scalliness; the left is the least affected. They are not now bluish.
- (1.) Nails of all toes normal.
- (2.) The same.
- (1.) A macula extending from about old fracture of left leg to the internal malleolus.
- (2.) The macula remains, chiefly of a brown colour now, it does not reach the internal malleolus, but extends in that direction. It is about 3 inches broad at most, perhaps 5 inches long.
- (1.) A similar macula on the right side.
- (2.) Scarcely visible, or even not present.
- (1.) No flattening of the metatarsi.
- (2.) The same; the right foot is a little wasted in comparison with left.
- (1.) The right patella has some oval scars below centre.
- (2.) Scars present, margins uncoloured.

- (1.) There was at first a desquamating reddened patch below the right knee; in June this had disappeared.
- (2.) There is no patch; but its site, or immediate neighbourhood, is anæsthetic.
- (1.) Right hand: the metacarpus flattened, interossei wasted, thenar and hypothenar eminences not distinctly wasted.
- (2.) Metacarpus very markedly (and more) flattened, interossei wasted, thenar eminence markedly wasted, hypothenar scarcely at all.
- (1.) Right index finger: thickened, not easily flexed, distal phalanx nearly absorbed, nail normal.
- (2.) The same, but the joints more fixed; the nail is now diminished in all directions, and is about one-third normal size.
- Additional: the ultimate phalanx of right thumb is undergoing absorption, the thumb consequently tapers; the joint is not fully mobile; the nail is markedly curved both forwards and laterally.
- (1.) Left metacarpus not as much arched as normal.
- (2.) Left metacarpus is now more distinctly flattening.
- (1.) Backs of hands, wrists, and fingers reddened and shiny.
- (2.) The same, but more so; hair nearly gone from central part; it is now quite clear that this state of the skin is abnormal, and not due (as conjectured it might be at first) to weather, &c.
- (1.) Forearms: skin roughened on extensor and outer surfaces.
- (2.) The skin in these situations is rather a little altered and perhaps a little thickened here and there, and very slightly roughened; hair not fallen.
- (1.) Over the first dorsal vertebra, towards the left shoulder, and at about the angle of the eighth rib, left side, three red and rough patches of skin nearly circular.
- (2.) The two latter had either disappeared or had left indecisive evidence behind them; the first was present. The doubtful remains towards left shoulder being pricked were found quite anæsthetic (this was done quite unexpectedly by the patient, and before his attention had been drawn to this kind of examination; his face being watched by another, it was plain he was unaware that he had been pricked—cuticle penetrated).
- (1.) Sensation in the above patches apparently normal.
- (2.) See above.
- (1.) Orbicular muscles normal.
- (2.) Orbiculars (of eyes) normal.
- (1.) Right cubital: decidedly enlarged; slight local swelling above the notch.
- (2.) The same.
- (1.) Left cubital: small, not easily traceable upwards.
- (2.) About the same; not easy to follow above the notch.
- (1.) Both peroneals hard, round, and smooth.
- (2.) The right peroneal much smaller than the left; the left hard, round, and smooth.
- (1.) Pilocarpine: Dr. Sawkins, October, 1894; 1-6th; moderate sweating; both hands and both feet absolutely dry; back of right forearm, and right wrist; scaly patches on either shin (since disappeared) and below right knee, remained dry. Dr. Taylor, 22nd June, 1895; 1-5th; feet and right hand dry, also skin over tibia of right foot (leg?); fingers of left hand remained dry, but slight moisture over back of hand, more freely over palm. Face and neck slight.
- (2.) 1-4th; right hand, and a triangular portion of skin on posterior aspect of forearm as wide as the wrist-joint at the bottom, apex about 6 inches above it, remained absolutely dry; the left hand sweated quite slightly, the first phalanges less, the second and third less still; right foot remained dry, the left had very moderate moisture; the spot over first dorsal vertebra sweated less than surrounding skin; another spot about the 12th dorsal made appearance under pilocarpine, and sweated less than surrounding skin.

From my report of 21st June, the difficulties thrown by this patient in the way of tests applied to sensation are apparent, and he still answered rather what he thought would testify to a normal state than what he really experienced. In the case of the shoulder macula, already mentioned, and in that of a site of a former macula below the right knee, I got quite trustworthy indications; so also I did during examination of the feet. But at whatever apparently abnormal part he was pricked, though he sometimes correctly spoke of the pin-point, yet it was quite clear that he nowhere received the sharp impression of pain he should have received—that is, he remained perfectly quiescent when pricked at those spots, and merely spoke of “something sharpish,” though he flinched in a normal way when much more slightly pricked on probably healthy areas. On this occasion he showed where he had been touched when he had not been touched at all, just as he did last time, and it is worth while to remember the note made in the last Appendix—that, being touched with the finger on the left foot, he flinched as though he had received the prick with a pin he had been led to expect.

The general outcome of the above notes shows that H.J.T. remains in the same state described last June, and there has been the improvement in general health usually (or often) observed in lepers after admission under regular dieting and treatment; some improvement in minor local respects, such as is common in a disease whose manifestations are subject to fluctuations, and advance in the trophic affection in the right hand, as well as increased (or at all events now manifest) wasting of the muscles of the left. Lastly, and merely for the sake of form, I reaffirm the opinion originally expressed by me on 5th October, 1894.

J. ASHBURTON THOMPSON,  
Chief Medical Inspector.

Read, meeting of the Board of Health held this day, 10th March, 1896. Directed that the President should frame a reply and submit it to the next meeting. He was desired to state the position in some such terms as these:—“Dr. Taylor was admonished because he did not, with sufficient promptitude and in accordance with law, report a case of leprosy which was in his charge. In his defence he has imported, very improperly, matters to which he has no business to refer. He actually accuses the Board of having overlooked his reports concerning the two lepers to whom he refers. He has done this without proper knowledge, and with great impropriety, because the Board had arrived at its decisions after full and careful consideration.” The President was further desired to append descriptive notes of the two cases in question, written briefly and concisely. The papers were directed to be again circulated in the meantime.—C.A.S.

No. 16.

The Principal Under Secretary to Professor Anderson Stuart.

My dear Sir, Chief Secretary's Office, Sydney, 16 March, 1896.  
Mr. Brunker would like to see you at 11 o'clock a.m. to-morrow, relative to the case of Dr. Taylor, Medical Superintendent of the Coast Hospital, Little Bay.

Yours, &c.,  
CRITCHETT WALKER,  
Principal Under Secretary.

I waited on Mr. Brunker, as requested, but was unable to see him, and have not yet been able to see him.—A.S., 19/3/96.

No. 17.

Professor Anderson Stuart to The Principal Under Secretary.

Board of Health Offices, 127, Macquarie-street, Sydney, 19 March, 1896.  
IN reply to the minute of the Chief Secretary of the 17th March, 1896, I beg to recommend that a letter be addressed to Mr. Taylor conveying to that gentleman the Chief Secretary's opinion as expressed in that minute.

At the request of the Board of Health, I also transmit herewith for the Chief Secretary's information a statement of the cases of two lepers, Georgie Yaw (a Chinaman) and H.J.T. (a native of this Colony), which was adopted by the Board on the 17th instant.

A.S.

BRIEF statement of the Board's position in regard to Georgie Yaw and H.J.T., at present confined in the Lazaretto.—Adopted by the Board at a meeting held on the 17th March, 1896.

GEORGIE YAW is a Chinese leper, who, if liberated from the Lazaretto, would be unable to maintain himself. He would therefore have to go to an asylum for the destitute, where his presence would probably cause much trouble to every one around him and much misery to himself. The law contemplates that a leper certified as such (as Georgie Yaw has been) shall be detained at the Lazaretto, unless his means are such that he can be duly and properly isolated elsewhere, which clearly is not the case with this man. He is therefore legally detained at the Lazaretto, and, besides, that probably is also the manner in which the greatest amount of comfort can be obtained in the Colony for him.

H.J.T. is a leper legally detained at the Lazaretto. Owing to representations made by various members of his family, the Board made careful inquiries into his condition, and the Board's officers had many interviews with members of his family, and as a result it was found that their circumstances entirely prevented him being maintained by his family, and from his condition he certainly would be unable to maintain them if released from the Lazaretto and detained in any place which might, in accordance with the law, be proclaimed a private lazaretto. As a matter of fact, representations were made to the Colonial Secretary, as the result of which a weekly allowance was made to his family, so poor were they. There is no doubt at all that the Lazaretto is the most suitable place for him. As illustrating the difficulties which a man in his position would meet if released from the Lazaretto, it might be mentioned that it has been reported that the mere rumour in the district where they lived of their father being a leper was sufficient to lead to the exclusion of the members of his family from such employment as had hitherto been open to them.

From this statement it will be seen that Mr. Taylor is in error in supposing that the Board had ignored his reports concerning Georgie Yaw and H.J.T. The action taken by the Board in both cases was in accordance with law, after careful deliberation and minute inquiry into the circumstances.

Moreover, the Board cannot refrain from expressing the opinion that Mr. Taylor has acted improperly in importing these two cases as new matter into the consideration of a perfectly distinct subject, viz., the action of the Board in directing him to be admonished for failing to obey the law by not reporting with sufficient promptitude a case of leprosy which had come under his observation in the Coast Hospital.

A. STUART,  
President.

The Principal Under Secretary to The Medical Superintendent of the Coast Hospital, Little Bay.

Sir,

Chief Secretary's Office, Sydney, 24 March, 1896.

With reference to your letter of the 7th ultimo, submitting a report explanatory of your conduct in relation to the case of one Timothy O'Rourke who died in the Coast Hospital, Little Bay, on the 9th November last, I am now directed to inform you that after carefully reviewing the whole of the circumstances, the Chief Secretary considers that you are deserving of censure in not promptly reporting the fact to the proper authorities that the deceased was suffering from leprosy, and in improperly importing into your defence matters to which you had no business to advert.

I have, &c.,  
CRITCHETT WALKER,  
Principal Under Secretary.

No. 18.

The Editor, *Australasian Medical Gazette*, to The President, Board of Health.

Dear Professor Stuart,

16, College-street, Sydney, 6 May, 1896.

At a Council meeting held last night (Tuesday, 5th) a resolution was passed directing the editor of the *Australasian Medical Gazette* to publish, in the next issue of that journal, Dr. Taylor's case of leprosy. This paper is a clinical report of a case of leprosy treated by Dr. Taylor at Little Bay Hospital,

Hospital, but it is not accompanied by any particulars concerning the *post-mortem* examination. Should it not be against the rules of your Department, I would like very much to receive from your pathologist some particulars regarding the *post-mortem* examination, which might possibly render the case more complete, and of higher scientific interest.

Thanking you in anticipation.

Believe me, &c.,

SAMUEL T. KNAGGS,

Editor, *A.M. Gazette*.

Let any *post-mortem* notes on this case be forwarded to Dr. Knaggs. Ask authority.—A.S., 7/5/96.  
Done.—C.A.S.

### Newspaper Extracts.

[From the *Daily Telegraph*, 7th May, 1896.]

#### THE LEPERS AT LITTLE BAY—AN ALLEGED HEALTHY PATIENT—NEW LEGISLATION REQUIRED.

A DIFFERENCE of opinion between medical men, between whom at times differences of opinion regarding cases do occur, has called attention to the apparently unsatisfactory conditions of the Leprosy Act, especially in regard to the detention of people confined as lepers, but who may be considered by medical men, other than those who certified to their being diseased, not to be lepers at all. A correspondent, who is a medical man, writes stating that there are at present two men at the Little Bay Lazarette whom Dr. Taylor, the Medical Superintendent, considers to be in a condition which should exempt them from this deprivation of their liberty, as, in his opinion, they are not afflicted with leprosy, although they were certified to be so diseased when sent into confinement. It is further stated that representations to this effect have frequently been made by Dr. Taylor to the Minister in whose Department this institution is, as well as to the Board of Health, but without effect, so far as securing the release of the men is concerned.

From inquiries made yesterday it would seem that the complainant has grounds for stating that, at any rate, one of these supposed lepers is considered by the Medical Superintendent of the Lazarette to be a person who should be liberated. It is understood that Dr. Taylor has reported respecting this man that there is not the remotest probability of his ever having been a leper. None of the symptoms of the disease, it is alleged, can be discerned in his case, and that he is not a leper is further substantiated by the fact that since he was taken to Little Bay he has put on flesh, being now described as stout, and that his general health also has improved. The other man, it is alleged, is suffering from nerve leprosy, which differs from the virulent form of the disease, and that this man also might safely be released.

Commenting on this assumed set of facts, our correspondent remarks that it is evident that the Leprosy Act is extremely defective, and that it requires immediate attention, being without effectual safeguards, and comparing unfavourably with our carefully drawn up Lunacy Acts. By the provisions of the lunacy law, in ordinary cases, before a lunatic can be confined, a request, authenticated by a Justice or Minister of religion, accompanied by two medical certificates, is required. For patients, when confined, there is an Inspector-General, and there are also two official visitors, one of whom must be a medical practitioner. The visitors must make visits at least once a month, with or without notice. Both these and the Inspector-General can recommend the discharge of patients. A Judge of the Supreme Court can order inquiry into the case of any confined person alleged to be sane, and order his release on result of inquiry. A Judge can also direct inquiry into the care and treatment of a patient. For obviously wise reasons, the Inspector-General and the official visitors are legally debarred from certifying any free person as a lunatic. It is evident that all these precautions were made because proved necessary to prevent abuse.

As to our present Leprosy Act, it provides that immediately on any case of leprosy appearing the medical attendant and the householder shall report it. The practice, then, is for the Board of Health to get two practitioners to examine, and if they consider it leprosy to certify. If they concur, a warrant is made out, and the patient conveyed to the Lazarette. No legal provision is made for appeal on the part of the patient, and none for discharge, under any circumstances. Once in the Lazarette he can do nothing, and is there for life, and can be subjected to neglect or cruelty by his attendants without hope of redress unless he has political influence or power to bribe.

Our correspondent remarks that a new Leprosy Act should contain safeguards and rules of procedure on the general plan of the Lunacy Acts. After notification, two physicians of wide clinical experience should be selected to report on the case, and should be well paid, as experts. Reasonable right of appeal should be given to the patient. The Lazarette should be subject to regular inspection by physicians debarred from signing leprosy certificates, and these visitors should have powers equal to those under the Lunacy Act. Patients should have right of appeal to a Judge, who should have power to direct inquiry into alleged abuses. Provision for legal discipline within the Lazarette should be made. At present it seems that a patient can commit an offence on another with impunity. A leper can scarcely be sent out of the Lazarette to gaol. There is no provision at present for criminal or insane lepers. Provision should be made for lepers required as witnesses, plaintiffs, or defendants in Courts of law, or who may be acting as trustees. Provision should also be made for medical or surgical consultation in difficult cases of illness. Proper legal provision should be taken to provide sustenance for the wives and families of lepers. At present the bread-winner is torn from his family for no fault of his own, and shut up in a lazarette for the sole benefit of the public; meanwhile his wretched family must beg, steal, or starve. Provision should also be made for keeping up existing insurance policies on the lives of lepers. It should be clearly understood that lepers are not criminals or, properly, paupers, but, within the Lazarette, free men, isolated for the good of their fellows, and they should be treated in the most liberal way, and every possible compensation given them.

It would be interesting, our correspondent adds, to know whether lepers are entitled to the franchise or not. If they are, he says that they might claim it, and their votes would have to be taken. Provision in a new Act should be made for allowing the exit of a patient from the Colony, should he so desire. It might be desirable and economical to offer to pay their passage-money, and a small pension, especially in the case of Chinese. It should be made illegal for a known leper to land as an immigrant to the Colony.

He also thinks that the general question of leprosy isolation should be to some extent raised. Isolation is certainly necessary in nodular lepers when ulceration has begun. Before this takes place there can scarcely be any appreciable shedding of leprosy bacilli, and if the patient is to be isolated the precautions may be a little less strict than later on. He states that it is rather difficult to see how "nerve lepers," as they are called, can be any serious danger to the community. This is a question for medical men, but it shows that some discretion as regards isolation and its extent might, perhaps, be allowed in the administration of the Act. It should also be remembered, he adds, that in some patients the leprosy dies out, leaving them "cured" so far as the leprosy goes, though maimed by its ravages.

In connection with this matter it may be stated that many medical men are of opinion that numerous cases of leprosy exist amongst us which have escaped detection. A remarkable incident which occurred several years ago, when the Coast Hospital was being used for typhoid patients, is mentioned in confirmation of this belief. Two of the patients who were being treated for typhoid were found to be in a leprosy condition. A third man, who called at the institution to inquire about one of them, was observed by the medical officers to be a leper also, and he had the disease in a very bad form. All three were afterwards confined to the Lazarette.

[From the *Evening News*, 6th May, 1896.]

ALLEGED LEPROSY SCANDAL AND DEFECTS IN THE LEPROSY ACT.

To the Editor of the *Evening News*.

SIR,—There are some very definite rumors published in the *Evening News* that a great scandal exists at the Leper Lazarette, in that two men alleged not to be lepers are confined there, and that this has been repeatedly brought under the notice of the authorities by Dr. Taylor, the Medical Superintendent. Now, Dr. Taylor is well known as an expert and scientific investigator in the subject of leprosy, and to have probably a closer experience of that disease than any other medical man in Australia. If it be true that no notice has been taken of his repeated reports the neglect is most culpable, and there is urgent call for inquiry. It is certainly necessary to sift the whole matter thoroughly. It is evident that the Leprosy Act is extremely defective, requiring immediate attention. It is totally without effectual safeguards, and compares most unfavourably with our carefully drawn up Lunacy Acts. By the provisions of the lunacy law, in ordinary cases, before a lunatic can be confined, a request, authenticated by a Justice or Minister of religion, accompanied by two medical certificates of insanity, is required. For patients when confined there is an Inspector-General and also two official visitors, one of whom must be a medical practitioner. The visitors must make visits at least once a month, with or without notice. Both these and the Inspector-General can recommend the discharge of patients. A Judge of the Supreme Court can order inquiry into the case of any confined person alleged to be sane, and order his release on result of inquiry. A Judge can also direct inquiry into care and treatment of a patient. For obviously wise reasons the Inspector-General and the official visitors are legally debarred from the power of certifying any free person as a lunatic. It is evident that all these precautions were made because proved necessary to prevent abuse. Now let us consider our present Leprosy Act. It provides that immediately on any case of leprosy appearing the medical attendant and the householder shall report it. The practice then is for the Board of Health to get two practitioners, one of whom is Dr. Ashburton Thompson, to examine and, if they consider it leprosy, to certify. If they concur, a warrant is made out and the patient conveyed to the Lazarette. No legal provision is made for appeal on the patient's behalf, and none for discharge, under any consideration. Once in the Lazarette he can do nothing, and is there for life, and can be subjected to neglect or cruelty by his attendants or others without hope of redress, unless he has political influence or power to bribe. In my opinion a new Leprosy Act should contain safeguards and rules of procedure on the general plan of the Lunacy Acts. After notification, two physicians of wide clinical experience should be selected to report on the case, and should be well paid, as experts. Reasonable right of appeal should be given to the patient. The Lazarette should be subject to regular inspection by physicians debarred from the power of signing leprosy certificates, and those visitors should have powers equal to those under the Lunacy Acts. Patients should have a right of appeal to a Judge, who should have power to direct inquiry into alleged abuses. Provision for legal discipline within the Lazarette should be made. At present it seems that a patient can commit an offence on another with impunity. A leper can scarcely be sent out of the Lazarette to gaol. There is no provision for criminal or insane lepers. Provision should be made for lepers required as witnesses, plaintiffs, or defendants in Courts of law, or who may be acting as trustees. Provision should also be made for medical or surgical consultation in difficult cases of illness. Proper legal provision should be taken to provide sustenance for the wives and families of lepers. At present the breadwinner is torn from his family for no fault of his own, and shut up in a lazarette for the sole benefit of the public. Meanwhile his wretched family must beg or starve. They are more humane than this, I believe, at Molokai, in the Sandwich Islands. Provision should also be made for keeping up insurance policies on the lives of lepers who possess them. It should be clearly understood that lepers are not criminals, and not paupers, but, within the Lazarette, free men, isolated for the good of their fellows, and they should be treated in the most liberal way, and every possible compensation given to them. It would be interesting to know whether lepers are entitled to the franchise or not. If they are, they might claim it, and their votes would have to be taken. Provision in a new Act should be taken for the exit of a patient from the Colony, should he so desire it. It might be desirable and economical to offer to pay their passage money and a small pension, especially in the case of Chinese. It should also be made impossible for a known leper to land from a vessel as an immigrant to the Colony. I also certainly think that the general question of leprosy isolation should be to some extent raised. Isolation is certainly necessary in nodular lepers when ulceration has begun. Before this takes place there can be no shedding of leprosy bacilli; and, if the patient is to be isolated, it does not require such strict precautions as later on. Also, it is somewhat difficult to see how "nerve lepers," as they are called, can be any serious danger to the community. Of course, this is a question for medical men, but it shows that some discretion as regards isolation and its extent might perhaps be allowed in the administration of the Act. It should also be remembered that in some patients the leprosy dies out, leaving them "cured" so far as the leprosy goes, though maimed by its ravages. Commending my remarks to the serious consideration of the public.

Yours, &c.,

PHYSICIAN.

LEPROSY.—THE CASE OF THE CHINESE GARDENER.

To the Editor.

SIR,—Under this heading a statement appeared in to-day's issue of the *Daily Telegraph* from Professor Anderson Stuart, which calls for comment. Dr. Stuart evidently feels that some explanation or excuse is required to sustain his action in causing the public arrest of this unfortunate man—an arrest which necessitated his being chased through the streets of the city as if he were a criminal, and carried off to the Coast Hospital, in spite of his violent protests and resistance. The extraordinary justification advanced by Professor Stuart, to the minds of unprejudiced people, is no justification at all, but the reverse. He says, "It has now been definitely ascertained that the man has the disease known as psoriasis. . . . this complaint sometimes requires close observation to distinguish it from leprosy." But, sir, it must be well known to Professor Stuart that the Leprosy Act gives him no power whatever to arrest a man for purposes of observation, or on mere suspicion, and now that these suspicions prove to be quite unfounded, I ask,—Who is to compensate this poor fellow for the loss of his liberty and the ruin of his business? If such action is passed over without condemnation, no person who may suffer from any common and innocent skin affection can consider himself safe. It must be remembered, too, that while the Leprosy—like the Lunacy—Act requires a certificate from two medical men before the patient can be interned, it provides none of the checks and safeguards of the latter against errors on the part of the certifiers. Under the Lunacy Act there is subsequent periodic inspections and examinations of the patients by competent independent visitors, medical and lay, the former being expressly debarred from certifying in the first instance, so that they may be absolutely unbiased. The Leprosy Act contains no such wise provision, and therefore once a patient is incarcerated in the Lazarette there is no appeal for him or her, except to the man who has originally certified that he or she is a leper. Professor Stuart acknowledges that a mistake has been made in this case. Is it not possible that in other instances the mistake may have proceeded further, and that in the absence of this independent inspection some one or more unfortunates may be now dragging out their days in the most horrible of all prisons—a lazarette—exposed, too, to the risk of eventually really contracting the disease?

On several occasions, if I mistake not, the President of the Board of Health has urged the advisability of an Act to render compulsory the notification of all kinds of infectious diseases, but with the warning before us of the disposition of the President of the Board to autocratic and inconsiderate action, the public will do well to pause before entrusting this gentleman with powers which may be used in a tyrannical and oppressive manner.

Yours, &c.,

Sydney, 17th April.

NAAMAN.

The President of the Board of Health (Professor Anderson Stuart), when seen yesterday, stated "that this man never was at the Lazarette at any time as a leper, and that he was not arrested at the instance of the Board of Health. The chief medical officer saw the man, and reported that he was in such a miserable condition that it would be a charity if he could be taken to the hospital and treated for his disease, whatever it was, and pointed out that during that time he would, of course, be under observation. After being at the hospital for a few days the man, or his friends, wished to get him out, and he was allowed to leave in the ordinary course of events. When the ambulance was sent for the man the driver was instructed to apply to the policeman who had the case in hand, because he alone knew where the man was to be found. Anything that may have been done by the police authorities after that was their own action, and was certainly not done at the instance of the Board of Health."

[From the Evening News, 16th April, 1896.]

AUSTRALIAN FREEDOM.

To the Editor of the Evening News.

SIR,—I notice in the papers of to-day a report of the "capture" (!!) of a "supposed leper," who was publicly arrested in Sydney by the police, conveyed as a common criminal to the police-station, confined there, and afterwards thrust into an ambulance and taken against his will to the Coast Hospital, where, I suppose, he is still confined. Now, I would like to know by what authority this man was thus outrageously deprived of his liberty in defiance of the law of the land. Do we live in Russia or in a free British colony? Under the Leprosy Act of New South Wales it is lawful to confine a man in the Lazarette after he has been duly certified as a leper by two suitable medical practitioners. But here we have a man, not certified as a leper, arrested without notice, torn from his business, and this, according to one newspaper, after most violent resistance, thrust into durance, and kept so at the pleasure of some unknown autocrat, apparently to wait for the slow development of symptoms which may enable him at length to be certified and confined in the Lazarette. If such symptoms do not appear, he is nevertheless to be confined at the Coast Hospital. He can no more be legally detained there for an hour than for life. Perhaps he is to be kept there for life. Who knows? But the case is indeed far worse than this. We are told that the man is not considered to be a leper, but that he is suffering from another disease—psoriasis. This, too, was well known, as we learn that Dr. Ashburton Thompson examined him a fortnight ago. The law enacts that a case suspected to be one of leprosy must be reported without loss of time. Dr. Thompson, however, cannot have considered it suspicious of leprosy, or a fortnight would not have been allowed to elapse in the face of the Act before dealing with the case. On the other hand, Dr. Thompson is reported to have called it psoriasis. Nevertheless, this unfortunate sufferer was pounced on and dragged off by his gaolers to the police-station, and imprisoned for the crime of having psoriasis, and is, I suppose, still illegally imprisoned for the same. Was any more abominably disgraceful act than this ever perpetrated in the history of New South Wales? Nowhere else, save in Russia, would anyone dare to commit such an atrocious outrage on liberty. Who is safe? No wonder he violently resisted. Will he be charged at the Police Court with resisting a policeman in the execution of his duty (*sic*)? I sincerely hope he will take legal action—firstly, to get his liberty; secondly, to get substantial damages for the injury to his liberty; and thirdly, to teach a much-needed lesson to those responsible.

Yours, &c.,

10th April, 1896.

HABEAS CORPUS.

[From

[From the *Daily Telegraph*, 8th May, 1896.]

LEPROSY ADMINISTRATION.

THE statements published by us yesterday regarding the Little Bay Lazaretto and the need for reform in legislation affecting lepers are such as demand inquiry. Furnished as they were by a medical man who does not speak from hearsay, and who must be assumed to have more knowledge of the subject dealt with than anybody outside the profession, they embody allegations which cannot be ignored. It was asserted that there are now in the Little Bay Hospital, under detention as lepers, two persons who are not afflicted with the terrible disease. It was also said that representations to this effect have been unavailingly made, in the case of one of these patients at least, by the Medical Superintendent of the Institution to the Minister in whose Department it is, and to the Board of Health. If the facts are as thus represented, very grave injustice is being done. Not only are two persons, for whose isolation from the rest of the community there is no warrant, incarcerated and prevented, to their own injury and that of anybody who might have been dependent upon them, from following any occupation, but they are subjected to a fearful risk. The purpose of removing lepers from among people unattainted with the most shocking of maladies is to prevent the spread of it by contagion. There is much difference of opinion among medical authorities regarding the conditions under which leprosy may be communicated; but it can hardly be doubted that the most likely place in which to become affected is an hospital devoted to the care of those already afflicted. Quite apart from the other wrongs involved in laying hands upon a man under wrongful suspicion of leprosy, and depriving him of liberty, there is, therefore, the greater wrong of exposing him to special danger of becoming a leper. This is obviously a matter on which the utmost caution should be exercised by those acting under the provisions of the Leprosy Act for the preservation of public health. As the Act stands, it is pointed out, no means exist for the release, or even for the removal from among diseased persons, of anybody incarcerated as a leper, and afterwards found to be clean in the legal sense. It is hardly believable, though, that unless the fullest assurance possible to science had not been received by those in authority that the persons referred to were leprous, and therefore a source of danger to the community if liberated, something would have been done towards causing their release. It would not surely have been very difficult in a matter of so much urgency to have moved Parliament to accept such an alteration in the Act as would convey any power required.

The need for an alteration in the Leprosy Act which would give the authorities power as far as possible to remedy mistakes made does not depend upon whether the facts in this matter are as alleged. Our informant, in referring to the existing law, shows that persons charged with lunacy have much better safeguards against wrongful detention than have those who are taken under control as lepers. It could not lessen the security of the public if persons suspected of physical unfitness to be at large were given as full an opportunity of proving the contrary as have persons supposed to be of unsound mind. It will certainly not be thought the best possible arrangement for the safety of the suspect, whose well-being is as important a matter as that of any other member of the community, that, on the verdict of two medical men, he should be branded as a leper and removed to a lazaretto without an opportunity of appeal. From the fortunate circumstance that it is a disease of comparatively rare occurrence among us, leprosy is not so well understood by medical men, generally speaking, as are most other maladies. And, considering how often we see the widest divergence of opinion among them regarding questions of diagnosis or treatment, the fact that two are found to agree upon the nature of the disease seems hardly a reason why that should practically be an end of the matter. The most important phase of the questions raised by our informant concerning leprosy administration is this of the safety of the individual as against the community. But there are others indicated which seem to call for remedial legislation. If, as is stated, there is no provision made for the punishment of persons within the Lazaretto who may assault others, a fresh horror is added to that undesirable place, especially for anybody wrongfully detained there. And it is hardly conceivable that a leper who had broken the law would be dealt with in the ordinary manner by the usual processes, and admitted to gaol among uncontaminated prisoners. There are other features of the present law and administration referred to which are well worthy of being considered by Parliament with a view to their reform. Whether or not the allegations made are all true, it is sure that a full inquiry into them would do much to remove doubts from the public mind as to how lepers are dealt with—doubts which may exist both on the ground of public policy and that of humanity.

THE LEPEBS AT LITTLE BAY.—ACTION OF THE BOARD OF HEALTH.

IN yesterday's issue of the *The Daily Telegraph* there were published the essential portions of a communication from a medical man regarding the position of some of the patients at the Little Bay Lazaretto. It was stated that Dr. Taylor, the Medical Superintendent of the Institution, had reported to the Minister in charge of the Health Department, as well as to the Board of Health, that one, if not two, of the patients at Little Bay was not in such a condition of health as to necessitate his further detention, and that the representations by Dr. Taylor had been ineffectual, the men, despite this report, being still confined at the station. From inquiries made yesterday it would seem that Dr. Taylor reported on several different occasions regarding the condition of one of the men, whom he is convinced is not really a leper, and should therefore be released. The medical officers by whose advice the Board of Health acts in these matters, however, take a different view from that taken by Dr. Taylor, they certifying that both of the men whose leprosy the Superintendent questioned were suffering from the disease in a contagious form. The difficulty which arose from the doctors differing so absolutely had to be decided by the Board of Health. It appears, from inquiries made at the Health Office yesterday, that the Board thoroughly investigated the matter. Indeed, a large file of correspondence on the subject was exhibited to the reporter who sought information on the subject, as the result of the investigations which the Board had made before coming to a decision. The decision which it arrived at was against the view taken by Dr. Taylor, and the men consequently continue to reside at Little Bay. It is understood that the difference of opinion regarding one of the patients turns on the question whether nerve leprosy is contagious.

On this point the Health authorities hold a very positive opinion that it is contagious. The difference between nerve leprosy and skin leprosy, it was explained, is that in the former the bacillus confines its action to the nerves, and is, therefore, more difficult to discover. But that the organism is present in cases of nerve leprosy has been demonstrated in Sydney by the discovery of the bacillus also in the skin in this form of the disease. The difference in the contagious properties of nerve leprosy and skin leprosy

leprosy is, therefore, considered to be solely one of degree, both being contagious, though the nerve variety being less so than the other. Another point taken in our correspondent's letter was that the existing law was defective in respect to the provisions under which a patient might be released. It was necessary, it was alleged, that the same two physicians who certified that the subject was diseased should certify that he was not, otherwise he could not be released. The certificate of any other two medical men, our correspondent stated, would not suffice. This, however, is not a correct reading of the law; all that the Leprosy Act provides on this matter being that the Health Board should satisfy itself regarding a patient's condition. The manner or method by which the Board should satisfy itself upon this subject is left wholly to its own discretion. But upon this question the Board disclaims the malevolence implied in a charge of detaining a man in the Lazarette when he is really not a leper. The Board has no personal interest to serve in thus imprisoning a man if he is not diseased. Its sole concern is the public safety, and when once a man has been certified to be a leper it has to be very certain that he is not before he can, or should be released. As a matter of fact, those patients in whom the virulence of the disease has exhausted itself, are released as soon as it is known for certain that the danger of contagion is past; for, although the disease is one which cannot be cured by the application of any known treatment, yet nature itself in some instances overcomes the affliction, and in those cases the patients may be spoken of as having recovered. In no case does the Board ever detain a man in whom a recovery is properly authenticated.

[From the *Daily Telegraph*, 9th May, 1896.]

#### THE LEPROSY ACT AND ITS ADMINISTRATION.

To the Editor.

SIR,—In to-day's *Daily Telegraph* is a rejoinder, not an answer, from the authorities of the Board of Health, to a letter of mine on leprosy matters. I venture to say that it is a most inaccurate, misleading, and unsatisfactory one. I make certain strictures on the Leprosy Act and its administration, and the Health authorities, unable to refute these, make a number of totally irrelevant statements, and, indeed, show the utter weakness of their position by setting up an altogether new accusation, attributing it to me, and then saying that it is "not a correct reading of the law." This method of meeting arguments is many centuries old. Indeed, it is rotten with age; and the Health authorities should not rely on such sorry weapons. I certainly said that a new leprosy law should be assimilated to the lunacy law in providing for official visitors possessing the power of recommending the discharge of patients, and debarred from the power of committing free persons to the Lazarette as lepers by certifying. And I adhere to this opinion.

With your permission, I will now proceed to quote the statements of the Health authorities, and criticise them. We read—"The medical officers by whose advice the Board of Health acts in these matters, however, take a different view from that taken by Dr. Taylor, they certifying that both of the men whose leprosy the Superintendent questioned were suffering from the disease in a contagious form. The difficulty which arose from the doctors differing so absolutely had to be decided by the Board of Health." It is now ten months since Dr. Taylor first raised the question. Now, sir, will the Health authorities state whether any notice whatever was taken of Dr. Taylor's report ten months ago? Will they state whether Dr. Taylor has ever been called on, from that day to this, to give his reasons for making such report? Will they please give the dates, if any? Again, will the Health authorities give the date on which "the medical officers by whose advice the Board of Health acts," were requested, if at all, to report? And, further, will the Board of Health state the names of the same medical officers who "certified that both the patients whose leprosy the Superintendent questioned had leprosy in a contagious form"? Will they state the dates on which the patients were examined, and the reports sent in? And what was the date on which the Board was called on to decide the difficulty of conflicting medical opinion? These are fair questions, and if the facts are as the authorities allege they can be easily answered, and in a categorical manner.

We are told that the Board "thoroughly investigated the matter." I beg leave to ask when and where did the "thorough investigation" take place. I maintain that in a case of such extreme gravity, in which a man of large and special experience states that one patient is clearly not a leper at all, and that another has symptoms very decidedly less marked than those of other patients who have been specially examined, and not certified from lack of sufficient evidence of leprosy, I maintain, I say, that nothing short of a very serious reconsideration of the whole case, and the commissioning of additional experienced consultants, can be demanded or accepted, and the reasons, in full, of the Medical Superintendent should be, and should have been called for. Next, "a large pile of correspondence on the subject was exhibited to the reporter." I do not observe that it was given to the reporter to read. I go on to say that the Health authorities dare not publish the correspondence in any professional journal. Again, "it is understood that the difference of opinion regarding one of the patients turns on the question whether nerve leprosy is contagious?" Allow me to remark that it is not so "understood" at all, and that it does not turn on the question whether nerve leprosy is contagious. The real question at issue has been categorically stated above. There are several other nerve lepers in the Lazarette, and their case was not mentioned. The present law enacts that isolation shall be enforced without any exceptions, and the Board has no power to discharge a nerve leper, however unnecessary, antiquated, and cruel the law.

I will now go a little further into the subject of nerve leprosy. We are told that "on this point the Health authorities hold a very positive opinion that it is contagious." We are also told, as if it were a sort of discovery, the honor of which belongs to some authority in Sydney, that the presence of the leprosy bacillus has been demonstrated in the skin of nerve lepers. I was certainly somewhat astonished to hear that this seemed to be considered by the Health authorities as something new. I recommend the authorities to read some of the modern literature of leprosy. They will then discover that the presence of leprosy bacilli in the skin of nerve lepers was, at any rate, well known to others. It was certainly well known to me. But, notwithstanding this, I stated not only that it was difficult to see how nerve lepers could be a serious danger to the community, but also that the question whether nodular lepers, before ulceration, required strict segregation was worthy of careful consideration. The columns of a lay journal are scarcely a suitable place for the discussion of a medical question like this, but I adhere to my position, and

and am perfectly ready to give ample reasons for it, if called on. I also venture to remark to the Health authorities that if they persist in holding, with regard to nerve leprosy, "a very positive opinion that it is contagious," demanding segregation in a lazarette, in opposition to the direct and indirect teaching of all modern authority, that they should justify themselves by proceeding to prove their position, which I know they cannot do.

Yours, &c.,

8th May.

PHYSICIAN.

In the official statement which has been made on behalf of the Board of Health in connection with the administration of the Leprosy Act there is a discrepancy which unfortunately occurs at a vital stage of the statement. The allegation was that two persons are being detained in the Lazarette who are not lepers. The Board replies that that is not so. Then it becomes a fair question—How does the Board know? And the answer is that the medical officers, by whose advice the Board acts in these matters, report that the two men have leprosy in a contagious form; and that as "all that the Leprosy Act provides is that the Health Board should satisfy itself regarding a patient's condition," there is an end of the whole subject. But that end is not so acceptable unofficially. The authority for saying that these two men are not afflicted with leprosy, or with contagious leprosy, is that of the Medical Superintendent of the Lazarette, who has been in charge of the lepers for some time, and who has presumably acquired an amount of leprosy knowledge in actual experience which very few doctors indeed have. As against his evidence is simply that of other physicians who may or may not know as much about the disease as the Superintendent does, but who certainly have not had his opportunities of daily observation of the disease and those who suffer from it, and who, above all, may be those who originally certified that the questioned men were lepers. In that case they may either have reported that their original diagnosis was correct, or adhered to it because their experience and opinions are what they were when they first reported. If this is so, it may be said without any disrespect to the Board's medical advisers that their report is not enough. The Board is said to have men incarcerated in the Lazarette who ought not to be there, and there is a conflict of opinion between its Medical Superintendent and its medical advisers. The only satisfactory way of disproving the statement is by taking the advice of physicians who are neither connected with the Board nor with the Little Bay Hospital.

#### No. 20.

#### Leprosy Histopathology—T.O'R.—Eight figures.

**Necropsy**, thirty hours after death. Specimens forwarded to the Laboratory by the Medical Superintendent of the Coast Hospital. Skin, ulnar nerve, popliteal nerve, spleen, and testis were examined. *Skin, portion of a tubercular nodule in eyebrow.* Epidermis, hair follicles, and sebaceous glands normal in structure. Cells of rete contain a small amount of pigment. Corium thickened, papillary layer obliterated, the line between dermis and epidermis being flattened out. The corium is extensively infiltrated with cellular elements. These consist of round, oval, and irregularly-shaped cells, each containing a single nucleus or occasionally two, but multinucleated masses ("lepra cells") were not seen. The cells occur in all parts of the corium dissociating the fibrous tissue, but the immediate subepidermal layer is comparatively free from them. The subcutaneous tissue shows some cellular infiltration of the areolar tissue between the fat cells, but is otherwise normal. Some striped muscular fibres seen were normal. The M. Arrectores pili, where seen, were normal in appearance. Nerve endings were not seen. Section of cutaneous nerves shows cellular infiltration between the fibres, but the fibres themselves were normal. Sweat glands normal. Blood-vessels present a variety of appearances, some normal, some with thickening of the external coat, some partly or completely occluded. Numerous thin-walled vessels are present. Bacilli are present in enormous numbers, as will be seen from the accompanying photomicrographs. They are situated in all parts of the corium and in the subcutaneous tissue, but in the subepidermal layer they are less numerous than in other parts of the corium. They were not found in the epidermis sebaceous glands, sweat glands, nor in the blood-vessels, but were present in several of the hair follicles and in the nerves. Both these appearances are shown in the accompanying photographs. The bacilli occur singly and in groups. The groups consist sometimes of a few bacilli, and sometimes of very large numbers forming masses from four to five times the size of a leucocyte. The bacilli are loosely or densely aggregated, and lie occasionally parallel but usually across one another at all angles. Many of the smaller groups are seen to be within mononuclear cells, which are often enlarged and have their nuclei situated eccentrically. In other cases the groups are isolated and have no apparent relation to the cells, though they commonly have a rounded cell-like form. These are best seen in the comparatively cell free subepidermal layer and in the subcutaneous tissue. In yet other places the bacilli occur in large masses in rounded or oval spaces, which they do not always fill up. The appearances suggest that these are transverse and oblique sections of lymphatics completely or partially filled with bacilli. Sometimes there is an apparently endothelial lining to these spaces (*vide fig.*), but this appearance may be due to condensed fibrous tissue round the group. Such spaces are extremely numerous, and although most conspicuous in sections treated by Unna's method, are readily seen on those which have been passed through alcohol and xylol, or bergamot oil, in the ordinary way.

Besides those already mentioned there are groups having an elongated or irregular outline.

In the looser groups the bacilli are embedded in a hyaline or faintly granular matrix. Between the groups there are innumerable bacilli, either single or in twos and threes, lying side by side or end to end, and in the latter case usually forming an angle. No definite chains were observed. The bacilli in the hair follicles occur singly and in small groups, and lie between the epithelial cells. In the nerves they also occur in small groups and singly between the fibres. Individual bacilli are from  $2.5 \mu$  to  $4 \mu$  long, and about  $0.3 \mu$  broad. The majority are straight, some slightly curved or twisted; outline often irregular; ends tapering or rounded; sometimes swollen, rarely pointed; moniliform staining, the ends often staining more deeply than the rest of the bacillus. Club-shaped and irregular forms are not common. In the groups there are many short rods, rounded and granular forms.

*Ulnar Nerve.*—Section measures 6 mm. in diameter. Under the microscope the sections show hyperplasia of the interstitial tissue and sheath, with numerous round, oval, and irregular cells in groups

and strings between the fibres. Many nerve fibres are normal, but the majority are degenerated, consisting only of primitive sheath and myelin droplets. Bacilli are very numerous. They occur in and outside of the cells; in the latter case either free or in matrix substance. They present similar appearances to those already described.

*Popliteal Nerve*—Section oval, measures 7 mm. by 5 mm. Microscopic sections show hyperplasia of the sheath and perineurium, and in less degree of the endoneurium (V. photo). The increased tissue contains round, oval, and irregular cells, for the most part mononucleated, but in one or two places large cells containing many nuclei (eight to twelve) were seen (V photo.) Normal nerve fibres are scanty; the majority were degenerated, presenting similar appearances to those already described. Blood-vessels either normal in appearance or have thickened adventitia, and are frequently surrounded by leucocytes. Bacilli are very numerous. They occur mostly in groups in and outside of cells in the perineurium and endoneurium. They present no unusual characters.

*Spleen*—Tissue very soft. Under the microscope sections show capsule normal, trabeculae less obvious than in a normal spleen, but where seen thickened any containing many spindle any round nuclei. The Malpighian corpuscles are normal in appearance, but the arteries have thickened walls. The cells of the pulp are of normal appearance. The sinuses are very full of blood, and there are numerous small circumscribed and diffuse hæmorrhages. Between the cells there is a large amount of granular material; no multinucleated are observed. The blood-vessels in the trabeculae are dilated, and have thickened external coats. Bacilli are very numerous (V. photo). They occur singly and in groups within and outside of cells. The groups are sometimes dense; sometimes loose. In the latter case there is a faintly granular matrix. Individual bacilli measure 2.5 p. to 4 p. long, and about 3 p. broad. They are usually straight, have rounded or tapering ends, sometimes swollen, or rarely pointed. Moniliform staining. Irregular forms are common in the groups. In the smear preparations from the spleen the bacilli were found sometimes in cells, sometimes free, in groups and singly. The larger groups were round or irregular in outline, and when loosely formed there was a faintly granular matrix. They contained many short, oval, rounded, and granular forms.

*Testis* (V photo.)—Tunica albuginea thickened and densely fibrous, trabeculae thickened by fibrous tissues containing round, oval, and irregular cells, each with a single nucleus; no multinucleated cells were seen. Tubules involved in the fibrosis often distorted. Many contained the remains of epithelium, and in some lining, spermatogenic cells, and spermatoblasts can be made out, and no definite spermatozoa were detected. The epididymis was not examined. Bacilli were very numerous. They occur chiefly in the intertubular tissue, the tunica being free, but they are present within the lumina of the seminiferous tubules. They occur singly and in groups. The groups are, as a rule, small. Sometimes, however, they are three or four times as large as a leucocyte, and are composed of loosely or densely aggregated bacilli arranged irregularly. They occur in the cells, and in a granular matrix, and in the latter case are rounded or irregular in outline. Innumerable bacilli lie between the groups, in cells and free, singly or in twos and threes, parallel or at an angle. Individual bacilli measure 2 p. to 4 p. in length, and about 3 p. broad. The majority are straight, but slightly curved and twisted forms are not uncommon. Ends rounded or tapering; often swollen, seldom pointed. Outline generally slightly irregular. Moniliform staining, the ends being commonly more deeply stained than in the rest of the bacillus. Short, oval, and granular forms common in the groups. Many granular masses, retaining a faint pink colour, but showing no bacterial contents, are also present.

#### *Summary and Remarks.*

The microscopical appearances are those of generalised tuberculous leprosy.

The skin presented the typical appearance of tuberculous leprosy, characterised by cellular invasion of the cutis, and the presence of innumerable bacilli.

The demonstration of bacilli in the hair follicles confirms the observations of Babes and others.

The nerves showed progressing fibrosis, with the destruction of nerve fibre consequent on leprosy invasion.

The spleen showed congestion, softening, and destruction of tissue, and was invaded by leprosy bacilli.

The testis showed progressing interstitial sclerosis, with destruction of proper tissue, consequent on leprosy invasion.

It will be observed that leprosy bacilli were found in every tissue examined. Since these comprised skin, nerves, spleen, and testis, it is safe to assume that they were distributed throughout the whole body, and that incalculable numbers were present. The extensive fibrous changes observed in the nerves, and especially in the testis, show that the disease had existed for a considerable time.

The enormous number of bacilli, their wide distribution, and the extensive pathological changes produced by them, warrant the conclusion that this patient was fairly riddled with leprosy.

#### *Notes explanatory of Photomicrographs.*

1. Lepromatous skin, from eyebrow, showing cellular invasion of cutis. x35. The cutis will be seen to be thickened by granulomatous tissue.
2. Lepromatous skin, from eyebrow, showing leprosy bacilli. x1,000. The photograph shows the enormous number of bacilli, and their situation in relation to cells.
3. Lepromatous skin, from eyebrow; leprosy bacilli in cutaneous nerve. x750. The photograph shows the cellular and bacillary invasion.
4. Lepromatous skin, from eyebrow; leprosy bacilli in hair follicle. x750. The photograph shows the groups of leprosy bacilli between the epithelial cells of the follicle.
5. Popliteal nerve, transverse section showing marked fibrosis. x35. The increase of the perineurium, and, to a less extent, the endoneurium, is well seen in the photograph.
6. Spleen, showing leprosy bacilli. x1,000. The photograph shows the groups of bacilli in the splenic pulp.
7. Testis, showing leprosy bacilli. x1,000. The photograph shows the fibrosed stroma, and the enormous number of bacilli present in it.

## No. 21.

The Medical Superintendent, Coast Hospital, to The President, Board of Health.

Sir,

Coast Hospital, Little Bay, 8 May, 1896.

I have the honor to state that the publicity given to my name in the *Daily Telegraph* and evening papers makes it necessary for me, as a public servant, to forward you my view of the subject therein referred to. Every attention is given to the unfortunate men and women in the Lazarette, and all that care and sympathy can do for them by myself and attendants has been done. The patients themselves constitute the best evidence upon this matter, and to them I respectfully refer you.

I notice in the *Daily Telegraph* of this day that a reporter who asked for information at the Board of Health was informed, "The medical officers by whose advice the Board of Health act in these matters, however, take a different view from that taken by Dr. Taylor, they certifying that both of the men whose leprosy the Superintendent questioned were suffering from the disease in a contagious form." It is evident to me that this statement (if correctly reported) is unsatisfactory. The only medical expert from whom the Board of Health appear to ask advice in cases of doubt about leprosy is Dr. Ashburton Thompson, the certifying of cases being done by that gentleman and Dr. Goode. Dr. Thompson's published statement in regard to the contagiousness of leprosy reads as follows:—

"*British Medical Journal*, 14th December, 1894, page 1514—'Is leprosy a Telluric disease?'

"A renaissance in the nineteenth century of the product of mediæval ignorance into mediæval egoism. 'The extremely severe laws against the liberty of lepers in force in five colonies amount to the hardship of adding imprisonment for life to the infliction of incurable disease.'"

I cannot think that Dr. Goode certified the patient Thompson as suffering from leprosy in a contagious form. How, in the case of Thompson, even admitting him to be a nerve leper (and I submit that the evidence of that disease to be discovered about the man is not sufficient to warrant his being detained in the Lazarette) he can be pronounced a danger to the public health if at large, I fail to understand. The most distinguished experts in leprosy, such as Hansen and Looft, recording as their experience that the bacillus is never found in the discharges from a nerve leper. If this be admitted as correct, how a man in robust health, who from the date of his admission into the Lazarette (10th October, 1894) has never had a day of sickness or the least evidence of advancing disease, whose ulnar nerve, which constituted the chief evidence of leprosy (*vide* my paper in the *Australasian Medical Gazette* of January last) is distinctly diminishing in size, and who, although he has been continually knocking about on the rocks, fishing, &c., has never suffered from ulceration of the affected hand or foot, so easily induced in a nerve leper. How this man can be pronounced to have the disease in a contagious form requires, in my opinion, a definite answer.

In the case of Timothy O'Rourke I was censured by you, and also by the Minister, to whom I appealed. I must therefore infer that many of the cases examined by me, in whom, as I have already stated in the *Australasian Medical Gazette*, I discovered certain symptoms suspicious of leprosy, but whom I could not certify as suffering from that disease, would, had the Board of Health known I failed to report upon them, have been included in the censure. The man Buckman reported by me was certified by Dr. Thompson and discharged. This case has already been referred to in my former letters, and it is therefore unnecessary that I comment upon it.

About the middle of last year two women were examined by Dr. Thompson, and certified by that gentleman as suffering from nerve leprosy. Dr. Goode refused to certify them. Dr. Scot-Skirving was then requested to examine the cases, that gentleman also refusing to certify. I respectfully ask the President of the Board of Health to hand the papers connected with the examination of these women, the papers connected with the examination and certification of Hung Yung, reported by me as suffering from tubercular leprosy and beri beri upon 22nd January last, and the papers connected with the examination and certification of the men Thompson, Buckman, and Ah You to any gentleman having a large clinical experience in disease, and whose judgment may be relied upon by professional men, and ask him to give an opinion as to the consistency of action with regard to these cases, and whether or not, from the opinions and statements in these papers, I was justified in stating that I exercised extreme caution in reporting suspicious cases of nerve leprosy. I have now been two years and two months in medical charge of the Lazarette. The misery in that most miserable place appeals to me, perhaps, more strongly than it does to those who only occasionally visit there. I therefore trust that my earnestness and desire to do what I consider to be right may not be misconstrued by the Board.

I have, &c.,

G. H. TAYLOR,

Medical Superintendent.

## No. 22.

*The Australasian Medical Gazette.*

LEPROSY INQUIRY.—GEORGE HENRY TAYLOR, MEDICAL SUPERINTENDENT, COAST HOSPITAL.

20 January, 1896.

I HAVE been nearly two years in medical charge of the Coast Hospital and Leper Lazarette, and as a considerable part of my time has been spent in investigating leprosy, and particularly nerve leprosy, I am now able to bring some of the results of my work under your notice. The details may appear to be trifling, but they represent a large amount of tedious work, and, I think, have not been noticed by any other observer.

Nerve leprosy in its early stages is an exceedingly obscure disease, and not unfrequently baffles the most careful and experienced examiners when the question of a definite diagnosis is necessary, the more so as the diagnosis involves the question of committing the patient to the Lazarette.

It occurred to me at an early date of my stay here that it was necessary in order to make my opinion a valuable one that I should examine the patients in the general hospital as I would do in the case of a suspected leper, and compare carefully the various departures from what I deemed to be a normal standard. After examining several hundreds of patients in this manner, I know that it is not uncommon to find thickening and tenderness of one or more of the nerves, particularly the ulnar and peroneal, with sensation referred downwards when the nerve is pressed upon, and that after very careful tests a slight amount of anæsthesia and analgesia can frequently be detected in the skin supplied by the affected

affected nerves, with occasional slight terminal anæsthesia. (I cannot have examined less than thirty patients who had these symptoms, and all of them were quite unaware of their condition.) In three cases I noticed eruptions of bullæ upon the hands and feet.

In all these cases of nerve disease, debility, and pains, described as rheumatic, and confined to the limbs, were present.

In my opinion this condition can only be accounted for in two ways—(1) That the majority of them were cases of nerve leprosy in a very early stage. (2) That it was from a cause not yet recognised. In favour of the first it may be argued that leprosy is endemic in New South Wales. That all the cases were anæmic, debilitated, and suffered from pains in the limbs. That all other known nerve diseases could be excluded.

From amongst all these cases I have excluded all those in which there was a history of possible injury to the nerve. It also occurred to me, and unfortunately only very lately, that unless there was some indication for so doing a medical man would not think of examining after death for the bacillus of leprosy, and I therefore determined after every *post-mortem* to remove a portion of the spleen and carefully examine it for the bacillus of leprosy. In three of these (all of them from patients who died after long and exhausting illness) I was able to find, out of a great number of preparations examined, a sufficient number of bacilli to enable me to definitely recognise them as the bacilli of leprosy. In two other cases I found bacilli, but so few in number that I was unable to determine between leprosy and tubercle, although no evidence of tubercular disease was present in either of the cases.

In none of these cases was there the least evidence of leprosy during life, and it remains to be proved whether the bacillus of leprosy is not frequently to be found in the spleen of persons who during life had no symptoms of that disease.

In my next paper I will go into detail in describing some of these cases, and also some of the conclusions I have formed respecting nerve leprosy.

I appeal to the profession to assist me in the matter, particularly in pathological research. The most fertile ground for this would be the various Government Asylums. It would be interesting to prove how many lepers at present are living in them. My experience here leads me to suspect that there are many.

---

#### No. 23.

#### The Acting Secretary to The Medical Superintendent, Coast Hospital.

Sir, Board of Health Offices, 127, Macquarie-street, Sydney, 23 January, 1896.

In reference to the statement made by you in a paper entitled "Leprosy Inquiry," published in the *Australasian Medical Gazette* of 20th January, 1896, respecting persons who have died in the Coast Hospital, and who had not in life been suspected of leprosy, that in three cases you were able to find a sufficient number of bacilli to definitely recognise them as the bacilli of leprosy, and that in two other cases you found bacilli, but so few in number as to be unable to determine between leprosy and tubercle, the Board of Health directed that you should be asked to submit to it the preparations on which you based such statement, and I am instructed by the Medical Adviser to ask that you will have the goodness to give effect to the Board's direction as soon as possible.

I have, &c.,

C. A. SIMMS,  
Acting Secretary.

---

#### No. 24.

#### The Medical Superintendent, Coast Hospital, Little Bay, to The President, Board of Health.

Sir, Coast Hospital, Little Bay, 27 January, 1896.

In reply to your letter dated 23rd January, conveying a request from the Board of Health that I should submit to it the preparation on which "I based such statement," I have the honor to inform you that I never preserve a slide after having carefully examined it. In the examinations of the spleen I referred to in my paper at least 100 slides were used, and these were cleaned without loss of time, so that I might be able to use them again. I consider that my statement can easily be proved by further investigation. The class of case I consider as suitable for such examination are persons who are either natives or have lived in Australia for many years, and who for years prior to death have suffered from debility. If the Board of Health determine to make an inspection of the inmates of the various asylums perhaps the officer who conducts the inspection can be authorised to perform a *post-mortem* examination upon patients who die during the period of inspection.

I have, &c.,

G. H. TAYLOR,  
Medical Superintendent.

---

Read; Meeting of the Board of Health held this day, 4th February, 1896.

Directed, that a letter should be sent to Mr. Taylor expressing the Board's regret that he had not preserved the slides, which would have constituted so important a record, and requesting that if in future he should discover any similar phenomena he should preserve the slide and also send some of the material to the Board for the purpose of independent observation.—C.A.S. Done.—6/2/96.

[One Plan.]

1896.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

VACCINATION.  
(REPORT FOR 1896.)

Printed under No. 20 Report from Printing Committee, 1 October, 1896.

The Chief Medical Officer to The Principal Under Secretary.

Sir,

Sydney, 18 September, 1896.

I have the honor to forward, for the information of the Chief Secretary, the Annual Returns of Vaccinations performed during the year 1895 by the Government Vaccinators of New South Wales.

The returns for 1895 show that 2,467 vaccinations were performed during the year, of which 2,437 were successful. Of the total number, 21 were performed in Sydney and its suburbs, and 2,365 in country districts. It will be seen that vaccination was performed in only 20 country districts. In 90 districts in which there are Government Vaccinators no vaccinations have been reported, and it is presumed that none have been performed.

Of the successful cases, the patients in 105 were under 1 year; in 529 between 1 and 5 years; in 1,008 between 5 and 10 years; and in 786 upwards of 10 years of age. The unsuccessful cases were 30, or 2.5 per cent. of the whole number.

The number of births registered in the Colony during 1895 was 38,715, and the vaccinations give a percentage of 6.29 on this number. In addition to vaccinations performed by Government Vaccinators, a number are performed by private practitioners; but of these no returns are made. There is reason to believe, however, that these cases would not add very materially to the percentage above given.

The department continues to supply pure calf-lymph to legally qualified practitioners of medicine on application at the office; and while this entails a considerable expenditure of public money, yet the money is considered to be well spent, and, after careful consideration, it is not proposed to curtail the supply.

Calf-lymph is procured fortnightly from an establishment in New Zealand. It is of satisfactory quality. No lymph is cultivated in New South Wales.

Whenever large supplies of lymph have been hurriedly wanted this Colony has had to rely on foreign sources. These have often proved insufficient, and always the supplies have been received only after a delay, which, in case of a threatening epidemic, would have gone far to render futile attempted prevention of smallpox.

A real danger is thus indicated, and long experience obliges me to point out that it can be avoided only by establishment of a station at which calf-lymph might be cultivated within and for the use of New South Wales. This I accordingly recommend.

I have, &c.,

J. ASHBURTON THOMPSON,  
Chief Medical Officer.

RETURN (No. 1) showing the number of Births during the past thirty-five years, and the number of Vaccinations performed by Government Vaccinators during the same period.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## INSANITARY STATE OF TOWN OF PARKES.

(RETURN RESPECTING.)

*Printed under No. 5 Report from Printing Committee, 18 June, 1896.*

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated 28th May, 1896, That there be laid upon the Table of this House,—

“A copy of the report of the Medical Officer who was lately sent to Parkes to inquire into the prevalence of typhoid fever and the insanitary state of that township.”

*(Mr. Perry, for Dr. Ross.)*

Sanitary inspection of the town of Parkes, with special reference to the recent outbreak of typhoid fever.

Sir,

Board of Health, 12 May, 1896.

In accordance with your instructions I visited Parkes and inspected the town on April 27th, 28th, 29th, and 30th, 1896. I received information and assistance from the following gentlemen:—The Mayor (Mr. John Medlyn) and members of the Municipal Council, the Council Clerk (Mr. Pulver), the District Registrar (Mr. Miller), the Postmaster (Mr. Lorking), Police-Sergeant Ranford, the Government Medical Officer (Dr. H. Oswin Johnson), Dr. Devlin, the Inspector of Nuisances (Mr. Garland), and others. I have the honor to submit the following report:—

*Area, Population, &c.*

The area of the Municipality of Parkes is 15½ square miles, the number of houses 750, population estimated at about 3,500, at 1891 census 2,950. The great majority of the inhabitants live in or near the town. The figures given indicate a ratio of four persons per house. In the course of my inspection I met with two families, numbering eleven and thirteen respectively, occupying small wooden four-roomed cottages. I am informed that such overcrowded conditions are not uncommon, and that occasionally children were found occupying the same bed as typhoid patients.

*Site and Drainage.*

The houses comprising the older part of the town are situated in a hollow, but a large number of newer houses occupy the slope of a range of low hills to the east and north. The soil is a loose gravel or drift on the east and north, becoming clayey on the west. The surface, and probably also the underground, drainage is from the east and north to three large dams at the south of the town, the overflow from which ultimately reaches Billabong Creek, further south. The dams referred to are used mainly for mining purposes. The consequence of these natural features is that the drainage of the higher-lying eastern and northern parts passes through or under the greater part of the town on its way to the southern dams. The porous stratum does not appear to be deep, nor the flow through it rapid. When rainfall is at all great in amount the lower part of the town becomes swampy. I am informed that water wells up in certain streets for weeks after rain, and that cellars contain water for some time in amounts that require pumping out. In Bogan-street, which coincides approximately with the junction

185—

of

[605 copies—Approximate Cost of Printing (labour and material), £6 1s. 9d.]

of drift and clay, a large cobblestone drain has been made, which is continued into the southern dams by a natural channel. This drain represents a storm-water sewer, having been constructed to carry off surface-water after heavy rain. At the time of my visit it was obstructed at intervals and grass-grown, and what water reached it became stagnant. This is the main drain of the town, and might be satisfactory if sufficient water reached it to maintain a current. Although gutter-spaces were made when the town was laid out they are now mostly filled up with soil and overgrown with grass. In one or two places impervious guttering has been laid down for short distances, but here such efforts are rendered abortive owing to want of continuity. The drainage into them, on reaching the gutter-spaces, which have not been impervious, becomes stagnant, and remains until it evaporates or percolates into the soil. In some places, especially in lanes, this stagnating drainage was extremely foul. Since house-drains, carrying slops, are allowed to discharge into the streets, it is of the greatest importance that more attention should be paid to gutters. This is not only desirable on the score of cleanliness, but necessary in order to lessen the pollution of the soil resulting from the neglect of such measures. If the means are lacking to provide impervious gutters, something might still be done with the spade and broom towards securing a better state of things.

#### *Houses and Premises.*

The private houses comprised the usual varieties found in country districts. Small wooden structures, weatherboard cottages, small and large brick cottages, and a few two-storey brick buildings. Inferior kinds of wooden buildings are numerous. Many of the older ones are dilapidated and unfit for habitation. In many cases where a brick house has been built the original wooden one remains attached and forms part of the dwelling. The roofing is almost universally galvanised iron. With regard to other points of construction I would at present only call attention to one important defect. In a few houses there is no flooring. In others, although there are floors in the front rooms, the back rooms and outhouses (kitchen, &c.) had no floors. In other houses, again, the flooring was deficient owing to large fissures between the boards. In very few instances was there an air-space between the floor and the earth, and it is needless to remark that no air-proof basements were observed. I have pointed out these defects for the purpose of showing that the occupants of the majority of the houses were not at all protected against ground-air and ground-water, with their contained impurities. I may here mention that I found that sometimes, but not always, the rooms were disinfected after typhoid patients had recovered or died. The disinfection, where practised, was carried out by the occupants. Recent investigations on other micro-organisms suggest the possibility of the typhoid bacillus remaining alive for a considerable time in household dust. Rooms in which the patients have been should be thoroughly disinfected and cleaned (painted or papered).

Municipal by-laws issued in 1894 (copy attached) direct that all yards, &c., shall be kept in a cleanly condition, all dust, mud, refuse matter, &c., to be collected into one place and removed when a certain amount has accumulated (By-laws 61 and 62). Refuse from stables, &c., to be similarly collected and removed (By-law 65). The collection of substances for manurial purposes is excepted under certain restrictions, with this exception, the garbage must be removed; burning it off is prohibited (By-laws 89 and 90). The Council has the right of entry on complaint of nuisance, and if this be not abated after notice there is a penalty (By-law 67).

Although these by-laws are satisfactory, they do not seem to have been enforced. Inspection showed that back yards were often ill-defined and not properly fenced off from one another. Sometimes there was no enclosure round the house. Many of the premises were badly kept and uncleanly. House-refuse, food-scraps, stable-litter, and other rubbish were usually found scattered about the yard, and there were no signs of any particular spot being used as a rubbish-heap, as directed in the by-law. These conditions, together with the absence of indications of much dumping of garbage at the depôt, showed that this matter was in general neglected. The absence of a drainage system perhaps necessitated the throwing of slops on the hard surfaces, but such a procedure is none the less dangerous. While certain kinds of slops are innocuous, others, such as those produced by the washing up of plates and dishes, contain such putrescible organic matter and possess potentialities for evil not far removed from those of sewage. In a few instances the slops were carried off the premises by open brick drains, but this only amounted to transferring the mischief to another spot a few yards away, since the slop-water ceased to flow on reaching the gutterless streets, and formed stagnant and often stinking pools. The site of the closets was usually at a sufficient distance from the houses. They were provided with either cess-pits or pails. Previously to 1890 cess-pits were almost universal. At that time a by-law (copy attached) was issued to the effect that a dry-earth system should be adopted within certain named boundaries. This by-law was complied with only by some, many cesspits being retained. The validity of the by-law was disputed, and it was not enforced by the local authorities. The 1894 by-laws apparently permit the retention of cesspits, provided they be so constructed so as not to be a nuisance, &c., and have watertight walls so that there shall be no overflow, leakage, nor soakage from them (By-law 60). They are to be emptied after the addition of a suitable amount of deodorizer, when their contents have accumulated to within a distance of one foot from the top of the cesspit (By-law 63). The Inspector of Nuisances informed me that he had visited 150 cesspits, and believed there were more which he had not yet seen. In addition to those in actual use there was reason to believe that many former ones on being replaced by pails were merely filled in without previous emptying. Such places were pointed out to me in back yards of several houses in the town. The cesspits are distributed irregularly throughout the town, and are numerous in the north-eastern part, that is on the higher ground, the drainage from which passes through the greater part of the town. I have mentioned that the soakage from this area wells up on the surface of the streets below, and I am informed that this soakage has been noticed to have faecal odour. In this and other parts of the town heavy rains sometimes cause the cesspits to overflow. I visited many cesspits in and about the town. They presented all the usual foulness of such contrivances, were not water-tight, and sometimes quite full. The odour emitted from some of them was nauseating, and a near approach was not necessary to its perception.

Although the by-laws mentioned above (1890) refer to the adoption of a dry-earth system no such system prevails. The 1894 by-laws in this regard require that when pails or pans are used supplies of earth, ashes, charcoal, lime, or other substance shall be kept and thrown on the excreta in sufficient quantity to cover and deodorize them (By-law 64).

The by-laws already quoted respecting cleanliness, leakage, &c., apply to pails as well as to cesspits. Inspection showed that these by-laws were neglected. It was exceptional to find any supply of earth, ashes, or other dry substance in the closets. The pails when they did not leak contained much liquid. Often, however, they leaked, and some had large holes in them. No regulations exist relative to the size and kind of pail to be used, this being left to the fancy or convenience of the owner of the closet. The pails were of a satisfactory nature occasionally. Generally, when of sufficient capacity they were too low, several inches of space intervening between the closet-seat and the top of the pail. The consequence was that the woodwork and ground beneath the closet (invariably porous) were nearly always foul with urine. The significance of this will be realised in view of recent investigations having proved that large numbers of typhoid bacilli are excreted with the urine. Not uncommonly the pails were improperly placed, and only partly caught the excreta. The outside of the pail and the ground beneath were then soiled by the bowel-discharges. Frequently the pails were much too small to serve the required purpose, and the openings in the walls of the closets by which the pails are introduced were often too small to admit a sufficiently large pail. I did not meet with a really good kind of pail. The best I saw were of galvanised iron, and were to be obtained from a maker in the town. It generally happened, however, that, either from lack of means or negligence, no proper pail was provided. Any piece of worn-out or disused hardware seemed to be considered by some as sufficiently good for the purpose. Amongst others, oil-kegs, half kerosene-tins, paint-pots, and similar defective utensils were found. In one instance I met with a closet in which there was neither cesspit nor pail, the excreta being simply deposited on the floor of the closet, and even the seat was fouled.

Far from being a dry-earth system, the arrangements were of the most primitive and faulty character—if anything, worse than cesspits. This would scarcely need saying were it not for the fact that I was told elsewhere that the experiences at Parkes showed that the dry-earth system was a failure.

#### *Removal and Disposal of Refuse.*

Garbage removed in accordance with the by-laws may be deposited only upon a certain area set apart for the purpose by the Council (By-law 66). This by-law was also neglected. Frequently the garbage removed was not taken to the depôt at all, but tipped out at the first convenient spot. I have already mentioned that the by-laws provide for the emptying of cesspits, but I could not find any regulation as to the emptying of pails. Apparently this is left to the discretion of the householder, but is supposed to be done once a week, oftener if required. The scavenger, who is only nominally under the control of the Council, is paid by the householders at the rate of 3½ per pail. The removal is done at night, the pails being merely emptied into a cart and replaced. No cleaning or scraping of the pails is indulged in. I made an effort to see the cart but failed, as its whereabouts did not appear to be known to the authorities. I cannot speak, therefore, as to its suitability for removing nightsoil. I am informed that it is never cleaned, and complaints were frequent as to bad smells associated with the nightman's operations.

By-law 66 (1894) directs that nightsoil may only be deposited at the depôt appointed by the Council, exception being made in the case of material from earth-closets to be used as manure. The depôt is situated 2 or 3 miles to the south-west of the town. Here the nightsoil is tipped into pits about 6 feet deep. When filled to within 2 feet of the top the pit is covered in and a new one made. It is said that nightsoil is frequently tipped into disused mining-shafts at places other than that set apart by the Council, but I obtained no evidence of this. The site of the depôt for garbage and nightsoil is unobjectionable as far as Parkes is concerned. Owing to the Condobolin railway line having been made through a portion of the site a new one has been selected a little distance away, but its use for the purpose has not yet received the sanction of the Lands Department. The disposal by burying was as satisfactory as such methods usually are.

It will be observed that the conditions relating to the care of premises and removal and disposal of refuse have not been described in relation to any ideal standard. The municipal by-laws have been taken as a guide to what might reasonably be expected to be done in such matters. It has been found that these by-laws have been neglected all along the line. The result has been wholesale pollution of the soil, from drainage, from slops, from rubbish, from nightsoil.

In answer to inquiries as to the method of dealing with the excreta of typhoid patients, most of those interrogated stated that they had buried them in the back yards or gardens. In a few cases this was done without any attempt to previously disinfect them, but in many cases the stools were covered with lime or ashes. Usually the motions were passed into a bed-pan containing carbolic acid or some other disinfectant and "buried at once." No time being given for the disinfectant to penetrate, the greater part of the stool, probably, remained infective. In one case only did I find that the stools were destroyed by burning. These excreta were not buried deeply—2 or 3 feet at most, sometimes only a few inches. Hence, in addition to the other deplorable sanitary errors, there was pollution of the soil with living and no doubt virulent typhoid germs. It is not known how long typhoid bacilli remain alive in the soil. The many factors influencing its existence would in one case kill the bacilli quickly, and in another prolong their life. The seasonal prevalence and recurrence of typhoid in the same locality year after year indicate that the bacilli are capable of living in the soil at least several months.

The result of soil-pollution would have an influence on the residents in two ways—

- (1) By contaminating the atmosphere.
- (2) By contaminating water.

The contamination of the air is due to the evolution of noxious gases (ptomaines and similar bodies). The inhalation of these gases produced the conditions included under the term mephitic poisoning. If the dose be sufficient the result is fatal. This has sometimes occurred in cleaning out cesspits. Short of this, more or less serious inflammations of the throat and lungs may occur. Even when diluted by diffusion their continued inhalation produces a condition of lowered vitality, scarcely amounting to a definite illness, but nevertheless rendering the individual more than usually susceptible to diseases produced by other causes (*e.g.*, pathogenic micro-organisms, such as the typhoid bacillus). I have called attention to the fact that the houses rarely provided any protection from such gases. No person with a normal sense of smell could fail to detect their presence in the open air, especially in certain lanes. They would therefore exert their influence both in and out of doors. (I am here assuming that foul odour means

means noxious properties. Though this is not scientifically correct, there is no doubt that the one condition is usually associated with the other. For our present purpose no distinction need be drawn between them).

Under the circumstances there can be no doubt that the inhabitants of Parkes have been fully exposed to the risk of depressed vitality produced by the inhalation of mephitic vapours. It only remains to point out that of all the influences which predispose to typhoid this is regarded as most dangerous.

Before discussing the second way in which soil-pollution would react it will be necessary to describe the water supply of Parkes.

Previous to 1893 rain-water was mostly used. In that year a public supply was first brought to the town. The source is underground water, from a drift under Billabong Creek, about 2 miles to the east of the town, and separated from it by the eastern range of hills already mentioned. The actual catchment area does not appear to be known, but it is believed to be several miles further up the creek. It is known that pumping does not effect the wells in the immediate neighbourhood, and that local rains do not augment the supply. In the drift a well has been sunk and pumping-gear erected. By this means water is pumped into a large open brick and cemented surface reservoir, situated on the upper part of the eastern range of hills overlooking the town. From this surface-pipes are distributed to the town.

There are several houses in the near neighbourhood of the pumping-station, but since the catchment area is probably some miles away this does not seem to be of any great importance. Further up the creek, I am informed, the houses are few in number. The service reservoir is unobjectionable as to site and construction.

The service-pipes being laid underground in a polluted soil are naturally in a dangerous position.

The service of water is very defective. It was commenced to part of the town in December, 1893, and completed in July, 1894; maintained constant to March, 1895, and then intermitted (twice weekly) till August, 1895, when it was stopped entirely to permit of repairs to the service reservoir. An intermittent supply was recommenced in November, 1895, the water being turned on about once a week till March, 1896. As the result of rain, a constant supply was maintained till 15th April, 1896, when it was again intermitted, being turned on for one hour twice a week.

During the intermissions water was purchasable at the Council's stand-pipes at the rate of 1s. per 200 gallons.

The public service is consequently a failure, and the year has been characterised as one of great scarcity of water. The other sources available were:—

1. Rain-water caught on the roofs and collected into tanks.
2. Water from wells near Billabong Creek.
3. Water from private wells in the town.

The roof-water was, in the majority of cases, collected into large galvanised-iron tanks. These do not seem to have been cleaned out often. In some instances the water was collected into underground tanks, usually, but not always, cemented. Some of these had a dome-shaped covering of cement, and were satisfactory as far as they went; others were covered merely by boards. These underground tanks were sometimes situated under houses, and many of them were not sufficiently protected against pollution by surface-washings.

The water carted from the wells near Billabong Creek was drift-water. Some of these wells were situated below the point at which the town-drainage entered the creek. The source of the water supplying them, however, is not known, and is not necessarily that of the creek.

Private wells were few in number. Those I saw were not protected from soil-water pollution, and were in dangerous proximity to cesspits. I could not obtain any evidence of the water from these wells being used for drinking purposes except for horses and cattle.

As the result of questions addressed to many of the residents as to the water used for drinking, I found that there was a general tendency to avoid the public supply. The rain-water collected into over-ground and under-ground tanks was mostly used. In a few instances creek-water was used, but only when no other was available.

The preference for tank-water seems to have resulted partly from its being "rain-water" and partly because it was clearer than the service water. Samples of the former were clear and sparkling and free from odour. The service water was slightly turbid, and contained specks and scales of rust, &c.

It scarcely needs saying that these obvious physical characters are no guide whatever to the purity of a water. The roofs from which the water was collected were clean at the time of my visit, but I was informed that previous to heavy rainfall in February last they were covered with dust to such an extent that in some cases the gutters were blocked. During the dry weather dust-storms are not uncommon, and the town is a dusty one. In washing the roofs clean the dust was, of course, carried into the water-tanks. If the polluted nature of the soil be borne in mind, the probabilities suggested that this dust contained not only the many impurities usual in dust, but also pathogenic organisms. Whether or not the bacilli, such as *B. Typhosus*, would remain alive in the dust till carried into the water-tanks depends on the amount of exposure to sunlight, oxygen, &c., they were subjected to. It is at least possible that some of them reached the tanks in a living condition, and in the contained water it would not take a few bacilli long to multiply into many millions.

It may here be remarked that the length of time typhoid bacilli remain alive in unsterilised water, such as that in the tanks, has been made the subject of experiment. They were found to have remained alive in large numbers after 158 days, or nearly six months, and may perhaps continue to live very much longer. They have been found alive in the mud from the bottom of deep lakes (Geneva), and would no doubt live well in the deposit in tanks.

Dissolved impurities derived from the dust must not be lost sight of. They, in themselves, might be such as would exert an injurious influence.

Another element unfavourable to this water is the fact that it had to be stored, often for long periods, and was consequently exposed to contamination in numerous ways. For instance, there was the possibility of pollution by surface-washings in the case of those wells with insufficient coping. The mere situation of underground tanks in a sewage-polluted soil would attach suspicion to the water they contain. Their cemented walls nominally, but by no means necessarily nor actually, protect them from pollution by ground-water. It

It will be obvious, therefore, that this so-called rain-water was not free from doubt as to purity, and was, at least, undesirable as a drinking-water. I would, however, lay stress on the fact that soil-pollution is the primary evil. Were it not for this the roof-water would be satisfactory for drinking purposes.

As to the service water. Underground water from sand, gravel, or drift may be perfectly pure, but on the other hand it may not. It is liable to contain an injurious amount of saline, and, at least, vegetable organic matter. Whether there be original impurity or not, the service-pipes run through sewage-soaked soil, and, moreover, the supply was intermittent and scanty. Insuction of materials from the soil can occur into a full flowing water-pipe, which is rarely air and water tight; but when, after running full, an intermission occurs, insuction of ground-air and ground-water is especially likely to happen. The hydrant-holes in Parkes are fitted with ball-valves, and I observed that at least one of them leaked. Materials so sucked in would be distributed when the water was again turned on. The soil-pollution again is the source of danger. Scarcity of water, both in itself and by involving neglect of cleanliness, produces defective health.

This consideration of the water supply of Parkes is sufficient to show that a very dangerous and undesirable condition of things exists. The water available is not free from suspicion as regards purity, and is not sufficient in amount.

Having considered the advisability of having the water analysed, I came to the conclusion that such a measure would serve no useful purpose, even if did not mislead. The present composition of the water, when the supply is short, would give no clue to its former condition when the supply was abundant. A biological examination, which would be necessary to detect typhoid bacilli, I did not see my way clear to undertake.

The methods of contamination shown to have been possible in Parkes are those known to have been instrumental in disseminating typhoid fever.

I am informed that a scheme is under consideration whereby water from a pure source may be brought to the town by gravitation in sufficient quantities to yield a constant supply. In view of the urgent need of such a supply it is to be hoped that the work will be carried on with all possible expedition.

#### *Dairies.*

The Dairies Supervision Act is in force in the district. The dairies I visited, though not of the best construction, appeared to be conducted in a satisfactory manner. The bail-yards and store-houses were clean, and the cans clean, bright, and free from sour odour. I was informed that the others were equally clean, and always kept so.

#### *Slaughter-houses.*

These are under the supervision of the police. On the report of the sergant that they were clean and well kept, I did not think it necessary to visit them.

#### *Other Sources of Food Supply.*

In the course of my inspection I visited the premises of several bakers, butchers, cordial-makers, &c. Nothing was found meriting special report.

The results of the inspection as regards general sanitary conditions may be briefly summed up as follows. The combined influence of natural conditions and the absence of an efficient drainage system is such as to render Parkes specially liable to diseases fostered by soil-pollution. The neglect of the by-laws provided for the suppression of nuisances has resulted in an excessive pollution of the soil. This pollution of the soil has in turn reacted on the air and the water, the latter, in addition to its possible contamination, being deficient in amount. The three great principles of hygiene have thus been neglected—there has been neither pure air, pure soil, nor pure water.

#### *The Causes of Death.*

The defective conditions above noted have been in existence for several years. If they have been injuriously affecting the health of the community the mortality returns should indicate it by showing high rates for those diseases (filth diseases) invariably associated with sanitary neglect. In the following table the numbers of deaths from such diseases are given for the five years 1891 to 1895, a note as to previous mortality (1883 to 1890) being added in each case. The figures were obtained from the district register. They have reference to the whole municipality, but since the majority of the residents live in or near the town the general conclusions drawn from them may be applied to the town itself.

Table showing numbers of Deaths from certain Diseases.

Deaths from.	1891.	1892.	1893.	1894.	1895.	In previous years.
Lung diseases.....	12	4	8	17	19	
Pneumonia.....	12	4	7	3	5	About 3 per year till 1890, then 11.
Bronchopneum.....				1		Irregular, few deaths.
Bronchitis.....			1	13	14	" "
Intestinal diseases.....	3	4	9	8	7	" "
Inflammation.....	1	1	7	6	2	" "
Dysentery.....			1			Irregular.
Diarrhoea.....	2	3	1	2	5	1 to 4 deaths a year.
Zymotic diseases.....	13	9	15	20	10	
Typhoid.....	1	1	7	2	3	Irregular.
Tuberculosis.....			6	3	3	No information.
Whooping cough.....		2	1			Irregular.
Influenza.....	1				3	" "
Diphtheria.....	7	6		12	1	1 to 3 deaths a year.
Sepsis.....	4		1	3		No information.
Totals—Causes specified.....	28	17	32	45	36	
Other causes—Nervous, circulatory, heat, accident, &c.	53	59	36	44	31	
All causes.....	81	76	68	89	67	

From these figures it would appear that previous to 1890 Parkes was fairly free from serious mortality. It will be remembered that the first efforts in the direction of sanitation were made in 1890. Since then the list of death-producing diseases includes the majority of those fostered by sanitary error. There are twelve in number, viz., Pneumonia, broncho-pneumonia, bronchitis, inflammatory diseases of the intestinal tract, dysentery, diarrhoea, typhoid fever, tuberculosis, whooping cough, influenza, diphtheria, and septic diseases.

During the five years under special consideration these diseases contributed 158 to the total of 381 deaths registered in the Parkes district. They were therefore responsible for nearly half the deaths. To the mortality of the whole Colony these same twelve diseases contribute about one-third of the total number. In 1894, for example, they caused 5,222 of the total 15,170 deaths. It is to be observed, however, that tuberculosis (phthisis) forms a conspicuous feature in the death-roll of the whole Colony, but is very insignificant in that of Parkes. Only twelve deaths from this cause have been registered during the five years. Excluding phthisis, the diseases in question contribute a little more than a quarter of the total number of deaths in the Colony; in 1894 they furnished 4,076 of the total 15,170.

From these comparisons it is clear that the diseases specified contribute an inordinately large number of deaths to the mortality of the Parkes district.

In the following table the death-rates for the last five years are given, expressed as a ratio per 1,000 persons living. The population for each year since the 1891 census has been roughly estimated and given in round numbers. A note as to important local events which may have influenced the mortality is appended to each year:—

TABLE showing Mortality from certain Diseases per 1,000 persons living.

Year.	Population.	Death-rate, all causes.	Pneumonia	Bronchitis	Lung diseases generally.	Inflam. Intest. diseases	Diarrhoea	Intest. diseases generally.	Typhoid.	Diphtheria.	Zymotic diseases generally.	Other causes.	Important local events.
1891...	2,950	27.4	4.0	...	4.0	0.3	0.6	1.0	0.3	2.3	4.4	17.9	Railway opened.
1892...	3,100	26.4	1.3	...	1.3	0.3	0.9	1.2	0.3	1.9	2.9	19.0	Exodus to Wyalong.
1893...	3,200	26.2	2.1	0.3	2.3	2.1	0.3	2.8	2.1	..	4.6	11.2	Peak Hill rush.
1894...	3,300	23.9	0.9	3.9	5.1	1.8	0.6	2.4	0.6	3.6	6.0	13.3	Water service completed.
1895...	3,400	16.7	1.3	4.1	5.5	0.5	1.4	2.1	0.8	0.2	2.9	9.1	Great heat and insufficient water.

The significance of the figures in this and the preceding table has been broadly interpreted in the following notes:—

*Death-rate from all Causes.*—There has been a satisfactory diminution during the five years, from 27.4 in 1891 to 16.7 in 1895. The rate is still, however, much above that for the whole Colony (14.9), and even more in excess of that for the country districts (excluding Sydney and suburbs), which is 13.0 per mille.

*Pneumonia.*—(Rate for the whole Colony, about .5 per mille.) The mortality from this disease was not serious till 1890, but in that and the succeeding year the rate was excessively high. This may perhaps be accounted for by the temporary influx of persons consequent on the opening of the railway and the development of mining. In 1889 and 1890 the numbers of miners' rights issued were 878 and 882 respectively, the usual yearly number being from 300 to 600. Since 1891 the death-rate has been less, but is still much above the mean, and does not appear to be diminishing.

*Bronchitis.*—(A few deaths registered as bronchitis and asthma are included.) (Rate for the whole Colony, about 6 per mille.) Till 1892 fatal cases were few and irregular. In 1893 there was a small mortality (.3 per mille). The rates show marked and successive increases in 1894 and 1895 (3.9 and 4.1). No special local event has been ascertained which could account for this sudden increase. The death-rate from bronchitis is excessively high, and is increasing.

*Respiratory Diseases generally.*—(Rate for the whole Colony, about 1.7 per mille.) Since 1892, when the rate was below the mean, there has been a continuous and marked increase, and it is at present excessively high (5.5 per mille).

*Inflammatory Diseases of the Intestines.*—(Rate for the whole Colony, about .5 per mille.) Fatal cases were few and irregular till 1893, when the rate jumped from a previous .3 per mille to 2.1 per mille. Since that time it has steadily diminished, and in 1895 was about the same as in the whole Colony.

*Diarrhoea.*—(Rate for the whole Colony, about .6 per mille.) The rate was fairly constant and about that for the whole Colony till 1895, when there was a sudden increase to about twice the mean.

*Diseases of the Digestive System generally.*—(Rate for the whole Colony, about 1.2 per mille.) Till 1892 the rate was about the same as that for the whole Colony. In 1893 a sudden rise occurred to twice that of the Colony. This high rate has been maintained, but has a tendency to diminish. The only ascertained local event which might have produced the increase in 1893 was the introduction of a new drinking-water. The public service was partially introduced in 1893, and completed in 1894. In support of the above surmise there is the fact that the use of water of different composition from that to which a community is accustomed, quite apart from the question of its purity, is known to sometimes produce sickness at first. The change in the case of Parkes was from roof-water to underground (drift) water. The evidence is not conclusive.

*Typhoid Fever.*—(Rate for the whole Colony, about .2 per mille.) This disease contributed irregularly to the death-rate till 1890, and regularly since then. In 1891 and 1892 the rate was already high. In 1893 there was a sudden increase to 2.1 per mille. In 1894 and 1895 the rate fell again, but remains much above the mean, and shows a tendency to rise.

*Diphtheria* (including deaths registered as Croup).—(Rate for the whole Colony, about .3 per mille.) Till 1890 the mortality from this disease was irregular, and not large. In 1891 and 1892 the rates were very high—2.3 and 1.9 respectively. The year 1893 seems to have been skipped. In 1894 the rate was excessive—ten times above the mean. In 1895 there was a fall to .2 per mille—that is, to below the mean. It is interesting to notice in this connection that the curative serum for diphtheria was used in 1895.

Deaths

Deaths from diphtheria constitute the principal sign afforded by the death-rate of the prevalence of sore throats. These predispose to diphtheria, but not being of a fatal nature do not themselves appear in the mortality. Consequently we may assume, and the assumption is supported by clinical evidence, that sore throats were numerous. Sore throats (sometimes called "sewer-air" throats) are commonly associated with sanitary defects.

*Zymotic Diseases generally.*—(Rate for the whole Colony, 2.2 per mile.) The only point to be noted is that the death-rate from Zymotic diseases is above—in some years very much above—the mean rate for the Colony.

*Causes other than those specified.*

The death-rate has a tendency to diminish.

I am conscious that the figures on which the above notes are based lack rigid accuracy. The estimations are only approximate, and the period covered is short. No allowance has been made for age and sex distribution, occupation, conditions of life, &c. Moreover, the population of a mining district is liable to fluctuations which would not be evident in estimations based on the census figure. These factors may, and no doubt did, influence the mortality. Nevertheless, in spite of these shortcomings, the conclusions drawn from the figures may be legitimately regarded as affording fairly reliable, though rough, guides to the condition of affairs. With this limitation in significance borne clearly in mind, the information furnished by the figures may be expressed in the following general terms:—

*Death-rates from—*

All causes	...	...	} Diminishing, but still high.
Unspecified causes	...	...	
Intest. inflam.	...	...	} Diminishing, and about mean.
Pneumonia	...	...	
Zymotic diseases	...	...	} Maintained high.
Bronchitis	...	...	
Pulmonary diseases	...	...	} High, and tend to increase.
Diarrhoea	...	...	
Digestive diseases	...	...	
Typhoid fever	...	...	
Diphtheria	...	...	Apparently checked.

The general result of this statement is to show that whilst there is a diminution in the death-rates from diseases not specially effected by hygienic conditions, the rates from those known to be intimately associated with sanitary defects are either increasing or are much above the mean. The evidence thus furnished confirms the proposition stated above, viz., that the influence of the soil-pollution, &c., would reveal itself in the mortality returns.

The whole chain of evidence is to the effect that at the end of the year 1895 the condition of the town and people of Parkes was such as to render them specially liable to an outbreak of typhoid fever. The experiences of the town during the present year show that such an outbreak has actually occurred. Since the beginning of the year 74 deaths have been registered, a number little short of the annual average for the last five years, viz., 76. A closer inspection of the register showed that the excess of deaths was mainly due to two causes, diarrhoea and typhoid fever. Other diseases contributed about the usual number.

From notes kindly supplied by Dr. Oswin Johnson and Dr. Devlin, I find that they have professionally attended about 200 cases of typhoid during the year. The number of deaths registered as due to this disease is 25. It would thus appear that the disease has attacked about 1 in 16 of the entire population, and killed 1 in 8 of those attacked. A fatality of 12½ per cent. is above the average in metropolitan hospitals. In the Coast Hospital, for instance, in 1893 the fatality was 12 per cent., and in 1894 8 per cent.

The outbreak was still in progress at the time of my visit. There were 18 cases under treatment in the hospital, and many more in the private practices of the doctors.

It would be injudicious to enter into the mode of dissemination, &c., of the disease, since the data at present in my possession do not admit of satisfactory conclusions being drawn from them. At least, I wish to investigate some points more closely before doing so. With the assistance of the Government Medical Officer, I propose to collect the required information, and the result will be presented to the Board as a supplementary report. This work will require some time, and could not be undertaken during my stay in Parkes. I had acquired much information of importance to the community, embracing the knowledge of sanitary defects which ought to be remedied without loss of time. I have therefore deemed it best to present the Report as it now stands, leaving the details of the present outbreak to be dealt with later.

I may, however, state that the evidence, as far as it goes, tends to exclude milk, meat, bread, vegetables, other foods, and beverages (lemonade, &c.), and points to water as the probable means of dissemination. Further than this it would not be safe to go until such facts as may be ascertained by the future investigation have been considered. The question must be left open for the present. In the meantime I beg to submit the following commentary and recommendation.

Typhoid fever, of all diseases, is that which is most closely associated with sanitary defects. Under the various subdivisions of the above Report there has been pointed out such a series of sanitary errors as must have resulted sooner or later in an outbreak of typhoid such as that which has occurred during the present year, and which will, unless rectified, inevitably lead to further outbreaks.

Besides predisposing to typhoid, the defective arrangements in existence are maintaining a high death-rate in the district. Such diseases as diphtheria and bronchitis have claimed many victims. These diseases chiefly kill the young and very old, and consequently do not attract attention as typhoid does, in which the mortality occurs amongst young adults and persons in the prime of life—the bread-winners and persons of importance—who are missed by the community.

It is very evident, therefore, that there is urgent need of attention to sanitary matters.

The outstanding evil in Parkes is in the pollution of the soil. This should be immediately checked, and the means to this end are at hand in the firm enforcement of the existing by-laws for the suppression of nuisances. But, in order to convert the present defective system of dealing with nightsoil and garbage into a satisfactory one, it is necessary that better methods of conservation and removal should be instituted.

In

In every town not provided with sewers provision must be made for the temporary storage of nightsoil on the premises. It is essential that this be so stored as not to be a danger to health. There are several ways of doing this, but a dry-earth system properly carried out would best meet the requirements of Parkes. For such a system to be successful there is need for care on the part of individual householders, efficient sanitary inspection, and a properly-organised scheme of scavenging.

In every closet there must be a suitable pail; the present assortment must be done away with. Anything will not do for a pail. The conditions which must be fulfilled are that the pail must catch all the excreta, liquid as well as solid, and must retain them when caught. Failure in this respect on the part of a few individuals involves a menace to the health of all. Where persons are unable by reason of poverty to buy a suitable pail for themselves the Council should supply one as a matter of public duty. Under other circumstances the purchase of a proper pail must be insisted upon. A duplicate system of pails is the best to aim at. In this system pails of uniform size are used, adapted for being fitted with a spring lid. On removal from the closet the lid is fitted on, and the pail and its contents conveyed to the cart, and taken in it to the depôt to be emptied and cleaned. A clean empty pail is placed in the closet on removal of the full one. The adoption of this system would involve alteration in many of the closets, an alteration which some of them sadly need.

The method, properly managed, is perfectly clean and free from nuisance, and can be carried out in the daytime—a point of great importance.

The need of using abundance of earth or ashes must not be forgotten. This is the basis of the whole system. The dry substance, whatever it be (well-dried garden-mould, ashes or sawdust), must be thrown over the excretions in sufficient quantity to absorb all the liquid. Keep the nightsoil dry, and there will be no nuisance. The Council should direct their Inspector of Nuisances to see that the by-law in this respect is rigidly attended to. It is to the advantage of the Council to make arrangements for the provision of the dry material required.

Experience has taught that the removal of nightsoil is much better done by the Council's own servants than by contractors. The work can be conducted on a definite plan under the immediate supervision of the Inspector of Nuisances, and defects are more easily detected and remedied. The pails should be emptied as often as possible—at least twice a week. The carrying out of a properly-organised system such as that suggested affords the only means of obtaining a satisfactory service, and of preventing grave danger to health.

The by-laws relating to collection and removal of garbage must be enforced. The amount to be removed might be considerably lessened by a greater use of the kitchen fire. The removal should be done by the Council. The garbage, previous to removal, should be stored in a dry place.

It is also a matter of some urgency that the Council should set about draining the town. As this means something more than the making of gutters, it would be cheapest to obtain the advice of a competent engineer.

I have already referred to the pressing need of a new water supply. No effort should be spared to secure this as soon as possible. In the meantime the above-ground tanks probably afford the best water at present available. The tanks should be cleaned out as often as opportunity permits. It is advisable to discontinue the use of water from underground tanks, cemented or not. All water should be boiled before being used for drinking, and, as far as possible, also before being used for household purposes whereby food may be contaminated. The use of germ-proof filters of the Pasteur-Chamberland type would find a useful place in the houses of those who can afford them. Ordinary filters should be steadfastly avoided. In other cases boiling the water gives the greatest safeguard, and it is indeed the best-known means of preventing infection by water-borne diseases such as typhoid fever.

Milk also should be always boiled before use.

The small amount of extra trouble to the individual which the performance of these simple precautions involve confers a great benefit on the community at large. This simple practice of using only boiled water, milk, &c., will, if conscientiously carried out, effectually prevent epidemics of typhoid and other diseases.

The excretions of typhoid patients should be mixed with a sufficient amount of dry material and burnt in the kitchen fire. Linen soiled by the excretions should be removed at once, burnt, or placed in a disinfecting solution, and subsequently well boiled. Soiled floors and utensils should be washed and scrubbed with disinfectant. The persons attending on patients should be most careful to wash their hands before handling food, or going to meals. In short, the greatest possible care should be taken that none of the excretions, neither solid nor liquid, escape destruction or disinfection, for it is by means of the excretions that the infection leaves the patient and becomes conveyed to other persons.

The above recommendations indicate that all general sanitary measures should be attended to by the Council directly. The health of 3,500 people demands an amount of care and precision in details in dealing with drainage, conservation, and removal of refuse, &c., which can only be secured by the direct and active control of a responsible authority. At present these matters are everybody's business, and consequently nobody's. They are in a hopeless muddle. Under the various headings I have purposely given such details as will aid the Council in organising a definite plan. Some such reforms as those suggested will have to be undertaken if outbreaks of disease like the present are to be prevented. The question of cost will have to be considered, of course: money will have to be spent. After the initial outlay, however, the Council should be able to carry on the work as cheaply as the individual householders can. The expense to the community as a whole would be no greater than at present. It must be remembered that reform is not a matter of choice, but of necessity. Unfortunately, typhoid does not remain quiescent whilst expenses are being considered: it is busy destroying valuable lives. It is the outcome of universal experience that this disease can be prevented by efficient sanitary measures. The institution and maintenance of these certainly must be paid for in money, but the neglect of them must be paid for in human lives. Epidemics are very costly; regarded from the most sordid point of view, it is much cheaper to pay in cash.

The President, Board of Health.

I have, &c.,  
FRANK TIDSWELL.

1896.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

INSANITARY STATE OF THE TOWN OF FORBES.

(REPORT ON.)

*Printed under No. 12 Report from Printing Committee, 6 August, 1896.*

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated 14th July, 1896, That there be laid upon the Table of this House,—

“A copy of Dr. Tidswell’s report on the insanitary state of the town of “Forbes.”

(*Mr. Raymond.*)

SANITARY CONDITIONS IN FORBES.—MAY, 1896.

To the President,—

Sir,

In accordance with your instructions, I visited Forbes, and on May 1st and 2nd inspected certain sanitary matters, under the guidance of the Mayor and Aldermen, and of the Government Medical Officer (Dr. McDonnell). It appeared to me, from conversation with these gentlemen, that their present purpose will be better suited by some critical remarks than by a report in the usual form. I have the honor to submit the following for your approval:—

Nightsoil and Refuse.

In every town which is unsewered provision must be made for—

1. Storing the nightsoil on the premises until such time as it can be removed ;
2. Removing the nightsoil in an efficient and cleanly manner ; and
3. Disposal of the nightsoil in such a way as not to be a nuisance and a danger to health.

In Forbes at the present time the closets are provided sometimes with cesspits, sometimes with pails. Cesspits are numerous, and are merely dug in the ground. Their walls are not impervious, and consequently the liquid soaks away from them into the surrounding soil. They were, as usual with such structures, extremely foul-smelling. Cesspits in a town are bad and dangerous things, and should be abolished.

The pails are of various kinds. In general they are of sufficient capacity, but not always of proper shape, nor placed in a proper position under the closet-seat to catch all the excreta. Most of those I examined contained much decomposing liquid.

A pail system is the best for a town which has no sewers, but it must be managed with great care and attention to details. The pails must be of a suitable size and shape, and must be properly placed. All the excreta, liquid as well as solid, must be caught in them. Some dry substance, such as well-dried garden mould, loamy soil, ashes, &c., should be thrown over the excreta in sufficient amount to absorb all the liquid. This is the basis of the whole system. If the nightsoil be kept dry no nuisance nor danger will arise. The height of pail in relation to the closet-seat must be such that no space intervenes between them. This will prevent the woodwork and ground beneath the closet being polluted with urine. There must also be some arrangement whereby the pail can only be placed in the proper position. Even a superficial inspection will show that both these matters are in general neglected. The pails must be removed as often as possible, probably not less frequently than twice a week. The better the attention to keeping the nightsoil dry the less frequent need the removal be. Under ordinary circumstances the removal of nightsoil is a very dirty business ; owing to carelessness the closet-floors, passages, and lanes become splashed with the liquid refuse.

A

302—

[605 copies—Approximate Cost of Printing (labour and material), £2 6s. 2d.]

A duplicate system is the best to aim at; the pails are of uniform size and are made so as to be closed by a spring lid. On removal from the closet the lid is fitted on, the pail and its contents removed to the cart and conveyed to the depôt to be emptied and washed. A clean empty pail replaces the one removed.

This system, if properly carried out, is perfectly clean, safe, and free from nuisance. The work of removal can be done in the daytime, and so can be supervised and properly conducted.

The efficiency of such a measure demands care on the part of householders, which must be secured by active sanitary inspection, and the institution of an adequate system of scavenging. This can only be hoped for by the council exercising direct control over the work. All experience teaches that the council's own servants will do it much better than contractors. The system is then uniform, defects are easily recognised and remedied, and grave danger to health prevented. To admit of this system some of the closets would need slight alteration, for the seats would have to be the same (or nearly the same) height in all to allow of the interchange of pails.

The same general principles apply to house refuse, stable litter, &c. At present there seems to be no special care of these matters. At North Circle Park, and in some lanes and open spaces, I saw some unsightly deposits of garbage. The refuse should be stored in one particular spot on the premises (a dust-heap), which should be so situated that the garbage can be kept dry. There should be a general instruction that the destructible garbage be burned in the kitchen fire. This will greatly lessen the amount to be dealt with. The removal and disposal should be carried out by the council.

### Slop Water and Drainage.

At present the slop waters of houses are allowed to run into the streets, into which they are often conveyed by box drains. These are bad; they soon become foul and are readily blocked up. Circular pipes are much better. At North Circle Park there is a stinking swamp, into which a large amount of slop water is received. An equally unhealthy condition is presented at the south end of the town, where the waters of a lagoon are polluted in a similar way. Whilst some kinds of slop waters are not harmful, others such as those derived from washing up plates and dishes are dangerous. They contain particles of food, fat, &c., which putrefy and create a nuisance.

It is very necessary that some system of surface drainage should be undertaken in order to deal with these slops. It is the complement of a water supply. The houses may be drained into impervious gutters, and provision made for keeping these clean. But the gutters must lead somewhere, and it would be best for the council to obtain the advice of a competent engineer to devise some scheme for properly draining the town. It would be well under these circumstances to keep in view some system of irrigation whereby sewerage as well as surface drainage might be ultimately dealt with. It is urgent that the condition of things at North Circle Park be immediately put a stop to. This area is in a filthy condition and constitutes a danger to health. The depôt for disposal of nightsoil and garbage should be so situated that no soakage from it can return to the town. There appears to be some doubt whether the Forbes depôt is satisfactory in this respect.

The aim of disposal by burying is that the refuse may be converted as rapidly as possible from organic (noxious) to inorganic (innocuous) material. This change is accomplished by the agency of minute organisms which live in the uppermost few feet of the soil. They do not exist in the deeper layers. Consequently, refuse should not be buried deeper than 6 or 8 feet. Admixture with earth renders the change more rapid by permitting the organisms to reach all parts quickly. The practice of casting the refuse into deep open shafts, as in Forbes, does not altogether amount to deep burial, and it is perhaps a sufficiently good method of disposal, provided the place be isolated. I am of opinion that land used as a depôt should be fenced in, and the public forbidden to trespass upon it.

It will have been noticed that the above suggestions are directed towards keeping the soil pure. It may aid in their appreciation if I briefly sketch the ways in which soil pollution react on the community.

The soil contains water and air, and soil pollution means pollution of this ground water and ground air. The liquid refuse from cesspits, slops, &c., mixes with the ground water, and with it sinks in till an impervious stratum is reached. It then flows along this in the line of natural drainage and ultimately enters a river or stream. The water in wells is also derived from this ground water, and a well actually drains a certain area around it. It is, therefore, easily enough understood how injurious material may be conveyed into water used for drinking purposes. The germs of typhoid fever, for instance, are passed in enormous numbers in the bowel excreta and urine of a person suffering from the disease. The germs can remain alive for many months in the soil and during that time can be carried long distances by the ground water. Reaching a well or river they multiply with extraordinary rapidity, and water thus contaminated with them can produce the disease in persons drinking it. Another way in which water can be contaminated with typhoid germs is by the infective material from the soil being sucked into water-pipes which are laid in it. Epidemics of typhoid have resulted from pollution of water in both of these ways.

The ground air occupies the soil above the water level. Since the level of the underground water is constantly rising and falling with dry and wet weather, air is always being forced out and sucked in. When organic matter in the soil, such as nightsoil or garbage, is decomposing, injurious gaseous products are evolved and mixed with the ground air. These noxious gases exist in abundance in the air over cesspits, and men have been killed by them whilst cleaning out old pits. The gaseous emanations from the soil have often produced serious illness in deep mines, &c. The air of a house is warmer than the air outside, and consequently it tends to rise and be replaced by the air from without. This effect is increased by fires in the house which create actual draughts. Some of the air thus drawn in comes from the soil unless special means are taken to prevent it, such as air-proof basements or an air space between the floor of the house and the ground. Polluted air thus aspirated into the house may produce sickness, especially if it enters bedrooms and be inhaled for long periods, as during sleep. By this means certain sore throats and inflammations of the lungs have been produced, or there may be no definite illness, but simply a lowering of the vitality of the person inhaling it. When an illness comes the individual whose health is so undermined cannot resist it, as a healthy one can. In this way the community is rendered very susceptible to certain diseases.

For these and other reasons it is necessary to take every reasonable means of preventing soil pollution, and it is to secure this end that sanitary authorities have insisted on the necessity of cleanliness in dealing with night-soil, and garbage, and slop waters.

### Water Supply.

Water is obtained from the Lachlan in sufficient quantity to afford a constant supply.

The situation of the intake is by no means free from danger, since there are several houses in its immediate neighbourhood. Typhoid-infected drainage from these houses might so pollute the supply as to cause an epidemic. This is the way typhoid is most commonly spread. Special care must therefore be taken that these houses are maintained in a sanitary state, and that their drainage does not pollute the river water.

The existence of a wool-washing business about a mile above the intake is a very regrettable circumstance. The establishment of this was permitted, I understand, on the condition that no refuse water should be turned into the river. The washings were to be irrigated over the adjacent land. I do not think this is a sufficient safeguard. Slop and drainage waters exist about the premises, situated as they are within a few feet of the river's bank, which must inevitably be carried into the river when rain falls. I found also that much refuse matter was placed actually on the bank of the river. There can be no doubt that some pollution of the river results from this source, and, considering the noxious nature of the business, the pollution is of a most objectionable kind. The water of a running stream undergoes self-purification, but many miles of flow are necessary to secure this end.

From the intake the water is pumped into a service reservoir. The water is said to be filtered, but since this consists of passing it through large loose pieces of sandstone, there is no true filtration of it. It may be mentioned that a properly carried-out method of sand-filtration would be to the advantage of this town. The service, I understand, is not quite sufficient for the needs of the community, and the laying of a new main is under consideration.

The important points to remember in connection with a water supply are, that the water shall be pure in quality and sufficient in quantity. It is necessary, therefore, to jealously guard the source against pollution in the first place, and next to take every precaution against contamination during distribution. The quantity of water required by a community is usually estimated at 30 gallons per head per day.

The above considerations embrace all the matters to which my attention was specially directed. In pointing out defects and suggesting remedies, I am conscious that reforms involve expense. Nevertheless, it is cheaper to institute and maintain efficient sanitary measures than to allow them to be neglected. Once instituted, the business of nightsoil and garbage removal and disposal can be carried out more cheaply by the council than by the householders themselves. The expense to the community as a whole would be less than at present. Some measure of the kind indicated above will sooner or later have to be undertaken, and the expense involved should not be beyond the means of a town like Forbes.

I have, &c.,

FRANK TIDSWELL.

1896.

EXTRACTS FROM THE VOTES AND PROCEEDINGS OF THE  
LEGISLATIVE ASSEMBLY.

VOTES NO. 10. TUESDAY, 2 JUNE, 1896.

13. THE ABATTOIRS:—Mr. Hawthorne moved, pursuant to Notice, That a Select Committee be appointed to inquire into and report upon,—

- (1.) The past and present management of the Abattoirs at Glebe Island.
- (2.) The advisability or otherwise of the removal of the present Abattoirs to another locality.
- (3.) The probable cost and route of a branch railway line from the main trunk line to Glebe Island, for the carrying of cattle and sheep, with the object of abolishing the present cattle-driving nuisance through the western suburbs."

(4.) That such Committee consist of Mr. Reid, Mr. Russell Jones, Mr. Bavister, Mr. Mahony, Mr. Frank Farnell, Mr. Law, Mr. O'Sullivan, Mr. Harris, Mr. Parkes, and the Mover.

Debate ensued.

Mr. Macdonald moved, That the Question be amended by leaving out paragraph (3).

Question proposed,—That the words proposed to be left out stand part of the Question.

Debate continued.

Question put,—That the words proposed to be left out stand part of the Question.

The House divided.

Ayes, 10.		Noes, 47.	
Mr. Fegan,	Mr. Ferguson,	Mr. Travers Jones,	Mr. Ball,
Mr. McLaughlin,	Mr. Copeland,	Mr. Macdonald,	Mr. Lonsdale,
Mr. McLean,	Dr. Ross,	Mr. Cotton,	Mr. Jessep,
Mr. Wilks,	Mr. Schey,	Mr. Howarth,	Mr. Garrard,
Mr. J. C. L. Fitzpatrick,	Mr. O'Sullivan,	Mr. Mahony,	Mr. Black,
Mr. Harvey,	Mr. See,	Mr. Sydney Smith,	Mr. Dick,
Mr. Harris,	Mr. Willis,	Mr. Cann,	Mr. Morgan,
Mr. Millard.	Mr. Dacey,	Mr. McGowen,	Mr. O'Reilly,
<i>Tellers,</i>	Mr. Watkins,	Mr. Archibald Campbell,	Mr. Cook,
Mr. Law,	Mr. Hughes,	Mr. Hogue,	Mr. Newman,
Mr. Hawthorne.	Mr. Brunker,	Mr. Thomas,	Mr. Young.
	Mr. Chapman,	Mr. Anderson,	<i>Tellers,</i>
	Mr. FitzGerald,	Mr. Thomas Brown,	Mr. Watson,
	Mr. Waddell,	Mr. Collins,	Mr. Moore.
	Mr. Carroll,	Mr. Afleck,	
	Mr. Pycers,	Mr. Reid,	
	Mr. Hurley,	Mr. Whiddon,	

And so it passed in the negative.

And Mr. Hogue requiring that the Committee be appointed by Ballot,—

Question, as amended, then put,—That a Select Committee be appointed to inquire into and report upon,—

- (1.) The past and present management of the Abattoirs at Glebe Island.
- (2.) The advisability or otherwise of the removal of the present Abattoirs to another locality.
- (3.) That such Committee consist of \* \* \* \* \*

The House divided.

Ayes, 51.		Noes, 9.	
Mr. Brunker,	Mr. Watkins,	Mr. Schey,	Mr. Carroll,
Mr. Fegan,	Mr. Thomas Brown,	Mr. Morgan,	Mr. Edden,
Mr. Young,	Mr. Harrey,	Mr. Collins,	Mr. Whiddon,
Mr. Garrard,	Mr. O'Sullivan,	Mr. Howarth,	Mr. Lonsdale,
Mr. McLaughlin,	Mr. Bavister,	Mr. Chapman,	Mr. Black,
Mr. Reid,	Mr. Ball,	Mr. Travers Jones,	Mr. Afleck,
Mr. See,	Mr. Pycers,	Mr. Cann,	Mr. Archibald Campbell.
Mr. Sydney Smith,	Mr. Millard,	Mr. Waddell,	<i>Tellers,</i>
Mr. McGowen,	Mr. Jessep,	Mr. Watson,	Mr. Ferguson,
Mr. Smailes,	Mr. Harris,	Mr. Anderson,	Mr. Moore.
Mr. Thomas,	Mr. Dacey,	Dr. Ross,	
Mr. Wilks,	Mr. Hurley,	Mr. Copeland,	
Mr. Hogue,	Mr. Mahony,	Mr. FitzGerald.	
Mr. Macdonald,	Mr. O'Reilly,	<i>Tellers,</i>	
Mr. Cotton,	Mr. Dick,	Mr. Hawthorne,	
Mr. Hughes,	Mr. Willis,	Mr. Law.	
Mr. McLean,	Mr. Cook,		
Mr. J. C. L. Fitzpatrick,	Mr. Newman,		

And so it was resolved in the affirmative.

Whereupon the House proceeded to Ballot; and Mr. Speaker declared the following to be the Committee duly appointed:—Mr. Hawthorne, Mr. Brunker, Mr. Hassall, Mr. Law, Mr. Bavister, Mr. Mahony, Mr. O'Sullivan, Mr. Wilks, Mr. Willis, and Mr. McElhone.

## VOTES No. 55. TUESDAY, 15 SEPTEMBER, 1896.

- 8 THE ABATTOIRS (*Formal Motion*):—Mr. Hawthorne moved, pursuant to Notice, That the Select Committee now sitting on "The Abattoirs" have leave to make visits of inspection, from time to time, accompanied by a shorthand-writer, to Abattoirs within the Colonies, for the purpose of holding inquiries and taking evidence, and that the Committee have leave to sit during the sittings of the House, or any adjournment thereof, for the purpose of making such visits of inspection. Question put and passed.

**THE ABATTOIRS.**

---

**REPORT.**

---

THE SELECT COMMITTEE of the Legislative Assembly, appointed on 2nd June, 1896, "to inquire into and report upon (1) *The past and present management of the Abattoirs at Glebe Island*; (2) *the advisability or otherwise of the removal of the present Abattoirs to another locality*,"—and to whom was granted on 15th September, 1896, "leave to make visits of inspection, from time to time, accompanied by a shorthand-writer, to Abattoirs within the Colonies, for the purpose of holding inquiries and taking evidence, and leave to sit during the sittings of the House or any adjournment thereof, for the purpose of making such visits of inspection,"—have agreed to the following Report:—

Your Committee, having taken a considerable amount of evidence, and paid visits of inspection to the Abattoirs and chilling and meat-preserving works in Melbourne, Brisbane, Aberdeen (N. S. Wales,) and Sydney, have arrived at the following conclusions:—

1. That it is desirable that the Government encourage in every possible way the killing of stock and chilling of meat in the country districts. In connection with this aspect of the question they would suggest that an expert inspector should be appointed for each establishment, as there is reason to believe that the present system of inspection is far from being a satisfactory one. The plan worked so successfully in Queensland by having a Dairy and Meat Board, might with advantage be considered by the Government of New South Wales; and better accommodation for the sale and shipment of frozen or chilled meat might, at the same time, be accorded by the Government.

2. Your Committee consider that it is absolutely necessary to have a central Abattoirs in or near the city of Sydney, in order to dispose of the large number of calves, pigs, lambs, and other stock which come from the coastal districts, as well as to supply the demand of those who prefer to have their meat fresh, and have an objection to chilled or frozen meat.

3. This point being conceded, the question of site for the Abattoirs then arises. Three positions claim attention. The first is that near Blacktown, where there is said to be a large area of land available and abundance of water at hand for cleansing purposes. The second is the Wentworth Estate, at Flemington, adjoining the present stock sale-yards, where there is also a considerable area of land, with a frontage on the Parramatta River, and will be shortly connected with the main sewer of Sydney. The third is the so-called Glebe Island (or peninsula), where the present Abattoirs are situated, to which cattle and sheep have now to be driven from the sale-yards.

4. With regard to the Blacktown site, it may be dismissed at once as being too distant from the city for the position of an Abattoirs. The evidence goes to show that even at present there is a considerable amount of killing done in private establishments (without inspection), and if the Abattoirs were placed at the proposed site near Blacktown (22 miles from Sydney) this evil would undoubtedly largely increase.

increase. The Wentworth Estate, near Flemington (9 miles from Sydney), is a better situation, but that also is somewhat too far for the majority of the butchers to go for their meat. It is to be feared that this distance, although much shorter than that at Blacktown, would also tend to the practice of private killing. The argument applied on behalf of both the Blacktown and Wentworth Estate sites, that there would be in each case a large area of land for resting or grazing paddocks, does not hold good. Sixty thousand sheep and nearly 2,500 head of cattle are sold every week at Flemington, and that number of stock would eat all the grass that was available at either of the sites mentioned, and when the first week's stock had eaten off the grass where would be the sustenance for those that followed? It is, therefore, not wise for the State to invest a large sum of money in the purchase of either of the estates referred to on the assumption that they would be required for resting or grazing purposes. Stock are driven to Flemington, as a rule, for slaughtering purposes, and there is, therefore, no necessity for grazing paddocks for them.

5. There remains, then, the Glebe Island site to be considered; and your Committee consider that it is admirably adapted for the purposes of Abattoirs and the shipment of meat. The objections against driving sheep and cattle to Glebe Island may be disposed of by the construction of a branch railway from the Abattoirs to a point on the main line of railway between Petersham and Summer Hill. A route almost free from buildings could be chosen, and, therefore, the cost of constructing the proposed railway ought not to be great. Trucking-yards already exist at Flemington for the purpose of sending stock to Bowral, Moss Vale, Katoomba, Mount Victoria, and other points on the railway system, for which purchases are frequently made at the sale-yards. The present Abattoirs are too heavily built, and there is a scarcity of room in the pens and an insufficiency of light. Its machinery is obsolete and unsuitable, and the Abattoirs themselves are in a somewhat dirty condition. These might be abolished altogether, and a new establishment laid out on the north-eastern side of the peninsula, where there are about 50 acres of Government land with water frontage. Here a set of Abattoirs should be built on the pavilion plan, as in Paris, so that plenty of light and fresh air might penetrate the establishment, good drainage be provided, and an equality of position ensured for those engaged in the trade. The building should be constructed upon the latest scientific principles, and ample room should be given in each pen for slaughtering purposes. In connection with the Abattoirs a meat market might be established for Balmain, Pyrmont, the Glebe, Annandale, Leichhardt, and other contiguous suburbs. Chilling and meat-freezing establishments might also be established near the Abattoirs, and proper wharfage accommodation given for large vessels to call there and load, as well as for coastal vessels to unload their stock near the slaughtering-houses. With regard to resting paddocks, there is ample room for these in the reclaimed reserve at White Bay, which adjoins the Abattoirs. If a high wall were erected around the reserve and the Abattoirs, no offensive sights would be apparent to the public, and there is abundance of splendid stone on the Island for the construction of these walls. The stock could be brought from Flemington to Glebe Island by rail, so that a dangerous nuisance which now exists would thus be obviated.

6. There remains the question as to whether the presence of an Abattoirs in a thickly-populated neighbourhood is not a detriment to the public health. On this point the evidence goes to show that, given the most modern and approved machinery for desiccating, &c., there is no danger whatever to the public health in a properly-conducted, cleanly-kept Abattoirs. In Chicago, Glasgow, Liverpool, Paris, Brisbane, Melbourne, Aberdeen (N.S.W.), and other places where the slaughtering of stock takes place in populous localities, no injury to the public health whatever is caused by the practice, and there is no reason why the Abattoirs of Sydney should not be rendered as innocuous as these establishments. The by-products of the Sydney Abattoirs now run to waste, and are taken out to the ocean at great expense, but there is no reason why these should not be turned to profitable account. At Bourke and Aberdeen, and elsewhere in New South Wales, at Melbourne, and at Queensport, near Brisbane, the by-products are the source of considerable profit to the proprietors of the works, where they are treated, and the same state of things should exist with regard to the Sydney Abattoirs. The vicinity of Glebe Island to the city is a great convenience to the retail butchers, and its existence is a deterrent to the system of private killing. Above all, a central Abattoirs, near Sydney, affords the  
means

means of a thorough system of inspection, and thus the public health is preserved from injury through diseased meat. The present Abattoirs might be demolished as soon as the new ones are erected, and the land they occupy used for wharfage or other purposes. With the reserve at White Bay there is ample room on the Glebe Island for Abattoirs, resting yards, markets, chilling works, and wharfs for several generations to come, and as the whole of the land referred to is Crown property there would be no occasion for expensive resumptions, while there is an ample supply of stone for building purposes on the Island.

7. In view of the tenacious character of tuberculosis, your Committee would recommend that strenuous steps should be taken to prevent diseased meat from being utilised as manure. It should be used for boiling-down purposes only, and the refuse should then be destroyed by fire, as the spreading of diseased meat over fields may propagate more tuberculosis, and thus endanger the public health. To prevent these and other abuses, however, more inspectors should be appointed, responsible to the Government alone, as it is evident that six inspectors are not sufficient to thoroughly do the work of examination at Abattoirs like those of Glebe Island.

8. Your Committee would suggest to the Government the desirableness of considering whether some steps should not be taken to prevent the public from being compelled to pay the excessive prices occasionally charged for meat. It might even be a wise proceeding for the Government themselves to work the Abattoirs in the public interest. If such a system were established, the public would obtain their meat at a cheaper rate, and there would then be no temptation to foist diseased meat on the market to the prejudice of the public health. The suggestion embodies an innovation, but the importance of the matter to the general public would more than justify such a departure from the ordinary functions of government.

J. STUART HAWTHORNE,  
Chairman.

*No. 1 Committee Room,  
Legislative Assembly,  
11th November, 1896.*

---

## PROCEEDINGS OF THE COMMITTEE.

---

WEDNESDAY, 10 JUNE, 1896.

MEMBERS PRESENT:—

Mr. Hawthorne,		Mr. Mahony,
Mr. Law,		Mr. Wilks,
	Mr. Willis.	

Mr. Hawthorne called to the Chair.

Entry from Votes and Proceedings, appointing the Committee, *read* by the Clerk.

Committee deliberated.

*Resolved (on motion of Mr. Law)*,—That the Chairman obtain leave of the House for the Committee to make visits of inspection from time to time to Abattoirs within the Colonies for the purpose of holding inquiries and taking evidence, and that the Committee have leave to sit during the sittings of the House, or any adjournment thereof, for the purpose of making such visits of inspection.

Reassembling of the Committee to be arranged by the Chairman.

[Adjourned.]

---

WEDNESDAY, 17 JUNE, 1896.

MEMBERS PRESENT:—

Mr. Hawthorne in the Chair.		
Mr. Bavister,		Mr. O'Sullivan,
Mr. Law,		Mr. Wilks,
	Mr. Willis.	

Committee deliberated.

Reassembling of the Committee to be arranged by the Chairman.

[Adjourned.]

---

THURSDAY, 2 JULY, 1896.

MEMBERS PRESENT:—

Mr. Hawthorne in the Chair.		
Mr. Law,		Mr. Wilks.

Committee deliberated.

*Resolved (on motion of Mr. Law)*,—That the Committee wait on the Premier, and report to another meeting on Tuesday next, at 3 o'clock, the result of the interview, respecting the providing of funds for a quorum of members to visit the Abattoirs in the leading capitals of the Australian Colonies.

[Adjourned till Tuesday next at 3 o'clock.]

---

TUESDAY, 7 JULY, 1896.

MEMBERS PRESENT:—

Mr. Hawthorne in the Chair.		
Mr. Bavister,		Mr. O'Sullivan,
	Mr. Wilks.	

Committee deliberated.

Reassembling of the Committee to be arranged by the Chairman.

[Adjourned.]

---

WEDNESDAY, 12 AUGUST, 1896.

MEMBERS PRESENT:—

Mr. Hawthorne in the Chair.		
Mr. Bavister,		Mr. Law,
	Mr. O'Sullivan.	

Committee deliberated.

[Adjourned till Tuesday next at 2:30 o'clock.]

---

TUESDAY,

TUESDAY, 18 AUGUST, 1896.

MEMBERS PRESENT :—

Mr. Hawthorne in the Chair.

Mr. Bavister,           |           Mr. Law,  
                                  |           Mr. Wilks.

Henry Brisbane Swan called in, sworn, and examined.

Witness withdrew.

Archibald McNeill called in, sworn, and examined.

Witness withdrew.

John Blowes Collerson called in, sworn, and examined.

Witness withdrew.

[Adjourned till Thursday next at 2:30 o'clock.]

THURSDAY, 20 AUGUST, 1896.

MEMBERS PRESENT :—

Mr. Hawthorne in the Chair.

Mr. Law,                 |           Mr. Wilks.

John Blowes Collerson recalled and further examined.

Witness withdrew.

William John Spencer (*Editor, Australian Meat Trades Journal*) called in, sworn, and examined.

Witness withdrew.

[Adjourned till Tuesday next at 2:15 o'clock.]

TUESDAY, 25 AUGUST, 1896.

MEMBERS PRESENT :—

Mr. Bavister,           |           Mr. Law,  
                                  |           Mr. Wilks.

In the absence of the Chairman, Mr. Wilks called to the Chair *pro tem*.

Henry William Austin called in, sworn, and examined.

At this stage the Chairman entered the room and took the Chair.

Witness withdrew.

Charles Thompson called in, sworn, and examined.

Witness withdrew.

Arthur Grey Kenway called in, sworn, and examined.

[Adjourned till Thursday next at 2:15 o'clock.]

THURSDAY, 27 AUGUST, 1896.

MEMBERS PRESENT :—

Mr. Hawthorne in the Chair.

Mr. Bavister,           |           Mr. Law,  
                                  |           Mr. O'Sullivan.

Arthur Grey Kenway recalled and further examined.

Witness withdrew.

[Adjourned till Tuesday next at 2:30 o'clock.]

TUESDAY, 1 SEPTEMBER, 1896.

MEMBERS PRESENT :—

Mr. Hawthorne in the Chair.

Mr. Bavister,           |           Mr. Wilks.

Arthur Grey Kenway recalled and further examined.

Witness withdrew.

[Adjourned till Thursday next at 2:30 o'clock.]

THURSDAY, 3 SEPTEMBER, 1896.

MEMBERS PRESENT :—

Mr. O'Sullivan,         |           Mr. Wilks.

In the absence of a quorum the meeting called for this day lapsed.

WEDNESDAY, 9 SEPTEMBER, 1896.

MEMBERS PRESENT :—

Mr. Law,                 |           Mr. McElhone.

In the absence of a quorum the meeting called for this day lapsed.

TUESDAY, 15 SEPTEMBER, 1896.

MEMBERS PRESENT:—

Mr. Law,		Mr. O'Sullivan,
Mr. Mahony,		Mr. Wilks.

In the absence of the Chairman, Mr. Wilks called to the Chair *pro tem*.  
Arthur Grey Kenway further examined.  
At this stage the Chairman entered the room and took the Chair.  
Witness withdrew.

[Adjourned till Thursday next at 2:30 o'clock.]

THURSDAY, 17 SEPTEMBER, 1896.

MEMBERS PRESENT:—

Mr. Bavister,		Mr. O'Sullivan,
Mr. Law,		Mr. Wilks,
	Mr. Willis.	

In the absence of the Chairman, Mr. Wilks called to the Chair *pro tem*.  
Alfred Allen called in, sworn, and examined.  
The Chairman at this stage entered the room and took the Chair.  
Witness handed in plan of an abattoir [*Appendix A 1*], and report on the Abattoirs at Glebe Island [A 2].  
Witness withdrew.  
Arthur Grey Kenway further examined.  
Witness withdrew.

[Adjourned till Tuesday next at 3 o'clock.]

TUESDAY, 22 SEPTEMBER, 1896.

MEMBERS PRESENT:—

Mr. Hawthorne in the Chair.

Mr. Bavister,		Mr. Law,
	Mr. Wilks.	

Entry from Votes and Proceedings granting leave to the Committee to make visits of inspection &c., read by the Clerk.  
Committee deliberated.  
*Resolved (on motion of Mr. Wilks)*,—That the Committee at its next meeting proceed to Melbourne.  
[Adjourned till Friday next at 4:30 p.m.]

FRIDAY, 25 SEPTEMBER, 1896.

MEMBERS PRESENT:—

Mr. Hawthorne (*Chairman*).

Mr. Bavister,		Mr. Law,
	Mr. Wilks.	

The Committee proceeded by express train to Melbourne.

AT MELBOURNE.

MONDAY, 28 SEPTEMBER, 1896.

The Committee proceeded on a visit of inspection to the Abattoirs at Flemington, and afterwards met in a room at the "Grand Hotel," Melbourne.

MEMBERS PRESENT:—

Mr. Hawthorne in the Chair.

Mr. Bavister,		Mr. Law,
	Mr. Wilks.	

John Robertson (*Superintendent of the City Abattoirs, and Inspector of the Cattle Market*) examined.

TUESDAY, 29 SEPTEMBER, 1896.

The Committee proceeded on a visit of inspection to the Abattoirs and freezing-works at Newport.

MEMBERS PRESENT:—

Mr. Hawthorne (*Chairman*).

Mr. Bavister,		Mr. Law,
	Mr. Wilks.	

John Maggs (*Clerk in charge of the Works*) examined.  
The Committee then proceeded to inspect the Abattoirs at Williamstown.  
Henry Smith examined.

## 11

The Committee having returned to Melbourne, met in a room at the Town Hall.

William Strong (*Mayor of Melbourne*) examined.

John Clayton (*Town Clerk*) examined.

Witness handed in plan, showing site of Abattoirs [*Appendix B 1*]; Return, showing the number of stock slaughtered at the Abattoirs, and the number condemned [*Appendix B 2*]; Regulation for the management of the Abattoirs [*Appendix B 3*]; Special Regulation to prevent the manipulation of a carcass so as to remove signs of disease [*Appendix B 4*]; By-laws regulating the carriage of meat through the streets of the city [*Appendices B 5 and 6*]; Reports by the City Surveyor, Melbourne, on the desiccating works, City Abattoirs [*Appendices B 7 and 8*]; Description of the pig slaughter-houses, City Abattoirs [*Appendix B 9*].

The Committee left for Sydney by the express train at 5.15 p.m.

---

WEDNESDAY, 30 SEPTEMBER, 1896.

The Committee having returned to Sydney,—

Reassembling to be arranged by the Chairman.

[Adjourned.]

---

THURSDAY, 1 OCTOBER, 1896.

MEMBERS PRESENT:—

Mr. Hawthorne in the Chair.

Mr. Law,		Mr. Wilks,
Mr. O'Sullivan,		Mr. Willis.

*Resolved (on motion of Mr. O'Sullivan),—*That the Committee proceed by train to Brisbane on Sunday evening next.

[Adjourned.]

---

WEDNESDAY, 7 OCTOBER, 1896.

MEMBERS PRESENT:—

Mr. Bavister,		Mr. O'Sullivan,
Mr. Law,		Mr. Wilks.

In the absence of the Chairman, Mr. O'Sullivan called to the Chair *pro tem*.

*Resolved (on motion of Mr. Bavister),—*That the Committee proceed to Aberdeen (N.S.W.) by train at 9 a.m. on Friday next, thence to Brisbane.

[Adjourned till Friday next at 8.30 o'clock a.m.]

---

FRIDAY, 9 OCTOBER, 1896.

MEMBERS PRESENT:—

Mr. Hawthorne (Chairman).

Mr. Bavister,		Mr. Law,
		Mr. Wilks.

The Committee proceeded by train to Aberdeen.

AT ABERDEEN.

Committee inspected Aberdeen Meat Company's Works, and afterwards met in the manager's room.

MEMBERS PRESENT:—

Mr. Hawthorne in the Chair.

Mr. Bavister,		Mr. Law,
		Mr. Wilks.

William Anthony Benn (*Manager of the Aberdeen Meat Company's Works*) sworn and examined. Committee then proceeded by train to Brisbane.

---

SATURDAY, 10 OCTOBER, 1896.

The Committee held a meeting in the train between Glen Innes and Tenterfield.

MEMBERS PRESENT:—

Mr. Hawthorne in the Chair.

Mr. Bavister,		Mr. O'Sullivan,
Mr. Law,		Mr. Wilks.

Arthur Richmond Morton (*Manager of the Tenterfield Meat Freezing Works*) sworn and examined. The Committee having arrived at Brisbane,—

AT BRISBANE.

MONDAY, 12 OCTOBER, 1896.

The Committee proceeded by steamer to Queensport, and inspected the Graziers' Meat Export Works, and then to Eagle Farm, and inspected the Queensland Meat Export and Agency Company's (Limited) Works.

ON THE STEAMER "MINER."

MEMBERS PRESENT:—

Mr. Hawthorne in the Chair.

Mr. Bavister,		Mr. Law,
Mr. O'Sullivan,		Mr. Wilks.

John Vigers Francis (*Manager of Graziers' Meat Export Company*) examined.David Traill (*Manager of the Queensland Meat Export and Agency Company, Limited*) examined.

[The Committee, having returned to Brisbane, adjourned.]

TUESDAY, 13 OCTOBER, 1896.

The Committee proceeded to South Brisbane, and inspected Messrs. Birt and Company's (Brisbane Meat Company's) Works.

The Committee met in a room at the Customs Office, Musgrave Wharf.

MEMBERS PRESENT:—

Mr. Hawthorne in the Chair.

Mr. Bavister,		Mr. Law,
Mr. O'Sullivan,		Mr. Wilks.

John Genge Andrews Peddle (*Manager of the Brisbane Meat Company's Works*) examined.

Russell Sinclair examined.

Patrick Robertson Gordon (*Chief Inspector of Stock*) examined.

The Committee left by train for Sydney at 6:50 p.m.

WEDNESDAY, 14 OCTOBER, 1896.

The Committee having returned to Sydney,—

Reassembling to be arranged by the Chairman.

[Adjourned.]

TUESDAY, 20 OCTOBER, 1896.

MEMBERS PRESENT:—

Mr. Hawthorne in the Chair.

Mr. Bavister,		Mr. Law,
Mr. O'Sullivan,		Mr. Wilks.

*Resolved (on motion of Mr. Law),—*That the Committee proceed to Adelaide by express train at 5:15 p.m. on Friday next.

[Adjourned till To-morrow at 2 o'clock.]

WEDNESDAY, 21 OCTOBER, 1896.

MEMBERS PRESENT:—

Mr. Hawthorne in the Chair.

Mr. Bavister,		Mr. Law,
Mr. O'Sullivan,		Mr. Wilks.

John Ashburton Thompson (*Chief Medical Officer of the Government and President of the Board of Health*) called in, sworn, and examined.

Witness withdrew.

Thomas Harry Houghton, A.M.I.C.E., called in, sworn, and examined.

Witness withdrew.

[Adjourned till To-morrow at 2:30 o'clock.]

THURSDAY,

THURSDAY, 22 OCTOBER, 1896.

MEMBERS PRESENT:—

Mr. Hawthorne in the Chair.

Mr. Law,		Mr. O'Sullivan,
		Mr. Wilks.

Francis Kirkpatrick (*Under Secretary for Finance and Trade*) called in, sworn, and examined.

Witness withdrew.

Edmund Compton Batt called in, sworn, and examined.

Witness *handed in* tracing showing proposed site for Abattoirs at Blacktown, and additional tracing showing proposed loopline connecting Blacktown and Doonside. [*Appendices C 1 and 2.*]

Witness withdrew.

[Adjourned.]

THURSDAY, 29 OCTOBER, 1896.

MEMBERS PRESENT:—

Mr. Bavister,		Mr. Law,
		Mr. O'Sullivan.

In the absence of the Chairman, Mr. O'Sullivan called to the Chair *pro tem*.

*Resolved (on motion of Mr. Bavister)*,—That the Committee proceed on a visit of inspection to the Glebe Island Abattoirs on Monday next, and to the Wentworth Estate on Thursday next.

[Adjourned till Monday next at 1:30 o'clock.]

MONDAY, 2 NOVEMBER, 1896.

MEMBERS PRESENT:—

Mr. Bavister,		Mr. Law,
Mr. O'Sullivan,		Mr. Wilks.

In the absence of the Chairman, Mr. O'Sullivan called to the Chair *pro tem*.

Committee proceeded on a visit of inspection to the Abattoirs at Glebe Island.

And having returned,—

[Adjourned till Thursday next, at 9:30 o'clock.]

THURSDAY, 5 NOVEMBER, 1896.

The meeting called for this day postponed by order of the Chairman.

WEDNESDAY, 11 NOVEMBER, 1896.

MEMBERS PRESENT:—

Mr. Hawthorne in the Chair.

Mr. Law,		Mr. Mahony,
Mr. O'Sullivan,		Mr. Wilks.

Chairman submitted Draft Report, which was read a first time as follows:—

#### DRAFT REPORT.

THE SELECT COMMITTEE of the Legislative Assembly, appointed on 2nd June, 1896, "to inquire into and report upon (1) *The past and present management of the Abattoirs at Glebe Island*; (2) *the advisability or otherwise of the removal of the present Abattoirs to another locality*," and to whom was granted on 15th September, 1896, "leave to make visits of inspection, from time to time, accompanied by a shorthand-writer, to Abattoirs within the Colonies, for the purpose of holding inquiries and taking evidence, and leave to sit during the sittings of the House or any adjournment thereof, for the purpose of making such visits of inspection,"—have agreed to the following Report:—

Your Committee, having taken a considerable amount of evidence, and paid visits of inspection to the Abattoirs and chilling and meat-preserving works in Melbourne, Brisbane, Aberdeen, and Sydney, have arrived at the following conclusion:—

1. That it is desirable that the General Board encourage in every possible way the killing of stock and chilling of meat in the country districts. In connection with this aspect of the question, they would suggest that an expert inspector should be appointed for each establishment, as there is reason to believe that the present system of inspection is far from being a satisfactory one. The plan worked so successfully in Queensland by having a Dairy and Meat Board, with power to advance money as loans on long terms, might, with great advantage to the State, be adopted in New South Wales; and better accommodation for shipping frozen or chilled meat might, at the same time, be accorded by the Government. More generous railway freights would also be of material assistance to this great industry.

2. Your Committee consider that it is absolutely necessary to have a central Abattoirs in or near the city of Sydney, in order to dispose of the large number of calves, pigs, lambs, and other stock which come from the coastal districts, as well as to supply the demand of those who prefer to have their meat fresh, and have an objection to chilled or frozen meat.

3. This point being conceded, the question of site for the Abattoirs then arises. Three positions claim attention. The first is that near Blacktown, where there is said to be a large area of land available and abundance of water at hand for cleansing purposes. The second is the Wentworth Estate, at Flemington,

Flemington, adjoining the present stock sale-yards, where there is also a considerable area of land, with a frontage on the Parramatta River, and will be shortly connected with the main sewer of Sydney. The third is the so-called Glebe Island (or peninsular), where the present Abattoirs are situated, to which cattle and sheep have now to be driven from the sale-yards.

4. With regard to the Blacktown site, it may be dismissed at once as being too distant from the city for the position of an Abattoirs. The evidence goes to show that even at present there is a considerable amount of killing done in private establishments (without inspection), and if the Abattoirs were placed at the proposed site near Blacktown (22 miles from Sydney) this evil would undoubtedly largely increase. The Wentworth Estate, near Flemington (9 miles from Sydney), is a better situation, but that also is somewhat too far for the majority of the butchers to go for their meat. It is to be feared that this distance, although much shorter than that at Blacktown, would also tend to the establishment of private killing. The argument applied on behalf of both the Blacktown and Wentworth Estate sites, that there would be in each case a large area of land for resting or grazing paddocks, does not hold good. Sixty thousand sheep and nearly 2,500 head of cattle are sold every week at Flemington, and that number of stock would eat all the grass that was available at either of the sites mentioned, and when the first week's stock had eaten off the grass where would be the sustenance for those that followed? It is, therefore, not wise for the State to invest a large sum of money in the purchase of either of the estates referred to on the assumption that they would be required for resting or grazing purposes. Stock are driven to Flemington, as a rule, for slaughtering purposes, and there is, therefore, no necessity for grazing paddocks for them.

5. There remains, then, the Glebe Island site to be considered; and your Committee consider that it is admirably adapted for the purpose of Abattoirs and the shipment of meat. The objections against driving sheep and cattle to Glebe Island may be disposed of by the construction of a branch railway from the Abattoirs to a point on the main line of railway between Petersham and Summer Hill. A route almost free from buildings could be chosen, and, therefore, the cost of constructing the proposed railway ought not to be great. Trucking-yards already exist at Flemington for the purpose of sending stock to Bowral, Moss Vale, Katoomba, Mount Victoria, and other points on the railway system, for which purchases are frequently made at the sale-yards. The present Abattoirs are too heavily built, and there is a scarcity of room in the pens and an insufficiency of light. Its machinery is obsolete and unsuitable, and the Abattoirs themselves are in a somewhat dirty condition. These might be abolished altogether, and a new establishment laid out on the north-eastern side of the peninsular, where there are about 70 acres of Government land with water frontage. Here a set of Abattoirs should be built on the pavilion plan, as in Paris, so that plenty of light and fresh air might penetrate the establishment, and good drainage be provided. The building should be constructed mainly of iron, and ample room should be given in each pen for slaughtering purposes. In connection with the Abattoirs a meat market might be established for Balmain, Pyrmont, the Glebe, Annandale, Leichhardt, and other contiguous suburbs. Chilling and meat-freezing establishments might also be established near the Abattoirs, and proper wharfage accommodation given for large vessels to call there and load, as well as for coastal vessels to unload their stock near the slaughtering-houses. With regard to resting paddocks, there is ample room for these in the reclaimed reserve at White Bay, which adjoins the Abattoirs. If a high wall were erected around the reserve and the Abattoirs, no offensive sights would be apparent to the public, and there is abundance of splendid stone on the Island for the construction of these walls. The stock could be brought from Flemington to Glebe Island by night by rail, so that a dangerous nuisance which now exists would thus be obviated.

6. There remains the question as to whether the presence of an Abattoirs in a thickly-populated neighbourhood is not a detriment to the public health. On this point the evidence goes to show that, given the most modern and approved machinery for desiccating, &c., there is no danger whatever to the public health in a properly conducted, cleanly-kept Abattoirs. The men now working at Glebe Island appear to be robust and healthy, and beyond an offensive smell—which could be obviated by the effective and modern treatments of the offal and refuse. In Chicago, Glasgow, Liverpool, Paris, Deptford, Brisbane, Melbourne, Aberdeen (N.S.W.), and other places where the slaughtering of stock takes place in populous localities, no injury to the public health whatever is caused by the practice, and there is no reason why the Abattoirs of Sydney should not be rendered as innocuous as these establishments. The by-products of the Sydney Abattoirs now run to waste, and are taken out to the ocean at great expense, but there is no reason why these should not be turned to good account. At Bourke and Aberdeen, and elsewhere in New South Wales and Melbourne, at Queensport, near Brisbane, the by-products are the source of considerable profit to the proprietors of the works, where they are treated, and there is no reason why the same state of things should not exist with regard to the Sydney Abattoirs. The vicinity of Glebe Island to the city is a great convenience to the retail butchers, and its existence is a deterrent to the system of private killing. Above all, a central Abattoirs, near Sydney, affords the means of a thorough system of inspection, and thus the public health is preserved from injury through diseased meat. The present Abattoirs might be demolished as soon as the new ones are erected, and the land it occupies sold for wharfage or other business purposes. With the reserve at White Bay there is ample room on the Glebe Island peninsular for Abattoirs, resting yards, markets, chilling works, and wharfs for several generations to come, and as the whole of the land referred to is Crown property there would be no occasion for expensive resumptions, while there is an ample supply of stone for building purposes on the Island.

7. Your Committee desire to call attention to the fact that a great deal of the condemned meat at the Abattoirs appears to be afterwards utilised for the purpose of poultry-feeding, and it is said that a portion of the condemned meat finds its way into the reservoir, from which the refuse is run into punts to be taken out to sea. This would suggest the idea that after the diseased portion of a carcase is cut out the remainder is sold for human consumption. Your Committee would recommend that a searching inquiry should be made into this aspect of the matter, and if the practice is found to exist a severe penalty should be imposed for the offence. In view of the tenacious character of tuberculosis, your Committee would recommend that strenuous steps should be taken to prevent the diseased meat from being utilised as manure. It should be used for boiling-down purposes only, and the refuse should then be destroyed by fire, as the spreading of diseased meat over fields may propagate more tuberculosis, and thus endanger the public health. To prevent these and other abuses, however, more inspectors should be appointed, responsible to the Government alone, as it is evident that six inspectors are not sufficient to thoroughly do

the

the work of examination at Abattoirs like those of Glebe Island. An experienced inspector should also be appointed for each chilling or freezing establishment, in order to see that none but sound meat is exported or used locally for consumption.

8. Your Committee would suggest to the Government the desirableness of considering whether some steps should not be taken to prevent the public from being compelled to pay the excessive prices occasionally charged for meat. It might even be a wise proceeding for the Government themselves to work the Abattoirs in the public interest. If such a system were established, the public would obtain their meat at a cheaper rate, and there would then be no temptation to foist diseased meat on the market to the prejudice of the public health. The suggestion embodies an innovation, but the importance of the matter to the general public would more than justify such a departure from the ordinary functions of government.

9. In conclusion, your Committee would suggest that the Government should, by the construction of the railway proposed in paragraph 5, as speedily as possible put an end to the cattle-driving nuisance, which is a cause of irritation, loss, and danger to a large number of people resident in the western suburbs, also Drummoyne and Balmain, and is, according to reliable witnesses, injurious to the cattle, and consequently deteriorates the quality of the meat supplied to the public.

Report considered.

Paragraph 1 read.

And certain amendments having been made,—Mr. Wilks moved the omission in line 8 of the words “More generous railway freights would also be of material assistance to this great industry.”

Question put,—That the words proposed to be left out stand part of the paragraph.

Committee divided.

Aye.  
Mr. Law.

Noes.  
Mr. Mahony,  
Mr. Wilks.

Words omitted.

Paragraph, as amended, *agreed to*.

Paragraph 2 read.

Question put,—That the paragraph as read stand paragraph 2 of the Report.

Committee divided.

Ayes.  
Mr. Law,  
Mr. Wilks.

No.  
Mr. Mahony.

And so it was resolved in the affirmative.

Paragraph, as read, *agreed to*.

The Chairman at this stage entered the room and took the Chair.

Paragraph 3 read and *agreed to*.

Paragraph 4 read, amended, and *agreed to*.

Paragraph 5 read.

Mr. Mahony moved the insertion of the words “do not” after “Committee” in line 1.

Question put,—That words proposed to be inserted be so inserted.

Committee divided.

Aye.  
Mr. Mahony.

Noes.  
Mr. Wilks,  
Mr. Law,  
Mr. O'Sullivan.

Proposed insertion of words negatived.

Mr. Mahony moved the omission of all the words after the word “The” in line 2 down to the word “great” in line 6.

Question put,—That the words proposed to be left out stand part of the paragraph.

Committee divided.

Ayes.  
Mr. Law,  
Mr. O'Sullivan,  
Mr. Wilks.

No.  
Mr. Mahony.

Words stand.

And certain amendments having been made,—

Paragraph, as amended, *agreed to*.

Paragraph 6 read.

And certain amendments having been made,—

Mr. Mahony moved the omission in line 6 “In Chicago, Glasgow, Liverpool, Paris.”

Question put,—That the words proposed to be left out stand part of the paragraph.

Committee divided.

Ayes.  
Mr. Law,  
Mr. O'Sullivan,  
Mr. Wilks.

No.  
Mr. Mahony.

Words stand.

And certain other amendments having been made,—

Paragraph, as amended, *agreed to*.

Paragraph 7 read, amended, and *agreed to*.

Paragraph 8 read and *agreed to*.

Paragraph 9 read.

Question put,—That the paragraph as read stand paragraph 9 of the Report.  
Committee divided.

Aye.	Nocs.
Mr. Law.	Mr. Mahony, Mr. O'Sullivan, Mr. Wilks.

Negatived.

Mr. O'Sullivan moved,—“That the Chairman report to the House.”

Question put.

Committee divided.

Ayes.	No.
Mr. Law, Mr. O'Sullivan, Mr. Wilks.	Mr. Mahony.

And so it was resolved in the affirmative.

1896.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON

## THE ABATTOIRS.

TUESDAY, 18 AUGUST, 1896.

Present:—

MR. BAVISTER,		MR. LAW,
MR. HAWTHORNE,		MR. WILKS.
J. S. HAWTHORNE, ESQ., IN THE CHAIR.		

Henry Brisbane Swan called in, sworn, and examined:—

1. *Chairman.*] You have been Mayor of Balmain? Yes.
2. You are in a large way of business close to the Abattoirs? Yes, the timber business.
3. Were you at one time connected with Glebe Island? Yes; I was there five or five and a half years.
4. What position did you occupy? Superintendent over the workmen in the desiccating portion of the works.
5. What years were you engaged there? From 1874 to 1879.
6. You have not been in any way occupied there since? No.
7. But your business being so close—your premises being on the Abattoir Road—brings you into close contact with all the doings at the Abattoirs? Yes, very close.
8. Do you think that the past management of the Island has been satisfactory? The management up to 1879 was very unsatisfactory, but since then there have been vast improvements.
9. What have been the improvements in the Abattoirs generally, so far as you are aware, which have been effected at the Island since 1879? The management has been very satisfactory, seeing what they have to put up with. I think the management has been excellent, but the buildings are unsatisfactory.
10. What difference is there between the management of late years and what it was when you consider that the Abattoirs were unsatisfactorily managed? There have been different kinds of improvements. They did not seem to have sufficient influence over the butchers or the men. There also seemed to be a great deal of political influence—the men used to get the influence of Members of Parliament to go against the officials and so forth.
11. That is in the days gone by? Previous to 1879 I am talking of.
12. Did you know the late superintendent at the Island, Mr. Jager? Yes.
13. Who was the manager in your time? Mr. Oatley.
14. Mr. Jager has managed since then? He succeeded Mr. Oatley.
15. Were any complaints made about the management during Mr. Jager's time? I never heard of any. Mr. Jager seemed to manage very satisfactorily.
16. What about the present manager? The present manager seems to be very satisfactory.
17. Do you find the Abattoirs at all objectionable to you, viewed either from a business or a residential standpoint? I could not say there is much nuisance there now. Of course a person coming there fresh from the country would, perhaps, call it a nuisance when I would not notice it, being so accustomed to it.

H. B. Swan.  
18 Aug., 1896.

- H. B. Swan.  
18 Aug., 1896.
18. Do you find that any objectionable smells come from the Island? I cannot say that there are any objectionable smells now; everything seems to be very satisfactorily carried out.
  19. Have there ever been any objectionable smells? In summer time, when they may have left refuse blood or offal standing overnight, there has been a very bad smell, but there has not been lately.
  20. When you were Mayor, did you hear any people complain of anything objectionable at the Island? Not a word.
  21. They have not complained to you as an alderman either? No.
  22. The ward you represent runs right down to Glebe Island itself? Yes.
  23. And you are not aware of any objection being urged by the residents of the ward, or of the borough generally, against the continuance of the Abattoirs in their present position? No, I have not heard a complaint with reference to the management or smells at the Abattoirs, but I have heard complaints with reference to the cattle driving.
  24. What do you find the greatest nuisance, so far as you are concerned? The cattle driving.
  25. If the cattle-driving nuisance were got rid of, and the cattle were brought to the Island by some other means than driving them along the road, do you think that the public of Balmain would be quite satisfied for the Abattoirs to remain where they are? I think the great majority of the people of Balmain would be. Of course some people do object sometimes.
  26. What portion of Balmain does the objection come from principally? At present, I do not know of any objection from Balmain.
  27. Who are the people you spoke of as being dissatisfied? We hear an objection sometimes. People not interested will say the thing is a nuisance whether it is or not. The very name of the Abattoirs is sometimes sufficient to raise an objection on the part of some people; but take them over the place and they form a different opinion. When I was there, I showed them over the place, and they went away with a different opinion as regards the Abattoirs being a nuisance. But the present buildings are certainly not suitable.
  28. What would you suggest in the way of improvement to the Abattoirs to make them altogether unobjectionable;—do you think that the closing up of the present roadway and the formation of a new roadway round, say, near the edge of the water, as was suggested some time ago at a public meeting, would have the effect of removing all cause of complaint from people who have to travel by road from Balmain and Sydney? I do not think that that expense need be incurred. There is a very steep grade on both sides—you have to ascend to get on to the Island, and to descend to get off it—and if that was cut down and bridged over, the traffic would go along under the bridgeway, and there would be a level road, and the people would not know that there was an abattoirs on either side. That is a cheap way, and it would ease the traffic too.
  29. Your opinion is that if the roadway were cut down on both sides of Glebe Island and bridged across what is now looked upon as being objectionable—men passing from one side of the road to the other covered with blood—would be removed? Yes.
  30. You think that that would be as good a way of getting over the difficulty as forming a roadway all round the Island? Certainly; because people would not see anything at all. Lowering the level would also be a great improvement towards getting a direct tram from the city.
  31. Have you seen them killing meat there lately? Yes; last week, I think.
  32. Have you seen slaughter-houses in any of the other colonies? I have seen them in Melbourne and also in Chicago.
  33. Did you visit the abattoirs at Chicago? Yes, eighteen or nineteen years ago.
  34. Have you been to any of the other colonies in recent years? Two years ago I was in Melbourne.
  35. Did you have a look at the abattoirs there? Yes. The engineer of Melbourne showed me through the abattoirs and desiccating works.
  36. Where are the abattoirs there situated;—close to the city? Near the racecourse, at Flemington, I think.
  37. How far from the centre of the city? About a mile.
  38. They are quite as close to the city as the abattoirs at Glebe Island are? Not quite, I think. Balmain may be said to be part of the city.
  39. In your opinion, are they as favourably situated as our abattoirs? No. I do not think there is a better site in the world for abattoirs than Glebe Island.
  40. They have no water close to the abattoirs at Flemington? Only a stream or creek—a branch of the Yarra.
  41. Did you notice any objectionable smells there? No.
  42. You found the abattoirs at Flemington well conducted? Yes. Of course the buildings are a great improvement on ours. Ours are old-fashioned.
  43. What style of buildings are their's? Their's are two-story buildings, and everything falls down.
  44. The cattle are lifted up above? Yes. As near as I can recollect, all the blood and refuse fall from the second floor to the basement. The level of the slaughter-houses is 6 or 7 feet above the roadway, and the offal, I think, falls into trucks.
  45. You think that our Abattoirs are quite equal to the abattoirs near Melbourne? Not the buildings. Our site is superior, but our buildings are not. They are a failure, and want sweeping away, and new buildings erected in their place. But I say that there is no better site than that of our present Abattoirs.
  46. As a man engaged in the building trade, do you think that it is not possible to improve our Abattoirs by a slight expenditure of money in such a way as would make them up-to-date abattoirs—something in keeping with those near Melbourne? Not the present buildings. They are not suitable.
  47. Do you think it would be necessary to pull down these massive slaughter-houses? Pull them down and rebuild them in a modern style.
  48. What would you consider something like a modern style? Something after the style of the Melbourne Abattoirs—have a sort of basement underneath and let everything fall down to it and be taken away. The Glebe Island Abattoirs are all cramped for want of room.
  49. So it is your opinion that if new abattoirs were built on the present site at Glebe Island, and were conducted on similar lines to those prevailing at the slaughter-houses near Melbourne, there would be no need for shifting the Abattoirs, and the public surrounding the Abattoirs would be perfectly satisfied to allow the Abattoirs to remain where they are? The Abattoirs could be so conducted as to be no nuisance to anybody.

H. B. Swan  
18 Aug., 1896.

50. Your property is, I think, within a quarter of a mile of the Abattoirs? Within 500 yards.
51. You have a considerable amount of property there? Yes; round about there.
52. And as a property-owner you have no desire whatever to see the Abattoirs removed from their present site? As far as the Abattoirs are concerned, they are of no benefit to me. It would, perhaps, enhance the value of property if they were removed. But personally I find no nuisance from the Abattoirs, and I get no benefit from their being there either. I am speaking conscientiously and saying what I think of them.
53. Is it your opinion that if the Abattoirs were removed from where they are now your property would be increased in value? I think so. I think there can be no two opinions about that.
54. But from a sanitary standpoint you have nothing to urge against the continuance of the Abattoirs where they are? From a sanitary point of view, you could never get a better place for the Abattoirs.
55. What is the general opinion of your council in regard to the matter;—do the aldermen, generally speaking, look upon the continuance of the Abattoirs there as unobjectionable? I think so. There may be an exception, but I think that a majority of the aldermen are in favour of the Abattoirs continuing where they are.
56. *Mr. Wilks.*] You stated that you had charge, principally, of the desiccating plant? Yes.
57. What is your opinion of the present desiccating plant? The present desiccating plant, I think, is worn out. It wants replacing with modern machinery.
58. You practically consider that the great weakness of the Abattoirs is the want of scientific appliances? Yes; the great weakness of the Abattoirs has always been because of patchwork. It has been added to and added to until it is very costly now to work it.
59. In regard to your knowledge of the detection of disease, such as tuberculosis and pleuro-pneumonia, do you think that that is effectively carried out? Yes. The management is very strict.
60. Then the objections to the Abattoirs are purely sentimental? I think so.
61. Just the fact of the Abattoirs being there? That is so.
62. Have you found any avowed public opposition to the continuance of the Abattoirs? Yes; there has been a meeting or two got up about it. Our council was opposed to the removal.
63. Supposing that the Island were used for meat-storage works, do you think that the opposition would cease? I think so. I do not see why it should not. Balmain is a working man's constituency and suburb; so long as you give him plenty of work he does not object.
64. Then am I to understand that the main objection to the removal of the Abattoirs is based on loss of work? That is one point.
65. You have admitted, as a property-owner in the district, that your property has not enhanced in value by the continuance of the Abattoirs at Glebe Island? Of course that is a common-sense view.
66. Some opinion has been expressed in favour of the Municipal Council having charge of the Abattoirs;—what is your opinion on that matter? I do not think they should.
67. You have no leaning towards the council taking charge? No; it is too big an undertaking for the council. I should certainly be opposed to the council having anything to do with it. The only question that cropped up in the Balmain Council was, that if the Government were going to hand the Abattoirs over to the City Council the Balmain Council might have been offered the first chance, and have been asked whether they could manage it or not.
68. With your experience of the Abattoirs, do you think it is better in the hands of the State? Undoubtedly. I am thoroughly in favour of its being in the hands of the State, in preference to its being in the hands of the council. I say nothing about private parties.
69. Would you favour the Abattoirs being in the hands of private individuals? Certainly; I think so.
70. Would you not be afraid that if the Abattoirs were in the hands of private individuals they would probably form a "ring"? I do not think so. In private enterprise there is so much competition.
71. You assume then that there would be more than one abattoirs? Yes. My opinion is, that the Government should lease them either Glebe Island, or some other suitable site—compel them to be in one centre and to build their own abattoirs under the inspection of the Board of Health, an architect drawing up plans for the abattoirs in a modern style. I should not like the Government to give up the supervision and inspection.
72. Have you visited the abattoirs at Duck River, under the control of the Graziers' Meat Export Company? I have been there.
73. Are they conducted any better than our own? I do not know. That is private enterprise.
74. Have they imported any better appliances than we have? Yes, they have more modern machinery. I had only a casual look at it. But that place is not an improvement on Glebe Island.
75. You spoke about the cattle-driving nuisance—you consider that that is the main objection of such suburbs as Drummoyne? Yes.
76. How would you suggest that that could be obviated? I suggested that a roadway be resumed direct to the Abattoirs for a cattle drive for the time being. Glebe Island will have to be utilised for some great work, and the railway will come there in the future—there is no question about that. This roadway could be used for a cattle-driving road for the time being, and a railway could be run along it afterwards.
77. The bringing of so many cattle, pigs, and sheep from places along the coast would not permit of the abattoirs being removed further inland, would it? A great many come from places along the coast, and, of course, sending them up the line would entail additional expense.
78. But it is argued that the driving of cattle has a detrimental effect on the cattle themselves;—what do you think of that? There are not two opinions about that. If you drive cattle a long distance the meat is not so good as meat killed on or near a station.
79. And cattle arriving by water from places along the coast would have to be driven? Only a mile or two, and that would not hurt any cattle. They are hurt only when you drive them 50 or 60, or perhaps 500 miles.
80. What is your opinion about retrucking, say at Flemington? I do not see much objection to the retrucking, for there is one straight run to Glebe Island. There are no stoppages, whereas in coming down the line to Flemington the trains stop at many places.
81. Would you suggest having saleyards in connection with the Glebe Island Abattoirs? That is the proper place for them.
82. What place would you use for that purpose? The reclaimed places at White Bay and Rozelle Bay.
83. Do you think that that area would be sufficient? Yes.
- 84.

- H. B. Swan. 84. You spoke about the necessity of rebuilding the Abattoirs;—have you any idea as to the probable cost of rebuilding the Abattoirs? I went into it at one time, and I think the calculation was that the expenditure of about £75,000 would make modern abattoirs right up to date, including desiccating plant and everything else requisite. You cannot base the estimate of cost on the past cost of the Abattoirs, because the money has been scandalously wasted.
- 18 Aug., 1896. 85. Through faulty management? If we wanted anything it was put in the hands of the Colonial Architect, and he would get out a costly design, and £1,000 or so would be wasted on costly plans before anything was done, and work that was put up one year was sometimes pulled down the next year.
86. *Chairman.*] The fault in the architectural management was probably at the time when Mr. Barnett was Colonial Architect? Yes.
87. You have not had any complaints to make in this respect since the change in the position of Colonial Architect took place? There has not been much improvement made since then.
88. Do you think that the fault you spoke of just now as regards putting up buildings one year and pulling them down the next was the fault of the Colonial Architect? Yes.
89. It was not attributable to any misdirection on the part of any of the officials at the Island? No. They could not get their ideas carried out. The Colonial Architect had his views carried out, and they complained very bitterly.
90. *Mr. Wilks.*] What seemed to strike you about the Melbourne Abattoirs as most to be recommended was the catching of the offal in a vessel and the carrying of it right away? Yes. The men all worked on one floor, and everything went from that.
91. Something similar to what is done in Chicago? They kill the carcasses on one floor, and they are dropped to the next and dressed there, and then are finished in another compartment.
92. The system we have here of killing all over the place is a bad one? Yes.
93. And the flushing with water does not destroy any dangerous germs that there may be? I cannot say that there are any dangerous germs, because if they see any sign of disease in the cattle they are not allowed to kill them.
94. I mean the germs that come from the offal—flushing with water does not destroy but simply spreads them about? It is only when it lies there. But there is nothing allowed to remain there now overnight.
95. Have you noticed the water there much discoloured? It has been lately. I think that they have stopped the desiccating plant from working, and they cannot get to sea with their punts, for I have noticed during the last few weeks that the water has been very much discoloured and has become objectionable.
96. Have you heard people raise objections to the discoloured water and the affluvia from it? Many years ago; but during the last ten or fifteen years the water has been free from that.
97. *Mr. Law.*] You say that in your opinion Glebe Island is the best site in the world for abattoirs? Yes, it is.
98. Originally it was an island with water running right round it? Yes.
99. I believe that you are the nearest resident to the Abattoirs? Yes.
100. And if there were any persons who would know that there was a nuisance there your family would be the family who would know it? Yes. When I was at the Abattoirs it was considered a very healthy place. I have known ladies, and men also, to come there to get the fresh blood to drink, to cure certain complaints, and I have known many cures effected at the Abattoirs.
101. You say that one fault in connection with the Abattoirs is that they are cramped for want of room? Yes, that is it.
102. I believe that the Abattoirs themselves—that is, where the work is carried on—occupy only an area of 8 acres? I do not think they occupy that. They may, including the sheep-pens and the paddock.
103. And on the other side of the road there are 28 acres, or nearly four times as much? Three times as much, anyhow.
104. At all events, there is ample room there to carry on a business five times as large as there is now? Yes.
105. You say that the buildings at Glebe Island are old, dilapidated, and altogether out of date? Yes.
106. In regard to the desiccating works, I believe they have already stopped working? I think they must have, from the way the bay is getting discoloured now.
107. Are you in a position to say whether these desiccating works did or did not pay? I could not say. But the great thing was that they did away with the nuisance previously there.
108. Can you tell me whether the desiccating works dealt with the blood alone, or with the offal and the blood? I think they dealt with both.
109. In regard to public meetings, or any agitation against the removal of the Abattoirs, is it or is it not a fact that large public meetings were held in the vicinity of the Abattoirs, and also at the Town Hall? There were meetings at the Town Hall, and I think also a meeting near St. Thomas's, to protest against the removal of the Abattoirs.
110. *Mr. Wilks.*] But they were not very largely attended, were they? I could not say.
111. *Mr. Law.*] Do you think that the system of inspection at Glebe Island at present could be improved upon? I do not think so; the supervision there is very strict.
112. Do you not think that the inspection at Glebe Island, everything being concentrated there, would of necessity entail much less expense than would be caused by having the abattoirs situated in different parts of the Colony? Undoubtedly.
113. *Mr. Bavister.*] Is it your opinion that the present objections are made in consequence of various personal interests, and not on the grounds of danger to the public health? I could not say; I have no interest in the Abattoirs.
114. I did not ask you about your interest, but whether your opinion is that the objection which at present is being voiced is in consequence of the interests of the individuals personally being affected, and not because they believe that the public health is liable to suffer? I know that the Annandale people said a lot of absurd things in reference to the Abattoirs.
115. You said that the council had an objection to the removal of the Abattoirs because that would tend to reduce employment, and, I suppose, to reduce their rates? I daresay that is one thing. Glebe Island employs a great number of men. I know one ratepayer who has eleven sons, three of them being butchers, whilst the others, who are engaged in various trades—such as engineers and boiler-makers—are interested in Glebe Island because their brothers work there, and they have property round about there also.

116. You replied partially to a question asked by Mr. Law as to how the inspection would be effected if, instead of the slaughtering being done at Glebe Island, it were distributed in different country centres;—do you think that as efficient an inspection could be obtained at the same cost? No; that is impossible. H. B. Swan.  
18 Aug., 1896.
117. You are of opinion that whatever objection does legitimately exist against the Abattoirs being retained at Glebe Island would disappear if the works were reconstructed according to the latest scientific ideas? Yes.
118. *Chairman.*] You said just now that if the Abattoirs were removed it would increase the value of your property? I assume that it would, because in places like Woollahra and elsewhere where there are no abattoirs the land is much dearer.
119. Your opinion is, that if the Abattoirs were removed you could look forward to an advance in the value of your property, both as selling property and as letting property? I do not know that it would make much difference.
120. *Mr. Bavister.*] During your visit to America, did you see any better method of transporting cattle by water than exists here? The cattle were all brought by railway.
121. Then you saw no method there of transporting them by water? No.
122. As a matter of fact, you and your Council have given great consideration to this question;—has there not been some system mooted by which cattle could be brought from the sale-yards in punts, without having a railway constructed and without interfering with private lands? That could be done, but that would be a costly work.
123. It was considered and found to be costly? I have heard a rumour, but I look upon it as a costly matter.
124. Have you any idea what the railway would cost? No, I have not; but I think it would cost 6d. or 9d. a head more to bring the cattle by the railway—that is, from Homebush to Glebe Island.
125. You consider it would cost that much more than it would in bringing them by water? Yes.
126. *Chairman.*] What distance, roughly speaking, would you reckon it to be from Glebe Island to Petersham station, *via* White's Creek? From 3 to 3½ miles.
127. Do you think that would be the best route to connect with Glebe Island? No; I think it would be better for a railway to come as far as Callan Park, and then through a tunnel on to Glebe Island.
128. Striking the main line where? At Croydon I think would be better.
129. You are still speaking of the proposed route for the Long Nose Point railway? No; I do not know the route proposed for that railway. I think the cheapest way you could come would be through Ramsay's bush and then across a lot of Government land.
130. *Mr. Wilks.*] There is one interesting answer you gave—you spoke about the construction of a special roadway for the conveyance of cattle? Yes.
131. Am I to understand that you meant a roadway and not a railway? Yes; an independent roadway.
132. Would that go through much valuable property? If it came through a tunnel from Callan Park it would cost nothing except for the tunnel.
133. But I am talking of a roadway for the conveyance of cattle;—what route would you suggest? My suggestion is to come by Mrs. Simmons' property and then come right through underground, and then you would not need to resume any land, and there would be only the cost of tunnelling.
134. *Chairman.*] Would that not be rather an expensive tunnel;—would it not have to go through solid rock? Yes, certainly, through solid rock; but no resumption of land would be necessary.

Archibald McNeill called in, sworn, and examined:—

135. *Chairman*] You reside at the Glebe? Yes; at 176, Bridge Road, Glebe.
136. You are an alderman of the borough of the Glebe? Yes.
137. You are also a carcase butcher at Glebe Island? Yes.
138. You have been engaged in that way for some years? Yes.
139. You have been engaged in the butchering trade nearly all your life? All my life.
140. You have had daily experience of the way in which the Glebe Island Abattoirs are conducted? Yes; ever since they have been erected.
141. What is your opinion about the past as compared with the present management? Well, of course, the past management was not carried out so strictly as it has been for the last five or six years, although there was never any fault found with any of the inspectors during the previous years.
142. Has any fault been found of late years with the management? Of course, in regard to fault-finding, you will have that in every case; but I, as an individual, have no fault to find with any of the inspectors, and especially Mr. Shelley, who is at the head. We had Mr. Oatley for, I suppose, twenty-five years.
143. Who is at the head of the Island now? Mr. George Shelley.
144. Since his appointment as manager the work on the Island has progressed very smoothly? Very satisfactorily, I should say. He is a man who takes a great interest in it. He is very strict.
145. As a carcase butcher, you do not see anything in connection with the administration of the Island for which you could suggest any improvement? There could be no improvement whatever with the present Abattoirs. When they were built thirty-six years ago our population was much smaller than it is now, and there was not half the quantity of cattle, sheep, lambs, and calves killed in those days as there are now. Therefore, to make better provision for the trade, the present Abattoirs will have to be remodelled.
146. In what way would you suggest that they should be remodelled? There are altogether 36 acres on the Island. There are from 25 to 30 acres in White Bay which have been resumed by the Government and filled in. That is alongside the Island. There is any amount of land there. Of course the slaughter-houses ought to be on the opposite side to where they are now.
147. You think that if the present Abattoirs were pulled down and new ones were built on the opposite side of the road, they would be in their proper place? Undoubtedly, that is the place they ought to be in.
148. What is the reason for your thinking that it would be better if the Abattoirs were built on the opposite side? Because there is more space. On the present site the lane and the approaches are too narrow for the amount of work that is done there.

A. McNeill.  
18 Aug., 1896.

- A. McNeill. 149. That is, the space between the slaughter-houses where the vehicular traffic has to come in, is far too narrow? Yes, fully half.
- 18 Aug., 1896. 150. It would require to be almost twice the width it is at the present time? Fully that.
151. What space is there between the two rows of slaughter-houses? From about 35 feet to 40 feet—not more.
152. I suppose that in getting in your carts, and taking them out again loaded with meat, you find that a great amount of confusion and inconvenience exists on account of the narrowness of space? Yes. The slaughter-houses on the west side are all for beef, and those on the east side of the street are all for mutton and pigs. When the waggons are backed in at each slaughter-house there is hardly space for any waggon to go up and down the centre without touching the horses heads, and you have to drive very carefully or you will come into collision with other waggons.
153. The only way you have of loading the beef on to the carts is by backing them to each slaughter-house? Yes, to the door-ways.
154. So the space is continually blocked up by the vehicles belonging to the carcase butchers who have leased premises there from the Government for the purpose of slaughtering cattle? Yes. Every year six beef and six mutton houses are sold. The other six houses are reserved by the Government for killing by the head. You pay 1s. 3d. a head for a bullock. Previous to this year, ever since the Abattoirs were established, the charge was 1s.
155. Are these houses always kept going? Yes, very busy; but this winter, No. 12 and No. 11 are doing scarcely anything—only just a few head.
156. What is the reason for that;—is it that the carcase butchers are shifting to private slaughter-houses, or that the trade has fallen off? The trade has fallen off. The carcase butchers formerly doing business on the island are still on it.
157. They are all remaining there? Yes.
158. What is your opinion about the island generally for killing purposes;—is it suitable or unsuitable generally as a site, leaving out the question of buildings? There is no better site that I know of in this Colony, or anywhere else.
159. Have you seen the slaughter-houses in the other Colonies? No; but I know from information given to me by people who have visited them.
160. What is the general opinion of other people who have visited the Abattoirs in other Colonies and in other parts of the world? They all say that our site is the best that they have ever seen; but they find fault with the slaughter-houses being so cramped for space.
161. So you are of opinion, that if the land on the other side of the roadway were levelled down, and the available space there were used as a site for the new Abattoirs, that would meet with the approval of the carcase butchers who trade there, and also the retail butchers of the city and suburbs, and also the general public? That is my opinion. There is no better site which could be chosen or got. It has deep-water frontage right round; it is convenient to the city and to the suburbs; the transit is easy and convenient. All the supplies required for the city and suburbs—that is to say, for a distance of from 6 to 7 miles away from the Abattoirs—could be obtained there conveniently. The quantity of stock killed there is something enormous, and if it had to be killed in the country districts, in the summer months, the city could not be properly supplied.
162. Why could not the city be properly supplied;—would the meat become unfit for food before it could reach the market? Yes; in the winter months, in the ordinary cars, without any ice at all, you could bring meat 400 or 500 miles; but in the summer time it is impossible. It has been tried times out of number and it has been an utter failure, even in refrigerating cars.
163. Is it a fact that meat is often brought into Sydney, by refrigerating cars, in a blown state? I have never seen any blown by blow-flies, but I have seen it green and bad, and unfit for human food.
164. Even when carried in the refrigerating cars? Yes; in the summer months.
165. And you think the evil would be intensified exceedingly if the present Abattoirs were shifted to another place outside Sydney? I do, undoubtedly.
166. Do you know of any other place round about Sydney which would be so suitable for the erection of Government Abattoirs as Glebe Island? None. I do not know of any site within 30 or 40 miles, or even beyond that distance. In the first place, Glebe Island is so situated that from one year's end to the other we never see a blow-fly on it.
167. That is a strange thing? It is a strange thing, but nevertheless it is true.
168. You never see a blow-fly on Glebe Island? No.
169. That is a fact that cannot be disputed? It cannot be disputed.
170. Have you visited any of the suburban or country abattoirs? Yes.
171. How do they compare in the matter of blow-flies and general conduct? Well, in regard to any of the country slaughter-houses, they are full of blow-flies; there is no question about that. In any place erected in the interior or the suburbs where there is a quantity of timber and bush about there is always any amount of blow-flies.
172. Would that apply to meat-works such as those at Rookwood? Undoubtedly, except the whole of the land round about were cleared and all the surroundings were asphalted or concreted, and the water were kept continually running.
173. Does asphaltting and concreting tend to remove blow-flies? It tends to do away with them, because it keeps the place cool.
174. Have you been outside the Colony? I have been to Melbourne several times.
175. Did you never visit the Abattoirs there? No.
176. Have you been to America or Great Britain? No.
177. As to the removal of cattle from the sale-yards to Glebe Island, do you think any better method than that which now prevails could be suggested? The only method would be to have a road for cattle driving alone.
178. What do you think about the construction of a railway, or the bringing of cattle round by a punt, say, from Homebush—which of the two systems would be the better? Neither of them is workable; because, in the first instance, re-trucking cattle at Flemington to bring them to Glebe Island would never do, because the cattle would be knocked about so much.
179. Would they not be as likely to be knocked about when being put into the trucks in the first instance, say,

say, at Dubbo, Bourke, or Gunnedah, or any of the inland towns, as in putting them into trucks again at Homebush? Double trucking is always double bruising. That is the way we reckon it. Say you truck cattle at Bourke, or anywhere 200, 300, 400, or 500 miles from Sydney, and they come to their journey's end before they are untrucked, and are retrucked again out of the sale-yards, the trucking must cause a great deal of trouble and annoyance to the cattle, and they would be bruised to pieces, and that would never do.

A. McNeill,  
18 Aug., 1896.

180. Has it ever occurred to you that sale-yards might be erected on the reclaimed land surrounding Glebe Island? That is the only way of evading the trouble of driving.

181. Do you think that the space on the reclaimed land at White and Rozelle Bays would be sufficient for sale-yards, and suit all parties in the way of carrying on the Glebe Island meat trade? Quite sufficient.

182. You think that the best solution of the whole difficulty would be to have the sale-yards and the Abattoirs close together? There is no doubt about it. That would do away with all the trouble and annoyance with regard to the driving.

183. Then the suggestion to take the Abattoirs nearer to Homebush you think would be out of the frying-pan into the fire, so far as the Abattoirs are concerned? I think so. There would be a great difference in regard to the price of meat if the slaughter-houses were removed from Glebe Island; because if you go outside Glebe Island to kill the meat and bring it into what we might call a central depôt—that is to say, a Government or any other depôt that might be established in the city—that means from 6s. to 7s. extra on every bullock.

184. So the transference of the Abattoirs from the present site to one out in the suburbs would mean an increased price for the meat, which would have to be paid by the consumer? Yes; of course it would fall on the consumer.

185. *Mr. Wilks.*] I understand that you look with disfavour on any site outside that of the present Abattoirs? Certainly.

186. Is that because the conveyance of the meat in the refrigerators would result in its being landed in the city in an unhealthy state? I did not say that; but in the summer months it would, undoubtedly.

187. You think that the Graziers Meat Export Company, who have their abattoirs on Duck River, must be guided very much by that? Yes, of course they are. You mean McMasters and Co.?

188. You think that that influenced them in placing their abattoirs on Duck River, or you would imagine so from your experience? Yes; but they have only killed a few cattle as yet.

189. In regard to the desiccating plant, is it a weakness of the present works at Glebe Island? In my opinion the desiccating works have been the root of all the evil in regard to the expense of Glebe Island, because the machinery is not up to the mark, and there is a great amount of waste labour and expense in carrying that place on.

190. You consider that if there were up-to-date appliances, that would be all that is required? That is undoubtedly all that is required. With an outlay of from £4,000 to £5,000 you could have a new plant altogether.

191. As small as that? Yes; it would not cost any more.

192. So the expenditure of £4,000 or £5,000 would practically make the desiccating portion of the works all that is required? Yes.

193. Are you in favour of the Abattoirs being continued under State management? Yes, undoubtedly.

194. You would not recommend handing it over to the municipal authorities? Yes; I say either the municipal authorities or the Government.

195. Which for preference? For my part I should prefer the Government.

196. You would not entertain the idea of handing the Abattoirs over to private people? Not at all.

197. You have no private reason, such as the removal of your plant, which makes you oppose the removal of the Abattoirs further inland? None whatever. I have always been in favour of the Abattoirs being at Glebe Island. Last year more than 80,000 cattle, over 1,000,000 sheep, and 55,000 pigs were killed on Glebe Island, besides a large number of calves.

198. What is your opinion about the cry of some residents of Glebe Point that the Abattoirs being at Glebe Island was injurious to Glebe Point;—do you think there was anything in that? Nothing at all. I attended that meeting and opposed it myself and spoke against it. There is no nuisance whatever. Mr. Wells, who is in business in Hunter-street, has the last house on Glebe Point, right at the water's edge, and his sons, whom I have seen every day, have told me that they never noticed any smell or nuisance whatever.

199. *Chairman.*] And Mr. Wells built his house after the Abattoirs had been in existence many years? Yes, many years. Mr. W. A. Hutchinson, who was mayor of the Glebe, and an alderman for many years, has the second house, and he has never grumbled.

200. *Mr. Wilks.*] You find your occupation a healthy one? Yes; it is the healthiest occupation. It is on record that the tanners' and the butchers' are the healthiest businesses in the world.

201. *Mr. Law.*] There is about a quarter of Glebe Island at present utilised for carrying on the work of abattoirs? Not more than that.

202. Consequently, in your opinion, three-quarters of this most valuable land just outside the city is not being used? Yes; Glebe Island is suitable for all kinds of stock to be killed there and taken straight away into vessels for export. If there were chilling rooms on Glebe Island in connection with the Abattoirs, you could load vessels and they could go straight away.

203. Are you satisfied that the inspection of cattle on Glebe Island is thorough? Yes.

204. Do you think that if the killing of bullocks were distributed over different parts of the Colony the cost to the consumer would be greater? Undoubtedly it would.

205. And the probability is that the inspection would not be so strict? No, it would not. We have no proper inspection outside Glebe Island. There is none at Riverstone, nor at the Meat Preserving Company's at Rookwood, and all the suburban slaughter-houses? A policeman goes round and says, "How many cattle did you get to-day, and what are the brands," and that is what is done.

206. I think that you said that to a certain extent it was probably owing to the desiccating works that there is a large loss? Yes; there is a large loss.

207. Are you quite sure there is a large loss in connection with the desiccating works? I am not quite sure that there is a large loss, but there is a loss.

208. But is it not a fact that the removal of offal and other matter costs something like £25 a week all the same now that the desiccating works are done away with, and that this is some of the loss that was put

A. McNeill. put down to the Abattoirs? I believe that in connection with taking the offal to the sea, the cost of towage is from £20 to £25 a week, because they have to keep a certain number of men to look after the punts and the loading, and they have also to keep firemen just the same as if the desiccating house were at work, on account of the hot water required for pig killing.

18 Aug., 1896.

209. You are satisfied, then, that if all this obsolete machinery were done away with, and the most modern improvements were effected, the desiccating works dealing with offal and blood, and so forth, could be carried on without a loss to the country? I think so. We all know the depression that there has been for the last four or five years in regard to our orchard people and farmers, and there has not been the same demand for the manure. The Government used to get £9 a ton for that manure, but now, I suppose, they do not get £4 a ton for it.

210. But is that in consequence of "rings" being formed in tendering for it? Oh, no. The only men who bought the manure from the Government there at one time were men named Shepherd and Montefiore, Joseph, & Co., and I presume they tendered in the usual way.

211. *Mr. Bavister.*] You spoke of the Abattoirs being rebuilt on the opposite side of the road—would that ground be as high as that on which the present Abattoirs stand? It is higher. From the opposite side of the road to the desiccating-house there would be a fall of fully 20 feet, and there would be ample fall from any place on which new Abattoirs were built to the desiccating-house.

212. You spoke of the bruising of cattle in trucking—do they get more bruised in being placed in the trucks than they do after they are in the trucks by coming in contact with other cattle, or with the sides of the trucks, more especially when the brakes are applied to check the speed of the train? The bruising we complain of is in the trucking and retrucking. When the cattle are in the train, they are perfectly quiet and do not get bruised. But while the train is being shunted they do get bruised, and if a bullock gets down, and there are nine, ten, or eleven bullocks in the truck, it is very difficult for him to get up unless he is a big strong bullock, and the consequence is that the others bruise him.

213. But, unless he gets down, all his bruises are obtained in getting into and out of the truck? Yes. The doorways are so small that they catch their hips in going in and getting out.

214. You spoke of a road to be used only for driving cattle,—how many public roads would they have to cross? That is where the query comes in. We will say that from Glebe Island to the present sale-yards is about 8 miles. The only available space between the island and the present sale-yards is across Leichhardt and Five Dock, and a portion of Ashfield. But, in my opinion, there is no nuisance.

215. But how many public roads would that cattle-driving road have to cross—of course every street in a borough is a public road? Well, we may say 100, perhaps.

216. If that road be used only for cattle driving, would you propose to block the other roads? Not at all.

217. Put bridges over them? No. Where the height would be sufficient for a bridge or subway, that could be done; but unfortunately the greater portion of the distance is over level country. I do not propose blocking the streets at all. The only thing I suggested is that, as in the case of a railway, whenever that road crossed a street you should have gates.

218. Then you would propose to put gates at every crossing of a street unless at places where a bridge over or subway under could be constructed? Yes.

219. And at each of those gates would you place an attendant in charge? No; the men driving would open and shut the gates.

220. You would leave it for persons travelling on a public road to open and close the gates of the cattle-driving road only? Yes.

221. Does not that strike you as being rather ridiculous? How are you to do it otherwise, except you place a man in attendance?

222. In crossing roads through a borough there is more traffic of individuals during the greater portion of the day along a public street than there would be of cattle-drovers along the cattle-road? Undoubtedly, because all the inhabitants of the borough would be passing to and fro.

223. And having had your attention called to that, do you consider it practicable to construct such a road as you say for the purpose of driving cattle along? I do not indeed. I do not see how the Government could do it.

224. *Chairman.*] The only real solution of the difficulty, in your opinion, would be the construction of a line of railway to Glebe Island, and the establishment of sale-yards surrounding Glebe Island? That is the only way of doing away with the cattle driving.

225. Because the road you spoke of would be thoroughly impracticable? I think so. As regards having sale-yards at the Island, what about the accommodation of the cattle before they are sold, and killed—what about paddock accommodation? Some of our paddocks are 2 or 3 miles away from the Island.

226. You attend the sale-yards on Mondays and Thursdays? Yes.

227. How many cattle do you buy on Monday? For ordinary trade, say, I buy 100. Some of the largest carcass butchers buy 200 or 300; but that is a week's supply.

228. How long would the 100 you purchased on Monday last you? Until Saturday; or, if trade were good, we might get them off by Thursday.

229. How many bullocks do you take in daily to the Island? From twenty-five to thirty.

230. Where do you keep the others in the meantime? In a paddock round Dobroyd.

231. The difficulty in having sale-yards round about the island on reclaimed land would be in keeping the cattle there until the different carcass butchers were ready to have them killed on the Island? Yes; but that difficulty could be got over in this way: we are allowed to keep cattle on the island; we have fresh water laid on to every yard on the island—both to the killing-yards and the side yards.

232. If the island were cut down and levelled, would it not be possible to have store yards where the cattle could be fed artificially, instead of, as now, being put into paddocks too often without the slightest vestige of grass? Yes; and they would do better so long as they have room to lie down. They do not want much feed. A little lucerne will keep them three or four days.

233. That would probably mean that beasts would be kept in better condition up to the time of slaughtering than they are now? Of course it would, because all the fever heat would be gone out of them after they had rested two or three days on the premises before being killed.

234. And are we safe in inferring that if the sale-yards remained where they are now, the paddocks now existing between the Abattoirs and the sale-yards could be disposed of for building purposes. There is no doubt about that, because they are all centrally situated.

Mr.

John Blowes Collerson called in, sworn, and examined:—

235. *Chairman.*] Where do you reside? At Prosper-street, Balmain.  
 236. What is your occupation? Engineer.  
 237. Where are you employed? Nowhere now.  
 238. What has been the scene of your employment in the past? I was managing the desiccating works at Glebe Island.  
 239. How long have your services at Glebe Island been dispensed with? Since the 1st of last July.  
 240. Were you retrenched by the Public Service Board? No, I was not. The Board of Health closed the desiccating works.  
 241. Did they assign any reason for closing the desiccating works? The machinery was getting very bad, and they would have had to lay out an amount of money on it if they continued the work much longer.  
 242. How many years have you been employed there? Over seven years.

J. B.  
Collerson.  
18 Aug., 1896.

THURSDAY, 20 AUGUST, 1896.

Present:—

MR. LAW, | MR. WILKS.

J. S. HAWTHORNE, ESQ., IN THE CHAIR.

John Blowes Collerson recalled and further examined:—

243. *Chairman.*] You were for many years engaged at the Glebe Island desiccating works? Yes.  
 244. You have been recently retrenched? Yes.  
 245. No fault was found with your administration? No.  
 246. You left simply because the desiccating works were abolished? Yes, that is so.  
 247. During the years that you were there, were the desiccating works considered to be making a profit, or were they creating a loss to the revenue? Directly they were creating a loss, but indirectly they were not.  
 248. What do you mean by indirectly? That the freight of the steamer to sea, hauling the punt, being taken into consideration, they were paying a great profit.  
 249. In what way did you receive the matter that was sent to you to be treated? It used to come down direct from the slaughter-houses.  
 250. How was it conveyed to where you were? By gravitation.  
 251. If I mistake not you were on the opposite side of the street to where the slaughter-houses are? Not exactly so. We were straight before the slaughter-houses, as it were.  
 252. On the same side? Yes; we were opposite Glebe Point.  
 253. The nearest part of the island to Glebe Point? Yes.  
 254. That is, on the extreme south side of the island? Yes.  
 255. And your desiccating-house was situated, I think, at the south side of the present Abattoirs? Yes.  
 256. Was there any marketable value attached to what you treated? Oh, yes; there always has been.  
 257. In what form? For manure. Seven years ago you could not get it under £9 a ton. Montefiore, Joseph, & Co. had a contract with the Government for it all, and they resold it.  
 258. How many tons did you usually turn out in a week? Ten tons.  
 259. Are you aware what price Montefiore, Joseph, & Co. paid to the Government for it? I think the price was £5, but I am not positive.  
 260. And they sold it at £9? They would not retail it under £9 a ton.  
 261. Was there a great demand for it? We always used to clear the shed.  
 262. Up to what date did that system continue? I think that Montefiore, Joseph, & Co. had the contract for about three years after I came there, and then it was let to Shepherd Brothers.  
 263. Have you always turned out the same quantity? I have always turned out about the same quantity—about 10 tons a week.  
 264. Up to the time you left? I was turning out more just before I left, from the fact of the offal being sent out to sea. That gave me a greater chance with blood.  
 265. Did you never treat the offal in any way? Yes; I used to treat the offal.  
 266. Were there no means of making that of marketable value, with the machinery that you had at your disposal, instead of sending it out in the punts, as they do now, to sea? Well, it was of less value than the blood—you may say 30s. per ton less value than the blood—as a manure.  
 267. What was the price recently paid for this manure? They have sold some by auction, and I think some of the offal fetched something like 7s. a ton.  
 268. And the other? I am not quite sure, but I think it fetched something like £1 14s. or £1 15s.  
 269. How do you account for the falling off in the price of the manure—has it depreciated in quality, or has the falling off in the price been owing simply to an alteration in the times? Well, I put down the alteration in the times as being the main thing, but the quality has not been so good for the last eighteen months, from the fact of the paunches being cut open and let down the same drain. Instead of taking it away, as formerly used to be done, and as is supposed to be done now, I believe, the paunch stuff would come down and mix with the blood, and it had to be worked in and desiccated with the blood.  
 270. What was the reason of the change in the way of conducting the blood and offal to you, as explained in your answer to a previous question? The machinery was getting very bad, and I asked Mr. Houghton, the consulting engineer, about it, and it appears that he could not get the necessary money.  
 271. Was he disinclined to recommend the Government to go in for superior machinery? Well, we could have kept on as I was going on, but the machinery might have given in. One or two machines might have given in, and then we would have had to repair them.  
 272. Are the machines obsolete in character, or are they up to date? They are not exactly up to date, but they are very good machines.  
 273. How old are they? I suppose that those machines would be fourteen or fifteen years old.  
 274. What is generally considered a fair estimate of the life of machinery for such purposes as that? You must understand that they have to have new agitators; I put new agitators in them every two years at least. It eats the inside of the agitators away very swiftly.

J. B.  
Collerson.  
20 Aug., 1896.

J. B.  
Collerson.  
20 Aug., 1896.

275. Have you, during the time that you have been engaged by the Government, had an opportunity of visiting any of the other colonies and viewing their respective abattoirs? No, I have not.
276. You have really had no practical experience in connection with abattoirs other than those on Glebe Island? Not with other abattoirs; but I have had practical experience with meat-preserving works, where I used to desiccate.
277. Previous to your engagement by the Government, in what private meat-preserving works were you employed? They were on the Clarence River, and were owned by a London firm—Whitehead & Co.
278. Were you engaged in the Colony, or sent out? I was engaged in Queensland for them, and I came to this Colony.
279. And it was at those works that you first got your practical experience in desiccating? Yes—meats, as a rule; but I used to desiccate blood at the same time.
280. You eventually became an employee of the Government at Glebe Island? Yes.
281. How many years did you remain there? Seven years, up to last May.
282. Were any complaints made during those years as to your management, or were any faults found with you? None whatever.
283. You appeared to be giving entire satisfaction? Yes.
284. What is your opinion about the management of Glebe Island at the present time;—do you think that it is judiciously managed, or otherwise? I do not. I have seen it far better managed than it is at the present time.
285. Do you think the management at the present time is not what it ought to be? Not what it ought to be, or has been.
286. Whose fault is that—is it the fault of the present manager or of any of the officers who have been put on to assist him? I can only look upon it as being the fault of the inspector, Mr. Shelley.
287. Were you there under a previous inspector? We had a superintendent, and he was retrenched.
288. What was his name? Kenway.
289. Are you of opinion that the Island was under better management during Mr. Kenway's time than it has been since? Oh, yes.
290. In what way has the management altered since Mr. Shelley took charge? For one thing—from a sanitary point of view—cleanliness.
291. Are the Abattoirs not kept in as cleanly a condition now as they used to be? No, they are not.
292. Would that result from a reduction in the number of hands, or from indifference or carelessness on the part of the inspector of the Island? Well, it is not from a reduction in the number of hands, because there are more hands there now than there were then—that is, on the sanitary staff.
293. The Island is less cleanly, and is not so well managed, to your mind, as it used to be under the previous administration? That is, to my mind.
294. Have you had any quarrel or any unpleasantness with the present inspector? No.
295. There is nothing in the way of malice in the remarks you are making? No.
296. Simply your opinion as an employee of the Government, working with the present inspector for some years on the Island? Just so.
297. Do you think that if a first-class manager were placed in charge of the Island it would be made more profitable to the Government, and more convenient for the carcass butchers who use the Island, as well as the retail traders who purchase there? Yes; I think there could be improvement.
298. Have you any other fault to find with the administration besides want of cleanliness? Of course the want of cleanliness brought the blood manure down lower in percentage on account of the paunches being emptied into the drain.
299. Was that simply an indication of laziness of administration, or was it to save expense in other respects, that this cutting of the paunches was resorted to? I do not think it was laziness; I think it was done through not looking after the butchers. Of course the drain is much closer than the place outside to which the paunches would have to be dragged in order to be carted away.
300. So it really was from want of proper oversight on the part of the inspector and his officers in looking after the butchers when they were dealing with the offal and matter from the different animals slaughtered there? Just so.
301. Do you think that if the services of the late inspector, Mr. Kenway, had been retained, the value of the manure would have been maintained? I am positive that he would have kept up the value of the manure.
302. And that would have meant that the desiccating works, practically speaking, would have been made a paying concern? Yes.
303. So that you are of opinion that it is not so much an alteration in the times, as an alteration in the management of Glebe Island, which has had the effect of bringing down to such a large extent the price of the manure? I think that it is not the times altogether; but the times have something to do with it, of course.
304. Do you think that the present site at Glebe Island is a suitable one for Abattoirs, or could you suggest a better one? I think it is indisputable that Glebe Island is the best available site for Abattoirs, not only in this Colony, but also in any part of the world.
305. You do not think that a better site could be obtained in any part of the world for Abattoirs than Glebe Island? I do not think so good.
306. Do you think that the present slaughter-houses could be altered at a moderate expense in such a way as to bring them up to date, or would it be wiser to build new Abattoirs on the opposite side of the road? I think it would be advisable to build new Abattoirs, and have them built up to date. You cannot patch up any buildings with advantage.
307. You think the present buildings are thoroughly out of date? They are thoroughly out of date.
308. And that no matter how much money was spent in improving the present buildings, they would still be found to be altogether inconvenient for the carrying on of any large meat trade, such as is to be found in connection with the city of Sydney and its suburbs? Yes, I do.
309. Would it not be possible, with improved slaughter-houses, to utilise everything that comes from the beasts, and make it of marketable value, instead of carrying it out to sea? Everything, I think. You must understand that nothing went out to sea, except the flushings—that is, the rinsing down of the sewers and the reservoir—when I was at work there.
310. But now that they have dispensed with your services, and the desiccating works generally, are all the substances that you used to treat taken out to sea? That is more than I can say.

## SELECT COMMITTEE ON THE ABATTOIRS.

J. B.  
Collerson.

20 Aug., 1896.

311. What do you imagine is being done with them? From 7 o'clock in the morning until 6 o'clock in the evening I used to treat 140 tons of thin blood and water mixed together. Then there would be about 50 tons of thick stuff besides that to go out every day.
312. And how many hands did you employ besides yourself there, in connection with the desiccating works? Fifteen.\*
313. Sixteen\* in all? Yes.
314. The average expenses of which for wages were—how much? £34 18s. a week for wages alone.
315. Can you tell us any other expenses that were incurred—I suppose there was wear and tear of machinery? Yes; wear and tear of machinery, and, of course, coal.
316. What was your coal bill? Our consumption was about  $4\frac{1}{2}$  tons for the twenty-four hours.
317. How many tons a week would that make—in six days? Yes; you can reckon on six days for that, and the quantity would be about  $28\frac{1}{2}$  tons a week.
318. Any other expenses besides that? The lubricants and belts, and the like of that.
319. At what would you estimate the other expenses all told, roughly speaking? Say, £4 per week.
320. Have you any other information that you have noted down which you think would be useful to the Committee at the present time in regard to the conducting of the desiccating works? I have noted down the punt.
321. Of course, the expense of the punt would have to be added to the expense of conducting the desiccating works? Yes.†
322. What would be the cost of keeping the punt going per week? £25 9s. 6d.
323. Are there any other expenses—wear and tear of the punt, I suppose? Yes; wear and tear of the punt.
324. How many trips a day did those in charge of the punt make? I cannot say how many they made.
325. How many were they supposed to make? Well, we used to stop for an overhaul about a fortnight each year, and it used to take me eight punts a week; that was two on a Monday and two on a Friday, and one punt on every other day.
326. Have you been to any other slaughtering-houses in this Colony? I have been to Riverstone and Auburn.
327. How do you think they are conducted as compared with Glebe Island? They are not conducted in a way anything approaching Glebe Island.
328. Not anything like equal to that? No.
329. Is the supervision at Riverstone and Auburn of such a character as to prevent the slaughtering of diseased cattle? No, I do not think it is. I do not think they could prevent it with the supervision which they have at those places.
330. You think it is much more easy for carcass butchers who have private slaughter-houses, such as those you have referred to at Riverstone and Auburn, to buy diseased cattle and slaughter them, and to send them on for sale to the public, than it would be at Glebe Island? Oh, yes, much easier.
331. The supervision at Glebe Island is particularly strict, is it not? Oh, yes.
332. Would it be at all possible under existing circumstances to get a diseased beast slaughtered for sale, and sent out of Glebe Island without its being noticed by the officials told off for that particular duty? I think it would be impossible without its being noticed; but there I must stop.
333. What do you mean by saying that you must stop there;—are we to understand by that that the carcass butchers frequently come to terms with the inspector so as to allow diseased cattle to be thrust upon the market in the form of diseased meat? I do not insinuate for a moment that they do it, but such could be done.
334. Did it ever strike you that such was done? No, not in the slightest—it never struck me.
335. You have never seen anything during your stay at the Island that would lead you to suspect that the officials stationed there would be liable to pass the beasts of any of the carcass butchers, either on account of pecuniary benefit, or from excess of friendship towards particular carcass butchers as compared with others? No; I have never seen anything to lead me to suppose that.
336. You have never seen anything approaching partiality displayed by the officials to any particular carcass butcher or carcass butchers at the Island as compared with others? Well, I think there are one or two carcass butchers that may have greater concessions than the others.
337. Would you have any objection to state the names of those carcass butchers? Well, I think that Mr. Henry Macnamara is one.
338. Do you think he gets concessions that are not generally granted to other butchers? I fancy I have seen it.
339. What form would you imagine the concessions take? For instance, there are so many beef-houses on one side, and so many mutton-houses on the other; and so many of those beef-houses are sold by public auction per year, whilst the others are open for anyone to go and kill in them.
340. So that any person buying half a dozen cattle at Homebush can, by paying a certain amount per head, have his cattle killed by himself or his servants at these particular houses on the Island? Just so. Well, I have seen one of these same houses turned into a place to kill calves in, although there are other houses purposely for calves.
341. And would it always be the case that the calves so killed in these particular houses belonged to Mr. Macnamara? Yes.
342. The same privilege would not be granted to other carcass butchers? No, I never saw it.
343. Did you ever see anything in Mr. Macnamara's conduct towards the inspector that would lead you to think that he was receiving these acts of kindness for anything he was doing for the inspector, or for any member of his family? I could not say that.
344. Is it a fact that Mr. Shelley has a son working for Mr. Macnamara? I believe so; he had.
345. One of Mr. Shelley's sons was in the employ of Mr. Macnamara? Yes.
346. Did it strike you that the fact of his son working for Mr. Macnamara had the effect of getting for him more generous treatment than the other carcass butchers had, who had none of the inspector's family in their employ? I cannot say that; but it has always struck me that he gets greater concessions—by what means, of course, I do not know.
347. Was there an impression prevailing amongst the other carcass butchers that Mr. Macnamara was specially favoured? Yes.

348.

\* NOTE (on revision):—Thirteen men and myself—Fourteen. † Expenses of punt would have to be deducted, instead of added.

J. B.  
Collerson.  
20 Aug., 1896.

348. Are the carcass butchers supposed always to kill during the day-time? The time differs in the summer months, as compared with the winter months.
349. What about the winter months? In the winter months the time is from 7 o'clock in the morning until 6 o'clock at night. On Friday, I think, there is an hour or two extra allowed at night, and an hour or two in the morning; and calf and pig butchers have a concession—I think it is on Friday night that they can kill pretty well all night.
350. What are the hours in summer? In the summer the hours are from 6 to 7 o'clock, I think.
351. And a few extra hours on Friday night? Yes.
352. Is Mr. Macnamara allowed to kill for longer hours at night than any of the other carcass butchers? He has been. He has been allowed to kill freezers for exportation pretty well all night.
353. And he is the only carcass butcher permitted to do this? No; I cannot say he was the only carcass butcher permitted to do that. I think that another was killing in the same way.
354. Would it be possible, during these night-killing operations, for diseased cattle to be put through without any of the officers knowing? There was always an officer on duty when they were killing.
355. Whenever they are killing there is an officer inspecting all that is being killed? Yes.
356. So that no beast could be killed without its being inspected by an officer representing the Government? Just so.
357. So that although Mr. Macnamara might be allowed to kill at night when other carcass butchers were not, we could not infer from that that it would give him an opportunity to push through cattle that would be condemned at any other hour? Oh, no.
358. *Mr. Wilks.*] In connection with the desiccating, is the liquid portion that flows into the harbour obnoxious? Oh, no.
359. Not at all? I have brought that away perfectly clear—as clear as water.
360. It is odorless? Yes.
361. You stated to Mr. Hawthorne that you had had no practical experience in slaughter-houses outside the Abattoirs? Just so.
362. Have you any theoretical knowledge? Yes, I think so.
363. Are you acquainted with the system used at Edinburgh? No, I am not.
364. Have you heard anything about that system being one of the best, if not the best in the world? I think it is considered that the best system in the world is the German system at Berlin.
365. In connection with the operations at the desiccating-house, do I understand that you treated the whole of the liquid? Yes.
366. Did you not find that with the extraordinary flushings that took place there, the amount of water was often more than would actually be required if there were a better system in vogue there? Yes; the smaller the quantity of cattle killed there, the more water I got down below. They have what they term a fall of four bullocks, as if they are working from hand to mouth, just as they get their orders, an order comes in for a bullock, and they slaughter that bullock, and there is the same quantity of water used for the washing of one bullock as there is for four.
367. Your machinery had to treat all that? Yes.
368. And that has been one of the main reasons for the expense of the plant, so far? Just so.
369. Supposing that you had a common receptacle for the blood and the offal, instead of slaughtering all over the place as they do now, and the flushings continuing, would that not minimise the cost to a great extent, so far as the desiccating portion of the works is concerned? Yes, they could throw the blood up by air to any distance. I tried some experiments, and I threw up the thick blood by steam 21 feet.
370. How many years were you in charge of that desiccating plant? Seven years up to last May.
371. During the course of the seven years you have been compelled to treat hundreds of tons of liquid matter which could have been avoided by having a better system? There is no doubt about that.
372. And that would have minimised the expense right through? It would have minimised the cost right through.
373. You consider that that is really the weak spot, so far as your plant there is concerned? Yes.
374. Did I understand you to say that Mr. Houghton, the head engineer, was not agreeable to enlarging the plant there? He was agreeable. But I did not ask for an enlarged plant, but for enough money to repair the plant I had there.
375. What expense would that probably have amounted to? There are six machines in all, and three machines that want repairing, and I suppose that the repairing of those three machines would have cost £120 or £150 for each. Two of them would have had to have a new inner shell. All those machines are jacketted. There are inner and outer shells, and the steam, of course, is between the two shells.
376. Have you any suggestion you would like to make to this Committee as a desiccator—the position you held there? No.
377. Have you any suggestions you would like to make as an engineer? It is very evident that if the blood was separated from the water in the slaughter-houses, and taken down below, there would be a great saving in every way.
378. The other information you gave Mr. Hawthorne was purely from observations made by you there? Yes.
379. Deductions you drew from personal observation? Yes.
380. In regard to inspection for the detection of tuberculosis or any other disease in cattle, have you found the inspectors rigid? Yes, pretty well up to the mark.
381. Did you find at any time that disputes occurred between the inspectors and the slaughtermen? Oh, yes. When there is a dispute of that kind—and it is of frequent occurrence—the veterinary surgeon, Mr. Stanley, is called in, and he decides it.
382. But his decision is not final, is it? Yes.
383. Have you not heard of cases where, after Mr. Stanley's decisions have been disputed, the matter has been referred to the Board of Health? I cannot say that I have.
384. You have never noticed a visit from the Board of Health after a dispute with the veterinary surgeon? Mr. Stanley is from the Board of Health.
385. I mean Professor Anderson Stuart being there at all? He has paid visits there, but I never heard of the visits being through that.
386. Are you a resident of Balmain? Yes.
387. Have you found any strong inclination or avowed disposition on the part of the public there to remove the Abattoirs? Quite the reverse.

388. What is the character of the objections that are mainly urged by anybody there to the Abattoirs? I have never heard any.
389. Never heard of a cattle-driving nuisance? I beg pardon; of course that is indisputable.
390. That is the only nuisance you could observe? Yes.
391. Have you any idea, as a resident of Balmain, how that could be obviated? I can only see one thing for it, and that is to lay down a railway, and to have a driving track alongside the railway. They could not retruck from the saleyards; but a 30-foot space would be any amount for a driving track.
392. And what would be the use of the railway, then, if you say they could not retruck from the saleyards? Well, they could have freezing works all round there. They could kill their meat and freeze it on the Island; and the ships could come alongside, and it could be put into the ships when they wanted.
393. When you called Glebe Island the finest site in the world, you were anticipating a large trade similar to that which you now speak of? Yes.
394. Not merely slaughtering for the city and suburbs? Just so.
395. You think Glebe Island could be made a good export depôt? Yes.
396. And you could have a freezing apparatus on the Island? Yes.
397. Would the island space be sufficient, or would you require to use the reclaimed ground? I do not think you would require to use that ground, if the stock came direct from the markets.
398. The ill-effect upon property there you put down as nil? Yes; I think that property would take a rise if the establishment there were on a larger scale.
399. But supposing it remained purely and simply as slaughter-houses, what effect would it have then? I do not think it would have any effect.
400. So far as the disagreeableness of odour is concerned, is that minimised, or is it increasing? There was no odour you could speak of at the time the desiccating works were in operation.
401. It is only while the desiccating works are not in operation that there is a disagreeable odour? Yes.
402. In reply to Mr. Hawthorne you said that there has been a want of cleanliness, and that although more hands were employed there was a want of cleanliness generally there now compared with what there was some few years ago under some other management? Yes.
403. Is that caused by laxity of the present administration? I do not know.
404. What is your opinion? I should say it would be.
405. It is not owing to an increased trade there? Oh, no.
406. Purely want of proper administration? Yes.
407. He has been lax in regard to his officers and seeing to the order, and so on, of the different departments? Yes.
408. Do you think that Mr. Houghton, the consulting engineer, would be of use to this Committee in giving evidence in regard to matters we have been speaking of? Yes, I do.
409. You consider him about the best expert in the city in the matter of desiccating machinery? I consider that he is one of the best in the city on desiccating machinery.
410. Did you ever pay a visit to the works of the Graziers' Meat Export Company at Duck River? No, I have not.
411. You are not acquainted with their system at all? No.
412. *Mr. Law.*] From an economical point of view, do you not think that the inspection, if it were carried out in different parts of the country, would not be half as good as it would be from having it at Glebe Island alone? It would be more expensive, of course.
413. And disease would be more liable to escape notice in the country districts? Yes.
414. Who are the chief purchasers of the manure made from blood? Chinamen. But if there were new appliances we might get the serum. That would fetch something like £30 or £40 a ton, if it could be saved.
415. *Mr. Wilks.*] The albumen is the most valuable now? Yes.
416. *Mr. Law.*] Only about one quarter of the Island is at present utilised? About that, I think.
417. Consequently there is plenty of room there to carry on a business four times the size of the one now carried on there? Yes.

William John Spencer sworn and examined:—

418. *Chairman.*] You are the editor of the *Australian Meat Trades Journal*? Yes.
419. I suppose your office is in the city? It is at No. 6, Spring-street.
420. Have you been long engaged in your present capacity? Since February last.
421. Previous to that did you have any connection at all with the meat trade of the city or suburbs, or Colony? None, except as a journalist in a general way.
422. Your experience of the meat trade has been confined principally, I suppose, to conducting a trade journal? Yes.
423. Have you had any experience at all of the management of Glebe Island? None at all.
424. Have you ever visited the Abattoirs? Not the Glebe Island Abattoirs.
425. Have you ever visited any of the private abattoirs of the Colony? No. I might explain to the Committee how I presume it is that I have been called as a witness. I was anxious to bring before the Committee the growth and importance of the country killed and chilled meat trade in connection with the meat supply of the city.
426. *Mr. Wilks.*] Have you any statistics bearing on that? I can give the Committee the names of the works at which the country meat-killing and chilling is carried on, and the quantity of sheep they are capable of dealing with, and the fact that in New York the meat trade has altogether drifted into this channel. They do not drive or truck cattle down to New York to kill, but the meat is killed and chilled at Chicago and Kansas City, and is brought down in refrigerating cars.
427. *Chairman.*] I presume that you have had practical experience in connection with the meat business in America? No; I have not had any practical experience of it, and, as a matter of fact, I told Mr. Bavister, with whom I communicated, that I had had no such practical experience; but I also brought under his notice the names of gentlemen who have had practical experience of it both in Australia and in the United States.
428. You have not visited the Abattoirs, and therefore cannot speak about their management in any way? I cannot.
429. Have you been brought into contact in any way at all with the abattoirs in any part of the world other than New South Wales? No.

J. B.  
Collerson.

20 Aug., 1896.

W. J.  
Spencer.

20 Aug., 1896.

- W.J. Spencer. 430. Can you speak authoritatively as to whether the present abattoirs are badly built, or in a wrong situation, or whether the carcass butchers generally, or the graziers, look upon the Abattoirs as not being on the right spot, where they ought to be? I cannot speak on that point. There is, of course, the broad general consideration of the cruelty involved in trucking or driving the stock so great a distance down to Sydney, when they might be treated nearer their own pastures; but of the details I know nothing.
431. Your suggestion would also apply to the cattle that come by sea—that instead of bringing them down alive, it would be better to bring them to the city in chilled chambers on the steamers? I do not think there is much of a cattle trade by sea at present.
432. I suppose that you recognise the fact that an abattoir of some kind is a necessity close to a large city like Sydney? I should say so.
433. Do you think that the tendency of the present age is to kill cattle as near as possible to their pasturage? I think so, decidedly.
434. And you think that the disposition on the part of the carcass butchers is to prevent as much as possible the bringing of live cattle long distances for the purpose of killing? I would not say that. Of course, when you come to talk about carcass butchers, there are vested interests. They wish the present channels to remain open and increased if possible.
435. But you do not see in the near future any prospect of the abolition of such a place, say, as the saleyards at Homebush? I do not at all look forward to the abolition of those saleyards; but I do think that the merits of the country-killed meat are bound to make way. I have here a list of works which perhaps the Committee may know of.
436. If you have a list of all the private slaughter-houses in the country, we shall be glad to have it? There is first of all Aberdeen, with a killing capacity of 12,000 sheep a week. Then there is the Graziers' Meat Export Company, who are erecting large works at Sandown, Duck River, near Parramatta. They are just starting there. They have, in the country works at Nyngan, with a killing capacity of 3,000 sheep a week; Werris Creek, 6,000; Carrathool, 6,000; and Forbes, 6,000. Then there is the Pastoral Finance Association. Their main works are at Kirribilli Point, on the other side of the harbour. They have country works at Young, with a killing capacity of 6,000 sheep a week; Gunnedah, 6,000; and Narrandera, 4,800. I have not put down the capacity of their Kirribilli works, but it is very large. I do not know exactly what it is. The Kirribilli works are chiefly a receiving depot. Then there is the firm of J. H. Geddes, Birt, & Co., Ltd., Pitt-street. They are the lessees of the Government meat-markets. They have country works at Narrabri and Tenterfield. The killing capacity of the works at Narrabri is 6,000 sheep per week. I do not know the killing capacity of the Tenterfield works; but they are at work, sending down meat every week. In addition, there is the Bourke Meat-preserving Company, whose killing capacity I do not know. They are sending down meat regularly every week to the Sydney market. Then there is the Dubbo Meat-preserving Company, with a killing capacity of 6,000 sheep a week. Probably the killing capacity of the Bourke works is about the same as at Dubbo.
437. Are all these works engaged in killing for the Sydney market, or more for the export trade? They are principally engaged in the export trade, but many of them are engaged in killing for the Sydney market.
438. But they were started principally with the idea of being export companies? Certainly that was the idea in starting.
439. And they are dealing with the export trade? Yes.
440. So, up to the present they have not been brought into competition very much with the abattoirs in killing for the Sydney market? Not very much. But their trade with the Sydney market is growing. That is a feature of which I am sure you will be able to satisfy yourself by independent testimony.
441. *Mr. Wilks.*] You said you were the editor of the *Australian Meat Trade Journal*? Yes.
442. Under whose auspices would that be—the fat stock salesmen? No; the proprietor is Mr. A. W. Pearse.
443. With whom are you immediately brought into contact—the fat stock salesmen or the retailers? With the freezing companies.
444. Have you any literature bearing on slaughtering? I have not.
445. Have you ever seen any literature bearing on slaughtering? No.
446. Do you consider that the Graziers' Meat Export Company are highly competent to deal with this trade—well versed in the mode of slaughtering, and so on? I think so.
447. And their opinions or action could be taken as a good guide? I think so.
448. You stated to Mr. Hawthorne that you believed the tendency of the age was to kill in the country? Yes.
449. On account of certain things, such as the meat becoming inflamed by travelling? Yes.
450. Then, how do you reconcile the fact that this powerful company, who have the assistance of experts, have their slaughter-house so close to the city as Duck River? I am not prepared to say that that will be a slaughter-house. Probably it will be more of a receiving house, as are the works at Kirribilli Point.
451. But are you not aware that they are slaughtering there now? I am not aware of that.
452. You are not aware that they have made arrangements for slaughtering there? I believe that they intended to slaughter there; but while a certain amount of slaughtering will no doubt always have to be done near the city, that company have already fitted up four works in the country. Nyngan is at work; Forbes is not yet; Werris Creek is at work; I am not sure whether Carrathool is at work; but they have fitted up to kill in the country. Therefore, there is nothing to prevent their killing meat there and sending it to town if they found it convenient to do so.
453. But are you not aware that they intend to do meat-killing at Duck River? I think it is highly improbable; otherwise they would not have four country works to kill at. They have gone to great expense in fitting up those works in the country.
454. Have you never heard that meat killed and chilled in the country and placed on the city market is inferior? I have heard precisely the contrary; and so far as I have been able to get hold of any chilled meat it has been immensely superior to the meat sold by the butchers, which ordinarily comes from the Abattoirs. We look upon it as a chance to get hold of any chilled meat which comes down from the country.
455. So you have not heard anything detrimental at all to chilled meat? No.
456. *Mr. Law.*] Your opinion is that the killing business carried on in the country should be extended? Yes.

457. You have enumerated a large number of places at which 3,000, 4,000, 5,000, or 6,000 sheep can be killed, and consequently there must be a large number of such places spread over the Colony? Yes.

458. Do you not think that, with these numerous killing-works, diseased meat is not so likely to be detected as it would be if the slaughtering were all concentrated in a large place like the Abattoirs at Glebe Island? I should like to point out that those works in the country are large works, and are easily inspected. They are to take the place, I understand, not of any central works in the city, which have never yet been erected to do all the work for the city, but of the innumerable private slaughter-houses, and it is more easy to inspect a large meat-works than a number of small slaughter-houses.

459. But you have told us of a great many places where there are 3,000, 4,000, 5,000, or 6,000 sheep killed, and does it not stand to reason that with inspection in a great central works in Sydney, the expense would be far smaller? Of course that is self-evident; but it remains yet to be demonstrated whether it is possible to concentrate all the killing in one place.

460. You know nothing about the Abattoirs at Glebe Island? No.

461. *Chairman.*] I suppose the idea is, that the Abattoirs could be continued as they are and still to do an extensive trade, but that on account of the increasing export trade, it would be necessary even to increase the number of the large country killing-establishments such as you have mentioned, and have given a list of to the Committee? Yes. The country killing and chilling facilities will certainly increase, if not for the town trade, at least for the export trade. Great advantages are claimed for country-killed and chilled meat, and it seems to me that it might well be made available as far as possible for the metropolitan meat supply.

462. Has it ever struck you that the Glebe Island, in addition to killing for the city, might, perhaps, be extended to such an extent as to do a very much larger trade in killing meat for export? A large trade is already done for export.

463. Have you ever visited or passed by Glebe Island? I have been past it.

464. Do you know the extent of the Island itself? No, I do not.

465. *Mr. Wilks.*] In view of what you have stated, do you consider it prudent for the Government to spend any reasonable sum of money in enlarging the present Abattoirs at Glebe Island? I do not think I am competent to pass an opinion upon that.

466. You practically gave an opinion on that? What I wished to convey was, that I did not think it would be wise for the Government to enter on a large expenditure, in view of increasing trade at the Abattoirs when, in my opinion, the trade there is likely to diminish. I believe the country trade will be an increasing one, and the Abattoirs a diminishing one.

467. The question with you is not one of removal, but simply one of extension? That is it.

TUESDAY, 25 AUGUST, 1896.

Present:—

MR. BAVISTER,

MR. WILKS.

MR. LAW,

J. S. HAWTHORNE, Esq., IN THE CHAIR.

Henry William Austin sworn and examined:—

468. *Mr. Wilks.*] What are you by occupation? Carcass butcher.

469. How many years' experience have you had as a carcass butcher? Ten years' experience as a carcass butcher, but I have been twenty years connected with Glebe Island.

470. Where else has your experience been? In my youth I had a little experience in old Newgate market.

471. Have you had any experience at Islington? I know Islington market.

472. Do you know the system adopted there? I do not know the system adopted there at the present time.

473. Have you visited any of the abattoirs in the adjoining Colonies? No.

474. Have you had an opportunity of reading up on the matter? Yes; I have read up on the matter at different times, and studied a good deal the management of abattoirs, and the way they should be situated, and that sort of thing.

475. In regard to our own abattoirs, what defects, if any, do you consider exist? Our own abattoirs at the present time certainly want repairing. The site is second to none.

476. What is the nature of the repairs which you would suggest in connection with our abattoirs? The mutton slaughter-houses are old and out of date.

477. Is that the only defect you can see in the buildings? There should be more yarding room for stock.

478. How would you attempt to get over the difficulty of want of yarding room? There is plenty of room on Glebe Island, which only wants a little levelling off, and yards built at the back, and also shelter for the stock. At the present time we have no shelter for our stock there. I do not suppose it would be possible to find any other place in the world with such bad shelter for stock.

479. Some little time ago you went on a deputation to the Premier? Yes.

480. You then laid before him a plan? Yes.

481. Would you mind giving the Committee the benefit of your knowledge as then placed before the Premier? When the deputation waited on the Premier, I went about the driving of stock. At that time there was a great to-do about the driving-stock nuisance, which I myself and all the other butchers admit is a nuisance—that is, the driving of stock to the Abattoirs during the hours when the public are using the roads. What I say is that the driving of stock on the roads should be limited to the hours between 12 p.m. and 6 a.m.

482. That is on the ordinary roads we have now? Yes; it will overcome that difficulty, and that is the only one I see standing in the way.

483. You do not see any necessity for constructing a road expressly for that purpose? At that time I pointed out to the Premier where there could be a road—not the whole of the distance, but brought from the northern road running through Five Dock, and down from Ramsay's Bush, and through Leichhardt. There is a lot of unoccupied land, some part of it being Government land. I thought at that time that if the Government were going to do anything in the matter, that road, if set out, would be the means of overcoming all the nuisance. The stock would not go through the populous streets.

484.

W. J.  
Spencer.

20 Aug., 1896.

H. W.  
Austin.

25 Aug., 1896.

H. W.  
Austin.  
5 Aug., 1896.

484. Have you heard anything about a system of railway in connection with the Island? Yes; I pointed out to the Premier then that a system of railway could be brought forward, and the main line tapped, I think, at Stanmore—I think that was my suggestion—and running thence along by White's Creek. There is a large piece of Government land which they are filling in there at the present time which could be utilised for a railway station, and likewise stock-yards. It is a valuable piece of land, which I do not suppose will ever be wanted for building purposes; but it would be very valuable for a railway-yard, and at any time the railway could be taken to Glebe Island, because it is a certainty that we shall have to have a railway to Balmain before many years pass. If the Abattoirs remain at Glebe Island a railway will have to be carried there. There are thousands of sheep that come to Glebe Island which do not go through the sale-yards at Flemington, and sometimes cattle. Sometimes there are 1,000 sheep in one consignment.

485. In regard to sale-yards, what is your idea—remove them from Flemington to the reclaimed ground around Glebe Island? The removal of the sale-yards is a very big question, and one which I do not think would be entertained, because there too is much money sunk at Flemington.

486. Through the City Council? Yes.

487. Vested interests are too strong? Yes; and I do not think the removal of the sale-yards could be brought about.

488. What is your idea in regard to the retrucking of stock? It would not act at all.

489. Well, if you could not retruck, you would have to have sale-yards at Glebe Island? Unless the stock were driven to Glebe Island at night.

490. There would be no necessity for a railway then? You will find the time will come when we shall have to have a railway.

491. I meant under this system? Yes, under this system.

492. What is your opinion of the present management of Glebe Island? It is up to date—the management is good.

493. There is nothing faulty there? There is nothing faulty in the management. No doubt there have been large sums of money spent on Glebe Island which could have been spent in a better manner.

494. Do you consider that the management is about as good as we could obtain? Yes, I think it is as good as we could obtain, and I think the inspection is excellent.

495. Have you any knowledge of the places called the calf-yards being used for other purposes than they ought to be used for? Not that I am aware of.

496. No carcass butcher having an advantage over another? I do not think so. I never knew anything of that sort. I think everything is dealt with fairly. That is my experience.

497. The desiccating plant is a source of weakness, is it not? It is a source of weakness, and it has been a source of great expense, but I think that under the present system they can cope with it.

498. What is the present system? Punting out to sea.

499. You consider that is a better system than the desiccating? Yes, and less expensive.

500. I suppose you have no knowledge with regard to slaughtering in Chicago? I have not been there, and cannot say much about it; but I know by reading that the sale-yards and the slaughter-yards there adjoin each other.

501. You are not aware, too, that they have what I may call a common cesspit to receive the offal in—they do not slaughter all over the place, but convey the offal to one given spot? The same is done at Glebe Island—that is, in regard to the blood. What we call the offal—that is, the inside of the bullock—the guts, the liver, and that sort of things—is taken away to pig and poultry farms, &c.

502. Are you aware of any objections being lodged against the removal of the Abattoirs? Yes, I have a knowledge of that. I have objected to it myself, because I am sure we could never do without them. It would be one of the greatest mistakes that was ever made in connection with Sydney if the Abattoirs were taken away from Glebe Island.

503. You do not countenance at all the idea of bringing chilled meat into the Sydney market? Chilled meat is all very well. The chilled-meat business here will come about naturally, the same as it does in all other big towns in the world. Those people who wish to send chilled meat to the market will send it. The stock belongs to them, and they have a right to deal with it in the best way they can for themselves, whilst people who wish to send their cattle to market to be sold to the butchers will do the same.

504. You know of no obnoxious smells from the Island which people complain about? Not of late years. Years ago, when the fat-house was put on the Island, there certainly was a very objectionable smell, but of late years, since the swamp has been filled in, I think it has been done away with.

505. You consider that a good deal of the objectionable smell in the past was owing, possibly, to the swamps around there? Owing to the stuff being emptied into the harbour and lying on the mud, and sweltering with the hot sun on it.

506. You might give to the Committee your opinion in regard to the necessity for the Abattoirs being at Glebe Island on account of the coast trade in cattle, pigs, and so on? My experience is that at the present time our Abattoirs are situated in a very good place, more especially to cope with the trade of Sydney, and likewise the export trade. The time will come, and I am sure that if there was a railway to Glebe Island it would be the means of opening up a big export trade from that Island. People can erect places as they have done in the country, and kill their meat and send it to Darling Harbour; but if it is sent to Glebe Island and dealt with there it is dealt with much more cheaply.

507. Have you visited the Graziers' Meat Export Company's works at Duck River? Not since the present plant was erected there.

508. They virtually carry out the principle you are now proposing for Glebe Island? Yes.

509. What suggestion would you make to utilise Glebe Island for larger purposes than the present? What I would suggest is the levelling off of the northern and north-eastern portion of the Island, building a sea-wall round and using the debris from the hills to fill in behind the wall, and to build stock-yards on the Island. No doubt the time will come when stock will be exported from Glebe Island as it is now from Newcastle, from which town it is exported to Noumea, Fiji, and other places. If we had suitable yards at Glebe Island that trade would be brought there. But we have not suitable yards for shipping cattle. Then, in the next place, refrigerating-chambers could be built on the wharf, and meat run into them to wait there until put on board ship. There is good water round Glebe Island. Any ship could come and lay alongside and load right away from the chambers, not as is done now—carting it down to Kirribilli Point in punts.

H. W.  
Austin.  
25 Aug., 1896.

510. You consider that the possibilities of Glebe Island are unbounded for a trade of that character? Yes. Of course Glebe Island is a big place, and other trades could be carried on there. If Glebe Island were properly laid out, there is no doubt that big canning works would spring into existence around it. There is one there at the present time—the Globe Meat Works. They carry on a very large business, and take away a lot of stuff from Glebe Island.

511. They deal with the Island direct? Yes.

512. The opinion you are now expressing is purely from a public point of view and not merely based on your own business relations? Not at all. It matters little to me where they take the Abattoirs to. If they were to shift the Abattoirs, I should shift too. But if the Abattoirs were shifted to the country it would be the means of large companies springing into existence. In time those companies would combine together, and they would ring the Sydney meat market, the same as has been done in a great many other towns. I am sure of that. That is what some people are trying to bring about at the present time.

513. You believe that the tendency is to try and place the Abattoirs under private control? That is the tendency, I believe, which they have at the present time.

514. Instead of having one central abattoirs, which they talk about now, there would be several central abattoirs? Of course there would be. The greatest mistake the country could make would be to do away with the present Abattoirs. In summer-time four months of the year, it would be impossible to do without them. You can kill meat even there in the morning in summer, and if it is not broken up, it will stink in the evening, and butchers look for two deliveries of meat a day to their shops. At the time there was the row with the butchers there among ourselves, in the summer-time they killed meat up at Rookwood—both beef and mutton. The consequence was that when it came to the market it was bad; and the same thing would happen again. If they tried to kill the whole of the meat for the city, even supposing the Abattoirs were removed to Belmore—and I know there is much talk of their going there, and likewise of another site on the Wentworth Estate—I am sure it would never pay. It is all very fine for people who have not had any experience in the trade to talk about what they could and could not do, but it would not suit the public, and if the Abattoirs were removed from Glebe Island I am sure that in two years' time the public would rise up in arms about it.

515. You have heard some talk about removing the control of the Abattoirs from the State and placing them under municipal control;—what is your opinion of that? My opinion is that the City Corporation is the proper body to have the control of the Abattoirs in Sydney, and also of the meat trade generally in Sydney. The time must come when, whether they are under the control of the municipalities or under the control of the Government, there will have to be public abattoirs, I think, at Willoughby, and also in the district of St. George.

516. Sort of auxiliaries to Glebe Island? Yes; but if the authorities allow private slaughter-houses to exist, they will simply get diseased meat into the market, and sold to the people; whereas, if the abattoirs are under the control of the municipal councils or the Government, they will exercise supervision over the meat, and the public can look forward to having a sound article to eat.

517. What is your experience, during the twenty years, in regard to the inspection of meat at the Glebe Island Abattoirs—is it a rigid one? Well, during the first ten years that I was at the Abattoirs, I cannot say that the inspection of meat was what it should have been; but during the last ten years it has been pretty rigid.

518. *Mr. Law.*] When you were referring just now to some works carried on there, did you refer to Mr. Barnes' works? Yes.

519. What trade in particular is carried on at those works? The canning of meat of all descriptions. They carry on a large business there.

520. Is it a fact that they are going to put up new extensive works there? Yes; there is not only Mr. Barnes' factory.

521. It is going to be a very big concern? Yes.

522. Five storeys, or something like that, and covering a large area of ground? Yes.

523. I think I understood you to say that if the meat were killed in the country that would increase the cost to the consumers in Sydney? Yes, it would, considerably.

524. Can you explain to me why it would increase the cost to the consumers? It would increase it in this way: In the first place, stock sent to Glebe Island is dealt with more cheaply than it could be dealt with in the country; in the second place, if the trade were driven away to country slaughter-houses, that would be the means of large companies springing into existence, and it would only be a matter of time when they would form a ring and have their own prices; whilst, on the other hand, in buying their stock from the graziers they would grind the graziers down to the lowest possible price, so as to make big profits for themselves. The same thing is done in plenty of other places, and that is a thing we want to fight against.

525. You look at it in that light? Yes.

526. Do you not think, also, that the fact of there being a large number of abattoirs in the country would necessitate far greater inspection, and also the employment of a considerable number of inspectors? Yes. It would be almost impossible to inspect all the meat that would come into this market.

527. Whereas at one central place it would be under the supervision of one or two inspectors? At the present time, I think there are six inspectors at Glebe Island, and I assure you that all the stock that is killed there is inspected.

528. In regard to Glebe Island, do you know that the part utilised at present in connection with the Abattoirs is only one-fifth of the total area of the Island? Yes.

529. And, consequently, there is sufficient space there to build abattoirs which would meet the requirements of a population six or seven times the present number? Yes; but, as I said before, the time will arrive when it will be necessary to erect abattoirs in the Willoughby and St. George's districts. Any man who understands the geographical position of Sydney can form that idea, because it would never do to cart all our meat from Glebe Island (say) in fifty years' time, when, of course, the city will have extended very much more. But at the present time Glebe Island is suitable, and will for some years to come be suitable for the city and suburbs. Every morning orders come to Glebe Island for meat for Manly, Narrabeen, Dapto, and different suburbs on the North Shore, &c. There are times when we have to send meat even to Newcastle.

530. Do any cattle now come from Queensland to Glebe Island by sea? At the present time boats are bringing cattle to Glebe Island from the Macleay, and sometimes from the Clarence and the Richmond.

H. W.  
Austin.  
25 Aug., 1896

Glebe Island is a suitable place for unshipping them. They are unshipped and can go right into the Abattoirs without being driven along the roads. But if the Abattoirs were taken away from Glebe Island those cattle would have to be driven from the ships to the sale-yards or slaughter-houses.

531. If a mob of cattle had to come from Grafton, what would be the difference in cost per head between bringing them by land and bringing them by water? I cannot say what the difference in the cost per head would be. But if cattle were driven overland from Grafton, by the time they arrived here their condition would be driven off them, and the cost would be greater, because if they come by the boat, they arrive here in good, sound condition.

532. Do you not think that it is a very essential point in the interests of Glebe Island that cattle should be brought to that Island direct by sea from Queensland and all the other colonies, inasmuch as you say that that would not interfere with the quality of the meat, whereas driving the cattle considerably deteriorates the quality? That is my opinion.

533. In regard to the desiccating works, I understood you to say that they were a serious source of expense? Yes.

534. Do you think that that is in any way attributable to the old antiquated machinery there now;—do you think that if the most modern improvements were effected there the desiccating works could be carried on profitably? Yes; I believe that if they had up-to-date machinery they could be worked more cheaply and more beneficially than they were before, because I always looked upon the machinery that was at Glebe Island before as machinery got up for eating coal, for I used to see them carting coal there every day, and I thought that there was a great mistake somewhere.

535. You are acquainted with all the carcass butchers? Yes.

536. What is your idea as to the prevailing opinion among the carcass butchers;—are they in favour of the retention of the Abattoirs in their present position? Most of them are. Of course they know the evil effect that the removal of the Abattoirs would have.

537. And as you supply a large number of the retail butchers, and know the majority of them, what is your opinion as to the trade generally? I was speaking this morning to one of the retail butchers—Mr. Henry Bartlett, of George-street—on the subject, and he said that it would be impossible to do without city abattoirs. I should like you, gentlemen, to obtain the opinion of some of the big butchers—say, Mr. Playfair and Mr. Bartlett, and also of Mr. Badgery (Pitt, Son, and Badgery), who is one of the agents for stock. I suppose that Mr. Badgery knows more about the trade than any other man in the country, both wholesale, retail, and graziers' business, and everything else.

538. Do you think that the removal of the Abattoirs from Glebe Island would enhance the value of property at Balmain? I would not like to say that.

539. Do you think that the fact of the Abattoirs being there depreciates it? No; I do not think it depreciates the value of property at all, because most of the people reside at that end of Balmain and Pyrmont.

540. The driving of cattle and sheep is, you think, about the only trouble there is in connection with the Abattoirs? About the only trouble I know of in connection with the Abattoirs is the driving of the stock. Of course there are a few people living on Glebe Point whom nothing would suit, except, I suppose, there were some nice villa sites on that part of Glebe Island where the desiccating house is.

541. *Mr. Wilks.*] Or a bowling-green or something else ornamental? Yes.

542. *Mr. Law.*] You mentioned that there was some talk of having abattoirs at Belmore and some other place, and you said that you did not think that either of those places was suitable. I suppose that the reason why it is not suitable is because the country there is flat? I do not say it is not suitable, but what I mean is that it would not suit the trade.

543. The Abattoirs at Glebe Island being 20 or 30 feet above the water-level there is consequently a good fall? Yes.

544. *Mr. Bavister.*] You have spoken of chilled meat, and I think you have also stated that you have known meat which was killed at Glebe Island to be unfit for food before night? Yes.

545. One of the previous witnesses stated that meat which came down from the country chilled was also in that state sometimes? Yes.

546. Is that common all the year round, or only in some particular season? You may say four months in the summer-time—December, January, February, and March.

547. I suppose that in your business it has been to your interest to watch the chilled meat that has come into the market? Yes; I have watched it.

548. Does the country killed and chilled meat now arrive in as good a condition for human consumption as that killed on Glebe Island? No, it does not. No man who knows anything about meat will take a piece of meat that has been in the chilling-room in preference to a piece of fresh-killed meat. For instance, take the Jews. They are the greatest authority on meat we have, or could get, and they will not eat a piece of meat that has been killed any time or hung. The fresher they get it the better they like it.

549. But there is a very widespread prejudice, especially among people who come from England, in favour of meat that has been killed for some time and hung? There may be among moneyed people, but the poorer classes do not care how long the meat has been killed so long as they can get it.

550. My impression was that it was the moneyed classes in England who insisted on having meat, especially mutton, hung a long time before they would eat it? Yes.

551. Do you think that with all the improvements that have been made in machinery in connection with the chilling of meat there may be still further improvements, and consequently that it may be possible to do without the Abattoirs in the city altogether? I do not care what machinery they introduce into the business, they can never do without the city Abattoirs.

552. I will put the matter in another way. Would it be possible to bring into Sydney meat killed at the country Abattoirs if the carcasses were broken up into smaller joints before being despatched? They would have to pack it. When you break up meat you have to hang it up in pieces in such a way that the air can get between; but they would have to pack it, and then it would become sour.

553. Would it not be possible to fit up the cars in such a way as to hang up the carcasses in large pieces instead of quarters? You could fit up the cars in that way, certainly.

554. Leaving out the question of cost, would it not be possible by such a system to supply Sydney with wholesome meat? No; the people would not have it.

555. I am not asking what the people would have; would it be possible to get the meat into Sydney in a wholesome condition, it being killed in the country, chilled, and broken up? It would be possible to get it in, but the trade would not take the meat.

H. W.  
Austin.

25 Aug., 1896.

556. Have you any idea how many slaughter-houses have to be attended to by the six inspectors on Glebe Island? There are 12 chains—there are twelve pithing-pens.
557. Is only one slaughterman employed in each of those pithing-pens? No, a dozen.
558. Then there may be as many as 144 slaughtermen working at one time? Yes.
559. And all the meat that passes through their hands has to be inspected by six men? Yes.
560. And you assert that the inspection is well done? Yes; it is well done. I will tell you why. In one place they run in the bullocks and they knock them down. After the lapse of two or three minutes the carcass is turned on to its back, and the inspector is there as you draw the lungs out of the bullock, and he handles them and squeezes them through his hands to see if there are any lumps, ulcers, or anything else there. If there is he throws it on one side, and then, as the bullock is raised on to the balks, the broad-arrow is put on it. It is the property of the Government then. We generally knock down three bullocks together, and the inspector watches those three bullocks, and as soon as they are inspected he walks into another place, but before he gets out another man perhaps walks in, and so they keep going alternately from one place to another.
561. As a matter of fact, it is not possible for a bullock to be slaughtered and dressed without the inspector seeing it before the inside of it is removed from the carcass? It is not possible on Glebe Island.
562. Then, whatever bad meat gets into the Sydney market must come from somewhere else? It comes from the country; but it would not do for me to say too much on the subject.
563. I suppose it is a fact that some meat does occasionally get into Sydney which should not come here? Yes.
564. But you are convinced that it does not come from Glebe Island? I am convinced that the Glebe Island meat is thoroughly inspected.
565. Do those six inspectors have to inspect all the sheep that are slaughtered there as well as the bullocks? They work among the sheep and pigs and everything.
566. And is the inspection of the sheep and pigs as efficient as that of the bullocks? Yes.
567. You said you suggested to Mr. Reid, when on the deputation, a course that the road to Glebe Island might take;—have you any idea how many public roads that would cross? I do not think it would cross one public road. I had a plan, and Mr. Reid asked me to leave it with him, and I have not been able to get it since. Everything was dotted out upon it—the road that was to be proclaimed for the stock and the Government roads and everything.
568. The driving of cattle, you say, is admitted by all parties to be a nuisance? Yes.
569. Is it not also admitted to be a danger? Yes; in the daytime it is dangerous.
570. It is only a few days ago that a lady was injured by some bullocks? I heard something of that.
571. Is that a common occurrence? No; that is the first instance I have ever known of anybody being hurt. I believe that that came about through some cattle being taken from a boat at Glebe Island last Saturday evening.
572. In connection with the whole question of the abattoirs is, of course, the question of droving;—have you been able to form an opinion as to whether the roads and the footpaths of the municipalities through which the droving takes place are considerably damaged at different times, more especially when they are newly put down? No doubt there is a certain amount of damage to footpaths where stock are driven, because you cannot drive stock the same as you can drive horses.
573. Have you had an opportunity of forming an opinion as to which do the most damage to the roads and footpaths—the sheep or the bullocks? It all depends on the condition of the roads. In wet weather, I believe, the cattle, and in dry weather the sheep, do the most damage, because I believe the sheep work up the stones.
574. Has it come to your knowledge that considerable lengths of newly asphalted paths have had to be entirely relaid in consequence of that? Such may have been the case, but I have not known of it. I know the drovers try to keep the stock off such paths.
575. I believe it is the custom of some of the municipalities to issue rules regulating the driving of stock through certain streets? Yes.
576. Do you know if the drovers try to carry out those rules, or do they set them at defiance? I have not heard of such a thing.
577. You spoke of the retrucking of stock as being impracticable? Yes; it is not workable.
578. Why? There would be the additional knocking about of the cattle in retrucking them, and, in the second place, the cost of retrucking them and bringing them to the abattoirs would be too great.
579. Have you any idea what the cost of retrucking would come to per head? No.
580. Can you guess within 5s.? I could not say.
581. Do you think it would be equal to 5s. a head? I think it would.
582. As to bruising the cattle—are they bruised more in getting into and out of the trucks than they are by the shunting and the journey? Well, having careful men to truck and untruck them makes a lot of difference. At Flemington the men are pretty well educated up to untrucking cattle, but I believe that at country places the cattle are knocked about very much at times.
583. That answer appears to point out that you consider cattle can be trucked more easily, and with less expense, and with less damage to the cattle, at Flemington than anywhere else, in consequence of the experience of the men? The experience of the men. Of course, I do not say it would lessen the cost.
584. It could be done better, with less injury to the stock, because the men are educated up to their work, and have had more experience? Yes.
585. Then it must be cheaper if it does less damage to the stock? Yes.
586. Having said that, do you still think it is impracticable to retruck? I do. I am sure it is unworkable.
587. *Mr. Wilks.*] In regard to the product of the desiccating plant, do you think it is of any commercial value to speak of? It is to a certain extent. Of course it is not so valuable now as it was some years ago, because everything has gone down in the market, more especially manures.
588. It is not simply that there is not a general use of manures, but the price has gone down in common with that of other commodities? Yes.
589. Do you know anything about the albumen that is obtained? I do not know anything about that.
590. Are you aware that the immense quantities of water which they treated with the plant led to the extra expense of the desiccating plant? They used to use very large quantities of water with it, I know.
591. And I suppose that that led to a great deal of the extra expense of working the plant? Yes.
592. How could that be obviated, if it could be obviated at all? I am sure I could not say. I have had no experience in that direction.

H. W.  
Austin.  
25 Aug., 1896;

593. Well, with your experience of cleansing, do you think there is an unusual quantity of water used? No, I do not think so. I know that if you let the water run to waste the inspectors are very soon down upon you, and take your name, and you are summoned.
594. It was never pointed out to you that the extra cost was because the desiccating plant had to do so much extra work because of the large quantity of water? No.
595. *Mr. Bavister.*] You spoke of the Belmore site not being suitable;—is that because while the water is close handy it is comparatively stagnant water—not tidal water? I spoke of the Belmore site not being suitable, but it is suitable in this way—if you had not a better place. But Glebe Island, as I said before, is second to none.
596. Is Glebe Island a better place in consequence of its being surrounded by tidal waters? Yes. There is one thing about the driving of stock which I should like to point out. You should license all drovers in charge of stock, and then, if anything wrong took place, you would have something to fall back upon, and it would make them responsible.
597. *Chairman.*] A little while ago you stated, in reply to one of the Committee, that you knew of diseased meat coming into the Sydney market, but not from Glebe Island;—can you state positively where this meat comes from? People who have read the papers from time to time might have seen.
598. You are not in a position to say positively? I am not in a position to say positively.
599. But you are of opinion that diseased meat does come into the Sydney market from abattoirs outside Glebe Island? Well, I should like to know what becomes of all the diseased bullocks. Before there was such a rigid inspection carried on at Glebe Island, we used to get a lot of cattle sent to Flemington suffering from cancer, tuberculosis, and actinomycosis, and different other diseases, and that stock used to come to Glebe Island. But since there has been proper inspection there the graziers dare not send diseased bullocks there, and I should like to know where they go to now. They go somewhere.
600. You are of opinion that diseased cattle still find their way into the sale-yards at Homebush, but they never put in an appearance at Glebe Island? I do not say they are sent to Homebush.
601. But is it a general impression amongst the carcass butchers at Glebe Island that diseased cattle are still being sent on to the Sydney market through being killed at other abattoirs, where the inspection is not so rigid as it is at the Island? What I should like to say is this—what becomes of that meat?
602. *Mr. Wilks.*] You think there is some brought into consumption? Yes.
603. *Chairman.*] Would it really pay you better to have private abattoirs than to go to Glebe Island—that is, so far as your ease, comfort, and general prosperity as a carcass butcher is concerned? Well, as far as prosperity goes, no doubt it would. If I had a private slaughter-house, and an inspector was appointed there, no doubt I should be able to grease his hand.
604. You think it is possible, then, to grease the hand of the ordinary inspector who comes round? I do not say they do it, but it might be done.
605. You think it is possible to grease the hand of the ordinary inspector who goes round to suburban or country slaughter-houses, but that remark is not applicable to the Government inspectors on Glebe Island? No; I do not say it is applicable even to the country slaughter-houses, but I say it would be possible, if I had a private slaughter-house, to work things in that way, and that is why I say that either the Government or the Corporation should have the control of the Abattoirs.
606. The Government have control of them now? Yes.
607. Do you think that the management of the Abattoirs has improved since they were placed under the rule of the Board of Health? No; I do not think so at all. I do not think the Board of Health has made much improvement in the Abattoirs, as far as that goes.
608. As a carcass butcher, can you see any great improvement or the reverse since the management was placed under the control and direction of the Board of Health? None whatever. The same thing exists now as did before.
609. As a carcass butcher, do you find the management at the present time equal to what it has been in the past under other people? Yes; in fact, better. I do not think the Abattoirs could be under better management than they are at the present time.
610. Does it not strike you as being rather contradictory when you say that the management has not improved under the Board of Health, whilst in the next breath you say that you think that the Abattoirs are under better management than they were previously? The Government would not vote the money required to improve them. The management is right enough. If the Government voted money for the Abattoirs to be improved there is room for improvement, and they could be improved.
611. Do you think that it is possible, by expending a fair amount of money on the present Abattoirs, to make them up to date? Yes; and second to none in the world.
612. The present Abattoirs? Yes.
613. A complaint has been made by other witnesses that the space between the two rows of slaughter-houses is far too narrow for carrying on the large amount of trade done in meat at the Island? It is too narrow.
614. Would it be possible to get over that difficulty while the present Abattoirs were allowed to remain? Yes.
615. What would you suggest to get over it—widening the space between the two rows of slaughter-houses? By pulling down the mutton slaughter-houses, which are out of date.
616. The beef houses, you think, are up to date? The beef houses are right enough.
617. Do you deal in both mutton and beef? No, in beef only.
618. You do not touch mutton at all? We used to kill it, but we do not at the present time.
619. You knew Mr. Kenway, the late manager? Yes.
620. During his administration were matters conducted satisfactorily to the carcass butchers and to the buying public at the Island? I always found that to be so. I never heard of anything to the contrary.
621. You have not been able to form any different opinion since the change of management took place? Not at all.
622. Since Mr. Shelley's appointment? Not at all.
623. Do you think that any favouritism is shown towards one carcass butcher or butchers as compared with others? No; that sort of thing is only idle talk.
624. Have you found generous and fair treatment all round from the management of the Island? Always. I always found things dealt with fairly there as regards everybody.
625. Have you thought the matter out as to the best method of getting stock to the Island without the inconvenience

inconvenience that is, generally speaking, supposed to be caused to the public by the driving of cattle and sheep and other stock to the Island along the public highways between the Flemington sale-yards and Glebe Island? As I have pointed out, there could be a private road striking off near O'Brien's place, and going between Inglis's and Keep's, and down across the reclamation—the canal—and through Ramsay's Bush, and then coming out by the bridge on the Parramatta Road—the North Road, as we call it—which comes down by Abbotsford.

H. W.  
Austin.  
25 Aug., 1896.

626. Are you aware that even the road you have just selected would cross at least a dozen public thoroughfares? Streets, no doubt; but not Government roads.
627. Macadamised roads of different municipalities? Yes; public thoroughfares, no doubt, it would cross. It would, for instance, cross the tram-line.
628. Would that not necessitate, in driving cattle particularly, as much care and attention as in driving them along a straight road now? Yes.
629. Cattle would be as liable to get away from a mob in crossing over those thoroughfares as would be the case under existing circumstances? Yes.
630. Have you ever thought out the advisability or otherwise of having a branch line of railway from the main line to Glebe Island? I have thought of that, and have spoken of it on different occasions—a branch line of railway running from Stanmore down by White's Creek and on to the Island. There is a lot of Government ground there of no use at the present time.
631. You know the route *via* White's Creek very well? Yes.
632. And a single line of railway, you think, would be sufficient, and it could be constructed at small expense and with a very small amount of resumption of private land? Yes, a very small amount.
633. You have seen cattle slaughtered in the district of Belmore? Yes.
634. And before half an hour has elapsed you have seen the same meat fly-blown? Yes.
635. The same thing occurs continually at suburban and country slaughter-houses? Yes.
636. A similar experience has never been known at Glebe Island? That is true.
637. That is probably owing to the absence of blowflies on the Island? There are no blowflies there, and very few other flies. Why it is I do not know; but it is so.
638. And you are of opinion that the country-killed meat sent in refrigerating chambers in the summer-time will, before that meat is delivered into the refrigerating cars, be fly-blown? Yes; some of it at times. I do not say all of it.
639. During the very hot weather? Yes.
640. And the great drawback of the country-killed meat is the presence of blowflies, and the danger of the meat being fly-blown? Yes; that and the excessive heat.

Charles Thompson sworn and examined:—

641. *Chairman.*] What is your address? 41, Weston Road, Roselle, Balmain.
642. What is your occupation? Butcher.
643. Retail or wholesale? Retail; but I have had some experience also as a wholesale butcher.
644. Have you lived long at Balmain? Since about 1880.
645. You have had a good deal of experience in connection with Glebe Island? Yes; a fair experience.
646. You visit there at least once a day, I suppose? Often twice a day, but in the cold weather I may go there only twice a week.
647. The place where you live, as well as your business, would give you a good opportunity of judging as to the general conduct of Glebe Island, both inside as regards the slaughter-houses, and outside, in the matter of cattle-driving? Yes. They pass my door.
648. *Mr. Wilks.*] Do I understand you have been a carcass butcher? I have in connection with retailing sold a few carcasses.
649. What has been your experience of the general management of the Abattoirs? Well, the faults I find with that are the cattle-droving, and the cattle not being sufficiently rested before they are killed.
650. The meat is inflamed? Yes; the meat is harassed.
651. How would you get over that difficulty? I would have the cattle kept in a paddock, and not killed for two or three days after they are bought, and to be fed and watered there. The expense of keeping would be nothing, for cattle fetched from the country will not eat much; they mostly require rest.
652. It would be a considerable gain to the consumers of meat, because healthier meat would be put on the market? Yes.
653. What is your opinion of the present Abattoirs;—would you recommend their removal or their continuance at Glebe Island? I would rather see them removed, unless a railway could be constructed to Glebe Island, and even if you had such a railway, I do not know how you would feed the cattle on that area of ground.
654. To where would you remove the Abattoirs;—which scheme you have heard of meets with your approval most? I would suggest Kurnell.
655. Have you been to Kurnell? Yes.
656. What recommends that site so much to you? It is away from all population, and if any people went to live there subsequently, they would do so at their own risk. The inhabitants would complain if you removed the Abattoirs to a populous suburb.
657. Then you consider there is a risk where the Abattoirs are at the present time? Yes.
658. As you live near the Abattoirs, will you tell us what is the general feeling there;—is it in favour of their continuance or their removal? I think it is in favour of their removal. But I suppose that the people who work at the Abattoirs would rather have them continued at Glebe Island.
659. What is the opinion of the people who live in Weston Road, with whom you do business? You must know that wild cattle are dangerous, and have been known to horn people along the road, and also to horn horses. Only last week a wild bullock had to be shot near our place.
660. Do you think that that could be obviated by limiting the time for driving, say, between 12 p.m. and 6 a.m.? No doubt that would get rid of a great deal of the trouble.
661. Have you noticed that the only objection that there is against the removal of the Abattoirs from Glebe Island is that some people are afraid that that site will not be used for some other business purpose;—suppose the people in your neighbourhood knew that the Island would be used for some larger business purpose, would they favour that more than the present Abattoirs? Certainly; I think it would improve property.

C. Thompson.  
25 Aug., 1896.

- C. Thompson. 662. Do you think that Glebe Island is well suited for the tinning and export of meat? Yes; it is surrounded by water.
- 25 Aug., 1896. 663. What is your opinion of killing meat in the country, and bringing it to the city chilled? Well, according to the butchers in general, that meat is much better than the Glebe Island meat, because the cattle are killed on the pastures, and are never killed in a heated state.
664. That meat is generally in a healthier state than the meat you receive from Glebe Island? Well, as a rule, any retail butchers prefer country killed meat to Glebe Island meat.
665. Is that your own personal opinion, or is it the opinion you have gathered by coming in contact with other retail butchers? I think it is better chilled, but not frozen.
666. You have no interest in a chilled meat company to lead you to speak like this? No.
667. Neither directly nor indirectly? No.
668. Have you heard of the probability of chilled meat being put upon the market fly-blown? I have never seen any, and I have passed by the market very often.
669. Under the present system of killing at private abattoirs in the country, have you heard of any carcasses of diseased animals coming on to the Sydney market? I have heard it said that a quarter, or one or two quarters, have been condemned at the markets, but that was some time ago.
670. But you do not think it is general? No.
671. Is there not a rigid inspection at Glebe Island to detect disease in meat? I know there are three or four inspectors there to do it.
672. Do you think they do their work? Well, I suppose they do attempt always to detect disease, but it is possible, I think, to deceive the inspectors at times.
673. By what means do you think they could be deceived—carelessness of inspection? That would be one thing.
674. Or connivance of the people themselves? They might have some already for them. People would naturally try to get it through if they had a diseased bullock.
675. Do you believe that sometimes they have passed it through? I do not know for a positive fact, but it is generally thought so.
676. It is not mere talk, but it is thought by experienced people that occasionally diseased meat does get through? Yes. It is only common sense to think that if you have a bullock that cost you so much you would try to get it through if you could, instead of losing so much on it.
677. If there were an increased number of inspectors do you think that could be prevented? It might be, but there is always a possibility of that sort of thing occurring.
678. *Mr. Law.*] You said that meat killed and chilled in the country is better for consumption than meat killed at Glebe Island? Yes, for the reasons I have given—that it is not killed in a harassed state.
679. But do you know for a fact whether it is apt to be sold at an increased price to the consumer;—can you get meat killed in the country as cheap per bullock or per quarter as you can get other meat? We buy it as cheap, generally, as Glebe Island meat can be bought.
680. In regard to the cattle coming down in a heated state, and then being killed, when a large number of bullocks were brought down by the steamers from the rivers or Queensland, did not the bullocks come down in much better condition than for consumption than when they were driven down? Well, they are liable to be knocked about on the boat. I have experienced that myself.
681. But would they not get here in a better condition than if driven to Sydney a number of miles? Well, as far as the weight of the cattle is concerned, I daresay you would actually get more weight at your destination if the cattle came by steamer than if they were driven, because, I think, the inside fat would be got rid of by driving.
682. Do you not think that the Abattoirs at Glebe Island, having such a good fall towards the water, would have greater facilities for carrying away debris or anything calculated to cause disease than would be the case at Kurnell where the land is level? There is plenty of land at Kurnell, and I think it has as good a fall as the land at Glebe Island, and you could gravitate it to the ocean.
683. *Mr. Bavister.*] You say that Glebe Island would be suitable for the purposes of meat export. If that is so, why should not Glebe Island be also considered to be the best place for killing purposes? Well, it is too close to the population. People do not like it so near them. It is against the value of property.
684. You are giving the opinion of the population, and not your own view of the matter? Well, it is better to keep meat, I should say, near the ocean.
685. Do you find, as a person engaged in the meat trade, that meat keeps better in a moist atmosphere than in a dry one? Well, I know my experience is, that meat keeps much better near the ocean. But perhaps the cattle I have seen killed there was properly killed after being allowed to rest, whilst the cattle killed at Glebe Island is heated, and the public have to suffer in eating bad meat owing to its being killed too soon after being driven.
686. But you said that meat kept better on the coast, near the ocean, than it did in other localities? Yes.
687. I assume that on the coast, near the ocean, the atmosphere is damper than it is inland? Yes.
688. You have had experience in your own place of business that some periods of the year are better than others for meat;—have you found meat keep better in dry weather or in moist weather? Better in dry weather than in muggy weather.
689. Therefore, your opinion, as just expressed, is not fully borne out by your own experience? Well, in muggy weather I think it does not keep so well as in hot dry weather. But it is not the same on the coast.
690. A question was asked you as to the height of the slaughter-houses above the level of the water at Glebe Island, and as to whether it did not constitute a healthy position for the slaughter-houses, by enabling the refuse to be carried away;—is it not a fact that that does not depend so much upon the height of the slaughter-houses above the level of the water as on the fall of the water? I could not say anything about the fall of the water.
691. If you had two positions, one of which was 30 feet above the level of the water, and discharged into sluggish water, whilst the other was only 3 feet above the level of the water and discharged into a rapidly running stream, which would you consider most fit to carry away the refuse? Well, of course, the one with a good current; but you get a very good current off Kurnell.
692. *Chairman.*] I think you stated a little while ago that people who lived round about Glebe Island complained simply on account of the Abattoirs being close to them? Yes.

693. Were those Abattoirs there before the people built those houses, or were the Abattoirs put there after those people had built those houses? I could not say. C. Thompson.  
25 Aug., 1885
694. But during sixteen years you have seen hundreds of houses built round about you? Certainly.
695. Therefore, people who are complaining of the Abattoirs being close to them, of their own free will, bought land and built houses close to the Abattoirs? There is no doubt about that.
696. Has it ever struck you that the same thing might occur in reference to other places—that, if abattoirs were erected there, people would go and buy land and build quite as close to the proposed new abattoirs in some other locality as they have done to those on Glebe Island? Yes; but I suppose that the Government would buy sufficient land to keep them reasonably far off.
697. Have you noticed anything very offensive where you lived coming from the Abattoirs? No.
698. You get no objectionable smell? No.
699. You do not think the health of the district surrounding your place is prejudicially affected by the presence of the Abattoirs at Glebe Island? I do not think the health is affected. It is not, so far as I know.
700. You have a family, I presume? Yes.
701. All fairly healthy? Yes.
702. And you have reared them in the district? Yes.
703. You have not heard of any complaints from either of the doctors practising in the district or from the people themselves about the unhealthiness of the district owing to the presence of the Abattoirs? Well, I have heard, but I would not take much notice of it. I think it is mere fancy. I do not think it is unhealthy.
704. You personally consider that it is just as healthy now, with the Abattoirs at Glebe Island, as it would be if the Abattoirs were removed, and some other industry started there? Yes; I have never had any objection as regards health.
705. *Mr. Law.*] You have been in the Abattoirs, backwards and forwards, about sixteen years;—have you ever seen a blow-fly on Glebe Island? I cannot say that I have ever seen any blow-flies in the slaughter-houses; I have not taken particular notice; but I have seen them outside the slaughter-houses.
706. *Mr. Bavister.*] What! on the Island? Yes; I may be making a mistake. I have not seen any actually in the slaughter-houses, but I think I have seen them outside the slaughter-houses, on the offal.
707. *Mr. Wilks.*] Have you ever visited any other abattoirs? Yes; Riverstone.
708. That is under private enterprise? Yes.
709. I suppose their management is not at all equal to the management of our Abattoirs? Well, in some things I thought it was better.
710. In what things? Well, in the killing of the sheep. They drove them under cover, and they killed them, as near as I can recollect, 10 feet overhead, on battens. They stuck the sheep there, and the blood fell through, and they kept much cleaner. It fell on to the floor, and could be swept away.
711. What is your idea in regard to the movement on foot to place the Abattoirs under private enterprise? I have never thought that out in any way.
712. Well, what is your idea of placing the Abattoirs under municipal control? There is no doubt they could greatly improve on the management at the present time. I looked at the clock the other morning, and noticed that it was a few minutes after 7 when the cattle were going by. That was very late in the day.
713. You think they are very lax? Yes.
714. Do you consider that under private enterprise there would be a danger of ringing the price of meat on the public? I cannot see how that could happen very well with competition.
715. But, supposing the Abattoirs were in the hands of, say, two people, who had different places for slaughtering—could not they ring the price? Yes.
716. Do you not think, then, that that would be the great danger of handing the Abattoirs over to private enterprise? Yes. I would not agree to that.
717. Which do you think is better—State or municipal control? Well, either of those.
718. Which would you prefer—the State, as now, or our own local Municipal Council, who have talked about taking over the Abattoirs;—do you think it would be prudent to hand it over to them? I think they could make it pay right enough.
719. *Mr. Bavister.*] Have you any idea how many cattle could be driven on the road from the sale-yards to the Abattoirs between 12 o'clock at night and 6 o'clock in the morning;—could a sufficient number be driven during those hours? Yes; and twice as many. I have seen men go out after 6 o'clock to fetch them in, and they are supposed to be on the Island at 7 o'clock, and are generally in by 7 o'clock. They fetch them from Homebush on Thursday or Monday half-way, or to within 3 or 4 miles of the slaughter-houses, and go back for them next morning.
720. How long will it take one mob of cattle to go from Homebush to the Island? I think you could get them there in three hours.
721. Are sheep driven as quickly? No.
722. Then, supposing you have half a dozen different mobs of cattle, and as many different lots of sheep, would it be possible for all those sheep and cattle to start from Homebush after 12 o'clock at night and get to Glebe Island before 6 o'clock next morning? Of course they could. They do not all come along the same road to Glebe Island. They come to the Island *via* the Abattoirs Road and down Weston Road.
723. Supposing the sheep could take one road and the cattle another, could half a dozen different mobs of cattle be driven on the road between 12 o'clock and 6? Yes. They do drive the cattle at times within 50 yards of one another, but they are generally a quarter of a mile behind each other.

Arthur Grey Kenway sworn and examined:—

724. *Chairman.*] What is your place of residence? Young-street, Burwood.
725. What is your occupation? None at present.
726. You are out of business? Yes.
727. What were you formerly? An architect.
728. And of recent years you had some connection with Glebe Island? I was Superintendent.
729. For how many years? Six years.
730. Previous to that were you engaged on the Island? Yes.
731. In what capacity? As officer-in-charge of works connected with the meat trade.
732. Mr. Oatley, I suppose, was the Superintendent at that particular time? Yes, at first.
733. You succeeded Mr. Oatley? No; Mr. Jager did.

A. G.  
Kenway.  
25 Aug., 1896.

- A. G. Kenway.  
25 Aug., 1896.
734. And you succeeded Mr. Jager? Yes.  
735. You were under Mr. Jager and also under Mr. Oatley for some time? No; independent of them, but under the same Minister—the Colonial Treasurer.  
736. Under the same Minister, but not under the immediate control of either of the two previous Superintendents? No.

THURSDAY, 27 AUGUST, 1896.

Present:—

MR. BAVISTER, | MR. LAW,  
MR. O'SULLIVAN.

J. S. HAWTHORNE, ESQ., IN THE CHAIR.

Arthur Grey Kenway recalled and further examined:—

- A. G. Kenway.  
27 Aug., 1896.
737. *Mr. Law.*] What is your opinion in regard to the site of the present Abattoirs? As a slaughtering site it is magnificent, as regards slaughtering and the production of meat. But I confine myself entirely to that in that answer.  
738. Do you think that it makes meat more expensive to the consumer by killing it in the country and bringing it down to Sydney than by having it killed at Glebe Island? If there were no metropolitan Abattoirs and we were dependent entirely on country-killed meat, that would probably result in a dearer price to the consumer.  
739. Have you prepared a statement which you would like to read? Yes. Referring to the question of the Abattoirs site, I may state that I have prepared these notes, which are more valuable than mere verbal evidence would be. They are the result of careful thought. The question of the Abattoirs involves these considerations—preservation of public health, preservation of the interests of the stock-raisers, the stock-buyers or agents, the butchering trade (including carcass and retail butchers, and the consumers), and the purchasers of the waste products—that is, including noxious trades, tanning, fell-mongering, &c.—whilst, of course, the staple industry of the whole Colony from beginning to end, wool, is partially involved in this. Beginning with the preservation of the public health, I must commence with the responsibilities of the Board of Health.

BOARD OF HEALTH'S RESPONSIBILITIES.

In connection with this phase I must be understood to be speaking as a layman, who makes no pretension to expert knowledge of diseases, but at the same time a layman that has made the Abattoir question his special study for many years past, and has during that time had special opportunities for investigating all questions relating to this matter, and to the meat trade generally, and one that ceases to be a layman in all Abattoir questions except the diagnosing and identification of diseases in live stock or meat and their effect upon man.

The first subheading is—

*Inspection of Live Stock arriving at the Abattoir.*

Although at first sight the necessity of this precaution on an establishment where inspection during slaughtering will follow is not very apparent; it is real, because it enables detection of disease in many instances, and the separation of diseased from healthy stock, and their killing under special arrangements.

*Inspection during Slaughtering.*

This is the more important function, and complete inspection during this operation is of vital importance, and can be perfect only when each individual beast is watched by the inspectors.

At present this inspection is far from complete at the Glebe Island Abattoir, the staff of inspectors being far too small. Very many individual beasts escape examination, especially among the smaller stock, and too many opportunities are afforded to conceal disease.

It was only upon my repeated strong representations that the original staff of two (2) was increased by the appointment of three (3) additional inspectors. The Board of Health have empowered two (2) more Abattoir employees with the powers of inspectors, but there are none that possess diplomas, or who have had special training except what experience the Abattoir has afforded them.

The Government Veterinarian has control of the whole Inspecting Staff, and directs any discretion used in passing or condemning meat.

It is nakedly apparent that a specially trained staff should be appointed to these important duties.

The present inspectors and assistant inspectors have by now had time to gain practical experience and have undergone an examination by the Board of Health.

In alluding to the absence of diploma'd inspectors I am referring principally to their responsibilities and powers of condemning or passing meat, and their discretionary power in so acting; I am not questioning their ability to detect disease.

In the case of the present Chief Inspector these remarks do not apply. His special aptitude in detecting disease in living stock, as well as identifying it in the dead carcass, is not likely to be possessed by a veterinarian who has not been brought up from childhood amongst stock; but, again, it is not always that a gentleman of such stock experience can be found, who has also made diseases such a special study, except beyond what is necessary to his business as a stock-raiser.

Inspection for diseases must be thorough and complete if the objects for establishing a public abattoir are to be achieved. A partial inspection gives the public false confidence, while allowing concealment of disease.

*Condemnation and Disposal of Diseased Meat.*

Carcasses that are pronounced to be diseased or unfit for food are condemned *in toto*. The body, offal, &c., is saturated with kerosene to prevent its entering into consumption, and it is then allowed to be taken away from the premises. The hide or pelt is allowed to mingle with others without any precaution. Bruised carcasses may be condemned wholly or partially as unfit for food.

The condemnation is made on the dictum of the Chief Inspector, but all inspectors have the power to condemn on their own responsibility. The liberty of appealing against such condemnation is allowed the butcher, but the authority appealed to is the Government Veterinarian, who is an officer of the same Department. I think appeal to independent authority should be allowed.

As regards the principle of condemnation, the inspectors are furnished with copies of works supposed to be the newest and best on the subject, but they are totally unarmed with proper implements, having only a knife and their natural unaided sight at command. It would appear that common sense would arm each inspector with a suitable microscope to enable detection of disease in the meat which might not be displayed to the naked eye, and also to guide the inspector in passing or condemning a carcass that may display disease in certain organs, and which may not necessarily be disseminated through the whole body. It appears to me like sending a mariner to sea without a compass.

The absolute necessity of such wholesale condemnation and destruction is worth serious inquiry. In some older countries experience has taught otherwise, and certain meat is allowed to enter consumption branded as diseased, but which is not thought to be necessarily dangerous to health. The same thing is partially done at the Glebe Island Abattoir without branding, but the discretionary power is wholly unprotected by the use of the microscope on meat passed or condemned, standing instructions from the Government Veterinarian to judge according to certain symptoms being the "rule of thumb" by which the inspectors are guided.

The

The following figures, showing stock killed and condemned at this Abattoir during 1895, are of interest:—  
Slaughtered—bulls, 8; bullocks, 77,644; cows, 8,628; calves, 11,807; pigs, 85,925; sheep, 737,281—being 921,296 animals in all. Condemned as diseased—bulls, 4; bullocks, 2,592; cows, 713; calves, 5; pigs, 3,020; sheep, 48. Only condemned as unfit for food, or bruised—bullocks, 17; calves, 1,297; cows, 51; pigs, 58; and sheep, 8.

This gives a total of animals condemned as diseased 6,382, and as unfit for food from other causes 1,424.  
These figures are very startling, and become more so when expressed in money value, calculated upon average values at present market rates, viz., totals condemned—bulls, 4 at £1, £4; bullocks, 2,609 at £6, £15,654; cows, 764 at £4, £3,056; calves, 1,295 at 15s., £971 5s.; pigs, 3,078 at £1, £3,078; sheep, 56 at 6s., £16 16s.—£22,780 1s.

When it is remembered that the institution of a public abattoir governing far wider districts than at present, and the abolition of private suburban Abattoirs, will at least double these figures, the grave importance of this is irresistibly forced upon one's attention.

I think it will be admitted that our stock supplies (with the exception of Queensland cattle) of the present day are freer from disease than they were a few years ago, when the numbers condemned at the Abattoir did not exceed twenty or thirty per annum, and yet it does not appear that disease in man acquired by eating diseased meat was more prevalent then than now, or that this wholesale condemnation is justified by any improvement in public health. Do country residents consuming meat not inspected suffer more than Sydney residents protected by the Glebe Island Abattoir?

I do not advocate the lessening of inspection, but the reverse; but I do advocate that more consideration shall be given to a national industry of such importance as stock-raising, unless very clear and definite reasons are shown in justification of such harsh measures.

There is an apparent inconsistency shown in the small number of sheep condemned as compared with other stock, cattle for instance, of which 3,377 were condemned out of a total of 80,280, while of sheep only 56 were condemned out of a total of 737,281, affording the relative percentage of 3.78 and .007 respectively.

Does such extreme difference in the proportion of disease in the two kinds of stock possibly exist? does the hardship of the journey to the Abattoir weed out diseased sheep so effectually before the flocks reach the Abattoir? or is it not the case that cattle receive more individual inspection than sheep? The proportion of pigs (which receive special inspection) which are condemned confirms the suspicion that laxity of inspection accounts for the discrepancy in the figures. If it is safe to use this discretionary laxity as regards mutton, why is it not equally wise to use the same discretion with beef? Everyone will agree that it is not desirable to use this discretion in dealing with pork. I may add that if mutton were to receive the same rigid inspection as beef its price in Sydney would, in my opinion, be 1s. per pound.

*The killing of stock in a fevered condition*, such as is the case at Glebe Island Abattoir, and for which no one is to blame (as the circumstances surrounding the stock traffic and trade enforce it), must surely be more or less injurious to public health, and is proved in practice to injure the quality and market value of the meat.

*Methods of slaughtering at this Abattoir* are very imperfect. The slaughter-houses are so placed, designed, and are of such limited capacity, that only the crudest methods can be used; the meat is hung in a vitiated atmosphere, and no opportunity is afforded for abstracting the animal heat. The dangers and evils resulting from these causes are obvious. The meat is liable to be contaminated by the absorption of noxious fumes and germs from the vitiated atmosphere, and is frequently decomposing before leaving the Abattoir.

The same causes prevent anything like cleanliness.

Control of sanitary management of the Abattoir should certainly be under the Board of Health.

Control of noxious trades connected with the Abattoir should also rest with the same body.

*Prevention of cruelty to live stock and control of watering and feeding*.—These matters should also be controlled by the same Board, who should have the power to enforce proper treatment of stock during the journey to and after arrival at the Abattoir.

The bruised condition, exhausted and the fevered state of stock is matter that has been frequently brought under notice of the Government by myself, but nothing practical has been yet done to lessen these evils.

*The present system of condemning and destroying stock consigned to the sale-yards*, under clause 3 of the Diseased Animals and Meat Act of 1892, is the cause of endless disputes and friction in the stock trade, and is conducive to the concealment of disease. The Act fails in its objects by its severity in punishment for offences, which are not always wilful, and sometimes unavoidable, and in causing the entire loss to fall upon the individual.

The only method that will succeed in ensuring the detection of disease in live stock is one that, while punishing severely the knowing or wilful concealment of disease, or even carelessness in dealing with the same, should offer every inducement for its exposure, by protecting the innocent from punishment, and ensuring that the total loss shall not fall on the individual.

A small inspection fee upon all stock consigned to the sales-yards, and again on its discharge from the same, would afford a fund that, if subsidised by the Government to the extent of one-third, would partially compensate the individual for the loss, and equally divide the burden between the stock-producer, the purchaser, and the public (as represented by the Government). This system should apply only to cases of disease discovered after the stock has been inspected and admitted to the sale-yards; any cases discovered prior to such admission should be thrown upon the consignor or owner.

*Note*.—By far the greater number of cases are discovered after the stock pass through the sale-yards.

*Licenses to Butchers*.—The Board of Health should have the power of granting, withholding, or withdrawing licenses to slaughtermen, carcass butchers, and shop butchers, making a clean bill of health (as regards certain diseases) a condition of granting a license. In view of the powers of absorption possessed by meat, and the amount of personal contact it suffers in its various handlings before it reaches the consumer, the obvious wisdom of some protection of this kind is apparent.

In conclusion, I wish it again to be understood that I do not pretend to be any expert in diseases or of their cause and effect. These notes are written with no intention to criticism, but they simply are an effort to express what I myself think is a common-sense view of the various phases of the abattoir question, and the figures quoted as to stock killed and condemned were published by the Board of Health, and appeared in the *Herald* of 15th February, 1896.

#### STOCK-RAISERS, SELLERS, AND MEAT TRADE.

##### *Site of Abattoir.*

The choice of site of a metropolitan abattoir must be governed by the following considerations:—

- The extent of population to be provided for.
- Extent and position of the area so populated.
- Isolation from such population.
- Isolation from future encroachments.
- Avoidance of any possible complaint of nuisance.
- Railway connection to stock centre.
- Railway to metropolis, suburbs, and districts to be served.
- Connection to seaport.
- Ample area of cheap land.
- Elevation of greater part.
- Permanent water supply.

##### *Area of Abattoir Ground.*

The area provided must be sufficient to fulfil the following requirements:—

- All future extensions.
- Isolation from future growth of population, should the position of the site itself not ensure it.
- The Abattoir proper, with its yards, roads, chill-rooms, desiccating works, &c., &c.
- Sale-yards, reserve-yards, roads, &c.
- Railway buildings and sidings, and possibly canal and docks.
- Receiving and resting paddocks.
- Stock storage and agistment paddocks.
- Farms and orchards for the utilising of waste materials and liquors.
- Accommodation and isolation of noxious trades connected with the Abattoir.

With the foregoing requirements in view, it appears necessary to choose the site of the abattoir somewhere between Blacktown and Parramatta, that being the district nearest Sydney where proximity to stock centre, and access to central meat market and seaport, will be most conveniently secured, while the comparative cheapness of the land will enable the acquiring of sufficient area to meet the requirements of isolation, paddock, and other accommodation, &c., &c. It should not be difficult to secure the advantage of elevation.

For abattoir, chilling, and desiccating operations about 30 acres would be sufficient.

To

A. G.  
Kenway.  
27 Aug., 1890.

To allow for saleyards, receiving paddocks, and partial furnishing of resting paddocks as adjuncts of the Abattoir, a total area of 500 acres would be required.

But to meet all the requirements enumerated an area of 2,000 acres would be necessary.

This large area will increase the returns from the Abattoir, and be a safe and profitable investment, for while affording a natural and economical means of disposing of, and utilising all the waste materials and liquours produced by the Abattoir, noxious trades, &c., which otherwise would be a very serious charge in the working expenses, it will afford a handsome revenue from rents charged for farm and orchard land, agistment fees, &c. The large area will greatly improve the exigencies of the stock market by giving means to meet any sudden glut or depletion of the market, the fluctuations of the carcass butchers trade will be largely prevented, the stock will be killed in a cooler and sounder condition, and the quality and value of the meat will be enhanced.

The rents from the noxious trades sites will return profit on the outlay upon land occupied by them.

Some strong objections will be made to the distance of such a site from Sydney, but if special trains are run to the Abattoir, the loss of time incurred will not be serious. In these days of refrigeration such distance from town has no significance as regards conveyance of meat in proper condition. The cost of extra freightage will be more than covered by the saving of droving and paddocking expenses. The suburbs between Homebush and Glebe Island will be immensely benefited by the abolition of droving of stock through their streets, and the animals themselves will be saved from a large amount of suffering.

The district suggested will be easily connected to our main water supply, and the large area recommended will allow economy in its use by the conserving of the local rainfall for the use of stock, &c. It may prove profitable to pump salt water and supply by gravitation for refrigerating purposes, and this water could be allowed to flow back to its source in an unpolluted condition. The comparatively small quantity used in cleansing the Abattoir might with advantage be put on the land.

*Memo.*—The adoption of this site would entail the closing of the Municipal Sale Yards at Homebush, for it is imperative that the sale yards for all stock shall be a part of, and be immediately adjacent to, the Abattoir. The question of compensation is beyond the province of these notes, but it will certainly arise directly any action is taken in adopting a site where these saleyards cannot be utilised.

#### REASONS WHY THE ABATTOIR SHOULD BE REMOVED FROM GLEBE ISLAND AND LOCATED FURTHER INLAND.

Public prejudice against the existence of an Abattoir amidst thickly-populated portions of a town will always exist, and will, sooner or later, result in its removal.

Balmain, which is the suburb most largely benefited by trade interests ensuing from the existence of the Abattoirs in its present site, is the only municipality that protects against its removal. Very strong desire for its immediate removal comes from the rest of the population in and around Sydney. Even the carcass butchers and shop butchers are not unanimous in desiring its continuance.

Although the site is admirably located as regards centralisation with railway, sea port, metropolitan meat trade, &c., it is surrounded by a portion of the harbour, the water of which is already very much fouled, and which, for want of "scour," must eventually become as bad, or worse, as that in Darling Harbour. The result is, and will be, an atmosphere too vitiated to benefit the meat. Again, land is already too valuable in this part of Sydney to be set apart on a sufficient scale for the purpose of one particular trade.

It being impossible to allow the erection of works for noxious trades connected with the Abattoir on this site, great unnecessary expense, and also nuisance, results from the carting of fat, heads, hides, pelts, &c., through the town on its way to the boiling-down, felmongering, and other works.

Although we cannot but believe that it is possible to avoid all nuisance from desiccating operations, with improved appliances, I know of no appliances yet made that do not, more or less, create some nuisance occasionally during practical operations, and it requires but a few occurrences of such offence to raise a general outcry from the public against the whole establishment.

Again, is there any vital necessity, or preponderating advantage to be gained from such centralisation?

By adoption of refrigeration, distance from town has ceased to be of much importance in relation to position of the Abattoir, so long that it is within easy reach of business men connected therewith. Cheapness of land, and the acquiring of large areas, present, of themselves (for reasons elsewhere explained) sufficient inducement for removal to the site proposed in these notes. Isolation, stock sales and treatment, purity of atmosphere, concentration, economy of working, utilising of waste products, &c., all point in the same direction.

As regards the coast-borne small stock, its trucking to the new site will not be so objectionable, or so cruel to the animals, as the driving through the public streets to Glebe Island.

As regards cattle imported from Queensland or other Colonies in exceptional seasons, and landed in the past at Glebe Island or elsewhere on the Parramatta River, and then driven to Homebush, such driving is one of the greatest evils sought to be abolished, and can be cured by trucking to the Abattoir, or by the importation of the meat in a chilled state, which could then be delivered direct to the metropolitan market or store rooms.

Certain existing businesses and vested interests would be certainly disturbed or destroyed; but no reform for the public good is ever effected without this result, which is generally met by compensating those who can establish a sound claim. The cost incurred by such compensation should not deter such a necessary reform.

Further reasons that urge the removal of the Abattoir from Glebe Island are:—The continual and distressing noises, which are more noticed at night time, created by pigs and calves. The cattle are not so disturbing, but on cold nights both pigs and calves create a ceaseless din, which it is impossible to become callous to. The surface drainage from yards, &c., and the waste manure from the Abattoir and from the desiccating works (which are more or less charged with organic matter), all tend to foul the waters of the harbour; and it is only by connection to main sewerage system that this evil will be overcome.

The great value of the land at Glebe Island, as compared with that at the site proposed, will greatly enhance the annual charges against the Abattoir if retained at the former site.

The levelling and filling, deviation of public road, and connecting railway to make the site available for modern requirements, as roughly estimated below, also add very seriously to the annual charges:—

Levelling off and filling in Glebe Island to suit Abattoir, 1,000,000 cubic yards, at 1s. 3d. ....	£75,000
Sea wall, about 1 mile, say.....	5,000
Wharves, &c. ....	5,000
Altering bridge approaches .....	1,000
Connecting railway, say, 3 miles, at £5,000 per mile, including land.....	30,000
Diverting public street.....	1,000

£117,000

Value of land occupied by Abattoir and saleyards, about 50 acres, at £2,000 .....

100,000

£217,000

Interest on this amount, at  $3\frac{1}{2}$  per cent., as an annual charge against the abattoir, £6,618.

This charge is for the site only, with its contracted area, which fails to meet many of the most important requirements,

The proposed country site with 2,000 acres, at (say) £20 per acre, would cost .....

£40,000

Levelling (if any) ..

5,000

Connecting railway, say .....

4,000

£49,000

Value of land occupied by Abattoir saleyards, resting and agistment paddocks, noxious trades sites, farms, orchards, &c., as above, will make an annual charge against the Abattoir at  $3\frac{1}{2}$  per cent. of £1,718 only, and a large proportion of this will be returned from rents, adjustment fees, &c., for land that is not used for distinctly Abattoir purposes.

#### THE PROPOSED SITE AT HOMEBUSH.

The proposed site at Homebush for the new Abattoir, presents the advantage of proximity to the valuable existing saleyards, upon which so much money has been expended by the Sydney Municipal Council, and which returns them a handsome revenue.

But

But its adoption is prevented by its proximity to existing population, whose property will be seriously depreciated by the institution of an Abattoir there, however perfect it might be, and the want of sufficient area of cheap elevated land for its proper requirements, and for its complete isolation. The attempt to establish connective noxious trades would lead to the condemnation of the entire scheme.

A. G.  
Kenway.  
27 Aug., 1896.

#### REASONS FOR RETAINING THE ABATTOIR AT GLEBE ISLAND.

Although the Abattoir possesses many imperfections, and is the direct and indirect cause of numerous justifiable complaints, remedial measures can be taken to remove very many of them.

By cutting down Glebe Island and so increasing its area, and resuming the reclaimed land in White and Roselle Bays, sufficient area could be acquired to found an abattoir, complete with all modern appliances and improvements, and with saleyards in proper juxtaposition. With improved appliances, no nuisances from escaping odours ought to occur. By railway connection, stock could be delivered direct to the saleyards, and all droving in the streets would be obviated.

Large water frontage in the principal seaport of the colonies would be gained. All business could be transacted in the metropolis of the Colony, and both import and export business could be carried on with the greatest convenience. Waste liquors could be run into the main sewerage system, if connection is made, and only the solid waste need be sent to sea.

Coast-borne stock would need to be trucked to the Abattoir at Blacktown or Homebush, and brought back again in the shape of meat. The disturbance or destruction of existing businesses and vested interests would result from such removal.

*Note.*—The necessity of entirely rebuilding the present Abattoir upon entirely new and modern designs, goes without saying, and needs no explanation here.

#### FURTHER REASONS FOR RETAINING THE ABATTOIR AT GLEBE ISLAND.

The greatest cause of complaint against the abattoir has been the driving of stock through the streets. This can be remedied by bringing a railway from somewhere near Petersham and having the sale yards in the White Bay reclamation as its terminus.

No illness in the surrounding neighbourhoods has been traced to causes resulting from the abattoir.

Its removal will cause incalculable ruin to the many workmen engaged at the abattoir who have put all their savings into the purchase of land and erection of homes for themselves and their families. Their case should be dealt with in the most careful manner.

#### CONCLUSIONS.

The conclusions I have arrived at from a thorough consideration of these notes are :—

1. That a Metropolitan Abattoir is, and always will be, necessary.
2. That country abattoirs should be under Government control, but such control can be only gradually applied.
3. That, under such control, it is not very material, except for the reasons stated, as to what body or persons carry on the business of the abattoirs, conditionally upon the due observance and satisfaction of the following requirements, viz. :—Suitableness of site, suitableness of design, suitableness of equipment.
4. That it is extremely unlikely that municipal bodies would be in a position (being small elective bodies), or that private enterprises would be willing, to expend sufficient capital as is required to build and carry on a practically perfectly abattoir, or one that would entirely meet all conditions imposed by the Government.
5. That the choice of site and erection of the establishment will be thrown upon the Government.
6. That the executive, municipal, or other body, or persons undertaking the responsibility of the Abattoir, must necessarily have permanent tenure for a prolonged period, and the total governance over definite "Abattoir Districts" within which no private abattoir shall be allowed to exist, except by the specified permission of the Government and the consent of the occupier of the metropolitan abattoir.
7. That the whole Colony should be gradually divided into abattoir districts, in which the principles governing the Metropolitan Abattoir District may be applied. Newcastle requires immediate attention.
8. That the principles underlying those suggested for the governance of the meat supply, are almost equally applicable to most other branches of our perishable food supplies.
9. That all data collected in these notes point to a site between Parramatta and Blacktown as the best that can be chosen.
10. That the scale upon which the metropolitan abattoir must first be instituted, must be somewhat larger than is necessary to meet the immediate demands of the districts to be served, for although on the one hand the extension of country killing will tend to diminish its business, on the other hand, growth of population and incertitude of seasons necessitates the Abattoir being capable of meeting the fullest requirements.
11. That the abattoir site must accommodate the noxious trades naturally connected therewith.
12. That the abattoir must be equipped with refrigerating and desiccating appliances.
13. That all waste solids and liquids must be utilised on the land surrounding the Abattoir, in order that no polluted drainage may escape therefrom.
14. That the Board of Health should be responsible for, and be properly empowered to enforce the—  
Prevention of meat entering into consumption that is dangerous to public health.  
Sanitary control of the abattoir and noxious trades.  
Prevention of unnecessary cruelty to live stock, and control of watering and feeding at the Abattoir, and during transit.  
Control of the methods of slaughtering and dressing of meat.  
Sanitary condition of men, vehicles, &c., engaged in the business.
15. That no noxious trades other than those connected with abattoir business should be allowed upon the ground.
16. That the interests at stake are of vast importance and of a national character, and that money should not be spared in carrying out in the completest manner the objects sought to be attained.
17. That the whole expenditure will prove a safe and paying investment. That at the present rate of fees, charges for chilling, returns from saleyards, resting and agistment paddocks, noxious trades, farms, orchards, &c., will yield sufficient revenue to pay at least 4 per cent. on the outlay, while providing a reserve fund for additions and improvements, and a suitable sinking fund.

740. *Mr. O'Sullivan.*] What becomes of the condemned carcasses you spoke of? After being saturated with kerosene at the abattoirs they are removed from the premises.

741. But what are they used for? Boiling down.

742. For what? For tallow, principally.

743. You said that more rigid inspection of mutton would make it a shilling a pound in Sydney? Yes; if the inspection of mutton were as rigid as the inspection of beef.

744. What reason have you for saying that? If the same proportion of condemnation occurred in regard to mutton as occurs in regard to beef it would be such wholesale condemnation that the price of mutton must go up.

745. Would it go up to as high a price as a shilling a pound? I have known fourpence charged.

746. You stated that decomposed meat sometimes leaves the abattoirs;—is this meat sold to the public? Yes. I do not think I said decomposed meat, but meat beginning to be decomposed. It is allowed to go to the public. The mutton is hung in clusters of five or six, on one set of hooks, and in warm weather the animal heat cannot get away; and if you put your hand in between any of the carcasses and withdraw it you get the smell of decomposition.

747. I understand from your evidence that you would prefer to see the abattoirs remain on Glebe Island if certain improvements were made? As far as the slaughtering business alone is concerned there is not such a good site anywhere else, but combining that matter with the other questions—the questions of the driving of stock and the condition of stock on arrival at the Abattoirs—it forces me to recommend a site where you could get a much larger area than that at Glebe Island.

748.

A. G.  
Kenway.  
27 Aug., 1896.

748. Do you know anything about a proposed site for noxious trades at Kurnel? I know something about it, but not much. My objection to that site is that it is right away from the centre of business; it is not on a stock centre of the railways. First of all, I should say that I am totally opposed to the abattoirs, which produce the meat for the people of the Colony, being located in a place where all noxious trades are allowed to be carried on without discrimination. Meat absorbs smells, as well as diseases, equally as much as milk does. Of course if you allow noxious trades to congregate you allow them to carry on their operations with a very wide latitude. But if you allow a noxious trade to be carried on within the metropolitan district, you force the manufacturer to find out some way of carrying on his business without creating a nuisance.

749. You suggest that a place somewhere between Parramatta and Blacktown would be a good site? My reason for choosing Blacktown is that it is a railway junction and could be made the stock centre for all the railways.

750. Could you get a sufficient water supply there? We could get the Nepean water supply at Blacktown. I should certainly prefer having the abattoirs nearer a river, where, for the sake of economy, we could get salt-water.

751. Where would the water run to after it had been used at the Abattoirs? On to the land. No noxious drainage at all should be allowed to go from the land where the abattoirs were located.

752. You would utilise the water for irrigation purposes? Yes; that is one reason why such a large area is required.

753. I suppose that that water would be of a fertilising character? Exactly.

754. *Mr. Law.*] According to the figures which you had worked out you stated that the total cost of up-to-date abattoirs on Glebe Island, including the levelling of the Island, the construction of a sea-wall, wharfs, a railway, saleyards, &c., would be £217,000? Yes; preparing the site only.

755. And the interest chargeable on that, at  $3\frac{1}{2}$  per cent., would amount to £6,618 per annum? Yes.

756. You also stated that somewhere along the line—at Blacktown—you could provide abattoirs, &c., at a cost of £49,000? Yes; site only.

757. And the interest chargeable on that would be £1,115 per annum? Yes.

758. You also stated that there was a great noise emanating from the abattoirs at Glebe Island in consequence of the calves and pigs making a great disturbance at night? Yes.

759. As that occurs in the night-time, would it reach the ears of the people at the Glebe? Yes.

760. Right across the water? Yes; and it would reach as far as Annandale. There are frequent complaints.

761. From the tenor of your remarks, it would appear that on the whole you favour the removal of the Abattoirs from Glebe Island? On the whole, yes.

762. Could not cattle be brought from Queensland and the northern rivers by sea to Sydney and landed on Glebe Island in better condition and at a cheaper rate than cattle could be brought from Queensland or the northern rivers to Blacktown? At present they have, on arrival at Sydney, to go up to the Homebush Saleyards. They have to be driven there, and stay there while they are being sold. Afterwards they have to be driven back again. After their sea voyage they are really more knocked about and in a more highly-fevered condition than stock that comes even from Bourke; but if they were trucked from the wharfs where the ships arrive straight to the abattoirs they would be no worse off, but slightly better, than under existing circumstances.

763. They would be in better condition than if they had been driven a long way? Yes.

764. I understand that they are not killed directly at the abattoirs, but are actually driven to Homebush and then back again and killed? Yes; thereby creating double nuisance in driving.

765. You have a pretty good idea of the feeling at Balmain, and I think you stated that the only people who desire the retention of the abattoirs at Glebe Island are people residing in Balmain? Yes.

766. And you said that the people outside Balmain were desirous of having the Abattoirs removed from Glebe Island? Yes.

767. I believe that, so far, the only evidences that have been observable with regard to any objections to the abattoirs being at Glebe Island have been at the Glebe and at Drummoyne:—those are the only places where public meetings against the retention of the abattoirs at Glebe Island have been held? I am not alluding only to more recent meetings, but I have a scrap-album containing extracts from newspapers, which have been published ever since my connection with the Abattoirs, and that has been a matter of continual public complaint. All the railway suburbs have been unanimously in favour of the removal of the abattoirs from Glebe Island on account of the stock-driving nuisance.

768. All the trouble with the railway suburbs has been on the score of the driving of cattle and sheep? Yes; the Glebe people have always complained and agitated for the removal of the abattoirs from Glebe Island. The people of Annandale have done the same—when Annandale was part of Balmain—and the people in a portion of Balmain have also agitated in the same direction. The Pyrmont people have done so too, and likewise Sydney residents. There have been no meetings in Sydney on the subject, but correspondence has taken place in newspapers, and the question has repeatedly arisen in Parliament. There have been meetings recently, of the result of which I am in ignorance, but I think I am correct in saying that as a municipality Balmain is the only suburb that has voted for the retention of the abattoirs in their present site, and even then not unanimously.

769. Have you been present at any of the public meetings held outside Balmain? Only at one.

770. Where was that? At Glebe Point.

771. Was not that a very small meeting? Very small indeed; you could not call it a public meeting.

772. You were not at the Drummoyne meeting? No.

773. So far as you know the meetings that have been held outside Balmain have not been attended by the public at all? No.

774. In other words, they cannot be properly designated public meetings? Even the Balmain meeting was not a large one. You could not call it an evidence of public interest being taken in the question.

775. *Mr. Bavister.*] Mr. O'Sullivan questioned you in regard to your statement that strict inspection would increase the price of mutton to a shilling a pound? Yes.

776. In forming that opinion, did you allow for the value of the by-products of the animal? No; I was simply alluding to the meat.

777. You gave a comparative statement as to the cost of two sites—in connection with the one on the Island you allowed £10,000 a mile for the construction of a railway and resumption of land? Yes, £30,000 altogether.

778. Did you make any estimate as to the cost of railway connection with the other site? Yes, £4,000.
779. You also stated that the present abattoirs, in order that they could be made proper use of, would require rebuilding and remodelling? Yes.
780. Have you gone into the probable cost of that? No. Of course I could do it; but in order to give any information of value to the Committee, it would involve the actual preparation of sketch designs and measuring up.
781. Are the appliances in connection with the desiccating works of such a character that they could be utilised, after such remodelling, or would it be necessary to have entirely new appliances? Desiccation, like refrigeration, is improving every day. I think the Committee will find that one of the carcass butchers at Glebe Island has adopted a process which opens the door to complete reformation. I mean Mr. Elliott. I think he has attempted to convert all the waste products into cyanide of potassium. In these days of metallurgy, there is such a demand for cyanide of potassium as never existed before, and that opens the door to the doing away with the desiccation of these materials entirely. I think it is very possible that all these expensive machines and the risk of nuisance will be done away with. But I should be sorry, from this point of view: the great curse of this country is that the people will not use manures. We are taking immense quantities of crops off the land year by year, and are not returning anything to it.
782. Have you visited any of the other abattoirs? Yes; Melbourne, Hobart, Auburn Meat Preserving Company, Aberdeen, and Riverstone. I have had experience in meat-preserving works.
783. *Chairman.*] Have you ever had any experience of, or have you inspected, any of the abattoirs in the older parts of the world? No; but I have books and pamphlets relating to them, and I have also a lot of information which was gained by the Royal Commission on the "sanitary condition of Melbourne," relating to other existing abattoirs.
784. Is the report of that Commission of recent date? Yes. I have the evidence which I gave them in a printed document, which I think it will be worth the while of the Committee to read.
785. Were you summoned to give evidence before that Commission? Yes.
786. You went from this Colony to Melbourne to give evidence? No; they came here.
787. They visited New South Wales for the purpose of taking evidence? Yes.
788. And you, I conclude, were one of the principal witnesses in this Colony? Yes, as regards the abattoir question.
789. Do they, in that report, make any reference to our abattoirs, either favourable or unfavourable? Yes; they visited our abattoirs, and they said that we were far ahead of Melbourne; imperfect as we were.
790. That was their opinion in 1888? Yes; I gave my evidence in June, 1888.
791. How many members of the Commission visited Sydney? The whole of them.
792. Was that report presented to the Victorian Parliament? Yes; I will lend you the first, second, and final report of the Commission.

A. G.  
Kenway.

27 Aug., 1896.

TUESDAY, 1 SEPTEMBER, 1896.

Present:—

J. S. HAWTHORNE, ESQ., IN THE CHAIR.

MR. BAVISTER.

MR. WILKS.

Arthur Grey Kenway recalled and further examined:—

793. *Mr. Wilks.*] I notice that you lay great stress on the inspection before slaughtering of live stock arriving at the abattoirs? Yes.
794. Would you recommend the introduction of that system? It is there now. At present the chief inspector inspects the cattle as they arrive at the Island; but the sheep are not examined individually as they arrive.
795. Later on you laid great stress on the importance of mutton inspection—you said you thought that it ought to be as rigid as the inspection of beef? No; because in the live state it is impossible. Bullocks present advantages for inspection in a live state which sheep do not. Bullocks are larger beasts, and you can pick out an individual. You can watch their gait (method of walking), the hang of the tail, or the head, and your suspicions are aroused. The difference between inspecting large stock and small stock is that when you are dealing with cattle you can see the individual beast.
796. The general signs of disease are more apparent? Yes, because of the bulk of the animal. The eye can see any defect in the walking of the beast. To the critic, a man really exhibits all his complaints by his gait. A bullock does the same; but a sheep, being in a mob, his gait is concealed. Therefore, individual detection of disease is impossible. It is impossible to detect all diseases in a mob of sheep.
797. That is when they arrive there? Yes.
798. What do you suggest in regard to inspection of sheep in their dead state—as carcasses of meat? I think it would want an army of inspectors to achieve the object of the Board of Health.
799. And you think that an army of inspectors would be impracticable? Of course.
800. Do you suggest that there should be a greater number of inspectors there than there is at the present time? Yes.
801. How many more would you suggest would be sufficient to do the work sufficiently for all practical purposes? In designing a new abattoir the detail of the design of the abattoir would enable detailed examination. At present it is utterly impossible; but to meet the requirements of the present abattoir there should be an inspector always present in each mutton slaughter-house—never leaving it.
802. That is as it exists now, but assuming that it is on the best agricultural plan, or one you conceive to be the best, would it then also require an extra number of inspectors? Yes; more than there are at present—that is, if the Board is to condemn meat in the same sense as it does at present.
803. Speaking of condemned meat, do you consider that much diseased meat goes into the market for consumption? I am speaking as a layman, and I do think so.
804. Do you think there are any real injurious effects from the consumption of diseased meat? I do not.
805. You really think it is more sentient than anything else? Yes.
806. That doctors are not able trace any complaint contracted from it? I do not know of any case in the Australian Colonies where any disease has been proved to have been communicated to human beings through eating diseased meat.

A. G.  
Kenway.

1 Sept., 1896.

A. G.  
Kenway.  
1 Sept., 1896.

807. *Mr. Bavister.*] Do you exclude pork in that? Yes, except in the case of trychinosi. It has been proved in other countries, and I cannot say it is not known here; but I do not know of any case in which it has been absolutely proved to be traceable to the eating of diseased pork. The experience, however, of other countries makes us very careful in using pork.

808. *Mr. Wilks.*] Are you aware of the rigid inspection they have in Germany for the detection of trychinosi? Yes, from reading. Not as relates to trychinosi specially, but diseases generally. They have an army of fifty or more inspectors, I believe, in the Berlin Abattoirs—I do not know the exact number. Each individual beast, small or big, is examined, and is examined microscopically—not only pigs, but all beasts—and diseased meat is allowed to enter into consumption if, under the microscopical examination it is thought not to be dangerous to public health; but it is branded as diseased,

809. It is branded as diseased, and, of course, sold at a lower price? Yes.

810. Would you suggest that a similar system should be adopted here? I dare not go so far, because of my want of knowledge of diseases and their effects. I am not an expert in meat.

811. But drawing an inference from the treatment in Germany for the protection of meat consumers, would you recommend the adoption of a similar system here? I look at the matter in this light: Germany is a very old country—has been autocratically governed and bureaucratically governed—and I think that all these questions have been far better studied there than in the Colonies. I believe that the present system there is the result of experience, and I do not know that the German nation suffer from diseases through eating diseased meat more than any other nation.

812. You would not be prepared to say that we should follow in their footsteps as closely as possible? No; circumstances surrounding the trade in the Colonies prevent us from adopting continental methods. From beginning to end, there are differences which in appearance may be trifling, but which in reality are all-important.

813. It would tend, then, to enhance the price of meat to the consumer? Yes.

814. Much enhance it? Very much.

815. That would make it unpopular, to start with? Yes.

816. In glancing over your previous evidence, I notice that you seem to have given the *pros* and *cons* of the case in regard to the retention of the abattoirs at Glebe Island, and also, reasons for removing them? Yes.

817. When that evidence is boiled down, it means, practically, that you believe in having a metropolitan abattoir? Yes; that is an absolute necessity.

818. One central abattoir, or several abattoirs? A metropolitan central abattoir. Sydney is the metropolis of the Colony.

819. Where would you suggest that should be? Everything points to somewhere in the neighbourhood of Blacktown, because that is a stock centre. Of course the railways are our national means of conveyance, and so long as that exists we must get a concentration of the railway systems at one natural point—not an artificial point, but one natural point—quite apart from population; and everything points to somewhere in the neighbourhood of Blacktown.

820. How would you deal with that portion of the stock which comes coastwise? At present, after being landed in the harbour they are driven by road to Homebush. They must go through the saleyards to be inspected before being sold, and they are driven by road to Homebush, [and afterwards those that are going to the abattoirs are driven back to Glebe Island.

821. They have a double journey? Yes; after the trials and cruelties of a sea voyage.

822. What is the main objection to the abattoirs being in a populous area—are there any obnoxious smells from the abattoirs? There is large evidence that there is no necessity for smell; but experience teaches that there must be. There is a smell naturally attaching to the killing of even only one beast. Supposing that a beast were being slaughtered in this room, anyone not accustomed to it would not like to be in the room at the same time. It is the same in yarding stock. Any yard will smell, no matter how perfect you may keep it. I am not alluding to pigs, but to sheep or cattle. There is a certain amount of smell. Those are unanswerably sound objections. But on the top of that there is public prejudice. The very neighbourhood of such an objectionable industry will always arouse public outcry against an abattoir in the neighbourhood of populated districts.

823. Well, have you heard of any public outcry against the existence of the present abattoirs? Yes.

824. In the immediate neighbourhood? From portions of Balmain, but not the bulk of Balmain; and from Leichhardt, Glebe Point, and Pyrmont, there have been complaints.

825. Glebe Point? Yes. I am confining myself now to the existence of abattoirs, not the driving of stock.

826. Then you speak about the area of 30 acres as the probable area that would be required? I think I speak of 50 acres as the area that might possibly be acquired, by taking White Bay, and levelling the Island.

827. But you speak of a model abattoir, and say 30 acres would be sufficient? Yes, for slaughtering accommodation, and the yards attached. At Glebe Island there are 30 acres, more or less, as it exists. A large portion of it is unavailable, owing to its roughness of contour; but if it were levelled and White Bay were included in the abattoirs, I roughly estimate that you could get an area of 50 acres.

828. That is 20 acres more than would be required for a model abattoir? Yes.

829. Would this model abattoir provide yarding accommodation? It would allow for very cramped saleyards, and for abattoir purposes.

830. In regard to the desiccating plant, you were manager there, were you not? I was superintendent of the desiccating works.

831. Would you mind giving us an opinion in regard to the desiccating plant? If it were repaired it could be made to meet all present requirements.

832. It would require, not a new installation, but simply repairing? Yes.

833. From your experience in the desiccating-works, do you consider that they treated more matter than they should have treated, owing to the extra amount of flushing with water? Yes; that is what prevented the desiccating-works from paying.

834. The main obstacle to their paying was the useless amount of water they treated? Yes.

835. What would you suggest to get over that difficulty? Further expenditure might, perhaps, be inadvisable in an effete establishment; but if the blood were by some means conveyed to the desiccating-works, separated from the water, then the present desiccating-works would pay handsomely. 836

A. G.  
Konway.  
1 Sept., 1896.

836. The by-products would pay handsomely? Yes; without any new machinery.

837. Conveying the blood to a common receptacle, after the Chicago principle? Owing to the defective design of the Abattoir, I had to find a remedy, and that was to form a sump under each slaughtering floor—a cast-iron cell, really—into which, after the animals were bled, the blood could be swept with a broom—an imperfect method certainly, but a practical one. I designed it, and the drawings are in the hands of the Board of Health. By pulling up a line, you would turn on the compressed air, and the joint would be made, and the clotted or liquid blood—it would not matter which—would be blown down direct into the desiccating-works. Then we could have dealt with the blood in its pure state. Not only could we have dealt with it at less than half the cost, but it would have brought double the price; because it would have been a pure marketable article. The present machinery would have quite met all that; but, owing to the imperfect design, the blood had to be carried through the drain with so much water as to make it, after being carried through that drain, in a very imperfect form. Having been once mixed with that water, it had to be separated, and to separate it we had to heat all that water—between 30,000 and 40,000 gallons per day—and then even when coagulated from that water, we not only lost a great deal by any methods we might adopt for catching and straining the coagulated blood, but even after pressing in an hydraulic press the pressed blood would contain 20 per cent. more moisture than the natural blood contained; therefore, there was all the expense of getting rid of that water by desiccation—the consumption of coal and the labour attached. If we could get the blood down to the desiccating-works, as they stand, in a pure state, the staff could be reduced by very nearly half, and the staff is really the bulk of the expense.

838. Would it necessitate the carrying out of a costly scheme to effect what you have spoken of? I did not go so far as to make out an estimate of the cost.

839. Could you not give a rough estimate now? No, not with any safety.

840. Still, all you have said would warrant a good expenditure? It would warrant it, if the place is to stand; but it would not warrant it as a temporary measure. It would require an air-compressing machine, and slight alterations to every house.

841. Then, assuming that the Abattoirs were to remain where they now are, the greatest recommendation you could make would be to perfect the desiccating-plant? No, for this reason: The whole of the roofs, from beginning to end, will soon tumble down. No private occupier would be allowed to let people live in such places. Of course people do not do so at the Abattoirs; but, I am illustrating the dilapidated condition of the Abattoirs. All the roofs are sagged, and because of the work of rats and white ant, are rotten.

842. An altogether new structure would be required? Yes.

843. Would that involve a heavy expenditure? I prepared an estimate when Mr. McMillan was Treasurer. Mr. McMillan was the Minister who took the most interest in the Abattoir question, and who paid the most visits to the Island, inquiring into every detail. I think I forced his hand, because I asked for £60,000. To justify myself, I gave him a detailed estimate and explanation of each repair required. He was not satisfied, and he came and personally entered into each detail of my estimate. He went thoroughly into everything that I was asking for. He did not in any sense imply that I was asking for too much. He did not tell me that it was impossible to supply the money; but I presume that that was the reason why he did not do anything. Judging from what he said to public deputations that waited upon him, I think he realised that the time had come when the question of shifting the Abattoirs to some other site, or continuing them at their present site, was of so much importance that it meant really not spending any more money on the Abattoirs as they now stand. I think Mr. McMillan would be one of your most valuable witnesses if he could be called.

844. Then the conclusion that you drew was, that Mr. McMillan did not feel warranted in incurring that large expenditure of money? He felt warranted, but I do not think he had power to get it.

845. Does the liquid refuse pour into the harbour? All the surface drainage does.

846. Do you think that that has a tendency to discolour the harbour around there? Only locally at the mouth of the drains, but of course it contaminates the water.

847. Do you think it does, to any large extent, in that bay? Not to anything like such an extent as the sewer discharge at Blackwattle Bay does.

848. For instance, we have water discoloured very much at Peacock's Point, the furthest eastern point of Balmain? I do not know Peacock's Point; but I suppose you mean that red chocolate colour. That is not contamination by sewage or organic matter in any sense or form. It is caused by animalculæ; I was the first to discover it. Being always accused of discharging blood into the harbour, my attention was drawn to it, and I discovered it was caused by animalculæ, and I was afterwards supported in my opinion by Mr. Hamlet, the Government analyst. But that same discolouration was evidenced at Manly, Garden Island, Circular Quay, Darling Harbour, White Bay, Rozelle Bay, right round Long Bay, and then as far as Gladesville.

849. I am not speaking of eight or nine years ago; I am speaking of local discolouration that exists in that bay only? Blood will not discolour salt water for more than an hour.

850. You have not been aware of any local discolouration? No, not the red colour.

851. I can assure you there has been in that bay marked discolouration? Not within my time.

852. In that bay within the last twelve months? Blood will not retain its colour in salt water more than three or four hours.

853. Then you are satisfied that there are no injurious properties at all flowing into the harbour? I do not say that. I am sure there are.

854. You are certain there are injurious properties flowing into the harbour? Yes.

855. Could that be prevented? Yes.

856. What system would you adopt to prevent it—that is assuming the Abattoirs remained at Glebe Island? I presume you mean now that the desiccating works are closed.

857. Is it owing to the desiccating-works being closed? I would naturally assume it is. I have carefully kept away from the place; but I know from past experience that it is impossible to convey all the blood and offal to sea without having between eight and eleven trips of the punt per week. I know that from the time when we were overhauling our machinery at the desiccating-works, and had to stop. It was an evil I could not get over, because the Government would not duplicate my plant, and at periods we had to stop, and I took every precaution, regardless of expense—that is one reason of my downfall—to prevent nuisance,

A. G.  
Kenway.  
1 Sept., 1896.

nuisance, and it did require from eight to eleven trips of the punt per week to convey all the blood and offal to sea—not the surface drainage.

858. Not from the cleansing process? Well, it did include the cleansing of the floors while slaughtering operations were being carried on. But when those operations had ceased, and the floors were given a final cleaning, even when the desiccating-works were running, we allowed that to go into the punt, and conveyed it to sea. Sometimes we allowed it to enter the harbour, when forced by circumstances.

859. How many journeys do they make now? I have heard, two or three a week.

860. You consider that owing to the stoppage of the desiccating-plant, and the want of a proper service to carry this matter out to sea, it surreptitiously finds its way into the harbour? It must find its way into the harbour. I do not say surreptitiously; but it must go into the harbour.

861. And that must be injurious to people residing on the foreshores? Certainly. It is contaminating the harbour still further. But there is this other side of the question. The sewer running into Blackwattle Bay, which drains a very large proportion of the town, is continuously running, but because it does not contain anything which discolours the harbour the public put up with it. In prevailing north-easterly winds all that drainage, or a large portion of it, is blown out into Roselle Bay and Johnstone's Bay, and lies there on the mud flats. No doubt the discharge from the island would very greatly increase the evil, but you cannot say that the Abattoirs are the only creator of nuisance. There is the other staring you in the face all the time.

862. Then you consider the Blackwattle Swamp is as great a nuisance, if not greater, than the present Abattoirs? Yes.

863. Assuming they are conducted loosely? Yes.

864. And the people residing at Glebe Point and surrounding districts have more to complain about from Blackwattle Bay sewer than they have from Glebe Island? Than they had from Glebe Island.

865. Than they would have from well-conducted Abattoirs there? Yes.

866. And they are accusing the Island of what Blackwattle Swamp is the main cause of? Yes.

867. In regard to the management of the Abattoirs, would you suggest private enterprise should run them, or municipal control, or the present State control? I have in my report, I think, measured the thing pretty closely. I do not think that private enterprise would spend sufficient capital to carry it out in a proper manner. I should like to see it under private enterprise if carried out properly. But I do not think that private enterprise would be prepared to spend sufficient capital to establish a proper Abattoir, and I am sure that no municipality would. We know that by proof afforded by existing circumstances in Victoria.

868. Would you mind giving that proof? The proof is given in the report of the Royal Commission on "the sanitary condition of Melbourne." You find the question summarised there, as to the effect of municipalities governing Abattoirs. That recommendation is one of the main things on which I based my papers. The Commission made very wide inquiries. They speak, first, of the city Abattoirs—that is Flemington—which they condemn. They say—

We are of opinion—

That it has not been possible, by direct evidence, either to prove or disprove that any injury to the health of the inhabitants of the metropolis is caused by the City Abattoirs as now existing.

That inconvenience arises from the driving of cattle.

That the site of the Abattoirs and the adjacent part of the accommodation-paddocks are much more low lying than is desirable.

869. But what about municipalities having charge of the Abattoirs—that is what I am dealing with particularly? These are the recommendations of the Commission.—

Finally, after deliberately weighing all the facts and arguments before us, we recommend that the metropolitan Abattoirs may be retained on the present site, provided—

That the site, buildings, and management of the Abattoirs and of the sale-yards of stock be transferred from the Council of the City of Melbourne to the Metropolitan Board of Works.

870. Taken from the council and transferred to a direct government department? Yes. At page 7 of their final report the Royal Commission say:—

Accordingly we recommended that the abattoirs then existing at South Melbourne, Port Melbourne, Collingwood, and Footscray be immediately abolished; that notice be given to the owners or occupiers of the remaining suburban abattoirs that, unless within twelve months they make their establishments conform with the code of rules prescribed by us, their establishments will be closed.

As regards the main Abattoirs—the Melbourne city abattoirs—the Commission recommended:—

To transfer the site, buildings, and management to a metropolitan Board of Works, under whose control the whole should be brought into accord with our code of rules—the city council receiving compensation for the buildings and improvements; or failing this

To resume the site of the cattle sale-yards and abattoirs.

You were asking about private enterprise. The Commission in their report say:—

We recommend that, in order to encourage the establishment by private enterprise of such trade for Victoria, (that is the chilled-meat trade)

the Railway Department should construct suitable trucks, run special meat-trains, and charge the minimum paying freight, and the cold-storage and chilling-rooms should be erected in connection with the metropolitan railway terminus.

They recommended the encouragement of private enterprise in that matter.

While, therefore, we fully appreciated the advantages which would accrue from the development of a system of country killed meat supply, we stated that in our opinion an abattoir would, in any circumstances, be required in or near the metropolis. A code of rules was accordingly drafted which should be observed in the construction and management of abattoirs. The existing city and suburban establishments were then tested by this code, and were found faulty in various degrees. In our first progress report, a full statement will be found of the evils which then existed. As a rule, the sites were bad; the arrangements for the approach and keeping of stock for slaughter were defective, and the accommodation insufficient; the drainage and the mode of disposal of offal were most unsatisfactory, and general cleanliness was imperfect or neglected. We concluded that the condition of the abattoirs then existing gave rise to nuisances, which, in some instances, were of great intensity; that much pollution of rivers was produced; and that these evil conditions must involve danger to health, directly or indirectly.

That reminds me that the Melbourne Abattoirs' desiccating process has been brought up repeatedly as an example for us to follow, and they have the "Farmer" machine. That is well and good. They put only the clotted blood in. All the liquid blood is simply allowed to run away into the Saltwater River. If we did

did that at Glebe Island the public would be up in arms immediately; in fact we were accused time after time of doing it. But we boiled the whole lot, and separated what blood it was possible to separate under those conditions. We have had people in boats from residences at Glebe Point to watch what we were discharging, but they did not know where to look. If they had looked at the surface drainage in wet weather—the drainage from the yards which still exists—they would have found that there is the real nuisance from the Island, even if desiccating works are progressing. If they are stopped, of course additional nuisance is added. You will see from the report of the Royal Commission that, in their opinion, the carrying on of abattoir business by municipalities has proved to be a failure.

A. G. Kenway.  
1 Sept., 1896.

871. In their opinion and experience? Yes; their opinion and experience.

872. And has now reverted to a Government Department? Well, they recommended it. I do not think it has in all cases. I should like to say that the conveyance to sea of the blood and offal is not curing a nuisance, but creating one.

873. In what way? All the refuse, in favourable winds, is blown back on the beaches of Manly, Bondi, and Coogee, and that was one of the causes of the establishment of the desiccating works. They are reverting to the old system which the establishment of the desiccating works was meant to avoid.

874. *Chairman.*] I think that in this report of yours you state that the inspection at the Island is not good? I do not say that; it is not good in all senses. I do not blame the inspectors for not doing their duty, but I say the inspection is insufficient.

875. Your complaint is that the inspectors at Glebe Island are too few? Yes.

876. During your time there as superintendent of the Abattoirs you suggested an increase in the number of inspectors, I think, from two to five? Yes.

877. And you think that, owing to the way trade is done at the Island, and the large increase in the trade done there year after year, a larger number of inspectors is required even now than you suggested? Yes; I should like to remark that when I recommended an increase to five, I then informed the Government that to fulfil all the requirements an army of fifty inspectors was necessary, to enable individual inspection of beasts. I protected myself in that way.

878. But do you think it is at all reasonable to suppose the Government would recommend the appointment of such a large staff of inspectors as fifty? No, I do not think it is reasonable at all; but the history of the Abattoirs from beginning to end shows that the public accuse the Abattoirs officials of not examining each individual beast, and I took the ground that that was not possible unless we had an army of fifty inspectors. I do not think it is necessary.

879. Do you think that the percentage of diseased animals that are detected at Glebe Island is sufficiently large to warrant a large increase in the number of inspectors;—do you not think that it would be possible for the present staff of inspectors, by continually moving from one slaughter-house to another, to meet all the requirements and to detect disease in any of the beasts or sheep slaughtered at the Island? Not amongst the small stock.

880. Are diseases in sheep of a varied character? I cannot give you an opinion on that—I am not an expert.

881. Who is the Government veterinarian at the Island? There is no resident veterinarian there. Mr. Stanley is the only Government veterinarian, and the only officer who holds a diploma.

882. The present veterinarian has complete control of the whole inspecting staff? Yes.

883. And he it is who directs any discretion used in passing or condemning meat killed at the Island? Yes. I should like to modify that answer by saying that the same inspectors are armed with the written authority of the Board of Health to individually condemn. They do not act on it, but they have the power.

884. I understand, then, that each of the five inspectors is armed with sufficient authority to condemn any animal that may be brought on to the Island for slaughtering purposes? Yes, on his own responsibility.

885. A carcass butcher, or any other person who brings an animal there to be killed, has a right to appeal, if he thinks that an inspector is wrong in his diagnosis of the case? Exactly.

886. The appeal, I understand, is not to the chief inspector of the Island, but to the veterinary surgeon employed by the Government? Yes.

887. Do appeals frequently take place? No.

888. Very infrequently? Yes, very infrequently.

889. Were many appeals made during your term of superintendence? Before the Board of Health took control there were a few appeals. I do not remember how many.

890. And when the appeals were made, were they, as a rule, successful or otherwise? They all failed. Mr. Shelley's decision was upheld by Mr. Stanley.

891. Was that the mode of appeal—first to the chief inspector? They appealed from the decision of the chief inspector.

892. Is Mr. Shelley chief inspector at the Island? Yes. They appealed from his decision to the Government veterinarian. In the early times the Government veterinarian was independent of the Abattoir Department—he was under a different department.

893. Did I understand you just now to say that any of the five ordinary inspectors could condemn cattle on his own responsibility? They are each empowered to do so.

894. Then, if a person disagrees with an inspector's decision, that person appeals to the chief inspector? No. Although the inspectors are empowered to condemn, for departmental reasons and discipline they are not allowed to condemn. It is only Mr. Shelley, or in his absence the assistant inspector, who actually condemns. I am simply speaking of the Board of Health empowering them.

895. But supposing (say) Mr. Brown, an inspector at the Island, condemns Mr. Smith's cattle, sheep, or pigs, or any other animal that has just been slaughtered, has Mr. Smith to appeal to Mr. Shelley in the first instance, if he is dissatisfied with the decision of the ordinary inspector, or to the Government veterinary surgeon? No; because every inspector, being a subordinate inspector, reports the matter to his superior, Mr. Shelley; therefore an appeal does not arise.

896. If the ordinary inspector notices an animal just killed which he considers to be diseased, or that it is necessary to diagnose carefully, does he at once go and seek the services of the chief inspector? Yes; or, failing his presence, the assistant inspector, Mr. Alfred Norton.

897. What kind of man do you consider the assistant inspector;—is he a man who thoroughly understands his duty? As far as I am aware, I think he is very nearly as capable as Mr. Shelley himself.

898. I think that, before going to the Island, he had a large experience in the retail trade? Yes; I think he knows his business.

A.G. Conway. 899. Your opinion, and the opinion of the carcass butchers and the retail butchers, is that the assistant inspector, Mr. Norton, is quite as capable of discovering disease in animals as the chief inspector? I cannot say that much, quite. Mr. Shelley has an exceptional gift for detecting diseases in living cattle—I do not say sheep.

1 Sept., 1896.

900. Then your opinion of the chief inspector is that he is a particularly clever officer at the work at which he is engaged? Not altogether, but in that particular branch—in detecting diseases.

901. In your report you state—

In the case of the present chief inspector these remarks do not apply. His special aptitude in detecting the disease in living stock, as well as identifying it in the dead carcass, is not likely to be possessed by a veterinarian who has not been brought up from childhood amongst stock, but, again, it is not always that a gentleman of such stock experience can be found, who has also made diseases such a special study, except beyond what is necessary to his business as a stock raiser.

902. You pay the chief inspector rather a high compliment in the report you have furnished to the Committee? In that particular direction, and I stick to that. I know that is a fact.

903. That, as a judge of disease in living stock, he stands, in your judgment, almost unequalled in the Colony? Oh no—but unequalled on the Island.

904. So you think, I suppose, that his knowledge entitles him, when he condemns an animal, to have his verdict listened to almost without appeal? No. The Board of Health themselves condemned Mr. Shelley before they took control. The Board of Health attacked Mr. Shelley as condemning beasts on a wrong basis, and when I defended him they said that Mr. Shelley displayed his ignorance by the explanations that he made, and that he was not fit to control the Abattoirs. Putting these two things together—my recommendation of Mr. Shelley and the Board of Health's condemnation of Mr. Shelley—you can see how necessary it is for a common sense view to be taken. I do not say that Mr. Shelley was wrong in his diagnosing of diseases and his method of condemning.

905. It is very likely that the Board of Health stated that Mr. Shelley was unfit to control the Abattoirs? It was within two years of the Board of Health taking control of the Abattoirs.

906. But the Board of Health took no steps to have him removed from his present position? No; I beat them with the common sense expression of my views in support of an officer who in that direction was doing his duty.

907. What position did Mr. Shelley occupy at the Island when you were superintendent? Chief Inspector. My office was simply abolished.

908. So that Mr. Shelley worked with you for some years? Yes, four or five years.

909. I think you stated that it would be impossible for even a skilled man, like Mr. Shelley, or one of the inspectors, to discover diseases at all times in beasts without the aid of a microscope? Yes.

910. So you think it is necessary always that a duly qualified inspector should be armed with a microscope for the purpose of thoroughly diagnosing the animals slaughtered at the Island? I should like to explain the reason why, because the question does not convey the whole meaning. In my report I dwell on the wholesale condemnation of meat. This wholesale condemnation is consequent upon fear of allowing diseased meat to enter into consumption. I maintain that the proper way of condemning meat is either to pass or to condemn with utter confidence. Why should the stock producers suffer because you fear it to pass. At present the inspectors are guided only by locating diseases in certain organs of the body. They do not examine the meat itself. They say "from experience we know disease must be disseminated through the meat"; but they do not prove whether it is or is not disseminated, and I do think that it is a matter of national importance, that before condemnation takes place the dissemination of the disease through the meat should be proved.

911. But would not that entail almost a consultation not only with the inspectors at the Island, but also with leading medical men? No. A pocket microscope will display disease. I am speaking, still, as a layman, and from what I have read of the system in Berlin. A pocket microscope will display disease in the meat if it is there, and I do think an inspector is not properly armed unless he is armed with a microscope.

912. You think it is quite possible for an animal at the Island, after being slaughtered, to be diseased and to pass by undetected, if the inspector has to depend only on his natural sight? Yes, because if a journeyman butcher wants to gain the good will of his master, all his instinct is to conceal any organ taken out of the inside and slip it on one side so that it shall escape the inspector's notice, he knowing the inspector cannot discern the disease in the meat.

913. Then, any of the journeyman butchers at the Island, if they wished to get into special favour with their masters, are at liberty and are able to extract the diseased portions of an animal and throw them on one side before the inspector comes along to inspect? Yes, and they will do it even in the presence of an inspector—that is, with small stock—and if a slaughterman did not do it, he would be dismissed by his employer.

914. So that there is really a dread on the part of the journeyman butcher of his employer, if the inspector comes along and finds a diseased bullock, or a diseased sheep, or a diseased pig, as the case may be? Yes. I would suggest, with all due respect, that the officers of the Journeymen Butchers' Union should be asked some questions of this nature, and they will be able to tell you better than I can.

915. So that really your experience of the Island trade is, that the men themselves are doing their best to try to prevent the detection of disease in the animals killed at the Island, on account of fear of their masters finding fault with them for not throwing away the diseased portions when they see them, before the arrival of the inspector? I would not like to say as much as that; but it is a necessity of their making their living that they do conceal, and it is a necessity of their getting not the good favour but ordinary dealing from their masters that they do conceal.

916. But could not that difficulty be got over by the inspector insisting upon every portion of the animal being left intact until after his inspection, and he had passed it, or put the Government brand on the slaughtered animal? You could do that only on the beef side, amongst the large beasts. It is impossible with the small stock. They kill thirty or forty sheep at a time—in a fall—and there may be eight or ten men in a room not so big as this—there may be thirteen men slaughtering and cleaning sheep.

917. How many sheep slaughter-houses are there at the Island? Six, sometimes seven.

918. Therefore there are sometimes between seventy and eighty men, in a busy season, employed in those different slaughter-houses? Yes. The thirteen men do not all kill at one time; but you can see generally from nine to thirteen men, and perhaps more, killing in these small pens, 18 x 12. 919.

919. So we may say that fifty or sixty men are killing continually in the sheep-houses, and dressing sheep? *A. G. Kenway.*  
Yes.
920. And there are only five inspectors to watch those fifty or sixty men as well as to pay attention to the bullocks killed on the other side of the way, and also the pigs and calves and other stock slaughtered at the Island? Yes. I go further than that. I would say that the inspectors pay only periodical visits to the mutton side. They trust to the hardships of the journey to weed out diseased sheep. The large stock and pigs and calves are most carefully examined by the inspectors, to the best of their ability, with their knowledge; but the mutton is left, I will not say to the casual, but to the intermittent visits of the inspectors to the mutton-houses.
921. So it is more like chance than otherwise if diseased sheep are found? Exactly.
922. From that I suppose we may infer that a considerable amount of diseased mutton finds its way into the different butchers' shops in the city and suburbs? I have been informed positively, but confidentially, that it is so, by a man who should know—that is Rabbi Phillipstein.
923. Why is it you bring in the Rabbi to testify to what you say about diseased meat? He is independent of all carcass butchers.
924. In what way independent? He is not employed by them. He is independent of the carcass butchers in the method of earning his living, and he can speak.
925. And what experience does he have in the slaughtering of sheep? He told me that not a few, but of great many diseased sheep, go into consumption. In fact he warned me several times—went out his way.
926. How does he come to take such an interest in the matter of sheep-killing—Jewish residents, I suppose, do a large business? No, comparatively small.
927. How did he come to go out of his way to give you information in regard to the killing of sheep? I used to consult with him, and he used to consult with me. He is a very gentlemanly man. I used to do my best to forward his business. He has had difficulties to overcome in carrying out his peculiar methods of slaughtering, and he responded by giving me information, not as to the individual action of anyone on the Island but as to the methods.
928. Have the Jews a special house in which their meat is killed? No. They limit their patronage to two or three who kill under contract, or at so much a head.
929. So I am to understand from you that the only strict inspection that takes place at Glebe Island by the inspectors appointed by the Government is in regard to the cattle? Cattle, calves, and pigs.
930. But the sheep are only inspected periodically, and there is a considerable amount of chance as to whether diseased sheep will find their way into the city and suburban markets or not? It is displayed by the figures which I quoted.
931. So the figures which you have quoted, showing the small number of sheep condemned, as compared with cattle, evinces that a considerable amount of neglect prevails in regard to the inspection of mutton at the Island? Not neglect, but I should say laxity. I do not say that the inspectors neglect their duty.
932. We are not to infer that you find fault with the inspectorial staff, but more with the fewness of the inspectors to do such a large amount of work? Yes.
933. You really think that in the interests of the health of the public, and to warrant the supply of sound meat all round to the public, an increase in the number of inspectors should take place at Glebe Island? That is, if the present method of condemnation is to be persisted in.
934. You feel confident that meat is very often branded as diseased, and that the peculiar disease of the animal is not sufficiently serious as to warrant its being cast aside as unfit for human food? I say so, not on my own judgment, but upon the systems that are in existence in other countries. It is not a personal opinion of my own.
935. *Mr. Wilks.*] You do not attach much importance to the inspection of meat? Yes, I do. I think it should be largely increased, so as to gain discretionary power as to what to condemn and what to pass.

TUESDAY, 15 SEPTEMBER, 1896.

Present:—

MR. LAW,		MR. MAHONY,
MR. O'SULLIVAN,		MR. WILKS.

J. S. HAWTHORNE, ESQ., IN THE CHAIR.

Arthur Grey Kenway recalled and further examined:—

936. *Mr. Mahony.*] As you are doubtless aware, some gentlemen interested in the trade have already given evidence before this Committee? I am in ignorance of what they said. *A. G. Kenway.*
937. In giving your reasons as to why the Abattoirs should be removed from Glebe Island, you used the phrase, "Even the carcass butchers and shop butchers are not unanimous in desiring its continuance"? That is from my present experience. *15 Sept., 1896.*
938. Can you give us the names of some carcass butchers who are in favour of its removal? Yes; Macnamara and Elliott are, I believe, both in favour of it, or they were in my time. It is, of course, a considerable time—nearly two years—since I had any connection with them, and they may have altered their opinion since then.
939. But two years ago, when they gave that opinion, they were old hands on the Island? Yes.
940. Mr. Henry Macnamara is one of the oldest hands on the Island? Yes; and carries on the largest business. Macnamara and Elliott would like the Abattoir to stay where it is, or to have an opportunity of establishing abattoirs of their own.
941. That is what you might call a selfish motive? Exactly. That reminds me of a point in my evidence which I did not bring out sufficiently. I allude to the importance of allowing private enterprise scope. The thing that prevents the encouragement of private enterprise is the danger of the creation of monopoly. Directly the establishment through which the food supply of the metropolis passes into the hands

A. G. Kenway. hands of private capitalists monopoly is immediately created: I did not bring that point out strongly enough in giving my reasons for the conclusions to which I have come—I mean the danger of monopoly arising directly private enterprise grasps the Abattoirs. From a sanitary standpoint there is no reason why private enterprise should not do it.

15 Sept., 1896.

942. That would mean, then, that if Macnamara and Elliott are only in favour of the removal of the Abattoirs, to give them an opportunity of establishing private abattoirs, you think that would tend in the direction of creating that monopoly? Yes.

943. Can you give us the names of any carcass butchers who, apart from any selfish reason, are in favour of the removal of the Abattoirs? Men who were of importance in my time have ceased to be since—for instance, there was Mr. Tancred.

944. Mr. Tancred, who is now out of business, was during your time in favour of the removal of the Abattoirs? I think so, rather than continue under the conditions under which they had to work at the present Abattoirs. I think Woolf would express a modified wish in the same direction.

945. On what ground would Woolf give it? Because he cannot compete fairly in the business. Woolf is an important man, especially in the pork line.

946. Is he a carcass butcher as well as a retail butcher in the pork line? Yes.

947. Well, taking Mr. Woolf's case, his reason for wishing the Abattoirs to be removed would be on account of the competition to which he is subjected? I think so. It is dangerous for me perhaps to attribute motives or wishes to others, but that is my inference from conversations.

948. Is there anybody else you can think of? Symes and Agnew, I think, would like to see the Abattoirs removed to a better place—more convenient.

949. Why is it inconvenient for Symes and Agnew? They are so cramped in the slaughter-houses, and cannot treat their stock properly. They have complained frequently that they lose their stock.

950. Does that mean that the Island itself is not big enough, or that the buildings on that site are cramped? It means all and every one of those points—imperfect design, the condition of the stock on arrival, and its insecurity while in that position.

951. The term "want of room" refers to the whole site whether built on or not? It does, but more especially to the slaughter-houses.

952. Is there anybody else? I am not sure about O'Brien and Roberts. That is another important firm in mutton. They all cry out for want of space: but it is not all who have expressed an opinion to me about their removal. I being a Government officer, and necessarily avoiding all those debatable questions which have arisen from time to time, I have not solicited opinions from any one of them. What opinions I have had given to me have been forced on me.

953. I suppose that they would meet you and conversationally would express an opinion? Yes.

954. That complaint of want of space is a general complaint amongst carcass butchers who are in favour of the removal or the retention of the Abattoirs? It is the universal complaint.

955. Is that a complaint that could be cured on that site? It could be partially but not totally cured.

956. Is there anybody else in the carcass line you can think of? Those who are mostly in favour of the removal of the Abattoirs, especially Macnamara and Elliott, are in favour of it because they want to get scope for private enterprise.

957. Are many of the shop butchers in favour of the removal? Many retail butchers have expressed the opinion that it is desirable to remove the Abattoirs in consequence of the condition of the meat which they are forced to buy there. It is killed in a highly fevered condition owing to the hardships of the journey.

958. What journey is that? From the pasture to the saleyards, and from the saleyards to the Abattoirs. Those retail butchers who have bought at the Darling Harbour Meat Markets, or at Richards's Riverstone Meat Depot, also near Darling Harbour, speak of meat that is killed near the natural pastures as being of very much better quality than that killed at the Abattoirs. You also get opposite opinions.

959. But is that a consensus of the opinions of those members of the retail trade who are of any importance? As far as I am personally able to judge it is so.

960. That means, practically, I suppose, that the meat killed so much farther away, and brought down in cars or trucks is very much more fit for human food? Exactly. It is proved by the trade. I understand that the Abattoir trade since I left has diminished enormously.

961. Is that falling off on account of the competition of the country killed meat? Yes, largely so, especially during the cold weather.

962. I suppose that that condition of the meat is at any rate one of your reasons for favouring the removal of the Abattoirs? Yes; I have recommended the Abattoirs to be brought to the nearest stock centre so as to diminish the amount of hardship inflicted on the stock during its journey to the Abattoirs, and also to give it resting time before being slaughtered.

963. Any suggestion, then, as to a railway over or near the present driving route would not aid in getting over the difficulty much? It would get rid of the driving through the suburbs.

964. But it would not, in any appreciable degree, get rid of that condition of the meat? No, unless the sale-yards were fixed at the Island instead of being at Homebush. Then a very large improvement would be made, but not all the improvement that is desirable.

965. Would there be room for that at the Island? If the Island were levelled and the filled-in space resumed for sale-yard purposes, with an area of about 50 acres, a large percentage of the requirements of an Abattoir and sale-yard would be met, but not all.

966. What would not be met? There would be no resting for the stock. They would have to be killed in their fevered condition as at present.

967. The construction of a railway over the present driving-route would not mitigate the evil of over-driven meat? No; it would not. Neither would it isolate the Abattoir from surrounding populated neighbourhood.

968. No, I suppose the increasing of the size of it would bring the surrounding neighbourhood so much nearer to those portions that are resumed? Yes.

969. I suppose that as a matter of fact, if the Government attempted to establish an Abattoir, even upon the very best lines, in a locality at all within reach of population, it would send up the value of the property there? It would not send it up, but it would not necessarily be a nuisance. I think it is quite possible with perfect appliances to have an Abattoir in the heart of a city.

970. The remark about depreciation of the value of property in your report refers to Homebush principally? Yes. A. G. Kenway.

971. Then I cannot quite reconcile that with this other statement of yours. In giving "further reasons for retaining the Abattoir at Glebe Island," you say, "Its removal will cause incalculable ruin to the many workmen engaged at the Abattoir who have put all their savings into the purchase of land and erection of homes for themselves and their families";—supposing that what you stated there were a matter of fact, that would only be a sentimental reason, would it not? No; if the Abattoir were removed the men would have to move, and they would have to sell their property in any way they could. They must follow their work. 15 Sept., 1896.

972. That means that those men have bought and paid for the places they live in? Many of them have.

973. They have got their own little homes there? Yes.

974. What would prevent their letting their houses when they went away? The Abattoir employs so many men, and it would mean such an exodus from Balmain that they would not get anything like a fair rent for their houses. It would be a sudden movement. It would be a terrible blow.

975. But do you not think that if the Abattoirs were removed the houses in the locality would, as a whole, really let better? No; because it is already built on with houses that would no longer be required.

976. How do you mean "be required"? Because that kind of inhabitant would not be there so numerously. If the land were unoccupied, and the Abattoirs removed, that unoccupied land would increase in value, because a better class of houses would be put upon it.

977. So I suppose they are what you would call workmen's houses? Yes.

978. What is good enough for one man in that line is good enough for another, is it not? I doubt it, for the Abattoir workmen form a very large percentage of the population of that part of Balmain. If there were a general exodus the value of the whole of the property would be depreciated.

979. Is it such a very large proportion? It is not ascertainable. Of course, no census has been taken to give you the information.

980. Are they men who work at the Abattoirs, or who sell stuff in connection with it? Both—directly and indirectly connected with it.

981. All that general work which arises from the conduct of an abattoir? Yes.

982. But I do not quite understand, if an abattoir being put in a populated locality depreciates the value of property, why its removal should depreciate it, although it involves an exodus of a number of people who live there in consequence of the work? Because the class of houses that are already erected fixes that land to that particular use.

983. But does not a man of one occupation live in a house similar to that occupied by a man of another occupation whose means are similar in amount? The working classes who have to reach Sydney or other parts would not, when the Abattoir ceased working, live in the houses which were built for convenience and accessibility to the Abattoir.

984. But is not that part of Balmain just as accessible as (say) Waterloo or Leichhardt? Yes; but I think it is the nature of all these suburbs to have a local growth.

985. Do you not think that the reason why Leichhardt, for instance, has grown has been because of the land being accessible to the working men on account of its cheapness? Not more than Waterloo and Balmain.

986. Waterloo and Balmain, too, I should say;—do you not think that is the reason? Cheapness of the land was, I think, the primary reason, more than its accessibility.

987. What I do not follow you in is—why the removal of the Abattoirs and the exodus of these people should prevent the houses from being occupied by others in the natural course of events? I speak from experience. At the present time I cannot let my house at Croydon.

988. But that is not a workman's house? No, but it is equally accessible to business men as it was in the past. I used to let it at 35s. a week, but now I cannot get £1 a week for it. That is because of the exodus and want of money, too.

989. What exodus has there been from Croydon? People, for economy sake, have to go nearer their work, and live in Sydney instead of the suburbs.

990. Would not that help to populate that part of Balmain vacated by the abattoir men? Yes; but that would not increase the value of the property in Balmain. People who have less money go in for saving money.

991. I cannot quite follow you as to why the exodus of those men should cause a whole district of cottages to remain vacant in a place so accessible to Sydney as Balmain is—more accessible than Lilyfield, and quite as accessible as Leichhardt? I can only speak on these general reasons.

992. Your opinion is that an exodus of the abattoir men leaving those cottages vacant, no one else would occupy them? I do not say that. In time no doubt they would become reoccupied; but it would not increase the value of the property—it must necessarily decrease it for a time at least.

993. That does not mean that those working men would lose their houses, but it means that for a little time there would be a chance of the property remaining vacant in consequence of the change;—is that it? I am not speaking of positive facts, but only as a matter of opinion, and I am strongly of opinion that the bulk of those who had to shift would lose their properties.

994. How lose them? Most of them have not paid up fully, and they would have to rent other houses, and they could not meet both liabilities.

995. And so, when you use the phrase "its removal will cause incalculable ruin," you apply that to those workmen who have purchased their properties on time-payment contracts or Building Societies' terms, and have not paid for them? Yes; and you must not forget the small people who have established the business there to supply the wants of those people.

996. You say that that phrase refers chiefly to workmen who have only partially paid for their dwellings? It would affect them mostly.

997. Are there properties over there other than these workmen's houses which the continuances of the Abattoirs at Glebe Island keeps down in value—I mean better class properties? I am not aware that it does, because what population has come there has already accommodated itself to the Abattoir being there. You cannot call it one of the best or most fashionable parts of Balmain. You must go away from the Abattoir district to reach that.

998. That is to say, the reason that would apply to starting abattoirs in a place like Homebush would not apply *vice versa* to Balmain? No.

- A.G. Kenway. 999. *Mr. Law.*] You said that Mr. Tancred desired the removal of the Abattoirs? Yes.
1000. Do you remember anything distinctly in regard to him that would make you come to that conclusion? The difficulties under which they work at the Abattoirs is the main reason.
1001. You say in regard to Macnamara and Elliott, you have heard them express an opinion in favour of the removal of the abattoirs on the ground of interested motives—that they would be likely to establish Abattoirs of their own—that is the reason? Yes.
1002. Macnamara and Elliott have, in course of conversation, led you to conclude they desired that the Abattoirs should be removed? They have expressed that opinion to me.
1003. In regard to Symes and Agnew, you say they have also expressed the opinion they would like to see the Abattoirs removed? That is not the way to put it, but that they want better abattoirs.
1004. You said, "I think they would like to see it removed to a better place"—you still hold that opinion? They have expressed that opinion to me—of course, some time since.
1005. "Because they are so cramped in the slaughter-houses, and cannot deal with their stock"—of course you will admit that that difficulty could be got over, because only one-fourth of the Island is utilised? So far as slaughtering operations are concerned, less than one-fourth.
1006. Have O'Brien and Roberts cried out for want of space? Yes.
1007. Is there a universal complaint on the part of the carcass butchers? Yes; not all at one time, but different times.
1008. They have all complained? I do not know any that have not.
1009. But is the whole sum and substance of the complaint that there is a want of room? Each individual has his own reasons for wishing the Abattoirs either altered or removed; some, no doubt, would like them to continue as they are at present, and I think in his inmost heart Mr. Macnamara would far rather see the present circumstances exist—the present condition of things gives him a grand monopoly.
1010. Your opinion is that the majority of the carcass butchers at the present time would prefer to see the Abattoirs remain in their present position, provided greater facilities were afforded? No; that is not my opinion.
1011. You think that many butchers have expressed the opinion that the removal of the Abattoirs is desirable in consequence of the condition of the meat which they are forced to buy there? Yes.
1012. That is, meat killed in a highly fevered condition? Yes.
1013. Have you seen the meat which is killed in the country? Yes.
1014. As an experienced man, if a hind or a fore quarter of beef were brought to a shop in George-street from the Abattoirs, and another were brought straight from the country, could you distinguish the one killed in the country from the one killed at the Abattoirs? No; but I can tell you that meat hanging in the Darling Harbour Meat Markets is in far better condition than meat hanging in the Abattoirs at the same time. I could not identify the difference in the piece, but taking the bulk you can identify the difference.
1015. You can tell by actual experience that one is fevered and the other is not fevered? That is not the whole question. I did say that the meat killed at the Island is fevered, but it suffers from other things besides being killed in a fevered condition. It has gone through such hardships that the animal has lost much of its fat also. The fevered condition is not the only deterioration the meat has undergone. The stock killed at the Abattoirs has suffered great deterioration owing to the hardships of the journey. Most of it in the hot weather is killed also in a fevered condition.
1016. Supposing it were brought direct to the Abattoirs in a ship from one of the country rivers or from Queensland, and were landed at the Abattoirs, and then driven to Parramatta, or some other place, would it not be in as fevered a condition, and lose as much of its weight as if taken to the Abattoirs? There is no stock brought from Queensland which is landed direct at the Abattoirs; it has all to be driven to Homebush and back again, and that stock is in a worse condition than meat trucked from Bourke.
1017. How far is it from the Abattoirs to Homebush? I think between 7 to 8 miles.
1018. It has to be driven out there during the night-time, has it not? Morning and night.
1019. *Mr. Wilks.*] The reasons that you assigned for a few carcass butchers objecting to the retention of the Abattoirs were, first of all, because there was want of space, and secondly, because existing conditions were not in the direction they wanted them? Yes.
1020. What about the keen competition? It is because they could not compete fairly.
1021. Why could they not compete fairly? Because of Macnamara and Elliott having practically a monopoly of the market, and also in consequence practically of a monopoly of occupation of the Abattoir.
1022. The practically have a monopoly of the Abattoir? Perhaps "monopoly" is a dangerous word. I say too large an occupation of the Abattoir.
1023. They have a practical monopoly? Well, monopoly is almost too wide a word; but they have an unfair occupation.
1024. Would you mind stating how that unfair occupation works, or in what direction it is? Of course the Abattoir is limited. A man who buys the largest needs the greatest space in the Abattoir. Unless very great precautions are taken, this occupancy of such a large proportion of the Abattoir accommodation cramps the smaller business men and injures their business very materially. Then, again, the position of what houses may be occupied in the central avenue of the Abattoir has a large bearing on the business of the butchers. The nearer to the front entrance gates the better chance has an occupied house of doing business. Naturally, the smaller men again suffer from the men carrying on the larger business and occupying a greater number of houses, having the best position in the market—that is, speaking of the Abattoir as a market.
1025. Then, all these matters could be obviated only by having an extended area? It is largely due, of course, to the imperfect design of the Abattoir. When I was superintendent I did my best to diminish this evil, but I could not obviate it entirely. The leases of the first six houses on each side of the avenue are submitted to auction sale.
1026. You stated in reply to Mr. Mahony that the area was not large enough? Yes.
1027. But in the earlier part of your evidence you say: "That is 20 acres more than would be required for a model abattoir"—so there is room there to afford sufficient area? It is difficult to make myself clear. That gives room for an ample Abattoir that will only partially meet all the requirements. If you notice in my recommendations I explain why a further area is required, and I think those reasons are vital when you consider the condition of the stock.

1028. And when asked your opinion in regard to the site you said that "as a slaughtering site the Island is magnificent?" Yes, as a site. It is a site that cannot be improved upon. It is elevated and open to all the winds. There are disadvantages, of course, which could be cured in time—such as the atmosphere of the surrounding neighbourhoods caused by polluted water. A. G. Kenway.  
15 Sept., 1896.

1029. *Mr. Law.*] You stated in your former evidence that it was absolutely essential that we should have metropolitan abattoirs? Yes.

1030. *Mr. Wilks.*] Would you kindly tell the Committee what you consider the unfair position occupied by Macnamora and Elliott? Their long purses enable them to carry on operations so largely as to unfairly handicap the smaller men.

1031. What effect has that upon the consumer? I do not know about the effect on the consumer, but it naturally strikes me that it enables Macnamara and Elliott to rule the prices of the retail trade, consequently enhancing the prices to the consumer, or the opposite.

1032. Did that objection hold good in your term of office there? Yes. It is a matter of history in the Abattoir that new capital desiring to enter into business on the Abattoir has been absolutely crushed out by combinations of the existing butchers at the Island.

1033. Then there is virtually a "ring" there? A present Member of Parliament, Mr. Anderson, is a sufferer in this direction. I have known business people to be driven away from the Abattoirs by combinations of the carcass butchers.

1034. Assuming that the Abattoirs were removed, the mere removing of the Abattoirs would not get rid of the difficulties of which you speak—they would occur just the same? If the Abattoirs were built on a large scale the evil would be overcome.

1035. But, even if they were built on a large scale, cannot you conceive that there would be some places of more primary importance than others? Not if the Abattoir were properly designed.

1036. It is a matter of design then? Yes. There should be no part of an Abattoir more valuable than another—that is one of the principles of designing a proper Abattoir.

1037. That is a *sine qua non* with regard to it? Yes. If in a public abattoir these evils exist, they would exist tenfold more if the matter were entirely in the hands of private enterprise.

1038. That is one of your strongest arguments, I suppose, for preferring the retention of the Abattoirs under State management? Yes.

1039. You prefer State management even to municipal control? Yes.

1040. You consider that under municipal control there would be a further power of "ringing"? Not that. I base my opinion on the recommendations of the Royal Sanitary Commission of Victoria.

1041. I understand that there has been a previous inquiry here into the administration of our Abattoirs at Glebe Island? Yes; by Messrs. Alexander Bruce, George Thornton, and Flood.

1042. Are you acquainted with the result of your deliberations? Yes.

1043. Would you mind telling the Committee what the result was? My opinion, on reading the report, is that the Abattoirs suffered even then from evils which had become aggravated by growth of business and neglect of repairs, and also by money being spent in making additions to the Abattoirs which were not in accordance with the original design. As to the management of the Island, it was ruled by a system of prosecution, not persecution.

1044. What am I to understand by the phrase "was ruled by a system of prosecution"? The rules and regulations written for the governance of the Island were attempted to be enforced almost entirely in the Police Courts. It resulted in the butchers, the journeymen especially, becoming largely demoralised—they would not do anything unless they were forced—and it enabled them to fight the officers of the department on a level footing in Court. To such an extreme had this bad system grown that a system of espionage on the men had come into existence. There was continual trouble, and no peaceable administration of the Abattoirs. Inspection duties were carried out in a perfunctory manner, there being only two inspectors.

1045. What is your opinion in regard to the desiccating, from its earliest stages? The McGovern machine, which until lately was in use, was the first machine that dealt successfully with the desiccation of blood and offal.

1046. Has that any bearing on what is known as "Swan's process"? It is the process which superseded Swan's process.

1047. Why was Swan's process superseded? By the printed report of the Commission of 1879 it was proved unsuccessful. The process was accused of creating an intense nuisance.

1048. How could the management and system be improved? The tendency of managing this establishment is to rule in a strictly official manner. Great discretion is required to preserve the goodwill, both of the master-butchers and of the working butchers, so as to enable the officers to effectually carry out the rules and regulations which govern the Abattoirs, otherwise continual appearance in Court, while possibly being successful in the imposition of fines, entirely kills any willing co-operation on the part of the butchers in attending to the sanitary condition of the Abattoirs.

1049. Is that fine system persisted in now? Yes; from what I hear I believe it is. I have not been to the Abattoirs since my office was abolished two years ago, or more. I avoided prosecutions as much as possible.

1050. The continuance of the fine system, you believe, is highly detrimental to the Government and the working of the Abattoirs? The improvements recommended by the Commission of 1879 to be carried out were put in hand by the Government of the day, and Mr. Shepherd and I were deputed as officers from the Public Works Department to carry out those works of improvement under the Treasury. The most important of the improvements were in the desiccating works which have gradually grown as improvements were discovered until six desiccators have been put in place. Whilst in good condition and kept in repair they abated nuisances very practically, but not so perfectly as they could have done if the Abattoir had been of better design. Additional calf and lamb houses were added; yards, lanes, and fencing improved and enlarged; and internal repairs effected. That brings me up to the time when I took office. Mr. Jager was retired in 1889, and I was appointed.

1051. Did you effect any sudden change in his administration then? I reopened the desiccating works, which had been temporarily closed.

1052. Under any new process? No; just as they were.

1053. The same plant? Yes; they had been closed with the view of using the Catternach process of disinfection, and conveying the whole of the materials to sea.

- A.G. Kenway. 1054. What was the result of the Catternach process? An utter failure.  
 15 Sept. 1896. 1055. Was it a costly experiment? I am speaking from memory, but I believe that their contract was £4,000 per annum for the cleansing of the Abattoirs, and the removing of waste products, from which no return was gained.
1056. There was no marketable product at all, then? No; it was all conveyed to sea. Complaints became very frequent of nuisances existing at the Abattoirs.
1057. Complaints from whom? Speaking from memory, I only know of complaints from Glebe Point and Annandale—complaints of the smells.
1058. From the fumes? There was no process being carried on. The smell was simply from the filthy state of the Abattoirs, and the Catternach process failed to operate. My connection with the matter had been severed during the continuance of the Catternach process, but the Treasurer of the day, Mr. McMillan, decided to reopen the desiccating works, to treat blood and offal in the same way, as had previously been done, it being considered the lesser evil of the two, and also as being the means of utilising waste products which were being conveyed to sea at great cost.
1059. Was there a strong demand for those products while you were in charge? There was not a strong demand, but I always got rid of them. I never sold them for less than £3 10s. per ton for the blood. The average price would be about £4 10s. We found that the manure trade was in the hands of two merchants' firms in Sydney—Montefiore, Joseph, & Co., and Gibbs, Bright, & Co.
1060. They virtually "cornered" it, then? They did, until I persuaded the Treasurer to accept the offer of Shepherd Brothers. I recommended concessions to be granted on these grounds: We had to sell to Gibbs, Bright, & Co., or Montefiore, Joseph, & Co. at their own figure, as they were the only customers. If Shepherd Brothers were given a contract for a definite period, their business was to mix the manures to suit the various customers, instead of selling it as with blood and so much offal, to mix the manures, and to induce a local trade. For some time they succeeded, and their trade was growing, until the Board of Health took control of the Abattoirs, when the Board suddenly ceased the contract. I believe that no such prices have since been obtained, consequently the returns from the desiccating works have been much reduced. I presume this is the reason why the works are closed. One of the first things I did on coming into office was to persuade the Treasurer to increase the inspection and sanitary staff.
1061. To what extent was that done? There were two inspectors before, and I procured three additional ones.
1062. At an expense of about how much? I think about £170 a year each.
1063. That would be about £600 a year? Yes.
1064. Were other expenses added to it? In connection with the sanitary staff I procured power to employ men as I needed them in addition to the permanent sanitary staff.
1065. A sort of *carte blanche* order? Yes. If we had a spell of wet weather, for instance, the yards and laies would get into such a terrible state that our permanent staff could not compete with it. If we undertook the whitewashing of the houses, that was an extra strain on our staff, which was met by an additional man or two, if necessary, being employed—not in all cases, but if necessary. The cleanliness of the Abattoirs was never allowed to suffer for fear of expense. Public health was of primary importance, the Abattoirs being an institution more for the preservation of public health and convenience than for returns to the Government.
1066. That is the view you hold now—that the Abattoirs are to be run on lines not commercial so much as benefit to the public health? Yes.
1067. Should not be regarded as a commercial venture? No. If it is made self-supporting, and to provide for a sinking and repairing fund, that is all it should meet. There was a sudden and tremendous increase of condemnation on the appointment of the increased number of inspectors, and in consequence also of Mr. Shelley acting first with a freer hand when supported by me. At this time the Board of Health attacked Mr. Shelley, and accused him of condemning cattle on a wrong basis; but no action was taken. Mr. Shelley has been continuously employed ever since the Board of Health took charge. In giving evidence just now I dwelt on the impossibility of applying regulations, and I should like to emphasise that it is utterly impossible to rule the Abattoirs satisfactorily by attempting to impose the rules and regulations by means of prosecutions in Court. During my administration I adopted the eight-hour system for all the working men. My own hours and the Inspectors' hours were very much longer, but for working men I adhered to the eight-hour system. The Board of Health have published that they made tremendous retrenchment in the administration of the Abattoirs on my retirement. I think it is important the Committee should be informed of the present cost of the Abattoirs.
1068. What is the present cost of the Abattoirs? I do not think it could be ascertained unless the Committee were to ask these questions—the total expenditure, including all fees to consulting engineers, &c. I am of opinion there is no retrenchment.
1069. *Chairman.*] You are of opinion that if questions were put to the Colonial Treasurer, under whose Department this matter comes, the fact would be elicited that no retrenchment has taken place in connection with the Abattoirs? No practical retrenchment.
1070. What are we to understand by that phrase? The closing of the desiccating works has resulted in the saving of so much expenditure, but is it retrenchment—is it not creating a nuisance?
1071. You think that by the mere saving of a certain amount of money, which is a limited one, by the closing of the desiccating works, a much greater evil is created by bringing about a nuisance in the conduct of the Island? Yes.
1072. Are you of opinion that the way in which the Island was conducted during your time, no retrenchment could be made on the lines you worked upon except at the expense of bringing a nuisance to bear on the public who surround the Abattoirs as residents? Yes, and allowing the establishment to go into disrepair. I should make an exception as regards the purchase of coal. The Board of Health buy coal very much cheaper than I procured it, but in my time I had no power to buy coal. I had to accept the annual contracts which other departments had to accept.
1073. Now, I suppose the Board of Health can go as a separate body and invite tenders on their own account, and buy coal for the carrying on of the Abattoirs? I believe they do not call for tenders.
1074. Do they keep a vessel to bring their own coal? They buy a cargo at a time, without calling for tenders.

1075. That, I suppose, would mean a considerable saving in the price of coal alone? Yes.  
 1076. *Mr. Wilks.*] About how much coal do they use a month there? When the desiccating works were going we used a little over 24 tons a week.  
 1077. They would probably save from £15 to £20 per month on that in buying it the way they do? Yes.

A. G. Kenway.  
 15 Sept., 1896.

THURSDAY, 17 SEPTEMBER, 1896.

Present:—

MR. BAVISTER,	MR. O'SULLIVAN,
MR. LAW,	MR. WILKS,
MR. WILLIS.	

J. S. HAWTHORNE, ESQ., IN THE CHAIR.

Alfred Allen called in, sworn, and examined:—

1078. *Mr. Wilks.*] What are you by occupation? Architect and surveyor.  
 1079. Where is your place of residence? Dixon-street, Darling Harbour.  
 1080. Have you had any acquaintance with the Abattoirs? Yes. A few years ago I was employed, with Mr. R. Seymour, the then Inspector of Nuisances of City of Sydney, on a Royal Commission in reference to noxious trades, and the slaughter-houses came within our province. I paid several visits during that time to Glebe Island, and I wrote a report thereon.  
 1081. What was the character of the report? A full report on the general management and sanitary condition of the Glebe Island.  
 1082. What was the tenor of that report? We found, as a general rule, that the Abattoirs were not equal to the requirements.  
 1083. In what way? The desiccating and general sanitary arrangement and appliances was insufficient for the requirement of the Abattoirs.  
 1084. About how long is it since that report was written? I think six or seven years.  
 1085. Who was in charge of the Abattoirs then? Mr. Oatley.  
 1086. You said that the desiccating plant was not sufficient? Yes. We also found that the excrescence from the paunches, where they were opened, strained into the harbour, but the gentleman in charge at that time was trying some experiments in reference to filtering it before it reached the water.  
 1087. Are you aware of the results of that filtering experiment? It produced water so pure that it could be taken in a glass, and unless one were told he could scarcely believe it came from that source.  
 1088. It was colourless? It was very slightly coloured—hardly perceptible.  
 1089. Was it obnoxious in any other way; I do not mean in regard to smell, but the effects of it? No. I should not like to drink it, but to all appearances it was fit to drink. It was filtered through some animal charcoal and sand, I believe, trenches being formed on the bank for that purpose, so as not to pollute the harbour. At that time also there was a boiling-down—belonging to Messrs. York and Rennie, I think—on the Island. We found that boiling-down to be the most cleanly of any we visited, and we visited every boiling-down within a circuit of 10 miles from the Town Hall.  
 1090. What was that owing to? It was worked very well. The men even worked in white sleeves and white caps, and the establishment was generally conducted in a most cleanly manner throughout. We approached it from various points in order to try and find out if there was any serious evil effect from it—approached it even in the middle of the night, from the Glebe side, and also from the Balmain side. Of course we found a slight smell from it. These works have since been removed. We found, when approaching the Island against the wind, an escape of gases from the Abattoir—a very objectionable cooking smell. We visited it several times and tried to find out whether it came from there or from the boiling-down, and there is no doubt that the greater part of it came from the desiccating house. But my opinion is that that could very easily be obviated by adopting modern appliances.  
 1091. But that was the gaseous vapours from a boiling-down? Not so much as from the desiccating works. The desiccating at that time was in full work, and we approached it from the bridge on the Pyrmont side, and it was at that time we found it worse—wind meeting us direct from the works. I daresay that Mr. Seymour paid something like six or eight visits to the Island.  
 1092. What is your opinion of the Island as a site for Abattoirs? My opinion is that so far as the Abattoirs on the Island themselves are concerned—I do not mean to say on that particular portion of the Island—the site could not be surpassed. There is a certain amount of isolation there. Wherever else Abattoirs are erected, a neighbourhood must of necessity grow up around it. But although this site is very close to the town, there are no families living immediately adjacent to it. We visited another proposed site for the Abattoirs.  
 1093. Where was that? Near Botany.  
 1094. What is your opinion of that site? The objection we raised immediately was that if an Abattoir were erected there a population would grow up around it.  
 1095. That is an objection that could be lodged against any site? Yes.  
 1096. In other words, a large settlement would follow the establishment of an Abattoir? A large settlement must of necessity follow its establishment there, and other trades would follow it, such as tripe-dressing, boiling-downs, glue factories, pig-feeding, duck and fowl farming, salting hides, tanneries, bone-grinding, soap and candle works, wool-washing, fellmongering, and many other trades.  
 1097. That is an auxiliary to it? Yes. There must be in the possession of the Government a map of Glebe Island—in fact, I obtained from the Government Printer a lithographic map of Glebe Island, and placed all the buildings up on that map; and I also obtained a large map of the City of Sydney, and struck a circle of 10 miles from the Town Hall, and marked every noxious trade, and made an index. I made two plans; one I left for the use of the city authorities, and the other must have gone in with our report.  
 1098. It is lodged with the Treasury, then? Yes; but the city authorities have my draft report now. It is very voluminous—almost a folio volume.  
 1099. Are you aware of any objections lodged by the slaughtermen themselves;—are they in favour of the retention of the Abattoirs at the present site, or their removal? Generally, I think they are in favour of

A. Allen.  
 17 Sept., 1896.

A. Allen. the retention of the Abattoirs at the present site, which is near to the principal market for the meat. Sydney is the largest market for the meat. There may be some objection to the present mode of getting the cattle to the Abattoirs, but that could be obviated by having a light railway from the cattle-market. The island itself affords great advantages. There is the advantage of having a lot of high land there upon which the water is stored; whilst on the Balmain side it faces merely a few boat-sheds and iron foundries, where it could not be a nuisance. But as it stands now, and in its present state—that is, without the modern appliances that could be adopted—the Abattoir establishment is probably a small nuisance to the Glebe.

17 Sept., 1896.

1100. Speaking of the Glebe, are you aware of the Blackwattle Swamp drain? Yes; I know it.

1101. Do you think that a lot of the objection that is lodged against the Abattoirs is really due to the Blackwattle Swamp drainage? Probably.

1102. You think there is good reason to believe that? Very good reason to believe that. But I maintain that in connection with the Abattoirs, by adopting proper appliances, the drainage should become a question of very secondary consideration.

1103. Are you prepared to suggest those appliances? Yes.

1104. What are they? It depends entirely on the bunching of your buildings. Your buildings can be bunched on a half-circle or on a portion of a circle, and by bringing your drains from the centre of each abattoir, and then forming a canal down, you can form that canal so as to lead into some large cisterns near the water's edge, and they could be tapped and the stuff could be taken away in barges to sea, or it could be filtered or evaporated and desiccated.

1105. Which do you prefer? I very much favour the desiccating.

1106. Have you any knowledge of the desiccating plant there at present? They are not using it at present.

1107. Well, what they were using within a few months from now? I could not say. I visited the island three or four times within the last few weeks to have a look over it just to see the difference between now and my former acquaintance.

1108. And the evidence you are giving now is borne out by your recent visits? Yes. I found that they proposed to put a bridge; in fact I saw the marks for the bridge on both shores, both on the Island and Pyrmont side.

1109. You mean a causeway? Yes; to connect with Pyrmont. It will take a course directly over the post-office and some cottages, and go to where there would be a good site for abattoirs. If they are to be put up there at all, they should certainly be on that side—the side facing Balmain. There is a very large tank there, and pumps which deliver from the harbour, I think, equal to between 40,000 and 50,000 gallons of water per hour for cleansing purposes.

1110. Have you any theoretical knowledge in the matter of slaughter-houses from studying, as an architect, slaughter-houses in other parts of the world? I have seen them on the continent of Europe.

1111. Which have you visited? Some in the neighbourhood of Paris and Berlin, and also around London. The slaughter-houses around London I found right in the middle of some of the largest towns.

1112. You speak of the neighbourhood of Paris and Berlin;—what do you call the “neighbourhood”—within a mile or two? They are within easy distance of the city—not a greater distance away than our present Abattoirs from this city.

1113. And no objection whatever is raised to them? None whatever. I can see no objection whatever to abattoirs being placed in Sydney itself. They should be no nuisance if proper scientific appliances are brought into requisition, with strict efficient supervision.

1114. Up-to-date appliances? Yes; there is much wasted at the present time which really should be utilised and be turned into a source of profit.

1115. That is, the bye-products? Yes; I hear, but I do not know personally about it, that in Chicago they slaughter a great number of hogs, and people buy the gut here and pay 1d. per lb. more for it than they can buy it from our Abattoirs, because they prefer it. It is all dried and prepared. The bristles from the hogs are actually turned to use at Chicago. In fact, nothing goes out there, except in the shape of meat, powder as manure, or products as a source of profit, with no waste.

1116. They study the economies more? Yes; there is really no nuisance. Appliances are brought into requisition which destroy all the supposed nuisances. There is no doubt a great deal of what is mere prejudice. People do not like the idea of having abattoirs so close to them.

1117. You think it is more sentiment than anything else? Yes, I do.

1118. Have you any knowledge of meat-chilling works? I have had a little to do with chilling works. Mr. Kenway put up some chilling-rooms on the island—and I was with him as draftsman at that time—as perfect as any works of the kind in the Southern Hemisphere.

1119. I am asking you this question more especially because of the argument in favour of having the Abattoirs more in the country;—what is your opinion of that, so far as meat consumers are concerned;—do you think that they would get better meat by it? No, I do not think they would get better meat by it.

1120. Do you think the meat would be inferior? I think it would deteriorate to some extent.

1121. Therefore the consumers of meat would not benefit by the removal of the Abattoirs from Glebe Island? No, they would not; and our general supply for the city would not be so easily obtained if the Abattoirs were put a long way out of town. That seems to be the general opinion of the retail butchers. I have had conversations with them on the question, for I took a great interest in it, during the last few weeks—since there was a suggestion to remove the Abattoirs—because I was always of opinion that it would be almost impossible to find a better site for abattoirs than Glebe Island—so near the city, and yet to an extent isolated, and which gave the population such a chance for a widespread, and which also gave the so-called noxious trades which originate from the Abattoirs a chance to spread. I believe that there was some suggestion made that the Abattoirs should be taken out as far as Blacktown. If you take them out so far these trades must follow them:—lanneries, glue-making, boiling-down, candle-making, tripe-dressing, pig-feeding, and fowl-farming, which all come within the designation “noxious trades.” We visited all of them within 10 miles from the centre of Sydney. They necessarily emanate from the Abattoirs.

1122. But they do not surround the Abattoirs closely? At present they do not; they are scattered. We found them scattered generally along the swamps near Cook's River.

1123. Do you think that the removal of the Abattoirs from the present site would cause these noxious trades to come round them? It would cause them to shift to wherever the Abattoirs were. At present they are not a very great distance from the Abattoirs, and yet they are very isolated. I believe that if application were made for documents, you could obtain our rough notes; I believe they would be of some service to you. Beyond all question they are in the Town Hall. We calculated the quantity of stuff that was removed from the Abattoirs for various purposes and necessary to other industries, and the quantity of like refuse that was removed from the city, and it came to extraordinary figures. We found that the refuse that was taken from the cook-shops alone within the city of Sydney for feeding fowls and ducks came to over 60 tons a day.
1124. Have you any knowledge of what is known as the "driving stock nuisance"? No.
1125. You never heard of it? I have merely formed a casual idea of it. No doubt it must have a certain prejudicial effect on the population in the places through which the cattle are driven; but my idea has always been that that could be obviated to a great extent by the construction of a light railway from the cattle market to the slaughter-houses.
1126. Do you think that the re-trucking would have any ill effect on the cattle? No; I do not. Why should it have a more evil effect here than it has in London? They never drive cattle through the streets of London. At the docks they are all put aboard trucks and trucked in.
1127. That is done to-day? Yes; and it has been done for many years. I was there with Mr. Bazalgette, the engineer to the Metropolitan Board of Works, when they were building the new cattle-markets near Snow Hill. The Islington markets, they also were built in my time. I was with Professor Dr. Donaldson at that time. He was the advising architect to the Crown, and it came within our jurisdiction to supervise works of this kind.
1128. I should like to know your opinion on the matter of control;—are you in favour of the present State control, or of municipal control, or would you favour handing the control of the abattoirs over to private enterprise? Whatever you have must be under very strict control, and from experience I think that the Government are the most capable of carrying out that control.
1129. The supervision would be more rigid under the State? I think so. I have been an officer both under the Government and under the Municipal Council—three or four times under the Municipal Council and three or four times under the Government.
1130. You would not countenance the idea of any municipality having anything to do with it? I would not.
1131. And you do not favour private enterprise? No; I do not.
1132. You believe in the continuance of State control? Yes.
1133. Under the present State control you think there is a rigid surveillance? Yes; we are not under the same advantages here as they are in a large city like London. There I should, perhaps, have a very different opinion. I might be in favour of municipal control there.
1134. *Mr. Willis.*] You say that meat deteriorates when killed in the country and sent here by truck? I think it will deteriorate to some extent in chilling and then sending it down. Sometimes we have very hot weather in summer, and two or three days will make a very great difference to meat. It does even in the butchers' shops.
1135. Then you do not favour country killed and chilled meat sent down for the consumption of people in the metropolis? No, I do not.
1136. You think it would deteriorate through climatic influences? I do.
1137. Are you aware that in America they run meat more than 1,000 miles, and then use it with beneficial effect on the people? That is very likely. If the people in this country had chilling rooms, in the shape of cars, to carry meat, that would certainly alter my opinion; but my opinion is, that chilling it in the country and then shifting it as they do to Sydney, gives it so much time to thaw that it deteriorates.
1138. As you seem to be a practical man in this respect, I should like to know if you are in favour of what is known as country-killed meat, trucked in refrigerating cars, and sent to refrigerating chambers in Sydney, and taken from those chambers and used? Yes, I am, certainly.
1139. As against meat killed in the present Abattoirs or any set of Abattoirs, in or about this or any other city? I would not put it against that; but I say that the meat would not deteriorate in being shifted carefully in that manner. I am in favour of it.
1140. Do you think that that system would have an advantage in giving the people better, purer, meat—less knocked about? I can scarcely say that, because it would be the shifting about that would be prejudicial to a certain extent—the handling of the meat. Meat wants, at any time, to be handled as lightly and as little as possible.
1141. But do you not think that killing in the country at various centres, and sending the meat down as I have just stated, would obviate the sanitary objection that there seems to be to the various abattoirs in the large centres of population? No; I believe the objections to the abattoirs in the large centres can be so easily surmounted that they would be overridden by other considerations.
1142. You say you inspected a site near Botany? Yes.
1143. With whom did you inspect it? There was an old commission—Mr. Michael Chapman, Mr. Pope, I think, and others.
1144. What commission? Commission on Noxious Trades. The abattoirs question was at that time agitating the public mind very considerably.
1145. Was that a good many years ago? Yes.
1146. Can you tell me where that site was? It was on the sea-shore, on the far head of Botany Bay—at Kurnel.
1147. You found that place unsuitable? Yes; because of the difficulty of getting cattle there, and the difficulty also of getting meat away, and I also thought that, at that distance, it would certainly draw other noxious trades, and of necessity, a population would settle around it.
1148. You say you have been an officer under Government and municipalities? Yes; I was with Mr. Barnet six years.
1149. The New South Wales Government? Yes; I was with Mr. Barnet six years, and was also connected with the Harbours and Rivers—on Floods Commission; and I was also special draftsman with Mr. Bennett, Commissioner for Roads, on all the Northern roads of the Colony. I was likewise surveyor for condemning buildings in the city of Sydney, and I wrote a report on the Chinese quarters of the city.
1150. For whom? For the City Council.

A. Allen.  
17 Sept., 1896.

- A.A. Hen. 1151. What became of that report? I suppose they must have it by them now.
1152. Did they adopt it? It was for the use of the Council's inspectors.
- 17 Sept., 1896. 1153. Was it ever made public? I do not think so. I also made a report, with plans, of all the dairies within the municipality of Sydney.
1154. For the Municipal Council? Yes.
1155. You say that the present site of the Abattoirs might be used with advantage if we were to construct a light line of railway from the present saleyards at Homebush and the cattle were retrucked there, because that would obviate the cattle-driving nuisance? Yes.
1156. Do you not think that if, after the cattle had come a considerable distance in trucks, they were unloaded and retrucked after being sold, and then conveyed to the place where the Abattoirs now are, the beasts would be terribly knocked about, and the meat would be considerably deteriorated by that great amount of trucking? No, because for the large consumption of a city like London or Paris, they go a very great distance, travelling many hundreds of miles by sea and then trucked and retrucked.
1157. What I want you, as a practical man, to tell me and the Committee is, whether you think that the constant and continuous knocking about of the cattle in the manner I have stated, would deteriorate the meat? No.
1158. *Mr. Law.*] According to the whole of your evidence, it seems to indicate that you believe that the present site is the best that could be found for abattoirs? Yes.
1159. And that we should have a large abattoir in the city? As near the city as possible.
1160. And your experience in other parts of the world is that there have been far more extensive abattoirs carried on in as close proximity to these cities as Glebe Island is to this city at the present moment? Exactly.
1161. You know that at the present time, only one-fourth of Glebe Island is utilised for abattoirs? Yes.
1162. There are about 8 acres utilised, and 32 acres on the other side which are not used? Yes.
1163. And that is the particular spot you think the abattoirs should be upon? Yes.
1164. You have also stated that wherever the abattoirs go, the population is sure to follow? Yes.
1165. And settle down immediately adjacent to the Abattoirs? Yes.
1166. It is not possible for people to settle down immediately adjacent to the present Abattoirs? No.
1167. In consequence of Glebe Island being surrounded by water? Exactly.
1168. In other words, it would be impossible for anyone to go and live within 200 yards at the very nearest? Exactly.
1169. And about nine parts of the circle round they could not get within a quarter of a mile of it? Exactly; and consequently, the trades that emanate from the Abattoirs are dispersed in the outskirts of the city like Patmore Swamp, and other places, to which people can easily drive in carts, whereas, if the abattoirs were placed at Kurnel, and there was a light railway to take the cattle there and to bring the meat to the city, that would not answer the purpose of bringing away what is brought away by these men in their carts to feed fowls, pigs, &c.
1170. You were asked a question by Mr. Willis in reference to chilled meat, and I think you stated that it would not be in any better condition than that killed at Glebe Island? Yes. I also think that if the abattoirs were distributed about the country, it would be almost impossible to have proper supervision—at any rate, it would be a very expensive process.
1171. I was just going to ask you a question on that point. There is another: A considerable number of bullocks come to the Island from the rivers and from Queensland, and is it not a fact that the bullocks which come from the rivers, direct to the Island, always arrive in a much better condition than they would if the abattoirs were at Parramatta or elsewhere? Much better than if driven, there is no doubt about it. report that you have taken considerable trouble in preparing? Yes. [See *Appendix A 2.*]
1172. *Chairman.*] This report marked "Glebe Island Abattoirs," and dated 24th August, 1896, is a 1173. It is the result of your previous connection with the Abattoirs, as well as recent inspection? Exactly.
1174. Did you write this report with the idea of having it put in as an accompanying report to your evidence? Yes, if so required. I thought it well to visit the Island in order to refresh my memory, and then I jotted down a few notes.
1175. Did you have a look at the present Abattoir buildings, to see if it would be possible, by the expenditure of a large or small sum of money, to make them suitable for all time as abattoirs for the city of Sydney? No, certainly not. I certainly should not hold with spending any money on the present Abattoirs.
1176. You think that the expenditure of any money on the present Abattoirs would be a waste of money? Yes, I do indeed.
1177. I think you had something to do, either directly or indirectly, with the erection of the refrigerating chamber there? Yes, I was connected as a draftsman with Mr. Kenway, in regard to that and other buildings on the Island.
1178. Do you think that the present building, which was originally intended for a refrigerating and cooling chamber, could be utilised for the purpose for which it was built in the event of new abattoir houses being built on either the present site, or on the opposite side of the road? Yes, I do indeed; they were very carefully thought out by Mr. Kenway and others, and are well up to date.
1179. Roughly speaking, what do you think a building of that kind would cost—I mean a building and also a chimney stack such as is attached to the engine-house there at the present time? I think £12,000 or £14,000.
1180. The building is comparatively speaking a new one? Yes, and all modern appliances were considered in carrying out that building. It is a great pity to see it used as a slaughter-house—a thorough waste.
1181. At the present time, owing to the small number of slaughter-houses available, the authorities have transformed it from a refrigerating chamber, for which it was built, into an ordinary slaughter-house? Yes, and the construction of that class of building is considerable. The construction of an ordinary slaughter-house is nothing in comparison.
1182. I notice at the end of your report a sketch of a slaughter-house;—is that a sketch plan of the present buildings? No, that is merely a suggestion for bunching, so as to bring the easy working, the drainage, and the ventilation within a limited space.

1183. This plan then, I understand, is something that occurred to your mind as a suitable plan for any future abattoir that might be built by the Government? No; I will not go so far as that. It is a mere suggestion that occurred to my mind. I thought that something of the kind might be done. You can form your bunching, perhaps, in an improved manner in comparison to that, but the bunching of the buildings thoroughly simplifies the most necessary requirements—that is to say, the drainage, the very easy working of the whole of the abattoir, and the ventilation you bring within a limited space.

A. Allen.  
17 Sept., 1896.

1184. You think that this rough sketch which you have submitted for the consideration of the committee would be a very great improvement on the construction of the present Abattoirs? In the construction of the present Abattoirs there seems to be no real plan. The avenues themselves are not half wide enough to work them properly, and the buildings are scattered, probably from being built piece by piece, and of various material, in fact no uniformity.

1185. You think, then, that to work the present Abattoirs properly it would be necessary to have at least twice the space between the two rows of slaughter-houses that at present exist? There is no doubt about it. There is not room for carts to pass if one stands back to one side of the slaughter-houses, and another to the other side. I maintain that you should have a centre avenue sufficiently wide to give a free passage.

1186. For carts going up and down? Yes; so that one might be backed against one side of the Abattoir and another against the other side, and then there should be a free passage between them.

1187. Did you go through the slaughter-houses yourself? Yes.

1188. Did they all seem to be cleanly? I certainly could not find very great fault with the slaughter-houses themselves. At any time I have been there they seemed to be under very fair supervision.

1189. Did you come in contact with any of the officials of the Island the day you visited it? No.

1190. Not at all? The inspector was away; he was in town on both occasions. I left my card at his office.

1191. Did you have any conversation with any of the officials? I had a conversation with those about different parts of the Island.

1192. But this plan was simply the outcome of your own thoughts and imaginations? Yes; it is a mere suggestion.

1193. You have taken no suggestions from any of the employees on the Island? No; I merely drew that in the same way as I should do in laying down a plan for any large building, like a barracks or an hospital.

1194. What is your idea as to the material to be used in the erection of abattoirs, brick or stone? I should very much prefer brick.

1195. Do you think that abattoirs are better built in one storey, the same as is the case at Glebe Island, or would you prefer two-storey buildings to be used? One-storey buildings for the abattoirs themselves. I do not mean to say that I would not, perhaps, for offices and so forth, erect a block or two of two-storey buildings, but so far as the abattoirs themselves are concerned, they should be one storey, and should be made of brick, for the simple reason that the present stone buildings are very much fretted away by the action of the salt air, and I should be afraid to trust only the very best picked stone. This could be used to advantage, especially where not much exposed.

1196. You think that would not apply to bricks? There is another question that that raises. It being one of the very early buildings put up on Glebe Island, they took the top cap, and, in geological experience, the top cap of a quarry is always the softest and will decay; but since that time they have got very much deeper into the quarries, and they get a superior class of stone.

1197. Your opinion is that if the Government decided to build new abattoirs at Glebe Island, they have plenty of suitable stone for the erection of suitable buildings? That they have plenty of suitable stone, I have not the slightest doubt, but I should object to using stone, in consequence of its quality of absorption, for one thing, unless it be lined inside; and I should line brick in the same manner, with tiles or white glazed brick, such as is generally used in butchers' shops. It is cleanly and very easily washed. With our heat, and the evaporation, stone walls absorb too much.

1198. Would you like to put in this plan? That I will leave entirely to you. [See *Appendix A 1.*]

1199. In producing this plan, you are not in any way desirous of forcing your architectural skill on the public as being superior? Certainly not.

1200. You are of opinion that our present Government Architect's department is capable of preparing a plan that would be quite suitable for a modern abattoir? Yes.

1201. This is a sketch which you have prepared in your leisure, after having visited the Abattoirs, and also from the practical experience that you had in connection with abattoirs when engaged by the City Council in regard to the sanitary arrangements of the city and suburbs? Yes.

1202. You have no objection to place this plan, simply as a rough sketch and suggestion, for the guidance of the Committee in bringing up their report? Yes; because the building in itself, as an abattoir, must be considered not only by an architect, but it wants the combined skill of a thoroughly good engineer, and I know from experience that in the Government service you have gentlemen as much skilled both as architects and engineers as there are in any other part of the world.

1203. *Mr. Wilks.*] In this scheme of yours have you done anything to prevent such disadvantage as it is said some of the carcase butchers suffer from owing to others having obtained preferable position as regards the slaughter-houses? Yes.

1204. You have put them all on an equality so far as business facilities are concerned? Yes; as far as I could.

Arthur Grey Kenway recalled and further examined:—

1205. *Chairman.*] I think you stated that the design of the present Abattoirs was so defective as to prevent any proper and suitable improvements being made there? Yes. The dilapidations, even when I was first connected with the Island, were so advanced and so huge that to put them in a really proper state of repair meant as much nearly as rebuilding.

1206. *Mr. Baxister.*] As a matter of fact it could only be satisfactorily done by rebuilding? Exactly.

1207. *Chairman.*] What is the difference between the past and the present state of the Abattoirs? Confining the past up to the time I took office, owing to the continual ban of banishment under which the Abattoirs

A. G. Kenway. Abattoirs had existed, no Government had felt justified in spending sufficient money for the same reason alluded to—it meant entirely rebuilding—but on my taking office, and pressing the Government repeatedly and repeatedly, I did get such work of improvements carried out as made the Abattoir in a tremendously different condition from a sanitary point of view compared with what it was when I first took charge.

17 Sept., 1896.

1208. Were designs prepared during Mr. McMillan's administration as Treasurer of this Colony for a model abattoir? Yes. Mr. McMillan, seeing the state of affairs, and how impossible it was to put the Abattoir in a proper condition, and knowing the Abattoir question was pressed on himself in the House repeatedly, instructed me to prepare a design for a model abattoir, irrespective of site or cost, I presume with the object of seeing what an abattoir should be if it possessed every requirement irrespective of cost.

1209. It was not drawn with the idea of erecting a new abattoir on Glebe Island? No.

1210. Is that sketch or design in existence now? Yes, at the Treasury.

1211. Did you estimate the probable cost of it? Yes; the whole erecting cost, the working cost, and the revenue, are all estimated there. Even taking the cost at £250,000—that expressing not the practicability, but the idealness of the design—and the killing on a scale equivalent to that outlay, it would still return a revenue of 7 per cent. on the outlay.

1212. What was the proposed design;—was it of stone or of brick? It was a design in which details were not displayed on paper, and you would require an hour or two to question me on the details.

1213. There was no sketch made of the details? No specifications written.

1214. But a design was drawn? Yes, detail drawings.

1215. Was that done by yourself or by some other architect? By myself; I employed a draftsman to prepare it.

1216. That was quite outside the Government service? Oh, no; it was while I was carrying out my duties at the island.

1217. You made use of one of the Government draftsmen to help you in the matter? Yes, I employed a temporary draftsman. Imperviousness of material was fully considered right through every detail—non-absorption.

1218. *Mr. Wilks.*] What material did you decide upon? Different materials; glazed bricks, slate, asphalt, and cast iron according to the circumstances. The design being an ideal one, I included also a meat market, a meat exchange, hide exchange, wool exchange.

1219. *Chairman.*] You must have had in your mind's eye at that time some position of the Abattoirs that would be tolerably central, or in close proximity to the centre of the city? What I had in my mind was a kind of standard or guide upon which any future design of an abattoir might be prepared. It was a record of all requirements of an abattoir.

1220. You probably took for your basis of work the position of the present abattoir, or an abattoir in an equally close and accessible position to the city as the present Abattoir? No; I had then somewhat the same opinion as I have now as to where a metropolitan abattoir should be.

1221. But it would necessarily have to be in close proximity to the city, if you are going to have a meat exchange, a meat market, and that kind of thing? No; I think that if—there is a great deal in the word "if"—the Abattoirs are fixed anywhere between Parramatta and Blacktown, there will be the centre of the business, and all connected businesses.

1222. As regards the meat market and exchange you speak of in connection with this ideal plan which you supplied to Mr. McMillan when he was Treasurer, did you have an idea of a wholesale market or of a retail market? Wholesale for the carcass butchers' trade.

1223. Where the retail butchers of the city and suburbs could purchase their supplies? Yes.

1224. Since you were here last you have visited the Wentworth Estate, near Homebush, and also the Newington Estate further on? Yes.

1225. What is your opinion in regard to either of those two positions as a site for future abattoirs to be erected upon, that is, having in view the saleyards and the supply of the city and suburbs with meat? The relative position of both to the saleyards is admirable.

1226. The Wentworth Estate is of course almost on the opposite side of the street to the present saleyards? It is only a street that divides them.

1227. Do you think that abattoirs erected on the Wentworth Estate would be found objectionable to the people who have made their homes at Homebush and Strathfield? Yes; there is not sufficient land to properly isolate.

1228. How does that apply in regard to Newington;—is that such a long distance away that it would not be objectionable? There is not sufficient distance. There is public prejudice as well as public interest. Public prejudice, although apparently sentimental, would be all powerful with any Government who might think of choosing that site.

1229. Do you think that the erection of abattoirs on either the Newington or the Wentworth Estate would be likely to bring down the value of properties already erected, and in the municipality of Strathfield? I do think so.

1230. And are you of opinion that, no matter how careful the erection of the abattoirs, if erected on either of those sites, might be, objectionable smells would arise sufficient to reach either of the fashionable suburbs of Strathfield and Homebush? Yes; they already reach there. Yesterday was not a hot day by any means, and I could trace smells all round the district.

1231. What did the smells arise from? From boiling-down and from the stockyards.

1232. Even from the present stockyards there is an objectionable smell arising? Yes.

1233. Where is the nearest boiling-down to those estates? The only place I know of now is not a boiling-down, but is the Sydney meat-preserving works at Auburn.

1234. Did you find an objectionable smell coming from that? Very.

1235. Do you think it would be impossible to have abattoirs erected even on the Newington Estate without preventing a nuisance to the suburbs west of Burwood and Strathfield? So far as an abattoir and desiccating process are concerned, it is quite possible. It is quite possible to have an abattoir in the heart of a city; but with the connected trades, and with the want of continual success in desiccating and other operations, there always will arise nuisance more or less, and complaints would always be made, whether justified or not, so long as the abattoirs were there. But at present Hastem's Creek, Duck River, and another small creek are as black as ink, and—the only words I can use—absolutely stink.

1236. Is this water at the present time emptying itself into the Parramatta River? Yes; and the part of the Parramatta River facing those two estates is already very much fouled. A. G. Kenway.  
17 Sept., 1896.
1237. Do you think that if the abattoirs were erected on either the Newington or the Wentworth Estate they also would in a very short time be likely to deteriorate the present state of the Parramatta River? If the two estates were acquired, and the Homebush flats were reclaimed, it is quite possible that sufficient land would be acquired to utilise all the waste from the abattoir without polluting the Parramatta River; but I do not think it possible that the noxious trades connected with an abattoir could be accommodated there at all. If they are accommodated there the river, no doubt, will be fouled.
1238. In all other respects those estates are in a convenient position as regards the present cattle sale-yards? Yes. There is also the advantage that they are connected with town both by rail and by water—that is if the water can be made deep enough.
1239. Do you think it would be possible so to deepen the water (say) in close proximity to the land as to allow of large steamers with ocean-borne cattle coming right up there? I do not think that is possible. I do not think an ocean-going boat could be brought anywhere near there.
1240. Not even if a span were put in the railway bridge running across the Parramatta River near Ryde? I would have to consult plans of the Harbours and Rivers Department, and soundings, before I could speak on that.
1241. How does the land seem adapted for the purposes of abattoirs? Admirably. It is porous, and with cultivation, with the waste products of the abattoirs, it would, no doubt, yield good crops.
1242. Do you think there is enough land there not only to erect abattoirs on but also to keep cattle there while resting previous to being killed? Nothing like sufficient.
1243. Would it be likely to prove a nuisance to the present Newington Asylum which is there? Yes; that would have to be wiped out.
1244. Do you think the present asylum would have to be taken away from there? Yes; and the land included in the abattoir premises.
1245. Is the land at present considerably isolated, or are there many houses erected in close proximity to those estates? There are not many houses of considerable value built in close proximity; but with the lie of the ground, if the abattoirs did create stinks, the stinks would be very perceptible in some of our most fashionable suburbs, whilst the enormous frontage to the Parramatta Road, which is almost its greatest frontage, would prevent isolation as much as we should like. The frontage to the Parramatta Road would be of no value to the abattoir, but it increases the value of the land, and it would mean increasing the purchasing cost.
1246. Do you think the Government would not be able to sell the frontage to the Parramatta Road, perhaps for business purposes, with the prospect of the abattoirs being established there, and that that would perhaps recoup them for the large expense that would be incurred on account of this valuable frontage? You would be bound to hear complaints from people who bought that land.
1247. *Mr. O'Sullivan* ] Am I to understand from your evidence that you prefer to see the abattoirs established at some point between Parramatta and Penrith? I do not go so far back as Penrith; I say between Parramatta and Blacktown. I should like to get as near a focus of railways as possible, so as to have a stock centre.
1248. Failing the abattoirs being established there, would you prefer to see them continued on Glebe Island, provided that the establishment there at the present time were extended and furnished with up-to-date appliances? No, for this reason: the primary object of an abattoir is the production of the best meat, and the killing of meat that is not properly rested, and consequently fevered, is the principal objection to a site where there is not sufficient area. The agistment—resting—paddocks should be the key of the whole site.
1249. Where is your second choice, then? I should say either the Newington or the Wentworth Estate is the next best place.
1250. But you have just given strong evidence against those two positions? Only in regard to area and want of isolation.
1251. But you also testified very strongly as to the direful results of drainage from those places? That is because of the want of area, and only because of that. The natural fall of the land is admirable, but it all falls into the Parramatta River.
1252. But supposing you had twice the area they are now offering there the drainage would still go into the Parramatta River? If we had twice the area no foul drainage would leave; all the waste products could be utilised on the soil.
1253. Putting aside the fact that you have not twice the area, you still think that one of those two positions would be the second best place to go to? Yes, apart from that.
1254. I gather from your previous evidence that you put out of sight altogether the proposal to go to Kurnel? Yes; I do not like it at all. No amount of cultivation could make that soil suitable for the growing of grass. Stock could not possibly feed there, however it was treated, and, again, it is so inaccessible that it would never become a stock centre.
1255. But supposing a railway were made from Glebe Island to the Homebush paddocks, where you could or ought to be able to get grass, or to some other place where you could get grass, could not Glebe Island then be made into a better abattoir than it is at present? It could be made a better one; but the retrucking of the stock entails a tremendous amount of bruising and further harassing of the stock, and increasing the fevered condition. Our wild cattle cannot be trucked and retrucked like cattle in other countries, which are stall fed. In America they do not allow stock to travel more than a certain distance without being allowed to rest, be paddocked, and retrucked, but the experience we have with our cattle here, with the one trucking, has prevented any resting or retrucking ever being adopted. The process is exceedingly cruel.
1256. You object to Glebe Island on the ground of stench from there going into a populous district? The waters of the harbour surrounding it are very foul. The drainage at present, although it will not be the case in future, at Blackwattle Bay, White Bay, Rozelle Bay, and Johnstone's Bay, all tends to foul that water. There is no scour; no continual current.
1257. But do not they, in the City of Glasgow, and also in the City of Chicago, where there is a tremendous population, carry on abattoirs successfully by using the latest machinery for desiccating and for preventing smells? I believe so.
1258. Could not we do the same here? We could, if the products had an equal value. Here manures are comparatively valueless; there they pay for production. 1259.

- A. G. Kenway. 1259. Would there be no sale, then, for the bye products of the Abattoirs here? Very little.  
 1260. There is a sale at the present time for manure from Glebe Island, is there not? I believe, but I do not know personally, that since the Board of Health took control they have found the sale of manures almost impossible.  
 1261. *Mr. Willis.*] Can you say what the value of blood manure is here? The trade is in the hands of one or two, and I think that if you were to offer 20 or 30 tons of blood to-morrow you would not get more than 30s. or 40s. a ton for it, but if you offered 200 or 300 tons, which would make a shipment, you would get £4 or £4 10s. a ton for it.  
 1262. Are you aware that the Bourke Meat-works have contracted for all their manure with a New Zealand firm, at £4 per ton, delivered on the works at Bourke? I quite believe it, if they supply it on a large scale, and act in a business-like way in making a contract; also, their manure would be more fit for general market purposes.

MONDAY, 28 SEPTEMBER, 1896.

[The Committee met at the "Grand Hotel," Melbourne.]

Present:—

MR. BAVISTER, | MR. LAW,  
 MR. WILKS.

J. S. HAWTHORNE, ESQ., IN THE CHAIR.

John Robertson examined:—

- J. Robertson. 1263. *Chairman.*] What is your official designation? Superintendent of the City Abattoirs and Inspector of the City Cattle Markets.  
 28 Sept., 1896. 1264. How long have you been in your present position? Three years on the 9th of November last.  
 1265. You were previously engaged in a subordinate capacity? Yes—assistant inspector to Mr. John Gee, the late superintendent.  
 1266. Had you any previous experience in the meat-killing business prior to becoming engaged by the City Corporation of Melbourne? Yes; almost ever since I was 12 years of age, both as wholesale butcher and slaughterman.  
 1267. In the colonies or in the old country? In the old country—for the London dead-meat market.  
 1268. In what part of the old country? Aberdeen, in Scotland.  
 1269. Did you come out under engagement to the Corporation here, or did you obtain engagement after you arrived here? I obtained an engagement after I arrived here. With the exception of about three months, I have been in the employ of the City Council ever since I came to the colonies.  
 1270. In what year did you come here? In 1883, I think.  
 1271. What is your general opinion in regard to the conduct of your abattoirs;—are they, as constituted, up to your ideas of what abattoirs should be? No, not exactly—not the beef-houses.  
 1272. The beef-houses you look upon as being somewhat out of date? Yes, they are getting out of date.  
 1273. It takes a considerable amount of labour, I suppose, to keep them in anything like a state of cleanliness? I spoke not so much from that point of view as because I believe in carcasses of meat being hung in rooms where there is nothing else hanging—for them to hang and cool properly there.  
 1274. The great difficulty which you experience at the present abattoirs is on account of the want of proper accommodation for hanging and exhibiting meat? Yes; the hanging-rooms are too small in the small beef-pens for the business that is being done now.  
 1275. The present abattoirs, I presume, were built when the population of Melbourne was very much smaller than it is at the present time? I believe so.  
 1276. How long have they been erected? As far as I know, over thirty years.  
 1277. That is, the first portion of the abattoirs was built about thirty years ago.  
 1278. Have you made any additions to them since then? Yes; there have been additional beef and additional mutton houses erected, and also the pig place, which was lately put up.  
 1279. Where the new slaughter-houses for sheep and cattle now exists, were there previously any slaughter-houses? I think they have been added on to, but I am not positive.  
 1280. The new houses are altogether additional premises? Yes; I think they are all additional.  
 1281. Would it not be possible for you to erect slaughter-houses for beef on something like the same lines as those you have adopted in building the new slaughter-houses for sheep and pigs? Yes. When we do build them, they could be built on a very much improved principle, compared with the beef-houses as they are now.  
 1282. What is your idea in regard to the cattle sale-yards and abattoirs—ought they to be in very close proximity to each other? Yes; as close as they can possibly be.  
 1283. Do you think that it adds to the quality of the beef if the cattle are driven as little as possible after leaving the trains? Yes; cattle should never be killed in a heated condition, or immediately after travelling. They should always be killed in as cool a condition as possible.  
 1284. If cattle had been driven 5, 6, or 7 miles the day before being killed, would you be able to detect it from looking at the meat immediately after the cattle had been killed? If they had been driven for 6 miles, and killed immediately after, you could detect it from the appearance of the blood-veins of the beef.  
 1285. And it would have a tendency to deteriorate the quality of the beef? Well, meat not properly bled, and killed in a heated condition, does not keep more than about half the time that meat killed and bled properly in a cool condition does.  
 1286. Are cattle from the country driven to your sale-yards, or are they brought by rail? There are some driven, but the bulk comes by rail—almost all the cattle come by rail; in fact, all except local cattle, which come from places within 20 or 30 miles.  
 1287. Where does your meat supply principally come from? Our meat supply comes from Gippsland, New South Wales, and Queensland, but the supply from Queensland is very light. I am talking of the direct supply, but there are a lot of Queensland cattle brought into Victoria and fattened, and kept for about two years, and then brought to the markets here. There are very few now brought direct from Queensland to be slaughtered here.

1288. Your principal supply, then, comes from Gippsland and New South Wales? Yes; and the western districts of this Colony. J. Robertson.

1289. How long are they generally kept in the sale-yards before being slaughtered? They are all received at the markets the day before sale—mostly at night. 28 Sept., 1896.

1290. Which are your sale-days? Wednesday for cattle, and Monday afternoon and Tuesday for sheep.

1291. And your sheep, I suppose, come in trucks, principally by rail? Yes; except local flocks—travelled in.

1292. How long do they remain in the sale-yards as a rule after being sold by the auctioneers? From half an hour up to half a day, perhaps.

1293. And then they are driven from there to the abattoirs? Yes.

1294. What distance would you reckon the abattoirs to be from the sale-yards? About half a mile.

1295. Do you drive them over your own territory only, or is there a public highway between the sale-yards and the abattoirs? There is only Epsom Road, which divides the sale-yards from the abattoirs.

1296. Do you ever find any difficulty in driving there, even at night;—do cattle ever escape or cause annoyance to the public? Very seldom; but still, I think that cattle going to the city abattoirs should not have any chance of escaping at all.

1297. If the sale-yards were situated, say as in the case of New South Wales, where they are at Homebush, a distance of about 6 or 7 miles from Glebe Island, and where the cattle, after being sold, have to be driven along metalled roads to, in many cases, yards close by, and then taken on and slaughtered at the island—would that, in your opinion, cause a great deterioration in the quality of the meat? There is no question about that, because in consequence of the knocking about which they receive both before they go to the yards and whilst they are in the yards, and also in going from the yards to the abattoirs, the beasts, if they are slaughtered right off, must be in a very bad, heated, excited condition. The muscle is very dark in cattle that have been travelled and knocked about, and they will never bleed properly, and the veins through the meat have a red appearance.

1298. Your opinion is that to drive cattle such a distance as that is unwise, in view of the desirability of keeping up the quality of the meat? Yes, I am quite positive about that, especially considering the way that the cattle are driven here—generally at half a gallop.

1299. Does the same observation apply in regard to sheep and pigs? It would apply, but the sheep are never driven to the same extent; they do not seem to get heated to the same extent. Cattle will go on for miles and miles, whereas if you push sheep they break down altogether, if they are good sheep.

1300. As to the delivering of your meat, I understand that it is taken from the abattoirs to the city and the suburbs? Yes, that is correct.

1301. You have a central meat-market? Yes; there is a city meat-market.

1302. Do you convey all the meat that is killed at the abattoirs to that central market? No; the butchers can take it where they like from our abattoirs.

1303. Do you exhibit meat in any large quantities at the abattoirs for butchers to come and inspect, and buy it if they like? We have nothing of that sort at the abattoirs.

1304. You do nothing in the way of selling meat at the abattoirs? There is, perhaps, not one carcass of meat bought at the abattoirs in one month.

1305. The carcass butchers do not keep salesmen at the abattoirs? Not one salesman.

1306. The abattoirs, then, are not leased out the same as is done by the Government of New South Wales in regard to the New South Wales Abattoirs at Glebe Island—you do not lease out the abattoirs to carcass butchers? No, we do not.

1307. You charge so much per head for slaughtering? Yes.

1308. How much do you charge for cattle? 1s. per head.

1309. Calves? 9d.

1310. Pigs? 6d.

1311. Sheep? 1d.

1312. Did you, at any time in the history of the abattoirs, since your connection with them, lease the slaughter-houses to the carcass butchers? No.

1313. Are there any slaughter-houses other than the Corporation slaughter-houses in which meat is being killed for the supply of Melbourne and its suburbs? Not in the City of Melbourne.

1314. But have you got any within convenient distance of your own abattoirs? Not any belonging to the City Council, but there are some private abattoirs.

1315. How far are they from the Corporation abattoirs? About 2½ miles.

1316. Are they under any supervision? Very slight, if any.

1317. What supervision are those abattoirs supposed to be under? There are fourteen of them altogether, and there is a nuisance inspector who has other duties to perform, and who just calls at the abattoirs now and again.

1318. And the way in which he performs his duties, you think, judging by your experience, it would be perfectly impossible for him to detect disease in the animals that are killed at those private abattoirs? He does not see one quarter of them killed.

1319. Then it would really be a payable thing for butchers who desired to slaughter cattle that were not exactly fit for human consumption, and were likely to be condemned in your abattoirs, or any other place under your jurisdiction, to send them to those private slaughter-houses? Certainly. They never come through our cattle-yards, but go direct to those private slaughter-houses.

1320. So, then, those diseased animals which we saw hanging up in the Corporation abattoirs to-day, and which the Committee and the other visitors with them considered were unfit for food, would, if they had been sent to private abattoirs probably have passed into the Melbourne meat-market for human consumption? In all likelihood, if the butchers so wished. There would be no one to check them.

1321. In the event of your condemning cattle, who suffers the loss? The butchers; but I should like to point out that in the outside private abattoirs there are some butchers as respectable as any of our men in the city abattoirs, and who would only pass good meat into consumption; but there are other men slaughtering outside who dare not come to the city abattoirs for the purpose of killing the class of stuff they get hold of.

1322. I understand you to mean that there are unscrupulous men engaged in the meat trade, who having

J. Robertson. got hold of cattle of a questionable kind, and being suspicious that they were diseased would, rather than suffer the loss of those cattle, send them to the private abattoirs rather than to the corporation abattoirs where there is so much stricter supervision? They will not send them to us if they have the slightest idea there is anything the matter with them. It is not to be expected that a butcher having paid £10 or £12 for a bullock will condemn it himself, when by stripping off the diseased portions he can send the rest of the animal into consumption, and get as much for that meat perhaps as for any other. There must be some independent authority to deal with these things.

28 Sept., 1896.

1323. So you are of opinion that it requires legislation of some kind, which will compel all meat to be properly inspected before being killed, and also afterwards, in order to prevent disease or injurious meat from passing into the market for sale? Yes. There is no guarantee for the public except a proper abattoirs inspection. The inspection of live stock, so far as tuberculosis is concerned, is of great value, but it is no guarantee, because diseased cattle will sometimes get past the best man you can possibly employ, without their real condition being detected, and it may be that until they are slaughtered, it is not found out that they are badly diseased—the disease perhaps being generalised right through them.

1324. Would it be possible for an ordinary man such as an inspector of nuisances, who has had no past experience of the meat-killing business, to detect disease in animals either before they were slaughtered or immediately afterwards, more especially in the latter case, if they were handled first by smart unscrupulous butchers? No. I am sure that there are butchers who could dress a beast in such a way that some of the nuisance inspectors would never know that it had been dressed specially to hide anything. It is done so neatly that you would never notice it unless it were pointed out to you.

1325. How many inspectors have you in connection with your own establishment? Two—besides myself.

1326. The men engaged in killing are, I understand, licensed? They are registered.

1327. No man can be employed in killing at your abattoirs until he has been registered by you? No; he cannot commence slaughtering until he has been registered by us.

1328. And if any of the men engaged in your slaughter-houses were found to have been guilty of passing an animal that was afterwards discovered to be diseased, would he be liable to dismissal, or to cancellation of his license? Cancellation of his license, and to be turned out of the abattoirs.

1329. What improvements do you think could be made in regard to your old slaughter-houses;—could they be altered as they are at present without pulling them down and rebuilding them? No. They would have to be pulled down, and rebuilt to make a proper job of them.

1330. Have you ever seen the New South Wales Abattoirs at Glebe Island? No, I have not.

1331. You have not been in New South Wales? No.

1332. Do you have any complaints from the public round about the Corporation Abattoirs in regard to smells or anything of the kind? We have not had any complaints for some years, but I think that five or six years ago there was an agitation for the removal of the abattoirs.

1333. How do you get rid of the whole of the offal that comes from the different animals that are killed? It is all taken to the desiccating works, and made into manure.

1334. After you have converted the substance into manure, what becomes of the refuse—is there any left? There is none left.

1335. What process do you put the blood through to deduct all that is good from it, and send the remaining liquid away? I cannot explain that properly to you; it is more an engineer's matter.

1336. What do you do with the blood as it comes from the beasts? It is baled out of the pits in the first instance, taken round to the desiccating works in trucks, taken up by a lift, and emptied into the cylinders on the top.

1337. Where did that blood come from which we saw running into the Saltwater River—was that simply the scourgings from the slaughter-houses? From washing down the carcasses of beef, and also the slaughtering places after the men have finished slaughtering.

1338. Do you find that the river becomes polluted in any way by what falls into it? No, it cannot become polluted, because no solid matter can possibly get down from our place to the river, but only water stained with blood.

1339. You cannot notice any discoloration 20 or 30 yards away from where the water stained with blood pours into the river? No; and you cannot trace it very far down the river. You can only see it just on the margin where it runs in.

1340. Is any matter that comes down slaughter-houses noticeable far down the river? I do not think you could trace it 200 yards down.

1341. And supposing there were no other establishment, excepting the abattoirs, in close proximity to the Saltwater River, do you think that anything coming from the abattoirs would be likely to interfere with the cleanliness of the river? Not in the slightest, and I am sure that if nothing more solid went into the river, there would be no objection taken by any one.

1342. Your opinion is that the best place for an abattoir to be built, and to be rendered as little objectionable as possible, is in close proximity to some running stream? Yes; but I do not think it is a good thing to have the drainage from abattoirs running into a fresh-water stream.

1343. You think it would be objectionable to have your drainage falling into a fresh-water stream? Well, it would depend on the stream, and if it were likely to be used for any purposes, such as cooking purposes. In this case I do not think it would be right to let the drainage go into the stream, but it would not cause any nuisance.

1344. What used to become of the stuff, such as you now convert into manure? About eight or ten years ago or more the solid matter used to be carted into the paddocks—or, at any rate, most of it—and there buried in trenches about 18 inches or 2 feet below the surface, hot lime being put immediately on the top of the blood.

1345. How is the other refuse from the different animals taken from your premises to the different boiling-down establishments? That is all carted away to different factories.

1346. The whole of the entrails go into the desiccating works? Yes; everything except what is to be used for human consumption.

1347. So that nothing objectionable goes away from the abattoirs? No.

1348. The whole of the other is converted into manure? People come for runners—the small intestines of the sheep and cattle—to be used in sausage-making. That is the only thing that goes out.

1349. How do they convey them from the abattoirs? They are put into bags, and have to be taken twice a day from the abattoirs in cars.

1350. There is no objection on the part of the public to anything coming from the abattoirs, either on account of smell or otherwise? None at all. I am particularly careful to see that the bags and cars are kept well washed. J. Robertson.  
28 Sept., 1896.

1351. What is your idea about the cartage question—do you not think that your method of carting the dead meat from the abattoirs to the meat market is somewhat out of date? Yes; I think the method could be very much improved on.

1352. Do you not think that it could be wonderfully improved on if you had a siding connecting the abattoirs with the railway, and if the meat were conveyed in cool chambers to the central meat market? There is no question about that, and I believe that if it were possible, owing to there being plenty of hanging accommodation, there ought to be a by-law that no meat should be allowed to be taken out of the abattoirs until it was properly cooled and set. If meat immediately after being slaughtered is jaggled about here and there, it will not become properly set nor keep.

1353. So your opinion is that, attached to every well-conducted abattoir, there ought to be alongside it a cool chamber in which meat can be hung up until it is thoroughly cooled and properly set? Yes; it ought to be at any rate twelve hours in a place where it would set—in a cool chamber, not a freezing chamber, to set it properly. The butchers here like to run it in hot, so as not to lose weight on the sheep and cattle. A sheep would lose about 2 lb., and a carcass of beef would lose about 14 lb. In the old country where meat is about three times the price it is here, no meat is allowed to be carted and jaggled about until it is properly set.

1354. That is the rule in the old country? Yes; and it is carried out strictly in most of the public abattoirs.

1355. How do your abattoirs here, generally speaking, compare with those in which you were accustomed to work in Aberdeen? Well, the mutton-houses and pig-places are better than any I have seen elsewhere.

1356. That is, your newly-constructed pig-houses? Yes.

1357. Those were designed, I suppose, by some architect attached to the Corporation? Yes.

1358. Acting on suggestions, I suppose, from yourself, and your officials? Yes; he got some practical hints from us when he was drawing the plans.

1359. How far do you think your abattoirs are from the General Post Office? About 3 miles, or a little over.

1360. Are the men engaged at your abattoirs under the control and in the employ of the Corporation of Melbourne? The men who do the cleansing are, but not the slaughtermen. The carpenters, paviors, and labourers are all Corporation men.

1361. The whole of the hands engaged at the abattoirs, with the exception of those employed in killing and dressing the meat are in the employ of the Corporation? Yes.

1362. The same remark applies to the hands employed at the sale-yards? The labourers there who do the cleansing are all Corporation men.

1363. You find that that is more conducive to cleanliness than if the men were allowed to be in the employ, say, of the butchers? Yes; you could not keep the place up to the mark, unless you had them directly under your own control, and there would be continual rows.

1364. So you think it is far preferable for any corporation or Government to charge so much per head for the slaughtering of cattle and other animals rather than to let the slaughter-houses at an annual rental? I certainly do. With the exception of the new pig-place the slaughtermen have to do all the cleansing inside. Every man, directly he has done his slaughtering, has to wash down his place and lime-wash the walls.

1365. One of your regulations, I suppose, is that these men have to keep their respective slaughter-houses in a cleanly condition? That is so. We do all the cleansing outside, and they have to do it inside.

1366. When an animal is condemned at the abattoirs, do you lose sight of it at all, or do you see that it is at once conveyed away and put beyond the reach of human consumption? When animals are condemned at the city abattoirs, they have, in accordance with the Health Act, to hang forty-eight hours. They must not be removed unless with the consent of the owner. When we have done with them and are going to send them to the boiling-down, they are cut down, all scored, and thoroughly saturated with kerosene, and then boiled down on our own reserve.

1367. Do you think it would be very injurious to cattle if they were brought down in railway trucks from the country and then put into the sale-yards, and after being sold there, were retrucked and taken 5 or 6 miles on the railway;—do you think that by retrucking them the meat would be very much injured? Of course it knocks them about to a certain extent—the shunting and one thing and another bruises them—and the more they are knocked about the longer they are before they get settled down into a cool condition.

1368. Supposing that you discover at the sale-yards an animal that you think is diseased, what steps do you take to find out whether it is or is not diseased? In the sale-yards each Wednesday I go through all the cattle, and the cattle that I suspect of being diseased are seized to be slaughtered at our city abattoirs under supervision. If they happen to prove fit for human consumption, the agent for them is allowed to take them and do what he thinks fit with them. On the other hand, if they are condemned, they are treated the same as if they were detected and condemned in the city abattoirs. Any proceeds derived from the sale of the hide and carcass are handed over to the agent.

1369. You send the condemned animals to the nearest boiling-down establishment? Our boiling-down is in connection with the abattoirs, at the Saltwater River. The carcasses are weighed before they are sent away, and booked to the different agents, and at the end of each month I have the returns for the carcasses and also for the hides and the fat. If there is anything over after paying expenses it is handed to the agents from whom the cattle had been seized.

1370. Do you have as rigid an inspection of mutton at the abattoirs as you have of beef? Yes; but mutton does not require as severe an inspection as beef. Tuberculosis is rare in sheep, but they have fluke very frequently, and hydatids are very common, but anthrax is very rare. As far as fluke in sheep is concerned, unless the sheep become emaciated and dropsical, they are fit for human consumption. Fluke is very seldom found anywhere but in the livers.

1371. How much per ton do you get for the manure? Three pounds or £3 5s., I think.

1372. Is there a good demand for it? Yes.

- J. Robertson. 1373. Is the supply equal to the demand? Yes, generally; but I think that just now the engineer is selling more than he is making. It goes just as the farmers and the gardeners want it, according to the season.  
 25 Sept., 1896.
1374. Sometimes there is a rush for it, and at other times you have some left on hand? Yes.
1375. *Mr. Wilks.*] In regard to the cattle sale-yards, the present objection in connection with them is to the intersecting road—Epsom Road? Yes.
1376. In a perfect sale-yards that should be removed? Well, the cattle ought to be taken across without having any chance of breaking away. It would not matter about the road being there, but there should be some sort of culvert, or something else, so that the cattle could be taken from the sale-yards to the abattoirs without any chance of breaking away.
1377. That is owing to many cattle being in a wild state when they arrive here? Yes; and they may break away and do a great deal of damage.
1378. The wild nature of Australian cattle is a very common feature? Yes. Cattle when shunted about on the railways are more or less wild.
1379. Are you aware that in America people are not allowed to travel stock such a long distance as people here do? I am not aware of that.
1380. But you can see the wisdom of that? I certainly do. If you travel cattle on rail, or on foot, for about a week, they get knocked about so much that if you keep them they will not feed, drink, or do anything else for about a week, and become very hardened, and waste away. When you slaughter them you can see how much the kidney fats and the fat around the intestines have wasted away.
1381. That meat, I suppose, is detrimental to the public health? I would not say that; but it becomes hard, tough, and muscular meat, almost as dark as your coat, if the beast has been travelled very much. In the case of cattle that have travelled and been knocked about, and have been killed in a fevered state, the flesh is always very muscular and dark in colour, and when killed is very tough.
1382. When cattle arrive at the sale-yards, do they take readily to food? A lot of them will not take readily to food. Quiet cattle accustomed to be fed will do so. I have seen cattle come into the yards which would not even go near the water-trough to drink.
1383. So the only practical use of the yards after all is to let them rest? Yes; and there is not a great deal of rest. The cattle are brought in on Wednesday night from 10 or 12 o'clock right up to the next morning.
1384. Is that rest sufficient to reduce the inflamed state? It does settle them down a bit, but directly daylight appears the different agents and drovers are amongst them again, stirring them up and classing them, and putting them into different pens—tops, seconds, and so on; and there is a lot of rushing about then, and in a few hours it is time to sell them, and there is another rushing and stirring about, for the butchers to see them in the pens, and directly they are sold, and the agent is out of the lane, the butchers are at them again, drafting them out and taking them into the big yards; therefore, they are kept in a continual swing almost the whole time they are there.
1385. The system which you have, in regard to slaughtermen having to report any diseased meat that may escape you, practically makes them additional inspectors? It does; but it is not meant for meat that may escape me. You cannot, however, be in all the pens at once, and this restriction was put on the butchers, so that they cannot remove anything until we come in. Supposing there is the least adhesion of lungs, pleurisy, or anything they notice wrong, they have to stop dressing at once, and must not go on with the dressing until I see it. This makes them inspectors in a certain way.
1386. In the absence of a stipulation like that, you would have to increase your number of inspectors? Yes. I understand that that is one difference between Glebe Island and the abattoirs here. Your meat is just slaughtered and taken away, and you must have a large staff of inspectors to see it at once and let it go, but none of the beef killed (say) to-day at our abattoirs is allowed to go out until to-morrow morning, no matter what time to-day it may be killed.
1387. Condemned carcasses you saturate with kerosene, and then take them to your own boiling-down establishment? The boiling-down establishment does not belong to the Corporation, although it is within their ground. It belongs to two of the butchers.
1388. They simply treat diseased meat? Yes; the refuse from their own private shops.
1389. By independent machinery? Yes.
1390. Therefore, you do not know whether it is or is not payable? I think it is payable enough.
1391. They treat so many carcasses that it is really payable? All the cattle that get down in the trains, and are killed or very much bruised, and also all the sheep that are smothered in travelling on the railway, are taken there and boiled down.
1392. Do you approve of the present method of killing cattle by spearing? It is the best we can possibly have at our abattoirs, but I believe in shooting if the place is adapted for it.
1393. What are your reasons for preferring shooting—is it more humane? Yes; that is the point of view from which I look at it. A man would scarcely ever miss cattle with a gun, but in spearing you do sometimes miss, and that means that you are apt to miss two or three times when the beast goes about, and unless you can get it in a proper position, so as to hit the spine between the two cups, the beast will not fall—he will not fall unless you hit and sever the spinal cord. However, such a miss very seldom occurs. But, if the slaughterman wishes to put down four cattle, the first one that is speared down lies there until the others have been speared down, and they lie there and breathe and yawn—for the beasts are only in a stunned condition—until the spinal cord is absolutely cut at the back of the neck.
1394. What extra arrangements would you require to carry out the more humane system of shooting? I am afraid it could not be carried out at our present abattoirs.
1395. From want of space you could not carry it out there? Yes. Bullets would be flying back off the walls. I know that in America shooting is an operation in almost all the large slaughter-houses, and is approved of.
1396. As to the effect of sending diseased meat on to the market, do you think that there are any complaints which are traceable to the consumption of diseased meat, or is that idea merely a matter of sentiment? I think that people have justification for it.
1397. Are you aware of any complaints that can be traced to the consumption of diseased meat? You cannot trace them directly, although everything goes to prove it. You cannot experiment on human beings with diseased meat, but you can experiment on pigs, dogs, fowls, guinea-pigs, or any other animal into which you can either inoculate the disease into or give it in food. 1398.

1398. The greatest compliment which you have to the rigidity of your inspection is that so many other slaughter-houses have been started? Yes; they have sprung up like mushrooms the last year or two. They have always existed, but they are now about double what they were. J. Robertson.  
28 Sept., 1896.

1399. That is proof that you are very particular in inspection? Yes. For instance, I know one butcher who killed about twenty head of cattle on one occasion, of which three were condemned by me. He was very dissatisfied about the condemnation of the cattle, which were diseased with tuberculosis, and he brought down the health officer of his own borough to see them. The doctor told him at once that he had not a leg to stand upon—that the disease was thoroughly generalised through them. Within three days that butcher “cleared out” of our abattoirs, and I think that is clear proof of what he went for.

1400. You would favour legislation in the direction of providing that within a certain distance of the city no slaughtering should be done except in the Corporation Abattoirs? An abattoir under proper inspection.

1401. But abattoirs are so costly that we may say the city abattoirs? Each small place cannot afford to have inspection. It would require one man for each private slaughter-house, and they could not possibly pay a man to stop there to inspect the meat.

1402. And, further, the scientific appliances required would increase the costliness of the abattoirs? Yes.

1403. What effect has the rigidity of your inspection on the slaughtermen;—do they feel inclined to leave you? No; the slaughtermen are very pleased to have the restrictions put on them. Before these special rules were passed, if a slaughterman happened to go and inform the inspector of anything being wrong, and the master butcher found it out, that man had to go. The men were really afraid; but, directly the restrictions were put upon them, they came at once, without the slightest fear, and they rather like the restrictions.

1404. Is it a fact that sometimes master butchers leave your abattoirs owing to the rigidity of your inspection? Yes.

1405. The desiccating plant is a main essential of an abattoir? If there is no other way of getting rid of the offal it is a main essential. Whenever there is a demand for the manure, and it will pay, that is the best method of dealing with the offal.

1406. In the early period of the operations of your abattoirs you dealt with the offal by burying it? Yes.

1407. Was that a very expensive method? No, it was not; but it is not a method to be recommended.

1408. On what grounds? Sanitary grounds. It is bad, even if you bury the offal 2 feet, because if you put in ten or twenty loads of sheep-paunches the gas is sure to break out through the top.

1409. And it makes a malaria? Yes.

1410. The occupation of a slaughterman is not an unhealthy one? No; it is not.

1411. You spoke about manure manufactured by the desiccating plant;—in this city it has to compete with manure obtained by desiccating night-soil? Yes.

1412. And the competition has a tendency to keep the price down? That and other manures from other places have a tendency to do that; but I think that, since the local market has been established for our manure, it is going on first-rate.

1413. A very heavy expense in connection with your abattoirs is owing to your being compelled to purchase Yan Yean water? Yes.

1414. If your abattoirs were in a position similar to Glebe Island, and you had abundance of water around you, there would be a great saving? Salt-water is of no use for washing meat or for drinking purposes.

1415. But I mean for cleansing purposes? It is fit for that. We use a lot of water for cleansing purposes; the cost goes into hundreds of pounds.

1416. Do you make any use at all of the salt-water river for such purposes? None at all. We simply use the Yan Yean water.

1417. The obnoxious smells that some people attribute to the abattoirs are mainly owing to the surrounding boiling-down establishments? Yes; there are a lot of establishments about 200 or 300 yards from the abattoirs—boiling-downs, fellmongering, and other establishments.

1418. And when visitors to the Flemington Racecourse complain of obnoxious smells, which they think come from the abattoirs, those are really coming from the surrounding noxious trades? Yes. No smell can come from the abattoirs, for no blood or offal is allowed to remain there until it would smell. As the pits become full they are emptied, and the contents are placed in trucks and taken away.

1419. The regulation that you have making the slaughtermen responsible for cleansing the premises before leaving is a very useful regulation? Yes; they have to wash everything down.

1420. Have you heard any complaints from carcass butchers in regard to the position of their pens? I have heard some, but very slight; there is not much advantage to be gained as to position at the abattoirs. You will hear more of that in regard to the dead meat market, to which people go to purchase meat.

1421. You obviate any difficulty by changing occasionally? Yes. Sometimes a man may hold two pens in connection with which there might be a slight advantage; his trade goes down perhaps about one-half; another man comes in and does about twice as much as that man, and I remove him at once, and put the man doing the most trade in the most convenient pens.

1422. What is your opinion in regard to the suggested improvements in reference to the conveyances for carrying the carcasses of meat to market? They ought to be properly closed.

1423. Something after the style of Bennett's meat-van which we saw? That is a very heavy, clumsy thing, and some of the butchers would not be able to have vans like that.

1424. You mean that for an average butcher they would be too expensive? Yes; and they are too cumbersome. One horse and a light trap would take about as much as two horses will draw in that van.

1425. Is the objection to carting meat to the city in the present ordinary way merely sentimental, or is it practical? It is practical. When there is a hot, windy day, and dust and horse-manure are being blown about, it would be useful to strictly require the conveyance of the meat in proper vans.

1426. In regard to the local consumption of meat, to which would you give preference—chilled meat or the ordinary slaughtered? Ordinary slaughtered meat.

1427. For what reason? I can always tell chilled or frozen meat from other meat. Chilled meat has a peculiar taste to me.

1428. Chilled meat? Yes. They chill it almost to freezing point.

1429. What about the chilled meat simply? Well, meat chilled, so long as it is not frozen, is a profitable meat to hold. It should not be eaten under one or two days at the very earliest—from two to three days is better.

- J. Robertson. 1430. Your previous answers were more in regard to frozen meat? Yes.
1431. How do you detect that? By the taste, the feel, and the colour. Frozen meat keeps no time after it has cooled down.
1432. It is not such a healthy food as ordinarily-slaughtered meat? I cannot speak from a health point of view; but I am quite sure that chilled meat is far preferable to frozen.
1433. And either chilled or ordinarily-slaughtered meat would be more saleable than frozen meat? Yes, in any city; but the great objection here is that they use meat before it is actually cool, and that meat is never good; it is tough.
1434. That lessens the market value of it? Yes. About one of the worst things is carting and jaggling about meat in cutting it up before it is properly set; it is always very tough.
1435. Does a railway connection run right into your sale-yards? No.
1436. The cattle have to be driven a certain distance? 200 or 300 yards.
1437. Is there a proper cattle-driving track reserved for that alone? Not altogether; there is other traffic on it.
1438. You had no previous experience in the control of abattoirs? No such experience until I came here.
1439. But you had practical knowledge as a wholesale butcher in the old country? Yes.
1440. And you know the supervision that there is in Aberdeen? Yes.
1441. It is a rigid inspection? They are more strict now; but when I was there the inspection was not half as strict as it is here. Neither was it in any part of England.
1442. How many years ago? Between thirteen and fourteen years. The inspection of meat there was almost nil.
1443. The most solid suggestion for the improvement of your abattoirs would be to put all the cattle slaughter-houses in the same condition as the pig and sheep houses? Yes; quite different altogether from the old places we have got. They were right enough in their day, when there were only a few killed in each pen, but they do not do when there is a lot to kill.
1444. Have you ever heard of a system of putting cattle in a certain position, so that they can be killed very rapidly one after the other? Yes; that is an American system; but we would want so much space that I do not think it is likely to come into force here.
1445. But space is of no consideration in a country like this? I mean that we should want a lot of space in building. In shooting cattle they are all run up into stalls, and a man walks along in front of them, and puts them down as he goes along—rows of them.
1446. It is not the public who complain about the inferior meat? Not so much. They do not seem to care so much about it, with the exception of a few.
1447. It is only the municipal authorities who, acting in the interests of public health, recognise the dangers of which the consumers are ignorant? That is it. The consumers do not appear to take very much interest in it.
1448. Therefore you consider that municipal control should exist? Yes.
1449. Have you any idea of a State department having the control of it? No.
1450. You consider that the municipal authorities are not amenable to any "ringing" operations? What I have noticed is that they always appear to manage this sort of matters better than a Government.
1451. To what is that owing—is it because they have more commercial men in their ranks? I cannot tell you the reason, but the municipal establishment is kept cleaner and under stricter regulations.
1452. *Mr. Law.*] Is it usual to kill cattle and skin them in sight of bullocks awaiting slaughter? Yes.
1453. That is the course of procedure always adopted? Yes; they can look in, but they do not take any notice of what is going on. If ever we had new beef-abattoirs erected we should have the cattle taken through a narrow crush into the pithing-pen, but not over any blood-drains. Now they often come to a drain and put down their head and smell the blood, and some of the cattle are so stubborn that it takes perhaps a quarter of an hour to drive them into the pen.
1454. But you have some gates that you could close between the pithing-pens and the cattle awaiting slaughter? When in the pithing-pen they are alright, but sometimes in getting them in they will turn round and round.
1455. What is the area of the abattoirs? I believe that the abattoirs and the cattle sale-yards are altogether 85 acres.
1456. Is that the total area of the cattle, sheep, and pig yards, and the abattoirs combined? Yes.
1457. In regard to the manufacture of manure, you told the Chairman that it was a certain price now; but I understand that some time ago it was nearly double that price? I believe that it was sold by contract one year at £5 15s., and another year at £5 17s. 6d. per ton.
1458. Has the price gone up and down? No; the manure was sent to the Mauritius then.
1459. What distance are the abattoirs from the railway? About three quarters of a mile.
1460. The Chairman asked you if there was any agitation, and you said "Yes." I should like to know what the agitation was about; it is some time ago, I think, since it occurred? Five or six years ago, or perhaps more.
1461. I believe that since then the very people who got up the agitation for the removal of the abattoirs are now clamouring for their retention where they are? Yes.
1462. That is, the people in the vicinity, and of the metropolitan area generally, are satisfied for the abattoirs to remain where they are? Yes.
1463. Are you in favour of the abattoirs being under municipal control or State control? Under the management of the council.
1464. Do you think it would be preferable to have the whole of the meat-killing for the Colony done at one central depôt, or allow the suburbs to have private slaughter-houses? I do not believe in private slaughter-houses, although it might be considered unfair to have all the meat-killing done at one place. Private slaughter-houses are no good at all, from any point of view.
1465. Do you think that the meat-killing could be more economically managed and be under greater supervision if it were all done at one central depôt? Yes, there is no question about that; and it would be fairer to all the butchers and the public too.
1466. Can you tell me what is the total number of bullocks killed annually at your abattoirs? We kill on an average about 800 a week.

1467. In regard to the diseased animals which you showed us to-day, part of the beasts, if they had not been seized by you, might have been made into sausages? Yes. J. Robertson.  
28 Sept., 1896.
1468. Are such parts ever utilised in the manufacture of sausages? Certainly not from our abattoirs.
1469. Are any blow-flies ever seen at your abattoirs? I have never seen blown meat in our abattoirs.
1470. But have you ever seen blow-flies there? Very, very few. They go to slaughter-houses where a few beasts and sheep are killed each week, and the hides and paunches and sometimes the dead carcasses of beasts are left lying about, and you can see thousands of blow-flies there.
1471. What is your opinion in regard to the effect of the abattoirs on the health of the employees there, and of the people living in the vicinity;—do you think it is beneficial to them? I cannot say that it is beneficial, but I am quite sure that it is not detrimental.
1472. You stated that there was a great deal of difference between bullocks killed after having been driven a long distance and those brought in from the vicinity of the abattoirs? Yes.
1473. The one, I suppose, is in a highly-heated state in comparison with the other? Yes.
1474. Supposing that a bullock was driven 50 miles to your abattoirs, and another was driven 5 miles, and they were both killed at your abattoirs, and a fore-quarter of each bullock was brought into the city and hung up in a shop,—could you tell which fore-quarter belonged to the bullock that had been driven 50 miles, and which fore-quarter belonged to the bullock that had been driven 5 miles? I should not like to say that I could do that, but I can tell any beast that has been travelled any distance by the colour of the flesh, and the small veins that you will see all over the carcass.
1475. You are an experienced hand, and yet you could not tell the difference? I would not say I could.
1476. *Mr. Bavister*] Are sheep and cattle much injured, in trucking, in transit, and in untrucking, on the railway lines? Yes.
1477. What percentage are killed, or are so much bruised and injured, as to be unfit for human consumption? I do not think 1 per cent.
1478. What percentage of cattle sold at the sale-yards are condemned before slaughtering? There may be 2 per cent. But many of the cattle seized at the sale-yards, and not absolutely condemned then, pass through afterwards. More pass through than are absolutely condemned.
1479. So the percentage condemned after slaughtering is not so great as the percentage condemned before slaughtering? It is more after slaughtering.
1480. *Chairman*.] Do you think that the present site of the abattoirs is sufficiently large to permit of the erection of an increased number of slaughter-houses, so that the whole of the meat now killed at the Corporation abattoirs, as well as at the private establishments close by, could be killed at the Corporation slaughter-houses, and be killed under your own or some other skilful supervision? Yes, there is plenty of room. If the council were pressed for ground on the abattoirs' reserve through an extension of the abattoirs they could get over that difficulty by not letting the cattle-yards, and making use of the large cattle-yards for cattle awaiting slaughter.
1481. Do you think it would be a good thing to introduce a by-law in connection with the slaughter-yards to prevent cattle from being slaughtered there, unless they were previously sent to the Corporation sale-yards to be sold? That could not be done without an amendment of the present Act.
1482. You think it would be conducive to the well-being and health of the public if all the abattoirs were placed under proper supervision? Yes; and I am quite sure that there are a lot of butchers slaughtering outside the city abattoirs who would be very glad if legislation of that sort came into force, so that the private abattoirs could be brought under proper supervision, because I know that directly they all come under proper supervision the butchers will stand out for a rebate from the owners of stock that is condemned.
1483. So that bringing all the slaughter-houses to one spot, where some official with a properly-organised staff could supervise them, would have the effect of preventing absolute loss to the butchers when cattle are condemned? Yes, I am sure of that, once they all come under one regulation.
1484. There would be no chance then of butchers getting diseased cattle away and making use of them, so as to prevent possible loss, because by their united action they could insist, as a condition of sale, on a rebate being given if the animals after they purchased them were found to be diseased? Yes. Some time ago the butchers slaughtering at the city abattoirs had some meetings to get a rebate on cattle that were condemned. The matter, however, fell through, owing to the men slaughtering outside the city taking no interest in it.
1485. So that, under the present regulations affecting the slaughtering of cattle, and their condemnation if they are found to be diseased, if any slaughter-man goes out of his way to inform the authorities that he has met with a diseased animal in killing it his situation is placed in jeopardy, simply on account of the master-butcher having to suffer the whole of the loss if an animal that is killed happens to be condemned? That is so.
1486. *Mr. Wilks*] Have you any fixed hours for slaughtering? Yes.
1487. What are they? From 5 o'clock in the morning until 10 o'clock at night.
1488. Can you suggest any improvement, or are you satisfied with those hours? They work very satisfactorily. Sometimes in the summer time, and in an exceptional state of the weather, the butchers are granted permission to slaughter during a few hours on Sunday. They have to get the consent of the Town Clerk.
1489. What would be the reason for that exception—a strong demand for meat? No. The reason is, that the people at the private slaughtering-houses can slaughter on Sunday, and if our men did not do so they would lose about one day's trade in the market in a week.
1490. That is another objection—that private enterprise forces you into Sunday slaughtering? Yes. There is not the slightest necessity for Sunday slaughtering. That is one great objection that I have to private slaughter-houses. People can deliver cattle there all day on Sunday, and there are no restrictions as to the hours of slaughtering. They just do as they like, with the exception of the Richmond abattoirs.

TUESDAY, 29 SEPTEMBER, 1896.

[The Committee met at the Newport Freezing Works.]

Present:—

Mr. BAVISTER, | Mr. LAW,  
                  | MR. WILKS.

J. S. HAWTHORNE, Esq., IN THE CHAIR.

John Maggs examined:—

- G. Maggs. 1491. *Chairman.*] What is your position in connection with these works? Clerk in charge.  
 1492. Have you been engaged here long? About two years.  
 29 Sept., 1896. 1493. What are your duties principally? I look after all the weighing and the shipping portion of the business.  
 1494. Have you anything to do with the killing portion of the business? No; there is a foreman slaughterman.  
 1495. How long have these works been in existence? About nine years.  
 1496. What was the company started principally for? For exporting frozen mutton.  
 1497. You confine yourself to the exportation of mutton? Yes.  
 1498. You do not touch beef? No; we do not touch beef.  
 1499. Do you find that the works prove offensive to the surrounding district? No; I do not think so. They are very free from smell. All the blood and offal are taken away after the day's killing.  
 1500. Do you reduce the offal to manure? No; we simply boil it down, and it is taken away to a farm.  
 1501. Have you a farm of your own? No.  
 1502. Do you sell the offal? No; it is simply carted away.  
 1503. You make it a present to those who cart it away? Yes.  
 1504. How far are you from the nearest shipping port? Williamstown is only 2 miles away; but we generally ship at Port Melbourne.  
 1505. How far is Port Melbourne away? Twelve or 13 miles.  
 1506. The railway trucks are drawn in close alongside the works? Yes; close alongside the chambers.  
 1507. Roughly speaking, how many sheep do you kill for export in a month? We are killing 20,000 a month—that is, for about nine months.  
 1508. What would be your annual average? Taking it right through the year, I think it would be about 4,000 a week.  
 1509. How is the stock brought to you;—by rail? Yes, by rail—brought right to the landing-stage at the works.  
 1510. There is nothing really driven? Only a few sheep we buy at Newmarket. That is the only place they are driven from.  
 1511. From where do you get your stock principally? Riverina—around Albury, and so on.  
 1512. New South Wales territory? Yes.  
 1513. How many hands do you employ here? I suppose we have about forty-five.  
 1514. Are you under Government supervision in any way? No. Of course the meat is inspected by a Government medical man. Each separate day's killing is always inspected before we export it.  
 1515. Is a Government officer always on the premises? He comes down every day.  
 1516. He is not stationed here? No.  
 1517. Has he fixed hours for inspection? No—at any time.  
 1518. If you were to meet with diseased sheep in slaughtering, would it be possible for you to dress them up for export without his detecting them? No; he comes here every day. He never misses a day.  
 1519. And he looks at every sheep? Not exactly. He looks at them in passing generally, as they are hanging up, and then looks at all the livers.  
 1520. What percentage would you reckon on for diseased sheep that would have to be condemned? In some lines there might be 2 per cent., and in others more. He rejects sheep more for bruises than for anything else.  
 1521. You do not detect much disease in your sheep? No; very rarely.  
 1522. Two per cent. would really be about a fair thing to assume, and that principally the result of bruises? Yes; getting down in the trucks coming down and being trodden upon.  
 1523. Have you any supervision over you in regard to cleanness? The Williamstown nuisance inspector comes round about once a week, and looks all over the place.  
 1524. So that if filth were allowed to accumulate the municipal officer from Williamstown would not only be able to discover it, but also be empowered to summon you and get you fined? Yes; he would. The blood is kept in a small channel, from which it is taken away. It is prevented from running out of the channel by a flow of hot water at one end, which keeps it back. Blood will not mix with hot water. Only a little coloured water runs to the sea, and although people have complained, there is no nuisance connected with it.  
 1525. What do you do with the blood? It is taken to Footscray, and converted into manure.  
 1526. So that there is really nothing objectionable either in the shape of solids or liquids coming from the slaughter-houses? Nothing whatever.  
 1527. *Mr. Wilks.*] Have you any acquaintance with the Melbourne storage in the Flinders-street markets? I have been there many a time.  
 1528. What is your opinion as regards the appliances there as compared with yours? They are much superiors to ours. They are up to date, whereas our machines are twenty years old. They can do 2,000 or more sheep a day, and we can do 1,000.  
 1529. And those are the appliances you would recommend to be copied? Yes; they have all the improvements.  
 1530. How is it you do not treat beef—it does not pay, I suppose? No; it is not profitable. No beef has been sent from these works for some years.

W. Strong. 1571. Do you think that the abattoirs interfere at all with the beauty or cleanliness of the Saltwater River close alongside? No; it does not interfere with it in the least. There are catch-pits, so that, as the blood and other matter pass along, the sediment is all caught, and what gets away hardly colours the water.

29 Nov., 1896.

1572. The whole of the offal, instead of being buried, as I understand it was previously, is now treated at the desiccating works, and converted into a marketable manure? Exactly.

1573. Do you think that the present killing business in and around Melbourne is of a satisfactory character? In Melbourne it is fairly satisfactory, as far as we can make it satisfactory. Of course it is not perfect even here; but as far as Melbourne is concerned, I think it is as satisfactory as it can be made at present. The Melbourne Corporation abattoirs supply about half of the meat consumed in the city; but the outside abattoirs are not under any proper supervision, and consequently meat not suitable for human consumption is oftentimes allowed to pass. Immediately beyond our abattoirs, in Braybrook alone, there are, I understand, about fifteen places where meat is killed, and in a recent report on those abattoirs it was stated that there no means for their proper supervision are in operation, and consequently meat that is not fit for human consumption passes through those places. Only a few days ago one beast was exposed for sale in our own market, which had come from one of those places, and it was so bad that the Magistrate fined the party exposing it for sale £10 and £3 3s. costs.

1574. That animal was slaughtered at one of the private slaughter-houses, where there is no supervision by Corporation officers? Exactly.

1575. A beast of the description mentioned could not find its way into the market if it were slaughtered at the Corporation slaughter-houses? No. You will find from the rules that each slaughterman, as soon as he finds anything wrong with a beast, is bound to report the fact to the superintendent, who inspects it, and decides whether it is or is not fit for human consumption. Therefore there is no possibility of meat unfit for human consumption going out of our abattoirs. As soon as a beast is found to be in that state it is marked with a large cross on the side, and is put aside, and afterwards cut up and desiccated.

1576. So that once meat is condemned at the Corporation abattoirs there is no possibility of its finding its way into the market for sale? No. It never gets out of the control of the superintendent until he disposes of it in the way I have mentioned.

1577. Have your sale-yards always been in as close proximity to the abattoirs as they are at present? For very many years they have. A long time ago we had them in North Melbourne, but for very many years they have been where they are now.

1578. They are close enough now to the abattoirs to prevent the possibility of injury to the cattle in driving, or of injury to the public by cattle getting away and running through the public thoroughfares? You doubtless noticed that the abattoirs' ground and the cattle sale-yards almost adjoin each other, so there is no difficulty whatever.

1579. The only public property separating them is a small roadway—Epsom Road? Yes.

1580. With the exception of that 66-foot road, they adjoin each other? Exactly.

1581. So that there is scarcely any possibility of danger from cattle-driving? No. I may also say that there is a movement on foot in favour of, and it is considered advisable, that a siding from the railway should be run into the cattle-yards, so that the cattle may be trucked right into the cattle-yards, and thus avoid any driving of them through Flemington or Kensington. That arrangement will most likely be carried out before long.

1582. So, although the distance is so short, you would truck the cattle right into the cattle-market? Yes; and, perhaps, when money is a little more plentiful, a siding will also be made right into the abattoirs, so that meat can be conveyed by rail to the city.

1583. At present inconvenience is experienced in conveying the meat from the abattoirs to the central meat-market? Yes. In connection with the carriage of meat from the abattoirs to the city we have a regulation that it must be so covered that no dust can get upon it; but sometimes some of the butchers break through that rule, and are fined for doing so. Bennett always uses perfect cars for conveying his meat.

1584. Do you find the cattle sale-yards a profitable investment? They pay very well. We let the sale-yards by tender every year.

1585. Are they let in one lot? Yes; and there is a certain scale of charges beyond which the lessee cannot go.

1586. The lessee is restricted in his charges in respect of all cattle entering the yards? Yes.

1587. And the annual rental which you obtain for the sale-yards is sufficient to pay interest on the capital invested in their erection? Yes.

1588. *Mr. Wilks.*] Have the city abattoirs always been under the control of the City Corporation? Yes.

1589. I suppose you would prefer a continuance of that system rather than that the abattoirs should be under the control of a State Department? I think it is better to have them under the control of the Corporation, more especially as the meat market is under our own inspectors, and it would be undesirable to have a clashing of inspectors.

1590. From your experience, do you think that either the aldermen or the councillors attempt to exercise any patronage in regard to the engagement of the employees? No.

1591. They never attempt to interfere? No.

1592. The establishment is conducted as if were a distinct department? Yes; as if it were a private enterprise. Matters in connection with the abattoirs, as is the case with every other department of the Corporation, are dealt with by a committee; and if anything arises in reference to the working of that department, the committee deal with it. But there is no interference by individual members of the Corporation.

1593. Therefore there is no danger of their making the abattoirs a refuge for their friends? No; the superintendent there is a man well qualified for his position—a man with eighteen or twenty years' experience, who, although not a veterinary surgeon, is so well acquainted with the practical working of the abattoirs that I think no man—not even a specially-trained man—could surpass him in that respect.

1594. Do you think that your rigid system of inspection causes any friction with the consumers—do the general public object to it at all? The consumers are favourable to it; but there is sometimes friction with the butchers. For instance, a number of cattle are exposed for sale; our inspectors visit the cattle-yards, and if they find any beasts there which they think are not up to the mark, they order them at once

to

to be taken to the abattoirs and have them killed; and of course, if they are diseased in any way they are condemned; but many of the butchers, if they find that they have cattle which they think are likely to be condemned in our abattoirs, will go to other abattoirs and have them killed where there is no inspection. W. Strong.  
29 Sept., 1896.

1595. Do you think there is any danger of going to extremes with inspection? No.

1596. I mean, making it a fad? No; I do not think so, so far as the Melbourne corporation are concerned. Our inspectors never go to extremes. They absolutely condemn meat only when it is unfit for human consumption. I may mention that we are trying to force the hands of the Board of Health to have the supervision which is necessary over the outside slaughter-houses.

John Clayton examined:—

1597. *Chairman.*] You are town clerk of Melbourne? Yes. J. Clayton.  
29 Sept., 1896.

1598. You have been in your present position for some years? Nearly six years.

1599. I suppose that you have a good deal to do with the administration of the abattoirs, as being one of the branches of your corporation departments? As chief executive officer I have to supervise the management of the abattoirs. The superintendent, of course, has the physical management of the establishment, but I have what you may term the clerical management of all arrangements.

1600. You, as the town clerk of Melbourne, have the general supervision of all the abattoirs administration? Yes.

1601. Mr. Robertson, the superintendent, I suppose, and also the engineer and other officials there, have continually to report to you the proceedings in connection with the administration of the abattoirs? Yes, on behalf of the Health and Market Committees of the Council.

1602. The abattoirs are managed by what is called the Health Committee of the City Council? Yes; and the cattle markets by the Market Committee.

1603. Since we saw you yesterday, I believe you have prepared some general information on the administration of the abattoirs—would you be good enough to give it to the members of the Committee? I have a few particulars which I thought would probably be useful to you. First of all I hand you a plan showing the site [*Appendix B1*] of the cattle markets and the abattoirs.

1604. You have no objection to have a copy of this abattoirs plan sent to us, to be attached as an appendix to the Committee's report? I will do so with pleasure. The cattle market site is 24 acres—that is, the small piece on top; the abattoirs site 57 acres. The title is by Crown grant, and it was given to the Council in the year 1857, in exchange for a site which was then owned by it, in Elizabeth-street, which is nearer the city. Under the Abattoirs Act, on the establishment of those abattoirs, it became illegal to have any other slaughtering done anywhere in the city. Part of the city abattoirs, as you saw it yesterday, was the original erection. Speaking roughly, on the cattle markets and the abattoirs reserves we have spent close on £100,000. Of course a good proportion of that expenditure was made in the earlier days when work was more costly. Of the more recent works, the desiccating plant was put up in 1889, and cost about £12,000; the sheep slaughter-houses were opened in 1891, and cost about £10,000; the pig slaughter-houses were opened this year, and cost about £3,000. In addition to that, we have remaining unexpended loan moneys amounting to £25,500, being part of the amount borrowed for renewing the whole establishment, of which we have carried out part, and for extensions. The only difficulty we have there is with regard to the contour of part of the land, which is low lying; and the City Surveyor has prepared plans for filling up the central portion so as to bring it to one useful level—a good draining level.

1605. That is, the low-lying land between the sale-yards and the abattoirs? Yes; it is part of the abattoirs reserve. Then we shall have a good useful fall right to the river. The difficulty which you saw yesterday of moist or wet paddock will be got rid of. The sites are absolutely adjacent, the only separation being a 66 feet road—Epsom Road. You will remember that that road forms a dish with a steep slope from either side. We have in view a plan to bring that road to something like a level, and to make an underground connection between the two reserves, so that practically the cattle will travel from end to end without ever going outside our fences.

1606. So the difficulty that now stands in the way of the perfect administration of the sale-yards and the abattoirs will be got rid of by the construction of a sub-way under the present road dividing the abattoirs and the cattle sale-yards properties? That is it. I may say that there is very little difficulty there, if any. But, at the same time, as the cattle have to cross a public street, there is a possible chance of a wild animal getting away.

1607. So in the near future that slight difficulty will be got rid of? Completely removed.

1608. After the construction of that sub-way the cattle will pass from the sale-yards right on to the abattoirs property? Quite so. The cattle at the present have to be driven to the sale-yards from a railway siding, which is situated about 400 yards away.

1609. Have you not been able to devise any means whereby a siding could be constructed from the main line of railway right into the sale-yards? That matter has been thought out carefully by the Council and the Railway Department, and a plan has been prepared showing a proposed siding. The red lines on the plan show the position of siding.

1610. It is proposed to construct this line so as to remove the difficulty, trouble, and annoyance of driving cattle from the main railway line to the sale-yards? Yes.

1611. I suppose you can let us have a tracing of this plan? Yes. We have also had other plans for a siding prepared to come in from the other side of the ground, our idea being that when the siding is put in it shall not only supply the live stock market, but shall also be connected with the abattoirs, so that the whole of the meat supply will then go straight from the cooling rooms into the centre of the city by rail.

1612. So the present system of cartage will then be entirely abolished? Yes; except so far as anyone may want to continue it for convenience. That also will give us the advantage of connecting our abattoirs with the cold stores, which are now connected with the railway system, and then meat could be slaughtered in our abattoirs, and without any further handling go right through to the cold storage chambers, and thence to the ship. Some years ago there was a local agitation for the removal of the abattoirs, and in this connection I should state that this site of 81 acres, whilst it is surrounded by another

J. Clayton. another municipality, is absolutely, a part of the City of Melbourne, so that it is under our own municipal control in every sense of the word—no other municipality has any control over it in any shape or form.

29 Sept, 1896. 1613. In the formation of the adjoining municipalities, these 81 acres were kept attached to the City of Melbourne? It is an island, but at the same time it has been proclaimed as part of the city. The agitation was based on one or two reasons, the soundest being the driving of stock from the railway siding into the markets. Another, at that date, was alleged offensiveness. One only ground for this was that a few years previously the offal had to be burned on the site.

1614. Has any agitation taken place since you got rid of that difficulty? No; not to speak of. That was some years ago. The main part of the agitation was because certain interested parties had a desire to have the land cut up and sold. I may say that the best way to describe the state of affairs at the present time is this:—Those who formerly wanted the abattoirs removed are now our strongest supporters for their retention.

1615. So that at the present time there is not, and for some time past there has not been, any agitation on the part of the inhabitants surrounding these places, or from the residents of Flemington, in favour of removing the present abattoirs? No; on the contrary, when a proposition was made about two months ago for an outside municipality to establish central markets and abattoirs within its boundaries, the residents in the neighbourhood of our abattoirs were, as they are now, strong supporters for the retention of the abattoirs where they are now. All nuisance has been removed by the establishment of the desiccating plant, by which everything of a character in the slightest offensive, is treated immediately after it is brought from the beast. It is not allowed to remain, so as to become offensive in any shape or form. It is taken straight from the slaughtering pens into trucks: and thence into the desiccating plant, probably with only the lapse of an hour or two.

1616. Well, within a few hours, at the very outside? Yes; a few hours will cover all the time from the moment that the stuff is taken from the inside of the beast and put into the desiccator. With regard to the liquid refuse, I may say that all the blood, or at any rate as much of it as possible, is saved as being a very valuable bi-product, and is utilised in the manufacture of blood manure. The drains are so constructed with silt pits that everything solid is caught, and nothing is allowed to go except what may be termed stained water—the washings down.

1617. So that nothing whatever escapes through the drains into the Saltwater River that could possibly be injurious to the health of the surrounding districts? Nothing at all.

1618. And although the water has the appearance of blood, still, if it is taken up in a small vessel, it is found to be simply discoloured water? That is so, and I do not suppose that it would be noticeable in the river a short distance from the mouth of the drain. The market and abattoir sites are built in on two sides. The cattle market absolutely faces the centre of population, on the north end, and is within 100 yards of the Town Hall of Flemington and Kensington, and is separated from the railway station only by a 99-foot road. Portion of the east side is faced by private residences.

1619. And no agitation has taken place, but rather the opposite, from the surrounding residents? That is so. We have, in addition, a market in the Sydney Road where the milch cattle are dealt with. So far as cattle are concerned, that market is restricted almost entirely to milch cattle. But it is also a pig market. It is under our own control.

1620. And your inspectors view all animals sold there? Yes; the markets are inspected by Mr. Robertson, who is our Chief Inspector. Every animal is inspected, and anything of a suspicious character is seized for slaughter under supervision, is taken to the abattoirs, and kept for forty-eight hours, in compliance with the Health Act, and during those forty-eight hours the owner has an opportunity of appealing to Justices against our seizure if he likes.

1621. Do you often have appeals? We have never had an appeal, yet, nor have we had what you may term an unsuccessful seizure. The inspector has sometimes seized cattle which, on being slaughtered, have been found to be in a condition which, whilst justifying his action, has enabled him to pass the meat for consumption, the affection being so localised that the carcass of the animal was absolutely fit for food. I have here a return of the stock slaughtered at the abattoirs, and also of the stock condemned. (*Appendix B 2.*) The abattoirs are managed under regulations, which I now put in. (*Appendix B 3.*) These provide for the registration of slaughtermen, for the hours of slaughtering, for the registration of all stock received, for the supply of food to cattle there, for proper cleansing, and for preventing anything from leaving the premises except such as is fit for food. I mean that, even from healthy beasts, nothing but what is good for food is allowed to go out, and the rest is treated at the works. We have a special regulation providing against the manipulation of a carcass so as to remove any signs of disease—what we technically term “stripping.” I put in a copy of these regulations (*Appendix B 4.*) We have also two separate by-laws of the city to meet the difficulty which some of your members noticed in connection with the carting of meat through the streets. I now put in a by-law which provides that no person shall convey through the streets of the city any meat, except in a cart or vehicle so constructed that the rays of the sun, and the rain and dust cannot possibly reach the meat (*Appendix B 5.*) I also put in a further regulation which was found to be necessary, providing that no meat shall be carried in any vehicle except such as has proper protection, and is provided with proper sitting accommodation (*Appendix B 6.*) We found that persons were in the habit of putting a piece of canvas on the meat sometimes, and then sitting on the top of the carcass itself. Under these by-laws we have instituted a good many prosecutions in regard to meat killed at other places but taken through the city. As to the system of supervision, Mr. Robertson's evidence will probably have given you sufficient information; but I have noted shortly that our staff consists of three inspectors, and that, at least, one of those inspectors is on duty at any time when slaughtering is going on—frequently two, and sometimes three.

1622. Have the two inspectors under Mr. Robertson power to condemn cattle as being unfit for food, without appealing to the chief inspector, Mr. Robertson? They do not do so. They hold back cattle, and send for him if there be any difficulty. In regard to anything that is very clear, of course, they have power to seize in the meantime.

1623. They have not power to condemn meat finally until Mr. Robinson inspects it? As a matter of internal management, it is Mr. Robertson who always formally condemns, that is the better way to put it. The slaughter-men are not our employees; they are employed by the master-butchers or master-slaughtermen. But no man is allowed to work in the abattoirs except he be approved of by the superintendent, and put on our register—holding a license, so to speak, from the City Council.

1624. No fee is charged for the license? No fee—it is simply a matter of approval.

1625. And he only holds that during good behaviour? Yes, and compliance with the regulations. Under our Health Act we have power to seize anything that appears to be unwholesome or unfit for food, at any stage, either in our cattle-markets or our Abattoirs, or in shops or the markets, or in fact anywhere else, and we act upon it. If the circumstances are of such a character as to show that the owner had reasonable means of knowing of the existence of the disease we prosecute in every such case. If the circumstances be otherwise, probably the seizure is all that occurs. Under the Health Act anything once seized belongs to the local authority absolutely; the owner ceases to have any further ownership in it; but in order to lessen the loss to the owner, we give him whatever it will produce at the boiling-down works, after deducting any expenses. Of course, he gets the benefit of the hide and the proceeds of the boiling-down, and that lightens his loss a little.

J. Clayton.  
29 Sept., 1896.

1626. So that if a bullock costs a butcher at the sale-yards £7, and it was afterwards condemned by your officers, you would send it to the boiling-down establishment, and if it realised £1 you would give that £1 to the butcher? Yes; and he gets the hide, which he takes away and sells to the best advantage elsewhere, there being no danger from the hide going out. I may also say that anything siezed is always taken to one pen. We keep one pen in the abattoirs exclusively as a quarantine pen, to which all condemned stock is taken. Anything siezed alive is slaughtered in that pen, and anything detected *post-mortem* is taken to that pen, so that, as far as possible, there shall be no risk of contamination from the bad meat of any good carcasses adjoining. We have by our system of supervision a double check. We inspect the animals in life, and we have the further check of inspection after slaughtering. The present site has the advantage of a water frontage, it being a necessity that there must be some outlet for the drainage, whatever it may be. The present cost of Yan Yean water is a very heavy item. We have to pay the same as any other consumer, namely, 1s. per 1,000 gallons, for all the Yan Yean water which we use for any purpose in the abattoirs. It has become such a heavy item that on one or two occasions the City Surveyor has reported recommending the expediency of putting up a pumping plant and pumping water from the river, although that water, being salt, would, of course, be used only for washing-down purposes. The adoption of the City Surveyor's recommendations would result in a great saving to us in the cost of water for cleansing. With regard to our desiccating-plant, I may say that it has been established for the purpose of treating all the refuse and offal from the abattoirs. I will put in reports from the City Surveyor with regard thereto. These reports are a report prepared in May, 1894, and the annual report for last year, dated February, 1896. The latter shows that during the year 1895 3,035 tons of blood and offal were passed through, producing 758 tons of manure, at a cost of £1,896. [Appendix B 7 and 8.]

1627. What do you get per ton for that? The blood-manure we are selling at the present time at £3 5s. per ton, or £3 per ton for larger lots. It is also sold in bags, and we have agents all through the colonies.

1628. *Mr. Wilks.*] Have you any legislation, regulating the sale of manures? No. There is a Bill before the House at the present time called the Sales of Manures Bill.

1629. *Chairman.*] What does it provide for? It provides for dealing with all manufactured manures. But the introducer of the Bill thinks that the manure produced at the abattoirs will not come under it. If we find that it would come under it we shall take steps to endeavour to prevent its being brought under it, for the Bill contains certain stringent provisions, which, although necessary in the case of manufactured manures, are unnecessary in the case of a corporate body which is simply drying up a bi-product without any adulteration or manipulation whatever, but for the purposes of sanitation. We do not profess to give anything beyond what the desiccators turn out. I suppose that I need hardly express my opinion as to the necessity for stringent supervision in regard to meat supply, and I am of opinion that that can be obtained only by, in some degree, a concentration of all slaughtering-places.

1630. You think that the present private slaughtering-places just outside the boundaries of the city, and which at present supply the city of Melbourne and its suburbs with a large proportion of the meat consumed, ought to be brought under the same strict supervision as is practised at the Corporation Abattoirs? Certainly, nothing less. I do not say that they should be brought to our abattoirs—as to that we do not care—but they should be so concentrated as to enable proper supervision to be carried out. At the present moment with private slaughter-houses in such large numbers, such supervision is absolutely impossible.

1631. You think that while those private slaughter-houses are allowed to exist in isolated spots outside the city boundaries, the health of the people of Melbourne and its suburbs is always liable to danger through want of proper inspection? Yes, a serious danger.

1632. That danger would be got rid of if those slaughtering-places were under such supervision as exists at the Corporation Abattoirs? Similar supervision in any abattoirs would be a very safe protection.

1633. And you are of opinion that while those private slaughter-houses are allowed to exist an invitation is held out to buyers of cattle to take them to the private slaughtering-houses to be killed rather than to your Corporation Abattoirs, for fear of the strict supervision, resulting in the condemnation of cattle that would otherwise be allowed to pass and go into consumption from the private abattoirs? The temptation afforded by a lack of supervision is too strong to be resisted.

1634. *Mr. Wilks.*] Our experience at Williamstown this morning would strengthen that opinion, would it not? If it needed strengthening. I may say that in visiting a certain private slaughter-house outside the city I saw eight bullocks hanging ready to be sent to the market; two out of the eight had been stripped, and I saw the organs which, no doubt, came from those beasts, and which were badly diseased; but they had been removed, and the beasts had been stripped. There was no doubt as to the beasts having been diseased, but in the absence of immediate proof, those beasts went into consumption.

1635. *Chairman.*] That would have been an impossibility at the Corporation Abattoirs? Yes; because even the stripping, as I have said, would not be allowed.

1636. I suppose you have found difficulty in conducting the Corporation Abattoirs, owing to the fact that the strict supervision there almost induces men who have been engaged in slaughtering at your abattoirs to go elsewhere? Yes. A number of the master butchers—I suppose I may say eight or ten—have, during the past few years, had to leave us, or have left us, because they could not stand the losses which were entailed by condemnation; that is their own statement.

1637. So that these men have admitted that for their own sake—that is, in order to avoid the great pecuniary loss entailed upon them by the condemnation of cattle at your abattoirs, owing to the strict supervision

- J. Clayton. supervision;—they have tried to get rid of the possibility of such loss by having their cattle killed at private slaughter-houses? That is so.
- 29 Sept., 1896. 1638. You think that, generally speaking, the carcass butchers of Melbourne and suburbs would rather have the whole of the slaughtering-places in and around Melbourne placed under one uniform system of provision? No doubt. They do not object to it at all, provided they are all placed on the same footing.
1639. So that they might be able, by combination, to obtain a rebate from the people from whom they buy cattle which are afterwards condemned? Personally I do not approve of that being legislated for, because directly it is legislated for, the Legislature has to manufacture the necessary machinery to carry out the law. If they know that the loss falls on the immediate owner the butchers will take care to buy under such conditions as will protect them against their vendors, in the event of seizure and condemnation, and I think that that is infinitely the best way;—it leads to fairness of trade between vendor and purchaser. I am unhesitatingly of opinion that the abattoirs should be under municipal control, in the same way that I think both lighting and water supply should be entirely under municipal control. The articles in question are consumed by every citizen, and, therefore, any profits derived from those industries should go to the citizens themselves, in addition to their having a voice in the management of those undertakings, and seeing that they are carried on, in their opinion, to the best advantage.
1640. *Mr. Wilks.*] How does the Board of Health co-operate with the City Council? The Board of Health is what you may call a superior or governing body, appointed by the Government for the whole Colony. It is composed of seven municipal representatives and two Government representatives, one of whom is its chairman.
1641. What about the scientific portion? The Chairman, Dr. Gresswell, is the chief medical officer.
1642. Does he ever assist the inspector at the abattoirs, or call his services into requisition? We work together to the extent that if any case of special interest arose, I would bring it under the notice of the Board's officers, and the Board's officers work in harmony with the officers of the Council. We also of course employ outside veterinary assistance if we want corroboration of our own officers' statements in any prosecutions.
1643. Have the Board of Health any officers who pay visits of inspection to the shops of retail butchers? The Board has a number of inspectors, and during the past few months the Government has appointed a special veterinary inspector, whose duty it is to supervise the whole of the dairy herds, and also the meat supply of the Colony.
1644. Do you favour a closer relationship than now exists between the Board of Health and the local councils? I do not like the idea of having an interfering body, but a body working in harmony with the local councils for the general good, and that is the relationship which the City Council endeavour to maintain with the Board.
1645. And that would be of great advantage to the large body of consumers? Of great advantage; because outside places could then have a superior officer to whom they could refer in cases of difficulty. I am now referring to some municipalities outside, who have not an opportunity of having a permanent staff of their own.
1646. In regard to the present private slaughter-houses, how would you look upon legislation prescribing the area that you had to operate upon? I think that the legislation should be in the direction of providing for probably three abattoirs for the whole of the metropolitan area—one each at three different points of the compass. Within a radius of 10 miles from the post-office there should be two or three abattoirs, in different centres, so as not to have too much inconvenience from carting long distances.
1647. So you would not concentrate all your efforts on one site? I think that would be a mistake. I do not think that the work could then be carried out with satisfaction.
1648. Your present site would be large enough for one? We have room to extend over a great deal more than we are now doing. I am of opinion that there is sufficient power under our Health Act now to require some of those defective places outside to be brought into a proper condition, if the law were enforced.
1649. The council having control of the abattoirs. Judging from your experience, you would say that there is no patronage exercised by members of the council in regard to the appointment of employees? None whatever.
1650. *Chairman.*] How do you manage about water-borne cattle—cattle coming from abroad by steamer, how do you manage to get them to the present sale-yards? I question if there are any worth talking of. I do not think that we have any to speak of. They would certainly be very few.
1651. You cannot call to mind any consignments of cattle coming by sea to your port? No.
1652. They mostly come by rail? From different parts of this colony or from the other colonies.
1653. So really you have not taken into serious consideration the cattle coming by steamer, simply because, if any, they are so few? If any came they would have to be driven, in accordance with our regulations controlling the travelling of stock through our streets, and limiting it to certain hours.
1654. *Mr. Bawster.*] In your statement, did you give consideration to the questions which I submitted to you in writing last night? I think I have answered them all.
1655. *Mr. Law.*] Can you tell me whether the desiccating portion of the works alone is paying its way? At the present time the desiccating works are just about paying their way—if anything, they are giving a slight profit.
1656. You say that in 1889 £12,000 was expended in constructing the desiccating plant? Yes.
1657. Do you think that the desiccating plant is fully up to date? I know of nothing better. If we had a bone-mill in connection with it, for the treatment of the bones from the abattoirs, we should have an ideal manure, by putting the pure bone-dust with the blood-manure. I may say, that in connection with the cattle sale-yards and the abattoirs, but mainly in the cattle yards, there are about 24 acres of pitching.
1658. *Mr. Wilks.*] Do you approve of the cattle-slaughtering pens being on the same principle as the places for slaughtering sheep and pigs? Yes, on an improved plan; but not being an engineer, I do not know what the latest improved plan is. In their present form they are so constructed as to save labour as much as possible. The sheep and the pigs walk up to the higher level, and we get practically a gravitation scheme for the treatment of the carcasses and all the offal, and by that means we save labour. No doubt our new buildings for cattle will be somewhat on the same lines. I submit a description of the big slaughter-houses recently erected, which may be of interest to the Committee. [*Appendix B 9.*]

## SELECT COMMITTEE ON THE ABATTOIRS.

FRIDAY, 9 OCTOBER, 1896.

[The Committee met at the Australian Chilling and Freezing Works, Aberdeen.]

Present:—

MR. BAVISTER, | MR. LAW,  
MR. WILKS.

J. S. HAWTHORNE, ESQ., IN THE CHAIR.

William Anthony Benn, sworn and examined:—

1659. *Chairman.*] What are your works known as? The Australian Chilling and Freezing Company's W. A. Benn. Works. 9 Oct., 1896.
1660. You are the general manager? No; the general manager is in London.
1661. You are the manager for the company in New South Wales? Yes.
- 1661½. The Company is an English one? Yes.
1662. Have you a local directorate? No; the Board of Directors are entirely in England. In this Colony Mr. R. M. Pitt (of Pitt, Son, and Badgery), Sydney, and Mr. Jesse Gregson, the manager of the A.A. Company, Newcastle, constitute what is called the Local Board of Advice.
1663. The whole management of the works is entirely in your hands? Yes.
1664. Did you come out from the old country to manage these works? No; I was thirty years in New Zealand.
1665. You had previously had a large amount of Colonial experience? Yes.
1666. Where were you employed previous to taking charge of these works? I was never previously employed. I was always working on my own account.
1667. Had you a large experience in the meat trade previous to coming here? Not much in the meat trade, but with large stock generally. I was a sheep farmer, and I had also a large experience in live stock and station business in New Zealand.
1668. Were you the first manager appointed here? Yes.
1669. And you have been here ever since the establishment of the works? Yes.
1670. What number of sheep do you generally kill here? At present we are killing about 1,000 "freezers" a day, and about 500 or 600 sheep for tinning and boiling besides. That is about the average number that we kill each day now.
1671. What number of cattle do you generally kill? We generally kill about 75 head of cattle a day.
1672. What has been the largest number that you have killed in any one day? A little over 3,000 sheep.
1673. And the largest number of cattle? About 130 head.
1674. Do you buy your sheep principally in this Colony? They come chiefly from the Liverpool Plains, in the Narrabri district.
1675. How are they conveyed to you? Chiefly by rail. The "freezers" come in by rail, and the sheep for boiling and tinning generally by road.
1676. And the cattle? They generally come from the Hunter on foot. We have never had any cattle sent to these works by rail.
1677. In regard to sheep and cattle, which do you think turn out the better meat, those that come by rail or those that travel along the road? There is no doubt that sheep travelled along the road, so long as you can rest them afterwards, turn out much better meat than trucked sheep. Trucked sheep get very badly treated whilst in the trucks, and they want a long time to recover.
1678. When you get sheep brought in by rail, how much time do you generally allow to elapse before you kill them? It depends on the conditions under which they are trucked. If the weather is wet, and the sheep are trucked wet, and they have a good deal of wool on them, they want a week's rest. If, on the other hand, they are shorn sheep, and they have not come a very long distance, and they have not very heavy fleeces on them, and if they have been trucked dry, you can reasonably kill them within three or four days after their arrival out of the trucks.
1679. And the cattle? Well, cattle, even if they walk only 3 miles in weather like this, want forty-eight hours' rest before they are killed, or the meat is more or less fiery.
1680. You never on any occasion start killing cattle just after they have been driven into the yards? Never. We always allow them at least forty-eight hours' rest before killing.
1681. And you find the meat is all the better the longer they are kept in the paddocks? Yes; within a reasonable time.
1682. You do not keep the cattle alongside the slaughter-house previous to killing? We yard twice a day, so cattle are never more than three hours in the yard before they are killed.
1683. You do not, then, require to resort to artificial feeding? No.
1684. You have sufficient grass paddocks to accommodate all the cattle you kill? Yes.
1685. What do you do with the offal from the sheep and cattle that you kill? Put it all through the desiccator and turn it into manure.
1686. Do you find that there is much demand for the manure? We sell it as fast as we can make it.
1687. Is it for export trade or is it used by the farmers round about? Both. There is a very strong demand for it on the part of orchardists. I am sorry that I sold a good deal for export a little while ago, for people about Gosford have been sending for a lot that I have been unable to supply.
1688. So that now you really find the local demand quite equal to, if not greater, than the supply? No; the local demand is not nearly up to supply, but still it is growing fast.
1689. You find an increasing demand on the part of orchardists and farmers for the manure? Yes; the Chinamen began the use of it, and now the European is following in the steps of "John."
1690. What is your average price for the manure? According to quantities—about 45s. per ton on the works, new bags given in.
1691. Which manure is that? The manure from the offal—what is generally called "fertiliser."
1692. Does manure produced from blood realise a higher price than that? Yes.
1693. What price do you generally get for it? About £4 a ton.
1694. What is the quantity of manure that you are able to manufacture per month? Our output for the last twelve days is 21 tons. We often get a great deal more than that which was only from "freezers." There were no "boilers." When we kill "boilers," we get a great deal more. You may say that we make 1,000 tons a year. 1695.

- W. A. Benn.  
9 Oct., 1896.
1695. Do you obtain a profit from your desiccating works? Certainly. It used to cost us about £500 or £600 a year to cart the stuff away, and this became such an intolerable nuisance that I had to bury it.
1696. When you first started, you were accustomed to cart the offal away? Yes.
1697. It is only recently that you have resorted to desiccating the whole of the rubbish? I was always wanting to do it, but my people did not care for it; at last, however, I persuaded them to go in for it. The desiccating plant was rather expensive. It cost about £1,200 or £1,300.
1698. But you have found that in resorting, as you have done, to desiccating all the offal and other excrement from the beasts you kill, it is a profitable concern, in addition to getting rid of all possible nuisance? Certainly.
1699. What did you used to do with the offal previously? The refuse from the vats was all boiled in the pots, and then carried away to the rocky side of the hill, where it was left lying in the sun till it was dried up, it being meanwhile raked about; it was then taken to the bone-mill and ground up, and subsequently sold as bone manure.
1700. Have you ever heard any complaints from residents in the district as to smells? Oh dear, yes.
1701. Any number of complaints? Yes; at that time. I had to put my head under the sheet at night when the wind came from that direction.
1702. But since you started desiccating? There is absolutely no smell. At least, there is a slight smell to a stranger, but I should never notice there was any smell at all.
1703. And you have had no complaint from the townspeople since the desiccating was started? None at all.
1704. How many men do you generally employ here? Between 200 and 250 men.
1705. Do the men work on piece-work? A large number of them.
1706. How do you manage in regard to the cleansing of the work;—is that done by the men in your employ on day-work? Yes; by the hour. Each gang of men have to clean up their own place.
1707. Were the works designed by a local architect? They were designed by Coxon and Greenstreet, engineers, of Sydney—I mean the original works were.
1708. You have added considerably to them since you became the manager? Yes; the additions have been done by ourselves, with Mr. T. H. Houghton, also an engineer in Sydney, as our consulting engineer.
1709. Were the brick buildings which we have just gone through erected at the commencement of your operations? Yes.
1710. In which year? In 1891.
1711. So that you have been established here about five years? We shall have had a five years' run on the 19th December next.
1712. Is your trade entirely export, or do you supply the colonial market with meat? I have been sending lately a good deal to the dead-meat market in Sydney—a couple of hundred head of cattle, and a few truck loads of sheep a week generally.
1713. Do you find in the hot weather, when meat is sent that distance, it in anyway becomes tainted? Not under proper conditions for chilling, and having the cars sufficiently cooled with ice or snow, but it would not do unless you took very careful precautions.
1714. Do you have much trouble in the slaughter-house to keep the meat from becoming tainted or blown? No.
1715. You have had no complaints that when your meat has arrived in Sydney it has been in a blown or tainted condition? I cannot say that we have had no complaints. In one of the cars there were a few quarters, once, or perhaps twice, which were reported as being slightly tainted, but that occurred when we were not chilling, at the beginning of the hot weather. We saw that not chilling would not do any longer, and we therefore went on chilling before sending any more. In the winter you can send it without chilling.
1716. In the summer, what period elapses between the time of killing sheep or cattle and the time the meat is placed in the refrigerating chamber? That entirely depends on what sort of day it is.
1717. Supposing it were a day like the present? An average of about eight hours—that is, for mutton.
1718. What was the temperature to-day? About eighty in the slaughter-house. In regard to a beast killed in this weather I would not approve of its being kept out of the refrigerator more than three hours.
1719. Do you suffer much from the blow-fly nuisance in the slaughter-house? No, very little. Blow-flies begin to come in October, or the early part of November, but they disappear directly the small flies come.
1720. *Mr. Wilks.*] Have you ever visited the Abattoirs at Glebe Island? Yes.
1721. Did you take particular notice of the desiccating works there? I did.
1722. How did you find them to be—up to date or out of date? Right out of date.
1723. Would you mind giving me a description of the expensive treatment there? I can hardly do that. I just went there and saw the character of the revolving hurdy-gurdies and other things there. I saw that the men were very fully employed with what they had to do, and I asked them if they put through the whole of the offal, and they professed to do so. I then asked to be kind enough to let me see their delivery book in reference to offal, and I found from the delivery book that the tons or bags of stuff delivered was nothing like approximate to the quantity of offal that I knew must come from the number of animals they said were being killed at Glebe Island. I then perceived at once that the desiccators were not doing the work they professed to be doing, because I could see what the outcome of the desiccators was in the bags of stuff taken away, and I say that those desiccators would be utterly unable to cope with what we do here, which is much less than what is done at Glebe Island.
1724. New desiccators are essential for the Abattoirs at Glebe Island? Absolutely.
1725. Did you notice the unnecessarily large quantity of water treated there with the offal? Yes. I should say that better desiccators than ours can be obtained.
1726. What improved desiccators would you recommend? The best makers of desiccators are Anderson & Company, of Cleveland, Ohio.
1727. What is the distinctive name of the machine itself? They simply call it a three-cylinder drier. The stuff goes in at one end, and is passed through, and then comes back again.
1728. The new machine that you have suggested would save a considerable amount of expense in connection with the Abattoirs at Glebe Island? Certainly it would, and it would also be a source of great profit.

1729. Are you acquainted with the difficulty experienced at the Glebe Island Abattoirs in connection with the sale of the manure? Well, they ought to experience none, if they had a good article, but they have not a good article—they have not an article that would stand analysis. They put in the contents of the paunches and other stuff, and reduce the analytical value of the manure to such an extent that you might just as well distribute so much dust about a place.

1730. So their article is rendered unprofitable through want of proper treatment? Certainly, because it will not stand analysis. I have not seen an analysis of it, but I know it must be a very poor one.

1731. What other weak spot did you notice there? Well, it was full of weak spots. The whole place is so cramped that it is impossible for any inspector to see everything that is being killed there. A diseased beast could be killed in the absence of the inspector, and all the diseased portions put out of sight before he had a chance of seeing them. Plenty of space is required. Our percentage of condemned cattle here is three or four times greater than the percentage at Glebe Island.

1732. What system of inspection have you here? Our inspector attends every morning, and stops here and sees every animal killed.

1733. What is the percentage of animals condemned here? Of cattle, between 3 and 4 per cent.

1734. And of sheep? Very few sheep are condemned for disease, but the percentage condemned is very large when we are on "freezers," because we reject so many for want of condition. Sometimes you may see in a newspaper report that during a month we have condemned 1,800 or 2,000 sheep, but we always condemn sheep that are out of condition.

1735. What is your private opinion in regard to the various diseases of animals;—do you think that they affect the healthiness of the meat supply, or is the matter merely a sentimental one? That entirely depends on the nature of the disease, and also on what is done with the meat before it is submitted for human consumption. You may take meat from a diseased animal and cook it in the form of a sirloin of beef, and if it be a little bit out of condition it may be poisonous; but you might put it in a tin and cook it for several hours at a certain temperature, and it might then be perfectly harmless. Therefore you can hardly say right off what is safe and what is not safe; but, as a broad rule, no diseased meat ought to go into human consumption.

1736. What is your opinion in regard to Glebe Island—do you think that is a good site for central abattoirs? No; I do not. There is the trouble of getting stock to the Island.

1737. You mean the cattle-droving? Yes; I think it is prohibitory—I do not think it is worth secondary consideration—if you have to drive cattle through small streets. I have my cattle driven round through out-of-the-way roads and through private gates, so that they shall not go through the streets of even a private township like Aberdeen. Not one beast out of 100 killed at Glebe Island is really fit to be killed when it is killed, because it is in a heated condition.

1738. Do you think that they rest at Glebe Island a sufficient time for the inflamed state to be reduced? I am sure they do not.

1739. The meat supply of the city suffers considerably from that? Undoubtedly.

1740. Are you acquainted with the modern pens for slaughtering pigs and sheep, the same as there are at Flemington, near Melbourne? I have seen some of them.

1741. What is your opinion in regard to them? They are very good indeed.

1742. In connection with the establishment of new abattoirs, would you recommend the erection of pens similar to those? I think so.

1743. Not only for sheep and pigs, but also for cattle? For everything.

1744. In connection with the establishment of new abattoirs, would you also recommend that there should be near at hand places for boiling-down purposes, and the dealing with all the by-products? Certainly.

1745. That would necessitate the removal of the present Abattoirs from Glebe Island, and the erection of abattoirs at a greater distance from the city? I think they ought to be as near the saleyards as possible.

1746. And all the so-called noxious trades should surround the Abattoirs? Yes. As a matter of fact, a proper up-to-date modern abattoir should be one of the most innocuous things extant—there should be less nuisance from it than from an ordinary butcher's shop in the city, because the butcher is obliged to keep meat for a long time hanging up in his shop, whereas the abattoir man is not, but has all the necessary appliances to get the meat away as soon as possible, whilst the butcher has sometimes to keep in his shop meat that smells.

1747. Therefore, not only is the design of the Glebe Island Abattoirs inadequate, but the system of inspection there is weak? I do not say that the system of inspection is weak, but the inspector cannot see everything that is done there. No inspector could possibly check all that is being killed there, on account of the structure of the building.

1748. Do you know how many inspectors there are at Glebe Island? No, I do not.

1749. Do you consider seven inspectors sufficient to do the work of inspection at Glebe Island? I do not know sufficient of the working of the place to express an opinion about that.

1750. Do you consider that the present number of inspectors—seven—is sufficient, in view of the present construction of the abattoirs? I should think seven inspectors ought to be sufficient.

1751. And with the improvement you speak of in regard to architecture fewer inspectors could do the work? Certainly.

1752. *Mr. Law.*] Can you tell me what is the total cost of the works here altogether, as they stand now? They represent about £59,000, including the land.

1753. Can you tell me whether there has been a fair return on the capital invested, in the shape of interest? There has not.

1754. Have you any objection to tell me what the return is? There has been one dividend declared of 5 per cent. in three years.

1755. Can you tell me what has been the total value of the output from all sources in any given year? No; I can hardly do that. Roughly speaking, it would average about £100,000 a year.

1756. In reference to the Glebe Island Abattoirs, your chief objection to them is on account of the want of space, architectural defects, and the inadequate machinery there at the present time? Yes; and the situation.

1757. But your objection to the situation is, I believe, only on account of one fact, and that is, the absence of proper means to enable cattle to get to Glebe Island? Yes; otherwise I maintain that a properly-conducted abattoir could be carried on in George-street without your knowing it was there.

W. A. Benn. 1758. Of course you know that only a small portion of Glebe Island—about one-fifth of it—is utilised for abattoirs at the present time? Yes.

9 Oct., 1896. 1759. *Mr. Bavister.*] You said, in reply to Mr. Law, that the total cost of the works was £59,000—what area of land is included in that expenditure? Freehold land, about 1,050 acres.

1760. Is the railway siding included in that expenditure, or does it belong to the Railway Commissioners? The railway siding from this side of the gates is included in the expenditure, and cost us £800.

1761. It has been stated by previous witnesses, without, of course, any special reference to your place, that the meat killed in the country does not arrive in Sydney at certain seasons of the year in a fit state for consumption, but I suppose there is nothing to prevent the meat arriving there in a fit state if proper appliances are used? Certainly not. There are the works at Narrabri, Gunnedah, and Werris Creek sending down carcasses of meat to Sydney every day past here in perfect order. If dead meat arrives in Sydney in bad order it is owing to culpable negligence on the part of somebody.

1762. Might not an improper condition of the meat be brought about in consequence of improper treatment of it before cooking and after its leaving the butcher's establishment;—is it necessary to take special precautions to avoid that fault? Sometimes the meat that is sent down to the dead-meat market has not been frozen. Unless you freeze meat that is sent down from the country it is not fit for the dead-meat market.

1763. Then the matter is principally one of prejudice? I should imagine so. I suppose I have sent down over 2,000 head of cattle to the Sydney meat market within the last three months.

1764. You stated, in reply to Mr. Wilks, that you have condemned as many as 1,800 or 2,000 sheep in a week when you were killing "freezers";—was that meat absolutely lost? No.

1765. Was it not possible to utilise that meat for canning purposes? Yes.

1766. And such course is adopted? Yes, with a great many of them. Of course, if the sheep has a lump or any cyst it goes into the desiccator at once.

1767. *Chairman.*] When you spoke of sheep being condemned you did not mean that those sheep were diseased in any way? The number I mentioned included diseased sheep. Sometimes there are sheep suffering from cysts and swellings, very rarely you will get a cancerous sheep; and you may get a sheep that has tuberculosis, but the limbs of which are absolutely harmless.

1768. The skilled experts you have met with have given you sufficient information to justify you in using what many people would call diseased sheep? No, certainly not what many people would call diseased sheep.

1769. Then, what are we to understand that the 1,800 sheep were condemned for? For want of condition—not being fit for freezing.

1770. That they were not presentable sheep? Yes.

1771. Your company, as far as possible, kill and freeze only sheep that are of a presentable character, and of the highest class procurable? Yes.

1772. I suppose the object of that is, first of all, to obtain a readier sale, and, secondly, at the same time to keep up the reputation of the works? It just depends where we are shipping to. If I got a Continental order, I have to send to that order sheep which I dare not send to the London market. On the Continent the lean, poor-looking sheep sell better than fat ones.

1773. But that does not apply to the English market? No. To the Malta market we have to send a particular kind of sheep.

1774. Where are your principal markets for export? London.

1775. Do you send any to Africa? We have sent a few, and hope to send more.

1776. You have also sent to Malta? Yes, and to Port Said.

1777. Do you send much to the Continent? No. We have had only one or two Continental orders, and they have been second-hand—we have no direct relations with the Continent.

1778. So you really kill for freezing purposes with the idea of exporting mutton and beef, and you also kill for canning purposes? Yes.

1779. And also for curing? Yes—tierce beef.

1780. How long is it since you visited Glebe Island? Nearly three years.

1781. The opinion you formed generally of Glebe Island was not of a favourable character? Certainly not.

1782. Have you visited the Flemington Abattoirs, outside Melbourne? A very long time ago. I have been there, but not for five or six years.

1783. What did you think of the Flemington Abattoirs? Well, they have been altered so much since then that I could hardly say what they are like now.

1784. You remember distinctly your visit to Glebe Island? Yes, distinctly.

1785. Do you think that the Glebe Island Abattoirs are suitable for the supply of a large meat market, such as that of Sydney and its suburbs? No, not as they are now; but abattoirs could be put up on Glebe Island which would do everything necessary.

1786. You think that the position of Glebe Island is in every way suitable? No, not the situation; but I think that you could put up an abattoir in George-street or Pitt-street and not cause a nuisance if the abattoir were properly conducted. The difficulty is in regard to getting stock to it.

1787. Your idea is that an abattoir, if properly conducted, could be placed in the most thickly populated place without being objectionable? Certainly.

1788. You have heard from people who have visited the Chicago Abattoirs that they are right in the most densely-populated portion of the city, and are found to be entirely unobjectionable? Yes. They have large yards at their abattoirs in Chicago, and they rest the cattle for a long time after they come out of the cars before they kill them.

1789. Have you visited the sale-yards at Homebush, near Sydney? Yes.

1790. You know that cattle have to be driven from the sale-yards at Homebush to Glebe Island before being slaughtered? Yes.

1791. What would your opinion be as to the character of the meat after the cattle have been driven for such a distance over hard macadamised roads? I would not care to have a pound of it for export.

1792. You think that the meat is injured to such an extent that no private company would care about having anything to do with it? I cannot say what any private company might care about doing, but if I were told to handle that class of meat I should chuck up my billet.

1793. You think that the method of driving cattle from the Homebush cattle sale-yards to Glebe Island is

W. A. Benn.  
9 Oct., 1896.

is about the best possible method to cause serious injury to the quality of the meat? It makes it heated and fiery. You cannot get the blood-veins back, and the meat must be suffused with blood, and it stands to reason that the more meat is charged with blood the worse it is, and the quicker it will go bad.

1794. Would you think it would be a much more advisable thing for the metropolitan abattoirs, instead of being at Glebe Island, to be as close as possible to the present saleyards at Homebush? Certainly I would—as near to the sale-yards as possible.

1795. Do you think it would be possible to have abattoirs constructed close to the present sale-yards at Homebush without their proving objectionable to the surrounding neighbourhood if they were conducted with all the modern appliances in the way of cleanliness? Nobody should know they were there.

1796. Would you also think it possible for the abattoirs to be so constructed close to the sale-yards at Homebush, and also in close proximity to the Parramatta River, without their proving in any way injurious to the public health, or destructive of the present appearance and beauty of the Parramatta River itself? Certainly; they need not let a drop of anything go into the Parramatta River if they work properly. There are two things which we do not do here which should be done in order to work a meat factory properly in a populous neighbourhood, and with an area of land upon which to work such as we have here. The whole of the soup from the digestors should be turned into tankage and evaporated, and the residue would then form a marketable fertilizer, which would pay for the work; you could get £4 a ton for it readily.

1797. The whole of the useless liquid that comes from your slaughter-house is pumped over the hill at the back of your slaughter-house? Yes.

1798. And nothing in the way of objectionable smell comes from the liquid after it has been deposited on the ploughed land? The ploughed land does smell a little, but it is a long way off,—right over the hill in the bush—and directly the ground begins to smell I put the plough in again, and turn it over, and get rid of the smell. There is one other thing that may cause a smell, and that is the blowing off of the steam from the digestors when you are cooking; but that could be got rid of by applying your system in a tunnel connected with a main chimney stack.

1799. What is the reason why you do not convey the soup down to the river? We should poison people; we dare not do it.

1800. The Government would object to anything like that? Of course they would. You would taste it down the river for miles.

1801. And I suppose that the water of the river is used for drinking purposes? Certainly.

1802. Going back to the machinery at Glebe Island, you are of opinion that the desiccating machinery is quite out of date? Absolutely out of date.

1803. If machinery something like what you have here were at Glebe Island, do you think that the whole of the refuse taken from the beasts at the island would prove far more profitable to the Government than it does at the present time? Certainly.

1804. Have you a Government inspector of the slaughter-house here? Not a Government inspector, but we have an inspector here, in whom the Board of Health have every confidence, and when I have any animals killed, I get certificates from him, and hand them to the Board of Health, and the Board of Health give me their certificate to accompany the shipment, and I send that certificate with the shipment.

1805. In whose employ is the resident inspector? The Municipal Council of Aberdeen.

1806. Has this inspector, to your knowledge, had any practical experience in the cattle business previous to being appointed inspector here? He was for nearly forty years a practical butcher.

1807. So he is thoroughly able to judge whether an animal is or is not diseased? Yes.

1808. How frequently does he visit you? He comes on duty when the whistle sounds in the morning, and he goes away after the last beast has been killed in the evening.

1809. So, practically speaking, he is here all day? Yes; all day.

1810. Do the Municipal Council of Aberdeen pay his salary? Yes; and we pay them fees for slaughtering; our slaughter-house fees help to pay his salary.

1811. May I ask you what are the fees you are charged for killing cattle and sheep? Three-pence a head for cattle, but nothing for sheep.

1812. You do not slaughter any pigs? No.

1813. Practically speaking, you have an inspector in the establishment all day long while the killing is going on? Always.

1814. And it would not be possible, for you, even if you felt desirous of doing so, to pass diseased meat into consumption? I should think not. I insisted on an inspector being appointed, because I want to export meat, and I cannot get meat into foreign countries unless I have a Board of Health certificate. The only way in which I could get meat into foreign countries was by insisting on having an inspector here whose certificate would be sufficient for the Board of Health to give me a certificate to accompany my shipment. It was at my request that an inspector was located here.

1815. So, as a matter of fact, so far from your being against inspection, it is strictly in accordance with your wishes that there should be the most rigid inspection of all meat killed here? Yes. Before the municipality was formed I offered to pay the Board of Health £250 a year if they would send a competent inspector here.

1816. How long has the municipality been in existence? A little over a year.

1817. Previous to that, what inspection took place here? None. We did not kill any cattle then—only sheep.

1818. But since you started killing cattle, you have had inspection by this inspector? Yes; ever since we killed the first head of cattle.

1819. Have you visited any other abattoirs besides those at Glebe Island? No.

1820. Have you visited any other large meat cooling establishments in the Colony? No.

1821. What was the idea in selecting this particular spot at Aberdeen for starting these works? This site was selected before I knew anything about it. But one of the reasons that induced its selection was that it was within a reasonable distance of a shipping port. It was then an unascertained fact how far you could carry meat in cars, and the people connected with this company thought that they reached about the limit of safe carriage in coming thus far; otherwise, perhaps, they would have gone nearer the pastures—the Liverpool Plains—instead of coming here.

1822. Those were the only ideas that actuated them? Yes, I think so. You must have a good water supply also, and be close to the railway.

- W. A. Benn. 1823. At Aberdeen you have a good water supply from the Hunter River, and are also alongside the main line of railway, and are within reasonable distance of a shipping port? Yes.
- 9 Oct., 1896. 1824. I suppose that we are safe in saying that within an hour after the slaughtering is done your slaughter-houses are perfectly clean and free from objectionable smells? Yes.
1825. *Mr. Bavister.*] We have noticed that you are making extensions;—what will be the full capability of your works after you have completed your present extensions? About 3,000 sheep a day, or 1,500 sheep and 100 head of cattle.
1826. *Chairman.*] What becomes of the animals that are condemned by your local inspector? They are boiled down.
1827. Does he do anything that would prevent the possibility of the flesh from being used for any other purpose? Yes; he jags it about with a sharp knife.
1828. He does not put carbolic or kerosene on it? No.
1829. It is boiled down under his supervision? Yes; it goes straight into the pots.
1830. It would not be possible for you, after the inspector left, to make use of it? No; it goes away at once. All the healthy bodies are put on the rails. When a beast is condemned it is condemned on the ground, and is never lifted on to the rails, and it has to be got out of the way at once to make room for the next animal.
1831. What is the average amount which you pay to the municipal council in fees for cattle killing? It varies very much.
1832. Taking it on an average, do you think that you pay enough in fees to compensate for the salary which the local council pay the inspector? Yes, just about enough.
1833. Does he do anything about the township of Aberdeen besides watching the killing of stock here? Nothing whatever.
1834. So he is practically an officer continually in this establishment? Yes, continually in this establishment.

SATURDAY, 10 OCTOBER, 1896.

[The Committee met in the train between Glen Innes and Tenterfield.]

Present:—

MR. BAVISTER,	}	MR. O'SULLIVAN,
MR. LAW,	}	MR. WILKS.

J. S. HAWTHORNE, ESQ., IN THE CHAIR.

Arthur Richmond Morton, sworn and examined:—

- A. R. Morton. 1835. *Chairman.*] You are the manager of a large meat works at Tenterfield? Yes.
- 10 Oct., 1896. 1836. What is its name? The Tenterfield Meat Works.
1837. How long have you been managing it? About eight months.
1838. How long have the meat works been in existence? I think about five years.
1839. Were you engaged in the establishment previous to becoming manager? Not at Tenterfield.
1840. Had you any previous experience? About two years' experience in Geddes, Birt, & Co.'s meat-freezing works, Darling Harbour.
1841. On an average, how many cattle do you kill in a week in the establishment at Tenterfield? We have put through as many as 300 a week.
1842. Do you confine yourself entirely to the killing of cattle? No; we also kill sheep.
1843. On an average, how many sheep do you kill a week? We can kill about 3,000 a week.
1844. What is your average killing? 2,500.
1845. Have you seen the meat works at Aberdeen? No.
1846. Your buildings are, comparatively speaking, new? Yes.
1847. Built on modern lines? Yes, pretty well.
1848. One or two storey establishment? One.
1849. You kill on the ground floor? Yes.
1850. From where do you principally get your cattle and sheep? From the Darling Downs, Tenterfield Station, the Richmond River and the Clarence River.
1851. Is your stock principally conveyed to you by rail? All by road.
1852. What is your opinion with regard to droving and trucking;—do you think the meat is superior when the cattle are travelled by road, or is it superior when the cattle are conveyed by rail? Superior when driven along the road.
1853. Do you not think that driving cattle along a road would have a tendency to make the cattle tired and worn out? Not if you drove them properly. You should never drive fat bullocks and fat cows together, because if you do the bullocks jump the cows and the cows jump the bullocks, and they bruise each other. You should drive fat cows together and fat bullocks together.
1854. Is your establishment under rigid inspection by any Government official? By Mr. St. Clair, the Government Inspector at Glen Innes and Tenterfield, and also by the senior-sergeant of Police, who attends the works every morning and inspects the cattle alive.
1855. Has the senior-sergeant had any previous experience in the matter of cattle inspection? I do not think so.
1856. Do you think that he is a man fit to detect disease if disease existed? No, he is not.
1857. Is the other Government official a man of large experience? Yes.
1858. He would be able to detect disease? Yes; Mr. St. Clair would.
1859. How often does he visit your establishment? He perhaps comes only once a week.
1860. So it would be quite possible for you, as manager of the company, if you desired to do so, to kill diseased cattle and to put it on the market without the fact being known to any of the officials here? Yes.
1861. What is the percentage of cattle condemned at your establishment? We have only had twelve condemned out of 4,800.
1862. That seems rather a small percentage? Yes.

1863. Do you think that, if the inspection were more rigid, a larger percentage would be condemned? A. R. Morton.  
No; some of those cattle were condemned by ourselves without the inspector being there.
1864. What do you do with the condemned cattle? Boil them down.
1865. Is your trade confined to export? No; we kill and chill for sale in Sydney and also for export.
1866. Which do you do most for—export or sale in Sydney? Sale in Sydney; in fact, we have exported no cattle this year, but have sold all ours in Sydney.
1867. You send your meat principally to the Government Meat Market at Darling Harbour, Sydney? Yes.
1868. You send it down in refrigerating cars? Yes.
1869. Do you find, as a rule, that meat suffers much through becoming tainted before its arrival in Sydney? Not at all. We have not had a loss of any meat this year.
1870. Have you, at any time, visited Glebe Island? Yes.
1871. Have you made a close inspection of Glebe Island as to its adaptability for slaughtering purposes? Yes, I have been through the establishment.
1872. What is your opinion, generally speaking, of Glebe Island as a slaughtering place? The slaughter-houses themselves are good.
1873. How do the slaughter-houses at Glebe Island compare with yours? They are smaller, and we have all concrete floors.
1874. And you have inclined troughs for the conveyance of blood? Yes.
1875. Have you made an inspection of the abattoirs in any of the other colonies? No.
1876. You have not seen any of them? No.
1877. What is your opinion in regard to the droving of cattle from the sale-yards at Homebush to the Abattoirs at Glebe Island? I myself have seen cattle leaving Homebush. They go by road to Five Dock, and stop there, about 200 or 300 at a time. They are put into paddocks there with not a blade of grass upon them, and are afterwards driven to the island between 3 and 4 o'clock in the morning, and the killing of them is begun straight away.
1878. What is your opinion in regard to the quality of the meat slaughtered under such conditions? I do not think that the cattle are fit to kill at all.
1879. You think that if cattle are driven for some distance, and then put into yards, and killed almost immediately afterwards, the quality of the meat is deteriorated? I am positive of it.
1880. What would you suggest as a better method than that now adopted in cattle-killing at the Abattoirs at Glebe Island? Something similar to our chilling works. I think you ought to have one depôt in Sydney, and that all the bullocks and sheep required for the markets should be killed in different country towns.
1881. Your opinion is that it is unnecessary to have a slaughtering-place so near the city as Glebe Island? I am positive of that.
1882. But how would you manage about the slaughtering of pigs and calves? I send lots of pigs from Tenterfield.
1883. And you would be quite capable of killing pigs and calves, and sending them to the metropolis with the same amount of confidence as cattle? I have done it. I have not had any loss this year. We kill pigs, calves, and poultry.
1884. Do you think that the Glebe Island Abattoirs are too far away from the cattle sale-yards at Homebush? Yes; I think so.
1885. You think that the quality of the meat would be considerably improved if the abattoirs were in closer proximity to the present sale-yards at Homebush? I think the cattle get more harm done to them before they get to Homebush, by the way in which they are rushed into the trucks, and afterwards knocked about and shunted on the railways. They are sometimes shunted, and left for a whole day in a hot, boiling sun.
1886. Do you think that the present method of trucking cattle to the sale-yards at Homebush is as injurious to the cattle as is the droving of cattle from the sale-yards at Homebush to the Abattoirs at Glebe Island? Yes.
1887. Your experience, then, is that the trucking of cattle alive is not beneficial? I am certain of it.
1888. Do you think it would be possible to conduct abattoirs in close proximity to the present sale-yards at Homebush without their proving a nuisance to the surrounding districts? I do not think you could conduct abattoirs close to the sale-yards without their being a trouble to the suburbs. I do not think you could get enough drainage there.
1889. Do you think that it is not possible to conduct an abattoirs in such a cleanly manner as for them to be completely free from any smells which would be objectionable to the surrounding neighbourhood? No; not about there.
1890. Could they be conducted in any other locality without being likely to cause a nuisance? I do not think you could conduct abattoirs anywhere about the city and suburbs without causing a nuisance.
1891. Not with proper desiccating works? No, I do not think so; because you cannot desiccate a lot of the guts and other things. The offal from inside a bullock you cannot desiccate, and that has to be carted away.
1892. Would you be surprised to know that the whole of the guts and offal matter coming from the cattle and sheep and other animals killed at the abattoirs in Melbourne are put into the desiccating works, and converted into a marketable manure? In our works we empty the contents out of the guts, which we boil down for the owner. They make a lot of fat, and he gets the tallow, and we use the manure for our cultivation land.
1893. Have you desiccating works at your establishment? No.
1894. What do you do principally with the offal? We cart it away every day, and sell it to different farmers round about.
1895. To what use do the farmers put it? They use it for manuring their land. They bury the offal in the ground, and keep it for two weeks or so, and then spread it over their land.
1896. Does that not prove very offensive to the surrounding neighbourhood? No. I keep the paunches and boil them for the pigs.
1897. But you do not feed the pigs with the guts? No; we kept them for the owners. Suppose we put a diseased animal into the digestors to boil it down for the owner; that is called hashmagundy. When that comes out of the digestors we sell it to the farmers; it is one of the best manures for crops.
1898. What price do you get for that? As high a price as £2 a ton. 1899.

- A. R. Morton. 1899. Is that ground previous to sale? No, it is sold just as it comes out of the digestors.
- 10 Oct., 1896. 1900. Are there any inhabitants round about your works? Yes.
1901. Have you ever had any complaints? Never a word.
1902. Have you any idea as to why the company started these slaughtering works at Tenterfield? They thought they would get a better price for their cattle. They started these works when there was so much talk about the trucking of bullocks to Homebush.
1903. So these slaughter-houses practically belong to a co-operative company of squatters? Yes. We have leased them for seven years.
1904. So you do not buy the cattle? No, we kill them on owners' account; we do not buy at all.
1905. Your revenue, then, is derived by charging so much for the cattle killed? Yes, so much per lb.
1906. How far do you reckon your slaughter-houses are from the main line? They are close to the main line.
1907. Have you a siding? Yes.
1908. *Mr. O'Sullivan.*] I gather from your evidence that you think there would be no occasion for abattoirs in Sydney, because the meat could be supplied from chilling works in country districts? Yes.
1909. But, still, do you not think it would be necessary to have abattoirs in or about Sydney for the stock that comes by steamer from the coastal districts, or from places in the vicinity of Sydney? I do not think there is any necessity to have abattoirs either in or about Sydney.
1910. But if we did not have abattoirs in a central place like Sydney, there would be a necessity for a number of chilling works in smaller localities? Quite so.
1911. Under these circumstances, do you not think it would be necessary to retain the abattoirs in Sydney for the purpose of dealing with cattle coming by steamer from other parts? I think it would be necessary, under those circumstances, to have abattoirs near Sydney; but I think that they should be either at Marrickville or at some place like that.
1912. You would prefer to have the abattoirs at some site other than Glebe Island? Yes.
1913. But if you were to remove the Abattoirs from Glebe Island you would not be able to land cattle immediately into the works as they can be now, but you would have to travel them to Marrickville? Yes.
1914. Would it not, then, be more costly and disadvantageous to have the site for the abattoirs at some place other than Glebe Island? I do not think so. It would not be far to drive the cattle. I think that Glebe Island is suitable for something better than Abattoirs.
1915. But, recognising the necessity for an abattoir in Sydney to treat the stock coming by steamer to Sydney, and the present Abattoirs being alongside the water near the wharfs, would it not be wiser to retain the Abattoirs where they are for the purpose of treating that stock without transshipment? I think that those Abattoirs would be altogether too large if chilling came into vogue.
1916. Supposing the Abattoirs were retained at Glebe Island, do you think it would be possible to render them not harmful to the public health? Yes. I do not think that they harm the public health very much now.
1917. Complaint is sometimes made about the noxious smell? Yes; because it goes to the Glebe at night.
1918. That could be prevented? Yes.
1919. As a matter of fact, in large cities like Glasgow and Chicago it is prevented? Yes; and it could be prevented at Glebe Island also.
1920. Referring to the chilling works in the country districts, you contend that the meat from those works would be more suitable for human food than meat obtained by killing cattle driven to Homebush, or taken in trucks on the railway to Homebush? I am positive of it. I am sure that meat coming from the country will make  $\frac{1}{2}$ d. per lb. more than the meat killed in Sydney.
1921. That meat would all go by rail? Yes, go by rail--dead.
1922. And the receipts from the railway traffic would be considerably increased if most of the meat used in Sydney came by rail instead of much of it coming by road? Quite so.
1923. So there might be an advantage to the State in that respect? Yes.
1924. You spoke of Marrickville as a possible site? Yes.
1925. What made you think of that place as a possible site? I have been there a number of times, and I saw a lot of good resting paddocks for cattle, and you could construct a railway siding to that place.
1926. How long should cattle rest? I always rest my cattle two clear days and two nights, and then they come into the slaughter-houses as they should be--they are not heated at all.
1927. I gather from what you have said that you disapprove of having slaughter-yards near the sale-yards at Homebush? I disapprove of that altogether.
1928. Do you know the Newington Estate, on the Parramatta River? Yes.
1929. Do you think that that would be a suitable site? I do not like the idea of trucking at all. I think that trucking the cattle to Homebush injures them more than driving them from Homebush to the abattoirs, wherever these might be, would do.
1930. That is the reason that inclines you to disapprove of the idea of having abattoirs either at Homebush or Newington? Quite so.
1931. Have you any evidence of tick in this neighbourhood? No; I have not seen a tick since I have been here. I have had a lot of cattle from Queensland, but have not got a tick with them.
1932. The cattle you get from Darling Downs and other parts of Queensland show no sign of tick? No.
1933. *Mr. Wilks.*] I understand that your strongest objection to a city abattoirs is the slaughtering of meat in an inflamed state? Yes; the trucking of cattle makes them more or less bruised.
1934. Your objection is not so much to the present site of the Abattoirs as to what you have pointed out? Yes.
1935. Your objection would apply in the case of any central abattoirs? Quite so.
1936. Have you any acquaintance with the inspection of meat? Yes.
1937. Do you consider that it is at all rigid in the city? I think it is now.
1938. There has been weakness in the past? Yes; a very great weakness.
1939. Do you think that the number of diseased cattle going into the market is on the increase? I have seen the returns lately, and they are about the same as they were previously.
1940. Do you think that the inspection in the country killing establishments is what it should be? No; they are not inspected as they should be.
1941. The inspection therefore is a faulty one? Yes.
- 1942.

1942. What system would you suggest to get over that difficulty? You would have to have an inspector *A. R. Morton* present all the time from the time started until the time they finished killing.
1943. That is, under the direct supervision of the Board of Health? Yes. 10 Oct., 1896.
1944. Do you supply certificates with meat? Yes.
1945. What is required is, practically, systematic inspection? Yes.
1946. That is one of the most serious points in regard to the whole of the slaughtering done in the Colony? Quite so. You may say that we have not had severe inspection at all.
1947. Do you think that there is any danger of going to extremes in the matter of supervision? No.
1948. Nothing like running to seed in the matter of supervision? No; I do not think that any man has a right to eat diseased meat.
1949. Then, from your experience in the meat business, you consider that an inquiry of the character of that now being held by this Committee is a very essential one? Yes.
1950. *Mr. Bavister.*] Have you done any canning? No.
1951. What is the largest number of sheep you have killed in one day? 450 or 500.
1952. Have you had any experience of the working of a desiccating plant constructed on up-to-date lines? No; I have only seen the Glebe Island desiccating plant.
1953. If you heard it stated that large works of the description of those at Glebe Island could be carried on, in a centre of population, without causing a nuisance or annoyance, you would find it difficult to believe that statement? I should, certainly. I do not think you could do that.

MONDAY, 12 OCTOBER, 1896.

[*The Committee met at the Graziers Meat Export Company's Works, Queensport, near Brisbane.*]

Present:—

Mr. BAVISTER,		Mr. O'SULLIVAN,
Mr. LAW,		Mr. WILKS.
J. S. HAWTHORNE, Esq., IN THE CHAIR.		

John Vigers Francis, Esq., examined:—

1954. *Chairman.*] You are the manager of the Graziers Meat Export Company's Works, Queensport? *J. V. Francis*. Yes. 12 Oct., 1896.
1955. How long have you been manager? I have been more directly connected with the works the last five months. Mr. Harry Baynes was the manager before I took charge, when he went to London.
1956. You are a member of the firm? Yes, the firm consisting of four individuals.
1957. And the late manager was also a member of the firm? Yes.
1958. Is your company an English one? It is a private firm—a sort of family affair.
1959. Were you a resident of this Colony before you were connected with these works? Yes; I have been here twenty-one years. I am a native of South Australia.
1960. Your partners in the firm are also natives? Yes. They have been here twenty-one years.
1961. Your trade is principally export? Nine-tenths of it is export.
1962. You confine yourself principally to mutton and beef? No, we trade in mutton, beef, veal, pork and lamb.
1963. Do you supply the Brisbane butchers with meat? Yes.
1964. In addition to your canning business, you also do a large wholesale business with local butchers? Yes, we supply twenty carcass butchers.
1965. And those carcass butchers, in turn, supply the butchers of Brisbane and its suburbs? Yes.
1966. I suppose your canning is done principally for export? Yes.
1967. You have a colonial trade as well? Yes; a very large colonial trade. For Queensland alone we do about 100 cases a week; 72 lb. in the case.
1968. Do you do much in the other Australian colonies? About 1,000 cases a week for Western Australia, about 500 cases a week for New South Wales, about 2,500 cases a week for Victoria, about the same for Tasmania, and about 200 cases a week for New Zealand.
1969. How many hands do you employ in connection with your business at these works? 622 hands last Friday.
1970. Have you any hands employed elsewhere? Yes; we have 1,100 hands employed altogether.
1971. Your establishment is kept going night and day? Yes; we start about 6 o'clock on Sunday afternoon, and we stop about 4 o'clock on Saturday afternoon.
1972. Where are the other men employed? We have a cooperage in South Brisbane, where about seventy-five hands are employed, and we have a fellmongery at Belmont, where we employ 120 hands. Belmont is about 3 miles from these works, and we have a large farm there, and grow all the fodder for the piggery.
1973. From where do you generally draw your supplies of cattle? Chiefly from the north and the west of Queensland.
1974. They come to you by rail? Yes. From stations 200 miles from Brisbane we bring them in by road.
1975. Have you any paddocks attached to the works here? Yes; 6,000 acres just behind the works.
1976. Have you railway communication to your works? Within a quarter of a mile of them.
1977. When the cattle have been taken from the trains you allow them to remain in these paddocks, for how long? Two or three days. It depends on the season. When the weather is very dry we allow them to remain there only two days, but in a good season they are fed about a fortnight in the paddocks.
1978. The longer the cattle are kept in the paddocks the better the meat? Yes; the flesh is not inflated.
1979. *Mr. O'Sullivan.*] What population is there living (say) within half a mile of your works? About 500, and 1,000 within 2 miles.
1980. Do the surrounding population complain of any nuisance or bad smells arising from the works? I have never had a complaint since I have been here.
1981. Do your desiccators and other appliances prevent, to a large extent, smells that would otherwise arise? Yes; you smelt, to-day, the only smell that exists, and that is caused by vapour. When the men open the digestors, the vaporous heat causes that smell; otherwise there is no smell at all. 1982.

- J. V. Francis. 1982. When we got to what you call the hashmagundy soup department, that was the most offensive portion of the works? Yes.
- 12 Oct., 1896. 1983. Do the men who work there complain of any evil consequences? None whatever; as a matter of fact they are the most healthy. I have never known a case of sickness.
1984. To what do you attribute that? There are thirty-two men employed round about the digestors. I have never had a case of sickness amongst them, and they have always the best of appetites. I think that the smells destroy germs that would otherwise cause illness. The same remark applies to our fellmongery, where we have never had a case of typhoid fever, or any other disease. The men there are very strong, and there is more smell there than there is at these works.
1985. So on the whole, although these smells may be offensive for the moment, the consequences are not detrimental to the health of the population? No; I think, just the reverse.
1986. So if we were to establish an abattoirs in Sydney, by adopting the same appliances you have here, we could prevent any offensive consequences that might otherwise result from the ordinary working of such an establishment? Yes.
1987. You indirectly supply all the retail butchers in Brisbane? Well, the majority of them.
1988. And no complaint is made by the population there about the quality of the meat they receive from you? No; they always consider it is the best meat they receive, and the carcass butchers with whom they deal give that as a reason for asking higher prices for the meat.
1989. You spoke of employing 1,100 hands in connection with your establishment? Yes.
1990. How are those 1,100 persons employed? There are 622 at the works at Queensport, 125 at the scouring works at Belmont, 3 miles to the east of these works, and there are seventy-five at the cooperage; and then we have our own establishment for plumbing, coach-building, &c., employing about twenty-five hands. We have also about fifty private shops where we retail the meat in Brisbane and suburbs, as far as Southport, averaging from four to six men in each of the shops. Then we have about sixty drovers, and about sixty men employed at the head shop, where our chilling and salting rooms are. We also have selections for our cattle where about thirty men are employed, and we also employ about thirty carpenters. We are always building, taking down, and putting up shops, and we keep thirty carpenters constantly employed.
1991. So I understand that the 1,100 men to whom you referred include the 622 men you have at the works at Queensport, and also the men employed in the retail shops, cooperage and plumbing works, and other places outside, but all connected with you directly? Yes; and in no way connected with any other firm.
1992. Your establishment seems to be supplied with all the modern appliances to prevent stench and all other objectionable things? Yes; being in a thickly-populated neighbourhood we have to be very careful in that respect.
1993. Do you think that if the same appliances were used at an abattoirs within the bounds of a large city like Sydney, they would be as unobjectionable as they are at Queensport? Yes; if used in Pitt-street, I think they would be not at all objectionable.
1994. Your opinion, as a man of experience, is that it is quite possible to work a slaughtering establishment like yours without detriment to the health of the population? Quite so. If anything, I think it is the other way about, and assists the health of the population. My experience is that we have less sickness than there is in a boot or any other factory.
1995. As a matter of fact, it is a somewhat peculiar thing that men employed in the slaughtering or the selling of meat generally appear to be very healthy? They not only generally appear to be, but they are healthy. They are a healthier lot of men than other men, as you can see from their complexions. We have had men come from the southern colonies for the sake of their health, and in every case during the first six months of their being here they have gained from 4 to 6 stone in weight. Even very delicate men become big strong fellows in six or nine months.
1996. Then it follows from what you say, as a man of experience, that working in a slaughtering establishment, or living near one, is not injurious to the health of those who work in or live near such an establishment? No; the contrary. I say this from my experience of twenty-one years. The healthiest portion of the community live near us.
1997. Do you know anything about the Abattoirs at Glebe Island? Yes; I have been all through them.
1998. Do you think that the existence of Abattoirs at Glebe Island, near a population situated at Balmain on the one side and at the Glebe on the other, would be likely to injure the health of the inhabitants of those places? No. There is nothing there to injure health. But, in my opinion, the appliances there for dealing with manure were obsolete. I think that the Abattoirs authorities could deal with the manure more profitably than they are now doing—they could make a profit out of them.
1999. What suggestions would you make to bring up-to-date the machinery at Glebe Island for the treatment of manures and all refuse from the Abattoirs? I should recommend the Abattoirs authorities to write to the Americans, who have splendid machinery; they ought to write to the authorities at Chicago and elsewhere, in order to get a desiccating plant to treat the refuse well and at once.
2000. You think that that if the large city of Chicago, with over 1,000,000 inhabitants, can maintain the health of its population side by side with large slaughtering establishments, it is quite possible for the city of Sydney, with only about one-third of that population, to do the same? I am sure it is.
2001. Provided they have the same modern appliances for destroying the offal and other offensive matter? Yes. You want to treat it at once. You must treat it before it decomposes. The fault of some manures is that they are not treated before they decompose. Within twenty hours from the time a bullock is alive our manures are treated. The great fault of many meat works is that they do not treat their manures before they decompose. Once decomposition sets in you cannot hope to do any good with your manure. You must treat it instantly. Our manure is fresh, and not decomposed at all. In our stores, where you saw the bags of manures, they might have been bags of flour for any odour that escapes from them. If I had told you that they were bags of flour you would have accepted the statement, and yet those are all bags of our special fertiliser.
2002. Then are we to understand that, putting aside the temporary offensive odours that arise from hashmagundy, your establishment is not a permanently offensive place to the inhabitants of the district in which you carry on business? No. Any offence that arises is only from the vapour from the hot water. There is no offence from the material itself. You could take that away from the heat, and there would be no offensive smell whatever. 2003.

2003. From what we have seen to-day at your establishment at Queensport it is evident that within six hours from the killing of a bullock or sheep the product would appear in the final form of manufactured food ready for the table? Yes. J. V. Francis.  
12 Oct., 1896.

2004. And during that time there is nothing offensive or dangerous to human health? No, there is not. The only offensive result would be if it were not treated at once.

2005. Then what I understand you to say is that, provided the refuse is treated promptly, there is no danger whatever to human health, but if it be allowed to decompose there is a danger? Of course there would be, naturally.

2006. And therefore, if the Abattoirs at Glebe Island, near Sydney, were carried on in a prompt manner, it might be possible to get rid of all the offensive and injurious matter in a short time, and thus to avoid doing any injury at all to the health of the inhabitants around that place? You would not have to get rid of it, because it would not exist. It only arises from decomposing matter.

2007. *Mr. Wilks.*] Do I understand that you supply a large quantity of meat to butchers in the city? Yes; I suppose we supply two-thirds of the meat consumed in Brisbane.

2008. How many cattle do you put through at one time both for your meat-preserving trade and for the city supply? We have averaged for the last four months 230 bullocks a day, and about 750 sheep.

2009. What system of inspection have you for the detection of diseased animals? Dr. Quinnell inspects every beast.

2010. He is the sole inspector? Yes; he appoints our head slaughterman to pass a beast in his absence. He has thoroughly posted him up, and he has learnt all that could be learnt under the inspector, and if there is the slightest doubt about a beast he puts it on one side if the inspector is absent; but if he is of opinion that there is no danger he passes it on.

2011. I understand that there is one inspector appointed by the Government, and also an assistant inspector, who is a slaughterman in your employ? Yes; in my employ, but appointed by Dr. Quinnell.

2012. What percentage of animals are condemned? Last month we had 175 bullocks condemned out of about 6,000 head.

2013. What were the principal diseases? Tuberculosis was the principal disease—114 were condemned for tuberculosis, and some for actinomycosis, and some for abscesses.

2014. What is the process adopted when they are condemned? They are taken to the digestors.

2015. They are not saturated with kerosene, as is done in some works? No; they are cut up into pieces and put into the digestors.

2016. You consider the inspection of meat a very important matter? Yes, very important, and very necessary to the health of the public.

2017. Do you find that the percentage of diseased animals is on the increase? I find that the percentage of diseased animals is according to the stations. Some stations have neglected the culture of their cattle, and have allowed disease to spread. From some of the stations we have a far larger percentage of diseased cattle than from others—up to 3 per cent. from one station.

2018. From what you have told me, I should imagine that you would consider an inquiry of the character now being held by this Committee an essential one? A very essential one.

2019. You consider that up to date the Colonies have neglected this matter of meat supply? Yes; almost criminally neglected the inspection of meat.

2020. And the inquiry now being held by this Committee is one that should have been taken in hand some time ago? Yes—twenty years ago.

2021. Not only by New South Wales? No; by all the Colonies. I think it is criminal on the part of the Government to allow a single beast to go into consumption without previous inspection.

2022. Your sole trade of an export character is that of preserved meats? No, not our sole trade; there are tallow and hides.

2023. Well, by-products and preserved meat? Yes, and wool-scouring.

2024. You do not freeze meat? No; we chill meat.

2025. That is not so profitable? No, our experience is a loss.

2026. Are you called upon for any certificate? Yes; in all our contracts we have to furnish a certificate for every tin of meat put up in our works.

2027. I understand that there is a Meat Export Act in force in this country? Yes; not a single tin of meat can be sent out without a certificate.

2028. There is not a Board of Health, but regulations under the Export of Meat Act? Yes; it is criminal for us to send away a single tin of meat without its being inspected. We are liable to a fine of £50 or imprisonment.

2029. I understand that a lot of your trade is by contract? Yes; I suppose about one-third of it.

2030. Principally with Java, the Dutch Settlements, and the French colonies? Yes.

2031. Your trade directly with London is not so great? Our trade with London is very large—10,000 cases a month, and it is increasing.

2032. Now, coming to the matter of desiccation, you consider that a high-class desiccating plant is one of the greatest essentials of a well-appointed abattoirs? Yes; it is absolutely necessary.

2033. Do you consider that your desiccating plant is a high-class one? No; ours is not a high-class one.

2034. Do you consider that it is better than the desiccating plant at the Glebe Island Abattoirs? I consider that the desiccating plant there is obsolete. There is unnecessary expense attaching to the work of it.

2035. Your plant is an improvement upon that? Yes; our plant is a labour-saving plant altogether.

2036. When inspecting the Abattoirs at Glebe Island, did you notice that the desiccators there had to treat an enormous quantity of water, which you avoid doing? Yes; we treat no water. I consider that the desiccating plant at Glebe Island is obsolete, because the expense is something ferrible. Our expense is not 5 per cent. of the value received; but the expense at Glebe Island was 105 per cent., because the desiccators there were worked at a loss.

2037. Even with your plant you can make a profit? We make a profit of 95 per cent. as compared with Glebe Island.

2038. Have you a ready sale for your manure? Yes. We put up 60 tons a week, and the only stock accumulated is about 200 tons.

2039. And this is owing to the tick scare in New Zealand? Yes. We had a contract there for 300 tons for three months, but the Government there will not allow our manure to come into New Zealand.

- J. V. Francis. 2040. They are so afraid of the tick that they have stopped your trade with New Zealand as regards manures? Yes; it is, of course, most absurd.
- 12 Oct., 1896. 2041. *Mr. Law.*] You do all your own cooperage work? Yes.
2042. And I suppose that you find that you can do it much cheaper, doing the whole of the work connected with the concern? Yes. When we first started our works we found that competition was nearly prohibitory, through the cost of the casks. We preserve very largely salt beef. One of our largest contracts with the Dutch Government is for salt beef. We found that the cost of the casks was prohibitory of our competition against the Americans. I got special machinery at the cooperage, and now as regards the expense of labour we can put up five casks where we could put up only one before—that is, a cask that cost us 9s. before costs us only 2s. to-day. Therefore, we are in a position to compete successfully against the Americans in sending meat to Canada. We have a very large salt-beef trade with the South Sea Islands through Sydney, and also with Java, and we send about 100 300-lb. tierces to London every month, under order for the shipping trade.
2043. You make your own tins? We manufacture everything required. We thus effect a great saving. We could not possibly successfully compete against America if we did not manufacture all our own tins and solder. I may mention that the Government of Queensland have thought fit to put a duty of 25 per cent. on ingot tin. This has caused us to take out of our own pocket and to pay to another smelting-works here at the rate of £1,000 per annum. The Government do not benefit by the 25 per cent.; it is simply a bonus to that company. The Government, instead of paying those smelting-works a bonus of £1,000 a year, make us pay it. There is only one tin-smelting works, and the Government compel us to buy from those works; otherwise, we could land tin from Tasmania at £8 a ton cheaper than we can get it from Queensland. But we should have to pay £15 a ton duty to the Queensland Government. The Government compel us to pay this bonus to that company, because some of the members say that that company has done a lot for mining. But why the meat-preserving works should compensate that company for what they have done for mining I do not know. It has been a great drawback to us.
2044. In regard to your desiccating plant, do you not think that there is more modern and better machinery than you have in your establishment at the present time? Yes.
2045. I believe that you have contracts with various Governments;—can you name all the places? We have three different contracts with the French Government, according to the different colonies—Haiphong (a China port), New Caledonia, and New Hebrides. We have also contracts with Batavia, which amounts to 700,000 kilos of meat per annum.
2046. At your wool-scouring works have you a good water supply? Yes. In wool-scouring, in order to make the works pay, it is necessary, after taking the skin off an animal, to treat it immediately, before the skin dries and cracks. If you delay the treatment the basil is not worth within 25 per cent. what it would be if you treated it at once.
2047. There are only four members of your firm? Yes.
2048. Has it grown from a small concern to a big one? Yes. When we first started business in 1859 we were killing only twenty-five bullocks a week, and it has gradually grown from that to its present dimensions.
2049. Will you explain the process of making oleomargarine? It is necessary that you should have no dirt whatever. Oleomargarine is analysed, and the slightest percentage of dirt would cause the article to be refused.
2050. Would you name the different articles made at your establishment? There are about eighty varieties.
2051. Can you tell me approximately the total cost of your works? About £75,000, including the area of ground.
2052. What is the total value of all sorts of products at your establishment in one year? £300,000.
2053. Have you any objection to telling me whether your business is a paying concern? Well, we would not carry it on if it were not.
2054. You work your establishment night and day? Yes; I suppose we have the best electric-lighting plant in Brisbane.
2055. You have the electric light right through the establishment? Yes.
2056. *Mr. Bavister.*] You stated in reply to questions that your manure was selling at £3 a ton locally for large orders? Yes; we deal only wholesale in manures.
2057. What is the cost involved in treating the material resulting in 1 ton of manure? About 3s. a ton.
2058. Do you mean 3s. per ton of material treated, or 3s. per ton of manure produced? About 3s. per ton of manure as we sell it.
2059. You stated that the inspector recognised by the Government is appointed by the Government? Yes.
2060. And he appoints as sub-inspector a person in your employ? Yes.
2061. And who is in your pay? Yes.
2062. Do you consider that that is conducive to satisfactory inspection? Yes. I think it is most necessary to.
2063. It may be necessary, but should not an inspector occupy an independent position? The Chief Inspector should. And considering that the Chief Inspector is there day and night at all times, if he found a bullock run down the race which had not been laid aside for him he would easily detect at any moment if the man he trusted had not done his duty.
2064. You say that the Chief Inspector is continuously on the works? Yes, night and day. We do not know when he is coming, and whether he is or is not there; the slaughter-man puts on one side anything questionable until he has inspected it.
2065. How far from the works does your Chief Inspector reside? About 2 miles.
2066. On the opposite side of the river? Yes. He has a boat.
2067. Has he stated times for visiting? No.
2068. But if occasion requires he is specially summoned? Yes.
2069. Are you called upon to contribute anything towards the payment of the inspector? Yes.
2070. What form does that payment take? So much per head on the cattle slaughtered.
2071. Would you mind stating the amount? Threepence per head for bullocks, and, I think, 3d. for every ten sheep, which I think is iniquitous, for it amounts in our business to £1,200 a year, and the inspector gets only £300 a year. Therefore the Government are making £900 a year at our expense, and we have to suffer the loss of the rejected cattle, which at the present time amounts to over £5,000 a year.
- 2072.

2072. Have you no arrangement as between the persons from whom the cattle are purchased and your firm as to sharing the loss on condemned cattle? No; we have to make our deals twelve months ahead, and up to the time when the Act was brought into force five months ago we had no idea of the Act coming into force, and therefore we did not protect ourselves, and this has caused us a loss of £2,000 up to the present time. In future deals I intend to make that condition; but we find it is difficult to make a deal, because the stock-owners object to that condition.
2073. In reference to the speed at which meat can be prepared, I think you stated that five hours was the shortest time? Yes.
2074. That is owing to the temperature of this locality? Yes.
2075. If the climate allowed you to do so, you would prefer to give a much longer time? Yes, at least twelve or fourteen hours.
2076. Do you think that the health of the persons who consume your meat would be better served by that meat being slaughtered and put up in a cooler climate? I do not think it makes the slightest difference. In our retail business the meat is not given to the public until fourteen days after it is killed; but in the tinning it does not make the slightest difference.
2077. Is there any private slaughtering, or any slaughtering done by small butchers? Yes; one-third of the Brisbane trade is done by private slaughtermen.
2078. And they are people in a small way of business? Yes.
2079. For instance, a butcher whose business required him to kill only one beast twice a week could do so? Yes; none of the private places are under Government inspection.
2080. Is any restriction imposed as to where and when cattle may be killed? No; outside the meat exporters of Queensland there is no Government inspection, or any Government control at all—that is, all butchers who are not meat exporters have not their premises under any inspection whatever, and they can kill anything they like, and sell it. The Act is only an exporters act. There may be tuberculosis or anything else, and as a matter of fact tuberculous meat goes into consumption in Brisbane every day.
2081. In connection with what you last stated, is it possible for a carcass or a portion of a carcass, after having been condemned for export purposes, to be broken up and to go into local consumption? No, it is not possible, because the Government inspector sees it is destroyed.
2082. But for local consumption there is no inspection of any kind? None whatever.

David Traill, examined:—

2083. *Chairman.*] What are you? I am manager for the Queensland Meat Export and Agency Coy., Eagle Farm Works, Brisbane River.
2084. How long have you been in that position? Three and a half years.
2085. Had you a knowledge of the meat-chilling business previous to taking charge of those works? No.
2086. Your works at the present time are at a stand-still? Yes.
2087. But you have done a very large trade in the past? Yes.
2088. What is the largest number of cattle that you have killed at your works in any given week or month since you took the management? 320 head per day; that is the most we have done.
2089. The cattle, I suppose, come to you by rail? Some by rail, and some by road.
2090. From where do you generally get your stock? We get all our stock from Queensland.
2091. You have also done a large meat-killing trade in mutton? Yes.
2092. At any time during the progress of your works has any complaint been made against them of being a nuisance to the surrounding district? Never.
2093. What do you do with all the offal and other refuse that comes from the animals that are killed? The offal is treated first for tallow, and then for manure.
2094. Is your trade entirely one of export? Entirely.
2095. You do not cater at all for the Brisbane butchers? No.
2096. Is it with the other Australian colonies or with the English and continental markets you have to deal? Entirely English and continental markets.
2097. Have you a rigid inspection of the meat killed in your establishment? Yes; a very rigid inspection.
2098. By whom? By the Government Veterinarian.
2099. How frequent are his visits when you are killing? Every day.
2100. Does he inspect every animal brought in for killing? Yes.
2101. Before or after death? Both before and after death.
2102. And it would be impossible for you, even if you desired it, to slaughter a diseased animal without his knowing it? It would not be impossible for us to slaughter a diseased animal, but it would be impossible for us to treat it after death without his knowledge.
2103. What was the percentage of animals condemned when you were killing (say) 350 a day? The average number condemned is about 2·2 per cent.
2104. That loss is entirely borne by your Company? No; it is not. Our Company do not make a business of buying stock. We have bought stock, but we mostly treat for clients.
2105. You kill stock for your own clients? Yes.
2106. And charge them so much per head for killing them and keeping them in the refrigerating chambers? Yes.
2107. Your clients are principally the pastoralists of Queensland? Yes.
2108. Is your Company a colonial-formed one, or representative of English capital? Colonial.
2109. Principally got up by the pastoralists themselves? Yes.
2110. *Mr. Wilks.*] Would you mind stating the main reason for the closing of your works? The principal reasons are the dearth of fat stock and the low prices in the London market.
2111. You do not find it sufficiently profitable to treat mutton to warrant your going into it to any extent? Of course, my answer to that question is contained in the answer I have already given. We merely make a certain charge upon meat put through our works.
2112. Then the inference to be drawn from that answer is that owners of that kind of stock do not consider it profitable? Not at the present moment.
2113. This is not a mutton-producing country? I would not say that, but our works principally deal with beef.

D. Traill.  
12 Oct., 1896

2114.

- D. Traill. 2114. This is not a mutton-producing country, compared with Victoria or the southern portion of New South Wales? No; it is not.
- 12 Oct., 1896. 2115. Has the tick fever been detrimental to meat? Not at our particular works.
2116. Only to the owners of stock? Yes.
2117. And many of the owners who use your works are within the infested area? Most of the pastoralists who put their stock through our works are south of the infested districts.
2118. In the matter of inspection, could you suggest anything to make it more rigid? I could suggest nothing more.
2119. You do not think that anything more is essential? No.
2120. Do you think there is a danger of too much Government inspection? Yes.
2121. You think it is a matter that may be allowed to run to seed, and become a fad? Yes.
2122. You are not acquainted with any diseases of the human family which are traceable to the consumption of diseased meat? No.
2123. As regards an inquiry, such as we are holding, in reference to the supply of meat in New South Wales, do you consider that the question is of sufficient importance to warrant the attention that is being given to it? Yes; I think it absolutely necessary that there should be Government inspection.
2124. Do you consider that the city of Brisbane has sufficient inspection in regard to the home supply of meat? We have no inspection in Brisbane as regards the home supply of meat, with the exception of one firm (the Graziers' Meat Company), and the inspection is apparently optional on their part.
2125. You think the same regulations as are applied to the export trade should be applied to the home trade? Yes.
2126. *Chairman.*] Do you think it is necessary that well-conducted abattoirs should be connected with the railway system, for the purpose of having stock brought to them by rail and for the conveyance of meat required for the supply of a city? Not necessarily.
2127. Do you think it is advantageous? Yes, advantageous, but not necessary.
2128. Your establishment is not at present connected with the railway? No; our works are not at present connected with the railway, but they will be in about three months' time.
2129. *Mr. O'Sullivan.*] What we want to know, amongst other things, is whether works like yours can be carried on without prejudice to the public health;—you have a fairly large population round about your works when they are in full going order;—does the operation of your works in any way injure the health of the inhabitants around you? No.
2130. I presume that is the case, because you are pretty well supplied with modern appliances for dealing with all the refuse connected with a slaughtering establishment? Yes.
2131. And what you do in a small locality like yours it would be possible to achieve in a crowded locality like that of Sydney? I am of opinion that it would not be injurious to the public health, but, at the same time, I do not think it would be advantageous to the public health.
2132. But do you think that the carrying on of slaughtering operations, if properly safeguarded as they are in large cities like Glasgow and Chicago, and other large centres of population, is really injurious to the public health? I do not think so.
2133. I gather from your evidence that, as a rule, throughout the year you are very busy at your works? Yes.
2134. And are carrying on a large meat export trade abroad? Yes.
2135. Then, by the same rule, it would be possible for us in Sydney with our abattoirs, not only to deal with the meat trade required for the city, but if necessary to establish there also a meat export trade, by working on the same lines as you do? Yes.
2136. Do you think that it would be better for the public health in a large city for it to be supplied with meat from killing works carried on in country districts rather than from abattoirs near the city where meat would be freshly killed? If the cattle were carefully driven and got sufficient food on the way to the works, I do not think there would be any material difference.
2137. How do you get your cattle down to your works at Eagle Farm? A very large number of them come by rail, and at certain times of the year a very large number are driven to the works.
2138. Where are they driven from? From stations as far away as twenty days' journey. I daresay that the average travelling time to our works would be about eight days.
2139. After the cattle have arrived near your works do you rest them for any period? Yes; for not less than two days.
2140. Do you consider that two days' rest is sufficient for them before they are killed? Yes; provided they get sufficient quiet and the necessary water.
2141. But can you assure them of that in a country like yours? Yes.
2142. Then you have plenty of grass and water? Near the works we have no grass. We do not want to feed the cattle for a couple of days prior to death, but we want to give them plenty of water. The cattle should be thoroughly rested for not less than two days in a locality where they will not be disturbed either by people on foot or by passing vehicles; in fact, they should be kept entirely secluded.
2143. They ought to be kept away from all disturbance or interference for at least two days before death? Yes.
2144. In your works, you utilise modern appliances for getting rid of the refuse? Yes.
2145. Do you think that you have the latest appliances for that purpose? Yes; we have the latest appliances for treating everything in our works, which are the most modern in Australia.
2146. Then if we had in a large city the same kind of machinery as you have, and under equally skilled men, we could utilise the refuse from the cattle that were slaughtered, in the same way as you do, without any injury to the public health? Yes.
2147. *Mr. Bavister.*] Previous to the outbreak of the tick disease and the restrictions imposed in consequence of it, your establishment was being carried on to its full capacity—at a profit or a loss? As I have already said, we kill only for the owners of the stock.
2148. *Mr. Law.*] What is your opinion in regard to the outbreak of the tick disease—has it had any injurious effect? It has had an injurious effect on the meat export trade of the Colony.
2149. Has it had an injurious effect on your company? Yes.
2150. Have you suffered any considerable loss by it? I may say that the stock does not belong to our company. We only treat the stock on behalf of the pastoralists. Our works deal with the pastoralist's stock, and we charge them a certain price—1½d. per lb. The effect it has had on our works is that at the present time our works are idle.
- 2151.

2151. What has been the total cost of the whole of the machinery and plant in connection with your works? Our works at Eagle Farm have cost us about £75,000. I consider that our works, so far as the abattoirs portion of them is concerned, are the most perfect in Australasia.
2152. Is it a fact that you do the largest meat export business in Australasia? Yes; the Queensland Meat Export and Agency Company has the largest export trade in Australasia in regard to bullocks—that is, we export the largest number of tons.

D. Traill.  
12 Oct., 1896

TUESDAY, 13 OCTOBER, 1896.

[The Committee met at J. H. Geddes, Birt, & Co.'s Brisbane Markets, Musgrave Wharf, Brisbane.]

Present:—

MR. BAVISTER,	MR. LAW,
MR. O'SULLIVAN,	MR. WILKS.

J. S. HAWTHORNE, ESQ., IN THE CHAIR.

John Genge Andrews Peddle, examined:—

2153. *Chairman.*] You are the manager of this company? I am the outside manager of their business in Queensland.
2154. For what purpose has the business been started? Chilling and freezing meat for export.
2155. Were you ever connected with any of the firm's establishments elsewhere? Yes; the Charleville Meat Works on the Warrego, 483 miles from Brisbane.
2156. Have you had any previous experience in the meat trade? No; only in squatting.
2157. Have you ever visited the Abattoirs in any of the other Colonies? Yes.
2158. Have you visited the Glebe Island Abattoirs? Yes; about a fortnight ago.
2159. Did you make a fairly minute inspection of them? I did. I went round with Mr. McAdam, the manager of the Darling Harbour works.
2160. He is the manager at Darling Harbour for the firm you represent here? Yes.
2161. What was your general impression of the Abattoirs—was it a favourable one? No. I thought the place was fairly well regulated, but there was not sufficient room.
2162. Did that apply to the slaughter-houses for the smaller as well as for the larger animals? The best place I saw was where they were killing sheep for export.
2163. That is the place which is known as Elliott's slaughter-house, and which was originally intended for a refrigerating house? Yes.
2164. What was there about that more striking than the others? There was more space. But still I considered that that was a poor place.
2165. Do you think that, so far as space is concerned, the Abattoirs at Glebe Island could be so altered and added to that, with modern appliances, they could be made suitable for, and would meet the requirements of, first-class abattoirs? I do not think so. You would have to commence *de novo*.
2166. Do you think, then, that, to make complete and satisfactory abattoirs, it would be necessary to pull down the present buildings? I should do so, certainly.
2167. Would it be possible so to improve the present slaughter-houses at Glebe Island as to make them up to date? No.
2168. No matter how much money was expended upon them. No. You could only build them afresh on the same ground.
2169. Do you know the cattle sale-yards at Homebush? Yes.
2170. Have you any idea of the distance between the sale-yards and the Abattoirs? I heard you say it was 6 or 7 miles, but I should have thought it was 10. I know that the sale-yards are on the other side of Strathfield.
- 2171-2. You have visited the sale-yards as well as the Abattoirs? Yes.
2173. Do you think that the present Abattoirs can be managed satisfactorily whilst the sale-yards are so far away from them as they are at the present time? No; the Abattoirs ought to be near the sale-yards.
2174. In connection with well-conducted abattoirs, you think the closer the sale-yards are to them the better it is for the meat after the animals have been slaughtered? Yes.
2175. Do you think it in any way interferes with the quality of the meat after the animals have been killed if the cattle and sheep are driven for such a distance to be slaughtered as are the cattle and sheep which are now driven from the sale-yards at Homebush to the Abattoirs at Glebe Island? That, on the top of the previous knocking about, must add to the fever.
2176. So you are of opinion that a bullock might start from the pasturage ground in a healthy condition, and after being sent by rail for some hundreds of miles, and then being put into the sale-yards, and after sale being driven to Glebe Island for slaughtering, might in many cases become so affected in health that it would practically develop some kind of disease? I know it is very much better without the knocking about. I cannot say whether it would or would not develop any disease.
2177. It would to a certain extent be likely to injure the quality of the meat? Yes. Cattle are actually trucked from Charleville to Sydney. I have seen hundreds of cattle trucked in that way.
2178. Have you visited the abattoirs in any of the other Colonies? I was at the Melbourne Abattoirs twenty-five years ago.
2179. You have not seen them lately? Not for twenty-five years.
2180. Do you think it would be better for the cattle to be slaughtered in the country and taken in refrigerating cars to some central depôt? That is what I and my firm believe in, and we do so from a business point of view.
2181. Do you think that the tendency of the commercial world is to so alter the method of killing beasts for consumption in large cities that in the future they will be killed in the country districts near to the pasturage ground, and taken afterwards in refrigerating cars along the different railways to the centres of population? All people who are interested in having good meat believe in that. But people who have vested interests, like Pitt, Son, and Badgery, at Sydney, Brisbane, and Adelaide, are dead against it—that is where the trouble comes in. You are fighting the vested interests.

J. G. A.  
Peddle.  
13 Oct., 1896.

- J. G. A. Peddle. 2182. *Mr. O'Sullivan.*] Your establishment here is for the purpose of freezing for the export trade as well as for the local meat-market for Brisbane? Well, that has been contemplated—at one time it was talked about.
- 13 Oct., 1896. 2183. One part of your building was designed for that? Yes; but as a matter of fact, they are not going on now with the internal fittings for that.
2184. Where is it supposed that your meat will be killed? Well, in the country we have feeders like Charleville. We hope to have another place later on at Roma, and stock fattened on the pastures near the coast will be killed within 5 or 6 miles of Brisbane. They will be fattened in large paddocks near Brisbane.
2185. The cattle will be brought down by train? No; they travel as stores down to the fattening paddocks, and then walk in. I suppose that 20,000 cattle are fattened within 100 miles of Brisbane every year—on the Logan.
2186. It is in contemplation to erect slaughtering establishments on the Logan River? Within a reasonable distance of Brisbane, or we may work here with some of the existing slaughter-houses.
2187. With those at Queensport and Eagle Farm? No, not Eagle Farm; but we may make arrangements with some of the people now slaughtering near Brisbane.
2188. Collins & Co. do slaughtering within a short distance of Brisbane? Yes; about 5 miles from here—that is the Pastoralists Butchering Company.
2189. Do people about there complain of offensive odor or nuisance? I do not think so.
2190. From your long experience, in various capacities, of cattle, do you think it is possible to work abattoirs near a large city without giving offence to the public? Well, you would have to desiccate the manure, and that sort of thing, to do it.
2191. Provided that the abattoirs were fitted with the latest appliances, and were lined with white tiles, and had proper drains to keep them clean? Yes; with good drainage, I believe it would be possible.
2192. I suppose you know that in some large cities abattoirs are carried on without offence? I have read so, but I have never seen a place where there was not some smell.
2193. *Mr. Law.*] Have you had any particular experience in connection with abattoirs? No.
2194. Have you any knowledge of the necessary machinery to carry on extensive works? I have only a general idea.
2195. Can you state, approximately, what the cost of machinery would be? No.
2196. You stated in regard to the Abattoirs at Glebe Island that they were altogether out of date, and that, in your opinion, if the Abattoirs were retained there, new buildings should be put up;—do you think that if the 30 acres now outside the buildings there were utilised, that that would afford sufficient space to deal properly with an output of 100,000 bullocks and 1,000,000 sheep a year? I think that, if there were no other objections, on that area you could put up a place that would deal with the meat satisfactorily.
2197. *Mr. Wilks.*] The trend of your evidence is in the direction of killing and chilling meat in the country? That is what I believe in.
2198. You consider that the public health is better served by that system than by any other? Yes; the people then get tender meat with all the juice in it.
2199. Do they get purer meat? I think so.
2200. That is, if you provide for regular and proper inspection? It should be, but I do not know whether it is enforced.
2201. Do you not consider that central abattoirs would provide a safeguard in the matter of inspection of meat? No doubt. You would have the one inspector, and officers under his eye there.
2202. Do you think that the inspection of meat in Australia is sufficiently rigid as regards meat for home consumption? I cannot say, but I think not. I have seen some stuff I would not like to eat.
2203. Then you are of opinion that in various parts of Australia meat is sent into consumption which should not be? I have not the slightest doubt about it.
2304. And one of the most serious things that could be taken into consideration is how to prevent that? Yes.
2205. Do you think that diseased stock in the Colonies is on the increase? In travelling in New South Wales for a few months a little while ago I saw more diseases amongst sheep than I ever heard of before. I lived sixteen years in New South Wales, and I have been thirty years amongst stock. Wherever I lived the country was healthy; but it seemed to me that in the part of the country I saw last year the sheep had worms and fluke, and lice, and everything under the sun—things I had never heard of previously.
2206. Then I understand that mutton which is placed on the market wants rigid inspection, because there is greater chance of disease in sheep than in cattle? The sheep I am referring to would never get fat enough to eat—they would never go into the market.
2207. Did you observe the system of inspection at the Abattoirs at Glebe Island? No.
2208. You did not go into that matter at all? No.

---

Russell Sinclair, examined:—

- R. Sinclair. 2209. *Chairman.*] You are an engineer? Yes. I belong to the firm of Willdridge and Sinclair, consulting engineers, of Sydney and Brisbane.
- 13 Oct., 1896. 2210. Your firm has had a large experience in the construction of freezing works in different parts of Australia? Yes.
2211. Where are the principal works with the erection of which you have had to do? In North Sydney, Pastoral Finance Association, Kirribilli Point; Geddes, Birt, & Co.'s place, Pyrmont, Darling Harbour; the Young Chilling Works; the Dubbo Chilling Works; the Narrabri Meat-chilling Works; the Gunnedah Meat-chilling Works—all in New South Wales. In Queensland, the Bowen Meat-freezing Works; the extensions to the Townsville Meat Works; the extensions to the works at Eagle Farm; and we are now busy with the Charleville Meat Works and the present South Brisbane Works here, and we are putting up a complete establishment at Lake's Creek, close to Rockhampton.
2212. Have you made a study of all the necessary appliances for the preservation of meat when it is killed up country, and also for its conveyance to the sea-coast? Yes.
2213. That has been your firm's special study? Yes; we have had to do with all the largest works.
2214. Judging from your past experience, do you think that the tendency of men engaged in pastoral pursuits now is to have their cattle and sheep killed as close to the pasturage ground as possible, and then sent

sent to the seaboard by means of refrigerating chambers? That is undoubtedly the tendency, except where a person has a station close to the seaboard. The tendency is to reduce the trucking and travelling of the stock to as little as possible. R. Sinclair.  
13 Oct., 1896.

2215. Judging by that statement, you seem to anticipate that in the near future large abattoirs close to any city would be unnecessary? I would not go so far as that, because there is always a large quantity of cattle to be drawn from the surrounding district; but I would put the matter in this way: that the size of the abattoirs near any city will be very much less in future than it has been.

2216. *Mr. O'Sullivan.*] As an expert in machinery for abattoirs and meat-freezing works, do you think it would be possible for the Abattoirs at Glebe Island to be fitted up with modern appliances in such a way as to render it impossible for bad odours or nuisance to arise? Quite possible to put up machinery of such a character that you would not know that there was anything going on at all.

2217. What machinery would you suggest for the purpose of working a slaughtering establishment free from all offensive odours? For working an abattoir I should suggest that you should go in for chilling machinery to deal with the meat as soon as it was killed, and that for getting rid of the blood you should have machinery which would treat it and work it up into manure, and you should have machinery for treating the offal. The half-chewed grass and the paunches should be worked up. All the paunches, guts, and offal, and everything that cannot be utilised for butchers' requirements should be desiccated, dried and turned into manure.

2218. As rapidly as possible? Yes; at once. Each day's killing should be finished right off. All the offal, &c., should be treated immediately.

2219. As a matter of fact they do that at Queensland now, do they not? They do it, but they could go further than they do now. There are no works in the whole of Australia which do it so perfectly as I think they should.

2220. *Mr. Wilks.*] Have you any acquaintance with the desiccating plant at Glebe Island? I have seen it several times.

2221. Do you consider it is very defective? I saw it twelve months ago, and I then considered it was very poor.

2222. Would you recommend new machinery, or an improvement of that plant? Complete new machinery.

2223. What would be the approximate cost of it? That would depend on the number of cattle killed; but, roughly speaking, machinery to treat the offal from 100 head of cattle all at once would cost you about £2,000.

2224. Am I to understand that well-appointed abattoirs of the character you are thinking of, near a city, must have a refrigerating works? Yes; not freezing works, because freezing is only necessary for export.

2225. You consider it essential that chilling works should accompany abattoirs? Yes, I do.

2226. And that the bulk of the meat going into consumption should be slaughtered in the country? Yes. Where it is any appreciable distance from a town it should be slaughtered in the country.

2227. What is your opinion of Glebe Island as the site for abattoirs to meet the requirements you have described? It is quite suitable.

2228. It would also make a good shipping depôt for meat? I do not know about that. You could not get big ships up there without removing that permanent bridge.

2229. Did you go into the matter of the architecture of the Abattoirs while you were there? I know what it is.

2230. Do you consider it is faulty? I do not consider it is well-arranged at all.

2231. *Mr. Bavister.*] As proof of the possibility of carrying on abattoirs on an extensive scale without nuisance or offence to the public, you have seen such in England—at Birkenhead and Deptford—on a larger scale than anything you have seen in the colonies? Yes, much larger. At both of those places they deal with imported cattle, which has to be slaughtered without going outside the gates.

2232. And as a proof of the effectiveness of their desiccating plant, it is customary for them to treat the refuse from the fish markets? Yes.

2233. And that is done without offence? Yes; at Birkenhead, and without offence.

2234. And that is done in consequence of the machinery necessary for such work having been obtained? Yes.

2235. There is no obstacle in the way of the same thing being done in Sydney? No; none at all.

Patrick Robertson Gordon, examined:—

2236. *Chairman.*] What is your position in the Queensland Public Service? Chief Inspector of Stock. P. R. Gordon.

2237. You have been a great number of years in your present position? Since 1868.

2238. Your position has brought you in contact with the cattle and sheep business of the Colony? Yes. 13 Oct., 1896.

I have been on two occasions despatched by my Government to Melbourne and Sydney to study the meat question.

2239. Did you visit both the abattoirs? Yes, in Sydney and Melbourne; but I visited the meat market principally.

2240. Did you go to the abattoirs at Flemington, near Melbourne? Yes; but a number of years ago that was.

2241. How long ago? In 1886.

2242. Did you find them, then, up to date? My business was principally in connection with the distributing market.

2243. Did you not investigate the abattoirs? Yes, I did.

2244. Did you find them cleanly? They were hardly so cleanly as the Abattoirs at Sydney.

2245. You think the Sydney Abattoirs had the advantage? Yes; but my principal object was to ascertain whether we could or could not get some means of distributing the meat, and do away with the wholesale butchers, as our trade here was principally in the hands of the wholesale butchers.

2246. Has the result of those visits of yours to the other colonies brought about any change in your meat supply up to the present time? No. I wrote a report, which the Government handed over to the municipal council.

- P. R. Gordon. 2247. And it is really not the fault of the Government so much as the municipal authorities that you have not had the public abattoirs before now? Quite so.
- 13 Oct., 1896. 2248. In your position of stock inspector you have long since recognised the necessity of having suitable abattoirs close to the city? Yes, particularly so in relation to inspection. For instance, Dr. Quinnell last month, at Queensport, condemned 111 animals, and when you consider that he does not condemn animals except when the disease is diffused, that is a large number. If the disease is localised, he condemns only the part in which the disease is localised, and lets the other go.
2249. Dr. Quinnell has been appointed only since your Legislature passed an Act providing for the inspection of all meat killed for export? Yes.
2250. So that, so far as the authorities are concerned, great care is exercised in regard to all meat killed for export, whilst the meat for home consumption, practically speaking, goes without the slightest inspection? The only inspection is under the 1834 Act, which was passed when there were only two towns in Australia, and that Act, practically speaking, applies only to cattle-stealing.
2251. So your experience leads you to believe that, at present, diseased cattle can readily be pushed on to the Brisbane market without the public having any knowledge of its being diseased? Quite so.
2252. You are also of opinion that the only means of preventing diseased meat from finding its way into the Brisbane market is by the establishment of central abattoirs, under either municipal or Government control? Quite so. As it is now, no man with a small capital can start butchering, whereas, if we had abattoirs, and reserved so many stalls for ordinary use, a man with enough capital to run a small place could start business.
2253. The way things are at the present time, practically speaking, a ring is formed in private circles, which can prevent a poor man from starting a butcher's shop in the city? Quite so. There is quite a monopoly here.
2254. You think it would be just as well for abattoirs at all times to be in close proximity to the sale-yards? Yes. We must have meat sent down here. Although I was a strong advocate for country killing and chilling, that would refer only to a certain part of the Colony. But the Brisbane meat supply is gathered from north and south, and the more you concentrate the killing the more chance there is of proper inspection.
2255. So you think that the meat supply for a large centre of population, such as Brisbane, Sydney, or Melbourne, must be under some recognised supervision to prevent disease? Yes; I am very firm in that belief.
2256. *Mr. O'Sullivan.*] Do you find that any cattle afflicted with tick make their appearance down this way? No; not for 600 miles from here. The nearest tick-infested place is Rockhampton, and that is only an isolated spot.
2257. The latest information about the tick is that it is abating considerably? Yes.
2258. And on the western plains, where there is lots of sunshine, it is almost extinguished? Yes; it will never gain headway there.
2259. The tick appears to plant itself where there is plenty of vegetation and scrub? Yes.
2260. *Mr. Wilks.*] Do you hold the opinion that diseased meat goes much into consumption? It has been here.
2261. Have you had any negotiations with the adjoining colonies on that matter? No.
2262. Have you ever paid a visit the Abattoirs at Glebe Island? Yes. There was good inspection when I was there the last time—that was in 1891.
2263. You found the inspection there all that is required? Yes, I did. The visit in 1891 was an unofficial visit.
2264. They were unprepared for your visit? Quite so.
2265. With your knowledge of stock, you consider that the most rigid thing we should have is inspection? Yes. I think you have really good inspection under Mr. Stanley.
2266. What is your opinion of Glebe Island as a site for abattoirs to supply the City of Sydney? I think that Glebe Island is a good site.
2267. I should like to know whether you consider that droving cattle from the sale-yards at Homebush to Glebe Island is detrimental to the meat supply? Decidedly. They are killed when in a fevered state, and meat is never good while in that condition.
2268. You discovered that the cattle were slaughtered when in a fevered state? Yes; they are bound to be in such a state.
2269. And to avoid this would necessitate the abattoirs being in close proximity to the sale-yards? Yes; or connected with them by rail. But even then you would have to re-truck the cattle, and that would knock them about.
2270. You think that the re-trucking of cattle from the sale-yards would be detrimental? Yes.
2271. Then the only alternative would be to remove the Abattoirs to a place near to the sale-yards? I think that would be the best. It would be rather expensive for butchers to go out there to get their meat.
2272. Would you give me your opinion with regard to outside abattoirs? I have none myself, but I saw Mr. Gilruth, the Government Engineer of New Zealand, and he told me that in Glasgow the abattoirs had been put up in the centre of the city, and there is no smell from them.
2273. And they deal with all the bi-products there? Yes.
2274. *Mr. Law.*] Have you any knowledge in regard to machinery used in connection with abattoirs? No.
2275. You do not know anything about the cost of machinery? No.
2276. You have no idea what it would cost to fit up a plant to carry on the work at Glebe Island? No; I have not.
2277. *Mr. Wilks.*] In the matter of slaughtering, do you know of any system that is an improvement on pithing? No; that is universally adopted here.

WEDNESDAY, 21 OCTOBER, 1896.

Present:—

MR. BAVISTER,  
MR. O'SULLIVAN,MR. LAW,  
MR. WILKS.

J. S. HAWTHORNE, ESQ., IN THE CHAIR.

John Ashburton Thompson, called in, sworn, and examined:—

2278. *Chairman.*] What is your official position? Chief Medical Officer of the Government, and President of the Board of Health.

2279. How long have you been in your present position? Two months as President of the Board of Health.

2280. How long in your position as Health Officer? Ten years.

2281. I suppose that you have had frequent opportunities of visiting the Government Abattoirs at Glebe Island? Many of them.

2282. What is your general opinion of Glebe Island as a site for the Abattoirs? I think the site is inconvenient, in its irregularity; too small, in not affording sufficient acreage; and an unsuitable place as regards the access to it of cattle. As to the buildings upon it, I reported upon them four years ago, and I then pointed out, first of all, that they were too small, the business to be done having increased since they were first erected, and that there was not room to extend them; secondly, that they were dilapidated, and so much so that to put them in order would practically amount to reconstruction.

2283. Then your opinion is that the Abattoirs would be better if erected somewhere else—in closer proximity to the present sale-yards? I think it is necessary to erect new Abattoirs, that they should not any longer be placed on Glebe Island, and that a site which I have, by direction of the Treasurer, inspected, adjoining the sale-yards, is a very good one.

2284. May I ask you what site that is—as we have had several communications sent to us, not only by the Premier, but also by people engaged in the trafficking of land? It is known as the Wentworth Estate.

2285. The ground called the Wentworth Estate is, I think, on the opposite side of the Parramatta Road, as regards the present sale-yards? Yes. It is bounded by the Parramatta Road on the south; by Powell's Creek on the east; by Haslem's Creek, I believe, on the west; and by the Parramatta River on the north.

2286. Have you visited any other estates in close proximity to the Wentworth Estate? No.

2287. Supposing the Abattoirs were erected on the site you have just named—the Wentworth Estate—do you think the could be conducted in such a cleanly manner as to make them acceptable to the people living round about there? I think there is absolutely no doubt about that. It is a sheer matter of regulation; of arrangement; of proper business management. The only thing that would be necessary there, or that would be extremely desirable, because I do not think that it is absolutely necessary, would be to effect a junction with the sewers. That would not be a very expensive work, in my opinion. I think that a 15-inch glazed pipe, laid down to the nearest intercepting sewer at Strathfield would be quite sufficient.

2288. Supposing your ideas were carried out, and that any offensive liquid coming from the Abattoirs was conveyed by 15-inch glazed pipes to the nearest sewer, do you think that that would prevent objectionable smells, and also entirely prevent the pollution of the Parramatta River, by the Abattoirs? Yes; I think it would prevent the pollution of the river entirely.

2289. Do you think it would be possible, with modern appliances, to conduct a large abattoir on the site which has been named by you, without their proving offensive or objectionable to the inhabitants of Strathfield and Homebush? Yes; I am entirely of that opinion.

2290. Supposing that the present abattoir site at Glebe Island could be enlarged by the cutting down of the Island, on the opposite side of the road as regards the spot upon which the present abattoir stands, do you think that it would be possible to conduct well-appointed abattoirs there? I think it would be very difficult. One must remember that the Abattoirs as they stand are not big enough for the work that is done. If you destroyed those buildings, and erected other buildings, and if you enlarged your available building site by cutting down the Island, you would want a great deal more room. You would have to occupy for your buildings very much more space than is now occupied.

2291. Your principal objection, I think, to the Abattoirs remaining in their present position is the difficulty in getting cattle from the sale-yards to the Abattoirs? That is one point.

2292. Is that the strongest point to your mind against the continuance of the Abattoirs in their present position? There is an entire want of accommodation for cattle when they get there. They are there for thirty-six hours sometimes. Even at present they are very much crowded, and as time goes on there will be a still larger number going there.

2293. So you think that under any circumstances, if the Abattoirs were retained in their present position, cattle would of necessity have to be kept there in tolerably large numbers for a considerable period before being killed? Yes.

2294. Supposing that Abattoirs were erected on the Wentworth Estate, would not the same difficulty apply to ocean-borne cattle, in regard to getting them from the steamers to the abattoirs, as now applies to those going by rail to the sale-yards at Homebush? Well, they could go by water all the way. That is one of the advantages of that site. There is deep water there.

2295. How would the steamers manage to get under the railway bridge at Ryde? I imagine that they would transship the cattle, and punt them up.

2296. From the steamers? Yes. I do not see why they should not. But supposing they did not do that, but had to bring them from the steamers by road—in the first place, that would apply to only a small proportion of the cattle, and, in the second place, they have now to go by road, or do go by road, to Glebe Island. It seems to be about as broad as it is long.

2297. You are generally of opinion that the Abattoirs, as at present present situated, are not at all suitable for the requirements of the present day, nor are they likely to be suitable for the demand in years to come? I am strongly of that opinion. I think they will become more unsuitable as time goes on.

2298. Have you inspected abattoirs in any of the other Colonies? No.

J. A.  
Thompson.  
21 Oct., 1896.

J. A.  
Thompson,  
21 Oct., 1896.

2299. Have you inspected abattoirs in any other part of the world? Yes; very often. I have seen them in various places.

2300. What abattoirs have you principally inspected previous to coming here? Abattoirs in London, Paris, Leeds, Hull, and many other places. For many years past, whenever I have been near an abattoir, I have visited it.

2301. In connection with the abattoirs to which you allude, are there any improvements that could well be introduced at the Glebe Island Abattoirs, or any new abattoirs that might be erected, which improvements would add both to the quality of the meat and the comfort of those engaged in the killing of the animals? I cannot speak of any particular detail. The erection of a good abattoir depends mainly on two things—one is the convenient arrangement of it, and the other is the materials that are used. Outside of that, I do not know that there is any particular appliance that is specially of use in abattoirs.

2302. Talking of the materials that are used, are those that are in use at the present time at the Glebe Island Abattoirs altogether unsuitable to a modern style of architecture for well-appointed abattoirs? We have a desiccating and manure-making plant, and we have disused that since the 1st July last, just because it was obsolete.

2303. So you are really doing no desiccating work at the Island? None.

2304. What becomes of all the offensive matter taken from the animals that are killed? It is taken three times a week to sea, 7 miles outside the Heads.

2305. Did you ever, in the course of your experience, find that the refuse or offal, when desiccated, proved to be a marketable and profitable commodity? Yes, it is so; and it is made at a great many slaughtering and freezing works up country, and as far as I know it is successfully sold. We did for a long time sell small quantities, and the price we put upon it was £5 per ton, which was the market value, but it cost us £7 a ton to make it with the old and obsolete plant, and therefore we gave up the business.

2306. Would it not have been better to have recommended the Government to purchase a new desiccating plant, and to have converted all the offensive matter into manure, rather than adopt your present system of taking that out three times a week to sea and depositing it outside the Heads? That is a point I would rather you put to the business members of the Abattoirs Committee of the Board of Health. They thought not.

2307. The Board of Health, I suppose, is divided into sections? It is, for that purpose.

2308. And the Abattoirs are under a kind of sectional committee? Yes.

2309. Of whom does it consist? The Under Secretary for Finance and Trade (Mr. Kirkpatrick), Mr. E. W. Knox, and Dr. Manning.

2310. Those gentlemen have the exclusive management of all matters affecting the Abattoirs? All the business management.

2311. Does a discussion ever take place at meetings of the Board of Health in reference to the Abattoir matters? Yes; they are a sub-committee.

2312. As regards the improvement of the desiccating machinery or improvements at the Island, this sectional committee would, as a matter of course, bring such a subject before the Board of Health as a body? Every decision comes before the Board of Health as a body.

2313. So their decisions on matters affecting the Abattoirs have no finality until dealt with by the larger committee? Quite so.

2314. Would you be surprised to know that desiccating works attached to the Melbourne abattoirs, as well as to some of the private slaughtering-places in Queensland, are conducted on such lines as to bring about a profit, and render the establishments perfectly inoffensive to the surrounding neighbourhood, as well as at the same time providing a most useful manure for the farmers and fruit-growers in the different parts where those abattoirs exist? Not at all. In my official capacity I have insisted upon certain works in this Colony providing themselves with a desiccating plant, partly in order to prevent nuisance, and they have always been willing to do it, because they know very well that the product is a marketable commodity. I think it is only a week since I decided that if certain meat works on the Clarence did not do that, they should not be licensed to slaughter, because you cannot conduct them properly, without nuisance, unless there is a desiccating plant. We do conduct the Glebe Island Abattoirs without nuisance, without a desiccating plant, because they happen to be on the water's edge, and we are able to get rid of the stuff; but if the works were situated inland, and on a river or anything of that kind, that could not be done. I should like your Committee to understand that the desiccating plant at Glebe Island has been given up, not because it is not a useful or an essential adjunct, but because the machinery is worn out, and is obsolete, and every ton of stuff made with it, worth £5 in the market, costs £7 to produce, on account of those faults, and considering the state of the whole establishment it did not seem to the committee worth while to purchase a new desiccating plant, or to re-establish it.

2315. So that, practically speaking, the committee have been reckoning on the Abattoirs being shifted from their present quarters, and that almost induced them to abstain from incurring the expense attending the erection of a new desiccating plant? Not exactly in that way. They have not been reckoning on the Abattoirs being removed, but before making any very heavy expenditure, they have been waiting until the Government should arrive at a decision as to what should be done. If the Government decided to keep the Abattoirs there, the committee, of course, would spend the money. They are quite aware that they ought to have a desiccating plant.

2316. Have you any idea what is the cost of removing the offal from the Abattoirs and conveying it out to sea? No; I would rather that you asked the sectional committee.

2317. *Mr. Law.*] You said that the business had increased since the Abattoirs were first erected, and that now there was no room to extend them? Not room enough, in my opinion.

2318. Do you know what area is at present occupied? No; I know by sight the whole area available, and I also know by sight what proportion is occupied, but I do not know the measurement.

2319. Do you know that only 8 acres are occupied, and that on the other side of the road there are 28 acres unoccupied—nearly four times the area at present used? Yes; I do know there is some such large piece.

2320. And there is an additional 12 acres of reclaimed land adjoining that, and belonging to the Government—White Bay? Yes.

2321. That is 40 acres, independent of the site that is at present utilised? I had not taken into consideration the reclamation. The other part of the Island I know, and I am not surprised to hear that it  
measures

measures as much as that, although I did not know exactly what it did measure; but it is very rough; it is not altogether useful land, on account of its steepness and roughness;—it is a little hill with very steep sides; and then there is a road running through the middle of it, which, in my opinion, is an exceedingly objectionable thing, as tending to dust, and so on.

J. A.  
Thompson.  
21 Oct., 1896.

2322. But do you not think that there is ample room there for the erection of yards for cattle, and the carrying on of a business ten times as large as that carried on at present—that is, if the Island were levelled down? That would make about 50 acres, as far as one could reckon.

2323. In conjunction with what is there already, do you not think that would be ample? It would make about 50 acres altogether, according to your reckoning. Supposing that were 50 acres of reasonably level land, there is no doubt that there would be plenty of room for all that.

2324. You said that cattle had remained at the Abattoirs as long as thirty-six hours? That was a slip of the tongue. They were not there so long as that.

2325. What is the longest time you have known them to be there before they were killed? Less than twenty-four hours. Sometimes they come in on Saturday and Sunday, and in the winter they are not begun upon until Monday morning early. In the summer they would be begun upon at 12 o'clock on Sunday night, and they might come in twenty-four hours before.

2326. They would be that length of time at the Island? Yes.

2327. But that is very unusual? Certainly.

2328. That is the exception, and not the rule? Yes, that is the exception.

2329. You also said that you thought it was necessary to erect new abattoirs, and that they should not be placed on Glebe Island? Yes.

2330. You think that they should not be placed on Glebe Island? Yes, I do think that.

2331. But your only objection seems to be in reference to the means of access to the Abattoirs for the cattle? That is one objection. The other objection is that they are driven into the Abattoirs from their resting paddocks, and are liable to be killed while they are heated. The resting paddocks, the sale-yards, and the abattoirs ought all to be near together.

2332. Do you not think that this difficulty could be overcome by having a branch railway from Petersham, or elsewhere, on the main suburban line? That is a question which I think many others could answer better than I, but I do not see how the difficulty could be got over in that way, because you would have no resting paddocks at Glebe Island. We have lately gone very carefully into the fate of cattle transmitted by rail from the west. The last lot we followed came from Bourke. They were three days—seventy-two hours—on the journey. They were taken to resting paddocks where there was no grass. The last of them was killed on the ninth day after leaving Bourke, and some of those animals were practically starved the whole of that time. After a railway journey, and when on it, it appears to be thought necessary to starve them. They must have time to rest and recover and get a little food before they are slaughtered, and having taken the trouble to give them an opportunity of getting that rest, you do not want to discount it by driving them from their resting paddocks, 6 or 7 miles from the abattoirs. It would be much better to have the abattoirs close at hand.

2333. But supposing you were to take them to the Wentworth Estate, adjacent to the Parramatta River, they would have to be driven just the same? That is only across the road—the sale-yards are on one side of the Parramatta Road and the Wentworth Estate begins on the other side of that road. The sale-yards and the abattoirs would really be one establishment. You would have to drive the cattle only across a paddock or two.

2334. In regard to water-carriage, is there as deep a water frontage to the site at the Wentworth Estate which you have mentioned as there is at Glebe Island? I have been told that there is deep water, but I cannot compare the depth. There is deep water available for small craft.

2335. You cannot state that from your own knowledge? No.

2336. But from your own knowledge you can state that there is deep-water frontage at Glebe Island? Yes.

2337. You said that the cost of producing the manure was £7 per ton, and that you got only £5 a ton for it;—could not the difference be made up if the most modern machinery were brought into requisition at Glebe Island? Certainly.

2338. Do you not think that it is essential that there should be a central abattoir somewhere in the vicinity of the city? I do.

2339. *Mr. Wilks.*] Am I to understand that you have made a series of inspections of proposed sites, as well as the present site? Yes.

2340. And your conclusions are that the present site, owing to its irregularity, the smallness of its acreage, and the dilapidated state of its buildings, is unsuitable for the trade? Yes.

2341. And of the proposed sites you have visited, the Wentworth Estate offers the strongest inducements? I have seen another site, which was a very good one, but it was 30 miles from Sydney, and in making a report upon it I specifically guarded myself against taking its position into consideration, because I consider that the advantages or disadvantages of position could be best spoken of by people who are actually engaged in the trade, and know what is wanted so far as position for the incoming of stock goes; but looking upon that site by itself as a site for this particular purpose, I thought it was just as good as the Wentworth Estate.

2342. The strongest objection you had in connection with the present Abattoirs was the obsolete nature of the desiccating plant? Not at all.

2343. I mean your strongest objection as regards the treatment of the offal, which, I presume, you think should be treated by desiccation? Yes; which I make other people treat in that way.

2344. Are you aware that not only is the desiccating plant obsolete, but that the treatment of an inordinate quantity of water has made the process very expensive? Yes.

2345. The evaporation of the water has added to the cost of the manure? Yes.

2346. That is owing to the defective architectural construction of the Abattoirs? It is.

2347. That could be obviated only by the construction of entirely new buildings? Yes.

2348. Upon an improved plan? Yes.

2349. In the construction of abattoirs, would you recommend buildings similar to those used for the slaughtering of pigs and sheep at Flemington, near Melbourne? I have not seen them.

2350. In Melbourne the sheep and pigs are driven into elevated pens, and are killed over gratings, and the blood is conveyed by reticulation to a vat for the purpose of desiccation, and that prevents the mixing of the blood with water used for sluicing, instead of their being allowed to mix, as is the case at Glebe Island?

J. A.  
Thompson.  
21 Oct., 1896.

Island? Of course the main part of the blood ought to be caught and carried away separately, and not allowed to mix with water used in sluicing.

2351. You would advise that to be done also in connection with the slaughtering of cattle? Undoubtedly. The main part of the blood ought to be caught, and carried away separately, by whatever means you adopt to do it. All that goes down with the water used in sluicing should be a mere smearing of blood, which you could not use for manufacturing purposes.

2352. That would minimise the cost of working the desiccating plant? Certainly.

2353. Do you consider that the inspection at the Abattoirs is sufficiently rigid? No, I do not.

2354. What system of inspection would you suggest? It is merely a question of the number of inspectors. The inspection that is done is efficiently done, but owing to the number and arrangement of the houses, and also to there being only five inspectors and one superintendent inspector, it is next door to impossible for them to be quite responsible for every carcass that is killed.

2355. Do you hold the opinion that diseased carcasses go from the Abattoirs into the market for consumption in any appreciable numbers? No; I cannot admit that.

2356. Do you admit that there is a danger of some going into consumption? There would not be any danger at all if we had ten inspectors instead of five.

2357. But, through the want of a sufficient number of inspectors, it is reasonable to believe that a certain amount of diseased meat may go into consumption? Of course, if a carcass is overlooked it is not inspected.

2358. You believe that there is a great danger of its being overlooked at the present time owing to the laxity of administration? No; that is just what I cannot admit. But, owing to the arrangement of the houses, and also owing to the very moderate staff of inspectors that we have, it is very likely that they are not able to inspect as carefully as they ought to inspect every carcass that is killed. I can explain what I mean by telling you that there are twelve beef-houses, and that in each beef-house three beeves can be knocked down and dressed in half an hour. There might, therefore, in any half-hour be thirty-six beeves knocked down and dressed and sent away from those twelve beef-houses.

2359. Through the architectural defects of the Abattoirs, and the smallness of the number of inspectors, there is a probability of diseased meat going into consumption? There is a possibility.

2360. Are you aware whether the proportion of diseased cattle in this country is becoming larger? No answer can be given to that question by anybody; we have not sufficient information.

2361. In the matter of the consumption of diseased cattle suffering from the ordinary diseases, are the objections tangible ones, or merely sentimental? Very tangible.

2362. You are acquainted with diseases in human beings which are traceable to the consumption of diseased meat? Demonstrably, it has been shown over and over again.

2363. Then, in our ordinary economics, there is nothing more useful than a rigid inspection at our abattoirs? Certainly; especially in regard to consumption.

2364. This rigid inspection can only be obtained at centrally-situated abattoirs? Undoubtedly.

2365. I take that to be one of your strongest reasons for supporting central abattoirs? Undoubtedly it would be.

2366. Then, inferentially, the probability is that with chilled meat coming from numerous slaughtering-places in the country the danger of diseased meat going into consumption would be increased? Yes. We have our inspectors all over the country, and such inspection as is possible is done at the freezing works, but, necessarily, it is even less effectual than that which is done at the Glebe Island Abattoirs. In point of fact, every large freezing works is as big as many a public abattoir, and it ought to have attached to it its own inspector, responsible to the central authorities, and not under the control of the owners of the freezing works. He should inspect as our deputy, and you will never get really efficient inspection until something of that kind is done. I know that some of the big companies do take very great care to weed out not merely diseased animals, but also animals which are not in very good condition for market. I do not think they all do that, but some of them do.

2367. Then the dangers to the general public through eating diseased meat are a long way more than visionary? Yes; consumption is not the only disease which is communicable to man by way of milk and meat, but it is perhaps the most important. It is so important that it is beginning to be a question whether a large proportion of the consumption that is met with in man in every civilised country in the world is not perhaps mainly due to the meat and the milk derived from animals which are suffering from tuberculosis. I have no doubt at all that one of the most important things which any health authority in any country can do is to strictly supervise the meat which is used for food, and also the milk which is supplied from cows. In this country, leaving the Glebe Island Abattoirs aside for one moment, the inspection of meat is imperfect, because the universal custom is to slaughter in private establishments. Of these, there are a great many in any district. So that, although we have men who are competent to act as inspectors under the Diseased Animals and Meat Act, and under the Cattle Slaughtering Act, and others who act generally as medical officers of health in some sense or other—usually at least three such people in any district—it is impossible for them to inspect more than a small number of the cattle that are slaughtered there, because the slaughter-houses are situated, perhaps, one 3 miles in the bush on one side of the town, and another 3 miles in the bush on the other side of the town, and so forth, up to the number of four, five, or six, and they all have their different days for slaughtering. They all give notice, but the inspector cannot always get to them in time. The remedy for that is precisely what we are talking of—that is, the erection of central public abattoirs to which should be attached an instructed inspector. In the Newcastle district, after talking about it for four or five years, during which I have very often discussed the matter with municipal bodies, and helped them to the best of my ability, they are now trying to establish a public abattoir. There, within a radius of a few miles—15 perhaps, or 20—there are about 100,000 people. I suggested to the Hon. the Treasurer that he should introduce an amendment of the Cattle Slaughtering Act into the Public Health Bill, whereby as soon as Newcastle or any adjoining municipalities which would combine have combined, and have established an abattoir, we should have power to prohibit meat-slaughtering anywhere within a radius of that abattoir which was found to be practically convenient. This has now been done. By confining to that central abattoir the slaughtering of the whole, or nearly the whole, of the meat consumed by those 100,000 people, a profit might be realised, and there could be attached to the abattoir an inspector, or as many inspectors as were wanted, and then the people there would have an opportunity of having a really efficient inspection.

J. A.  
Thompson.  
21 Oct., 1896.

inspection of the meat. As regards Sydney, a very large proportion of the meat consumed in Sydney is slaughtered here, and, notwithstanding the presence of Glebe Island, it is equally necessary that central slaughter-houses should be erected. In a memorandum drawn up by the Abattoirs Committee of the Board of Health, after being at work for a couple of years, you will see it mentioned that the tendency of the trade is to revert to slaughtering in private slaughter-houses scattered about in the neighbourhood of Sydney. I believe, as a matter of fact, that that statement is correct. I travel about in the suburbs, and I know what the people themselves say, and the fact is, that they revert to those private slaughter-houses, not at all, perhaps, on account of the inspection, or for any other reason than that Glebe Island is a very inconvenient place, and does not suit them. It is not conveniently situated for them, and is not in a proper position.

2368. You do not think that they avail themselves of the private slaughter-houses in order to avoid inspection? I do not think they do so to any important extent; some of them do, but not to any important extent.

2369. Have you within your recollection the percentage of meat condemned at the Glebe Island Abattoirs per annum, or in any given time? No; the fact is, I got your notice only this morning, and I already had appointments, and I have been exceedingly busy with the Public Health Bill, and not able to prepare my evidence in any way.

2370. You can supply that information as an appendix? Yes. We have the information, but I cannot remember it off-hand; I may, however, tell you this off-hand—that the proportion of cattle condemned at the Glebe Island Abattoirs, which we must take to be something very near the proportion of actually diseased cattle met with there, is infinitely higher than the proportion condemned at places outside; and that arises partly from the difficulty I mentioned just now of private slaughter-houses being scattered about, and not accessible to the inspector, who is usually a municipal inspector, sometimes a police officer with other things to attend to, and, therefore, unable to get to the slaughter-houses always in time. That is one reason. Another reason is that these inspectors are not, in reality, educated men. One of the main advantages, from this point of view, of having public slaughter-houses where you can, is that you can then afford to pay an educated man, who knows disease when he sees it.

2371. You would have trained inspectors? Yes; veterinary inspectors.

2372. From the seriousness of some of the information which you have given in reply to previous questions, am I to understand that you consider this inquiry of the highest possible concern? I think it is decidedly one of the most important inquiries, in view of the public health, which could be held. I think that in these deliberations the immense importance of careful inspection should be constantly kept in mind.

2373. In reply to a question just now, you said that a certain time should be allowed for the resting of cattle—would you suggest any regulation fixing the length of time for the resting of animals;—we have been told by practical men that they consider forty-eight hours for resting sufficient? I was going to say that three days would be the minimum. I think they require a little longer than forty-eight hours. The cattle I mentioned just now got out of their trucks at the end of the third day from the time they started, and they had not had any water for twenty-four hours before that, and had been on the journey all the time. I do not think that forty-eight hours would have been long enough to rest those cattle.

2374. Why do practical butchers object to the feeding of cattle for some time before they are slaughtered? Because of the inconvenience that would otherwise arise from having the paunches and entrails overloaded with half-digested food.

2375. It is not that the animals would not avail themselves of the pasturage during the time of resting, but, simply as a matter of business, the butchers prefer to keep the animals without food for the reason you have mentioned? It is quite right to starve them for a little while. You do not want to kill an animal while the process of digestion is going on very actively, but forty-eight hours' rest is necessary. Nobody ever proposed to feed the cattle when they got to Glebe Island. They get there, as a rule, eight, twelve, or fewer hours before they are killed.

2376. Then, assuming that the Glebe Island site was determined upon for future use, there would be no necessity to have pasturage-paddocks there—simply resting-paddocks would be all that was requisite? But you would not have room for that at Glebe Island.

2377. Not with the reclaimed land? I do not think it is at all a suitable place for such a business. That reclaimed land is surrounded by houses, and all the people there would be annoyed by the noises at night, and I think that would be a very unsuitable place. Glebe Island one pictures to oneself by means of the buildings upon it—that is, one thinks first of the water side of the Island, away from the houses in Balmain—but directly you begin to speak of using the reclaimed land in White Bay one has to remember the ridges opposite, which are covered with houses, and you would destroy the value of that property. There would be the bellowing of yarded and driven cattle all night if you used that reclaimed land for resting-paddocks. I think there are many objections to that.

2378. Have you considered, in connection with the Abattoirs at Glebe Island, the erection of a suitable cold storage department? Yes; that is an essential adjunct.

2379. Would the Wentworth Estate provide facilities for that? It would, in my opinion, be best to have the main cold storage in connection with the cold storage that is contemplated by the Government Board for Exports. They are thinking of putting up cold storage buildings at Darling Island, and the main cold storage in connection with our meat supply should be there, but if the Abattoirs happened to be situated near the sale-yards, as soon as they were erected the Board of Health would, under an amendment of the Noxious Trades and Cattle Slaughtering Act, proclaim an extensive radius from them to be a radius within which no slaughtering should take place except at those Abattoirs, and it would be necessary to have a smaller cold storage there for the convenience of butchers who lived 7 or 8 miles away, and not in the direction of Sydney; but that would be a subsidiary, and not a very big storage. The main storage should be at Darling Island, and the meat would, or could, reach Darling Island by means of punts; but meat required by the butchers in the neighbourhood of the Abattoirs could be cooled at the cold storage there, and be fetched daily from that place by the butchers themselves.

2380. Well-appointed abattoirs could be so conducted as to be innocuous to the general public? I have no doubt at all about that, and I speak partly from experience gained in administering the Act managing the noxious trades.

2381. There is not the slightest danger to be apprehended by the public from centrally-situated abattoirs? Not the least. 2382.

- J. A. Thompson.  
21 Oct., 1896.
2382. *Mr. O'Sullivan.*] I understand from your evidence that while you would favour the establishment of abattoirs in crowded centres like Sydney and Newcastle, you think that a better site than Glebe Island could be chosen? Yes.
2383. I understand that you prefer the proposed site on the Wentworth Estate, at Homebush, to Glebe Island? Yes.
2384. You have admitted that the Abattoirs would not be dangerous to public health? Yes.
2385. Then where is the necessity for removing the Abattoirs from Glebe Island? I think that there is every possible objection that could be named to Glebe Island. In the first place you would have to raze to the ground all the buildings at present existing on Glebe Island. They are not capable of being used much longer, and are not in the least worth repairing—everybody is agreed about that.
2386. Supposing that new abattoirs were built on the other portion of the Island—on this side of Johnson's Bay bridge—and were fitted up with the most modern appliances for preventing nuisances, would not the Abattoirs then be perfectly safe as regards the public health? I think they might be safe at Glebe Island as regards the public health. If it is merely a question of putting up Abattoirs on Glebe Island, and if money is no object, I do not think that the public health would suffer at all.
2387. You have spoken about a good deal of slaughtering being carried on in private premises, because of the inconvenient distance of Glebe Island? Yes.
2388. Would it not be still worse if the butchers had to go out, a greater distance, to Homebush? Well, in as far as Homebush is just about where those private slaughter-houses are, I do not suppose that it would be inconvenient for those people to go there.
2389. Are not private slaughter-houses to be found all round the city? They are to be found all round city, but still that is the direction in which they mostly lie—Canterbury and Enfield and so on.
2390. *Mr. Wilks.*] There is a large growing population at North Shore? Yes. It might be considered whether there should not be another public abattoir at North Shore. I may take this opportunity of pointing out that a public abattoir is always a paying concern, and I have taken care that it shall have every advantage in this Colony by the amendment that I mentioned just now. Supposing that the North Shore Municipal Council decided to establish an abattoir at North Shore, as soon as that abattoir was established we should proclaim the whole district, and would say that there should not be any private slaughtering done within it. That abattoir would have the monopoly of the slaughtering, and the Council would know exactly what the return on the money invested in the abattoir would be, and it would be a paying concern.
2391. *Mr. O'Sullivan.*] You say that abattoirs are always worked at a profit? Yes.
2392. But, as a matter of fact, our Abattoirs at Glebe Island have resulted in a loss to the State for some time past? Certainly.
2393. Owing to the obsolete machinery and the backward condition of affairs there? Yes.
2394. Would it not be possible to so reorganise the Abattoirs at Glebe Island and fit them up in such a way as to make them a source of profit to the State, without, as you admit, any detriment to the public health; and, if that be so, where is the necessity for the removal of the Abattoirs further out, except as regards the one idea which you have mentioned, namely, that there ought to be greater accommodation for pasturage purposes? I do not think that, do whatever you might with that site, you would have in the first place all the room that would be required, due regard being had to necessary extension in the future and the much increased area you would have to cover with your new buildings, and the accommodation that you would want, not for resting paddocks, but for killing-pens and all that sort of thing. Then you would have to have a branch railway to take your cattle there, and you would also have to get rid of the sale-yards at Homebush—they would no longer be of any use. Or if you kept the sale-yards at Homebush, some one would have to provide resting paddocks near by. But you would have to transfer your cattle from the sale-yards to Glebe Island, and you would have to do that by means of a railway.
2395. But where is the necessity for transferring the sale-yards to Glebe Island when they are already in existence at Homebush and are working apparently to the satisfaction of the public? I do not want anyone to do that. What I have in mind is that the sale-yards and the abattoirs are two establishments which work together, and that they ought to be close together—they ought to be one establishment. The cattle should be taken from the sale-yards right into the abattoirs—that is what everybody wants to do.
2396. But does it not strike you that it might be wiser to keep the sale-yards separate from the abattoirs for several reasons—for example, the cattle themselves, if in sale-yards near the abattoirs, might smell the blood? I do not think they would. I do not mean that the sale-yards should be close up against the abattoirs. Speaking of Wentworth Estate merely for the sake of illustration—for I am not assuming that that is where the abattoirs would be if they were put on some site other than Glebe Island—the slaughter-houses would be  $\frac{1}{2}$  of a mile from the sale-yards. The Wentworth Estate is a large piece of land.
2397. There appears to be ample room at the present time for the sale-yards at Homebush, and more room could be obtained by taking in some of the land mentioned by you as a possible site for the abattoirs? Yes.
2398. Supposing the two establishments were still kept separate—the sale-yards at Homebush and the Abattoirs at Glebe Island—and a railway were constructed to Glebe Island, branching off at some point near Petersham, there would then be no necessity for pasturage ground at Glebe Island, because the cattle would go straight from the sale-yards to the slaughter-houses? Instead of being driven  $\frac{1}{2}$  of a mile they would ride half a dozen miles—that is all the difference.
2399. It would get rid of the dangerous nuisance of driving cattle through the streets? Yes, it would get rid of that.
2400. If that were so, the objection that you have, that there is no land for pasturage purposes at Glebe Island, would not hold good, because the pasturage land would be required near the sale-yards? Yes; that is quite true.
2401. There can be no doubt that the major portion of the supply of meat to large cities like Newcastle and Sydney in the future will come from country districts? It does not do so at present.
2402. But judging from the rapid way in which chilling and refrigerating works are being constructed, I think it is probable that the major portion, at all events, of the meat supplied to Sydney and Newcastle will come from establishments in the country districts? It may.
2403. If that should be the case, we shall not require very large abattoirs in the city, but we shall require something in the shape of a central slaughtering establishment where rigid inspection could be carried out? The inspection must be carried out where the animals are slaughtered. You cannot properly inspect carcasses of animals after the inside has been taken away—after they have been dressed.

J. A.  
Thompson.  
21 Oct., 1896.

2404. If we are to be supplied in the future with the greater portion of our 'meat by establishments in country districts, as we seem likely to be, then all that would be required about Sydney would be a central slaughtering establishment, where rigid inspection could be carried out in regard to the stock that were slaughtered there? But if the meat is chiefly going to be slaughtered in the country, why should there be a slaughter-house in Sydney?

2405. Because I think we shall always have a proportion of the meat slaughtered in Sydney—for example, the stock that comes by coastal steamers; a large number of pigs come from coastal districts, and they would be slaughtered in Sydney, and it is possible that in future cattle will be brought from Twofold Bay as well as from the Richmond by steamer, as they have been in the past, and those cattle would be slaughtered at the central establishment, and for this purpose we should always require to maintain an abattoir? Yes.

2406. Even though the greater portion of our meat might come from the refrigerating works in the country districts? Yes; no doubt there will always be some slaughtering done in Sydney.

2407. That being so, all we have to decide upon is a site for the central abattoir? Yes.

2408. And I gather from your evidence that while you admit that abattoirs can be carried on without prejudice to the public health in a crowded population, still you think that a better site than Glebe Island for them would be on the Wentworth Estate at Homebush? Yes. Any neighbourhood where there is a larger area of land available so as to practically remove the business from the immediate neighbourhood of houses. If you have a very large area of land you can put your slaughter-houses in the middle of it, and dwelling-houses need not be near them.

2409. Do you know the area available on the Wentworth Estate? If I remember rightly, there are 1,200 acres, and 500 more than that might be acquired. The Wentworth Estate is a very large piece of land.

2410. Have you heard anything of a proposal to establish the abattoirs between Parramatta and Penrith—at Blacktown? Yes.

2411. What do you think of that position? As a site, I think it is a very good one. As to its position, that is a matter on which I would rather not express any opinion, because I think that people engaged in the trade can speak much better as to its convenience and suitability. But regarding it as a site, it is a very suitable and good one. I liked it very much.

2412. Do you know the site proposed some years ago at Kurnel, south of Botany Bay? Yes.

2413. What is your opinion of that? I do not think anything would be gained by having the abattoirs there. It is out of the way except for the suburbs immediately on the South Coast Line.

2414. At one time there were some very strong arguments advanced in favour of the abattoirs being established there? Yes, I know; but who advanced the arguments? I do not think that arguments are always based on the merits of the case.

2415. Have you heard anything of a site near Marrickville? No.

2416. Do you think that that would be in any way suitable as a site for abattoirs? There is a site which would be a very good one at Canterbury, on the Marrickville railway. I have heard about that, and I know the land more or less. That would not be a bad place, but I think Homebush is better. It is on the main line.

Thomas Harry Houghton, Esq., A.M.I.C.E., M.I.M.E., called in, sworn, and examined:—

2417. *Chairman.*] You are in business in this city? Yes; as a consulting civil engineer.

2418. Where is your office? 12, Spring-street.

2419. Have you been long in business in this city? For the last five or six years.

2420. Has your business brought you in any way into contact with abattoir construction or management? Very largely.

2421. *Mr. O'Sullivan.*] What establishments have you been connected with? I am engineer to a number of them. I am engineer to the Aberdeen Company, the Gladstone Meat Company, Queensland, and the Graziers' Meat Export Company, Duck River, Granville. I have also been the engineer to the Board of Health since they took over Glebe Island Abattoirs.

2422. You have, therefore, an intimate knowledge of the machinery in use at the Glebe Island Abattoirs? Yes.

2423. Do you consider those up to date or obsolete? Very obsolete.

2424. At the present time, is there much nuisance arising from the use of that obsolete machinery? The desiccating works are shut up. They have been shut up for the last three months.

2425. Why were they shut up? Because they did not pay under the system in vogue there.

2426. What do you mean by saying "under the system in vogue there"? Obsolete machinery requires a great deal of handling. The abattoirs are badly designed and worn out.

2427. Do you think it would be possible to design and erect on Glebe Island modern abattoirs fitted with all the latest improved machinery for desiccating and other purposes which would be able to carry on their operations without detriment to the public health? Of course it could be done, but with difficulty. At the abattoirs, I do not know how many lessees there are, but there are twenty-four main slaughter-houses, and each of the men stops and sluices down at whatever time pleases him. The result is that a man may be killing in one house, and the butchers on each side of him may be sluicing down their places, and you get a very large quantity of the water in the blood. That is expensive to remove. Whereas, at the abattoirs connected with the meat-works in the country districts, when they are killing for export, they stop killing at the same time all the way through, and begin to wash down after the blood has been removed. The result is that you can treat it profitably, but, where you have a great deal of water with the blood, it is expensive to treat.

2428. I understand from your answer that it would be possible to lay out modern abattoirs at Glebe Island and work them without detriment to the public health? I think that at present no detriment to the public health arises from Glebe Island.

2429. Even with the obsolete appliances? Even with the obsolete appliances. I have never noticed any appearances of ill-health amongst the people there. I have never suffered myself from it.

2430. Do you think that Glebe Island is a fairly good position for an establishment of that sort? No.

2431. What are your objections to the position? The distance from the cattle-yards is one objection.

2432. Supposing that that were got over by the construction of a railway from Petersham to the abattoirs? The same objection would still exist. You would have to retruck the cattle and sheep, and that is a very serious objection.

2433.

T. H.  
Houghton.  
21 Oct., 1896.

T. H.  
Houghton.  
21 Oct., 1896.

2433. Where would you prefer to see the new abattoirs erected? I think the most suitable site is adjoining the sale-yards—if you continue the sale-yards in their present position, somewhere within a reasonable distance of that; or, if you remove the sale-yards, within a reasonable distance of the place to which you remove them. Glebe Island itself would be a splendid site for anything like that if it were not for the inconvenience of having to drive the cattle a distance from the sale-yards, and the absence of any paddocks adjoining the slaughter-houses.

2434. But the retrucking of stock need not be a very serious affair if proper appliances are provided? Cattle are frightened, and are as nervous as they can be when once taken out of the trucks. After doing a journey from, say, the Upper Hunter to Sydney, they do not care about being put back into the trucks. The best thing, when once they are out of the trucks, is not to put them in again until they are dead.

2435. How would you provide for stock coming from the coastal districts—for example, pigs and calves coming from the coastal districts? The small number coming from the coastal districts would come up by train, would they not?

2436. They come up in steamers? Well, if you had a site near the present sale-yards, you could easily barge them up there.

2437. That would cause a transshipment? Yes; it is not so awkward with pigs and calves as it is with cattle. Cattle get very much bruised.

2438. I daresay you have heard that cattle have been landed here from the Richmond River, and perhaps in the future they may be loaded here from Twofold Bay;—how would you deal with those? You have to travel them round to Glebe Island as at present arranged, and I do not think that with the few likely to come up from Twofold Bay, it would hurt landing them at some point on the Parramatta River and travelling them up. I have never looked into the matter of cattle coming by water to Sydney.

2439. Do you hold, then, that it is essential to have central abattoirs for a large population like that of Sydney? Certainly; I think it is the best thing you can have. You can have proper inspection then.

2440. Although in the future a large proportion of the meat to be consumed in the city will probably come from chilling works in the country districts? Of course that depends on whether you can convince the butchers that that is the best thing to do.

2441. But judging from the rate at which those establishments are going up and are extending, is it not probable that that will be the case? It is hard to say, because there is such a very strong vested interest in the Homebush sale-yards, on the part of the agents selling there, and I think that for many years they will maintain Homebush as cattle sale-yards.

2442. What would be the cost of fitting up new abattoirs, constructed either at Glebe Island or elsewhere, with all the modern appliances necessary to bring the establishment up to date? I have not looked into that matter at all. Holding the position of consulting engineer to the Board of Health, it would not be wise for me to answer that question without consideration.

2443. Would it be a very expensive item? Yes; the erection of new abattoirs of the capacity of those at Glebe Island would be expensive.

2444. I am talking now in regard to machinery only? The machinery is a small item compared to the main part.

2445. I am putting out of sight the cost of the buildings and the adjuncts, and I want to know whether the item of machinery would be a very expensive one? About £4,000.

2446. *Mr. Wilks.*] Your acquaintance with abattoirs is mainly as an engineer and expert? Yes, entirely.

2447. The conclusion you have drawn in reference to Glebe Island is that the desiccating plant is obsolete? It is worn out.

2448. Are you also aware that for a long time the treatment there of the offal has been made more costly by the evaporation of an inordinate amount of water—water used in sluicing? It always has been so, on account of only one drain being used to carry everything away. You cannot stop a man sluicing in one house after he has finished killing, because somebody below him is still killing.

2449. Then it is an architectural fault? The place is badly laid out, because there is so little fall in the drain—1 in 500, or something like that—and you cannot get the blood along without water.

2450. What other weaknesses have you detected there in regard to machinery? The whole place is worn out.

2451. It would practically require rebuilding? Certainly. When I reported on it before, I think I said that £10,000 or £12,000 would put it in a proper state of repair only.

2452. Supposing that in connection with the abattoirs we entertained the idea of erecting on Glebe Island cold storage works for supplying butchers and for export, how would you view the site then? Well, it is inconvenient; ships will not come up to there at present. If the meat were for export you would have to barge it to the ships.

2453. You mean on account of the depth of water there? Yes. You would have to build new wharfs there, and under present circumstances you would have to barge all your frozen meat. Besides, as the works are now, on the top of the hill, you would have to make arrangements for delivering the frozen carcasses to the barge.

2454. If this matter were put before you in your professional capacity you would not entertain the idea of building cold storage there? I think there are more suitable places in Sydney than Glebe Island for cold storage. Viewing the present surroundings, especially in regard to the water, I think you could get a better place than Glebe Island.

2455. More economically worked? Yes. For instance, Darling Island would make a far superior position for cold stores.

2456. Am I to understand that the chilling-works mainly direct their attention to export trade now? Almost entirely. A great deal of chilled meat is sold in Sydney at the Government meat-markets, but I think that that is only a small quantity compared with what is exported. I have no statistics as to how much does come down.

2457. Then it is not the retail butchers who appreciate those chilling-works, but they are chiefly established for export purposes—at least, that is the inference? I think the best guide you can have is the number of sheep sold at Homebush. I believe that about 60,000 sheep are sold at Homebush each week, and I think that not 10,000 sheep that come in frozen from the country are sold at the meat-markets. I cannot give you any definite figures, but they could easily be obtained. In connection with any abattoirs established outside Sydney, I think it would be desirable to provide cold storage, because if

you

you had to bring the meat in by train from Blacktown, or any of the places named by different people as sites for the abattoirs, you would not want to be running an odd truck a dozen times a day, but you would want to bring your meat in by one or two trains, and consequently you would want stores here where the smaller butchers could obtain their supplies.

T. H.  
Houghton.  
21 Oct., 1896.

2458. You favour central abattoirs? Certainly.

2459. Am I to understand that by favouring central abattoirs you mean one site or a number of sites surrounding the city? I think that for a city the size we now have one site would be ample. You have only one sale-yards.

2460. You have not entertained the idea of establishing several abattoirs about the city? No; that would be very costly. I have not considered that. In London the slaughter-houses are north and south. In Melbourne there is only one public slaughtering establishment—at Flemington.

2461. You have visited Flemington? Yes. At Adelaide there is only one public slaughtering establishment.

2462. Have you visited the Adelaide Abattoir? Yes. I reported to the Board of Health about that a little while ago.

2463. What is your opinion of the Adelaide slaughter-houses? For a small town they are very satisfactory.

2464. How do they compare with the Melbourne slaughter-houses? They are much smaller. Only cattle are slaughtered there. Sheep, pigs, and calves are slaughtered at private slaughter-houses in Adelaide. No appliances at all are used at the Adelaide public abattoirs except the ordinary winches. All the blood is discharged into a drain, and goes on to a sewage farm. It has been most satisfactory. They have never had any coagulation in the sewer, although I thought that the blood might coagulate in such a way as to block the sewer.

2465. *Chairman.*] I think you have furnished a report to the Board of Health on the Glebe Island Abattoirs? Yes.

2466. I think the tendency of your report is in favour of the removal of the present abattoirs to some other locality? I do not think that I have ever reported on that point, but I am not certain. I may have done so, but I do not remember it.

2467. Your report was more particularly in regard to the machinery at Glebe Island? It was made in view of the very large annual expenditure for such a very small return in treating the blood and offal there. That was the first report which I made to the Board.

2468. So the information which you rendered to the Board quite recently had reference only to the desiccating machinery at Glebe Island? To the general drainage. It had nothing to do with the management as regards the supervision of the slaughter-houses.

2469. I think you complained that the treatment of blood and other offensive matter coming from the animals killed there was rendered very expensive on account of the large quantity of water that was allowed to mix with the blood? Yes; and the want of automatic machinery. There is too much handling in connection with the machinery.

2470. Do you think that that difficulty might be got over by the Abattoirs being placed under the control of the Government, and the carcass butchers being allowed to slaughter there, as at Melbourne, on paying so much per head for each animal killed, and the cleansing of the buildings being done by officers under the direct control of the Government? I hardly know if that would result in the production of blood-manure at a profit.

2471. Would you be surprised to know that in the other colonies we have had evidence already given to us that the offal and blood coming from the animals killed there are treated at a profit? In Melbourne I believe it is so. Mr. Mountain has told me that there it is done at a profit, but you will doubtless have noticed that in the sheep abattoirs in Melbourne the blood is caught quite free from water.

2472. Supposing at our Abattoirs an order were issued that none of the men were to cleanse the Abattoirs at all until after the whole of the blood had been captured and transmitted to the desiccating house, and if the blood, therefore, were treated in the same way as it is in Melbourne, do you think that, with our present machinery, that treatment would result in a profit to the Government? No; the present machinery is utterly worn out. I have reported to the Board of Health time after time about it. In fact, I could only just keep it going by constantly having it repaired. It is very much eaten away.

2473. The present machinery at Glebe Island is, practically speaking, useless? You can use it, but you never know what day something may give way.

2474. As an engineer of large experience, you could have no other recommendation to make to the Board of Health, who have the control of the Glebe Island Abattoirs, than to do away with all the desiccating work? Yes; or spend a lot of money upon repairs.

2475. Do you not think that it would be more economical for the Government to spend £1,000 or £1,200 in the erection of new desiccating works rather than resort to the present system of carrying all offensive matter outside the Heads three or four times a week by means of a steamer? Not with the present system of drainage.

2476. So you think the Abattoirs would have to be entirely rearranged or rebuilt before you could hope to make any profit, even though improved desiccating machinery were introduced in connection with the working of the Abattoirs? Yes. I could save money in the case of manure manufactured by improved machinery, but you could never make a satisfactory job of it. Speaking from memory, I think that my estimate of the cost of new drainage for the present Abattoirs was £3,000.

2477. So you are generally of opinion that instead of spending a large sum of money in improving the desiccating machinery, as well as in improving the drainage, it would be better for the Government to erect new abattoirs on some other site, in closer proximity to the present sale-yards? That is so. At the present Abattoirs the stones are all crumbling away, and the woodwork is all eaten away, and we are constantly spending money in patching it up.

2478. So, in the ordinary course of events, the present Abattoirs would have to be dispensed with, and new buildings erected, either in Glebe Island or some other locality? That is so.

2479. Do you think it would be possible to erect new abattoirs on the Wentworth Estate, adjoining the sale-yards at Homebush, without their proving offensive or objectionable to the large number of people living at Strathfield and Homebush, and in the surrounding districts? I think so. You would not carry on any noxious trades there. Of course, there is always a certain amount of effluvia where you have a large number of sheep or cattle; you could not avoid that; but otherwise I think you could carry on the abattoirs without giving any offence. I do not know the size of the Wentworth Estate, but I think it is a couple of thousand acres, and, if so, you could put the abattoirs far enough away from any residences.

- T. H. Houghton.  
21 Oct., 1896.
2480. Do you think that abattoirs could be conducted on that particular site without in any way injuring the Parramatta River? Yes. You have the main sewer within about a mile of that site.
2481. You think it would be possible, with the aid of pipes connecting the abattoirs with the main sewer terminating close by, to convey all objectionable and offensive liquid from the abattoirs into that sewer, and thus prevent any offensive smell? With plenty of water we could do that, and we have any quantity of water in the Parramatta River.
2482. Have you looked at any other site that struck you as being a suitable one upon which to erect abattoirs? No; I have never been instructed by the Board of Health to investigate any site. I looked at the Wentworth Estate, not for the Board of Health, but for other meat-works, and I approved of it for that purpose.
2483. Supposing that you had a house at Strathfield or close to the Homebush railway station, would you look upon the establishment of abattoirs on the Wentworth Estate, right opposite the present sale-yards, and just on the other side of the Parramatta Road, as being likely to injure the value of your property? It is altogether a matter of sentiment.
2484. You think it would be only a matter of sentiment? Entirely a matter of sentiment.
2485. Regarding property situated at Strathfield and Homebush to-day, would you consider that it would be as valuable six months hence if abattoirs were erected in the meantime on the Wentworth Estate, and were carried on there with the most modern appliances? As a matter of fact, the property would be just as valuable, but you cannot say how far sentiment would enter into the matter, and depreciate the value.
2486. So you think that so far as objectionable smell or objectionable sight, or anything of that sort is concerned, no property need depreciate in value except from a sentimental standpoint? That is so. I know that at some of the country works with which I am connected, you could not tell, within a quarter of a mile of them, from any smell, that you were near them.
2487. Do you think that in designing new slaughter-houses on the proposed site you would follow something like the lines followed in designing the Aberdeen meat-works? Something like them. It all depends on the site and the quantity of buildings.
2488. Did you inspect the machinery at the Flemington slaughter-houses? Yes.
2489. What was your opinion about the desiccating machinery erected by the Corporation of Melbourne at their abattoirs? Very efficient, but very costly.
2490. Does not the efficiency and the costliness of the machinery add materially to the profit they are supposed to be making? No; I do not think the costliness of the machinery does. I think we get more nitrogen in the manure in the machines which desiccate more quickly.
2491. You think that machinery could be erected much more cheaply than that which exists now at the Flemington Abattoirs, and produce quite as satisfactory results? I think more so. The machine at Aberdeen gives more nitrogen in percentage than the machines at Flemington do. I designed the one at Aberdeen, and put it up there.
2492. I think it is proposed to substitute new machinery at Aberdeen of a more modern style even than you have erected there? That is not for desiccation, it is for freezing.
2493. You do not think you could make any great improvement on the desiccating plant at Aberdeen? Yes; I could. It has been up two years, and I think I could improve it now; in fact, there is a machine which is being built for one of the companies by Hudson Bros., which is, I think, an improvement on the one at Aberdeen.
2494. Is it the intention of the Board of Health, if the present Abattoirs were allowed to remain at Glebe Island much longer, to continue taking the blood and offal out to sea? It must be done, or they must face a large expenditure, which the Government will not allow.
2495. At what would you estimate the cost of suitable desiccating machinery to be erected at Glebe Island? I think it would cost a couple of thousand pounds.
2496. *Mr. O'Sullivan.*] That is in the old establishment;—when you spoke of £4,000, you meant for the new establishment? Yes; £2,000 would be sufficient to do as much as you could do with the present establishment.
2497. *Mr. Wilks.*] Would your estimate of £4,000 cover drainage? No.
2498. *Chairman.*] You say you have visited the Adelaide Abattoirs? Yes.

THURSDAY, 22 OCTOBER, 1896.

Present:—

MR. LAW, | MR. O'SULLIVAN,  
MR. WILKS.

J. S. HAWTHORNE, ESQ., IN THE CHAIR.

Francis Kirkpatrick, Esq., called in, sworn, and examined:—

- F. Kirkpatrick, Esq.  
22 Oct., 1896.
2499. *Chairman.*] You are Under Secretary for Finance and Trade? Yes.
2500. I believe you are also a member of the sub-committee of the Board of Health having specially to do with the Abattoirs? Yes.
2501. Have you taken any practical interest in the work, by attendance at meetings of the sub-committee or by visiting the Abattoirs? I could not possibly attend the meetings of the sub-committee, because I could not get away from my business at the Treasury. I have been to the Abattoirs once or twice, but I have not sufficient expert knowledge to enter fully into the matter of the management.
2502. So your practical knowledge of the working of the Abattoirs is confined principally to returns furnished? Yes; I may say altogether.
2503. You have really had no practical experience in connection with the working of the Abattoirs? None whatever.
2504. Your colleagues on the sub-committee would probably be better informed on matters of detail in connection with the working of the Abattoirs? Much better, because they attended all the meetings.
2505. I suppose you would know whether the Abattoirs have been working at a profit or at a loss for some time past? Yes. The desiccating works have been worked at a very considerable loss—£3,000, I believe, in 1895. That was the cause of the change of the system. 2506.

2506. I suppose you are informed, by reports from some of your officers, that the principal cause of this great loss was the old-fashioned machinery used in connection with the desiccating works? That is stated to be partly the cause.

F.  
Kirkpatrick,  
Esq.

2507. Is it within your knowledge that the abattoirs at Flemington, near Melbourne, are worked at a profit, and that the manure turned out by the desiccating works more than compensates for any labour expended in making it, whilst at the same time that gets rid of all objectionable matter coming from the animals that are killed at the Abattoirs? I have heard so, but I do not know it of my own knowledge.

22 Oct., 1896.

2508. You have numerous complaints, I suppose, from time to time about the proposed removal of the Abattoirs? There are a great number of papers bearing on the question of the removal or the retention at Glebe Island of the Abattoirs—some in favour of the removal, and some contending that the Abattoirs should remain where they are. The majority are in favour of the removal.

2509. The general consensus of opinion seems to be in favour of the removal of the Abattoirs from their present position? Undoubtedly.

2510. You have papers bearing on the question of the Abattoir's management generally? Yes, I have the Treasury inspectors' reports and other papers.

2511. These you are prepared to furnish to the Committee? Yes, at once.

2512. So that they may attach them as appendices to their report? Yes. I shall have great pleasure in furnishing all the information I can.

2513. *Mr. Wilks.*] Although you are nominally a member of the sub-committee of the Board of Health dealing with the Abattoirs, through press of other business, you practically have no knowledge of the Abattoirs? None whatever, except from the papers.

2514. And any evidence which we could obtain from you would, in your opinion, be of very little importance? That is so.

2515. Do you remember the large amount of correspondence that passed in regard to the Abattoirs at the time Mr. McMillan was Treasurer? Correspondence has been going on for years.

2516. But there was some outlined scheme in reference to the Abattoirs at that time? Yes, there was.

2517. I suppose you have no recollection at all of the outlined scheme? No.

2518. But it included either the removal of the Abattoirs or their retention at Glebe Island? I would not be sure.

2519. You have those papers in your possession? If I have I will have great pleasure in forwarding them to the Committee.

2520. *Mr. Law.*] You stated that there were a certain number of people in favour of the retention of the Abattoirs at Glebe Island and others in favour of their removal, and that the majority were in favour of their removal? Undoubtedly—that is, the majority of papers we have received. I could not say as to majority of people, because Balmain is a large place.

2521. You mean just the communications received by the department? Yes, so far as I remember.

2522. But not representing large bodies of people? I could not tell.

Edmund Compton Batt, called in, sworn, and examined:—

2523. *Chairman.*] You are a member of the firm of Batt, Rodd, and Purves? I am.

E. C. Batt

2524. Have you had any experience in connection with the abattoir movement or cattle-killing? A good deal.

22 Oct., 1896.

2525. Where did you gain your experience? The first two years of my life in Australia at Ramornie Meat-works. I had the entire management of those works.

2526. Where are they situated? At Clarence River.

2527. Had you any previous experience in connection with the management of similar works? None whatever.

2528. That was your first experience of management in connection with cattle-killing? On anything like a large scale it was.

2529. Had you previously had any other experience, small or large, in connection with abattoirs? No; practically speaking, that was my first experience of the matter.

2530. Since you undertook the management of the Ramornie Meat-works, have you had any experience, by visiting or otherwise, of the management of abattoirs either in this or in the adjoining colonies, or in the United Kingdom or in America? In the management, no; but I have always taken a great interest in the question, and at times I have, for my own satisfaction, visited our Abattoirs, and, in the same way, the sale-yards. Twelve or fourteen years ago I drew up a scheme under which, if it had been adopted, the sale-yards would not have been where they are now.

2531. What was your idea in regard to the position that the sale-yards ought to occupy? At that time I may fairly say the question about the change of the abattoirs site was never mooted; it was simply when the old Homebush yards were worn out. I had land at Liberty Plains surveyed, and I consulted with Sir Henry Parkes, and brought before him a scheme to take 1,000 acres of land on the loop between Rookwood and where it meets the Southern line towards Liberty Plains, and I offered him 1,000 acres of land at £25 an acre, and within a few months the land at Homebush was bought for about £250 an acre.

2532. In your letter to Sir Henry Parkes did you state why you thought the land at Liberty Plains was the most suitable for the erection of abattoirs? It is a good many years ago; but I am inclined to think that I had a personal interview with Sir Henry Parkes, and that I took the plan myself to his office, and that what took place between us was entirely conversational.

2533. Did you at that time contemplate the early removal of the abattoirs from Glebe Island? No. That was simply in connection with the sale-yards only.

2534. Had you then an idea that the cattle sold at the proposed sale-yards at Liberty Plains should be driven from there to Glebe Island? No. At that time the question of the removal of the abattoirs from Glebe Island was not ripe. I always saw from the first that driving the cattle from the Homebush sale-yards to Glebe Island was an awful mistake, because during my two years' experience at the Ramornie Meat-works, we were killing, perhaps, eighty head a day, and I knew how much the meat was affected if the cattle were killed after being driven a distance like that. For five years I was living at Ashfield, and Mr. Rodd and I drove to and from Sydney every day, and I saw not only injury to the cattle, but also the danger;

- E. C. Batt. danger to the public from from the cattle driving. I think I wrote some letters about it; but it is so many years ago that it has passed out of my memory.
- 22 Oct., 1896. 2535. As a business man, do you consider that it is advisable to have the sale-yards, as at present, so far away from the slaughter-houses? No. I think that it is entirely behind the times. To my mind there is only one proper course, and that is that, wherever the sale-yards are situated, the area of land available should be sufficiently large to have the abattoirs there also; a site near by being set apart for all cognate trades closely related to the abattoirs. I would not make this a site for all noxious trades, but I would have it for all other cognate trades. I would not only do away with the cattle-driving nuisance by having the sale-yards and the abattoirs close together; but, at a convenient distance away from the abattoirs, I would have works where hides, bones, blood, and other bi-products could be treated.
2536. Judging from what you have just stated, I should say that you are of opinion that if the sale-yards cannot possibly be put closer to the present abattoirs at Glebe Island, then the abattoirs ought to be brought closer to the sale-yards? Yes.
2537. Do you know the Wentworth Estate at Homebush? I do.
2538. The old Homebush racecourse? Yes.
2539. Do you think that that would be a suitable site for the abattoirs, seeing that it is only separated from the present sale-yards by the Parramatta Road? I do not. My reasons for saying that I do not are two. One is that the site is not large enough to embrace my ideas. It might do for a year or two, but this is a big question, and should be settled for the next 100 years or so.
2540. But supposing the area could be considerably increased by the purchase of land adjoining the Wentworth Estate, do you then think that that would be a suitable site for abattoirs? I think it might be a suitable site, but not the most suitable. The reason is that it is too near the present population area. I think you would have all the boroughs, such as Homebush, Strathfield, and Concord up in arms about it.
2541. But supposing you learnt, as we have done in taking evidence, that abattoirs could be conducted there quite as extensively as, or even more extensively than is the case at Glebe Island, without causing the slightest offence in the way of smells, do you think then that that would be likely to injure the value of property surrounding the Wentworth Estate? I must ask you before I answer that question to give me the area of land you propose to have.
2542. Well, supposing we could get the Wentworth Estate, which consists of 250 or 300 acres, and also an additional 1,000 acres adjoining it? If you mean that 1,250 acres would be the aggregate area, I do not think that that would be sufficient, and I will give the reasons why I do not think so. That site adjoins municipalities, but I think that wherever the sale-yards and the abattoirs are established, you should be able to get at a reasonable figure resting paddocks. There is one paddock at Wentworth which Hill, Clark, & Co. have—a cattle paddock—but that is only big enough for one large stock and station agent. One of the great advantages of whatever place was selected should be that in the vicinity there was land which could be rented at a reasonably cheap rate for resting-places for cattle and sheep.
2543. I take it from your statement that you consider the present sale-yards, as well as the suggested site at the Wentworth Estate, is far too valuable for that purpose? I do.
2544. You think it would be better to go a little further away, and secure land of a larger area at a much cheaper rate than could possibly be the case in regard to the land in question? I should say that that would be so, provided that the price of the Wentworth land is assessed at something like what I imagine it might be.
2545. Have you in your mind's eye any site that, as a business man of large experience, you would be able to suggest as a more suitable site for the successful carrying on, not only of sale-yards, but also of abattoirs? I have.
2546. May I ask you to name it to the Committee? Certainly. I have brought a little sketch to show you. I have been at this thing some months. My business as a land-seller was to try and find out the most suitable site. I may premise by saying that I do not own an acre of land at the place in question, nor have I anything to do with it, except that I am acting as agent for the land.
2547. Are you prepared to put in this sketch of the proposed site to accompany your evidence? Yes. [See Appendix C 1.]
2548. What is the area of this land at Blacktown, which you have suggested as a suitable site? About 3,250 acres.
2549. And at what price do you think, roughly stating, it would be possible for the Government to purchase this land? I think, under £12 an acre; but I cannot say exactly. There is no blood money or high rate asked for the land.
2550. You think that, taking it all round, the whole of the area you have just mentioned could be got on an average for £12 an acre? Yes, or less.
2551. Is the land low lying or elevated? The highest land between this and the Blue Mountains on the western line. Of course it is undulating.
2552. And a portion of this land would abut on to the main western line? The whole of one boundary has a frontage to the main western line—about  $1\frac{1}{2}$  or 2 miles.
2553. And your suggestion is that a short loop-line might be constructed to run right into the abattoirs? Yes, connecting Doonside and Blacktown. That would be, practically speaking,  $1\frac{1}{2}$  to 2 miles of railway—of course, only a loop connecting the two stations. [See Appendix, C. 2.]
2554. What would be your idea in having this  $1\frac{1}{2}$  of railway constructed? I take it the cattle ought to be landed the same as they are at the present Homebush yards. If they are brought by train for immediate sale, it is of no use knocking them about with various changes. If they come straight from the trucks to the sale-yards, and if when they are taken from the sale-yards they are not to be killed at once, they must be driven somewhere, and there are thousands of acres of land available near this land—just outside the boundary—and people would be glad to sell or lease it.
2555. You think that the people surrounding the proposed site would have no objection to the establishment of abattoirs there? We have their consent in writing.
2556. As a land auctioneer, and an agent of large experience, do you think it would be likely to affect the value of land at Strathfield and Homebush if the abattoirs were erected on the Wentworth Estate, as has been suggested? Yes, to a large extent, as the prejudice would still remain however properly they were conducted. The Strathfield Council has, both in its meetings and by letters, opposed the scheme, and would, I think, still oppose it.

2557. You know pretty well the district of Strathfield and Homebush—although in one municipality I name them both, because they are distinct portions of the one borough—do you think that the land there, and the buildings upon it, would be looked upon as being more valuable now than they would be after the erection of abattoirs on a site so close to them as the Wentworth Estate? I certainly think that the erection of abattoirs on the Wentworth Estate would create a great fall in the value of the better class of house property in that borough. E. C. Batt.  
22 Oct., 1896.
2558. You think it would have a tendency to cause people to look for other suburbs to reside in rather than go there, as is the case now, and that that would reduce it from being one of the most favourite of suburbs to being one to be avoided by people who could secure homesteads elsewhere? Yes; but I think that applies more particularly to the better class of houses for residences only.
2559. I meant to apply it to people in well-to-do circumstances, who would occupy a class of houses such as are at Strathfield at the present time? They would object to it, and it would lessen the value of the property.
2560. Do you think that, notwithstanding all the precautions taken in the desiccation, there would still be a certain amount of smell arising from the abattoirs on the Wentworth Estate which would necessarily prove offensive and objectionable to people living within half a mile or three-quarters of a mile of it? I do; especially when the wind blew from that particular direction, and if they could not always smell something offensive they would fancy they did.
2561. You think there is a good deal of sentimentality about it, perhaps more than actual injury arising from the smell? I think there is a great deal of sentiment attached to it.
2562. Would the use, for abattoirs and sale-yards purposes, of the land which you have suggested as a suitable site at Blacktown, in any way interfere with the catchment area of our present water supply? No; we are on the other side of the fall.
2563. So it does not come within the catchment area? Not at all. I may add that one great advantage of having the sale-yards and abattoirs on the land in question would be that an ample supply of water for them could be obtained without any trouble, it being simply a question of laying on water from the Prospect Dam.
2564. The proposed site is so close to the Prospect water supply that a large supply of fresh water could be secured at a very little cost? Yes; I think as cheaply as you could get it from a river.
2565. This land, I presume, is not a very great distance from the present Riverstone works? As the crow flies, I think it would be about 8 miles.
2566. The general run of the people in that locality would rather hail with delight the advent of abattoirs there than take exception to their establishment there? I think so, for this reason: The people there live on their land, and they would hail the carrying out of this project, as it would not only afford them a market for their fruit, but would also supply them with cheap manure. There are hundreds of acres further back, of which I have sold some as low as from £5 to £6 an acre.
2567. You think that the establishment of abattoirs there, instead of being looked upon as a nuisance, would be regarded as doing a great amount of good, especially in the providing of manure, which would be within easy reach of the farmers and settlers round about there, and would tend to enrich what is at the present time somewhat barren land? No; I cannot admit that it is barren land. It is not barren land; it is an orchard district.
2568. As a matter of fact, is it not looked upon as being unsuitable for any agricultural purpose except fruit-growing? Yes; it is used for fruit-growing. It is not rich agricultural land, but it is good strong land, and will bear favourable comparison with most of the county of Cumberland soil.
2569. The land about there is looked upon generally as being unfit for ordinary agriculture? It is fit for fruit-growing; it is not rich land.
2570. So that the presence of an establishment manufacturing manure would probably be a great boon to the people round about there in supplying them with a rich manure at probably a small price? Of course, they would save the carriage, which is a material item. They get their manure from Riverstone, and even as far as from Dubbo now.
2571. As regards the plans you have put in, I presume you propose to send copies to the clerk, so that they may be attached to our report? I will do so with pleasure.
2572. The rough plan you have shown us, as well as this sketch? Yes. My only object is that if you think this is the best site you should take it.
2573. Your object in appearing as a witness is not to give evidence from a business standpoint, but rather as a citizen, desirous of rendering service to the country in connection with the proposed establishment of new abattoirs? I took it up entirely in that light in the first instance.
2574. It is not a new matter with you;—you discussed this matter with Sir Henry Parkes some years ago? About fifteen years ago, I think. I paid for the whole survey of a site at Liberty Plains out of my own pocket.
2575. So you have really in the past been at considerable expense in the preparation of plans, and in suggesting a method for the creation of sale-yards and the erection of abattoirs? I think I have taken more pains in the matter than, perhaps, anybody else.
2576. You can scarcely call to your mind any other citizen who has taken a more lively interest in the matter which this Committee has been appointed to inquire into than yourself? Unknown to me there may have been others.
2577. Has it ever struck you that in establishing abattoirs on the site at Blacktown which you have suggested, the retail butchers of the city would have to go a long distance to purchase their supplies unless a central market were established, and the meat were brought in in refrigerating chambers in the summer? I am quite with you; that is part of my plan; that is why I want a loop line, so that the carcasses might go off the baulks directly into the cars, and be carried to a central meat market, which would give the small and the large men the same chance.
2578. Your idea is that we should have some great central meat market, to which the meat from the Government abattoirs at Blacktown should be sent, so that the retail butchers would have all the facilities of buying and selecting their meat in the freest possible manner? Where they could go and get half a side or a quarter as they do at the present time. It would be unreasonable to expect them to go out all the way to Blacktown.
2579. Has it ever struck you that a large number of ocean-borne cattle arrive here continually, and it would

E. C. Butt. would be necessary to have a killing establishment somewhere within reasonable distance of the water frontage of the harbour? One cannot know everything. I have not gone sufficiently into that question to know the proportion of cattle that are ocean-borne, but I think it is comparatively very small. I do not suppose it would be 5 per cent. of the total number. When preparing myself on this question I wrote to Mr. M'Lachlan, the Secretary for Railways, because I wished to have reliable data, and very courteously he gave me the following information:—

Sir,

Office of the Railway Commissioners, Sydney, 14 August, 1896.

Referring to your letter of the 7th instant, asking to be informed of the number of cattle and sheep carried by rail to the Flemington Sale-yards during the year 1895, I am directed to inform you that the following are the numbers of live stock received by rail at Flemington.

	From—		
	Southern Line.	Western Line.	Northern Line.
Horses .....	2,494	1,596	2,462
Cattle.....	30,892	34,817	41,499
Calves .....	355	164	74
Sheep.....	1,417,327	1,057,469	549,651
Pigs .....	287	299	194
Total.....	1,451,355	1,094,345	593,380

I have, &c.,

H. McLACHLAN,

Secretary.

E. C. Butt, Esq., 88, Pitt-street, Sydney.

2580. *Mr. O'Sullivan.*] That makes no allowance for cattle and other animals that come in by steamers? No; that is by rail only.

2581. I understand that you are opposed to the continuance of the Abattoirs at Glebe Island? I am.

2582. For what reasons—I should like you to reiterate them? I take two objections. In the first place I think that the present Abattoirs are absolutely out of date, and very much too small for the trade that is being done there. My other objection is on account of the Abattoirs being separated from the sale-yards by such a long distance. I think that one of the crying evils for the last twelve or fifteen years has been the driving of cattle through the suburbs to the Abattoirs. It is a cruelty to the cattle, and an abominable nuisance to the people who live in the various suburbs between the sale-yards and the Abattoirs. I think there is also very great danger to the health of the citizens of Sydney from the way in which cattle are killed in a heated condition.

2583. But supposing that the objection about driving the cattle through the streets could be got rid of by the construction of a line of railway to Glebe Island from a point near Petersham, and by the cattle being brought from the sale-yards along the present line to Petersham, and thence being conveyed right into the Abattoirs at Glebe Island? That would minimise the evil, but would not do away with it.

2584. We have it in evidence that abattoirs in the centre of the city need not be dangerous to public health—that by using proper appliances, and taking sufficient care, there need not be any nuisance whatever—I am speaking more particularly in regard to the injurious effects of abattoirs on the public health? I have said plainly that I think a great deal of that is sentiment. If abattoirs are properly conducted, I do not think that they should necessarily be a very offensive place. But when experts give evidence on that point they seem to forget one thing. I have noticed the omission in more than one instance. They seem to forget that if the bi-products are not utilised in the neighbourhood where the abattoirs themselves are, and if you have to remove them through the city or suburbs it may well be taken as an objection that that is not desirable.

2585. But cannot even those bi-products be treated in such a way as to render them inoffensive? I have no doubt they could be. But it should be remembered that in some cases you would destroy their value for any after use. No doubt if they were treated sufficiently with disinfectants and lime they might be so conveyed innocuously through any borough, but I do not think that they are ever treated in that way.

2586. But most of the bi-products would be saleable, and very likely be exported to coastal districts, or taken away to the other colonies? But they are not, so far as I know.

2587. Well, they could be? Of course, I am simply putting it in the way it is. I have seen them carted away. We know where they go.

2588. As a matter of fact, these bi-products are being exported from the meat works at Bourke to New Zealand and the other colonies at a profit? That is possible.

2589. If it can be done from Bourke, it could be done from Sydney? It is a question of trade. Anybody who goes to Glebe Island now can see them being removed in carts.

2590. That is with the present method of treatment? Yes.

2591. But with the latest machinery, and a proper application of it, even those troubles could be got rid of? It would never smell like roses, however much it were desiccated or otherwise treated.

2592. If these works were established, as you suggest, near Blacktown, the butchers of Sydney would find it very inconvenient in having to go such a long distance for their meat, and I suppose you would require a central depôt at the railway terminus, where the butchers could obtain their meat? I think that would be almost a necessity, and I also think that thereby you would get better meat in Sydney. You have doubtless seen the butcher's carts coming from Glebe Island. There is just one dirty rag covered with blood stuck over the cart, and you know what the Glebe Road is on a dry, dusty day—something awful.

2593. But having the abattoirs such a long distance from the city as Blacktown would lead to a good deal of private slaughtering, such as goes on at the present to some extent? I may be wrong, but I think it would have the effect of doing away with, at any rate, some of the outside establishments, and I take it that if you are going to make it a sort of national thing, part of the scheme, which the Board of Health would have a voice in, would be proper supervision for the protection of the public. For the benefit of the grower, there must be a central market somewhere near Sydney. I do not believe in the plan, advocated by some people, of having cattle-killing centres all over the country. If you multiply your centres you must multiply your inspectors. In such places as Orange, Bathurst, and Newcastle, you might have a central market, and on a small scale the same kind of thing might obtain there, but I think you would find, if that idea were carried out, that the effect would be the doing away with private slaughter-houses. You could not help shutting them up. There would be a by-law to the effect that no private slaughter-houses should be allowed to be carried on there.

2594. But Dr. Ashburton Thompson tells us that now there is a good deal of private slaughtering in boroughs? There is; but it is only carried on on sufferance. The men there keep the matter as quiet as they can; but all those places are not half looked after as they should be. E. C. Batt.  
22 Oct., 1896.
2595. Do you think that in future the meat supply of centres of population like Sydney and Newcastle will largely come from the chilling works in the country districts? There seems to be a great prejudice at the present time against chilled meat, but I think that it will be overcome in time. But if you have a metropolitan cattle market for the relief of the grower—and that is the only place where you can get any chance of competition—you must have central abattoirs at the same place, and I think that the better they are conducted, and the better the quality of the meat that comes from there, so gradually will you do away with the chilled meat trade to a great extent, because people do not like chilled meat if they can get fresh.
2596. Is it not a fact that at the present time the meat trade is largely in the hands of a limited number of men in Sydney? Undoubtedly.
2597. A very close monopoly? A pretty close monopoly.
2598. And the public have to pay rather dearly for their meat? I think they have to pay more than they ought to pay. My evidence tends that way. A large meat market, instead of creating monopoly, gives the smaller men a better chance.
2599. *Mr. Wilks.*] I understand that you consider that the present site of the abattoirs inadequate? Totally inadequate for the trade.
2600. I also understand that, in your opinion, in connection with a properly-appointed abattoirs, the area should be so large as to provide (1) for sale-yards and (2) for the carrying on of cognate trades? I do think so.
2601. I also understand from your evidence that you think that the best site is Doonside, near Blacktown? Yes; the estate between Blacktown and Doonside.
2602. You stated that Dr. Ashburton Thompson has visited that site? He has.
2603. Are you aware of his opinion about it? I have not seen his opinion.
2604. Are you aware that he has visited other sites? He told me so himself; but, he being a Government official, though I was in the train with him, I never pressed him for an opinion upon it. All he said to me was that he saw no difficulty in regard to the drainage question.
2605. The Wentworth Estate, you consider, is not large enough? I do not think it is big enough. That is one objection I have to it.
2606. In answer to Mr. O'Sullivan you said that you think the prejudice against chilled meat will be broken down in a short time? It is possibly one of those things that will outgrow itself. I may say that at Newcastle the people are continually complaining of the want of supervision and the dangers of diseased meat.
2607. There would be a large central abattoirs? Yes.
2608. You would require an acreage of about how much? The larger you make it the better, because I am looking to the future. At Blacktown you will be outside the objections you would be bound to have in most cases from the municipalities. We have no municipality there. If you leave the question unsettled for many years, you will have to go further afield. The population at Blacktown is not likely to increase very rapidly, because all the land is used for orchard and grazing purposes.
2609. Owing to the difficulty of supervision, you recognise the fact that it is not desirable to have other abattoirs erected around the city? I am one of those who believe in the fairness of not killing a man who has spent money in developing any industry, as he had a right to do under the existing law, and therefore, if I were a legislator, I would not do anything to compulsorily make a man close his works—at all events, I would give him a certain time. In the end, you would, I think, have powers under the Act to confine the slaughtering to licensed places.
2610. You favour the principle of centralisation in regard to abattoirs? I do. I may say that the land at Blacktown is bounded by roads, and there is no objection by the people to the establishment of abattoirs there. The western line would deliver stock directly into the yards. The northern line comes round by a loop to Homebush, and, of course, the southern line comes in not many miles away at Granville. No new line of railway, with the exception of the small loop I mentioned, would have to be constructed, and the position is about as central a one as could be obtained.

## THE ABATTOIRS.

## APPENDIX.

## A 2.

[To Evidence of Mr. Alfred Allen.]

Chester-street, Camperdown, Sydney, 24 August, 1896.

I HAVE had considerable experience in sanitary matters, extending over a period of thirty years in this Colony and in Europe, of which twenty years in Australia. I was associated with sewerage matters of the city of London and many large provincial towns and cities, besides large establishments—hospitals, galls, work-houses, factories, &c. I have been employed on various occasions in the city of Sydney, under the municipal authorities, filling at various times the position of surveyor for condemned buildings. Reported upon the condition of the Chinese quarters throughout the city of Sydney; making plans and reports upon the condition of all the dairies within the city boundary. I was also engaged with Mr. Richard Seymour, the then City Inspector of Nuisances, to report for a Royal Commission upon noxious trades within a radius of 10 miles from the Sydney Town Hall. This brought me directly in contact with slaughter-houses, both public and private, and other industries bearing upon and affecting the question at issue—boiling-down, salting of hides, tripe dressing and cleansing, bone-mills and other like establishments which actually derive their origin and support from the utilisation of matter derived from such an establishment as proposed. We carefully inquired into their sanitary condition, suitability of locality, buildings, drainage, ventilation, machinery—how worked, with what effect; making plans and sketches where necessary. Most of the slaughter-houses were isolated, but very primitive in construction and appliances, and, so far as I remember, extremely deficient in system of drainage, ventilation, cleanliness. These are the most essential requirements in conducting this class of business, and, if not carefully observed, would prove most detrimental to the public health, which should certainly require most careful consideration and cannot be guarded with too much caution, and efficient, and even strenuous, means and measures of supervision, and through such control enforce severe measures for the strict observance of the law. For of necessity such places must be in a constant state of damp, if even fairly drained, so that there exists a certain amount of evaporation, some of which necessarily adheres to the meat, and then, of course, the cleaner so much the safer, for germs of disease will float in the atmosphere from an unclean surface. Another matter, only second in importance to my preceding statement, is as to the handling of the meat—the less the better. Coolness, in summer, by through currents of air. Thorough system in ventilation—especially top ventilation, to take off all rising vapours and noxious gases. Use of material that will not absorb and retain for future germination offensive substances, even from the atmosphere. In order to arrive at somewhere near perfection in laying down so gigantic a scheme as public abattoirs, the proper bunching and grouping of the various blocks of buildings is of vast importance; it facilitates the general working; concentrates within a limited space a system of drainage and ventilation; eases the supervision; therefore, the most careful inquiry and thought should be brought to bear upon every point. I have not the slightest doubt, and am even convinced from actual experience, that the Government have a combination of talent in their various departments of works, equal in every way with any emergency, and could find sufficient data to produce something near perfection, or, at least, to meet the requirements; but, even with such advantages, information in reference to these and other matters should be obtained from the various other sources open for fair consideration. I mean the study of modern establishments of this class—the various scientific and mechanical adaptations to meet emergencies and general requirements, the expense of construction, general arrangement, cost and ease of working, disposal and utilisation of offal, sewerage, and other matter. Much of this information could be obtained from other cities. Plans must be in existence, and I have no doubt that every facility would be graciously afforded to assist the concentration and perfecting a plan, wherever the site may be. The defects could be seen and avoided, and the improvements adopted or modified so far as locality will allow. I maintain that, by following some such course, invaluable information would be obtained at a very nominal cost, which cannot be overrated, and I have not the slightest doubt would save thousands of pounds, preserve public health, and materially assist in producing all that could be desired. I am of opinion, which is held out by many eminent men, that there should be no waste. If proper precautions be taken, and judicious care and appliances be brought into requisition, every particle of an animal can be turned to use, and in the process of conversion all vapours, gases, smoke, smells, &c., can be destroyed. Wherever an abattoir be erected, a population must of necessity follow. Glebe Island is somewhat isolated, and must retain advantages in that respect, for, from its close proximity to Sydney, the working population scatters itself throughout Balmain, Pyrmont, Ultimo, and the city. It would be very satisfactory to have accurate statistics of epidemic disease and death in the immediate surrounding neighbourhood, and what effect the working of the abattoirs would have in their production, and a comparison with other districts.

The present slaughter-houses and necessary appurtenances are much too scattered, and certainly behind the age, having been added to from time to time—no doubt meeting the requirements for the time being, but yet scattering and deviating from system in this manner, it is impossible to conserve a proper system of drainage. Many of the additions are of wood. This would have a most disastrous effect in case of fire. The main buildings are built of local stone, and in a sad state of decay, although so recently erected as 1869. This is attributable to being built from the top cap of the quarry, geologically speaking, which is always coarse and soft—being the most recent formation, has not formed under the same pressure. The salt atmosphere, with wind, assists to disintegrate the particles of silica, rounding off all sharp edges, and in many cases eating into the face of the stone 2 or 3 inches; but now the quarries on the Island have been further worked, the stone now obtained is of a much superior quality, and could, I have not the slightest doubt, be used for many purposes, especially where not exposed, although I could not advise it for general use. Internally it would absorb much of the objectionable matter, and externally perhaps be subject to the same influences, although not to such an extent. I would, in preference, certainly advise brick as a general material, and some of the best stone where solidity is essential, and an inside lining of glazed bricks or tiles and slate where I could—in fact, very similar to those used in modern butchers' shops—or a good cement face, easily washed, soon dry, very clean, no adhesion or absorption, and looks well. All the finer external ornamentations terra-cotta. The roofs formed with iron as far as practicable, and covered with plain tiles. Flooring of cessal asphalt. This should be laid on a good concrete bed of broken stone and blue-metal. This would avoid any chances of percolation.

I found the present accommodation to consist of—first, a large tank, with a capacity of about 1,000,000 gallons. This is excavated in the solid rock, and supplies an abundance of salt-water, and could be used for another establishment of a like character. It is filled from the bay with a 6-inch service. The pumping establishment is situated near the foot of the bridge from the Pyrmont side and the Glebe side of the Island. The supply pipe runs out about 60 yards into the bay, and the pumps throw 40,000 gallons per hour. There are two pumps, and a 6-inch service throughout. The engine-shed, pump-room, and other necessary buildings are of a very temporary character. The tank itself measured about 60 yards in length by about 20 feet in width, by about 25 feet deep. It is situated upon a very elevated position, and is admirably adapted for the purpose for which it is used.

The man who works these pumps is not required to devote the whole of his time to this work, but can also attend to the pumping of hot water for scalding pigs, &c., which is delivered from the old desiccating establishment. These desiccating rooms are not in use now, and machinery lies idle. At any rate, it is quite inadequate to the work. Much of the offal was forced to be sent to sea even when in full working order. Now all is destroyed, diverting a channel of cleanliness and profit if properly applied.

The comparatively recently erected cooling block of buildings, with engine-house, is now used as slaughter-houses for sheep. This was erected at a great cost, with all modern appliances, for its intended purpose; and a very substantial building it is, and could still be used for that purpose. I speak from actual experience, having worked upon the drawings. The shaft will bear comparison with any in the Colony.

This

## B 3.

[To Evidence of John Clayton, Esq.]

## CITY OF MELBOURNE.

## BY-LAW No. 96.

A BY-LAW to make better regulations for the management of the Abattoirs of the City of Melbourne, and for the dues to be charged thereat.

By-laws Nos. 41  
and 46 repealed.

1. By virtue of section 8, of Act No. 356, of the Parliament of Victoria, intituled "An Act to amend the laws relating to Abattoirs and the Slaughtering of Cattle," it is enacted by the Council of the City of Melbourne, hereinafter called "the Council," that from and after the date of this By-law coming into operation, By-law No. 41, intituled "A By-law for the regulation of the public Abattoirs, and for fixing the rates of dues for slaughtering to be charged therein," and By-law numbered 46, intituled "A By-law to repeal By-law No. 43 of the Council of the City of Melbourne, and to prescribe a decreased scale of rates of dues for Slaughtering to be charged in the public Abattoirs of the City," which were made and passed by the Council, the former thereof on the 1st day of October, 1860, and the latter thereof on the 24th day of February, 1862, shall be and the same are hereby repealed. And in lieu of the provisions of the said by-laws, the public abattoirs erected and established by the Council, and situate in that portion of the parish of Doutta Galla, which is within and parcel of the City of Melbourne shall be regulated, managed, and made use of, subject to, and in accordance with the regulations following—that is to say.

*As to Superintendence.*

Superintendence.

2. The land of the Council held for Abattoir purposes and all buildings and structures thereon, and appurtenances thereto (and which land, buildings, structures, and appurtenances, are meant by and included in the word "establishment," where occurring in this by-law) shall be under the charge, care, management, and direction of an inspector, with such one or more assistants as the Council have appointed, or shall appoint for that purpose.

Inspector's duties.

3. Along with such other duties as the Council shall assign to the inspector, it shall be especially his duty to carry out and enforce the regulations of the Council for the management of the establishment as to cleanliness and otherwise. To examine all animals slaughtered at the establishment, and take action as prescribed by law with regard to any which he may find to be unfit for human food. To see that all animals awaiting slaughter be duly supplied with food and water, and that no ill-treatment or unnecessary treatment be inflicted upon any such animal. To take care that good order and propriety in conduct and speech be observed throughout the establishment. To keep the register of names of slaughtermen permitted to work at the establishment. To report weekly through the Town Clerk as to the condition of the establishment, the work done thereat and any breach of the regulations by any person employed or working there.

Assistant Inspector.

4. During absence of the Inspector, his duties shall devolve upon and be performed by the Assistant or other person in the service of the Council then in charge of the establishment, and such assistant or person shall for the time being have all the power, authority, and duty of the Inspector.

*As to Slaughtermen.*

Slaughtermen.

5. No person shall be permitted to commence or continue to work for any other person at the establishment as a slaughterman, unless his name shall be entered in the Register of Slaughtermen kept by the Inspector, and he shall have signed an undertaking to observe, comply with, and obey each and every of the rules of the establishment under pain (apart from any other penalty) of having his name expunged from the Register of Slaughtermen.

Responsible slaughtermen.

6. In every compartment of the abattoirs in which slaughtering shall be carried on, one of the slaughtermen shall be especially responsible for the observance of the regulations of the establishment in such compartment. If the master butcher or employer be working in the compartment, he shall be the responsible person, and if not, he must nominate and appoint one of the slaughtermen who is to be responsible, and must notify such appointment to the Inspector. Such appointment, however, shall not absolve any other slaughterman from the consequences of wilful disregard or breach of the regulations.

*As to Use and Management.*

Use and management.

7. The establishment shall be open and slaughtering shall be permitted therein on every day (Sunday excepted) from 5 o'clock in the morning until 10 o'clock at night, and at no other time, unless upon special occasions, and except upon such special conditions as may be prescribed in writing under the hand of the Town Clerk.

Use on payment of dues.

8. Every person who shall pay to the Inspector the dues for slaughtering as hereinafter fixed, shall be entitled to the use for a reasonable time of such portion of the establishment as shall be available and assigned to him for the purpose by the Inspector.

Repair of drainage.

9. Every person using the establishment, who shall do any breakage, injury, damage, or destruction thereto, shall make good the same, and if he shall have so acted wantonly or maliciously, he shall also upon conviction thereof forfeit and pay a penalty not exceeding £10.

Cattle to be reported.

10. Every person who shall bring cattle to the establishment shall inform the Inspector of the description and number thereof, and the Inspector shall enter such information in a book to be kept by him for that purpose, and shall direct and indicate the portion of the establishment in which such cattle shall be placed, and such person shall place such cattle in no other part of the establishment than that so directed and indicated, and shall himself be responsible for the safety and proper sustenance thereof. He must also give notice to the Inspector of his intention to commence slaughtering stock before he shall commence to slaughter same.

Animals not to be ill-treated.

11. No person shall ill-treat any animal, or resort to unnecessary cruelty in slaughtering any animal at the establishment.

Food and water for cattle.

12. Every person who shall bring cattle to the establishment, and keep the same there for more than one day, shall provide the same with sufficient food and water.

Compartments to be kept clean, &c.

13. Every person who shall have assigned to him for his special use any compartment of the establishment shall at all times, while he shall use such compartment, keep the same with the yards and appurtenances thereof clean and free from offence, whether by accumulation of blood, filth, or otherwise, and shall as, and whenever required by the Inspector, cleanse, scrape, limewash, or otherwise purify in such manner as shall be necessary, and as the Inspector shall direct the walls, doors, floors, or other portion of such compartment and the appurtenances thereof which he shall be so accustomed and entitled to use, and he shall in all respects comply with the regulations for the management of the establishment.

Pithing-pens to be cleansed.

14. In every compartment of the establishment, upon one or more head of large cattle, which shall have been enclosed in the pithing-pen being killed, and before any other beast is driven into such pen, the responsible slaughterman must sweep or cause to be swept cleanly all the blood from such cattle into the blood-pit constructed to receive the same, and must put or cause to be put any refuse which shall have resulted from such slaughtering into the separate bin or receptacle provided for it.

Sheep, &c., to be killed on frames.

15. In any such compartment no small cattle, that is to say, no sheep, lamb, pig, or goat, shall be slaughtered, except with a knife, and upon the frame provided for that purpose, and with a trough beneath such frame for reception of the blood of the animals slaughtered. And when such trough shall have become full, but not to overflowing, the responsible slaughterman shall call upon the labourer employed under the Inspector to empty and replace the said trough.

Compartments to be cleansed after use.

16. After completion of slaughtering, and before leaving the compartment, the responsible slaughterman shall carefully cleanse or cause to be cleansed the portion of the establishment which he shall have been at work in, and shall leave the same in a state of cleanliness and order to the satisfaction of the Inspector.

Offal must be hung up.

17. No offal which can be hung up shall be allowed to remain upon the floor of any pithing-pen or hanging-room; but all such offal, when produced, must be hung up upon the hooks provided for that purpose in the hanging-room or other portion of the compartment.

Refuse not to be removed by users of the establishment.

18. No refuse or offal, other than such as shall be capable of being without sanitary objection used as or converted into human food, shall be removed from the premises by any slaughterman or person permitted to use any portion of the premises.

Dogs excluded. Trespassers not to intrude.

19. No dog shall be brought upon or allowed to remain upon the premises.

20. No person unless registered as a slaughterman or having lawful business to transact at the establishment, shall intrude into it or remain therein.

21. Any person who in any portion of the establishment shall be drunk, or shall be guilty of profane swearing, or of foul or abusive language, or of obscenity or indecency, or who shall conduct himself riotously, or create disturbance, or who shall obstruct in the execution of his duty the inspector, his assistant, or other officer, or person appointed by the Council to conduct or aid in the good management of the establishment, or who shall neglect or refuse to comply with any lawful request of any such inspector, assistant, officer, or person made in accordance with the provisions of this by-law, or of such regulations as shall for the time being be lawfully in force at the establishment, or shall deposit any blood, offal, filth, or refuse-matter upon any portion of the establishment, or on any land or road abutting thereon, save in the pits, bins, or receptacles provided and appointed for reception of the same, shall, for every such offence, upon conviction thereof, forfeit and pay any sum not exceeding £10. Penalty for misconduct

22. The slaughtering dues which shall be demanded, received, and taken at the establishment by the inspector or other officer or person appointed for that purpose by the Council shall be as follows—that is to say:— Dues for slaughtering.

	s.	d.
For every ox, cow, bull, heifer, steer, or calf .....	1	0
For every sheep or lamb or goat .....	0	1
For every head of swine .....	1	0

23. For every offence against any of the provisions hereof for which no fixed penalty is hereinbefore prescribed, the offender shall, upon conviction thereof before any one or more Justices of the Peace for the said city, forfeit and pay a penalty not exceeding £10. Penalties.

Made and passed by the Council of the City of Melbourne, on the 9th day of May, 1889,—

(L.S.) B. BENJAMIN,  
Mayor.  
E. G. FITZ GIBBON,  
Town Clerk.

[To Evidence of John Clayton, Esq.]

CITY OF MELBOURNE.—DESICCATING WORKS, CITY ABATTOIRS.

The Chairman, Health Committee, 12/5/90,—  
Sir,

City Surveyor's Office, Melbourne, 10 May, 1890.

I have the honor to submit certain particulars with reference to the results attendant on the introduction of the establishment erected for the purpose of treating the blood, offal, and other refuse from the slaughter-houses at the City Abattoirs. The works referred to have now been in use for a sufficient length of time to enable some reliable data to be obtained, which I have embodied in the form of a statement accompanying this report, which shows:—

The first cost of the works;  
The annual working expenses;  
Quantity of work done; and  
Revenue received by sale of manure.

With reference to the first item, I have embraced in that the entire cost—not only of the desiccating establishment itself, but also necessary alterations to the abattoirs, and the cost of blood-trucks, paving, roadway, &c.—the whole of which is within the original estimate of £12,000, and has been paid for out of current revenue.

The high price of coal, and the large quantity of water used for condensing purposes, have been together more than double the cost for labour in the item of working expenses; but, by careful supervision, a gradual reduction in the quantity of

of coal used as compared with the manure manufactured, has been effected, which, I trust, will continue. As regards water I have already reported more than once on the ultimate economy of spending money in erecting our own pumping plant for the purpose of obtaining from the Saltwater River what water is required both for condensing and for washing-down purposes at the Abattoirs. Until this is done, the charge for Yan Yean water will remain a large item in the cost of working, although I have caused that to be considerably reduced in amount to what it was during the first months of working.

The labour-sheet has been carefully supervised, and is now kept as low as possible.

Notwithstanding the cost of working the machines (from above-named causes), it is gratifying to find that during the period of the first contract for the sale of the blood fertiliser, the receipts therefrom have actually exceeded the cost of working.

A new contract entered into on the 1st of April, 1890, and extending until the 31st March, 1891, at an advance on the former contract price of 2s. 6d. per ton, gives promise of a more substantial surplus for the coming year, especially as the business is growing to such an extent that your Committee has enabled me to prepare for the enlargement of the building and the erection of a third desiccator, which I hope to complete during the present year.

As regards the practical working of the desiccating establishment, it may be said that any impartial visitor to the works must admit the absolutely unobjectionable and inoffensive way in which the process is carried on, and the great change which its presence has effected at the Abattoirs, not only in dealing effectively with what before had been termed the offence of the place, but also in pointing the way to its being retained in its present site, which is so admirably placed, and on which there is no reason why new buildings should not be erected so designed as to render the place a model Abattoir.

In this connection I cannot refrain from reminding your Committee that plans and specifications for a portion of this much-needed work have been approved by Council, and the money voted for that purpose some ten months since. Although the work did not proceed then—the Council staying its hand out of courtesy to the Government, it is imperatively necessary that the present slaughtering accommodation be increased, more especially if the sheep-slaughtering on the bank of the Saltwater River is to be abolished, as is the expressed determination of your Committee, which, of itself, would constitute a very great and much-needed improvement. It is, indeed, desirable that the low-lying portion of the Abattoir land be raised and drained, and that new buildings on approved principles be erected in the place of the present slaughter-houses, as proposed by your Committee some time since.

At present, with every good wish to effect these changes, so as to render this otherwise admirable site an unobjectionable establishment, your Committee has been prevented from effecting these improvements, and is at the same time blamed for the present condition of the Abattoirs by the very men who are instrumental in influencing the Ministry to object to further expenditure on this site. The fact that these improvements have not been carried out has been even noted in the final report of the late Royal Sanitary Commission in such a manner as to lead those uninformed as to the facts of the matter to imagine that the city authorities were blameable in the matter.

I attach the particulars as to the desiccating plant already alluded to.

CITY OF MELBOURNE ABATTOIRS.—DESICCATING WORKS.

(1.) Capital cost, working expenses, &c.

Total expenditure on works (including sundry alterations at Abattoirs, blood-trucks, roadways, paving, &c.) :—

	£	s.	d.
Buildings.....	3,717	5	8
Machinery and connections .....	6,953	8	4
Labour in erecting, supervision, &c.....	1,100	9	7
	11,771	3	7

During March, April, and May, 1889, the machinery was at work producing blood fertiliser, which was gratuitously distributed amongst farmers and others interested, in order to make the product known; and also to enable experiments to be made as to its value. The results of some of these tests is given in the printed lists of testimonials which are supplied to parties tendering for the manure.

The working expenses during these three months amounted to £1,076 5s. 4d., or at the rate of £35s 15s. 1d. per month. For this there was no return, as explained above.

A contract was entered into, however, commencing on the 1st June, 1889, and termination on the 31st March, 1890, by which the "blood fertiliser" was sold, ready bagged, at £5 15s. per ton. During this period of ten months the total cost of working expenses amounted to £4,307 0s. 9d., whilst the proceeds from the sale of the manure realised £4,339 6s. 2d., thus showing that the establishment is capable of paying the cost of its working. The following table will show the detailed statement of expenditure and receipts for each month during the term of this contract, as also the quantity of blood fertiliser produced, and the proportion of coal used in manufacturing that quantity :—

Expenditure for ten months.

*Average Monthly Work.*

Blood and offal treated .....	252½ tons.
Manure disposed of.....	75 tons 9 cwt. 2 qrs.
Quantity of coal per ton of manure manufactured .....	1·815 tons
Monthly receipts by sale of manure.....	£433 18s. 7d.
Monthly working expenses .....	£430 14s.

It will be seen from the foregoing figures that the manure sold amounts to about 30 per cent. of quantity of offal and blood put through the machines. The present working expenses I am striving to keep below £400 per month, whilst I trust the receipts (under the new contract) will be, at least, £450. The machines are in first-class order, and have worked satisfactorily from the start, notwithstanding the extremely bad foundation on which they have been built, and which has increased the original cost of the works.

I have, &c.,  
A. C. MOUNTAIN,  
City Surveyor.

## B8.

[To Evidence of John Clayton, Esq.]

CITY OF MELBOURNE.

DESICCATING WORKS, 1895.

The Chairman, Health Committee,—  
Sir,

City Surveyor's Office, Melbourne, 3 February, 1896.

I have the honor to report that during the past twelve months (ending 31st December, 1895) the machinery at above establishment has been kept in first-class order; also that—*notwithstanding* the reduction on the output as compared with some preceding years—the cost of production has been kept very low, and the receipts more than cover the working expenses. There is reason to believe that an increase of business will take place at the abattoirs during the year 1896, now that supervision has been decided on for the neighbouring slaughter-houses, in which case I trust to be able to present a still more favourable statement at the close of the present year.

During 1895 3,035 tons 12 cwt. of blood and offal were passed through the desiccators, producing 758 tons 18 cwt. of blood manure, at a cost—for working expenses—of £1,896 6s.

The receipts from sale of manure, &c., amount to £2,123 5s. 10d., showing a surplus of £226 19s. 10d.; but, in addition to this, quite 215 tons of manure were lying in stock at the close of the year. This will find ready sale directly the dry season ends, and the much-needed rain permits farming operations to be resumed. For the Committee's information, and as an illustration of the falling off of business at the abattoirs during the last two years, I may state that, whilst in 1892 no less than 1,127 tons of blood manure was produced, in 1894 this was reduced to 742 tons.

The relative figures for last year as compared with 1894 are as under:—

	For the Year—	
	1894.	1895.
Quantity of manure produced .....	tons. cwt. qr. 742 8 0	tons. cwt. qr. 758 18 0
Cost of manufacture .....	£2,069 0s. 0d.	£1,896 6s. 0d.
Cost of producing 1 ton .....	£2 16s. 0d.	£2 10s.
Fuel consumed per ton of manure .....	1·64 ton.	1·55 ton.
Receipts from sales .....	£2,524 1s. 10d.	£2,123 5s. 10d.
Receipts in excess of expenditure .....	£455 1s. 10d.	£226 19s. 10d.

It will be seen from the above figures that whilst the working expenses have been kept down, the resultant profit is not so large as it was in 1894. This, of course, is due to the smaller demand for the blood manure during 1895, in consequence of the long drought; and is explained by the fact that, whilst we had only about 80 tons of blood manure in stock at the end of 1894, we had no less than 215 tons (as previously stated) as at 31st December, 1895. This represents an additional value of about £330, which should properly be added to the £226 19s. 10d. already received in cash in excess of the working expenses.

I have, &c.,  
A. C. MOUNTAIN,  
City Surveyor.

## B9.

[To Evidence of J. H. Clayton, Esq.]

PIG SLAUGHTER-HOUSE.—CITY ABATTOIRS.

The design of this building is to facilitate the killing, dressing, and handling of pigs in a cleanly and expeditious manner. The pigs are received (either from the carts, for which a special landing and "ramp" is provided, or from the back stock road leading from the sale-yards) into a lane, and thence driven into lairs, of which there are four large and seven small. These lairs, or pens, are snugly covered over portion of their area with a shed, and the back of same is sheltered from the weather by corrugated iron lining to the fencing. They are paved with brick set in cement grout, fitted with water and feed troughs, properly drained, and will accommodate from 500 to 600 pigs comfortably.

As the pigs are wanted for killing they are driven from their pens up an inclined plane into the crush-pen, thence they go to the killing-place, which is raised some 3 ft. 9 in. above the floor-level of the dressing-room to enable the blood to be collected by means of receiving trucks, whence it goes to the desiccators.

The killing-place is floored with slate sloping to a central grating (which is connected with a drain-pipe leading to trucks), and the walls are of asphaltum. The pigs may either be slaughtered here in the usual local manner, or they may be killed in the Chicago method, should that be preferred, as tackle has been provided for hoisting and hanging the animal when alive.

From the "place of execution" the carcass is allowed to slide into the scalding tub (where it is freed of bristles), thence into the cold-water tub, after which it is lifted on to the "runner," disembowelled, dressed, and carried along on the running bar to the hanging-room. Slate slabs are provided in the dressing-room for the "small goods." The scalding water is obtained from a vertical boiler housed in an outer shed, the steam from which heats the water in the tubs.

Such is the general arrangement for the killing and dressing of the pigs; there are four sets of killing-places, crush-pens, tubs, hanging-rails, &c., in the building, so that four butchers can be carrying on their work independently of one another at the same time. At each tub, however, four men can work, so that the facilities of the present building will permit of 500 pigs being passed through per day. The floor of the dressing-room is paved of brick set in cement, and white enamelled tiles line the brick walls for a height of 4 ft. 6 in.

The hanging-room in which the carcasses remain to cool until removal from the building is a brick apartment 60 x 30, built with hollow walls, paved with asphaltum, lined (as the dressing-room) with enamelled tiles, and covered with a concrete ceiling. The windows are double, and the doors (which are iron, and slide on rails) are packed with charcoal. Ventilation above the ceiling is provided by large louvres at each gable end of the building. A network of hanging-bars depends (by means of light iron rods) from the ceiling; these are all ingeniously connected by means of switches with the main runners from the dressing-room. About 500 pigs can be accommodated in this hanging-room. Whilst it has been kept as dark as possible, and will be isolated so far as may be from the external air, the necessary ventilation of the room has not been omitted, as six 12-inch torpedo cows have been provided through ceiling and roof.

Two lavatories for the use of the workmen form part of the design of the building, the plans of which were prepared by the City Surveyor, and the work carried out under his supervision at a cost of about £3,000.

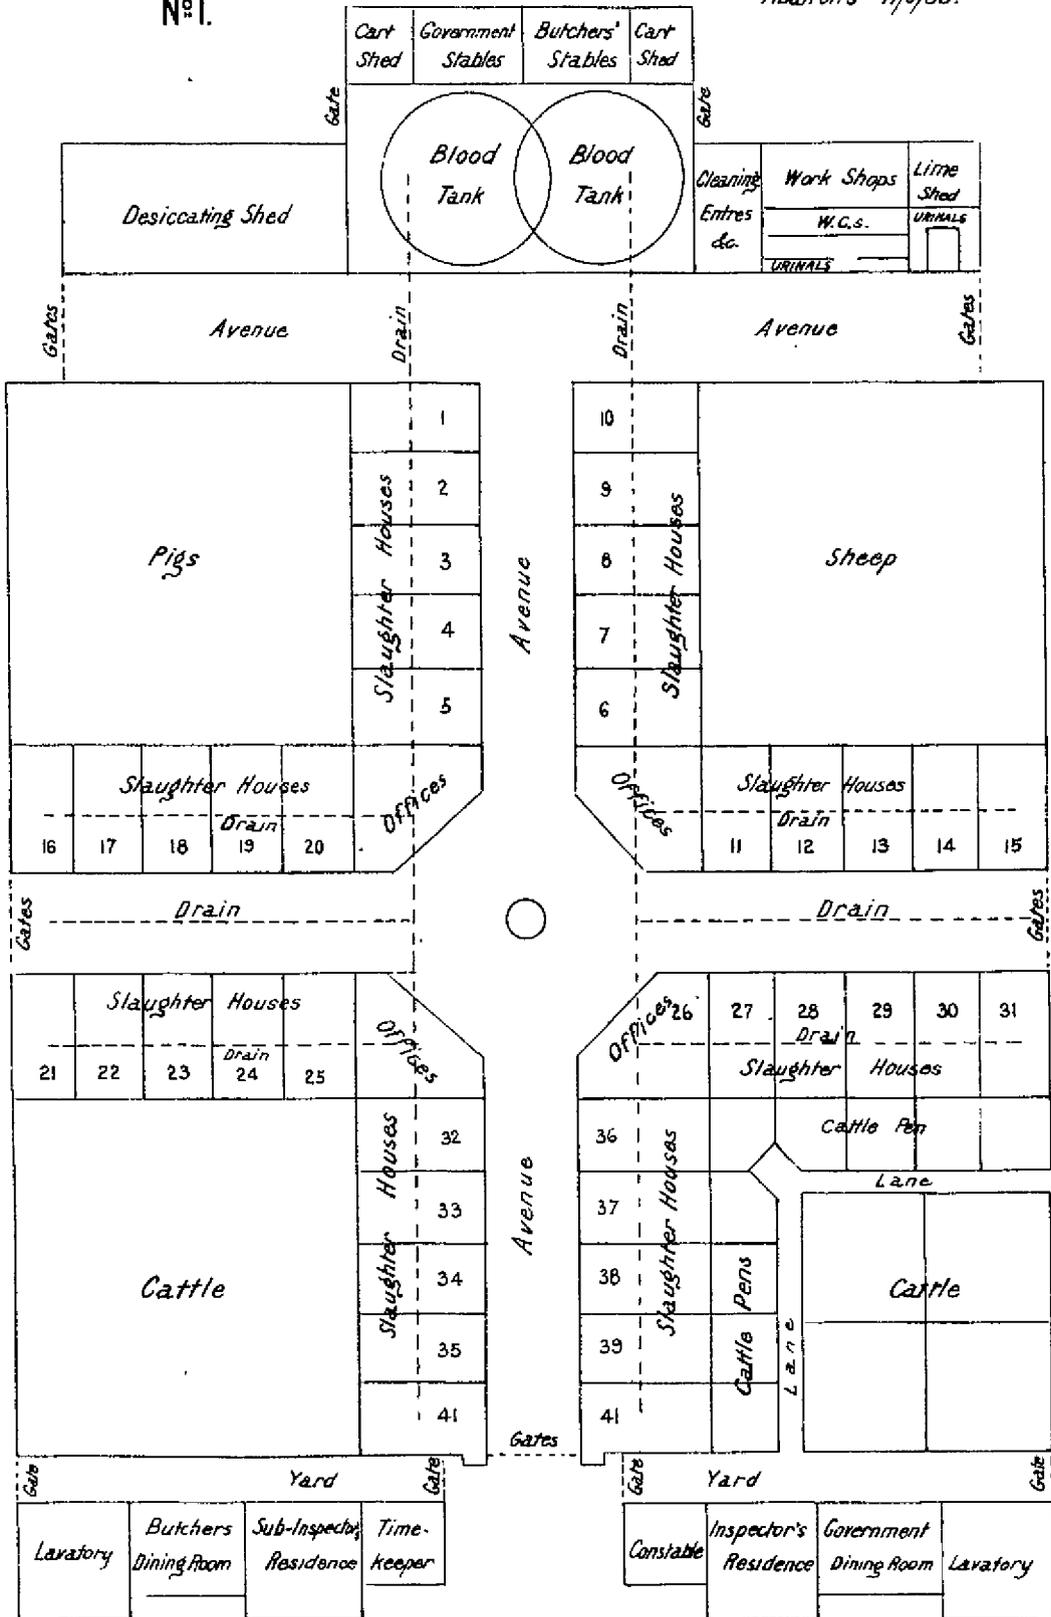

[4 Plans.]

NEW SOUTH WALES.

NOXIOUS TRADES AND CATTLE SLAUGHTERING ACT, 1894.  
(REPORT ON THE WORKING OF PART I OF THE, FOR THE YEAR ENDED JUNE 30TH, 1895.)

*Printed under No. 1 Report from Printing Committee, 21 May, 1896.*

The President of the Board of Health to The Under Secretary for Finance and Trade.

Sir,

Sydney, 29 February, 1896.

I have the honour to report that, in anticipation of the Act coming into force, the Chief Medical Inspector of the Board of Health made an inspection of all the premises used in connection with the carrying on of trades in the county of Cumberland which could be found, and which might be considered either to be at the time or thereafter to become noxious—that is, offensive or injurious in some way or other, either to the workmen engaged in the trade or to the inhabitants of the neighbourhood of the place in which the trade was carried on. This preliminary inspection was not always an easy matter to accomplish, because there was at that time an impression that the Board would prove somewhat exacting in its administration, and the traders themselves were, in some cases, not altogether desirous that any change whatever should take place, fearing that it would result in a considerable outlay of money in putting their premises in a condition satisfactory to the Board, and in procuring the necessary apparatus and appliances to carry on their calling in accordance with modern methods. For the most part, the trades with which this Act has to deal are those concerned in the working up of animal substances, from which the most offensive effluvia are given off.

As is well known, the question of dealing with these noxious trades has been a prominent one in this Colony for very many years, and a plan which was generally advocated was the setting apart of some particular area of land in an out-of-the-way place, to which all these trades might be relegated, in the belief that, being so far away, they might carry out their operations without offence to any considerable population. Against this, however, many considerations were urged. For instance:—The cost of transmission of materials; the great likelihood of decomposition of animal matters, especially in summer-time and during transmission; the fact that where many factories were, settlement of population would occur; although such factories might be isolated at present, they would be the centre of a populous neighbourhood in the near future. This mode of dealing with these trades might be called that of isolation. Acting upon these considerations, and from my experience in other countries, I strongly urged the abandonment of this scheme in favour of the system of regulation, the trades being controlled so that the various processes are carried on in such manner as to prevent the escape of offensive effluvia into the atmosphere, the possibility of which is proved by the fact that these trades are, and for many years have been, carried on in the midst of populous places in many parts of the densely-populated districts of Europe without creating any nuisance. The Bill to enact this system took effect on the 1st July, 1894. It provided that it should at first apply only to the county of Cumberland, and it has not been extended to any other district of the Colony, which the Act provides may be done when necessity arises.

As the result of the preliminary inspection before referred to, the trades of fat-melter, fat-extractor, bone-boiler, bone-grinder, blood-boiler, blood-dryer, glucemaker, fellmonger, tanner, leather-dresser, and wool-scourer have been found to be the chief causes of nuisance, and those which most urgently required regulation. Since that time likewise the trade of poultry-farmer would appear to be oftentimes the source of much annoyance to neighbours. The first-mentioned trades were gazetted as noxious trades within the meaning of the Act on the 2nd August, 1894, and, at the same time, by-laws for their regulation, which had been prepared by the Board of Health, based upon the models of by-laws in force for similar objects in England, were gazetted. Proclamations, dated 26th September and 30th October, withdrew the trades of fellmonger, leather-dresser, wool-scourer, and tanner from the list of noxious trades, but subsequent experience has abundantly proved that there is an urgent necessity for at least the trade of wool-scouring being again proclaimed as a noxious trade, because of the very numerous reports which have reached the Board, showing that the rivers, particularly in some districts, have been, and are still being, grossly polluted by the operations of wool-scours.

The number of traders actually carrying on during the year was thirty-five, but two of these ceased, so that at the end of the year there were thirty-three actually at work. These were distributed in the following districts, viz. :—

1 Randwick (Municipal).	1 Auburn (Municipal).
2 Botany (Municipal).	1 Liverpool (Police).
5 North Botany (Municipal).	1 Liverpool (Municipal).
8 Alexandria (Municipal).	1 Windsor (Police).
1 Marrickville (Municipal).	1 Ryde (Police).
1 Enfield (Municipal).	1 Ryde (Municipal).
1 Strathfield (Municipal).	1 Rockdale (Municipal).
1 Granville (Municipal).	1 Willoughby (Municipal).
1 Rookwood (Municipal).	2 Parramatta (Police).
	2 Lane Cove (Municipal).

At the inception of the operations of the Act the Board were anxious to give every possible latitude to the traders who had been allowed for so many years to go on with their work pretty much as they liked, and who had come to think, in many cases, at all events, that their trade was necessarily a dirty one, and, therefore, might, without blame to themselves, be carried on in a dirty place and in a dirty manner. This, however, is not the case, and the Board tried, and it believes successfully, to induce the traders to take another view of things, and to see that to carry on their trades in a decent, orderly, cleanly manner would not only diminish the offence to their neighbours, but would actually be a source of profit to themselves. The Board is, therefore, pleased to report that in very many cases the traders showed a most commendable willingness to comply with the Board's regulations. Some of these, indeed, said that they would have done so of their own motion long ago, only, of course, it meant an expenditure of money, and so long as other traders were not required to and did not incur this additional expenditure, they would have been placed at a disadvantage in trade competition.

Five traders who occupied exceedingly filthy premises, where they followed the offensive method of rendering putrid butchers' wastes in open pots, were stopped altogether. One of these was compelled to erect proper apparatus on his old site. The other four elected to remove to more suitable sites and to new and well-arranged premises.

Seven traders who had been carrying on their trades in dilapidated old premises removed to well-built premises on the southern outfall line of sewer, with which their premises are now connected; and five traders also, who were either already there, or began business there during the year, were connected with the sewer.

Every one of the thirty-three premises has been altered and improved. For instance, all floors are now constructed of concrete or other impervious material, and are graded to gutters, so that it is possible now to keep the floors clean.

While giving such assistance as it reasonably can in advising the traders as to the best methods in which the Board's requirements may be met, the Board has been careful not to commit itself to particular methods or processes by which a given result may be attained, because a method which is suitable for one trader might not be so good for another, and because an apparatus which works well in the hands of one trader might not work so well in the hands of another. I am now referring chiefly to the means for disposing of offensive vapours and gases. Seven traders have adopted chambers in which the offensive fumes are destroyed, so that they no longer escape to the air. Other traders pass their vapours into tanks containing various chemical substances in solution, while others again use other means. The one point upon which the Board insists is that these vapours shall not escape into the atmosphere.

There has been no unusual difficulty in initiating the operations of the local authorities, which have usually effectually supervised the premises in their districts. It is only fair to say that in the Borough of Alexandria, which has by far the largest number of such traders, the local authority, through its Inspector of Nuisances, has performed its duties with unusual intelligence and energy.

In only one case has there been obstinate refusal to comply with the regulations, and only after every effort has been used, without success, to persuade the trader to comply with the regulations and place his premises in decent order and condition, has it been decided to institute legal proceedings to compel him to do so.\*

\*The result was the conviction of the trader.

I have, &c.,

A. STUART, M.D.,

President of the Board of Health.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

METROPOLITAN BOARD OF WATER SUPPLY AND  
SEWERAGE.

(REPORT OF, FROM 1ST JANUARY, 1895, TO 30TH JUNE, 1896.)

*Printed under No. 21 Report from Printing Committee, 8 October, 1896.*

To the Honorable the Secretary for Public Works,—

Sir,

4 September, 1896.

The Board of Water Supply and Sewerage have the honor to submit to you their Eighth Report, embracing the period from 1st January, 1895, to 30th June, 1896.

Hitherto it has been customary to furnish these Reports annually, from 1st January to 31st December, but no Report was submitted for the year 1895, as it was deemed advisable to alter the year of the Board to correspond with the financial year of the Government, and instead of presenting two Reports this one has been extended so as to cover the eighteen months.

WATER.

2. The average daily consumption of water per head of estimated population supplied was 40·76 gallons, as against 34·23 gallons during the year 1894. The average daily supply was 16,645,014 gallons, and the estimated population supplied 408,282.

3. During the eighteen months 1,433 houses were connected to the Water Supply, making a total at present supplied of 85,059 houses.

4. The work of laying reticulation mains has been pushed on with expedition, the demand for extensions having increased to an enormous extent in consequence of the abnormal heat and dryness of last summer. Over 99 miles of new mains were laid and 1,853 hydrants fixed; of these latter, 157 were screw-down and 1,696 of the ball pattern. The total length of water-mains, exclusive of trunk mains, now under the control of the Board in the city and suburbs and country districts is 891·26 miles, with 1,608 screw-down hydrants and 16,904 ball hydrants.

5. During last summer advantage was taken of the lowness of water in the rivers forming the source of the supply to clear out the Nepean tunnel, and execute certain other very necessary improvements there, which have had the effect of preventing

preventing silting-up in the tunnel, and considerably increasing the volume of water capable of being drawn through the same. The utility of this work was manifested when it was required to quickly fill the storage reservoir, the level of which had fallen some 8 or 9 feet during the progress of repairs to the canal above the reservoir. The Engineer reports that he was able to augment the supply from the Cataract River, which was 40,000,000 gallons per day, by a further quantity of 70,000,000 gallons per day from the Nepean River.

Improvements have also been made at the entrance of the Cataract tunnel.

The work of relining and strengthening the banks of the canal on No. 8 section, near Kenny Hill, a portion of which was done during 1894, has been continued with very satisfactory results, a further length of 2,725 feet having been so treated, making a total length completed of 3,358 feet.

On 26th February, 1896, a slip took place in the canal bank at  $38\frac{1}{4}$  miles, while a very large quantity of water, viz., 117,000,000 gallons per day, was being sent down to the reservoir; the supply was shut off, repairs promptly effected, and water turned on again on the following day.

In the Board's Report for 1894 reference was made to the fact that, in order to release the water impounded in the Prospect Reservoir embankment and prevent any possible movement of the upper surface, several tunnels had been driven in along the base and filled with rubble, so as to form permanent drains. These have proved so eminently satisfactory that it was deemed advisable to continue the work; four more headings have therefore been driven, making eleven in all. Since the completion of this work no movement of the outer slope is perceptible.

The planting of ornamental trees has been continued at Prospect, the old Veteran Hall has been renovated and otherwise improved, and three workmen's cottages erected, so that the men may be always within call in the event of any contingency arising.

In May, 1895, the control and management of the Trout Ponds constructed by the Board, near the point of discharge of the canal into the Prospect Reservoir, for the propagation of fry intended to be liberated in the reservoir, were offered to and gladly accepted by the Department of Fisheries, together with a piece of land, in area about 6 acres, near the Outlet Tower, as a site for the construction of a fish-hatchery. Buildings and other accessories have been erected by the latter Department, and hatching operations are now in full swing. The wisdom of this step has been amply proved by the success which has been since achieved.

The fence on both sides of the canal between Prospect and the Pipe Head Basin has been made dog-proof by the addition of wire netting to the existing post and rail fence.

The work, commenced in 1894, of strengthening the slopes of the bank of the Potts' Hill Reservoir at the back of the pitching with dry rubble wall was continued by contract and completed in October, 1895, the whole of the eastern slope of the reservoir having been so dealt with.

6. Only one fracture of a trunk main is reported. This took place on the Liverpool Road, at Enfield, and was promptly repaired without any inconvenience to consumers.

7. The heavy draught on the mains during last summer demonstrated the existence of certain weak spots, and these were taken in hand and improvements ordered to be carried out. The districts particularly referred to are Pymont, Waverley, Randwick, Woollahra, Balmain, Strathfield, North Sydney, and the Illawarra suburbs. Most of the work is well advanced, and will be available before next summer, and no time will be lost in completing the remainder.

8. The Engineer in his report points out the necessity for a trunk main being laid the whole distance from Prospect to Potts' Hill reservoir. This conviction has been forced upon him as a result of the difficulties he had to contend against during last summer, when it was found that to keep up a sufficient head in the screening-tank at Potts' Hill to give the quantity required at Crown-street reduced the head between Potts' Hill and Prospect, and thus prevented the canal between these places being availed of to its fullest capacity. The cost of this work is estimated at over £100,000, and the Board have already asked that provision may be made for this sum to be voted on the next Loan Estimates.

9. Since last Report the village of Smithfield has been included within the sphere of the Board's operations. A circular concrete tank, of a capacity of 100,000 gallons, has been constructed alongside the canal about 3 miles below Prospect; thence a 4-inch supply main is laid to the township, which is reticulated with about  $3\frac{1}{2}$  miles of mains, supplying a population of 300.

10. The supply to the new districts along the railway line from Chatswood to Hornsby has also been completed, and has proved a great boon to the residents; while intending residents are daily importuning the Board to execute fresh extensions to localities lately subdivided, in order that they may lose no time in starting building operations. The reservoir for supplying these districts is situated at Wahroonga, alongside the Lane Cove Road, at a height of over 700 feet above sea-level, and consists of tanks of a capacity of 40,000 gallons, which were formerly used in connection with the North Shore supply. The water is pumped to these tanks from Chatswood through a 10-inch steel main, the distance between the two points being  $7\frac{1}{2}$  miles, and the head which the pumps have to work against is 390 feet. The engines used are those formerly employed for raising water from Woollahra reservoir to Waverley reservoir, but a new pump has been fitted suitable for the extra duty required. The 10-inch main already alluded to (which also acts as a distributing main) has been extended from the tanks to Hornsby township. From this trunk main about 9 miles of reticulation mains have been laid in various thoroughfares.

It is intended to still further improve this supply by providing duplicate pumping-plant, and erecting additional storage tanks at different levels, as the districts develop.

11. In October last the Board were appealed to by the Borough Council of Parramatta to supply the residents with water, as the supply in the local reservoir was nearly exhausted, and what remained was unfit for use. The necessary assistance was at once afforded by permitting two connections to be made—one at Harris-street, and the other at the Sydney Road—between the Parramatta Council's mains and those of the Board. The Board continued to supply the town until the beginning of July, when the connections were shut off, the local reservoir having been replenished by copious rains.

12. The system of hiring out meters to consumers at a low rental finds increased favour daily. Since last Report a contract for a three-years supply of meters was let to Messrs. Davis, Shepherd, & Co., of Melbourne, but one of the conditions of the contract was that the meters were to be manufactured within this Colony. The contractors, therefore, lost no time in beginning operations here, the result being that they were able to commence delivery before the stipulated time. The work turned out by this firm has been executed in a prompt and highly satisfactory manner.

The number of new meters fixed during the eighteen months is 1,266. Of these, 1,175 are rented from the Board. 213 were removed, the net increase for the period being 1,053.

The total number of meters now fixed to the Board's mains is 6,134, of which 1,575 are rented from the Board.

13. Every day, and more especially during the hot weather, when the storage capacity of the high-level reservoirs is taxed to its utmost extent, the necessity for the Centennial Park reservoir becomes more and more apparent. The Board note with satisfaction the work which has already been carried out in connection with the contract for excavation, but regret the delay which is now taking place in calling for tenders for the second contract, which it is understood is unavoidable on account of the necessity for certain tests being carried out; but the Board desire to respectfully impress upon the Minister the importance of the work, with the hope that the utmost expedition may be exercised in carrying it to a speedy and successful conclusion.

14. The question of the free supply of water to public hospitals, charitable institutions, &c., has for some time past been engaging the serious attention of the Board, as it was found that the consumption of water for these purposes was annually increasing to a very large extent. During the year 1894 the quantity supplied free was 40,000,000 gallons, representing a value of £2,000, but in 1895 the consumption increased to 47,000,000 gallons, valued at £2,350. The figures for 1895 represented an average consumption by persons supplied of 44·36 gallons per head per day, and as the average consumption throughout the whole of the city and suburbs for all purposes was only 34 gallons per head per day, it was apparent that considerable waste was taking place, and the Board foresaw that, unless some restriction was placed upon the consumption by the institutions concerned, the misuse of water was likely to increase and become a serious question, and one that would very materially affect the Board's revenue, as most of the water supplied was from the high-level reservoirs, and was, therefore, costly on account of the pumping required to raise it.

After mature consideration the Board decided to limit the free supply to 50 gallons per head per day for persons resident in hospitals and 30 gallons per head per day for persons resident in charitable institutions; all water consumed in excess of this quantity to be charged for by meter at the usual rate. The allowance fixed upon is considered an abundant supply for all purposes. In Melbourne the free supply to public hospitals is only 30 gallons per head per day.

It might be mentioned in passing that the Board solicitor has advised that section 63 of the Principal Act is so framed that its legal construction is, that only hospitals and charitable institutions which are supported out of municipal rates are entitled to be supplied free, on such terms and in such quantities as may be agreed upon between the Board and the Council of the city or borough in which the water is to be supplied. As no hospitals or charitable institutions in this Colony are supported

supported out of municipal rates, the provisions of the section are nugatory. In the Bill now before the Legislature provision has been made to overcome this difficulty and to supply free, on the 50 and 30 gallons per head basis.

While recognising the value of the work done by the public hospitals and charitable institutions, the Board fail to see why the ratepayers of the city and suburbs should be taxed so as to contribute to such an undue extent to the maintenance of institutions in which are housed persons from all parts of the Colony. It is therefore proposed to submit for your approval a recommendation for permission for the Board, from 1st July, 1896, to take credit annually in their revenue account for the value of all rates forgiven, and water supplied free, by statute.

The water supply to public parks has also been placed on a satisfactory footing, a charge at the usual rate being now made for all water consumed in excess of the quantity allowed free, which is calculated on an acreage basis.

In addition to the above, a considerable quantity of water is daily granted free for street-watering, washing wood-blocked roadways, and gutter-flushing where no sewers are available, of which no record is kept.

15. The cost of pumping 1,000 gallons 100 feet high at the Crown-street pumping-station, compared with former years, was as follows:—1890, ·75d.; 1891, ·70d.; 1892, ·48d.; 1893, ·32d.; 1894, ·35d.; 1895–6, ·347d.

At Ryde pumping-station the cost was only ·324d., and the Engineer reports that if the quality of the coal delivered at these stations had been as good in the earlier part of 1895 as it was later on the result would have been more favourable.

The quantity of water pumped was 48·09 per cent. of the whole supply, being 4,378 $\frac{3}{4}$  million gallons.

16. A further allotment of land, forming portion of the old Botany Water Reserve, on the east side of the Botany-road, has been leased for wool-scouring and fell-mongering purposes to Messrs. Johnson and Vicars, which makes the fourth establishment of this kind now located on the Board's property at Botany.

17. The work of properly defining the boundaries of the catchment area of the Nepean, Cordeaux, and Cataract Rivers, which was placed in the hands of Mr. Trevor Jones, has now been completed, and plans and descriptions prepared. These are now with the Department of Lands, with a view to an amended description of the boundaries being proclaimed, as at present it is found that large tracts of land are included in the proclaimed area which are really situated on the other slopes, while, on the other hand, land which forms portion of the watershed has been omitted.

18. In November last a complaint was made by the Borough Council of Richmond, which town is supplied direct from the Hawkesbury River, that the waters of the river were being fouled by the discharge of effluent from a wool-scouring establishment at Emu Plains, some 12 miles above the Richmond off-take, and the Council were naturally apprehensive as to the effect upon their water supply, seeing that the river was then very much below its usual summer level. An inspection was at once made, when it was found that there was ample cause for the Council's fears. The Board were unable to take action themselves, as this supply is not yet vested in them, and they are only managing it on behalf of the Minister, pending the passing of the Amending Bill; but representations were immediately made to the Government, and action taken, which resulted in an abatement of the nuisance and removal of any possible danger.

19. Complaints were made during last summer by the residents of Camden and farmers and other settlers along the banks of the Nepean River that the water had ceased to flow, and that in the waterholes was becoming brackish and unfit for consumption, which misfortune they attributed, to some extent, to the fact that the river and its tributaries were tapped higher up, and water drawn off for the supply of the Metropolitan districts, thus depriving them of their riparian rights. As there was undoubtedly considerable force in these contentions, the Board decided that on certain days in each week, while the drought lasted, the scour-valve at the Cataract Dam was to be opened, and the whole of the water allowed to pass down the river, instead of being diverted into the tunnel; this practice was continued for many weeks, and had the desired effect.

20. A monthly analysis of water by Mr. William M. Hamlet, Government Analyst, is attached, which shows that "it maintains the ordinary good character of the Sydney Water Supply, namely, that of a good water suitable for all drinking purposes."

#### SEWERAGE.

21. During the eighteen months 22.63 miles of sewers were laid by the Board, and 5.62 miles by the Government, and transferred to the Board, making a total of 28.25 miles of sewers now under the control of the Board. 4.60 miles of stormwater ducts, constructed by the Government, were also handed over, making a total length of 14.42 miles of stormwater drains now managed by the Board.

22. The number of houses connected to the sewers was 4,497, making a total of 44,462 houses now connected, and an estimated population served of 213,417.

23. Surveys have been completed for extending the sewerage system to the western suburbs, Annandale, eastern slopes of Waverley and Randwick, and southern portions of North Sydney; and for stormwater relief drains in the City, Paddington, and Woollahra.

24. Good progress has been made with the work of sewerage the low-lying portions of Erskineville, Alexandria, and Newtown; and the pneumatic ejectors for raising the sewage into the main outfall are being fixed, and will probably be ready for work in a few months.

25. The northern and southern main outfalls, with branches thereto, together with the whole of the reticulating sewers in the city and suburbs, have been maintained in a satisfactory condition, and are regularly flushed. Very few cases of flooding of premises in consequence of surcharging of sewers have occurred, and in these cases steps were promptly taken to prevent a recurrence.

26. The Board have been confronted with a difficulty in respect of some of the old City sewers, in consequence of the inaccuracy of the old records; the exact position of the drains was therefore unknown, and many were found to run under house property; these the Board are, in every instance, taking steps either to divert or strengthen, so as to prevent any possible damage to premises over the same by the collapse of the work.

27. Total quantity of silt removed from the sewers was 4,351 tons; of this, 2,801 tons was taken from the sewers of the old system, 1,350 tons and 200 tons respectively from the Bondi and Botany main sewers. This is an increase on former periods, and is said by the Engineer to be due to the prevailing dry weather and the extension of reticulation. The most of this silt was conveyed in the Board's punt and deposited on Government reclamation works. About 2,000 cubic yards of deposit was also taken from the various stormwater drains.

28. The following branch sewers of the old City system have been thoroughly renovated and repaired, and consequently the life of same considerably prolonged :—

Brick sewers, Elizabeth-street and Pitt-street.

The whole of these old sewers are being dealt with gradually year by year, and the cost of same provided from revenue, and as each one is completed the annual cost of maintenance is considerably lessened.

29. The total number of houses connected to the sewers by the Board under the compulsory clauses of the Act was 84, all of which are situated in the suburbs, the average cost per house being £9 10s., which is less than this work has been done for previously. The number of persons who took advantage of the Board's deferred-payment system was 136. This system is daily increasing in favour, as persons in indigent circumstances are enabled to reap the advantages of the sewerage system without suffering the disadvantage of being compelled to pay at once the full cost of the work.

30. For the protection of property-owners the Board in 1891 decided to issue certificates when sanitary plumbing and drainage jobs had been satisfactorily carried out. This has proved a great success—indeed, very few proprietors will now pay for work done unless the certificate is produced ; the number of these certificates issued during the eighteen months is 879.

31. Numerous instances, of which particulars are given in the Engineer's report, continue to come under the notice of the Board's Inspectors of serious defects in drainage work carried out prior to the inception of the Board ; but unfortunately the Board's hands are tied in cases where the owners neglect or refuse to make alterations, as, owing to an omission in the Acts, the Board have no power to recover the cost if they do the work compulsorily. However, provision to meet cases of this nature has been made in the Bill now before the Legislature.

32. The Engineer reports that very satisfactory results indeed have attended the erection of ventilating-shafts in the city and suburbs, and the work of erecting new shafts has been pushed on vigorously. Since last Report, 419 exhaust and 266 induct shafts have been fixed, as well as 8 induct and 4 exhaust water-sprays, the work extending over the city and eight boroughs or municipalities. The total length of sewers now ventilated is 182·50 miles.

#### SEWAGE FARM.

33. In the last Report it was mentioned that the Board had accepted a tender for the lease of the Farm for a period of ten years ; but this experiment proved a failure, as owing to the very unsatisfactory manner in which the Farm was being worked the Board were compelled to exercise their power of re-entry for breaches of the conditions of the lease. Possession was therefore taken in October last, since which date it has been worked by the Board, who found it necessary to expend a considerable sum of money in repairing banks and roads, and cleaning, ploughing, and harrowing the irrigation and filtration beds, which had been sorely neglected by the lessee. These beds are now working well, and the sludge is regularly and satisfactorily disposed of, and everything is being got in readiness for planting in the coming spring.

The area of the Farm has been increased by 22 acres by the construction of 11 acres of filtration tanks, and the balance has been laid out in undulating pasture-land, which it is intended to sow with English grasses. The main carrier through the Farm has also been extended to this area.

The

The average daily flow of sewage on to the Farm was 2,095,000 gallons, from a drainage area of 1,150 acres. The quantity of silt removed from the screening chambers and deposited on the Farm was 1,960 cubic yards, and the quantity of lime used for cleansing the walls, &c., of the chambers after removal of sludge was  $4\frac{1}{2}$  tons.

34. The question of forcing the sludge by compressed air through a submarine pipe on to the Farm is under consideration, and a sum of money sufficient to meet the cost has been included in the draft Loan Estimates. The completion of this work will be the means of saving a considerable sum now spent annually on the maintenance of the present bridge across Cook's River, which is an insecure and unsightly structure, as well as an obstruction to the navigation of the river.

35. The report of Mr. W. M. Hamlet, Government Analyst, on the result of an analysis of effluent water from the Farm will be found attached to the Engineer's report, from which it will be seen "that the high standard of purity hitherto reached is still maintained."

## FINANCIAL.

### WATER.

36. The following table shows the working of the Water Branch :—

Year.	Revenue.	Working Expenses.	Capital Cost.	Capital Cost, excluding item City Council's Water Fund.	Percentage of Working Expenses to Revenue.	Percentage of Working Expenses to Capital Cost.	Percentage of Revenue on Capital Cost.	Interest on Capital Cost after Paying Expenses.
	£	£	£	£				
1888	125,486	19,205*	3,004,557	2,623,837	20.40	0.97	4.78	3.81
1889	138,923	36,568	3,088,068	2,707,500	26.32	1.35	5.13	3.78
1890	145,990	34,788	3,189,080	2,808,412	23.82	1.23	5.19	3.96
1891	165,831	38,291	3,306,649	2,925,987	23.09	1.30	5.66	4.36
1892	155,886	45,078	3,394,581	3,013,919	28.91	1.49	5.17	3.68
1893	157,426	37,141	3,409,731	3,029,059	23.59	1.22	5.19	3.97
1894	161,167	39,274	3,440,614	3,059,957	24.36	1.21	5.26	4.05
1895 for six months.	85,364	19,693	4,078,979	3,698,323	23.06	1.06	4.60	3.54
1895-6	174,357	37,495	4,154,261	3,776,879	21.50	0.99	4.61	3.62

\* For nine months only.

37. Comparing the results of the year ending June, 1896, with that ending December, 1894, it will be seen that the revenue has increased to the extent of £13,190. This is principally due to the very great increase in the quantity of water consumed by meter during last summer, which was exceptionally hot and dry; the increase in the meter revenue alone was £10,510.

Although the water-rate was increased 1d. in the £ from 1st January, 1895, this did not result in any material addition to the revenue, the extra rate, allowing a discount for prompt payment, being intended merely to counter-balance the falling municipal assessments of both city and suburbs.

38. The working expenses were reduced by £1,779, which is very satisfactory, seeing that since the last Report was published nearly 100 miles of new mains have been laid, with the necessary hydrants, valves, &c., as well as additional pumping-stations and reservoirs.

39. The capital debt has been increased by the sum of £713,647, which includes the cost of the Potts' Hill Balance Reservoir, the duplicate pipe-line between Potts' Hill and Crown-street, and the North Shore Water Supply, all of which were constructed by the Government and transferred to the Board, and also the expenditure by the Board in extending the reticulation to new districts.

40. The revenue for the year 1895-6 was £174,357, and the working expenses amounted to £37,495, or 21.50 per cent. of the gross revenue, leaving a net revenue of £136,862, or a return of 3.62 per cent. upon the capital cost.

41. The towns of Campbelltown and Liverpool are supplied direct from the main canal, and are debited with the actual cost of all the local works, and charged 3d. per 1,000 gallons for the water supplied, calculated at the rate of 32 gallons per head of population per day.

42. The following are the tables worked out on this basis:—

#### CAMPBELLTOWN WATER SUPPLY.

Year.		Annual Instalment required to pay off Cost of Reticulation and Interest thereon in 100 years.	Maintenance (including proportion of Head Office expenses).	Charge for Water supplied from Canal, 32 gallons per head per day at 3d. per 1,000 gals.	Total Charges.	Revenue.

43. The following is the table for

RICHMOND WATER SUPPLY.

(Date of Transfer to Board, 26th May, 1893.)

Year.	Capital Cost.	Interest at 4 per cent.	Maintenance (including proportion of Head Office Expenses).	Total Charges.	Revenue.
	£ s. d.	£ s. d.	£ s. d.	£ s. d.	£ s. d.
1893 .....	12,340 0 0	493 12 0	314 16 1	808 8 1	399 15 3
1894 .....	12,340 0 0	493 12 0	638 7 10	1,131 19 10	438 18 6
1895 .....	12,352 2 6	247 0 10	178 6 2	425 7 0	337 3 2
(for six months)					
1895-6 .....	12,430 7 0	499 4 3	529 10 1	1,028 14 4	547 11 11

44. The Amending Bill, which contains provisions for rating premises not connected with the mains, not yet having become law, the financial result of this scheme still continues unsatisfactory.

SEWERAGE.

45. The following table shows the working of the Sewerage Branch :—

Year.	Revenue.	Working Expenses.	Capital Cost.	Capital Cost, exclusive of items paid from Revenue.	Percentage of Working Expenses to Revenue.	Percentage of Working Expenses to Capital Cost.	Percentage of Revenue on Capital Cost.	Interest on Capital Cost after paying Expenses.
	£	£	£	£				
1890 .....	81,800	22,249	1,281,045	1,177,614	27.19	1.88	6.94	5.06
1891 .....	81,302	25,411	1,447,287	1,343,856	31.25	1.89	6.05	4.16
1892 .....	87,927	27,305	1,605,948	1,503,517	31.05	1.81	5.84	4.03
1893 .....	93,661	27,092	1,691,462	1,588,031	28.92	1.70	5.89	4.19
1894 .....	93,134	28,053	1,745,120	1,641,689	30.12	1.70	5.67	3.97
1895 .....	43,110	14,250	1,831,611	1,728,180	33.05	1.64	4.98	3.34
(six months)								
1895-6 .....	85,486	30,304	1,892,256	1,788,825	35.44	1.69	4.73	3.09

46. The revenue has decreased £7,648. This is accounted for by the reduction in the municipal assessments and the discount allowance for prompt payment.

47. The working expenses have increased £2,251, due to the extra maintenance on account of the 33 miles of new sewers and stormwater drains constructed.

48. The capital debt has been increased by £147,136, being the cost of main sewers and stormwater drains constructed by the Government and transferred to the Board, and also the reticulation sewers carried out by the Board.

49. The revenue was £85,486, and the working expenses £30,304, or 35.44 per cent. on the gross revenue, leaving a net revenue of £55,182, or a return of 3.09 per cent upon the capital cost.

WATER

## WATER AND SEWERAGE.

50. The following table shows the working of the two Branches taken together :—

Year.	Revenue.	Working Expenses.	Capital Cost.	Capital Cost, exclusive of Items on which Interest has not to be paid.	Percentage of Working Expenses to Revenue.	Percentage of Working Expenses to Capital Cost.	Percentage of Revenue on Capital Cost.	Interest on Capital Cost after paying Expenses.
	£	£	£					
1890	227,790	57,037	4,470,125	3,986,026	25·03	1·43	5·71	4·28
1891	247,133	63,702	4,783,936	4,269,843	25·77	1·49	5·78	4·29
1892	243,813	72,383	5,001,529	4,517,436	29·68	1·60	5·39	3·79
1893	251,087	64,233	5,101,183	4,617,090	25·58	1·39	5·43	4·04
1894	254,301	67,327	5,185,734	4,701,646	26·47	1·43	5·40	3·97
1895	128,474	33,943	5,910,590	5,426,503	26·42	1·24	4·72	3·48
(6 months). 1895-6	259,843	67,799	6,046,517	5,565,704	26·09	1·21	4·67	3·46

51. The capital cost of the water and sewerage schemes on 30th June, 1896, amounted to £6,046,517, but this sum includes two large items on which interest has not to be paid, viz., £377,382, value of assets taken over from the City Council in 1888, which assets were paid for from rates collected from the citizens; and £103,431, paid out of Consolidated Revenue for Sewerage Works, leaving £5,565,704 as the amount upon which interest has to be paid.

52. The total revenue was £259,842, and the working expenses of both branches £67,799, representing 26·09 per cent. of the gross revenue, leaving a net revenue of £192,043, or a return of 3·46 per cent. upon the capital cost of works under the control of the Board.

53. The amount required to pay interest, calculated at rates varying from 6 per cent. to 4 per cent. on the municipal debentures taken over by the Board, and 3·789 per cent. on moneys provided out of Government Loans raised for general purposes, is £208,527 1s. 1d., to which must be added £4,497 19s. 5d. for depreciation in the value of machinery, working plant, buildings, &c., and £67,799 6s. working expenses, making the total expenses of the Board £280,824 6s. 6d., whilst the revenue was £259,843 8s. 9d.; there was, therefore, a net deficiency on the year's transactions of £20,980 17s. 9d.

	WATER.			SEWERAGE.		
	£	s.	d.	£	s.	d.
Maintenance ... ..	23,714	6	4	20,037	14	11

Total Expenses	£ 182,075	7	9	98,748	18	9
Revenue	£ 174,357	14	4	85,485	14	5
Deficiency	£ 7,717	13	5	13,263	4	4

54. There was also a debit balance of £9,983 0s. 9d. in the transactions of the half-year ending 30th June, 1895.

	WATER.			SEWERAGE.		
	£	s.	d.	£	s.	d.
Maintenance ... ..	12,506	9	10	8,626	6	2
Management ... ..	7,187	0	5	5,624	7	0
Depreciation ... ..	775	16	5	230	15	8
Interest ... ..	71,383	2	9	32,124	0	3
Total Expenses ... ..	£ 91,852	9	5	£ 46,605	9	1
Revenue ... ..	£ 85,364	16	0	£ 43,110	1	9
Deficiency ... ..	£ 6,487	13	5	£ 3,495	7	4

55. The total debit balance for the eighteen months on both water and sewerage was therefore £30,963 18s. 6d.

The cause of this deficiency is the large shrinkage in the Municipal assessments on which the water and sewerage rates are based, the alterations in the city assessments alone being responsible for a reduction in the Board's revenue of nearly £10,000 per annum, while the suburban revenue was lowered from the same cause by a like amount.

Another reason for the shortage is the increase in the capital debt, particulars of which have already been given, which rendered it necessary for the Board to debit themselves with an additional sum of about £28,000 in order to meet interest charges.

56. Up to the end of 1894 the accumulated credit balance amounted to £34,500 6s. Deducting therefrom the deficiency for the eighteen months ending 30th June, 1896, there will still remain £53,536 7s. 6d. The Board do not propose to make any alteration in the rates at present charged, but it may be found necessary before the end of the present year to consider the advisability of abolishing the concession now granted of 5 per cent. for prompt payment.

57. The stormwater ducts constructed by the Government, and transferred to the Board in terms of the "Metropolitan Water and Sewerage Act Extension Act of 1894," in order that revenue may be collected in connection with the same, are a constant source of loss. The capital cost of these works is debited to the Board, although many of them cannot be considered in any way adjuncts to the main sewerage system, and the Board are precluded by the Act from striking a rate of more than 3 per cent. of the assessed annual value of the premises within the area draining into the ducts.

The Act further provides that when the sewerage system is extended to any district or drainage area within which a stormwater drain has been constructed, the stormwater drainage rate is no longer to be charged. The value of the ducts constructed within sewered districts is £37,944, for the payment of interest and expenses upon which no revenue can be collected.

The cost of the stormwater drains constructed in districts not at present liable for sewerage rates is £90,598; but in these cases the rates that can be collected fall far short of the sum required for interest and other expenses. The total cost of the stormwater drains transferred to the Board is therefore £128,542, the sum required to meet interest and working expenses is £6,371, but the rates collected only amount to £4,223, or a deficiency of £2,148 per annum.

In

In order to arrive at even this unsatisfactory result it has been necessary to charge premises within some of the areas the maximum rate allowed by the Act, viz., 7d. in the £, which is the same as that charged for the benefits of a complete sewerage system in the reticulated districts.

The Board consider this a very great hardship on the owners of the properties concerned, as in many instances their dwellings are situated on the top of the ridge forming the watershed, and long distances from the drains; they consequently derive little or no benefit whatever from the work, yet have to contribute a sum equal to a full sewerage rate.

The Board feel so strongly on this point that they intend, in view of the prospective transfer of other drains now nearing completion, to address the Minister specially on the subject before imposing a rate on any additional areas.

58. The amount of revenue outstanding on 30th June was £43,970 15s. 11d., of which the following are the principal items:—Government rates, £1,182 13s. 8d.; municipal rates, £285 19s. 6d.; domestic rates—houses, £8,950 2s. 8d.; land, £6,648 6s. 1d.; meters, £13,814 8s. 2d.; churches and charitable institutions, £6,681 16s. 1d.; compulsory drainage, £4,258 14s. 6d.; plumbers and drainers, £1,156 5s. 9d.; and Richmond Water Supply, £99 15s. 11d.

59. The gross receipts paid into the Treasury during the eighteen months, exclusive of Richmond rates, amounted to £374,333 2s. 1d. Legal proceedings were taken for the recovery of £8,291 12s. 1d.

60. The number of premises which became liable for water rates was 7,423, and sewerage rates, 2,373, making the total number now rated—water, 115,990; sewerage, 45,542. Rate notices to the number of 337,278 were delivered.

61. Four hundred and eighty-three notices were served by the Waste-water Inspectors in reference to infringements of the Board's by-laws; and 197 leaky taps were repaired by them in the course of their inspections without charge to the consumers.

62. The report of the Medical Adviser to the Board as to the health of the staff and employees is very satisfactory. Two deaths occurred—one from cancer, and the other from phthisis—both the victims being elderly men. One case of typhoid fever is reported, the patient being an officer of the clerical staff. No case of disease occurred which could be traced to defective ventilation, or attributed in any way to the Board's sewers, and the health of the sewer maintenance-men, notwithstanding the severe heat of last January and February, and the virulent epidemic of typhoid fever, was extremely good.

63. A most excellent report by the Medical Adviser is attached hereto showing the very admirable results which have been achieved by reason of the extension of the water and sewerage systems to the outlying suburbs. Dr. Kendall has furnished many interesting tables, from which it will be seen that the general health of the community, as shown by the death-rate, has greatly improved, and the mortality from such diseases as typhoid fever, diphtheria, and phthisis decreased. It is interesting to note that from personal inquiry it has been demonstrated that not a single case of typhoid fever originated on premises the sanitary arrangements of which were in accordance with the by-laws of the Board.

From the statistics quoted by the Medical Adviser, it will be noticed that by comparison of the death-rate from enteric fever in various cities of the world the City of Sydney holds a very enviable position, which result is no doubt fairly attributable to the Board's operations.

64. The Comptroller of Stores reports that the value of the goods received by him was £43,298, and issued £54,083, leaving a balance of stock on hand of the value of £19,235.

65. The personnel of the Board has been considerably altered, the following changes having taken place :—

On 1st April, 1895, Mr. R. R. P. Hickson, M. Inst. C.E., and Mr. W. L. Vernon, F.R.I.B.A., resigned their appointments as official members, their places being filled by the appointment, on 10th April, 1895, of Colonel T. Rowe, F.R.I.B.A., and Mr. G. A. Mansfield, F.R.I.B.A., respectively.

On 10th March, 1896, Mr. C. W. Darley, M. Inst. C.E., resigned his appointments as President and official member, on taking over the duties of Engineer-in-Chief for Public Works; and, on the 12th March, Colonel Rowe was appointed President, and Mr. J. Macpherson an official member.

On 23rd March, 1896, Alderman J. Ahearn was elected a suburban member in lieu of Alderman G. W. Lander, who retired by effluxion of time.

Alderman J. Taylor was re-elected unopposed as a City member, and afterwards to the position of Vice-President.

66. In addition to visiting and personally inspecting all the principal works under their charge, the Board held eighty-nine meetings at their offices, the attendance at which is set forth in the following table :—

MEETINGS OF BOARD FROM 1ST JANUARY, 1895, TO 30TH JUNE, 1896.

(5) Appointed

President, 12 March, 1896.

(6) Appointed, 22 March, 1896.

(7) Elected, 23 March, 1896.

\* Absent from Colony on leave

67. The Board have also to record the retirement, on 30th June, 1895, of Mr. Reginald Bloxsome from the office of Secretary, a position which that gentleman had held since the inception of the Board.

This change was rendered necessary on account of Mr. Darley giving his whole time to the position of President, in conjunction with that of Engineer-in-Chief for Metropolitan Sewerage Construction.

The positions of Secretary and Chief Clerk were then amalgamated, and Mr. W. Holmes, the occupant of the latter post, appointed to the new office.

68. Enclosed are the Reports of the Engineer, Mr. J. M. Smail, M.Inst. C.E., and other heads of branches, together with the Balance-sheet.

WILLIAM HOLMES,  
Secretary.

THOMAS ROWE, Col., F.R.I.B.A.,  
President.

DESCRIPTION

## Description of Sydney Waterworks at end of June, 1896.

The source of supply is from the Nepean River, and two of its tributaries, the Cordeaux and Cataract Rivers. The catchment area is about 354 square miles. Across the Nepean River is built a concrete dam 10 feet high, which is designed to divert a portion of the stream only into the tunnel, and lift it to level of crown of the same. The water is then taken by a tunnel  $4\frac{1}{2}$  miles in length to the Cataract River. Another concrete dam, similar to that on the Nepean, is thrown across this river just below the outlet of the tunnel from the Nepean, and the water is thence conveyed by a tunnel for about  $1\frac{1}{2}$  miles, and then by a series of open canals and tunnels, making a total distance from the source of about  $40\frac{1}{2}$  miles to Prospect Reservoir. There are  $11\frac{3}{4}$  miles of tunnels and about  $28\frac{1}{2}$  miles of open canal from the off-take to the Prospect Reservoir. Several gorges are crossed—some by inverted siphons, others by pipe aqueducts.

### Prospect Reservoir.

This reservoir covers an area, when full, of 1,261 acres, and has a capacity of 10,812,313,000 gallons.

The dam is earth with a clay-puddle core, and is 7,300 feet long, maximum height 84 feet, with slopes of 3 to 1 on the water side, and  $2\frac{1}{2}$  to 1, with two 15-foot berms, on the outer side, and is 30 feet wide on the top; the water-face is covered with heavy bluestone pitching. When quite full there is 6,744,343,000 gallons available by gravitation.

The water is drawn off from the reservoir through a valve-tower into pipes placed in a brick tunnel, carried outside and round the northern end of embankment, and is discharged through controlling valves into a basin (at the end of this basin is placed a gauge-weir, from which can be read the quantity passing over daily), from which it then proceeds by an open canal for 5 miles to the Pipe Head Basin, situated  $16\frac{1}{2}$  miles from Sydney, and is then conveyed by a wrought-iron pipe, 6 feet in diameter, to Potts' Hill, a distance of 5 miles.

### Potts' Hill Balance Reservoir.

The water is delivered here into a 100,000,000-gallon tank, built partly in excavation, partly in bank, the bottom of which is lined with hydraulic lime concrete, and the sides, which are laid to slopes of 1 to 1, are lined with dry-coursed rubble. This work is designed to tide the city over any interruption of supply from Prospect, as well as to prevent fluctuation of head of pressure.

### Screening Tank and Trunk Mains.

This screening-tank is of brick, built in two concentric rings. The water is delivered into the outer ring, and passes through a series of copper-gauze screens of 840 meshes to the inch. These screens are arranged so that the orifice which they fill can be closed, and the screen taken out and scoured. From these tanks the water passes into two 48-inch cast-iron mains.

The 48-inch main first laid continues with same diameter to Lewisham, whence it bifurcates, one branch (48-inch) leading to Petersham Reservoir, the other (42-inch) to Crown-street Reservoir. The new 48-inch main was completed in 1893, and is worked alternately with the old. The two trunk mains are connected at New Canterbury Road, Petersham.

### Crown-street Reservoir and Pumping-station.

Crown-street Reservoir is built of brick, and contains 3,250,000 gallons. The top-water level is 141 feet above high-water mark. At this place is situated the main pumping-plant, consisting of three compound high-duty pumping-engines. No. 1 Worthington pumping-engines are capable of raising 500,000 gallons per hour to the Paddington Reservoir, a height of 70 feet above the pumps; No. 2 Worthington pumping-engines are capable of raising 210,000 gallons per hour to Woollahra Reservoir, a height of 140 feet above the pumps, and also of raising 200,000 gallons per hour to Waverley, a height of 220 feet above pumps. Owing to the small storage capacity at Paddington and Woollahra these engines are not being worked to their greatest advantage, as they have to start and stop at short intervals. No. 3 pumping-engines, of the horizontal compound condensing rotative direct-acting type, designed and erected by Mort's Dock and Engineering Company, are capable of raising 100,000 gallons per hour to a height of 219 feet.

Four 142-h.p. Babcock and Wilcox boilers generate the requisite steam.

### Paddington Reservoir.

Paddington Reservoir, top-water level of which is 214 feet above high-water mark, or 73 feet above Crown-street, is built of brick, and contains 2,000,000 gallons, and is supplied by a 36-inch cast-iron main from Crown-street pumps, and distributes the water through a 24-inch cast-iron main *via* Begg-street, and a 36-inch *via* Park Road.

### Woollahra Reservoir.

Woollahra Reservoir, top-water level of which is 282 feet above high-water mark, or 141 feet above Crown-street, is built of brick, and contains 1,000,000 gallons, and is supplied by a  $24\frac{1}{2}$ -inch wrought-iron main from Crown-street, and distributes the water through a 20-inch main.

### Waverley Reservoir.

Waverley Reservoir top-water level is 360 feet above high-water mark, and 78 feet above Woollahra, is built of brickwork, and contains 1,037,000 gallons. It distributes the water through a 15-inch main. Supplemental tanks in Waverley Park, erected at an elevation of 20 feet above the present reservoir, now supply the upper zones of the district.

Petersham

### Petersham Reservoir.

This reservoir is built of brick, and contains 2,157,000 gallons. The top-water level is 166 feet above high-water mark, and receives its supply by gravitation from Potts' Hill through a 48-inch cast-iron main, which branches off the 48-inch main at Lewisham, and distributes the water through two 18-inch and one 20-inch outlets, the latter about being utilised.

### North Sydney Supply—Ryde Pumping-station, Ryde Hill Tank, and Chatswood Tanks.

North Sydney, which was supplied from Paddington by a submarine pipe up to the end of 1891, has since received its supply from Potts' Hill, the water being delivered through a cast-iron pipe partly 24-inch and partly 20-inch diameter into a balance reservoir, near the Ryde Railway Station. Here a pair of powerful pumps raise the water through a 24 $\frac{3}{4}$ -inch wrought-iron rising main into a 1,000,000-gallon wrought-iron tank to Ryde Village, at a level of 234 feet above high-water mark, and by a continuation of the same main into a pair of each 1,500,000-gallon wrought-iron tanks at Chatswood, at an elevation of 370 feet above high-water mark.

From the first-named tank the whole of Ryde, Gladesville, and Hunter's Hill get their supplies, and a 9-inch branch was extended over the Parramatta River and Iron Cove Bridges for the supply of the heights of Balmain.

The pair of iron tanks at Chatswood afford a liberal supply to Willoughby, North Sydney, and Mosman, and the newly-reticulated district of Gordon and Hornsby.

### Gordon, Wahroongah, and Hornsby.

This popular residential district, extending from Chatswood to Hornsby, and adjacent to the Milson's Point Railway, is now supplied with water from the Board's works. A small pumping-plant has been erected at Chatswood, from whence water is pumped to Wahroongah into a 40,000-gallon elevated tank, at a height of 720 feet above sea-level. The pumping main, which is also used as a main distributory, is 10 in. in diameter, and is 7 $\frac{1}{2}$  miles in length; a further extension, also of same diameter, was laid to Hornsby. About 9 miles of reticulation mains of 6-inch and 4-inch diameters have been laid along such streets in the various centres of population as are sufficiently built upon to warrant the outlay. Further extensions of this scheme are intended, in the immediate future, to meet the growing wants of residents.

### Campbelltown.

Campbelltown is supplied direct from the main canal by gravitation, a 6-inch pipe from the canal at 16 miles 40 chains being laid to the town, a distance of 2 $\frac{1}{2}$  miles, and the reticulation consisting chiefly of 4-inch mains.

### Liverpool.

Liverpool receives its supply by a 9-inch pipe from the main canal at Cecil Hills, which is extended as far as Mount Young, and thence by a 6-inch main to the town. In order to tide over any possible interruption to the flow in the canal a 4,000,000-gallon earthen reservoir has been constructed close to the canal, and is filled from the canal.

### Smithfield.

The Smithfield water-works, completed in July, 1895, were designed to supply the township of Smithfield, which is situated on the Prospect Creek, about 3 miles south-east of the reservoir. The works included may be briefly summarised as under:—

An off-take on the main Canal, about 3 miles below Prospect Reservoir; a circular concrete tank on the bank of said canal, having a capacity of 100,000 gallons; a 4-inch main to the township; and mains totalling about 3 $\frac{1}{2}$  miles of the same diameter laid in all streets occupied by dwellings. The works cost about £2,900, and supply a population of 300.

### Granville, Auburn, and Rookwood.

Granville is supplied by gravitation through a 15-inch branch from the 72-inch wrought-iron trunk main laid along Woodville Road for a distance of 2 $\frac{1}{2}$  miles

Rookwood and Auburn receive their supply from a 12-inch main along Joseph-street from Potts' Hill.

### Ashfield.

A part of Ashfield is too elevated to receive a supply by gravitation from Potts' Hill level; therefore the loftier parts are supplied from the Woolahra Reservoir by the Petersham trunk main, which conveys the water to a 100,000-gallon wrought-iron tank, erected on a brick circular support, at an elevation of 223 feet above high-water mark.

### Hurstville, Kogarah.

The bulk of the supply to Kogarah is given by gravitation from 12-inch mains connected with the Petersham Reservoir system. The higher portions of this district are supplied with water from Penshurst, where is erected a 20,000-gallon cast-iron tank, built on brick piers. The water is pumped from Carlton Station by the small steam pumping-plant (Blake's duplex), which was formerly erected at North Sydney to supply that district, prior to the completion of the Ryde pumps. The gas-engine is still occasionally used.

### Richmond.

In July, 1893, the Board assumed the temporary management of the Richmond water-works, which were completed in 1892, and had since then been worked locally by the Richmond Municipal Council. The scheme, which is entirely unconnected with the Sydney supply system, consists of a small pumping-plant—two horizontal 6-horse-power engines, coupled and geared, working two brass-lined single-barrel deep-well pumps (Tangyes), fixed 61 ft. 6 in. below floor of engine-room—erected on the left bank of the Hawkesbury River, just below the confluence of the Grose and Nepean; a circular brick service tank, 60 ft. in diameter, having a capacity of 225,000 gallons; a 6-in. supply main to Richmond, 4 miles in length; and 5 $\frac{1}{2}$  miles of reticulation mains, 3 in. and 4 in. diameter, within the town.

## Description of the Metropolitan Sewerage System.

THE Metropolitan Sewerage System, under the control of the Board of Water Supply and Sewerage, comprises the old and new systems, the former having been initiated by the old City Commissioners in 1853, and was carried out by their successors, the present City Council, which was incorporated in 1857. The City Council had control of the water and sewerage works within the city until the year 1888, when the waterworks were transferred to the Board. The transfer of the existing sewerage-works followed in 1889.

The old system comprised four main outfalls, with subsidiary sewers along the principal streets, which in turn received the reticulation sewers of the minor thoroughfares. The four main outfalls discharged the sewage of the city into the various parts of the harbour at Blackwattle Bay, Darling Harbour, Sydney Cove, and Woolloomooloo Bay, respectively. This system was designed on the principles of what is termed the "combined system." The pollution of the freshness of the harbour, by the discharge of the sewage of the city, and consequent danger to public health, led to the appointment of a Commission to inquire into the best means of diverting the sewage from the harbour and otherwise disposing of same. The new intercepting system was the outcome of the labours of the Commission. The main works were carried out by the Government, and on completion were transferred, with all other existing works, to the control of the Board by Act of Parliament. The system, which is on the lines of the partially "separate system," intercepts all sewage, which heretofore was discharged into the harbour, at a level of 40 feet above high-water mark. This is termed the gravitation zone. The sewage from the low-level area, *i.e.*, between high-water mark and 40 feet contour, will eventually be pumped into the gravitation sewers, and discharged into the ocean or into the sewage farm.

The system consists of two main outfalls, named the northern and southern respectively, the former discharging into the Pacific Ocean, at a point named "Ben Buckler," at Bondi, and the latter discharging into a sewage farm at "Webb's Grant," on the shores of Botany Bay. These works are of considerable magnitude, and have not been constructed without considerable difficulty and outlay.

### Northern Outfall.

The northern system commences at "Ben Buckler," where a large chamber was constructed in the sandstone rock. From this chamber two channels bifurcate, so as to ensure a free discharge during the prevalence of either northerly, easterly, or southerly gales. From the chamber a shaft extends to the surface for ventilation and escape of air when the sea breaks into the discharge channels. The dimensions of main outfall at chamber is 8 ft. x 7 ft. 6 in., and decreases by decrements to 6 ft. 10 in. x 5 ft. 10 in. at Oxford and Liverpool Streets junction. At this point is a large chamber into which three different branches discharge, *viz.* :—The northern branch, which passes under Hyde Park to Castlereagh-street, where it bifurcates, one submain intercepting the sewage from main outfall at Macquarie Point, and the other intercepting the sewers discharging at Queen's Wharf. 2nd. The western branch, which extends along Liverpool-street to and along Kent-street to Miller's Point, intercepting the sewage which discharged into Darling Harbour. 3rd. The south-western branch, which passes under Belmore Gardens, Benevolent Asylum, and along George-street West to Carlton-street, where it bifurcates into two sub-mains, one passing through Darlington, University Grounds, to Camperdown, Newtown, and Petersham, intercepting old city sewers and draining new areas; the other submain passing along George-street West by a long siphon, on account of a depression. Connected with this siphon is a scour chamber and valves for periodic cleansing. This branch extends to the Glebe and boroughs of Balmain and Leichhardt. The whole of the sewage above the 40-foot contour line, which formerly flowed into Blackwattle Bay, is intercepted by this branch and discharged into the ocean. 4th. The Potts Point branch, commencing at Bourke-street, near rear of Darlinghurst Goal, and extending along same for some distance, then passing along Victoria-street, and terminating at Challis Estate. This sewer intercepts a considerable quantity of sewage formerly discharging at Woolloomooloo Bay. 5th. Elizabeth Bay branch, which extends along western bank of Lacrozia Creek and Rushcutter's Bay, intercepting sewage formerly discharging into them. 6th. The Woollahra and Waverley branch, extending along east side of Double Bay valley, passing under Edgecliff Road, and terminating at present at Denison-street, Waverley; this sewer drains the northern watershed of Woollahra and Waverley.

The work was carried through varying formations—in some instances the stratum was indurated sandstone; in others shale, clay, and water-charged drift-sand. Concrete enters largely into the construction of the works, the lining of rock tunnels being principally bluestone concrete rendered with cement mortar. Wherever the outfall sewer crossed natural creeks or watercourses offlet and scour valves were provided. An overflow sewer discharging into Rushcutter's Bay is connected with the main outfall to take surplus water during heavy rain-storms. This sewer was carried across low-lying swampy land on arches and circular piers; the latter were constructed on the same principle as carried out in India.

### Southern Outfall.

The southern main outfall commences at the inlet chamber, which is constructed on the north bank of Cook's River, near its junction with Botany Bay. The sewer is 5 ft. 6 in. in diameter, constructed of concrete, with brick lining rendered with Portland cement. In places the sewer is above the level of the adjoining land, and in others it passes through low sand-hills and swampy ground. Where natural watercourses are passed over, concrete culverts and overflow chambers and valves are provided. The outfall sewer extends to Botany Road, where the size is decreased for a short distance, to 4 ft. 6 in. x 3 ft. 6 in. Hawksley Section: From Botany Road the sewer extends along Bourke-street, through the boroughs of Waterloo, Redfern, and the City of Sydney to Nobbs-street, where the submains from different districts join. This outfall drains the southern watershed of the city and boroughs of Redfern, Waterloo, Alexandria, Macdonaldtown, and Newtown.

### Inlet House.

The sewage passes from the main outfall into the straining-chambers of inlet house. The chambers are in duplicate and controlled by inlet valves, so that when one series is in use the other is being cleaned out. The sewage is strained by means of three circular screens; the mesh varies from 3 inches to 1 inch. The screens are worked by one central shaft, with gearing fixed on the platform at one end, and intercept all extraneous matter before the sewage passes into the siphon-well. From the siphon-well the sewage passes under the bed of Cook's River by a cast-iron siphon 3 ft. 9 in. in diameter laid in a trench and surrounded with concrete. The siphon is connected with a well in outlet house on south side of river, from which the sewage flows along a main carrier, and is distributed over the irrigation-beds and settling-tanks by valves. The valves are of simple construction, and the distribution of the sewage is easily controlled by the farm manager.

### Sewage Farm.

The Sewage Farm is situated on a neck of land called Webb's Grant, the formation of which is raw drift-sand, originally covered with low dense scrub. For agricultural purposes, to be worked at a profit, the soil is useless, but as a filter for crude sewage—this being the state in which the sewage is distributed over it—it cannot be surpassed. The farm is laid out on one side in irrigation-beds, at different levels, so as to enable the manager to command the whole area. On this area the sludge, which is dredged from the inlet house, is conveyed in trucks by a small locomotive to the various beds, and is used as manure. On the other or southern side the ground is laid out in a series of filtering-tanks, the number admitting of the sewage being dealt with intermittently. At times, when circumstances admit, these tanks are cultivated, which assists in keeping the ground clean and improves the soil as a filter. Cattle and pigs are reared and fattened on the surplus products of the farm. The styes are built in concrete, and kept clean by daily washing. Cattle and horses are also taken for agistment. The daily discharge on to the farm is 2,059,200 gallons; this is disposed of over 65½ acres of land prepared to receive same, the irrigation and filtration beds being specially formed and subdrained, the effluent water discharging above high-water mark at Botany Bay.

The farm is now being worked by the Board; the experience of leasing same was not successful.

### Western Suburbs.

The sewerage system for this district is now being carried out by the Government Sewerage Department under a special vote as regards the main ducts. The outfall works are nearly completed, and the eastern branch sewer is now in progress. This sewer drains portions of Marrickville, Petersham, and Leichhardt, and will also receive the sewage from low-level system which will be pumped into it at Meeks' Road pumping-station. The system will also discharge on a portion of the Sewage Farm area upon the western side, further resumption of land having been made for that purpose.

## Rates and Charges for Water, Sewerage, and Stormwater Drainage.

### WATER RATES.

1. The following rates and charges are those which the owners and occupiers of houses, tenements, and lands shall pay in respect of water supplied by the Board, that is to say:—

*For Water supplied for domestic purposes otherwise than by Measure.*

2. (i.) In respect of lands and tenements of which the assessed annual value is £17 or under, 10s. per annum.
- (ii.) In respect of lands and tenements of which the assessed annual value is over £17, a rate of 7d. for each pound sterling on the amount of the assessed annual value up to £300 inclusive; 5d. for each pound sterling on the amount of the assessed annual value in excess of £300 up to £700 inclusive; 4d. for each pound sterling on the amount of the assessed annual value in excess of £700 up to £1,000 inclusive; 3d. for each pound sterling on the amount of the assessed annual value in excess of £1,000 up to £4,000 inclusive; and 2d. for each pound sterling on the amount of the assessed annual value in excess of £4,000.

3. The following rates shall be paid in each year in respect of lands and tenements which are not supplied with water for domestic purposes, and which are not more than 60 yards distant from a main constructed by or vested in the Board, that is to say:—

- (i.) In respect of lands and tenements of which the assessed annual value is £10 or under, a rate of 1s. in the pound.
- (ii.) In respect of lands and tenements of which the assessed annual value is over £10, a rate of 10s. per annum up to the assessed annual value of £17 inclusive.
- (iii.) In respect of lands and tenements of which the assessed annual value is over £17, a rate of 7d. for each pound sterling on the amount of the assessed annual value.
- (iv.) In respect of lands on which no building is erected for human habitation, a rate of 4d. in the pound of the assessed value.
- (v.) The like rates as those above-mentioned shall be charged on all lands and tenements not included in any valuation by the Municipal Council of the City of Sydney or Redfern, or of any Borough or Municipal District, and on all lands for the time being valued by the said Municipal Council of the City of Sydney or Redfern, or by such Borough or Municipal District, at a sum less than the true value thereof.
- (vi.) When any lands or tenements become liable to a rate, or to an increased rate, during the currency of any half-year by reason of the extension of a main or for any other reason whatsoever, then a part of such rate or increased rate, as the case may be, proportionate to the unexpired period of the current half-year, shall become due and be paid forthwith.

*Supply of water by meter.—Charges for water supplied by meter.*

4. The charge for water supplied by meter shall be 1s. per 1,000 gallons for all water consumed up to 20,000,000 gallons per annum, and 9d. per 1,000 gallons for all water consumed in excess of 20,000,000 gallons per annum; Provided that the minimum quantity of water to be charged for, where water is so supplied, shall be 10,000 gallons per annum. Her Majesty's ships will be supplied free of charge.

5. All charges for water supplied by meter shall, unless otherwise provided by a contract made between the Board and the person to be supplied, be paid within one month after service by the Board upon the person liable to pay such charge of a notice in writing setting forth the amount due for water so supplied, and demanding payment thereof within the period of one month aforesaid. Service of any such notice may be effected by serving the same personally on the person named therein, or by sending such notice through the post to the person named therein at his last known place of abode or business; and where the place of abode and the place of business of such person are unknown to the Board, by sending it through the post addressed to him at the lands and tenements to or in respect of which the water is supplied, or by leaving it on such lands and tenements.

6. A discount of £5 per cent. will be allowed by the Board on all rates imposed upon lands and tenements of the assessed annual value of over £17, and on all lands and tenements not supplied with water on which no building is erected for human habitation of the assessed value of over £30: Provided that such rates are paid within thirty days from the date of service of the rate-notice in each half-year. A like discount of £5 per cent. will be allowed by the Board on all charges for water supplied by meter where such charges shall be paid within one month of the delivery of the meter account: Provided that such discount as aforesaid will not be allowed in any case in which its allowance would have the effect of reducing the amount of the rate or meter charge respectively payable below the sum of 10s.

*For water for other than domestic purposes otherwise than by measure.*

- (vi.) The charge for water supplied to gas-engines or oil-engines shall be 5s. per annum for each engine of two horse-power and under, and for every additional horse-power beyond two horse-power an additional charge of 2s. 6d. per annum for each horse-power.
- (vii.) The charge for water supplied to steam-boilers shall be £1 per annum for each steam-boiler up to three horse-power. And for every additional horse-power beyond three horse-power an additional charge of 5s. per annum for each horse-power.

(viii.)

(viii.) The charge for water supplied for actuating ventilators or refrigerators shall be by special fee, according to the following scale, namely:—

Class A.—Passing 60 gals. per hour at 65 lb. pressure—	
1 nozzle,	£6 per annum.
2 „	£4 10s. per annum each.
3 „	£3 10s.
4 „	and upwards, £3 per annum each.
Class B.—Passing 40 gals. per hour at 65 lb pressure—	
1 nozzle,	£3 15s. per annum.
2 „	£3 per annum each.
3 „	£2 10s. per annum each.
4 „	and upwards, £2 per annum each.

*Supply for twelve hours only in each day.*

Provided, however, that the supply of water under this By-law shall be for twelve hours only in each day, and no person having such supply shall continue to use the same for more than twelve hours in any one day.

*Water for trade purposes, &c.*

(ix.) The charge for water supplied for purposes of the undermentioned or other trades shall be at such rates upon such terms and subject to such conditions as may be agreed upon by the Board and the person requiring to be supplied, provided, however, that for any year or part thereof, the minimum charge for water supplied for the undermentioned trades shall be that in each hereunder case set opposite the trade, viz.:—

Photography, and any like process...	...	...	5s. per annum.
Tripe-cleaning	...	...	5s. „
Tying purposes	...	...	5s. „
Laundries	...	...	5s. „
Dyers	...	...	10s. „
Condiment-making	...	...	5s. „
Bottle-washing	...	...	5s. „
Small goods (sweets)	...	...	5s. „
Waterfalls and fountains	...	...	5s. „
Shop-fronts, by hose	...	...	5s. „
Organ motors and such like mechanisms...	...	...	20s. „

*Washing Vehicles.*

(x.) The Board may supply water for the washing of vehicles with a hose, without meter, at the rate of 5s. per annum for each vehicle.

In all cases where special fees are charged the Board reserve to themselves the right of insisting upon a meter being fixed at any time, notwithstanding the fact that the special fee may have been paid. All special fees are in addition to the assessed annual rate of the premises on which such fees are charged, and are payable in advance. All premises on which water is used for other than domestic purposes, and upon which special fees are paid, shall be open for inspection by the inspectors of the Board at any reasonable hour.

2. Assessed rates shall be paid half-yearly in advance, whether a meter is used or not. In the case when a meter is used the meter account will be rendered only when it is in excess of the assessment. Cheques and Post-office orders will be received in payment of rates; but if the cheque tendered by any person as payment for rates due is dishonoured, the Board may cut off his service, and proceed for the recovery of the amount by warrant for distress or otherwise. Cheques and Post-office orders must be crossed in favour of the Board.

3. The minimum charge for water, whether supplied through meter or otherwise, for domestic purposes and for purposes other than domestic, is the assessed annual rate. If the water is supplied by meter, and the meter account exceeds the assessment (calculated at the rate of 1s. per 1,000 gallons), then such excess shall be charged in addition to the assessment.

4. One meter may be allowed to supply several tenements when such tenements are occupied by one person or firm as a place of business or abode, and the meter account will be credited with the assessments of all such tenements. One service only will be allowed under these conditions, upon which the meter will be fixed, and all the water for such tenements must pass through such meter. Where peculiar circumstances entail a departure from the above, and two services are absolutely necessary, then there shall be a meter on each service pipe.

*Building Charges, &c.*

(xi.) The charge for water supplied for building and plastering purposes, for buildings to be used either wholly or partly as dwelling-houses, shall be at the rate of one half-penny per cubic yard on the cubical contents of each building. The Board will supply water for all other buildings either by meter or at the rate above-mentioned per cubic yard on the cubical contents of each building as the Board shall determine: Provided that before any water shall be used through meter for building purposes such meter shall be submitted to the Board in each case for examination, and must pass the sensitive test; and the minimum charge in each case for water so supplied through meter shall be 10s.

(1.) The charge for water supplied for plastering rooms only shall be 2s. 6d. for each room, and for the building of wash-houses, water-closets, coppers, and chimneys only, 2s. 6d. each.

(2.) The charge for water supplied for making and mixing of concrete for foundations of wooden blocks, stone cubes, or other form of permanent roadway or pavement, shall be at the rate of £1 1s. per 1,000 square yards by superficial measurement of road surface, and for all other concrete, brickwork, or masonry, at the rate of three half-pence per cubic yard, as measured on the work.

(xii.)

- (XII.) Any person who maintains horses or cows may be supplied with water, without meter, from the domestic service for the sum of 5s. per annum for each animal, in addition to the assessed annual rate of the premises on which such animal is maintained or supplied with water.
- (XIII.) All lands or premises actually supplied with water by the Board, on which any one or more head of horses or cattle shall be kept or maintained, shall be liable to an extra rate or charge (beyond and in addition to the assessed annual rate of the premises) of 5s. per head for each head of horses or cattle kept or maintained on such lands or premises. And where such lands or premises are not actually supplied with water by the Board they shall be liable to an extra rate or charge (beyond and in addition to the assessed annual rate of the premises) of 2s. 6d. per head for each head of horses or cattle kept or maintained on such lands or premises.
- (XIV.) The Board may supply water for gardens (and for such purpose may permit a hose and stand-pipe to be used) without meter, at the rate of 10s. per annum per 1,000 square feet superficial area, or part thereof, and 2s. 6d. for every additional 250 square feet superficial area, or part thereof, in addition to the assessed annual rate of the premises to which such garden belongs or is attached.

#### SEWERAGE RATES.

1. The following rates and charges are those which the owners and occupiers of houses, tenements, or lands shall pay for or in respect of sewerage, or for or in respect of the liability of such houses, tenements, or lands to rates and charges for sewerage, that is to say :—

- (i.) Where the premises are of the assessed annual value of £17 or under, 10s. per annum.
- (ii.) Where the premises are above the assessed annual value of £17, a rate of 7d. for each pound sterling on the amount of the valuation.

2. The following rates shall be paid in each year in respect of vacant and unoccupied lands and tenements, on which no building is erected for human habitation, and which are not connected with any sewer or drain under the control of the Board, and which are situated within 150 feet from a sewer or drain belonging to the Board, that is to say—

- (i.) A rate of 4d. for each pound sterling on the amount of the assessed value.

3. A discount of £5 per cent. will be allowed by the Board on all rates imposed upon lands and tenements of the assessed annual value of over £17, and on all vacant and unoccupied land unconnected with any sewer under the control of the Board, and on which no building is erected for human habitation of the assessed value of over £30: Provided that such rates are paid within thirty days from the date of service of rate-notice in each half-year: Provided that such discount as aforesaid will not be allowed in any case in which its allowance would have the effect of reducing the amount of the rate payable below the sum of 10s.

#### METROPOLITAN DRAINAGE BY-LAWS.

Whereas by the "Metropolitan Water and Sewerage Act Extension Act of 1894" the Board of Water Supply and Sewerage is authorised and empowered to make, alter, and repeal By-laws: Now, the Board of Water Supply and Sewerage, under and by virtue of the powers contained in the above-mentioned Act, do hereby make the By-laws following, that is to say :—

##### *Assessment and Rates.*

1. For the purposes of these By-laws the value of lands and tenements in each year shall be the value (if any) at which the same are for the time being assessed for rating purposes by the Municipal Council of the City of Sydney or the Borough or Municipal District respectively in which such lands or tenements are situated, on the 1st day of January and the 1st day of July respectively, as the case may be, in each year; and such value shall continue to be the value of such lands or tenements for the purposes aforesaid during such year.

2. The rates which are respectively set opposite to the descriptions of stormwater drains hereunder mentioned are those which shall be paid by the owners or occupiers of the lands or tenements situated within the boundaries of the drainage areas respectively proclaimed in respect of such stormwater drains, and for the purpose of assessing such rates, the valuation of such lands and tenements by the Municipal Council of the City of Sydney or the Borough or Municipal District respectively within which the same respectively are situated, shall be taken as the valuation thereof by the Board under the said Act. The minimum rate payable under these By-laws shall be in each case 1s. per annum :—

Rushcutter's Creek Drain.—A rate of 7d. for each pound sterling on the amount of the valuation of the lands or tenements.

Willoughby Falls Creek and Careening Cove Drain.—A rate of 6d. for each pound sterling on the amount of the valuation of the lands or tenements.

Blackwattle, Glebe, and Denison Ward Drain.—A rate of 7d. for each pound sterling on the amount of the valuation of the lands or tenements.

Beattie-street, Balmain, Drain.—The rate to be paid by the owners or occupiers of the lands or tenements situated within the boundaries of the drainage area proclaimed in respect of the Beattie-street, Balmain, Drain, shall be 2d. for each pound sterling on the amount of the valuation of such lands or tenements.

Iron Cove Creek, Ashfield, Burwood, Enfield, and Canterbury, Drain.—A rate of 3d. for each pound sterling on the amount of the valuation of all lands or tenements situated within the drainage area described in the Schedule hereto as applicable to the said drain, and a rate of 2d. for each pound sterling on the amount of the valuation of all lands or tenements situated outside of the area described in the Schedule hereto and within the drainage area proclaimed in respect of the said drain.

Long Cove Creek, Leichhardt, Ashfield, and Petersham Drain.—A rate of 2d. for each pound sterling on the amount of the valuation of all lands or tenements situated within the drainage area described in the Schedule hereto as applicable to the said drain, and a rate of 1d. for each pound sterling on the amount of the valuation of all lands or tenements situated outside of the area described in the Schedule hereto and within the drainage area proclaimed in respect of the said drain.

Erskineville and Munni-street, Newtown, Alexandria, and Erskineville Drain.—A rate of 7d. for each pound sterling on the amount of the valuation of the lands or tenements.

3. All such rates as before-mentioned shall be paid in advance by equal payments on the first day of January and the first day of July in each year, and the first payment shall be made at the time when an owner or occupier becomes liable to pay such rates.

4. A discount of £5 per cent. will be allowed by the Board on all rates imposed upon houses, tenements, or lands of the assessed annual value of over £17, and on all lands not supplied with water on which no building is erected for human habitation, of the assessed annual value of over £30: Provided that such rates are paid within thirty days of the date of service of rate-notice in each half-year. A like discount of £5 per cent. will be allowed by the Board on all charges for water supplied by measure where such charges shall be paid within one month of the delivery of the meter account: Provided that such discount as aforesaid will not be allowed in any case in which its allowance would have the effect of reducing the amount of the rate or meter charge respectively payable below the sum of 10s.

#### FOR COUNTRY DISTRICTS IN COUNTY OF CUMBERLAND.

For water supplied for domestic purposes otherwise than by measure:—

- (i.) On every house, tenement, or land of £10 assessed annual value and under, 10s. per annum.
- (ii.) On every house, tenement, or land above the assessed annual value of £10, a rate of 1s. for each pound sterling on the amount of the valuation.
- (iii.) Vacant or unimproved lands are subject to a rate of 4d. for each pound sterling on the amount of the valuation.
- (iv.) The like rates as those abovementioned shall be charged on all lands, tenements, and hereditaments not included in any valuation by any Borough or Municipal District, and on all lands for the time being valued by any such Borough or Municipal District at a sum less than the true value thereof.

For water supplied by measure:—

- (v.) The charge for water supplied by measure shall be 1s. per 1,000 gallons for all water consumed up to 20,000,000 gallons per annum, and 9d. per 1,000 gallons for all water consumed in excess of 20,000,000 gallons per annum.

RESULT of Analysis of the Sydney Water Supply ; by WILLIAM M. HAMLET, Government Analyst, Government Laboratory, Sydney.

Date of Analysis.	Description.	Expressed in Grains per Gallon.				Expressed in Parts per Million				Appearance in standard 2-foot Tube.	Poisonous metals.	General observations on character of water.
		Total Solid Residue dried at 290°	Chlorine as Chlorides.	Nitrogen as Nitrates and Nitrites.	Phosphates from animal impurity.	Free Ammonia.	Albuminoid Ammonia.	Oxygen absorbed in 15 min.	Oxygen absorbed in 3 hours.			
1895.												
16 January	Crown-street Reservoir	6.02	2.55	.00	.00	.05	.12	.27	.52	Clear and bright	None	The results, with the exception of the water from Crown-street Reservoir, are normal, and call for no special remarks. There is a trace of precipitated organic matter in suspension, which subsides in standing. This is so fine that it will have a tendency to choke up any ordinary domestic filter.
	Belmore-road, Randwick	6.30	2.55	.00	.00	.00	.09	.20	.52	do	do	
	Prospect Reservoir, near Inlet	6.30	2.55	.00	.00	.00	.05	.24	.50	do	do	
	Basin at head of canal	6.44	2.55	.00	.00	.00	.05	.24	.48	do	do	
18 February	Crown-street Reservoir	6.58	2.60	Trace	None	.04	.12	.35	.72	Clear	do	Maintains its usual standard of excellence.
	Belmore-road, Randwick	6.72	2.55	do	do	.00	.07	.35	.72	do	do	
	Prospect Reservoir, near Inlet	6.60	2.50	do	do	.01	.08	.42	.70	do	do	
	Basin at head of canal	6.70	2.50	do	do	.00	.07	.42	.93	do	do	
30 March	Crown-street Reservoir	6.02	2.50	do	do	.00	.05	.50	.75	do	do	These analyses disclose a water of undoubted organic purity, and fit for all domestic purpose
	Belmore-road, Randwick	6.10	2.50	do	do	.00	.03	.36	.75	do	do

Sydney, 2nd September, 1896.

MELBOURNE GREEN,  
Accountant.

## The Medical Adviser's Report for the year 1895, and the half-year ending June 30th, 1896.

I HAVE the honor to inform you that notwithstanding the very severe and sudden extremes of temperature, and the deficient rainfall, the general health of the community, as shown by the death-rate for the year 1895, greatly improved, and the mortality from such diseases as typhoid fever, diphtheria, and phthisis decreased. The unparalleled extremes of heat experienced during the first quarter of the year 1896, and the still more scanty rainfall than during the corresponding quarter of the year 1895, proved potent factors of evil; and the death-rate for the half-year ending June 30th, 1896, was greater than that for the corresponding half-year of 1895. The efficiency of the working of the water supply and sewerage systems is greatly minimised by the absence of an efficient municipal control; and it is to be regretted that a short-sighted policy of retrenchment is allowed to discount the safety of the public, for the sanitary arrangements of a dwelling may be in good order while the surroundings are very dirty, and it is useless to provide houses with efficient sewerage and water systems unless these are supplemented by the general cleanliness of the dwellings themselves. The relation between filth and disease is not properly appreciated. The key-note has been given by Pettenkofer, who compares filth to gunpowder, for which disease is the spark. Proper and efficient municipal control will remove the gunpowder, but our most frantic efforts to beat off the spark will be vain unless the filth has been removed.

Keeping fowls and animals in close proximity to dwelling-houses is detrimental to health, especially when it is remembered that fowls suffer from a disease akin to diphtheria.

My investigation of the reported cases of zymotic disease has led me to view with alarm the extreme prevalence of the disease enteric fever among young children, and as this fever is not readily transmitted by school attendance, unless the sanitary condition of the school premises is at fault, I asked that the whole of the public schools might be thoroughly inspected and reported upon. This report is not yet complete, but has already revealed many existing sources of danger, which make one surprised that those in authority have for so long a time allowed masses of children to be exposed, quite unnecessarily, to the risk of drinking water stored in filthy tanks, and to the foul emanations of latrines destitute of proper sanitary fittings.

Enforced poverty has also, without doubt, fostered the spread of enteric fever. An insufficiency of proper food induces physical weakness, followed by an adynamic condition which predisposes to all diseases of an infectious nature.

The population of the metropolis during the year 1895 began to diminish, and the decrease for the first half-year of 1896 was considerable.

		1895.	1896.
City	...	103,870	100,000
Suburbs	...	319,730	308,000
Metropolis	...	423,600	408,500
Density per acre in city	...	46.6	44.4

The rainfall for the year 1895 showed a very marked decrease on the past three preceding years, and the dry season extended through the first quarter of the year 1896 up to the end of May, when several showers fell, while during the month of June, 1896, the rainfall was phenomenal, as much rain falling in one week as fell during the whole of the first quarter of the year 1896.

As the rainfall has a great bearing upon the public health the following table will be interesting:—

	1893.		1894.		1895.		1896.	
	inches.	days.	inches.	days.	inches.	days.	inches.	days.
Quarter ending March 31st	.....	...	17.25	61	16.20	59	9.97	43
Quarter ending June 30th	.....	...	6.63	38	5.12	41	18.70	34
Quarter ending Sept. 30th	.....	...	7.11	39	4.41	31	.....	...
Quarter ending Dec. 31st	.....	...	6.75	50	6.13	42	.....	...
	49.36	208	37.74	188	31.86	175	28.67	77

The temperature during the year 1895 was subject to sudden and severe extremes of heat and cold, more especially during the third quarter of the year, when 36.8° F., the lowest temperature for the year, was registered on July 9th; 83.8° F. on September 9th; and 43.9° F. on September 23rd; 49.8° F. the mean temperature for July, was the lowest known for thirty years, and 57.4° F. the mean temperature for August was the highest known during that month since the year 1864. The highest temperature registered during the year was 96.8° F. on December 16th, and the greatest range, 31° F., occurred on November 7th. The heat wave which began in December, 1895, continued through January of the succeeding year, the highest temperature, 108.5° F., ever known in our city, being registered on January 13th. The greatest range for the first half-year of 1896 was 32.2° F., which occurred on January 16th, when the temperature was 105.2° F., at mid-day, and 73° F. at night. On January 30th the temperature fell to 63° F. and rose again on February 1st to 98° F. On February 4th 58° F. were registered, on March 5th 80.5° F., and on March 31st 52.6° F. The heat wave continued during the first part of the second quarter of the year 1896, 83.9° F. being registered on April 8th, and no really cool weather prevailed until June, when 42.5° F. were registered on the 22nd of the month.

The

The total number of deaths registered for the Metropolis during 1895 was not so great as for the preceding year, but the extreme heat and the very dry weather which was experienced during the first half-year of 1896, made a material difference and greatly increased the death-rate.

	1894.	1895.
City ... ..	1,782	1,682
Suburbs ... ..	4,177	3,867
Metropolis ... ..	5,961	5,549
Rate per 10,000 of Population...	140·7	130·7

For the half-year ending June 30th :—

	1895.	1896.
City ... ..	802	838
Suburbs ... ..	1,887	1,981
Metropolis ... ..	2,689	2,819

The zymotic death-rate for the city at the end of the year 1894 was 3·6 per 10,000 of the population. At the end of January, 1895, it fell to 1·7, at the end of February to 1·5, at the end of March to ·7. It rose at the end of April to 1·1, falling again at the end of May to 1·0, and at the end of June to ·8. It did not vary again till the end of August, when it rose to 1·0, falling again at the end of September to ·4. The onset of the warm weather brought it to 1·0 at the end of October, and at the end of November to 1·5; the increase of typhoid fever and diarrhoea bringing it at the end of December to 2·4. The great heat and the virulence of the epidemic of typhoid fever caused this rate to rise at the end of January, 1896, to 2·5, from which it fell at the end of February to 1·2, and rose at the end of March to 2·2. It fell at the end of April to ·9, and although it rose again at the end of May to 1·3, it fell at the end of June to ·7. The suburban zymotic death-rate which was 2·3 at the end of December, 1894, rose to 2·7 at the end of January, 1895, and fell to 1·3 at the end of February, 1·2 at the end of March, 1·1 at the end of April. It rose to 1·2 at the end of May, falling to ·4 at the end of June, and rising to 1·0 at the end of July. At the end of August it fell to ·7, at the end of September to ·6, and at the end of October to ·5. It rose in November to 1·8, and at the end of December to 2·6. At the end of January, 1896, the rate fell to 2·3, at the end of February to 1·9, and at the end of March to 1·4. Owing to the prevalence of diphtheria and enteric fever it rose at the end of April to 1·6, but fell at the end of May to 1·5, and to 1·1 at the end of June.

The mortality from diarrhoea was somewhat in excess, during the year 1895, of that for the previous year, and during the first quarter of the year 1896 was very great, but diminished greatly during the second quarter. The essential cause of diarrhoea lies ordinarily in the superficial layers of the earth, where it is intimately associated with the life processes of some micro-organism not yet isolated (Ballard). Experimental observation has shown that the laying of sewers has the effect of materially altering the earth temperature, and as this temperature bears a strong relation to the disease, it is highly probable that the extension of the sewerage system will be productive of much good, and help to free our suburbs from this disease which has proved so disastrous in the past.

City ... ..	39	43
Suburbs ... ..	120	143
Metropolis ... ..	159	186

The increase for 1896 occurred during the phenomenally hot and dry first quarter of the year.

The peculiarity of the distribution of diphtheria "suggests," says Mr. Longstaff, "That its cause should not be sought for primarily in any high development of civilization such as sewers, but rather in some condition associated with a more primitive form of life." The disease is very frequently sporadic, and may occur in dwellings possessing all modern sanitary improvements. The mortality from this disease has shown a gradual decrease which has been very marked during the year 1895, as only 16 deaths were registered for the city, and 88 for the metropolis:—

Phthisis,

Phthisis, which is now recognised as a micro-parasitic disease, intimately connected with the dampness of the soil, and of an infectious nature capable of being transmitted by means of a specific virus or microbe, has proved less and less fatal since the installation of the present system of water supply and sewerage. The following table shows the saving of life through the reduction in the mortality from phthisis after the establishment of sanitary works. The reduction is per 10,000 of the population:—

Salisbury	...	...	...	...	from 44·13 to 22·23
Ely	...	...	...	...	from 32·0 to 16·0
Banbury	...	...	...	...	from 26·23 to 15·35
Sydney, N.S.W.	...	...	...	...	from 20·5 to 10·5

The

The cost of such a virulent epidemic to the community is not lightly to be passed over, and it would be well if those who would lessen the efficiency of municipal control through a short-sighted policy of retrenchment, would consider the following table, and appreciate the fact that the typhoid epidemic of 1896 approximately cost the community in valuable lives the sum of £14,000. This calculation does not in any way take into consideration the loss through sickness only.

DISTRIBUTION of Deaths from Enterica for the half-year ending June 30th, 1896, according to age, in the Metropolis.

Under 5 years.	5 to 9 years.	10 to 20 years.	21 to 30 years.	31 to 40 years.	41 to 50 years.	53 years.	54 years.	56 years.	76 years.
3	10	24	27	26	7	1	1	1	1

The maintenance of a water supply in a pure state is not of itself enough to eliminate typhoid fever. The local hygienic conditions must be good as well, otherwise the resisting powers of the human organism will be lowered and less unable to oppose the invading germs which may come from some other source. I have before now advanced the opinion that this disease is in some way connected with soil, and although defective drainage tends to promote the spread of enterica, still it is often difficult to dissociate its influence from that of co-existent hygienic defects, such as a want of personal cleanliness and impurity of the soil. I am supported in this opinion by Sir Charles Cameron, of Dublin, who in his last communication to me says:—"Typhoid fever owes its spread not altogether to excessive defects in the drainage system of houses, or to any impurities of the water supply. I am convinced that it is a soil disease, and that it resembles in its mode of propagation malarial diseases. A filth-laden soil is a good virus for the bacilli of typhoid fever, and just in proportion as we preserve our soils from human excreta may we expect a diminution of the amount of typhoid fever.

For the year 1895 381 cases of enterica were reported to the Board as against 542 cases in the year 1894.

	1894.	1895.	1896.

" " June 30th ...	168	87	216
" " September 30th	27	30	.....
" " December 31st	133	88	.....
	542	381	.....

Many of the dwellings have been reported year after year, and as some of them have only recently been provided with a proper system of sanitation, the vitiated dwelling and soil still remain to be purified by time, and at present are always ready to regenerate their long time inhabitant, the germ of typhoid fever. During the year 1895 15 cases were reported independently by various medical practitioners, but as most of the cases so reported were sent to the different hospitals they appear under those headings. This form of notification should be encouraged by the payment of a small fee by the central health authority.

During the year 1895, 367 cases of typhoid fever were admitted into the various hospitals:—

Hospital.	Jan.	Feb.	Mar.	Apr.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Total.
Prince Alfred ...	35	36	19	22	11	6	1	2	4	2	13	18	169
Sydney ...	6	7	6	5	4	2	2	2	6	5	4	12	61
Coast ...	19	15	14	6	1	2	0	6	3	6	9	11	92
St. Vincent's ...	4	1	0	3	2	1	0	0	0	1	0	3	15

	70	54	43	42	20	13	4	11	15	14	26	45	367

During the half-year ending June 30th, 1896, 469 cases of typhoid fever were reported to the Board. Of these, 428 were admitted into the various hospitals, 2 were reported by private practitioners, and 39 were reported through making application to the Government Statistician for information concerning registered deaths:—

Hospital.	Jan.	Feb.	March.	April.	May.	June.	Total.
Prince Alfred ...	17	24	28	13	23	11	116
Sydney ...	17	14	17	23	10	5	86
Coast ...	23	29	38	38	32	16	176

Children's ...	2	2	5	10	2	3	24
	67	71	91	86	74	39	428

Again it must be repeated that many of the dwellings had been reported during previous years, and many have only recently been provided with a proper system of sanitation. An

An investigation of the reported cases for the year 1895 was very carefully made by the Board's Inspectors, and it was found that only 69 of the 381 reported cases came from dwellings the sanitary fittings of which were in accordance with the By-laws of the Board.

	Jan.	Feb.	Mar.	Apr.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Total.
No sewers were available ... ..	54	35	34	26	5	13	0	4	8	8	13	20	220
Dwellings were in an insanitary state	7	8	9	5	3	7	3	3	4	3	4	15	71

Children's ... ..	0	0	0	0	0	1	1
	9	15	11	10	9	9	63

The percentage compared with the number of admissions is:—

Hospital.	Percentage of deaths.
Prince Alfred ... ..	9.5
Sydney ... ..	20.9
St. Vincent's... ..	30.7
Coast ... ..	7.8
Children's ... ..	4.1

Altogether, 102 deaths occurred in the metropolis from typhoid fever during the first half-year of 1896, and an inquiry into the sanitary surroundings of these cases showed—

	Jan.	Feb.	March.	April.	May.	June.	Total.
No sewers were available ... ..	13	15	13	12	9	12	74
Dwellings were in an unsanitary state ... ..	3	3	5	4	5	1	21
Owners had complied with the regulations of the Board ... ..	0	1	0	1	1	0	3
No fixed abode ... ..	1	1	2	0	0	0	4
	17	20	20	17	15	18	102

Of the 216 cases of typhoid fever reported during the first half-year of 1896, 153 were children under the age of 16 years.

From personal inquiry, I have found that not a single case of typhoid fever originated on premises the sanitary arrangements of which were in accordance with the By-laws of the Board.

It will be interesting to compare the death-rate from enteric fever in various cities of the world for the year 1894. The rate is per 10,000 of the population.

Edinburgh, 1.5; Glasgow, 2.6; Dublin, 4.8; Calcutta, 11.8; Paris, 2.9; St. Petersburg, 4.9; Berlin, 0.4; New York, 1.6; Sydney, 1.9; Melbourne, 3.02; Adelaide, 5.1; Hobart, 7.6; Perth, 13.3; Brisbane, 3.05.

From this it will be seen that our city holds a good sanitary position, and that although we may, owing to the exigencies of climate, be sometimes visited by a disastrous epidemic, the good effect of the Board's operations is very apparent.

I have, &c.,

THEO. MAILLER KENDALL,  
Medical Adviser.

To the Secretary, Water and Sewerage Board,  
Sydney, August 14th, 1896.

## The Health of the Board's Officers and Employees, 1895.

Sydney, 2 January, 1896.

SIXTY-NINE persons presented themselves for examination during the year. Fifteen were examined for certificates of fitness for employment; 1 of these was rejected.

Fifty-four were examined for sick leave—3 of these were ordered back to work, and 1 was reported as suffering through his own misconduct.

Of the remaining 50, 12 suffered from accident and 38 from general sickness.

Accidents caused sick leave to be granted for 118 days, 60 days of which were granted to one man who burnt his foot while at work.

General sickness caused sick leave to be granted for 382 days—100 days being granted to one man suffering from the sequela of influenza, 38 days to a man who contracted pneumonia, and 40 days to a man suffering from tumour in the abdomen.

The Board is again to be congratulated that no case of sickness reported can be traced to defective ventilation or attributed in any way to the sewers. The necessity of having good strong boots for the men cannot be too strongly emphasised, as in this way much of the rheumatism and catarrh would be prevented.

THEO. M. KENDALL,  
Medical Adviser.

The Secretary.

## The Health of Officers and Employees, Half-year ending 30th June, 1896.

Sir,

Sydney, 15 August, 1896.

I have the honor to report that the general health of the officers and employees of the Board for the first half-year of 1896 was good.

Twenty-six persons presented themselves to me for examination. Seven of these for certificates of health as to their fitness for the Board's employ. Two were ordered to return to work, and 2 were reported as having brought about their illness through their own fault.

Two hundred and sixty days' leave were recommended:—21 days to Inspector Lance, who died of cancer; 42 days to Inspector Alexander, who died of phthisis; 21 days to maintenance-man Morrison, who was in the Sydney Hospital suffering from obscure abdominal trouble; 21 days to cases of sunstroke which occurred at the beginning of the year; 42 days to Mr. Hewlett, of Waverley, who contracted typhoid fever; 42 days for cases of accident; and 7 days to Mr. Grain, who was operated upon for a tumour on the knee. The remaining 64 days were recommended for general ailments.

No case of disease came under my notice arising from any fault of the Board's sewers, and the health of the maintenance men, notwithstanding the severe heat of January and the virulent epidemic of typhoid fever, was extremely good.

I have, &c.,  
THEO. MAILLER KENDALL,  
Medical Adviser.

To the Secretary.

## Report of Assessor's Branch for the eighteen months ending 30th June, 1896.

Sydney, 9 September, 1896.

I HAVE the honor to submit a report on the work accomplished in this branch during the period ending June, 1896.

Reference has again to be made to the depreciation of property values, and, as a consequence, large reductions have been made by the City and Suburban Councils in their assessments, which have a corresponding effect on the Board's revenue. This was increased by the City Council making new assessments of all city properties for the year commencing January, 1896, which resulted in the ratable value within that area being reduced by a considerable amount. But notwithstanding this, and the still congested state of financial affairs, the amount of rates received may be considered a subject for satisfaction.

The following is a summary of the work transacted:—

### Rate Notices.

397,993 notices were served on ratepayers, including those for new mains, new sewers, and finals for payment of overdue rates.

### New Mains and New Sewers.

3,392 properties became liable for rating from new mains, and 1,556 from new sewers, making a total for the eighteen months 4,948.

### New Assessments.

3,235 assessments of new buildings, &c., were made, and building fees amounting to £3,078 3s. 3d. received.

### Summons Work.

35,514 final notices were served, and 5,619 summonses issued at the various Courts as under:—

Balmain Court	...	...	...	...	373
Campbelltown Court	...	...	...	...	15

## Annual Report of Stores Branch.

Sir,

Stores Branch, 12 August, 1896.

I have to report on the work of the past eighteen months as under:—

A special re-organization of this Branch led to a considerable reduction in the duties performed, with a consequent economy of wages. The form of book-keeping instituted by the Government Auditors on the formation of the Board in 1888 has been abolished, and books of the simplest possible form substituted. The duty of Comptroller has been merged with that of Paymaster, and the Store staff now consists of one clerk, a storeman, and a labourer, together with working caretakers at two of the suburban depôts. All stores supplied to the Board not being in contract are now bought by the particular officer requiring the same, and such purchases are not recorded by this Branch. Appended are two statements showing value and source of material passed through this Branch during the eighteen months under review:—

## GENERAL CONTRACTS from 1st January, 1895, to 30th June, 1896.

Article.	Contractor.	Rate	Value.
Building material .....	W. Wales .....	10 % over schedule .....	£ s. d. 219 11 7
do .....	J. Power .....	7½% below schedule .....	76 17 5

Ball hydrants .....	J. Danks and Son .....	948 4 1
Stop-valves .....	H. Vale and Sons .....	512 5 9
Special castings .....	do .....	91 1 11
		£54,979 2 2

## Stock-taking.

To lessen the cost of an annual counting and valuation of stock it was decided that only such goods of value as were kept under lock and key should be checked annually, while the heavy iron pipes and water-fittings should be checked every other year only. Under this rule the stock-taking of the smaller goods was effected in September, 1895, with the net result of a small surplus, and the satisfactory report of the Examiner of Accounts thereon was adopted by the Board.

## Material recovered from ground.

Several large schemes devised by the Engineer for improving the water supply to the suburbs required new mains of a larger size in replacement of existing mains, which were carted into the outlying depôts, and, after survey, the good material was thoroughly fettled, repaired, and recoated. Several hundred tons were thus treated by an experienced gang of men, at an average cost of 18s. per ton for material and labour. Under ordinary conditions the mains taken out of ground, and found to be worth it, are fettled, &c., by the depôt caretakers as part of their daily work.

## Stock Balance.

Stock in hand, 31st December, 1894	£ s. d. 30,020 18 6	Issues...	£ s. d. 54,083 7 1
Receipts	43,297 15 3	Stock in hand on the 30th June, 1896	19,235 6 8
	£73,318 13 9		£73,318 13 9

The Secretary.

A. ELLICE FLINT,  
Paymaster and Comptroller of Stores.

## Engineer's Report.

Sir, Engineer's Office, 9th August, 1896.  
I have the honor to submit, for the information of the Board, the Annual Report on the working of the Engineer's Department for the period ending 30th June, 1896.

### 1. WATER SUPPLY BRANCH.

#### Canal and Prospect Reservoir.

A considerable amount of work has been done at Kenny Hill in strengthening and relining of canal and dressing of slopes; the length dealt with was 2,725 lineal feet, making, with length previously treated in 1894, a total length of 3,358 feet.

The slopes of several deep cuttings have been flattened and soiled.

It has been decided, in order to economize in maintenance, to cover in canal at some of the deep cuttings at entrance of tunnels; this, with works of strengthening sides and bottom of canal, will be carried out by contract when funds are available. New drains and flumes have been carried out at 25-mile peg to prevent slips in cutting.

A new line of fencing, 1 mile in length, has also been erected, and thirty wrought-iron gates have been provided and fixed in lieu of slip rails.

The face of cliff at entrance to Cataract Tunnel has been underpinned, and the last shaft has been domed over and carried to surface.

The entrance to Nepean Tunnel has been cleaned out, and inlet extended 32 feet into the river. This work will prevent future silting up, and admit of a free scour in flood-time. Since the work was completed heavy floods have occurred, during which the waters passed over crest of dam to depth of 9 feet, the entrance to tunnel being quite free of silt or obstruction. The advantage of a clear inlet enabled the Superintendent to pass 110,000,000 gallons per day into the Prospect Reservoir, to make up for depletion while the repairs to No. 8 section were in progress, during which time the supply from canal was cut off.

On 26th February, 1896, a slip occurred at 38½-mile peg, when water at rate of 117,000,000 gallons per day was being sent down to the reservoir; steps were immediately taken to repair same, and water was turned on again on 27th.

The intake race at reservoir has been backed and strengthened with rubble, on account of the earth at back being scoured.

The reservoir embankment has been attended to during the last eighteen months since last report, and movements carefully tested by instrument.

Four additional headings were made into the outer slope, making a total of eleven headings and ten drains. The effect of the headings appears to have arrested any movement of outer slope, and consolidated the material by removing the impounded water. During heavy rains the water is quickly removed, instead of being pent up, as heretofore. There is every appearance that this portion of the embankment is now perfectly stable.

The intake-tower and valve-house are in good order, and valves regularly attended to. A new gauge has been fixed in valve-house, which enables the attendant to see the height of water in reservoir without the necessity of going to the intake-tower.

The new cottages which have been erected, and the removal of old buildings around the Veteran Hall, has considerably enhanced the appearance of the place, and admits of Superintendent having men at hand in the event of any contingency occurring.

The Fisheries Department has erected a new hatchery, in connection with breeding of trout, in the ground allotted to them by the Board, an inspection of which is one of the points of interest to visitors.

The planting of trees along the avenue leading from Western Road has been extended, and formation of new paddocks contributes to the handy working of the place for agistment purposes. The revenue from agistment for the period of eighteen months was £505 4s. 8d., the past six months contributing £204 8s. 6d. of the amount.

#### Supply from Prospect Reservoir.

The quantity of water supplied from the reservoir during the eighteen months ending 30th June was 9,104,822,372 gallons, or an average of 16,645,014 gallons per day, or 40.76 gallons per head of population supplied.

#### Works below Prospect Reservoir.

The canal below Prospect has been attended to, and puddle backing to No. 9 embankment has been extended, which has further contributed to prevention of leakage.

The 72-inch main has been recoated with cement wash. This appears to be the best material for the purpose, after trial of several others.

The fence between Pipe-head Basin and Prospect has been enclosed with a dog-proof fence. This work was found to be absolutely necessary to preserve the purity of water in canal, as it was found impossible otherwise to keep dogs out of the reserve.

Owing to the heavy consumption during last summer, it was decided to increase the discharging capacity of the lower canal, and with this view the walls of aqueduct and byewash at Boothtown were raised and additional water sent down to Potts' Hill Reservoir.

ENGINEER'S REPORT—*continued.*

## Potts' Hill Reservoir.

Owing to slips which occurred on the eastern side of the reservoir when water was let out in May, 1895, it was found necessary to strengthen the whole of the pitching on that side, a short length of 321 feet having been previously dealt with by the department. A contract was let for reconstructing and strengthening the pitching by rubble backing and facing with existing pitching. This work was satisfactorily carried out, and water turned into reservoir on 21st October, 1895. In order to expedite the work the Board decided to grant a bonus to contractor, equal to the fine for demurrage, for every week he completed the work under contract time. This concession was availed of, and the reservoir was available for use considerably under the contract limit. The whole of the valves and inlet and outlet chambers were attended to while reservoir was empty.

## Trunk Mains.

I have only to record one burst on the trunk mains during past eighteen months. This occurred on the Liverpool Road at Enfield. Repairs were effected without any appreciable interference with supply to the metropolis.

## Quality of Water.

The water has been analysed every month by the Government Analyst, Mr. Hamlet, and retains its high character for purity.

## General Reticulation.

The reticulation mains generally are in good condition. During the past eighteen months 99 miles of mains have been laid, of which 76 miles are of 6 inches diameter and under, the balance ranging from 8 inches to 20 inches diameter, of cast-iron and steel. The number of leaks reported was 190. This is a very satisfactory record with a system aggregating 900 miles of mains.

During last summer the general system was taxed to the utmost to maintain a supply, the main branches in some instances being too small to meet the supply of districts which they supplied; the districts particularly affected, being Waverley, Randwick, Woollahra, Pyrmont, Balmain, and Strathfield. The Board having approved of schemes for improving the supply to these places, the necessary funds were obtained from the Minister and orders were placed with the contractor for supply of the necessary pipes, and where same were not included in existing contract, fresh contracts were prepared and let for supply of materials and laying of pipes. The works for improving supply to Waverley, Randwick, Pyrmont, Woollahra, North Sydney, and Illawarra suburbs are well advanced and will be available for next summer. Other schemes have been prepared and will be carried out during following year.

The great draught on the reservoirs during the past summer showed that the water did not come in from Potts' Hill fast enough to keep reservoirs at a proper level to ensure sufficient pressure at the higher zones. It was found that to maintain a sufficient head in the screening-tank at Potts' Hill to give the quantity required at Crown-street reduced the head between Potts' Hill and Prospect. Under these conditions the full capacity of the canal could not be availed of. With the view of improving the supply between Prospect and Potts' Hill, surveys and sections have been taken for a trunk-main which will admit of the whole available head being utilised; the main will also act as a duplicate to the 72-inch pipe line and admit of the latter being examined and cleaned when necessary. Funds for this work will be provided for in next Loan Estimates. The lengths of mains cleaned and renewed is shown in report of Chief Inspector.

## House Services.

During the period of eighteen months, 16,124 permits were issued for connections to Board's mains, and 770 inspections were made by the plumbing staff. A large percentage of the complaints re defective supply were found to be due to house services being either corroded or too small for the purpose. In many of the city tenements a  $\frac{3}{4}$ -inch service has been found to be provided for the supply of a terrace of houses. In many instances when the terrace was originally owned by one person, the houses have been subsequently disposed of to various owners with a common right to the service. Under these conditions, when the service becomes defective, the onus of repair becomes a fruitful source of trouble. The Board having power under a late Act to connect premises to the mains under a deferred system of payments, have carried out several contracts on these lines and the system is very much appreciated by small property owners who under other conditions could not avail themselves of a constant supply of water.

## Meter Branch.

The result of the working of this sub-branch for the period of eighteen months is satisfactory. On the completion of the first contract for supply of meters of Board's pattern, a new contract was entered into with Messrs. Davies, Shepherd, & Co., of Sydney and Melbourne for three years' supply. The contract was commenced in April, 1895, and the first delivery was made in July of same year, since which the contractors have delivered 770  $\frac{3}{4}$ -inch, fifty 1-inch, and twenty-five 1 $\frac{1}{2}$ -inch, a total of 845 meters. The manufacture has been highly satisfactory, and reflects great credit on the firm.

During past eighteen months 1,179 meters have been issued on the hiring system, and 182 sold to consumers. The increase of meters under the above system is considerable, indicating that same is appreciated by the public. Where the use of Board's meters shows an increase that of meters by other makers shows a decrease. The number of new meters examined and tested was 154, and number explained, 610.

A considerable amount of work is done for country towns water supply in connection with meters, the number of new meters examined and tested being 307, and number repaired, 169, the majority of meters dealt with being of Board's pattern; the number is an increase on former years. The Board's shops practically deal with the water fittings and meters of the water supply of the Colony as well as the metropolis.

The number of water fittings which have been tested aggregate 95,969; of this number 93,113 were approved and stamped, 2,532 returned for alterations, and 324 condemned.

There

ENGINEER'S REPORT—*continued.*

There is a marked improvement in two directions, viz., in the number forwarded for approval and the number condemned. It speaks well for the manufacturers, as well as for the supervision exercised, that out of such a large number of fittings only 324 should necessitate being rejected.

The bulk of the goods is manufactured locally, and it would appear as if the supply could be kept up from local firms.

In the latter end of 1895 it was found that Board's stamp was being used by unauthorised persons, and on same being investigated the offending parties were proceeded against in the Law Courts, and dealt with.

The various electrical instruments—recorders, gauges, &c.—connected with the service are in good working order.

The report of the Meter Clerk shows a satisfactory record for period of eighteen months. The number of meters fixed was 1,266, the number disconnected 213, leaving a balance of 1,053. Of the number fixed 1,175 were on the rental system.

The number of meters issued since the inception of the Board is, viz. :—

City, Suburbs. and Government buildings ... ..	8,496
Disconnected ... ..	2,362
In operation ... ..	6,134

The number of meters fixed on rental system since April, 1894, is 1,575, showing the system finds considerable favour with the public. As against the above number ninety-one meters of other makers were purchased by owners and fixed.

The number of meters which became inoperative was 526. These were either promptly repaired at Board's repairing shop or replaced by new ones on purchase or hire.

In March the water supply was extended to Gordon-Hornsby district, and since then no less than sixty meters have been applied for and fixed.

The gross revenue from meters, which is in excess of assessment, is £61,632 3s. Of this amount the earnings of Board's meters is £723 16s. 3d. for hire and revenue above assessment of £3,903 18s.; total, £4,627 14s. 3d. The increase of revenue during past six months as compared with corresponding period in previous year, viz. :—

	£	s.	d.
January to June, 1896 ... ..	26,639	12	3
Do 1895 ... ..	20,067	10	8
	6,572	1	7

## Free Supplies of Water.

The quantity of water supplied free to the different charitable institutions and public gardens is, viz. :—

	Gallons.
January to June, 1895—Charitable Institutions ... ..	21,215,000
Public Parks ... ..	6,175,000
July to December, 1895—Charitable Institutions ... ..	23,512,000
Public Parks ... ..	9,457,000
January to June, 1896—Charitable Institutions ... ..	26,455,000
Public Parks ... ..	7,520,000

or a total of 94,334,000 gallons, the value of same, at 1s. per 1,000 gallons, being £4,716 14s.

## Fires.

The number of fires that occurred in the city and suburbs for period of eighteen months is 511. Of this number only forty-five were reported by turncocks as requiring any mention.

It is very satisfactory to note that an ample supply of water was available in each case.

## Pumping Plant.

No. 1 Worthington engine was laid up for general overhaul and renewals from June 6th to July 20th, 1895, the details of which will be found in the Chief Mechanical Engineer's report.

No. 2 Worthington engine has been working satisfactorily without any repairs, except those incidental to ordinary wear and tear. This engine is due for general overhaul, which will be made during the ensuing year.

No. 3 Mort's Dock Company engine had to be stopped for a few days in August, 1895, for purpose of remaking slide valve casing and steam jacket-joints, and removal of some defective valves. With these exceptions and repairs incidental to ordinary wear and tear, the engine has been running daily.

The boilers and connections have been periodically examined, flue spaces cleaned, and defective steam-joints made good.

The fire service of the establishment has been tested monthly, and kept in efficient order ready for emergency.

The Board having decided to dispense with gas, and substitute electric lighting, a contract was entered into with Messrs. Edge and Edge for installing same. This has made sufficient progress that on the arrival of the engine and dynamo the installation will be complete. It is also proposed to provide electric motive power for the repairing and carpenter's shops.

The telephone communication between the Chief Inspector of Water Service and turncocks has proved of the utmost service in case of breaks or other contingencies. The system is now as complete as it is possible to make it. The head works are in direct communication with the central station, and the lines of communication ramify to all the outlying suburbs.

The

ENGINEER'S REPORT—*continued.*

## Duty of Engines.

The work performed by the several engines, as indicated by the returns, is, viz. :—

Crown-street to Paddington	... ..	62,600,000	ft.-lb. per cwt. of coal.
"    Woollahra	... ..	63,400,000	"    "    "
"    Waverley	... ..	54,800,000	"    "    "
Ryde to Ryde Village	... ..	55,500,000	"    "    "
"    Chatswood	... ..	67,300,000	"    "    "
Carlton to Ponshurst	... ..	22,800,000	"    "    "
North Richmond to Richmond	... ..	22,400,000	"    "    "

## Length of Mains under the control of the Board.

The total length of mains, exclusive of trunk mains, under the control of the Board is 891.26 miles. The total number of screw-down hydrants fixed is 1,608, and ball hydrants, 16,904. The length of mains lowered on account of alterations to level of road is 2.31 miles; the length of mains cleaned is 8.92 miles; and length removed, 8.5 miles.

## New Districts.

During the past eighteen months two districts have been added to the area supplied by water, viz., Smithfield and Gordon-Hornsby districts.

The former is provided with a storage tank constructed of concrete, having a capacity of 100,000 gallons, and situate alongside canal, about 3 miles below Prospect. From the tank a 4-inch main is laid to the township, and from which the various streets are reticulated, the length of mains aggregating 3½ miles. The tank provides an ample supply of water, with good pressure when supply to canal is cut off.

Hornsby-Gordon Supply.—The system comprises a pumping plant with engine-house at Chatswood tank reserve, a rising main made of steel, 10 inches in diameter, 7½ miles long, to Wahroongah, the highest point, at which tanks, having a capacity of 40,000 gallons, have been erected. This section also acts as a reticulating main between abovenamed places. From Wahroongah the 10-inch steel main extends to Hornsby township. From the trunk main about 9 miles of reticulating mains, of 6-inch and 4-inch diameter, have been laid, the necessary revenue being guaranteed in each case before reticulating mains are laid.

The engine and tanks were used in other places, the former at Woollahra, and was fitted with a new pump for its present service; the latter formed part of the original North Shore supply. The head which pumps have to work against is 390 feet. This is the greatest head, so far, that the Board's pumping plant has to work against.

The main being of steel, special connections were provided in each length, and the two-way cocks, for house service on each side, are fixed under pressure by a special fitting by the tarmacock.

It is contemplated to provide duplicate plant as a stand-by, and to take up the work during summer months as district develops; also, to erect storage reservoirs at Wahroongah, Hornsby, and Pymble.

Extending the water supply to this district has given a considerable impetus to building, and there is every prospect of the system returning the best results of any under the Board. The contract for manufacture and supply of steel riveted pipes, altering and fixing pumping plant, &c., was carried out by Messrs. G. and C. Hoskins, and erection of tanks by Messrs. Eaton Bros.

## Country Towns Supply under Board's control.

Liverpool.—Beyond a small extension of 6-inch main, of 217 yards, no works of importance have been carried out. The improvement carried out at Liverpool dam in the previous year has been effective in obviating complaints as to quality of water in the township. The works are in good order.

Campbelltown.—The only work carried out here was 223 yards of 4-inch main. The mains, &c., are in good condition.

Richmond.—During past eighteen months 464 lineal yards of mains have been laid, and eighteen new connections made. There is an improvement in the consumption, but the system can never be worked satisfactorily (financially) until the Board has the same rating powers as in the metropolitan area and other country towns in the county of Cumberland. The front boundary fence has been renewed, and new entrance gate fixed.

## Botany Reserve.

In order to conserve as much water as possible for Board's tenants, several of the existing dams have been repaired and made available for storage purposes. During the end of last summer, an abnormally dry one, the water in engine-pond, from which lessees draw their supply for wool-scouring purposes, got so low that fears were entertained that the supply would be seriously curtailed; with the improvements now effected up stream a shortage need not be feared. There are now four large wool-scouring establishments located on the old reserve, and as a large number of hands are employed during the season, the reserve presents a busy scene.

The four lessees, when in full work, use an immense quantity of water—about 554,000,000 gallons in eighteen months—the value of which would equal about £2,310.

The old pumping plant which was erected in 1857, and is now of no use, has been placed for sale, and it is expected that same will be cleared, leaving the building, which is a substantial one, for lease for other purposes.

## Contracts let.

In addition to annual pipe-laying contract, fifty-five contracts for various works have been carried out. The manufacture and supply of cast-iron pipes from 4-inch up to 20-inch diameter, and of inverted steel pipes, 8, 10, and 20 inch diameter, have been carried out with vigour by the contractors for same. The placing of orders for large-sized mains with Messrs. G. and C. Hoskins necessitated them laying down

ENGINEER'S REPORT—*continued.*

down new plant, and considering that the men were not accustomed to the work, and stoppages incidental to new plant, the contractors have met the requisitions of the Board very well. A large number of men found constant employment in connection with fulfilling Board's requirements. Every pipe, steel or cast-iron, is made and tested under the immediate supervision of the Board's inspector, who is constantly on the premises.

The old flooring of Crown-street was removed, and a neat tile one substituted. Painting of storage tanks at Chatswood, Ryde, and Ashfield, and suspension bridge, Lane Cove, Crown-street engine-house; erection of cottages, stables, and alteration to Veteran Hall, Prospect; erecting engine-house at Chatswood; constructing effluent drain at Botany; strengthening pitching, eastern slope, Pott's Hill Reservoir; alterations and painting at head office, &c., and also numerous small works carried out by the staff.

## Expenditure on Loan Vote.

The expenditure in connection with works chargeable to Loan Vote for period of eighteen months is, viz.:—

	£	s.	d.
New mains, including trunk and reticulating mains ...	92,640	19	0
Buildings, machinery, and other works ... ..	7,637	13	8
	<u>£90,278</u>	<u>12</u>	<u>8</u>

## Expenditure on Maintenance Vote.

The expenditure on maintenance of works for period of eighteen months was £35,882 17s. 5d., being an increase of about £2,000 per annum over previous year.

## Report of Chief Mechanical Engineer.

Sir,

The Waterworks Reservoir, Crown-street, 10 July, 1896.

I have the honor to submit the following report upon the working of pumping engines, &c., and water supply for the year ending 30th June, 1896.

No. 1 engine was laid up for general overhaul, renewals, &c., from 6th June to 20th July, 1895,—and which overhaul consisted in fitting new piston rings throughout; low-pressure B cylinder was disconnected from high-pressure cylinder, defective broken studs were drilled out, and new ones fitted; low-pressure piston rod glands cut in halves and fitted together with steel plates; new piston rod end and nut fitted; exhaust pipe and valve casing joints remade; Corless valves drawn and adjusted; all connecting gear stripped and adjusted; air-pump buckets drawn; new Muntz-metal guard studs fitted throughout, in the place of defective iron ones; air-pump valves renewed throughout; water channels opened; all brasses of connections let together; compensators dismantled, buckets and glands rebushed; gudgeons trued up and bushes bedded thereto; all valve gear brasses let together; jacketing drain pipes renewed throughout; feed-pump plungers turned up; new neck and gland bushes fitted; new gudgeon pins fitted to plungers and connecting rods; all bushes trued out and new driving studs fitted where found necessary; a new feed valve chest (gun metal) fitted complete; parallel cross-head guides readjusted; main pumps dismantled, cleaned, and coated throughout; valve studs refastened with feathers; 200 defective iron nuts replaced with gun metal nuts; renewed 1 dozen springs, 2 valves and plates, 200 gun metal spring-caps replacing defective iron ones. Since completion of overhaul this machinery has been working uninterruptedly.

No. 2 engine has been working satisfactorily throughout the year, the only casualty of any note being the brass bushes of compensator becoming disarranged; they were replaced by new ones, fitted internally (for the time being) with shoulder bushes to prevent the packing passing through; otherwise, the renewals and repairs were nominal, incidental only to ordinary wear. This engine is now due for general overhaul.

No. 3 engine was laid up for a few days in August, 1895, for the purpose of remaking several slide valve casing and steam jacketing joints; lined-up some bearing brasses; drew air-pump buckets; renewed several valves thereon where found defective. These pumps have since been running daily; only slight renewals wanted incidental to ordinary wear.

Boilers and connections have been periodically examined; flue spaces, &c., cleaned; steam-pipe joints, &c., made good when defective.

The connections for protection of buildings in case of fire have been tested monthly throughout the year in order to their being kept in efficient working order and condition.

The water pumped during the year and a half, as shown in tabulated form herewith, attached.

Water pumped by Crown-street pumps during the year to Paddington Reservoir was 1,909,364,800 gallons, showing an increase of 238.56 million gallons on the previous year, and for the quarter an increase of 66.5 million gallons on the corresponding quarter of the previous year.

The quantity of water pumped to Woolahra Reservoir during the year was 443,229,440 gallons, being an increase of 1.04 million gallons on the previous year, and for the last quarter 9.74 thousand gallons increase on the corresponding quarter of the previous year.

The quantity of water pumped to Waverley Reservoir during the year was 254,526,650 gallons, being an increase of 38.4 million gallons on the previous year, and an increase for the quarter of 2.45 million gallons on the corresponding quarter of the previous year.

Ryde

ENGINEER'S REPORT—*continued.*

Ryde pumping works are in efficient working order. The quantity of water pumped at Ryde during the year to Ryde Hill was 108,654,000 gallons, being 30.12 million gallons increase on the previous year, and to Chatswood, 265,968,000 gallons, being an increase of 55.34 million gallons on the previous year, and for the last quarter of the year an increase in the total pumping of 31.55 million gallons on the corresponding quarter of the year previous.

*Carlton pumps.*—These pumps have been working uninterruptedly for the year, excepting short stoppage for necessary boiler sludging, &c. The quantity of water pumped at Carlton for the year was 40,343,800 gallons, being 14.61 million gallons more than the previous year, and for the last quarter 4.04 million gallons more than the corresponding quarter of the year previous.

The Engineer-in-Chief.

J. FYFE,

Chief Mechanical Engineer.

## Superintendent's Report.

Prospect Reservoir, 6 July, 1896.

I HAVE the honor to report on the state of the main line of conduit, and reservoir embankment at Prospect.

The whole line has been kept in good order, and the following works have been carried out, to improve and strengthen, and otherwise:—

*Potts' Hill Reservoir.*—The whole of the eastern slope of this reservoir has been completed, in the same manner as the first 321 feet in 1894, by strengthening the slopes at back of pitching with a dry rubble wall. The necessity of this was seen immediately after water was let out of reservoir on the 7th of May, 1895, by the slopes slipping for nearly the whole length of the old work. The work was completed and water turned into reservoir on 21st October, 1895.

*D. Davidson's Length.*—The 72' main has been rewashed with cement wash.

Puddle has been extended to Embankment No. 9 on lower canal; this has further stopped some of the leaking.

Owing to the heavy consumption of water last summer it was decided to raise the water in lower canal so as to give a better supply. To carry this out it was necessary to raise the walls of aqueduct and bywash at Boothtown; this was quickly executed, and the extra water put in.

The fence from Pipe Head Basin to Prospect has been made dog-proof; this was found necessary on account of the difficulty of keeping dogs from going into canal.

*Prospect Reservoir Embankment.*—A further number of four headings have been put in at seat of this embankment, making a total of eleven headings and ten drains. This completes the lot intended for the present, and since its completion no movement of outer slope appears to be taking place. It is readily seen in heavy rains how quickly the water is carried off, instead of being pent up in embankment as heretofore. I have no doubt but this part of embankment is now perfectly safe.

The intake race to reservoir has been backed up with rubble stone; this was found necessary as the water from race meeting the water in reservoir caused a heavy scour at back of concrete.

A further lot of trees and shrubs have been planted on each side of the road leading to the Western road. This road has been fenced on each side, thus giving greater facilities for grazing stock taken in for agistment.

The old buildings have been pulled down around Veteran Hall, and new stables erected, together with three new cottages, for the maintenance men at Prospect. This has added very much to the appearance of the place.

Two concrete walls have been put in at Byewash, to prevent scour.

*Ganger Whalan's Length.*—A short embankment at 38½ miles carried away on 26th February, 1896, when 117 million gallons of water were being sent down. Water was cut off at the Cataract on the evening of the 25th, and the scour valve opened above, and water lowered some 2 feet before the bank carried away. This was repaired, and water turned on again on the 27th.

A further mile of fencing has been erected with top rail and four wires.

A further length of 2,725 feet of relining and strengthening of canal pitching on No. 8 Section has been treated similar to the 633 feet carried out in 1894, thus making a total of 3,358 feet completed, in addition to slopes of cuttings, on the lengths being flattened and soiled, together with re-making berm drains.

Several cuttings on Harris and Harvey's lengths. The slopes have also been flattened and soiled.

A new W.I. 30-inch flume has been put in at near 25 miles, to take water from high side of cutting, and putting in a sub-drain 5 feet deep in drain on high side to cut off soakage, and thus prevent slips in cutting.

30 new W.I. gates have been supplied to take the place of slip-rails to bridge crossings.

*Wonson's Length.*—The last shaft to the Cataract tunnel has had a dome put in, also the cliff at entrance to tunnel has been underpinned for a distance of 35 feet. Another 18 feet will be done this year to complete it.

Nepean Tunnel entrance has again been cleaned out, and advantage taken of water being low to extend the tunnel some 32 feet, and clearing large boulders and stores away to give the current of water a free course. This has answered the purpose intended, no silting up having taken place since it was completed, the late heavy rains taking flood-waters some 9 feet over dam, still the entrance was clear, and I was able to pass water on through after closing repairs to pitching on No. 8 Section. This was a great advantage, as I only had some 40 million gallons in Cataract, which I increased to 110 millions required, so as to quickly fill reservoir at Prospect.

The agistment fees for the eighteen months amount to the sum of £505 4s. 8d. £204 8s. 6d. of this is for the last six months ending 30th June, 1896.

W. WAKEFORD,  
Superintendent.

ENGINEER'S REPORT—*continued.*

## METER DEPARTMENT, HEAD OFFICE.

Report of progress in this department from January, 1895, to June, 1896.

Sydney, 21 July, 1896.

THE number of meters fixed during this period is 1,266—of these, 1,175 are rented from the Board—213 cut off, leaving a net increase of 1,053.

Number of meters issued from commencement—City, Suburbs, and Government, 8,496; disconnected, 2,362; in operation, 6,134. The increase is largely in excess of previous years, and is very satisfactory.

The number of meters rented since April, 1894, is 1,575, showing conclusively the favour with which this system is received by the public generally, as out of a total of 1,266 issued between January, 1895, and June, 1896, 1,175 are rented, the balance, 91, representing meters purchased of the Board or elsewhere.

The number of meters which became inoperative during this period was 526. These were in nearly all cases promptly repaired or replaced by rented or purchased meters.

The water was extended to the district of Gordon in March, and already 60 meters have been applied for.

The gross revenue from meters is £61,632 3s. (this amount is in excess of assessment). Of this the portion earned from Board meters is—rents, £723 16s. 3d.; excesses over and above assessment, £3,907 18s.; total, £4,627 14s. 3d.

During the latter part of 1895 and the early part of 1896 the weather was remarkably dry and hot. This will partly account for advance on previous years in the amount of revenue earned and the number of meters issued.

In October, 1895, it was found necessary to appoint an additional reader, but beyond that the expenses in working this department have not been increased, although the additional work involved in issuing rented meters, filling in agreements, &c., &c., is considerable.

Engineer.

E. R. ABSELL,  
Meter Clerk.

The increase during the last six months as compared with the same period in previous year is noteworthy, viz. :—

January to June, 1896...	...	...	...	...	...	£26,639	12	3
January to June, 1895...	...	...	...	...	...	20,067	10	8
						<u>£6,572</u>	<u>1</u>	<u>7</u>

The quantity of water granted free from January, 1895, to June, 1896, is—

ENGINEER'S REPORT—*continued.*

## II.—SEWERAGE BRANCH.

DURING the past eighteen months the following sewers and storm-water drains constructed by the Government Sewerage Department have been transferred to the Board under the provisions of the Amending Sewerage Act of 1889 :—

- (a) Sewers—  
Portion of North Sydney Reticulation Sewers.
- (b) Storm-water Drains—  
Long Cove Creek, 2nd Section.  
Iron Cove Creek, Extension.  
Baptist-street.  
Homebush Creek, 1st Division.  
Iron Cove Creek (Croydon Branch), Lower Section.  
Iron Cove Creek (Croydon Branch), Upper Section.  
Macdonaldtown Park, Extension.

Total length of sewers and storm-water drains aggregate 10·22 miles, and are shown in Appendix A.

## Surveys—New Work, &amp;c.

Surveys have been made for extending the sewerage system to western suburbs, Annandale, eastern slopes of Waverley and Randwick, and southern portion of North Sydney, and for relief drains in city, Paddington, and Woollahra.

## New Sewers.

The length of sewers constructed during the last eighteen months aggregated 22·63 miles, shown in Appendix B.

The total length of sewers and storm-water drains under the jurisdiction of the Board is 244·62 miles.

The construction of reticulating sewers has been pushed on with vigour, in order that the public may have the benefit of improved sanitation without delay when main sewers are completed, and the Board be in a position to collect revenue on the whole to obviate having to pay interest on dead capital.

The low-lying portions of Erskineville, Alexandria, and Newtown will shortly be reticulated, and property owners be placed in the same position as those on higher levels, which are served by the gravitation system, by having improved sanitation, and thus abolish the anomalous state of things in connection with drainage rate.

The low-lying areas referred to were considered by the health authorities as the unhealthiest portions of the several boroughs; and to improve the sanitary condition it was necessary for the Board to anticipate the more complete low-level system by constructing a temporary pumping station to which the sewage of the abovementioned areas will gravitate, and will be lifted from thence to the Erskineville branch of the southern outfall sewer by an installation of shone-ejectors and air-compressors.

The necessary plant, including ejectors, engine and compressors, and connections, was imported from the manufacturers, Messrs. Hughes and Lancaster, the boiler and air-receiver being manufactured locally by Messrs. G. and C. Hoskins. It is anticipated that the whole of the plant will be in working order in a few months, when the efficiency of the system for dealing with low-lying districts will be tested. The number of persons provided for is 8,000.

## Contracts in Progress.

There are twenty-seven contracts in progress, embracing 104,606 lineal feet of foul-water and relief sewers; also for manufacture of sludge-trucks, pumping plant, and repairs to buildings.

## Storm-water Sewers.

The several districts served by the storm-water sewers transferred to the Board have been divided into drainage areas, and rates levied on same, as provided in the Act, the differential rating system being adopted.

The provision of revenue for interest on capital and working expenses, as limited by the Act, does not cover the annual expense. The present result, shown by returns from the accountant, results in a loss of £800 per annum. This shows the advisability of the greatest care being exercised in constructing these ducts, as in the western suburbs the cost of those already constructed will form an appreciable addition to the capital account, and must eventually be met by the revenue on sewerage account; and it is within the bounds of possibility that the rate for the western suburbs will be higher than in the other districts rated by the Board.

## Outfall Sewers.

The northern and southern outfall sewers, with branches thereto, have been inspected and found in good working order. The various penstock valves have been regularly tested and kept in working condition. The automatic flow-recorders continue to give satisfaction.

## Reticulating Sewers—Sydney and Suburban.

The whole of the reticulating sewers are in good working condition; they are kept regularly flushed by the maintenance staff. A few cases of flooding during heavy storms occurred, and measures were taken to prevent a recurrence of same. Considering the mileage of sewers under the Board, the cases of floodings are very few. Owing to an adverse verdict in a case of flooding of premises through a

ENGINEER'S REPORT—*continued.*

defective sewer passing under premises which had been erected over the sewers, and the correct position not being known, the Board were cast in damages. To avoid further actions at law, it was decided to reconstruct such sewers which were found to pass under dwellings on different lines, or, where same was not possible, to so strengthen the sewer that either flooding or crushing of sewer would be prevented. On these lines the Board has altered two lines of drains, and others will be gradually taken in hand.

Arrangements have been made to take over such portions of drainage systems carried out by the Boroughs of North Sydney and Glebe as can be worked in with the new system, under provisions of the Amending Sewerage Act.

The Randwick section has been improved and enlarged, and the majority of the property owners have altered the house system to conform with Board's by-laws.

## Removal of Silt from Sewers.

The quantity of silt removed from the sewers of old system during the past eighteen months was 2,801 tons, of which 2,315 tons were disposed of on Government reclamation works. The quantity from the main outfalls, new system, was—Bondi main sewer 1,350 tons, and Botany main sewer 200 tons. This is an increase on former years, due in a measure to the prevailing dry weather and extension of the reticulating system. The removal of silt from the storm-water sewers, which totalled 2,000 cubic yards, requires considerable labour during dry spells, as, on account of the width and small fall, there is not sufficient scour to carry away the detritus from roads and streets discharging into same.

The abolishing of large pit at Darling Harbour, and carrying main sewer through to harbour, has saved considerable labour in removing silt, as it is more economical to remove by dredge than by hand and cartage to punt.

The Board's silt punt has been thoroughly overhauled and painted.

## Repairs to Sewers.

The following branch sewers, old system, have been thoroughly repaired, and the life of same has been considerably prolonged, viz.:—Elizabeth-street, Pitt-street (in progress).

The repairs effected since the work was taken in hand are as under:—

Jan.	June.		Invert repaired. Feet super.	Pointing. Feet super.	Arch repaired. Feet lineal.
1895-1896...	...	...	5,660	30,914	.....
1894	...	...	4,591	2,352	1,690
1893	...	...	10,212	33,072	59
1891-2-3	...	...	15,354	143,013	68
			35,817	209,351	1,817

The cost of this work is provided out of revenue, and when the whole of the brick sewers, old system, have been dealt with the charge upon revenue will become lighter.

The bricklayers have also carried out work on requisition from the Water Branch of such works as could not well be done by contract.

## Outlet Works.

The buildings, valves, screens, &c., are in good working order. No stoppage has occurred during the past eighteen months. The quantity of silt removed from screening chambers was 1,960 cubic yards, showing an increase of 265 cubic yards over 1894. This is satisfactory, considering the extension of the reticulating sewers discharging into the outfall. The quantity of lime used was  $4\frac{1}{2}$  tons. This is used for washing walls, &c., after cleaning out of sludge.

The oil engine for working lifting grab continues to give satisfaction, the cost per cubic yard of sludge being  $\frac{1}{2}$ d. as against  $\frac{3}{4}$ d. in 1894.

The buildings are being re-coloured and tuck-pointed, this being the first expenditure on this head since Board assumed charge in 1889.

The workmen's cottages are in good repair and all occupied, and trees appear to be thriving.

The locomotive has been fitted with new boiler, and been generally overhauled, and is in first-class running order. The sludge trucks have been repaired, but it was found necessary to have a new set supplied, which can be worked easier by the men in tipping. The temporary bridge is in fair condition, but requires close attention to prevent accident. A scheme is being worked out to dispose of the sludge on the farm by means of a submarine pipe, and obviate the necessity for a bridge.

## Sewage Farm.

The Board have foreclosed on the late lessee, and entered into possession of the farm again. Steps were taken to put it into something like the condition prior to being leased. A contract was let for cleaning up farm, repairing banks and roads, which was satisfactorily carried out. An annual contract was also let for ploughing and harrowing the irrigation and filtration beds, the whole of which had become practically inoperative as filtering media through neglect of lessee. The cow-shed and styes were also cleaned out and lime-washed. When the public were aware that Board had resumed charge, the manager had more applications for agistment than he could comply with, as he had instructions to take no more than he had foed for. New flumes were made, and various other minor improvements carried out. Tree planting has been carried out to a considerable extent on the foreshores to replace the natural scrub, which is gradually disappearing.

The Board's property is now securely fenced in, so that agistment stock can be worked within bounds.

The late staff were re-employed on work being commenced, and it would conduce to the appearance of the place and efficient working if workmen's cottages were erected on the farm, as it would not be advisable for the Board to permit the working of the farm to pass into other hands in the light of past experiences.

The

ENGINEER'S REPORT—*continued.*

The results from stock and pig raising under the Board show that same will be profitable, and stock of approved breed will be placed on same for breeding and sale.

The irrigation and filtration areas are working very well, and the sludge regularly and properly disposed of. The effluent water is regularly analysed by Mr. Hamlet, Government Analytical Chemist, and the working of farm by manager is guided by his reports. The effluent generally bears an uniform character. Report of analysis shown in appendix.

The filtration area has been extended since last report, and main carrier extended in connection with same. The extension comprises 22 acres—11 acres of filtering tanks, which were formed on, nearly as possible, the same lines as the natural tanks, with a 66-foot bank between. One tank is lower than the other and connected by a weir to prevent overflowing of the upper one.

Both tanks are underdrained with subsoil pipes, specially made for the purpose, which have given great satisfaction. The outlet of drain is carried to low-water mark in Botany Bay. There is also provided a high-water discharge in the junction chamber, so that at all tides there is an outlet for subsoil water.

The bank between tanks is planted with two rows of trees; and surface sown with grass. The fringe of the tanks will be planted with willows, which are large absorbers of water. Tree planting is being made a feature on the farm, and I am indebted to Mr. Charles Moore, the late, and Mr. Maiden, the present, Curator of Botanical Gardens, for advice on this matter.

The other section of extension is 11 acres, laid out in undulating pasture land. This will be sown with English grasses, and will eventually form splendid resting paddocks for cattle, and should be a source of profit in the future.

The sandy soil in banks on each side of main carrier has been covered with sludge to prevent the sand being shifted by the wind—the surfaces are gradually being covered with grass and banks becoming set. The railway has been extended to end of main carrier for more efficient working of the Farm. The manager was not able to plant any crops owing to the bad state the ground was left in, but in the coming spring he intends sowing all beds which can be spared.

A return is kept of the flooding of each bed with dates of ploughing and harrowing. A return showing the working of one old and one new bed is shown in Appendix.

The daily flow of sewage on to the farm is 2,059,200 gallons—the late wet weather required the whole of available area to deal with same—a large proportion of which could be turned into the river without detriment or danger to health.

## House Connections.

The number of houses connected with the Metropolitan and Suburban Sewers under the supervision of the Board is:—

	1890.	1891.	1892.	1893.	1894.	1895-6.	Total.
City ... ..	961	541	1,070	1,223	1,050	1,384	6,229
Suburban ... ..	3,804	3,578	3,448	3,437	2,853	3,113	20,233

Connected to City Sewers prior to Board's control ... ..							18,000
							44,462

An analysis of the drainages during past 18 months gives the following results:—City, 1,384; Alexandria, 115; Camperdown, 328; Glebe, 990; Erskineville, 46; Marrickville, 36; Newtown, 169; Petersham, 268; Paddington, 118; Redfern, 145; Randwick, 270; Waterloo, 64; Waverley, 244; Woollahra, 104; North Sydney, 216.

The above returns include those properties which were connected under the compulsory section of the Act, and those for which applications were received to have work done under the deferred system of payments, the different numbers being:—

## Compulsory Drainage.

Erskineville, 27; Newtown, 13; Alexandria, 14; Redfern, 3; Waterloo, 11; Camperdown, 2; Paddington, 14. Total, 84.

Deferred payment system:—City, 21; Glebe, 39; Paddington, 11; Randwick, 19; Waverley, 6; Woollahra, 4; Camperdown, 7; Newtown, 7; Waterloo, 2; Alexandria, 10; Redfern, 7; Petersham, 1; North Sydney, 2. Total, 136.

The total number of houses connected under the compulsory powers of the Board and average cost per house is shown under:—

	1891.	1892.	1893.	1894.	1895-6.
City ... ..	19	6	4	.....	.....
Suburbs ... ..	245	240	32	91	84
	£14 14s.	£12 10s.	£18 14s.	£9 14s.	£9 10s.

The number of estimates prepared for work, or applications for work to be done under deferred payment system, was 191.

## House drainage plans.

The fees received for house-drainage plans, and number of plans prepared, was, viz.—

	1890.	1891.	1892.	1893.	1894.	1895-6.	Total.
Plans ... ..	2,213	2,303	2,485	2,669	2,119	2,624	14,512
Fees ... ..	£1,033	£1,088 15s.	£1,087 13s. 6d.	£1,106 7s. 6d.	£818 15s.	£869 5s.	£6,003 16s.

The number of houses surveyed and plotted in record plans was 1864, and the number of building plans lodged for approval was 257.

The reduction in the number of houses dealt with under the compulsory section of the Act is principally due to the provision made whereby property owners, who have not the necessary funds but all the desire to have improved sanitation, can avail themselves of same by the Board doing the work on the deferred payment system.

House-drainage

ENGINEER'S REPORT—*continued.*

## House-drainage Certificates.

The number of official certificates issued to owners in connection with house-drainage since inception of the Board is, viz.—

	1891.	1892.	1893.	1894.	1895-0.
City ... ..	251	272	265	294	335
Suburbs ... ..	1,140	843	1,148	500	514

## Defective Drainage.

The examination of premises with defective drainage by the Board's inspectors has been carried out with fair results as to reconstruction of same. 442 first notices and 113 final notices to alter or repair defective drains were served on properties; of the number, 183 houses were attended to by the owners.

Forty-five house-drains were smoke-tested, and in each case found defective.

The Board is precluded from taking such action as the interests of public health would indicate owing to absence of necessary power to make a charge on property in cases of recalcitrant owners of property connected with the old city system, although such powers are given in connection with the new system. It is in connection with old drainage and obsolete sanitary fittings that the greatest danger lies; and it is impossible to think that the Legislature intended, within certain limits, to withhold on one hand that which they freely granted on the other. The reports received from the Medical Adviser are dealt with by inspections by the inspectors, and notices are served setting out the requirements to place the premises in a sanitary condition.

## Sanitary Plumbing.

This branch, in addition to the ordinary routine of inspection of plumbers' work, makes inspections in connection with returns from Medical Adviser and on request of architects and others.

During the past eighteen months 3,059 jobs have been inspected and passed, for which 1,041 certificates were issued on application of owners; 279 notices to alter defective fittings, out of which 113 were attended to; ten systems were smoke-tested, and 312 soil-pipes tested hydrostatically.

The application of the water test was not one viewed with much favour by plumbers when first introduced; but as it has been the means of detecting faults not visible to the eye or covered up with fittings it has been insisted upon with favourable results to occupiers of the premises.

In one case a cast-iron soil-pipe was found with a cracked socket and an imperfect connection between same and water-closet.

In another instance where three (3) soil-pipes existed the owner objected to the test, but after consideration the test was applied, with the result that the whole three were found defective.

In a third case a soil-pipe was found inside a dwelling with open joints—the bend at top was found to be eaten through with sewer-gas—the joints of waste-pipes in walls found imperfect, and in other cases joints of pipes wrapped with cloth and twine.

The foregoing descriptions are a few of the many cases of defects found in the sanitary fittings of city property, and in similar cases the Board should have power within certain limits of rectifying same in the interests of the health of the city where owners will not take action.

I have to report that a considerable improvement has taken place in the manner in which plumbing jobs are carried out, notwithstanding the keen competition there exists in the trade.

The plumbing class at the Technical College still attracts a large number of young men qualifying themselves for plumbers and the higher branches of the trade.

## Ventilation of Sewers.

The various shafts erected in the city and suburbs have been tested during the year with satisfactory results. The returns are shown in tables at end of report.

Very few complaints were received as to smells from the shafts; these were found on investigation to be unfounded, as far as the shafts were concerned. That many of the complaints originated from sentiment is illustrated by the steps taken by the inspector to close down the shaft unknown to the complainant, who still complained, and on being shown the shaft fitted with an expansion plug, which prevented any sewer-air passing out of shaft, effectually settled the question.

The maintenance staff has been busily engaged in painting existing shafts, which totalled up 1,000 square yards, removing shafts and re-erecting same in other positions on account of alteration to buildings to which they were fixed, repairing cowls, and refastening bonds.

In addition to above, general plumbing work to offices, stores, and pumping-stations has been carried out. During the eighteen months only two shafts were broken by strong gales of wind which prevailed.

## Special Shafts.

Bathurst-street, City ... ..	.....	.....	.....	52,129	" "

\* No water available in bore in 1894.

The total quantity of air delivered by induct sprays into the sewers now connected with Obelisk, Hyde Park, is 229,720 cubic feet per hour, and the work done by the Obelisk is 205,597 cubic feet per hour, the loss being about 11 per cent.

## New Works.

The erection of ventilating-shafts and arrangement for inducing air into sewers by means of watersprays, and connecting up old and new systems, for ventilating purposes, has been vigorously pushed on during the past eighteen months. The effect of the ventilating work has had a marked effect on sewers which have been operated upon; but there is much yet to be done in the outfall sewers and some of the main branches before the system can be considered satisfactory. The greatest trouble has been experienced in locating some of the existing sewers in the city, and in order to reduce the number of shafts the dead ends have been connected up to other sewers which are ventilated, thus ensuring circulation of the air currents.

The amount of work performed during the eighteen months is considerable, representing the erection of 419 exhaust and 266 induct shafts, and fixing 8 induct and 4 exhaust sprays with chambers and automatic fittings. The work extends over the city and eight boroughs, with no less than 1,500 openings in the various streets. Only two complaints were received, which were found not to be due to the contractor. This speaks very highly of the manner in which the contractor falls in with the views of the city and suburban authorities as to restoring streets, notices, &c.

Several of the shafts attached to high buildings vary from 100 to 150 feet in height, several of which are 9 inches in diameter. The average cost of shafts, including watersprays, is about £11 each.

The following boroughs have been dealt with:—Newtown, Camperdown, Glebe, Petersham, Stanmore, Erskineville, Alexandria.

Several shafts have also been erected at request of Borough Councils, viz.: 4 at Balmain and 5 in Strathfield, in connection with stormwater sewers.

A return of the work of the sprays, induct and exhausts, is shown in the appendices, which may be considered satisfactory.

The quantity of material used in contract in progress totals 33,012 feet of ventilating-pipes of 9" and 6" diameter, and 25,186 feet of stoneware connecting-pipes, the average height of shafts being 48 feet.

## Drawings, &amp;c.

During past eighteen months the Chief Draftsman reports that 117 sheets of drawings and 408 tracings have been prepared, and in the Heliotyping Room 1,240 heliotypes were made and 826 plans mounted.

EXHAUST WORK.—1,008 6-in. shafts, 18 9-in. shafts, and 14 stacks, steam shafts, and water sprays.  
 Exhaust per hour, 3,675,563 cubic feet of air; per day, 88,213,512 cubic feet; per week, 617,494,584 cubic feet.  
 INDUCT SHAFTS.—514 6-in. shafts, 6 9-in. shafts, 9 water sprays.  
 Induct per hour, 2,611,108 cubic feet of air; per day, 62,666,592 cubic feet; per week, 438,666,144 cubic feet.

O. H. WINDSOR,  
 Tester.

ENGINEER'S REPORT—continued.

APPENDIX D.

Government Laboratory, Sydney, 24 June, 1896.

ANALYSIS of a Sample of Water received from effluent from Sewage Farm.

		Results expressed in—	
		Grains per gallon.	Parts per 100,000.
Appearance in 2-ft. tube	Well A } Clear brown, but not offensive		
	" B }		
Chlorine as chlorides	" A	6.8	
	" B	7.4	
Nitrogen existing as free ammonia	" A		1.3
	" B		1.5
Organic nitrogen, or "Albuminoid Ammonia"	" A		6.0
	" B		7.0
Oxygen absorbed in 15 minutes at 80° Fah.	" A		10.0
	" B		14.0
Total solid residue dried at 220° Fah.	" A	35.0	
	" B	46.5	
Phosphates from animal impurity	" A	25.0	
	" B	40.0	

General observations on the character of the water.—May be allowed to pass into tidal waters and estuaries without creating offence.

WILLIAM H. HAMLET,  
Government Analyst.

HUNTER DISTRICT WATER SUPPLY AND SEWERAGE BOARD.

No. 1.

Minute by The Under Secretary for Public Works.

Hunter District Water and Sewerage Board Elections.

Department of Public Works, Sydney, 9 May, 1896.

For the purposes of the Hunter District Water and Sewerage Board Elections, which take place on the 30th proximo, it will be necessary to appoint two Returning Officers, one for the City of Newcastle, and one for the Suburban Municipalities. On the previous occasion the Mayor of Newcastle and the Mayor of Hamilton were asked to act in this capacity.

Submitted for instructions.

ROBERT HICKSON,

Under Secretary for Public Works and Commissioner for Roads.

Same officials may be asked to undertake the duty.—J.H.Y., 11/5/96. Write, 11/5/96. The Mayor of Newcastle, the Mayor of Hamilton, the Mayor of Wallsend informed, 12/5/96.

No. 2.

The Under Secretary for Public Works to The Mayor of Hamilton.

Sir,

Department of Public Works, Sydney, 12 May, 1896.

I am directed by the Secretary for Public Works to ask whether you are willing to act as Returning Officer for the purposes of the election on the 30th proximo of a Municipal Member of the Hunter District Water and Sewerage Board, and also whether you will kindly allow the Council Chambers to be used as a polling place as in the case of previous elections.

I am to ask that you will be so good as to favor me with an early reply.

I have, &c.,

R. R. P. HICKSON,

Under Secretary and Commissioner for Roads.

No. 3.

The Council Clerk, Hamilton, to The Under Secretary for Public Works.

Sir,

Municipal Council Chambers, Hamilton, 14 May, 1896.

I have the honor, instructed by His Worship the Mayor of Hamilton, to respectfully acknowledge receipt of your letter of date 12th March, *re* acting as Returning Officer for the purposes of the election on the 30th proximo of a Municipal Member of the Hunter District Water and Sewerage Board, and also for use of Council Chambers as a polling-place, as on previous elections, and in reply I am instructed to state that the Mayor will act as Returning Officer, and that the Council Chambers will be granted as a polling-place, as on previous elections.

I have, &c.,

JAMES RAY,

Council Clerk.

Seen.—R.R.P.H., 18/5/96. Mr. Holliman to note.—J.No. P., 18/5/96. Executive Minute herewith.—19/5/96.

Mayor.

No. 4.

Minute for the Executive Council.

Subject :—Regulations for the conduct of the Third Election of Members of the Hunter District Water Supply and Sewerage Board.

Department of Public Works, Sydney, 19 May, 1896.

I HAVE the honor to submit for the approval of His Excellency the Governor and Executive Council, the enclosed draft regulations for the conduct of the third election of members of the Hunter District Water and Sewerage Board, which have been prepared in pursuance of the provisions of the Hunter District Water Supply and Sewerage Act of 1892.

I have also to recommend that Irvine Keddie, Esq., Mayor of Hamilton, be appointed to act as Returning Officer in connection with the said election.

J. H. YOUNG.

The Executive Council approve of the Regulations referred to.—ALEX. C. BUDGE, Clerk of the Council. Min. 96-26, 19/5/96. Confirmed, 26/5/96. Approved.—HAMPTON, 19/5/96. Seen.—R.R.P.H., 28/5/96. Mr. Holliman to note.—J.No. P., 28/5/96. Inserted in *Gazette* of 26th May; copy enclosed.—J.W.H.

## No. 5.

## Regulations for the conduct of the Election.

[Published as a Supplement to the *Government Gazette*, Tuesday, 26th May, 1896.]

Department of Public Works, Sydney, 26 May, 1896.

It is hereby notified that His Excellency the Governor, with the advice of the Executive Council, has been pleased to approve of the appointment of

IRVINE KEDDIE, Esquire, Hamilton,

to act as Returning Officer for the purposes of the election, on the 30th proximo, of one member to represent the boroughs of Plattsburg, New Lambton, and Wallsend, and the Municipal Districts of Adamstown, Carrington, Wickham, Hamilton, Lambton, Merewether, and Waratah, on the Hunter District Water Supply and Sewerage Board, in accordance with the provisions of the "Hunter District Water Supply and Sewerage Act of 1892."

J. H. YOUNG.

Department of Public Works, Sydney, 26 May, 1896.

It is hereby notified that His Excellency the Governor, with the advice of the Executive Council, has been pleased to approve of the following Regulations, which have been prepared in accordance with the "Hunter District Water Supply and Sewerage Act of 1892," for the conduct of the third election, on the 30th proximo, of members of the Hunter District Water Supply and Sewerage Board, under the provisions of the before-mentioned Act.

J. H. YOUNG.

THE following Regulations for the conduct of the third election of members of the Hunter District Water Supply and Sewerage Board, have been prepared in pursuance of the provisions of section 42 of the Act 55 Vic. No. 27 :—

1. In the event of there being a contested election for any of the members of the Board, the polling shall take place as follows :—

For the election of one member to represent the Municipal Council of the City of Newcastle, at the Town Hall, Newcastle, between the hours of 11 o'clock in the morning and 1 o'clock in the afternoon of the 30th day of June, 1896.

For the election of one member to represent the boroughs of Plattsburg, New Lambton, and Wallsend, and the Municipal Districts of Adamstown, Carrington, Wickham, Hamilton, Lambton, Merewether, and Waratah. At the Council Chambers, Wallsend, for the boroughs of Plattsburg and Wallsend and the Municipal District of Lambton, and at the Council Chambers, Hamilton, for the borough of New Lambton, and the Municipal Districts of Adamstown, Carrington, Wickham, Hamilton, Merewether, and Waratah, between the hours of 8 o'clock in the morning and 4 o'clock in the afternoon of the 30th day of June, 1896.

2. For the convenient and proper conduct of such elections, a roll shall be prepared, showing the names and addresses of the persons entitled by the provisions of the Hunter District Water Supply and Sewerage Act to vote thereat; and such roll shall be duly certified by the respective Returning Officers, and used by them for the purposes of such election: Provided, however, that in the event of any alderman being elected to any of the Municipal Councils, the members of which are entitled by the said Act to vote at the election of members of the said Board, subsequent to the preparation of the said roll, but prior to the date of the said election being held, he shall be entitled to vote thereat upon the production of the *Gazette* notice of his election as alderman, or other satisfactory evidence that he has been duly elected: Provided further, that if the name of any person legally entitled to vote shall have been accidentally omitted from such roll, such omission shall not preclude his voting at such election upon his satisfying the Returning Officer that he is entitled so to vote.

3. Before, and in time for such election, the Returning Officers shall cause to be printed, or to be written, ballot-papers, according to the following form :—

*Third Election for Members of "The Hunter District Water Supply and Sewerage Board."*

Ballot Paper.

Member for (as the case may be).

Polling day, the 30th day of June, 1896.

(Names of Candidates.)

And shall provide as many of such ballot-papers as shall be fully equal to the number of electors entitled to vote.

4. At each polling-place there shall be one or more compartments or ballot rooms, provided with all necessary materials, for the purpose of enabling the electors to mark the ballot-papers, as hereinafter provided; and in each such polling-place no person shall be entitled to be present, other than the Returning Officer, poll clerks, and scrutineers of the several candidates (if any) appointed as hereinafter provided, and the elector who shall at that time be voting.

5. The Returning Officers shall each provide a locked box, of which they shall keep the keys, with a cleft or opening in such box capable of receiving the ballot-papers folded as hereinafter provided, which box shall be open to inspection by such poll clerks and scrutineers on its being locked for receiving the ballot-papers, and such box shall be placed upon the table at which the Returning Officers and scrutineers preside and are placed; and each elector, having previously satisfied the Returning Officer that he is entitled to vote at such election, shall then receive from the Returning Officer or poll clerk one of the ballot-papers initialled by the Returning Officer. At the time of the delivery of such ballot-paper to any elector, the Returning Officer shall, upon a copy of the roll certified by such Returning Officer as before provided, make a mark against the name of such elector, which mark shall be *prima facie* evidence of the identity of such elector with the person whose name shall be so marked upon the roll, and of the fact of his having voted at such election.

6. Every such elector shall, in one of the compartments or ballot rooms provided for the purpose, strike out from the ballot-paper the names of such candidates as he does not intend to vote for, and shall forthwith fold up the same in such manner as will conceal the names of the candidates, and shall deposit it

it in the ballot-box in the presence of the Returning Officer: Provided that while an elector is in the compartment or ballot room, preparing his ballot-paper, no other person shall be allowed in such compartment or ballot room.

7. Every elector may vote for any number of candidates not exceeding the number of members then to be chosen, and any ballot-paper containing a greater number of names of candidates, or without the initials of the Returning Officer, shall be rejected at the close of the poll.

8. Each candidate may appoint one person to be a scrutineer at the polling-place.

9. No inquiry shall be permitted at the time of polling as to the right of any person to vote (unless under the circumstances mentioned in Regulation No. 2) except only as follows—that is to say, the Returning Officer may, if he think fit, or shall, if required by any scrutineer, put to any elector before he shall have voted, and not afterwards, the following question, and no other—that is to say:—

Are you the same person whose name appears as (A.B., No. ) on this roll?

And any person so required to answer the said question shall not be permitted to vote until he shall have satisfactorily answered the same.

10. Each Returning Officer at the close of the poll, in the presence of his poll clerk and of such scrutineers as may attend, shall examine and count the numbers of votes for each candidate at his own polling-place, and shall make and sign a statement of such numbers, which statement shall be countersigned by the poll clerks and scrutineers. The Returning Officers shall thereupon seal up the ballot-papers and transmit them to the Under Secretary for Public Works, who shall safely keep the same for one year after the receipt thereof.

11. As soon as it shall have been ascertained who have been duly elected, the official declaration of the state of the poll shall be openly made by the Returning Officers at the respective polling-places.

12. The Returning Officers may appoint such poll clerks as they may deem necessary for carrying out the duties imposed upon them by these Regulations.

13. The Returning Officer for the election of a member to represent the boroughs of Plattsburg and Wallsend, and the Municipal Districts of Adamstown, Carrington, Wickham, Hamilton, New Lambton, Lambton, Merewether, and Waratah, shall appoint a Deputy Returning Officer to preside at the polling-place at the Council Chambers, Wallsend.

#### No. 6.

#### The Under Secretary for Public Works to The Mayor of Hamilton.

Sir,

Department of Public Works, Sydney, 29 May, 1896.

I have the honor to forward, herewith, a copy of the *Government Gazette* containing the notification of your appointment as Returning Officer in connection with the forthcoming Water and Sewerage Board election, and also copy of the Regulations for the conduct of the election.

I also forward copy of the Hunter District Water and Sewerage Act, and four copies of the draft notice to be issued by you, as required by section 17 of the Act. I shall be glad if you will sign one copy and return it to me at once, in order that it may be inserted in the *Government Gazette* of Tuesday next. Will you also be so good as to take steps to insert the notice, not later than Tuesday, in one or more newspapers circulating in the Newcastle district, as required by the section referred to.

I shall also be glad if you will forward me a list of nominations received by you.

I have, &c.,

R. R. P. HICKSON,

Under Secretary and Commissioner for Roads.

[Enclosure.]

#### HUNTER DISTRICT WATER SUPPLY AND SEWERAGE ACT OF 1892.

NOTICE respecting the Third Election of one Member to represent the Boroughs of Plattsburg, New Lambton, and Wallsend, and the Municipal Districts of Adamstown, Carrington, Wickham, Hamilton, Lambton, Merewether, and Waratah, upon the Hunter District Water Supply and Sewerage Board.

NOTICE is hereby given that the christian and surnames of candidates for the position of Member to represent the above Boroughs and Municipal Districts upon the Hunter District Water Supply and Sewerage Board must be given in writing and signed by a nominator (who must be duly qualified as an elector under the abovenamed Act), and delivered to me at the Council Chambers, Hamilton, within seven days from the date hereof; and in the event of more than one candidate being proposed, the polling will take place as follows:—At the Council Chambers, Wallsend, for the Boroughs of Plattsburg and Wallsend and the Municipal District of Lambton; and at the Council Chambers, Hamilton, for the Borough of New Lambton and the Municipal Districts of Adamstown, Carrington, Wickham, Hamilton, Merewether, and Waratah, between the hours of 8 o'clock in the morning and 4 o'clock in the afternoon of the 30th day of June, 1896.

Any person is eligible for election as Member to represent the said Boroughs and Municipal Districts upon the Board, who, at the time of holding of such election shall possess, in and for the said Boroughs and Municipal Districts, the qualification, and not be within any disqualification respectively prescribed and imposed in respect of the office of Alderman by the "Municipalities Act of 1867," or any Act amending the same.

IRVINE KEDDIE,

Returning Officer.

Hamilton, June, 1896.

#### No. 7.

#### The Returning Officer, Hamilton, to The Under Secretary for Public Works.

Sir,

Municipal Council Chambers, Hamilton, 9 June, 1896.

I have the honor to inform you that Joseph Brown Barclay, of Clyde-street, Newtown, Hamilton, has been nominated as a candidate for the vacancy of a member to represent the Boroughs of Plattsburg, New Lambton, and Wallsend, and the Municipal Districts of Adamstown, Carrington, Wickham, Hamilton, Lambton, Merewether, and Waratah, on the Hunter District Water Supply and Sewerage Board. Also that Henry Rushton, of Wallsend, was also nominated, but received too late, on 9th June, at 12 o'clock noon, therefore Joseph Brown Barclay is duly elected without opposition. I enclose letter and certificate addressed to the Governor certifying that Joseph Brown Barclay has been duly elected to the position of member of the Hunter District Water Supply and Sewerage Board without opposition.

I have, &c.,

IRVINE KEDDIE,

Returning Officer.

Mr.

Mr. Holliman.—Jno. P., 11/6/96.

Certificate has been forwarded to the Governor. I would, however, draw the attention of the Under Secretary to the fact that the Returning Officer appears to have acted wrongly in refusing to receive the nomination of Mr. Rushton. The notice (copy attached) which was published on the 2nd of June required the nominations to be delivered to the Returning Officer within seven days from that date, which would seem to include the whole of the 9th. The Returning Officer, however, appears to have considered the nomination out of time because it was delivered at 12 o'clock noon on that day.—J. W. HOLLIMAN.

For the information of the Minister. This is a matter between Mr. Rushton and the Returning Officer.—R.R.P.H., 12/6/96, Under Secretary for Public Works and Commissioner for Roads.

No. 8.

The Returning Officer, Hamilton, to The Under Secretary for Public Works.

Sir,

Municipal Council Chambers, Hamilton, 11 June, 1896.

I have the honor herewith to forward you letter received from Mr. Henry Rushton, of Wallsend, one of the candidates for a representative of the Hunter District Water Supply and Sewerage Board, claiming that his nomination was handed in in ample time, and claiming the right to go to the ballot.

I may state the reason that I ruled that Mr. Henry Rushton's nomination was received too late is according to section 17 of the Hunter District Water Supply and Sewerage Act of 1892, wherein it states that the names of all candidates must be forwarded to the Returning Officer within seven days of the giving of such notice. The notice calling for nominations was dated 1st June, and appeared in the *Newcastle Herald* newspaper on the 2nd June, therefore all nominations according to the Act were due on Monday, the 8th June, 1896, at 12 o'clock p.m.

Awaiting any further instructions in regard to the matter,—will forward nomination papers on if required.

I have, &c.,

IRVINE KEDDIE,  
Returning Officer.

No. 9.

Mr. H. Rushton to The Returning Officer, Hamilton.

Sir,

Wallsend, 11 June, 1896.

Referring to my nomination for the position of member to represent the Suburban Council on the Hunter District Water Supply and Sewerage Board, and to your conversation with me this morning when you informed me that you had sent on my nomination with another to the Under Secretary for Works, but that you are of the opinion that my nomination paper was lodged too late, I beg respectfully to repeat my contention that such is not the case, and further that I claim the right to go to the ballot.

I beg to refer you to the provisions of section 11 of the Acts Shortening Act, 22<sup>d</sup> Victoria No. 12.

Will you be good enough to transmit this letter or a copy of the same to the Under Secretary at once, so that he may consider it with the papers now before him.

Yours, &c.,

HENRY RUSHTON.

According to my reading of the Act the Returning Officer was wrong, but I see nothing in the Act to warrant the Department interfering in the matter. It might perhaps be as well to refer the matter to the Crown Solicitor.—R.R.P.H., 12/6/96.

No. 10.

Telegram from Mr. A. Brown to The Under Secretary for Public Works.

Newcastle Station.

If there is to be contest for suburban municipal seat, between Rushton and Barclay, advertisements must appear, in accordance with 17th section, in local papers here not later than to-morrow's issue.

No. 12.

Mr. A. Brown to The Under Secretary for Public Works.

Newcastle, 23 June, 1896.

Dear Sir,

All I can say in response to your telegram that the matter is now out of your hands, and all your Department had to do was to make the appointment, is that it is one of the most flimsy answers ever made to an important communication. The Returning Officer was your appointment, and you are as much responsible for his actions as you would be for the deficiencies of any officer in your Department; and when you can repair his errors by the exercise of a little intelligence I take it that it is your business to do it. As the matter stands now you are doing a grave injustice to a candidate, who in a contest

contest for the seat would, I think, be returned; but your officer having sent in a certificate, in defiance of all law, declaring a certain person elected, you propose to let the matter stand at this, and compel his opponent to seek redress in the law courts, which the exercise of a little judgment would avoid. I shall certainly have the matter ventilated in Parliament, and chance the Minister's patronage for the Presidency.

Yours, &c.,

ALEXANDER BROWN.

Submitted.—R.R.P.H., 24/6/96. Need not be replied to.—J.H.Y., 24/6/96.

### No. 13.

The Returning Officer, Hamilton, to His Excellency the Governor.

Municipal Council Chambers, Hamilton, 9 June, 1896.

THIRD election, Hunter District Water Supply and Sewerage Act of 1892, of one member to represent the Boroughs Plattsburg, New Lambton, and Wallsend, and the municipal districts of Adamstown, Carrington, Wickham, Hamilton, Lambton, Merewether, and Waratah.

I HEREBY certify that Joseph Brown Barclay has been duly elected as a member for the abovenamed boroughs and municipal districts, Hunter District Water Supply and Sewerage Act, 1892, without opposition.

IRVINE KEDDIE,

Returning Officer.

The Chief Secretary.—HAMPDEN, 15/6/96. The Under Secretary for Public Works and Commissioner for Roads.—C.W., 19/6/96. B.C. Gazette and Inform Board.—R.R.P.H., 2/7/96. Done, 2/7/96. Put with papers. Mr. Holliman.—Jno. P., 20/6/96.

### No. 14.

The Under Secretary for Public Works to The Secretary, Hunter District Water Supply and Sewerage Board.

Sir,

2 July, 1896.

I am directed to inform you that a certificate has been received from Irvine Keddie, Esq., the Returning Officer appointed to conduct the election of a member to represent the boroughs of Plattsburg, New Lambton, and Wallsend, and the municipal districts of Adamstown, Carrington, Wickham, Hamilton, Lambton, Merewether, and Waratah, on the Hunter District Water Supply and Sewerage Board, under the provisions of the Hunter District Water Supply and Sewerage Act, 1892, to the effect that Joseph Brown Barclay has been duly elected without opposition.

I have, &c.,

R. R. P. HICKSON,

Under Secretary and Commissioner for Roads.

### No. 15.

Mr. J. B. Barclay to The Under Secretary for Public Works.

Dear Sir,

Hamilton, Clyde-street, 12 June, 1896.

Having been informed to-day that a protest has been lodged by H. Rushton against my election by Returning Officer, as the only nomination received by Returning Officer in accordance with the Act, and acting under legal advice I intend taking my seat as a member of the Hunter District Water and Sewerage Board, therefore, having been elected as member by Returning Officer. Mr. H. Rushton if not satisfied has his remedy at law, and as pointed out by my legal adviser, the Act is clear and conclusive on the course adopted by Returning Officer, and I am now very pleased that Returning Officer had his duty so clearly pointed out by yourself and Mr. Norrie on the 4th instant.

I have, &c.,

J. B. BARCLAY.

### No. 16.

The Crown Solicitor to The Under Secretary for Public Works.

Sir,

Crown Solicitor's Office, Sydney, 17 June, 1896.

I have the honor to return herewith the papers numbered as in margin, referring to the refusal of the Returning Officer to accept Mr. Henry Rushton's nomination as a candidate for election on the Hunter District Water Supply and Sewerage Board, and to inform you that the Attorney-General considers this is a matter for the private solicitor of the parties and is not a subject for the Crown Solicitor.

I have, &c.,

GEO. COLQUHOUN,

Crown Solicitor.

Seen. File.—R.R.P.H., 19/6/96.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## HUNTER DISTRICT WATER SUPPLY AND SEWERAGE ACT AMENDMENT BILL.

PETITION FROM CERTAIN PROPERTY-OWNERS AND RESIDENTS OF LOUTH PARK, OAKHAMPTON, BOLWARRA, MIDLORN, GLENARVON, LIDDESDALE, AND ADJACENT FARMING LOCALITIES NEAR MAITLAND, AGAINST CLAUSE SIX OF.)

*Received by the Legislative Assembly, 8 July, 1896.*

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The humble Petition of the property-owners and residents of Louth Park, Oakhampton, Bolwarra, Midlorn, Glenarvon, Liddesdale, and adjacent farming localities near Maitland,—

SHOWETH AS FOLLOWS:—

1. That a Bill to amend the "Hunter District Water Supply and Sewerage Act of 1892, the Country Towns and Hunter District Water Supply and Sewerage Acts Amendment Act of 1894, and for other purposes," is now under consideration by your Honorable House.

2. That your Petitioners will be most seriously affected by the clause in the said Bill which extends the distance in respect of which property may be rated for the purposes of the said water supply to four hundred and forty yards from the water-pipes of the Board.

3. That your Petitioners consider the present limit of distance from such pipes, viz., sixty yards, quite sufficient for all necessary purposes.

4. That your Petitioners are compelled at a very great outlay to maintain embankments to protect their farms from inundation by flood-waters, and the imposition of a tax for water supply purposes would entail great hardship upon them, as they are already supplied with water for all necessary purposes.

5. That your Petitioners never asked for the extension of the water supply to their farms, and never for a moment anticipated that they would be liable to taxation for water supply purposes, otherwise they would have strenuously opposed the passing of the said Acts.

6. That having regard to the great losses which they have sustained by reason of floods, necessitating in many cases appeals to the Government for assistance, your Petitioners feel very strongly that they should not be harassed by taxation of this nature.

Your Petitioners, therefore, humbly pray that the above-mentioned clause may be omitted from the said Bill, or if inserted therein, that your Petitioners may be exempted from the operation of the same.

And your Petitioners, as in duty bound, will ever pray, &c.

*[Here follow 77 signatures.]*

A similar Petition was received,—

On 8th July, from certain property-owners and residents of the same localities; 68 signatures.

## HUNTER DISTRICT WATER SUPPLY AND SEWERAGE ACT AMENDMENT BILL.

(PETITION FROM THE MAYOR AND ALDERMEN OF THE BOROUGH OF MORPETH IN FAVOUR OF  
AN AMENDMENT OF.)

---

*Received by the Legislative Assembly, 29 July, 1896.*

---

To the Honorable the Speaker and Members of the Legislative Assembly.

The Petition of the Mayor and Aldermen of the Borough of Morpeth,—

HUMBLY SHOWETH:—

1. That the provisions contained in clause 6 of the proposed Hunter District Water Supply and Sewerage Act Amendment Act, whereby the distance of 60 yards in the Principal Act is made to extend to 440 yards, are calculated to work great injury to and hardships upon the agricultural portions of the Borough, and on such lands therein as are used for grazing purposes only, and would enable the Board to lay unnecessary mains simply as a means of largely increasing their revenue. And your Petitioners therefore suggest that as far as such lands are concerned the distance should be limited to 110 yards.

2. That the minimum rate of 10s., as provided by clause 15, sub-section (a), has an unequal effect upon the taxpayers of the Borough, and makes the holders of small and comparatively useless areas pay in proportion a much larger sum in the way of tax than those whose holdings may fairly be rated at that amount, and your Petitioners, in order to equalise the taxation, would ask that the section should be amended by reducing the minimum to 2s. 6d.

3. That the provisions contained in clause 33 of the said amending Act, whereby a mortgagor is bound to disclose the name of his mortgagee, are inquisitorial in the extreme. A mortgage upon a taxable area does not change the ownership thereof, and whilst for purposes of ownership or occupancy the names of the purchasers and lessees may fairly be asked for, that of mortgagees, can, without any benefit to the Board, disclose only the financial position of the taxpayer.

Your Petitioners therefore pray that all references to mortgages may be omitted.

And your Petitioners, as in duty bound, will ever humbly pray.

*[Here follow 9 signatures.]*

## PLAN.

Plan showing proposed Gravitation Scheme.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

WATER SUPPLY FOR THE TOWN OF TAMWORTH.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of constructing Works of Water Supply for the Town of Tamworth, in lieu of the scheme already approved by the said Committee and authorised by Parliament," have, after due inquiry, resolved that it is expedient the proposed works should be constructed, but that the capacity of the storage reservoir should be increased from 35,000,000 to 50,000,000 gallons; and, in accordance with the provision of subsection IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

1. The proposed work as placed before the Committee is a gravitation scheme. It is proposed to construct a concrete dam, 360 feet in length, with a maximum height of 32 feet, across Moore Creek, near the head, which will impound about 35,000,000 gallons of water at a height of about 1,000 feet above the town. The catchment above the dam is about 22 square miles in area. It was intended to convey the water a distance of about  $11\frac{1}{2}$  miles by steel pipes, 6 inches in diameter, to a concrete service reservoir holding 500,000 gallons, situated about  $1\frac{2}{3}$  of a mile from the centre of the town, and at a height of about 250 feet above the main street. The present population of Tamworth is estimated at 5,100; the proposed works will be capable of supplying a population of 10,000, as provided for in the pumping scheme. The fall in the main pipe-line (63·6 feet per mile) is so great that it will be possible, by using a 7-inch pipe, to utilise the surplus head for generating electricity for lighting or other purposes should the Council desire to do so. In designing the works the Department therefore propose to make provision accordingly. The reticulation pipes provided for the pumping scheme previously before the Committee will be used, with some slight alterations necessitated by the change of the service reservoir site and additions to reach some recently-built houses. Thirty-three acres of land will have to be resumed for the storage reservoir, and the main pipe-line will pass through about 5 miles of private land.

Official description of the proposed work.

2. It is estimated that the scheme will cost £32,824, the estimate comprising the following items:—

Storage reservoir, 35,000,000 gallons .. .. .	£5,311	19	0
Main pipe-line, 6-inch ... .. .	8,628	5	0
Service reservoir ... .. .	1,665	7	6
Service main and reticulation ... .. .	14,151	14	6
Engineering and contingencies ... .. .	2,976	14	0
Land ... .. .	90	0	0
Total ... .. .	£32,824	0	0
Add for providing a 7-inch pipe instead of 6-inch for the purposes of electric power ... .. .	2,550	0	0
Grand Total ... .. .	£35,374	0	0

Estimated cost.

Reasons for  
the present  
inquiry.

3. The proposal for constructing works of water supply for this town was under the consideration of a previous Committee during the months of October, November, and December, 1892. The scheme then submitted by the Department was a pumping scheme, it being proposed to obtain the water from a well sunk in the river-drift immediately above the confluence of the Peel and Cockburn Rivers. The question as to whether a gravitation supply could not be obtained was considered by the Committee upon that occasion, and inquiry was made as to the merits of the gravitation scheme proposed by Mr. F. B. Gipps, C.E. It was found, however, that there were serious objections to that scheme, which precluded its adoption, and the then Engineer-in-Chief for Harbours and Rivers stated to the Committee that a proper gravitation scheme could not be obtained at a less cost than £50,000, as against £22,000, the cost of the pumping scheme then proposed. The local Borough Council admitted the soundness of the objections raised to Mr. Gipps' scheme, and, though they were in favour of a gravitation supply, they accepted the proposal of the Department, as it appeared that a better scheme could not, without going to much greater expense, be obtained. As the result of their inquiry, the Committee then came to the conclusion that the pumping scheme should be carried out, but they recommended that before any of the permanent works were undertaken a thorough test with temporary pumping machinery should be made to prove the quantity of water in the drift whence it was proposed to take the supply. This recommendation of the Committee, together with the difficulties which had in the meantime arisen in regard to the works at Cootamundra and Parkes, which were similar to those proposed for Tamworth, led to the further consideration of the whole matter by the Department of Public Works, and it was decided that before taking further steps in regard to the pumping scheme a careful exploration should be made of the mountain ranges in the neighbourhood, in order to ascertain beyond doubt the possibility of obtaining a gravitation scheme at a reasonable cost. Mr. E. B. Price was the officer selected to carry out the investigation, and his inquiries resulted in the present scheme being placed before the Committee.

The Commit-  
tee's inquiry.

4. After obtaining from the Under Secretary for Public Works a general statement of the circumstances which led to the reconsideration of the matter, and examining Mr. Hickson, the Engineer-in-Chief for Public Works, Mr. E. B. Price, M.I.C.E., and Mr. J. Davis, M.I.C.E., the officers intimately concerned with the designing of the new scheme, and also Mr. F. B. Gipps, who submitted a modification of his previous scheme, a Sectional Committee was appointed to visit Tamworth for the purpose of inspecting and to take evidence. They devoted considerable time to inspecting the pipe-line service and storage reservoirs and catchment area of the proposed water supply and the main features of the modified scheme proposed by Mr. Gipps. They examined the Mayor, two of the aldermen, and the District Surveyor, and received such evidence from ratepayers as was forthcoming.

The evidence.

5. The evidence received by the Committee is, on the whole, very favourable to the scheme. The Mayor and one of the aldermen who were examined by the Sectional Committee expressed the opinion that the Departmental scheme was by far the best of the several proposals which had been from time to time under the notice of the local authorities; and referring to the sentiment of the ratepayers, the Mayor doubted whether more than two persons in the town would be found opposed to the proposed works, and these persons, he pointed out, would probably be found opposed to any scheme of water supply. He, however, thought the capacity of the proposed storage reservoir was insufficient, and should be increased to at least 50,000,000 gallons, and also that the service reservoir should be enlarged to provide for a week's instead of a three days' supply. Mr. Poate, the District Surveyor, was also of opinion that the capacity of the storage reservoir should be not less than 50,000,000 gallons. The municipal authorities stated that the town was in a good financial position and well able to bear the cost of the scheme. It was estimated that the revenue from the works, including a general rate of 1s. in the £, would be, approximately, £2,300. The power generated by the scheme could, it was stated, be readily utilised in the town for various purposes. Mr. Poate recommended that the Crown land within the catchment area should be at once resumed, and that such power as the Government had upon the conversion of the conditional lease land into conditional purchase land should be exercised in order to provide for any probable extension of the storage reservoirs.

6. The witnesses were agreed as to the purity of the water in the creek from whence it was proposed to take the supply. The Under Secretary for Public Works submitted to the Committee an analysis from Mr. Hamlet, the Government Analyst, in which the water was described as being exceptionally good. The Mayor also handed in an analysis made at his brewery, by Mr. Daniell, a chemist, which confirmed this. Purity of the supply.

7. There can be little doubt, in the opinion of the Committee, as to the sufficiency of the supply. Though it is admitted that Moore Creek may, in exceptional seasons, become dry, the supply provided by the catchment area will be more than ample. Taking a minimum annual rainfall of 18 inches, the average being from 29 to 30 inches, and assuming that only 4 inches, or less than 25 per cent., would reach the drainage centre, the District Surveyor calculates this would amount to 1,120,000,000 gallons, or sufficient to fill the storage reservoir thirty times over. The Chief Engineer for Water Conservation and the officers of the Public Works Department confirm this evidence. The local witnesses examined are also satisfied on the point. Sufficiency of the supply.

8. The estimate of the probable revenue furnished by the Department, and the accuracy of which was confirmed by the Mayor, is as follows:— Financial aspect of the scheme.

General rate of 1s. in the £	...	...	...	...	£1,490	0	0
Public buildings and departments	...	...	...	...	240	0	0
Meter accounts—excess over rates	...	...	...	...	215	0	0
Irrigation (gardens, &c.), 60 at £2 10s.	...	...	...	...	150	0	0
Live stock, horses—at 5s. per head	...	...	...	...	50	0	0
Cows—at 5s.	...	...	...	...	25	0	0
Contribution from lighting rate, on account of motive power supplied	...	...	...	...	150	0	0
					£2,320	0	0
					Total revenue	...	...

The estimated annual expenses are as follows:—

Amount required to meet the annual payments on account of interest and sinking fund	...	...	...	...	£1,280	0	0
Working expenses	...	...	...	...	200	0	0
					£1,480	0	0

showing an estimated annual surplus of £840. In addition to this, it appears that a saving of £70 per annum will be effected by using the power for the working of the present electric light plant, thus increasing the surplus to £910 per annum.

9. Mr. Gipps appeared before the Committee to give evidence in regard to certain modifications he proposed in his original scheme which was the subject of inquiry when the question was before the previous Committee. From the evidence taken it would seem that the objections already raised to this scheme in the main still hold good. Although the catchment area of, and therefore the flow of water in, the Cockburn River, whence Mr. Gipps proposed to obtain the supply, is larger than that of Moore Creek, the scheme is undesirable for various reasons, the most important of which is that it does not provide sufficient head to supply the reasonably accessible higher land within the municipality, and if it were adopted a pumping service would eventually have to be incorporated with it. The distance of the service reservoir from the centre of the town, viz., 5 miles, and the greater cost of the scheme, also constitute serious objections. Scheme proposed by Mr. Gipps.

10. The site for the storage reservoir appears to have been wisely chosen, but great care should, the Committee think, be exercised by the Department to ensure that on the southern side the dam finds its resting-place upon the solid rock, as boulders might possibly be mistaken for it at this point. At a distance of about a mile above this site is another excellent site, where, if the storage proposed were found to be insufficient, an equal supply could be impounded, which could be delivered, without an additional pipe-line, from the upper to the lower reservoir. With regard to the quantity of water to be stored, the Committee are of opinion that this should not be less than 50,000,000 gallons, which is more than a year's supply, at the ordinary rate of consumption, for a town larger than Tamworth. The extra cost involved by this will be £2,148, and will increase the amount of annual repayment by £77 12s.; but the Committee think this additional expenditure is well warranted. Storage reservoir.

Service  
reservoir.

11. The Committee had under consideration the question of increasing the capacity of the service reservoir, and the matter was inquired into at some length. The scheme provides for a three days' supply, which the engineers consider to be amply sufficient, as any accident to the pipe-line could be repaired within twenty-four hours. It is pointed out that the Sydney water supply service reservoirs at present scarcely hold one day's supply, and that when the additional service reservoirs now being constructed are completed the provision will be only about equal to two days' supply. A majority of the Committee, therefore, came to the conclusion that the capacity of the reservoir as proposed is sufficient for the present needs of the town.

Resumption  
of land at the  
site of the  
proposed  
reservoir.  
Decision of  
the Com-  
mittee.

12. It is proposed in the Departmental scheme that an area of 33 acres should be resumed at the site of the storage reservoir, but the Committee consider that at least 50 acres should be resumed. In the opinion of the Committee the land is of nominal value only.

13. The Committee recommend that the amended scheme proposed by the Department should be carried out with the following provisos:—

- (1.) That the capacity of the storage reservoir should be increased to 50,000,000 gallons.
- (2.) That the present Crown lands within the catchment area of the proposed supply should be at once reserved, and that the Department of Lands, in measuring lands held under conditional lease, should exercise their power under the law to excise those portions required for the present or probable future storage.
- (3.) That the first impounding dam should be constructed, in view of the contingency of the construction of a second dam at some future period, and that in connection with the dam at present proposed, ample provision should be made to obviate any reduction of its capacity by the accumulation of sand.
- (4.) That an area of not less than 50 acres be resumed at the site of the proposed storage reservoir.

Resolution  
of the  
Committee.

14. The resolution passed by the Committee is shown by the following extract from the Minutes of Proceedings of 24th January, 1896:—

“The adjourned debate upon Mr. Humphery's motion,—

‘That the Committee consider it expedient that the proposed Water Supply for the Town of Tamworth, as referred to the Committee by the Legislative Assembly, be carried out, but they recommend that the capacity of the storage reservoir be increased from 35,000,000 to 50,000,000 gallons.’

Upon which Mr. Lee had moved as an amendment,—

“That the motion be amended by the addition of the words ‘and the capacity of the service reservoir to 1,000,000 gallons,’—

was resumed.

Upon the question,—“That the motion be amended by the addition of the words ‘and the capacity of the service reservoir to 1,000,000 gallons,’—the Committee divided as follows:—

Ayes, 4.

Mr. Davies,  
Mr. Hoskins,  
Mr. Clarke,  
Mr. Lee.

Noes, 5.

Mr. Ewing,  
Mr. Humphery,  
Mr. Fegan,  
Mr. Black,  
Mr. Wright.

The motion was then passed.”

THOS. EWING,  
Chairman.

Sydney, 30th January, 1896.

# PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

## MINUTES OF EVIDENCE.

### WATER SUPPLY FOR THE TOWN OF TAMWORTH.

TUESDAY, 17 DECEMBER, 1895.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.

The Hon. JOHN DAVIES, C.M.G.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

ANGUS CAMERON, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee proceeded to consider the proposed Water Supply for the Town of Tamworth.

Joseph Barling, Esq., Under Secretary for Public Works, sworn, and examined:—

1. *Chairman.*] I suppose you would like to make a statement to the Committee? Before I give a description of the proposal which I desire to put before you, perhaps it would be desirable that I should give you a short account of the circumstances which led up to the change in the scheme which we propose to carry out at Tamworth. You are aware that some six months ago we effected a reorganisation of the Public Works Department, and one of the changes which took place in connection with the reorganisation was that Mr. Darley took charge of the Water and Sewerage Board, and also of matters in connection with the construction of the sewerage of the city, which previously had been in the hands of Mr. Hickson, Mr. Hickson, on the other hand, taking up a great deal of the work which Mr. Darley had been accustomed to supervise. On Mr. Hickson taking charge of the combined work, this question of carrying out the supply of water to Tamworth came under his consideration, and, in looking at the report of the Committee, which was dated December, 1892, he specially noted the 12th section which reads as follows:—

The Committee are of opinion that the scheme as proposed by the Department should be carried out; but they recommend before any of the permanent works are commenced, a thorough test with temporary pumping machinery be made to prove the quantity of water in the drift, and that, should this be found satisfactory, sufficient land surrounding the well be resumed as an additional safeguard against any contamination of the water.

Mr. Hickson found that this well had not been sunk, and no temporary pumping machinery had been erected. As a matter of fact, I understand that borings were taken around the site of the well, which proved the continuous existence of the drift, but it brought very forcibly to Mr. Hickson's mind the question as to whether a gravitation scheme could not still be found, and after having a conversation with Mr. Price on the subject, Mr. Price and Mr. Davis wrote this joint minute:—

In accordance with your instructions we have visited Tamworth, and made an examination of the proposed water supply scheme, and of the surrounding country.

We are of opinion that before any further steps are taken in regard to the pumping scheme, a careful exploration should be made of the mountains in the neighbourhood of the town, in order to put beyond doubt the possibility of obtaining a gravitation scheme at a reasonable cost. We would strongly recommend that an officer should be sent to make this examination at once.

Failing a gravitation supply, we recommend that a further examination of the river flats should be made by boring, before the site of the pumping-well is fixed, and that when the position of the well has been decided on, that a temporary shaft should be sunk through the drift, and the quantity of water available, tested with a centrifugal pump. The further examination of the pumping scheme is provided for in the report of the Public Works Committee.

Upon which Mr. Hickson wrote: "Without committing myself so far as to say that a gravitation scheme for Tamworth is an assured fact there is sufficient evidence before me to warrant my recommending that no further steps be taken with the authorised scheme for the present, and that a careful examination be

J. Barling,  
Esq.  
17 Dec., 1895.

immediately made in order to ascertain if the gravitation scheme, at a reasonable cost, can be secured." I submitted that to the Minister for approval, which he accordingly gave. Then on the 28th of June last, this further minute was written by Mr. Hickson:—

Referring to my minute 22/4/95 re the possibility of obtaining a gravitation scheme for the water supply for Tamworth, and the Minister's approval thereon that a careful examination should be made with this end in view, I instructed Mr. Price to visit and report.

Mr. Price has made a very careful examination of the country around Tamworth, and has selected what I think will prove a very successful gravitation scheme, the cost of which will amount to about £30,000.

The Public Works Committee approved of a pumping scheme estimated to cost £22,500, and an annual expenditure of £560. Capitalising this latter amount at 4 per cent. would bring the cost of the pumping scheme up to £36,500, thus showing a saving on the gravitation scheme of about £6,500.

In addition to this, as Mr. Price points out, it will be quite possible to use this gravitation scheme for working the electric lighting of the town, and so save the large expenditure now involved in this work. I recommend that a complete survey be now put in hand with a view to bringing the matter before the Public Works Committee.

ROBT. HICKSON,  
Engineer-in-Chief for Public Works.

I submitted that to the Minister for approval to carry out the necessary survey, and wrote, "Mr. Price, I think, deserves great credit for the way in which he has dealt with this matter, and this is not the first time that he has distinguished himself in a similar way." With regard to this Mr. Young wrote, "I quite agree that Mr. Price deserves much credit. It is unfortunate that either he, or an equally able officer, was not sent to investigate the matter at first." Now, with regard to the question as to why this scheme was not discovered at first, I cannot of course thoroughly explain it, but I can give the Committee some idea, I think, as to how it came about that it was not put forward at first. I can only say this, speaking of the Minister, that the sentiment in his mind is one of satisfaction that whether discovered early or late it has been discovered in time to prevent the other scheme from being carried out. I may mention for the information of the Committee that Mr. F. B. Gipps, who was once an officer of the Public Works Department, was commissioned by the Tamworth Council to examine the country around and propose a water scheme. You are aware that he submitted a long report on the subject, and he eventually recommended a gravitation scheme from the Cockburn River, sometimes called the Swamp Oak Creek. I think that the Department put very substantial reasons before this Committee why this scheme should not be carried out, and one great reason was that it would not have a sufficient head. I think the only head that that scheme would give was 127 feet above the railway station. It was not sufficient head to cover the town. There were a number of other objections against this scheme, which I think I placed before the Committee in giving my evidence in 1892.

2. Is there a plan of Mr. Gipps' scheme? I have a plan here.

3. But that plan does not show the Swamp Oak Creek? I have a plan which shows it, but that scheme not being before the Committee I did not bring it down. It was, however, very carefully examined by the Sectional Committee at the time. But to proceed. You are aware that Mr. Gipps made a report to the Tamworth Council, and in his report to the Council he made the following statement—or rather, I should say (as I have not his original report) from a letter of his, dated 7th September, 1895, which I believe must have appeared in one of the Tamworth papers. He says:—

In my report to the Municipal Council of July, 1890, I wrote thus:—"The sources of water supply for Tamworth are as follows—the Peel River, the Cockburn River, Moore Creek, Moonbi Creek, and Goonoo Creek."

Again, in writing on the merits of these different sources, I said of Moonbi Creek and Moore Creek, "That they offer exceptional watersheds at a sufficient elevation to command the highest part of the town by gravitation, but that they have been known to be quite dry for many months at a time, and after a careful examination of both valleys, under the guidance of Mr. W. J. Smith, the Mayor, I was unable to discover any favourable site for a storage reservoir. . . . It shows that I did examine Moore Creek, and condemned it on account of its incapability to supply the most essential want of any water supply scheme."

I have ascertained that the Mayor drove Mr. Gipps over the route to this Moore Creek to a point about 8 miles by road from Tamworth. Now, I think I am right in saying that neither the Mayor nor any other person in the town was aware of the possibility of the country to supply a gravitation scheme, simply because the examination did not extend far enough up the creek. It is not to be wondered at, therefore, that Mr. Gipps, under these circumstances, did not discover the capabilities of Moore Creek. Mr. Price and Mr. Davis too will show you that it is only after you proceed to about 6 miles further on the road that you have any idea as to the capacities of the scheme. When you arrive at 14-mile point going from Tamworth you would find even then that you have no idea of the existence of the fall from above which the proposed dam is to be built. It looks there as if the gully had come to an end, in fact that it had pinched out, but proceeding further you discover that the creek runs through precipitous rocks, its course being hidden until you come to what appears to be the head of the gully. About a mile further still you reach a fall of 700 feet, down which the creek plunges, forming a picturesque cascade. It is here that it is proposed to construct the dam. The greatest difficulty was experienced in reaching this fall. I think I am correct in saying that these features were unknown to Mr. Britten and to Mr. Gipps, and to most of the people in Tamworth, if not all.

4. How far is that from Tamworth? About 16 miles by road. There was another reason that led Mr. Hickson to look carefully into the matter. The water supplies which we have carried out in Parkes and Cootamundra have been by no means successes. The deep drifts there, which were supposed to carry a large amount of water, have been found to a very large extent to have given out, and although the case at Tamworth is not altogether parallel with that of Parkes and Cootamundra, still there is a sufficient similarity between the two places to make an engineer, having had experience in these works, hesitate before embarking on it. In Tamworth the drift would not be likely to give out. At Parkes there was a creek which has disappeared, and at Cootamundra there is a very small stream. We have had another case at Dubbo. There we have a water supply which is also drawn from the drift, which is found near a large flowing river—the Macquarie—and there it has been an eminent success. Notwithstanding the dry weather we have had, it was impossible to reduce the water in the well by more than about a foot. The well is now 60 feet deep, and the water is found at 45 feet, so that there is about 15 feet of water in it, and with all the pumping they have not been able to reduce it more than about a foot. I think now, Mr. Chairman, that without further preliminaries I might read you a brief description of this scheme:—It is proposed to construct a concrete dam, 350 feet in length, with a maximum height of 32 feet across Moore Creek, near its head, which will impound about 35,000,000 gallons of water, at a height

height of about 1,000 feet above the town. The catchment above the dam is about 22 square miles in area. The water will be conveyed by about 11½ miles of steel pipes, 6 inches in diameter, to a concrete service reservoir holding 500,000 gallons, situated about 1½ of a mile from the centre of the town, and at a height of about 250 feet above the main street. The present population of Tamworth is estimated at 5,100; the proposed works will be capable of supplying a population of 10,000, as provided for in the pumping scheme. The fall in the main pipe-line (63·6 feet per mile) is so great that it will be possible, with a 6-inch pipe, which is the smallest advisable size to utilise the surplus head for generating electricity for lighting or other purposes should the Council desire to do so. In designing the works provision will be made for this being done. The reticulation pipes provided for the pumping scheme will be used with some slight alterations necessitated by the change of the service reservoir site, and additions to reach some recently built houses. Thirty-three acres of land will have to be resumed for the storage reservoir, and the main pipe-line will only pass through about 5 miles of private land. The estimated cost of the scheme is £32,824, as follows:—

J. Barling,  
Esq.  
17 Dec., 1895.

Storage reservoir, 35,000,000 gallons ... ..	£5,311	19	0
Main pipe-line, 6-inch ... ..	8,628	5	0
Service reservoir ... ..	1,665	7	6
Service main and reticulation ... ..	14,151	14	6
Engineering and contingencies... ..	2,976	14	0
Land ... ..	90	0	0
<b>Total... ..</b>	<b>£32,824</b>	<b>0</b>	<b>0</b>
<i>Add for providing a 7-inch pipe instead of 6-inch for the purposes of electric power ... ..</i>	<i>2,550</i>	<i>0</i>	<i>0</i>
<b>Grand total ... ..</b>	<b>£35,374</b>	<b>0</b>	<b>0</b>

The site of the old reservoir was at the junction of Murray-street and Raglan-street. The site of the reservoir which we now propose, and which will be about 250 feet above Peel-street, will be on the common at the back of the hospital. We have gained very considerable advantage by the site now proposed compared with former one. The old reservoir has a height of about 187 feet about Peel-street; the present reservoir is 250 feet above Peel-street. I may mention here, also, that the highest ground to be served by this scheme is 238 feet, while we have a reservoir site of 250 feet, as against the old site of 187 feet. As far as I can make out, the population to be served by the reticulation will be something like 4,300 people. The balance of the population will not come in at present. The cost, as you will see from the estimate which I shall give, will be £35,374, or £2,550 in addition to the cost which will be required for merely supplying the town with the water scheme. This extra sum is required in order to supply a 7-inch pipe instead of a 6-inch, which will give the necessary power to work the electric lighting plant. In other words, it will give an electric power equal to 100 horse-power. At present their power gave them only 20 horse-power, and this, in giving them 100 horse-power, will enable them, not only to light the streets, but the houses.

5. It is an electric service, then, as well as a water supply? Yes; it will develop power to enable them to work the electric lighting plant. The old scheme provided for 22 miles of reticulation, but it was considered that 19 miles of reticulation would be quite sufficient for the town, and even that is a liberal supply. With regard to the quality of water from this source, there can be no possible doubt about it. I have here a report from Mr. Hamlet, the Government Analyst, which is as follows:—

GOVERNMENT LABORATORY, SYDNEY.  
RESULTS of Analysis of Potable and Polluted Waters.

Description.	Expressed in grains per gallon.				Expressed in parts per million.				Appearance in the standard 2-foot tube.
	Total solid residue, dried at 220.	Chlorine as chlorides.	Nitrogen as Nitrates and Nitrites.	Phosphates from animal impurity.	Free ammonia.	Albuminoid ammonia.	Oxygen absorbed in 15 min.	Oxygen absorbed in 3 hours.	
From Works Department— Supplied to Tamworth from Moore Creek.	15·00	1·5	Trace.	None.	·03	·00	·45	·90	Clear.

General observation on the character of the above water.—An exceptionally good water. The absence of albuminoid ammonia will be remarked.  
8th October, 1895. W. M. DOHERTY, F.G.S.  
(Pro Government Analyst).

Speaking of the financial aspect of the case, I may mention that one of the accountants of the office was sent to Tamworth to report. He only returned last week, after having gone into the subject with the Council most fully. The result of his investigation is as follows:—

TAMWORTH WATER SUPPLY.

ESTIMATED Annual Revenue from all sources.

General rate of 1s. in the £... ..	£1,490	0	0
Public buildings and departments ... ..	240	0	0
Meter accounts—excess over rates ... ..	215	0	0
Irrigation (gardens, &c.)—60 at £2 10s. ... ..	150	0	0
Live stock, horses—200, at 5s. per head ... ..	50	0	0
Cows—100, at 5s. ... ..	25	0	0
* Contribution from lighting rate, on account of motive power supplied... ..	150	0	0

Total estimated revenue ... .. £2,320 0 0

\* Does not apply to pumping scheme.

J. Barling, Esq. I have prepared a statement comparing the pumping scheme passed by the Committee and the gravitation scheme now under consideration, which is as follows:—

17 Dec., 1895.

*Comparison between Pumping and Gravitation Schemes.*

Pumping scheme—			
Estimated cost, £22,500—Annual repayment	... ..	£814	
Working expenses	... ..	560	
Total annual cost	... ..	1,374	
Revenue as per statement annexed	... ..	2,170	
			£796
Gravitation scheme—			
Estimated cost, £35,374—Annual repayment	... ..	£1,280	
Working expenses	... ..	200	
Total annual cost	... ..	1,480	
Revenue as per statement annexed	... ..	2,320	
Saving in the working of the present electric light, <i>i.e.</i> —			
Cost of working	... ..	£220	
Less payment to water account	... ..	150	
			70
			2,390
			£910
Pumping scheme—Annual surplus	... ..	£800	
Gravitation scheme—Annual surplus	... ..	910	
			£110
In favour of gravitation	... ..		£110

or, a capital value of about £3,000.

I have urged that there are advantages to be gained in using this scheme for electrical purposes, and I put that down at over £150. The gravitation scheme is estimated to cost, as I have given before, with the electric lighting power £35,374; this means an annual charge towards interest and repayment of £1,280. The working expenses we have put down at £200, as against £560 under the pumping scheme. I may mention that Mr. Hickson and the engineers have put down £100 for the working expenses, but I am of opinion that they cannot be carried out for less than £200 a year. I shall be glad if the Committee will make a note of this and examine Mr. Hickson on this point. The working expenses and the annual repayment will come to £1,480.

6. *Mr. Lee.*] What is the total revenue? £2,320.

7. *Mr. Roberts.*] I thought you said it was £1,480? £1,480 represents the expenses. The saving in the working expenses of the electric lighting plant will be £70. At present it is costing the Municipality £220 per annum for work which will be done by water power under the proposed scheme, and for which the Municipality propose to credit the revenue with £150. If the £70 saved be added to revenue, £2,320, it will give a total annual revenue of £2,390, showing an annual surplus of £910, as against £796 under the old scheme. In other words, it shows £110 in favour of the gravitation scheme—that is, not taking into account the other many advantages to be gained from the gravitation scheme. This £110, calculated at 3·616 per cent., will show an annual saving in the capital value of £3,000.

8. How long is it since Mr. Hickson took charge of the Department? He took charge from the 1st July of this year.

9. Previous to that this Tamworth Water Supply had been under the consideration of Mr. Darley? Yes, and even before Mr. Darley's time. If I remember rightly it was ten or eleven years ago when it was first introduced. The first record we have was in February, 1880.

10. The result of Mr. Darley's consideration of it was that a scheme was submitted to this Committee? Yes.

11. And the Public Works Committee recommended that Mr. Darley's scheme be carried out? Yes.

12. What was the cause of the delay in the recommendation of the Public Works Committee not being carried out? I think, if I remember rightly, there were two causes. I am speaking now at a moment's notice, and from memory, but I think that the first cause was that the Tamworth people were not satisfied, and they kept on urging the Department to reconsider the matter. The second reason why it was not received was that at the time the Tamworth water supply, along with many other public works which were to be paid for out of loan, were held in abeyance on account of the financial difficulties of the country.

13. No doubt the principal reason was the opposition of the people of Tamworth to the scheme. They were in favour of a gravitation scheme, were they not? I do not think that they were in favour of Mr. Gipps' gravitation scheme, but they wanted a gravitation scheme.

14. Then I presume that the work was allowed to stand aside for a while? Yes.

15. Then Mr. Hickson came into office, and the question came under his notice? Yes.

16. Was Mr. Hickson moved by the Tamworth people asking that the work should be carried out? I do not know that; I have no written correspondence upon the subject, but I know that Sir George Dibbs, when he was Member for the district, brought the Mayor to the office several times, and a good deal of verbal correspondence took place.

17. Do you know, as a matter of fact, that it is really necessary that some scheme of water supply should be given to the people of Tamworth? Well, as they have done so long without a water supply, it might be

be possible for them to do without it for a while longer, but I do not think it would be desirable when it is shown they are so able to pay for it. Tamworth stands in the centre of a very large and fertile district. There is every probability, I should think, of its making rapid progress.

J. Barling,  
Esq.

17 Dec., 1895.

18. With regard to the recommendation of a former Committee that a thorough test with a pumping machine be made to prove the quantity of water in the drift,—was that test made as recommended? The necessary bores were made, and I suppose that satisfied the Engineer-in-Chief.
19. Was that test made at the instance of Mr. Hickson? I think it was made before he took charge. I have not the exact dates, but my impression is that it was made before.
20. Was it satisfactory or otherwise? Satisfactory as to the quantity of water. The quality of water has already been shown to be very good by a report from Mr. Hamlet.
21. But when you spoke of that water you referred to the old scheme, did you not? Yes; but what I have been giving in evidence refers to the new scheme.
22. Did you draw any comparison as to which water was better? I do not think any comparison was drawn, but both were very good. No exception could be taken to either.
23. Mr. Hickson having sent Mr. Price and Mr. Davis to report, he felt justified in recommending the Minister to submit this matter to the Public Works Committee for an expenditure of £30,000 for this new gravitation scheme? He felt justified in recommending it to the Minister at that particular stage that a survey should be made.
24. And this really may be termed an improvement on the gravitation scheme submitted by Mr. Gipps? No; it is another gravitation scheme altogether, from another source. Mr. Gipps' scheme was from the Cockburn River or Swamp Oak Creek. This is from Moore Creek.
25. Would you kindly point out Mr. Gipps' scheme as originally submitted? It is in exactly the opposite direction.
26. What distance is Moore Creek? From the site of the dam,  $11\frac{1}{2}$  miles from the Town of Tamworth. You must add on  $1\frac{1}{2}$  mile from the service reservoir to the town.
27. Is there a large fall of water there? There is a considerable fall of water there. I think it has been known to cease running. I may mention that the dam will impound about 35,000,000 gallons of water, and supposing the creek were to cease running, which it seldom does, I believe there is sufficient to supply the Town of Tamworth with 300,000 gallons a day for 116 days at a time without any water running into the reservoir.
28. Can you tell the Committee what is the extent of the catchment area? About 22 square miles.
29. What knowledge have the Department that it will supply Tamworth? The calculation I have given proves it. It will hold 35,000,000 gallons of water, and when once filled there will be 116 days' supply for Tamworth at 300,000 gallons per day, or about double the quantity the present population will in all probability require.
30. What will be about the fall? About 750 feet to the service reservoir, and 1,000 to the town.
31. Is it fair to assume that it would be continuous, except in very dry weather? I do not say that the fall of water will be continuous, but if you get the dam full you can do without the fall of water.
32. *Chairman.*] Does the 116 days mean a fair supply, or is it an excessive supply? An excessive supply. This would supply over 10,000 persons at 30 gallons per day. The population of Tamworth is about 5,000, and the actual number to be served is about 4,300.
33. Really it would be a sufficient supply for 250 days? On that we can safely reckon.
34. *Mr. Roberts.*] What would be the size of the dam? 360 feet in length, with the maximum height of 32 feet across Moore Creek at its head.
35. What quantity would it contain? 35,000,000 gallons.
36. What is the estimated total cost? £35,374—that is, allowing for a 7-inch pipe to generate electric power. It is proposed that there will be a 7-inch pipe. It would be a pipe with a valve or cock turned on so as to give the necessary power. It will have to drive the turbine wheel, which will generate the power for electric purposes.
37. Will any land be resumed? I am glad you mentioned that point. In our estimate we have allowed only £90 for a resumption of land. My own impression is—although Mr Hickson does not think so—that when the Committee see the locality they will recommend the resumption of a little larger area; so that I think the estimate will very likely be increased in amount, but that is a question which the Committee will have to judge of.
38. What area exactly is to be resumed? We should have to resume about 33 acres for the reservoir, but it is conditionally-purchased land, and is not very valuable.
39. Where the pipes traverse a person's property would they be entitled to compensation for severance? It is really a legal point. We have before paid for the resumption of pipe-lines, but it is a question whether we cannot refuse to do so under the Act. We do not, of course, propose to fence the pipe-line. The pipes will be buried. They will pass through about 5 miles of private land, but it is not to the interest of property-holders themselves that we should fence. By fencing them in you only create a harbour for weeds.
40. Is there not any precedent for that? The precedents are in favour of our resuming the land.

WEDNESDAY, 18 DECEMBER, 1895.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY,  
The Hon. JOHN DAVIES, C.M.G.  
The Hon. JAMES HOSKINS.  
The Hon. CHARLES JAMES ROBERTS, C.M.G.  
The Hon. WILLIAM JOSEPH TRICKETT.  
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
JOHN LIONEL FEGAN, Esq.  
ANGUS CAMERON, Esq.  
THOMAS HENRY HASSALL, Esq.  
GEORGE BLACK, Esq.  
FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Water Supply for the Town of Tamworth.

Joseph Barling, Esq., Under Secretary for Public Works, sworn, and further examined:—

J. Barling,  
Esq.  
18 Dec., 1895.

41. *Mr. Roberts.*] I think that when the Committee rose yesterday afternoon I asked you what would be the area of land resumed if this scheme were carried out? We shall have to take 33 acres about the reservoir. I may mention that it struck me as very possible that when the Committee came to see the ground that they would advise the resumption of more land around the reservoir. The Committee did this in the case of Junee, for instance. Then comes the question of putting the pipes through 5 miles of private land, and if we had to resume that, we should only resume a strip of 15 feet along the pipeline—this amount would be very small—equal to, I think, about 10 acres. Supposing we say 45 acres as the total area to be resumed.

42. Can you tell the Committee what has been done in other similar cases? In nearly every case we have resumed the land. In the earlier work we had not the power to take temporary possession of land to run pipes through, but it is a question as to whether we have not that power under the Public Works Act.

43. Would it not be well to ascertain as to whether you have that power beyond a doubt? I think there is no doubt about it. I will read the clause, 27th section Public Works Act, subsection (III):—

(III) To make or construct in, upon, across, under or over any lands, streets, roads, rivers, streams or other waters, within the lands described in the plans or mentioned in the books of reference of any authorised work, or any correction thereof, such temporary or permanent inclined planes, tunnels, embankments, aqueducts, bridges, roads, ways, passages, conduits, drains, piers, arches, cuttings, fences, as shall be considered necessary.

In connection with the sewerage works in Sydney, under these powers, we have run a large number of small sewers through private land, and except in very few cases there has been no claim at all made for compensation.

44. And if one were made in this particular instance, it would be of very small moment? Yes; I should just like to read in connection with the 27th section the 34th section.

34. In the exercise of the powers granted by this Act the Constructing Authority and all other persons shall do as little damage as possible; and, if required, full satisfaction shall be made in manner herein provided, to all persons interested in any lands or hereditaments which shall have been taken, used, injured, or prejudicially affected, for all damages sustained by them by reason of the exercise of such powers.

If owners can prove that we have damaged the land in any way they can claim for the damage.

45. Has the Government any knowledge as to whether the Tamworth Council approve of this scheme? I have no official knowledge, but I know, as a matter of fact that they will thoroughly approve. There has been no time to get their formal approval, but as the Committee are going there themselves they will, of course, find out from the Council direct whether they approve of it or not.

46. The Council was always in favour of the gravitation scheme, was it not? Yes; I may say here that the Chairman asked me yesterday to get some authoritative statement if possible as to the taking of the land for the pipe lines, and I sent to Mr. Watkins, Parliamentary Draftsman, and he wrote the following minute:—

The Minister may, under section 27 of the Public Works Act of 1888, enter any private land, and lay pipes there, and construct drains, &c. But before that section is applicable, the work must be "authorised," i.e., authorised by sanctioning Bill passed in pursuance of section 16 (1), of the Public Works Act.

If the land used is "prejudicially affected" by the construction of the work, compensation must be paid for damages sustained (if any).

I cannot see anything in the Country Towns Water and Sewerage Acts to authorise the Minister to lay pipes through private lands, although that power is by section 16 (5) given to the Council constructing works, subject to the liability imposed in the latter part of the section to make full compensation for all damage sustained.

No power to enter and use private land can be implied; it must be expressly given; and when given, the requirements of the statute must be complied with.

Section 124 enables the Governor by the hand of the Minister to construct and complete works for water and sewerage, and impliedly he has the powers necessary for carrying the intention of the section into effect, e.g., he may make contracts, employ men, &c.; but I do not think that the section authorises him to interfere with any private rights of property, e.g., by entering private land or using private land for the purpose of laying pipes, &c.—J.L.W., 18/12/95.

47. *Chairman.*] You will see it is a remarkable thing if a municipality has any right of interference 12 or 14 miles out from the municipality? Well, I cannot say as to that; I think there is no doubt that if we resume the land they would certainly be under the control of the municipality, but of course there may be difficulties in the way.

48. *Mr. Cameron.*] You tell us this track will pass through about 5 miles of private land about 15 feet wide—can you give the Committee any idea as to the amount that may be chargeable for compensation? I cannot exactly say.

49. What number of people will be affected by this proposed water supply? The population of Tamworth is now about 5,100, but the population affected by this will be a little over 4,000.

50. And the total expenditure will be how much? The total expenditure would be £35,374, including the 7-in. pipe.

51. And what advantages will the Government receive in respect of the expenditure of this money? The Country Towns and Hunter District Water Supply and Sewerage Act Amendment Act of 1894 gives the Government power to extend the payments over 100 years, and provides for interest to be charged at 3½ per cent. and that means that they pay for principal and interest in 100 years at 3.616 per cent.

52. What is the capacity of your reservoir? Thirty-five million gallons.
53. *Mr. Wright.*] What is the extent of the catchment area? Twenty-two square miles.
54. Have the Municipal Council been consulted about this last scheme? Yes; but I have no formal acknowledgment that they have accepted it.
55. Would it be necessary that they should notify their acceptance before the work is entered upon? The Act does not imply that.
56. Is there anything in the Act which renders it obligatory on them to accept the work when it is completed? The Minister, on completion of the work, reports the fact to the Governor and the cost of it, and then by notification in the *Gazette* it is handed over to them and becomes vested in them.
57. Do I understand that whether the Council approve or disapprove of the work, they are compelled to take it? As a matter of fact, I think it is so.
58. I think you will find in the Act that you will have to have the concurrence of the Council? No; I think it is as I have stated. I will read from the fifth part of the Country Towns Water and Sewerage Act of 1880, section 125:—

J. Barling,  
Esq.  
18 Dec., 1896.

125. Upon the completion of any such work the said Minister shall report that fact to the Governor. And the Governor shall notify such completion in the *Gazette*, and thereupon the Council of the Borough or Municipal District within, and for the purpose of which the said works shall have been constructed shall take over the same, and the administration and management thereof upon the terms and conditions hereinafter prescribed, and upon any further terms or conditions which the Governor may in any case appoint, viz. :—

- (1.) The whole amount [subject to such partial remission as the Governor may think just under any special circumstances] expended upon any such works as certified under the hand of the Minister for Public Works, shall be a debt chargeable upon the general revenues from whatever sources derived of such Borough or Municipal District until defrayed as hereinafter provided.
- (2.) Such debt shall be liquidated by periodical payments to the Colonial Treasurer to be by him carried to the Consolidated Revenue Fund. And the first payment shall be made within one year from the date of the *Gazette* notification of transfer, and shall be for an amount equal to six pounds per centum of the debt so certified as aforesaid. And before the end of each succeeding municipal year thereafter, a payment shall in like manner be made until the aggregate amounts paid shall equal the amount so certified as aforesaid, together with interest added at the rate of four per centum on the balance remaining unpaid in each year. So soon as the sums so paid shall equal such amount together with interest added as aforesaid, all further payments shall cease, and the rates and income arising from such works shall be discharged from any further payments in respect thereof.

59. That being so it is obligatory on the borough to accept this responsibility, but I would like to know if the municipality of Tamworth has been consulted about this new scheme? We have sent the reports to them, and an officer has been there the last week going through the municipal books, and I understand from him, and from other sources, that they are quite willing to have this scheme.

60. With regard to the pipe line of some 5 miles through some private property, you say you may possibly resume a strip 15 feet wide,—have you made any calculation for severance to the properties? I do not think so, because the pipes will be buried, and they will have the use of their paddocks all the same.

61. But at the different levels they may be on the surface sometimes? In this case the pipes will be always under the surface.

62. *Mr. Black.*] What did you say was the catchment area? Twenty-two square miles.

63. I see that Mr. Gipps' catchment area would be 300 square miles? He takes in the Cockburn River.

64. Is this creek any great length about the point where you think to construct the dam? It will be pretty well at the head of the creek, but we have calculated the catchment area. I may say that we have, as it were, a roof of 22 square miles to fill this reservoir, which contains 35,000,000 gallons.

65. Would it be possible, if it were proved by experience, that that dam did not contain sufficient water for the requirements of the town, to construct another dam nearer to the town? It would be possible, but not desirable. There is about 7 miles of the creek above the dam which we propose to construct, and it would be possible to put another one above it. The engineer would be able to give you any information on that point.

66. What advantage would there be in that—would not the water which you dam up there be prevented from reaching the other dam? When the upper reservoir became full it would overflow, and the water would run into the other dam.

67. Would it not get there in any case? This dam would retain it to its level and then the surplus would flow away.

68. What is the estimated pressure? We have got a head of 1,000 feet to the town.

69. What pressure did Mr. Gipps' scheme give? Mr. Gipps' scheme would not have a head of more than 170 feet above the railway station. We should have a head from our service reservoir of 250 feet. One of the greatest objections to Mr. Gipps' scheme was that the head was not sufficient to enable the higher parts of the town to be supplied.

70. Then this scheme would not only reach higher parts of the town, but would be adapted to the purpose of giving general water power? Yes; such as would be used for electrical purposes.

71. You get that great head on the service reservoir, and by having this 7-inch pipe? We should be able to shut off the water so as to develop 100 horse-power.

72. I suppose there is no settlement above there? No; it is entirely cattle and sheep runs.

73. Do you propose to resume the whole of that? No; it is quite unnecessary. We only propose to resume 33 acres around the reservoir.

74. Is that piece part of the station? That 33 acres would compose part of the station, but I think it is conditional purchase land.

75. Then there is no danger of pollution? I do not think so at all; in fact, I think it presents all the features of an ideal water supply.

76. You have seen those photographs;—did it not strike you that it would have been better to have taken a photograph of the waterfall, giving us some idea of it—of the volume of water? That might be so.

77. The photographs are admirable as scenic effects, but they give us very little idea of the amount of water that falls over? The officer who went up took the photographs himself. They are useful as showing the kind of country which shows the very best watershed.

78. What quantity of water would be dammed? 35,000,000 gallons.

79. What is the usual estimate of household consumption? About 30 gallons per head per day.

80. *Chairman.*] Your reply yesterday was that the present population of Tamworth would find a sufficiency of water for about 250 days? Yes.

- J. Barling,  
Esq.  
18 Dec., 1895.
81. *Mr. Humphery.*] Are all the opinions expressed by you derived from officers of your Department whose direct evidence will be available for this Committee? Yes.
82. You have no information other than that obtained from the officers? No. Of course I have been to Tamworth, but I have not been there for that purpose.
83. Have you a list of the country towns having their water supply provided by the Government? Yes. We have spent about £494,288 in water supplies—*i.e.*, outside of the Hunter River and Sydney.
84. In how many cases are you receiving repayment? The amount of the existing debts comes to £352,283. There are other water supplies which we are either carrying out or have completed, but have not yet gazetted the debt which amounts to £132,005, making a total of £494,288 now. The instalments due at the present time we can compel to be paid on the 31st December. We have brought the debts up to December of last year, and a year has been allowed in which to make the payment; so that, on the 31st December this year, we can compel the payment of £4,732 7s. 5d. I am saying this subject to correction, because it has been estimated roughly. At the present moment we have received £9,183 8s. 6d. In fact, we are compelling all the municipalities to pay up, and we, on 31st December, intend to put the Crown Solicitor in motion to compel those who have not paid up to do so.
85. Will the £4,732 represent the total instalment payable? Yes; it will.
86. Can you furnish a return showing the total expenditure by the Government in providing water supply for the country towns and of the cost under which the amount payable has been gazetted? Yes; I will have a statement prepared showing this.
87. And all other cases where the expenditure has not been completed and the water supply has not been handed over? If the Committee wish I will show the actual cost. I will show the amounts due as gazetted, and then I will show what instalments are due, and what have been paid. We have received £9,183 8s. 6d. as against £13,915 16s. 1d.
88. Are there many instances in which country towns have been unable to pay instalments for which they are responsible? A number of them have expressed unwillingness and inability to pay. In the case of Goulburn, where the amount due on the 31st December of last year was £1,988 16s., they were given a twelvemonth to pay it in, but of course we asked for the payment at the beginning of the year, although we cannot legally press for the amount until this year. They have paid £1,450 of that £1,988 16s., and they have represented to us that £1,450 is as much as they can pay per annum. At the same time they can show a cash balance of £4,000 odd. I have written to them to the effect that if the money is not paid on the date due, the Crown Solicitor will be put in motion to compel it to be paid. Then there is the case of Wagga Wagga. There they have paid £1,251 10s. 3d., when they should have paid £1,592 3s. They will also be compelled to pay the balance. There are several other cases of the same sort, such as Wentworth and Balranald. I am speaking now more from memory; but I think it has been conclusively proved to us that in the case of Wentworth, at the present time it is absolutely impossible for them to pay the instalment. Since the works have been constructed at Wentworth, the town has decreased in importance, and the question now is if, under the Amending Act which will be brought before Parliament, we should not give them power to go to a higher rate of taxation.
89. What is the present rate? A shilling in the pound.
90. Are you quite satisfied now yourself that in the case under consideration the district is well able to pay? Undoubtedly. I think they will be able to pay the full instalment.
91. What is the present estimate of the amount that will be available for the repayment of instalments in connection with this water supply? We expect a revenue of £2,390, which will leave an annual surplus of £910.
92. When you were under examination in 1892, you estimated it at £1,632? Yes.
93. What gives rise to the difference? I think, if I remember rightly, the Committee drew attention to the fact that we had under-estimated it then.
94. What have you now estimated the ratable property within the reticulation area? The general rate, at a shilling in the pound, will come to £1,490. I have statistics which will support what I am saying. What the general rate of one shilling in the pound would be is all shown in the statement I handed in yesterday.
95. Do you wish to add anything to your statement with regard to the matter about which I have asked you some questions? There is one thing which I think in fairness I should say. In making a comparison between the pumping scheme and the gravitation scheme, it is fair to point out that in the pumping scheme there are 22 miles of reticulation, and that in the gravitation scheme there are only 19 miles. Therefore, I made out an amount of £110 in favour of the gravitation scheme, and I take it these 3 miles of reticulation would account for the apparent difference in amount between the two schemes. I have not taken into account the full amount which will be gained by the supply of electric power at the present time. Electricity is only supplied for lighting four arc lamps and ninety incandescent lamps. The scheme we propose will enable private residences to be lighted.
96. I suppose the Department has now formally rejected the former pumping scheme? Yes.
97. Although that was strongly recommended at the time by the Department? Yes, at the time.
98. And the Department is now of opinion that a gravitation scheme would be suitable? Yes, a gravitation scheme is always superior to a pumping scheme.
99. *Mr. Hoskins.*] With regard to your answer in reply to Mr. Humphery's question as to the Goulburn Water Supply, do not the Railway Commissioners use the water at the Railway Station? I forget for the moment, but it is probable that they do.
100. I ask you for this reason—because if they have, is not a large proportion of the rates paid by the Government? They cannot have paid very much.
101. Was Mr. Hickson in any way influenced by the evidence that was given before the last Public Works Committee on the subject? Everybody is so fully satisfied that a gravitation scheme is so much better than a pumping scheme (other things being equal) that I have not the smallest doubt that Mr. Hickson thought that if he could possibly get a gravitation scheme it would be better to try again.
102. Have you read the evidence of the last Committee on the inquiry into this subject? Portions of it.
103. Mr. Darley's evidence? I just looked through it.
104. Mr. Pridham's evidence? No.
105. Mr. Price's evidence? No; but I know pretty well what it is.
106. Do you know that Mr. Price stated most positively in his evidence that the gravitation scheme would be undesirable? I do not think he could have said that. What he said was that he preferred the pumping scheme to Mr. Gipps' gravitation scheme.

J. Barling,  
Esq.  
18 Dec., 1895

107. At question 954 of the evidence he was asked "You would recommend a pumping scheme in preference to gravitation," and he answered "Yes." What do you make of that? The only gravitation scheme that was before the Committee then was Mr. Gipps' scheme, and that would have a head of only 127 feet, and then further there was no possibility of that scheme developing power for the generation of electric light.
108. Are you aware that Mr. Darley gave his evidence before that of Mr. Gipps? Yes; but Mr. Darley knew what Mr. Gipps' scheme was when he gave the evidence.
109. Can you give the Committee any idea of how much public money has been expended, and in making inquiries and exploration with a view of ascertaining what would be the cost of a pumping scheme? We have really spent on this Tamworth Water Supply about £14,000 at the present time, but a larger part of this amount has been spent in pipes which were sent up to Tamworth some time ago, and of course they are still available for use.
110. And would these pipes be as well adapted for a gravitation scheme with a heavy pressure as for a pumping scheme? Yes; there would not be the 1,000 feet fall that I spoke of but the 250 feet fall from the reservoir.
111. Are you aware that in addition to the expense that is incurred by Government in sinking wells, and in testing drifts there is the expense of the Public Works Committee inquiry? Yes; but I did not include that.
112. Are we to infer that any portion of the original scheme will be availed of? Yes; we have the service reservoir and the pipes for reticulation, but the pipes from the reservoir to the impounding dam will be fresh altogether.
113. *Mr. Davies.*] How do you arrive at so large a revenue under this scheme in comparison with the old scheme? The revenue to be derived has been got out more carefully for this scheme.
114. In your estimate of revenue, with how much do you credit the railway buildings? I have included that under the heading of public buildings, £240, and we have put down the railways at a lump sum of £150; they were willing before to go to £180, but we thought it was fair, considering that the water would be really cheaper, to put it down at a smaller sum.
115. You provide in your estimate for street-watering? No, I have not allowed for that.
116. You are aware that in the former report £167 was set down for that purpose? Yes; I am inclined to think the Committee, when they go into this, will see that we have still under-estimated it.
117. From the data supplied by the officers of the Department you think that the income will be fully realised in the estimates submitted to the Committee? Yes.
118. Then you set apart £200 as the annual cost of the control and management of this supply? Yes.
119. Is that independent of the Council, or is it included in the annual cost to be deducted? I take it that it is a part of the working expenses that the Council will have to pay.
120. What officers will be employed under this £200 a year? There would have to be a turncock, and a man would have to see to any repairs that may be necessary. Mr. Hickson thinks that this amount is over-estimated.
121. What wages would a turncock get? I suppose about £2 per week.
122. And the engineer? We should not want an engineer, but I have allowed £100 per year for repairs.
123. Do you not think that the sum set down is a very small one to provide for repairs and for a turncock? No; Mr. Hickson put it down to a smaller sum, and it was only after conversation with him that I got it increased.
124. You think that one turncock would be sufficient? Yes; the maintenance men of the Council would be available to assist.
125. What provision have you made in your scheme for renewals and repairs outside this £200? The surplus will be so large that we shall have ample to meet charges of that kind.
126. The estimated surplus under the former scheme was about £400, was it not? Yes.
127. You stated, I think, that the pipes were to be 7-inch steel pipes? Yes; that is, between the service reservoir and the impounding reservoir.
128. Can you give us any idea of the probable life of a 7-inch steel pipe? I would rather you would ask that of the engineer.
129. Simply as a matter of common sense, what would you say it would last—sixty years? I should think it would; but I say again that I would rather you asked the engineer about it. My opinion on the subject is of no value.
130. I want to ascertain what provision has been made by the Department for renewals under this scheme—the whole scheme might be dead and buried in 100 years' time? In the estimate of expense I have given, an ample amount is allowed for anything of that sort.
131. The capacity of the reservoir is such as to supply Tamworth for 116 days? Yes.
132. *Chairman.*] Supposing Tamworth to be twice as large? Yes.
133. *Mr. Davies.*] Have you any calculation that you can put before the Committee as to the annual rainfall for the last twenty years in this locality? I have not particulars now; but, of course, I could easily get them.
134. I want to know how long it will take to fill the tank? I am not in a position to give that information.
135. How far will the embankment of your catchment reservoir be from the cascade that you told us of yesterday? About  $\frac{3}{4}$  of a mile.
136. The depth of it I think you described yesterday as about 30 feet? Yes; the greatest depth.
137. Is there any provision made for weirs? All the necessary provisions are made, and will be explained to the Committee by the engineer.
138. You say you remember that when the former scheme was submitted to the Committee the officers of your Department were very strongly in favour of the pumping scheme on Peel River, and I think Mr. Price was one of the officers who gave very strong evidence in that respect;—he, at that time, appeared to be the only officer of that Department who had any experience in carrying out a pumping scheme from a shingle or drift, so far as this Colony was concerned? I should not like to say so for certain, but it is possible it is so.
139. Cootamundra was the first scheme carried out on the principle of the former scheme for supplying Tamworth? Yes.

J. Barling,  
Esq.  
18 Dec., 1895.

140. You have had several complaints as to the defective character of that scheme? Yes.
141. What has been done to increase the supply of water for the people of Cootamundra? We have done nothing, except trying to liberate some more of the water in the drift; but it is something like a sucked sponge.
142. Still the municipality of Cootamundra is to be saddled with this great cost of supplying them with works that do not supply water? I think, most undoubtedly, that we shall have to come to the assistance of both Cootamundra and Parkes. It is not as if the schemes are altogether worthless, because the reticulation plant is still there, and the pumps that we have used there will be of considerable value, and can be used elsewhere.
143. And the same will apply to Tamworth, as far as reticulation is concerned? Yes.
144. If the former scheme had been carried out the fall from the distributing reservoir would not have been sufficient to serve the whole town? It was proposed in that case to add a small reservoir to that, to supply the higher parts of the town.
145. It would have left a certain portion of the town unsupplied? Yes.
146. This scheme would be something like 1,000 feet above the level of Peel-street? The pressure to supply the town is 250 feet, as against 187 feet in the former scheme.
147. So that it would reach the highest point of the Town of Tamworth? Yes.
148. *Chairman.*] With regard to the engineering aspect of the case, that is left to your officers? Yes.
149. Then you have nothing further to state? I do not think so. I should, however, just like to draw the attention of the Committee to the financial position of Tamworth, as stated in the Committee's report, page 7, section 5, which I will now read:—

5. The position of Tamworth in relation to its ability to meet the financial obligations in connection with the scheme referred to the Committee appears to be satisfactory. According to a statement produced by the Under Secretary for Public Works, the figures are as follows:—

The annual value of the ratable property within the reticulated area is £32,348 3s. 7d., which, less 10 per cent., gives a sum of £29,114.

A rate of 1s. in the £ on this amount would give.....	£1,450 0 0
Water supply to Railway Department, say .....	182 0 0
Total revenue .....	£1,632 0 0
Amount required to provide for interest on capital sum, viz. (£22,500) and sinking fund, at 4 per cent. ....	£900 0 0
Estimated working expenses.....	560 0 0
Total .....	£1,460 0 0

This statement shows an annual surplus of revenue over expenditure of £172, and nothing has been allowed, it is pointed out, for water which will doubtless be supplied to factories and other places by meter, or for any increase in the future. The Sectional Committee, in an estimate which appears in their report, place the revenue at £2,260, and show the surplus to be £800. They say also that "the Borough Council is in an exceptionally sound financial position, its total indebtedness being £5,000, while its assets, consisting of freehold property, electric lighting plant, and credit balance at the bank, is over £7,000."

150. *Mr. Humphery.*] There is no doubt that statement was borne out by the evidence which the Sectional Committee took at the Town of Tamworth? Yes.
151. I think, in answer to a question by Mr. Wright, you said that there would be no formal approval, as far as the local Council is concerned, but you are well aware that they favour a gravitation scheme as against the pumping scheme? Yes.
152. Even if it cost £35,000? Yes.
153. *Mr. Trickett.*] Look at question 15 in the prior evidence, and you will see that it distinctly states there that the Council did not care to involve itself in more cost than £30,000? The cases are quite different now. In that £30,000, which may have been expended under Mr. Gipps' scheme, there was no provision made for the electric light. This is a cardinal feature of this scheme, and completely alters its character.
154. Is it not rather "putting the cart before the horse," to go to the expense of this Committee, afterwards to find that the Council will not subscribe to this scheme? I will get a resolution passed by the Council formally approving of it.
155. In the amending Act of 1895, it is provided that the cost of any water supply for a country town with interest added would be spread over a term not exceeding 100 years—have you worked out what amount would have to be provided by this Council? Yes, 3·616 per cent. will pay for capital and interest in 100 years.
156. What amount would that come to per annum? £1,280.
157. It is estimated by the Government that the annual repayment over a term of 100 years, in conformity with the Country Towns Amendment Act of 1894, will involve an annual charge for 100 years on the Tamworth municipality of £1,280? Yes.
158. Will you put that feature before the Council? Yes.
159. Looking at the question of gravitation as against pumping, the present scheme seems rather to find favour with the Tamworth people does it not? Most undoubtedly.
160. *Mr. Clarke.*] Is the Tamworth Municipality in favour of this particular scheme of gravitation? Yes.
161. I notice that in the case of some municipalities which have had the works carried out before this are in default? Yes.
162. What steps do you take to make them pay up? If they do not pay up all their liabilities directly the period expires the Crown Solicitor will be put in motion to compel them to do so.
163. What have you to levy on? We can put a receiver in and take the whole of their rates from any source.
164. Would not it be harsh treatment? It would not be harsh to councils who could and yet would not pay.
165. *Mr. Cameron.*] You consider this should be a primary charge upon all rates? Yes.
166. *Mr. Lee.*] As a matter of fact, have you not already received the sanction of the Municipal Council to fix up water-works? We have not in a formal way.

167. I refer you to your evidence before the Committee in October, 1892, page 2, where you quoted the following resolution, which had been passed by the Tamworth Council:—

J. Barling,  
Esq.

That the Council of the Municipal Borough of Tamworth, having taken into their consideration the question of water supply for the town of Tamworth, do hereby request His Excellency the Governor, with the advice of the Executive Council, to take all such steps and cause such works to be executed as may be necessary to provide a water supply for the town of Tamworth, and the said Council, on behalf of the Municipality of Tamworth, hereby agree to do and undertake all the liabilities and obligations mentioned in Section 125 of the Act 44 Victoria, No. 14, and it is hereby expressly agreed that such liability is accepted for the total amount to be expended on such works, provided that such amount does not exceed twenty thousand pounds.

18 Dec., 1895.

—? Yes, but we would not accept that.

168. That was in December, 1891? Yes.

169. And the Minister would not accept that proposal with that stipulation? No.

170. But in January, 1892, was it not a fact that the Minister received communication from the Tamworth Council agreeing not to insist on that stipulation? Yes.

171. And in reply to a question asked you as to whether the Council were in favour of the gravitation scheme, you said yes? Yes, I think so.

172. Without any stipulation as to the amount? I do not think so.

173. That, at all events, shows that the Council had taken action in the first place—and not the Department? Yes.

174. Since that resolution has passed has there been any communication from the Council desiring to withdraw that resolution? Not that I am aware of.

175. So far as the Department is concerned, is there any reason to think otherwise than that the Council is equally desirous now to have the gravitation scheme? No reason.

176. The only question that can be submitted to the Council now is a formal one? Yes.

177. As a matter of fact, has not the Municipal Council assisted you to get out your statement of revenue; therefore, they know all about it? Yes; an officer of the Department was for some days engaged with the Finance Committee of the Council.

178. And received a great deal of information and assistance, and got supplied with the data from which he made his calculations? Yes.

179. And they are, therefore, well aware of the probable cost of this work? Yes; I know they are.

180. *Mr. Wright.*] The cost of this scheme is nearly double to that of the old scheme? I have pointed out that Mr. Gipps' scheme could not be carried out at this estimate.

181. *Mr. Hassall.*] The additional advantages of this scheme, you consider, would counterbalance the extra expense? Yes.

182. Have you any knowledge as to whether the objection to the pumping scheme was that it would cause probable contamination of the water? I can only draw attention to Mr. Hamlet's report; you will find all about it there.

183. Have you any knowledge of the locality from which it is proposed to draw this water supply? I have been to Tamworth, but never to this particular place. Mr. Price and Mr. Davis have both been there, and when they come before you they will give full details.

184. You are not aware that Moore Creek is a permanently-running stream? I could not say that it is a permanently-running stream; but there is sufficient water for our purposes, even at the driest time of the year.

185. *Mr. Fegan.*] Did it not strike you that your officers did not go a great deal further than they did in connection with the first scheme—that they did not make a better inspection? It is to be regretted that it was not done.

186. You think that it will be cheaper to have a 7-inch pipe than a 6-inch pipe? Yes; because it will supply power for the electric lighting as well.

187. The extra expense of the 7-inch pipe over the 6-inch pipe will be how much? £2,550.

188. You say that your revenue will total £2,590—on what water rate do you base that upon? A shilling in the pound.

189. And if the Tamworth people will not pay that—have the Tamworth people agreed to that shilling in the pound rate? There is no doubt they will agree to it.

190. Do you know of any work that cost twice as much as the estimated cost? The Hunter River supply was increased about double, I think.

191. Have the residents of that district made any complaints about the high water rates? They complain of a shilling in the pound, undoubtedly; but from our views of the case a shilling in the pound is not a high rate.

192. Then you base your income on the supposition that one shilling in the pound will be paid? Yes.

193. You stated yesterday that the population at present is about 5,000? 5,100.

194. And that with this scheme you would be able to supply a population of 10,000, at the rate of 30 gallons a day? Yes.

195. Do you not think that the question Mr. Black asked with reference to a second reservoir would help considerably to provide against a drought? Yes; but it is quite unnecessary.

196. Are there no great droughts up there? Yes; but there is quite sufficient rainfall to supply the town, notwithstanding.

197. And, therefore, you think that, in the interests of the health of the people of Tamworth, this scheme is necessary? Yes.

198. Have you got any medical officer's opinion upon this scheme? Well, we have Mr. Hamlet's report as to the purity of the water.

199. *Mr. Black.*] What is the water rate in Goulburn? A shilling in the pound.

200. *Mr. Cameron.*] Do you anticipate that if this scheme is carried out that the maximum amount will have to be levied from the people? It would be wise to do so at first; they will soon find out what amount is necessary.

201. In your opinion it may be reduced when the thing gets into working order? Yes.

THURSDAY, 19 DECEMBER, 1895.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JOHN DAVIES, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. JAMES HOSKINS.	ANGUS CAMERON, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
HENRY CLARKE, Esq.	FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Water Supply for the Town of Tamworth.

Robert R. P. Hickson, Esq., M. Inst., C.E., Engineer-in-Chief for Public Works, sworn, and examined:—

R. R. P. Hickson, Esq., M.I.C.E.  
19 Dec., 1895.

202. *Chairman.*] Would you like to make a statement in regard to the works now under consideration? I think Mr. Barling has pretty well explained them.

203. *Mr. Wright.*] Are you perfectly familiar with the plans of the proposed works? Yes.

204. Will you kindly explain the plan to the Committee? Yes. The red line, as shown on the plan, is the line on which we propose to take the pipes from the reservoir into Tamworth. We follow Moore Creek Valley along the road until we get to the bottom of the waterfall, and from the turn, which is about 10 miles from the reservoir, we come to the falls, and there is a rise there of 700 feet in about a quarter of a mile, and it is on top of that flat that we propose to put the concrete dam.

205. About the catchment area—has that country been examined by yourself? I have been over some of it.

206. Are you quite satisfied as to the holding qualities of the ground? It is excellent gathering ground both for pure water and for holding it.

207. Has the flow of water from Moore Creek been gauged for any length of time? No.

208. Would it not be desirable in a work like this to gauge the supply of water there—for about three months, say? I do not think it is necessary when you have a catchment area of 22 square miles.

209. Would you think it advisable to gauge the fall of running water there for a certain period of time? I hardly think so for the reason I give.

210. The Peel River is sometimes almost dry, and at Moore Creek, which is only a tributary of the Peel River, is it not likely that it may become dry also? It is quite possible. From the information that I have been able to gather I believe it has never actually run dry, but there is no doubt that at times there is very little water in it.

211. When your catchment dam is erected what quantity of water do you expect to impound there? 35,000,000 gallons.

212. And how long will that last supposing that this creek were run dry? For the present population it would last for about 250 days.

213. Over such a large catchment area would not the evaporation be very great in summer-time? Yes, it would.

214. Have you ever made any calculation as to what the evaporation would be there—say for three months in summer-time? It would be considerable, but I have never made any exact calculation.

215. You feel quite satisfied that this scheme would give Tamworth a permanent water supply? Yes.

216. There is no likelihood of it ever failing? Not the slightest.

217. You have got a reservoir in Tamworth, have you not? Yes.

218. May I ask if you do not sacrifice a considerable fall by the construction of a service reservoir at such a low elevation? It is not desirable that it should be any higher, as it would put too great a strain on the taps. The site that we have selected is a very suitable one, and is just about the right height above the town for the supply of water.

219. I understand that since you assumed your present position you advised that the old scheme for a supply to Tamworth of water be abandoned;—what led you to take that course of action? When I assumed my present position, tenders were in for the pumping engines for Tamworth, and looking through them, I asked the question as to whether one of the conditions of the Public Works Committee had been fulfilled, as given in page 9 of the report:—

The Committee are of opinion that the scheme as proposed by the Department should be carried out; but they recommend that before any of the permanent works are commenced a thorough test with temporary pumping machinery be made to prove the quantity of water in the drift, and that should this be found satisfactory sufficient land surrounding the well be resumed as an additional safeguard against any contamination of the water.

I asked if that had been done, and I was told it had not, and then I sent for Mr. Price, who told me that he felt satisfied that a gravitation scheme could be obtained. From what he said to me, I recommended to the Minister that he should have an examination made. Mr. Price made the examination, and it led to the scheme that we are recommending now.

220. Do you know if any proper test was taken as to whether the drift would give sufficient water? Not to my knowledge.

221. Have you, or any of your officers, been in communication with the municipal officers at Tamworth? I saw the late Mayor, Mr. Smith, and the present Mayor, and they were both very favourable to the scheme.

222. Did you give them any idea of the cost of this scheme? I gave them an approximate idea of the cost.

223. And still they approved of it? Yes.

224. Do you think any difficulty will arise in this case, as has risen in the case of Goulburn and Wagga Wagga, and several towns where they expressed their inability to pay to the Government? All I know is that the works will certainly be constructed for the estimate.

225. Do you not think that in all these cases some official communication should be made to the municipality, asking them whether or not they are in favour of the scheme, and whether they are prepared to take it up at the estimated cost? I think that is generally done, but whether it has been done in this case, I cannot say.

226. *Mr. Black.*] I would like to know what proportion the cost of this work will bear towards the revenue derived from ratable property as compared with Goulburn? I am not prepared to give that answer—you will get that reply from the accountant. R. R. P.  
Hickson, Esq.,  
M.I.C.E.
227. *Mr. Humphery.*] Have you satisfied yourself as to the details of the proposed scheme and the cost? 19 Dec., 1896.  
Yes.
228. What sized pipe do you propose to use for conveying the water from the dam to the 10-mile point? A 7-inch pipe, if we provide for the working of the electric lighting—if not, a 6-inch.
229. There is a fall, I understand, of some 700 feet between the dam and the 10-mile point? Yes.
230. Do you intend using the same sized pipe between the fall and the 10-mile point as you will use from the 10-mile point to Tamworth? It is a 7-inch pipe right through to the service reservoir.
231. Do you remember the size that was mentioned as being necessary in the gravitation scheme proposed by Mr. Gipps? No.
232. What would be the cost per mile of the pipe line? The pipe line is £8,628.
233. That is for the whole distance? Yes.
234. How would you divide that up—that is to say what cost per mile between the dam and the 10-mile point, and between the 10-mile point, and the reservoir? I cannot give you that information now.
235. What fall would there be from the dam to the 10-mile point? About 750 feet.
236. What is the difference in height between the 10-mile point and the reservoir? About 100 feet.
237. What fall will you have per mile? The hydraulic grade is 1 in 83 or 63·6 feet in the mile.
238. Do you intend having a continuous line from the dam to the reservoir with a uniform fall of 1 in 63—is that it? No, not exactly. The hydraulic grade from the dam to the service reservoir is 63·6 feet to the mile, but the way the pipes will come depends upon the irregularities of the ground.
239. What quantity of water will a 7-inch pipe deliver into the reservoir? A 7-inch pipe will deliver 547,200 gallons in 24 hours with that fall.
240. You are aware that under the gravitation scheme that was before the Committee when this question was being considered previously there was a fall of 3 feet per mile, and Mr. Darley's evidence was to the effect that the delivery from a 10-inch pipe would be 300,000 gallons daily. I suppose that owing to the greater pressure in your scheme, there would be half a million gallons at least in the twenty-four hours? Yes.
241. So that there is no question that there will be a sufficient quantity of water delivered through a 7-inch pipe? Not the slightest.
242. That would be an advantage in favour of this scheme in the case of the pipe line? Yes.
243. What is the difference that you estimate in the cost of a 10-inch pipe line and a 7-inch pipe line per mile? It would be very great. A 10-inch steel pipe would, I daresay, cost double what a 7-inch would.
244. In round figures what would be the saving in that item alone, that is, between the 7-inch and the 10-inch pipe? To speak approximately, I should say, the saving would be about £8,600 as against £16,000—there is no occasion for the 10-inch pipe at all.
245. As to the reservoir, I suppose there will practically be no difference between the cost now proposed and the one that would have been necessary for the other gravitation scheme? Practically no difference.
246. Do you know anything about the figures that Mr. Barling supplied yesterday, showing the amount of annual instalment that would be payable by the Tamworth Council? No.
247. I suppose you have read the evidence supplied with the report of the Public Works Committee on the abandoned scheme? I read most of it.
248. You are aware that it was not contemplated by the Public Works Committee previous to commencing the permanent works with a view to ascertaining if the proposed supply would be a satisfactory one? Yes.
249. Was it that evidence alone which led you to make this investigation of the different sources of supply, or had you any other information before you? I had no information before me at that time, except what Mr. Price told me, which was that he thought the gravitation scheme could be obtained—and I may say too, that knowing the formation of the country, I found it hard to imagine that a gravitation scheme could not be carried out there.
250. Are you aware that Mr. Price strongly recommended this pumping scheme in opposition to any gravitation scheme? No, I am not.
251. You do not gather that from the evidence then? I get quite a contrary impression.
252. It strikes me as somewhat singular that the pumping machine should have been so suddenly abandoned? Mr. Price will explain that fully.
253. *Mr. Hoskins.*] Have the Department any pipes in store for the supply of Tamworth with water as the result of the recommendation of the last Committee on the subject? There are a lot pipes at Tamworth.
254. Is there a sufficient number of pipes to carry out your proposed scheme? No; but we would utilise what are there.
255. What is the size of these pipes? There is a short length 9-inch—the rest are, of course, 7-inch.
256. Do you think that the pipes which are there are sufficiently strong to carry off the water where there is a pressure of 700 feet? Yes.
257. Then you intend to use larger pipes up near the dam? No; smaller pipes, and consequently stronger ones.
258. The dam is only  $\frac{3}{4}$  mile from the fall, is it not? Yes; about that.
259. Do you think it wise to have the dam so near to the fall? You might put it on the very edge of the fall if you have a granite foundation.
260. With respect to the catchment area of which you were speaking—most of the country; I understand, consisting of sand and granite boulders—do you not think that in dry weather a great deal of the water would sink away? I do not think so; there is very little sand above the fall, and it is all granite rock country which, I think, will hold every drop of water that falls on it.
261. Would you not require, in addition, to make a concrete bottom for the dam, that is to hold the water so that it would not escape? The dam rests on a granite bottom.

- R. & P.  
Hickson, Esq.,  
M.I.C.E.  
19 Dec., 1895.
262. Yes; but it is not solid granite—you would still have the joints? We propose to cut down into it until we get a good bottom; it will be a similar foundation to that of the Armidale and Junee dams, and they are as good as can be wished for.
263. Do I gather from you that this new scheme was evolved in consequence of the evidence given before the last Committee? Partly; and from what Mr. Price told me.
264. I suppose you are aware that Mr. Darley, Mr. Pridham, Mr. Price—notably Mr. Price—all expressed the opinion before the last Committee on the subject, that a scheme for pumping water from a drift was preferable to a gravitation scheme? I do not gather that from Mr. Price's evidence. What he said was that he preferred the pumping scheme to the gravitation scheme then before the Committee.
265. He was asked (Q. 954): "You would recommend a pumping scheme in preference to gravitation, even if it cost you £50,000 for the latter? Yes."? That is quite right.
266. *Mr. Trickett.*] Since the report of the last Committee, has anything occurred with regard to the possible impurity of the water to be obtained by the pumping scheme, which induced the Department to change their views? Nothing of the kind; I think the water is pure.
267. It is simply that the Department think a gravitation scheme would be preferable to a pumping scheme? Yes; cheaper and better.
268. I notice that on page 3 of a former Committee's report these words occur: "All the other witnesses examined were in favour of a gravitation scheme, if it could be had at a reasonable cost,"—that is your view at the present time? Certainly.
269. You were asked with regard to the pipes, if you thought those at Tamworth would be suitable for the requirements of the proposed scheme? Everyone of them will be used.
270. For what part? For the reticulation,—the 9-in. pumping main will be used as the supplying pipe from the storage reservoir down to the town.
271. You think it will be sufficiently strong for that purpose? Yes.
272. Are you fully satisfied that the height of this service reservoir will be sufficient for the purpose of supplying all parts of East and West Tamworth? Yes; it is 250 feet above the main street, and the highest ground to be served is 238 feet;—there are no houses there at present, and it is very unlikely there ever will be.
273. But if it were, you would still have a head of water of about 12 feet? Yes;—if it were at all necessary to supply this point, it would be very easy to take a small pipe from the high pressure line of supply to the top of the hill.
274. Yesterday, Mr. Barling told us that you estimated that the extreme cost of carrying the working expenses in connection with this scheme, if once established, would be £200 per year;—are you quite satisfied about that? I think it is too high.
275. Would you give us your opinion as to the amount that would be incurred? You require very little under a gravitation scheme. Orange now, for instance, has had a gravitation scheme for over ten years, and I do not think they have spent a £5 note on it.
276. Are not some permanent hands employed? I believe myself that the present corporation labourers will be able to do all that is necessary, but in case that more might possibly be required to be done I have allowed £50 for additional clerical work, and £150 for a man. I think, however, that if they get this scheme, they will be able to do it without extra assistance. The Mayor, however, is the one to give you information on that point.
277. But with regard to the whole length of the pipe from the dam to the town—will not some permanent labour be employed in connection with looking after that? No; once the pipes are laid, there is no more trouble with them.
278. Therefore, you think that £200 a year is more than sufficient? Yes.
279. Will you tell us how much a mile you have allowed in your estimate for the reticulation service? The principal assistant engineer will be able to give you that as he has all the details at his fingers' ends.
280. I was going to ask you to describe in detail the dam that is to be erected? It is simply a repetition of Junee to all intents and purposes—a concrete dam.
281. In constructing a dam of this kind in the turn where the water lies there will be beds of sand here and there—that, I suppose, will be cleared out until you get down to the granite bottom? There is hardly any sand at all above the creek for 3 or 4 miles.
282. Have you checked the proposed expenditure which is supposed to be £35,374? No; I have not gone into the quantities, but they can all be certified to.
283. Has that amount been checked by anyone except Mr. Price? The quantities were taken out by the officers of the Department, and checked by Mr. Davis, the Principal Assistant Engineer.
284. Is it based upon the price of labour at the present time? Yes, upon fair prices.
285. Can you tell us at what you estimate the cost of the service reservoir which is to contain, I understand, 500,000 gallons? £1,665.
286. Mr. Gipps when he had his scheme under consideration, estimated the cost of a similar dam, to contain the same quantity of water, at £2,000—has labour gone down, or what? Well I cannot say altogether.
287. I suppose the dam is to be located on an expensive site? The site would be inexpensive, and I cannot imagine a much better one.
288. *Mr. Davies.*] What is the width of the base of your chief reservoir? It is 24 feet.
289. What would be about the height of it? About 36 feet from the very bottom of the excavation—from the surface it would be about 32 feet.
290. I want now to ascertain from you what would be about the pressure or weight of water against the wall supposing the reservoir was filled? I would have to work that out—you can get the information from the officer who designed the wall.
291. But you think it will be strong enough to hold 35,000,000 gallons of water? Yes.
292. In your judgment would it be possible for a breakaway or a washaway to take place by reason of the want of strength in some part of the wall? No, because we have provided strength enough in the wall to allow a large margin for safety.
293. I understand you to say that the foundation will be built upon the boulders? No, on the rock.
294. So you cut down into the rock? Yes.
295. Will there be any possibility of percolation or escape? We would make it absolutely water-tight.

E. R. P.  
Hickson, Esq.;  
M.I.C.E.

19 Dec., 1895.

296. You would use no puddle nor anything of that kind? No, it would be a concrete wall.
297. And the price of that wall you have separately estimated? Yes, at £5,312.
298. I think you have said that you propose to use steel pipes from the dam to the service reservoir? Yes.
299. What is the difference between the head of your reservoir at the catchment area, and the service reservoir? About 750 feet.
300. So that there is practically a fall from the storage reservoir to the service reservoir of 750 feet? Yes.
301. Will the 250 feet from the service reservoir give you sufficient head to supply the whole town of Tamworth? Yes.
302. Do you represent the difference between the level of the service reservoir of this scheme, and that of the pumping scheme? The old reservoir was only 187 feet high, and this is 250 feet.
303. So that it will give you a much better head for a town delivery than the proposed pumping scheme? Yes, 63 feet more.
304. At what per ton do you estimate the cost of your 7-in. steel pipe? I have not got the figures here just now.
305. Do you base your estimate on what the pipes can be got for in the cheapest market, or in what they can be got for in the Colonial market where you might have to pay 15 or 20 per cent. more? I estimated on the cheapest price that I knew them to be obtainable for. If the people here can supply them for the price, well and good.
306. Are they imported pipes or Colonial made pipes? Imported pipes.
307. You are aware that in the previous inquiry it was proposed to get a supply of pipes to cost a large sum of money—£23,000, I think—and it was estimated that the pipes could be got in a local market alone, even if they might cost 15 or 20 per cent. more. I do not know how the estimate was worked out.
308. Did you base your idea on getting your pipes in the cheapest market? Yes.
309. *Mr. Lee.*] You told the Committee that the distance from the 10-mile point to the dam, would be—how far? Less than half a mile.
310. With a fall of 700 feet? Yes.
311. As a matter of fact, the real pressure under that gravitation scheme would be in that  $\frac{1}{2}$  mile? The greatest pressure would be at the lowest point of the pipe.
312. But for the first  $\frac{1}{2}$  mile, where you would have a fall of 700 feet, do you estimate that the 7-inch pipe would be sufficient to resist that pressure? That is not where the heaviest pressure is. The heaviest pressure is at the lowest point of the pipes, about 5 miles further down.
313. In this instance the real fall is in the first  $\frac{1}{2}$  mile? Yes, practically.
314. Still it is at the lowest point the greatest pressure would be? Yes; and we have made our calculations accordingly. I may say that in regard to these pipes we calculate what pressure would break them, and then we design the pipes to stand four times that amount.
315. Notwithstanding all these precautions, accidents do happen to the service pipes, do they not? I think I am correct in saying that we have only had one steel pipe that has broken, and then that only gave way because of a bruise in the caulking. We have had no steel pipe break yet under the pressure that we have put on it in any water supply.
316. You absolutely rely on steel pipes for safety? Yes, beyond all question.
317. The service reservoir is estimated to contain 500,000 gallons? Yes.
318. The population estimated to be served is 4,300, at a daily use of 30 gallons? Yes.
319. That would be equal to a little over three days' supply? Yes, about that.
320. Supposing that you met with an accident to your supply pipe from the dam, what position would your townspeople be placed in then? They would not be in a worse position than they are now. If you propose to load all water-supply schemes with such contingencies as that, you put out of the question the carrying out of them at all. The probability of a steel pipe bursting, is so remote that it would be very bad engineering to meet it by constructing large reservoirs.
321. Do you think a three days' supply sufficient to leave the people to depend upon? Yes; in Newcastle, with a population of 60,000 people, they have only 1,000,000 to depend upon, and I have never known them to be short.
322. The Hunter River water supply did not meet the requirements under the first expenditure? That was because there was only one pumping main.
323. But leave to supplement it was got from Parliament quite recently? Only a new pumping main from West Maitland to Buttai.
324. In the event of heavy rain, what is to prevent the water stored in your dam from becoming unfit for use? Why should it be with such a catchment area?
325. But after heavy rains the water must become muddy? That applies to every water supply.
326. What about filter-dams? They are perfectly useless.
327. Why? Except to take up impurities, they are no use in clearing the water. They have had experience of that in Newcastle.
328. But they would extract the mud and filth from the water? They would extract the impure matter.
329. The colour would be given to it by the influx of mud, would it not? Yes, slightly; but the dam would act as a large settling tank.
330. What would be the cost of a large settling tank? Such a thing is not used.
331. But might it not be used for the dual purpose of a settling tank and a reservoir for additional supply? You could put a few loads of sand in the bottom of a service reservoir, for that matter; it would not cost very much, but it would be utterly useless.
332. You think it would be quite unnecessary? I know it would be.
333. And do you find that people are satisfied with muddy water? I can only ask you what you think of the Sydney water supply? It is just dealt with in the very same way; in fact, with the Sydney supply it is worse, because the water is brought down from Prospect in an open drain into which dirt can get on the way. Still I do not think you would call the water you get muddy.
334. That would be in the section between the Nepean and the reservoir—is there not a provision for shutting off the water when the Nepean is flooded? No, none that I know of; I have seen the water going down the drain quite thick. What takes place at Prospect is on a very much larger scale than what would take place in this high-water level dam.

- R. R. P.  
Hickson, Esq.;  
M.I.C.E.  
19 Dec., 1895.
335. Take the Hunter River;—are there not large settlement tanks or reservoirs there? There are; but they were never used during my time.
336. But are there not specially constructed reservoirs at the Hunter River for the purpose of settling the water? There are; but as I say, they are useless.
337. But they must take out a large quantity of sediment by allowing the water to settle, do they not? Yes; you take out the sediment and any impurities, but you do not alter the colour of the water.
338. *Mr. Clarke.*] You say that the dam will hold 35,000,000 gallons of water; you also say that it will supply Tamworth for 250 days? Yes.
339. There must be some mistake here, because Mr. Barling said in his evidence yesterday that it would contain only 116 days supply? Two hundred and fifty is for the present population; 116 for double that amount.
340. You think that on the whole the present scheme is preferable to the one reported on by the Public Works Committee some years ago? I do.
341. Some of your officers, I think, said they preferred the pumping scheme? Very likely.
342. *Mr. Fegan.*] Following up the question put to you by Mr. Lee, you have got passed through Parliament a Bill providing for the expenditure of another £35,000 for emergencies in connection with the Hunter River District Water Supply;—that was for a double line, was it not? For a double pumping scheme.
343. It was, as Mr. Lee pointed out, to provide against the emergency of one of these pipes breaking? Not exactly. The same state of affairs does not exist here as at Tamworth. There you have to pump the water at a very severe pressure, and you subject the pipes to continual hydraulic rams the force of which it is difficult to estimate; but here you can calculate to a pound what a pipe has got to do.
344. Do not hydraulic engineers recommend filtering beds in connection with water supply? I do not think so.
345. Have they not been extensively used recently in the various water supplies of Great Britain? They have been used in some cases where the water was not as pure as one could wish.
346. You think this water is perfectly pure? Yes.
347. Much better than the Hunter River water? Infinitely better—the whole catchment area here is virgin ground.
348. Have any complaints been made to you as to the abandonment of the original scheme of supplying the Town of Tamworth? On the contrary, the Mayor and the late Mayor are decidedly in favour of this, as against the pumping scheme.
349. Have there been any deputations to your Department asking about the delay in carrying out this service? The only deputation I know of was one to the Minister, asking for the work to be postponed until the gravitation scheme was considered.
350. Mr. Gipps' scheme was a pumping scheme, was it not? No; a gravitation scheme.
351. How do the inhabitants of Tamworth regard this scheme, as regards Mr. Gipps' scheme? Not being connected with either the pumping scheme or the former gravitation scheme, I cannot say.
352. I think you were President of the Water Supply in Sydney at that time? I was one of the members.
353. Was not your advice asked for as to the desirability of Mr. Gipps' scheme? No; it did not come under my jurisdiction at that time.
354. What would be the difference in the cost of land resumption under this scheme, as against the former scheme? You mean the quantity to be resumed?
355. Yes, and the price? There would be very little resumption under this scheme at all, because most of the way the pipes follow the main road; we would, of course, have to resume the area for the reservoir.
356. Have you any idea what was the cost of resumption of the old scheme recommended by the Committee? I cannot tell you.
357. Do you think there is any necessity for a second storage dam? I think not—a tenth of an inch rainfall running into the reservoir would fill it.
358. Do you know what the rainfall is up there? It averages about 28 inches a year.
359. That dispenses with the idea of the second dam? Yes.
360. You will not be using any machinery in connection with this scheme, will you? We propose to work the electric lighting plant with it.
361. I mean to say that there will be no machinery in connection with this water scheme? No.
362. *Mr. Hassall.*] Have you calculated the difference between the cost of Mr. Gipps' scheme and this one? No; Mr. Gipps' scheme was given at £17,000, and then revised and made £24,000 by Mr. Darley; but the cost of carrying it out as it should be done would be £40,000.
363. What was the cost of the pumping scheme? The cost of the pumping scheme was £22,500.
364. Would that have been increased in any way? They would have to spend £560 per year on working expenses.
365. This scheme is estimated at how much? £35,374.
366. Is it your opinion that the present scheme would be much cheaper than the pumping scheme, and entail less charge on the residents of Tamworth? Yes.
367. In view of that pipe passing through first-class agricultural land, could the storage capacity of that dam be increased at a reasonable cost, so as to allow of some of the water being used for irrigation purposes? It would be very difficult to do that after the dam was built, because you could not increase the height without increasing it at the base.
368. But in building a dam could it be done? That could be done easily enough, because you could have a broader base to build upon.
369. What would it cost to carry that dam 10 feet higher? It would run into a good deal of money.
370. What I wish to arrive at is this—would the additional expense be justified in view of the fact that irrigation might take place along the line of that pipe? Before you speak of irrigating that country you had better see it, it is most barren country. To do what you say would increase the cost of the dam enormously—the base of a dam 40 feet high would be much greater than the base of one 30 feet high.
371. But could you increase the storage capacity if 35,000,000 gallons were not found sufficient? If it were found necessary afterwards to increase the storage capacity, it would be better to put one or two smaller dams higher up.

372. *Mr. Cameron.*] Which would not interfere with the present scheme at all? Not at all.
373. In the construction of this proposed reservoir, what are the materials you would use? Sand, gravel, and cement, and big blocks of stone.
374. No brick? No brick.
375. *Mr. Roberts.*] Mention has been made about utilising this water supply for the supply of Tamworth with electricity;—is not Tamworth already lighted with electricity? To a certain extent.
376. How do you get the power for the electric-lighting at the present time? They have two 20-horse power engines working one at a time, but they supply a very small portion of the town. They have asked me to provide 100-horse power in this scheme, and I have done that with a 7-inch pipe.
377. It would be a great advantage to Tamworth to have this increased power? Yes, they can save £250 a year by it.
378. If it were not for being able to supply this power to Tamworth you would have used the 6-inch pipe? Yes.
379. What is the difference in cost between the 6-inch and the 7-inch pipe? £2,500.
380. And the revenue you will get you estimate will more than pay for the increased outlay? Yes.
381. *Mr. Black.*] I would like to ask where you propose to make the electric power attachment—from the pipes at the service reservoir or from the pipes above? The pipes above.
382. So as to have a greater pressure? Yes; you would not get the head from the service reservoir—you understand that that water is not wasted; it goes through the pipe, works the engine, and goes into the reservoir.
383. *Chairman.*] You have stated that your catchment area is some 20 square miles—the only information before the Committee in regard to that is shown on the plan. You must have something to base your calculation of the area on? It was taken from the parish map.
384. You will notice on the plan that in places there are some sharp bends in the line;—will you tell us as an engineer, whether at any serious bend in the pipe friction would take away the head. Why do you not make it straight across the bend? We are trying to follow the road wherever possible.
385. Why keep on the road? It is always better whenever possible to have the pipe on the road. It is possible that you may have to pay for resumption, and if you take the road you avoid that.
386. With regard to the statement you made that a tenth of an inch falling over 22 square miles would fill your reservoir—is that so? I said a tenth of an inch going in.
387. What is the rainfall at Tamworth? About 28 inches.
388. In your opinion how much of the water falling on that water-shed gets into your dam? Half an inch falling over it would fill the dam.
389. The red line on the plan shows the hydraulic grade, and in going down you will see that you have several high places to go over;—what is the effect when a pipe is taken over the hydraulic mean? It will reduce the flow.
390. At once? Yes.
391. When it goes over the hydraulic mean the flow is at once reduced? Yes.
392. Have you taken measures so that you will not be above the hydraulic mean? Yes; we will sink the pipe deeper into the ground at those particular places.
393. The Committee can see those places if they go up I suppose? Yes; one is on the road and the other is a short distance from it.
394. Your officer would be able to tell us any detail in connection with it? Yes.
395. *Mr. Hoskins.*] In your evidence you have stated that a dam proposed to be constructed here was somewhat similar to a water supply authorised to be constructed at Junce? Very much the same.
396. Is that dam finished? Very nearly.
397. Is there any water impounded in it? We are letting the water go through it—it is similar in construction to the Orange dam, which is full.
398. The Committee which reported on the Junce works were very dubious about the dam's holding capacity, and I would have liked to have known if it succeeded in impounding as much water as you expected? We are letting what water comes in go through.
399. *Mr. Cameron.*] Can you give the Committee any information as to how long Tamworth works are likely to take? About eighteen months, I should think.
400. It would give employment to a number of men? Yes; we could start the work at once.
401. Do I understand that the Department will carry out the work itself, or call for tenders? Call for tenders. We can start the reticulation works at once.
402. You think there will be no difficulty in obtaining in the district everything required for going on with the work? Everything but cement.
403. What is cement running at now? 10s. 6d. per cask.
404. *Mr. Hassall.*] Was it possible to take any other route following down the bend down the valley of Moore Creek? We did try one route, following up the cattle reserve and going across Levy Springs, but it was too high.
405. *Mr. Davies.*] Would it be possible to modify your plan and take out that sharp angle at the crest of the ridge? We have gone as far west as it is possible to go at that point.
406. *Chairman.*] Is that point shown on the plan right up against your hydraulic mean? Yes.
407. *Mr. Davies.*] Would not those angles very much reduce the head of water? All that was taken into account when making our calculation.
408. *Mr. Black.*] What size of pipe will be used for the supply of electric power? Seven-inch pipe.
409. But is not that the same size as the pipe that will supply the service reservoir? That is the pipe that works the electric-lighting plant. On that 7-inch pipe there is an engine erected to work the electric-lighting.
410. You do not actually withdraw the water into another pipe? No; it is throttled there. There was a question asked yesterday as to the life of the steel pipes—I would like just to read an extract from a standard work on hydraulics bearing upon the question. It is from Burton's, "The Water Supply of Towns," published in 1894. He says:—

R. R. P.  
Hickson, Esq.,  
M.I.C.E.

19 Dec., 1895.

Experience in the United States goes to prove that there is no danger in using steel or wrought-iron pipes instead of cast-iron, and they have in some cases been used for thirty-three or more years. Our bituminous coating is a perfect provision against corrosion, and the only care that has to be observed is in seeing that the pipes are properly coated before they are laid in the track.

R. R. P. I would like to read a further extract from a pamphlet read before the Victorian Institute of  
Hickson, Esq., Engineers—  
M.I.C.E.

19 Dec., 1895. The larger wrought-iron pipes are much cheaper and secure against bursting, and if properly coated will last at least as long as the cast-iron pipes with the ordinary coating. Mr. Schussler's experience of wrought-iron pipes laid for city water supplies extends over twenty years; his recent remark that the first of them, although put into the ground twenty years ago, "are as good as when laid," is a fair credential. He refers to 200 miles of pipe ranging up to 37½ inches in diameter as, although being from eight to seventeen years in operation, are perfectly sound to-day.

411. *Mr. Davies.*] The longest period of life is thirty-three years? That is the longest period that has been observed.

412. You are aware when the Government construct works for country towns or municipalities, they give them 100 years in which to pay off the capital cost? Yes.

413. Then how many times in that period would it be necessary to renew the whole of the pipe service;—taking thirty-three years as the average life of a steel pipe it would have to be renewed three times, I suppose? In the extract that I read, it was stated that at the end of thirty-three years they were as good as when put into the ground.

414. Taking the payment of the capital cost of the construction of these water-works at 100 years, do you believe that the steel pipes that will be put down to serve the Town of Tamworth will last 100 years? Yes; I see no reason why they should not if they are properly coated.

415. What is the thickness of these steel pipes? One-eighth and three sixteenths.

416. Is it possible that a one-eighth and three-sixteenth steel pipe will last for 100 years? If the bituminous coating is put on properly, I see no reason why they should not last 100 years.

417. Are they coated internally? They are coated internally and externally.

418. In your estimates do you provide for coating? Yes.

419. Has it not been the practice in this Colony for sixty years to do the same thing with pipes? No; they were only tarred.

420. Are you aware that it was really the practice of the Sydney Council to do that for years? It was not the same sort of thing—by the new method we place them in a bath, and coat them inside and outside.

421. *Mr. Wright.*] By what name is this coating known? It is bituminous coating.

422. *Mr. Davies.*] Would there be no wear from the pressure of the water? No.

423. Have you any other authorities you would like to quote from? No, it is not necessary; the quotation I have given is from a standard work on hydraulics.

424. You have seen the enamelling on baths and things of that kind—now would that last fifty years? No, I do not think it would; it is subject to what we might call wind and water. In the case of the pipes, they are only subject to water. If a pipe is sometimes empty and sometimes full, it makes a great difference. When the air gets in, oxidization takes place.

425. In the catchment area, will not a certain amount of acid and other mineral quality impregnate the water, and thus have an action upon the pipes? We have had that water tested, and the result is before the Committee in Mr. Hamlet's report.

426. If the pipes are properly coated over in the way you speak of, you do not hesitate to express the opinion that they would last 100 years? I do not know what is to wear them out.

427. *Mr. Black.*] Is not the wear on the pipe more from the inside than from the outside? That will depend upon which side the coating comes off.

428. Is there not more danger of the coating coming off inside than outside, owing to the continual flowing through of the water? I do not think so; I think there is very little difference.

FRIDAY, 20 DECEMBER, 1895.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JOHN DAVIES, C.M.G.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

ANGUS CAMERON, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Water Supply for the Town of Tamworth.

Edward Bellingham Price, Esq., M. Inst. C.E., Assistant Engineer, Department of Public Works, sworn, and examined:—

E. B. Price, Esq., M.I.C.E. 429. *Chairman.*] What position do you hold? I am Assistant Engineer for Public Works.

430. You are the pioneer in connection with this work, are you not? Yes.

431. The main principles of the scheme you are therefore responsible for? Yes, entirely.

20 Dec., 1895. 432. Has it been handed over to another officer to carry out the details? Yes.

433. Then your examination had better be limited to the general principles of the scheme? Yes.

434. *Mr. Black.*] May I ask you if you arrive at your decision regarding the suitability of the scheme now under notice as a means of securing a water supply for the Town of Tamworth by reason of the quantity of water that falls from that precipice, or because of the latent possibilities of the catchment area? I think, perhaps, it would simplify matters if I were allowed to hand in or read my preliminary report on the subject.

435. Will you kindly read it? Ycs. It is as follows:—

The Engineer-in-Chief for Public Works,—  
Sir,

Public Works Department, 1 June, 1895.

E. B. Price.  
Esq., M.I.C.E.

20 Dec, 1895.

I have the honor to submit my preliminary report on an entirely new scheme for the water supply of Tamworth. Having been sent to Tamworth during the course of the Public Works inquiry into the authorised pumping scheme, in order to clear out the old trial shaft, and take samples of water for analysis, I became more or less familiar with the proposed pumping scheme, which, as far as pumping schemes go, would have been an excellent one, provided the proper site had been selected for the well. It, however, struck me from reading the evidence, and from the questions which were put to me during my own examination, that no single person had examined all the country within reasonable distance of Tamworth, with the view of finding a source for a gravitation supply. All engineers, whether Government or private, had followed in the same groove, first trying the gullies at the back of the town, and then having resort to the rivers, where the want of fall entailed very long mains of a comparatively large diameter.

No one seems to have thought of examining the country beyond the ranges to the north of the town, where it was possible some large creek might be found, having its source in the Moonbi Mountains, on which a storage reservoir could be constructed of sufficient capacity to supply the town during drought.

Probably the difficulty of obtaining sufficient head to gravitate over the ranges near the town was considered insurmountable, more especially in the days when wrought steel mains were unknown.

Not being personally connected with the authorised scheme, and being practically unacquainted with the mountains, my opinions could hardly be expected to carry weight. Having, however, of late frequently to cross the Moonbi Range on the way to the Armidale water supply, my opinions as to the possibility of obtaining a gravitation supply became so strong that I thought it my duty to bring the matter under your notice, with the result that you stopped the acceptance of a tender for the pumping-engines, and instructed me to point out to Mr. Davis (in whose hands had been placed the country towns water supplies) the locality from which I thought a water supply might be obtained by gravitation.

This was done last month, when we stopped for a day on our way back from Armidale and drove across the ranges and for a short distance up Moore Creek.

On our return we reported, recommending an officer should be sent to investigate. This was approved of, and I had the honor to receive your instructions to make the investigations myself.

I have now much pleasure in reporting the success of my explorations.

I arrived in Tamworth on Tuesday morning last, and started on horseback to examine the head of Moore Creek. Owing, however, to the difficulty of the country and the impossibility of obtaining a guide, and the misdirection of those who thought they knew the tracks, I spent the whole day in the mountains without striking the real creek. On Wednesday I followed up the creek as far as possible in a buggy, and then walked. By this means there is no difficulty (except for the heavy climb) in reaching the head of the creek. On the following day, though well satisfied with the result obtained, I examined all the creeks on the other side of Tamworth, in the direction of Moonbi and Nundle, but found nothing to compare with Moore Creek as a source for the gravitation supply.

On Friday I investigated the pipe-track through the ranges at the back of Tamworth and to the storage reservoir, re-checking my aneroid levels. I also took rough cross-sections of Moore Creek at the dam site sufficient to prepare a reliable estimate of the cost of the dam and holding capacity of the reservoir.

On Saturday, before leaving, I had a long interview with the Mayor (Alderman Britten) and explained the proposed scheme. I also called upon Mr. Poate, District Surveyor, who kindly fixed the limits of the catchment area from the original plans, and supplied other valuable information.

Moore Creek, the proposed source of supply, rises in the Moonbi Range, near Bendemeer, and after flowing for about 9 miles through poor grazing and extremely wild country, enters a narrow gorge, where it flows over bare granite and diorite bars, till it reaches the edge of a series of falls, in all about 700 feet in height.

Some idea of the character of the country is given by the accompanying photographs, which I was fortunately able to take. Most of the loose boulders appear to have been swept off the top, leaving the intrusive bars of granite bare, and carried down to the bottom of the falls, where they form a heap several hundred feet high, as shown in one of the photographs, which was taken from the opposite side of the valley.

Just at the head of the falls is an admirable site for a concrete dam; in fact, one of the best I have seen yet in the Colony. The rock is perfectly bare and sound on each side of the valley, and very little excavation will be necessary to prepare the foundation for a dam 35 feet in height.

In the centre of the creek are a few large rocks which have fallen from the top, and are now resting on solid rock. The removal of these, and some sand which has accumulated round them, is practically all the excavation which will have to be done before starting the concrete.

Just above the dam site, as is generally the case where there has been a granite upheaval, the bed of the creek is fairly level, and admirably suited for a storage reservoir.

The catchment area of Moore Creek above the proposed site for the dam is 23½ square miles (fully four times as large as necessary), the greater part consisting of wild rocky mountains. The present flow in the creek, after one of the driest seasons known, is about 70,000 gallons per day, and I doubt if the creek has ever been lower, as it appears to be fed by springs and soakages.

Under the authorised pumping system it was proposed to provide engine-power sufficient to supply 30 gallons per head per diem to a population of 10,000, or more than twice the present inhabitants. I have, therefore, provided for a supply of not less than 300,000 gallons per day, although I consider a much less quantity would supply Tamworth for very many years to come. Still, as the site for the storage reservoir is such an economical one, and as the surplus water is always available for supply of power to the electric lighting plant, the full supply may as well be provided for in the first instance.

The following table gives approximately the comparative contents, cost, and storage capacity of a reservoir, with dam of different heights on the site selected:—

Height.	Cubic yards concrete.	Cost.	Storage Capacity in gallons.
30 feet.	1,030	£ 1,850	16,500,000
35 "	1,580	2,700	28,000,000
40 "	2,300	3,850	39,000,000

As previously stated, the present flow in the creek amounts to about 70,000 gallons per day. It is possible that in even drier years than the present the flow for a time may be less. Taking it, therefore, at 50,000 per day, a 30-foot dam would provide for a period of sixty-six days without rain; a 40-foot dam for 156 days, while the 35-foot dam would provide for 112 days.

The average rainfall at Tamworth is about 28 inches per annum, and is probably heavier on the mountains where Moore Creek rises. I think, therefore, that with a 35-foot dam, Tamworth might rely on a permanent supply of 300,000 gallons per day.

The catchment area is a very large one—nearly three times as great as that of the Armidale supply. One inch flowing off it would yield the enormous quantity of 341 million gallons.

The elevation of Moore Creek at the site of the proposed dam is about 1,000 feet above the railway station in Tamworth, while the lowest gap in the range, at the back of the town, is only about 320 feet. There is, therefore, a very great fall in the pipe-line. The distance from the dam to the gap in the range, by the course I have marked for the pipe-line, is about 10½ miles, and the fall per mile 64 feet. If the service reservoir were constructed at this point a 6-inch pipe would supply it at the rate of 380,000 gallons per day (some authorities give higher discharges, up to 420,000). It might, however, be better to construct a service reservoir nearer the town, as the distance from the gap to the railway station is 2½ miles.

E. B. Price,  
Esq., M.I.C.E.  
20 Dec., 1895.

A fairly good site can be found on a hill in the recreation reserve, near the rifle range. The length of pipe line to reach this spot would be nearly  $1\frac{1}{2}$  miles, and the distance from the railway station 1 mile. This is, however, a matter for the surveyor to decide in consultation with the Municipal Council. For the purpose of estimate, I have taken that the service reservoir will be on the level ground at the summit of the range.

On the map that accompanies this report I have marked the general course of the pipe-line in red. This track is fairly easy, and follows Crown lands and public roads where possible. About 5 miles, however, would be through private land (provision for the resumption of a narrow strip being made in the estimate).

It is possible that a shorter pipe-line may be found by survey, and in order to assist whoever is sent to do this work I have had the features put on to the map. I am inclined to think, however, that the pipe-line as shown in red will be found the cheapest in the end. It would not pay to shorten the pipe-line at the expense of so much loss of head as would entail a larger pipe being used.

A very great saving has resulted from being able to use so small a main as 6 inches in diameter, which will actually discharge 80,000 gallons more than what the consumption is estimated to be for double the present population.

This excess will go to compensate for loss through friction of rivet-heads.

On actual surveys being made it may be found that my aneroid levels are not very correct. I do not, however, think the fall will be found much less than what I have stated, as my levels were checked up and down on two different days, on the latter of which the barometric pressure was wonderfully steady. With the same instrument in the case of Junco Water Supply the maximum error was only 25 feet.

The general course of the pipe-line is through easy country. The get-away from the dam for a few hundred yards is difficult, the pipe having to pass under the boulder shown in one of the photos. Owing, however, to the sudden fall of the land the pipe soon reaches the top of the spur, where the ground is sandy and free from rocks for half a mile. The curve across the end of the spur and the drop into the creek will be more difficult, but from thence onward the course is easy till the limestone quarries are reached, beyond the second crossing of Moore Creek. Here the surveyor must select the route most free from rock, shortening the pipe-line as much as possible without interfering with the hydraulic grade. The remainder of the pipe-line to Tamworth is through easy red-soil country.

After the first crossing of Moore Creek the statical head on the pipes will be about 650 feet, and will remain pretty constant for the next 4 miles, as the line follows the base of the mountains. At the second crossing of the creek the head will be about 950 feet, and from thence it decreases to 700 feet at the service reservoir.

Owing to the great pressure to be resisted, it is important that the pipe should not be larger than necessary.

The pipe I would propose would be 6 inches in diameter (side to side, and not from rivet-head to rivet-head) of  $\frac{1}{4}$ -inch steel double rivetted, spigot and socket similar to those supplied for Junco Water Supply, only  $1\frac{1}{2}$  inches smaller. I would, however, recommend that a recess should be given to keep the lead-joint from blowing, and that the pipes should be dipped into asphaltum composition of a tougher nature.

The bursting head of a 6-inch steel pipe  $\frac{1}{4}$ -inch thick may be taken as over 3,000 feet.

The safe working head in England would be taken as about 833 feet, while in America 1,500 feet would be allowed.

I do not think, therefore, that the pipe need be any thicker than  $\frac{1}{4}$  inch, even where it crosses the creek the second time under a head of 950 feet.

As to the quality of the water above the falls in Moore Creek there can be no question. The gathering ground is generally granite and too poor ever to be used for anything but grazing purposes.

The water appears to be very soft and is beautifully clear. I had no bottle with me or I would have taken a sample for analysis, but really it is not necessary.

Should a sample be taken at any future time care should be exercised that it is taken from above the falls, as a sample taken low down in Moore Creek would contain lime, as well as other minerals, from Back Creek.

There is one important advantage which this gravitation supply will possess, viz., that it will be available for the production of power.

The streets of Tamworth are lit by electricity, which is generated by steam power. The plant is owned and worked by the Municipal Council, and there is no reason why an auxiliary generating station should not be established at the proposed service reservoir.

As previously stated, the proposed 6-inch main will discharge 80,000 gallons in excess of what the requirements of Tamworth will amount to for many years to come. It will, therefore, cause no inconvenience if the discharge is checked back (for, say, five hours a day), sufficiently to raise the pressure in the main.

Allowing a difference of 700 feet in level between the storage and service reservoirs and a length of  $10\frac{1}{2}$  miles of 6-inch pipe the full discharge will be at the rate of about 265 gallons per minute, and the pressure at the outlet zero. By contracting the outlet till the discharge is reduced to 150 gallons per minute the pressure will be raised to about 205 lb. to the square inch. Theoretically this should produce 21 horse power. With a well-constructed "Pelton wheel" an efficiency of 85 per cent. will be obtained, or an actual horse power of 18. No loss of water will result, as, after driving the "Pelton wheel" the water will fall into the service reservoir, the only difference being a reduction of 6,900 gallons per hour in the rate of supply to the service reservoir, which would not be missed, as the power would only be required for a few hours a day.

Though 18 horse power would not be sufficient to light the whole town it would materially assist.

Moreover in wet seasons when the creek is running strongly and not so much water being used for domestic purposes, an additional 19 horse power could be obtained by allowing 17,400 gallons per hour to run to waste in the river through the reticulation pipes. By having, therefore, two power stations, one at the service reservoir, and the other near the present generating station, a total of 37 actual horse power would be available at a cost of 17,400 gallons per hour to run to waste.

Unless a 9-inch pipe is laid from the service reservoir, the power will be considerably reduced I think, therefore the 9 $\frac{1}{2}$ -inch steel pipe which was sent to Tamworth for the pumping main should be utilised, the remainder of the town connection being made up of the 6-inch cast-iron pipes which will be to spare from the eastern end of the town. I need hardly point out that this additional 19 horse power would only be available for a portion of the day, as otherwise the service reservoir would lose more than it gained—as, however, the electric light is only needed for, say, five hours a day, this would not matter as the loss would only amount to 87,000 gallons, leaving about 258,000 gallons for domestic and other requirements.

As the estimated consumption is based on a population of 10,000 it would be quite safe for Tamworth to count on having 90,000 gallons per day to spare for many years to come, even in the driest seasons.

By the time the population of Tamworth reaches 10,000 so much electric lighting will be required that the 37 horse power will not be of so much value—but at present it should be sufficient to light the whole of the streets.

This question of electric lighting should be carefully considered when the plans are being prepared, and the work designed so that no additional work or alterations will be required in case the council decide to utilise the water power.

I have prepared the scheme and estimate so as to include all the pipes at present lying at Tamworth.

Owing to the service main coming into the town at the western end, it will be possible to do away with about  $1\frac{1}{2}$  miles of unproductive 6-inch reticulation pipes at the eastern end, and utilise them, together with the wrought-steel pumping main, for the connection between the service reservoir and the town.

The estimated cost of the works is as follows:—

<i>Estimate.</i>	
Storage reservoir (capacity 28,000,000 gallons) .....	£2,700
Pipe main (6-inch steel— $10\frac{1}{2}$ miles) .....	8,610
Service reservoir (500,000 gallons) .....	1,350
Reticulation and service main (pipes already provided) .....	14,260
Land .....	310
Surveys, engineering and contingencies .....	2,723
Total .....	£29,953

(Say) £30,000.

The cost of the pumping scheme was estimated at £22,500, and this amount was approved of by the Public Work Committee,

Subsequently

Subsequently the amount of reticulation was considerably reduced, and the price of labour having fallen, the work would probably have been carried for somewhat less, even making allowance for compliance with the conditions as to testing of drift imposed by the Committee. F. B. Price,  
Esq., M.I.C.E.

The estimated working expenses of the pumping scheme were £560, which, capitalised at 4% and added to the cost of the scheme, will bring it above that of the proposed gravitation supply. 20 Dec., 1895.

436. Is this as regards the scheme now before the Committee? No; it only deals with the amounts and quantities in a general way. The site of the dam under consideration of the Committee is placed higher up the creek.

437. Do I understand from your remarks that the difficulty in regard to the gravitation for Tamworth hitherto has been the absence of sufficient force to carry the water over the range? Yes.

438. Can I further infer that that difficulty would still exist, were it not that by the use of steel pipes you have a conveying power sufficiently strong to stand the extra force made necessary by these ranges? Yes; if we had to use cast-iron pipes to stand a 1,000-foot head, the cost would be so much that it would simply put the scheme out of the range of possibility.

439. You say there is a fall of 700 feet from the proposed catchment area to the foot of the cliff? Yes.

440. What is the height of the highest intervening range between the bottom of the dam and the town of Tamworth? 700 feet.

441. You mean to say that the water has again to rise 700 feet? No; the height of the range at the back of Tamworth is about 320 feet over the railway station—that is the highest intervening point on this line.

442. What is the height on the crest of the ridge? Approximately about 540 feet.

443. And the next in height to that is the one you pointed out on the permanent common;—as a matter of fact at the point where the service reservoir will be is viewed hydraulically as the highest point? Yes; that is the point nearest the town.

444. That is to say that the one which is physically the lowest point is hydraulically the highest? Yes; because it is furthest away from the storage reservoir. It is the ruling point in the whole scheme.

445. We were led yesterday to imagine that the other was? You can lower the other as much as you wish by altering the course of the line.

446. We had evidence yesterday which, to my mind, was directly in opposition to that;—we were led to understand that the crest of the range was the highest point? The crest of the range is the first obstacle to be met with. It is possible to lower that as I said, but it is not possible to lower the second. In the case of the first obstacle you can take a different route, but it would not be advantageous to do so, because you would then get the pressure on the pipes where you do not want it, besides lengthening the line.

447. How far is the reservoir from the second obstacle? I put the service reservoir at the second obstacle in my preliminary sketch. The present position of it is nearer the town.

448. How far is that from the 320-foot obstacle? It is not quite 1 mile nearer the town.

449. You proposed originally to have the service reservoir on the top of that 320-foot range? I left it to the Municipal Council. They could either have it there or where it is at present.

450. What is the height at which it is now proposed to be placed? About 240 feet over the railway station.

451. Then there will be a lessening in the head of about 80 feet? Yes.

452. I have been looking at the photographs handed in to see if there was any view of the cataract? I think it is shown in one of them.

453. Just now you said that Mr. Poate supplied you with the plan of the catchment area from the original plans? He did not exactly supply me with a plan, but he spent some time with me in going over the original plans in which the water-sheds are marked, which we transferred to this plan.

454. Are the original plans that you refer to the original plans made by the surveyor of the district? Yes.

455. The pipe you recommend for this work is a 6-inch one, is it not? Yes.

456. But the size of the pipe to be used in carrying out the scheme is a 7-inch? Yes; the reason for the change is that the Council asked us to give them power enough for the generation of more electric light.

457. You think that with the increased size of pipe, providing that with the increase of the size of pipe the strength of the pipe is proportionately increased, that there is an increase of water power up to a certain point? I worked that out some time ago. I hand into the Committee statements giving particulars of discharges of 6-inch and 7-inch pipes, with a fall of 64 feet per mile; and showing the horse power to be derived from the water supply by using electric accumulators. They are as follows:—

## TAMWORTH WATER SUPPLY.

(Moore Creek Gravitation Scheme.)

TABLE giving particulars of discharges of 6-inch and 7-inch pipes with a fall of 64 feet per mile, calculated with Pollit's Slide Rule (based on Box's formula).

Diameter of Pipes.	Discharge in gallons, with fall of 64 feet per mile.			Surplus supply per 24 hours.	Fall per mile required to give 300,000 gals. per day.	Surplus head available for power, per mile.	Total head derived from 11½ miles of main available for power.
	Per min.	Hour.	Day of 24 hours.				
6 inches	270	16,200	388,800	88,800 gals.	40 feet ...	24 feet ...	276 ft. = 118 lb. sq. in.
7 inches	395	23,700	568,800	268,000 gals.	20 feet ...	44 feet ...	506 ft. = 217 lb. sq. in.
Consumption provided for ...	208½	12,500	300,000				

E. B. Price,  
Esq., M.I.C.E.

20 Dec., 1895.

TAMWORTH WATER SUPPLY.  
(Moore Creek Gravitation Scheme.)

TABLE showing horse power to be derived from Water Supply by using Electric Accumulators.

Diameter of Pipes, in inches.	Gallons per minute (discharged.)	Effective head.	Horse power.			Total h. p. hours stored in accumulators.	Effective electric output of accumulators per hour for five hours.
			Theoretical.	Pelton wheel.	Generator.		
6 inches	208	276 feet	17	14½	12½	294	50 h.p.
7 inches	215	506 feet	33	28	23½	570	97 h.p.

NOTE.—These powers are calculated by using Box's formula, and allowing an efficiency of 85 per cent. to "Pelton wheel," "generator," and electric accumulators, respectively.

458. What is the proposed capacity of the service reservoir? 500,000 gallons.

459. Do I understand you to say that if it is proposed to light the town by electricity the capacity of the service reservoir is so limited that it would be necessary to dissipate a large quantity of water—as far as I can see from your figures somewhere about 87,000—through the reticulation pipes over that which is necessary for the generation of the electric light? I think your question refers to my first proposal, which was to light the town direct without the aid of storage batteries.

460. I understand you to say that it would not be possible to use sufficient water power to generate electricity for the supply of the whole town unless a large quantity of water were allowed to run to waste through the reticulation pipes? No; the steel main will discharge into this reservoir on the top of the hill, and instead of letting it discharge at full bore, you close it by means of a jet—you put a nozzle on to the end of it.

461. That would increase the pressure on the pipe, would it not? Yes, that is what you want.

462. And would that be dangerous? No.

463. I think you told us what quantity of water would be necessary to generate sufficient electricity to light the whole town? 300,000 in twenty-four hours is what is required.

464. That is what is supplied? Yes; you do not waste any water. If you wish to generate 97 h.p., and you have 7-inch pipes, you must run 300,000 gallons through into the reservoir in twenty-four hours.

465. The reservoir has a holding capacity of 500,000 gallons? Yes.

466. Did I understand you to say that there were some subsidiary reservoirs to be constructed in connection with the electric-lighting? I think not.

467. *Mr. Humphery.*] Have you provided for an ample water supply and sufficient power for electric-lighting purposes, and complied with the requirements of the Council in regard to their electric-lighting scheme? The scheme before the Committee provides sufficient water for the town, and sufficient power to not only light the streets but all the important buildings in the town.

468. When you say that you have a reservoir to contain half-a-million gallons, and the consumption will not exceed 300,000 gallons, are you speaking of the present consumption or of the probable consumption in the future, with the population of the town double? Of the probable consumption of the future.

469. The present consumption is about 130,000 gallons, is it not? Yes.

470. That being the case, will it be necessary to run through your pipe for providing an electric power 300,000 gallons daily? Yes; that provides for the increase of the town.

471. But dealing with the town as it is at present—will 130,000 gallons give you 20-horse power? Yes.

472. As a matter of fact, at the present time it would not be necessary that any water should go to waste, because the supply is more than would be required, and the passage of 130,000 gallons through the pipe would supply all the electric-lighting needed? Yes.

473. With regard to the cost, you told the Committee that you had already stored a supply of pipes ready for use in connection with this reticulation;—how did you estimate them? I did not estimate them. I took the actual cost, but allowed so much for laying them.

474. Can you speak of any scheme similar to the one under consideration;—do you know of any similar scheme that has been carried out? Yes; the one at Junee.

475. Has the Junee dam been completed? All but plastering the top of the dam.

476. What distance have you brought the water in that case? Twenty-one and a-half miles.

477. What is the daily delivery? 304,000 gallons.

478. Are the pipes used steel pipes? Yes.

479. What head have you there? The maximum head there is 630 feet. The maximum head of this scheme is close on 1,000 feet.

480. In preparing these figures for the consideration of the Committee, have you been guided by the actual cost at Junee? Yes; I took the cost at Lithgow, Armidale, and Junee. The price allowed for concrete here is a good deal higher than any of them.

481. Then the estimate supplied to this Committee will exceed, if anything, the actual cost? The estimate of £35,000 supplied to the Committee will more than do the work.

482. You are satisfied that if the scheme is carried out it will be a success? Yes.

483. How much have you provided for the dam at Tamworth? You had better let Mr. Davis give you those details.

484. As to the quality of the water—have you taken any steps to test its purity? I did not myself, but the Mayor of Tamworth had an analysis made of it, and it turned out to be splendid water. I think Mr. Davis also got a report on it from Mr. Hamlet, who says that it is especially good water.

485. What data had you for the estimate for the area of the water-shed;—did you make a personal examination of the whole place? I was over some of it on horseback, but I got the original plans from the District Surveyor, Mr. Poate. They show every creek, and we marked the water-shed from that on to this.

486. *Mr. Wright.*] Is the catchment area alienated? A great part of it is. One side of the river is an annual lease; it is wretchedly poor country.

487. *Mr. Humphery.*] Did you make any test as to the volume of water falling over the cliff? When I gauged it, it was about 70,000 gallons per day.

488. Can you conserve the whole of the water falling over the cliff? We can only conserve a hundredth part of it. E. B. Price, Esq., M.I.C.E.
489. My question is on the assumption that there is not sufficient fall in the dry season? You cannot impound anything like what falls. 20 Dec., 1895.
490. My meaning is this—supposing that in a very dry season you have only 50,000 gallons per day falling, what proportion of that can you impound in your reservoir? The whole of it.
491. In answer to a question put yesterday, it was stated that if there should be no rainfall for 116 days there would be sufficient in the dam to supply the town during that period? Yes.
492. So that if the worst came to the worst you would always have at least 50,000 gallons a day? Yes. I may mention that I do not think it is likely that the storage reservoir will be required more than one year in every three.
493. *Mr. Hoskins.*] Mr. Humphery asked you respecting the Junee Water Supply;—is the dam there completed? It is completed all but the plastering of the top.
494. Have they succeeded in impounding as much water as they expected? They have not closed the valve yet.
495. Would there be as much water caught there as at Moore Creek? The catchment is just exactly four times as great as at Junee.
496. Have you been over the whole extent of this proposed water scheme from the waterfall right down to Tamworth? Yes.
497. Have you been over it yourself? Yes.
498. And you prefer this scheme to a pumping scheme? Yes. It depends on what would be the cost of the pumping scheme, though.
499. In your evidence before the last Committee, you said that you preferred a pumping scheme? If this gravitation scheme was to cost £50,000, or even £45,000, I would prefer a pumping scheme; but if it cost anything below £40,000 I would prefer a gravitation scheme.
500. With respect to the dam, will you not have to make a cement bottom for it, seeing that the granite there is very jointy, and there are very large crevices between the boulders? The granite round the immediate site of the reservoir is rather solid.
501. You would have a large body of water impounded above the dam besides that immediately against the wall—is not that composed of jointed granite rock with large crevices? It is wonderfully close granite—in fact, it is like one flat rock, every piece of stone having been swept down over the falls with the rush of water.
502. Over the extent of 23 acres? All the way up the creek for a mile I could not see a boulder of any size.
503. Moore Creek is a tributary of the Cockburn River, is it not? It runs into the Attunga, 14 miles below Tamworth.
504. *Mr. Clarke.*] Did you not, on a former occasion, recommend a pumping scheme in preference to a gravitation supply from the Cockburn River, as recommended by Mr. Gipps? That is a very different scheme to this.
505. I suppose you were responsible for the scheme recommended by the Public Works Committee not being carried out? I was instrumental in stopping it.
506. Then you say that this scheme is preferable to any other? Very much.
507. What quantity of rain at the present time would fill the dam that you say would contain 35,000,000 gallons? A thunderstorm of 2 inches would fill it ten times over.
508. Are the pipes through which it is proposed to carry the water from the reservoir into Tamworth to be steel pipes? Yes, riveted or welded; it is not decided which.
509. Do you consider them preferable to cast-iron? They are very much preferable when there is heavy pressure. A steel pipe has a certain amount of elasticity; a cast-iron pipe has not.
510. Will they last much longer than the other pipes? It is very hard to say how long a steel pipe will last; they have not been in use long enough to say; it all depends on the coating. If the asphaltum is knocked off, or is badly put on, they will corrode quicker. If it is well put on there is no saying how long they will last. I have seen asphaltum over 1,000 years old, and it appeared to be as good as ever.
511. I suppose there is no danger of contamination at the catchment area, is there? No; there is only one person living on the watershed, and he is a shepherd, I think.
512. Is there any country fit for farming purposes between the proposed reservoir and Tamworth? Yes; there is some farming land at the summit of the range, between the creek and the town. There is some very good red soil country there.
513. *Mr. Trickett.*] Would you mind giving us a little more detail as to what caused you to go from the old to the new in regard to this question of water supply? I always had my doubts about the pumping scheme, because I never thought that the country was properly explored. I went so far as to say so to Mr. Darley, but he thought that as so many officers had been there from the Department, and so many private engineers had been over the country, that it must be well explored. When Mr. Hickson came into office, and the questions of the pumping engines came before him, I suggested to him that before he accepted them he should let me make another exploration of the country, as I said that I had an idea that something might be found. I thought that in such a mountainous region the site for a gravitation scheme could surely be got. Mr. Hickson told me to go and examine the country, which I did, with the result as stated in my report.
514. Then all through you desired to obtain a gravitation scheme in preference to a pumping scheme? Yes; I would always give a gravitation scheme the preference over a pumping scheme, provided it could be constructed at a reasonable cost.
515. Had you any reason to change your view as to the purity of the water to be obtained under the pumping scheme? No; my opinion was borne out by Mr. Hamlet.
516. As far as you are concerned, you are still of opinion that first-class water could have been got at the drift? Yes.
517. Have you got the quantities for the expense of the catchment dam? No; Mr. Davis would have them.
518. You have given us the minimum flow of water at the fall in the dry season as 40,000 gallons per day. Have you been able to ascertain what would be the maximum flow of water? I have seen proofs that the water has gone over there 10 feet deep.
519. Was that in consequence of continuous rain, or after a heavy shower? A thunderstorm of 2 inches would make it 10 feet deep in that gorge. 520.

- E. B. Preece, Esq., M.I.C.E.  
20 Dec., 1895.
520. I want to know particularly whether you think the ground that will be covered by these 35 acres of storage water is of a good holding character? You cannot have any better holding ground. It is superior to Prospect or the Junee reservoir.
521. Therefore you think the scheme is sound in every way? You would lose no water from that reservoir, except by evaporation.
522. Some questions were asked by Mr. Hickson yesterday with regard to the life of those steel pipes. What has been your experience in that respect? My experience on steel pipes extends over only about ten years. I have, however, read a great deal about them. At the time of the Junee inquiry I went into the question thoroughly, and I looked into every book on the question that I could find. The longest life that I could find any mention of was forty years, and they were wrought iron pipes. In America there are some wrought-iron pipes thirty years old. It was at the time the country was engaged in the war and the price of cast-iron pipes went up enormously and they made pipes out of sheet-iron, which they dipped in Portland cement. In France they found that asphaltum was better, and they dipped wrought-iron pipes in it, and now steel pipes are dipped in it.
523. Then you consider that the life of these pipes is almost indefinite? Providing the coating is put on well. This is so important that I would feel almost inclined to have a chemist watch them being dipped.
524. Is the cost of dipping included in the present instance? Yes.
525. Is it a heavy item? The Junee pipes cost £24 19s. per ton delivered at the railway ready dipped.
526. Is that the most modern way of treating these pipes? Yes.
527. Does the creek water affect these pipes in a very marked degree? No water will affect the asphaltum, but if the asphaltum gets knocked off then the softer the water the more they are affected; hard water does not affect them so much.
528. You remember that in the Junee scheme when the supply became very low the water became of a very brackish character; does that prevail here? No; when there was simply a little trickling in the creek the water was perfectly pure.
529. How long do you estimate it would take to have these works carried out? About two years. The pipes are yet to be made, and you must import the steel.
530. You say the steel pipes must be imported? Yes; import the plates. They could have the work completed and the water turned on in two years.
531. The pipe main from the catchment dam to the service reservoir takes a very tortuous course? It does.
532. Is that absolutely necessary for the purpose of having the pipe on the ground all the way there? Yes; the bends are necessary to avoid rough ground. There is nothing so expensive as laying a pipe in ground where you have to cut through boulders. It is far cheaper to get smooth ground, even if you have to go round a bit.
533. One part of the line runs through private land, does it not? Yes.
534. Would they not have to be compensated? Yes, I think so.
535. The question of compensation for putting a pipe through is not very large, is it? No; I think it is about £2 per acre, which is about £4 per mile.
536. What width do you take in along the line? About 16 feet.
537. Do you resume that portion? We resume it, but we do not fence it.
538. Would there be any cost for severance? We have paid no severance at Junee.
539. *Mr. Lee.*] Regarding the life of these pipes, do you think they would last 100 years? I would not put it so high as that unless extreme care is taken with the coating.
540. You are aware that if this scheme is carried out it will be under the Country Towns Water Supply and Sewerage Act, under loan from the Government, to be repaid in 100 years. I wish to ask in what position the project will stand? The way I have always looked at it is that in (say) fifty years the town would have to increase its supply by laying an additional pipe-main.
541. But under the primary working provision for repayment of interest, and so much for repayment of capital, there is no provision made in that for the maintenance of the water supply? I think I have provided for maintenance. I know I allowed £200 per year for expenses in the case of Junee.
542. Who is supposed to pay the cost of maintenance? The Council.
543. Independent of the charge levied by the Government? Yes.
544. Then your proposal is on the assumption that in fifty years time the population will be doubled, or at any rate increased largely;—what provision have you made for increase in the supply? You could put three or four more dams, if necessary, on that creek higher up, holding 30,000,000 or 40,000,000 gallons, and could save 100,000,000 gallons if you wished quite easily.
545. But suppose in that time that portion of the creek has been settled upon, and become liable to contamination? I hardly think that you will ever see settlement on that creek—it is too poor.
546. That is the way you suggest provision may be made for additional supply? Yes.
547. The experience is that as population increases the consumption will be very much larger;—then the revenue derived by the Council will be proportionately increased to meet the demands of the Government? Yes.
548. And to provide for an increased supply they would have to put in additional pipes? Yes; it would cost them £1,000 a mile to put in a little larger piping.
549. What provision have you made for the outlet of surplus water? It flows over the top of the dam.
550. Do you estimate a concrete dam will be of sufficient strength for that purpose? Yes; we always allow concrete dams to be overshot dams. We have had an overshot concrete dam at Goulburn seven years, and it is as good now as when it was put up.
551. Is the wall of this dam to consist entirely of concrete? We intend to build it the same as the Goulburn and Junee dams. We put a layer of concrete in first and then we put in big stones bedded in concrete, and then with a layer of very rich concrete about 18 inches thick on the inner face.
552. Would it require very careful working in putting it down? Yes; it requires to be very carefully done.
553. Have you engineers in your Department who have carried out this work satisfactorily in other places? Yes, Mr. Harold Blomfield. I do not think you would get a more careful man than he is.
554. Supposing the dam were to give way, would it endanger the town of Tamworth? No; it would flow about 15 miles below Tamworth into the river.

555. I would like to know how it is proposed to hold this catchment area—is it to be specially reserved for water purposes? I do not think it is proposed to specially reserve the whole area, but I presume that any Crown lands there would be gazetted as water reserves. That is what has been done at Junee.

E. B. Price,  
Esq., M.I.C.E.  
20 Dec., 1895.

556. Supposing that in the course of a few years a mineral field broke out there, particularly an alluvial field, in which the water would have to be used—in that case how are you to keep your water free from contamination? You cannot preserve it from contamination in that case, unless you put a small reservoir higher up to act as a settling dam.

557. That would mean an additional cost? It would, but not very much. It might be done with rough stones and logs for about £500. We did that in the case of the new scheme for Armidale. We built some log dams higher up to catch the sand, and they worked well.

558. I notice you have made no provision for filter dams? No; we have filter dams in other places, and they are never used.

559. You have some at West Maitland, have you not? Yes; but the water there is very different from this.

560. But might not this be the same under some circumstances? No.

561. You know that if water suddenly rushes over the country and goes into this reservoir it will be in a dirty state? It might be a little dirty, but along the course of the creek it flows through sand and over little water falls, and by the time it would get to the dam it would be pretty well purified.

562. From the Engineer-in-Chief, it would appear that you have entirely discarded these filter dams as quite unnecessary? Quite unnecessary.

563. Do you not think it would be very much better to put up an additional service reservoir? I do not think it would be necessary; we have no use for it. The only time that an additional reservoir might be required is when a pipe bursts, and I have never heard of a steel pipe bursting yet.

564. Are pipes not likely to freeze in the winter season? No; not in this country.

565. But as a matter of fact they do; I have known them to? They might at Kiandra.

566. I have known them to in this very locality? Not if they were underground; the ground is a great protection. It is very rarely, even in England, for an underground pipe to freeze. The fact of the water flowing through them prevents that.

567. What do you consider would be a wise supply of water to keep in the reservoir? It would always be full, except in the middle of the day perhaps, when there was a draw upon it.

568. It is supposed to hold 500,000 gallons, is it not? Yes.

569. And that, according to the present population to be served, will equal a three days' supply? Yes.

570. Supposing a pipe were to burst, and there was some difficulty and consequent delay in discovering the fracture, what position would the people be in then? There would never be any difficulty in discovering fractures.

571. But what would be the result if the water ran out? Well, the people would be in just the same condition as they are at present. They would still have their present tanks.

572. Do you not think it is drawing the thing pretty fine to leave the people to this limited supply? I do not think so.

573. You will admit that a severe accident to a pipe would put the people in a very precarious position? No; if the pipe were to burst it could be put in again in one day.

574. But supposing that the reservoir should be empty for only one day, would that not take away the hydrant power for all the houses in the town, and consequently leave the insurance offices without the assistance of water to extinguish any fires? Yes; I presume that if any accident like that occurred the Council would put the people on a limited supply (say) 100,000 gallons a day, and then the water would last five days.

575. *Mr. Hassall.*] Were you right through that country round the catchment area where you propose to build your dam up to the head of the creek? I have been a good way up. I came in from Moonbi side.

576. That is from the road running up through Moonbi? Yes; I also came through Back Creek way. I may say that I do not know anything about the catchment area up at the extreme end of it. I have never been up there.

577. You could not say whether the creek is fed by springs, or whether it is fed by the rains from the hills? No; I saw springs lower down though.

578. Then you know as a fact the creek is fed by springs? Yes.

579. You say you made a pretty exhaustive examination of the country up towards Nundle;—I suppose you also examined the Cockburn River site? Yes; there was a splendid supply of water there, but no head. I also examined some springs which I have since heard called the Moonbi springs. I gauged them, but I found that the supply from there was not sufficient for present requirements.

580. In all the country you examined you could not find as good a water supply with the same facilities for impounding and catchment as you discovered at the head of Moore Creek? I could not.

581. The pipe you propose to use in this scheme is a 6-inch one is it not? No. 7.

582. Could you bring as much water in a 6-inch pipe by having a larger pressure than could be brought in an 11-inch pipe as proposed by Mr. Gipps' scheme? Yes.

583. With regard to the question of cost the pumping scheme was estimated to cost £20,500, was it not? Yes, it was.

584. The present scheme is estimated to cost £35,734? Yes, with a 7-inch pipe.

585. Have you any idea what reduction would result from a 6-inch pipe being used in place of a 7-inch pipe? Something over £2,000.

586. You agree that it would be better to have a gravitation scheme to cost £33,000 than a pumping scheme to cost £22,500? Yes.

587. For what reason? If you take out the cost of working the pumps, engine-drivers' wages, wear and tear of engines, &c., and capitalise it, it would bring the cost of the pumping scheme up to more than the gravitation scheme.

588. Then the tax on the people would be greater under the pumping scheme than under the gravitation scheme? Yes.

589. And for that reason you now advance the present scheme in preference to the pumping scheme? Yes.

590. With regard to the site for the dam, you say it is one of the best in the Colony? It is one of the best I have ever seen, being on solid rock.

E. B. Price,  
Esq., M.I.C.E.  
20 Dec., 1895.

591. In taking a site for the dam, were you guided by surface indications? Yes, for the preliminary report; but for the detailed report trenches would be cut to test the ground.
592. From your examination of the locality, you say that the bed of the creek where you propose to erect the dam was solid rock? Yes; the site I chose was solid rock; but I may mention that the site at the present time is some 900 feet further up the creek.
593. With regard to the surplus water, you propose to have an overshot dam? Yes.
594. And being built on solid granite, you do not think the force of water would have any effect on it? No.
595. Do you put boulders at the back to break the force of the water? We do at Goulburn, but we do not require to do so here.
596. You estimate that the service reservoir will have a capacity of half a million gallons, and that it will cost £1,350? That was my estimate. I do not know what the new estimate is. I may say that that was the actual cost of the Junee reservoir.
597. Is the reservoir at Junee the same size as the proposed one under consideration? Yes.
598. A question has been asked with regard to what would happen to the Town of Tamworth supposing there should be any intermission in the supply and a consequent exhaustion of the service reservoir,—what in your opinion would it cost to double the service? It would cost about one-third more.
599. For (say) £2,000 you could put down a service reservoir that would hold 1,000,000 gallons? Yes; I think, though, that 500,000 gallons is sufficient to last during the period of repairs. It does not take long to put a pipe in, because there are always pipes left along the line of route.
600. Taking into consideration that you would use (say) 300,000 a day from your service reservoir, and that it would only last you two days at the outside, do you think that the repairs would be effected in two days? Yes; the repairs can be done in one day. It would take another day to fill the pipe gradually.
601. You do not think it advisable to go to the extra expense of constructing a larger reservoir? No; if they were cast-iron pipes I would go for a bigger reservoir.
602. With steel pipes you do not think it necessary? I do not.
603. *Mr. Fegan.*] Being the pioneer of the scheme, I suppose you have been complimented by the Minister for originating it? Well, yes.
604. How long have you been in the Department? Ten years.
605. From an answer to a question by Mr. Black in reference to electric lighting, I gather that there is no necessity for any waste of water in giving sufficient power to light the town? No; if there are storage batteries there is no necessity to waste any water.
606. Can you give us any reason why this country was not explored sooner when the Department was thinking over a scheme for the water supply of Tamworth? It is very hard to say. It is partly owing to the way the scheme was got up. About fifteen years ago it was first started. At that time the Council wanted a reservoir to impound some water at the back of the town, but when trial shafts were sunk at the site of the dam they found no bottom. An officer was sent up from the Department and he was there some months, but he never inspected a great deal of the country, and instead of looking further out for a suitable site they went to the river and pumped. I may say that at that time there were no such things as steel pipes known, and this scheme would be out of the question without steel pipes.
607. Would not cast-iron pipes do? No; cast-iron pipes have to be about three-quarters of an inch thick to resist the pressure, and then they would cost £1,800 instead of £800 per mile.
608. But the stress in a gravitation scheme is not nearly so high as in a pumping scheme? No.
609. Therefore, being a gravitation scheme, it would require three-quarter inch cast-iron pipes? Yes; I calculate it takes three-quarter inch iron pipes to be safe.
610. What lengths of pipes have you to lay? Eleven and a half miles.
611. Can you tell me how much you think it would be possible for the Council to place to a sinking fund under this new scheme—something like £700, would it not? I think about £500 a year.
612. In an emergency such as the bursting of one of these pipes, they could put down a double line of pipes to replace them if necessary? You can duplicate the present pipe for £10,000. The Council should be able to save enough money to provide for duplication in about twenty years.
613. *Mr. Roberts.*] I understand that since Mr. Hickson was appointed Engineer-in-Chief for Public Works, you suggested to him that you should be allowed to visit Tamworth with a view to investigating this water supply? Yes; I think it was on the 10th April last.
614. It would be interesting to know what caused you to make that application;—were you dissatisfied with the previous scheme which had been adopted by the Parliamentary Public Works Committee? I was not dissatisfied altogether, but I began to think there might be something better. I had been frequently travelling to Armidale in connection with the new water supply there, and passing by the Moonbi Ranges, and when I saw those great mountains out there I began to think that surely there must be a possibility of getting a good site for a gravitation scheme.
615. You looked upon the cost of Mr. Gipps' scheme as far too high, did you not? No; far too low.
616. I understood you to say that it was estimated at £50,000? That is the cost of making a proper scheme. It provides for a pipe instead of a ditch.
617. Have you heard if Mr. Gipps has expressed any opinion on the present suggestion? I saw several letters in the Tamworth paper that was sent to me by some friend, in which Mr. Gipps still protests that there is no sight for a dam at the head of Moore Creek. Of course, the Committee can settle that matter when they go up there themselves.
618. You think that the present scheme is pretty well all that can be desired? It is an exceptionally good scheme.
619. *Mr. Wright.*] In speaking just now of a possible fracture to these pipes, have you made any arrangements for turning off the water? We have retension valves put in every 1 or 2 miles.
620. How long will it take to empty the pipes? A very short time.
621. How long would it take to refill? If the pipe burst it would probably empty the pipe-line for 4 miles, and the refilling would have to be done very gradually. It would take, perhaps, twelve hours.
622. *Chairman.*] The retension valves are automatic? Yes.
623. *Mr. Wright.*] In your statement I think you spoke about the possible electric lighting of Tamworth, and you spoke of the number of tons of power you would require—what was the number you said? It is reckoned in foot pounds. The number of horse-power hours would be 570.

624. Do you think that ninety-five horse-power is sufficient to drive the dynamos? It would require a Pelton wheel of twenty-eight-horse power, and that would be working twenty-four hours a day. E. B. Price,  
Esq., M.I.C.E.
625. Did you ever go into the question as to what it would cost for a Pelton wheel and electric dynamos, &c. The Pelton wheel would cost about £100, and there are two generators which would cost about £250 apiece. 20 Dec., 1895.
626. Do you think the Pelton wheel and dynamos can be put up for £400? Yes.
627. Under your scheme you are perfectly satisfied that you will have not only abundance of water for all possible contingencies, but also abundance of generating power to light the town? Yes.
628. You advocated the pumping scheme for Tamworth? Yes, in preference to Mr. Gipps' gravitation scheme.
629. Have you had any experience of pumping from river drifts? Yes; Dubbo is a case in point.
630. Would you be surprised if I said that 15 miles this side of Dubbo I saw the bed of the river drained with a galvanised hand-pump? That could not have been in the old bed.
631. Have you never known the river to be dry at Dubbo? No.
632. That is the only experience you have had? Yes, of river drifts.
633. Of course you are aware that the catchment of the Macquarie is very much larger than the catchment area of the Peel? It is very much larger.
634. I have taken the trouble to check your figures, and I find that an area of 22½ square miles gives you 350,000,000 gallons of water with a rainfall of an inch; so there seems to be no possibility of a failure? Hardly.
635. *Chairman.*] Will you prepare a brief statement of the four different water-supply schemes for Tamworth, giving the reasons why you rejected the pumping scheme, the Cockburn River, the Moonbi Spring, and Goonoo Goonoo schemes, for the information of the Committee at a later stage? Yes.

TUESDAY, 7 JANUARY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.  
The Hon. JOHN DAVIES, C.M.G.  
The Hon. JAMES HOSKINS.  
The Hon. WILLIAM JOSEPH TRICKETT.  
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
JOHN LIONEL FEGAN, Esq.  
ANGUS CAMERON, Esq.  
THOMAS HENRY HASSALL, Esq.  
FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Water Supply for the Town of Tamworth.

Edward Bellingham Price, Esq., M. Inst. C.E., Assistant Engineer, Department of Public Works, sworn, and further examined:—

636. *Chairman.*] The Committee asked you at their last meeting to state definitely the reasons why you rejected the water-supply schemes to which I then referred? Yes; my reasons are as follows:— E. B. Price,  
Esq., M.I.C.E.

*Pumping Scheme.*—The annual cost of working, if capitalised and added to cost of construction, renders the scheme more expensive than the proposed Moore Creek gravitation scheme. It also provides no power for electric lighting. 7 Jan., 1896.

*Cockburn River.*—The fall in the river is so slight that it would be necessary to go at least 17 miles to obtain sufficient head to supply the town, and a pipe fully 11 inches in diameter would be required to deliver 300,000 gallons per day. Even then the higher portions of the town would not be supplied. The cost of the scheme would be fully £15,000 greater than that from Moore Creek.

*Moonbi Springs.*—The elevation of the springs and of the creeks in the neighbourhood is not sufficient to supply the higher portions of the town, even by using a large pipe. The supply from the springs is quite insufficient, and cannot be increased, while that from the creeks would require to be impounded, and there is no site for a reservoir. The pipe-line would be longer than that from Moore Creek.

*Goonoo Goonoo and Nundle.*—Sufficient elevation cannot be obtained on any suitable stream in this direction without going an unreasonable distance.

637. *Mr. Davies.*] How did you come to make this discovery of a scheme at Moore Creek? I had an idea that Moore Creek, as it rises in the Moonbies, might come from a very high tableland. I noticed that there was granite formation obtruding through slate formation, and the experience I had gained at Juneec was that where that occurred you might expect to find a waterfall.

638. Did Mr. Poate, the district surveyor, give you any information as to Moore Creek? None, until three days after I had been to the place. I then called upon him and asked him to define the watershed, and he did so.

639. He did not suggest to you that the probabilities were that a gravitation scheme would be discovered by making an inspection at the head of Moore Creek? No. I never met Mr. Poate until three days after I had found this scheme was possible. When I informed the Mayor of it, he said, "We will call and see Mr. Poate"; and he afterwards gave me information about the watershed.

640. You were strongly in favour of the scheme originally proposed by the Department? I never was very strongly in favour of it. I thought it was a good pumping scheme—that was all I knew of it.

641. Was not your former evidence in favour of the scheme of the Department? I recommended the pumping scheme in preference to Mr. Gipps' gravitation scheme.

642. At that time, had you not a strong feeling in favour of pumping from the shingle or the bed of the river? Not in preference to a good gravitation scheme, if it could be obtained. The Juneec Water Supply was to have been a pumping scheme, but I turned it into a gravitation scheme.

643. *Mr. Hoskins.*] Do you think the new scheme at Juneec will answer? I think so, if we get a shower of rain.

644. *Mr. Davies.*] The scheme originally proposed for supplying Tamworth permanently with water was a pumping scheme? Yes.

645. And you gave strong evidence in favour of it? It was a good pumping scheme.

646.

- E. B. Price,  
Esq., M.I.C.E.  
7 Jan., 1896.
646. I believe you also advocated the scheme for the supply of water to Cootamundra? That was not my scheme.
647. But you supported it? Yes; I thought it was worth trying.
648. Also the scheme at Parkes? Yes.
649. Have not those schemes failed? Both have practically failed, and the wonder is that other schemes have not failed considering the dry year we have had.
650. One of your strongest reasons for advocating a gravitation scheme is probably the failure of the schemes to which you have referred? The pumping schemes referred to had not failed at the time of my first advocacy of a gravitation scheme. It is over a year ago since I first spoke of seeking for a gravitation scheme at Tamworth.
651. How does your Department propose to adjust the expenditure incurred in the supply of water to country towns in cases where the schemes have proved absolute failures? It is not right to say that the schemes have absolutely failed. They are still getting water from them, although perhaps not as much as is required, and when the rain comes the deficiency will cease.
652. Is there not a telegram in to-day's papers to the effect that one of these schemes has given out absolutely? I would not be surprised to hear it, the weather has been so dry. In my original report with reference to one of the works you refer to I said that the scheme was worth trying because it could be so easily turned into a gravitation scheme.
653. Would you obtain a sufficient head of water by the construction of a dam, to supply the people of Cootamundra? Yes. It would be an expensive dam, and that is why the pumping scheme was proceeded with.
654. From your experience at Cootamundra and Parkes, and one or two other places where pumping schemes have been adopted, you would not recommend the construction of any similar work for supplying country towns with water? I would not recommend any such scheme unless I had put down the trial shafts myself. It is no use mincing the matter, but the officers who put down the trial shafts gave unreliable returns. For instance, one shaft was made to show 24 feet of shingle. A shaft was afterwards put down there and it was found that there was no shingle.
655. Is the officer who did that work still in the employ of the Government? No; he has been gone for along while.
656. What were the trial shafts put down in the case of Tamworth? I do not think the trial bores which have been put down are to be doubted in any way as they were done by one of our most reliable officers.
657. I see you estimate a larger revenue under the new proposal than under the old one? I cannot speak definitely as to that, but I think there will be a larger revenue taking into account the value of the scheme for electric-lighting plant.
658. You are not in a position to say definitely whether the income will be larger than was estimated in the case of the previous scheme? I am sure it will be larger by the amount contributed for the electric-lighting power.
659. The expenses of the scheme now proposed will be less than those of the pumping schemes? They will be less by the cost of all the fuel used, repairs to the engine, drivers' wages, and possibly an extra shift in summer-time.
660. And the new scheme will enable you to supply water at a higher level? Yes.
661. Under this gravitation scheme you would be able to supply at the highest levels? To any height 700 feet above the railway-station by an additional service reservoir.
662. You believe it is the best and the most economical scheme which can be procured for supplying Tamworth with water? Yes.
663. Have you made an investigation into Mr. Gipps' gravitation scheme? I have been along the Cockburn River. I have not seen the site of his dam, but I have gone along the river and have taken levels, and I found that I had to go 7 or 8 miles further along it than along Moore Creek to obtain an elevation sufficient to supply the town.
664. You think that Mr. Gipps' scheme would not supply the higher levels in the town? No. I think that Mr. Gipps has agreed that his scheme would not supply the higher parts of the town.
665. With regard to the cost of the proposed scheme you saw Mr. Gipps' evidence I suppose;—do you think the work could be carried out for the sum mentioned? At the time of the last inquiry I made a rough estimate as to the cost of two schemes. The cost of Mr. Gipps' scheme was £46,700 if carried out with a pipe instead of a ditch.
666. Mr. Gipps' estimate being £17,000? Yes; Mr. Gipps only provided £5,000 for reticulation, while the Departmental scheme provides £14,000.
667. You are clearly of opinion that Mr. Gipps' scheme could not have been carried out for the amount he estimates? I think not. If I had found that a scheme could be obtained at Cockburn River I would have recommended it.
668. *Mr. Hoskins.*] Mr. Gipps proposes to bring his supply from the Swamp Oak Creek, I believe? Yes; but that is 17 miles from Tamworth.
669. *Mr. Davies.*] You propose to deliver from the main reservoir to your receiving reservoir by means of a 7-inch pipe? Yes; 6 inches was proposed in the first instance, but it was altered to 7 inches. The pipes used will be one-eighth of an inch of steel, exclusive of the coating. There will be a coating inside and outside of asphaltum, supposed to be  $\frac{1}{2}$  inch in thickness.
670. What will be the life of the pipes? They would last over fifty years if properly coated. Only an odd pipe here and there would go, perhaps one in twenty or thirty.
671. *Mr. Cameron.*] Is not this treatment of the pipes largely in the nature of an experiment? No. Similar pipes made of wrought iron instead of steel were laid in America thirty years ago, and are good to this day.
672. *Mr. Humphery.*] You say that the difference between Mr. Gipps' estimate of the cost of reticulation and the Departmental estimate is £9,000? Yes.
673. For how many miles of reticulation did Mr. Gipps provide? From 5 to 6 miles.
674. For how many miles have you provided in your estimate? For 19 miles, I think.
675. *Mr. Fegan.*] I believe that a steel pipe of  $\frac{1}{2}$  inch is equal to a  $\frac{3}{4}$ -inch cast-iron pipe? Yes. Cast-iron pipes for this scheme would require to be  $\frac{3}{4}$  inch thick.
676. They would be equal to steel pipes  $\frac{1}{2}$  inch in thickness? The steel pipes would still be stronger.

677. *Mr. Lee.*] When you were last examined I asked you whether you thought a three days' supply was sufficient to provide in the service reservoir? Yes; I think it is quite sufficient.
678. In view of the possibility of the population of Tamworth largely increasing, do you think your service reservoir will be sufficiently large to place the people of the town beyond all doubt as regards the supply? I think the service reservoir of 500,000 gallons capacity will be large enough for present requirements and for requirements ten years hence unless the town goes ahead very quickly. If that is the case a second reservoir can be added.
679. The present proposal is to afford a three-days' supply for the present population? Yes.
680. Supposing there were an increase of 50 per cent. in the population? Then we could construct another service reservoir. If there were an increase of 50 per cent. in the population they could construct an additional reservoir out of revenue.
681. But you think the reservoir now proposed will do for the next ten years? Yes.
682. Would the supply from the dam be sufficient to serve two reservoirs? Yes.
683. Through the pipes you propose to put down? Yes; the pipes we have provided will be large enough to supply double the present population of Tamworth.

E. B. Price,  
Esq., M.I.C.E.  
7 Jan., 1896.

Joseph Davis, Esq., M. Inst. C.E., Principal Assistant Engineer for Country Towns Water Supply and Sewerage, Department of Public Works, sworn, and examined:—

684. *Chairman.*] You are Principal Assistant Engineer for the Country Towns Water Supply and Sewerage? Yes.
685. If this work is carried out it will be done under your supervision? Yes.
686. Therefore, you are prepared to give us details as to the scheme? Yes.
687. How did you come to decide upon the exact position of your pipe-line? We had two things in view: first the shortest route, and then a uniform hydraulic grade. We have secured, I believe, the shortest route consistent with that.
688. Consistent with a satisfactory hydraulic grade? Yes.
689. Your pipe-line follows the road? In some places; in other places it leaves the road.
690. Why did you follow the road? Because it happened to come near the line we adopted. At the same time it would save any trouble with private owners.
691. The liability of the Department to pay compensation for the laying of pipes is a moot question? I am of opinion that we have full power to lay the pipes provided that if we do any damage we compensate the owner or occupier concerned.
692. Having that power, why did you follow the road? It saves a great deal of trouble, and at the same time it might save a little compensation. We might have to compensate persons to some extent.
693. Does not the line you have chosen increase the friction? Not materially.
694. Does not following the road materially reduce the head by increasing the friction? No, not materially. The water will flow round a bend of 120 degrees with friction equal to only the fraction of foothead.
695. But it takes a greater length of pipe? Slightly.
696. Supposing there had been no road there, how would you have taken the pipe-line? The only alternative would have been to follow the dotted line between  $7\frac{1}{2}$  miles and  $5\frac{1}{2}$  miles shown upon the plan. That is the only alteration which could possibly be made in the route.
697. If you had not been confronted by the question of compensation you would have followed the dotted line from the point A to B on the plan? Yes.
698. And if your Department comes to the conclusion that no compensation is necessary, that you have the power to put down these pipes on private land without paying any, you will follow the dotted line from A to B? When damage is done compensation must be paid.
699. How much do you lose by friction before you get to the reservoir? It depends upon the quantity of water discharged at the reservoir. I have prepared a table in connection with the electric power question showing this.
700. What I want to get at is the loss of head by friction between the dam and the service reservoir? There will be a minimum loss of 68 feet and a maximum to a discharge of 300,000 gallons of 204 feet.
701. Therefore, you will have a surplus head of 600 feet? In the first case of 670 feet and in the second case of 534 feet.
702. What is the reason for the difference between the reticulation in the scheme previously submitted to the Committee and that in the present scheme? Provision was made in the pumping scheme for  $22\frac{1}{2}$  miles. It was estimated to cost £17,415. We have provided in the present scheme for £14,151. That includes £1,000 of extra reticulation which will probably have to be carried out before the scheme is completed. If £1,000 is deducted from £14,151 it leaves a net provision for reticulation of a little over 19 miles.
703. What portions of the town of Tamworth have been omitted from the present scheme, and why are they omitted? Since the previous inquiry, in accordance with the desire of the Committee then expressed, a plan has been submitted to the local Council by the Department, and they have approved of the plan. I have it with me to-day. There have been some slight modifications, but the alterations have been made at the instance of the Council.
704. It is shown upon the map before the Committee? Yes.
705. Among your papers have you any documents showing that the Tamworth Council approve of the work? No.
706. But they have approved of it, have they not? No formal approval has been given, but we have had verbal communications with them which render it clear that they will approve.
707. Do they fully understand what the proposal is? The Mayor and one or two of the leading aldermen and the Council, as a whole, do, I believe.
708. Are they aware of the expense of the whole scheme? Yes.
709. And their liability under it? I think they are aware of that too. They know what they will have to pay to the Government.
710. Mr. Price in one of his reports recommended the use of 6-inch pipes; you have adopted 7-inch pipes;—will you explain the reason why? Mr. Price simply provided for 20-horse power to generate enough

J. Davis, Esq.,  
M.I.C.E.  
7 Jan., 1896.

J. Davis, Esq.,  
M.I.C.E.  
7 Jan., 1896.

enough electricity to light the streets. Since Mr. Price made his report I have received a communication from the Mayor, and he therein requests that provision should be made for 100-horse power. With a view of finding out how this could be done I have had three methods under consideration.

711. I gather from what you say that the 7-inch pipe has been adopted to give increased power? Yes. I might read you an extract from a report which I submitted at the time the scheme was brought before the Engineer-in-Chief. I said in my report:—

There are three ways by which this might be done, viz.: (a) With the storage reservoir as proposed, by increasing the size of the main pipes from 6 to 7 inches, and passing the daily quantity of 300,000 gallons through a suitable water-wheel working continuously at the service reservoir, sufficient electrical energy could, by the use of accumulators, be stored during the twenty-four hours to light the town for five hours nightly; (b) and leaving the proposed storage capacity unaltered, by increasing the size of the main pipe from 6 inches to 12½ inches in diameter, the necessary power could be obtained at the service reservoir by delivering the daily supply of 300,000 gallons in five hours through a water-wheel without the use of accumulators at an estimated cost of £56,255; (c) by doubling the capacity of the storage reservoir and laying 12-inch pipes to a point on the pipe-line 82 chains from the dam, where there would be a head of about 700 feet, the necessary power could be obtained by means of a water-wheel, with the expenditure of 240,000 gallons of water in five hours. As this short 12-inch pipe, in combination with the proposed 6-inch main to the service reservoir, will deliver more than the required daily quantity of 300,000 gallons in nineteen hours, the whole available head could be used for generating electricity for five hours nightly. The current would be brought to the town, a distance of about 11½ miles, by an overhead conductor in the usual manner, no accumulators being required. The estimated cost of this method is £39,717 18s., without including line and extra for generator. Of the three methods described above, the first is recommended as being by far the most economical. As the Council could obtain the requisite power for lighting their town in the manner described at a less expense per annum than by an extension of their present machinery, there does not seem to be any reason why the proposed main pipe should not be increased in size to 7 inches, should the additional expenditure involved be financially feasible, and the following figures go to show that such would be the case."

Some figures follow showing the cost of increasing the main pipe to 7 inches to furnish power for electric lighting to be £2,550. I have had a sketch made showing how it would be possible to work a Pelton wheel automatically so that the water supply would be regulated. I will hand it in. There will be no loss of water whatever. Sufficient power can be supplied without any loss of water by means of this wheel. I might, perhaps, refer to some correspondence with the Mayor, because according to his own showing it will be of greater advantage to the Town of Tamworth to have this power than he appears to think now.

712. I believe the Council offered £150 yearly for the use of the power? Yes.

713. Is that a fair amount? I think it is very much under the mark, as their own letters will show. In a letter written by the Mayor, and dated 28th August, 1895, he shows the probable saving, even supposing they have the 20-horse power, to be £222. He shows in the same letter that if they had 100-horse power their revenue would be increased to £1,460, while their expenditure would be only £810, a difference of £650.

714. And for that £650 they propose to pay £150? Yes.

715. Can you compare the steel and cast-iron pipes in regard to cost? I have made an estimate in the case of both the steel and cast-iron pipes. For 6-inch cast-iron pipes the cost will be £15,004; steel pipes, £8,604; for 7-inch cast-iron pipes, £16,867; and for steel pipes, £11,178.

716. A difference of £5,700 with regard to 7-inch pipes? Yes.

717. What is the difference in the weight? That will be tremendous. The steel pipes would not be more than 20 per cent. of the weight of the cast-iron pipes.

718. Your estimate of the pipes is for pipes laid, including carriage and everything? Yes.

719. With regard to the wrought-iron pipes? They are not made now. Since soft steel came into use wrought-iron pipes have been to a great extent discarded. Steel is considered to be the better material.

720. What do you calculate the life of the pipes to be? It is fair to suppose that a steel pipe, if properly coated, will last as long as a cast-iron pipe. The Water and Sewerage Board at the present time in their accounts allow a life of thirty years for a cast-iron pipe; but all agreed that the life would be considerably more than that, and that it would be fair to take it at fifty years. Of course if there were acid in the water or in the ground it might affect the pipe. If a little of the coating were chipped off the pipe the acid would get at the steel, and that would reduce the length of life considerably.

721. Is this bath you give the pipes an experimental thing, or has it got beyond that stage? I do not think it can be regarded as being in its experimental stage. As the result of some recent experiments, we have decided to put on a mixture composed wholly of Trinidad refined asphalt. Formerly about one-half of tar and one-half of asphalt was used. The reason tar has not proved a success is, I think, owing to the fact that when it is boiled it loses its oil, and is reduced to pitch, which very much reduces the durability of the coating. Everything in connection with the life of these steel pipes depends on the coating put on, and it is of the utmost importance in laying the pipes if a little of the coating be chipped off that more should be put on.

722. Have you had any experience of the new bath? None, except in the experiments to which I have referred. We are so satisfied that it is the proper and indeed the only thing to do to get a good durable coating that we have now specified that it should be put on the Walcha pumping main. The chief objection to the coating previously used was that it became very brittle and chipped off. This new coating is rather soft. We propose to put lime on to solidify it.

723. What has been the nature of the tests you have made? Putting iron into the mixture, raised to a temperature of 300 degrees Fahrenheit. The iron has been subjected to the bath in just the same way as the pipes would be. In the case of the old coating you could peel it off with a knife; in the case of the new it adheres to such an extent that you could not do that. The coating is supposed to penetrate into the pores of the iron to some extent.

724. *Mr Wright.*] Have you made any tests with acids or anything of that kind? No.

725. *Chairman.*] I take it that the coating you have finally adopted is more adhesive than those formerly used? Yes. I produce a sample of a 6-inch steel riveted pipe, which burst at a pressure of 1,568 lb. to the square inch. The maximum working pressure of this pipe would be 392 lb. The 7-inch piping I also produce stood a similar pressure.

726. What pressure will the pipes used in connection with the Tamworth water supply be called upon to stand? The pipes I produce burst at 3,612 feet. The maximum pressure in the case of the Tamworth pipes will be 900 feet.

727. *Mr. Hoskins.*] Do you know whether there has been much work done in the vicinity of Tamworth in connection with the original scheme? Pipes were supplied for the reticulation, and also for the pumping main. J. Davis, Esq.,  
M.I.C.E.  
7 Jan., 1896.
728. Has anything further been done? Not since the Committee were there I believe.
729. *Mr. Humphery.*] Have you examined Mr. Gipps gravitation scheme from Swamp Oak Creek? I know of it, but I should prefer not to give evidence in regard to it, because I have not looked into it.
730. You are not able to make any comparison between the two schemes? Only from information obtained in the office.
731. With regard to the details of the scheme before the Committee have you worked them out carefully so as to be able to fix the cost definitely? Yes.
732. The sum of £35,000 will cover the whole cost? It will.
733. It will cover the inclusion of 7-in. instead of 6-in. pipes? Yes. It is intended to use 7-in. pipes from the storage reservoir to the service reservoir. The water supply itself did not require more than 6-in. pipes, but when the Council asked for 100 horse-power, the question arose as to what pipe was necessary in order to give it to them, and a 7-in. pipe was decided upon.
734. Do you confirm Mr. Price's evidence as to the quantity of water necessary to pass through the pipe to supply the present population and also the electrical power? I do not quite agree with him on that point.
735. In what respect do you differ from him? I do not think it is necessary to pass 300,000 gallons through the pipe to secure 100 horse-power. The quantity could be automatically regulated so as to give the exact supply necessary, and at the same time the desired horse-power. The minimum quantity of water that will be required is about 170,000 gallons. If that quantity is discharged into the service reservoir it will give a theoretical horse-power of 115 or an efficiency of 92. If 216,000 gallons are discharged it will give an efficiency of 107. If 300,000 gallons are passed through it will give an efficiency of 126 horse-power.
736. The supply of electrical power as well as the water supply itself will be obtained without any waste whatever? Yes.
737. Have you examined the catchment area? A good portion of it. I have not been over the whole of it. I have not been over the upper portion of it. There has been no survey made of the catchment. It was considered to be so ample that the information supplied by the district surveyor was thought sufficient.
738. Were you employed in connection with the Coonamble water supply works? I completed the works. The water in that case is obtained from a bore, and the bore is in the town itself. The water flows into an elevated tank and gravitates from it into reticulation pipes.
739. Is electrical power obtained? They are speaking of it; but nothing has been done in the matter yet.
740. Will this be the first water supply combining electrical power? Yes.
741. *Mr. Trickett.*] I see that a sum of £200 a year is estimated to be the annual expense in connection with this scheme;—do you think that is sufficient? I consider it is quite sufficient, even supposing that the council's men do nothing towards maintenance, and supposing they have to employ a clerk in the office.
742. Comparing the scheme with any existing scheme do you think that is a sufficient amount to allow? Yes. At Orange they employ simply one man. There have been the office expenses in addition.
743. Has there been any completed scheme in connection with which there has been a large dam, and where the dam has shown any tendency to break away? The Junee scheme is finished, but the dam has not had a great quantity of water in it up to now. However, there is not the slightest danger. The dam itself is so constructed as to be stable.
744. The dam is so constructed as to render it improbable that there will be any washing or breaking away? Yes.
745. Has not the length of piping in the proposed scheme been very much reduced as compared with the previous scheme in the matter of reticulation? By about 3 miles.
746. In the course of our enquiry into the last scheme we discovered that there were a great many pipes in connection with vacant blocks of land; I suppose they have all been cut out? They have all been cut out. There has been very little increase to the town, and therefore little necessity of increased reticulation on that account since the last proposal was before the committee.
747. Have you made any provision for the possible growth of the town? We have allowed an amount of £1000.
748. The pipes will be laid down I suppose in those portions of the town which are most likely to be quickly built over? The pipes will only be laid down as population increases, under circumstances which will permit of their paying interest on the expenditure.
749. There will be no latent expenditure as it were? No.
750. I suppose the council objected to the unnecessary laying of reticulation pipes? I do not know that they formally objected, but it is usual in all such cases to consult the council, and to put in the reticulation provided they ask what is reasonable in the places where they require it.
751. You have not personally examined the catchment area? I have been over portions of it several times.
752. What do you think of the holding character of the soil? It is granite country excellently situated for a gathering ground for a water supply.
753. There will not be much absorption? No, not a very great deal. At the same time the catchment is so large that absorption has not to be taken into consideration.
754. Is the catchment area so situated that it is not likely to be subject to pollution to any great extent? I do not think there will be any pollution to affect the quality of the water.
755. Settlement is not likely to go on to such an extent as to constitute a source of pollution? It is almost all sheep country. There is a little cultivation here and there, but none of any consequence.
756. Were you consulted as to the abandoning of the pumping scheme? When I first took charge of the water supply Mr. Price said to me privately that he considered there was some prospect of obtaining a gravitation scheme. We consulted with Mr. Hickson about the matter and he finally instructed us to go to Tamworth to see what could be found. Mr. Price showed me what was in his mind at Moore Creek and we reported that we thought there was every possibility of a good gravitation scheme being found.

- J. Davis, Esq.,  
M.I.C.E.  
7 Jan., 1896.
757. Did the possible impurity of the water induce you to change from a pumping to a gravitation scheme? I was not sure about the quantity of water; the quality I felt would be all right.
758. As far as you know that was not one of the considerations which influenced the Department in making the change? That point was not considered. It was regarded as having been absolutely settled by analysis.
759. *Mr. Davies.*] Will any portion of your pipe service be exposed? No, it will be buried. It will be 18 inches below the surface of the ground.
760. So that the heat of the sun will not affect the asphaltum on the pipes? No.
761. I believe it is proposed to make a change from riveted to welded pipes? Yes.
762. Have you had any tests made of the welded pipes. Pipes are now on their way out with which it is proposed to make exhaustive tests before finally adopting them.
763. Have you in any of these schemes used welded pipes? No.
764. So that you had no experience as regards the superiority of welded over riveted pipes? No; it is a question whether the welded pipes are as strong as the riveted pipes. When they are procured alternative tenders will be invited for the supply of these pipes, and the cheapest will be taken. We shall specify the tests which will have to be applied before we take delivery.
765. Why is the departure from riveted pipes proposed? We thought the welded pipes would be cheaper.
766. Have you had any prices quoted to you showing that there would be a reduction in the cost? The riveted pipes are quoted at £25 per ton, and the welded pipes at £22 12s. per ton. There would be a difference of £2 8s. upon the 7-inch pipes.
767. You propose to subject the welded pipes to the same test as the riveted pipes before they are used? Yes.
768. Do you invite tenders in the Colony as well as in London? We do not invite tenders in London. We invite tenders in the Colony. Importers can put in tenders if they wish to.
769. Have you based your estimates on the lowest charges for welded pipes? Yes.
770. So that if you have to revert to riveted pipes, your estimate will be exceeded by a considerable sum? If we have to pay £25 a ton for the pipes, the cost will be slightly above our estimate.
771. About how much? I cannot give this just now. Welded pipes are not sold by the ton, but by the lineal foot.
772. The extent of the catchment area is about 22 square miles, I believe? Yes.
773. Do you know what the rainfall there has been during the last eleven years? I have a return showing an average of 28 inches for the last thirteen years.
774. What was the smallest fall during that period? In 1888 there was 18.67 inches.
775. What rainfall will be necessary to fill your storage reservoir over an area of 22 miles? If one-tenth of an inch actually reached the dam it would be sufficient to fill it.
776. It would take a fall of about 1½ to 2 inches to fill the dam? Yes; if the ground were dry and the rain steady.
777. Do you, as a professional man, regard the wall in front of the catchment dam as sufficiently durable to stand the pressure in the event of the dam being full? It must be so. The pressure behind the wall is less than the weight of the wall.
778. Would not the wind add to the pressure? It might create a little wash, but it would not affect the pressure.
779. The Department has made provision for all emergencies of that kind;—for instance, there is not likely to be a greasy wheel to the dam? We shall take care in building the dam to get to the bed-rock.
780. *Mr. Lee.*] Have you had anything to do with the financial aspect of this matter? When I submitted this scheme I prepared an estimate of the revenue, but it has since been set aside by a more reliable return prepared by an officer of the Department.
781. Is that the return put before us by Mr. Barling? Yes.
782. The rate proposed to be struck within the reticulated area is the estimate of the Department, not of the Tamworth Council? Yes. But the material for making out the estimate has been obtained from the Council's books.
783. Had you anything to do with the preparation of the financial estimates in connection with the previous scheme? No.
784. You will see that there is a great discrepancy between the revenue, estimated in 1892 and 1895? I take it that in connection with the former scheme there was simply an estimate. The figures now put before the Committee are facts.
785. According to the evidence given by Mr. Barling on the 12th October, 1892, there was an estimated revenue of £1,632 from the water supply scheme—the estimated revenue now is £2,320;—how does that great difference arise? I expect the circumstances of Tamworth have greatly changed since the former information was supplied. The ratable value of property has probably changed materially. At the same time the town has increased in size within given areas.
786. Considering that the former estimate was made such a short time ago and that in the meantime so few properties have changed hands—considering also that property has fallen in value to the extent of 50 per cent. how do you account for the estimated revenue being so largely increased? I can give no explanation beyond that I have already given.
787. This is a Departmental estimate, it is not the Council's estimate? It is a Departmental estimate, but it is based on material supplied by the Council and obtained from their books.
788. At what distance are you calculating the reticulated area from the reticulating pipe? One hundred and fifty feet.
789. Will your proposal embrace the whole of the settled portions of Tamworth and West Tamworth? Yes. There may be a few isolated houses to which it would not pay to lay pipes at the present time, but there are very few of them.
790. Is it not proposed to strike a general rate of 1s. in the pound upon the whole of the municipality? We have no power under the Act to rate the whole of the municipality. We have no power to rate any property which is not within 150 feet of the reticulating pipe.
791. You said just now that the whole of the pipe would be covered; how do you propose to cross the river from Tamworth and to West Tamworth? We cross the bridge. I had forgotten that there the piping would be exposed. Composition about ¾-inch thick to protect the piping from the sun will be probably put on. It has been done at Armidale, and it has answered very well. 792.

792. Did you not furnish an estimate for a 6-inch service? Yes.
793. What caused you to alter your opinion, and recommend a 7-inch service? It was in consequence of a request from the Council for 100-horse power for electrical purposes.
794. How long after you had made your estimate for a 6-inch pipe did you arrive at the conclusion that a 7-inch pipe would be desirable? The estimates were made simultaneously. The 6-inch piping was for the water supply pure and simple. It was a question whether the Department should give the extra-sized pipe, and in that way provide the horse power the Council asked for.
795. If the thing was practically decided in the first instance, why was not an estimate made at that time for 7-inch pipes? Mr. Barling read only a portion of my report. He discontinued reading just as he reached the portion referring to the estimate for the 7-inch pipe.
796. If he had quoted your report in full it would have saved any misapprehension on the point? Yes.
797. *Mr. Fegan.*] You say that the Departmental estimate of revenue is based upon the Council's books? Yes.
798. Really the estimate depends upon the Council's own estimate of their own property? You may put it in that way.
799. You altered your decision as far as the pipes were concerned, believing that you would get a better return from a service which would afford a water supply, and at the same time provide electric power? Yes; I regard that as most desirable.
800. You think there would be a better prospect of the Government getting its money returned? It would be better both for the Government and for the Council. It would be economical all round.
801. The alteration was made at the wish of the Council? Yes.
802. *Mr. Wright.*] Can you give me any information as to the cost of the scheme suggested by Mr. Gipps? I have looked into the scheme, and it seems to me that it could not be carried out with 17 miles of steel pipes for less than £45,000.
803. What is Mr. Gipps' estimate? £17,500 with an open drain.
804. Has any Departmental estimate been made upon the same lines? An estimate made when the Tamworth Water Supply was previously before the Committee amounted to £24,000. That was made by Mr. Darley upon Mr. Gipps' plans.
805. What is the height of the service reservoir in connection with Mr. Gipps' scheme? It is 118 ft. above the railway station.
806. Would Mr. Gipps' scheme supply all parts of the town by gravitation? No. The service reservoir would be about 60 ft. below the highest ground which has to be served.
807. Is that information gathered from Mr. Gipps' own plans? No survey was made by the Department.
808. I presume the cost of the pipes includes the cost of delivery? Yes.
809. What charge do the Railway Commissioners make on pipes to Tamworth. £3 15s. per ton.
810. Do you not think that if proper representations were made to them they might make a reduction on that charge? They might.
811. It appears that a very large factor in the costs of the work consists of the railway charges on the pipes? Yes.
812. What is the superficial area of your main reservoir? Eleven acres.
813. What is the mean depth? Sixteen feet.
814. Have you gone into the question of evaporation? Yes.
815. What would be the evaporation in the months of December, January, and February? It would be difficult to say. Taking the twelve months I have estimated it at 40 inches. That is a liberal allowance for evaporation in a place like Tamworth. On this basis it would be eight and a half million gallons in the year.
816. It would mean a loss of 25 per cent. by evaporation? Yes.
817. In the event of two or three successive years short of rain, what would become of your permanent supply? We estimate that we should have enough stored there for 250 days' supply without any water whatever running in, except sufficient to compensate for evaporation.
818. Has any inquiry been made as to the permanency of the water in Moore Creek? Yes; it is quite an exceptional thing for it to be dry. During the time the survey was being made its discharge was never less than 20,000 gallons in twenty-four hours.
819. You have exhausted every means of information to satisfy yourself of the permanency of this supply? Yes; the season this year is exceptionally dry, and the flow has not been less than that given.

J. Davis, Esq.,  
M.I.C.E.  
7 Jan., 1896.

WEDNESDAY, 8 JANUARY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.  
The Hon. JOHN DAVIES, C.M.G.  
The Hon. JAMES HOSKINS.  
The Hon. WILLIAM JOSEPH TRICKETT.  
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
JOHN LIONEL FEGAN, Esq.  
ANGUS CAMERON, Esq.  
THOMAS HENRY HASSALL, Esq.  
FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Water Supply for the Town of Tamworth.

Frederick Bowdler Gipps, Esq., civil engineer, sworn, and examined:—

820. *Chairman.*] You are a civil engineer? Yes.

821. I believe you desire to make a statement to the Committee? Yes; I should like, with the indulgence of the Committee, to read a statement in regard to certain proposed modifications in my original scheme for the Tamworth Water Supply:—

F. B. Gipps,  
Esq.  
8 Jan., 1896.

My original scheme provided—1st. For a storage of 100,736,000 gallons, in an area of 38.6 acres, with a dam 26 feet high, at a certain point in Cockburn River, just below 198 miles mark on the Great North railway line; 2nd. For the delivery, by open conduit, of 4,000,000 gallons a day into a service reservoir 4½ miles from Tamworth; 3rd. For the storage of 2,400,000 gallons in the service reservoir; 4th. For a supply main of 12-inch and 11-inch pipes to the reticulation pipes; 5th. For the provision of 25-horse power for electric lighting and a large supply for irrigation. The mean level of the service reservoir was 118 feet above the railway station and 15 feet below the highest point in the town measured by me.

When

F. B. Gipps,  
Esq.  
8 Jan., 1896.

When I gave my evidence on this scheme before the Public Works Committee in December, 1892, I had only landed from England the day before; I knew nothing of the evidence that had been given before it; nor was I even prepared with notes and data which might have assisted the Committee in judging on its true merits.

The modification of my scheme embraces:—1. The raising of the dam 6 feet to a maximum height of 32 feet; 2. The substitution of a 16-inch steel pipe for the open conduit objected to by the Borough Council, which will deliver 942,000 gallons to the service reservoir; 3. A service reservoir of 500,000 gallons capacity  $9\frac{1}{2}$  miles from the storage reservoir, and  $4\frac{1}{2}$  miles from Tamworth; 4. A delivery-main of 9-inch diameter steel pipes from the service reservoir to the reticulation pipes; 5. The application of an accumulated 90-horse power in Tamworth for electric lighting; 6. The application of a minimum supply of 400,000 gallons per diem for irrigation. The cost of this modified scheme is £34,220, or £35,000 if connected with the Moonbi Springs.

The effectiveness of the scheme.

I would now draw your attention to a few points in connection with the effectiveness, durability, and economy of this modified scheme to provide for the present and future requirements of the town.

I would first consider the effectiveness of the scheme under five heads:—1. In regard to the area and character of its watershed, ensuring an ample supply of pure water to the storage reservoir; 2. In regard to the capacity of the storage reservoir to provide the required supply of water to the town in the emergency of the most severe drought; 3. In regard to the capacity of the pipe-line to deliver the required supply at a sufficient elevation to command the highest point of the town; 4. In regard to the provision of a service reservoir of sufficient capacity to ensure such supply from any danger of interruption; 5. In regard to the capability of the scheme for expansion to meet the growing wants of an increasing population.

Watershed.

The character of the watershed cannot well be excelled. It rises in the rugged peaks and spurs of the main dividing range of mountains, and preserves its broken features throughout to the site of the storage reservoir dam. The prevailing country rock is granite, ensuring clear and pure water. Its area is close on 313 square miles, or 200,000 acres. According to the report of the Government Meteorologist, Mr. Russell, the driest year (1885) recorded for Tamworth in seventeen years' observation had a rainfall of 13.67 inches. Judging from actual observations taken for eight consecutive months on the Cordeanx River, the proportion actually available for supply would be 4 per cent., which would represent 3,885,500,000 gallons in the whole year. This is equivalent to a supply of 10,000,000 gallons daily. There can, therefore, be no doubt that the capacity of the watershed is sufficient to meet the emergency of the longest drought, provided that its discharge can be stored, as the bed of the Cockburn River has been known to be dry for two or three consecutive months at a time.

Storage reservoir.

I propose to add 6 feet to the storage reservoir. This would give a dam 32 feet high, commanding an area of over 40 acres, and would throw the river back for over 7,530 feet, and impound over 163,000,000 gallons of water. It follows, therefore, that most of the watershed supply would run to waste. Mr. Hawksley, the eminent English hydraulic engineer, has laid down a law for storage reserve which is now generally adopted. This law establishes that the storage reserve of water should vary inversely, as the square root of the rainfall of the mean of three consecutive dry years divided into the constant number of 1,000, the result being the number of days for which storage will be required. The three driest consecutive years recorded so far at Tamworth were 1880, 1881, 1882, and their mean rainfall is 19.69 inches. This, treated by Hawksley formula, would give 225 days as the period for which the storage reservoir might be required to provide the supply. Therefore a supply of 300,000 gallons a day would require a storage capacity of 67,500,000 gallons in the reservoir. As my proposed storage reservoir would impound 165,000,000 gallons, it would provide for double the storage required.

Capacity of pipe-line.

The Borough Council having objected to the open conduit in my original proposal, I have modified my scheme by substituting 16-inch diameter steel pipes. The surface level of my storage reservoir would be 177 feet above the railway station, and 44 feet above the junction of Brisbane and Raglan streets, the highest part of Tamworth measured by me. From this level the 16-inch pipe would deliver 942,000 gallons per diem into a service reservoir on a spur close to the site of my old service reservoir,  $4\frac{1}{2}$  miles from Tamworth, having a surface level of 200 feet above Peel-street, and 153 feet above the railway station, and 21 feet above the junction of the above streets. As the pipe-line would deliver the required supply of 300,000 gallons in eight hours, I propose to apply the surplus of 642,000 gallons for sixteen hours to motive power and irrigation, as proposed in my original scheme. With an effective head of 200 feet from the storage reservoir, 642,000 gallons would give 40-horse power, allowing of an accumulated horse power for electric lighting in Tamworth.

Service reservoir.

The service reservoir would impound 500,000 gallons, and being of the same dimensions as that proposed by the Works Department needs no further comment.

Supply main to Tamworth.

The supply main to Tamworth would consist of  $4\frac{1}{2}$  miles of 9-inch steel pipes, half a mile of which I am led to believe is available from the intended pumping main pipe included in the reticulation pipes, owing to the abandonment of the Works Department pumping scheme.

Effectiveness of scheme proved.

Thus I have demonstrated the effectiveness of my proposed works, not only to provide for present requirements, but also for very valuable collateral advantages in its provision for horse power and irrigation, whilst I have shown its capability to meet the growing wants of the town, which, owing to its situation as commanding a large and excellent area of agricultural land, must be considerable in the near future.

Durability of the scheme.

The next point to be considered is the durability of the scheme. Exception has been taken to my proposed dam of combined rock and timber, because of its assumed temporary character; but considering that works of similar character and of much larger dimensions have been constructed in the United States for over a century without the record of any significant failure, this objection seems groundless. Though masonry dams may seem positively to ensure permanence and stability, yet their failure during this century in Spain, California, and quite recently in France, has proved that they are not entitled to such absolute confidence. The Bousey masonry dam in France was constructed with great care, its foundations were taken down 30 feet to what was considered a solid base, and yet without any other apparent reason except the failure of the cement joints, it burst on the 27th April last year, releasing a huge wave of water, which devastated one of the fertile valleys of the Vosges, carrying away towns and villages in its seething torrents, and drowning many of the inhabitants. As a notable instance of timber and rock structures, the Holyoke dam stands prominent. It was constructed in 1849 across the Connecticut River, at South Hadley Falls, 8 miles north of Springfield, Massachusetts. Its length is 1,017 feet and its height 32 feet. It was built on rock bottom. The volume of the water passing over its crest may be best imagined from the fact that the roar of the fall has been heard for 40 miles. It supplies power to a large number of cotton, paper, and flour mills, to ironworks and different factories which employ thousands. Now, considering that Springfield is an important town of over 40,000 people, it is hardly probable that a work of so great importance to its industries, and at the same time menacing the lives of so many people, would be allowed to be constructed except on the most solid and secure conditions. Again, the dams on the north fork of the American River and at the head of the Poudre Canal, in California, both 30 feet high, and the Arizona Canal weir, are constructed on this principle, and are all of too great importance to be considered as only temporary structures. In Victoria, again, it appears by the report of 1891 that out of fifty-four weirs and dams inspected forty-eight were of timber and only six of masonry. The Doon dam, except in its foundations, resembles the proposed dam at Cockburn, its dimensions being nearly similar. Its length at top is 199 ft. 4 in., and its height 26 feet. Its cost was £1,707. My proposed dam, therefore, as it has been calculated to resist many times the pressure it will ever be taxed with, may be relied on both as to strength and durability.

The pipe-line.

The pipe-line would traverse the right bank of the Cockburn River for the first 2 miles, when it would strike the Great North Railway line, which it would follow for the remaining  $7\frac{1}{2}$  miles almost to the site of the service reservoir situated on a bold spur on the right of the line. For the first 5 miles the pressure on it would be insignificant, never exceeding a head of 60 feet of water. In the next  $4\frac{1}{2}$  miles to the service reservoir it would not exceed 102 feet, and would be only that for a short distance at Tintuhall Station. The thickness of the proposed pipe-line is .083 inch, or 14 B.G., which will allow of a factor of 16 for safety. The pipe-main which supplies Virginia City, Nevada, with water is 11½ inches in diameter and is of wrought iron. Its thickness for a head of 200 feet and less is only No. 16 B.G., and for a head varying from 330 to 340 feet, 14 B.G. The strength and durability of the main works proposed by me, can, therefore be relied on

Estimate Works

	£	s.	d.
Storage reservoir .....	2,500	0	0
$9\frac{1}{2}$ miles of 16-inch steel pipe, 14 B.G.....	9,500	0	0
Service reservoir .....	1,800	0	0
4 miles of 9-inch steel pipe, 14 B.G.....	3,600	0	0
Reticulation .....	14,260	0	0
Survey and contingencies .....	2,500	0	0

£34,220 0 0

The

The cost of the storage reservoir dam has been carefully calculated by me, and as it would require little more material than the Doon dam which cost £1,707, and has a much better foundation, and as also there is an abundance of available timber in the neighbourhood, whilst the rock-filling is immediately at hand, it is not likely to be exceeded.

The pipe-line has been estimated at £22 per ton for pipes, and £4 per ton for railway freight, and as the pipes can be taken to their position for most of the distance by the railway trucks, and the laying on their prepared bed will be inexpensive, they will probably cost less than £1,000 per mile. In California where steel is £6 or £7 per ton dearer than in England 6 miles 3,620 feet of a main pressure pipe-line has quite recently been laid from Raynor Springs to Riverside for irrigation and domestic purposes. It cost \$31,500, or £6,300, being somewhat less than £1,000 per mile. The contract and specification provided for the best quality of double-riveted steel-pipe No. 14 B.W.G., weighing 3.35 lb. per square foot, and thorough workmanship. The pipe-line consists of 9,000 feet of 16-inch diameter, and 26,300 feet of 14-inch diameter pipes having a carrying capacity of 4.3 cubic feet per second, or 2,322,000 gallons in twenty-four hours. From this it will be observed that though the pipes had to resist greater pressure than the pipes proposed by me, and whilst also iron was dearer, yet they were laid for less than £1,000 a mile.

The Works Department have already, it appears, committed the Borough to an expenditure of £14,260 for reticulation, so that I am in no wise responsible for this heavy charge.

The revenue from my proposed scheme would be twofold. Independent of the Borough water rates, it would realise a certain revenue from the available 40-horse power (which would assist electric lighting) and from the supply then available for irrigation. At the low price of £4 per annum per horse power, 30 horse-power would realise a sum of £120 per annum, whilst the sale of 400,000 gallons at one penny per 1,000 gallons (instead of one shilling per 1,000 gallons, the Sydney charge) would realise £60 per annum, giving a combined revenue of £728, independent of rates, which it would assist to largely reduce.

The storage capacity of the reservoir at Cockburn River could be more than doubled by raising the dam another 10 feet, so that when the growing wants of the town require it, the water supply embraced in this scheme could be doubled at the cost of £12,000. In the event, however, of a pottery being established at Tamworth, the estimate for the pipe-line could be largely reduced by the substitution of stoneware pipes for steel pipes. By removing the pipe-line a short distance from the railway line, there would be no appreciable pressure on it for this distance. This would reduce the estimate of pipes by £3,500, leaving a total of £8,500 for the duplication of the scheme, whilst assisting also in establishing an important industry. Stoneware pipes of even larger diameter are used on water supply works of different English towns, whilst they are practically permanent and indestructible, having, according to description, been unearthed from the ruins of Pompeii after eighteen centuries of constant use whilst buried in the ground. Finally, the water passing over the dam, which, in ordinary seasons, would average fully 3,000,000 gallons a day, would offer Tamworth an immense advantage for the establishment of all kinds of industries by the adoption of the available water power, by running an open ditch to my first reservoir site. Lastly, the Moonbi Springs, so strongly advocated by Mr. Riely for the water supply of Tamworth, would undoubtedly be a very valuable auxiliary to the supply of my scheme, at the cost of only half a mile of piping.

822. *Mr. Hoskins.*] You were employed by the Municipality of Tamworth to make a survey, and to prepare plans for the supply of Tamworth with water? Yes.

823. What has brought about the modifications in the scheme which you have laid before the Committee this afternoon? The scheme has been modified because the Borough Council did not seem inclined to carry out the open conduit line. The scheme I now put forward does away with the open conduit line and slightly increases the height of the service reservoir.

824. Is not your scheme very different putting aside the question of the open conduit line? No. The supply is from the same spot—the storage reservoir is the same. I have only added 6 feet to the height of the dam. You will see that I have not gone further afield for the storage reservoir. I do not alter the site of that, nor do I actually alter the position of the conduit very much.

825. Then how comes it that you estimate the cost of your second scheme to be £34,220, whereas your estimate for the original scheme was £17,650? In the first instance I provided for an open conduit and that could be cut at a price very much cheaper than that at which a line of pipes could be laid. I estimated 13½ miles of conduit costing £5,600, a storage dam at £1,750, and my reticulation cost only £5,000.

826. Did your original scheme propose that all water should be conducted to the storage reservoir by open conduit? Yes; although the idea of a conduit has been rather ridiculed. I believe one of the engineers examined called it a ditch. I might mention that open conduits are to be found not larger but smaller than that which I propose at many places in France; for instance, at Lyons, Metz, Versailles, Montpellier. The conduits in those places are very much smaller than that which I propose. I could have carried out a much more effective scheme at a much less cost with an open conduit. I see no valid objection to my proposal, but it having been objected to by the Borough Council I am compelled to adopt a pipe line.

827. The Borough Council objected to your original scheme mainly on account of the open conduit? Yes.

828. Will the substitution of a pipe line for an open conduit account for the difference between your two estimates of £17,650 and £34,220? Certainly not. But I allowed only £5,000 for reticulation, whereas the Government put down £14,000.

829. Have you allowed only £5,000 for reticulation under your amended scheme? No; I put down the same amount as that in the Government scheme. That is what makes the difference in the estimates.

830. In your amended scheme you have adopted the view of the Government in regard to the extent and the expense of reticulation? I am obliged to. The reticulation, as far as I can learn, is either done or is ready to be carried out.

831. Your original scheme, including only £5,000 for reticulation, would have been insufficient, judging by your amended scheme? Not in my idea. As a rule we look for a revenue from reticulation. We never think of supplying reticulation to streets in which there are only one or two houses. I proposed to supply reticulation pipes to certain streets and for a certain mileage, with which I understood the Borough Council were satisfied at that time. It would seem that they afterwards altered their opinion.

832. Then the increase in your estimate for reticulation is brought about by the dissatisfaction of the Municipal Council of Tamworth with the amount originally allowed by you? I do not think it can be said to be due to their dissatisfaction. They might have considered that the reticulation I proposed was sufficient at the time I was there, and they may afterwards have altered their mind. They made no comment upon my report when I handed it in, leaving me to suppose that they were not at all dissatisfied; on the contrary, they congratulated me upon it.

833. What is the reason you have brought forward this amended scheme? Mine was a gravitation scheme in the first place, and that of the Government a pumping scheme. The Government then brought forward a gravitation scheme as the only one available at a moderate price. I want to show that my gravitation scheme can be carried out, and that it is more effectual in every way than that of the Government, comparing the watersheds, the storage reservoirs, the delivery of water, and the supply for irrigation. In every respect my scheme is worth more than double the scheme of the Government.

F. B. Gipps,  
Esq.

8 Jan., 1896.

Storage  
Pipe-line

Reticulation.

Revenue.

Capability of  
expansion.

- F. B. Gipps, Esq.  
8 Jan., 1896.
834. You were not asked by the Municipal Council to prepare an amended scheme? No.
835. Have you ever designed or had charge of a water supply scheme for a town of any size in the colony? Not in the case of a town, but I have carried out some of the largest hydraulic schemes in the colony. Not only that, but I have been the adviser in regard to irrigation schemes for some of the biggest financiers in London. I carried out works on the Turon River and for different companies at Kiandra, and I was also the consulting engineer in the case of the Goulburn and Wagga works.
836. Were not the Goulburn works carried out by the Government? Yes; but I was consulted by the Municipality in regard to certain points in them.
837. Did the Municipality make any deviations from the recommendations of the Government officers? They objected to take over the service reservoir on account of the condition of the banks.
838. But they did take it over? After it had been refilled.
839. Seeing that you have been consulted by municipal councils with regard to the stability of their schemes, did it not occur to you that it might be advisable for you to submit your scheme to the Government with a view to their adopting it? I had a lesson in that matter when I submitted my Kenny Hill high-level scheme to the Government. All the return I got was a couple of lawsuits; I am tired of that sort of thing.
840. Do you submit this amended proposal to us with the view to induce us to report in its favour, or with a view of inducing the Government to adopt a portion of it? With a view to induce the Government to adopt it. I think it is superior to that submitted by the Works Department. I take it that this Committee is appointed to investigate proposals of this kind upon their merits; and if any member of the public is able to give the Committee information upon any scheme which is brought before it, it is his duty to do so.
841. Did you not propose in your original scheme a catchment area of 200,000 acres? Yes.
842. Have you had any survey made showing this area? It was given to me by Mr. Poate the District Surveyor.
843. Your original scheme provided for a dam 32 feet high? Twenty-six feet.
844. Would that be a secure dam? Yes: it is on a splendid rock foundation.
845. Would not the granitic formation be full of fissures? It is not on granite; it is a siliceous schist.
846. Would there not be fissures in the formation to collect a quantity of water? I do not think there would be any fissures in it.
847. What would be the area of the dam? Forty acres.
848. Have you made allowance for absorption? In the case of every reservoir a certain allowance is made for evaporation and absorption.
849. Is it not a fact that in the case of the best water supply schemes the bed of rock at the point where the water is arrested is cemented to prevent absorption? The Holy Oak Dam is one of the most important in the world for water power, and that is not cemented. It is tied right on to the rock bottom.
850. I believe you expect to collect 163,000,000 gallons of water in the storage reservoir? Yes.
851. Do you know very much of this locality? I surveyed the whole line, and I was there for some time.
852. Do you think that you will be able to collect at the spot to which you refer 163,000,000 gallons? Yes. I think there is very little doubt about my being able to keep it up to that storage.
853. With an average rainfall of 13 inches a year you think you will be able to collect 163,000,000 gallons? I think so, judging from the actual experience there. The oldest residents informed me that they had only known the river to be dry once for two consecutive months, and that was in 1868. A storm then followed which brought the river up a banker. I have provided for over a year's supply at 300,000 gallons a day.
854. Have you read the evidence given before the Committee by the officers of the Works Department in regard to the scheme they now propose? Yes.
855. You propose to conserve a quantity of water very largely in excess of that which is to be conserved by the Government scheme? Yes.
856. And you have no hesitation in saying that all your estimates can be relied upon in the event of the scheme being carried out? I am confident that my estimates will be realised. I have the Moonbie Springs to assist me besides the water-shed I have mentioned. Considering the water-shed is very little short of the water-shed which supplies Sydney, and which is expected to give a supply of 120,000,000 gallons a day, I do not think there is very much doubt about my getting a 1,000,000 gallons a day.
857. The pipes you propose to use are very much larger than the pipes proposed to be used by the Department? Yes.
858. I suppose the pipes you use would be sufficiently large to supply Tamworth for very many years to come? Of course if the water can be supplied for industrial purposes, and can be made to return a revenue so much the better.
859. *Mr. Cameron.*] Still the pipes you propose to use are largely in excess of existing requirements? Yes; but I have provided for the expansion of the town.
860. *Mr. Hoskins.*] I suppose you know that the evidence of the officers of the Works Department is to the effect that your estimate of the cost of your original scheme will not suffice to carry it out? I am hardly surprised to hear that. Their estimate for pipes was over £30,000. Their pipe-line was a cast-iron pipe-line, and they were asked what would be the difference between cast-iron and wrought-iron. The reply was that it would make very little difference. Mr. Price was asked a similar question, and he replied that cast-iron pipes would cost £18,000 instead of £1,800. If my scheme had been estimated in that way that would be sufficient of itself to account for the difference in price.
861. What kind of pipes do you propose to use? Steel. I suppose I have the largest experience of any engineer in the Colony in wrought-iron pipes. I was the first to introduce them here.
862. And you are prepared to abide by your estimate of £34,000 as being sufficient to carry out the work? Yes; I myself would contract to carry out the work at that price.
863. *Mr. Humphery.*] Are your 16-inch steel pipes of the same thickness as those proposed in the scheme of the Government? The pipes proposed to be used by the Department are  $\frac{3}{4}$ -inch in thickness. They give a bursting strain of 1,568 lb., giving a tensile strength of 10,976 lb. per square inch, or 911 lbs. per sectional inch in my pipes. My pipes would be about  $\frac{1}{2}$  of an inch thick; 55 lb. would be the highest strain, allowing a factor of 16 for safety.
864. What do you estimate the cost per mile of 16-inch pipes? £1,000.
865. What would be the cost of the 7-inch pipes? I should have to make a rather long calculation to discover that. I am not prepared to answer that question at present.

866. Are you familiar with the Departmental scheme? Yes; according to the evidence I have read.
867. Have you visited the locality from which it is proposed to bring the supply? I have not been to the storage reservoir, but I have visited Moore Creek.
868. How far up the creek have you been? I cannot say; I rode up.
869. Can you say how far from the fall? I never saw the fall.
870. And you would not be prepared to pronounce an opinion upon the relative merits of your scheme and the Departmental scheme without visiting the locality from which the Department propose to bring the water? I could only pronounce an opinion from comparing the different points. In the first instance Mr. Hickson proposes to give a supply of 540,000 gallons from his storage reservoir, and as his storage reservoir will not provide anything like sufficient for 225 days at the rate of 300,000 gallons per diem it certainly could not provide for the larger quantity he proposes to draw.
871. In your first service reservoir I think you proposed to make provision for two and a half million gallons. Why do you in your present scheme suggest a reduction from two and a half millions to half a million? I was then delivering 4,000,000 gallons a day, and of course I wanted a much larger storage to provide for emergencies than I do now when I am delivering less than 1,000,000 gallons a day.
872. Would you not have had sufficient storage for water in the impounding dam? It might have been sufficient, but you generally store from two to three days supply in the service reservoir.
873. Have you made any estimate of the probable cost of carrying out the Departmental scheme? I have not. In my idea the weak point in the Departmental scheme is that the provision for storage is nothing like sufficient. 35,000,000 for a supply of 542,000 gallons a day is nothing like sufficient. It is positively necessary in the opinion of the best authorities in England to provide for a period of 225 days.
874. *Chairman.*] Your main objection to the Government scheme consists in the inadequacy of the storage? That is one of my objections.
875. The catchment area you think is sufficient? Yes. If the storage reservoir were enlarged, it would be sufficient for a supply of 300,000 gallons a day, but it would not provide for the expansion of the town. If you take 300,000 gallons a day for 225 days, you would require 67,500,000 gallons. You will see therefore, that the storage reservoir would be empty twice over.
876. That 300,000 gallons a day is on the basis of the population being double what it is at the present time? Yes.
877. The present requirements being less than 200,000 gallons a day? Yes. But 300,000 gallons a day is what we should call the duty of the scheme. If you supply 170,000 gallons for power, it means that as the population grows the value of your scheme would decrease. You will have either to give up that horse-power or to bring in fresh pipes to keep up the supply of the town.
878. Upon the basis of an ample storage at the head of the supply is the Government scheme inferior to that which you propose? It is inferior in every way. I take in the first instance the watershed, which is fifteen times less in area. Take the storage reservoir—that is less than one-fifth in storage capacity. Take the pipe-line, that gives very little over one-half of the pipe delivery, and for irrigation purposes again the Government scheme provides nothing at all. Upon all these points the scheme is distinctly inferior to that proposed by me.
879. *Mr. Humphery.*] Why are your figures similar in their totals to those contained in the Departmental estimates, your pipe-line being of 16-inch pipe and of greater length than that in the Government scheme? The great point of difference is to be found in the thickness.
880. What would be the proportionate difference arising from the difference in thickness? I should have to go into figures to give you that.
881. Would it be 10 per cent., 20 per cent., or 50 per cent.? I could not say without going into figures.
882. Do you contend that the pipes proposed to be used by the Department are unnecessarily strong? Undoubtedly no; but the pipes will cost much more to lay, and they will have to be taken further away from the railway line. In the case of my pipe-line the cars can deliver the pipes along the line.
883. *Mr. Hoskins.*] But the Government officials have a greater pressure of water? 700 feet as against 60 feet.
884. *Mr. Humphery.*] I think you admitted when you were last before the Committee that a pipe scheme would be superior to an open conduit scheme? I did not admit that. I said that if Sydney could do with an open conduit where there was hardly any fall per mile, and where, therefore, aquatic infusoria of all kinds calculated to be dangerous to the health of the people would accumulate I did not see why an open conduit in a case where there was a velocity of over 1 foot per second could be objectionable. I may have said that an open conduit would be objectionable in a case where it passed through shale country, and where the water might collect saline from the shale which would help to decompose the water. In this instance the water would run through granite country, and the conditions are totally different from those which exist in the case of the Sydney Supply Canal.
885. *Mr. Davies.*] When you were instructed by the local council of Tamworth to investigate the water supply, you were limited to a certain sum? I was urged to try and keep the amount under £20,000.
886. And your estimate of a gravitation scheme was £17,000? Yes.
887. A large proportion of your scheme was an open conduit? Yes.
888. A part of the metropolitan scheme is an open conduit? I believe 43 miles to the reservoir is open conduit, and, as far as I can recollect, 3 or 4 miles on this side of it.
889. The municipal body who employed you were opposed to open conduits? They were after the Government officers had objected to them, but they were not when I first brought the scheme forward. They then congratulated me upon the scheme in every way.
890. Did you subsequently propose to substitute flumes for open conduits? I may have given an estimate, but not officially.
891. At what additional cost do you remember? I do not recollect at the present time.
892. What will be the probable life of a 16-inch double-riveted pipe of the type you speak of? It is hard to say. I introduced wrought-iron pipes from America of No. 18 gauge, much thinner than the pipes alluded to, about eighteen or nineteen years ago, and they are in use at the present time.
893. Have you any data showing the life of steel pipes? It would be, I suppose, slightly longer. They have been collecting records in America. Only lately I read a record of twenty years, but it is not sufficiently long.
894. You know that the Government have undertaken to supply country towns with water-works, extending the repayment of the capital cost and interest over a period of, I think, 100 years? Yes.

F. B. Gippi,  
Esq.

8 Jan., 1886.

- F. B. Gippes, Esq.  
8 Jan., 1896.
895. What portion of that pipe service and reticulation in the case of these particular works would be likely to be in existence 100 years hence? It is impossible to say. We do not yet know the life of the wrought-iron and steel pipes.
896. Would it not be necessary to renew the whole pipe service two or three times within the period I have named? It depends upon the character of the water. Junee obtains its supply from water containing saline matter, which would have the effect of corroding the pipes much more quickly than in the case of the Tamworth supply.
897. In your opinion would the pipe service, either as suggested by you or by the Department, last for a period of fifty years? I am not prepared to say that; we have no data to go upon.
898. Do you think it probable that it would last for that time? From what I know of the pipes I do not see why it should not.
899. What is the capacity of your storage reservoir? With the extra 6 feet it would be over 163,000,000 gallons, as against 35,000,000 proposed by the Department.
900. What would be the height of your dam? Thirty-two feet.
901. What is the proportion of thickness from the foot to the top? I have not the sections. I think they are with the Tamworth Council. So far as concrete is concerned I may mention that one great objection to using concrete is that we have very little data to go upon as to its actual endurance. We know that lately the concrete blocks used in the breakwater at Cherbourg have given way in several instances. There are two great objections, so far as cement pipes are concerned. One is the erosion of the shell by water containing grit and silt, and the other is the weakening of the shell by the percolation of water.
902. What would be the age of the cement blocks at Cherbourg? The Cherbourg breakwater was completed, I think, in 1868.
903. In this case the water would be purely soft water? That would make no difference to the percolation. The cement is bound to absorb a certain amount of water.
904. In the case of the Cherbourg breakwater, of course you would have the action of the salt water and of the waves to contend with? The conditions so far as the absorption by the cement is concerned would be very similar.
905. You propose to construct a dam partly of wood and partly of stone. I propose to combine wood and stone. That has been used at Hollyoke. The wood would be protected inside by clay concrete to keep it dry at the back and make it impermeable by water.
906. Have you adopted this principle in the construction of your reservoir on the ground of economy? Yes. All the material is there. The timber can be obtained not far off, and there is rock on the ground. If we can get the necessary strength with this material I see no reason why we should use any other. In the case of wood and stone you get economy combined with efficiency.
907. Would such a wall be as stable as a concrete wall? I think more so. We have not yet had an opportunity to judge of the life of concrete.
908. What would be the wind and water pressure at the front of your wall? Those particulars should be at Tamworth.
909. You think you have made every provision for safety? Yes. I have given ten as the factor of safety.
910. What would be height of the mean level of your service reservoir to Peel-street in Tamworth? 200 feet.
911. What would be the level to Brisbane and Raglan Streets? Twenty-one feet.
912. You would be running it very close to get water to the houses there? The area affected is very small and is very little inhabited.
913. It would be the highest part of Tamworth? Yes; as far as I know.
914. Would you be able if your scheme were adopted to deliver water to the second storey of houses in that locality? Yes.
915. By gravitation? Yes. It would not give very much of a flow but we could deliver water. As I have said, however, the area is so small that it would not be of much consequence.
916. I believe the last scheme proposed by the Department was defective in that respect—that the water would not have reached that point? I do not know.
917. You are not familiar with the proposal? No.
918. Your estimate of £35,000 includes the pipe line from Moonbie Springs and the reticulation? Yes.
919. Is there anything further you would like to say? No; except that it would be hardly advisable to tax any water supply scheme with the highest point in any place. It would be like taxing Sydney with the North Shore heights 700 feet above it. The practice is to allow reticulation to wait until it pays to extend it.
920. What is the height of your storage reservoir above Peel-street? 226 feet.
921. What is the Departmental proposal? That would give a height of 1,000 feet.
922. There is a marked difference? Yes; it gives a tremendous pressure upon the pipes. It compels the use of strong thick pipes to resist the pressure, whereas in my case you could use earthenware pipes, and when you wanted to extend the scheme you could have an open conduit for water power, which would be a great saving.
923. Have you obtained the price of the 16-inch pipes from local manufacturers? I know that I can get them at £22 a ton.
924. Would your pipe-line have any sharp angles such as are shown on the Departmental scheme? It has no angles at all.
925. You have not your plans with you? No.
926. What is the saving you estimate by the adoption of your pipe-line as against the pipe-line of the Department? My pipe-line would bring in nearly double the quantity of water to begin with.
927. And there would be a saving in the delivery of the pipes from the railway? That would be very great. They could be delivered on the spot right along the line.
928. Have you any idea of what the saving in that respect would be? I have not.
929. Your proposal of 16-inch pipes would give a much larger supply of water? Yes; and almost at the same cost.
930. *Mr. Lee.*] I notice that you provide 16-inch pipes as against the proposal of the Department of 7-inch pipes? Yes.

E. B. Gipps,  
Esq.  
8 Jan., 1896.

931. Have you adopted that increased size for the purpose of providing sufficient water, if necessary, for irrigation along the line of route? It will give an increased revenue at a very slight increase in cost.
932. Did I not understand that your chief reason for increasing the size of the pipe was to provide additional water along the line of route? And to give water-power as well as irrigation supply.
933. Do you think that if you abandoned the idea of water-power and irrigation the use of 7-inch pipes would answer in the case of your scheme? No.
934. Why? Because I have much less fall. I had a fall of only  $2\frac{1}{2}$  feet per mile to my service reservoir.
935. How far distant is your service reservoir from the Town of Tamworth? Four and a half miles.
936. How far is your storage dam beyond the township of Moonbie? About  $4\frac{1}{2}$  miles.
937. How far would your pipe line be from the village of Moonbie? About  $1\frac{1}{2}$  mile.
938. And how far from the settlement at Tintinhall? It runs through it.
939. Would it not run parallel to the Cockburn river from the dam to the service reservoir? It would follow the railway line.
940. Would it not be close to the Cockburn river for nearly the whole distance? Yes.
941. Is not the land in the vicinity of the Cockburn river on both sides very good? Yes.
942. And that is the land you have in view as fitted for irrigation? Yes.
943. The river flats near Tamworth are at present under cultivation? Yes.
944. And you think that area will in future require water for irrigation purposes? Yes.
945. You think that irrigation ought to be provided for in every scheme of water supply in such a district? Yes; it adds considerably to the revenue to provide for irrigation as well as for domestic purposes.
946. Have you seen the Cockburn River in a state of flood? Yes.
947. Do you think your dam would be sufficient to withstand it? Yes; I have provided for the flood discharge.
948. How do you propose to dispose of the surplus water in the storage dam? I have no proposal, although it would be very valuable both for irrigation and for water power.
949. It will flow over the top of the dam? Yes; it is an overshot dam.
950. Have you seen Moore Creek in a state of flood? I have not. Judging from observations already made in the watersheds of this country the water going into the dam would depend very largely upon the season of the year at which it fell, and also upon the period of dry weather preceding the fall. Observations seem to show that not more than 4 per cent. can be relied upon to go to catchment areas into creeks during a prolonged drought.
951. What is the chief water course in that district? The Peel River.
952. But in the mountains? The Cockburn and Swamp Oak Creeks.
953. From which you propose to take your supply? Yes.
954. Have you had any comparison made as regards the purity of water from the Cockburn and in Moore Creek? I do not see that there can be any more objection to the watershed in the case of the Cockburn than there could be in the case of the Sydney supply.
955. Is there not mining on the banks of the Cockburn? Yes, but it is some 20 miles further up.
956. Is there not some much closer than that? I do not know; there was not when I was there in 1890?
957. If there were alluvial mining going on there, and if it were likely to largely increase in the future how would that effect your storage water? Not much, because we could provide for it, as they have done in California, by making the miners run their water into lateral valleys.
958. Supposing there were no valleys into which to run it? There are plenty of valleys. It is all rough country.
959. There is no law compelling them to do it? If it were necessary in the interests of the health of the people, I suppose a law could be passed as in the case of California.
960. If the miners ran their sludge into the water, would it not be contaminated? Of course, if it were allowed to run into the dam; but that could be stopped.
961. *Mr. Clarke.*] I notice that in 1892 you proposed a gravitation scheme, to cost £17,650? Yes.
962. What will your present scheme cost? £35,000, including a pipe line from the Moonbie Springs.
963. What is the chief reason for the difference in the two estimates? It is chiefly due to reticulation. I put down £5,000 in the first instance, and in this case £14,000 is provided.
964. Would the 16-inch pipes you propose to use bear the same pressure as the 7-inch pipes proposed by the Government? They would not be exposed to the same pressure. One would have seven times the extreme pressure of the other.
965. I understood you to say that in the case of some breakwaters concrete had not lasted well? Yes; and cement pipes in California had been proved to deteriorate very rapidly.
966. To what do you ascribe that? To the absorption of water, and to the deterioration of the material which constitutes the adhesiveness of the cement.
967. You think the scheme you propose would be more economical than that proposed by the Department? I think it would be of far greater advantage. It has fifty times the area of watershed and it is largely in excess of the other scheme in the matter of storage and delivery.
968. *Mr. Fegan.*] You say that you do not know the scheme proposed by the Government? Only from the evidence, but I may mention that what led me to give up Moore Creek was the information I got from the farmers. They had known the creek to be dry for months at a time. It is now only giving according to the evidence 20,000 gallons a day. From report, this has not been a bad season in that part of the country. I noticed in the daily papers the other day that in the rangos, near Armidale, they were having too much rain. If you get only 20,000 gallons in the case of an ordinary season, I do not know what you might expect in the case of a drought. When the Cockburn River with its immense watershed has been known to be dry for months what can you expect in the case of Moore Creek.
969. You know that the height of the reservoir in the case of the Moore Creek scheme would be 1,000 feet, whereas the height of yours would be only 220 feet? I think the height of 1,000 feet would, if anything, be an objection. Of course, if you would bring in a large supply of water with that pressure, it could be used for water power; but with a limited supply I think the economy of the proposal is very doubtful.
970. But we are told that a mere shower of rain is ample to fill the dam? That would not alter my opinion. The filling of the dam would depend upon the condition of the country at the time.
971. Why did the municipality of Tamworth reject your first scheme? Chiefly on account of the open conduit.

- F. B. Gipps, Esq.  
8 Jan., 1896.
972. *Chairman.*] I understand you to say that only 4 per cent. of the water falling upon the watershed of a creek could reasonably be expected to enter it? Yes. That statement is founded upon Mr. Clarke's report from his observations upon the watershed of the Sydney supply.
973. Would you be surprised to hear that I have been informed by the Water Conservation Department that the percentage of water generally reaching the drainage centre might be estimated at 44 per cent. and not 4 per cent.;—you still adhere to your statement? Yes; and in continuing my examination to-morrow, I will give you the observations brought by Mr. Bateman before the Royal Commission in London on this point.

THURSDAY, 9 JANUARY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.  
The Hon. JOHN DAVIES, C.M.G.  
The Hon. JAMES HOSKINS.  
The Hon. WILLIAM JOSEPH TRICKETT.  
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
JOHN LIONEL FEGAN, Esq.  
ANGUS CAMERON, Esq.  
THOMAS HENRY HASSALL, Esq.  
FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Water Supply for the Town of Tamworth.

Frederick Bowdler Gipps, Esq., civil engineer, sworn, and further examined:—

F. B. Gipps, Esq.  
9 Jan., 1896.

974. *Chairman.*] I believe you were at one time employed by the Works Department? Yes.
975. What were your duties? I assisted in laying out the Sydney Water Supply Works. The alternative lines I laid out were adopted by the Department, although they refused the high-level reservoir which I proposed. I also surveyed and laid out water supply works for Forbes, Hill End, Gulgong, and Mudgee. Previous to my employment upon the Sydney Water Supply Scheme, I was engaged by Mr. Manning to survey and report upon his high-level gravitation scheme from the Loddon and Wingecarribee Lakes to Sydney. I was obliged to report against that scheme on account of the insufficiency of the storage. It was open to the same objection as is the Government scheme of water supply from Moore Creek.
976. You informed the Committee yesterday that of the rainfall falling upon an ordinary catchment area about 4 per cent. would be all that would reach the river? Yes, during a long drought.
977. What is your authority for that statement? It is taken from the report by Mr. Clarke upon the Sydney Water Supply. It will be remembered that he was specially brought out from England by the Government of New South Wales to report upon the different schemes proposed for the supply of water to the city. He says, on page 6, "From the commencement of June, 1871, the Cordeaux observations were taken as more nearly representing the average rainfall for such an area, and will be more nearly applicable to the various projects which have to come under consideration. During the dry period alluded to from August, 1875, to March, 1876, when 9.94 inches fell at Sydney, 16.92 inches were recorded at Cordeaux, and the table as constructed calculates the ratio of discharge from rainfall as observed at Cordeaux." Further on he gives the rainfall on the Cordeaux watershed as 16.92, and the discharge at 0.42.
978. Is that statement not qualified in any way? No. He says, "Past experience of droughts, some of them extending over more than one year, and the certainty of their recurrence, makes it necessary to adopt the minimum rainfall as the safe unit for calculation when considering the source of a future supply \* \* \* It would appear, however, that even smaller quantities of rain have fallen, as, in 1824, it is stated that 19 inches only fell, but no authentic record of this seems to exist, and it cannot, therefore, be taken into consideration." Thus Mr. Clarke, in all his reports upon the different water supply schemes for Sydney, adopted a flow of only 4 per cent. of the rainfall as the basis of his calculations for necessary storage, and on that calculation the storage for the Sydney Water Supply is equal to 230 days.
979. Can you give us any other authority upon this point? Yes. Mr. Bateman, the eminent hydraulic engineer in England, in giving evidence before the Royal Commission upon water supply in London, in 1869, referred to the drought of 1868 in Liverpool and Blackburn. In Liverpool, from the 28th April to the 16th October, a period of 161 days, there was a rainfall of 12.20 inches, while the amount collected was 12.5 per cent., the mean average rainfall being 49 inches. In the case of Blackburn the mean average rainfall was 44 inches, and from the 27th March to the 25th September, a period of 182 days, the rainfall was 12.8 inches, the amount collected being 6 per cent. He, however, expressed doubt as to this record. It is estimated that in the West of England, where the mean rainfall averages over 40 inches per annum, there should be a storage of from 100 to 120 days, and in the East of England, where the mean rainfall averages under 30 inches per annum, a storage of from 240 to 260 days. The Hawksley rule is that storage capacity should vary inversely as the square root of rainfall of the mean of three consecutive dry years, which gives 225 days for Tamworth.
980. Supposing we have it on record that on the Cataract River in the greatest drought, when there would be the smallest return of water to the stream, with an estimated rainfall of 10½ inches, 10 per cent. went down the river? That would depend upon the conditions of the rainfall. If it fell at the rate of an inch in two or three days a large proportion would go down, but if it were distributed over six or seven days a very small percentage would flow down. Mr. Clarke's evidence, I take it, must be correct, because it was based on the observations of Government officers at the heads of the rivers, and this gave for the eight months to which I have referred a percentage of 4 per cent.
981. Do you regard Fanning as an authority upon water supply? I should not regard him as an authority in comparison with Bateman. He has collected very valuable data, but I could not accept him as a practical hydraulic engineer. Humber has also written a valuable engineering work, but I can hardly accept him as an authority upon this question.
- 981½. I find that Fanning, on page 77 of his treatise on hydraulics and water supply engineering, says: "When monthly data of the flow of any given stream is not obtainable it may ordinarily be taken upon average drainage areas for an annual flow as equal to 50 per cent. of the annual rainfall; or for different surfaces its ratio of the annual rain, including floods and flow of springs, is more, approximately as follows:—From mountain slopes or steep rocky hills, 80 to 90 per cent.; wooded swampy lands, 60 to 80 per cent.; undulating pasture and wood lands, 50 per cent.; flat cultivated lands and prairie, 45 to 60 per cent.?" I should not consider that of any value at all. It would

would depend entirely upon the conditions of the rainfall. Mr. Clarke was an eminent hydraulic engineer, and he was specially engaged to report upon the Sydney Water Supply Works. I should prefer to take his 4 per cent. as being the result of actual observation.

F. B. Gipps,  
Esq.

9 Jan., 1896.

982. From the information before you, do you believe that only 4 per cent. of the water falling on the catchment area at the head of Moore Creek would reach the dam as designed by the Government? I think that would be so under certain conditions. Under the conditions of a long drought, for instance.

983. You adhere to that statement, notwithstanding what Fanning says, and notwithstanding that the country is precipitous, and that the water might naturally be expected to flow rapidly to the creek? I should not feel disposed to credit Fanning's statement in comparison with Mr. Clarke's in this particular instance.

984. Apart from drought, and under ordinary conditions, what quantity of water might be expected to go into Moore Creek? It would depend upon the conditions. In the winter time, when the ground would be well soaked, perhaps more than 50 per cent. might flow off.

985. How much would run off in an average season? I could not say.

986. But in a dry season you think that it would not amount to more than 4 per cent.? That is so.

987. You give us that evidence in view of the catchment area under consideration? Yes.

988. In your opinion there will not be sufficient water from the catchment area proposed by the Department to supply a suitable quantity of water for Tamworth? No.

989. You think that an area of 22 square miles is not sufficient in that country under the conditions? No; 22 square miles at the rate of 4 per cent. for the lowest rainfall of 13'67, would only give 182,441,000 gallons a year. Mr. Hickson's pipe supply is given as 547,000 gallons a day. That would amount to 199,555,000 gallons, consequently there would be a shortage of 17,000,000 gallons from the water-shed.

990. How far is it from your storage reservoir to the service reservoir? Nine and a half miles.

991. And how far from the service reservoir to Tamworth? Four and a half miles.

992. Do you know the absolute distance? The absolute distance from Tamworth to the storage reservoir is 14 miles by measurement along the railway line.

993. You propose to lay your pipes along the railway line? Yes; with the exception of the first 2 miles.

994. What is the height of your storage reservoir from the railway station at Tamworth? 177 feet.

995. And what would be the height of your service reservoir? 153 feet.

996. Is that sufficiently high to reach all parts of Tamworth? I think so. It would give 21 feet above the junction of Raglan and Brisbane Streets which was the highest point measured by me.

997. The Department to meet the wants of Tamworth and various outlying areas have thought it necessary to make a reservoir to reach land 100 feet higher than would be reached by your scheme;—do you think it necessary? I do not, and there would be a heavy expense in obtaining reticulation pipes sufficiently thick to withstand the pressure.

998. Do you desire to make any further statements to the Committee? I have previously shown that 225 days storage was positively necessary. We find from Mr. Clarke's report that in the case of Sydney Water Supply there is a storage of 230 days' supply. I have allowed 225 days, taking the Hawksley formula. That would give at the rate of only 300,000 gallons a day 67½ million gallons in the storage reservoir, instead of what the Government provide, only 35,000,000 gallons, so that it would not even provide for 300,000 gallons per day, to say nothing of 547,000 gallons. Upon the basis of a 225 days' supply there would require to be in the reservoir, in order to give 547,000 daily, 123,120,000 gallons. There is, therefore, a shortage of 88,120,000 gallons in the storage reservoir proposed by the Government. In the report of the Commission upon the Sydney Water Supply, it will be found that 48 gallons per diem per capita is allowed, and it is further stipulated that any scheme should be capable of expansion. Mr. Clarke says, "The Commission also define what they consider to be the capacity for expansion that any scheme for the metropolis should have, viz., double the above amount, or 24,000,000 gallons a day." It will be seen, therefore, that there should be provision for 96 gallons per capita. Mr. Clarke also said "The Sewage and Health Board at their meeting on the 28th March, 1876, resolved 'that no supply would be considered adequate unless it would ensure a daily supply of at least 30,000,000 gallons.'" Actually over 100 gallons per capita should therefore be provided for the city of Sydney. Fanning gives the average daily supply per capita in Boston, Brooklyn, and twelve other places, and I find that none of them are under 40, most of them are over 50. The larger per capita allowance here can be understood when we come to consider the different climate. The intense heat necessitates the use of a greater quantity of water for baths and domestic purposes, also for watering the streets. I think, therefore, the allowance of 30 gallons per capita is much too small, having regard to the importance of the town to be supplied with water.

999. What does Sydney use at present? Thirty-four gallons per head, I am informed, but this does not include watering the streets.

1000. And you think that 100 gallons should be provided for Tamworth? In the case of a big town like that we should give sufficient for expansion.

1001. Is there anything further you wish to state? In drawing comparison of the relative values of the two schemes from a financial point of view, the storage capacity of my storage reservoir, taking it at so much per thousand gallons, would cost 4d. per thousand gallons, whereas the cost of Moore Creek storage would be 1s. 6d. per thousand gallons. My scheme would be more valuable by the difference between those figures. If the water delivered by me was nearly double that delivered by the scheme proposed by the Department, my supply would be worth nearly twice the Moore Creek Supply. Then, again, I propose to allow 400,000 gallons a day for irrigation, which would give £500 a year above what would be given by the Government scheme. The revenue from my scheme I estimate as follows:—General rate at 1s. in the £, £1,400; Government offices, £240; meters, £215; livestock, £50; irrigation, £608; horse-power for electric lighting, £150; giving a total of £2,753. The Government estimate a revenue of £2,295. There would thus be a difference in favour of my scheme of £458, which would be 4 per cent. on £11,000. That would be the actual value of my scheme over and above the Government scheme, while for expansion my work would also be cheaper than the Government proposal.

1002. You think the bringing of your supply some 14 miles in such thin pipes is likely to be a satisfactory process? Much thinner pipes have been used with a much greater pressure.

1003. Do engineers generally use pipes of that thickness? They have been used in Victoria.

- F. B. Gipps, Esq.  
9 Jan., 1896.
1004. Where have they been used there? At Mildura, for irrigation and also water supply. My factor of safety using these pipes would be 16, and that is an enormous factor. The water supply pipes in Virginia City, California, were thinner than those I propose. For a pressure of over 200 feet, the water supply pipes are No. 16 wrought-iron instead of No. 14, steel.
1005. *Mr. Davies.*] You are quite satisfied as to the strength and durability of your pipes? Yes. They have been actually laid for water supply works in different parts of the world, and especially in California. I could, if necessary, give you exact information as to the use of pipes in Victoria.
1006. Would a pipe 1-12th inch in thickness be sufficient to resist the pressure you propose? According to the information given to the Committee as to bursting pressure of other pipes my pipes ought to stand a pressure of 991 lb. per sectional inch, that is giving a factor of safety of 16. As a safety of 4 is considered sufficient I am giving four times the necessary factor of safety.
1007. *Mr. Hassall.*] You think the catchment of the Government scheme is not fitted to secure a permanent supply of water for Tamworth? I think it is fit for a limited supply only.
1008. I understood you to say just now that the supply in dry weather would be about 182,000,000, and that would not give a supply of 300,000 gallons a day? But Mr. Hickson says his pipes are to deliver 547,000 gallons a day. He proposes, I conclude, to take 247,000 for power purposes, and I state that the scheme would not supply it.
1009. You think that the scheme would not supply the Town of Tamworth itself? It would not supply 547,000 gallons a day.
1010. Do you not think that by increasing the capacity of the storage reservoir an ample supply could be provided both for domestic and power purposes? If you increased the storage reservoir to provide for three times the quantity provided for at the present time I think it would be sufficient; but I do not think that that would meet the need for expansion. Tamworth is going to be a big town. The fault of most of our works in the Colony is that we have not looked sufficiently forward. I think we should look forward to a population of 30,000 people at Tamworth.
1011. From what source do you anticipate the increased population;—what will attract them to the place? The increase of agriculture on the Peel River. There is a very large area of good land there.
1012. What is the total distance from your impounding dam to the town itself? Exactly 14 miles.
1013. You give the cost of 11 or 12-inch wrought-iron pipes at £1,000 per mile? Yes.
1014. Can you account for the discrepancy between that estimate and Mr. Darley's estimate of £2,700? Mr. Darley's estimate was for cast-iron pipes, and mine was for steel pipes. The carriage alone would be an enormous item.
1015. Assuming the highest point in the town to be 200 feet above the railway station, would your supply serve that spot? I do not think it would. The only portion which would not be commanded by my scheme would be the town blocks above Raglan-street.

## THURSDAY, 16 JANUARY, 1896.

## Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.  
The Hon. JOHN DAVIES, C.M.G.  
The Hon. JAMES HOSKINS.  
The Hon. WILLIAM JOSEPH TRICKETT.  
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
JOHN LIONEL FEGAN, Esq.  
ANGUS CAMERON, Esq.  
THOMAS HENRY HASSALL, Esq.  
GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Water Supply for the Town of Tamworth.

Hugh Giffen M'Kinney, Esq., Chief Engineer, Water Conservation Branch, Department of Mines, sworn, and examined:—

- H. G. M'Kinney, Esq.  
16 Jan., 1896.
1016. *Chairman.*] What are you? Chief Engineer for Water Conservation.
1017. Do you know the catchment area of the Tamworth Water Supply? Not intimately. I have been in the district, but I have not been over the catchment area.
1018. Do you know the present proposal to supply Tamworth with water? I do not know the details of it.
1019. The catchment area is an abrupt granite country in places, and the granite rocks are exposed;—in country of that kind, what proportion of water would find its way to the drainage centre? That is a matter which depends on several other points besides the catchment area. It depends upon the way in which the rain falls. If the rain falls in large quantities at one time a great deal more water will flow off than will flow off if the rain is very much distributed throughout the year. But I should fancy that from a catchment area like that the proportion which would flow off would not be less than from 30 to 40 per cent.
1020. Have you any knowledge of the rainfall at Tamworth? There is a rainfall of about 29 or 30 inches per annum at Tamworth.
1021. On an area such as I have described with a rainfall of 29 or 30 inches, what quantity might we reasonably expect would find its way into the drainage centre? I should say on an average from 30 to 40 per cent. of the rainfall.
1022. *Mr. Davies.*] How long is it since you visited Tamworth? I should think about three years.
1023. Have you been consulted by the Department with reference to this water scheme? I cannot say that I have. I have been asked for some information in connection with my own experience about the flow of catchment areas, but I cannot say that I have been consulted about the scheme.
1024. Do you know the extent of the catchment area? I do not.
1025. So that you have very little knowledge of the proposal before the Committee? I have not gone into the scheme at all; it lies quite outside my province.
1026. Supposing there is a fall of 4 inches all over an area of 22 square miles, what quantity of water would that give? If that fall of 4 inches took place very rapidly it would very likely give as much as 70 per cent. off the area, but if 1 inch fell at one time and another inch at another the chances are that it would be under 30 per cent.
- 1027.

1027. You could not tell how many million gallons could be expected? That is a matter of calculation.
1028. You are aware that the dam at the foot of the catchment area is estimated to hold 35,000,000 gallons? I was not aware of the actual quantity that the dam will hold.
1029. Would a fall of 4 inches over that area fill that dam thirty times over? On a rough guess I should say that it would. Four inches over 22 square miles is an enormous quantity of water.
1030. Would it be too large an estimate to expect from a rainfall of 4 inches that that dam, with its capacity of 35,000,000 gallons, would be filled thirty times over? That would depend upon the way in which the 4 inches of rain fell. If the 4 inches of rain fell all at once it certainly would fill the dam a great number of times over.
1031. You could not tell the Committee whether we might expect to have the dam filled thirty times? No; I do not consider it is a thing that anybody could say.
1032. You just stated that the average rainfall is from 28 to 30 inches? Yes.
1033. Can you state what quantity it would represent if 4 inches of that actually ran off? Yes. That is a matter of easy calculation; it would certainly fill the dam a great number of times.
1034. Do you know what is the smallest rainfall that they have ever had in the district of Tamworth? No.
1035. If the lowest rainfall in Tamworth has been 18 inches—never less—would you regard a catchment area of 22 square miles as sufficient for supplying and refilling a dam which will hold from 35,000,000 to 50,000,000 gallons? That is a matter I would rather have some time to go into, but, speaking offhand, I believe that it would be.
1036. You have not gone into that? I have not gone into details.
1037. You are not familiar with the plans before the Committee? No.
1038. Have you any details in reference to the flow of water off catchment areas? I have in some cases. I can tell you what proportion of the rainfall flowed off the catchment area of the Murrumbidgee in 1884, but I have no particulars about this river.
1039. *Mr. Fegan.*] How long would it take you to give us that calculation—as to the number of times the reservoir would be filled. Supposing the rainfall to be about 30 inches, and that 4 inches of that goes into the dam, what would the supply be from the 22 square miles? It would be 20,441,600 cubic feet, and that multiplied by  $6\frac{1}{2}$  gives 1,277,760,000 gallons.
1040. Do you think 4 inches is a small percentage to run into the drainage centre out of a rainfall of 28 or 30 inches? I do.
1041. Therefore, you think the Committee is safe in concluding that there will be a sufficient supply for the people of Tamworth? Yes; I think it will be ample.
1042. Considering the population to be 10,000, you do not think there is any danger of the town going short of water with that catchment area? I have not heard what the storage is to be. There is no doubt that the catchment area is large enough.
1043. The storage is supposed to be equal to 50,000,000 gallons, and the rainfall being 28 inches, you do not think there is any fear of the people of Tamworth being short of water if that scheme is carried out? I do not think there is the slightest fear of it.

H. G.  
M'Kinney,  
Esq.  
16 Jan., 1896.

FRIDAY, 17 JANUARY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.  
The Hon. JOHN DAVIES, C.M.G.  
The Hon. JAMES HOSKINS.  
The Hon. WILLIAM JOSEPH TRICKETT.  
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
JOHN LIONEL FEGAN, Esq.  
ANGUS CAMERON, Esq.  
THOMAS HENRY HASSALL, Esq.  
GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Water Supply for the Town of Tamworth.

Joseph Davis, Esq., M. Inst. C.E., Principal Assistant Engineer for Country Towns Water Supply and Sewerage, Department of Public Works, sworn, and further examined:—

1044. *Chairman.*] What will it cost to increase the storage capacity of the Moore Creek reservoir up to 50,000,000 gallons? The total cost will be £7,460. The difference between the cost of impounding 35,000,000 gallons and the cost for impounding 50,000,000 gallons is £2,148.
1045. It will involve an extra expenditure of £2,148? Yes.
1046. What alterations will have to be made to the dam which you have already described to the Committee? The base of it will be wider, and the level of the crest will be raised by 4 feet 6 inches.
1047. Will there be any alteration in the width of the base? The base will be proportionately stronger to correspond with the difference in height.
1048. What would a service reservoir, to hold a million gallons, cost? The probable cost would be £3,000. The present one cost £1,800, or £1,200, more.
1049. If subsequently another 500,000 gallons had to be put in, what would it cost? About £1,800.
1050. There would be a difference between the cost of doing it now and postponing it? Yes.
1051. What would be the interest on the £2,148? 3-616 per cent.; that would be interest and sinking fund. It would amount to about £77 14s. per annum.
1052. What will it be on the other £1,200, if it is determined to increase the service reservoir? About £43 7s.
1053. The total yearly rate which the Tamworth people will be called upon to pay will be £121 1s.? Yes.

J. Davis, Esq.,  
M.I.C.E.  
17 Jan., 1896.

1054.

J. Davis, Esq., M.I.C.E. 1054. Is there anything else that you desire to say? I will read the following statement, in answer to the evidence of Mr. Gipps:—

17 Jan., 1896. For the information of the Committee, in view of the evidence given by Mr. Gipps, I beg to submit the following observations:—

#### Levels.

The most serious defect in the modified Cockburn scheme is the limited head. The levels will not admit of the water being supplied by gravitation above the broken red line shown on the wall plan. Even at this contour line, which is 73 feet above the railway station, instead of 133 feet as given by Mr. Gipps, the pressure would be so small that in case of fire it would be useless.

#### Dam.

Mr. Gipps states (p. 33, Minutes of Evidence), that the Dooen Dam, in Victoria, resembles—except in its foundations—his proposed dam, its dimensions being nearly similar. An inspection of the cross-sections of the two dams, which are shown on the attached diagram, will show that the designs are totally different in every respect. The Dooen Dam is founded on clay (not rock), and constructed of timber, clay, and gravel.

It would be impossible to keep Mr. Gipps' dam watertight for any length of time if constructed as shown, and the percolation of water would give such a degree of buoyancy to the materials as to make it unstable in times of flood. The top width is also insufficient to withstand the momentum of the large body of water and floating timber which would pass over it after heavy rain storms. I have therefore included in the estimate for a concrete dam, the probable cost of which will be £8,630 15s.

#### Steel Pipes.

In his original scheme Mr. Gipps proposed to use 12-inch and 11-inch wrought-iron pipes 16 B.W.G. thick; he now increases the proposed thickness to 14-inch B.W.G. for 16-inch and 9-inch pipes of steel. Although it is well known that in America even thinner pipes have been used, chiefly for mining purposes, yet it is not considered advisable that any steel pipes above 6 inches diameter intended for permanent waterworks should have a less thickness than  $\frac{1}{2}$  inch, chiefly because there is a practical difficulty in caulking the seams of a thinner pipe without injury to the plates. For this reason, in the estimate I have prepared I have provided for pipes  $\frac{1}{2}$  inch thick, which at £22 per ton will cost £20,185.

My estimate of Cockburn scheme, as modified by Mr. Gipps, is as follows:—

	£	s.	d.
Storage reservoir .....	8,630	15	0
9½ miles of 16-inch diameter steel pipes.....	15,640	2	2
Service reservoir .....	1,800	0	0
4½ miles of 9-inch diameter steel pipes .....	4,544	18	6
Reticulation .....	14,260	0	0
Survey and engineering expenses, &c. ....	4,487	4	4

Total ... .. £49,363 0 0

Turning now to the Moore Creek scheme and to the evidence given by Mr. Gipps respecting the catchment and the quantity of water which may be expected to reach the storage reservoir therefrom, the best authorities state that from mountain slopes such as those in question, 80 to 90 per cent. of the rainfall may be expected to run off the gathering ground. Actual observations, extending over several years in connection with the Sydney Water Supply, show that the Cataract River discharged 44 per cent. of the rainfall. Mr. Fitzgerald, in a paper read before the American Society of Civil Engineers in June, 1892, gives the annual percentages of rainfall collected from the following river watersheds near Boston, U.S.A., as follows:—

Sudbury River; catchment, 75 square miles; hilly with steep slopes; mean for 16 years.....49·5 per cent.  
Cochituate River; catchment, 18·8 square miles; flat and sandy slopes; mean for 29 years.....43·8 „

The average catchment area for 1,000 persons for thirty-eight water supplies given in the "Manual of American Water Supplies" and "Burton," is equal to 331 acres, or 1,630 persons to the square mile. Applying this to Moore Creek watershed, a catchment of 6 square miles would be sufficient.

The average rainfall recorded for Tamworth for the three driest consecutive years is 19·69 inches, and if it is assumed that only 20 per cent. of this ran off the catchment, 1,255,000 gallons per annum would be available.

The drift in the creek indicates that in times of storm 1,362,500 gallons per minute pass down the creek. To give this quantity, a quarter of an inch per hour must have reached the creek from the watershed.

Regarding the storage capacity of the reservoir, I have prepared a diagram giving the rainfall from 1880 to 1895, and the condition of the water during that time in a storage reservoir having a capacity of 35,000,000 gallons at the proposed site at Moore Creek. Assuming that only 20 per cent. of the rainfall runs off, and that 300,000 gallons are used per day, the result shows that with the exception of the year 1888, when 13·17 inches rainfall was registered, the storage capacity would not be seriously strained.

Mr. Gipps throws some doubt on the adequacy of the proposed provision of 30 gallons per head. The daily average consumption in Sydney during 1894 was 13,739,000 gallons, equal to 34·23 gallons per head. The average quantity used in thirteen European cities is given in Panning as 27 gallons per head. It would therefore appear that a reasonable provision has been made in the Departmental proposal.

Mr. Gipps in his evidence refers to the failure last year of the Bouzey masonry dam in support of his contention in favour of combined stone and timber in preference to concrete, and remarks that this dam "was constructed with great care, its foundations were taken down 30 feet to what was considered a solid base, and yet without any other apparent reason except the failure of the cement joints it burst on the 27th of April last year." A reference to the description of this French dam in *Engineering*, of 3rd May, 1895, will show that this is entirely incorrect, and that on the contrary the design was very faulty according to the best English practice, the line of resistance with the reservoir full falling considerably outside the middle third of the section, thus causing tension on the inner face; that the materials used were soft sandstone of very low tensile strength, set in lime mortar; that the foundations were not carried down to solid rock, so that on attempting to fill the reservoir the dam "slid down the valley several inches," and had to be strengthened before it could be used.

There is no record of the failure of a properly constructed concrete dam or masonry dam, designed in accordance with Professor Rankine's rule (which is adopted by the Department) that the line of resistance in straight dams to any pressure should fall within the middle third of the cross section.

In accordance with the instructions of the Sectional Committee I have prepared an estimate for increasing the capacity of the storage reservoir to 50,000,000 gallons, which amounts to £7,460, or £2,148 more than the dam for impounding 35,000,000 gallons. The Engineer-in-Chief for Public Works thinks, however, notwithstanding that the pipe-line will be longer, and in the lower parts the pipes will have to be increased to  $\frac{1}{2}$ -inch thick, that when a survey has been made it will be cheaper to construct a dam at the upper site.

J. DAVIS,

Robt. Hickson,  
Engineer-in-Chief for Public Works.

Principal Assistant Engineer, C.T. Water Supply and Sewerage.

1055. The Engineer-in-Chief thinks it would be better, if 50,000,000 gallons is required, to have it impounded on the other site? He is of that opinion.

1056. It will cost £2,000 more to make the dam hold 50,000,000 gallons? Yes.

1057. And the piping? There will be 1½ mile of piping, which will cost about £950.

1058. Will you require to strengthen your pipes running into the service reservoir? Yes; a very great length will require to be strengthened.

1059. What will that cost? Probably it will cost £2,000 to strengthen the pipes.

1060. That is £2,800, or say £3,000, against £2,000? Mr. Hickson's idea is that the cost of the upper dam will be considerably less than that of the lower one to impound the same quantity of water, and no doubt he is right. The question is, whether, if we have to spend more money on the pipes, we shall save that much in putting in the upper dam. I should like to correct myself as to the cost of the pipes. The difference in the cost of the pipe-line between the upper and the lower dam would be £3,100 instead of £2,900.
1061. *Mr. Humphery.*] Will you explain the difference in cost of the two schemes—that is to say, the upper dam and the lower one? It is impossible to give an accurate estimate of the scheme for the upper dam until a survey has been made, but approximately it will stand thus: The extra length and thickness of the pipes in the lower portion of the pipe-line will cost £3,100 more for the upper site than for the lower site, but the upper site being a better site for a dam than the lower site, the dam will probably be constructed for, say, £1,500 less to impound the same quantity of water. So that it would appear from that that it would be more economical to adopt the lower site.
1062. Was the proposal to adopt the higher site brought under the notice of the Tamworth Council? No; the Tamworth Council have always been led to suppose that we were to keep that as a reserve.
1063. What would be the additional cost of constructing a second dam, assuming that the storage hereafter should be insufficient in the lower dam? A second dam could be constructed to impound 35,000,000 gallons for slightly over £4,000, or to impound 50,000,000 gallons for about £5,500.
1064. What would be the cost to make provision for 50,000,000 gallons? It would be over £37,000.
1065. £37,000 will cover the total cost of the water supply if you carry out a proposal to construct a dam on the lower site to hold 50,000,000 gallons of water? That is correct.
1066. And you can double the capacity by an expenditure of an additional £5,000? Yes.
1067. You have allowed 30 gallons per head for a population of 5,000? The present population is 4,300.
1068. Assuming a consumption of 30 gallons per head per day, that would be about 150,000 gallons a day? Yes.
1069. Then, with a storage capacity of 50,000,000 gallons, you would have a reserve supply for about 160 or 170 days? We should have a reserve supply for twelve months.
1070. But doubling the present population, with a storage of 50,000,000 you will have a reserve supply for about half a year? Yes.
1071. If you have the present consumption of 150,000 gallons a day for a population of 5,000, and assuming that 10,000 people, in round numbers, would consume 300,000 gallons a day, if you had a storage reservoir to hold 100,000,000 gallons, would that give you nearly a year's supply in the reserve? There would be a year's supply for double the present population.
1072. *Mr. Lee.*] I believe that taking the additions to the present Departmental proposal for storing the 50,000,000 gallons, and doubling the capacity of the service reservoir, the additional cost would be £3,348? Yes. That is correct.
1073. The annual interest upon which would be £99 4s.? Yes, including the sinking fund.
1074. You are aware that there is a general desire on the part of the Tamworth people to have an increased storage? Yes.
1075. They did not doubt about the 35,000,000 gallons supplying the present population? No; but they considered that it would be safer to have 50,000,000 gallons.
1076. And also safer to have double the service supply? Yes; but I thought without any rhyme or reason.
1077. At all events to give the increased capacity in both reservoirs the additional cost would be £3,348? Yes.
1078. Has your calculation been sufficiently thought out for the Committee to rely upon this estimate? Yes. The estimate has been made correctly.
1079. The same doubt does not exist there that exists as to the probable cost of the dam on the upper site? No.
1080. Then, in the event of provision being made to give this increased storage, does it not follow that the upper dam will be an invaluable reserve to have in hand? That is my opinion.
1081. Then, if 50,000,000 gallons can be stored under the present proposal, it will serve every purpose until the population of Tamworth doubles itself? Yes.
1082. In the event of the present storage being increased to 50,000,000 gallons, have you any doubt that the reservoir will be filled? I have not the slightest doubt. With such a catchment area as we have there there should certainly be no scarcity of water.
1083. Are there not many indications given by the height of the driftwood in the creek as to the height of the flood-water under certain conditions? Yes, many.
1084. And from them you gather that there must be an enormous body of water passing down? Yes; and I have made calculations which I read to the Committee showing that if there was such a stream as has been indicated in the creek it would fill the reservoir in half-an-hour, supposing the reservoir to be empty.
1085. You are well acquainted with the shifting nature of the country there—the disintegrated state of the granite and the liability of the sand to find its way into water-courses? Yes.
1086. What provision are you going to make to keep the dam thoroughly scoured? I propose to put in two penstocks instead of one, as is usual in such cases, the object being in time of flood to open those penstocks and allow the dam to flush. My own opinion is that that will cause a current along the present bed of the creek at the bottom of the reservoir and the sand will be discharged below the dam.
1087. Do you think that that will be sufficient to clear the bed of the dam for a considerable distance? Yes, I am satisfied that it will. Sand dams might be put in above the reservoir, but they would be a cause of continual expense, as it would always require one man there to keep them clean.
1088. I should like to hear you on the question of the service reservoir;—I am aware that there is a conflict of opinion between yourself and the mayor and aldermen of Tamworth? Well, if the service reservoir is constructed to contain 500,000 gallons it will be sufficient to last the people of Tamworth under present circumstances for three days, which should be ample. But even supposing that a pipe burst in the valley of Moore Creek, it could be repaired and the water turned on again before the water in the service reservoir was exhausted.

- J. Davis, Esq.,  
M.I.C.E.  
17 Jan., 1896.
1089. In other words, you have no doubt about its being ample for the requirements of the city? I am satisfied that the provision is ample, and indeed compared with many other places it is more than ample.
1090. I want you to look at it from this point of view: The township has expressed a desire to have an increased storage there, and they show that they will have an ample margin within the estimated revenue to pay interest upon the extra cost;—under those conditions do you offer any objection to it? I should, because I consider it would be a waste of money, and I do not think they gave any reason for it.
1091. What great objection can there be to granting that increased supply if they are willing to pay for it? I do not see that it would be increased accommodation. If the Tamworth people have as much water in the service reservoir as will keep them going I do not see what more they can want.
1092. I think you have already stated that this extra reservoir could be put down for less money now than it could by-and-bye? Slightly less.
1093. That being the case, is there any objection to the increased storage? There would be just as much sense in making that a million gallons as there would be in making the storage capacity 100,000,000 when there is a consensus of opinion that 50,000,000 would be sufficient.
1094. Laying your engineering calculations aside for a moment, what is the great objection to granting this increased storage if they are willing to pay for it? You cannot control people when they like to be foolish.
1095. We cannot take that view of it. I suppose we may take this view of it: that if this increased accommodation were given now it would be part and parcel of the total cost of the work? Yes.
1096. The redemption of which would take place within 100 years? That would be so; but I should like to state that in future it will be possible to extend these works on the same terms to any extent. That will be when an amending Bill, which it is proposed to bring into Parliament, has become law.
1097. As the law stands at present the original cost is that which is charged by the Government to the Municipality? That is so.
1098. Any additional service after that has to be incurred at the cost of the Municipality? Municipalities cannot afford to do it, so that the work has to go undone, and it will be so until the Bill to which I have referred has become law.
1099. As the law now stands they would have to do this work at their own expense? Yes; if they have funds.
1100. You do not offer any objection to the increased storage of 50,000,000 gallons? No; I favour that.
1101. But you take exception to the increased accommodation of the service reservoir? I regard that as unnecessary.
1102. If the increased service is omitted the total extra cost will be £2,148? That is so.
1103. If the extra service is given it will increase the cost by £1,200? Yes.
1104. *Mr. Fegan.*] In taking the water supply from Moore Creek are you not taking it from a number of residents along the creek? We impound behind the dam sufficient water to supply Tamworth.
1105. In impounding the water you take from a large number of people the water which they have hitherto had access to? There will be sufficient water flowing down after we have taken what we want for Tamworth to supply all the residents there. There are two large branch creeks, the Kangaroo Creek and Back Creek, and if we use all the water which flows from the 22 square miles of catchment area those two creeks will give a sufficient supply for the residents to whom you refer.
1106. How much would those residents have now if they depended on those two creeks;—is it not a fact that they would be entirely without water? No; there is water flowing in Back Creek to my knowledge. I am not so sure as to Kangaroo Creek, but I believe there is water in that creek too.
1107. It would considerably hamper these people for water, would it not? I do not think so. The residents are so few along the creek in the valley that they would have quite enough water after we had taken all that we required for Tamworth.
1108. Are there not as many residents along Moore Creek depending upon the water as there are in the higher section of Tamworth which Mr. Gipps' scheme could not reach? I should say that there is no comparison between the two.
1109. One of the principal objections to Mr. Gipps' scheme is as to its inability to get the water to a certain point? Yes.
1110. Do you know the number of residents along Moore Creek? I should think that there are not more than twelve homesteads at the outside.
1111. Are you going to make any provision in your scheme to give these people water? If they ask for it and pay for it they will get a supply from the pipe.
1112. Have you made any provision in your scheme to provide them with water? There will be sufficient provision to supply them without causing Tamworth to suffer in any way whatever.
1113. You told Mr. Lee that you thought the additional service reservoir entirely unnecessary? Yes.
1114. I suppose, as an engineer, you consider it your duty to see that the work is carried out with as little expense as possible, and in such a way as to afford the greatest facility to the people? With as little expense as possible consistent with efficiency.
1115. That is a point in your profession? I am supposed to look after that part of the business.
1116. In making provision for a storage of half a million gallons in the service reservoir, which will be as much as the inhabitants of Tamworth can consume in three days, you think that that is quite sufficient? Yes.
1117. Will there be spare piping along the line in case of any accident? Yes. Pipes are always kept at certain places along the line for repairing.
1118. Therefore, the people will not suffer as long as they have a three days' supply in the reservoir? No.
1119. *Mr. Humphery.*] Do you know of any country town water supply having a service reservoir containing more than three days' supply? Not under similar conditions.
1120. *Mr. Cameron.*] And in your opinion that is ample? Yes; it is infinitely better than Sydney.
1121. *Mr. Humphery.*] What is the supply for the City of Sydney contained in the service reservoir? Not more than half a day's supply.
1122. *Mr. Hoskins.*] When the reservoir at the Centennial Park is finished there will be more then, will there not? Yes.
1123. What supply is that supposed to hold—will it be a three days' supply? Something like that.

1124. *Mr. Black.*] What was the cost of the Goulburn Water Supply? £55,000.
1125. What is the population of Goulburn? I suppose about 8,000.
1126. And the population of Tamworth is 5,000? Yes.
1127. Then this Tamworth scheme is not only absolutely cheaper than the Goulburn scheme, but it is relatively cheaper as compared with the population? Yes. It compares favourably with the Goulburn scheme from that point of view.
1128. Do you think it will be possible to get figures showing the difference to each of the ratepayers between the two systems? I think I could get them.
1129. *Mr. Hassall.*] Have you any knowledge of the Manly water supply? No.
1130. You do not know what the holding capacity of the reservoir is? No; but I could get it.
1131. Will you let us have that? I will.
1132. Have you made any estimate as to what will be the cost of the silt-pit above the storage reservoir? No. I propose to scour the silt out of the reservoir by means of penstocks which I have described. That will be a cheaper way.
1133. Is the cost of that contained in your estimate? Yes.
1134. Do you think it is necessary to increase the carrying capacity of the storage reservoir to 50,000,000, as asked for by the Council? I think it will be on the safe side—the droughts are very protracted there.
1135. You do not think it necessary to go one and a quarter mile up the creek to the second site? I would not express any opinion beyond what I have already done.
1136. By using the site first selected, and increasing the storage capacity to 50,000,000 gallons, you will not require to make any alteration in the pipe-line, and there will be no additional expense? The only additional expense will be £2,148 for the extra dam.
1137. And in the event of the construction of extra storage above, you would not require an extra pipe-line? No. The water would be allowed to run down the bed of the creek as required from the upper to the lower dam.
1138. *Mr. Cameron.*] Have you, in connection with the Works Department, a system of cement-testing? Yes; I have charge of it.
1139. Have you tested the local cements with reference to the various works? Yes. We have had colonial cements under tests from time to time ever since they have been making them.
1140. How does it compare with the Portland or other imported cements? It is inferior to the home-made cements. It is not so strong.
1141. Is it as good as the German? The German cement from my experience stands first on the list as to quality, the English comes second, and the colonial comes third.
1142. Is the cement that is used for public works tested before it is used for each work, or is there a periodical examination? Every parcel of cement before it is used on any public work is tested, and accepted or rejected without regard to maker or brand or country.
1143. Then, in the event of a local manufacturer wishing to have his cement used in connection with a proposed work, would a special examination take place, or would you go by the result of the past examination? Every parcel would have to stand on its own merits.
1144. Then an application would ensure a test being made? We are testing colonial cement now for works.
1145. *Mr. Wright.*] I suppose you have a standard? Yes; and if the cement complies with the standard in twenty-eight days it is accepted; if not it is refused.
1146. Does the colonial cement work with an equal quantity of sand? The colonial cement is very fine, and if not put through the usual test would in all probability be accepted as very superior cement. In that respect it is like the German. The English cement is rather coarse.
1147. Does it harden quickly? It hardens in some instances too quickly.
1148. Does it crack? Yes, in many cases. It contains a certain quantity of free lime, which is slaked during the process of setting. An internal strain is set up and the cement cracks.
1149. In price I suppose it is about the same? I think so.

J. Davis, Esq.,  
M.I.C.E.  
17 Jan., 1896.

FRIDAY, 24 JANUARY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.  
The Hon. JOHN DAVIES, C.M.G.  
The Hon. JAMES HOSKINS.  
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
JOHN LIONEL FEGAN, Esq.  
GEORGE BLACK, Esq.  
FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Water Supply for the Town of Tamworth.

Joseph Davis, Esq., M. Inst. C.E., Principal Assistant Engineer for Country Towns Water Supply and Sewerage Department of Public Works, sworn, and further examined:—

1150. *Chairman.*] We wish you to give a sketch showing the height of the reservoir with a supply of 35,000,000 and also with a supply of 50,000,000 gallons, taking it in the driest year when the estimated one-fourth of the rainfall falling on the catchment area would be available for storage purposes? The quantity estimated was 20 per cent.
1151. Twenty per cent. or one-fifth;—have you got that plan? I have; the two plotted on the same sheet, showing 35,000,000 and the 50,000,000 gallons supply.
1152. You hand in the plan showing the storage for the driest year? Yes; for the year 1888. That was the driest year; but 1895 was very near to it.
1153. What rainfall was there in 1888? 13.6 inches.
1154. And your plan shows by the blue line the effect of the supply of 35,000,000 gallons? Yes; with 20 per cent. of the rainfall and 300,000 gallons a day consumption.
1155. And you show in red the same supply under similar conditions with a storage of 50,000,000 gallons? Yes.
1156. How much have you increased the height of the dam? Four feet six inches.

J. Davis, Esq.,  
M.I.C.E.  
24 Jan., 1896.

J. Davis, Esq., M.I.C.E., 24 Jan., 1896. 1157. Just describe the effect of 300,000 gallons consumption on a storage of 35,000,000 gallons in the reservoir, and one of 50,000,000? With 20 per cent. of the rainfall and a consumption of 300,000 gallons a day equal to the requirements of a population of 10,000, twice the present population, with a supply of 35,000,000 gallons the reservoir would have been emptied in the month of September, 1888. But if the capacity were increased to 50,000,000 gallons then under the worst conditions which existed in the year 1888 there would probably be a third of the 50,000,000 gallons still left in the reservoir.

1158. You have made no allowance for evaporation? I have not.

1159. Will you explain why? To begin with, it is very difficult to make an allowance for that in a diagram like this. Secondly in making that allowance the rainfall itself would have to be taken into consideration. Supposing the evaporation to equal 40 inches in the year, against that would have to come the rain that actually falls on the surface of the reservoir which would reduce it considerably. In addition to that the allowance of 20 per cent. of the rainfall on the catchment area is so very small that there will be ample to compensate for any small quantity that would be lost by evaporation.

1160. Therefore 50,000,000 gallons is ample? 50,000,000 gallons is ample for 10,000 people taking the last fifteen years which is a fair criterion as a basis.

1161. Is there any other statement which you desire to make? Yes; I desire also to supplement my statement made to the Committee on the 17th instant, in regard to the provision Mr. Gipps makes in his scheme for motive power and irrigation. In his statement read before the Public Works Committee on the 8th instant, Mr. Gipps states that inasmuch as his proposed 16-inch main from the storage to service reservoir would deliver the required daily supply of 300,000 gallons in 8½ hours, it would be possible to use 642,000 gallons in 15½ hours for generating electricity and irrigation. It has already been shown that Mr. Gipps' proposed 9-inch pipe from the service reservoir to the town is not large enough to give a satisfactory supply to the higher levels for domestic purposes alone; it will therefore be evident that in order to furnish sufficient power for electric lighting (as proposed by the Department) a separate pipe will be required, and it will be necessary to increase the capacity of the service reservoir to at least 1,000,000 gallons. Mr. Gipps' estimate will therefore have to be increased as follows:—

12-inch steel pipe, 5 miles long ... ..	£6,240	0	0
Additional cost of service reservoir, 1,000,000 gallons...	1,200	0	0
Total... ..	£7,440	0	0

If this sum be added to the estimate of £49,363 previously submitted, it will bring the estimated cost of Mr. Gipps' scheme for the supply of water from the Cockburn River, and motive power for electric lighting, to £56,803. It must, however, be borne in mind that even with this expenditure no water would be available for irrigation, inasmuch as the turbine being in Peel-street, would be situated where there is no land to irrigate, and the water therefrom, after passing through the turbine, would run to waste.

1162. *Mr. Hoskins.*] What would be the difference in cost between a service reservoir of 500,000 gallons and a reservoir that would hold a million gallons? £1,200.

1163. *Mr. Black.*] Have you a return of the cost of other water supplies? I have prepared a statement of the provision as far as service reservoirs are concerned for Sydney and the suburbs. I find that when the two reservoirs which at present are being constructed are finished there will be a provision of 32,000,150 gallons. That is equal to about two days' supply; at present there is scarcely a day's supply.

1164. *Mr. Davies.*] If the proposed service reservoir provides 500,000 gallons—enough for three days—if that were duplicated as suggested and provision were made for the storage of 1,000,000 gallons, that would be a week's supply? Yes; with an average of 30 gallons per head of the population of 3,000.

1165. In the dry seasons it has been customary with the Sydney Water Supply to place the people on half supply? I think they have recently had to go on short commons in some of the higher parts of the suburbs.

1166. But even before the water supply was taken over by the Metropolitan Water and Sewerage Board, was it not the custom in dry seasons to reduce the supply to one-half? Yes; I know that from my own experience.

1167. Then if that course were resorted to in this case you can have a fortnight's supply if you have 1,000,000 gallons stored? Yes; but the question is whether it would be necessary.

1168. You do not contemplate any necessity for anything like that? I do not.

1169. You believe that any breakage in the delivery pipe could be repaired within 24 hours? Yes.

1170. So that there would be ample time to make the repairs and continue the supply? Yes.

1171. Without any difficulty at all? Yes.

1172. How will the pipes be connected? Socketed in the usual way with lead joints.

1173. Then if there was a burst in one pipe the water could be shut off at the storage reservoir, and repairs could be made without any great loss of water or much delay? Temporary repairs could be done in two or three hours probably.

1174. You do not anticipate any inconvenience from that source? No.

1175. From your knowledge of the character of the locality in which you propose to erect your service reservoir do you favour any enlarged storage capacity there? I think it will be safer to have the 50,000,000 gallons.

1176. Would it be safer to have 1,000,000 gallons in the service reservoir? I think we have got an ample supply with half a million gallons there.

1177. You do not think it necessary to increase the capacity of the service reservoir? No.

1178. Although it would cost only £1,200? It is not much, certainly.

1179. But if the ratepayers of Tamworth are willing to pay the additional cost, would it not be an advantage to store another 500,000 gallons? I do not think it would be money well spent.

1180. Do you approve of provision being made at the storage reservoir for a larger supply? Yes.

1181. What would it cost? £2,160.

1182. You believe that that would be money well spent? Yes.

1183. It would give a larger supply in case of dry seasons? It would tide over such a season as the year 1888 and last year.

1184. Do you propose to provide for that £2,160 stronger walls? Yes; the whole of the extra expense is absorbed in that way.

1185. So that whilst you provide for increased storage you provide also for increased strength to resist the pressure of water and wind in your storage dam? Yes; to correspond with the extra depth of water in the dam. J. Davis, Esq.,  
M.I.C.E.
1186. What depth would you have to store 50,000,000 gallons? Thirty-six feet six inches. 24 Jan., 1896.
1187. *Mr. Lee.*] On this question of an increased service reservoir you hold very strong opinions. You think that the provision made by the Department will be sufficient? That is my opinion.
1188. I should like to direct your attention to the view taken of it by the Mayor of Tamworth. He was asked this question: "It will make a lot of difference to your storekeepers as to whether you have an ample supply of water for your streets or not?" His answer was: "Yes." I look at the matter in this way: that we should do better to obtain a full supply now, and have 100 years in which to pay off the money, than to have to increase the works at some future time and find the money ourselves. I cannot see what security we should have to offer at any future time for the money we require. The Government would have all our securities on account of the existing water supply. Three and a half years ago the then Mayor and Alderman Smith both said in their evidence that they would support a gravitation scheme up to £40,000, and that the town could pay for it. If we could do so then, I am sure we could do so now.—You see the financial position as put by the Mayor? Yes, and I appreciate it; but the Mayor leaves out of consideration one important factor, which is this: the Country Towns Water and Sewerage Act must be amended in the direction which I have already pointed out; that is to say, to give facility for extending these works. It is the most natural thing in the world to expect that these water supplies must be extended from time to time. The Council has no money, and as the Mayor points out they have no security to give for the money, so that it is almost incumbent on the Government to make provision for the extension of these works.
1189. Then, unless Parliament should pass an amending Act, it will be impossible for that or any other municipality to increase its works? That is so.
1190. Having that in view, do you not think, from an economical point of view and from an engineering point of view, that it will be better to make ample provision in the first instance? If this work could not be extended it would alter the case, but I regard it as a certainty that provision will be made for extending such work. You cannot carry out the whole reticulation for a borough like Tamworth at once. The reticulation must be extended as the town extends, and provision must be made for that work.
1191. As the reticulation area is increased, the supply in the service reservoir also must be increased? Yes.
1192. You view the present storage site as a permanent one for Tamworth? Yes.
1193. I presume that the Committee will be safe in assuming that if this scheme is carried out it will be the water supply for Tamworth for the next fifty years or more? Yes.
1194. I think you view Tamworth as a place which is likely to extend? Yes.
1195. Which at some future time is likely to require a larger supply than the service reservoir will at present provide? Yes; no doubt it will. But all that you can do is to make provision in a scheme of this kind for a reasonable expansion, and we regard the doubling of the present population as that.
1196. Your argument is that a service storage of 500,000 gallons will be ample to meet the requirements of Tamworth for many years to come? Yes, until the population reaches 10,000; and probably, as far as the service reservoir is concerned, beyond that.
1197. It would also follow that if there were an increased quantity stored, which could be supplied for various purposes, there would be a greater demand? Yes. The supply no doubt creates a demand to a certain extent.
1198. Take the present season. If they had an abundance of reticulation at Tamworth, do you not think the water would be very largely used for watering the streets and tempering the heat there? Yes; but in the 30 gallons per head all contingencies of that description are included.
1199. The Town of Tamworth is very scattered? At present it is.
1200. Consequently the mileage of streets would be very large? Yes; and therefore the reticulation will be expensive.
1201. Do you think that 500,000 gallons would be sufficient under conditions like the present? I do. We have had an abnormal time, but as far as the service reservoir is concerned it will be equal to present requirements.
1202. In an arid atmosphere like that would not the evaporation be great? Yes; but it would not be great at the service reservoir. That would have to be taken into consideration in connection with the storage reservoir. The evaporation is in proportion to the extent of the surface.
1203. *Mr. Wright.*] Would a daily supply of 30 gallons per head be about equal to what is used in large cities in other parts of the world? Yes; as far as Sydney itself is concerned the consumption is about 34 gallons a head.
1204. That embraces the sewerage and everything? Yes, I have a list of 13 European towns and they give an average of 27 gallons per head.
1205. Have you the returns of any towns where the conditions of climate are similar to those of Tamworth? I have tried to get some data from our country towns but it is difficult. You cannot get the number of the town population supplied, and they are careless in the estimation of the quantity of water used.
1206. Have you got any returns from towns in the southern part of Europe? In Paris the consumption is 30 gallons a day, in Madrid the supply is 16 gallons a day, Berlin 18 gallons a day. The highest in my list is Glasgow, manufacturing town, 40 gallons a day.
1207. Do you know the latitude of Madrid? I cannot say precisely.
1208. From all the information you can get you consider you have provided an ample water supply for Tamworth? I think the most reliable case we can refer to is that of Sydney and the suburbs, and there the consumption for the last two years has equalled about 34 gallons per head, including the use of water for everything.
1209. Including the watering of streets and flushing sewers? The whole of the water used.
1210. Have you any reliable data as to the consumption of water at Orange? No; it would be almost impossible to get it. They use all the water there direct from the storage reservoir, and I am not sure if they pass it through a meter.

- J. Davis, Esq.,  
M.I.C.E.  
24 Jan., 1896.
1211. Supposing they have a six months' drought without any fall of rain, and that is not an impossibility in Australia—it has happened—do you consider then that the provision you have made for Tamworth is ample? I am satisfied that the provision we have made, supposing we have a storage of 50,000,000 gallons, is ample.
1212. Notwithstanding that, there might be six months without rain? Yes.
1213. You are of opinion that even if they had to water the principal streets, and the system of sewerage were introduced in the populous parts of the town, that the proposed supply would be ample? Certainly.
1214. Do you think with 20 per cent. of the rainfall running into this larger dam, with a rainfall of 18·6 inches in a dry season, you would have a sufficient supply? Yes.
1215. Can you tell us what would be the pressure per inch upon the pipes from the storage reservoir to the service reservoir? The 700-feet head at the service reservoir would give a pressure equal to 284 lb. to the square inch.
1216. Do you consider that with that pressure, which is a very large one, you would be justified in using any other pipes than flange and bolted pipes? From actual experiment I know that the joints proposed to be used would stand as much pressure as the pipes.
1217. You think that leaded joints will be sufficient? It will be anchored into the sockets. The sockets will be shaped so as to anchor the lead.
1218. Mr. Black.] I asked you if the scheme would not be less expensive than any pumping scheme that might be proposed, and I asked for the cost as compared with other gravitation schemes; and I am going to ask you to make a comparison between the cost of the Tamworth scheme as compared with the rate-producing capacity of other towns? I hand in a table showing the cost per head of the population of the water supplies of ten country towns, six of which are gravitation schemes and four pumping schemes. But I wish to explain that, inasmuch as in those schemes the water used by the Railway Commissioners is included, the result is not of a reliable nature. (*Vide Appendix.*)
1219. Mr. Hoskins.] Are not the Railway Commissioners paying £1,900 a year for the Junee water? They were to do so, according to the recommendation of the Works Committee, but they have only undertaken to pay £1,500 a year. The matter has not been finally settled.
1220. Mr. Fegan.] I suppose you know there is no regular system of sewerage in Tamworth? Yes; no system whatever.
1221. And, necessarily, there will be a smaller quantity of water used there than there would be if they had a proper system of sewerage? Yes; less, for instance, than in Sydney.
1222. Therefore, they will need a less supply? Yes, until they carry out a proper system of sewerage; then, if they adopt the water-carriage system, they will require more water.

\* The Railway Commissioners are to contribute £1,500 per annum towards this supply.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

SECTIONAL COMMITTEE.

WATER SUPPLY FOR THE TOWN OF TAMWORTH.

REPORT.

THE Sectional Committee appointed on the 8th January, 1896, to inspect, take evidence, and report upon the proposed water supply for the town of Tamworth, have the honor to report to the Parliamentary Standing Committee on Public Works.

Your Committee left Sydney by train at 6.15 p.m. on Friday, January 10th, and arrived at Tamworth at 4 a.m. on the following morning. They opened their inquiry at the Court-house, Tamworth, at 11 a.m., examining the Mayor and an Alderman of the Borough, who afforded valuable information as to the suitability of the proposed scheme of water supply, and also in reference to the opinion of the ratepayers in regard to it. They thought the Departmental scheme by far the best of the several proposals which had been from time to time under the notice of the local authorities; and referring to the sentiment of the ratepayers, the Mayor doubted whether more than ten persons in the town would be found opposed to the proposed works, and these persons, he pointed out, would probably be found opposed to any scheme of water supply. The Departmental scheme should, the Mayor thought, be altered in only two directions—namely, by the enlargement of the service reservoir, to provide for a week's instead of three days' supply, to meet the contingency of a temporary interruption to the delivery from the storage reservoir; and by the addition, if practicable, of a second storage reservoir, at an elevation higher than the site of the reservoir now proposed by the Department, to meet future requirements. Both witnesses believed that the proposed supply would be adequate to the present requirements of the town, allowing for the use of a considerable quantity of water for manufacturing purposes, providing it could be supplied at a charge not exceeding 8d. or 9d. per 1,000 gallons. The power generated by the scheme could be readily utilised in the town for a variety of purposes. It was estimated that the revenue from the works, including a general rate of 1s. in the £, would be, approximately, £2,300. The population of the town was said to be steadily increasing, and the witnesses thought the municipal exchequer would defray, without any difficulty, the annual charge in respect of interest and principal. In the absence of information as to the details of Mr. Gipps's modified scheme, the witnesses preferred not to express an opinion upon it, but the Mayor doubted whether the scheme could be carried out at the estimated cost of £35,000.

On Monday, January 13th, the Committee inspected the pipe-line, service and storage reservoirs, and catchment area of the proposed water supply, and on the following day they examined the main features of the modified scheme designed by Mr. Gipps for a supply of water from the Cockburn River.

On Wednesday, January 15th, the Committee again took evidence at the Court-house, Tamworth. Valuable information was elicited from Mr. Poate, the District Surveyor, as to the holding of the land within the catchment area. He recommended that the Crown land within the area, as shown upon the tracing submitted by him, should be at once resumed, and that such power as the Government had, upon the conversion of the conditional lease land into conditional purchase land, should

should be exercised in order to provide for any probable extension of the storage reservoir. He believed that 4 inches, or less than one-fourth of the year's rainfall, would enter the reservoir, and that quantity would fill it thirty times over. The site of the storage reservoir was wisely chosen; but he believed it should be sufficiently enlarged to admit of the storage of not less than 50,000,000 gallons. In his opinion the Cockburn River scheme was defective in that the supply would not reach the higher lands of Tamworth. Alderman Lambert confessed that he had at one time entertained doubts as to the adequacy of the proposed Moore Creek scheme, but these had been dissipated by the information afforded by the District Surveyor, and by the assurance that the capacity of the impounding dam could be materially increased without any considerable addition to the cost of construction.

The Mayor was further examined, and stated that after full consideration he was of opinion that the capacity of the storage reservoir should be increased to 50,000,000 gallons. The estimated revenue from the present reticulated area would be ample to meet the additional charge in respect of this work and the suggested enlargement of the service reservoir.

There can, the Committee think, be no doubt as to the need for a scheme of water supply for Tamworth. The present population of the town is 5,100, and there is every indication of a steady increase. At the present time the town is mainly supplied from tanks and wells, which are readily exhausted. The supply is then obtained from the river drift by means of a pump, the cost being approximately 1s. per 120 gallons. There is no adequate supply of water for municipal purposes. The want of an adequate supply is fully recognised by the ratepayers. The Committee are satisfied that a vast majority of them are prepared to accept the responsibility involved in the provision of a suitable supply.

The evidence given by the Municipal authorities confirmed that already tendered to the main Committee in regard to the ability of the town to defray the annual charge upon the works.

The inspection of the Moore Creek scheme disclosed the following:—

*Catchment Area.*—The catchment area lies in abrupt granite country. The water falling within it will rapidly find its way to its drainage centre, Moore Creek. The granite lies generally close to the surface; a large proportion of it is exposed; and the abruptness of the country renders it improbable that there will be any unusual loss, such as might be expected upon a flatter surface or on more porous soil. At the time of the Committee's inspection there was a fair stream of water of excellent quality flowing in the bed of the creek, and it was apparent from the drift-wood and debris deposited at a considerable height above the centre of the bed that an enormous body of water would pass down at a period of heavy rain. The Committee instructed the Principal Assistant Engineer of Country Towns Water Supply and Sewerage, who accompanied them upon their tour of inspection, to furnish a cross-section showing what would be the probable quantity of water passing down at a given point a short distance above the storage reservoir. The Committee are satisfied that the catchment area is sufficient to provide the water likely to be required for the present and immediate future requirements of Tamworth. The soil of the watershed being generally unfitted for cultivation will be devoted entirely to pastoral pursuits. The nature of the country will prohibit any heavy stocking operations; and there is, therefore, no probability of any pollution of the water from such a source. It is, however, shown by a plan furnished by the District Surveyor that a large proportion of the land within the catchment area has been alienated.

*Storage Reservoir.*—The site of the storage reservoir appears to have been wisely chosen. Great care, however, should be exercised by the Department to ensure that on the southern side the dam finds its resting place upon the solid rock and not upon boulders, which might possibly be mistaken for it at this point. At a distance of about a mile above this site is another excellent site where, if the storage proposed in connection with the present scheme were found insufficient, an equal supply could readily be impounded, which could be delivered without an additional pipe-line from the upper to the lower reservoir.

*Pipe-line*

*Pipe-line.*—The pipe-line appears to be properly situated.

*Service Reservoir.*—The service reservoir is situated about one mile and a half from the business centre of Tamworth. It is on an elevation 300 feet above the lowest part of Peel-street, and 250 feet above the railway station. The formation may be described as decomposed trap known locally as ridge gravel. The Committee do not desire to dwell upon the question of the elevation being sufficient to command the town; it is enough to say that the information given to the Main Committee upon this point is correct.

*Resumption of land.*—The Committee are of opinion that an area of 50 acres of land should be resumed at the site of the proposed storage reservoir. The fencing of this area will be sufficient to prevent local pollution. The land is third-class grazing country, its extreme value being £1 per acre.

In regard to Mr. Gipps's scheme, it may be said that the catchment area of, and therefore the flow of water in the Cockburn River is larger than that of Moore Creek but its utilisation for the supply of Tamworth is impracticable for various reasons. The surface level of the storage reservoir proposed by Mr. Gipps is but 177 feet above the railway station. Therefore the bottom of his dam will be but 147 feet above that place which must be reduced again by 24 feet of loss of level between the storage and service reservoirs, bringing the surface level of the latter reservoir to 123 feet above and the bottom of it about 105 feet above the railway station. But, without entering minutely into the merits of the scheme, and accepting Mr. Gipps's levels as correct, it is apparent that it must fall very far short indeed of supplying the reasonably accessible higher land within the municipality, and that if it were adopted a pumping service would eventually have to be incorporated with it. The greater distance over which the water would have to be conveyed would necessarily largely enhance the cost of the scheme, and the distance of the service reservoir from the business centre of Tamworth, 5 miles, constitutes a further, although minor, objection to the work in comparison with the Departmental proposal.

The Committee are of opinion—

- (1.) That a water supply should be provided for the town of Tamworth from Moore Creek.
- (2.) That the quantity of water stored for the use of the town should be not less than 50,000,000 gallons.
- (3.) That the present Crown lands within the catchment area of the proposed supply should be at once reserved, and that the Department of Lands, in measuring lands at present held under conditional lease, should exercise their power under the law to excise those portions required for the present or probable future storage.
- (4.) That the first impounding dam should be constructed in view of the contingency of the construction of a second dam at some future period, and that in connection with the dam at present proposed ample provision should be made to obviate any reduction of its capacity by the accumulation of sand.
- (5.) That an area of not less than 50 acres be resumed at the site of the proposed storage reservoir.

16th January, 1896.

THOS. EWING,  
Chairman.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

WATER SUPPLY FOR THE TOWN OF TAMWORTH.

[TAKEN BEFORE THE SECTIONAL COMMITTEE.]

SATURDAY, 11 JANUARY, 1896.

[The Sectional Committee met at the Court-house, Tamworth, at 11 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. JOHN DAVIES, C.M.G.  
CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.  
FRANCIS AUGUSTUS WRIGHT, Esq.

The Sectional Committee proceeded to consider the proposed Water Supply for the Town of Tamworth.

Charles Jeffries Britten, Esq., Mayor of Tamworth, sworn, and examined:—

1. *Chairman.*] You are the Mayor of Tamworth? Yes.
2. How long have you occupied the position of Mayor? Two years.
3. You are aware of the scheme proposed by the Public Works Department for the supply of Tamworth with water? Yes.
4. Do you approve of the scheme? Yes.
5. Speaking in your representative capacity, do you believe that the people of Tamworth approve of the scheme? Yes.
6. *Mr. Lee.*] Some few years ago a proposal was brought forward for the supply of Tamworth with water by means of a pumping scheme? Yes.
7. I believe that did not altogether meet with the approval of the townspeople? The proposal was not favourably received by a majority of them.
8. You understand that the present proposal is to supply the town with water by means of a gravitation scheme, the water being taken from Moore Creek? Yes.
9. I suppose you know that locality? Yes.
10. You have examined the plans, and you are aware of the situation of the storage reservoir? Yes.
11. You know its height above the town? Yes.
12. With reference to the site itself, from your local knowledge, do you think sufficient water can be stored there? Yes, ample.
13. To supply the present population? Yes.
14. And in the event of a large increase of population, you think the supply will be sufficient for the next twenty years? Yes; and by putting in a dam a mile or a mile and a half higher up the creek than the site of the dam now proposed by the Department twice the proposed storage capacity could be obtained.
15. Have you seen Moore Creek in a state of flood? Yes.
16. And, I suppose, there are times when there is very little water in it? At times; but I myself have never seen it dry.
17. Has the Council considered the question of filtering the water before it is supplied to the reticulation pipes? No, we have not. As far as I am personally concerned, I think the water is perfectly pure.
18. You think there is no need to provide a filter-bed? I do not think there is.
19. Would not the water coming down the creek in flood time be very thick? No; it is never very thick; it passes over what you might call granitic sand, and even at a time of heavy flood the water is rarely discoloured.
20. The Committee may take it for granted that the Council have considered that point? Yes; we have never thought it necessary to consider the question of filtration.
21. The Council have raised no objection to the proposed scheme on that score? No.
22. Do you think the service reservoir is in a proper position for the reticulation of the town? Yes; I do not think a better spot could be chosen.
23. The townspeople are quite satisfied with it? Yes; I have heard no complaint in regard to it.
24. Do you know the Cockburn River and its watershed? Yes.
25. You are aware that the proposal has been made by Mr. Gipps to obtain a supply of water from that source? Yes.
26. I believe Mr. Gipps was at one time employed by the Council? Yes.
27. When was that? About five years ago.
28. Had Mr. Gipps any authority from the Municipal Council to appear before the Public Works Committee recently? No.
29. And any evidence which he may have submitted to the Committee must be taken to have been given entirely at his own instance? Yes.

C. J. Britten,  
Esq.  
11 Jan., 1896.

C. J. Britten,  
Esq.  
11 Jan., 1896.

30. What is your opinion of the Cockburn River scheme? I was always in favour of the Cockburn River scheme until the Moore Creek scheme was pointed out to me as being far more advantageous than the pumping scheme proposed some time ago. I think the Moore Creek scheme will be of immense advantage to the town, and that it is also preferable on the score of cheapness. Had we adopted the Cockburn River scheme it would have been necessary to use filter-beds, but in the case of the Moore Creek scheme I do not think that is necessary.

31. Why do you think it would be necessary to have filter-beds in the case of the Cockburn River scheme? If it comes down in flood the water is very muddy. The nature of the soil at the head of it is a great objection to it.

32. Are you aware of the difference in the fall comparing the Cockburn River scheme with the Moore Creek scheme? Yes.

33. You are aware of the site selected by Mr. Gipps for the service reservoir? Yes.

34. Would it be a convenient site for the purpose? It would be a convenient site for his scheme; it is the only site he could get, I think.

35. Would you get the same fall for purposes of reticulation? No; we get a greater fall from the Moore Creek scheme.

36. Comparing the two sites for a storage reservoir, you are strongly of opinion that the one proposed in connection with the Moore Creek scheme is the best? Yes; it has a greater head by 150 feet, and will reticulate the whole town.

37. The extra head of water is a great consideration in a town like this, particularly in connection with insurance? Yes.

38. Do you know how far the diggings on the Cockburn River would be above the proposed dam site? About 15 miles or more.

39. Is there any mining upon Moore Creek? No; nowhere near the catchment area at all events.

40. Is it known to be mineral country? I do not think there is any mineral there at all.

41. You think there is no probability of a discovery of minerals there in the future, and of the consequent aggregation there of a number of persons? No; I do not think there is any danger of that.

42. You know of no likely source of pollution so far as the Moore Creek scheme is concerned? I do not know of any.

43. You are bearing in mind that the scheme would be one for all time? I know that.

44. Being satisfied with the position of the proposed works, and the supply to be afforded by them, are you prepared to offer to the Committee any suggestions for improvement? As far as I am concerned, I would rather see a larger dam than they are giving us, that is the only thing.

45. Do you know the quantity of water proposed to be impounded by the dam? 35,000,000 gallons.

46. Why would you prefer a larger dam? Well, the greater the supply of water we get the better for us.

47. The Department propose to store 250 days' supply, would not that be ample? I think we should have plenty of water so that it may be used for electric lighting and things of that kind.

48. You know that the Department have substituted a 7-inch for a 6-inch pipe? Yes.

49. You propose to take your electric power from the storage reservoir? Yes.

50. Considering the ordinary rainfall of the district, and seeing that you would have a supply for 250 days, even if there were no rain, do you not think you would have a sufficient margin for electric purposes? We might; but if there is plenty of water we can always find a way to use it—of course, the more water there is the more cheaply we should be able to sell it to the townspeople. I myself would put in a little Pelton wheel, which would do a great many things at my brewery. Water-power is the cheapest power you can have, and its use would bring in a revenue which would pay for any extra cost which might be incurred in providing the greater supply.

51. How would you increase the storage capacity—by raising the dam now proposed, or by putting in a second one? I leave that to the engineers. One great recommendation of the Departmental proposal is that it would give us an ample supply for immediate requirements, while a second dam could be put up at any future time without interfering with the supply of the town.

52. Would the supply be sufficient in the future in the event of a sewerage system being established here? As far as I understand the matter if we had a sewage farm we should want more water. It would be necessary then to have a second dam. The two dams together would give us an ample supply for almost any purpose for many years to come.

53. The second dam could be put in at any future time? Yes.

54. Whether the works now proposed are enlarged or not there would be an ample supply for all purposes for the next fifteen or twenty years? Yes.

55. You know the quantity of water which is proposed to be stored in the service reservoir? Yes; 500,000 gallons.

56. About how many days' supply would that be? About three or four days, I should say. So far as I am concerned, I should prefer to see a service reservoir containing a week's supply. In the event of a pipe breaking, or anything of that kind occurring, we might have to depend upon the service reservoir only.

57. You think three days storage hardly sufficient? It is not sufficient, I think. In certain circumstances, we should have to cut the ratepayers down to a short allowance as was done at one time in Sydney.

58. You know the increased cost of construction means increased interest, and it is a question as to whether your ratable property can supply it? I think there is no doubt at all as to our being able to stand it.

59. You understand that any increased supply afforded after the works now proposed have been carried out will have to be afforded at the cost of the municipality? I understand that.

60. In the event of there being a large increase in population in the future, and larger service-pipes being required, the municipality would have to bear the cost of it? Yes.

61. You seem to be pretty well in touch with this scheme, and your opinion, I suppose, may be taken to be fairly representative of that of the ratepayers? I have never heard anyone object to it; in fact, I do not believe you would find more than ten persons in the whole municipality opposed to it. I am quite safe in saying that a very large majority of the people of Tamworth are in favour of the scheme.

62. Is there any weak spot in the proposal upon which you would like to comment? No; I have carefully considered the scheme, and I have been over the locality on several occasions. I have talked the matter over with the Engineer of the Department, and I am perfectly satisfied with the proposal.

63. You think there can be no doubt as to the efficacy of the scheme even if carried out as now proposed? There is no doubt but that it would be a good scheme. C. J. Britten,  
Esq.
64. I suppose your Council have assisted the Department in framing its estimate of revenue? Yes. 11 Jan., 1896.
65. You are aware of the area proposed to be reticulated? Yes.
66. And of the cost? Yes. If the Government had allowed us to get our own pipes we could have saved £2,000 or £3,000.
67. Are not some of the pipes already stored here? All the pipes are stored here.
68. Are they steel pipes? No; cast-iron—all sizes.
69. Are any of the 7-inch steel pipes here? Some of the pipes which were intended for the pumping scheme are here. I believe they are 9-inch pipes.
70. How would you have saved the £2,000 or £3,000 to which you refer? We could have had them landed in New South Wales from England more cheaply than they could have been supplied in Sydney. We should have saved nearly £1,000 in railway carriage alone.
71. But you say the pipes are here now? I am sorry to say they are.
72. And you will have to bear the increased cost? I suppose so. It is a swindle all the same.
73. You think they could now be obtained for less money? At the time they were delivered here they could have been bought a great deal cheaper.
74. *Mr. Wright.*] I suppose the Municipal Council has gone into the question of cost? Yes.
75. You know that the estimated cost of the proposed works is about £36,000? Yes.
76. Have you estimated the revenue likely to be derived? Yes; very carefully.
77. And you feel satisfied that the Council can bear the burden of the work? Yes.
78. You do not think the Council will presently come to the Government and say that they cannot make their annual payment, and ask to be relieved of it? I am sure they will not.
79. You know that in other districts of the Colony the municipal councils who have had these works constructed have after the lapse of a year or two asked to be relieved of the annual charge? Yes; I know that.
80. What is your estimate of revenue from the proposed works? Within the reticulation area there will be a general rate of 1s. in the £, giving £1,490. The public buildings, such as the Lands Office, Public School, Police Barracks, and the Court-house, we put down at £240, a very low sum. Then the water which would be supplied to breweries, mills, and factories we estimate at £215. We have put down 5s. a head for horses and cattle, and I estimate that if we use the water for motive power it will save us from £150 to £200, which we now have to pay for the lighting of the streets. There will be a total of about £2,300.
81. Your general rate is 1s. in the £? Yes.
82. Have you any special lighting rate? Yes; 5d.
83. Are there any other rates? There is a watering rate for a part of Peel-street; it is borne only by the storekeepers in the street, and it is 3½d. in the £.
84. You propose an additional rate of 1s. in connection with this supply? Yes.
85. Do you not think that people will complain when they have to pay a rate of 2s. 5d. in the £? I do not think they will. There are plenty of persons in Tamworth paying the present rates who have to buy water at the rate of 1s. for 120 gallons.
86. Then you do not think those persons will object to pay the additional rate of 1s.? No; if you took a vote in the borough to-morrow it would be found in favour of the water supply.
87. Do you think there is any likelihood of your selling water for irrigation purposes along the pipe-line? It might possibly be done; in fact, the pipe-line would come through districts where the selectors have to cart water from here to their farms.
88. The selectors might buy the water for domestic use, but would it pay them to buy it for irrigation purposes? I do not think we would have enough to give them any for irrigation purposes.
89. You do not think there would be sufficient water for that? No.
90. Are there any orchards along the pipe-line? There are a few which have just started, but they are not of any size.
91. Do you think this scheme is likely to encourage the growth of fruit in the district? I think so. Some special areas have lately been occupied in 40 and 60 acre blocks—it is very good land.
92. You said in answer to Mr. Lee you would prefer a larger impounding dam, and a larger service reservoir,—would not that entail a considerable additional cost? I do not think it would be very costly.
93. You are sure the Municipality would be able to bear the additional expense? I think it would.
94. And you would recommend a larger impounding dam and service reservoir? Yes.
95. Of course, that would mean the raising of further revenue to meet the expenditure? Yes; we have revenue at the present time far above what is necessary to pay the annual charge, and you must allow for the increase of the town.
96. But supposing the cost were very much increased? We do not want to increase the cost very much.
97. You think the proposed service reservoir should be at least doubled in size? Yes.
98. And I understand you to be perfectly satisfied with the scheme as far as its financial aspect is concerned? Yes.
99. An officer of the Public Works Department was asked by the Committee in Sydney whether the Department had any official evidence of the Council's acquiescence in the scheme;—have you written to them informing them that the Council approved of the scheme? We have not yet done so.
100. Do you not think it would be wise to do so? Yes; I will have the matter laid before the Council, and I will have the Department notified that we approve of the scheme, and are prepared to incur the liability attaching to it.
101. *Mr. Fegan.*] You are thoroughly acquainted with the scheme proposed by Mr. Gipps? Yes.
102. I refer to his modified scheme? Yes; I have seen plans of it.
103. Have you seen those plans for the first time to day? I am also acquainted with the scheme, to some extent, from what I have seen in the newspapers.
104. Mr. Gipps has not been employed by the Council since the rejection of his first proposal? He has written to the Council pointing out that his scheme was the best put forward, but he has not since been employed by us.
105. What has the Council done with the proposals Mr. Gipps has since made? We have received them, that is all.

- C. J. Britten, Esq.  
11 Jan., 1896.
106. You have not recognised his amended proposal officially? No.
107. You are aware that Mr. Gipps proposes in his modified scheme, instead of having an open conduit, to have a pipe-line following the line of railway? Yes.
108. That would be cheaper as far as the laying of the pipes is concerned? Yes.
109. Do you know that he proposes a storage reservoir holding 160,000,000 gallons? Yes.
110. And a service reservoir holding over a million gallons? Yes.
111. That would be a good water supply, would it not? Yes.
112. But you do not think it would efficiently serve the town? I do not think it could be done for the money—I think we should want stronger pipes to begin with.
113. You think stronger pipes would be required? Yes; you would require to have a good deal larger pipe to bring the water in, and the larger the pipe the greater the cost.
114. Do you think that under Mr. Gipps' modified proposals there are any portions of the town which could not be supplied with water? I think there are some parts of the town which could not be supplied.
115. Have you any guarantee that the higher portions of the town to which you refer would be supplied? None whatever. It seems to me that if you adopted Mr. Gipps' scheme you would require to have a pumping scheme to pump the water from one reservoir to another.
116. You would therefore require to have practically two schemes? Yes.
117. You are aware that with other towns in the Colony where water supply works have been carried out there has been a complaint in connection with the excessive annual charge? Yes.
118. Is it not the fact that in some instances the estimated cost has been actually doubled? I believe it has.
119. You think that in those cases the persons concerned have a right to complain? I think they have.
120. Especially when you consider that they have had no voice in the expenditure, and that they have not participated in the supervision of the work? Yes.
121. Speaking in your representative capacity, you think a rate of 1s. in the £ would not be too much in connection with this water supply? I am certain that the townspeople on the whole would be quite content to pay a rate of 1s. in the £ in consideration of the advantages of a water supply.
122. How many gallons do they obtain at the present time for a shilling? From 100 to 120.
123. And they do not grumble at paying the shilling? They cannot help paying it.
124. Even with the proposed rate of 1s. in the £ the people would be obtaining their supply of water much more cheaply than they are obtaining it at the present time? Yes.
125. You think the capacity of the proposed service reservoir should be doubled? Yes.
126. What do you suppose would be the additional cost? About £1,000, I think.
127. You think the townspeople would be satisfied if the capacity of the service reservoir could be doubled at that cost? Yes; I think it would be a very good business outlay.
128. You are also of opinion that there should be a larger impounding dam? Yes.
129. You have been to the catchment area? Yes.
130. You never heard anything about it when the other schemes were under consideration? Never.
131. How long have you been a resident of the town? About twenty-five years.
132. And during that period you have never been impressed with the possibility of obtaining a supply from this source? I was over the ground many years ago.
133. Is it not rather surprising that when the other scheme was before you this particular locality was not thoroughly explored? I believe this was the very place to which Mr. Alderman Smith first took Mr. Gipps. In those days Mr. Gipps thought it impossible to bring the water in from this source for the money we were prepared to pay.
134. This place has been spoken of before, then, as a good site for a storage reservoir? Yes; it has been known, but it has never been considered in connection with the other schemes.
135. Is it not singular that it should not have been reported upon? I perhaps ought to explain that when Mr. Gipps first made the survey the Council bound him down to an expenditure of £20,000.
136. And I suppose that being bound down to that figure he thought it would be impossible to bring the water from this spot? I suppose so.
137. No provision has been made for irrigation in connection with the Moore Creek scheme? No.
138. But Mr. Gipps' scheme does make provision for it? Yes.
139. Do you think there would be much irrigation under Mr. Gipps' scheme? For my own part, I do not think the scheme could be carried out for the money.
140. But you think the scheme is practicable so far as irrigation is concerned? It could be done, but I do not think you would find persons energetic enough to go in for irrigation to an extent which would make that part of the scheme pay.
141. You know that the cost of Mr. Gipps' modified scheme is about £35,000? Yes.
142. And you think the scheme could not as readily be carried out for that money as could the Moore Creek scheme? I feel confident it could not be.
143. Would you get as good and pure a supply of water from the Cockburn River? You would have a pure supply, but I do not think it would be as pure as the supply from Moore Creek. I do not think you could get a purer supply of water anywhere than could be obtained from Moore Creek.
144. You propose to utilise the Moore Creek scheme for electric power? Yes.
145. Could that power be obtained without waste of water? Yes.
146. The supply of electric power would involve no danger to the ordinary water supply? Not in the least.
147. *Mr. Davies.*] I believe that the resolution originally passed by the Council, and upon which Mr. Gipps acted, limited him to an expenditure of £20,000? Yes.
148. Mr. Gipps sought to obtain a supply for the town from Moore Creek as well as from the Cockburn River? No; I think he only went into the Cockburn River scheme.
149. Did your Council favour the proposal which emanated from Mr. Gipps? Yes.
150. You are not now in favour of the modified proposal which he has put forward? No.
151. Assuming Mr. Gipps proposed to deliver from a service reservoir 1,000,000 gallons daily, as against a proposal to deliver 300,000 gallons daily, which scheme do you think would serve the district best? If the work could be carried out at the same price by all means give us the one million gallons.
152. With reference to the municipalities in which the estimated cost of the water supply has been doubled, I suppose that if the works now proposed cost £60,000 instead of £35,000 you would consider yourselves responsible for the expenditure of only the £35,000? Of course.
- 153.

C. J. Britten,  
Esq.

11 Jan., 1896.

153. No municipal council would make itself responsible for an expenditure greater than that to which it had agreed by resolution? Well, Mr. Lyne, when Minister for Works, told us that the Government would not bind themselves to any specific sum.
154. You consider that in approving of this scheme you bind the ratepayers to an expenditure of only £35,000? Yes.
155. Is it intended to call a meeting of the Council to deal with the amended reticulation plans submitted by the Department? I do not think it is necessary to call a special meeting. Our next meeting is on Tuesday, and I will then give notice for the consideration of the question on Tuesday week.
156. Did not the Council pass a resolution approving of the pumping scheme previously submitted by the Department? I do not remember it.
157. Individually, you were strongly opposed to the scheme? Yes.
158. Where do you now get your supply for the town? It is chiefly stored in tanks; of course, we use the old well.
159. Is there any quantity of water in it? Not any quantity, but there is plenty for present use.
160. Have you the same amount of sickness in the district that you had at the time of the visit of the Sectional Committee to inquire into the former scheme? There is not much sickness in Tamworth at the present time.
161. The public health officer said there was at one time a large amount of typhoid;—is there any at the present time? A little.
162. Do you attribute it to the impure water? I do, to a great extent.
163. You were strongly opposed to the pumping scheme? Yes.
164. On more than one ground? Yes.
165. I suppose there is no one in the district who knows the watersheds better than you do? I daresay there are some who know them better, but I know them pretty well.
166. You have been over the catchment area of the Departmental scheme as well as over the catchment area of the scheme put forward by Mr. Gipps? Yes.
167. And which of the two schemes do you favour now? I favour the Moore Creek scheme now.
168. Supposing Mr. Gipps proposed a storage reservoir at a higher level than his original proposal, would you still hold to the opinion that the Moore Creek scheme was the best? If Mr. Gipps can give us a million gallons a day for the same price at which the Government are offering to give us 300,000 then let us most decidedly have a million gallons.
169. You know that in connection with the pumping scheme there would be a considerable annual expenditure? £600 a year.
170. And even then it would not serve the whole town? Yes, I think so, because the position of the reservoir was changed.
171. After the inquiry by the Committee? Yes.
172. To what site was the reservoir changed? It was changed further up the mountain.
173. The capacity of the reservoir was 500,000 gallons? Yes.
174. The same as that proposed in this case? Yes.
175. You have some misgiving as to 500,000 gallons in the service reservoir being sufficient in view of a possible accident to the pipe service? Yes; or in the case of a big fire. I believe in having as large a supply as possible on hand.
176. What do you propose to charge per 1,000 gallons to those who use water by meter? That will have to be decided by the Council. If they give the water cheaply I suppose I myself would be paying them £50 a year. I can get the water for 8d. or 9d. per 1,000 gallons, and unless the Council sell it to me at that price I shall stick to my old plan. If I find I can pump water cheaper than the price at which the Council agree to sell it I shall certainly pump.
177. What does it cost you to pump your present supply? I do not know exactly.
178. Would it be much less than 8d. per 1,000 gallons? It might be 8d. or 9d. per 1,000 gallons.
179. What sort of a pump do you use? A Tangve.
180. Have you to raise your water a good height? Not very high.
181. It would not pay persons following the pursuits of agriculture to pay 8d. a 1,000 gallons for irrigation purposes? No; they could not give anything like that.
182. So that the revenue derived from the scheme in that direction would not be very considerable? We do not estimate any revenue from irrigation, except from the owners of private gardens.
183. What would be a fair price per 1,000 gallons for irrigation purposes? I could not say.
184. *Chairman.*] You said it cost you, perhaps, 8d. or 9d. per 1,000 gallons of water;—in making that estimate do you take into consideration the cost of your well and your pipe? It is down there already. I am reckoning only the working expenses and wear and tear.
185. *Mr. Davies.*] Would you be prepared to take water at 8d. per 1,000 gallons for manufacturing purposes? Yes.
186. You know the Departmental scheme curtails your reticulation to the extent of 3 miles? Yes.
187. And with that curtailment do you expect to obtain the same amount of revenue as from the reticulation formerly proposed? We went through the books, house by house, taking them at the general rate, and the amount came to £1,490.
188. What was the estimate under the proposed pumping scheme? I cannot say from memory, but I believe £1,450.
189. How do you come to estimate more revenue now than under the former scheme when you had 3 more miles of reticulation? More houses have been built within the area proposed to be reticulated.
190. You know that wherever the pipe service passes in front of a property that property is liable to be taxed? Yes; we should get more revenue, of course, from the occupied than from the unoccupied land. There are 900 buildings and public offices in the reticulated area. I may mention that we did not go into matters so carefully on the former occasion as we have done this time.
191. From inquiries made by your officer do you think the estimated revenue would be realised? Yes.
192. You think the revenue is likely to increase? Yes.
193. *Chairman.*] You estimate the amount in connection with the electric lighting power at £150 a year? Yes.
194. Upon what horse-power do you make that estimate? We are using about 40 horse-power now; that is only for the lighting of the streets.

- C. J. Britten, Esq.  
11 Jan., 1896.
195. And for that 40 horse-power you offer £150 a year? Yes.
196. Supposing the Government scheme gave you 100 horse-power, would it not be possible to make the extra 60 horse-power recoup the cost of the supply? I hope so. It is one of my expectations from the scheme. If we did not utilise the extra power we should be very bad business men indeed. There would be a great waste.
197. You believe you could dispose of the other 60 horse-power? Yes.
198. Under the Government scheme you would have to pay 1½d. per 100 gallons, or 1s. 4d. per 1,000 for your water supply;—at the present time you say you are paying 1s. for 120 gallons? Yes, about that.
199. That being so, you think the people will be quite prepared to pay 1½d. per 100 gallons? Yes.
200. They would be very glad to get the water at that price? Yes.
201. You have already informed members of the Committee that your first objection to Mr. Gipps' scheme is that the elevation does not seem to be sufficient? Yes.
202. Another ground is that you regard the catchment area as likely to be polluted by the diggings higher up? Yes.
203. Mr. Gipps' scheme requires a greater length of piping? Yes, it would require larger pipes.
204. And you think the cost would be altogether greater than the Government scheme? Yes; it must cost a great deal more to put down 16-inch than to put 7-inch pipes. The piping would also have to be taken a greater distance. Then, again, it would cost a great deal more to throw a dam across the Cockburn River than across Moore Creek.
205. In general terms, you believe Mr. Gipps' scheme is a more expensive one than he has estimated? Yes; if the estimates for the Moore Creek supply are correct, I should say that the cost of Mr. Gipps' scheme must have been under-estimated.
206. Mr. Davies.] Should the Council approve of the Departmental scheme you will forward their resolution to the Secretary for Public Works? Yes.
207. Did the Secretary for Public Works say he would accept no limitation in the matter of cost? Yes. When the Borough Council resolved that £20,000 should be expended upon a water supply, Mr. Lyne distinctly told a deputation which waited upon him—and I was one of them—that the Government would not bind itself to any cost at all.
208. Do you not think it fair that in submitting the resolution in favour of the Departmental scheme at the next Council meeting you should limit the cost? We will certainly do that.
209. There have been cases where the estimated cost has been doubled? Yes.
210. And in view of those cases you think you are justified in limiting your responsibility for the expenditure to the amount now estimated? Yes; if the Department cannot carry out the work for the amount estimated, it will be their lookout.
211. Have you ever taken into consideration the probable expenditure for renewals and repairs? Yes.
212. And you think the anticipated revenue will meet all fair charges in that respect? Yes. We estimate a surplus after paying the Government what is due to them of something like £600 a year.
213. Mr. Lee.] You also estimate that there will be an increase in the number of houses, and that the revenue will be enhanced from that source? Yes. Tamworth is not standing still; it is increasing fast, and we expect that it will continue to increase.
214. Is your estimate of revenue based on calculations within the reticulation area proposed under this scheme? The estimate I gave you is an estimate in respect of every house within the reticulation boundary proposed by this scheme.
215. The proposed reticulation area does not embrace the whole of the Municipality? No.
216. It leaves plenty of room for extension in the future? Yes; Tamworth is a very scattered town.
217. Mr. Fegan.] How many times have you made application to the Government for a water supply? We have been talking about a scheme of water supply for the last eighteen years.
218. I believe that some time since you lost a valuable block of property through having no water supply? We might have lost it if we had had the best water supply in the world.
219. You think there has been no material loss resulting from your being without a good water supply? There have been a number of small fires in Tamworth which might have been saved if we had had a good water supply.
220. And even from that point of view you think it is necessary that this scheme should be carried out? Yes.

Mr. William Joseph Smith, alderman, Tamworth, sworn, and examined a—

- Mr. W. J. Smith.  
11 Jan., 1896.
221. Mr. Davies.] You are a tanner and an alderman of the Borough of Tamworth? Yes.
222. You were a strong advocate for a pumping scheme when a Sectional Committee last visited your town? Yes, I was opposed to the scheme proposed by Mr. Gipps.
223. You were most enthusiastic in your advocacy of a pumping scheme? Yes; I always advocated it.
224. You had some doubt as to whether Mr. Gipps would be able to carry out a gravitation scheme for the sum of £17,000? Yes; that was one of my reasons.
225. There was a strong division of opinion as to the quality and quantity of the water then proposed to be supplied by the Departmental scheme? Yes.
226. You know that very little examination has been made by the Department of the site of the pump in the shingle of the Peel River? The examination was not made then, it was made afterwards.
227. An officer of the Department put down a trial shaft beside a Chinese garden? Yes.
228. You were not afraid of the pollution of the water, nor were you afraid that it would give out? No.
229. Are you aware that several pumping schemes have been carried out by the Government in different municipalities of a character similar to that which was proposed here—that is, drawing water from the shingle—and that they have given out? I have read that that is so.
230. Cootamundra, for instance, is almost in a state of water famine? I believe so. The circumstances are not quite the same; their river is not like ours.
231. You think your river is more permanent, and that it is likely to give a larger supply? There is a larger deposit of gravel.
232. There was no test by the Department; there was only a shaft of a few feet put down by one of the Council officers? Yes, only 11 feet.
233. Did your Council feel rather indignant with the Department for abandoning the scheme which was so heartily supported by yourself and others? No. We thought the proposal now made was a great improvement upon it.
- 234.

234. You are aware that I myself and another member of the Committee were the only two members who opposed the scheme? Yes.
235. If you now get a good supply by gravitation from Moore Creek you will not regret the delay consequent upon the abandonment of the proposed pumping scheme? Not at all; I think it is a very fortunate thing.
236. Do you think that if the scheme were carried out as proposed by the Department the Council would be able to supply water at a rate cheaper than that at which they could have supplied it under a pumping scheme? I believe we should be able to give the ratepayers a great deal more water.
237. Would you not be able to supply the town more cheaply? I believe the two proposals would involve much the same annual cost.
238. If the scheme now proposed will give an abundant supply, and you find that you have a surplus, it will enable you and your brother aldermen to strike a rate of 9d. or 10d. in the £;—so long as the rate will cover the capital cost and provide for interest and renewals, I presume the Council will be satisfied? Yes.
239. You heard the estimate given by the Mayor of the probable revenue;—do you think those figures will be realised? Yes.
240. If for the purposes of the industry in which you are engaged you could obtain water from the Council at 8d. or 9d. a 1,000 gallons you would become a consumer? I should be very glad to get it; I have been wanting it for a long time.
241. You have not at present a sufficiently good supply of water for the purposes of your industry? No.
242. And you think you would become a consumer if the water were brought from Moore Creek? Yes.
243. Have you in your estimate of revenue taken into account the number of industries which would avail themselves of a permanent supply of water of good quality at a cheap rate? I believe so.
244. During the time you were Mayor was not a resolution passed by the Council approving of the pumping scheme? I think no resolution was passed after the formal resolution asking the Government to carry out a scheme of water supply at a cost not to exceed £20,000.
245. Was there not a subsequent resolution approving of the pumping scheme? I think not. The reticulation has been approved of.
246. That reticulation covered a larger area than the area proposed in connection with this scheme? Yes; I believe over 2 miles have been taken off.
247. And your officers estimated that you would receive a larger sum under the reticulation now proposed than under the reticulation proposed formerly? Yes.
248. You have given a good deal of consideration to the question of a water supply to Tamworth? Yes.
249. You have not confined yourself to the pumping scheme, but you have explored the Moore Creek and Cockburn River schemes? Yes.
250. Which of the two schemes, the Moore Creek or Cockburn River scheme, will, in your judgment, give the best and purest supply of water? The Cockburn River scheme will give the largest supply, but so far as purity is concerned the Moore Creek scheme is infinitely the better one. There is no doubt about that.
251. And the elevation at which it is proposed to locate the storage reservoir would give a much better head for delivery into the service reservoir than you would get under the Cockburn Creek scheme? Yes.
252. Has there of late been any analysis of the well-water supplying the town? Not since the last inquiry by the Committee.
253. You are not in a position to say much with reference to the quality of that water, then? I have heard typhoid attributed to the town well.
254. Do you remember evidence given by Dr. Harris, to the effect that a great deal of the sickness of his patients was due to bad water? Yes, I remember that.
255. Do you think, from your general knowledge, that there is any reason for alarm in connection with the quality of the well-water at the present time? No, I do not.
256. You thoroughly approve of the Moore Creek scheme? Yes.
257. I believe there is some mining going on on the Cockburn River? Yes.
258. How many men are engaged there in mining? I could not say how many hands, but I could obtain the information for you.
259. *Mr. Lee.*] There are a good many fossickers there? Yes, and there are established diggings there. There is some quartz-crushing machinery, I believe.
260. Is Swamp Oak a tributary of the Cockburn River? Yes.
261. You heard the Mayor's replies to the questions asked him as to the suitability of the sites chosen for the proposed storage and service reservoir;—do you corroborate the statements? I do not agree with the whole of them, but generally I do corroborate them.
262. You think his view of the position is the correct one? Yes.
263. Are you in accord with his opinion that the service reservoir should be increased in size? That is a matter for the Engineering Department, based upon their experience in other places.
264. You know how much water the service reservoir will hold;—it is a question for the inhabitants of the town rather than the engineers to determine whether they will have the increased capacity? Providing the pipe does not burst, I do not think we want more than 500,000 gallons.
265. Do you think that a three days' supply is ample to meet any contingency? I leave that matter entirely for the engineers. I could not offer an opinion upon it. In some circumstances a week's supply would not do.
266. If there is any doubt, I suppose you think it would be well to err on the right side, and increase the accommodation? Yes.
267. *Mr. Fegan.*] Has the town well ever given out? No.
268. How many gallons a day do you think it could supply the people of Tamworth with? It can pump about 30,000 gallons a day.
269. That is far short of the quantity given by the proposed water supply? You could not pump enough for the town supply; it is only a small well.
270. The question of a water supply is an important one to the people of the town? Yes.
271. Being an alderman, when you go before your constituents I suppose you are asked your opinion on the question? Yes. Last year when I had to stand for re-election I made a special point of saying that so long as I was an alderman I would advocate the bringing of the water into the town, and I said that if they did not like it they could vote against me.
272. For how long have you been an alderman? Ten years.

Mr.  
W. J. Smith.  
11 Jan., 1896

Mr.  
W. J. Smith.  
11 Jan., 1896.

273. I see that you gave evidence against Mr. Gipps' scheme on a former occasion, and that you were an enthusiastic supporter of the pumping scheme;—the people of Tamworth have not censured you in any shape or form for your disagreement with Mr. Gipps' scheme? Some have done so. I think that altogether I have lost votes by advocating a scheme of water supply.
274. It would seem from that that the people of Tamworth do not want a water supply? Only some of them.
275. What percentage do you think? A very small percentage. Since the election at which I was returned by a narrow majority there has been a dry season, and that has turned the opinion of many persons.
276. I believe you were the first to discover the site of the impounding dam now proposed? No; Mr. Price found it out. I was the first to take Mr. Gipps to Moore Creek. We went 10 or 12 miles up the creek, but he has not seen the higher part. He said, "We will not go any further; the money will not cover it." We were then bound down to an expenditure of £13,500, under the old Municipalities Act of 1867.
277. Has there been any public meeting in Tamworth asking the Government to construct water supply works? No.
278. The proposal has emanated from the Council? Yes.
279. Has any public meeting been held in the town against the proposed scheme? No.
280. *Mr. Wright.*] I suppose a great many of the residents have underground and ordinary tanks? Yes.
281. Probably some of those who are opposing this scheme of water supply have a liberal supply provided by the rainfall on their roofs? Yes.
282. Is there perfect unanimity in the Council as to the advisableness of this scheme of water supply? No, I think not; I think there may be one or two who have some doubts about it.
283. A certain section of the townspeople are also opposed to it? Very few.
284. Is the opposition from the Council against a water supply generally or against any particular scheme? I think you might perhaps find one or two in the Council who are altogether opposed to a water supply, but that is only a matter of opinion; I cannot speak from any vote which has been taken.
285. *Mr. Davies.*] In what year did you take Mr. Gipps up Moore Creek? It was in 1891, the second time I was Mayor.
286. You did not go up to the site of the proposed storage reservoir? No.
287. Have you yourself seen the waterfall? Yes.
288. You have been there since? Yes.
289. What is the largest flow of water you have seen coming over the fall? I have never seen a great quantity coming over; there would be what you would call a good stream of water.
290. Would it fill a 6-inch pipe? If it were running level.
291. That is the largest quantity you have seen falling over? Yes.
292. How far is it from the point to which you went with Mr. Gipps to the waterfall? There is no regular waterfall; there is a series of cataracts spread over a mile and a half. I took Mr. Gipps to within 1½ mile of the site of the proposed impounding dam.
293. Mr. Price went further and made a discovery of the site? Yes.
294. Although you had previously seen the site it never occurred to you that it would be a good site for a reservoir? That is so; it has been a surprise to me that I could have passed over it.
295. The country is all granite rocks and sand? Yes.
296. Has the water been tested? Yes; Mr. Daniell, the chemist at Mr. Britten's brewery, tested it.
297. Judging from his analysis, you think it would be a good pure supply? Yes.
298. Acceptable to the consumers? Yes.

Charles Jeffries Britten, Esq., Mayor of Tamworth, sworn, and further examined:—

- C. J. Britten, Esq.  
11 Jan., 1896.
299. *Chairman.*] Your estimated revenue does not include any amount from the railway? No.
300. *Mr. Wright.*] The £240 of estimated revenue from public buildings does not include any revenue from the railway? No.
301. *Chairman.*] Will you hand in to the Committee, or forward to Sydney, a list of buildings showing how the £240 is made up? Yes.
302. You now hand in an analysis of water from Moore Creek made by Mr. Daniell, a chemist at your brewery? Yes. [*Vide Appendix.*]

WEDNESDAY, 15 JANUARY, 1896.

[*The Sectional Committee met at the Court-house, Tamworth, at 9 a.m.*]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. JOHN DAVIES, C.M.G.,  
CHARLES ALFRED LEE, Esq.,

JOHN LIONEL FFGAN, Esq.,  
FRANCIS AUGUSTUS WRIGHT, Esq.

The Sectional Committee further considered the proposed Water Supply for the Town of Tamworth.

Frederick Poate, Esq., District Surveyor, Tamworth, sworn, and examined:—

- F. Poate, Esq.  
15 Jan., 1896.
303. *Chairman.*] You have inspected the catchment area of the Moore Creek scheme of water supply? Yes.
304. Do you think sufficient water falls within the area to supply the Town of Tamworth? Yes. I have had prepared a tracing showing the catchment area and the different classes of land comprised in it. I find that it contains 21 square miles.
305. You think that is sufficient? Yes; I have made a rough calculation in regard to it, and taking 18 inches as the minimum rainfall, I find that 195,000,000 cubic feet will be discharged by the creek in the course of twelve months.

306. What proportion of water falling upon the catchment area do you calculate would go into the creek? *F. Poate, Esq.*  
Of the 18 inches 10 inches would be of no use for water conservation, that leaves 8 inches, and of that quantity again I take only 50 per cent.—the remainder is lost by evaporation, by permanent soakage in the ground and by trees and plants and things of that sort; that reduces the quantity to 4 inches or a discharge of about 195,000,000 cubic feet. *15 Jan., 1896.*
307. You think you are justified in expecting that quantity? Yes, in the worst year we can have.
308. How many gallons would there be? About 1,120,000,000 gallons with 4 inches of available rainfall. That is the rainfall which remains to be stored after allowing for all losses.
309. In your opinion, then, a dam providing a storage of 35,000,000 gallons would be filled thirty times over in the course of the year? Yes, that quantity will pass over the dam.
310. You have virtually allowed for a loss of 75 per cent. of the rainfall? Yes.
311. With regard to the catchment area itself, how is it held? I hand in a sketch showing 738 acres of freehold land and 4,435½ acres of conditionally-purchased land and 4,253½ acres of conditionally-leased land; of annually-leased land, 1,754 acres, and of vacant Crown land, 2,259 acres.
312. As to the pollution of the area, do you think there is much likelihood of that? It is not a class of country on which there is ever likely to be close settlement. The general description of the country is rough barren country, hugh granite boulders in places, timbered with box, apple, peppermint, stringybark, and gum, with sandy soil.
