313. As to the storage reservoir do you know the position of it? Yes.
314. Do you think it has been wisely selected? Yes I think it is a good site.
315. Did you see the site of the second dam which it might be necessary to utilise at some future time? Yes.
316. Do you think that a good site? Yes.
317. You believe in both the sites? Yes.
318. As to the quantity of water stored, do you think 35,000,000 gallons is sufficient? Not in a climate like this. I should prefer to see a full year's supply stored, say 50,000,000 gallons.
319. Do you offer any suggestion as to the best way in which that could be done? By increasing No. 1 reservoir—the present Government proposal.
320. Your idea is to increase the storage capacity of the first reservoir to 50,000,000 gallons leaving the other storage reservoir for expansion? Yes.
321. Have you any suggestion to make with regard to the catchment area? Yes, I think all the Crown land there ought to be at once reserved and that any conditional purchase or lease falling in should also be reserved.
322. What are your powers provided these persons exercise their right to convert their conditional leases into conditional purchases? The 25th section of the Crown Lands Act of 1889, deals with the conversion of conditional leases into conditional purchases. It says it may be done subject to all provisions of the Principal Act and that Act as to the making of applications, available land, area, deposits, measurement, and all other conditions applicable to ordinary conditional purchases. The 60th section of the Act of 1884, among other conditions, provides that necessary roadways, trigonometrical stations, and sites for, and sources of water supply may be excluded from any measurements.
323. Have you any knowledge of the location of the pipe-line? Yes a general knowledge.
324. Do you regard it as wisely situated? Yes.
325. Do you know where the service reservoir is? Yes.
326. Do you regard it as being in a suitable place? Yes.
327. Do you think 500,000 gallons or a three days' supply is sufficient to store there? I should prefer to see a week's supply. I think the quantity should be doubled in case of accident.
328. Is there anything further you desire to say in reference to the Departmental scheme? No.
329. You have a fairly full knowledge of the scheme Mr. Gipps has recently put forward? Only from what I have seen in the papers.
330. The supply coming down by the Cockburn Valley would be greater than that coming down Moor Creek? Yes.
331. How far is Mr. Gipps' service reservoir from the centre of Tamworth? It is about 6 miles out.
332. Is it wise to have a service reservoir so far from the town? No.
333. You regard that as a defect in the scheme? Yes.
334. Do you know where Mr. Gipps proposes to put his dam across the Cockburn? Yes.
335. Is it a good site? Yes.
336. Do you know the elevation there? I understand it is about 175 feet above the railway station.
337. Is that a sufficient height to command all those portions of the Tamworth Municipality which require water? It would not command the whole of it.
338. Do you think a head of 170 feet on the Cockburn Creek is sufficient to control the reasonably accessible land within the municipal boundary of Tamworth? If the levels are correct the difference between the site of the dam and the railway is 175 feet; that would give a head for houses within 100 feet of the level of the railway station.
339. Mr. Gipps would lose 70 feet by the water coming in? He could bring the water in at a loss of about 3 feet a mile.
340. He would therefore lose 45 feet? Yes.
341. And what about the other 32 feet? I allow for the depth of the dam and giving a little head of water for houses that are near to the 100 feet limit.
342. Do you think 100 feet above the railway station is a sufficient head for Tamworth? No; because the town is extending up the hill. Under Mr. Gipps' scheme it would be necessary to have pumping as in Sydney; that would eventually have to be done.
343. What distance is it from the storage reservoir under Mr. Gipps' scheme to the business centre of Tamworth? About 15 miles.
344. Do you think the Cockburn Valley catchment area is more likely to be polluted than is the Moore Creek catchment area? I do not think so; it is simply grazing country.
345. The mining would not have that effect? It would affect it very little.
346. You do not pay much attention to that aspect of the case? No.

Mr. James Lambert, alderman, Tamworth, sworn, and examined:—

Mr.  
J. Lambert.  
15 Jan., 1896.

347. *Mr. Davies.*] You are an alderman for the Town of Tamworth? Yes.
348. Are you in favour of or against the proposed scheme? I do not think I can be said to be against the scheme.
349. What knowledge have you of the Moore Creek scheme? Some considerable time ago a number of us went up and inspected certain portions of the catchment area and the reservoir site.
350. Do you disapprove of the scheme? To some extent.
351. For what reason do you disapprove of it? I do not think the catchment area is sufficient.
352. Supposing a competent professional man stated there would be ample water from a catchment area of 21 square miles to afford an abundant supply of water to Tamworth for the next twenty years? If that opinion has been expressed by a professional man I should be inclined to give way. I would not venture to set up my opinion against that of a professional man.
353. All you are anxious for as an alderman is to see a permanent supply for the people of the borough? Yes.
354. Your desire is that it should be procured as cheaply and as abundantly as possible? Yes.
355. In what other particulars do you disapprove of the Departmental scheme? I have no objection to it except that I think the catchment area is not large enough. That was my first impression.
356. You have no other doubt as to the catchment area? No; and if Mr. Poate thinks it sufficient I am willing to yield on that point.
357. If Mr. Poate has said the rainfall within the catchment area would be sufficient to fill the dam thirty times over in the course of the year supposing only 4 inches went into the creek would you be satisfied with that expression of opinion? I should be quite satisfied.
358. It would remove any doubt in your mind so far as the catchment area is concerned? Yes.
359. Is there anything further you wish to state? Yes. I have been informed that in certain years the creek runs dry.
360. Do you not know that it is proposed not to depend upon the creek alone, but upon the rainfall spread over the 21 miles—the rainfall would be intercepted and caught in a reservoir estimated to contain some 35,000,000 gallons? Supposing the creek runs dry.
361. That would make no difference? I thought it would.
362. If you stored 35,000,000 gallons in the reservoir at the foot of the catchment area what difference would it make if the creek went dry below. It is proposed to store sufficient water for the supply of Tamworth for a period of 250 days. These facts being brought under your notice do you still object to the scheme? You must fill your dam in the first instance, and if the creek is not running in hot weather like the present how are you going to fill it?
363. The rainfall upon the area of 22 square miles, there being only one storm upon it, would more than fill your dam? If we only had that storm.
364. Is the weather ever so dry that there is no storm? It is dry enough for anything now.
365. How long is it since you had rain in the district? We have not had any for a month or two.
366. What is the average rainfall, say, for a period of five years? I do not know.
367. Have you any further statements to make? To my mind a question of this kind ought to depend upon a vote of the ratepayers.
368. That is a matter for the Municipality, not for the Committee. Is there any large number of ratepayers in the borough who are sceptical as to the proposed supply? Yes.
369. How many would there be approximately? I should say there would be a few score.
370. Do you think there would be 100 persons? I should say more.
371. You think there are over 100 persons in the Town of Tamworth who do not want a water supply? I believe there is a number of ratepayers, and the proper thing to do would be to give them a chance of saying "Yes" or "No" to the scheme, as they will be responsible for the repayment of the cost.
372. Is it because they catch water in their own tanks that they do not want a water supply? A good many have their own tanks.
373. Is there any other point in connection with the Moore Creek scheme on which you would like to make any comment; do you know of any other point in the scheme? I cannot think of any just now.
374. *Mr. Lee.*] Your difficulty appears to be that the proposed catchment area would not afford a supply sufficient to meet the requirements of the people of Tamworth? That was my difficulty.
375. You are aware that the proposal is to store 35,000,000 gallons; do you think it would be desirable to provide for a larger storage than that? I think 35,000,000 gallons would be ample for the present. It would be from seven to eight months' supply.
376. Supposing the storage could be increased to 50,000,000 gallons, which would of course mean a much more abundant supply, and supposing that the rate proposed to be struck within the reticulation area would still pay the interest upon the additional cost of construction, would you under those circumstances suggest that the increased quantity be provided? Certainly, if it would keep us within the limit of the shilling rate, and prove satisfactory to the ratepayers.
377. If the revenue derivable from the rate would pay the interest on the increased cost of construction, you think it would be advisable to afford increased storage? Yes, in time to come.
378. You still have some doubt as to whether the rainfall would be sufficient to fill the reservoir; are you aware that in December last 7 inches of rain fell in the district? I know there was a great quantity of rain, but I cannot exactly say how much.
379. Had the dam been constructed it could have been filled by any storm at that period? I suppose so.
380. There is more or less rain here every year? Quite so.
381. Therefore, any danger which might arise from the absence of rain would be to a great extent removed if the storage were increased? Yes; I feel satisfied upon that point now.
382. *Mr. Fegan.*] If I am not mistaken, another reason you are opposed to the scheme is that it has never been properly before the ratepayers? Quite so; that is my main reason.
383. You believe it ought to be put before them? I do.
384. What method would you adopt—of course you are aware that the Committee cannot assist you in that direction? Quite so; I made a suggestion at last night's meeting of the Council, but I was ruled out of order.
385. Have there been any petitions to the Council for or against the scheme? Not to my knowledge.
386. Have there been any public meetings held against the scheme? I do not think so. 387.

387. Therefore, while there may be a number of persons who are not against the scheme, they have not taken any decided step in opposition to it? Quite so.
388. They knew from the announcements in the press that the Committee were about to visit Tamworth to take evidence upon the question? Exactly so, only the local newspaper notice was too short.
389. But none of those opposed to the scheme have put in an appearance? I believe some are present now.
390. If you waited until everyone was favourable to the proposal do you think you would ever get a scheme of water supply? I do not suppose we should; but to my mind the majority of ratepayers should vote on such a big expenditure.
391. You yourself think it is necessary to adopt this scheme? I believe it is. Individually, I have always been in favour of a water supply.
392. You are entirely in favour of some scheme of water supply for Tamworth? I have been all the way through so far as I am personally concerned.
393. The scheme of the Department is one which you can fairly stand behind? Yes, so far as I have seen into it.
394. You think it would be a blessing to Tamworth if properly carried out? Yes, so far as I can see at present.

Mr.  
J. Lambert.  
15 Jan., 1896.

Mr. Edward Cooper, Tamworth, sworn, and examined:—

395. *Chairman.*] Have you been long resident in Tamworth? Twenty-two years.
396. Do you know the scheme at present under consideration? I know nothing at all about it.
397. You desire to limit yourself to general principles? I am totally against the scheme of water supply to Tamworth.
398. Why? Because the present supply in the tanks and in the town well is an ample one.
399. Have any people in the town authorised you to speak for them? No.
400. In your opinion the present supply from the drift is ample for all requirements? Yes.
401. Do you water your streets in Tamworth? Only one street.
402. Do you think it an advantage to water the streets and flush the drains? I do not think it is necessary at present.
403. *Mr. Fegan.*] What is your objection to the proposed scheme of water supply? That it is not required.
404. How many gallons do you use daily? I could not say. Eight inches would supply me for a year. Assuming the rainfall to be 28 inches, I should have 20 inches in excess of what I require.
405. But there are a number of other persons living in Tamworth, and they have asked for a water supply? A few of them.
406. How many do you think? I could not say, perhaps one-third or a little over.
407. Is not the expense the chief obstacle in your way? It is no obstacle whatever.
408. If a water supply could be given you for nothing you would not have it? No.
409. *Mr. Davies.*] You are a property owner? Yes.
410. You find the rate of 1s. 5d. in the £ pretty stiff at the present time? It is quite enough.
411. You do not want to pay another rate of 1s. in the £? I object to a scheme of water supply because it is not required.
412. Do you know how much water is lifted from the town well every day? I do not; but in any case I consider the provision now made quite sufficient.
- 413-4. Would not an abundant supply of water be a great convenience to the residents of the district;— would it not promote their health and happiness? We have a sufficient supply already.
415. What quantity of water have you stored at your house? Something like 2,000 gallons. That is for my own residence. There is also a well averaging 50 feet of water all the year round.
416. Has the supply in your tanks ever run short? Never.
417. Have you a provision for a plunge and shower bath at your residence? Yes.
418. And you say you are entirely opposed to a scheme of water supply? Yes.
419. You would have to pay 5 per cent. on the assessed value of your property if you had a scheme of water supply? Yes, and something besides, I fancy; but I do not object to the scheme on that ground.
420. *Chairman.*] You are dependent personally upon your well, and that is a good standby? The rainfall supplies me; I scarcely ever use the well.
421. Is it a porous soil here? Yes; there is plenty of drainage.
422. Water would easily get through the soil? Yes.
423. Are there any cesspits about Tamworth? Yes.
424. And you have your source of water supply and your cesspits in the same porous soil? I use my well-water for irrigation.
425. I suppose some of the townspeople have to use well-water? Yes.
426. And you think that does not matter? I do not think so, because the cesspits are cemented.

Mr. E. Cooper.  
15 Jan., 1896.

Charles Jeffries Britten, Esq., Mayor of Tamworth, sworn, and further examined:—

427. *Mr. Lee.*] Since you gave evidence the other day you have had an opportunity to inspect the site of the proposed dam at Moore Creek with the Principal Assistant Engineer for Country Towns Water Supply and Sewerage and the Committee? Yes.
428. You clearly understand that the proposed storage would be about 35,000,000 gallons? Yes.
429. The Committee wish to know definitely from you whether you think that storage would afford a sufficient supply? I do not.
430. To what extent do you think it should be increased? I think a storage of 15,000,000 or 20,000,000 gallons might be added to it.
431. Giving a total of 50,000,000 gallons? Yes; I think we should be safe then.
432. Have you estimated the cost of the additional construction required to afford that storage? I have not made a calculation, but I should say it could be done for £1,500.
433. Supposing it cost £2,000? I should vote for it being carried out.
434. The interest charge being £80 a year? Yes.

C. J. Britten,  
Esq.  
15 Jan., 1896.

- C. J. Britten, Esq.  
15 Jan., 1896.
435. That would still leave you well within the revenue for the water rate? Yes.
436. If the additional supply can be afforded at an expenditure of an additional £2,000, your opinion is that the work ought to be carried out? Yes.
437. It would be immensely cheaper, you think, to make this extra provision in the original construction of the work than to add it afterwards? Yes.
438. You have seen the site suggested for an additional reservoir about 1½ mile above the site of the reservoir now proposed? Yes.
439. You do not think the additional storage could be provided for there at some future time as cheaply as it could be provided now? No; I think the best course is to increase the size of the dam now proposed. The additional supply could be afforded much more cheaply in that way.
440. Coming now to the service reservoir, have you thought over your suggestion that that should be increased in size? Yes; I am still of opinion that it would be better to have 1,000,000 gallons there instead of 500,000.
441. At a cost of, say, another £1,000? Yes.
442. Or £40 a year more in interest? Yes.
443. Making a total increase to the interest charge for the additions you now propose of £120? Yes.
444. You think the ratepayers would be satisfied to have the expenditure increased to that extent in order to afford a larger supply? Yes.
445. It will make a lot of difference to your storekeepers as to whether you have an ample supply of water for your streets or not? Yes. I look at the matter in this way: that we should do better to obtain a full supply now, and have 100 years in which to pay off the money, than to have to increase the works at some future time and find the money ourselves. I cannot see what security we should have to offer at any future time for the money we require. The Government would have all our securities on account of the existing water supply. Three and a half years ago the then Mayor and Alderman Smith both said in their evidence that they would support a gravitation scheme up to £40,000, and that the town could pay for it. If we could do so then, I am sure we could do so now.
446. *Mr. Davies.*] Do you think the Council would be prepared to endorse the additional expenditure in order to obtain the additional supply? I think so. I think that if the matter were laid before them in a businesslike manner they would see that as business men they would have to agree to it.
447. Do you think the provision of the additional supply would increase your income? I cannot say definitely, but I should think that if we had an abundant supply of water we should receive a certain amount of revenue for its use for hydraulic purposes.
448. Do you, as Mayor of the borough, think that the additional income would be sufficient to pay the cost of the extra provision? I cannot exactly say that. Speaking for myself, I can only say that if we had an ample water supply I would do one or two things with water-power at my brewery.
449. You yourself would become a large consumer at a reasonable rate? Yes.
450. Have you any outstanding rates at the present time? Very few indeed. The principal amount is on account of unimproved blocks—unoccupied land—the owners of which cannot be found; the total amount of our arrears for 20 years is £383 11s. 8d.
451. You think that, as Mayor of the borough, you voice the opinion of the ratepayers in this matter? Yes, for the last ten years there has been an agitation in the borough for a water supply. During the whole of that time there has not been a single public meeting held in opposition to the proposal.
452. For how long have you held the position of Mayor? For two years. I have been in the Council six years.
453. Have you had any representations made to you officially as to the shortness of the present supply? A number of persons have complained to me that they have had no water. The greatest opponents of the scheme have been those who did not know to what extent they would have to be rated. Now that they understand the matter better, they all see that the supply will be to their advantage rather than to their disadvantage.
454. What provision beyond the one which has been spoken of was made to supply the town? None whatever.
455. Has the number of houses within the borough increased since the last inquiry here by a Sectional Committee? Yes.
456. Your income is fast increasing? Yes.
457. The Council has a system of lighting by electricity? Yes.
458. You have not calculated the income you would derive from that source for public and private supply? No; we have had applications in connection with new buildings in Tamworth to supply the electric light. Six years ago, when we went in for the electric light, there was a strong feeling in Tamworth that the Council had done wrong. That feeling was expressed through the public press very strongly indeed. It was said that instead of going in for an electric light we should have gone in for a water supply. I have never known public feeling here condemnatory of a water supply; it has always been in favour of it.
459. *Mr. Fegan.*] You think the construction of a bigger storage reservoir would give greater security so far as the supply is concerned? Yes.
460. And you think that security is worth the additional price you would be paying for it? Yes.
461. *Mr. Lees.*] How does the Town of Tamworth rank in the list of country towns? I think it is about the sixth.
462. Were many new buildings erected last year? I think about forty-five.
463. There is an annual increase in the number of buildings in the town? Yes.
464. You are not aware of any circumstances which would lead one to suppose that the town was likely to go backwards? No; I think it is bound to go ahead.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Water Supply for the Town of Tamworth.

SECTIONAL COMMITTEE.

APPENDIX.

A.

[To Evidence of C. J. Britten, Esq.]

ANALYSIS OF WATER FROM MOORE CREEK.

Tamworth, 25 July, 1895.

Dear Sir,

In accordance with your suggestion, I took a sample of water from Moore Creek, at the proposed site of the dam, on 15th July. The water was clear and bright, and its temperature 45 degrees Fahrenheit. On analysis, the following results were obtained :—

	Grains per gallon.
Silica .....	·35
Carbonate of lime .....	2·66
Carbonate of magnesia.....	2·92
Carbonate of soda .....	·92
Sulphate of magnesia .....	·95
Chloride of sodium .....	2·19
Undetermined matter .....	1·77
<b>Total solids.....</b>	<b>11·76</b>
Free ammonia .....	·001
Albuminoid ammonia .....	·0056

The water contains more mineral matter than one would expect to find in granite country, but considerably less than the waters in the various town wells analysed by Mr. Hamlet in 1892. See below.

	Analyst.	Total Solids—grains per gallon.
Tamworth well, A, new .....	Hamlet.....	17·92
"    B, Chinamen.....	".....	24·08
"    C, old, Chinamen .....	".....	30·66
"    D, town well, tap .....	".....	30·24
"    E, town well, bucket.....	".....	30·01
"    Brewery.....	Daniell.....	65·38
Moore Creek .....	".....	11·76
Sydney Supply .....	Hamlet.....	6·53

I am of opinion that, as a rule, the water will be much softer, on account of the large percentage of rain-water that will always be in the dam; for after the present long-continued drought the water running in the creek must be at its hardest.

The amount of albuminoid ammonia is somewhat large for a first-class drinking-water; but that, too, should be much diminished when diluted with rain-water.

In conclusion, I am of opinion that this water is far more suitable, for domestic and industrial purposes, than that obtainable from any wells in the Tamworth valley.

Yours truly,

L. C. DANIELL, F.C.S.

[1 Plan.]

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

**TAMWORTH WATER SUPPLY.**

(PETITION FROM CERTAIN RATEPAYERS OF THE MUNICIPALITY OF TAMWORTH, AGAINST.)

*Received by the Legislative Assembly, 13 May, 1896.*

To the Honorable the Members of the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the undersigned Ratepayers of the Municipality of Tamworth,—

RESPECTFULLY SHOWETH:—

That your Petitioners are strongly opposed to the scheme for supplying the town with water, now before the public, and indeed to any other project at present which will involve large expenditure of money and consequent taxation.

The Municipal Council have already incurred heavy debts, which, so far from being reduced, will be largely increased this year by work of a non-productive nature, now in course of construction.

That the town has now a very fair supply of wholesome water in the town pump, in wells, and in tanks, which never entirely fails, and which is sufficient for present purposes, which is more than can be said of some towns which have expensive waterworks.

That business is in a very depressed condition, and as property has greatly depreciated in value within the last few years, in many cases to the extent of 50 per cent., an additional tax of 5 per cent. on rent, which a general water scheme is likely to involve, would be very severely felt by the residents, and would tend to deter strangers from coming to settle in the town.

Your Petitioners, therefore, pray that your Honorable House will take the premises into your favourable consideration, and stop all further proceedings in this expensive project.

And your Petitioners will ever pray.

[ *Here follow 523 signatures* ]

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

---

**LIQUOR TRAFFIC LOCAL OPTION BILL.**

(PETITION FROM HIS LORDSHIP THE BISHOP OF SYDNEY, CHAIRMAN OF A PUBLIC MEETING HELD IN SYDNEY ON 26TH INSTANT, IN FAVOUR OF.)

---

*Received by the Legislative Assembly, 27 October, 1896.*

---

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the undersigned Residents of Sydney,—

HUMBLY SHOWETH:—

That at a duly-convened Public Meeting held in Sydney on the 26th instant, of which your Petitioner was appointed Chairman, the following resolution was passed by an overwhelming majority:—

“That this Public Meeting of Citizens expresses its satisfaction at the introduction of the Liquor Traffic Local Option Bill in the Legislative Assembly, and in view of the manifold evils arising from the prevalence of intemperance in the community, urges upon Parliament the importance of immediately passing the measure,” and “that the Chairman be requested to sign and present this Petition to the Assembly.”

Your Petitioner therefore respectfully prays your Honorable House to consider the foregoing resolution.

And your Petitioner, as in duty bound, will ever pray.

WM. SZ. SYDNEY,  
Bishop of Sydney, Chairman of the Meeting.

1896.

NEW SOUTH WALES.

---

LIQUOR TRAFFIC.

(PETITION FROM CERTAIN INHABITANTS OF NEW SOUTH WALES, PRAYING FOR THE EARLY PASSING OF A BILL THAT WILL CONCEDE TO THE ELECTORS, IN EVERY ELECTORATE, FULL LOCAL OPTION WITHOUT COMPENSATION.)

---

*Received by the Legislative Assembly, 27 May, 1896.*

---

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the undersigned inhabitants of New South Wales,—

HUMBLY SHOWETH:—

That, in view of the manifold evils through intoxicating drink, which not only include drunkenness, but much poverty, immorality, lunacy, and crime, your Petitioners humbly pray for the early passing of a Bill that will concede to the electors themselves, in every electorate, full local option without compensation.

And your Petitioners, as in duty bound, will ever pray.

## LIQUOR TRAFFIC.

(PETITION FROM CERTAIN OFFICERS OF ST. JOHN'S DARLINGHURST BRANCH OF THE CHURCH OF ENGLAND TEMPERANCE SOCIETY, IN FAVOUR OF FULL LOCAL OPTION WITHOUT COMPENSATION.)

—  
*Received by the Legislative Assembly, 2 June, 1896.*  
 —

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the undersigned officers of St. John's Darlinghurst branch of the Church of England Temperance Society,—

HUMBLY SHOWETH:—

That, in view of the manifold evils through intoxicating drink, which not only include drunkenness, but much poverty, immorality, lunacy, and crime, your Petitioners humbly pray for the early passing of a Bill that will concede to the electors themselves, in every electorate, full local option without compensation.

And your Petitioners, as in duty bound, will ever pray.

[*Here follow 3 signatures.*]

Similar Petitions were received,—

On 4th June, from residents of the City and Suburbs of Sydney (92 signatures).

„ „ members of the Church of England Temperance Society, Eveleigh-street, Redfern (2 signatures).

„ „ certain inhabitants of New South Wales (17 signatures).

The Petition of the undersigned Inhabitants of Cootamundra and District,—

HUMBLY SHOWETH:—

That, in view of the manifold evils through intoxicating drink, which not only include drunkenness, but much poverty, immorality, lunacy, and crime, your Petitioners humbly pray for the early passing of a Bill that will concede to the electors themselves, in every electorate, full local option without compensation.

And your Petitioners, as in duty bound, will ever pray.

(PETITION FROM JAMES McCALLUM, CHAIRMAN OF A PUBLIC MEETING HELD IN THE PEOPLES HALL, SYDNEY, IN FAVOUR OF FULL LOCAL OPTION WITHOUT COMPENSATION.)

*Received by the Legislative Assembly, 8 October, 1896.*

To the Honorable the Speaker and the Honorable Members of the Legislative Assembly in Parliament assembled.

The humble Petition of the undersigned,—

RESPECTFULLY SHOWETH:—

That, at a Public Meeting held in the Peoples' Hall, Sussex-street, Sydney, on September 30th, 1896, the following resolution was passed:—

“That, in the opinion of this meeting, the legalised traffic in intoxicating drink is the direct cause of a terrible amount of poverty, vice, and crime, with all the resulting cost and suffering which have to be borne by the people. It therefore affirms the principle that the residents of every electorate should have the power to effectively deal with this demoralising traffic, and this by means of a full Local Option Bill without compensation.”

Your Petitioners therefore humbly pray your Honorable House to take these presents into favourable consideration, and to speedily pass such a Bill into law.

And your Petitioners, as in duty bound, will ever pray.

JAS. McCALLUM,  
Chairman of the Public Meeting.

(PETITION FROM JOHN KENT, CHAIRMAN OF A MEETING OF THE UNITED CHRISTIAN CHURCHES IN THE PROTESTANT HALL, SYDNEY, IN FAVOUR OF LOCAL OPTION WITHOUT COMPENSATION.)

---

*Received by the Legislative Assembly, 23 July, 1896.*

---

To the Honorable the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of the United Christian Churches of New South Wales, represented by at least 500 adherents, assembled in the Protestant Hall, Sydney, July 20th, 1896,—

HUMBLY SHOWETH:—

That, in consequence of the numerous and serious evils connected with the sale of intoxicating liquors, this meeting is of opinion that a Bill should be passed by the Parliament conceding to the electors in every constituency full local option.

That it is the opinion of this meeting that a demand for compensation, made chiefly on behalf of the brewers, for the non-renewal of a yearly permit to sell liquor, is unreasonable, and should not be permitted to block the progress of reform.

That, inasmuch as the four successive previous Parliaments have affirmed the principle of full option, this meeting, believing the present House to be also favourable, is of opinion that any further delay in passing a Bill would be unjustifiable and contrary to the best interests of the people, and therefore pray that your Honorable House may speedily pass the Bill into law.

And your Petitioners, as in duty bound, will ever pray.

JOHN KENT,  
Chairman of the meeting held July 20th, 1896

## HARBOUR AND RIVER IMPROVEMENT WORKS.

(RETURN RESPECTING MONEY VOTED FOR.)

*Printed under No. 24 Report from Printing Committee, 29 October, 1896.*

[Laid upon the Table of the House in answer to Question No. 2 of 5 December, 1895.]

### Question.

(2.) MONEY VOTED FOR HARBOUR IMPROVEMENT WORKS:—MR. ARCHIBALD CAMPBELL asked THE COLONIAL TREASURER,—

The total amount of money recently voted by this House on the Estimates, including Loan Estimates, for harbour and river improvement works on the coast northward of Sydney, specifying the respective sums making up such total and the different works for which they were voted?

The amount voted on the same Estimates for similar works on the coast southward of Sydney, with like particulars in every respect?

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

IMPROVEMENT OF COOK'S RIVER.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of carrying out certain works for the Improvement of Cook's River, near Tempe, with the object of providing for the better discharge of flood-waters," have, after due inquiry, resolved that it is not expedient the proposed improvement of Cook's River, at a cost of £36,400, as referred to the Committee by the Legislative Assembly, nor the alternative Departmental scheme, at a cost of £25,000, be carried out; but they recommend that a portion of such work be undertaken by the Government, viz.:—(1) Lowering the sills at the southern end of Cook's River Dam and extending the sluice-gates to the necessary width; (2) Dredging Cook's River and Wolli Creek; (3) Constructing an embankment, with proper escape for storm-waters, across the entrance to Marrickville Creek. The total cost not to exceed £15,000. The storm-water channel down the centre of Marrickville Creek should be carried out under the provisions of the Metropolitan Water and Sewerage Act Extension Act of 1894;—and, in accordance with the provision of subsection (iv), of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

1. The question of improving Cook's River and dealing with the flood-waters and the low-lying lands in its vicinity has engaged much attention for some years past. The necessity for action has been admitted, but there has been a difference of opinion as to the best means for dealing effectively with the insanitary condition of the river and the flats adjacent thereto. Property-owners on the low-lying portions of Marrickville have urged the adoption of remedial measures, on the ground that "their properties were submerged during every rainstorm with upland water which, owing to defective outlets, remained on this land a considerable time, ultimately, when drying off, leaving a deposit of sewage matter which became offensive and prejudicial to the health of the inhabitants." About 100 acres of the land are below high-water mark, and this accentuates the difficulty of dealing with the question. Complaints have been numerous from residents in the neighbourhood of Cook's River and Wolli Creek, who assert the district is becoming unhealthy from the foul state of those water-courses.

Departmental statement.

2. The original scheme proposed by the Department contemplated the removal of 300 feet of the Cook's River dam and the construction of a bridge across the opening; also the building of a dam having low and ample sluice-gates across the Marrickville drainage outlet, the top being high enough to prevent floods passing

Outline of the original scheme.

passing down Cook's River from entering upon the low lands. Concrete overshot dams were to be constructed across Cook's River, near Undercliffe Bridge, and across Wolli Creek, a short distance up from its junction with Cook's River. In addition, fascine banks or training walls were to be formed for the purpose of preventing tidal and flood-waters from submerging some low-lying lands. It was also intended to resume certain river frontages near Tempe, and to make reclamations in front.

3. The estimated cost—£36,400—of the original Departmental scheme is made up as follows:—

Estimated cost of the original Departmental scheme.

Removing Cook's River Dam, altering level of portion of road, remaking same, and providing side fences ... ..	£800
New timber bridge, 300 feet long and 40 feet wide ... ..	5,500
Temporary bridge, required during progress of works ... ..	1,600
Training-walls and fascine banks on both sides ... ..	10,200
Dam and sluices across Marrickville flats ... ..	4,300
Dam and sluices across Cook's River at Undercliffe ... ..	3,100
Dam and sluices across Wolli Creek ... ..	2,600
Dredging full width of channel 5 feet deep up Cook's River to Undercliffe and up to Wolli Creek Dam ... ..	5,000
Contingencies (say) ... ..	3,300
Total ... ..	£36,400

4. The objects to be gained by the proposed work were stated to be:—(1) To keep the Cook's River waters wholly out of Marrickville. (2) To allow the flood-waters to pass freely down and escape far more rapidly than is possible under existing conditions. (3) To lower the low-water level of Cook's River above the present dam by fully 2 feet, and thus provide a better escape for the drainage.

The original Departmental scheme—its objects.

5. The Engineer-in-Chief for Public Works states that much of the flooding of the low lands in the past has been due not so much to the rainfall on the Marrickville basin as to the flood-waters of Cook's River entering and passing up the Marrickville Valley; an alternative proposal was therefore submitted by the Department providing an outlet for the Marrickville surface drainage less under the influence of the Cook's River floods. This, it was said, could be done by constructing an outlet partly by open channel, then by tunnel, and again by open channel, starting from the centre of the valley a little below the Marrickville to Burwood Road railway junction, under the Cook's River Road, near the Bay View Asylum, to the junction of Shea's Creek with Cook's River. The invert would be at about the level of low-water mark spring tides, the fall 1 in 3,200 feet, and the dimensions of the tunnel would be 15 feet by 6 feet. It would be necessary to construct self-acting sluice-gates to keep out tidal water and allow flood-water to escape during falling tides. From the outlet of the tunnel to Shea's Creek would be an open canal 50 feet wide and 2 feet deep at low water.

Alternative scheme—Departmental.

6. The estimated cost of the alternative proposal was stated to be £25,000, and included the following items:—

Estimated cost of alternative Departmental scheme.

Tunnel and drain to Shea's Creek, with flood-gates, &c, complete ... ..	£15,000
Dam across Marrickville valley ... ..	2,000
Dredging in Cook's River and Wolli Creek ... ..	4,000
Lowering sills, Cook's River dam ... ..	2,000
Contingencies (say) ... ..	2,000
Total ... ..	£25,000

7. No estimate was placed before the Committee regarding the probable cost of land resumption; it was stated the amount required would not be heavy.

Land resumption.

8. The Committee have, by visiting the site of the proposed improvements and examining those qualified to give evidence in relation thereto, made themselves thoroughly acquainted with every feature of the scheme. A large number of witnesses have been examined. These include Mr. C. W. Darley, Engineer-in-Chief for Public Works; Dr. J. Ashburton Thompson, Chief Medical Inspector to the Board of Health; Mr. J. M. Smail, Engineer-in-Chief, Metropolitan Board of Water Supply and Sewerage; Mr. R. W. W. McCoy, Mayor of Marrickville; Aldermen W. R. Benson and G. A. Morehouse, Marrickville; Mr. C. Moyes, Marrickville; Mr. J. P. Webster, Borough Engineer, Marrickville; Mr. E. Campbell, M.A., solicitor, Richmond; Mr. T. Stanley, Marrickville; Mr. J. P. Sharkey, civil and

The Committee's inquiry.

and hydraulic engineer; Mr. F. Gannon, solicitor; Dr. A. E. Perkins, Marrickville; Mr. S. R. Lorking, Mayor of Canterbury; Aldermen J. Denniss, J. Quigg, and J. McBean, Canterbury; Mr. J. Wren, Canterbury; Mr. F. Davis, Canterbury; Miss M. L. Campbell, Wanstead, near Tempe; Mr. J. P. Josephson, civil and consulting engineer; Mr. J. H. Clayton, Mayor of Rockdale; Aldermen W. G. Judd, E. Godfrey, H. Cooke, and J. Curtis, Rockdale; Mr. J. Bowmer, Rockdale; Mr. J. Goode, Rockdale; Mr. D'A. H. Bucknell, Tempe; and Messrs. J. W. Watkin and Benjamin Lee, Directors of the Sydney Permanent Freehold Land and Building Co., Limited.

9. Description of the various watersheds which discharge at the Cook's River Dam :—

Various watersheds discharging at Cook's River Dam.

Cook's River, immediately above the dam, receives the water of Wollie Creek from the south, and that from the valley of Marrickville Flat on the north. The main river continues its westerly trend.

The watershed of Wollie Creek is about 5,000 acres in extent. This creek is the storm-water discharge for portions of the municipalities of Rockdale, Canterbury, Kogarah, and Hurstville.

The area of the watershed draining into Marrickville Creek is about 1,700 acres. This valley forms the storm-water discharge for portions of the municipalities of St. Peter's, Newtown, Petersham, and Marrickville.

The catchment area of Cook's River above the dam, not including the area described, is about 8,000 acres; this part of Cook's River receives the storm-water from portions of the municipalities of Enfield, Ashfield, Marrickville, and Canterbury. Thus Cook's River at the dam is the outlet for storm-water from an area of about 14,700 acres.

Portions of these areas carry dense populations, and since a sewerage system is not complete, nor likely to be for years to come, it is apparent that a quantity of objectionable matter must be borne by the storm-waters to Cook's River, and, if intercepted, must gradually create a nuisance which will become intolerable.

10. Evidence has been given as to the insanitary condition of Cook's River above the dam, and of Marrickville Flat. These localities are doubtless a menace to public health, and with the increase of population the nuisance will, unless immediate steps be taken, certainly be augmented.

Insanitary state of Marrickville Flat, &c.

11. Having decided that Cook's River, near Tempe, and Marrickville Flat are in an insanitary condition, the matters requiring special consideration are :—

Matters for special consideration.

- (1) How far the cost of the necessary improvements should be made a State obligation?
- (2) What proportion of the cost the municipalities occupying the watershed should be called upon to defray?
- (3) The wisest method of abating the nuisances.

12. The powers of the various municipalities adjacent to Cook's River are limited by the banks of the river, which in its lower reaches form their boundaries.

State obligation.

Cook's River being a tidal water over which the State holds control, any expenditure on its channel not only would be an illegal outlay of municipal funds, but would not be permitted by the State unless under Departmental supervision. The cost of such works could only be defrayed from a fund levied upon the various areas, which fund the municipalities are not legally entitled to create. Further, if there has been any interference with the interest of these municipalities by the erection of works by the State which have increased any nuisance adjacent to the municipal boundaries, on areas under State control, it is the duty of the State to remedy the evil as far as possible.

13. The Committee are of opinion :—

- (1) That the lower reaches of Cook's River, being naturally tidal waters, are under State control.
- (2) That the existence of the dam, with a sluicing discharge less than the natural discharging area of the river impedes the ready escape of the storm-waters.

Views of the Committee—  
Cook's River under State control ;  
State responsibility, &c., &c.

(3)

- (3) That the railway embankment may have somewhat contracted the original discharging area of the river, the current from Wollie Creek being thereby forced from its original bed and thrust further north into a less direct and shallower channel.

The erection of the dam, with inferior sluicing power, and the construction of the Illawarra Railway embankment, may have prejudicially affected the discharge of Cook's River, and probably have been the means (a) of augmenting the floods which periodically visit the lower country; (b) of increasing the tendency for objectionable matter to deposit near Tempe.

The Committee are, therefore, of opinion that there is a certain amount of State responsibility with regard to the present insanitary condition of Cook's River, and it should be discharged by the carrying out of dredging operations, to provide a channel in the lower reaches of Wollie Creek and Cook's River, sufficient to furnish a reasonable outlet for these waters, and by providing sufficiently large sluice-gates in the dam to deal with such discharge.

Submergence  
of Marrick-  
ville Valley.

14. Marrickville Valley is liable to submergence either from the rain falling upon its own catchment area or by the overflow from the flood-waters from Cook's River. In the valley 109 acres 2 roods and 37 perches are at an elevation of not more than high-water mark, of which 48 acres are 1 foot, 14 acres 2 feet, and  $1\frac{1}{2}$  acre 3 feet under high-water mark. It is therefore clear that no gravitation scheme for draining this flat can more than alleviate the floods which occur. The only method by which flood-waters could be thoroughly dealt with would be by the construction of a bank across the entrance of the valley to keep out the overflow from Cook's River, and the erection of a powerful pumping plant capable of dealing promptly with a portion of the waters which reach the Marrickville flat from its own catchment area; and by intercepting some of the waters on either side of the valley at a sufficient elevation to admit of their discharge into Cook's River above flood-level. But the importance of the interests involved does not justify at present the necessarily heavy expenditure.

Treatment of  
flood-waters  
in Marrick-  
ville Valley.

15. The Committee recommend that a bank be erected across the entrance to Marrickville Valley, and that a storm-water channel be constructed down the drainage centre, discharging through the bank by a sluice-gate which can be closed when the flood in Cook's River is higher than in Marrickville Valley. This channel must be sufficiently wide to drain the flat in ordinary weather and to provide for the speedy clearing of the lower lands as the flood-level in the river falls. The work should be carried out in accordance with the terms and conditions which obtain in other works of the kind. The storm-waters which flood Marrickville Valley are collected over a water-shed of 1,700 acres, embracing various municipalities, and this work should be a joint charge upon them. The annual cost will be very small indeed, and should be defrayed in a manner similar to that obtaining in the case of storm-water discharges constructed in the interest of other municipalities.

Scheme, as  
submitted to  
the Com-  
mittee.

16. The scheme, as submitted to the Committee, contemplated an expenditure of £36,400, and embraced items for the erection of dams on Cook's River, near Undercliffe Bridge, and on Wollie Creek, and the erection of fascine banks practically from the dam to these places, which would be rendered necessary by the inflow of salt water consequent upon the proposed removal of the dam. If the contention be correct that the present dam has aided in creating the nuisance at Tempe, as the population increases it is clear that the evil would simply be transferred a short distance up each creek to the proposed new dam sites. If it be contended that such dams can be erected without creating an insanitary state of things, the sluice-gates at the present dam can be so constructed. The erection of the fascine banks in front of private properties may lead to litigation.

Alternative  
Scheme sub-  
mitted to the  
Committee.

17. The alternative scheme, at a cost of £25,000, has two salient defects—
- (1) The lowering of the sills of the present gates at the Tempe Dam will not furnish a sufficient discharge for the flood waters of Cook's River.
  - (2) A storm-water discharge from an area of 1,700 acres, through a tunnel of 15 feet by 6 feet, with a fall of 1 foot in 3,200 feet, and an intermittent discharge controlled by both tide and flood, will be ineffective. The flood-waters awaiting discharge will submerge the lower lands and hang there until they creep slowly through the intermittently discharging tunnel.

The

The velocity of the water in the tunnel would be not more than  $1\frac{3}{4}$  miles per hour; there would therefore certainly be a deposit from storm-water (which would be aggravated by the fact that when the tide was up, the water would lie dead in the tunnel), unless it were intercepted at the intake, which would necessarily be a difficult operation.

18. Many witnesses, amongst whom were several municipal representatives, were of opinion that the removal of the dam at Cook's River, and the consequent ebb and flow of the tide, would be the best means of purifying both Cook's River and Wolli Creek, but they do not appear to have considered the damage that would thereby be caused by the submergence with salt water of the low-lying lands. Owners of land so situated gave evidence that they would suffer great loss, and the Department recognise the possible claims for damage that might arise if salt water were let into the river. Proposal to remove Cook's River Dam.

19. The Committee recommend the following works should be undertaken by the State:— Works to be undertaken by the State.

- (1) Lowering the sills at the southern end of Cook's River Dam, and extending the sluice-gates to a width of not less than 200 feet.
- (2) Dredging Cook's River and Wolli Creek.
- (3) Constructing an embankment (with proper escape for storm-water) across the entrance to Marrickville Creek.

The present sluice-gates at the northern end of the dam to be left for flood discharge.

20. The necessary outlay in connection with the storm-water channel should be a charge on the municipalities on the catchment area of Marrickville Creek. Cost of storm-water discharge to be borne by municipalities.

21. The Committee are of opinion that these proposals will deal with the nuisance in Cook's River satisfactorily, mitigate the floods in the Marrickville Valley, and much improve its sanitary condition. It will be understood that the certain increase of settlement on the watershed of Cook's River and Wolli Creek will create further pollution, but if these waterways continue to be the flood-water discharge of the municipalities particularised they should be treated as such, and the municipalities rated to construct and maintain them for that purpose. Marrickville Valley can only be kept free from floods by a pumping and intercepting scheme, and the interests involved therein are limited to the localities and municipalities from which the flood-waters are collected. Effect of Committee's proposals.

22. In carrying out any works the result of which will only alleviate insanitary conditions, care should be exercised that the temporary measures, as far as possible, should form part eventually of a complete scheme. It is clear that were the dams erected in Cook's River and Wolli Creek, as proposed by the Department, their removal would be the first step necessary in a thorough scheme to deal with the localities on these drainage areas, and therefore the expenditure of nearly £6,000,—to which must be added the cost of such removal—would have been expended on doubtful work of a purely temporary character. In the future, as interests become sufficiently great to justify the total prevention of floods in Marrickville Valley, a pumping scheme will be necessary, and then the flood-water discharge channel, recommended by the Committee down the drainage centre, will form a portion of the permanent work necessary to attain that object. It will be well, when constructing this storm-water channel, to extend it beyond the proposed intake of the alternative scheme, to intercept the flood-waters further up Marrickville Valley. Temporary works should form part of permanent scheme.

23. The following extract from the Minutes of Proceedings of 22nd July, 1896, shows the resolution arrived at by the Committee:— Resolution of the Committee.

Mr. C. J. Roberts moved—

"That the Committee are of opinion it is not expedient the proposed Improvement of Cook's River, at a cost of £36,400, as referred to the Committee by the Legislative Assembly, nor the alternative Departmental scheme, at a cost of £25,000, be carried out; but they recommend that a portion of such work be undertaken by the Government, viz.:—

- (1) Lowering the sills at the southern end of Cook's River Dam and extending the sluice-gates to the necessary width;
- (2) Dredging Cook's River and Wolli Creek;
- (3) Constructing an

an embankment (with proper escape for storm-waters) across the entrance to Marrickville Creek. The total cost not to exceed £15,000. The storm-water channel down the centre of Marrickville Creek should be carried out in accordance with the provisions of the Metropolitan Water and Sewerage Act Extension Act of 1894."

Mr. Fegan seconded the motion.

Mr. Hassall moved,—

"That the motion be amended by the omission of all the words after the words 'Wolli Creek.'"

The amendment was seconded by Mr. Wright, and negatived on the following division, upon the question, "That the words proposed to be omitted stand part of the motion":—

Ayes, 6.		Noes, 2.
Mr. Ewing,		Mr. Hassall,
Mr. Humphery,		Mr. Wright.
Mr. Roberts,		
Mr. Clarke,		
Mr. Lee.		
Mr. Fegan.		

The motion was then passed on the following division:—

Ayes, 6.		Noes, 2.
Mr. Ewing,		Mr. Hassall,
Mr. Humphery,		Mr. Wright.
Mr. Roberts,		
Mr. Clarke,		
Mr. Lee,		
Mr. Fegan.		

THOS. EWING,  
Chairman.

Office of the Parliamentary Standing Committee on Public Works,  
Sydney, 24 July, 1896.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC  
WORKS.

MINUTES OF EVIDENCE.

IMPROVEMENT OF COOK'S RIVER.

TUESDAY, 16 JUNE, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.  
The Hon. CHARLES JAMES ROBERTS, C.M.G.  
The Hon. WILLIAM JOSEPH TRICKETT.  
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
JOHN LIONEL FEGAN, Esq.  
THOMAS HENRY HASSALL, Esq.  
GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee proceeded to consider the proposed Improvement of Cook's River.

Cecil West Darley, Esq., Engineer-in-Chief for Public Works, Department of Public Works, sworn, and examined:—

1. *Chairman.*] Has the scheme before the Committee been prepared under your supervision? It has. C. W. Darley, Esq.  
2. Have you a Departmental statement to make in respect of it? Yes; it is as follows:—This matter has occupied the attention of many engineers during the last ten or eleven years, and while all seem to admit the necessity for something being done, there has been some diversity of opinion as to the remedy. On main points, however, all agree, also, that to do anything effectively, the work must involve a considerable expenditure. For many years the call for some remedial measures came from property-owners on the low-lying portions of Marrickville, the complaints being that their property was submerged during every rain-storm with upland water, which, owing to defective outlets, remained on this land a considerable time; ultimately, when drying off, leaving a deposit of sewage matter over their land which became offensive, and prejudicial to the health of the inhabitants. That this was not without grounds for complaint, may be realised from the fact that over 100 acres of the land is below high-water mark, and this at once points to the difficulty of dealing with the whole question. Of late, the complaints have been more numerous from residents in the neighbourhood of Cook's River and Wollie Creek, who state that the district is becoming unhealthy from the foul state of those water-courses. This is no doubt largely due to the long continuance of dry weather, and the absence of rainfall to scour out the channels; there is no doubt but that the evil is intensified also from the addition of drainage matter from suburbs surrounding Marrickville flats. For the information of the Committee, I hand in the following papers:—

1. A *précis* of the papers on this subject from 1885 to date, and the following reports in full, which show some of the schemes proposed for dealing with the matter, also an early history of Cook's River Dam, collected from old records.
2. Dr. Ashburton Thompson's report on the sanitary condition of creek through Marrickville Valley.
3. Report by Mr. Stayton on drainage of Marrickville Valley.
4. " Mr. Price " "
5. " Mr. Bagge " "
6. " Mr. Hickson " "
7. " Mr. Williams " "
8. " Mr. Darley " "
9. " "Digna Sequamur" "
10. Report of Mr. Price on last proposal.

THE main difficulty in the way of proper drainage of this district is the obstruction offered by the causeway carrying Cook's River Road across the river, known as Cook's River Dam. This dam was constructed in the early days of the Colony—as nearly as I can ascertain it was erected in 1839-41 by prison gangs during Sir George Gipps' governorship, the object being to shut out salt water from the low-lying land, and retain fresh water up the creeks for various business purposes; sluice-gates were provided at the same time for passing out the river water, but these were evidently found insufficient, for between the years 1861 and 1876 several sums were voted and expended in providing a greater number of sluices, and enlarging those originally constructed. Altogether the sum of about £7,344 was expended during the years named in improvements to the dam; this probably included a sum spent in widening the roadway. The improvements in the river below the Cook's River Dam, viz., forming fascine banks and dredging, have so improved the channel that the tidal range at the dam has been largely increased, low water being now about 2 feet below what it formerly fell to at that point; this at once points to the possibility of improving

C. W. Darley, Esq., improving the drainage outlet by lowering the sills. In one of the earliest reports, viz., that by Mr. Stayton, dated 19th July, 1888, he deals with the state of the then drain or creek between Renwick-street and Cook's River; this has, however, been subsequently greatly improved by the Marrickville Council constructing a drain lined with sheet-iron the whole way down the valley, from near St. Peter's Station, which provides a free discharge to Cook's River; he also suggests the opening of the flaps in Cook's River Dam, or the total abolition of the dam. On this report Mr. Bennett, the Engineer-in-Chief for Sewerage and Commissioner for Roads, writes a minute as follows:—"Now that the river below the dam has been improved by the Harbours and Rivers Department and made susceptible of further improvement by deepening, there is no doubt that the proper course is to make a clear deep opening in Cook's River Dam, remove the sluices, if required, higher up the river, reclaim the surplus land along river by embanking and filling in to above junction of the Marrickville Creek, straightening and deepening that creek—so as to bring the level of low water at Botany right up, by widening the creek; also the discharge of floods could be provided for, some material obtained to raise the level of the adjoining low-lying land, and by having, at reasonable intervals, simple flushing-gates, the high water could be retained until ebb allowed a good cleansing flush being let go. The removal of the dam, now that a definite channel is made below would most likely have the effect of reducing high flood level in Cook's River." This minute is quoted in full as it embraces most of the main features of all the more recent proposals. About this time a number of residents and others interested formed themselves into what was termed the "Marrickville Sanitary Trust"—and drafted a Bill to submit to Parliament—seeking power to resume all low-lying land, improve it by drainage works, and re-sell, &c. On this draft Bill or scheme, Mr. E. B. Price was asked to report. His report is among the papers already handed in. Mr. Price points out that the capital of the Trust was limited to £100,000, which excludes the purchase of land and compensation, but according to Mr. Price's estimate, the works proposed would most probably cost £158,000, exclusive of purchase of land, and he arrived at the conclusion that it would be impracticable to raise the whole valley above flood-level, as proposed. Mr. Price then goes on to recommend a scheme embracing the following principal features:—

1.—A dam across Marrickville Flats, near Tempe.

2 and 3.—North and south intercepting drains, the former 84 feet wide, and the latter 20 feet wide.

4 and 5.—A low-level drain up centre of valley, and raise the ground on either side.

6.—To erect a pair of low-lift centrifugal pumps to deal with low-level drains.

Estimated cost, exclusive of the purchase of land, houses, and compensation, £51,817.

As many streets have since been formed and built upon along the site where it was proposed to construct the intercepting drains, it is very probable that the cost of resuming the land required to form the drains now, would amount to nearly £100,000, so this scheme would seem to be out of the question, on account of the probable cost. Mr. Bagge, Assistant Engineer for Sewerage Construction, next reported. [*Vide Appendix*]. He compares Mr. Stayton's and Mr. Price's suggestions, preferring the former, and gives fresh estimates for various schemes, varying from £11,000 to £141,400. Mr. Hickson covers this with a minute recommending Mr. Price's scheme. [*Vide Appendix*]. Mr. Williams next reported. [*Vide Appendix*]. He recommends additional dredging in Cook's River below the dam—the lowering of the sills in the dam, construction of ten additional sluice-gates, and deepening and widening the channel above the dam, estimated cost, £14,000. The matter is then referred to Mr. Darley for report. In his report [*Vide Appendix*] the scheme now submitted to the Public Works Committee is sketched out; no estimate is attached, this scheme being fully dealt with later on. The next stage is reached when the Marrickville Council offer a premium for the best scheme for dealing with the whole subject. So far as can be gathered from the papers, the award was given to an author signing his paper "Digna Sequamur," which was submitted by the Council for the consideration of the Department. The scheme proposes the formation of a navigable canal from Cook's River up through the centre of Marrickville flats, requiring—

1. Removal of a portion of Cook's River Dam, and erection of five bridges, viz., four of 30 feet span and one of 50 feet span, with 14 feet headway.

2. Dredging Cook's River above railway bridge to a depth of 9 feet.

3. Raising the railway bridge 6 feet, and an additional opening for Wolli Creek.

4. Dam across Marrickville flat.

5. Navigable canal, 95 feet wide, up flat, alongside the railway, with an entrance lock and upper basin.

6. Filling up low ground to high-water mark.

7. Two lift bridges and three fixed bridges over canal.

8. Three miles of new roads along canal banks—Cost estimates at £41,263.

A foot-note states: "This estimate does not include the raising of Tempe railway bridge, nor compensation for filling up low lands, for it is considered that the Railway Commissioners should do the first, and that the latter is an improvement to property." This scheme was referred to Mr. Price for report. [*Vide Appendix*]. After dealing fully with the scheme, Mr. Price points out that it is altogether underestimated, and sums up by saying, "The conclusion I have arrived at as to the merits of the scheme prepared by 'Digna Sequamur' is that it would be very costly, and would not prevent the periodical flooding of Marrickville." In August, 1892, Mr. J. B. Webster, Borough Surveyor, supplied the Marrickville Council with a lengthy report on the subject, but the recommendations are very similar to those proposed in 1890 by Mr. Darley. He suggests that certain temporary works be carried out, at an estimated cost of £6,887, this is chiefly to lower the sills of the flood gates. The *précis* shows that subsequent action taken mostly during 1895, had reference to the insanitary condition of Cook's River and Wolli Creek, due, no doubt, to the very dry season. The Minister having previously instructed Mr. Darley to prepare plans and estimates for the scheme, on the lines suggested by him, this was done, and on 12th February, 1895, Mr. Darley submitted the following report and estimate—"Numerous reports have been prepared dealing with this matter. In November, 1889, Mr. E. B. Price made a careful investigation, and sent in a report and estimate (M.P. 89/7,903). In April, 1890, Mr. Williams prepared a report (M.P. 90/2,764). On this I wrote a minute, pointing out the direction in which the improvements should be commenced (M.P. 90/3,202). About the same time Mr. Hickson wrote a report, and submitted several alternative estimates for dealing with the drainage (M.P. 90/498 sewerage). The Council subsequently offered a premium for the best scheme, and, I believe, awarded the prize to one marked "Digna Sequamur" (M.P. 92/3,201). Mr. Price reported on the proposal made therein (M.P. 92/8,741), the conclusions Mr. Price arrived

arrived at being "that it would be very costly, and that it would not prevent the periodical flooding of Marrickville." Mr. Price's report deals chiefly with the question of providing intercepting channels for dealing with the upland drainage, and a pumping station and channel to deal with the low levels. I consider it unnecessary to open this part of the subject again, as it seems to me to be a matter which should be dealt with by the council, or a local trust on the betterment principle, but as pointed out in my previous report, I think the Government might take in hand the outfall or Cook's River improvements to provide a better escape for flood-waters and prevent the backwater flooding, which now takes place when Cook's River is in flood. Many years ago the Government constructed Cook's River Dam, and provided flood-gates therein, but these are insufficient to let off flood-waters, and at any time not low enough to obtain any benefit from low-tide drainage. It would be a very simple matter to remove a portion of this dam, and provide a bridge across the opening, and then construct a dam with low sluice-gates across the outlet from the Marrickville flats, but the question of admitting salt water up Cook's River, and submerging a large area of land with salt water at high tide would soon crop up, and lead to much trouble, as I assume all those who own lands have a vested interest in the fresh-water frontage. This I pointed out in my previous report, and the surveys that have since been made have further confirmed me in this opinion. I, therefore, see no reason whatever for departing in the least from the scheme I originally proposed, namely, to remove 300 feet of Cook's River Dam, and construct a road-bridge across the opening, and to construct a dam with low and ample sluice-gates across the Marrickville drainage outlet, keeping the top high enough to prevent floods passing down Cook's River from entering the lowlands. Construct concrete overshot dams across Cook's River, near Undercliffe Bridge, and across Wolli Creek, a short distance up from its junction with Cook's River. Then to construct fascine banks or training-walls to keep tidal and flood waters from entering the low portion of Unwin's Hill Estate. To resume some frontages near Tempe and make reclamations in front. I have had soundings and borings taken, and detail plans have been prepared for all these works, and estimates have now been prepared. I estimate the cost as follows:—

C. W. Darley,  
Esq.  
16 June, 1896.

	£	s.	d.
Removing Cook's River Dam, altering level of portion of road, re-making same, and providing side fences	800	0	0
New timber bridge, 300 feet long and 40 feet wide	5,500	0	0
Temporary bridge, required during progress of works	1,600	0	0
Training-walls and fascine banks on both sides	10,200	0	0
Dam and sluices across Marrickville flats	4,300	0	0
Dam and sluices across Cook's River at Undercliffe	3,100	0	0
Dam and sluices across Wolli Creek	2,600	0	0
Dredging full width of channel 5 feet deep up Cook's River to Undercliffe and up to Wolli Creek dam	5,000	0	0
Contingencies (say)	3,300	0	0
<b>Total</b>	<b>£36,400</b>	<b>0</b>	<b>0</b>

In this estimate I have not put down any sum for land resumption—some questions of title are likely to crop up, so I have avoided the subject—but I doubt if the item can possibly be a heavy one under any circumstances. The objects to be gained by this scheme will be to keep the Cook's River waters wholly out of Marrickville, to let the flood-waters pass freely down and escape much more rapidly than is possible at present, to lower the low-water level of Cook's River above the present dam by fully 2 feet, and thus provide a better and lower escape for the drainage. I think that if the owners of property in Marrickville carried out the drainage of the lowlands, as sketched out by Mr. Price, at their own cost, that the Government might undertake the outlet works as set forth in my estimate. I have put down the sum of £5,000 for dredging. Perhaps this item might be omitted, as the work would be carried out by our dredges, and paid for from the annual dredge vote, as in the case of all other river dredging. This is the scheme which has been submitted for the consideration of the Public Works Committee. During the debate on this matter in Parliament the sum of £56,000 was named as the probable cost of Mr. Darley's scheme. This was the first estimate prepared, but it included sums for an iron bridge in Cook's River Dam instead of a wooden bridge subsequently adopted; also sums for lengthening the railway bridge and Unwin Road Bridge. Mr. Darley decided not to provide for these works, as it was very doubtful if they would be necessary for the scheme, and, as they involved a sum of £20,000, they were omitted and the estimate reduced to £36,000, which sum appears in Mr. Darley's report.

#### ALTERNATIVE PROPOSAL.

When further investigating this matter, it occurred to Mr. Darley that the object sought, viz., to drain Marrickville lowlands, might be accomplished in a manner different from any scheme previously proposed. Mr. Darley's report is as follows:—

##### *Alternative Design for Drainage of Marrickville Flats and Improving Cook's River.*

Engineer-in-Chief for Public Works to Under Secretary.

Department of Public Works, Engineer-in-Chief's Office, Sydney, 11 June, 1896.

When further investigating this subject preparatory to dealing with it before the Parliamentary Standing Committee on Public Works, it occurred to me that all the schemes hitherto proposed were more or less liable to be ineffective during heavy floods in Cook's River. There is no doubt but that much of the flooding of the lowlands which has taken place in the past was due, not so much to rainfall in the Marrickville basin as to the flood-waters of Cook's River entering and passing up the Marrickville valley.

The dam at mouth of valley proposed in the scheme submitted would, of course, confine the flooded river to its own channels, but so long as a flood lasted there would be little or no get-away for the rain waters collected on the Marrickville drainage area, and even if the Cook's River Dam were removed and other improvements carried out, Cook's River, when in flood, must always maintain a level up to—if not above—mean high level. It is therefore obvious that if an outlet could be provided for the Marrickville surface drainage away from the influence of Cook's River floods, it would be most desirable to bring this about.

I find this can be done by constructing a drain through a tunnel, passing from the centre of the valley a little below the Marrickville to Burwood branch railway junction to Shea's Creek, passing under the Cook's River Road, near the Bay View Asylum.

The invert of this drain to start at about L. W. M. S. T. with a fall of 1 in 3,200 through the tunnel, which I propose making 15 feet wide and 6 feet high. Being through sound sandstone rock, very little lining will be required; but at the ends of the tunnel there might be a length of covered way to avoid land severance.

At

C. W. Darley,  
Esq.  
16 June, 1896.

At the outlet of tunnel it will be necessary to construct a set of self-acting sluice-gates to shut out tidal waters and allow the inland water to escape during falling tides down to low-water level. From the outlet end of tunnel to Shea's Creek I propose to construct an open canal 50 feet wide and 2 feet deep at low water, free from any disturbing influence such as must exist in Cook's River, to within 3,200 feet of the centre of the Marrickville basin.

It will still be necessary to construct the dam across the outlet of the valley, as in original scheme, but without any sluice-gates, and to lower the sills of the sluice-gates in the Cook's River Dam, and to carry out some dredging for the sanitary improvement of both Cook's River and Wollie Creek, but otherwise to leave things as they are. This will save the cost of expensive bridges, levees, two dams, and sluice-gates.

I estimate the cost of this alternative scheme as follows:—

Tunnel and drain to Shea's Creek, with flood-gates, &c., complete .....	£15,000
Dam across Marrickville valley .....	2,000
Dredging in Cook's River and Wollie Creek .....	4,000
Lowering sills, Cook's River Dam .....	2,000
Contingencies (say) .....	2,000
Total .....	£25,000

In this scheme sluice-gates in the Marrickville dam are unnecessary, thus making that work much less costly, for even in the event of an abnormally heavy rainfall taking place and submerging the tunnel for a time during high water, this can but cause a very temporary flooding, and such would still occur were sluice-gates provided, as they would be inoperative through the flood-waters in Cook's River.

In a short time the sewerage reticulation of the district surrounding Marrickville flats, as well as a low-level system for the more densely populated part of the lowland, will be carried into effect. This will remove all cause of pollution which makes the drainage from this valley so offensive, and causes much of the fouling of Cook's River.

Within the last year or so, many complaints have been made of the polluted state of Wollie Creek. The reports on the subject indicate this to be more or less due to water discharged from a tannery and obstruction in the creek caused by the growth of weeds, &c. This might be removed by some dredging for which provision is made in the estimates, but lowering the sills of Cook's River Dam, and occasionally sluicing out with salt water, may do much to improve the condition of the water inside the dam.

I have made no provision for drain through the valley approaching the tunnel. These drains should be cut wide and as straight as possible to give a free discharge towards the tunnel.

This work is not included in either scheme, as I consider the local drainage should be carried out by the Council. It should not, however, be a costly matter.

C. W. DARLEY.

3. Why do you propose to extend the fascine bank beyond the dam in Wollie Creek? To prevent the water from running on to the land crossed by the Unwin's Bridge Road.

4. Is that private land? Well, the Government paid for the piece which was taken for the Western Suburbs sewerage main, but there is a legal question involved. It is open to question whether all the land originally below high-water mark does not belong to the Government.

5. Have you a map showing the drainage area of Cook's River? Yes; the map of Sydney and its environs before the Committee, shows, enclosed by red lines, the Marrickville water-shed, 1,700 acres; the Cook's River water-shed, 8,000 acres; and the Wollie Creek water-shed, 5,000 acres—a total area of 14,700 acres. I also submit a plan showing my alternative scheme, and a longitudinal section.

6. Have you a sketch showing the nature of the improvements which have been made in the Marrickville Creek basin? I think the plan before the Committee shows most of the houses erected within that area.

7. Have you any information with reference to the value of that land and of the improvements upon it? No, I have not. The Marrickville Municipal Council would give you that information.

8. What is the rise and fall of the tide in Cook's River below the present dam? Six feet.

9. Therefore, it follows that any portion of the Marrickville Creek basin, which is 6 feet below high-water mark, cannot be drained except by pumping? Yes; but none of the land is quite so low as that. There are, however, 100 acres which are below high-water mark.

10. *Mr. Wright.*] How much would the lowest of that land be above low-water mark? About 3 feet.

11. *Chairman.*] If there were a flood in Cook's River, you could not drain the water from the Marrickville basin? When Cook's River is in flood no water can escape from the Marrickville basin.

12. Cook's River would be in flood at any time when the Marrickville valley was likely to be submerged by local rains, so that even if your works were carried out the valley would still be submerged at certain times? There may be times, after a very heavy fall of rain, when the tunnel will not carry off the water as quickly as it comes to it.

13. I am referring to the first scheme, not to the alternative scheme? There may be periods when the water will accumulate in the valley in the way you mention.

14. How high does Cook's River rise in flood time? We have had the flood-water about 2 feet over the dam.

15. Under the altered condition of things which you propose to bring about, must not Cook's River occasionally rise sufficiently high to prevent the water from flowing off the Marrickville valley? That is so.

16. Can you tell us how often that is likely to happen? Whenever the river is in flood. We have had several floods in some years, but there has been no flood for the last two years.

17. Is this then a flood relief scheme which will be ineffective in flood time? It will be ineffective while the flood in Cook's River lasts.

18. What area of land drains into Cook's River in addition to the area shown upon the plan? 8,000 acres.

19. What municipalities drain into it? —

20. Will Cook's River become a sewer for the reception of the drainage of those municipalities? All their storm-water drains will find an outlet in the river.

21. Therefore the proposed improvement to the river will be of benefit to other municipalities besides those immediately affected by the existing nuisance? That is so.

22. The substitution of an open bridge for the present Cook's River Dam will necessitate the construction of a long fascine bank on the south side of the river, and the making of a dam across Wollie Creek and across a higher part of Cook's River, together with a dam across the outlet of the Marrickville valley? Yes.

23. If sluices were made in the present dam, would not that do away with the necessity for all these works which are intended to prevent the sea-water from running on to the adjacent lands? Yes; but whenever Cook's River was in flood its waters would flow up the Marrickville valley, and we want to stop that. The residents in the Marrickville valley suffer most from the flood-water of Cook's River running up into the valley. The valley might be flooded in consequence of heavy rainfall upon the southern slopes of Ashfield, Petersham, and Canterbury, although there might be no rain locally.

24. But if you have sluice-gates in the present dam the sea-water would be kept out of the river? The sea-water is kept out now. C. W. Darley,  
Esq.  
16 June, 1896.
25. The flooding of Marrickville valley by local rain-water would probably occur when Cook's River was in flood? Yes, the worst floods occur in that way; but you may have a flood from one cause alone.
26. The flooding of Cook's River is caused by heavy rainfall above the dam? Yes.
27. Have you given the Committee any detailed information as to the cost of resumption, the cost of the fascine work, and so on? I will supply that information.
28. What is the total cost of the alternative scheme? £25,000.
29. Does that include the cost of land resumption? There will be so little land resumption that I have put nothing down upon that account. It will not be necessary to resume the land through which the tunnel will pass. I think the only land that will have to be resumed will be a piece lying between the mouth of the tunnel and Swamp Road.
30. *Mr. Wright.*] That is not very valuable land? No.
31. *Chairman.*] To what distance are the banks of Shea's Creek fascined? For nearly a mile above Ricketty-street.
32. Then the fascine banks there prevent the tide from flowing on to the adjacent land? Yes; the tide is confined within the channel of the creek.
33. The alternative scheme is simply a scheme for draining Marrickville Flats? Yes; to drain the Marrickville valley, and to prevent it from being flooded by the water of Cook's River.
34. Would not the first scheme, besides benefiting the people in the Marrickville Valley, be advantageous to the residents of other municipalities? You would not get as good a result from the first scheme as from the alternative scheme. Cook's River itself will be sufficiently improved by lowering the sills of the flood-gates in the dam 2 feet, and thus allowing a better discharge.
35. Why will the alternative scheme bring about a better result? Because the proposed drain will discharge at a lower level than could be got if the water were taken to the outlet of the Marrickville Valley. Cook's River is so wide at Shea's Creek that it is impossible for any flood to make any great difference in the height of the water there.
36. The proposed drain will have a better fall? Yes, it will have a constant fall at extreme low water, whereas the fall into Cook's River above the dam would be uncertain. The fall there would depend upon whether the river was in flood or not, and the chances are that in flood-time the water would not be able to get out of the valley.
37. If your first scheme were carried out the water would have to travel about a mile and a half to reach the mouth of Shea's Creek, while if the alternative scheme were carried out it would only have to travel a mile? Yes; but I do not think that any flood in Cook's River would materially affect the water-level of Shea's Creek.
38. If the Cook's River Dam were removed, and the river rose 6 feet at the mouth of Marrickville Creek, would it be down to sea-level at the mouth of Shea's Creek? If the dam were removed I do not think the river would rise more than 3 or 4 feet at the mouth of Marrickville Creek.
39. If it rose 3 feet at the mouth of Marrickville Creek, would it be down to sea-level at the mouth of Shea's Creek? Yes.
40. That would mean a fall of 3 feet in a mile and a half? Yes; but immediately below the present dam the river spreads out into a very wide channel.
41. Why was the dam originally constructed? I was speaking to-day to an old resident who saw the first man walk over the dam after its completion in 1841, and he told me that it was constructed merely as a causeway; but it is evident, from the fact that sluice-gates were put into it, that there was also an intention to keep the water above the dam fresh. There were some manufactories there, I believe, which required fresh water.
42. You recommend that the scheme before us should be carried out at the expense of the State, and that the works necessary to bring the water in the Marrickville Valley to Cook's River should be carried out by the local municipality? Yes.
43. Do you make a similar proposal in regard to the alternative scheme? Yes.
44. The alternative scheme simply provides a storm-water channel? Yes. The object of that scheme is to prevent one district from being flooded by water coming from other districts.
45. Was the storm-water channel at Croydon constructed at the expense of the State? Yes; but the local municipalities are taxed to pay something towards its cost.
46. Is this a similar case? Not quite; because the water flowing into the Marrickville valley comes from other districts. To prevent water from entering that valley it is necessary to block up the natural outlet, and the proposed channel gives another outlet.
47. If the Cook's River Dam were removed the locality would be as nature left it? Yes; and then the salt-water would cover 100 acres of land there.
48. *Mr. Fegan.*] You propose to drain private land at the expense of the public? The same thing has been done in a number of similar cases. On the Hunter, for instance, the Government have constructed dams to prevent flood-water from flowing upon adjacent lands. Of course, if we put a dam across the mouth of the Marrickville valley any water draining into the valley would be impounded there, and, therefore, we propose to construct a channel draining towards the mouth of Shea's Creek.
49. *Chairman.*] You say that if the Cook's River Dam were removed, you would have to protect a large area of land above the railway bridge from being overflowed by salt-water? Yes; I think the Government would be bound to prevent that land from being covered with salt-water.
50. *Mr. Hassall.*] What is the object of the scheme? The object of the scheme is to drain the Marrickville flats, and to prevent the flood-water of Cook's River from flowing over that land.
51. It is a scheme to drain the low-lying parts of Marrickville? Yes.
52. What area of land would be inclosed by the fascine banks on the south side of the river? About 20 acres, I think.
53. Is that land now flooded at high water? No; because the sea-water is shut off by the Cook's River Dam.
54. Is it low-lying land? Yes. The sea-water is only held off it by the dam.
55. What are the fascine banks for? To keep the water off the land after the dam has been removed. If the dam were removed, and no means were taken to protect the land, the salt-water would flow over it to where there is a blue line shown on the map.

- C. W. Darley, Esq.  
16 June, 1896.
56. If the dam is not removed that land will remain in its present condition? Yes; the owners of that land make no complaints at present, except about the unsanitary condition of Cook's River and of Wollie Creek. Wollie Creek is full of weeds, and there is a tannery discharging into it.
57. I suppose this land is not of much value at the present time? I think it is fairly good grazing land.
58. A fascine bank constructed around it would improve it materially? If the dam were removed such a bank would keep the salt-water off the land; otherwise the land would not be improved.
59. If the dam were removed, it would be necessary to construct this fascine bank and to make two other dams—one higher up Cook's River and the other across Wollie Creek? Yes.
60. Is there any person there who would have a claim upon the Government if salt-water were allowed to run upon that land? I think the Crown would be liable for claims for compensation for loss of fresh water.
61. *Chairman.*] What objection is there to making more sluice-gates in the present dam? You could not in that way give the flood-water so free a vent as it would have if there were an open bridge. The object of removing the dam is to reduce the height of the water in Cook's River, and to enable the water to be drained off Marrickville Valley. The earthwork dam shown on the map is common to both schemes, but it would be cheaper to construct if the alternative scheme were carried out, because then no sluice-gates would be required.
62. How much would the water back up if there were large sluice-gates in the present dam? I think it would be more costly to put large sluice-gates in the Cook's River Dam. Originally there was only one sluice-gate in that dam, but that was found insufficient, and therefore, in 1861, a second was made alongside it; that cost £2,637. In 1876 extra sluice-gates were made at the southern end of the dam; they cost £4,600. Altogether, £7,344 have been spent in putting extra sluice-gates into the dam.
63. *Mr. Hassall.*] You estimate that if the water is kept out of the Marrickville Valley it will only be necessary to lower the sills of the present flood-gates 2 feet? Yes.
64. To whom does the land on the north side of the river belong which you propose to reclaim? I think that it is part of the Warren estate. It was cut up into small allotments, but I do not think it was sold. There is a small piece of land between a road and the water which we propose to resume in order to get rid of any frontage rights. That resumption will increase the value of the reclaimed land, which will have a long frontage to the Cook's River Road.
65. Do you think that that land will repay the cost of reclamation? I think so.
66. Why not reclaim the land on the opposite side of the dam? That place has only lately been dredged out as a sort of basin for ships.
67. The Government will sell the reclaimed land? It will be quite within the power of the Government to do so.
68. How will the Marrickville Council meet the Government in regard to the expenditure upon this scheme? I think that the Marrickville Council should make whatever drains are necessary to convey the water to the outflow channel.
69. Does this land drain into Cook's River now? Yes; it is drained by a channel passing through the middle of the valley, and following Carrington Road.
70. Is there an open drain? An open drain constructed with temporary water-pipes. It is 4 feet across, and 2 feet deep.
71. What provision do you make for draining the southern part of the valley? The valley is almost level. Water will run almost as easily from the end at which it is proposed to place an earthwork dam to the mouth of the tunnel as it will run from the other end of the valley.
72. Will the Marrickville Council assist in the construction of the proposed tunnel and channel? That is a matter for arrangement. I think that they might fairly be asked to pay in some degree towards it, though, as an engineer, I have not much to do with the matter. I have made no provision for the construction of drains leading towards the channel, because I think that those drains should be made by the Municipal Council. If the Government shut the water out of the Marrickville valley, and give an outlet for water falling into that valley, they will have done the most that can be expected of them.
73. The Government are not responsible for the water which flows into the valley? Well, the Government has accepted a similar responsibility in other parts of the Colony. On the Clarence, at Maitland, and in other places, large sums have been spent upon similar works.
74. But this expenditure will not benefit the public estate;—there is no Crown land here? No.
75. Do you think the alternative scheme is the better of the two? Yes; it is the better and the cheaper of the two.
76. If you drained into Cook's River the fall would depend upon the height of the water in the river, whereas if you drained towards Shea's Creek there would be a constant fall, without any danger of the water backing up? That is so.
77. If you commence to interfere with the works at present in existence, you begin to interfere with vested rights, and claims for compensation will follow? Complication will arise.
78. No complication can arise if the proposed scheme is carried out? No.
79. *Mr. Roberts.*] What will be the cost of your proposed tunnel? £15,000 will be the cost of the open channel, the tunnel, and the outlet works. Sluice-gates will be necessary to keep the salt-water from coming up the channel.
80. What area of land will it drain? 1,700 acres.
81. How much of that area is within the Municipality of Marrickville? —
82. What other work is there in connection with the alternative scheme? The dam across the entrance to the Marrickville valley, which is necessary to keep the flood-water of Cook's River out of the valley. Cook's River will flood the Marrickville valley as far as the Sydenham Road.
83. But if the proposed channel were made, would the flood-water pass it? Yes; I think it would. It would be necessary to prevent the water of Cook's River from flowing into the valley.
84. How do you propose to expend the £10,000 balance? £2,000 will go in constructing new sluice-gates in the existing dam, and £4,000 in dredging and cleaning out the channel of Cook's River and Wollie Creek. Then there will be the earthwork dam to construct, and about £2,000 for contingencies.
85. What area of land will be reclaimed? There will be no reclamation under the alternative scheme.
86. Are there any wharfs to be constructed? Not necessarily.
87. Will the railway bridge have to be lengthened? No; I do not propose to touch it.

88. *Mr. Wright.*] The fascine bank is only designed to protect the property it surrounds from sea-water? *C. W. Darley, Esq.*  
Yes.
89. I gather from your remarks that the alternative scheme will effect the object of draining the Marrickville valley with more certainty than the original scheme? Yes; and it will be cheaper.
90. If the alternative scheme is carried out will the pollution of the river cease? Yes; so far as that pollution is caused by the drainage coming from the Marrickville valley. I propose to guard further against pollution by lowering the sills of the sluice-gates in the present dam, and by spending £4,000 upon dredging and cleaning the river.
91. Will that effectually destroy the nuisance? I think it will.
92. A freer flow will scour the river? There will be a better scour, and it will be possible to admit the salt-water occasionally, and thus create an artificial scour with the help of the tide. That has been done lately with good results. We propose to lower the sills of the sluice-gates to low-water level.
93. You feel confident that this alteration will effectually destroy the nuisance? Yes.
94. Has the Metropolitan Water and Sewerage Board constructed any sewers in the neighbourhood of Cook's River? One main sewer has been constructed there, and the north-west slopes of Marrickville will drain into it. The reticulation works are now going forward. Contracts are also being prepared for the carrying out of what is known as the low-level system. That part of the district lying around Sydenham Station will be drained to a central place, and the drainage will then be pumped into the main sewer, which runs on the western side of the basin.
95. Does the bulk of that sewage now flow into Cook's River? Yes.
96. Principally house slops, I suppose;—the night-soil is dealt with differently? Yes.
97. When the sewerage works are completed a great deal of the present contamination will cease? Yes.
98. Your proposed channel is only a storm-water sewer? Yes.
99. It could not be made to drain on to Webb's farm? No; the sewage of the district will be conveyed by other sewers on to Webb's farm.
100. If the alternative scheme is carried out, what do you propose to do with Wolli Creek? We propose to clean it out.
101. What applies to Cook's River, so far as the scour is concerned, will apply also to Wolli Creek? Yes.

16 June, 1896.

THURSDAY, 18 JUNE, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.  
The Hon. CHARLES JAMES ROBERTS, C.M.G.  
The Hon. WILLIAM JOSEPH TRICKETT.  
HENRY CLARKE, Esq.  
CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.  
THOMAS HENRY HASSALL, Esq.  
GEORGE BLACK, Esq.  
FRANCIS AUGUSTUS WRIGHT, Esq.  
FRANK FARNELL, Esq.

The Committee further considered the proposed Improvement of Cook's River.

Cecil West Darley, Esq., Engineer-in-Chief for Public Works, Department of Public Works, sworn, and further examined:—

102. *Chairman.*] There are one or two matters upon which I think you have some further evidence to give the Committee? Yes. I was asked yesterday to make a statement as to the separate cost of the different parts of the fascine work and so on. The cost of that work would be divided up as follows:—  
Estimated cost of fascine bank along the right bank of Cook's River from near Undercliffe Bridge to Unwin's Bridge, thence up left bank of Wolli Creek, including sluices, £3,980. Estimated cost of fascine bank along the right bank of Wolli Creek from the proposed dam to western boundary of Sparke-street, £800. Estimated cost of stone bank along the left bank of Cook's River from Unwin's Bridge to Cook's River Dam, £5,440. I do not propose to spend any money upon the private lands on the south bank of the river near the existing dam. I think the owners of that property will be very glad to improve it themselves. If any expenditure is required there, it will be very slight. The cost of the Marrickville Dam in the original scheme is £4,300, and in the alternative scheme, £2,000; but in the latter case no provision is made for sluice-gates.
103. Have you any definite scheme with regard to the completion of the work at Shea's Creek? No definite scheme. We are pushing on with the construction of the canal, and are improving the banks on each side, the ultimate design being to give wharfage accommodation.
104. Are the fascine banks there standing? Some of the fascine work is decaying, and is being repaired from time to time. It does not last.
105. Notwithstanding that it does not last, you intend to use it in Cook's River? Well, although the fascine work itself decays the clay behind it is left, and that is generally quite sufficient. At Shea's Creek I have recommended that the fascine work should be faced with stone pitching, and we are doing some of that work now.
106. *Mr. Humphery.*] The estimated cost of the alternative scheme—£25,000—does not, I presume, include the cost of land resumption? The land resumption can only be a very small item.
107. Can you say approximately how many acres will have to be resumed? I should say, at the outside, we shall not require more than 1 or 2 acres.
108. And that land is situated in the least valuable part of the district? Yes, it is low-lying land.
109. Will your channel enable the Municipal Council of Marrickville to drain the Marrickville Valley if they connect with it? Yes, it will allow them to drain off the surface water.
110. It will make sufficient provision to deal with floods? Quite sufficient.
111. Assisted by the dam at the mouth of the valley? Yes; the object of that dam being to keep the water of Cook's River out of the valley. The natural watercourse down the valley was very ill-defined, and became choked with weeds. Then, in the dry season, all the sewage of the neighbourhood accumulated in it, and when a fresh came this sewage was swept out and distributed over the surface of the land. The

18 June, 1896.

local

C. W. Darley, local municipality then obtained from the Water and Sewerage Board a number of the temporary water supply pipes, which they split open and used to make a drain similar to that shown on the diagram before the Committee. This diagram shows the section of the present drain and of the proposed channel, with their relative levels. At the present time they can only drain the valley to about 3 feet above low-water mark, but the proposed channel will drain it right down to low-water mark. Last week, when there was a fall of 5½ inches of rain within twelve or thirteen hours, there were 10 inches of water lying on the surface of the ground at the site of the inlet of the proposed drain; but by the afternoon all the water was running down the present small drain. Of course it would take a very large channel to drain away the whole of the water falling on 1,700 acres, if it came direct to the channel, but we find from experience that rain-water does not reach such a channel all at once. Some of it soaks into the ground, and it is retarded in other ways.

Esq.  
13 June, 1896.

112. *Chairman.*] What is the level of the surface at the entrance of your proposed channel into Shea's Creek at the site of the Marrickville dam, and at the inlet of the proposed drain in the Marrickville Valley? If we call the low-water level at the mouth of Shea's Creek 10 feet, which is the level given on our plan, the average surface level at the site of the Marrickville Dam will be about 13 feet, and at the site of the tunnel inlet, from 14 to 15 feet.

113. *Mr. Humphery.*] What would be the fall of the channel? From 4 feet 4 inches to low-water.

114. And what fall is there from the Marrickville Dam towards the inlet of the proposed tunnel? The natural fall of the surface of the ground is slightly towards Cook's River; but the difference in level is not much more than a foot, so that by making any drain a little deeper at the tunnel end, you would get the water to flow into the tunnel.

115. What is the distance from the inlet of your channel to the Marrickville Dam? 2,650 feet. From the Marrickville Dam to the Cook's River Dam is 3,150 feet, and the whole distance from the intake of the channel to its point of discharge at Shea's Creek, going by way of the Marrickville Dam and along Cook's River, is 11,208 feet, while the actual length of the channel is 5,400 feet.

116. So that the discharge from the channel provided for in the alternative scheme will be at a point more than a mile from the Cook's River Dam? Yes.

117. That channel will drain off all the stormwater that would otherwise accumulate in the Marrickville basin? Yes.

118. If the alternative scheme is carried out, it will not be necessary to make the fascine banks shown on the plan before the Committee? No.

119. The only expense besides the cost of the channel will be in connection with the Marrickville Creek Dam, and the dredging of Cook's River and Wolli Creek? Yes, together with the lowering of the sills in the Cook's River Dam, for which I have put down £2,000.

120. But the expenditure in connection with the dredging of Cook's River, and the lowering of the sills in the Cook's River Dam may be looked upon as something altogether apart from your alternative scheme? Yes, it is a different expenditure.

121. *Mr. Trickett.*] Will you explain the working of the sluice-gates which you propose to place at the mouth of your channel? They will be ordinary flap valves, hung from the top, and will be so arranged that when the water in the channel is at a higher level than the water in the creek they will open; but when the tide in the creek rises they close automatically. These gates will be somewhat similar to the gates in the existing dam.

122. If you lower the sills of the gates in the first dam will not there be a risk of the salt water getting in? No; because the sluice-gates will be lengthened so as to keep it out.

123. Are you prepared now with the information asked for by question 81? Yes; the area of Marrickville watershed is about 1,700 acres. Of that the portion in Newtown is about 170 acres, the portion in St. Peters about 230 acres, and the portion in Marrickville about 1,300 acres.

124. Has the desirability of bringing this district under the operation of the betterment principle been considered by the Department? That is a matter of policy for the Minister to deal with. Very large drainage works have been carried out in the Newcastle district, but I am not aware that the betterment principle has been applied there.

125. In carrying out the alternative scheme, do you propose to improve any large area of land by filling in? No; all we do is to give an outlet for the stormwater in the Marrickville Valley.

126. Looking at the character of that part of Cook's River just above the dam, one would think that it would always remain pestilential unless some very definite channel were made;—is it proposed to do that? Everything will remain practically as it is; but if the Marrickville Dam is constructed it will be possible to keep the Marrickville Valley quite dry. Of course it will be necessary for the local municipal council to make drains through the valley to connect with our channel.

127. But in a stream like Cook's River, where there is so slow a current, if any at all, it would seem necessary to improve the channel;—I understand that there is a wool-washing establishment in Wolli Creek? A wool-washing and fellmongering establishment, I believe.

128. Will it not be desirable, if these works are carried out, to take steps to keep the stream clean in the future? I think that that would be desirable. In many parts of England manufacturers are required to filter any polluted water coming from their works before it is allowed to enter a river. A great deal of solid matter goes now into Cook's River besides the polluted water.

129. Is there much Government land along the banks of Wolli Creek? Not that I am aware of.

130. The land there has most of it been alienated? It has practically all been alienated, though some of the frontages belong to the Government. The land upon which it is proposed to erect the Marrickville Dam belongs to the Government, and the Government also owns some land between Unwin's Bridge Road and the main outfall sewer.

131. Will not the Marrickville Dam be likely to throw the water back on to the surrounding land? Not if proper provision is made for drainage.

132. At the present time that land drains into the river? Yes.

133. You propose to reverse the existing order of things? Yes.

134. And you think that there will then be no risk of flooding? There will be nothing like what occurs now. Whenever there is a fresh in Cook's River all that property is under water as now.

135. I presume that the land between the proposed dam and the inlet of the proposed channel is almost level? It is practically a dead level.

136. What is it used for now? There are some houses upon it; but it is chiefly waste land.

C. W. Darley,  
Esq.  
18 June, 1896.

137. You strongly recommend the adoption of the alternative scheme? Yes.
138. Do you think the local municipality will be able to bear the expense of constructing the necessary drains to connect with your channel? Yes; because I think the cost will be under £1,000. The municipality will be able to make these drains very cheaply, and they could use the material excavated to raise the level of various parts of the surface.
139. It is not likely that the people there would raise any objection to the undertaking? No; I should think they would be only too glad to have the land drained.
140. *Mr. Clarke.*] Who will benefit by this work—the public or the local proprietors? The local proprietors.
141. Do you think that they will be willing to bear part of the expense? I cannot say what the people of Marrickville think; but if I were a landowner there I should be willing to contribute.
142. You stated on Tuesday that in other parts of the Colony works of this kind were carried out entirely at the cost of the Government? At Maitland a great deal has been done on the principle of giving £ for £, though a great many works there have been carried out wholly at the expense of the Government. With regard to some works on the Richmond, I believe that the people benefited have agreed to pay part of the cost eventually, but in the meantime the Government is bearing the whole expense.
143. Do you think there will be any claims for compensation in connection with the making of the proposed channel? There will be no room for such claims, except in regard to the smaller drains, which I recommend should be left to the municipality. A municipality can always deal with people better than the Government can.
144. If the proposed fascine banks were made, would some of the low-lying land in the district still be liable to flooding? In times of very heavy rainfall the water might not run off the land as fast as it fell, but it would only lie on the land for about a day.
145. You do not propose to pump the water off the land? No. If a very heavy fall of rain occurred during a high tide the water might back up in the channel for a short time.
146. Have you proved these fascine banks to be a success? In certain cases they have answered very well; but I prefer to face a permanent work with stone. The fascines, however, are better than a clay bank, because they prevent a scour.
147. You use ti-tree in their construction? Yes.
148. Will that be easily obtained in the locality? There will be no difficulty in getting it.
149. How long do these fascine banks last? The outer portion decays away in about five years; but a good solid bank is left behind. Under some circumstances we might dispense with the fascines altogether.
150. Are you aware that at Moruya a large amount was expended upon fascine dykes which did not prove a success? Yes; but Mr. Moriarty, the then engineer, was quite opposed to the use of fascines at that place.
151. The first heavy flood swept the fascine work away? Yes, because it was built on sand, which the flood-water undermined. The Minister ordered the work to be done in spite of the protest of Mr. Moriarty.
152. *Mr. Lee.*] I think that a double object was sought to be gained by this work—first, the draining of the Marrickville Flats, and, secondly, the rapid removal of water in Cook's River? In the original scheme the two things had to be combined; but the second object is not essential in the alternative scheme.
153. The dam across the entrance to the Marrickville Flats is to be put there solely to prevent the inflow of water from Cook's River? Yes.
154. In the original scheme sluice-gates were provided in that dam? Yes; to let the water from the Marrickville Valley drain into the river.
155. In dealing with this matter, it is essential to prevent the inflow of water from Cook's River? Yes.
156. If there were a phenomenal fall of rain upon the Marrickville Valley, and a heavy flood in Cook's River, the water would be impounded at the dam under the first scheme? Yes.
157. I understand that the water which now spreads over Marrickville Flats carries with it a great deal of insanitary matter, which, being deposited, causes a great nuisance? Yes.
158. This insanitary matter is deposited not only on the surface of the ground but also in the buildings which are flooded? Yes.
159. You think that the alternative scheme will best keep this district from being flooded? Yes.
160. Either that scheme must be carried out or some system of pumping must be adopted? Yes; but I think that this scheme will be found sufficient.
161. The alternative scheme has this advantage: that it will enable the water falling into Marrickville Valley to immediately discharge itself into Sheca's Creek? Yes; without the disturbing influence of any flood in Cook's River.
162. If the alternative scheme be carried out will it be still possible for water to accumulate in the valley? If a very heavy rainfall occurred during a high tide the drains leading to the channel might overflow.
163. How long would a high tide last? Say, for three hours.
164. A high tide would obstruct the free discharge of the water? Yes; we cannot shut our eyes to the fact that the surface of the ground in the Marrickville Valley is 2 feet below high-water level, and, therefore, at high tide there is no outlet for the drainage of the valley.
165. There is no other point at which you could arrange for a better fall? No.
166. Therefore, under the most extreme conditions the flooding of the valley will not last for more than a few hours? No.
167. Now it lasts for days? Yes.
168. The drain which was constructed by the Marrickville Council has, to a certain extent, failed in its object? It is as effective as it can be expected to be. It drains the water into Cook's River pretty rapidly when Cook's River is not in flood.
169. From an economical point of view, it would seem eminently more practical to prevent flood-water from getting into the valley than to make provision for taking it out of the valley after it has got in? Yes.
170. Do you think that the lowering of the sills in the Cook's River Dam, and the dredging of the river above, will keep the water there free from pollution? The proposed work will allow the water to run off more rapidly. Complaints about the state of the river occur principally in very dry seasons, and at such times it would be possible to occasionally flush out the basin with salt-water.

- C. W. Darley, Esq.  
18 June, 1896.
171. What is the object of dredging Wolli Creek. We propose rather to clean out the water-way. In some parts you can hardly see the water-course, because of the reeds.
172. If these works were carried out, you think the condition of the river would be very greatly improved? Yes; a great deal of the drainage that now finds its way into the river will be shut off by the Marrickville dam, and in the course of a year or two the slop-water from the whole district, which now goes into the river, will be drained into the metropolitan sewers.
173. If we adhere strictly to the object of preventing the pollution of Cook's River, we must adopt scheme No. 1? I think that by lowering the sills in the Cook's River Dam the alternative scheme will be equally effective. No. 1 scheme would be more expensive; but I do not think that it would improve the condition of the river more than the alternative scheme.
174. You can give almost as much relief by the alternative scheme as by the original scheme? Yes.
175. I presume that neither scheme would involve interference with the railway line? No.
176. Will either scheme mean the closing of any roads? No.
177. With regard to the route of the proposed channel, I notice that for a long way it goes down Way-street? It follows the line of the street; but it will not affect the traffic, because it will be underneath.
178. Has the Government power to enter upon and tunnel under these roads without compensating the municipality? Yes; the Government has power to tunnel under any land for drainage work without paying compensation.
179. *Mr. Fegan.*] Does the Burwood Road railway prevent the water from getting out of the Marrickville Valley? No, because very large openings have been left in the embankments.
180. What is the depth of Cook's River at the site of the proposed Marrickville dam? Two or 3 feet at low water.
181. What is the bed of the river? Mud, on sand.
182. Is there any rock there? Not for some depth.
183. Then dredging will be easy enough? Yes.
184. I suppose you will use one of the small sand-pumps? No, a small grab-dredge.
185. What is the thickness of the sandstone along the line of channel? It crops out on the surface all the way. There will be 60 feet of cover under Cook's River Road. All across the hill the stone crops out on the surface. On the Shea's Creek side, however, the rock drops very suddenly.
186. What is not tunnel will be open drain? Yes.
187. What would be the cost of covering that drain? To cover it would be a costly matter, and nothing would be gained by doing so.
188. Has any offer been made by the municipality or the landowners of the district to convey to the Government free of cost any land required for the carrying out of the proposed works? No; we have not been in treaty with anyone about it. If the alternative scheme were adopted, the only land that would have to be resumed would be a small piece between the outlet of the channel and Swamp Road. About an acre of land would be required there.
189. Is that all the land that would have to be resumed? That, and a little bit at the site of the proposed dam.
190. When was this nuisance first complained of to the Department? The Department has been reporting upon it since 1885.
191. And a great deal of expense has been incurred in trying to get rid of it? No; the Government have not spent very much, except in maintaining the sluice-gates at the Cook's River Dam. The municipality, however, has incurred a good deal of expense.
192. Will not the alternative scheme, if carried out, ultimately form part of the sewerage system? It will help the sewerage system by taking off the surplus water which would otherwise drain into the low-level system, and have to be pumped into the outfall sewer.
193. That being so, do you not think that half the expense of the scheme might be put as part of the expenditure on the general sewerage scheme? The sewerage system will certainly benefit by the construction of this channel.
194. Therefore, part of the expense should be borne by that Department? All the storm-water drains in Sydney have been transferred to the Water and Sewerage Board, and that Board collects rates upon them. This drain might be dealt with in the same way.
195. *Chairman.*] How far does the Marrickville Valley extend? The flooded district extends close up to the St. Peters station.
196. Does the flood-water go up as far as the clay-pit marked on the map? Yes. A heavy flood in Cook's River will cover all that land, even if there has been no local rainfall.
197. Have you a statement as to the area of this valley? The following table shows flooded areas and quantity of water at various levels:—

Contour.		Area.	Contour.		Area.
R.L.		a. r. p.	R.L.		a. r. p.
13·00	3 feet below high water .....	1 2 15	17·00	1 foot above high water .....	138 3 0
14·00	2 feet below high water .....	14 3 35½	18·00	2 feet above high water .....	159 0 9
15·00	1 foot below high water .....	48 0 14	19·00	3 feet above high water .....	176 2 16
16·00	High water .....	109 2 37	20·00	4 feet above high water .....	.....

198. The difference between the original scheme and the alternative scheme is that the alternative scheme gives a fall which will enable the flats to be thoroughly drained, while the original scheme would leave 4 feet of water upon it at times? Yes; the fall given by the alternative scheme will allow all the water to drain off the valley.
199. *Mr. Humphery.*] What is the amount fairly chargeable under the alternative scheme to the draining of the Marrickville Valley;—is it about £18,000? Yes.
200. *Mr. Wright.*] The balance of the £25,000 will be expended with the object of purifying Cook's River? Yes, and of giving a better discharge to the water there.

FRIDAY, 26 JUNE, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G.  
The Hon. DANIEL O'CONNOR.HENRY CLARKE, Esq.  
JOHN LIONEL FEGAN, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Improvement of Cook's River.

John Ashburton Thompson, Esq., M.D., D.P.H., Chief Medical Inspector to the Board of Health, sworn, and examined:—

201. *Chairman.*] What is your official position? I am Chief Medical Inspector to the Board of Health.
202. Have you a knowledge of the submerged area in Marrickville known as Tram Vale? Yes.
203. Some years ago you made a report in regard to that place? Yes.
204. Have you had an opportunity of refreshing your memory in regard to your report? Yes.
205. You maintain its correctness still? As far as I know, certainly.
206. Have you recently seen the country under consideration? Yes, within three months. I have seen it from time to time pretty continuously for the last eight or nine years; I know it thoroughly well.
207. You are prepared to express a definite opinion on its sanitary state? Yes.
208. Had you made any report subsequent to the report you made in 1888? There have been from time to time complaints from persons who have bought land on that flooded area during dry weather, and have erected houses, and who found themselves in a lake when the weather became wet. There have been several complaints from such people who sought some remedy. My attention has been drawn again and again to the circumstances, and I have on two or three occasions reported concerning the area, but always with reference to a particular case.
209. The tenor of each report being somewhat similar to the tenor of the general report? Entirely to the same effect.
210. *Mr. Farnell.*] At whose instance were you called upon to report in 1888? A gentleman named Campbell seems to have made a complaint.
211. How many times have you been called upon to make a report? I was never called upon to report on the matter except in connection with the definite complaint of some inhabitant. I have been called upon to report under these circumstances perhaps two or three times, but as I had in 1888 made a formal report of rather a general character I never repeated my remarks.
212. Had you made a full report subsequent to 1888? No.
213. Do you know how many municipalities are concerned in this matter? No. I know the lay of the land.
214. How many do you think are concerned? St. Peters, Newtown, perhaps Petersham, and Marrickville.
215. Any improvements which might be carried out would not be alone for the benefit of the Borough of Marrickville, but would partake of a national character? That was not exactly what I meant. The municipalities I mentioned are interested in the matter because they supply the offensive material. In as far as the area referred to is offensive, that is, of course, the fault of other municipalities than the one within which the area lies. In as far as the area is flooded I do not know anything about that. I take it that that would be an engineering matter altogether.
216. In 1888, I take it, the whole of the surroundings were in a primitive condition as regards any arrangements for the discharge of the flooded waters and sewage? That was so. The natural watercourse by which these matters would be carried off appeared to have been interrupted by the embankment, the road made across the channel.
217. Do you know whether any attempt has been made by the local authorities to remedy this nuisance? Their efforts have been confined to straightening and re-forming the creek referred to, so that the slop-waters coming down from the other municipalities I mentioned might run through their district and not lodge in it.
218. Has this straight water-course had the desired effect? Not altogether. It has been beneficial as far as it goes during dry weather, but as soon as Cook's River rises it backs up the slop waters in this channel which is then insufficient for the purpose.
219. Would that be the means of distributing the sewage over a broad area? Yes.
220. Would it be that until the tide receded these waters would remain in these areas? Yes.
221. Have you subjected the sewage to any analysis? No.
222. Apart from the possibility of infectious diseases arising from these fever beds, can you see the probability of any danger to public health from these habitations being surrounded by the flooded waters, that is to say without sewage at all? Undoubtedly great danger, especially in conjunction with the way in which houses are usually built, that is without proper precautions to cut them off from the soil, and also frequently without proper precautions to keep their foundations dry.
223. Do you consider the present condition of affairs a danger to public health? I do.
224. Have you had an opportunity to consider the original scheme as well as the alternative scheme before the Committee? No; I have not interested myself very much in that. It being purely an engineering matter I do not know anything about it. The river backs up and it floods this flat. Flooding the flat is bad for health, I know, but why it backs up—I do not think I can make any remark about that.
225. I notice that in your report of 1888 you do not coincide with the views expressed by Mr. Stayton, who was deputed to make a report there? Yes; I agreed with Mr. Stayton entirely.
226. *Mr. Fegan.*] I suppose that a number of people have time after time pointed out the necessity of something being done to preserve the health of the people? Yes.
227. Round about that quarter has the health of the people improved since Shea's Creek works have been started; is it not a fact that Shea's Creek has materially drained the low land in the vicinity of the creek? Shea's Creek is on the other side of a ridge, and does not flow into that part of Cook's River.
228. Prior to that event had you received any complaints as to the insanitary condition of Marrickville Valley? The year 1888 got mentioned, because it is the date of this report, but I have known this valley ever since I was engaged in public work in the Colony. It was perhaps one of the first places my attention was specially directed to as a particularly unhealthy place.

J. A.  
Thompson,  
Esq., M.D.,  
D.P.H.

26 June, 1896.

J. A.  
Thompson,  
Esq., M.D.,  
D.P.H.

26 June, 1896.

229. Has the municipal drain made any difference to the drainage? It has made a difference during fine weather. The channel has been straightened and formed with sheets of iron, and the stuff now flows past where before it used to stagnate.
230. Yet it stagnates in another place lower down the valley? At present it falls into the river above the dam.
231. I mean down by Sydenham-street? It does not stagnate at that corner.
232. Do you know that there are 3 or 4 feet of water on that land at the present time? It is very likely; but I do not know that there are.
233. When that valley is flooded it is detrimental to the health of the residents? Undoubtedly.
234. Do many cases of typhoid fever come under your notice from that locality? Yes, from time to time; but, until comparatively recently, the number of houses really exposed to these conditions has not been very great. When I first made acquaintance with it it was open country; there may have been a house scattered here and there. It is only within a year or two that people have begun to build much on this flat.
235. You do not know much about the proposal to drain that locality? I have read about the schemes. I should not have said just now that I was not interested in them, but I am quite incompetent to discuss their merits.
236. You are deeply interested in the proposal? Certainly.
237. Considering the shallowness of the river, and that at low tide the river overflows its banks and fills the valley time after time, is it possible to have a proper system of drainage in these circumstances, or is it possible to so deepen the river that it will not overflow its banks there? I really do not know; I can only guess.
238. With the river overflowing its banks it is very hard to carry out a system of sewerage? The whole of that area will, in any case, whatever may be done with respect to the river, have to be sewered by pumping. It is below the possibility of connection with the designed sewers. It is sometimes a saving of money to pump instead of making tunnels.
239. Do you know of any place where such sewerage schemes are carried out? Yes, that is the recognised means, I should think, in every big city. There are areas from which the sewage has to be pumped up, and in which it is either cheaper to have a little pumping station for a low-lying locality, or in which you are obliged to do it because the locality cannot be connected with sewers of the grade necessary to serve the greater part of the people.
240. Do you know of any town or city where the pumping system has been adopted? A great part of the sewage of London is pumped; all the sewage of Berlin is pumped. The pumping of sewage is quite a common thing, and at Southampton there is pumping done on a scale which is likely to be adopted here, perhaps.
241. In some cases the pumped sewage is made use of for manure? Yes.
242. That would help to defray the cost of the scheme? That is the theory and the prospect; but I do not think it has ever been realised.
243. What is the area of the flooded valley at Marrickville? I think it is between 100 and 150 acres.
244. This matter has been before you almost ever since you took the position you now occupy? Yes; as a matter very much requiring remedy.
245. *Mr. Roberts.*] Has the Government frequently asked you to report on the state of this locality? The Government have never asked me to report upon it. I have made Departmental reports in the ordinary course of my day's work, and this report of 1888 is one of them.
246. What has been the nature of the request made to you by the Board of Health? Some resident wrote to the Board of Health and said that his house was flooded, or that he found it standing in a swamp, and he thought it was the duty of the local council to drain the land. He had appealed to the local council, who would take no notice of his complaint, or said that they could not do anything, and then he appealed to the Board of Health under the impression that that body had power to compel the local council to do what is necessary. In my early days in Sydney, I used to go and see all these places. In that way I got to know the country.
247. You have made several reports to the Board of Health? I made one or two reports. I have on my table at this moment a complaint similar to that, which I believe originates in the same manner, but I have not yet attended to it.
248. Can you tell the Committee what recommendations, if any, you made to the Board? My statement to the Board for their practical guidance was that the matter was one which required considerable public works to be executed before it could be remedied. Any one could see that the trouble arose in the flooding from the river on the one hand and in the slop waters coming down from the slopes of Enmore on the other.
249. You mentioned all these matters in your report? I mentioned as much of them as I thought necessary to enable the Board to reply.
250. Did you ever find that the people were suffering from illness occasioned by the insanitary condition of the land? No; I do not think that any of these complaints ever were made in connection with illness, although when I have got there the complainants have always alleged that there had been illness in such and such houses which were not far away.
251. When you visited the district did you find much illness prevailing? Unless there is an epidemic I have not the means of visiting the district in the sort of way which I think you have in mind. We have no knowledge of cases of infectious diseases that occur in any district except persons are removed to a hospital, and then I watch the hospital returns, and if I see that a great many persons are coming from a particular district I go into the district and make some inquiry and try to find out what has gone wrong; but on such an occasion as this it would be of no use. I have no source of information except by going from house to house, which, of course, is impossible.
252. I thought from the fact of your being asked to report there had probably been an outbreak of illness, perhaps of typhoid fever? A complaint arose in the fears of the people living on what was practically a swamp, that it would interfere with their health if it was not altered. The fact is they bought their property when the weather was dry, and they thought it ought to be dry all the time.
253. I was anxious to ascertain whether the place had been proved to be almost unfit for human habitation? I do not think there are any means of providing that absolutely, for the reason I gave just now

now to Mr. Fegan, which was that the number of houses on this area was quite small and had only lately begun to increase.

254. Do you regard it as an undesirable locality for anyone to reside in? Eminently undesirable. Until the conditions of that locality and other such localities are remedied by execution of the necessary public works, in my opinion there ought to be a power vested in some competent authority to prevent such land from being sold for building purposes.

255. Have you made a recommendation in that respect to the Board of Health? Yes, very often.

256. Are you in a position to indicate which part of the district is suffering most from the stagnant waters? The part which suffers most from the flooding is the part from Marrickville Road down to Cook's River.

257. Do you know anything of the part round Wollie Creek? I have been at Wollie Creek; if I remember aright, because the Council complained of it as a source of nuisance, and wished something to be done to clear it.

258. It is in a very bad state now? It is very much overgrown with weeds, and so on.

259. Do you think that if Wollie Creek and Cook's River were thoroughly dredged it would have a beneficial effect? No.

260. I mean, in addition to other works, such as works to prevent the flood waters from remaining on the land? In that case, yes.

261. Other desirable steps being taken, you think that the drainage of Cook's River and Wollie Creek must have a good effect? I doubt very much whether it is necessary to do anything worth talking of to Wollie Creek.

262. Beyond cleaning it out? No. These are engineering questions. I have never been able to satisfy myself that Wollie Creek was the source of nuisance which it was alleged to be.

263. As regards Cook's River, what opinion have you formed from a sanitary point of view? I did not very often go down as far as Cook's River, but as far as I have observed Cook's River, chiefly from crossing Unwin's Bridge, and occasionally from crossing it at the dam, the river is not a source of nuisance. On the other hand, I know it contains a great deal of foul matter, namely, all that which comes down from the southern slopes which have been mentioned. All that slop water flows in and is confined by the dam. There must be a considerable accumulation of deposit from these slop waters. The water is filthy, but for some reason it happens that I have never smelt anything from that river.

264. Supposing that Cook's River and Wollie Creek were flushed with salt water every day at high tide, would it have a beneficial effect? If by any means these channels could be thoroughly scoured out every day with water, salt or fresh, it would have a beneficial effect.

265. Will you state what remedies should be carried out, without pointing out how they should be done? In the first place intercept the sewage which comes down from the southern slopes I mentioned, and in the second place prevent the waters of Cook's River from backing up over this flat.

266. You think that if works to secure these two objects are constructed, the sanitary condition of the district will be secured? Yes.

267. You think that a scheme to prevent Cook's River from over-flowing on to these low lands, and to intercept the drainage from Sydenham Road down to a point south of the Burwood Road, would be a scheme worthy of favourable consideration? Yes; I think it would do all that is necessary to turn that valley into a site on which healthy houses could be erected.

268. You expressed your regret that there is no power to prevent the people from building in such unhealthy places? What I intended to express was rather regret that there is no power to prevent the putting up to auction and sale of such land until provision has been made for draining it and keeping it dry. I do not mean sewerage, but land drainage. It is the proprietors one rather wants to get at.

269. I suppose that sometimes these lands are sold in times of drought, and the purchasers do not discover the unhealthy character of the situation until we have copious rains? Yes; until after they have built upon them.

270. Then they find themselves living in houses altogether unfit for human habitation? Yes.

271. *Mr. O'Connor.*] The carrying out of this scheme would not only be advantageous to Marrickville but, without becoming a national one, would be equally beneficial to the adjoining municipalities? An unhealthy inhabited area is a source of danger, more or less, to every adjoining area.

272. *Mr. Clarke.*] Having seen the plans of the two schemes, can you express an opinion as to which scheme would be the better one for the district in the public interest? I do not think I could. I think I should approve of any scheme which will answer the intended purpose; but as to how that scheme is to be carried out is not for me to speak upon; it is an engineering question.

273. Do you think that if either scheme were carried out in a proper manner it would prevent the sewage from spreading over the low lands and the flooded waters from submerging those lands in flood time? I do.

274. Unless the nuisance of the sewage and of the flooding of the lands is abated it would be almost unnecessary to go on with these works? The first thing to be done is to make the area healthy.

275. Is there not a large population in the neighbourhood of Marrickville and all down near the dam? Yes.

276. It is absolutely necessary in their interests that something should be done to prevent this nuisance? Yes.

277. Are you aware that a sewerage scheme is being carried out in Marrickville? Yes.

278. Until these works are executed that drainage scheme will be of very little use to the public to prevent this nuisance? Flood waters are unhealthy, and if the lands are flooded with the ordinary water which comes down the river it is bad enough; it may be a little worse if they are flooded also with slop waters.

279. From your experience of this locality you think it is absolutely necessary that either these works or other works should be completed as soon as possible? Yes.

280. *Chairman.*] Marrickville Valley in your opinion receives the stormwaters discharged from a number of municipalities? Yes.

281. That stormwater discharge requires to be dealt with in some way? Yes.

282. Cook's River also receives the flood waters from a number of municipalities? Yes.

283. Virtually it is the stormwater discharge for these municipalities? Yes.

J. A.  
Thompson,  
Esq., M.D.,  
D.P.H.

26 June, 1896.

- J. A. Thompson, Esq., M.D., D.P.H.  
26 June, 1896.
284. It requires to be dealt with also, but, not being an engineer, you do not say how? Yes.
285. With regard to the sanitary condition of Wollie Creek you are doubtful? Yes. I have never satisfied myself that it is a source of nuisance, but other people have said so.
286. Is it the stormwater discharge for various municipalities or for any area? I do not quite know how far back that creek extends.
287. Can we briefly summarise your evidence in this way with regard to the condition of Marrickville Valley and the vicinity of Cook's River—you have no doubt that it is insanitary and that the responsibility does not rest only on the lands adjacent and that the evil is created by other municipalities in some instances far removed? Yes.
288. Do you desire to add anything to what you have said? I cannot think of anything.

John Moore Smail, Esq., Engineer-in-Chief, Metropolitan Board of Water Supply and Sewerage, sworn, and examined:—

- J. M. Smail, Esq.  
26 June, 1896.
289. *Chairman.*] What is your official position? I am Engineer-in-Chief of the Metropolitan Board of Water Supply and Sewerage.
290. You are in control of the Departments dealing with the sewerage of Sydney? Yes. Under the Government and the Board.
291. Do your operations extend to Marrickville Valley, and to the lowlands under the consideration of this Committee? The construction of the sewerage works has not extended that far yet.
292. Have you any stormwater channels in connection with that valley? No.
293. This area has not yet received the attention of your Board? No, we are proceeding with the works now.
294. What works? The sewerage works which will intercept the sewage flowing into Cook's River. We do not deal with stormwaters.
295. Will you be able to intercept all the sewage which now reaches Cook's River? Eventually.
296. The stormwaters you will not be able to reach? It will be a separate provision.
297. Does sewage reach any portion of Marrickville Valley? Yes.
298. Will you be able to intercept that sewage? The whole of the sewage which flows down the valley into Cook's River, and which is causing the nuisance, will eventually be intercepted under the present scheme.
299. When you say that it will be "eventually intercepted" what do you mean? Within two years I should say 40 per cent. of the present contributing Marrickville area will be intercepted, and within five or six years I should say that the whole of it will be intercepted.
300. As regards the proposal before the Committee we can dismiss the sewage question? Yes.
301. Therefore it becomes a stormwater question? Purely.
302. For all time will certain municipalities discharge into Cook's River as the best stormwater outlet, and, if so, what municipalities? I should say there would be Marrickville, part of Petersham, Newtown, and St. Peters.
303. Is Cook's River naturally a stormwater discharge for these municipalities? It is.
304. And will remain so? Yes, for the Marrickville side. A portion of St. Peters will go into Shea's Creek.
305. What municipalities will Cook's River remain a stormwater discharge for for all time above the dam? Wollie Creek watershed will take portion of Canterbury and Hurstville; Cook's River watershed will take part of Marrickville, part of Newtown, portion of St. Peters, and a very small portion of Petersham.
306. Supposing sewage were dealt with, would the stormwaters coming down the valley and Cook's River create an insanitary state of things above the dam? There would be a certain amount of sewage. What we call the first shedding of the rain brings from the streets and the yards horse manure, which cannot possibly go into the sewers. It is bound to set up in the long run a nuisance, but comparatively speaking at the present time there will be no nuisance. Comparing the river in the future with all the real sewage out of it, and the river at the present time, there will be no nuisance when the sewage is all intercepted.
- 307-8. Would it or would it not? I must make a comparison, because at the present time it receives all the sewage and everything else. I do not wish to mislead the Committee. If the river did not get naturally flushed by rains with even stormwaters going into it, it would cause a nuisance.
309. There will still be a liability to an insanitary state of things with the discharge of stormwater only above the dam? There is a liability.
310. Are the stormwater channels paid for by the municipalities which use them? Yes, in this way; we never carry out any stormwater ducts unless they can prove adjuncts to the present sewerage system. Drainage areas are taken out and every one within the drainage area is charged a drainage rate, that is a certain rate fixed by Parliament on the value of the property; but when the sewerage system is carried out the drainage rate merges into the sewerage rate—only one rate is charged. All stormwater channels which are considered adjuncts to the sewerage system form part of the general system.
311. In carrying out any stormwater discharge you see that it fits in with your general scheme? Yes.
312. Have you considered the best way to discharge the stormwater from the Marrickville Valley? I dealt with the question in 1885 and 1886.
313. In what way? At that time there were two alternative schemes. When Mr. Bennett was the Commissioner he recommended something very much on the lines of the scheme which has been referred to this Committee by the Legislative Assembly. I found by taking levels that some portion of Marrickville Valley near the Burwood Road railway was 2 feet below high water. The question was how to get that water down into the river. When the river was in flood the dam was the crux of the whole thing. The water could not get away notwithstanding that provision was made for sluice-gates. I have seen half a dozen boats floated up against the sluice-gates in flood time. When reports were made, Mr. Bennett wrote a minute—which is I think in Mr. Darley's *précis*—in which he pointed out that it was necessary to make some provision for widening the sluices and taking this bridge away. It would give Cook's River a clear flow out, that is after the new works were carried out. The conditions of Cook's River at that time were quite different from what they were prior to 1885. It was then proposed to dam across Marrickville Valley, but after consideration we found that to get this portion dry we should have to pump it. The whole thing resolved itself into either a gravitation scheme or a pumping scheme. After looking at these plans, as an engineer, I should say that I prefer the gravitation scheme.

314. The alternative scheme is to your mind the better scheme in that you get a better flow for the water? A better get-away for the water. The object of the dam is to prevent the water in flood-time from getting into Marrickville Valley. It would become necessary to find some outlet for the waters that will come down from the uplands into the valley. This outlet would either have to be by pumping or a gravitation scheme, and of the two, as an engineer, I would prefer the gravitation scheme. J. M. Smail,  
Esq.  
26 June, 1896.
315. Do you recognise that as most of the lands to be drained are not more than 2 or 3 feet above low water, your gravitation scheme must work intermittently? I admit that. The alternative scheme shows the invert of the outlet to be 1 foot below low water. The invert of the inlet is at low water, consequently there is only one foot fall for the whole length. When it is neap tide, the outlet must be partially tide-locked, consequently if a heavy rainfall happens to come concurrently with a high tide the water would not get away so quickly as it would if the tide were low, but that is a condition that you will find in all seaboard discharges, where you are confined by the tide. In Blackwattle Valley I had to deal with a place, not so large in area as Marrickville Valley, and all the fall there was between high water and low water. You can understand that when it comes high tide the mouth of the sewer is partially tide-locked. But since the larger sewer has been put in we have never had any complaints of flooding.
316. Was the land you were dealing with on a level with high water? Some of the land was 2 feet below high water. It was a case almost similar to this one, only that the area was different, and the streets being paved and metalled, the water used to come down very much faster on to the low land than can occur in this case. Here with so much open ground a portion of the rainfall will naturally be absorbed in the ground and will not get to the outlet.
317. Does this stormwater proposal differ in any way from other stormwater proposals to which the whole of the interested municipalities contribute—is there any local reason here which we should take into our consideration? The stormwater proposals we have been accustomed to deal with are generally considered adjuncts to the sewerage system, consequently there may be two or three municipalities in one drainage area, and we assess the whole lot of them. But in this case I do not see that it would be a charge upon the revenues at all, because it cannot be considered an adjunct to the sewerage system. If in the future, when the levels come to be worked out, it, or any portion of it, can be utilised as an overflow from the foul water sewers into Cook's River, then, of course, the Board will have to pay their quota of the cost.
318. Eventually you will require to deal with the stormwaters in that vicinity? Yes; the map shows where the main sewer passes on its way to Botany sewage farm. Any stormwater sewer carried out in connection with Marrickville Valley, as far as I can see yet, cannot be worked into the western suburban sewerage system.
319. Why should it not still form a portion of that system? Any stormwater sewers which cannot be worked as adjuncts to the sewerage system the Government or the Board throw upon the municipal body to carry out. Unless it could be worked with the sewerage system it would be illegal to pay for the work; under the Act we could not strike a rate.
320. Under the Act is it a fact that unless a stormwater channel may become eventually an overflow channel it cannot be charged upon the rates gathered for such purposes? It cannot be charged to the sewerage rate.
321. Could such a stormwater channel as is now proposed become an over channel? I do not think it would be of any use whatever to the western suburbs sewerage system; every day we are refusing applications to carry out stormwater channels, simply because we cannot work them in with stormwater ducts. Since my examination began I have received some information for which I telephoned to the office. Out of the 1,800 acres that comprise Marrickville Valley, the Board are now dealing or have dealt with the reticulation of 1,000 acres. Within twelve months 1,000 acres will be reticulated, and the sewage will be intercepted from Cook's River, so that I was quite within the mark when I said that it would be done within two years.
322. *Mr. Roberts.*] Will you indicate which portion of the land you refer to? The southern portion of Newtown, the upper portion of Marrickville, that is in connection with the eastern branch of the western suburbs sewerage system.
323. Will that work be carried out within twelve months? To be on the safe side I will say eighteen months.
324. When will the remaining 800 acres be dealt with? A good deal of that comes from the low level system, which will be a pumping scheme. I will say six years for the rest of the scheme.
325. The whole of that valley will be dealt with within six years? I believe it will be done sooner.
326. Have you made yourself thoroughly acquainted with the two schemes before the Committee? Yes; No. 1 scheme is an old scheme which I have known since 1890.
327. Which scheme do you prefer? Really to make Cook's River a sanitary river the dam ought to be taken away to the extent shown on the map and having a good outlet. Whether you construct the alternative scheme or not a certain amount of work must be done at Cook's River to prevent the water getting back.
328. Will Marrickville dam prevent the water from getting back? Assuming that it is built it will prevent the flood-waters of the river from getting into the valley.
329. That is a portion of the alternative scheme? I take it to be so.
330. Do you think the alternative scheme as submitted at a cost of £25,000 will prove thoroughly effectual? It will prove as effectual as you can possibly get it in the circumstances. I do not say that the water will run off as it will off a paved street. From my experience of the place, where the water now lies for months I may say that if you carry out that system it will lie there for only hours.
331. Can you suggest any improvement in the alternative scheme? No; I think they have adopted the best line they could possibly adopt. I have not gone into the calculations as to the size of it and so on, but as regards the general line and the general principles, I think it is the correct thing. They have got down to the lowest level, and they have got the best discharge, and I do not see that any engineer can improve upon that.
332. You think that something further ought to be done with the dam? Yes.
333. It is contemplated to lower the sills; do you think anything more should be done? I think they ought to widen the sluice as well.
334. You favour the dredging operations which are contemplated in Wolli Creek and Cook's River? It is very hard to find Wolli Creek.

- J. M. Smail, Esq.  
26 June, 1896.
335. Is it in a very bad state? You could not see it; but for the few piers which carry the sewer across you would not know Wollie Creek from the surrounding ground. It is full of rushes and other things. It is all silted up to just a little dribble. It used to be a fine creek years ago.
336. *Chairman.*] What silted up this creek? I think the dam had a lot to do with it. It is in a great measure answerable for all this nuisance.
337. *Mr. Roberts.*] Do you favour the construction of that tunnel as suggested by Mr. Darley 15 feet wide and 6 feet high? I certainly favour the idea of constructing a tunnel, but as to whether its dimensions are correct, I should not like to give an opinion. There is no doubt that the principle is correct. With the tunnel it will gravitate from the Marrickville Dam back to the inlet, and also intercept all the water from the up lands, provided the borough councils will make inlets to the tunnel.
338. There is no doubt in your opinion that the water will gravitate from the Marrickville Dam to the tunnel? Certainly not. It will gravitate with the very slight fall it has now.
339. The ground falls that way? It is practically level. There may be a difference of a few inches. The part tinted red on the map is absolutely lower than a portion near the dam.
340. You think there will always be some trouble there? There will not be any trouble, because the tunnel will be at low water, and that is 2 feet below high water. That will give a 4-feet fall down to the inlet.
341. You think the tunnel will effectually carry off the waters coming from the direction you indicate? I think so. In my answers I am always keeping in view that the principal question is gravitation *versus* pumping.
342. Have you read Mr. Darley's explanation of his proposal? I have glanced over it. From my knowledge of the district I think he has very happily hit upon the solution of the difficulty.
343. Assuming that the alternative scheme is carried out, what work would be required to be done by the local council to make the place as perfect as possible? The local council, I think, would have to reverse the fall of the drain from Marrickville Dam—that is the drain made out of Hudson Brothers' pipes—right back to the inlet for the tunnel. I do not believe there is more than a 3-feet fall from one point to the other. The expense of lowering that would not be very much.

TUESDAY, 30 JUNE, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).	
The Hon. CHARLES JAMES ROBERTS, C.M.G.	HENRY CLARKE, Esq.
The Hon. DANIEL O'CONNOR.	JOHN LIONEL FEGAN, Esq.
FRANK FARNELL, Esq.	

The Committee further considered the proposed Improvement of Cook's River.

Richard Watson Walker McCoy, Esq., Mayor of Marrickville, sworn, and examined:—

- R. W. W. McCoy, Esq.  
30 June, 1896.
344. *Chairman.*] Are you aware of the scheme that was submitted by Parliament to this Committee? I am.
345. And of the alternative scheme? I am.
346. Do you desire to make a statement with regard to the matter? Yes; I desire to say that I have taken the voice of the whole Council, and they have unanimously expressed their opinion that Mr. Darley's original scheme is the one they would like to see carried out.
347. Are you prepared to inform the Committee the reasons for that? There were no reasons expressed. The matter had been considered from time to time.
348. You desire to see the drain brought right down Marrickville Valley rather than taken by a tunnel and channel to the mouth of Shea's Creek? Yes.
349. *Mr. Clarke.*] Would you be kind enough to state under what disability your municipality labours under the present system of the low lands being flooded? By reason of the dam which now exists the river has from time to time become silted up, and now, near the dam, there is scarcely a channel left, and at times the result is certainly dangerous to health, and the river, which was once a pleasant resort, is now a place to be avoided. This has been occasioned by the silt from time to time coming from the various municipalities, and down Wollie Creek. The deposit is there, and the river, as can be seen at any moment, is almost silted up.
350. What was the cause of that silting-up? I think that if the dam had not been placed where it is the silting-up would not have taken place.
351. But has not the dam been there for many years? It has; but the silting has been of gradual growth.
352. I think I remember the dam being there fifty years ago;—is there any nuisance caused besides the overflow of the waters over the low lands, through drainage or sewage, or any other offensive matter remaining there? Yes; at times there is certainly a very great nuisance. The smell, in summer-time particularly, we have found is very troublesome, and probably likely to cause a great danger to public health.
353. I suppose you have been from time to time asking the various Governments in power to remedy all those defects? From time to time we have.
354. But this is the first occasion, I suppose, when anything has been proposed to be done to obviate the difficulty? The first time anything definite has been proposed; but on several occasions the Minister has told us that something ought to be done, and that if he could do it for a reasonable sum of money he would see it was carried out. But the thing would then be delayed, and we would go again and find it was not carried out. Nothing has been done, but finally a scheme has been propounded and sent to this Committee. We have had promises from time to time that something would be done, if it could be done with a small outlay.
355. You think that this is a matter that ought to be done entirely at the expense of the public? I do. Cook's River is a natural watercourse.
356. Can you give us any instances of where similar work has been done in other municipalities? I do not know that a like work has been done in other municipalities; but there has certainly been similar work

R. W. W.  
McCoy, Esq.  
30 June, 1896.

work on some rivers. I think that the work at White Bay, Balmain, and at Darling Harbour, was done without a betterment tax being applied. I think that a similar work has been carried out at Rozelle Bay, Balmain; and as far as my memory serves me, there has been no betterment tax levied on those districts.

357. Then you think that the Municipality of Marrickville, or those interested in this scheme, should not contribute anything towards its cost? I do not think they should.

358. You have stated already that you approve of the original scheme submitted by Mr. Darley, which would cost £36,400? Yes.

359. Can you give any reason why that scheme should be adopted in preference to the alternative scheme which he now submits? I believe that is a matter more for engineering evidence. I have my own ideas on the matter, but they are based only on what I have gathered from engineering evidence. My opinion with regard to the alternative scheme, from what I have been informed as to the tides, is that at high tide the flood-gates would of course have to be closed. In flood-time the water would then have no means of escape, and would flood a certain portion of Marrickville which at present is very rarely flooded.

360. But I think we have it in evidence that it would only be for a short time? For a few hours probably, until the tide went down, but still that water is 2 or 3 feet deep, and it would be sent over ground which is comparatively free from it at present, and a certain amount of danger would also ensue to the people living in that locality. Moreover, Cook's River, of course, is a natural outlet.

361. The flooding of the low lands was not such a cause of nuisance when the population in the neighbourhood was small? It was not felt to so great an extent then of course. The general increase of population throughout the whole district has probably made it felt more not only in Marrickville, but in the surrounding districts.

362. From what I have seen of the low lands, I think that houses should never have been built there? Many of us think the same.

363. But people have gone there, and cannot be prevented from doing so? Unfortunately, I believe, that happened in a very severe drought.

364. It happened, I suppose, in the boom times? There were a number of years when rain was very scarce, and I believe that low land then was very dry, and people were foolish enough to build there.

365. Well, those people who were foolish enough to build there in those times, do you not think that they should contribute something towards the expense of this work, they having gone there of their own accord? If the low-lying lands are perfectly drained, and those properties immediately in the vicinity are benefited thereby, I do not think that anybody could reasonably object to those properties being taxed for that purpose, but the actual cleansing of Cook's River is a different matter. The work on the river is, I think, a national work, and I do not think that those people should be taxed for that. I do not think that the people getting a benefit from the draining of the low-lying ground would complain of being called upon to pay a small tax for that, but the question should be divided into two parts, one affecting the river and the other the low lands. The work on the river would be a national work.

366. The alternative scheme would cost only £25,000, as compared with the original scheme to cost £36,400? Yes, but it would still leave the nuisance coming from Wollie Creek, which is a very great nuisance.

367. Would not the dredging in Wollie Creek obviate that difficulty? It would remove it temporarily.

368. I suppose that the obstruction of Wollie Creek is caused by rushes and similar things? Yes, it is; and it is pretty well silted up at the mouth.

369. The difference between the cost of the two schemes is £11,000? Yes.

370. But on the whole, you consider that it is absolutely necessary to have the drainage as proposed in the original scheme? I do.

371. You also think it is absolutely necessary for Marrickville and the neighbourhood that this work should be carried out? I do.

372. Entirely at the cost of the public? Yes, so far as the actual dredging of Cook's River is concerned; but if there could be a division of the question, I think it might probably be fair that a small proportion of the people should be taxed in connection with the drainage of the low-lying land. However, as to the cost of work on the river, and in connection with the river, I certainly think that the people should not be asked to contribute anything towards the cost.

373. You have mentioned several places where you believe that works of a similar character have been carried out at the expense of the country? Yes.

374. I suppose you are aware that flood embankments have been made at West Maitland, on the Hunter River, and you think you are as much entitled to have such works near Marrickville as the people near West Maitland are? Yes; I think we are equally entitled.

375. You are contending for uniform treatment? Exactly.

376. *Mr. Egan.*] What is the population of your municipality? About 20,000.

377. I understood you to say that a great deal of the flooding is caused by the dam which the Government have constructed? Yes.

378. If that dam were removed, what would be the consequence to the municipality? If the dam were simply removed, and nothing else were done, the probability is that the result would be disastrous, for the water would rush in and probably flood lands not now flooded.

379. The objection that you raise as far as the dam is concerned is that the nuisance would be a great deal worse if the dam were taken away? If the dam were taken away, I believe it would be worse if nothing further were done.

380. Part of the flooded area is a portion of the old Warren Estate, is it not? Yes.

381. How many acres of the Warren Estate do you think are liable to be flooded? I could not say how much of the Warren Estate, but I suppose there are a couple of hundred acres altogether which suffer from flooding. Our engineer will be able to furnish a more accurate statement than I can on that point.

382. I suppose you know that the Government have recognised their responsibility so far as Cook's River is concerned? Yes; they have promised to do work from time to time.

383. I understood you to say that your Council came to a decision that Mr. Darley's alternative scheme was useless to you, and, therefore, you preferred the first scheme? I did not say that. What I said was that they unanimously agreed that the carrying out of the original scheme should be obtained if possible. I was then asked a question in regard to my opinion concerning the alternative scheme, but there were no reasons given by the Council.

- B. W. W. McCoy, Esq.  
30 June, 1896.
384. No reasons given? No; but the matter has been under the consideration of all the aldermen for years past.
385. But, as a business man, do you not think that it would be well to give reasons why you are against the alternative scheme? I gave one reason personally.
386. But I mean as representing the Council;—if a body of men representing the interests of the rate-payers come to a decision, it is only natural that this Committee should want to know why they came to that decision? We have to a great extent come to the decision on the advice of our engineer. He is here, and will be able probably to deal with that question better than any of the aldermen.
387. But the aldermen, and not the engineer, are responsible for the conduct of business in your municipality? Yes; but we call for reports, which he makes for our consideration.
388. But you have the right to adopt or reject them? Quite so.
389. I ask you the reasons given for adopting his report—that is, preferring Mr. Darley's original scheme to the alternative scheme? We thought that the larger scheme would be more effectual—that it would do away with the Wolli Creek nuisance entirely, which, we understand, causes a great deal of the nuisance now existing in the river between the Illawarra Road and the dam. Moreover, the alternative scheme would, I believe, flood lands at certain times and do a certain amount of damage to property which at present would not be affected by a heavy rainfall.
390. And considering the two costs—£25,000 and £36,000—you think that taking the small difference, £11,000, into consideration the original scheme is the preferable one? I do.
391. It would give a better sweep for the water? Certainly, and would also widen the channel.
392. And be the means, I suppose, of taking the silt with it as well? Yes. The bridge which is proposed would, of course, allow the water to come in and probably act as a scour up to the dam now proposed to be erected at Unwin's Bridge. If the present dam is removed there will be a scour up to that point.
393. Are there times when that water comes over the embankment? Yes, there are times, but they are very rare.
394. During the last rains did water come over? I think not.
395. Have you much sickness about this flooded part of the district? I cannot say that we have; it is not closely built upon.
396. Your municipality would not have any objection to have the cost of whichever scheme was carried out added to the general sewerage scheme? I do not know that the matter of Cook's River could be added to that.
397. I mean apart from that;—the dredging expense the Government are willing to undertake at once, I understand, but I mean the draining of the flats? Well, so far as that is concerned, I think it would be fair to tax in some way the people whose pockets were actually benefited; but that is, of course, only to the Tram Vale flats. That was a matter entirely outside the original Cook's River dredging movement.
398. But do you not think that the higher portion of your municipality is to a certain extent responsible to the lower portion so far as the drainage is concerned;—you have no complete system of drainage yet? No, not complete.
399. Therefore, the higher portion of your municipality is responsible to a certain extent to the lower portion—I mean as far as the drainage is concerned? Of course, the drainage must come from the higher to the lower portion. But it is not the drainage that causes any nuisance immediately.
400. But you say that at the present time you have not a perfect system of drainage? It is not a perfect system.
401. Therefore, when you have heavy rains the water will naturally flow from the higher to the lower portions of your municipality? Yes.
402. If you had a proper system of drainage a great deal of that water would go into the regular system of drainage, would it not? Yes.
403. Therefore, is it not fair to ask that the other portion, with the exception of the dredging of the river, should be added to the general drainage system? When you speak of dredging of the river, what do you really mean.
404. I mean the deepening of the river as proposed—"dredging full width of channel, 5 ft. deep up Cook's River to Undercliffe, and up to Wolli Creek Dam, £5,000"? But the removing of the dam is also river work, and the new timber bridge is river work, also the temporary bridge, the training walls, and the fascine banks.
405. If the Government see the necessity of doing part of the work it is only fair to ask the general sewerage system to bear its share;—I think you are in favour of that, are you not? If it is a matter of draining Tram Vale, I think there should be a fair distribution of the tax upon those whose properties are improved, but if it is a matter of the improvement of Cook's River—and I take this to be a matter almost entirely of the improvement of Cook's River—I do not think that the property-owners should be asked to contribute.
406. But you admit that a great portion of the surface waters from the heights of Marrickville finds its way down to the flats of Marrickville? Yes.
407. Therefore, you must be responsible for that; you cannot expect the Government to prevent that, can you? Of course, so far as the high ground of Marrickville is concerned, it also affects adjoining municipalities. It comes across from Petersham, Newtown, and all round.
408. Therefore, I ask should not part of this expenditure be added to the general sewerage system;—you get a great deal of surface water from Petersham and St. Peters and Newtown, and if part of this expenditure were added to the general sewerage system, that would lighten the burden on the people of Marrickville as well as the proposal that is before us? Certainly.
409. You have no objection to that, have you? I take it that the expenditure of this £36,000 will not by any means relieve merely Tram Vale, and is really for the purpose of putting the river in a proper state, and keeping it clear. Therefore, I think that to charge the people for what really would not be done for them would certainly be imposing an unfair tax upon them.
410. How much has your municipality spent in trying to get rid of the water in the lower portion by drainage? We have spent a large amount of money. We have an open drain there now.
411. What was the cost of that? I cannot say; it has been there many years.
412. I suppose that is fairly silted up now? There is a certain amount of silt in it, and the drain will probably require renewing very shortly if something else is not done.
413. Renewing and making deeper? Yes.

414. Do you not think that the general sewerage system should bear portion of this expenditure? I cannot see which portion could be fairly applied to it.

415. You have a certain amount of private property there, have you not—the Warren and other estates—which could afford to bear a share of the expense? I have not entered into the matter of who could afford to pay. The question is whether it is a fair and reasonable charge to make, not a question of whether the people have or have not reasonable means. We do not think it is a fair charge to make upon them.

416. If this work is carried out as proposed—either the first or the second scheme—will it enhance the value of those people's properties to any extent? I certainly think that if Cook's River is put in the state in which we are anxious to see it, the whole of the surrounding district, and consequently those properties, would be improved.

417. And do I understand that you are asking the Government to bear the cost of making other people's property better without those property-owners coming to the assistance of the Government? I am asking that, because we are only asking that Cook's River should be placed in the position it should occupy as a natural water-course of the Colony.

418. *Mr. Farnell.*] Are any other municipalities besides Marrickville concerned? Yes, ten or a dozen—Hurstville, Arncliffe, Rockdale, St. Peters, Newtown, Petersham, Canterbury, Ashfield, and Enfield.

419. Would all those districts, forming as it were a water-shed, be responsible for the accumulation of these flood-waters? Yes.

420. In regard to the discharge of sewage, which municipality's sewage matter passes through Marrickville? That of Petersham and Newtown.

421. Are you aware of any proposal having been made by the Water and Sewerage authorities to relieve the different municipalities of the grievance they have as to the accumulation and discharge of sewage matter from the different localities? There is a scheme now being carried out which, when completed, will be of great service to the municipalities. That is the only scheme I know of.

422. When the sewage nuisance is combated I take it that your complaint then would be as regards the damage done and the danger to health likely to arise from the accumulation of flood-waters? Yes, if the sewerage system is completed; but we have to look forward to a very long time. That which was to have been done in three years has taken six or seven years already, and we have to base our calculations for the future on the same ratio.

423. And you ask that some temporary relief may be given in conjunction with the scheme for dealing with the flood-waters? Yes.

424. You consider, then, that independent of the accumulation and distribution of the sewage matter which may contain germs of disease, there would be danger to the public health from allowing the storm-waters to remain and inundate that land? Certainly. Even with storm-waters there is always a certain amount of matter which, if it stands for any length of time, becomes dangerous to health.

425. And while you think that some advantage would be gained by the people who own those areas of land that become inundated owing to the accumulation of flood-waters, a national benefit would also arise by removing a nuisance, and having properly discharged the flood-waters from those municipalities which form the water-shed and run their water through that area? Certainly.

426. Has this matter received much consideration at the hands of your Council? Yes; it has been under the consideration of aldermen for years past.

427. And I understand that the municipal council did make an attempt to cope with this difficulty, but it has not proved sufficient to combat with the nuisance? No; it has given relief to a great extent, but nothing short of a comprehensive scheme will really be effectual.

428. It has improved the condition of affairs which existed some years ago? Yes, the condition of affairs is better than it was.

429. You have some defined channel, whereas years ago there was simply a chain of marshes and quagmires? Quite so.

430. In connection with the alternative scheme, if Shea's Creek is dredged and deepened, and in connection with the original scheme, if Cook's River is dredged, and the Departmental proposal is carried out so far as Cook's River is concerned, do you think that will meet the difficulty? Certainly.

431. I think you stated that you do not know of any cases that had actually come under your notice where disease had been contracted through the accumulation of this sewage matter? Personally, I know of no cases which could be directly attributed to it.

432. But there can be no doubt there has been sickness in the district? There has been a certain amount of sickness there, and the wonder is it has not been greater. It is a sort of surprise to us, because when we go there we are always glad to get away from the place. It must do a great deal of harm, although the individual cases do not come under our notice. We are anxious to prevent what may be a very serious danger.

433. Do you think that any advantage would accrue to the Government other than relieving the municipalities concerned if Cook's River and Shea's Creek were dredged sufficiently to make them navigable at all tides? I think it would. It is very noticeable the difference in the number of travellers to and from Cook's River. Ten years ago at holiday times and on Saturdays and Sundays you would see Cook's River alive with boats. I admit that is a very small question compared with the necessity of giving us a good healthful resort and waterway, but I have seen the river crowded with boats, whereas you scarcely ever find a boat on it, though there are boat-sheds there.

434. Do these flood-waters generally do much damage to adjoining municipalities? I have no knowledge of the extent of the damage to adjoining municipalities.

435. It would not be likely that the adjoining municipalities would join in paying any portion of the expense supposing they were asked? I can speak for eight or ten of the municipalities. I know that in conference they have said that they thought it was unfair they should be charged with any tax for the improvement of Cook's River.

436. *Mr. Roberts.*] How long have you been Mayor of Marrickville? Only this year.

437. And an alderman for how many years? This is my third year; but I had resided there for fifteen years.

438. And consequently you have an intimate knowledge of the district under consideration? Yes.

439. When you joined the Council was this question one of prominence in debate amongst the members of the municipal body? It has, ever since I have been in the Council, been a matter for constant reference.

R. W. W.  
McCoy, Esq.  
30 June, 1896.

440. Could you describe the insanitary condition of the municipalities;—I want you to explain on what ground you are asking the Government to take up this work? I am not here to-day to say that our borough is in an insanitary condition. I should be very sorry to do the district that much damage. On the contrary, I can say that, as a municipality, it is a very healthy one, and I wish to say that with emphasis; but I do say that there is a great nuisance caused on Cook's River, which is very dangerous, and I fear that if something is not done a very serious outbreak may be the result.

441. What I wanted to know was whether the municipality was asking the Government to carry out this work, or something which would have a similar object in view, on account of the danger which exists to public health by reason of the insanitary condition of those areas? We realise that it must be a menace to the public health, and it is our duty to try to prevent distress and disease rather than to move after the damage has been done.

442. But up to the present time no sickness of any magnitude has exhibited itself in the municipality? No; I do not think there has been any extraordinary amount of sickness. In fact, I think we have a healthy municipality; but we are anxious to keep it so.

443. Would you explain what nuisance it is that exists which you want remedied? Certainly. The river in its present state is a danger to anybody in the vicinity. It is silted up, and I have been informed that there are certain evidences there of the very worst kind to be found in the worst stagnant waters. I cannot speak from my own knowledge. It is only what I have been informed by those who know about these things, and who say that it is really little better now than a cesspit between the Illawarra Road and the present dam.

444. Can you tell the Committee how many people are affected by this nuisance? It is very hard to say. I have heard complaints made by daily travellers on the Hurstville railway line. As they pass in the train, they are greatly inconvenienced by the smell. I have had numerous complaints. I have had the Mayor of an adjoining municipality speaking to me about it, and numbers of other people, who say that in summer-time the smell rising as they pass through is unbearable. So it is very hard to say where the thing may end, there are so many travellers on that line. Then there are other travellers through our borough from Canterbury and Belmore crossing the river. Of course there are not many houses built on the banks of the river or near the water.

445. What do you think is necessary to be done in order to abate the nuisance that at present exists? That is a difficult engineering question, but first of all we are anxious to see the river dredged.

446. You want to see the waters of Cook's River prevented from flooding the Marrickville Valley? Yes; we want the river dredged and a proper channel made, but how these things should be done is a matter for your engineers to decide, and I understand that it has given them considerable trouble to work it out.

447. I think you told the Chairman that you had made yourself acquainted with both schemes submitted by Mr. Darley? Yes.

448. And if you look carefully at the alternative scheme will you not admit that it carries out most of these suggestions that you have just mentioned? It would certainly relieve the low lands to a very great extent.

449. There would be a tunnel and drain to Shea's Creek? Yes.

450. Do you not think that would have the effect of draining the whole of the Marrickville Valley? I could not very well say the extent of ground a certain tunnel would drain, but in my opinion it would not drain the whole of the valley.

451. That is one of the objects you have in view? Yes; it is one of the objects.

452. If the construction of that tunnel and drain to Shea's Creek will have the effect of draining the whole of the Marrickville Valley, that is one of the objects you have in view? If it will have the effect of draining it without putting us to any extra inconvenience or risk, and if we can get the river put in a proper condition, then, of course, we would be satisfied; but our anxiety is about the river, because the other is not causing us any more inconvenience, but the condition of the river is, we think, a menace to health.

453. Then it is contemplated to put a dam across the Marrickville Valley the object of which is to prevent the waters of Cook's River from flooding the valley—that would meet your approval? Yes.

454. Then there is an item of £4,000 for dredging Cook's River and Wollie Creek—that is a necessary work? Yes.

455. Then there is the lowering of the sills at the Cook's River Dam—that must be done? That must be done if the original scheme is not carried out.

456. I have mentioned those four items;—can you tell the Committee what other work you think ought to be done? You want to continually dredge unless the dam is removed; but if the dam is removed probably the tide will act as a scour.

457. I was endeavouring to get you to see that I thought that if those four works, the carrying out of which means the adoption of the alternative scheme, were carried out they seem to do all the work which you yourself, as representative of the Council, ask for, and, if they do, I wanted you to show me what advantage it would be to spend another £11,000? I think I mentioned that it does not provide for putting the river in the state it was formerly in. It only provides for dredging, but according to the big scheme we are to have certain resummptions which will give the river its full width, and will place it in the position in which it was originally. Now it is silted up to such an extent that it is quite a narrow little stream.

458. But does it not strike you that if that scheme were adopted the salt water would be allowed to flood certain portions of private land there which are entitled to a fresh-water frontage? I do not know that they are entitled to it.

459. I understand that you look upon this more as a national work—a work for the Government of the country—instead of being a municipal work? I do. It is truly not a municipal work, for the simple reason that it is outside the municipal area. Our boundary is the bank of the river, and we cannot expend one shilling outside of the municipality. The river is a national waterway, and the Government are the only people who can control or who are entitled to spend money upon it.

460. But supposing that the waters of Cook's River were prevented from going on to the Marrickville Valley, you would be able to deal with any drains that might be necessary then? I would not like to say that we could.

461. I mean necessitated by a heavy rainfall? We might cope with a heavy rainfall perhaps if we had a complete sewerage system, but we do not know when we may have that.

462. Well, we have had it in evidence here that a portion of it would be in operation within eighteen months, and I think the balance in about 6 years; you base your claim that the Government should carry out this work on the ground that it is similar to the carrying away the flooded waters in connection with the Hunter River where money has been spent to get rid of flood-waters? Quite so.

R. W. W.  
McCoy, Esq.  
30 June, 1896.

463. Can you mention any works of an exactly similar character that have been carried out in the Colony in regard to which no special taxation has been imposed? Not of exactly a similar character; but I think there have been works on the various rivers from time to time which had undoubtedly the effect of benefiting surrounding property, and no such thing as a betterment tax has ever been heard of. Here, where people have formed themselves into a municipality, and taxed themselves for municipal purposes, why should they be placed in a worse position than people in the country where the rivers have been attended to and they have got the benefit of it?

464. In other words, you ask for this work to be done on national grounds, with the view of preserving the health of the people living in the neighbourhood and surrounding districts? I do. Of course there are a number of works around the city, with which I suppose you are more conversant than I am, to which the principle of betterment tax has not been applied, and I ask that what is fair should be done in connection with our river.

465. *Mr. O'Connor.*] During the time you have lived at Marrickville, with the advantages of being the Mayor, you could have known very little more than you would know as an ordinary resident? I have known the river twenty-five years.

466. *Chairman.*] You regard Cook's River as a State waterway under the control of the State? Yes.

467. Before the municipal council was in existence that water-way was obstructed by the dam at Cook's River, and since the erection of that dam certain vested interests have grown up; therefore, it becomes only fair to those vested interests to allow Cook's River to flow unimpeded to where it originally went? Yes.

468. You find on the borders of your municipality, consequent upon the construction of that dam, a nuisance with which you are powerless to deal, it being outside your municipality? Yes.

469. This nuisance is created partly by the presence of the dam and partly by the fact that stormwater and sewage from outside your municipality find a resting-place there? Yes.

470. Therefore, you contend that although adjacent to the Borough of Marrickville, it is not the business of the Borough of Marrickville to deal with that sewage and stormwater? Quite so.

471. With regard to the drainage of Marrickville Flats, you believe that a reasonable rate might perhaps be levied on those primarily benefited so long as it is limited to that expense which might be legitimately incurred in bringing about that benefit? Yes.

472. Any rate that might be levied for the draining of Marrickville Flats, and the property in the flats should be absolutely limited to the cost of the works in doing that draining;—in other words, you contend that, as regards dealing with stormwater and sewage, and the pollution of Cook's River, charges for work of that kind have no right to be put on any vicinity that might be benefited by the draining of Marrickville Flats? Yes. I should like to qualify that by saying, so far as the trouble was effectually removed.

473. And you contend that no benefit should be paid for unless it were perfectly clear that a benefit had been conferred? Quite so.

474. If it be not a State matter to deal with the stormwaters, you say it is not the business of the municipality into which those stormwaters find their way to dispose of them; in other words, if it be not a State matter it is clearly not a matter for the municipality in which those stormwaters discharge, but for all the municipalities where they collect to deal with? Yes; that is my contention.

475. The present state of Cook's River and the valley leading to it is a continual menace to the health of the community? Yes.

476. It is also an annoyance to the municipal authorities, and to the residents in the submerged area? Yes.

477. And unsightly to a considerable portion of the municipality? Yes.

478. As Mayor at Marrickville, your opinion is that Marrickville is a very healthy place? Yes. It is a fact that our municipality, taking it throughout, is a healthy municipality, and we are anxious to keep it so, but will not be able to do so unless these works at Cook's River are carried out.

479. You do not approve of the alternative scheme;—you express no engineering opinion with regard to any schemes;—you limit your expression of opinion to the evil and the need for the removal of that evil? Yes.

480. You state that one objection to the alternative scheme is that there is a probability that it would cause water to collect at the intake in a portion of the flats not generally liable to submergence? Yes, at certain tides.

481. Inasmuch as the height of the land is so little above low water, there is a probability that at certain tides, in that it will not be able to get away into Cook's River, it may flood land at the north-eastern portion of the valley which otherwise might escape? Yes.

482. *Mr. Fegan.*] Do you not think that legislation is necessary to prevent people from building on those swamps and flats in the future? I certainly do think it is necessary.

483. Seeing that Government money has to be spent in getting them out of those swamps, prevention is better than cure? I think something should be done to prevent such a state of things existing, and nothing can be done except by Act of Parliament.

William Robson Benson, Esq., Alderman of the Borough of Marrickville, sworn, and examined:—

484. *Chairman.*] Have you heard the evidence given by the Mayor? I have.

485. In general principles, do you agree with him? I do.

486. Is there any serious difference between your views and his? I have represented several public meetings in Marrickville, and as honorary secretary of those meetings, I am expressing their opinion when I say that all they are asking for is the dredging of Cook's River to remove the existing evil. The conferences represented about eleven municipalities—Hurstville, Rockdale, Kogarah, St. Peters, Erskineville, Newtown, Camperdown, Marrickville, Canterbury, Enfield, and Ashfield. The result of those conferences was that they agreed that the river in its existing condition is a menace to public health, and the river being a national water-course, and the evil being in a great measure caused by the Government erecting the  
Cook's

W. R.  
Benson, Esq.  
30 June, 1896.

W. R.  
Benson, Esq.  
30 June, 1896.

Cook's River Dam, therefore it is the duty of the Government to remove the evil and prevent the spread of disease which would be likely to result from the present condition of the river. I may also mention that about eighteen months ago a deputation, the result of one of these conferences, had the honor of waiting on the Minister for Public Works who then almost promised that if the dredging of the river did not mean a serious sum of money to be expended he would undertake the work for the people. However, an answer was received by me on behalf of the conference to the effect that it would be too costly—that it would run into a sum of about £36,000, and necessitate the building of an expensive dredge on the river at an unreasonable cost, and other incidental expenses. The conference took exception to the cost of building the dredge, and I presume you will have evidence brought forward proving that the building of a dredge for the purpose of removing the mud and silt from the river would not necessitate a great expenditure. Afterwards a second conference was held, representing from 88,000 to 91,000 people\*—that is the whole of the residents of those municipalities which I have enumerated—and the result was that it was determined to petition the Minister for Public Works to remove this evil. But before the petition had been in circulation for any length of time the matter was remitted to this Committee, by Parliament, on the motion of the Minister for Public Works, and therefore those petitions have not been completed. But I recognise the fact that we should have very little difficulty in procuring the signatures of 30,000 or 40,000 people praying the Government to abate the evil from which we are now suffering, that is the insanitary condition of the river. The river, as you are perhaps aware, has been dammed up for nearly sixty years; it has no outlet at all. As population has surrounded the river, naturally decomposed organic matter has drifted into it, and the sills of the flood-gates being 2 feet above low-water level, the whole of the decomposed matter is in the river itself, and in the summer the fact is recognisable very easily. I had the Secretary of the Fisheries Commission (Mr. Smithers) on the river with me one day, and the smell was so foul that it caused him to vomit. I have also seen fish absolutely poisoned there through the insanitary condition of the river, and floating on the surface of the water. During the ordinary level of the river in summer-time if you were to stir some parts of it with a stick, you would be very glad to run away from the banks of the river. I recollect the river 25 years ago, and I used to bathe in several portions of it—one in particular at the Arncliffe Bridge, where there were 8, 9, or 10 feet of water. At the bottom of the river then there was crystal sand, and the water was almost absolutely pure in appearance; but now I do not think that anyone could venture to bathe in the river and visit another person afterwards without fumigation. The petitions referred to have been suppressed for the reason that the matter is now under reference to this Committee, and therefore no further action has been taken pending the result of this inquiry. Mr. Darley's original scheme is, I think, to remove about 300 feet of the existing dam, so as to give free access to the waters of Botany Bay. The expression of the wish of the conferences was, that the river should be made free and navigable; and being a national waterway, and purely under the control of the Government, and not under that of any municipality, it was the duty of the Government, having created the evil in a great measure by the construction of the dam, to remove the evil complained of.

487. *Mr. O'Connor.*] Which ward do you represent in the Borough Municipality? The south ward, immediately bordering on the river.

George Alfred Morehouse, Esq., Alderman of the Borough of Marrickville, sworn, and examined:—

G. A.  
Morehouse,  
Esq.  
30 June, 1896.

488. *Chairman.*] You have heard the statement of the Mayor and also the statement of Alderman Benson, setting forth in detail the insanitary condition of the river? Yes.

489. Are you prepared to corroborate those statements? Not entirely.

490. Will you please state any point of difference? The main point of difference I take is as regards the Mayor's statement, inasmuch as the Borough of Marrickville have not asked the Government to deal with the flats. I am of opinion that we can deal with the flood-waters that fall on our own area ourselves, if the river is properly dealt with by the Government.

491. But, unfortunately, a considerable quantity of water which drains down the valley of the creek comes into Marrickville? In a very short time, when the sewerage works are completed, very little of that will come.

492. Do you mean us to understand that the question of the drainage of Marrickville Valley itself is a matter which can stand over until the main scheme is decided? I believe the local authorities could deal with the flats themselves if other water were kept off the flats by the Government, and the river dredged.

493. What water makes its way down the valley of Marrickville Creek which does not fall within the boundaries of Marrickville? A small amount from Petersham, Newtown, and St. Peters.

494. The stormwaters from those three municipalities come down the valley? Not the whole of those municipalities, but a portion of them.

495. How then is it possible to deal with the drainage of the valley without taking into consideration the stormwaters. I think it is, if we have an outfall at Cook's River to drain to.

496. If a dam be erected across the mouth of Cook's River, and Cook's River be up 3 feet, the Marrickville Valley will be flooded from the municipalities enumerated? I do not think so. I do not think there will be sufficient water to flood it.

497. You are not prepared to tell us the exact catchment area, or the amount of the waterfall? No; but our engineer, I think, could.

498. You might just as well be flooded by Cook's River as by the waters which come down from the other municipalities? Yes, if sufficient came to flood us.

499. You recognise that danger? I certainly do.

500. Therefore the draining of this valley for the stormwater coming down the valley is a matter for more municipalities than Marrickville? Yes; but of course my contention is that when all the places are connected with the sewerage system there should not be any great quantity coming down there.

501. But the sewerage will not deal with the stormwater? No, but it will deal with all the filth of the sewage matter.

502. *Mr. Farnell.*] You really approve of the original Departmental scheme? I do, certainly.

Charles

\* NOTE (on revision):—88,000 to 91,000 people as under (say) Hurstville, 6,000; Rockdale, 6,200; Kogarah, 2,500; St. Peters, 6,000; Erskineville, 6,000; Newtown, 22,600; Camperdown, 7,000; Marrickville, 17,000; Canterbury, 3,000; Enfield, 2,500; Ashfield, 13,000; total, 91,800.

Charles Moyes, Esq., Marrickville, sworn, and examined:—

C. Moyes, Esq.  
30 June, 1896.

503. *Chairman.*] You are an old resident of Marrickville? Yes.
504. How long have you been there? About thirty-five years.
505. Have you heard the evidence given by the Mayor, Mr. Benson, and Mr. Morehouse? Yes.
506. Do you agree, generally speaking, with the evidence we have heard? Yes, generally speaking.
507. Do you differ from them in any way on any essential point? There may be some minor point on which I would differ from them.
508. But, generally speaking, you would allow their statements to go for yours? Yes.
509. There is nothing you desire to particularise in which you differ seriously from them? There is nothing on which I differ seriously from them. I look at everything from a practical standpoint, not from an engineering standpoint. I have known Cook's River for forty-one years.
510. Do you know how high the tide used to go up before the dam was erected? It used to make up Cook's River to very near Canterbury. There was a breakwater at the old sugar-works to keep the tide back in order to get fresh water for the engines.
511. And how far up Wolli Creek? About a mile.
512. What was Wolli Creek like when you first knew it? There was a creek, but it was silted up greatly.
513. Is there much difference in Wolli Creek in the last thirty years? Yes, a great difference.
514. What is the difference? It is now, you may say, merely a flat. There is scarcely any watercourse there, whereas at that time there was a clear stream running through it the same as Cook's River.
515. Wolli Creek has gradually silted up until now it is not much more than a reed-bed? Yes, that is so.
516. Has there been much difference in Cook's River in the last thirty years? Yes; a great difference. At that time it was a beautifully clear stream of water, and now it is nothing but a mud-hole. If a dog goes into it to swim he comes out covered with mud. If you are rowing in a boat every paddle you strike in the water you stir up the black mud which is on the bottom. It is something like the Yarra at Melbourne. When steamers go up the Yarra you can see the black mud that is stirred up behind them. I may say that I have seen people fishing with nets above the dam.
517. Can you tell us in what consists your difference of opinion as regards the evidence given by the Mayor? In the main what they have stated is right, but as to the expense, I do not believe the work would cost half the money.
518. Your difference of opinion is limited to the question of cost, and not being an engineer you are not prepared to definitely state that? No, I am not.
519. But it appears to you to be more than it ought to be? Yes. In reference to Mr. Darley's scheme, I see that there is to be a road bridge across the dam 300 feet, and looking at the matter from my practical point of view, I think it would be a waste of money to build a 300-foot bridge there. You could take the waters of the Nepean through it and it would not do as much good to the river as a narrower bridge. It would not clean the river out so well as a bridge of 100 or 120 feet.
520. How often have you seen the flood over the top of the dam? I have not seen it since the last opening was put in on the south side, but I have seen it when it was 3 feet over the dam from one side to the other. That was about forty years ago, and the Government has from time to time raised the road. The usual level of the road was where you see the flags laid along the side of the road, and I have seen the tide washing over that, but the Government has added to it and added to it and made the thing worse behind it. Another obstruction to the river was made when the railway was constructed. What was done in connection with the sinking of the cylinders made the river narrower there.
521. Supposing the dam were removed and a bridge were erected to allow the flood-waters to get clear away, how high then, at the present bridge site, would the highest flood you have ever seen in the river rise? I do not think it would rise more than 3 feet higher.
522. Then only for the dam, in your opinion, Cook's River would never get out of its banks? That is my opinion.
523. Any floods in Cook's River would be inconsiderable only they are obstructed by the dam? That is my view.
524. *Mr. Clarke.*] You think that a bridge of 300 feet would be expensive, and not be so useful as a narrower bridge? Yes.
525. By that, I presume, you mean that a narrower space would give more of a current to take the waters away? Yes; it would clean the river more.
526. But if the dam were taken away, and a bridge were erected, would not the low-lying lands be flooded? They would have to prevent that by banks. I am sure the Marrickville Council would be only too willing to protect themselves if there were an outlet for the river.
527. You mean to prevent floods going on the low lands, either fascine or other embankments would have to be formed? I believe that. I do not think it would require more than 3 or 4 feet at the outside.
528. It would be inexpensive? Yes; I cannot see why a large sum of money should be expended. All that is asked for is the opening of the river to take away the flood-waters, and I think the Marrickville Council would protect themselves, and I am sure the people interested in the low lands would be glad to assist in opening up drains, and throwing up an embankment, so as to protect that land from being flooded.

Edward Campbell, Esq., M.A., Solicitor, Richmond, sworn, and examined:—

E. Campbell,  
Esq., M.A.  
30 June, 1896.

529. *Chairman.*] Where do you reside? At Richmond; but my people have lived at the junction of Cook's River and Wolli Creek forty years, and I was born shortly after they settled there.
530. Do you desire to make a statement? Yes. The Cook's River Dam was originally erected to prevent floods in Cook's River. The area of arable land in the Colony was limited to the county of Cumberland principally. In order to keep arable lands from being flooded the dam was erected, previous to 1840. My father, seeing that the dam did not answer the purpose for which it was erected, for over 20 years besought the Government to put in a second opening on the southern end of the dam. That was done in 1876. After that the floods were very much lessened above the Cook's River Dam. In 1884 the Government engineers, contrary to the advice of local residents, put embankments on the southern channel of Cook's River above the dam, right at the mouth of Wolli Creek. The waters of Wolli Creek drained from Hurstville through Rockdale and Arncliffe, and when they debouched into Cook's River their former outlet was blocked by this railway embankment and they were thrown back up Marrickville. Previous to that embankment being erected in 1883, it took a week's rain to cause such a flood as would now be caused in the same area.

E. Campbell,  
Esq., M.A.

30 June, 1896.

area by twenty-four hours rain. The Government engineers, contrary to the advice of local residents built the railway bridge on what was a mud island. The silt from the cylinders was thrown on to the island, and all the back-waters from Rookwood on the one side and Hurstville and Penshurst Park on the other, together with the drainage of the basin south of St. Stephen's Church, Newtown, were kept back; they had to rise to get over the island where the bridge was, and the water was thrown back. The natural current of Cook's River follows the southern bank. The only useful opening in the Cook's River Dam to let out the flood-water I find is now recommended to be closed, and the very natural outlet of the trend of the stream is recommended to be closed under this scheme. The scheme proposed, I consider, and say advisedly, is preposterously expensive. There is no necessity for improving private lands at the expense of the State, and I speak as an interested person, for that would be to my personal pocket interest. If nature may be followed in an engineering undertaking,—that is if, not as proposed now, but as proposed twenty-five or thirty years ago, the proper outlet for Marrickville be allowed into the river, the natural flow of the water from Marrickville would go fairly well in a direct line from the present site of the railway bridge to the embankment. I have said that the Wollie Creek is blocked by the railway embankment; but Wollie Creek now has to carry off that part of the Arncliffe valley drainage which formerly had its outlet on the West Botany side of the Cook's River Dam. If instead of falling in at the north-eastern corner beyond the dam, and instead of closing present openings, or in any way interfering with the dam as it at present exists, more openings towards the southern side were put in and properly worked, that would prevent a flooding of the area which is now subject to floods. But the flood-gates have never been properly attended to. If a man happens to be there they are attended to; but when flood-water comes down, and meets the high tide, very often the Marrickville Flats and the Cook's River flats receive the benefit both of the flood-water and the high tide simply through want of attention to the flood-gates now. To prevent the flooding of Marrickville, steps should be taken to prevent the Wollie Creek from backing up. The tendency of Wollie Creek is to make north instead of turning down Cook's River, on account of the obstruction at the railway embankment. That I have proved by noticing after a flood that on the Unwin's Bridge Road the sand is washed to the north rather than to the south. The proposed concrete dam at Undercliffe Bridge is not at all recommendable—that is the most charitable word I can use.

531. You think it would force the nuisance up the river? Exactly. There is no necessity for any large expense to be gone to. When I read in the papers that a sum of something like £36,500 was proposed to be spent on improving Cook's River, I thought it very large, because if the dam be widened and the high tide water kept out and prevented from joining with the flood-waters, the question of flood is largely and perhaps absolutely done away with, but not if the southern flood-gates are closed. The area between the railway and the present dam is silted up on account of their being no scour. The waters from the river and the waters from the creek are both blocked at the railway bridge, instead of being allowed to flow where they used to flow previously. In 1882, I know there were 10 or 12 or perhaps 15 feet of water where the southern railway embankment is, right close to the shore. There is no scour there, and the consequence, as Mr. McCoy said, is there is no channel between the railway and the dam. It is simply a mud flat.

532. What would be the difference in the rising of the tide between the mouth of Shea's Creek and the lower side of the dam? I do not know. All the grants lying up Cook's River and Wollie Creek were made by the Crown to the individuals who first owned them, after the erection of the dam.

533. You are sure of that? I am certain of that. I know that in our own case—Unwin's grant—there were vested interests created by the dam, and the dam was made to prevent the flooding of the area with salt water, and the removal of the dam would flood land granted by the Crown since the dam was made, unless this expensive fascine bankwork were carried out.

534. Supposing the Cook's River Dam were not in existence, would there ever be serious floods in Cook's River? There would be a larger flood in Cook's River than I think has ever been known within memory.

535. If there were no dam there the flood would be higher? Very much higher.

536. How do you come to that conclusion? Because the present flood-waters when separated from high tide waters rise 4 or 5 feet over the lowest part of the flats, and if they were allowed to mix with the tide waters and another 5 feet were added, it would just double the height of the flood. In my opinion if the waters of Wollie Creek were let out to the sea quickly, and means were taken to prevent them from running up Marrickville Flats, and if the flood-waters of Cook's River were taken out quickly without being allowed to run over Marrickville Flats, or to block back the waters from there, the same could be done at a very much less expense than that proposed. I know that in the Western Suburbs Out-fall Sewerage Scheme what is called the low-level system would take away a lot of the sewage which now runs into Cook's River. What has caused the floods to rise so quickly in Cook's River is, that the water from the high levels, owing to curbing and guttering in different municipalities, gets away more quickly into the river than it formerly did, and rushes down more quickly. The flood comes more quickly now than it did before, but the flood does not get away as quickly now as it did before, and the two things combined cause the trouble complained of by the Marrickville people.

537. *Mr. Fegan.*] Have you given any consideration to the alternative scheme? Yes. As an engineering scheme to display engineering knowledge, and hang the expense, you could not beat it. It is elaborate.

538. *Mr. Roberts.*] Would you consider an expense of £25,000 an extravagant one with the view of remedying the evils complained of? Well, for the benefit of health it is hard to say what the value would be, but I know it might be done more cheaply—that is, if the scheme were carried out in a practical way, and not on a theoretically grand scale. If the course pointed out by nature were followed rather than that suggested by man, I think £25,000 would be ample to do the whole work.

WEDNESDAY, 1 JULY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G. |  
The Hon. DANIEL O'CONNOR.HENRY CLARKE, Esq.  
JOHN LIONEL FEGAN, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Improvement of Cook's River.

James Phillip Webster, Esq., A.M.I.C.E., Engineer and Overseer to the Borough of Marrickville,  
sworn, and examined:—539. *Chairman.*] What are you? I am a civil engineer.

540. What is your present employment? My appointment at the present time is that of engineer and overseer to the Borough of Marrickville.

541. Have you been there long? I have been in the position nearly five years.

542. You have therefore an intimate knowledge of Cook's River, and of the vicinity of the river—Marrickville Valley, and so forth? I have.

543. Are you aware of the Departmental proposals—the scheme first submitted to the Committee, and also the alternative scheme? I had the privilege of seeing both schemes with the Marrickville Council last week.

544. You have had an opportunity of forming an opinion with regard to them on general principles? I have.

545. You know Cook's River? I do.

546. You are aware of the insanitary state of Cook's River above the dam? I am.

547. How is that caused? That is caused by various reasons.

548. Will you state them? The first reason is the amount of *debris* brought down by Wollie Creek principally in the shape of sand; the second is the amount of light matter held in suspension by the floodwaters coming from the Marrickville Valley; those are the two principal reasons.

549. With regard to Cook's River itself, is that a polluting agent? Cook's River is a polluting agent, by reason of the amount of country that it drains, the Canterbury district in particular.

550. Therefore we have three agencies at work, first, Wollie Creek, second, Marrickville Valley, third, Cook's River? Quite so.

551. Will you describe the catchment area of Wollie Creek, and the reasons why it is a polluting agent? The catchment area at Wollie Creek extends from the dam towards Hurstville, and the watershed then lies to the west of Hurstville, and runs northerly to Cook's River again. It is a basin lying on the southern bank of the river.

552. A large basin? The extent of that basin is 8 square miles, or 5,120 acres.

553. Is that basin much occupied by settlement? It is much occupied by settlement from the fact that the Illawarra settlements are within the basin.

554. When you speak of the Illawarra settlements, what do you mean? Part of Kogarah and of Hurstville, and a district lying between and to the west of those portions with which I am not very well acquainted. There is a considerable amount of settlement; in fact, a large population resides within that drainage area.

555. In addition to the ordinary pollution that may naturally be expected from settlement, are you aware of any special pollution that takes place on Wollie Creek? I am not personally aware of any special pollution, but from what I have gathered from the reports in the papers from time to time, I believe that causes of pollution do exist in the shape of manufactories.

556. Up Wollie Creek? Yes.

557. Tanneries? Something of that kind.

558. But you are not prepared to express a definite opinion on that point? No, I am not.

559. But that Wollie Creek is a polluting agent you have no doubt? I have no doubt of that.

560. Will Wollie Creek, for all time, be the discharge for flood-water over the 8 square miles you particularise? It will.

561. Now, turning to the question of Cook's River, will you describe the catchment area of Cook's River, and, as far as you can, the cause of the pollution of its waters? That is the main catchment area under consideration. The total catchment area at Cook's River above the dam is 30½ square miles. The area of that portion of the river under consideration now—above the dam, and above Wollie Creek basin also—is 22½ square miles. That would be 14,400 acres.

562. What is the settlement upon that? The settlement within that basin is also considerable. The township of Canterbury is situated therein, and a portion of Enfield, whilst a portion of Ashfield, and the western portion of Marrickville also drain into it.

563. Will Cook's River be for all time the discharge for flood-waters for that district? It is the natural outlet for the whole of that district.

564. And is likely to be the flood-water discharge for it for all time? Yes.

565. What causes the pollution of Cook's River;—do you know of any special cause of pollution in connection with it? It is caused by general settlement.

566. Are there any manufactories upon Cook's River? Not a great many; the pollution is from residential settlement.

567. You prefer to limit your statement in regard to the pollution of the water of Cook's River to the general term of "general settlement"? Quite so.

568. What flood-water comes down Marrickville Valley? The total watershed of Marrickville Valley is, in round numbers, 1,700 acres.

569. From where does the flood-water come? From St. Peters, Newtown, Petersham, and Marrickville.

570. Are all these municipalities interested in having a suitable discharge down Marrickville Valley? More or less.

571. For all time will the area you last particularised find its outlet for storm-water down Marrickville Valley? Yes; for all time.

572. Or by some scheme that takes the place of Marrickville? Quite so.

J.P. Webster,  
Esq.,  
A.M.I.C.E.

1 July, 1896.

- J. P. Webster, Esq., A.M.I.C.E.  
1 July, 1896.
573. With regard to the pollution of those waters, do you again describe it as a matter of "general settlement" on the catchment area? Yes, I do; more so than any of the other basins. The settlement is denser on the Marrickville basin.
574. And therefore the pollution is greater? Quite so.
575. Are you aware of the system of sewerage that is being carried out in connection with the city and suburbs? I am.
576. Are you aware that the sewage of the area last described by you will, in the course of a few years, be intercepted by the system of sewerage which is now being carried out? I am aware that the Marrickville basin sewage will be intercepted within a few years, but not that of the other areas—that is the Wollie Creek basin and the upper waters of Cook's River. The total drainage area of Cook's River is 19,520 acres—that of Wollie Creek is 5,120 acres, and that of Cook's River proper is 14,400 acres.
577. The sewage that at present finds its way into Cook's River and also into Wollie Creek will not be intercepted by any sewerage system at present being carried out for some considerable time? That portion of Cook's River above Marrickville will not be—at least not to my knowledge.
578. And therefore Wollie Creek and Cook's River will be, for all time, the storm-water discharge for the drainage centres of the areas described, and also carry the sewage for some considerable time? Quite so.
579. Marrickville Valley will be the storm-water discharge for all time, or some alternative scheme that takes the place of Marrickville Valley will be; but in the course of a short time the sewage will be intercepted? I am not in a position to say in a short time. Judging from the progress that the western suburbs sewerage system has made during the last few years I should say it would be a very long time before the whole of that were intercepted.
580. But it appears to be terminable? Yes.
581. You have seen the Departmental scheme that was first submitted to the Committee? Yes; I have seen the original scheme.
582. And the alternative scheme? Yes.
583. You understand them? Yes.
584. Have you any levels from the junction of Shea's Creek to the present dam across Cook's River? I have no levels along that portion of the river.
585. Have you ever taken the rise and fall of the tide at the dam on Cook's River? Yes; I have given attention to that matter.
586. What does it rise between spring-tide and neap-tide? Between neap-tide and spring-tide—high-water mark—there is a difference of 2 feet at the dam.
587. On the lower side of the dam? Yes.
588. From dead low water to spring tide—highest water—is how many feet? Six feet.
589. Do you know what is the rise and fall of the tide in Botany Bay? I have not had opportunities to take observations in Botany Bay.
590. Is it reasonable to suppose it will be much more than that? I am opinion that would be about the same.
591. There is no material difference? No.
592. Is Shea's Creek about one-third of the way to Botany Bay? I should say it is, approximately.
593. Are you of opinion that there would be any great difference in the rise and fall of the tide at the mouth of Shea's Creek compared with Botany Bay? No appreciable difference.
594. Therefore no appreciable difference between that and the dam? None whatever.
595. Therefore, there would be, in your opinion, as great a difference on the lower side of the dam in the rise and fall of the tide as there would be at the mouth of Shea's Creek? Yes; that is so.
596. Have you any levels for the dam up the entrance of Marrickville Valley? I have levels. The water is, with the exception of heavy gales, level.
597. Can we regard it as being approximately level? It can be regarded as being approximately level.
598. Therefore, do you believe that it is practically level from the entrance of Marrickville Valley to the mouth of Shea's Creek? Not so, because at the present time there is a drop of 2 ft. 6 in. from the western to the eastern side of the dam—that is, the waters at Cook's River, west of the main dam are close on 3 ft higher than low tide to the east of the dam.
599. You attribute that to the effect of the dam and not to the contour of the country? It is decidedly the dam that backs the water up to that extent.
600. Supposing the Cook's River Dam were so constructed that there was no impediment to the water in getting away, would the water then lie approximately level—say within a few inches—from the mouth of Shea's Creek to the mouth of Marrickville Creek? In my opinion it would be for all practical purposes level.
601. Do you believe the discharge of the alternative scheme would have a 2 ft. or 3 ft. better fall than a discharge into Cook's River at the end of Marrickville Valley? That is if the dam is cleared away and Cook's River is so that the waters can get away without impediment of any kind.
602. If arrangements are made so that Cook's River Dam does not materially affect the free running of the water, would there be 3 feet difference of head between the mouth of Shea's Creek and Marrickville Valley? I decidedly say no to that question.
603. There would not? Not in my opinion.
604. Therefore if a Departmental scheme is placed before us, one of the main reasons for which is a better discharge at the mouth of Shea's Creek than at the mouth of Marrickville Creek, you believe it is based on a wrong contention? I do.
605. You candidly believe so? I do, candidly.
606. If there be not 2 feet or 3 feet better head at the mouth of Shea's Creek than at the mouth of Marrickville Creek, can you urge any other reason for the alternative scheme being proposed? I can urge no reason whatever for the alternative scheme.
607. If the mouth of Shea's Creek and the mouth of Marrickville Creek be practically the same level, which, in your opinion, will be the best place at which to discharge the flood-waters from Marrickville Valley? Into Cook's River, at the bottom of the valley.
608. Using the old valley bed as it were, for the drainage centre? Quite so.
609. You have already stated the area drained by Marrickville Valley;—can you give us any idea what amount of water would fall on that area, with a given number of inches, and how long it would take to go through a tunnel 15 feet by 6? I calculate that taking a rainfall of 8 inches in twenty-four hours—that

is an excessive rainfall, but it has happened in Marrickville, and 25 per cent of that water being absorbed by the ground, leaving 75 per cent. or 6 inches to run off in the twenty-four hours, that tunnel would take fifty hours to discharge that quantity of water. Those figures are given on the assumption that the tunnel in the alternative scheme has a maximum grade at low water of 1 in 3,200.

J. P. Webster,  
Esq.,  
A.M.I.C.E.  
1 July, 1896.

610. Do you mean that, supposing the tunnel were working all the while, and carrying continuously, it would take fifty hours to carry it off then? Yes.

611. And if we halve the rainfall and make it 4 inches, which would be not an unreasonable quantity, the tunnel would take twenty-five hours to carry it off? Quite so.

612. With an uninterrupted flow, if 75 per cent reached the drainage centre and sought the intake of the alternative scheme, it would take twenty-four hours to drain away if it ran free all the time? Quite so.

613. If the tunnel were worked only one-third of its time—worked intermittently because of the tide—it would take three days? It would take three times the twenty-four hours.

614. What would be the condition of the valley then? The result would be that the valley would be under water.

615. Flooded from end to end? Yes.

616. Are you aware how much the outlet of the open channel is, in relation to high water? I take it from the section, that the outlet of the tunnel is at dead low-water mark.

617. Does the section show that? There are no levels on this section.

618. We will discuss the alternative scheme,—presuming the discharge to be at dead low-water, how much would that then be below the intake—in other words—how much is the mouth of Shea's Creek, in your opinion, below the intake of the open channel to the west? Well, the grade of the tunnel at 1 in 3,200, is little better than 18 inches to the mile.

619. We turn now to the original scheme: have you any information as to what the cost will be of constructing a suitable storm-water channel from the mouth of the intake of the alternative scheme to Cook's River—what width would the storm-water channel require to be? In 1892 I prepared a report for the Marrickville Borough Council, in which I gave an estimate for improvements of Cook's River similar to those proposed by Mr. Darley. My proposal was to lower the sills of the flood openings on the main dams, to construct a V-shaped training-wall, or two training-walls, at the entrance to the railway bridge, to deepen the channel from the main dam to the lower portion of Marrickville Flats, and other smaller items, which I estimated would cost altogether £6,887.

620. And your storm-water discharge at the Valley? I did not touch the Valley. I looked upon that as a secondary consideration.

621. How wide would it require to be to carry the flood-water? Under that scheme I recommended 300 feet.

622. You are talking of Cook's River? Yes.

623. How wide would the storm-water channel require to be to carry the flood-water that comes down Marrickville Valley? My estimate of that is—north of Sydenham Road, 20 feet wide. At the Sydenham Road crossing, the north-western drain joins the main drain, and 40 feet wide is my estimate from that point south to the railway bridge. The railway bridge crosses the Marrickville Valley opposite the park. From the railway bridge to Cook's River, my estimate is 60 feet wide.

624. Taking that part from the railway bridge to Cook's River, what length would that be? About 50 chains. Of course, these measurements are only approximate.

625. You therefore consider it is necessary to have a 60 ft. storm-water channel to do the same work that the alternative scheme proposes to do in 15 ft.? Yes.

626. You have four times the width? Yes.

627. From an estimate of the catchment area, do you believe that width is required? I believe that width is fully required to take off the storm-water.

628. We will divide the cost of that into two—the cost of land resumption or severance, and the cost of construction. Is it possible that any extensive land resumption would have to take place to get the storm-water channel down Marrickville Valley? In my opinion it is not.

629. You would require to pay for some land? Yes.

630. Can you give us any estimate of what it would cost? That is a question I have not gone into.

631. Would the cost be serious? No, it would not be serious; because the land at the lowest portion of the valley is of very little value.

632. Is it not a fact that any lands lying so low that they would be contiguous to this storm-water drain or channel, would be very much benefited, and, therefore, the owners, for purposes of that kind, ought to be prepared to sell the land at a very low rate? It would appear reasonable that they should dispose of their ground for such a purpose at a low rate.

633. It is clear that it must do them a great deal of good? Quite so.

634. Except in flood-time, it would keep Marrickville Valley perfectly dry? It would minimise the danger of flooding considerably.

635. Can you give us any opinion as to the cost of such a drain? I have not gone into that question, because I am not an advocate of draining the whole of Marrickville through a central drain. Since I have been in the employment of the Marrickville Council, I have never advocated a system of that kind.

636. What do you propose to do with the storm-water that comes down? My proposition would be to intercept the high-level water on a certain contour-line, so that it would gravitate into the river at all tides. Then that would separate the high-level water from the low-level water.

637. But your resumptions under a scheme of that kind would be very heavy? In carrying out the proposal that I should make in that case the resumptions would be very light indeed, because Marrickville is so situated that advantage could be taken of two ridges for channelling purposes, and you could intercept at two points in the Borough of Marrickville, so as to intercept the upland water at such a level that it would gravitate into the river at all tides, and by doing that, you would get rid of the high-level water for all time. It has been a great source of complaint.

638. Which would be the cheaper thing to do? I do not look so much to the cost as to the effectiveness of the two schemes.

639. What was your estimate for intercepting the water of the higher levels? I have never been asked to give an estimate; and I have not gone into that question. I went only into the question as to which was the best system to adopt in dealing with the storm-waters of Marrickville.

J. P. Webster,  
Esq.,  
A.M.L.C.E.  
1 July, 1896.

640. With regard to the question before the Committee, is it your opinion that it can be divided into two—one the question of remedying the pollution of a tidal river—Cook's River—and the other the proper dealing with the discharge of flood-waters from the areas which naturally discharge into Marrickville Valley? That is my decided opinion.

641. And if Cook's River be dealt by the State, it then should be reasonable for the municipalities interested to find a suitable discharge into that? Quite reasonable and just.

642. The opening shown between the fascine banks of Cook's River and the position of the iron bridge is apparently 300 ft.? Yes.

643. Would it be possible to have sluice-gates that discharge at the Cook's River Dam in such a way that immediately the water below the dam fell the water of the river should commence to fall equally above the dam; in other words would it be possible to preserve a continuous level through the dam? In my opinion it is not possible to preserve a continuous level.

644. Not through the sluice-gates? No; because there is the friction of the sluices to overcome, and the power required to work those sluices, and that must necessarily take a certain head of water. At the present time the sluices in the Cook's River Dam take a head of 15 inches of water to work them.

645. What would be the least amount of rise it would be reasonable to expect, must of necessity be overcome in any system of sluicing? In my opinion, about 4 inches.

646. Therefore, the erection of suitable sluice-gates in a properly constructed work across the present position of the dam would not necessitate the rise above the dam being more than 4 inches higher than the water below it? I may say from 4 to 6 inches.

647. Therefore, with sluice-gates large enough to deal properly with the discharge of Wollie Creek into Cook's River, you would not lose more than 4 inches head? That is so.

648. Then it follows if you brought the cutting round the toe of the ridge, and under the railway station, discharging into the square basin running along by the dam, you would have a 4-inch better discharge than if you discharged out of the mouth of Marrickville Valley? Any discharge into Cook's River, below the dam, would be 4 inches better than the discharge above the dam, provided in the first case no gates were used.

649. Supposing it were regarded as a wise thing to gain that 4 inches, do you see any objection to discharging into the sort of dock that is cut running past the dam? I am of opinion it is not possible to discharge with less than that, because unless you have some mechanical means of staying the rising tide, the whole of the flats will be inundated.

650. But I take it for granted you would discharge intermittently—I mean, you would have a gate or door of some kind? Then you would lose so many inches by the working of that gate or door.

651. You think that by discharging into the corner of the dock, you would lose as much as you would in going through the sluice-gates in the dam? I think so. If you discharge at dead low-water mark, with the action of the sluice-gates you lose 4 inches, that is, your discharge into the river to the west of the main dam, would be 4 inches higher than that. You have practically a fall of 4 inches by the action of the gates on the sills in the dam.

652. By bringing a canal round the point of the ridge, and discharging into a corner of the dock you do not think it is possible to save those 4 inches? I do not think so.

653. Is 4 inches very material? Yes; 4 inches is material, but at the present time, with the dam holding up 2 feet 6 inches, in comparison to that, it is immaterial.

654. You approve of the dam across the mouth of the Marrickville Valley? Yes, I do.

655. With the exception that there should be an opening there to let the water out in that direction? Quite so.

656. Wollie Creek, as we have it shown on the plan before us, would have a tendency to hug the bank and make up towards Marrickville Valley as it is at present;—have you a proposal to obviate that? My proposal to obviate that is to construct a proper training-bank, so that the waters of Wollie Creek should be drained in a line parallel to that of Cook's River, so that the two currents should go through the railway bridge side by side. The action of Wollie Creek at the present time, is, to run right athwart the waters of Cook's River, and in consequence of that action they choke one another. To get over that difficulty the proposition was to construct a training-bank opposite the railway bridge in the shape of the letter V.

657. That is to throw the Cook's River water through the bridge? To catch the Cook's River water, and throw it through the bridge in a line parallel to the Wollie Creek water.

658. And the dyke would throw the Wollie Creek water through the bridge? Yes; it would throw the Wollie Creek water through the bridge, whilst the other would throw the Cook's River water through in a parallel line, and thus the two currents would assist each other.

659. Have you any knowledge of what effect the railway bridge has had on that portion of Cook's River? I have not been in Marrickville sufficiently long to be able to express an opinion on that question; but I have taken levels, and I have also taken cross-sections of the river; and from my figures I have proved that there is ample room under the railway bridge; in fact there is a greater area through the railway bridge than is requisite to take the combined waters of Wollie Creek and Cook's River.

660. Have you ever seen a flood in Cook's River below the dam, submerging the surrounding country? No; I have never seen that.

661. Is it possible that any flood could rise over the fascine banks at present in existence? In my opinion, no.

662. The flood, according to your contention, is intercepted at the dam; well, supposing we remove the dam, what would be the difference in the flood, then, at the mouth of Marrickville Valley;—in other words, how much is the flood held up at the dam? The 1889 flood was held up 18 inches over the centre of the dam, and fell in a cascade on the eastern side. The flood-level in the Marrickville Valley, if I bring to mind the figures properly, was held up 4 feet by the action of the dam.

663. You speak of the cascade—how far was it above low water in Cook's River at that time;—how much was the fall? That was high water—that is, the waters in Marrickville Valley were held up 4 feet above ordinary high-water spring tides.

664. They were held up 4 feet by the dam? Quite so.

665. And if the dam had not been there, the water would have been 4 feet lower at the mouth of Marrickville Valley? Yes, that is so.

666. Have you any estimate with regard to the amount it would cost to put proper sluices in the dam? I estimated that erecting new flood-gates, and lowering the sills of the present flood-gates to low-water mark, would cost £2,012.

667. Would that leave ample discharge? When I wrote this report and furnished it to the Council, it was my opinion that it would leave ample discharge for the flood waters. J. P. Webster,  
Esq.,  
A.M.I.C.E.
668. Do you consider that the only expense necessary at the dam is £2,012? Yes.
669. What would be the cost of your fascine work inside? The fascine work with this scheme would be unnecessary. 1 July, 1896.
670. You propose to close the north-eastern sluice-gates, and to put all your discharging power down at the south-western corner of the dam? No, not under that scheme. The scheme that I furnished to the Council, was on economical lines. It was to take advantage of the existing openings, and to make just sufficient new ones to give the increased water room necessary. Under that scheme, I did not intend to do away with the northern flood-gates. Then there would be the dredging of the river, which would be necessary before the sills were lowered.
671. What do you consider should be the total width of the sluice-gates necessary now? Three hundred feet, that is, for a complete scheme under the system of sluice-gates.
672. You see the fascine bank running from the north-eastern end of the proposed Government bridge; if a fascine bank were placed there, there would require to be a sluice-gate right across the termination of that fascine bank to the southern shore, as shown—it would require to be all sluices? Yes; this would require to be all sluices.
673. Do you approve of reclaiming the V-shaped piece opposite the north-eastern sluices coming down to where it shows on the plan the commencement of the bridge, marked in red, and then making sluice-gates right across from there to the south-western side of Cook's River? Yes, in preference to a scheme which necessitated the erection of sluice-gates in Wollie Creek and on Cook's River, and at the mouth of Marrickville Valley.
674. What, in your opinion, will be the effect of the Government scheme of erecting fascine work round Campbell's property, and dams across Wollie Creek and immediately above on Cook's River, as shown? The effect would be similar to the effect of making the main opening through Cook's River Dam and making the sluice-gates there.
675. Would there be any chance of the insanitary state of things being transferred from Cook's River Dam to above these dams? In my opinion, no, if properly constructed sluice-gates were put in; but if sluice-gates such as exist in the present dam were put in, then there would be.
676. Supposing that water brought from Marrickville Valley were taken down to the intake of the alternative scheme, in fairly heavy rainfalls, would it be able to get away down through the alternative scheme with such levels as we have? It would get away slowly.
677. What would the result be at the end of the intake? The result would be that water at present impounded on the southern portion of the flat would be removed to the centre of the flat.
678. You would have a lake there, you think? Quite so; until such time as the tides would permit of its being drawn off.
679. Have you any figures to show what catchment area drains into Marrickville Valley between the open channel intake of the alternative scheme and Cook's River? That is the water-shed between Cook's River and the intake of the alternative scheme. It would be, approximately, 180 acres. 180 acres would drain northerly into the intake of the tunnel.
680. Is the intake of the tunnel practically on the same level as the Cook's River and of Marrickville Flat? The ground-level at the outlet of the Marrickville Flats, and the ground-level at the centre of the Marrickville Flats, about the position of the entrance to the tunnel, is very much about the same, but I gather from the section that the intake of the tunnel is, I should say, between 3 and 4 feet lower than the ground-level.
681. In general principles, then, is the best flood discharge a covered drain such as would be in a tunnel, or an open channel? Unhesitatingly I say an open channel.
682. Simply because you can get at it? Yes; at the present time, I may state, it costs the Marrickville Council £120 a year to keep the present drain free from road debris and matter brought down in suspension by the waters, and that is only a small drain, but it gives us an idea of what a tunnel, such as that proposed, with a flat bottom would cost to clean if it were covered in for half a mile.
683. What is the fall? 1 in 3,200.
684. What velocity would that give? Something under 150 feet per minute.
685. You mean that it would give something under 2 miles an hour? About a mile and three-quarters an hour.
686. In your opinion what should the fall be? Nothing less than 4 feet per mile.
687. With such a fall as we should have in the proposed tunnel, you think there would be a choke by the tide or by flood, and that the debris would settle, and the force of the current would not shift it? It would be a nuisance.

Tom Stanley, Esq., late Overseer, Excelsior Land Company, Marrickville, sworn, and examined:—

688. *Chairman.*] What are you? I am at present an overseer.
689. In charge of an estate? I have been for the last four years; but I have just left the Excelsior Company.
690. *Mr. Fegan.*] Is that company what is known as the Warren Estate Company? Yes.
691. I think you went over part of the ground with the Committee the other day? Yes.
692. How long has this agitation to have something done in this matter been going on? I think close on ten years.
693. Have you been long a resident of Marrickville? I have resided on the Warren Estate for over ten years.
694. Have you looked at both the schemes that are before the Committee? Yes.
695. What is your opinion with reference to the alternative scheme? I have taken an interest in the matter during my residence in Marrickville, and I may say that about ten years ago we had what was called a progress committee there, in connection with municipal matters, and this question was considered on various occasions for some two or three years, whilst the committee lasted; and it was then, as it is now, the opinion of the older residents, that the scheme propounded by Mr. Webster is the most practical, and most suitable for the locality and the circumstances of the case.
696. Do you think that the proposed Marrickville Dam would be any detriment to the valley? Yes.

T. Stanley,  
Esq.  
1 July, 1896.

- T. Stanley,  
Esq.  
1 July, 1886.
697. In what way? I may point out that that is the position where you stood with the other gentleman when you were there—on the wooden bridge. If the dam were constructed there, I am of opinion that there would be a lake there when there was a heavy rainfall, because the alternative scheme would not be sufficient to take the water off in anything like a reasonable time. This being part of the company's property, of course I have had special opportunities for observing that—it was part of my duty—and I found that the whole trouble seemed to be that the outlet was not large enough to drain that flat in anything like a reasonable time.
698. You say that you have been representing the Excelsior Company for about four years;—has there been any difference in the flooding of that valley during those four years? No. For the last four years, in fact since the 1889 flood, we have not had anything like high floods, we have had ordinary floods. You have seen the effect of the last one by the debris deposited on the street. That was an ordinary flood. That did not block us from getting to Tempe station, but I noticed that with the same amount of rain now, as fell, say, six or seven years ago, the water remains a longer time on the flat.
699. What is the reason for that? I attribute it to the silting up of the river, and the position of the dam.
700. Which makes it more difficult for the water to get away? Quite so.
701. Do you think that dredging the river would be of any service for the drainage of that area? Not unless the dam is removed.
702. Which dam are you speaking of now? The Cook's River Dam.
703. That is where the bridge and the sluice-gates are at present? Yes.
704. What would be the consequence if they were taken away? The water would get away more quickly.
705. And a high-tide would go down the valley? A spring-tide would, I daresay, but I do not think a neap-tide would.
706. You do not think the usual tide would? Not if those fascine banks were made.
707. And in your opinion, the taking away of these sluice-gates would not be any detriment to the valley or low ground there? No; I think it would be a benefit, that is, providing a canal were cut up the flat.
708. Would that be Government or municipal work? I think the cleansing of the river—it being a tidal river—is work for the Government to do.
709. And the draining of the flat? Well, as that affects some five or six municipalities, I certainly think they should have something to say in the matter, and should bear part of the cost either directly or indirectly.
710. Do I understand you to mean that the dredging and deepening of the river is purely Government work, and the expense therefore should be defrayed by the Government? Yes.
711. But the cost of constructing a drain in the flat should be defrayed out of the general sewerage scheme of expenditure? Well, as the municipalities affected are not in a financial position to do it themselves, I take it it should be done on the betterment principle. I think that those municipalities that would be benefited by the construction of the canal should at least contribute towards the interest on the cost.
712. Do you think that the residents in the near vicinity of the flat would object to contribute their share towards the draining of that flat by the municipalities? If it were put upon them as an extra rate, I am of opinion they would. The principal part of the land is owned by large landowners—the Excelsior Land Company, the Haymarket Land Company, and others; there is a lot of it unsold.
713. Is a portion of it Government land? Only a small reserve, which has been dedicated to the people of Marrickville for a park. It is 150 yards from where you stood.
714. Can you tell me the reason why the ratepayers should object to pay for a storm-water sewer going through that flat? I cannot give you any reason why they should.
715. Can you give us any reason why the Government should pay for a storm-water sewer going through that flat? Well, the only reason I can offer is that the municipalities are not in a financial position to do it themselves at the present time.
716. But, rightly speaking, if the municipalities were in a fair position, it is really their work? I am of opinion it is.
717. And, therefore, that does not take away from the municipalities the responsibility of constructing this storm-water sewer? If they were able to do it, I think it fairly comes within their duty.
718. As one of the ratepayers, do you not think it is reasonable that if the storm-water sewer is constructed the cost of its construction should be a charge on the general sewerage-system expenditure? I am of opinion that the cost should be shared by the municipalities that help to cause the trouble.
719. What would your reason be for constructing this channel;—to get rid of the stagnant waters there? Yes.
720. Would you not call that part of the sewerage system in a small way? The storm-water is the source of the trouble, and it comes from the higher ground. You would have to intercept it at about a dozen places if you wanted to make use of the sewer to relieve the flat.
721. It comes from the high lands of the municipalities of Marrickville, Newtown, St. Peters and Petersham? Yes.
722. This drain if constructed, would answer for this flat, as the sewerage will answer for the higher ground? Quite so.
723. Therefore, the cost should be charged to the general sewerage account? I suppose so.
724. You believe that? Yes.
725. You do not think it is fair that the Government should carry out this scheme without being remunerated by those who would benefit by it? I am certainly of opinion that they should not.
726. You are of opinion that if the Government bear the expense of dredging the river and making other improvements necessary, the municipalities on their part should bear the other expense? Quite so.
727. What companies do you say hold land there? The Excelsior Company, and the Haymarket Company, and I think also the Intercolonial Investment Company, but I am not quite sure as to the third company.
728. Three large land companies? Yes.
729. And there is a certain amount of property there not yet sold, in private hands? Yes, in the hands of those companies.

THURSDAY, 2 JULY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

THE HON. CHARLES JAMES ROBERTS, C.M.G.,  
THE HON. DANIEL O'CONNOR,HENRY CLARKE, Esq.,  
JOHN LIONEL FEGAN, Esq.,

FRANK FARNELL, Esq.

The Committee further considered the proposed Improvement of Cook's River.

John Phillip Sharkey, Esq., Civil and Hydraulic Engineer, sworn, and examined:—

730. *Chairman.*] What are you? I am a civil and hydraulic engineer, a licensed surveyor, and a J. P. Sharkey, sanitary engineer.

731. Are you aware of the Departmental proposal that was placed before the Committee, and also the alternative scheme? Yes.

2 July, 1896.

732. Do you desire to make a statement in regard to matters proposed to be dealt with under those schemes? Partly. I do not come here to combat those schemes in any shape or form; but, as I formulated a scheme some years ago which was accepted as being complete in every respect I thought it my duty, and I have been told that it would become my duty, to lay that scheme before this Committee as it would completely remedy the evil of the flooding of Tram Vale without involving any expenditure on behalf of the Government. I have the whole of the evidence in the form of a prospectus that was issued to the landowners on the flooded area, and the shortest way would be for me to read this prospectus as it outlines in the most concise form with the whole of the design and mode of operation under my proposal.

733. You consider it properly sets forth your views in connection with the matter? Quite so.

734. If you consider that is the best way to give us the information the Committee will have no objection? I would preface my remarks by reading a copy of the letter I wrote to the Minister for Public Works, which shows the reason why I appear before you to-day:—

Mercantile Chambers, 187 Castlereagh-street, Sydney, 14 September, 1894.

The Honorable the Minister for Works, Sydney,—

Sir,

Observing that a deputation from the Marrickville Council is about to wait on you in reference to the drainage and reclamation of Tram Vale, situated at Marrickville, by which the Government is likely to be asked to undertake the cost of such works as may be considered necessary by your engineers for that purpose, I do myself the honor to bring under your notice the following facts:—

Competitive designs for the drainage and reclamation of the above area were called for by the local Council in October 1891, in conformity with which I formulated a complete scheme, with plans (the subject of this communication) which were submitted, but not dealt with on account of some slight informality as to the time of lodgment.

In September, 1893, a strong and influential promoters' syndicate was formed with the view of floating a company to carry out the scheme formulated by me, and for the following objects:—

- (a) To acquire by purchase at the then low value all that area situated at Marrickville, known as Tram Vale, or more generally known as the flooded area of Marrickville.
- (b) By means of an efficient and complete drainage system to erect the same into a "model township" where the most perfect sanitary arrangements shall prevail.
- (c) To light the model township, together with a portion of Marrickville, with electricity.
- (d) To subdivide the lands thus acquired to a uniform design, and to sell the same at their enhanced value.
- (e) To secure by legislation the necessary powers (x) to light portion of the borough with electricity (y) to close and divert streets (not main streets) to enable the land to be laid out with uniformity to suit the conditions of drainage to be established, and (z) to apply the betterment system to those lands which the company are unable to purchase.

So as to thoroughly advertise the movement, the prospectus, including details of the works proposed to be carried out, was published in the local newspaper, and lectures were delivered before the borough council when a large assemblage of ratepayers was present, and before the Ratepayers' Association.

This company had every prospect of being a success financially and otherwise, had it been possible to purchase the lands so situated within the flooded area at anything like their fair value, but on treating with the owners it was found that the prices demanded had risen threefold on the intentions of the company becoming known, and therefore the project became impossible for that reason alone.

Besides, considerable opposition was shown to the formation of the company purely on socialistic grounds. At a meeting of the Ratepayers' Association, held on the 2nd November, 1893, resolutions were carried unanimously affirming that the scheme was a huge monopoly and that the work should be carried out by the Government.

For the two reasons above enumerated it was decided by the promoters to merge their company into a co-operative proprietary company, by which means the grounds of socialistic objection would be at once removed and the difficulty attending the purchase of land obviated.

With this object in view a new prospectus was prepared (copy herewith) and published *in extenso* in the local newspaper. Amongst the first to accord their support by offering to surrender their lands under the provisions provided by the cooperative proprietary company were the Excelsior Land Investment and Building Company and Bank, Limited, and the Mutual Life Association of Australasia, while the Joint Stock Bank, Limited, intimated its intention of falling in with the movement when further developed, and the small landowners had shown a disposition to co-operate. These institutions own a large proportion of the area to be reclaimed.

On approaching the smaller owners difficulty was at once met with, as a movement was on foot, headed by the local council, to induce the government to carry out the work of reclamation. At this period a deputation to the Hon. W. J. Lyne, Minister for Public Works, was so far successful in that he directed his engineers to make an inspection of the locality and prepare a report showing the best means of drainage and reclamation. Under these circumstances it was considered useless by the promoters of the Co-operative Proprietary Company to continue treating with the landowners who expected a work of such magnitude to be carried out without cost to them at the public expense. So, further action in the interests of the company has been suspended pending developments.

I understand a report is now being prepared for presentation to you by your engineers and I am sufficiently confident to believe this will take no other shape than that of confirming the scheme formulated by me as the only one possible or natural to the locality. I submit the scheme in book form, formulated by me with plan for the inspection and report of your engineers, which scheme is that on which the Co-operative Proprietary Company is being formed and which was submitted to the Marrickville Council on the 2nd November, 1891.

I would most respectfully submit that a work of this kind would possess nothing of a national character, while the public policy involved in the question is of the greatest importance, as should State funds be extended in affording relief in this case similar action will be claimed for other localities standing in the same position.

For the following reasons it will appear that interference with private enterprise by the government in this case cannot be advocated on national grounds:—

- (a) That not one foot of land within the flooded area of Tram Vale is owned by the State;
- (b) that the expenditure by the State of the large sum of money necessary for the complete drainage and reclamation of Tram Vale, will exclusively benefit the private individuals and companies whose holdings would be increased in value at the expense of the public exchequer;
- (c)

J. P. Sharkey,  
Esq.  
2 July, 1896.

- (c) that it is within the power and therefore the duty of the landowners themselves, at their own cost, to carry out such works as may be considered necessary, on the co-operative principle, following the example of the reclamation, drainage, and irrigation colonies of America and elsewhere, they being the only persons to be benefited thereby and they receiving the entire profits arising therefrom, in proportion to the assessed value of their holdings ;
- (f) that a complete scheme for co-operation and combination has been placed within the reach of the parties interested which injures no man and reduces no man's rights, and which in the opinion of financial authorities of the highest standing, will enable sufficient funds to be raised by loan for carrying out the whole scheme of drainage, reclamation, and lighting, when effect has been given to its provisions by the combination of the landowners and their registration as a Co-operative Proprietary Company. A glance at the capital value of the holdings affected as they appear in the municipal rate register will prove this ;
- (g) that it is difficult to contemplate the Public Works Committee or the Parliament of the Colony would be likely to approve of work of this nature being carried out by the State under the circumstances enumerated ;
- (h) In the majority of cases these lands were purchased at very low prices, for the express reason that they were low-lying and known to be subject to periodical flooding. It would suit the owners well should public moneys be spent on them to raise their value to that of the adjacent high lands free of cost to themselves.

The only obstacle so far to the floating of the Co-operative Proprietary Company has been the action of the Government in authorising the formulation of a scheme of reclamation by their engineers, which has led the landowners to believe they have inserted the thin end of the wedge and will be ultimately successful in inducing the Government to carry out the works at the public expense.

When their minds are disabused on this question, as I hope they will be, on the occasion of a deputation which is about to wait on you, steps will be taken to continue the enrolment of landowners with the object of completing the formation of the Co-operative Proprietary Company which already has met with considerable success, as instanced by the larger proprietors and companies surrendering their lands in the terms of the Company's prospectus.

I have, &c.,

JOHN P. SHARKEY,  
Civil and Hydraulic Engineer, &c.

In consequence of the action of the Government in taking the matter up, it was useless for me to continue the enrolment of the landowners. Therefore it was stopped, pending the result of that action, and it is for that reason I have come before this Committee to lay before you, first of all, the position the Company stood in, and secondly the scheme.

735. You have now come to the scheme? Yes. I will continue by reading this prospectus, as it will lay before you exactly what the scheme was :—

Capital, £75,000, to be raised by loan or the sale of debentures as required, on the security of the estate to be acquired by the Company.

This sum or as much as may be necessary will be expended on the reclamation works, electric lighting, and the construction of a light line of tramway, all of which are hereafter described.

The debentures will be retired as the sale of lands will allow, and the profits in the form of dividends will be distributed amongst the shareholders half yearly, when the financial position of the Company permits.

All owners of land within the flooded area as defined by the flood-level of 1889 will be asked to surrender their holdings to the Company without reservation, and to accept in lieu thereof shares representing the assessed value of such lands.

These lands, together with improvements (if any), will be valued by competent valuers, but where the value thus arrived at is not accepted by the owner he will have the option to nominate a valuator of public capacity to act in conjunction with the Company's valuator, an umpire being selected before deliberation.

After the deed of association has been executed and the shares allotted, each share representing £10 fully paid up, a board of nine directors will be elected by ballot by the shareholders from amongst themselves to carry out the objects of the Company, three directors retiring each year by rotation, but who will be eligible for re-election.

A Bill will be submitted to Parliament, having for its objects the granting of the necessary powers to the Company to enable streets to be altered, for the application of the betterment principle to all lands within the flooded area not acquired and those outside which have been improved by the drainage and reclamation works, and for other purposes.

In ordering the pumping plant from England provision will be made for the supply of two dynamos, each capable of running 1,000 electric lights of 10-candle power each. No exclusive rights in this respect will be required from the local council, as the Company will be in a position to compete against all comers.

736. That completes the introductory portion? Yes, it does. I may say that this company is not dead yet. We should be willing to go on to-morrow if the Government were to decide not to carry out this work at the public expense, and the large landowners I have mentioned are quite willing to co-operate in the matter.

\* \* \* \* \*

The land to be reclaimed and dealt with comprises about 250 acres, all of which at present is unfit for human habitation. A considerable portion is subject to inundation by spring tides, while moderate rains cause the lodgment of more or less water in the various depressions throughout its extent, natural drainage of any kind being impossible, as practically there is but little or no fall to the outlet at Cook's River. Drains have been formed along the centre of the area, but their utility is limited owing to the slight gradient procurable, and the waters but sluggishly and slowly wend their way to their estuary at Cook's River, affording but little relief.

#### *Cause of land being flooded.*

The name Tram Vale denotes the land to be low-lying in comparison to the surroundings, and thus it becomes subject to inundation by the flood-waters of Cook's River, by the storm-waters falling on the high lands of Marrickville, and by the rainfall within its own area. •

#### *Projected works.*

It is intended to for ever get rid of the flood-waters of Cook's River by constructing an embankment 8 feet 6 inches high, which will be 3 feet above the highest flood-mark, with a puddle wall in the centre, and faced with stone on the river side, to extend from Unwin's Bridge Road embankment to the foot of the Warren Hill, a distance of about 800 feet. The material for the embankment will be taken from the drainage canal hereafter to be described, and the stone for facing same from the excavation for engine foundations which are to be fixed at the foot of Warren Hill. A roadway 66 feet wide will be formed on the top of the embankment.

#### *Catch-water drains.*

For the purpose of dealing with the waters falling on the high lands of Marrickville, having their natural fall towards Tram Vale, catch-water drains, one on each side of the Vale, will be constructed along the slopes, at a sufficient elevation to permit of their being discharged over the crest level of the embankment. These drains will be provided with sufficient fall to ensure rapid flow, and will be of sufficient capacity to carry off the heaviest rainfalls.

#### *Drainage canal.*

In order to effectually drain Tram Vale proper and provide the first most necessary requisite, perfect sanitary conditions for the "model township," a drainage canal will be constructed of concrete topped with brick in cement mortar from Edinburgh-road to the embankment at Cook's River, a distance of about 112 chains. It will be 6 feet deep and 6 feet wide

wide at Edinburgh-road end, and 17 feet deep and 30 feet wide at the embankment, thus giving a fall in its entire length of 11 feet, the coping of the walls being nearly level throughout, following the surface of the ground. It will provide a large storage capacity and permit of the most rapid house and street drainage from every portion of Tram Vale, ensuring the most perfect sanitary arrangements, so that the healthfulness of the locality and its surroundings will be assured—this blot on the map of Marrickville being for ever removed. J. P. Sharkey,  
Esq.  
July, 1896.

737. At the intake of the alternative scheme, how wide do you propose your channel shall be? I think it would be 20 or 22 feet wide there.

738. You broaden it, then, gradually? Yes; it goes from 6 feet at Edinburgh-road to 30 feet at the embankment.

739. You believe that is ample to carry the drainage? Yes; I will prove that to you.

740. Stormwater and everything else? Yes; everything. I have already said that I should have catchwater drains to catch the water on the slope. Now, I am merely dealing with the rainfall that falls within the area flooded.

741. Therefore, this channel which you are describing is not intended to deal with the whole of the stormwaters that now find their way into the Marrickville Valley? Quite so. Now, I want to show you that this canal which I propose to construct along this valley will have a greater capacity than is actually necessary for the purpose of carrying off the rainfall from that valley. The capacity of this canal will be equal to all possible strain that could be put upon it. The land is almost a dead-level right through, and, therefore, the top of the canal will be practically a dead-level right through. The holding capacity of the canal will be 1,530,144 cubic feet, or 9,563,400 gallons, or 42,844 tons of water; pumps at 500 tons per minute would clear the canal in 1 hour 26 minutes; 1 inch of rainfall on 250 acres equals 907,500 cubic feet, or 25,410 tons equal to 51 minutes' pumping by one engine at 500 tons per minute.

#### *Pumping-plant.*

The drainage water finding its way into the canal will be disposed of by means of compound condensing centrifugal pumping-engines in duplicate, capable of discharging at least 500 tons per minute over the embankment into Cook's River. The pumps will be connected with a chamber forming the terminal of the canal, the inlet to such chamber being provided with screens so that no solid matter of any kind can find its way through the pumps and consequently into Cook's River. A tray, to be worked by crane, will be placed in a chamber in front of the screen sills to receive all solid matter, which will be lifted out into carts for removal to a sewage farm or dépôt. The canal will be flushed out frequently every day, which becomes possible owing to its steep gradient, by the inflow at its head of 50,000 gallons of water. For this purpose a receiving or storage chamber will be provided, forming the extreme end of the canal, which will be filled with water as occasion requires by means of a small direct acting pump to be worked in connection with the larger machinery, with little or no extra expense, the sluice-gate being opened and closed automatically. One engine will be always under steam, and will have the capacity of performing more duty than the greatest rainfall recorded at the Sydney Observatory during a period of 40 years would impose for the area to be drained. Each engine will be worked alternately for a week at pumping, while the second during the same period, if necessary, will drive a dynamo forming a part of each plant with which it is intended to light the model township and a portion of Marrickville with electricity. There will be two distinct plants, each comprising engine, pumps (2), and dynamo, to be worked alternately, so that every reasonable security is provided against a breakdown of any kind, while the cost of fuel and working expenses are reduced to a minimum. During dry periods, when the pumping duty is but light, one engine will work the dynamo and pumps; and as the dry periods extend over more than two-thirds of the year, so in proportion will economy be effected.

742. How much would your channel be below low water on the land wayside of the dam? It would be about 11 or 12 feet below low water.

#### *Cost of Works.*

An estimate has been carefully prepared which shows the cost of reclamation works, providing for every detail, to be £57,470, made up in the following way:—Canal, £16,500; Cook's River embankment, £4,500; catchwater drains, £8,000; pumping engines and dynamo in duplicate, with engine-shed, &c., £19,000; tramway line, with cars, &c., £5,000; bridges over canal, £600; road and drain diversions, £770; electric lighting installations, £3,100. Total, £57,470.

I may say that in making out the estimate for the catchwater drains it was intended and expected that the municipalities affected, whose lands drain into that valley, would contribute about £4,000 towards the cost of construction of those catchwater drains, and, therefore, the estimate is rather less than the actual expenditure on those catchwater drains would be.

743. *Mr. Roberts.*] Where would your catchwater drain be on the eastern side of the valley? About a section east from the railway line and crossing it approximately where the alternative scheme is shown to pass on the Committee's map; thence, following down on the western side of the railway, it would discharge some distance below the eastern side of Tempe railway station.

744. On the western side where does your contour line run? Approximately parallel with the Marrickville Creek, starting at an elevation of 30 feet, and following the contour until it discharges into Cook's River at a height of about 8 ft. 6 in. above high water mark. I may say, in reference to the figures I have just given, that some of those estimates are much too high for the present time. They are the original estimates:—

The pumping-plant to be provided (over 500 tons per minute, in duplicate) will not be considered exceptionally large when compared with other plants of similar character in use for similar purposes in various parts of Europe and America. When quotations were supplied for the pumping-plant by the manufacturers in England the capacity given was based on a lift of 25 feet, but as the pumps will be performing their greatest duty after, or during a heavy rainfall, when water would stand in the pump-chamber of the canal at, say, 8 feet, thus allowing 17 ft. 6 in. for lift, so in proportion would the capacity of the pumping-plants be increased, or two of less cost be sufficient for the duty required.

I should like to show you that 500 tons per minute is not a large capacity for this particular description of pumps. There are kinds of centrifugal pumps where enormous power is exercised for the purpose of throwing water over lifts 30 feet high, and in recent times Messrs. J. and H. Gwynne, of Hammersmith, near London, have supplied the following power pumps:—

Ferrara, Italy.....	2,100 tons per minute.
Morozzo, Italy .....	710 " "
Rose Hill, Demarara.....	330 " "
Mersey Docks, Liverpool.....	1,200 " "

Therefore, you will see that the capacity of these proposed pumps—500 tons per minute—is not much in comparison with what is done in other places. The principle I now put before you is not a new principle at all, but exists all over the world, and has been used where large areas of land—particularly

J. P. Sharkey, Esq., in England and America—have been completely drained by means of embankments, catchwater drains, and pumps. There is nothing new to me in this design, only in its application to Marrickville. I have had large experience in drainage of a similar character—of areas reclaimed from the sea:—

## AREAS drained and reclaimed by embanking and pumping.

Locality.	Area drained.	Drained by	
		Engines.	Horse-power.
	acres.		
Deeping Fen, near Spalding, Lincolnshire .....	25,000	2	80 and 60
Marsh West Fen, Cambridgeshire .....	3,600	1	40
Misserton Moss, with Everton and Graingely Carrs .....	6,000	1	40
Littleport Fen, near Ely .....	28,000	2	30 and 40
Middle Fen, Cambridgeshire .....	7,000	1	60
Waterbeach Level, between Ely and Cambridgeshire .....	5,000	1	60
Magdalen Fen, near Lynn, Norfolk .....	4,000	1	40
March Fen, Cambridgeshire .....	2,700	1	30
Feltwell Fen, near Brandon .....	2,400	1	20
Soham Mere, Cambridgeshire (formerly a lake) .....	1,600	1	40

I want also to point out to you that the system of drainage I propose is in existence in many places in the world, and I want to mention something in regard to Mr. Darley's alternative scheme. I will, first of all, speak of the last-mentioned. Mr. Darley's scheme is one to which objection could not be taken for arable lands by any engineer who has any knowledge of such works. The principle of it can be mentioned in a few words. He intends to make use of the fall in the tide of 6 feet—which is the difference between the level of the high-water mark and of the low-water mark—for the purpose of draining this area of Marrickville. The difference in tide levels has been used in many places for draining areas and reclaiming them from the sea for arable land; but I would point out to you, as gentlemen of common sense and large knowledge and experience, that 6 feet for draining this valley is nothing and could not properly drain it, or put it in a sanitary state for town settlement. On the Mediterranean, where the fall of the tide is 16 feet, there are large areas, both in Egypt and other countries, reclaimed in a similar manner. When the tide comes in the whole of the drainage is stopped, and the sea is also held back by means of flood-gates. The waters behind the flood-gates are banked up to a height of 16 feet by the flood-tide. When the tide is fully out, and then only, of course, for a short period—when it is at its lowest—the waters accumulated on the embanked area are let off, and that acts as a scour and cleanses the water courses in that period. That is land where there is a fall of 16 feet, but here you have a fall of only 6 feet, and, as Mr. Darley properly says, all this 6 feet of fall is available only when the tide is at its lowest, which is for only three minutes. It is stationary only for three minutes, and, therefore, the 6 feet fall is available for only three minutes and then the tide comes in. Near the turn of the tide, of course, it runs out very fast, as you are doubtless aware.

745. Supposing that the present dam were removed, would there be much difference between the rise and fall of the tide at the mouth of Shea's Creek and the rise and fall of the tide at the mouth of Marrickville Creek? Of course the fall at Shea's Creek would be much greater than at Marrickville; the stream is wider there, and consequently there would be much more get-away for the water. I should think there would be over 2 feet in favour of Shea's Creek.

746. Therefore, the discharge into low water, as shown by the alternative scheme, would probably be 2 feet lower at the mouth of Shea's Creek than at the mouth of Marrickville Creek? Yes; but I would qualify my statement by saying that the tide at the mouth of the Marrickville Creek, either now or at any other time, does not rise and fall 6 feet.

747. We are taking a problematical case, that of the dam being removed? Yes.

748. You told the Committee that in order to take away only the water that falls on the 250 acres of Marrickville Valley you require a canal varying from about 26 feet at the mouth of the intake to about 30 feet at the pumping-station? Yes.

749. If a channel of that width be necessary simply to take the water of Marrickville Valley alone, you would require a considerably wider channel to deal with the whole of the waters that at present find their way in the shape of stormwaters to Marrickville Valley? I think so. In calculating the capacity of that canal it was also intended to act as a storage, and to hold one hour's rainfall. That canal, merely to carry off the waters that would come into it, need not be so wide or so large, but we want, as it is usual to do in such cases, to store one hour's rainfall, and we calculated that at 1 inch to the hour.

750. Do we understand, therefore, that we must regard it also as a storage channel, and not merely as a carrying channel? Both.

751. But do you think that a tunnel 15 feet x 6 feet would carry the whole of the stormwaters from Marrickville Valley and the adjoining municipalities which at present find their way there? I should think it would if it had a sufficient fall. It is all dependent on the fall.

752. The fall is 1 in 3,200? I give you a greater fall than that—1 in 600 and odd.

753. You see that is a very small fall to carry mud through a tunnel? Yes, it is.

754. In general terms, speaking without levels, but from your general knowledge, you think it is probable there would be a better discharge at Shea's Creek than at the mouth of Marrickville Valley? Yes; any person with any experience at all must know that there would be a difference of at least 2 feet. If the waters confined in Cook's River open out to five or six times their area they must fall and give the advantage of their increased breadth.

755. In your opinion is it possible, by any gravitation scheme, to get rid of the water that at present finds its way into Marrickville Valley? None, except by lowering the Pacific Ocean—that is the only possible way. I have thought the matter out myself nights and days.

756. You think it is not possible for any gravitation scheme to deal with it? It could not, unless the falls were in favour of Marrickville Valley. Although I admit there is a difference of 6 feet between the drain here and the outfall at Shea's Creek, the levels of a portion of this flooded area are actually, on an average over 100 acres, 2 feet below high-water mark. Therefore, in reality, Mr. Darley's scheme gives you only 4 feet to deal with.

757. Do you believe it would be wiser to intercept the flood waters on the higher levels, or to make one work to deal with the local drainage of the valley and the storm waters from the heights down the drainage centre of the valley? To let all the waters from the high lands get into the valley and then deal with them at the drainage centre would be less effectual and would over-charge the canal.

J. P. Sharkey,  
Esq.

2 July, 1896.

758. Have you any great objection to that? I have not, but I may tell you that the area is very extensive, and if you go into a calculation of the cubic feet that would fall on that area to see how you are going to deal with it, you will find that you would require to have almost the most powerful machinery in the world to effectually drain the area by pumping. The rainfall here is phenomenal in short periods. In England it extends over long periods. The general rainfall in England is forty-six and up to 100 inches in some places, but the rain falls here in a short time really more heavily than it does in England. It is very exceptional to have a rainfall of 1 inch an hour in England, whereas we have it here often.

759. Your objection, then, to using the drainage centre of the Marrickville Valley is simply that the amount of water falling on the watershed would render it very expensive to deal with it? Yes, and that the catchwater drains act as ordinary municipal drains in carrying off the rain water from the streets and so forth. The water could be directed to these drains, which are the best drains you could have for carrying off the surface or rain water that falls on the heights. There is nothing unusual in that, and there is not much expense attaching to that, if carried out on the system I propose in connection with this scheme. This system is not a new system. It is in operation nearly all over the world, and I propose to put it into practice here as a system that is universally admitted to be applicable in such a case. Wherever land is too low for ordinary gravitation drainage, you must pump—you must embank and you must intercept the water from the higher land, and that is exactly what I have done here. I may mention what is in existence, as you may know, in England. There is what is called the Erith pumping station on the Thames, near London, a place I am well acquainted with. The Thames at Erith was so low that the spring tides inundated the land all about there. The land there is much more valuable than the land at Tram Vale, Marrickville. Steps were taken, but not as early as might have been expected, to remedy the evil from which that portion of England was suffering, and they constructed a system of drainage there, pumping in the same manner as I speak of here. The pumps are centrifugal. It is possible for a man almost to pass through them and be unhurt. Anything that gets into the throes of the pump and the sump from which it takes its feeding is carried through it without any trouble. The bore is so great that even sheep and dogs and all kinds of offal and things like that are swept into its throes and carried through the pipes to Erith. At Erith there is what is called a sewage depôt, and all filth that passes through the pumps and pipes is strained and treated as manure, and sold in large quantities. The sale of it has been so immense that I see from reports of late years that the sewage system is nearly self-supporting. I will give you another instance which I have had experience of in connection with large cities drained in the same way. It will be, perhaps, within the memory of some of the members of this Committee that New Orleans, in America, was at one time a hotbed of fever, so much so that people would not attempt to go near the place. I remember well, reading about the plagues of yellow fever in New Orleans. That state of things was continued for years, until the place was decimated. Engineers were brought from New York and they found out the whole cause of it. The water in the River Mississippi was found at spring tides to be actually 3 or 4 feet higher than the main street of New Orleans, near the Post Office, when the tide was in, and it was found that the percolation of water from the Mississippi rendered the houses so damp as to cause the paper to fall off the walls. Immediately steps were taken by the engineers in selecting localities where they could fix sumps, and they directed four systems of sewerage to these sumps. They erected pumps, the same as I propose for Marrickville, with great capacity, and they pumped the sewage into tanks, which it diverted by means of large pipes to the Mississippi River, and discharged it below a point in the river from which it was impossible to return to the town. In that way they have rendered New Orleans one of the healthiest towns in America. I was reading a report the other day which shows that the sanitary condition of New Orleans at the present time is as good as that of any other part of America. The same system was adopted at Erith, but at Erith they are not so close to the river mouth as they were at New Orleans, and they store the water that is pumped at Erith until the tide is going out, and the water after being filtered is discharged as the tide is passing out, so that it does not return except in a purified form. If the Government scheme now under your consideration be cast aside, I have sufficient ability to carry out my project, and am backed by men of undoubted standing here who offer to find all the necessary money to carry out my scheme. All I require is to get the consent of the owners of some of the land. When I first went there I could have bought the allotments for 10s. a foot with frontages of 25 feet, and even 30 feet, but the price of some of the lands I have been speaking of in the course of a fortnight went up to £3 or £4 a foot, and I could not purchase them at all. I am sure that if this Government proposal were not persisted in I should be in a position to deal with the owners of those lands and go on with the scheme I have laid before you.

Frederick Gannon, Esq., Solicitor, sworn, and examined:—

760. *Chairman.*] Are you a resident of Tempe? Yes.

761. *Mr. Roberts.*] How long have you resided at Cook's River? I have a 50 years' knowledge of it.

F. Gannon,  
Esq.

2 July, 1896.

762. So that you are thoroughly acquainted with every inch of the district under consideration? I am.

763. Are you personally aware that something is required to be done to relieve the Marrickville Valley from flood and storm waters? I am, and not only Marrickville. It appears to me that the mistake that has been made is that they have been considering Marrickville and no other part. I have heard a lot of evidence, and it appears to me that it only points to Marrickville Valley, but there is more to consider than that, namely, from Cook's River Dam right up to the Canterbury Dam.

764. What do you regard as the great source of the trouble? The pollution of the river, commencing at Canterbury. There is a tannery there and slaughter-houses, and the river is being continually polluted by dead sheep and dead animals of all descriptions, which are allowed to remain in it. Then there is the drainage from the manufactory at Marrickville. At times when out shooting I have gone up the Marrickville Valley Creek and have seen it as black as ink, and so nauseous that I have had to hold my nostrils with my fingers.

765. Whereabouts was that? At the junction of the Canterbury railway and the Illawarra railway. It is near Mr. Angus' property, and where the Chinese garden is. I have been there many times with my gun,

F. Gannon,  
Esq.  
2 July, 1896.

gun, and the place was so bad that I had to leave it. That was in consequence of the drainage from the tweed factory. The only means of drainage is a small pipe, and at times the drainage spreads over the land and remains there in a stagnant pool. At the mouth of this particular drain when it reaches the river it forms a sort of bar which interferes with what I may call the navigation of the river, and you have only to put a stick into the banks of the river to be overwhelmed by the stench, which is something frightful.

766. Do you remember Cook's River when it was in a healthy state? I do. I remember Cook's River when I have taken a boat many a time and rowed from where the dam is proposed to be built, and have followed the natural course of the creek up the valley towards Enmore to Smidmore's property near the tweed factory—in fact right up to the Newtown municipal boundary. I knew it when there were salt-pans there, and they obtained salt from the water in the river.

767. How long ago was that? Forty-five years; that creek was an arm of the river.

768. How long has the river been in a polluted state? Since the land boom I may say, when people began to build all round it and to divert the channel. People were gulled into buying what I call a swamp.

769. I suppose they bought the land in times of drought? In times of boom, and without having a knowledge of what the country was like in times of flood. Afterwards when they found out what it was like, some of them deserted their houses; not many were built there, and some have been washed away.

770. Do you know Wolli Creek? I do, well.

771. In what state is it now? It is full of rushes.

772. Is there any difficulty in finding water in it? I could find water in it but other people might not. I have rowed up Wolli Creek in a boat for at least 1½ mile when there was beautiful water there. My father used to live where Angus' place is now, near the Tempe station, and he had a gardener named Farrell who lived up Wolli Creek and who used to row down the creek 1½ mile to come to his work. It is now simply overgrown with rushes. It would cost very little to clear it, and it could be made navigable for 1½ mile, nearly up to what is called Broad Arrow Road. It was a beautiful creek until they put the tanneries there. The water was perfectly pure and sweet at Mrs. Campbell's property, but recently M'Namara's tannery has been there and some boiling-down establishments. They put their refuse on the land and it gets into the creek from which there is no outlet into the river. I was very much surprised to hear yesterday the evidence of a gentleman who said that Wolli Creek polluted the river now. It cannot do that because there is no outlet for it into the river, and it is perfectly grown over with rushes and other things. Recently I walked across it with my trousers tucked up to my knees.

773. If Wolli Creek were thoroughly well cleaned out and dredged, and Cook's River were thoroughly well cleaned out and dredged, you think there would be a great improvement? That would meet all requirements. We do not want large schemes costing £56,000, and elaborate engineering proposals. Let nature have its course. Open the creeks and let there be proper contributories to the river. Let the Government resume the whole of the land in question and give us a 100-foot channel the same depth as the river, and you may snap your fingers at all the engineering difficulties. We do not want the present dam to be removed; that would be an absurdity. The cure would be worse than the disease. If you have a flood-tide with the ocean at the back of it, you know with what force the tide will come up and what it will carry with it. When the tide recedes, it leaves there whatever the force of the water has carried up. We had experience of that at the end of the dam before they made the embankment opposite the hotel, near the dam. The flood waters used to bring the drainage from Shea's Creek and all the tanneries, and used to deposit it at the end of the dam in a sort of half-moon shape, and when the tide receded it left it there, and the stench was abominable. Since the Shea's Creek reclamation work has been done we have a good channel, and we have nothing of that kind now, but that is what we should have if you opened the dam and let the tide leave the stuff there.

774. *Chairman.*] Is there as much rise and fall of the tide at the lower side of the dam, or nearly as much rise and fall there as there is at the mouth of Shea's Creek? There cannot be the same amount, for the simple reason the dam stops it. If the dam were taken away, and the tide had its natural flow, there is no doubt there would be exactly the same.

775. Do you believe there is a difference of 2 or 3 feet between the rise and fall at the mouth of Shea's Creek and at the mouth of Marrickville Valley? Not the slightest difference, except for the dam. If the dam were not there all the lands which have been reclaimed and are now cultivated gardens would be flooded.

776. *Mr. Roberts.*] What are your views on the alternative scheme? It is simply a scheme for draining Marrickville Valley, and does not relieve the pollution of the river. It simply means a large expenditure of money to relieve land which could be more cheaply reclaimed by the Government. I have no doubt that the cost of resumption at the present time would be next to nothing. What is required could be done by making a canal 100 feet wide, and using the material taken out in making the canal to build the embankment. I suggest that the Government should resume the whole area at once.

777. Do you look upon the draining of Marrickville Valley as a work that should be done by the Government or the municipality? No municipality could do it. The draining of the valley simply means draining it for the benefit of those interested in that particular part. The real matter is the pollution of the river, and Marrickville alone pollutes the river with the exception of the dead animals thrown into it between Undercliffe Bridge and Canterbury. The tweed factory at Marrickville causes more nuisance than any other contributory to the river.

778. Do you know where it is contemplated to construct a dam called the Marrickville Dam? Yes.

779. Six feet above high water? The most absurd thing in the world. My experience is that the flood waters from Marrickville are much stronger than those they get from the river. There is a large area, and you will find that Marrickville is flooded before the river has increased 1 foot.

780. Do the waters of the river in flood time run up Marrickville Valley? No; Marrickville Valley is flooded before the river is. There is such a large catchment from Newtown, Enmore, The Warren, St. Peters, and all round, that a heavy shower, two hours rain in the morning, will cause Marrickville Flats to be flooded.

781. There is a lot of water up the valley before the river rises? Yes.

782. Water coming from St. Peters and other places? That is so, and the river cannot carry away the flood water of Marrickville except when the water is low on the other side of the dam. It is not the flood waters

waters in the river which flood Marrickville. Marrickville is flooded when there is no perceptible difference in Cook's River, because the only get-away from Marrickville is the little drain they have got. I have known Marrickville to be flooded for days when there has been no perceptible difference in the river. I believe that some portions of Marrickville are much lower than the river is at the present time, and I think that is the cause of the trouble. What I would suggest is that you should have a channel, not a straight channel, but a channel following the present water-course, and then there will be no expense for bridges because there are some built across the streets already, and the land in a great many cases is of no value. I have no personal interest to serve; I am merely dealing with this matter from a sanitary point of view. In the first place I do not believe that the Marrickville Flats are at all habitable. They never would have been taken up, except that the people brought the land at the time of the land boom, without any knowledge of it. I know that some people paid £50 deposit and then left their buildings on the hands of the building society. They did not know before what they were doing. All this agitation comes from Marrickville. They are doing what they can in their own interests. The people of Marrickville are causing the pollution, and the onus of getting rid of the difficulty is thrown on the council, and they are doing the best they can. I will assist them as far as I can, but my object is to have the work done without any outrageous expense to the country, and, if it can be done apart from engineering propositions, to take a common sense view of it. In addition to constructing a canal 100 feet wide, I suggest that a short Act of Parliament should be passed, giving each municipality—Canterbury, Marrickville, and St. Peters—the control over the river within its boundaries, and power to prosecute anybody throwing animals into it or allowing dead animals to remain in it. The municipal limits are bounded by the bank of Cook's River, and therefore the municipalities have no control over it. I believe it is proposed to construct a dam somewhere near the Undercliffe Bridge. To put a dam there would spoil the navigation of the river at that place at once, and simply flood the land on the other side. I believe that is proposed on the understanding that the dam which now prevents the tides from coming up is to be removed. In that case the cure would be as bad as the disease, because the land would be flooded with salt water instead of fresh. Why should the navigation of the river be obstructed? The river is the resort of picnic parties on holidays, there being a boat-shed a Tempe with 100 boats, every one of which is let out on holidays—the river being navigable up to Canterbury. If you carry out the proposed excavations, and cut the suggested channel up the valley, that is all that is necessary.

F. Gannon,  
Esq.  
2 July, 1896.

Alfred Edward Perkins, Esq., M.D., Marrickville, sworn, and examined:—

783. *Chairman.*] Where do you live? Marrickville.

784. Do you know Cook's River? Yes, I have known it 20 years.

785. Do you believe it is in an insanitary condition? I am sure it is.

786. Is it a menace to the health of the people? Yes, I am certain that it is absolutely injurious and a menace to the health and lives of the individuals living around there at the present time.

787. Do the same remarks apply to Marrickville Valley? Yes.

788. The long resting body of stagnant water is injurious to the health of the whole municipality? Yes.

789. And you, as a medical man, regard the condition of that part of the municipality as serious? Yes. Not only is that so, but during the last couple of years I have taken considerable pains to point out to the municipal councillors of Marrickville and the surrounding municipalities that this portion of Cook's River, from Canterbury, say, to Shea's Creek, carries away the whole of the excreta or the solution of excreta, if I may term it so, of the whole of these municipalities—Canterbury, Tempe, St. Peters, Stanmore, and Marrickville. The whole of these places practically drain into it, and some of them at least, I know, tip their human excreta—that is to say their night soil—not very far from the banks of the river, and you can easily understand that, when a good fall of rain comes, it must wash the whole of this organic matter into Cook's River. Hence it is that we have it silted up in places, and the water of it rendered extremely impure. Twenty years ago, I remember the water of Cook's River was quite clear, there was no stench whatever arising from it, and the places surrounding it were quite healthy and pleasant places of resort for holiday makers and others. But during the last few years, I am sorry to say, the condition has much altered.

790. Now it is more like a sewer than a river? It is indeed. The factories that are in the vicinity of these municipalities no doubt do drain into the area under consideration, and the products from these factories must, to a certain extent, still further render the water of Cook's River noxious to the people about there.

791. You are speaking of Wollie Creek, Cook's River, and Marrickville Valley? Yes. I have been over the place hundreds and thousands of times in the last three or four years, and I have every possible knowledge of it. It has been my lot during the past week to go into houses to visit patients where I had almost to walk on stilts or swim.

792. That generally describes your view of the case, I suppose? Yes.

793. Is it possible to directly trace any cases of sickness to the pollution of the river? I believe it is possible in very many cases to trace illness to nothing else but the stagnated, polluted water lying about the domiciles of the patients. The whole of the low-lying area during wet weather is covered with a dense miasmatic fog.

A. E. Perkins,  
Esq., M.D.  
2 July, 1896.

TUESDAY, 7 JULY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
The Hon. DANIEL O'CONNOR.	GEORGE BLACK, Esq.
HENRY CLARKE, Esq.	FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Improvement of Cook's River.

Sydney Robert Lorking, Esq., Mayor of Canterbury, sworn, and examined:—

- S. R. Lorking, Esq. 794. *Chairman.*] You come here in your official capacity as Mayor of Canterbury? I do.
795. Are you aware of the Departmental scheme first submitted to this Committee, and also of the alternative scheme? Yes.
- 7 July, 1896. 796. You desire to make a statement? I do. After viewing the plans of the proposed works submitted by Mr. Darley for your consideration, I may say, that in the first place, I am greatly disappointed to find that the scheme, as shown on the plans, does not affect the district of Canterbury. To my mind it appears to be a scheme dealing entirely with Marrickville. In the district of Canterbury we are suffering from the insanitary state of the river, which is certainly very offensive, and we were in hopes that any scheme which was submitted through your Committee to the Government to carry out, would be one that would give us some relief in this respect. The principal things that we require are, first of all that the insanitary condition of the river should be removed, and that the river should be made navigable. Looking at the scheme prepared by Mr. Darley, we find that he proposes to remove the dam at Tempe, and to carry out certain works along the banks of, and to deepen the river; but he proposes to erect another dam higher up the river near Undercliffe Bridge. We consider that by a dam being erected there, the nuisance from which we are suffering would simply be perpetuated. It would be removed from Tempe and thrown back to Canterbury. Cook's River we look upon as being a national or a state waterway, which is beyond the control of the local authorities, and we consider that it is therefore the duty of the Government to put it in proper order. In my opinion the nuisance from which we are suffering—not only the offensiveness of the river, but also the flooding from the river—is caused by the silting up of the bed of the river, owing to the erection of the dam at Tempe, also by the growth of reeds, and by fallen timber along the banks, which accumulate all floating refuse matter. This matter is collected along the banks, and during the long term of dry hot weather, it remains there festering in the sun, and that is a very great nuisance, and is a menace to the health of the population.
797. Do you mean this insanitary state of things applies to Wolli Creek and Cook's River, contiguous to the dam at Tempe, or does it apply to the higher reaches of the creek and river? I am alluding to the portion of the river which is within our own boundary.
798. Do you mean us to understand that Cook's River, from the dam at Tempe, right up to where the Canterbury municipality is on both sides of the river is in an insanitary state all the way? Yes.
799. And with regard to Wolli Creek, how far up do you consider that that is in an unsatisfactory state? I could not undertake to say, because my knowledge of Wolli Creek is not sufficient to allow me to make a statement in regard to it. We also consider that the water of the river being dammed back at the old sugar-house in Canterbury, keeping the fresh water in a stagnant condition, is also another source of danger to the health of the inhabitants, because I think it is a well known fact that fresh water when allowed to remain in a stagnant condition must become very offensive. We think that if the dam at Tempe be removed, and the sea-water be allowed to ebb and flow, causing a current, that would remove the whole of the difficulty. During flood times the water that comes down Wolli Creek, which meets the flood-water from Cook's River at an angle, causes the water in Cook's River to be thrown back up towards Canterbury, thus causing the lowlands in the vicinity to become flooded. There is no doubt in my mind, that consequent on the depth of the river bed being lessened by the silt, it does not allow the water to flow in its natural state, but if the dam at Tempe were removed and the water were allowed to flow out in the same manner as it did before that dam was erected, the silting up would not occur, and, therefore, the flooding would not take place. To put the matter in a few words, I think the main thing we want, is, that the river be opened out, so that it would be what we might term a navigable river—that, as a matter of fact, it should be allowed to revert to a state of nature. My acquaintance with the river does not extend over a great number of years, but there are gentlemen present who have known it for a great number of years, in fact almost from the time when the dam at Tempe was erected, and they will be able to tell you what condition the river was then in; and it is that condition which we think the river should be allowed now to revert to.
800. You used the term "navigable";—what do you mean by that? So that an ordinary boat or small steam-launch could travel up and down the river.
801. Supposing the dam at Tempe were taken away, have you sufficient local knowledge to tell us how far the tide would then reach up Cook's River? I should imagine that it would reach up to Enfield.
802. Then you would have salt water running to that part of the eastern portion of your municipality? Yes.
803. Have you any idea what effect that would have with regard to the submergence of the adjoining land? I do not think that that would submerge adjoining land to any extent, more especially if the river-bed were deepened by dredging, to allow it to carry the volume of water that would come in. I may mention that some gentlemen here present knew the river when the tide did flow up.
804. You will see from the plan before you that permitting the tide to reach even as far as Undercliffe Bridge, would necessitate a long reclamation, extending almost all round Campbell's property; and the same sort of thing would obtain to a greater or lesser extent as you passed up the valley of the river? But I think the banks of the river within our own district are not flat, as they are in that portion of the river.
805. It would be less, no doubt, in some instances? It would be considerably less.
806. You do not then approve of Mr. Darley's scheme of placing sluice-gates on Wolli Creek, and near Undercliffe Bridge? No.
- 807.

807. Do you approve of the scheme otherwise? Yes, as far as I am able to judge.
808. That is your objection to it? That is the principal objection. Of course we would also like to see the work continued all up the river; and the banks of the river in our opinion require defining.
809. Where is the dam near the sugar-house? The sugar-house dam is about 2 miles up Cook's River, from a portion of the eastern boundary where we join the municipality of Marrickville.
810. Do you know when that dam was built? I do not; but I should imagine that it was built about fifty-five years ago.
811. You have no knowledge of the time of its erection, but you believe from the best evidence you can get that it was built between fifty and sixty years ago? Yes.
812. Do you regard Cook's River as the storm water discharge for your municipality? Yes.
813. Does any of the water from any portion of your municipality reach Marrickville Flats? No.
814. Therefore you are not interested in the alternative scheme? No.
815. It is of no value to you? Not the slightest.
816. Do you regard Wolli Creek as a storm water discharge for any portion of your municipality? Yes.
817. Can you offer us any opinion with regard to whether Wolli Creek will continue to be a storm water discharge? I decidedly think the storm water discharge will continue.
818. Into Cook's River from Wolli Creek for all time? Yes.
819. How do you deal with your sewage at Canterbury? It is allowed to flow into the gutters.
820. And from there it finds its way into the river? Yes.
821. Is that above or below the sugar-house dam? Both above and below it.
822. How do you deal with your night-soil? It is removed.
823. By the pan system? Yes.
824. Is there a proposal to connect Canterbury with the metropolitan sewerage system? Yes, I believe there is.
825. Where do you remove the night-soil to? To a place within the municipality.
826. Is it on the watershed at Cook's River? Yes, it is.
827. How far is it from the river where you deposit your night-soil? I think,  $\frac{1}{2}$  a mile or more. I may state that the greater portion of it is taken away, and used as a fertiliser in the gardens.
828. Do you sell it? No; it is removed and used for cultivation purposes.
829. Also on the watershed of the river? No.

S. R. Lorking,  
Esq.  
7 July, 1896.

Jeffrey Dennis, Esq., Alderman of the Borough of Canterbury, sworn, and examined:—

830. *Chairman.*] What are you? I am a tanner.
831. *Mr. Clarke.*] Where do you reside? Canterbury.
832. How long have you been residing in Canterbury? Eleven years.
833. Are you aware of the two schemes now before the Committee? Yes.
834. What is your opinion about the alternative scheme;—would it benefit your municipality at all in any way? It does not affect our municipality at all.
835. It affects only Marrickville, St. Peters, and some other places? Yes, Tram Vale.
836. Do you approve of Mr. Darley's other scheme as shown on that plan? Yes, with the exception of the proposed dam.
837. You do not approve of the proposed dam? I do not.
838. Do you think it would be injurious to the good working of the scheme to have dams at Wolli Creek and further up? It certainly would in Cook's River.
839. I suppose that ultimately Canterbury will be connected with the metropolitan sewerage system? Not the low levels, so far as I know.
840. A portion of Canterbury will be connected with that sewerage system? Yes, I think so.
841. What do you think is the best thing to be done in the public interest? Make Cook's River a tidal river.
842. Do you mean by that to remove the old dam at Tempe altogether? Yes.
843. What would you substitute in its place? A bridge.
844. But with the removal of the dam and the erection of a bridge at or near the site of the present dam, how would you prevent the high tides or the storm water from overflowing the lowlands in the neighbourhood of Wolli Creek and the lower parts of Marrickville? At present the floods at high-tide must rise over the dam or sluices before they can get away. The river is about half-tide.
845. But what could prevent the lowlands from being flooded? They are flooded now. There would be nothing to prevent that unless some banks were built to prevent it.
846. One thing they intend to do under the present scheme is to prevent the lowlands from being flooded? I do not object to that. My main objection is the construction of a dam at a site in the Canterbury municipality.\*
847. Then so far as Canterbury is concerned, it might answer very well, but you think that if the dam at Tempe were removed the Government should construct embankments to prevent the flood-waters and high tide from overflowing the lowlands? I always understood that all lands under high tide belong to the Government; the contrary is a revelation to me.
848. But at Marrickville a great deal of the lowlands are built upon? Yes.
849. The people who built those houses may have gone there in dry seasons without due thought, and imagined that it was a good site for building; but they being there, do you not think it would be a fair thing to have some means of preventing them from being flooded out? In reference to that matter, I think that new-comers certainly should be warned of the flood-mark.
850. But what about those who are there already? Well, theirs is a very unfortunate position to be in.
851. Still, as they are there, and have built their houses there, would it not be necessary for something to be done to prevent their being flooded either with salt-water or with storm waters? Well, they are already flooded regularly, and my opinion is that it would be better for them to be flooded with salt water than with sewage.
852. Do you think it would be better for the Government to resume those lands altogether? I think so. I have no interest in that particular part other than the public health, which is, I think, greatly menaced at that particular place.

J. Dennis,  
Esq.  
7 July, 1896.

853.

\* NOTE (on revision):—\* I wish to mention that I also said: Most people were guided by their experience in this matter. The present dam is acknowledged to be the cause of the trouble, still it is proposed to perpetuate the evil by building another. I think the cost of the proposed new dam would go a long way towards remedying any trouble that may be caused by allowing the tide to rise as far as the sugar-house dam.

- J. Denniss, Esq.  
7 July, 1896.
853. Do you think, in the event of this or any other scheme being carried out at considerable cost, the various municipalities, such as Canterbury, St. Peters, and Marrickville, should contribute something towards the cost? Well, Cook's River is a national river. It is beyond our control. We dare not spend any money on it. The Government will not give us any control of it.
854. You think, then, it is the duty of the Government to do that at the public expense? Yes, certainly, as it is wholly a national river.
855. Are there many manufactories on the banks of Cook's River at Canterbury? Only one, I think, working at present.
856. A tannery? Yes.
857. Any wool-washing establishment? No.
858. Is that tannery at Canterbury? Yes. There is also a tannery on Wolli Creek.
859. You think, then, that in the public interest, and to prevent the probable spread of disease, something should be done to remedy the defects you now complain of? Yes.
860. *Chairman.*] How far up is Cook's River running now—is it running at the sugar-house dam? The river is not running, but there is a little by-wash at that dam.
861. Above that, I suppose, it peters out altogether? It is still water. It is practically still water from Tempe to the second dam, and then beyond that again.
862. Does Cook's River run freely, not at flood-time, at the sugar-house dam? There is a wash there now of about 6 inches by 12 wide running freely, but if the dry weather continues that will cease. It diminishes almost daily, and it would cease to run in the course of five or six weeks.
863. And the quantity of fresh water which will come down Cook's River will not be sufficient to flush it? In flood-time it would be abundant.
864. But not after three months' dry weather? No.
865. Very soon after the rain has ceased and the flood has gone down, the river sinks away? Yes.
866. *Mr. Clarke.*] You would only depend, then, on the wash of the tide? Yes.
867. Would that be sufficient? Better than the plan proposed.
868. But it would not be sufficient? I think it would for many years, because our population is not very thick. You, Mr. Chairman, were asking the Mayor about private property along the banks. I have during the last few days been interesting myself in that question. I fancy that Mr. Darley anticipates trouble with those private property-owners, but I think if you were to call them here as witnesses you would find them almost unanimously in favour of tidal waters coming in.
869. *Chairman.*] Without fascine banks to keep the tidal waters off their property? Yes; the banks are comparatively high from where Mr. Darley's scheme terminates to Canterbury.
870. Do you believe that there would be any objection on the part of owners of property from the sugar-house dam down to the boundary of Campbell's property, were the Government to remove Cook's River Dam at Tempe to enable Cook's River to make its way, as it did originally, up the valley of the river, without erecting any fascine-banks to keep the water off the adjacent properties? Generally, I believe, they would be favourable to the tidal water rising.
871. Can you suggest any way in which we could get a definite expression of opinion in regard to that? By calling as witnesses the people interested. Two people would cover very nearly the whole distance. One would nearly cover it on one side, and two very nearly the whole of the distance on the other side.

---

John Quigg, Esq., Alderman of the Borough of Canterbury, sworn, and examined:—

- J. Quigg, Esq.  
7 July, 1896.
872. *Chairman.*] What are you? I am a landowner at Canterbury; I have been living there more than forty-eight years.
873. Do you know Cook's River? Yes, well.
874. Have you heard the evidence of the Mayor, and Mr. Alderman Denniss? Yes.
875. Do you agree with that evidence? Yes, I do; the whole of it.
876. Do you think they were wrong in any way? They were slightly wrong as to the date of the erection of the dams. It is rather misleading to say that the sugar-house dam was erected fifty-five years ago. The dam at Tempe has been erected about fifty-five years; but I remember the river within the last forty-eight years when the tide flowed up to Hilly's Crossing, and even above it; that is on the boundary between Canterbury and Enfield, and between 4 and 5 miles from the dam which Mr. Darley proposes to put in at Undercliffe Bridge. I have seen the tide rise 10 inches at Hilly's Crossing. The crossing I refer to is the one that runs straight to the Burwood station. The banks of the river in several places were nice little sandy beaches. Fresh water causes reeds and other plants to grow, but salt water has a tendency to remove all vegetation. Of course when the river gets choked with these plants it runs much more dead. When it became known that this Committee was inquiring into the proposed improvement at Cook's River, I considered that the most important thing would be to have the salt water coming up the river. We get rain there pretty often, and there is a very big volume of water running down the river at times; and if it could come down the river there, and without the obstruction of reeds and dams, it would be better. A dam 10 feet high stops the water, and it runs more sluggishly along its whole course, and reeds grow on the banks. I know a place where I used to swim, and where the water was so deep that it was over my head; but that is a Chinaman's garden now. If the salt water were allowed to come up, we believe that it would prevent reeds from growing on the banks, and that when there was a flood the flood-water would scour out the river. It always has done so. The Cup and Saucer Creek is not a very large creek, but it runs pretty well seven or eight months in the year into Cook's River. There is nothing to obstruct the running of that creek, and it keeps the place clear. No sewage stops there. The banks of the river are principally good banks; there is stone in many places. From Canterbury up, the river has good solid clay banks, not at all likely to be injured by the influx of the tide. Cook's River is not like the Clarence or the Hunter River, where the land is chiefly composed of *debris* from the mountains. The banks of Cook's River seem to be good solid clay and shale, and most of the banks are above high-water mark. I know that in the case of one grant, 100 feet above high-water mark was reserved; and I think there would be no difficulty about the land question. As far as any land which I have adjoining the river is concerned, I should be pleased to sign any agreement with the Government. I should be pleased to have the salt water coming up; it might injure vegetation, but the advantage would be much more than the loss. Less than thirty years ago you could bathe in Cook's River,

River, but not many people would care to bathe in it now. I have caught sea mullet right up at Hilly's Crossing. Any person who can remember Cook's River forty-eight or forty-nine years ago, as I can, must know that it was very different then from what it is now. The village of Canterbury was able to support four hotels forty-five years ago, and it was a very brisk place; there was more population there then than is now about Marrickville. It has begun to get thickly peopled again, and it would be very quickly peopled again if Cook's River was in the same state as it was then. If a man had 50 acres on the banks of the river, even if 25 acres had salt water alongside, he would be better off than having the river as it is now.

J. Quigg,  
Esq.  
7 July, 1896.

877. Do you know why the dam at Tempe was built? Not from personal knowledge; but from what I have been told I think it is about fifty-five years since that dam was built.

878. Who built it? I do not know.

879. Who built the dam at the sugar-house works? One of the Lucas'. I do not know whether it was the Hon. John Lucas or his brother William—I think it was William.

880. Why was it built? Because the Sugar Company wanted to get the river water made fresh. The salt water used to corrode their boilers, and the dam was put in to stop the salt water coming up.

881. That was after the Tempe dam was erected? Yes, ten years after.

882. Do you know why the Tempe dam was built? Only from hearsay.

883. What is the hearsay? The hearsay is that it was built for a roadway. When the sugar-works dam was built the people were all pleased to see it, because we were sure of getting fresh water then, and it has been used for domestic purposes.

884. The building of the dam at Tempe evidently did not prevent the salt water from coming up, or there would be no need to build the sugar-works dam? Certainly not, because the salt water will come up if it is allowed to do so.

885. What is to prevent the salt water from coming up? There are flood-gates.

886. There have always been flood-gates in the dam at Tempe? Yes.

887. Of course if you lift up the flood-gates when the tide is up, the salt water will run up? Yes.

Mr. Joseph Wren, Canterbury, sworn, and examined:—

888. *Chairman.*] What are you? A carpenter and joiner.

889. You have heard the evidence that had been given? I have.

890. Do you agree with it in general principles? In general principles I do.

891. What point of difference is there? I do not know that there is actually any difference.

892. Do you think any of the witnesses were wrong in what they said? No; but I think they might have said more to strengthen their argument, because, judging from my experience of the river, I do not think that fascine work would be necessary above the Illawarra Road. I think that the banks are sufficiently high from the Illawarra Road to the source of the river to contain the tidal waters that are likely to flow, unless something over and above the common should happen.

893. You are speaking from a general knowledge of the locality? I am.

894. You have not taken any levels? No, I have not.

895. Therefore, you make a statement only in accordance with what you believe to be the case? From observation of the river. I believe that if the obstructions to the stormwaters were removed, the whole cause of complaint would also be removed. Timber growing on the banks of the river has been allowed to fall into the river, and that, of course, causes the silt to accumulate there, and prevents the wash of the flood-waters when there is a flood in the river from carrying it out to sea, and I have noticed during the last few years the trouble appears to be aggravated, simply by reason of that fact, and more so on account of population beginning to congregate all round the entrance to Cook's River, and the making of roads. The snags and the accumulation of weeds growing in the river prevent the flood-waters from carrying the silt out to sea as they originally did. There is a vast difference in the appearance of the river now from what it was when I first knew it.

896. You agree with what has been said by the other witnesses, but you desire to emphasise the fact that the flood-water is not likely to do much serious damage above the Undercliffe Bridge? No; there is no possible way in which it can. I think that the intention of constructing a dam at Tempe in the first instance was to supply the city of Sydney with water. It was erected by the Government.

897. You think that was the intention? I am almost certain from hearsay that it was originally intended to supply the city of Sydney with water; but it was a failure.

898. It may have been built in order to form a portion of the road to Illawarra? Of course, they had that in view, but I believe, from what I have heard old hands say, that the supplying of the city of Sydney with water was also an object in the first instance. Of course, after the Sugar Company removed their works from Canterbury, the sugar-works dam got into a state of disrepair, and now it is simply a track for foot passengers.

James McBean, Alderman of the Borough of Canterbury, sworn, and examined:—

899. *Chairman.*] You have heard the evidence that has been given? Yes.

900. Do you agree with it? Yes.

901. You believe that is right in general principles? Yes, I do.

902. Do you desire to add anything to what has been said? I do not know that I can add very much to it. I have been living at Canterbury for about forty-four years, and I can endorse every word that has been said. So far as the silting up of the river is concerned, that has been increasing from year to year. I remember swimming in the river when I was a boy, when the bottom of the river was sand, but now if you dive you come up covered with black slime and mud.

903. Are you referring to the river above or below the sugar-works dam? From the Tempe dam right up to the head of the river. On the boundary of Canterbury and Enfield, there is only just a drop of water where you could at one time row a boat.

904. Is there much pollution of the river from factories or tanneries or anything of that kind in the vicinity? There is only one tannery at Canterbury, and one at Wolli Creek.

905. Are there any other manufactories? No.

J. McBean.  
7 July, 1896.

- J. McBean. 906. Is there much pollution at Cook's River from the tannery on it? No; I think they pump all the liquid into the sand in the paddock, and it percolates through the sand and cannot pollute the river much.
- 7 July, 1896. 907. You think there is not much pollution of Cook's River from any manufactory or tannery? No, there is not.
908. You think the insanitary condition of the river is consequent on surrounding population? Yes.
909. Do you know anything of Wolli Creek? Yes.
910. Do you know the buildings on Wolli Creek? I know that there is a tannery there, and also there are some poultry-farms and piggeries on the bank of the creek. During some portions of the year there is no water in the creek, and when a storm comes the refuse of those places is washed into the creek and down into the river.
911. You believe that the tannery there does affect the river? Yes.

Mr. Frederick Davis, Inspector of Nuisances, Borough of Canterbury, sworn, and examined:—

- Mr. F. Davis. 912. *Chairman.*] What are you? I am Inspector of Nuisances for the Borough of Canterbury.
- 7 July, 1896. 913. *Mr. Fegan.*] You have heard the statement of the mayor and aldermen? Yes.
914. Have you anything to add to it? I know very little about the engineering matters in connection with this proposed improvement. All I am prepared to say is about the insanitary condition of the river, and the health of the inhabitants adjoining it. I have been Inspector of Nuisances for the Borough of Canterbury for a little more than twelve years. I have seen a wonderful change in the river in that time, caused by the flow of sewage matter from the various streets.
915. You are speaking of your own municipality? That is all. I know the river extends a long way through the Borough of Canterbury.
916. I understand you to say that sewage matter from the streets finds its way into the river? It does, directly.
917. Is there any fever or other sickness traced to the condition of the river? We have a good deal of sickness. Last summer in particular, we had an outbreak of typhoid fever at Rosedale, which is a portion of our borough, adjoining the river. It was principally confined to children, who, in my opinion, contracted it by bathing in the river. They drank good city water, and the house premises where they lived were perfectly clean, and I could come to no other conclusion than that they contracted the fever by bathing in the river.
918. Have you had any medical evidence on it? The doctors have complained greatly about the state of the river.
919. Have you looked at either or both of the schemes now before us? No, I have not.
920. You know nothing about the schemes? I would not like to give any opinion upon them. My own impression is that if the tide came up and washed all the obstructions away, and cleaned the river out, it would be much better than it is at the present time.
921. You have nothing whatever to say against either of the proposed schemes? I would not like to say anything either in favour of or against it. I am not well up in engineering matters—I do not study them at all.
922. You are not giving an opinion as an engineer, but as a citizen? As a citizen, I should like to see the river cleaned out, and the dams taken away.
923. Is there any point of this scheme to which you object? I am not prepared to express an opinion upon it. I should like to see the dams removed, and the tide come up and go down. According to people who have lived there longer than I have, the tide used to flow up a considerable distance, and then the river used to be pure. The river within our boundary is filled up, and has become a stagnant pool, or, at any rate in summer time it is a stagnant pool, filled with filthy matter. Dairy cows come from Enfield, Ashfield, and our own borough to drink there, and according to medical evidence that has been one very great source of the spread of typhoid fever. I am sure that the milk of any cows drinking water there cannot be pure, and they do drink it because they have nowhere else to go.
924. How far from the river are the nightsoil paus emptied? So far as the nightsoil collected in Canterbury is concerned, it is used for manure in market gardens, and the nearest garden to the river which takes it is nearly 2 miles away from the river, and the others are farther away from it.
925. And it is impossible for it to find its way to the river? I think so. As they use it, putting it in the ground, I think it is impossible for any portion of it to find its way into the river.
926. Have you any regulations as to where it shall be deposited? Yes; it is under my control.
927. Is it taken by a contractor? Yes; and he puts it in certain places where I tell him to put it.
928. You have an opportunity of seeing that those regulations are complied with? Yes, I do; I would not permit of anything in the shape of a nuisance.
929. You have not had to direct attention to those regulations being broken? Yes, I have, in one or two cases, some years ago; but that was a considerable distance from the river. A man erected a kind of dam, and put a considerable quantity of the stuff in it. It was in the bush, and I did not see it; but when it was discovered we had it removed. But it would not have reached the river.
930. Notwithstanding the breach of regulations in that case, it could not do any harm to the river? No, it could not; it was too far away.
931. Do you think that the tannery has any effect on the river? The owners of the tannery carry out the regulations strictly; they let nothing flow into the river which would contaminate it. But where anything from the tannery reaches the river, the water is salt, and not water the cows drink.
932. Is there any possibility of refuse from the tannery getting into the river? The refuse from the pits is pumped into dams, and finds its way by percolation some 200 yards before it reaches the river.
933. But ultimately it goes into the river? Yes.
934. There is no mistake about that? It finds its way into the river ultimately.
935. I suppose you have not heard complaints about nuisances caused by woolscouring? There is no woolscouring on the river, and has not been for a considerable time.
936. Is there not one such establishment on Wolli Creek? There used to be one, but I think it has been removed to Alexandria. There was considerable trouble in Rockdale about it, and law proceedings took place. Mr. M'Namara was the owner of it.
937. You have not heard of any complaints against the tanneries? No; nothing I could interfere with at all events.
- 938.

938. But there are many things you hear of which you cannot interfere with? There are many things I hear about of which I take no notice, for I find that people are very apt to complain when there is very little to complain about. Mr. F. Davis.  
7 July, 1896.

939. Is there much stir in your municipality with regard to this scheme? Yes; most people I speak to about it wish to see the salt water coming up.

940. Why? Because the fresh water is very offensive in the summer, and even the action of oars in rowing boats causes a terrible stink.

941. Do you think that if it were possible to make Cook's River a tidal river that would get rid of the nuisance? No doubt it would.

942. Has it been a tidal river? Not in my time. I believe the flood-gates were opened a few months ago, and I was told that the river flowed a foot over the sugar-house dam, and if it did it would reach considerably higher up than that.

943. How long has this agitation been on foot to make the river tidal as far as Canterbury? Of course it has risen more since this matter has been referred to this Committee, but it has been spoken of for a considerable time past.

944. Have you lived long in the district? About twenty years.

945. And during all that time there has been no movement to approach the Government with a view of making the river a tidal one until this scheme was submitted to the Committee? I do not think there was any agitation. It was merely a matter of general talk.

946. But if there is anything that affects the welfare of the municipality the aldermen are generally so much on the alert that they bring the matter before the Government? What is generally done takes the form of public meetings.

947. Therefore, we may come to the conclusion that until this scheme was submitted to the Committee this matter has not affected the minds of the aldermen or the people of Canterbury? I will not go so far as to say that. Within the last five years there has been a little agitation, but it has not reached the Government. A number of years ago there were a number of Government surveyors employed surveying on the river for some months, and that allayed the agitation. We were in hope that something was going to be done. We were given to understand that the banks were to be straightened, and the Cook's River Dam to be removed, and that the tide would come up. At that time the agitation was growing.

948. Were there any public meetings? I do not remember any public meetings.

949. In what way did the agitation show itself? I heard it in talking.

950. Merely in talking? Yes. They are a quiet, rather retiring people in Canterbury, and it takes a lot to stir them up. They bear evils remarkably well.

951. And as far as this scheme is concerned, you can express no opinion, and your evidence is that, so far as your municipality is concerned, they wish to see Cook's River made a tidal river up to Canterbury for the purpose of getting rid of the sewage in the river more than anything else? We should like to see it beyond Canterbury, but for that purpose only.

952. But you are only speaking for your own municipality? Yes.

953. That is really your evidence? Yes; I can only speak as to the insanitary condition of the river, and consequent sickness. We have a great deal of sickness in dry seasons in consequence of the bad state of the river.

954. That evidence has been confirmed by the medical opinion you have received from time to time? Yes, it has. All the sewage matter from districts round about finds its way through Canterbury into the river.

955. *Mr. Trickett.*] You, as Inspector of Nuisances, can tell us if Canterbury comes within the metropolitan and suburban sewerage scheme? Only one portion of it—the upper end of it, towards Ashfield and Petersham.

956. Supposing that that portion of the scheme were adopted, would that relieve you from the trouble you now seek to be relieved from by means of this river? It would, to a certain extent; but there is a considerable portion of Canterbury on the other side of the river, for instance, which that scheme would not affect at all.

957. I suppose that the greater portion of Canterbury comes within that sewerage scheme, does it not? No, only a very small fringe of it—the upper end of it. The greater portion of our borough extends 5 miles beyond it.

958. But does not the drainage of the greater portion of the populated area of Canterbury find its way into Cook's River? The whole of the drainage of Canterbury finds its way into the river.

959. Is that not a source of pollution? Yes.

960. Why do not the Canterbury people agitate to have that portion of their area which is within the metropolitan sewerage area brought under that scheme? I remember the scheme being submitted to the Council some years ago, and it only served the top end of Canterbury. I do not see how you are to get the lower portion of Canterbury connected with that sewer at all.

961. But do you not think that if this river continues to be the outlet for all your sewage it will always remain a nuisance, whether the salt water comes up or not? I think that if the salt water came up it would take it away.

962. It would help, but it would not be a perfect cure? It might not be, but we are thankful for small mercies.

Sydney Robert Lorking, Esq., Mayor of Canterbury, sworn, and further examined:—

963. *Chairman.*] Do you desire to say anything further? I desire to say that Mr. Fegan put a question to Mr. Davis to which he was unable to reply, and I should like to reply that, to my own personal knowledge, about two and a half or three years ago, my Council joined with that of Marrickville to commence an agitation on this very question. We had a conference, and the result of it was a deputation to the Minister for Works, Mr. Young, and he promised to give the matter consideration. I think he also promised to do something, but that something has not been done. On the 18th May last, we had a public meeting in Canterbury to deal with this question. That was previous to this matter being referred to this S. R. Lorking,  
Esq.  
7 July, 1896.

S. R. Lorking, Esq., this Committee. At that meeting certain resolutions were passed, a copy of which I have here. The resolutions are as follows:—

7 July, 1896.

That the residents of Canterbury view with alarm the insanitary condition of Cook's River and its tributaries. That Cook's River being under the entire control of the Government, they be requested to take immediate steps to abate the nuisance, and preserve the health of the inhabitants of this district.

That in the opinion of this meeting the proposed application of the betterment principle to one of the national rivers would be unjust, and this meeting respectfully protests against the same.

That the foregoing resolutions be forwarded to the member for the electorate, for presentation to the Hon. the Minister for Works.

964. *Mr. Fegan.*] Who was the member for the electorate? Mr. Varney Parkes. The whole of those resolutions were carried unanimously at a fairly representative meeting held at Canterbury, and I may state that a week or two previous to that I was present at a meeting, having the same object in view, at Marrickville, at which similar resolutions were carried.

WEDNESDAY, 8 JULY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Improvement of Cook's River.

Miss Mary Louisa Campbell, Wanstead, near Tempe, sworn, and examined:—

- Miss M. L. Campbell. 8 July, 1896.
965. *Chairman.*] Where do you live? At Wanstead, near Tempe.
966. Near the junction of Cook's River and Wolli Creek? Yes.
967. How long have you lived there? My family have been living there a considerable number of years.
968. And you have lived there nearly all your life? All my life.
969. Are you aware of the proposal placed by Parliament before the Committee? I have some idea of it. I am not absolutely seized of the whole thing.
970. You have an interest in property lying at the junction of Cook's River and Wolli Creek? Certainly.
971. Have you any interest with regard to the proposed works beyond that on the eastern side of Wolli Creek? No.
972. Of what extent is your family's property there? It is supposed to be 121 acres, exclusive of roads.
973. Can you inform us why the dam was put across Cook's River at Tempe in the first instance? I believe it was to conserve the waters of Wolli Creek, which were fresh, and to prevent the entrance, I suppose, of the sea-water.
974. To keep the water of Cook's River fresh? To keep the water of Wolli Creek, which has always been a fresh stream, fresh, and to prevent the entrance of the sea-water in any way into the river.
975. Originally Cook's River went far up beyond where it is at present intercepted by the dam? Naturally I should suppose so.
976. Before the dam at Tempe was erected, would Cook's River have overflowed some of the property which your family own at the junction of Cook's River and Wolli Creek? I think that that is a question better suited to an engineer than to me.
977. In point of fact, the dam was built before you had any knowledge of the place? Yes; I have only known it with the dam as it stands at present.
978. Supposing Cook's River Dam at Tempe were taken away, and a free passage were permitted to the river at all times, would that be satisfactory to the people above the dam? Certainly not.
979. Would it be satisfactory to you, who are the owner of property there, if a fascine bank were erected around your property? I do not think fascine banks are very much good, because they fret away in time.
980. Supposing a fascine bank were so constructed that it was a permanent block to any inundation of your property by salt water, do you consider it would have any detrimental effect on your land? It might be an advantage.
981. Supposing that a satisfactory fascine bank were placed round your property to prevent it from being inundated, and the Tempe Dam were taken away, thus allowing Cook's River to run unimpeded along its original course, would it be a benefit to your property or not? No, I think it would be a disadvantage.
982. Why would it be a disadvantage? Because there is no provision made for keeping the water of the creek fresh.
983. You believe that it is more advantageous to your property to have fresh water in Cook's River than salt water? I should think so.
984. That is your first point of objection to Mr. Darley's scheme, is it? I think that if the dam were taken away, and no provision made to prevent the sea-water from entering Wolli Creek, we should find the want of fresh water a very great disadvantage.
985. Why do you require fresh water there? Well, in times of drought we have had occasion to use it for household purposes, but the Government, by the erection of the railway bridge and embankments at Tempe, has rendered the stream unfit for use. Last year we should have had occasion to use it if the drought had lasted a week longer, and we should have been unable to use it.
986. Are you aware that there is a wool-scouring establishment, or tannery, further up Wolli Creek? I am not personally aware, but I have been told there is one.
987. Might not that affect Wolli Creek, and make it unfit for use, irrespective of what the Government may have done? I do not think it ever affected it very seriously—at any rate, not so much as the entrance of the salt water into the creek has done. This has prevented our letting our property on the Creek,

Creek, because fresh water was necessary for wool-scouring. We should have let our property for wool-scouring or fellmongery purposes, I think, but the water being rendered salt by the dam not acting as it should act, has prevented our letting that land, and it has damaged us in that way, besides making the water unfit for use for household purposes.

Miss M. L.  
Campbell.  
8 July, 1896.

988. You are speaking only of fresh water in Wollie Creek? Yes.

989. The presence of salt water there would prevent your utilising your property for fellmongery and other purposes? It has prevented us. The waters of the creek have been rendered salt by the blocking of the channel of the river by the southern railway embankment, and the northern embankment has also affected the flood-waters, or the great surplus of waters that come when there are heavy rains, and impede the water and send it back. In 1861 additional flood-gates were erected to carry off the water. They were found to be not efficient, and, on the representations of my father, in 1876, Mr. Moriarty put in other flood-gates, on the southern side where the channel of the river is. These were effective, and the land was scarcely, even in very bad weather, flooded at all—I mean any of the lowlands, I am not speaking of our property alone. Subsequently the Government built the Illawarra Railway, and whilst it was in course of construction my mother pointed out to the engineers in charge the damage that would probably result. They laughed at the idea; but as years have gone on they have proved that she was correct in her view that the construction of the embankments—of the southern embankment particularly—would spoil the effect of those new flood-gates, because the waters could not get a free flow out as they had been accustomed to do. Previous to the erection of the Illawarra Railway embankments at Tempe, the flood-waters would go off the land in six hours, and the land was not then subject to such floods as it has been subject to since the building of that railway. I believe that 60 miles of country is drained by Wollie Creek, and that Cook's River drains very much more. The flood-waters run up to the embankments, and when they get there only a certain proportion of them can get out, owing to the very narrow entrance to the space left under the railway bridge. The outlet is not at all deep; indeed, it is very shallow there. Before the flood-waters get in sufficient volume to the flood-gates, especially the southern flood-gates, the tide changes, and the waters come back again. The land on the northern end of the dam is high land, and therefore, the waters cannot go over that as they do over the lowlands, and they must come back and flow over the lowlands. I may also mention that the Government have raised the road near the Tempe railway station, and there have been reclamations on the northern side of the river, to the left of what is known as Unwin's Bridge Road. There has been an extensive raising of the land there; and all that helps to flood the lands on the southern side.

990. Do you know what was done with the material that was taken from where the cylinders of the bridge were erected? It was put on the mud flat, across which the railway bridge is carried.

991. Cylinders were erected in the middle of the stream at Cook's River? Yes.

992. Do you think there was any shallowing of the bed of the river by the construction of the railway works? The railway works blocked up the river. The river across from side to side would I should say, be over 200 ft.

993. You say that in the construction of Unwin's Bridge Road, and the bridge on that road, some works were carried out which delayed the disappearance of the flood; did the embankment or approach to the bridge there affect the flooding? I do not think it affected it so much as the railway. It is the fact of the waters not being able to get away through the railway opening which causes the extensive flooding. I do not think the erection of the bridge on Unwin's Bridge Road has had very much to do with it, because when the water gets through that, there is a large field on our land on to which the water comes. It flows right back and rests there. It forms a sort of pool and remains there until it gets through under the opening.

994. Have the floods been worse in the valley of Marrickville Creek since the construction of the Marrickville Railway? I do not think that to any great extent Marrickville has been very much worse. It is the lands immediately about the river that suffer so much—not Marrickville.

995. If it affected your land on one side of Cook's River, it is reasonable to suppose that it would affect Marrickville Flats on the other side of the river? In a measure; but I think that the flooding of Marrickville is in a great measure due to waters coming from Benmore, Stanmore, and other places being brought down by formed drains and channels and other means into the Marrickville Valley.

996. The floods from another watershed? Yes. During the recent rains I particularly noticed that the Marrickville Valley was flooded before the lands immediately about the river were flooded. The water came down from the watershed at Stanmore and other places into the river, and flooded Marrickville Valley before the lands near Tempe were flooded.

997. You mentioned a period when on the southern side of the dam sluice-gates were put in—that was prior to the construction of the Illawarra Railway? Yes; in 1876, I think.

998. Did you feel the effect on your property of those sluice-gates at once? Certainly—they were a very great advantage.

999. Did you have any heavy falls of rain between the time those sluice-gates were erected and the time the Illawarra Railway was constructed? Yes; I think we had heavy rains. We have rain very heavy locally at times when it does not touch other places.

1000. Can you tell us how long Cook's River took to fall, passing through those sluice-gates, before the railway bridge was erected;—how long it was before the river was back in its bed, and off your land? About six hours.

1001. How long would it take for the same amount of rainfall to clear away now? It would take weeks and months before the final effects were gone.

1002. But how long before Cook's River sank back into its channel again, and left your land free of water? Not the whole of the water; but it takes quite a week, I think, for the river to get back on to the surface which it now occupies, because it was not always so high. Before the railway was put there, and dammed the waters back, there were at times 18 inches in parts, and 4 feet in the channel of the river, and scarcely ever more than that.

1003. Do you contend that land that was cleared of water in six hours prior to the construction of the Illawarra Railway, now takes as many days to clear? Quite as many days, before all the water is drained off.

1004. Do you approve of the proposed dams with sluice-gates at Wollie Creek and Cook's River, near Undercliffe Bridge? No, I do not think that is at all a good scheme. I do not see the advantage of it.

1005. It lets the salt water up to those two points, which you object to, as you have already told us? Yes. I object to the salt water.

Miss M. L.  
Campbell.

8 July, 1896.

1006. Will you tell us what you would approve of? Well, I think that as so much money is to be spent on the improvement of Cook's River, the southern railway embankment should be altogether removed, and replaced by open archways the same as the sewer across our property. Of course, it would have been a much greater advantage if the river had been bridged from shore to shore, instead of the Illawarra railway being constructed there with embankments on the northern and southern shores while the bridge is over a mud flat.

1007. Do you mean that sluice-gates should be put right across? No; but to put an open bridge right across from bank to bank, or open archways the same as the sewer which crosses another portion of our property.

1008. You believe it would be unwise to allow the salt water to pass beyond the present Cook's River dam? Yes.

1009. How do you propose to carry out works at the Tempe dam to intercept the tide? I should leave the dam as it is now, with perhaps extra flood-gates in it of an improved pattern, and I should lower the sill or floor of the flood-gates. If the flood-gates act properly the salt water cannot get in.

1010. Do you think there should be sluice-gates in the Tempe dam or bridge, whichever happens to remain there eventually;—do you think the salt water ought to be allowed to come past Tempe dam at all? I do not think so.

1011. Neither into Cook's River nor into Wollie Creek? No.

1012. Therefore you propose to intercept it there? Yes.

1013. You would intercept it there by means of sluice-gates? I would not allow the salt water to enter the river there in any way, because it does damage—it destroys all the pasture lands when the floods come. As it is, the waters of Wollie Creek cannot get away, because they are blocked back by that southern embankment.

1014. Above that, what do you propose to carry out? The pollution of Cook's River has been mainly caused by the drainage from Marrickville.

1015. You propose to clean the river out, I suppose? Yes; I would dredge the river.

1016. And I suppose you would put something at the mouth of Wollie Creek to direct the current straight down to the dam instead of making its way partly into Marrickville Valley—we have been informed that Wollie Creek has a tendency to make its way up the Marrickville Valley? Yes; it goes back; it is blocked by the railway—that is the surplus water in flood-time.

1017. You propose to direct that down straight towards the Tempe dam? Yes.

1018. What would you do with Marrickville Flats? I should have those iron drains taken away altogether. As Marrickville Flats drain such a considerable area, I should intercept the water that comes from Enmore and other places before it could get down so low, and would take it across country, instead of draining all that watershed into Cook's River, which is already blocked by the railway embankments. I should not bring that water into the river at all, but provide some other way of getting rid of the water before it could get into the river, because after the flood-waters have gone down, all the backwater from Marrickville comes into the river, and it is certainly not pleasant. It has made the river very unpleasant. Instead of being a clear stream in which you could see the sandy bottom, it has become a most dreadfully offensive pool. Drainage of all kinds—solid substances, and house rubbish—comes down into the river. At present it is daily and hourly flowing into the river. That causes all the trouble there. It has polluted the river, and rendered it unpleasant for any one going on or passing it.

1019. You are aware of large populations settling on various portions of Wollie Creek and Cook's River? Yes.

1020. That has not resulted from the pollution of the stream? As far as I can recollect it, the upper part of Marrickville, before that drain was constructed, was always very offensive, and the river was then clear. Although there was a large population about Enmore and Staunmore, the drainage did not come into Cook's River then. The stream was clear, and people did not suffer any unpleasantness from it. In the olden days a flood was looked upon as an advantage, because it brought enrichment to the land. In days gone by I suppose we were years without a flood, and especially when the southern flood-gates were erected, the advantage was very noticeable. But after the railway was made there, even the smallest quantity of water seemed to be thrown back over the land however small the quantity of rain that fell. Since the railway has been constructed I have of late years known the river to overflow its banks three times within a fortnight.

1021. *Mr. Humphery.*] Do you know the whole of the watershed for which Cook's River, above Tempe, is the outlet? Cook's River drains a considerable area of country.

1022. Would not the whole of that country contribute to the pollution of the waters of Cook's River? Occasionally the river was not clean, owing to the wool-washings at Canterbury, but not in the terrible way it is now. The flood-waters coming down would clear the river, and perhaps for some years there would not be anything like that again. But the drainage from Marrickville causes a daily—hourly—pollution of the river. The pollution of the river is chiefly about Tempe, especially at the outlet of the drain from Marrickville. Above Undercliffe Bridge the river is not at all unpleasant, even where the sewer crosses it is not so unpleasant.

1023. Your property commences about the Undercliffe Bridge, does it not? Yes.

1024. *Mr. Trickett.*] To what extent is your property affected in flood time—out of your total acreage how many acres are submerged? I could not tell you how many acres are actually submerged; but since the railway has been there we have had one very bad flood. I do not remember, and none of our servants who have lived there before I was born remember, the flood having ever been so high before. Though they have had what they call high floods, still the flood never reached such a height, or was of such extent as that flood which occurred since the railway has been constructed. The land is subject to flooding now after almost every rainfall since the railway has been constructed.

1025. A large proportion of your property? The lower flats about the river.

1026. If the Tempe dam were removed, and the salt water were allowed to flow up and mix with the fresh water, and submerge your property, would you consider that a benefit or otherwise? I should consider that a very great damage. Our lands are all agricultural, almost up to the bank of the river—in fact I may say up to the bank of the river they were fit for agriculture until the railway was built.

1027. If the salt water were let in, it would render that land absolutely useless for pastoral purposes? Yes.

1028. I ask the question, because that is a scheme which has been suggested by people higher up the river, and I want to ascertain from you whether you would not consider that a substantial injury to your property? Certainly it would be a most grievous injury—an actionable thing. 1029.

Miss M. L.  
Campbell.

8 July, 1896.

1029. *Mr. Clarke.*] Do I understand you to say that you would like to have the Tempe dam removed altogether? No: I should consider the removal of the Tempe dam a very serious injury.

1030. You would like the present Tempe dam to remain as it is with some improvements? Yes, with improvements; but I do not think that those improvements would be of any great service, because the railway embankment keeps the river always fuller than it used to be prior to the construction of the railway, besides blocking the free discharge of the flood-waters from the river and creek.

1031. But I understood you to say that you would prefer to have the river water near your property fresh? Yes—not to have the salt water let in.

1032. But how would you keep the salt water from coming into that portion near Wollie Creek, except it were closed up altogether? The salt water had no entrance from the outside. The river may have been a little brackish. I do not know what condition the stream was in originally, because it is so many years ago that I think very few people, even the oldest amongst us, would remember it. The flood-gates open from the river side into the other side, and of course when the tide is down, they open automatically. The river water did not enter the creek. Each seemed to flow out independently of the other, in a measure.

1033. You think, then, that the proposed fascine banks would not be beneficial? They would not be of the least benefit, because they would wear away. Of course, if the river were often in flood, the constant flooding of the land would wear away the soil. The soil has been washed off our land by the continuous flooding since the railway was built.

1034. I think, if I understood you correctly, you said that since the formation of the railway embankments the flood-waters from Wollie Creek do not get away so freely as they did formerly? No, they do not. They go up to the opening under the railway bridge which is narrow, and they cannot get out before the tide changes, and they flow back again on to our land. Instead of going off in one sweep and in a few hours, as they did in days gone by, they flow back again and remain for many days.

1035. And that, to a certain extent, causes an obstruction of Wollie Creek with rushes and other material? It has caused Wollie Creek, of course, to be filled up with rubbish, in a measure. It cannot get an outlet for the rubbish coming down after every rainfall; and as the weather gets calmer, and the rain ceases, the water there has no impetus as before, and this stuff is deposited at the entrance.

1036. The railway embankment does not give such a free discharge to the flood-waters as there was before? Certainly not; it is the cause of the whole trouble. Since the erection of the flood-gates in 1876, there was very little flooding in the river, and that, perhaps, only after ten days' rain; but now the river never gets to its normal level, and therefore the flood-waters flow back in consequence of the obstruction caused by the Illawarra Railway embankments, especially the southern one.

1037. *Mr. Roberts.*] You come before the Committee as an opponent of the scheme at present under consideration? Yes; I am opposed to taking away the dam; I think it would be a serious injury; and I do not see that any good could be gained by putting a dam at Undercliffe Bridge, nor at Wollie Creek. They did not need these things before a railway was constructed. The creek was not at all brackish. We constantly used the creek water in very hot seasons for household purposes, and for watering the cattle; in fact we relied on it in a great measure; and if the railway had not been constructed, there would have been no necessity to put a dam or anything like that at the mouth of Wollie Creek, because the water remained fresh of itself. The drainage from the watershed was of course always fresh water, without any salt water coming in at all.

1038. Are you not aware that under what is known as the alternative scheme it is not proposed to remove the Cook's River Dam at Tempe? I know there is a second scheme proposed; but I do not know whether that includes the removal of the dam or not.

1039. What you wish the Committee to understand is, that you have a strong objection to the admission of the salt water into Cook's River? Certainly.

1040. Is there any other fact in connection with the scheme that you wish to make known to the Committee? I think that the reclamations outside of the dam prevent the river from being as low as it used to be outside the dam. Land has been reclaimed over which the river used to flow. At the change of the tide before the reclamation works were begun there, that land which is now reclaimed by the Government, was, I think, subject to flood twice a day; it was a mangrove swamp. The tidal waters used to come on it twice a day; but the Government reclaimed that land, and narrowed the channel, and when they had done that the water in the narrowed channel rose considerably higher than it used to do before. That also, I think, retards the free flowing away of the waters of Cook's River, because if the floor of the dam were lowered now the water from outside might enter the river. In regard to Marrickville Valley I may say that I should intercept any water from the high lands beyond Marrickville Valley, and I would not let it come into the Marrickville Valley Creek at all. The water falling on the Marrickville Valley Creek itself, I should bring down into Cook's River by a deeper channel. The old channel has been filled in to a great extent by people who bought land there. That was a great mistake.

Frederick Gannon, Esq., Solicitor, sworn, and further examined:—

1041. *Chairman.*] I understand that you wish to add something to the statement you made the other day? I have listened to the evidence given by Miss Campbell. I agree with a great deal she has said. I think that owing to my more advanced years, I can add to the information which she has given. There is no doubt that to a certain extent the railway embankment is a great cause of complaint. Where the opening in the railway embankment is at the present time, there used to be a mud flat. It was not the channel of the river there. Miss Campbell has said that in consequence of the embankment being there, the waters have flowed back on to her family's land. The bridge should have been erected where the natural channel was, and not over the mud flat. The bridge ought to have been further south.

F. Gannon  
Esq.

July, 1896.

1042. You say the natural channel of Cook's River was further south from where the bridge was erected? Yes, in an exact line with the mouth of Wollie Creek. An opening should have been made where the one is now, and there should have been another opening over the channel.

1043. Was the embankment thrown over the main channel? Yes. The channel is blocked up at one side and open at the other. The channel runs on the western side of the river, and not on the southern side at all. Wollie Creek and the channel formed one, in fact the channel ran up Wollie Creek. When they built the railway they blocked the natural channel and put in the opening on the mud flat, farther north or farther east.

1044. In other words, they forced the water further north than it used previously to go? Yes; and, as Miss Campbell has said, that has caused the flood-waters to go back. There are flood-gates at one extreme end

F. Gannon,  
Esq.  
July, 1896.

end of the dam, and flood-gates at the other extreme end. There was a sort of channel going to the north side of the dam, and there was a channel going where the Tempe Refuge is. There were two channels, and the result of putting the embankment where they did put it, and of putting the bridge where it is, was to spoil the flow of water that used to go to the farther flood-gates, and consequently the water could not supply both flood-gates with the same amount as it did before. The opening in the railway embankment was made only equal to the opening of either of the flood-gates, and, therefore, if there had been another opening made on the farther side of the river from Sydney, as well as the other opening, then the flood-gates would have been able to do their work, just as they did before the embankment was made; in other words, there is not that get-away for the water that there was before the embankment was made. The mistake was in putting the opening in a wrong place. I suppose that was done for the sake of economy in connection with the construction of the railway; but they have blocked the channel.

1045. You state that where the railway embankment now stands was, prior to the construction of the railway, the main waterway for Cook's River? The natural channel. The embankment has been put on the deepest part, and the opening made on the shallowest part.

1046. The channel ran originally, as it were, to the mouth of Wollie Creek, and then hugged round to the southern side of Cook's River? Yes.

1047. Your contention is that the bridge ought to have had another span or two? There ought to have been another opening where the channel is, because having only one opening spoilt the effect of two flood-gates. The same quantity of water cannot go through the one opening as used to go through the flood-gates. There ought to have been another opening on what is called the southern embankment. There is one thing I should like to mention which has probably not occurred to a great many people. I daresay the Committee are aware that Unwin's Bridge is much shorter now than the original bridge there was. I knew Unwin's Bridge when it extended from the northern side to where the white railings are on the other side. It was the full width. You can now see the piles that were cut off when the Government made the new bridge, and where the roadway was filled in there. That was the natural width of the river, and the narrowing of it has caused the silting up of the river where it is now proposed to excavate and give the river its original width. If that is done, I believe it will have a very beneficial effect. Unwin's Bridge, when I knew it first, was over 200 yards long.

1048. *Mr. Fegan.*] How deep is the water under that bridge now? Where the stone piers are, I think, the deepest part is from 6 to 8 feet.

1049. *Mr. Humphery.*] Do you say that the old Unwin's Bridge was never under water in flood-time? I know it has been.

1050. Do you not know that it has been under water 4 or 5 feet? Yes; but I have known that occur since the erection of the dam. In former years I have rowed in a boat up to Wanstead.

1051. Therefore, floods in Cook's River are not a novelty? But they have never had anything like that since the new flood-gates were put on the southern end of the dam.

1052. *Chairman.*] Supposing there were ample sluice-gates in the dam—say, increased four or five times what they are at present—do you think you would have heavy floods in Cook's River again? They will have floods in Cook's River unless there is an opening made in the railway embankment. No matter how many openings you make in the dam, the water cannot get away there unless you have another opening in the railway embankment. I am certain from my knowledge of the river, I having lived on it for many years, that if the floor of the flood-gates were lowered a foot or two the floods would get away much faster, and would not remain on the lands above the dam so long as they do at the present time.

1053. But how much difference have you seen between high water on the lower side of the dam and a flood on the upper side of the dam? I have seen the water flowing from the upper side right over the dam.

1054. How much fall would that be? Two feet at least.

1055. Therefore, it is clear that the dam held the floodwaters up 2 feet anyhow? Yes.

1056. If the rise and fall of the tide on the lower side of the dam is some feet more, then you would have the dam holding up the floodwaters at least 5 or 6 feet? It is between low-water and high-water where the damage is caused, that is to say, the floodwaters cannot get away while the tide is making; but, from the moment it goes out, for about six hours, the floodwaters can get away.

1057. *Mr. Humphery.*] What you say is that, unless there were an additional opening in the embankment, it would be useless to provide a greater discharge in the dam itself than at present exists? Yes; I am quite certain of that.

1058. *Chairman.*] If a larger discharge area were provided at the Illawarra Railway embankment, would the sluice-gates at the present dam be useful? I think so; since the flood-gates were put on the southern end, near the Tempe Refuge, I have never known the water to be on the dam, and we have had heavy floods too. I have never known it on the dams since the railway was constructed either, but the water is a little slower in getting off the flats, and as Miss Campbell has said, it will perhaps remain a week instead of only a few days.

1059. *Mr. Fegan.*] Have you considered the alternative scheme? Yes, I have.

1060. Do you think that that will give the relief which the people of Marrickville are asking for? It will give relief to the people of Marrickville, but you want to relieve other people besides those at Marrickville. My idea is to open the natural creek that was originally in the Marrickville Valley, and make it a branch of the river. They will never have any cause to complain then, because as the river recedes the floodwaters will come from Marrickville.

1061. You think that that will get over the difficulty? Yes; Marrickville will always be flooded until the river is lower than Marrickville.

1062. You think that that is the general opinion of the people about there? I think so. If there were a good channel there, there would be a good outlet for the stormwaters and surface drainage, which are now kept back as there is not sufficient space to permit of their going into the river.

1063. Do you think that a law should be passed to prevent people from building on these lowlands which are not drained? I think it would be a good thing to pass such a law, because people do not seem able to protect themselves. They squat down on a place and erect dwellings there, and it is not until a storm comes that they know what they are doing. I think I said before that I thought it would be a good thing if the Government were to reclaim all that land.

1064. *Mr. Hassall.*] From your knowledge of that locality, do you think that if sufficient openings were made

made in the railway embankment to carry off the flood-waters, that would practically answer all requirements? Yes, and if the excavations were also made as proposed in the Government scheme. I do not think that the people would then have any cause for complaint.

1065. You think that all the land above the railway bridge would not then be subject to inundation in the same degree as it is now? I am sure it would not.

1066. Were there not floods there in days gone by before that railway bridge was erected? Yes.

1067. Did they do any particular damage? They put deposits on the flats all round, the same as every other river in the country would.

1068. What has been the effect of building the bridge there? It has retarded the getting away of the stormwaters, that is all. They do not get away as they used to do.

1069. And the water remains longer on the land than it otherwise would do? Yes; we had the full scope of the river before the railway embankment was put there.

1070. How many additional arches would you suggest should be put in the embankment? I think it would require only an opening of about 60 feet—about the width of the channel—and I do not think it is wider than that.

1071. That is the original main channel? Yes.

1072. Which you say has been blocked up by the embankment? Yes. If there were that opening there the flood-gates would be able to do their work properly.

1073. *Mr. Roberts.*] Do you desire the removal of the old Cook's River Dam? Certainly not. I consider that there would be no end of actions against the Government, unless a special Act were passed to save them from actions for damage done to the lands which have been reclaimed, and which are now used for pastoral or agricultural purposes and which would be spoilt by salt water.

1074. I suppose that if the salt water were admitted a large area of land would be flooded? There is no doubt that it would be destroyed.

1075. And consequently it would make it a very expensive job, whatever scheme were adopted? Very expensive. I suppose Mrs. Campbell would be the largest sufferer. Her land extends from Wolli Creek on one side up to Undercliffe Bridge on the other. The whole of the flats which she lets for grazing purposes would be destroyed, and that is a very considerable area. I can remember the time when I have walked over that land and have been able to scratch the natural salt off the surface of the land, but you see nothing of that sort now.

1076. Would many landowners, who have rights to a fresh-water river, be able to make a claim against the Government? I think so, all the way up to Canterbury. I believe it is proposed to build a dam at Undercliffe Bridge, and if the Government do that I think it would flood all the lands above it, and the landowners would claim damage on account of the flood-waters being thrown back upon their lands.

Joshua Percy Josephson, Esq., A.M.I.C.E., Civil and Consulting Engineer, sworn, and examined:—

1077. *Chairman.*] What are you? A civil and consulting engineer.

1078. Have you a knowledge of the two schemes at present before the Committee? I have.

1079. Do you desire to make a statement in regard to them? More especially with regard to the main Departmental scheme—not the alternative scheme. I know these schemes very well. The alternative scheme will no doubt relieve the Marrickville Flats, but only to a certain extent. It will not do all that is required. We want the whole thing dealt with under what I may call a natural scheme.

1080. Do you approve of the main Departmental scheme? Yes.

1081. And the reasons that have been given by the Government officers are the reasons that would sustain you in your approval of it? Yes.

1082. I will ask you then about the alternative scheme;—do you know anything about the storm-water discharges in various suburbs? I do.

1083. Do you know what fall the storm-water discharges have? They vary. For instance, if you want a storm-water discharge to the alternative scheme the fall should be about 1 in 1320—that is, 4 feet per mile.

1084. What is the plan? About 1 in 3,200.

1085. What is that? About  $1\frac{1}{2}$  ft. per mile.

1086. You state that it ought to be twice that? Yes, at least.

1087. If the drain discharged intermittently, and there were a fall of  $1\frac{1}{2}$  ft. per mile, what would be the result? That would not drain the flat.

1088. But supposing the storm-water entered it what would be the result? When it got to a certain height it would be choked. The velocity of that would be 143 ft. per minute.

1089. With an intermittently discharging drain the storm-water would stand for a considerable time in it? Yes, when it got to a certain height.

1090. And what would become of the matter in solution while it was standing in the channel, it would sink, would it not? It would sink certainly.

1091. And when it had sunk would a velocity of 143 ft. per minute clear the sewer of the stuff there would be in it? It certainly would not.

1092. What would be the result? It would be partly choked; the sediment would remain in the channel.

1093. Do you know anything about the storm-water discharges in connection with the city? I did.

1094. Has any difficulty been experienced with regard to the deposit of sediment in them? I should not like to say anything as to that.

1095. Supposing that silt were deposited in the tunnel, how would they get it out if the velocity of the current were not sufficient to shift it? It would have to be cleaned.

1096. How would they clean the tunnel? By going inside it and cleaning it. There would not be a sufficient force of current to clear it out. To shift sand requires a velocity of about 4 ft. per mile.

1097. Do you know the amount of catchment area of the water that is at present discharging into the drainage centre in Marrickville Valley? Marrickville Valley itself is about 1,700 acres.

1098. Have you any information to show the amount of water that would seek the intake of the alternative scheme and the discharging capacity of the tunnel in relation to the amount of water that would require to use it from such an area? Eight inches fell in twenty-four hours in May, in the flood year, and, allowing an absorption of 25 per cent., it would take about fifty-one hours to discharge.

F. Gannon,  
Esq.

8 July, 1896.

J. P.  
Josephson,  
Esq.,  
A.M.I.C.E.

8 July, 1896.

- J. P. Josephson,  
Esq.,  
A.M.I.C.E.  
8 July, 1896.
1099. Running full time 4 inches would take twenty-five hours, and 2 inches would take twelve and a half hours? About that.
1100. But inasmuch as it is not running full time, it being choked by the rise of the tide, 2 inches of rainfall on that watershed would take thirty-seven and a half hours to get through; is that so? About that.
- It will, of course, vary a little.
1101. If 2 inches fell on that watershed in twenty-four hours, and had to find its way out through that tunnel, it would take thirty-seven and a half hours to clear the flat? About that. From statistics I have obtained, I find that the heaviest rainfall we had was 2·2 inches in one hour. That was on the 25th February, 1873. In the great rainfall of May, 1889, there fell 16·78 inches in four days. I mean on the area near Cook's River.
1102. What are we to understand is your attitude with regard to the alternative scheme;—from an engineering standpoint is it likely, in your opinion, to be effective? I do not think the alternative scheme will do at all.
1103. You think it has not enough discharging capacity? It will not relieve the flat by 2 to 3 feet. There will always be from 2 to 3 feet of water there. The in-take of the tunnel is, I think, 2 feet above low-water mark to start with, and it comes within low-water mark at Shea's Creek.
1104. What area of the valley is there lower than 2 feet? From the dam to the in-take is 180 acres.
1105. Do you know anything about the levels of Cook's River? Yes.
1106. What is the rise and fall of the water in Cook's River, spring tides? From 5 feet 8 inches to 6 feet above low water mark.
1107. Would there be any difference between the rise and fall at Shea's Creek and at the Tempe Dam? Nothing to speak of.
1108. Is it practically a level? Yes.
1109. Would the discharge at Tempe Dam practically find the tide as low as it would at the mouth of Shea's Creek? About the same. There might be a few minutes' difference.
1110. In your opinion, would the discharge at Tempe Dam, above Marrickville Flats, have as good a head behind it as one would at Shea's Creek? I think so.
1111. Therefore, in your opinion, if the alternative scheme be based on the assumption that it will find some 2 or 3 feet lower water at Shea's Creek than it would at the mouth of Marrickville Creek, the present dam being removed, it is based on a wrong contention? Quite so.
1112. If the present Tempe Dam were removed, and Cook's River were allowed to flow out unimpeded, or if there were sluice-gates which were equal to the carrying capacity of the river, would the discharge from the mouth of Marrickville Creek be pretty well as low as the discharge at Shea's Creek? Yes; I think it would.
1113. Not much difference? Not much difference.
1114. The difference in the levels of the river at the mouth of Marrickville Flats and at the mouth of Shea's Creek is accounted for by the presence of the dam, and by no other reason? That is right.
1115. How far is it from Marrickville Creek to Shea's Creek? I should think that it would be quite a mile, going round the fascine banks.
1116. You believe that that distance in an estuary, such as Cook's River would be if the dam were not there, would not account for much difference in the level? No, it would not.
1117. You are aware that Cook's River narrows as it goes up; but you do not think that that will materially alter the level? Quite so.
1118. We take it for granted that in giving these replies you are well acquainted with the surroundings of the place? I know the whole district.
1119. Do you desire to make any further statement with regard to the main Departmental scheme? The alternative scheme will not relieve the flat from flood-waters, except only partially. The main thing is the river. On the southern end of the present dam at Tempe, if there were a new opening of 300 feet, with gates 2 feet 6 inches lower than they are at present, that would relieve the flat better than the alternative scheme would. The gates are about 2 feet 2 inches above low water at the present time, and I think that they should be 3 inches below it. It takes from 12 to 16 inches head to work the present gates.
1120. How much head ought to work a gate? From 4 to 6 inches ought to work a proper gate.
1121. *Mr. Wright.*] I understand that your objection to the alternative scheme is that it has not got fall enough; and secondly, that by reason of the high waters coming into it, it would be blocked from running during high tide? Quite so.
1122. Can you tell us what is the fall of the great outlet sewer to Ben Buckley? About 4 feet per mile.
1123. Are you sure of that? I think so. It was so when I drew the plans for the late Mr. Clark, hydraulic engineer to the New South Wales Government. I was with him when he designed the sewerage for the city of Sydney. I do not think the plans were altered.
1124. What is the distance for that outlet? About 6 miles.
1125. And yet that takes sewage within 10 feet of high-water mark in Sydney? I think it is 40; it was 30. It takes all sewers above a 40-foot contour.
1126. I think Mr. Dariey said lately that the fall of the outlet sewer to Bondi was 10 inches to the mile? Then they have altered it.
1127. You are quite sure that, under no circumstances, the alternative scheme would clear the Marrickville Flats? I am sure it would be of no use to it.
1128. From the in-take to the proposed site of the dam is it not a dead level? No; it is higher along the bank of the river than at the in-take.
1129. How much lower than the in-take do you think would be the lowest part, going from the in-take to Cook's River? I do not think it is worth talking about.
1130. You say the in-take would not take away the water from the lower part of the valley? Certainly.
1131. How much lower is the lowest part of the valley than the in-take? About 2 feet.
1132. How do you propose to clear that valley; even if you lower the sills of the Cook's River Dam 2 feet 6 inches, how could you clear that valley at high tide in heavy rains? The lowering of the sills 2 feet 6 inches would lower the water 2 feet on that flat.
1133. At high tide? Not exactly, but when it is on the move again.
1134. Do you see any possibility of permanently draining that valley at all times? The only possible way is by a pumping scheme.

1135. *Chairman.*] Is there anything further you would like to say? In the main Departmental scheme there is provision for a dam on the Illawarra Road, and another dam on Wollli Creek. If that scheme were carried out, and the southern end of the present dam had an open waterway, and the water were allowed to go up the river, it would be a miniature of the present scheme.

J. P.  
Josephson,  
Esq.,  
A.M.I.C.E.

1136. *Mr. Roberts.*] Have you looked into both these schemes put before the Committee by Mr. Darley? I have.

1137. Do you approve of them? Not in their entirety.

1138. Mr. Darley provides for lowering the sills of the Cook's River Dam at a cost of £2,000;—do you approve of that being done? Yes.

1139. And then Wollli Creek and Cook's River are to be thoroughly dredged and cleaned? I think that would have the desired effect, and is about all that need be done.

1140. Are you prepared to make any other suggestions with a view of improving the scheme? One thing I thought of suggesting was this: supposing that the Government remove the present Tempe Dam, they could take a contour line of the whole of the land on both sides of the river up to Canterbury, and see what land would be covered at high tide, consequent on the removal of the dam, and then that land could be reclaimed up to a certain mark—say, 6 feet—and be subdivided and sold.

THURSDAY, 9 JULY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEF, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Improvement of Cook's River.

John Horatio Clayton, Esq., Mayor of Rockdale, sworn, and examined:—

1141. *Mr. Trickett.*] Will you inform the Committee in what way your borough is affected by the proposal now before us? So far as our borough is concerned, the part of Cook's River which interests us is the part above the Tempe Dam, commencing at the dam, extending up to Wollli Creek, and then going along Wollli Creek. Those are the parts which skirt our boundary.

J. H.  
Clayton, Esq.

9 July, 1896.

1142. Will you tell us how your borough is affected by the present state of affairs? There are gentlemen here who have known the river longer than I have. I have known it ten years, frequently passing over it. It is a thorough nuisance. Passing over the railway dam, as we do daily, you can see an accumulation of green stuff, the smell from which is very bad; worse in summer time, of course. You see it under the best of circumstances now. In summer time the river is lower, and I have seen the foreshores covered with this green accumulation. Wollli Creek is very bad indeed. It is a constant cause of complaint. The river has been so pretty well ever since I have been there, and it is growing worse from year to year.

1143. Does the drainage of any part of the Rockdale Municipality go into any part of Wollli Creek and Cook's River? Yes; the drainage of a large portion of our municipality goes into Wollli Creek and Cook's River.

1144. So that, in a measure, you are contributors to the nuisance yourselves? Of course we are, in a measure, if there is any nuisance, the same as the city of Sydney contributes to the harbour nuisance.

1145. Is there any scheme of drainage provided for Rockdale under the Metropolitan and Suburban Water and Sewerage Act? I am not aware whether it is provided for, but I should say that it is. The western outfall sewer goes to the sewage farm through our district—crosses Wollli Creek, and makes its way to the sewage farm. I take it that we shall be connected with that by-and-bye. It may be some years hence. No start has been made yet.

1146. But I suppose that the sewage that at present goes into Wollli Creek and Cook's River from Rockdale does so inevitably at the present time? Yes.

1147. Then you are interested in this project? Solely with regard to the improvement of Cook's River; not in any way as regards the drainage of Marrickville.

1148. That does not affect you and your aldermen? Not in any way. We look upon it as merely local.

1149. Has this subject had consideration at the hands of your council? It has.

1150. Can you inform the Committee whether you agree with that part of the Government proposal which affects Rockdale? Yes, so far as the council are concerned; I may say they have considered this matter as being a nuisance to the public. They have seen the river dammed, and they could not perceive that it was other than a good sewage-pit. If they desired a sewage-pit they could not do better than dam the river as it is dammed. That is the grievance, but some of us have stood off from the consideration of any scheme, because we thought that we were not competent to deal with one. Schemes have been suggested, but we thought that it was a matter for skilled men to deal with.

1151. Do you and your council think that the mode suggested, of cleaning out the river, and also lowering the sills of the dam at Cook's River will help to improve things? I do, personally, and I think that the majority of my council also do. If future interests may be considered, why not make the river, as far as possible, navigable, looking to what may take place in the future, such as the use of the river by coal barges, or anything of that kind.

1152. But if that were provided for would that not let the salt water into Wollli Creek? I do not know what the effect of that would be. It is a matter I should not like to enter into.

1153. But to make the river navigable you would have to let in the salt water? Yes.

1154. And we have had evidence that to do that would cause very great damage to the low-lying lands higher up the river—do you think it would be desirable that, besides dredging and cleaning out the river, its banks should be made permanently good by fasciæ work, or anything of that kind;—is that necessary? I think it would be.

1155.

J. H.  
Clayton, Esq.  
9 July, 1890.

1155. Can you tell us what frontage your borough has to Wollie Creek and Cook's River? I cannot give you any idea as to that. It may extend a mile and a half or a couple of miles, or perhaps more.
1156. You know the railway bridge near the junction of Wollie Creek and Cook's River? Yes.
1157. Have you considered whether that does or does not interfere with the free scour of the river? I should say it does, and that it adds to the nuisance.
1158. Owing to the embankment being put in part of the river channel? Yes.
1159. Is there any rapid flow of the river after heavy rain? I have not noticed particularly. It gets low very quickly, and it rises very quickly. I have seen it in flood about Marrickville, and it apparently goes down in the course of a day or two, but I have not particularly noticed the flow.
1160. The state of Wollie Creek is attributed by the Department in a great measure to the tannery that exists on Wollie Creek;—do you think that has much to do with it? No; I do not. It may have assisted at one time. The pollution has been greatly helped by reeds growing up in the creek not allowing the free flow that otherwise there would naturally be. So far as the tannery is concerned, I may say it is within our municipality, and I find the manager very willing to assist the local governing body by clarifying the water before it gets into the creek. If there is any pollution it is for the Department to deal with it. The creek is outside our boundary, and we have no power to stop or prevent its pollution by prosecuting people. It is for the Department itself to prevent the pollution. Our boundary more or less goes up to the edge of Wollie Creek.
1161. Therefore, Wollie Creek is not actually within your boundary? No; Wollie Creek is a tributary of Cook's River.
1162. And you say that at the tannery the effluent is treated, in a measure, so as to prevent pollution of the creek? Yes; in every possible way. Whenever I have heard a complaint I have sent to the manager, and he has certainly done all a man could do.
1163. I suppose that the water now gets away tardily from Cook's River through the flood-gates in the Cook's River Dam? Yes.
1164. It is proposed by the Department to lower the sills of those flood-gates about 2 feet;—do you think that will facilitate the outflow? I should say it would; but whether that would be sufficient or not I am not competent to judge. I have always taken the view that we are not competent to deal with the matter. Every second alderman appeared to me to have a remedy, but I preferred to leave the matter to experienced hands.
1165. I understand, then, that the object which you gentlemen have in coming here to-day is chiefly to accentuate the great nuisance that exists at this part of the river? Yes.
1166. You have not come here to suggest remedies, but only to endorse all that has been said as to the urgent necessity for something to be done? Yes.
1167. But you appear to agree that one great necessity is that the river should be cleared of these weeds and other things? Yes.
1168. And that there should be some dredging to facilitate the ready flow of the river? Yes.
1169. You think that would be a very strong factor in keeping it clear? Yes.
1170. Comparing those parts of the river where the weeds are much grown with those parts where they are not so bad, is the state of the river worse in those parts which are very reedy? I cannot say. They all seem to me to be much alike. Not only do we come here with regard to the nuisance—without suggesting a remedy—but we also wish to say that we think that this is not a matter in connection with which the betterment principle can be applied. The Cook's River Dam was put there by the Government, and of course we had no power to remove it. The Government by putting the dam there have caused a nuisance, and by neglecting to dredge the river, and treat it as they have treated other rivers, deterioration has been caused. Now, after a lapse of some years, the Government come along and say they will dredge the river, and do other necessary works. Under the circumstances, we cannot see how the principle of betterment can be applied. We say that adjacent properties have been deteriorated in value, and that if possible the principle of compensation for deterioration should be applied.
1171. I suppose you also urge that you are not the greatest offenders in regard to the pollution of this stream? We are not offenders. We try to do what we can. A great deal of our drainage is treated by the householders themselves, who are very glad to utilise it as far as they can.
1172. What system have you in regard to closets? The pan system.
1173. Where is the night-soil deposited? On the sewage farm by the contractor.
1174. It is taken right away to the sewage farm? Yes.
1175. Therefore, it does not contribute to the nuisance? No.
1176. So all that runs into the river is house-slops? Yes; and not a great deal of that from Rockdale. Drainage also comes into it from Hurstville, and from a very large area besides Rockdale.
1177. I suppose that if a proper system of sewerage were adopted, connecting Rockdale with the sewage farm, the Municipality of Rockdale would willingly fall in with the Government scheme;—it would be glad to have a system of water-carriage, if it could get it? Very glad.
1178. Are you prepared to offer any opinion as to the scheme in any other respects? No; except that I should like to see a good scheme, making provision for future requirements, so as to rid us of all nuisance. We can give data with regard to the nuisance, and then I think it is for skilled men to provide an adequate scheme for remedying it.
1179. You are able, I suppose, to state that the nuisance has gone on increasing as population has increased? Yes.
1180. Is Wollie Creek the outlet for the storm waters of your municipality? For a large portion it is.
1181. Where do the storm waters from the other portion go? They make their way towards Cook's River—below the dam and Botany Bay.
1182. Below the dam—that is, to the south-east? Yes.
1183. Is there anything else you would like to say? No. There are some very old residents here who recollect the river in early days—Alderman Judd, who was once member for West Botany, and others, who can, perhaps, add a little with regard to their own experience of thirty or forty years.
1184. They will be able to state that the nuisance has been an increasing one? Yes.
1185. *Mr. Clarke.*] Do you think the present scheme would be of any benefit to Rockdale in removing the nuisance that at present exists? I think it would be, judging from the opinion expressed by such an officer as Mr. Darley. I think it would relieve us of the nuisance.

J. H.  
Clayton, Esq.  
9 July, 1896.

1186. As regards the alternative scheme, what do you think of that? That does not interest us at all—it is merely local.
1187. You think that the railway embankment has prevented the usual flow of the water from Wollie Creek;—do you think that has been the cause of the waters not getting away so easily as they should have done? I think it has added to it.
1188. Wollie Creek formerly discharged into Cook's River at the end of the southern railway embankment, did it not? I do not recollect that. That is going back a little before my time.
1189. It has been stated here in evidence by some of the witnesses that the railway embankment, not having an opening on the southern side, where Wollie Creek formerly discharged into Cook's River, has been the means of preventing the water from getting away as readily as it formerly did? I should say that that is the case.
1190. It has also been stated that the reeds and other obstructions growing in Wollie Creek have been caused chiefly by the railway embankment? I cannot say whether it is so or not.
1191. You think that if this scheme were carried out it would be a benefit, not only to other municipalities, but also to the Municipality of Rockdale? Yes; I do.
1192. Do you think that it should be carried out entirely at the public expense? I do, Cook's River being a national waterway.
1193. And you think that no municipality in the neighbourhood should contribute towards its cost? I do.
1194. *Mr. Wright.*] I suppose you look upon this matter principally from a sanitary standpoint? I look upon it from a sanitary standpoint, not only as touching our own district, but also as touching the metropolis, because it is a growing danger. Year by year we become more impressed with the danger.
1195. The insanitary condition of a river you look upon as a danger, not only to that immediate neighbourhood, but also to the surrounding country? I do.
1196. What arrangements have you for sewage in your municipality? So far as the treatment of night-soil is concerned, we have the contract pan system. The contractor removes the night-soil to the sewage farm. With regard to household slops, most of the people utilise them about their own places, others may, it is possible, drain into the street; but the population of Rockdale is very scattered, and that would be really next to nothing. The principal drainage into the creek are the waters that fall from the heavens.
1197. But the waters that fall from the heavens are not polluted? I know that. But I do not altogether admit pollution, or, rather, I admit it in this way: Cook's River is dammed, and if you wanted to construct a sewage pit, you could not do better than dam up the river, and let it receive all the drainage from the adjoining areas.
1198. That makes it a stagnant pool? Yes; a stagnant pool.
1199. Is your night-soil buried within the bounds of your own municipality, or carried outside it? It is buried in the municipality. Unfortunately we have the sewage farm in our area; it is the outfall for the western suburbs.
1200. There is nothing insanitary about that, is there? We urge that at times an offence has arisen, but the sewage authorities say that there is no offence, that they treat it without offence.
1201. They profess to deodorise the stuff at once? No; they separate the solids from the liquid, and put the solid into the sand.
1202. Where do your slops drain to? Some of the slops are utilised by a number of the householders on their premises, other house-slops may drain into the street, but in such small quantities that you would never see a running gutter in our municipality, or, at any rate, very seldom. The household drainage dries up, and I daresay that sometimes the rain-water may carry some of it into Cook's River.
1203. Does it gravitate naturally into Cook's River? Yes, eventually. We are on a ridge, and the drainage of one side goes towards Wollie Creek, and that of the other side towards Botany Bay.
1204. So a portion of your borough must necessarily drain into Cook's River through Wollie Creek? Yes; but only a little.
1205. Would not the alternative scheme interest you in this respect—if any portion of the surrounding district were insanitary, would you not suffer from it? It touches us in that way.
1206. So the insanitary condition of that district would affect you more or less? It would if it were insanitary.
1207. Do you not admit that both Cook's River and Wollie Creek are insanitary? Yes; but where you saw the flood the other day, if you saw the place in the summer-time you would see that it was a green spot sometimes. Those poor people have been allowed to buy land there in dry weather, and afterwards have found out to their cost that the property is flooded every now and again. The legislature has allowed the law to be such that people can come along and buy up land in such places.
1208. Have you ever considered the Departmental proposal in reference to the present dam? No.
1209. One proposal is to lower the sills of the present dam 2 feet, that is a little below low-water mark, and the Department declare that if that is done and the flood-gates are occasionally opened, Cook's River will be scoured out, and they propose to dredge it above the dam—do you think that that would fairly abate the present nuisance? I think, from a common-sense point of view, it would help.
1210. Do you think the purification of the stream would be assisted by occasional flooding by salt water also? I think so.
1211. *Mr. Lee.*] You do not desire to offer any opinion as to the scheme proposed by the Government for the drainage of Marrickville? No, I do not.
1212. You wish to impress on the Committee the fact that no matter what may be done for the relief of Marrickville there is a necessity to do something for the relief of Cook's River? I do.
1213. That is your object? Yes; and I should like to see something done for Marrickville as well.
1214. But you offer no opinion as to how that should be done? No.
1215. If the alternative scheme for draining Marrickville were adopted, in your opinion that would give no relief to Rockdale and the adjoining municipalities abutting on Cook's River? I do not think that as a matter of drainage it would assist us at all.
1216. Is it not a fact that during the last twenty or twenty-five years, since the population has increased so largely in those suburbs, the pollution of Cook's River has been largely intensified? My knowledge extends only over ten years back, but I should, of course, say that increased population has no doubt added to the nuisance.
1217. I presume it is clear that population must still further increase very fast there? It is increasing very quickly.

- J. H. Clayton, Esq.  
9 July, 1896.
1218. There is much room for it to settle there? Yes.
1219. And the inference is, that in the course of a few years the pollution of Cook's River would be very much greater than it is at the present time? Yes.
1220. Do you hold that opinion? I do.
1221. And, without expressing an opinion as to what should be done for the Marrickville people, you, on behalf of your people, have no doubt as to what should be done for Cook's River—that is, that something should be done to enable the water to have an uninterrupted flow? Yes.
1222. Without admitting the full flow of salt water at high tide? I think so.
1223. *Mr. Fegan.*] You say you are conversant with the alternative scheme? Yes.
1224. I suppose you know that in connection with that scheme it is proposed to dredge Cook's River? Yes.
1225. Do you think that if the river is properly dredged it will give you all you require at Rockdale? Yes; as far as we are concerned we have only troubled ourselves about the river, leaving Marrickville to attend to its own local requirements.
1226. If the river is properly dredged from point to point it will give you all you want? Yes; I think so.
1227. In his alternative scheme Mr. Darley proposes to dredge the river, to lower the sills at the Cook's River Dam, at a cost of £2,000—the alternative scheme is really a local one so far as the Marrickville tunnel is concerned, but the dredging of the river, and the lowering of the sills, of course, will affect not only Marrickville, but also your municipality? Yes.
1228. Have you thought out any other scheme which would be preferable to make your municipality healthier than this scheme would? No; I have not. On the contrary, I have avoided thinking out a scheme, because I heard so many expressions of opinion with regard to schemes, and some of them were so foolish, that I thought it best for aldermen to leave schemes alone, and to leave the matter to the engineers. My idea was that whatever Mr. Darley or any other good engineer proposed, would be worthy of very great consideration.
1229. You think that a man holding the high position of Mr. Darley is more competent to think out a scheme than a person who knows nothing about engineering? I think so.
1230. And under these circumstances you are willing to be led by the opinion of Mr. Darley in this matter? Yes; we supplying him with all the necessary data. That is all we can give him. I do not know that any one of us is capable of propounding a scheme to meet the requirements in such a case as this.
1231. In connection with the alternative scheme, Mr. Darley also proposes a dam across Marrickville Valley at a cost of £2,000—of course that is really local, and does not touch you in any way? No; it does not.
1232. Therefore, the chief point of your evidence is that you believe that the river should be thoroughly dredged? Yes.
1233. *Mr. Hassall.*] In what way would this scheme affect your municipality? The scheme would relieve the river from the almost intolerable nuisance now existing, and which is increasing—at least we take it that it will. There is the nuisance, and we leave it to the officers to devise a scheme for its removal.
1234. The alternative scheme proposed by Mr. Darley for draining Marrickville Flats would not be of any benefit to your municipality? No, except, as Mr. Wright put it, from a sanitary point of view. There is no doubt that the Marrickville Flats are insanitary, and add to the pollution of the river. That flooded area requires to be drained, but we are not capable of saying whether the system of drainage proposed for it is a competent one.
1235. Where is the outfall for your drainage? Part of the watershed, being one side of a ridge, drains into Wolli Creek, and another part drains into Cook's River above the dam, and another part, on the other side of the ridge, makes towards Botany Bay and the lower part of Cook's River below the dam.
1236. How long has your municipality been established? Since 1871, under the name of West Botany. We are one of the oldest municipalities in the Colony.
1237. Was the dam across Cook's River built before your municipality was formed? A long time before, according to report.
1238. It is a very old road, is it not? A very old road, and outside the boundaries of our municipality, of course.
1239. That dam was built a considerable time, at any rate, before your municipality was established? Yes.
1240. Therefore, the municipality has grown up with the existing conditions? Yes.
1241. And whatever obstruction may have occurred through the building of the dam has not occurred merely since your municipality was formed? No; it has not occurred merely since then. Of course, the railway was built later on, and caused a second damming of the river, and increased the nuisance.
1242. Then your opinion, I presume, from the evidence given by you, is that that scheme which would be beneficial to the largest number of residents in that locality, including Rockdale and Marrickville, would be one providing for the deepening of the river, and for the outlet of flood-waters in a more comprehensive manner than has been adopted up to the present time? Yes.
1243. *Mr. Roberts.*] Do your council employ a civil engineer? No; we employ an overseer.
1244. Has he ever furnished the council with any report on the state of Wolli Creek, or offered any suggestions as to its improvement? Yes, he has. Our inspector of nuisances has done that from time to time.
1245. What was the nature of the report? We have written to the Government asking them to have those reeds cleared away—asking that the creek may be cleared out—but unfortunately the Government could not undertake the work, and we had no power to touch Wolli Creek. It is outside our boundary. We come up to the shore.
1246. And that was the recommendation of your inspector of nuisances? Yes; we have applied time after time. We called attention to the state of the river and Wolli Creek. We have waited on the Government, but without result.
1247. Do you regard it as a menace to the public health; is it as bad as that? I do, not only locally but to the whole metropolis; it is growing year by year.
1248. Can you trace any cases of sickness to the state of the creek? We cannot do that. We can only say that it is probably a factor with regard to disease. We cannot trace any actual disease to it. It is in such a state that if it were round our own homes we could not tolerate it.
1249. Does the creek ever overflow? I think it has done so in flood-times, but of course the water generally in it does not get away. I have never been up the creek, but, in crossing over the dam, I have seen the river very high at times.
- 1250.

1250. Is there much population around Wollie Creek? No; but in Rockdale itself the population has increased wonderfully since the railway was made. Our last return showed that we had something like 6,000 people in Rockdale. Our area is about 8 square miles. Taking out about a square mile for the sewage farm leaves about 7 square miles of territory on which there is a population of 6,000 people.

1251. The borough contains a scattered population? Yes.

1252. Do you think that if the rushes were removed from Wollie Creek, and the place were thoroughly dredged and cleaned out a great improvement would take place? I do.

1253. Can you suggest anything else that ought to be done? I cannot. I know the nuisance is there. I should like to see it got rid of, but I do not know how to suggest any remedy.

1254. So far as you are able to judge, you regard the dredging and thorough cleansing of Wollie Creek and Cook's River as a desirable work? Yes, very desirable. As regards the Cook's River Dam, I should like to point out that although that dam has been there for so many years, of course, it has not been there with our consent. We have agitated against it, we have asked for its removal, and for the erection of a bridge, but the Government have not complied with our request. We saw the nuisance arising from it, and we agitated against it. We have not lain quietly by. We could not, of course, forcibly remove it, and it has been kept there. As regards the sewerage rate, I would point out that in paying our contractor for the removal of the pans, we now pay what is equivalent to a sewerage rate. We should not pay more for a proper system of sewerage. As regards having dams higher up the river, I should like to say, in justice to those municipalities above us, that if our argument is good in regard to the Tempe Dam, a nuisance must in course of time be created by the erection of dams higher up. We desire to act for the benefit of the public generally and not selfishly, merely for our own benefit, and that a good job should be made of whatever is done.

William George Judd, Esq., Alderman of the Borough of Rockdale, sworn and examined:—

1255. *Mr. Clarke.*] Have you been long a resident in the neighbourhood of Rockdale? Yes; for nearly forty years.

1256. Do you wish to make a statement to the Committee as to the necessity or otherwise of the works proposed to be carried out in order to abate the existing nuisance? There is no doubt that Cook's River has for many years been an intolerable nuisance. As gentlemen sitting in the room know, the first part of the river, that is, from Botany Bay up to the dam, was so intolerable that people on the southern slopes of the city felt the effects of it until the Government carried out those reclamation works. Now the same thing is occurring on Cook's River between the dam and Canterbury. It is becoming just the same as those flats were between the dam and Botany Bay. An offensive greasy matter gets on the surface of the water, particularly in the summer-time, and if we have not had much rain, the wind from the north-east carries the smell, which is intolerable, over Rockdale. No doubt that arises from sewage matter. The dam seems to make a nice little cesspool between the railway bridge and the dam. If you are passing over the river in a train on a summer's evening, and the wind is coming from the north-east, you get a nice smell. I have seen ladies and gentlemen rush to put the windows down, when they reached Tempe station, in order to shut out the smell.

1257. You believe that something is absolutely necessary to be done to prevent this nuisance? Yes.

1258. Have you seen the present plans? Only a few minutes ago. I have not examined them, but I have some idea of them from reading in the newspapers what Mr. Darley proposes.

1259. Can you express an opinion on the alternative scheme, or on the main departmental scheme? The alternative scheme will not do any good for the district of St. George. I have known that place for nearly forty years, and I have seen the tide go up the Marrickville Valley higher than where the tunnel is proposed to be made. I have caught bream weighing 1½ lb. each at the site of the proposed intake of the alternative scheme. The alternative scheme will not affect the state of Cook's River from a sanitary point of view. It will only deal with flood-water that comes down from the higher land of Newtown, St. Peters, and Petersham.

1260. From what you see of the plans now you think that the main Departmental scheme would be of the greatest benefit to the various municipalities and the public at large? Yes, it would.

1261. Can you suggest anything that should be done? I do not think that, unless something were done to Wollie Creek, any work that is carried out would be of great benefit to the river. I have watched the river in floodtime and in dry seasons. The water from Wollie Creek comes down with a great rush, and since the railway crossing has been made the waters of Wollie Creek seem to strike in its original channel against the earthworks of the railway. That sends the water as a kind of whirlpool up the river again, and consequently blocks, to a great extent, the water from Marrickville Flats, and I think that whatever is done will not be successful unless something is done to Wollie Creek in the way of dredging it and making up some of the lower banks. Wollie Creek was at one time a beautiful clear stream, but to-day you can walk over parts of it.

1262. Can you say when the present dam at Tempe was built? I cannot say how long ago; it was erected before my time. Of course, there have been alterations to it since.

1263. The original dam was small compared with what the dam is now? It has been raised a good deal. I can remember that.

1264. Several witnesses say that it was originally built about fifty-five years ago? I cannot say.

1265. The dam having been originally built, I presume, by the Government of the day, and the nuisance having increased since through the dam being erected there, and thus preventing the flood-waters from getting away, you think it would be the duty of the Government to remedy the defects in the system at the public expense? I certainly think so. If you were to put a dam across George's River at Como, at the end of ten years you would have pretty much the same sort of thing as we have at Cook's River. The foetid water seems to accumulate more near the convent, where the still water is, than at places higher up the river.

1266. Do you consider that the railway embankment, by diverting the waters of Wollie Creek from their natural outlet, has increased the nuisance? I would not say that it has increased the nuisance, but it has interfered with the free flow of the water. The flow of water from Wollie Creek is right against the buttress of the railway bridge, and since the railway has been built the road has been raised and extended to that new bridge at the Tempe Station put in by the Government, and the waters that used to go that way strike

J. H.  
Clayton, Esq.  
9 July, 1896.

W. G. Judd,  
Esq.  
9 July, 1896.

W. G. Judd,  
Esq.  
9 July, 1896.

strike that bridge and the higher part of the road, and then the Wollie Creek waters curl round and block the water of the river. It has naturally made a whirlpool there.

1267. In other words, before that railway embankment was made, did the water get away more freely than it does at the present time? It did from the low-lying lands on the Wollie Creek side and Miss Campbell's property.

1268. *Mr. Lee.*] You have been connected with the Municipal Council of Rockdale for a number of years? Yes.

1269. Do you remember the council making any previous representation to the Government respecting this matter? Repeatedly. St. Peter's Council and Rockdale Council have both been making representations to the Government for years.

1270. It has been a cause of complaint then for many years? Yes.

1271. It is not a matter that has cropped up since this reference was made to the Committee? No.

1272. So far as your council are concerned they have always been placing it before the Government? Yes.

1273. You are acquainted with the scheme originally referred to this Committee? I have not looked through it.

1274. Have you ever looked at the estimate of it? No; I have not.

1275. *Mr. Darley* proposes to remove the Cook's River Dam, to alter the level of the road, to erect a new bridge 300 feet long and 45 feet wide, to put in training walls and fascine banks on both sides as shown on the plan, to have a dam and sluice-gates across Marrickville Flats, a dam and sluice-gates at Cook's River at Undercliffe Bridge, and a dam and sluice-gates across Wollie Creek, to dredge the full width of the channel 5 feet deep to Undercliffe Bridge, and to clean out Wollie Creek;—if that work were carried out, would that give the relief you think is necessary? I think it would.

1276. You see that the object of that fascine work is to prevent the influx of salt water on to that land and to create a scour in the channel? Yes.

1277. The object of the dam across Marrickville Flats is to prevent the inflow of flood and tidal waters? There is no doubt that would be a great improvement.

1278. I will now direct your attention to the alternative scheme. It is proposed, under that scheme, to tunnel and drain to Shea's Creek, to have flood-gates and a dam across Marrickville Valley, to dredge Cook's River and Wollie Creek, and to lower the sills at the Cook's River Dam. You see, even under that proposal there is work to be done at Cook's River—to give an easier outlet for the foul water there;—do you think that would be effective? I would not care to offer an opinion about that open channel and tunnel.

1279. You see, there are two things sought to be done—one is to give relief to Marrickville, which is flooded by surface water, and the other is to give relief to Cook's River;—in your opinion, which of those schemes would be the more effective? In my opinion the original proposal would. It only seems reasonable that the river should have a proper scour.

1280. You have seen the Marrickville Valley in wet weather? Yes.

1281. Things are very bad there? Frightful.

1282. I believe it also drains the watershed of adjoining municipalities? I suppose that four or five municipalities drain into it.

1283. You admit that there is a necessity for something to be done there? There can be no doubt as to the necessity.

1284. Without expressing an emphatic opinion as to the proposal, are you prepared to admit that if the proposal under the original scheme will give relief to Marrickville, you are of opinion that it will also give the relief sought in regard to Cook's River? It will assist in relieving flood waters, but whether it would be a success, I would not like to give an opinion.

1285. But if it would be effective in draining the Marrickville Valley, in your opinion would it be sufficient to give effect to what you require to be done in Cook's River? I consider that if it were constructed, and it relieved the flood-waters, it must of necessity relieve Cook's River—that is, if it were effective.

1286. The output of waters from Marrickville Valley will assist in keeping up the scour of Cook's River? Yes.

1287. *Mr. Wright.*] If a system of underground drains were carried out in your and the adjacent municipalities, would that largely effect your object—I mean, if the Water and Sewerage Board carried out the ordinary sewerage there? Well, in the Municipality of Rockdale I do not think it would cause any alteration if we had underground sewerage there. I do not think it would make any difference to Cook's River. All the slopes to Wollie Creek and Cook's River are of a sandy, porous nature, and I do not think that within a mile of Cook's River or Wollie Creek you could see any household soapsuds or water running from any of the houses. I have not seen it myself, and I live amongst them. Most of the people, on account of the land there being so porous, dig a pit, and fill it up with rubble, 5 or 6 yards square, and cover it with bushes, and use it for years for refuse water. I have one that has been in operation for seven years.

1288. But if St. Peters, Marrickville, and Rockdale, and other municipalities were sewered, would that not, to a large extent, get rid of the nuisance? It would at St. Peters and Marrickville and the southern slopes of Newtown, because they all drain into the Marrickville Valley, but Arneliffe Ward, which is the portion of Rockdale that abuts on Cook's River and Wollie Creek, is so sparsely populated, and the ground is so friable, that you cannot see any drainage.

1289. In the event of this work being carried out, do you think it would be fair for the Government to ask the local municipalities to pay for a portion of that work? No; I do not think so. The Government dammed the river up, and then the railway people made it worse.

1290. You think that, as they have destroyed the natural flow of water, they ought to make it good again? Yes; let the river scour itself.

1291. If the sills of the dam are lowered, and the river is dredged as the Government propose, do you think that in a few years, with the present population and the large increase of population that will naturally take place, it is only a question of a very short time when the river will be as foul as ever? No. Marrickville is now becoming connected with a sewer, the outfall into the sewage farm, and the population there will not affect the river in future years as they do at present.

1292. According to your own statement, the river below the dam was very foul before the Shea's Creek work was undertaken? Yes.

W. G. Judd,  
Esq.  
9 July, 1896.

1293. Was that caused by the accumulation, principally, of sewage matter? Yes.
1294. Was that brought down there by gravitation, or lodged there by the tide? It was brought there during flood-times and spring tides, and it hung about the mangroves and other weeds, and lay festering there in the sun, and gave off an awful stench.
1295. There you had the uninterrupted natural scour? Yes.
1296. And yet it did not abolish the nuisance? The work that has been done there has abolished the whole of the nuisance.
1297. Yes, by clearing it out; but if that state of affairs existed below the dam, would not the same state of affairs exist above the dam, even if the river were cleared out? Not if the river got a scour. I will tell you why: the river is confined to a channel, but below the dam it was not confined to a channel, but spread over hundreds of acres of land, and was only knee-deep under water.
1298. You think that an occasional flooding of the river will assist to clear it out? Yes; if there is a proper get-away.
1299. *Mr. Hassall.*] The erection of fascine banks at Tempe and on Bonnie Doon property has made a well-defined channel, and been a great improvement there? Yes; a splendid improvement.
1300. And so a great deal of what was complained of before that work was undertaken has now been removed? Yes; I think the whole of it.
1301. You admit that Rockdale has practically been established since that dam was erected across Cook's River? Yes.
1302. Well, the Government are not to be blamed for erecting that dam, are they? They are to be blamed for blocking the river, and then, of later years, for making the railway crossing in the way they did.
1303. But they did not erect the dam across the river or the railway for the benefit of any private individual, did they? The erection of the dam was before my time.
1304. But have not those works been carried out for the benefit of the general public? There is no doubt that the erection of the dam was for the benefit of the travelling public, who in those days went that way to Wollongong and other places in the South Coast district.
1305. It was the means of their going backwards and forwards? It was a Government highway.
1306. Practically, Rockdale has grown up since that dam was constructed, and the people knew what they were facing? Yes.
1307. With regard to the original scheme of Mr. Darley, would the expenditure of money in the direction indicated in Mr. Darley's scheme, the particulars of which have been given to you during this examination, have the effect of improving private property at the expense of the State? There are some low-lying properties abutting on the river which might be improved, but I will state my own case. What improvement would it be to me a mile or a mile and a quarter away. It would be no improvement to me at all, except the getting rid of the intolerable smell.
1308. Your land is not liable to inundation? No; I think that if low-lying land is made marketable that is a different thing.
1309. But in reply to a question put by Mr. Wright, you admitted that the river in its present condition was offensive? Yes.
1310. What is that offensiveness caused by; is it not caused by settlement in the locality, and drainage coming into this natural watercourse? Yes.
1311. Therefore, are not the people who cause it more to blame than the Government? Yes, they are to some extent; but what are they to do where they have no sewerage scheme.
1312. Do you think that the Municipality of Rockdale would be willing to bear a share of the expense of carrying out this work to benefit their own particular municipality? No; they will not be any party to that.
1313. Do you think the Government ought to go to the expense of putting this river into shape after it has been polluted by the municipalities which are on its banks? We cannot do anything. It is a natural waterway—it is beyond our control.
1314. Will you not admit that the residents in that locality have been, to a certain extent, responsible for the pollution of this natural water-course? Yes; for several miles from it. All the southern slopes of Newtown, Petersham, St. Peters, and part of Macdonaldtown—all for miles around. It is the natural outfall. The drainage could not very well go anywhere else.
1315. Well, if this is to be looked upon as a work calculated to improve the sanitary conditions of the various municipalities affected, do you not think that it would be a fair thing for the Government to make a charge on those municipalities to cover the interest on the cost of construction? No, I do not; because I think that if we had a proper sewerage system, which we are prepared to pay a sewerage rate for, we should not contribute any nuisance to that.
1316. But would not this have the same effect? No. It would never have the same effect as an underground sewerage system would.
1317. If this work were carried out, would there be any necessity for an underground sewerage system to be carried out also? There would be in time, as the population increased. At present, as the Mayor has said, we have a contractor who takes all the night-soil away to the sewage farm, where it is dug in.
1318. Practically, then, the carrying out of this proposal will mean the expenditure of £30,000 or £40,000 for the purpose of tiding over a period of a few years until a better scheme is brought into operation? This will get rid of a serious injury to the inhabitants within some miles of Cook's River, which it will always be if it is not remedied as proposed. But an underground sewerage scheme must come along sooner or later.
1319. To embrace the municipalities of Rockdale, Marrickville, and certain other surrounding municipalities? They must have it later on, and they will have to pay a rate for it.
1320. But you would not expect them to pay any rate for this, which would practically have the same effect for a certain time? It will not have the same effect, because we could not use the river for an open sewer.
1321. Then you object to pay for it because it would not benefit you? Yes.
1322. Then why would you advocate that the work should be carried out at all? I am not a medical man; but there is no doubt that serious results are traceable to the condition of the river. I think you could get a medical man in the district to pretty well locate it.

W. G. Judd  
Esq.  
9 July, 1896.

1323. That is caused by local pollution, is it not? Yes.
1324. And if it is caused by local pollution, do you not think that those responsible for that pollution have some right to pay for the removal of what is objectionable to the bulk of the inhabitants? No, I think not, for the barrier has been placed there by other people before they came there.
1325. It is admitted in evidence that the barrier was there before your municipality was formed? Yes.
1326. Your municipality has grown up in spite of that barrier being there? Yes.
1327. Therefore, the Government cannot be blamed for having put the barrier there to the detriment of a large population which settled in that particular neighbourhood after the barrier was erected? Yes.
- Blackwattle Swamp was in the same condition, and the Government had to come to the rescue to save the lives of people, as they will have to do here, through Parliament.
1328. Instead of the Government going to the great expense of reclaiming land and erecting fascine banks, if they were willing to carry out such works as the lowering of the sills of the present dam and enlarging the opening through which the water could make its escape, do you think that that would carry out, practically, all that is necessary at the present time? I think that would be a great improvement.
1329. Making the natural flow of the river available for keeping it clear as far as possible? I think it would.
1330. Do you think the Government would be justified in going to an expenditure of between £30,000 and £40,000 in carrying out extensive works which would have the effect of improving private property, the Government getting nothing back in return? Well, the private property which it would improve, or at any rate give it a marketable value, would be very small.
1331. Then who would benefit by it? The people at a distance of a mile or 2 miles away from the river, because the air would not be polluted with vapours arising from the river.
1332. Do you not think that people who will be benefited through the work being carried out will have a right to pay some portion of the cost? No more than the residents of Rockdale could call on the people of the city and other suburbs for assistance because they empty their night-soil into part of the Municipality of Rockdale. We cannot claim anything from them, and we have to put up with Cook's River.
1333. *Mr. Roberts.*] I think you represented this district in the Legislative Assembly? Yes.
1334. How long ago is that? Eight or nine years.
1335. Did the nuisance exist then at Wolli Creek and Cook's River? There was a certain amount of nuisance there.
1336. Was your attention directed to it as member for the electorate? Yes.
1337. Was any money granted by the Government for the improvement of Wolli Creek or Cook's River upon your representations? Not that portion, but between Botany Bay and the present dam.
1338. Not for the portion under consideration? No. *Mr. Lyne*, who was then Minister for Public Works, said that eventually Cook's River would have to be dealt with, as it was no use carrying out those reclamations unless Cook's River and Wolli Creek were attended to, as the stuff coming from there would filtrate under and fill up where they put in the fascine banks.
1339. Can you recollect what the complaint was at the time you approached the Government on the subject,—was it of the same character as now, namely, the pollution of Cook's River and its tributaries? Yes.
1340. How long has Wolli Creek been in a polluted state? Well, it has been bad for the last five or six years.
1341. And no Government money has been spent upon it with the object of removing the nuisance? I am not sure whether some money was not spent in cutting some reeds out of the bed of the creek.
1342. Have all the rushes absolutely been taken out, and has the creek been thoroughly cleansed? No.
1343. Do you think that if that were done the nuisance would cease to exist, at any rate for some years? Only cutting the rushes out would not stop it now, because Wolli Creek has got into such a state that only here and there are there pot-holes where the water lies, and then there are dry parts. In flood-time so much silt and other stuff is brought down that the creek is almost silted up in places.
1344. Could it not be dredged? One of those grab-shell dredges could do that very easily.
1345. Is there a tannery upon Wolli Creek? Yes.
1346. Is that regarded as a source of nuisance? My opinion is that tanneries must be a source of nuisance, though they try their very best to clarify the water before it empties into the creek. I think it is difficult to work a tannery without creating some nuisance on the watercourse.
1347. What is the great complaint you have at Wolli Creek and Cook's River? Well, at Wolli Creek it is the growing up of the flags and rushes impeding the water, and when the heavy rain comes it forms a block and floods a lot of the land along the banks of the creek, because there is no get-away for the water.
1348. If the creek were thoroughly cleansed, you think that would remedy it, at any rate for a considerable time? Yes.
1349. *Mr. O'Connor.*] You are a very old resident in that district? Yes; nearly forty years.
1350. As regards a question put by *Mr. Hassall* in regard to the barrier that is in existence, it was there long before the municipalities were formed? Yes.
1351. Yours is a very old municipality? One of the oldest.
1352. You pay your rates and taxes the same as anybody else? Yes.
1353. You have looked into *Mr. Darley's* scheme, and in your judgment it is a fair proposal? From what I have seen of the scheme this afternoon, and this is the first time I have seen the plan, the main Departmental scheme seems to me to be a practicable one.
1354. *Mr. Humphery.*] You said it was only during the past five or six years that Wolli Creek has been a source of offence to the residents of Rockdale; is that so? Yes.
1355. Do you not remember that for thirty years past the creek has been polluted either by wool-washing or fellmongering establishments? Not for thirty years past.
1356. Yes? Not Wolli Creek.
1357. You do not remember so long back? Yes, I do; but I do not remember its being polluted then.
1358. Well, twenty years ago was it so? No; not twenty years ago. I do not recollect anything being on Wolli Creek twenty years ago.
1359. Although a portion of the Municipality of Rockdale is bounded by Wolli Creek the residents of Rockdale do not in any way contribute to the pollution of the creek; is that so? No; they are so scattered along that creek.

1360. Do you think that the mere dredging of Cook's River will give the relief that you are seeking? Not the mere dredging only. W. G. Judd, Esq.

1361. Will it not be necessary to prevent future pollution of the river by some strict regulations as to drainage from the different boroughs that at present contribute to its pollution? Yes. 9 July, 1896.

1362. What scheme do you think is possible in order to afford you the relief you are seeking? Well, I do not like to venture an opinion upon the alternative scheme, because I am not an engineer. If you get drainage from a watershed where there are thousands of souls located, you must, as a natural consequence, get some sewage in the flood-water, and that is so from Newtown, Petersham, St. Peters, and the surrounding slopes right up to Stanmore. All the slopes in that direction send flood-water down into Marrickville Flats. It is the natural outlet for it, and it then comes into Cook's River.

1363. Is this your view: that if the drainage scheme in connection with Marrickville were carried out the pollution of the river would cease? I would not say that, but it must relieve it.

1364. It would be minimised? Yes.

1365. Assuming that that drainage scheme were carried out, in what way would the river be still polluted? If you keep the dam where the water becomes stagnant some portion of it must become putrid, unless we have floods now and then to clear it. It looks very well this morning, but if you had seen it before these last rains set in, you would have noticed that it was offensive to the sight and smell.

1366. Assuming that the drainage scheme in connection with Marrickville be carried out, and removes any pollution at present existing at Marrickville, will not the river still be polluted by the drainage from other boroughs? Yes; it will, unless there is a proper system of sewerage carried out in these localities.

Mr. John Bowmer, Rockdale, sworn, and examined:—

1367. *Chairman.*] What are you? I have been a market gardener.

1368. *Mr. Lee.*] You are an alderman of Rockdale? I was for twelve years, but I am not now.

1369. You have had the advantage of hearing the evidence given by His Worship the Mayor and Mr. Alderman Judd? I did not hear much of it, because I am rather deaf in one ear; but I heard some of it, and my experience would corroborate what has been stated. 9 July, 1896.

1370. Do you think that either of those witnesses missed any point which you would like to emphasise? They missed one.

1371. Would you be good enough to state it? I will. It is with respect to the causeway, or what is called the dam. The present causeway certainly is the means of keeping back the water on the western side. Nearly forty years ago I travelled across the old causeway before it was raised, when there were 18 inches of water flowing over it. Since the causeway has been raised, I have never seen the water flowing over it. Therefore, in my opinion, to a certain extent it dams the water back.

1372. Can you assign any other cause for the recent pollution of the stream? No; with the exception of this, that the *debris*, as a matter of course, has been accumulating for years, as it has come down from the western side. I remember the junction of Wolli Creek with the present causeway when it was in a better state than it is now in, but as far as I have observed it has yearly been filling up.

1373-4. We have a lot of evidence to that effect, and your evidence corroborates what has already been placed before us;—I should like to know whether you think the scheme proposed would have the effect of removing the foul water from Cook's River? It is my firm opinion that if the scheme is carried out it will do that, and that it will also drain the whole of the Marrickville Flats? If the river is dredged, and the scheme is carried out, as I have read of it, Mr. Darley's scheme will, in my opinion, answer all the purposes for which it was designed.

1375. You are now speaking of Mr. Darley's original scheme? Yes, as far as it has been published.

1376. You know that there has been an alternative or more recent scheme put before us by which he proposes to take the flood-water from Marrickville into a tunnel, and thence through an open channel down to the junction of Shea's Creek? My opinion is that you would block Shea's Creek again very quickly, and destroy nearly all you have done if you were to carry out that plan.

1377. You see the tunnel located on the map by being marked in red? Yes.

1378. Supposing that work were carried out, as well as dredging in Cook's River and Wolli Creek, and if the sills of the Cook's River Dam are lowered, do you not think that that would have the effect of draining Marrickville and permitting of the foul waters passing out of Cook's River? I do.

1379. That is the alternative scheme;—now are you thoroughly acquainted with the original scheme? I would not say that I am.

1380. [*Description of main Departmental scheme read by Mr. Lee.*] Which scheme do you think would be the best? In my opinion, if the original scheme were carried out it would answer the purpose as well as any other scheme I have heard of.

1381. That is so far as keeping Cook's River moderately clean? Yes.

1382. But you are not attaching very much importance to the question of draining Marrickville; that is not the object of your visit here to-day? No; it is not.

1383. All you wish to give evidence upon is the necessity of, and the best means for cleansing Cook's River? Just so.

Mr. John Goode, Rockdale, sworn, and examined:—

1384. *Mr. Wright.*] How long have you lived in Rockdale? About thirty-seven years.

1385. You have heard the evidence given by His Worship the Mayor? Yes.

1386. Do you endorse the statement of the Mayor? Yes; in every particular.

1387. You thoroughly understand the scheme? Yes.

1388. Would you like to supplement the mayor's evidence with anything? There is only one little thing I have thought of. It has been asked if certain things were done would Wolli Creek be still polluted. Of course the cause of the pollution of the river, to a great extent, is the natural flow of the water from the hills, the area from which it comes being so large, and the *debris* being accumulated in the reeds and rushes, and the floods blocking the waters back, and the decayed matter filling up the bed of the river.

1389. You think if this scheme were carried out, Wolli Creek would still be impure? Not if the river had a good scour.

1390. Taking away the present dam altogether and putting fascine banks along the shore? Yes.

1391.

Mr.  
J. Bowmer.  
9 July, 1896.

Mr.  
J. Goode.  
9 July, 1896.

- Mr. J. Goode.  
9 July, 1896.
1391. There is another scheme, for lowering the sills of the dam? I think that would alleviate the nuisance.
1392. Thus letting out a large volume of water, and occasionally flooding the river with salt water if it got impure;—you think that would do all that is necessary? Yes.
1393. *Chairman.*] Can you add anything else to what we have heard this afternoon? No; I do not think I can add anything more.
1394. You can simply corroborate it? Yes.

Edwin Godfrey, Esq., Alderman of the Borough of Rockdale, sworn, and examined:—

- E. Godfrey, Esq.  
9 July, 1896.
1395. *Mr. Hassall.*] You have heard the evidence given before the Committee this afternoon? Yes.
1396. Have you anything you can add to it? Well, I think that lowering the sills of the bridge 2 feet is altogether absurd. I have known Cook's River Dam for thirty-nine years. I have seen 5 feet of water on it. I have seen the whole of the centre of it cut right in two in one night. The Government, I suppose, when that dam was constructed, had no engineers in the country, but of late years the Government have had to put up two separate flood-gates there, through which to let the water away. The original scheme, in my opinion, is the one that ought to be carried out. I think it would prevent any nuisance in the future, and make the land round the river habitable, and also enable those who are there to stop there.
1397. But which do you call the "original" scheme? The one with the fascine work. But I think that, stone being so handy, it would be much cheaper to do it with stone, whilst *debris* would not cling to that so much as it would to fascine work. The drainage down Wollie Creek has caused a nuisance. Between the present dam and the railway embankment there are holes 10 feet lower than the sills of the dam, and by lowering the sills 2 feet you have 8 feet of water in those holes. Decayed vegetable matter accumulates there in the summer-time, and the stink is abominable. It is absurd to talk about lowering the sills 2 feet. All the drainage of Bankstown, Ashfield, and back as far as Homebush and Belmore comes into Cook's River; in fact, from as far as Salt Pan Creek the drainage comes into Cook's River; and to ask the people in a little place like Rockdale to pay for the drainage of those people miles back is absurd.
1398. It is not proposed to ask the people of Rockdale to pay for all that;—do you not think that the whole of the municipalities which would benefit by the proposed scheme being carried out have a right to pay something towards the interest on the cost of construction? Well, I do not think that the people of Rockdale have a right to do so. The Government have already deprived us of a square mile of our municipality, for which we can get no rates, and now they ask us to pay for the improvement to Cook's River.
1399. You think that the dam across Cook's River is the means of creating a nuisance, not only to the municipality you represent, but also to many others? Yes.
1400. And yet you expect the Government to come to the rescue and clear away all obstructions, and benefit every private property-owner throughout the whole of those municipalities, whilst the Government are to get no return for doing that, is that it? Yes; we expect that.
1401. *Mr. Wright.*] You said that if the sills of the dam are lowered that will not clear the river, because holes in the bed of the river above the dam are 10 feet deeper? Yes; between the railway and the Cook's River Dam.
1402. But it is proposed to lower the sills 3 inches below low-water mark;—supposing you swept the dam away altogether, those holes would still remain full, and if they are 8 feet below low-water mark the water could not get away? Having the dam removed altogether will allow that water to get away.
1403. If they are 10 feet below low-water mark, how will the water get away? Well, I suppose they will silt up in time.
1404. Your evidence amounts to this, that the dam should be removed and the river dredged, and that would do all that is required? Yes; if the channel were narrowed by fascine banks.

Henry Cooke, Esq., Alderman of the Borough of Rockdale, sworn, and examined:—

- H. Cooke, Esq.  
9 July, 1896.
1405. *Mr. Roberts.*] How long have you been a resident of Rockdale? About thirty-five years.
1406. Then you are thoroughly familiar with the district under consideration? Yes.
1407. Have you been appointed by resolution of the Council to come here this afternoon? Yes.
1408. What is the object of your desiring to give evidence? Simply because of the annoyance and nuisance we have suffered from, owing to the pollution of Cook's River, in consequence of which the Council have received complaints from different people.
1409. And, I suppose, the pollution of Wollie Creek? Yes.
1410. Have you heard the whole of the evidence that has been given here this afternoon by His Worship the Mayor, members of the Council, and residents of the borough? I have.
1411. Do you endorse all that has been said by those gentlemen? I do.
1412. Is there anything you would like to add? Only as regards Cook's River. Thirty years ago we had to cross it for food for our families, and I have waded the river near the dam. At one time, before we had police protection, we could see twenty or thirty people bathing there. I do not think any one dare go into it to-day.
1413. The state of the water is so polluted compared with what it was some years ago? It is.
1414. Have you formed any opinion what work it is necessary to do to remove the cause of the complaints which you make? Cook's River Dam should be removed entirely, and Wollie Creek thoroughly cleaned out.
1415. Is there anything else you would suggest? No.

John Curtis, Esq., Alderman of the Borough of Rockdale, sworn, and examined:—

- J. Curtis, Esq.  
9 July, 1896.
1416. *Chairman.*] You are a resident of Rockdale? Yes.
1417. You have heard the evidence given to-day? Yes.
1418. Do you agree with it? Yes, I do, entirely.
1419. Do you desire to make any further statement on any point which you think the witnesses have left out? Nothing more than to advocate the removal of the dam and the cleansing of Wollie Creek.
1420. That is virtually the same as the others say? Yes. 1421.

1421. You have a thorough knowledge of the district? Yes; I am a native of the district, and have been there all my life—forty-four years. There is no doubt that Wollie Creek is very much filled up, compared with what it was twenty-five or thirty years ago. At that time an old resident living next to my place used to go in his boat down the creek, but at the present time I could walk across Wollie Creek in many places, even after rain. It is almost entirely filled up.

J. Curtis,  
Esq.  
9 July, 1896.

1422. You attribute that partly to settlement on the watershed and partly to the dam? Yes. If Wollie Creek were cleaned out and there were a bigger opening through the dam it would allow the flood-water to get away more quickly, and Marrickville would not flood so high.

1423. Do you approve of allowing the salt water to come above the dam? Yes, I do. I think it ought to be allowed to ebb and flow.

1424. You approve of the dam which it is proposed to construct near Undercliffe Bridge—the Government propose to put a dam to intersect the tidal water there;—do you approve of that? I do not approve of any dams.

1425. No dam anywhere? No.

1426. What is to happen to all the low-lying lands if you let the salt water in? By cleaning out the debris you would raise the banks, and I do not believe that the salt water would then come in at all.

1427. Your idea is that an embankment should be put anywhere where the bank is low, so as to prevent the salt water from submerging the adjoining lands? That is my idea.

1428. Can you give us any idea of the cost of that? No.

1429. Mr. Humphery.] In what manner is Wollie Creek polluted at the present time? By flooding particularly.

1430. But flooding would not pollute it? Floods wash down leaves of trees, cattle, manure and other things; the creek is blocked up, and when the flood goes down it leaves the debris there.

1431. Is that the only cause of the pollution? There is a tannery, and also one wool-washing establishment. I will not say that they may not help to pollute it a little, but I know of my own knowledge, from visiting the tannery, that they have many filter-beds through which the water runs, and, I believe, they do all they can to send the water to the creek as pure as possible.

1432. How long has the wool-washing establishment been in operation? The one there now has been at work perhaps twelve months. Previous to that there was no wool-washing on the creek for some years. During the last twenty years, wool-washing may have employed sometimes two or three men, and sometimes a dozen, perhaps, for five years, or four years, out of the twenty.

1433. At the present time the only cause of pollution is the flooding? That is my opinion.

FRIDAY, 10 JULY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED, LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Improvement of Cook's River.

Cecil West Darley, Esq., Engineer-in-Chief for Public Works, Department of Public Works, sworn, and further examined:—

1434. Chairman.] The general impression seems to be that the flooding of Marrickville in no way results from the floods in Cook's River? One or two have mentioned that the floods are due to the local rainfall. 1435. Is it not this way—although Cook's River holds the water up, the catchment area in the Marrickville Valley is so great that the flood comes from the watershed into the Marrickville Valley, and the water is held up by Cook's River? It depends upon the rainfall. We may get a local rainfall, that will flood the valley without a flood in the river.

C. W. Darley,  
Esq.  
10 July, 1896.

1436. It amounts to a comparison between the amount of the rainfall upon either watershed, and the amount of the discharge? There is no very serious difference of opinion except on that point. I hold that, as long as you are trying to discharge the water into Cook's River, you will always have a difficulty in dealing with floods. You cannot get a fall whilst the river is in fresh, therefore, it is desirable to remove the discharge from Marrickville, if possible, away from the influence of flood disturbances. As long as you attempt to drain into Cook's River there must be times when Cook's River will be above its normal level, therefore you will have a complication arising from the different flood-waters.

1437. The engineer for the Marrickville Council had run a level from the mouth of Marrickville Creek round to where Shea's Creek enters Cook's River, and he makes the statement that the land from both sides is practically level—that any alteration will come from the contraction of Cook's River in its high reaches, therefore all that you would lose would be lost by the contraction of the water, not by a rise in the flood of Cook's River. Do you agree with him? I understand what you say, but I differ from the conclusion drawn. If the river were in the normal state of low water when the levels were run, I do not think he would get a serious difference in the levels. In taking levels it is not easy to run a line to the level of the water unless you adopt proper precautions and put in a tide-gauge, having some person to observe the reading. Unless this is done, it may be very deceiving. When you speak of running a line of levels it does not indicate that the usual course has been taken of establishing tide-gauges. When the river is in flood we get disturbing elements of various kinds. The Wollie Creek coming in at right angles will make a difference. The engineer says:—

In my opinion this action has a great deal to do with the backing up of the waters. It could be rectified in a simple manner by forming a training bank for the waters of both streams, this bank to form a curve so as to train the water in such a manner that they will be united just to the west of the bridge, and taking through it in nearly parallel lines.

After passing the railway bridge the water spreads out over a wide surface, part going to the northern flood-gates and part to the southern. If the water is backed up towards the source you will have a certain amount

- C. W. Darley,  
Esq.  
10 July, 1896.
- amount of artificial head during the freshes in the creek and the river. If you attempt to drain into the river you cannot get as low as if you went down into low water at once.
1438. The question is how much head would do—on that you are not prepared to express a definite opinion? It must be problematical. It is not during flood. From my experience of rivers and the grades they fall at, I expect there would be a difference of quite 2 feet between the flood-level and low water at Marrickville drain and Shea's Creek.
1439. That is to say, the flood would be 2 feet higher at the outlet of Marrickville drain? I should expect it to be 2 feet higher at that point than low water at Shea's Creek, but could not say definitely. No man could estimate it. You have to get the grade of the river, and it is comparatively irregular till it gets past Cook's River Dam. After that the channel opens out very wide, therefore the water cannot rise so high.
1440. I understand that the 2 feet is lost in the slope between the entrance and Shea's Creek? I anticipate that there would be that much loss during a flood in Cook's River.
1441. According to the engineer, it does not appear that there is much difference between the flood-level at the lower side of the bridge and the mouth of Shea's Creek; therefore, the water above the bridge would be discharging at pretty well the same level as about Shea's Creek? You cannot base anything on that, because the water can only get through it at a certain rate. It cannot get through fast enough to raise it at that point. His statement shows that the water rose 2 feet over the dam. That shows that the water was not discharging at any greater rate, therefore it could not raise it on the lower side of the dam.
1442. You discharge it at the lower level, but how much that is you are not prepared to say? I am not prepared to say. I do not think anyone could say. I can only surmise what the result would be.
1443. Your tunnel is 15 ft. x 6 ft.? Yes.
1444. You have seen the statement that a tunnel of that kind would take twenty-four or twenty-five hours to discharge 4 inches of rainfall over a catchment area 75 per cent. of which reaches the intake? Yes.
1445. Is that so? I do not agree with that at all. Some three weeks ago 5 inches of rain fell there in one night, and the next morning the whole of the water was passing through a little iron drain with a sectional area of only 5 square feet. I sent an officer to get the information. A 5½-inch fall took place in one night, and of course there was a rush of water in the morning, but in the afternoon, although delivering into Cook's River at a higher level than we propose to deliver, it was not over the top of the drain that was carrying it. I pointed out to the Committee before that it was quite possible, during a heavy and continuous rainfall in a wet season, that there would be flooding; that the water would rise up over the land as it does now for a short time during high water, but that it would get away certainly in two tides. There would be a temporary flooding. It all depends how the rain falls—whether after a dry season or when the ground is soaked and the pools are filled. In the latter case another rainfall would cause a flood to rise with great rapidity, causing a temporary flood.
1446. Your drain or tunnel discharging into tidal water will be discharging about one-third of its time? It depends upon the level of the water.
1447. I am talking of the discharge into Cook's River as controlled by the rise and fall of the tide in the River? Yes.
1448. Previously you told us that it would discharge during about one-third of its time? If inland it was dry it would be discharging during the whole period, and there would be an effective discharge taking place for one-third of its time.
1449. Have you seen the calculations upon which that statement I mentioned just now in regard to the 2-inch rainfall was based? No; I have not. In matters of this kind you can prove anything by figures.
1450. The catchment area, the amount of water falling on it, and the amount of water reaching the intake, and the discharging power of the drain are all facts, are they not, and a fair comparison can be formed between them? It is really a very complex question, because the tide is rising and falling all the time. You are discharging into water that is always at least 2 feet lower than the valley, and you are tapping the valley in the centre instead of the water having to run another 3,000 feet to Cook's River, so that the water could have come both ways to the drain.
1451. I ask you whether the amount of water available in a certain area, and a certain portion getting down to the intake, could not be fairly estimated, also the discharging capacity of the tunnel, and would not the division one by the other give you fairly correctly the time that the accumulated body of water would require to get through that discharging channel;—does a comparison of that kind seem to be based on any surmise? The tunnel discharge upon the whole area will be one-eighth or one-tenth of an inch per hour of rainfall.
1452. Over the whole area it will take one-eighth of an inch per hour? Yes.
1453. In eight hours it will take off 1 inch? Yes.
1454. You are taking its full discharging power? Yes.
1455. Then 2 inches would take sixteen hours to go off; but still, it is an intermittent discharge;—how much that would lengthen the time you are not prepared to say? The water does not come down into the valley as fast as it falls. We had a 5-inch fall the other night, and it was running away in the channel one-thirteenth the area of the tunnel.
1456. That is your statement with regard to discharging power. It could discharge 2 inches in sixteen hours, but that sixteen hours must be increased somewhat—you cannot say how much, owing to the intermittent discharge of the drains? Yes; that would be the mean discharge.
1457. The fall of your drain is about 1 foot in 3,400 feet? Yes.
1458. What is the fall in your usual storm-water discharges? They vary very much; from 1 in 2,000 to 1 in 3,000 is the usual thing. It would vary according to our gradient. That is a very fair gradient.
1459. The storm-water discharge is from 1 in 2,000 feet to 1 in 3,000 feet, and is regarded as sufficient? Yes.
1460. Is there any trouble being experienced with the storm-water discharge in any part of the suburban area at present, from sediment. Have you to employ men to throw the stuff out of them? Yes; in many cases.
1461. With as good a flow as this, is it necessary to send men with shovels to throw the stuff out? Yes; but many have not got that gradient.
- 1462-3. What is the fall that you require for the sewage as a rule? About 1 foot in 2,500 feet in some of the larger sewers.

1464. The clear water flowing into the Sydney water supply has about the same fall as the storm-water discharge? The same as the proposed tunnel. C. W. Darley, Esq.
1465. Do you think there is any probability, with this intermittent discharge, of any sediment settling in the drain? I do not think there is much risk of a deposit in the drain. I know there is a good deal of deposit in portions of the Marrickville drain, but that is in the portion near to the slope; but this discharge commences a good distance from the foot of the hill. A large amount of sediment is brought down the streets, and that will come down into the main channel, but the current will be so slow from the foot of the different hills between that point and the mouth of the tunnel that the sand will all be deposited before it reaches the tunnel. 10 July, 1896.
1466. The velocity at 1 in 3,000 would be how much?  $1\frac{1}{4}$  of a mile per hour.
1467. At what velocity would water require to travel to move ordinary sand? A great deal would depend upon the nature of the bottom.
1468. Would 1 mile an hour move ordinary sand in a pipe? Hardly.
1469. If the outlet were choked, there is a great probability, certainly a possibility, of sand depositing in the tunnel? My answer to that is, that there will be three channels approaching it, each of which should be larger than the tunnel, therefore the velocity in the channel will possibly be one-third or one-fourth of that through the tunnel, so that the sand will be deposited in the channels, not in the tunnel.
1470. The efficiency of the scheme, therefore, depends upon the sand not getting into the tunnel? If the sand reaches the tunnel it will go through, because the velocity that brings it to the tunnel will carry it on. The velocity will be greater in the tunnel than in the channel.
1471. It is necessary to intercept the sand before the water gets to the tunnel? Yes.
1472. Therefore if the intercepting canals be not widely constructed and kept clean the sand will get into the tunnel? There is no evidence that there is any great quantity of sand there. There is no great bank of sand at the discharge of the Marrickville drain into Cook's River.
1473. All storm waters carry a large quantity of sand? It all depends upon the nature of the streets. In all storm water there is a certain quantity of sand running off the streets, but in this case the sand will be deposited at the foot of the hill; it will not reach the tunnel.
1474. You think it undesirable that it should reach the tunnel? Certainly; it is better that it should not. The water in the channels will be running at a much smaller velocity than the water in the tunnel, therefore, there will be nothing to bring the sand along.
1475. Do you think that the railway embankment has contributed to hold floods up in Cook's River? No doubt it has diverted the course of Wollie Creek. The creek is thrown right against the course of Cook's River.
1476. It has contributed to it then to some extent? I think it must tend to keep up the water.
1477. Marrickville Flats being 3 feet below high-water the only way to keep them absolutely clear would be by a pumping scheme? Yes; any drainage system into Cook's River will only grant a certain amount of relief. No doubt the tunnel will dry up the lower levels, but to make sure of keeping the water off the surface nothing short of pumping will do.
1478. These are at the best a means of mitigating it? Yes.
1479. You view the scheme as a storm-water discharge? Yes; either scheme.
1480. From various municipalities certain drainage finds its way to the centre of Marrickville Valley? That is the present storm water discharge for it.
1481. Is that to be the storm water discharge for those municipalities for all time, or, in your opinion, will the storm water be intercepted upon a higher level? A portion of it will be intercepted, but only a small portion, by the sewerage works. A certain portion of the water from the roofs and the yards will find its way into the sewer.
1482. But speaking of the main flood waters? At present there is no proposal to be carried out to intercept it at a higher level.
1483. Will the storm water seek the Marrickville Valley as a discharge, or will there be some scheme which will take the place of the Marrickville Valley? It will always have to go by the Marrickville Valley.
1484. For all time? Yes.
1485. In your opinion we need not take into consideration the question of intercepting the storm water from those municipalities on the higher land? I have heard of no scheme for the purpose at all. I do not know how it could be done.
1486. Could it not be done by going round the foot of the hills, and intercepting it sufficiently high above the high-water in Cook's River for discharge by pumping? There was a proposal to do that, but it worked out very costly.
1487. Can we dismiss that for the present? Yes; it would cost an immense sum of money.
1488. Therefore, for some considerable time to come, either the alternative scheme or the drainage centre of Marrickville Valley will discharge the storm waters? Yes.
1489. Do you regard Cook's River as likely for all time to be the storm-water discharge for the municipalities lying on its watershed? Unquestionably it must be.
1490. Will Wollie Creek be the storm-water discharge for the municipalities lying on its watershed? Yes.
1491. Therefore Marrickville Creek, Cook's River, and Wollie Creek are the natural outlets? Yes.
1492. The only point doubtful is whether the water should be permitted to go down Marrickville Creek, or to find an outlet by Shea's Creek? Yes.
1493. Are storm-water discharges as a rule regarded as a liability of the State, or of the municipalities interested? Where they are improved by artificial means the storm-water discharges through municipalities have been charged to the Water Board.
1494. Therefore it is a reasonable thing that the alternative scheme or the discharge down the centre of Marrickville Flats is a legitimate charge to those municipalities that furnish the storm waters? I think so. It would be necessary to tax the district to pay for it.
1495. But Cook's River and Wollie Creek being tidal waters, you do not regard them as a legitimate charge? No; there is no work done on them.
1496. But if works were carried out on Cook's River and Wollie Creek, would it be a legitimate charge to the municipalities? I do not think so.

- C. W. Darley, Esq.  
10 July, 1896.
1497. Your discharging area will be about 350 feet wide, just below the railway bridge in Cook's River? Yes.
1498. That appears to be enough to carry any water coming down Cook's River, Wollie Creek, and Marrickville Creek? It is quite sufficient.
1499. Supposing that the sluices were taking the places of the present dam, how much would it cost if it were left 350 feet wide? Do you mean to cut out 300 feet and put in sluices.
1500. Yes? The sluices constructed in 1876 at the south end, 90 feet, cost £4,600. Cutting out the bank and putting them and a bridge over the top cost £4,600.
1501. What would it cost now? It would cost £4,000 to do the work now, but you would have to go 2 feet lower. They are not low enough.
1502. Can you tell us approximately what would be the cost of the dredging necessary in Wollie Creek and Cook's River, above the dam, to put them in a fair condition;—your estimate here is £4,000? I put down £4,000, thinking that that would do all that was wanted. We should have to build a pontoon inside the dam and move one of our existing dredges into it temporarily.
1503. If Cook's River and Wollie Creek were cleaned up and sluice gates 300 feet across were erected, the river would be placed in fairly good order? It would.
1504. It would be sufficient to allow the accumulation of water to go out? I think so. It would let the flood-waters go out and prevent any great accumulation of sediment. I read in the evidence that Wollie Creek brought down a great deal of sand, but there is no indication of sand in it, there is nothing but mud. The presence of rushes indicates that there is no sand moving. You never find sand moving through a reed bed.
1505. You have in your original scheme made provision for a dam for a short distance up Wollie Creek and near the bridge? Yes.
1506. Are we to infer from that that if the flood-water went higher up beyond the fascine bank which you propose to construct, it would damage the property higher up Wollie Creek or Cook's River? If you did not put these dams down, the salt-water would go right up and cover all the flats on Wollie Creek.
1507. Is there much flat land up Cook's River? There is a considerable area towards Canterbury.
1508. You regard it as impracticable to allow the salt-water to flush this creek right out? You cannot do it without flooding a great deal of country.
1509. The original scheme shows a bank round the Campbell property? Yes; but it would be no improvement to a property to have to live inside a big bank.
1510. *Mr. Lee.*] Do you wish the Committee to understand that if the other scheme is adopted it will not entirely relieve Marrickville of flood-water? It will not.
1511. To make that a complete success there would have to be a pumping scheme? Either intercepting drains on a high level, or a pumping scheme.
1512. In the former case it would belong especially to the province of the municipalities? Yes.
1513. As far as the Departmental schemes are concerned, neither of them will completely remove the nuisance? No; they will not.
1514. The alternative scheme would prevent the inundation that goes on? There might be a temporary inundation, but it would be very rapidly relieved. At present the water remains on the land for weeks. If that scheme were carried out, the water would only remain two or three days, and not to the same depth as now.
1515. Would not temporary inundation mean the flooding of some of the buildings that are there? They should not build there. It will enable them to use the land for grazing and other purposes.
1516. Would the original scheme prevent that inundation? No; it would not.
1517. Then these are only provisions to take the storm-waters off a little more quickly than they go at present? It will be a little quicker, and also better drainage altogether.
1518. Those small residences in the lower portion of the area will continue to be inundated? They will always be liable to be inundated when there is a heavy fall of rain, but after the scheme is carried out, I do not think it will be so bad as it is now. Now there may be no local rainfall, yet they will be inundated by flood-waters passing down Cook's River.
1519. Could any scheme be devised by which that could be completely prevented? Certainly.
1520. It would involve a heavy pumping scheme? Pumping and high-level drains intercepting the water. It would cost more than the district is worth.
1521. *Mr. Wright.*] In the particulars you have given us you give one area as 3 feet above high-water mark, and so on, in regard to different areas, and you have given an area of 176 acres;—does that embrace all the other areas? Yes; the greater in every case includes the lesser.
1522. Can you tell us how many residents there are on the lower areas;—are there any residences on the areas 3 feet, 2 feet, and 1 foot below high-water level? There are several residences in the area 1 foot below high-water, and some in the area 2 feet below high-water.
1523. I presume that if that land were acquired by the Government the difficulty of draining the remainder of the land would be very much lessened? Yes.
1524. And an effectual grade would be obtained? It would be a very simple thing to deal with all that above high-water mark, or at the level.
1525. To effectually deal with these low lands that 109 acres would have to be acquired? Yes.
1526. Unless that portion is set apart either for a recreation ground or as a swamp, you cannot effectually drain the area? It might be a little less than 109 acres. That means a very large storage. It would take an excessive rainfall to fill that up to high-water mark.
1527. Supposing that 50 or 60 acres were resumed and set apart as a storage reservoir, could you deal effectually with it? If 60 acres were set apart to be occasionally flooded more or less, then the rest could be easily dealt with.
1528. Could it be drained by gravitation? Yes.
1529. Supposing that 60 acres could be acquired at £100 per acre, would that be cheaper than carrying out the scheme now proposed? People complain about it being unhealthy on account of the flood-waters resting on it. They object to the miasma arising from the swamp.
1530. If 60 acres were acquired by the Crown would it take many years to raise it a foot or two by tipping street sweepings into it? No; no provision is made to compel the inhabitants to contribute towards the expense

expense of this undertaking. I thought it would be dealt with in the same way as the storm-water channel. C. W. Darley, Esq.

1531. If the Government have to undertake the cost of draining this land by any of the schemes suggested, would it not be cheaper to acquire a certain portion of the land and use that? It would be. 10 July, 1896.

1532. *Chairman.*] In your opinion, would it be justifiable to charge the draining of the Marrickville Flats to the various municipalities that contribute the flood-waters to it and the storm-water channel? I am doubtful whether it would be a fair thing to charge them under the Act as it is now.

1533. Are there any similar cases? There are some where it is very doubtful whether they are legally a proper adjunct to the sewerage system.

1534. Do you think the Government ought to carry out the scheme, or is it the work of the municipalities? I think the Government should carry it out and tax the municipalities.

1535. You say that we cannot do it? It could be done under a special Act. The work would require a Bill to authorise it, and in the same Bill there should be a clause to levy a rate on the district. It is so essentially a local improvement that I think there ought to be a levy on the district towards the cost.

1536. On the district contributing the flood-waters? On the watershed.

D'Arcy Hubert Bucknell, Esq., Tempe, sworn, and examined:—

1537. *Mr. Farnell.*] How long have you been resident in the Cook's River district? We have owned our residence, which is a frontage to Wollie Creek, upwards of thirty years. D'A. H. Bucknell, Esq.

1538. What is the area? We have 20 acres, and it has a frontage to the creek.

1539. Is it affected by the stormwaters which accumulate there? Yes.

1540. Have you had under consideration the proposed scheme for doing away with the nuisance? I have seen the original scheme. 10 July, 1896.

1541. Will you state your views on the matter? I do not know anything about the alternative scheme, and I do not wish to give evidence as an expert on either scheme, but as a resident of Arncliffe having 20 acres of land with a frontage to Wollie Creek, I thought I could not do any harm by tendering my evidence to the Committee, and by pointing out that Wollie Creek and Cook's River, the natural outlets for the watershed around that district, have been very much impaired by reason of the dam put up by the railway people, and now, especially in the Wollie Creek, there is practically no current at all, whereas up to eight or ten years ago we used to be able to bathe there with great comfort, and even drink the water, but the state of affairs is now so bad, not only so that you cannot bathe, and cannot even let cattle drink the water, but dogs cannot swim in the water, it is so stagnant and dirty. This has been brought about to a great extent by the mouth of Wollie Creek being stopped by means of the railway embankment, and also by the pollution that has been allowed to run into the creek. I say that if anything is to be done with the view of improving that district, and allowing Cook's River and Wollie Creek to be the natural outlets of the water, then Wollie Creek and Cook's River should, in my opinion, be clear, and that quite irrespective of whether the low-lying land of Marrickville should be effectually drained. The difficulty in regard to these low-lying lands of Marrickville should be separately dealt with, and if Mr. Darley's scheme, namely, making a dam near Cook's River or building an embankment a small distance up Wollie Creek, will have the effect of making our land more liable to flood, or if it has the effect of letting the salt water come up, then it will be a serious matter for compensation. If the salt water is allowed to rush right in, there can be no doubt that the land, which is under ordinary circumstances very valuable agricultural and grazing land, would be very much damaged; and if the dam which is intended to be built by Mr. Darley has the effect of preventing the waters of the creek from running away, and flooding our land very much, then it is very possible that under both these circumstances the Government will be rendered liable for a very serious amount as compensation. The nuisance which exists along Wollie Creek cannot be exaggerated in any respect. To anybody who can afford to leave, it is almost impossible to live there for any lengthened period. Anybody who is able to do it likes to get away from the district periodically to recruit. The stench arising from the pollution of the creek and the stoppage of the current is enormous, and cannot be exaggerated.

1542. What do you think is responsible for the pollution of Wollie Creek? There is no doubt that the tannery people are greatly responsible for it and the stagnation that has arisen by reason of the railway embankment.

1543. Was this area, which you say you are interested in, subject to floods years ago, before this complaint in regard to the pollution of the river first arose? We had slight overflows of water, but they ran off very quickly.

1544. Has the present condition of things been brought about since the erection of the old dam? Yes.

1545. You think that the erection of the railway embankment has aggravated the evil? Yes; very seriously.

1546. Is there an extensive area subject to floods owing to the backing up of the water? A very considerable area. I should not like to say what the area is.

1547. You think that the dredging of Cook's River and the removal of the obstacles of which you speak, and the dredging of Wollie Creek would, to a great extent, remove the evil? To a great extent.

1548. What municipality is your land in? Rockdale.

1549. Has the Rockdale Council taken any steps to mitigate the evils arising from the pollution of the river? Yes; I think it has done a great deal to remove M'Namara's boiling-down establishment, but there is a difficulty with regard to the tannery, because Wollie Creek is a boundary between two municipalities. I do not see that they ought to allow the nuisance to continue, but they say that that is the difficulty. Of course, it would be an invidious thing for a private individual to take up a case like that, and it is very expensive, otherwise we should have done it ourselves.

1550. I understand you are in favour of the free admission of the tidal waters up Wollie Creek and Cook's River as far as they will go? You mean to take the dam away.

1551. Yes, to remove the dam? No, I am not in favour of that. I am afraid that that would inundate so much land with salt-water that it would do an enormous amount of damage.

1552. How would you provide for a freer means of escape for the water—by clearing the creek? I think it would almost run itself, if you made a larger opening in the railway bridge.

1553. Does not the present dam back the water up to a certain extent at the present time? I believe it does, but these flood-gates might be enlarged. I am afraid that letting in the salt-water would do a great deal

D'A. H.  
Bucknell, Esq.  
10 July, 1896.

deal of harm, but I do not come to speak as an expert. I only wish to bring before the Committee the fact that there is a good area of land there, and that it will be a serious matter not to regard the question of compensation in anything that is done. I say that irrespective of whether anything is done with the very low-lying land at Marrickville.

1554. Can you tell me whether much sewage matter finds its way into Wolli Creek? It is the catchment for a large district, and there must be a good deal one way and another.

1555. And when the creek becomes swollen, and owing to the action of the back waters, do you think that sewage matter becomes distributed and thus makes the locality offensive? Yes, there is no doubt about it. I think it is possible that in a very dry time you may be confronted with a very serious disaster of plague in the district. The stench is something tremendous. It is outrageous in dry seasons.

TUESDAY, 14 JULY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.  
The Hon. CHARLES JAMES ROBERTS, C.M.G.  
The Hon. WILLIAM JOSEPH TRICKETT.  
The Hon. DANIEL O'CONNOR.  
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
JOHN LIONEL FEGAN, Esq.  
THOMAS HENRY HASSALL, Esq.  
FRANCIS AUGUSTUS WRIGHT, Esq.  
FRANK FARNELL, Esq.

The Committee further considered the proposed Improvement of Cook's River.

John Wesley Watkin, Esq., Director of the Sydney Permanent Freehold Land and Building Company (Limited), sworn, and examined:—

J. W. Watkin,  
Esq.  
14 July, 1896.

1556. *Chairman.*] What are you? An auctioneer.

1557. *Mr. Humphery.*] Are you also a director of the Sydney Permanent Freehold Land and Building Co. (Limited)? Yes.

1558. To what extent is your company interested in the land that will be affected by the proposal now under the consideration of this Committee? I suppose that the total area of the estate, which is known locally as the Undercliffe Estate, is something over 450 acres.

1559. Undisposed of? Not been subdivided—not been touched. It is intact.

1560. Will you point to its locality on that map? It is in Caunterbury, on the southern bank of Cook's River, starting from below Undercliffe Bridge, and then going right up the river to Thomson-street, with the exception of a few blocks on Nobbs' Flat, which form a portion of Nobbs' subdivision. We are very largely interested in land on the banks of Cook's River.

1561. But the land in which you are interested would not be affected by the alternative scheme, as shown on the map, for draining Marrickville Flats to Shea's Creek? No.

1562. Are you familiar with all the proposals that have been from time to time submitted for the purpose of removing the nuisance complained of? Yes; I have watched them through the papers. I have also seen this plan, and I know Mr. Sharkey's proposal, because I was consulted by him at the time he was attempting to acquire land in Marrickville Flats.

1563. You have expressed a desire to be examined by this Committee with regard to the proposals now under consideration? Yes.

1564. Do you desire to make a statement? Yes; I desire to protest against the construction of a concrete dam just below Undercliffe Bridge. The reasons why I object are that it would only be removing the nuisance further up the river. That concrete dam will be just below Undercliffe Bridge, and opposite portion of our estate.

1565. Will you state your reasons for objecting to the construction of that dam? It would silt up the river, and only remove the nuisance to a place further up the river. I am more concerned, perhaps, in the source of Cook's River than in its mouth. I do not know whether you gentlemen have been along the banks of Cook's River, if not, I would certainly recommend that before you close this inquiry you should take a tour right up its banks to its source. I contend that the first mistake was in making the Cook's River Dam at Tempe—I mean the dam on the Cook's River Road. It seems to me that the engineers, or the Government officials, in the past, have never recognised in any way the possibilities of Cook's River. By constructing that dam across the river, they have destroyed it as a water highway. Then the railway people came along and again made the river worse by reducing the space by constructing an embankment. Then, again, the Board of Water Supply and Sewerage came along and put another barrier across the river by the construction of that sewer. What I want to impress on the Committee is that I should like to see Cook's River restored to its natural tidal condition.

1566. That is the full scope of the evidence you wish to give? Yes; I wish to impress on the Committee that they should look to the future, and, if possible, take away the obstructions which prevent the tide having a full ingress into the river, as far as it will go.

1567. In your opinion the removal of the Cook's River Dam at Tempe will effect all that is necessary in connection with the abatement of the evils that exist? Yes; and dredging the river, and taking away the sugar-works dam.

1568. Would that prevent the flooding of Marrickville? No; I cannot say that it would.

1569. Are you aware that the proposal before us is one for the drainage of Marrickville as well as for the improvement of Cook's River? Yes.

1570. You do not desire to give any evidence with regard to the drainage of Marrickville, but simply wish us to understand that, in your opinion, the proper way to deal with Cook's River is to remove the dams and dredge the river? Yes; and, if possible, make it navigable for small boats right up to the Liverpool Road.

1571. Assuming that the Cook's River Dam at Tempe were removed and the river were dredged, as suggested by you, do you think that that would prevent the pollution of the river? I consider that the dams have tended to increase the pollution of the river.

1572. Has not the settlement that has taken place during the last twenty years between the Cook's River Dam at Tempe and the Liverpool Road, in proximity to the river, tended to its pollution? Perhaps the construction

construction of roads has tended to bring down the *debris* from the roads into the river; but I do not know that there has been much pollution in the shape of sewage going into the river. Of course there must be a certain amount. We have no sewerage up there yet.

J. W. Watkin,  
Esq.  
14 July, 1896.

1573. But has there not been a drainage into the river from all those surrounding high lands? Yes, naturally so. Cook's River drains a large watershed.

1574. What you propose would simply abate but not remove the existing evils? I contend that if you allow the salt water full ingress into the river, it must, to a large extent, abate any nuisance that now exists. At present the dams merely impound sewage matter. It must be healthier to have the tide running than to have still water.

1575. You are aware that the dam to which you have referred was constructed more than half a century ago? It was constructed for the sugar-works in the old days.

1576. More than half a century ago? Yes.

1577. And certain rights may have been acquired since then? I am not a lawyer, and I do not understand that matter.

1578. They would have to be considered, there being fresh water now where formerly the water was salt? I should not call it fresh water.

1579. Is there not any fresh water in Cook's River above the dam? Not water fit for a dog to drink.

1580. I am not saying that it is water that might be used for drinking purposes—the water may be polluted? It is polluted water.

1581. But it is not salt-water? No; because the dam keeps the salt water from coming up the river.

1582. You are speaking now of the dam at Canterbury? Yes; the sugar-works dam at Canterbury.

1583. Not the Cook's River Dam at Tempe? No. But unless that is dealt with the tide could not get up to the sugar-works dam.

1584. I was under the impression when you offered to give evidence that it would affect the entire scheme, but apparently you have only one object in view, and that is the improvement of the river? The object I have in view is, at all events, to render it possible in the future, if not to-day, to improve the river—not to put any more obstructions in the way of the improvement of the river.

1585. And your protest is against any dam that might have the effect of continuing the nuisance? Yes; I protest against the proposed concrete dam near Undercliffe Bridge.

1586. Are you aware that if the Cook's River Dam at Tempe were removed the low-lying lands at present above the dam would be submerged? Well, so much the worse for those low-lying lands. But I suppose that the dredgings out of the river could eventually be utilised for filling up those low-lying lands. They have very little value at present. I say, restore Cook's River to its original condition, as far as possible, and improve it by dredging and widening where possible.

1587. When did your company acquire this large property you speak of? We have had it about twelve or thirteen years.

1588. Has it been depreciated in value since you purchased it, by reason of the existence of the Cook's River Dam at Tempe? The fish in Cook's River died a couple of years ago between the sugar-works dam and the lower dam, and Cook's River was what you may call a cesspool the summer before last. I can recollect the time, and I dare say that Mr. Humphery, and some other members of the Committee can remember when Cook's River was a nice salt-water stream, or when, at all events, salt-water fish could live in it, and I certainly consider that the condition of the river would have depreciated the value of our estate the summer before last if we had had it in the market.

1589. Have you considered or estimated the area of land that would be submerged in consequence of the removal of the dam? No; I have not; that would be a matter for a surveyor. I daresay that a portion of our property on Nobbs' Flat would be submerged; we have some low-lying land there. But I consider that the benefit to be derived from restoring Cook's River to the condition of a tidal stream would more than compensate us for any low-lying land we might have submerged.

1590. Was the river ever navigable past Nobbs' Flat and up to the Liverpool Road? It is navigable now for small boats a considerable distance above the sugar-works dam.

1591. Up to Liverpool Road? I recollect when it was navigable up to Hilly's Ford; but it is not so now. You could not get within yards of it. But it is capable of being made navigable up to Liverpool Road.

1592. *Mr. Trickett.*] A number of witnesses have suggested that the Cook's River Dam at Tempe should be left, but that the sill should be lowered so as to let the water flow a little more freely; and that for a certain distance up the banks of the river should be cleared of all growth, and the corners trimmed off; and that the river should be dredged, and certain holes filled in;—do you think that that would have a beneficial effect? It would not have such a beneficial effect as I think the scheme which I suggest, of making Cook's River a tidal river. Lowering the sill would only partially remove the difficulty.

1593. But does it not occur to you, as it does to most people, that Cook's River is a very slow-running river, and that if the tide did run right up the river the river would still remain, at any rate, a partial nuisance, owing to the growing population all around, and the filth that must inevitably be washed into the river? I should think that if the filth ran into a salt-water river the nuisance would not be anything so great as if the filth ran into what we may call a semi-salt or fresh-water river. The sea water must act as a deodorant.

1594. But even in parts of the Parramatta River, where there is a large scope of water, we have evidence of pollution of the river near Parramatta, where it is a quarter or half a mile across? Yes; but look at the filth that is poured into the Parramatta River from the asylums and other places. Besides, the Western Suburbs Sewerage Scheme will take in all the suburbs along Cook's River, and Cook's River could be restored to its original condition of a beautiful stream of salt water.

1595. But we have no evidence that all those suburbs are to be dealt with under the Western Suburbs Sewerage Scheme;—all the evidence we have is that Marrickville and one portion of Canterbury will be so dealt with? I am talking about a general sewerage scheme that would embrace all the suburbs up to Strathfield.

1596. So am I, but there is no evidence of it; the Engineer-in-Chief, the other day, could not give any evidence of it? Are then all the people about Strathfield, and other places, to be denied the right of sewerage.

1597. You say it ought to be dealt with? As a matter of course, it must. We have no sewerage at Ashfield and Burwood, and other places, but there will have to be, and it will stretch to other suburbs, and will drain all the suburbs that now drain into Cook's River.

1598.

- J. W. Watkin, Esq.  
14 July, 1896.
1598. But a great many rights have cropped up, and that is a difficulty? Where are the rights that would be injured.
1599. If you had 100 acres of land which were now valuable pasture and grazing land—as evidence has been given here concerning another landowner—and if letting the salt water into the river would submerge that land, and make it utterly useless, I think you would object? That is a bogie. What is the value of land that is below high-water mark.
1600. *Mr. Clarke.*] From your evidence it appears that the only remedy you think suitable would be the removal of both the Tempe Dam and the sugar works dam? Yes.
1601. In that case what would become of the low-lying lands? The low-lying lands would have to be filled up to the high-water mark.
1602. By an embankment or something of that kind? By an embankment, and by the dredgings out of the river. They were low-lying before the river was interfered with. The river has not, in any way, reduced their level.
1603. Still, the Committee understand that the drainage of Canterbury and several other municipalities flows into Cook's River at the present time? Yes; but is not that an argument in favour of making Cook's River a tidal stream. Will it not be much healthier if the sewage does flow in a tidal stream instead of into a lake, which is really only impounded sewage.
1604. No doubt that would be the case; but there are several interests to be looked after, including those of the people who bought land there? I would look after the interests of the future. Do not put obstructions across the river, and thereby destroy the possibilities of it.
1605. But supposing that the Tempe Dam were removed, that would necessitate the erection of a bridge to enable the people to get across the river there? Yes; that would not cost much. I do not suppose you would have to remove the whole of the causeway across the river there.
1606. It would not be possible to remove the railway embankment, because that is a fixture? No, it would not. That was the second mistake that was made.
1607. You think that that railway embankment has prevented the waters from flowing as freely as they formerly did? I think it has caused a great deal of silting up about there. I travel a good deal, and from my personal observations in doing so it seems to me that the river-flats have been considerably raised by that embankment. You can see more shoal-water. I think that the engineers in the past have looked upon Cook's River as of no account at all. I wonder they did not propose to fill it up altogether.
1608. Still do you not think that those people who have, unfortunately, bought low-lying lands at Marrickville, and have built upon them—lands which, in my opinion, ought never to have been built upon—are entitled to some means, by embankment or otherwise, of preventing those lands from being flooded? No doubt there are lots of suburbs of Sydney unfit for habitation, and Parliament should legislate on the question. Sir James Martin tried to do so forty or fifty years ago.
1609. *Mr. Lee.*] Have you taken the trouble to make yourself acquainted with the exact proposal that is before the Committee? I have concerned myself only with the question of the proposed concrete dam.
1610. That is only a very small portion of the proposal? I did not come here to give evidence about Marrickville.
1611. But I am speaking of Cook's River. Your object in being here to-day is to show that something must be done to purify the river, and also something that should be done to maintain it in the future? That is the main object of my giving evidence.
1612. If the proposal before the Committee were carried out, would that meet with your views? Not at all. I have told you that I object to dams.
1613. Your reply is that there should not be a dam either at Undercliffe Bridge or at Wolli Creek? Yes, all dams are a nuisance.
1614. You see that the object of the proposal is to do two things—first, to prevent flood-waters from entering Marrickville Flats, and to drain off flood-waters there, to a certain extent, and then to admit of Cook's River draining itself—on the whole you object to it? I do not object to your improving Marrickville, or Wolli Creek, if you can do it without interfering with the full ingress of the tide into Cook's River.
1615. You are an advocate for the admittance of the tide into Cook's River? Yes; and for dredging it, and deepening it—if possible right up to Liverpool Road.
1616. There should be no dams to obstruct the tide? On the river no dams at all. Improve the banks as much as you like by fascines or anything else, but do not interfere with the main stream.
1617. Your evidence is, seemingly, from a Cook's River point of view only—you are taking no consideration as to the part of the proposal for the draining of Marrickville? No; I did not come here to give any evidence about Marrickville. Still, I believe that the proposed embankment at the mouth of Marrickville Flats would be a great improvement if you can arrange to pump the water over it into the river. I am conversant with Mr. Sharkey's scheme. He proposed to pump the water over that embankment into the river.
1618. Are you acquainted with the alternative scheme submitted by the Engineer-in-Chief? I know what it is. It is the construction of a tunnel to Shea's Creek.
1619. It is proposed to do this: Have a tunnel to Shea's Creek with flood-gates to drain the Marrickville Flats, put a dam across Marrickville Valley to prevent the inflow of the water from Cook's River, dredge Cook's River and Wolli Creek for the purpose of giving an outlet for the waters, and lower the sills of the Cook's River Dam at Tempe 2 or 3 feet in order to give a greater fall;—do you think, leaving Marrickville out of the question, that that proposal would be sufficient to effect the purposes you have in view? No.
1620. Bear in mind that it is not proposed to put dams at Undercliffe Bridge or Wolli Creek, but that it is proposed to dredge the river, and to lower the sills at the Cook's River Dam? Will lowering the sills make the river navigable—admit of your getting a boat through.
1621. No? Well, that is what I object to. I say make Cook's River navigable.
1622. For what? For a canoe if you like, or for a flat-bottomed punt.
1623. You are aware that if the proposal which you suggest were carried out there would be a large expenditure of public money;—are you prepared to offer any evidence as to whether it should be carried out on the betterment principle? I have not considered that question.
1624. Can you cite any cases where works of this character have been carried out by the Government without

without imposing a betterment tax or a local tax? I do not suppose you will find any stream in England or in any other civilised part of the world which has been dammed as Cook's River has. J. W. Watkin, Esq.

1625. Never mind that; can you cite any case in point? No, I have not looked up the question.

1626. *Mr. Wright.*] You are aware that there is a large settlement at Marrickville? Yes.

14 July, 1896.

1627. And that under any scheme, except the alternative scheme for draining Marrickville, all the drainage must come into Cook's River? Yes.

1628. If the river were restored to its normal condition, the dams removed, and the river dredged, would not the large population which is settled in Marrickville and the surrounding districts soon silt up the river, even by the washings off the streets? It surely cannot silt it up as fast as Cook's River Dam and the railway embankment.

1629. Why not? Because the stream would keep it in motion.

1630. In twenty years the present population will, very probably, be doubled? All the more reason for making Cook's River a great water highway.

1631. Do you not think that with a large population the mere surface washings would, in the course of time, absolutely silt up Cook's River? No; I do not think so. I think the municipal councils will require to have silt-pits, as in Sydney, to prevent sewage from going into Cook's River.

1632. I am speaking of stormwater. If the population in the district is doubled, and the whole of the stormwater goes into Cook's River, would it not in ten years be absolutely filled up? If so, that is an argument in favour of making it a *bona-fide* salt-water river.

1633. You have lived long enough to see the foreshores of portions of Sydney harbour reeking with filth? Well, it is a disgrace to us, if it is so. We should try to make the people along Cook's River cleaner than some people along the foreshores of Port Jackson have been.

1634. You want Cook's River to be a tidal river, and my contention is, that if you remove the dams, and dredge it completely, and clear it as deep as it was when Captain Cook came here, in twenty years it must be filled up by natural storm-water drainage? Then you would dredge it out again—keep it clean.

1635. *Mr. Fegan.*] Do I understand you to say that the property you represent is along the south bank of Cook's River? Yes.

1636. Four hundred and fifty acres? Yes; it stretches to Wolli Creek.

1637. You are intimately acquainted with Cook's River? Yes; with Cook's River along the frontage we are interested.

1638. Do you remember when it was a tidal river? No; Cook's River Dam was built before I was born, I expect.

1639. And yet, up to the present time, there has never been a request that this river should be made a tidal river? I do not know about that.

1640. Have you ever heard it asked for before? Yes; I have talked to dozens of people about it.

1641. Has any action been taken by the public in reference to the matter? It has been mentioned by candidates for Parliament.

1642. That shows the lively interest they take in it. I understand you to say that your proposals are simply to remove the dams, and allow the river to have a free scope? Yes; and to dredge and deepen it.

1643. Do you not think that the Government would be liable for damages for allowing salt water to come on private property? That is a legal question I would not pretend to answer. But if that property is below high-water mark, I cannot see where the damage would come in.

1644. But people have bought land in the vicinity of Cook's River since the erection of the dams, and if the Government were to remove those dams, and to allow the salt water to come on to their property, would not the Government be liable for damages? That is a legal question, which I would not be prepared to answer. Land that is below high-water mark can have very little value.

1645. How far is your land from the river? It stretches along the southern bank of the river. It has a water frontage. On one portion of it there is a 100-ft. reserve from high-water mark.

1646. What portion? On the upper portion, towards Thomson-street. There is also another reserve.

1647. As a business man, you generally look at the cost of a scheme of this kind, and if you cannot see a return for the outlay of money, you say it is not worth carrying out? I should say so.

1648. In the event of those dams being taken away, do you not think that the Government would be liable for damages on account of salt water going on to private property, because you know that salt water damages grazing land, or anything like that? That shows, then, that the Government in the old times gave grants for land which was below high-water mark.

1649. But that is not the question here? It comes in.

1650. If it is a fact that the Government would be liable for damages, do you think it would be wise for the Government to take those dams away? I certainly think that in the interests of the whole district and looking to the future, it would be wise for the Government to do it.

1651. Taking your own proposal that those dams should be taken away, who should pay the cost? The Government put the obstructions there, let them take them away.

1652. Your company bought land with all these obstructions erected? The Illawarra railway was not constructed then, neither was the sewer across Cook's River.

1653. Has your property there never exceeded 450 acres? Well, it may be an acre or two more.

1654. And in the course of selling those few acres? We have never sold any of it.

1655. You intend to? Yes.

1656. And I think you will admit that the Illawarra line will be no drawback to your company in selling land? The Belmore railway will help us more than the Illawarra railway will.

1657. They will assist you to sell your land, will they not? Most certainly they will.

1658. That then, disposes, at once of the idea of the construction of these railways being a barrier in this case? I did not say the railways were a barrier, I said that the railway engineers made a mistake in the way they constructed the bridge over the river. I never mentioned the Belmore railway before, until this moment.

1659. Did you not say, when I said that you bought that property with all those obstructions, including the dams, "No, the Illawarra railway was not built then";—was not that your answer? The Illawarra railway was not built then.

1660. Then, the construction of that railway has been an accession to your property? I suppose it has.

1661.

- J. W. Watkin, Esq.  
14 July, 1896.
1661. Well, you and private individuals having bought property there whilst obstructions such as these dams existed, do you not think, if you want the removal of the dams, that it is fair that you should help the Government to remove them? So long as everybody is put on the same footing, I would not object. Treat the whole country the same.
1662. You think it is only fair, in carrying out a scheme like this, that if the Government are put to an expense of some thousands of pounds, those directly benefited by it should pay their proportionate share? With reference to the obstructions which the Government have put across the river, I think the Government should take them away at their own expense. With reference to any other improvements, of course, let the people of the whole county contribute to the expense, if you can devise an equitable scheme by which they can do it.
1663. Do you know the history of the building of the sugar-works dam? It was built for a fresh-water supply for the old Canterbury sugar-works.
1664. By the company? I believe that the gentleman who built it was the Hon. John Lucas, and that he can tell you all about it.
1665. Do you not think that under either scheme—whether the scheme that has been submitted to this Committee, or the proposal that you make—those people who own properties directly benefited should pay a proportionate share of the cost? Yes, certainly, if it is done under a betterment scheme. But you must prove that there is a betterment, and logically, of course, if there is any detriment, the State should pay for that.
1666. Do you not think that it would come under the betterment if you were to push your property in the market at the present time? We could not sell it at all now.
1667. But if, owing to the dredging of this river, it would sell straightaway, do you not think there would be a betterment? The proposed concrete dam below Undercliffe Bridge would prevent us from selling our property.
1668. Have you ever tried to sell it? No. We are surveying it now.
1669. *Mr. Hassall*] Did you become possessed of this land before or after this dam was erected across Cook's River? After.
1670. Therefore, the objection as to the river being blocked by that dam existed at the time you bought this land? Yes.
1671. *Mr. Roberts*.] Is the whole of your property in the Borough of Canterbury? Yes, all this estate.
1672. Are you aware of the views of the mayor and aldermen of Canterbury with regard to dealing with the nuisance at Cook's River? No; I cannot say that I am thoroughly aware of them. They are aware of the nuisance that existed in the river the summer before last, and that the fish died in the river through the muck that was impounded.
1673. You do not know whether they are in favour of the removal of the dam, and have an objection to the erection of any other dams across the river? I believe the Canterbury aldermen are in favour of restoring the river to its tidal condition.
1674. And, therefore, you coincide with them? I certainly do. I have always held that view.
1675. Do you advocate the removal of the sugar-house dam? Yes, most certainly.
1676. Every dam? I would remove every obstruction across the river.
1677. And you wish Cook's River to be restored to its natural state? Yes, deepened and dredged; and taken right up to the Liverpool Road—not to do it now, but to leave the possibility of its being done, and not to destroy it for the future.
1678. What are the principal reasons why you advocate that course being adopted? I think it will be better for all the dwellers along the banks of Cook's River. It will be healthier, and there will be a chance of Cook's River being made a navigable river. We might get blue metal by it up as far as Ashfield, Enfield, Strathfield, and other suburbs; in fact, you cannot say what Cook's River might become under intelligent management.
1679. Have you considered the possibility of a large area of land being flooded by the river being restored to its natural condition? I do not think that any very large area would be flooded.
1680. *Mr. Wright*.] About 109 acres of Marrickville Flats would be submerged, if the salt-water were let into Cook's River, and Cook's River were restored to its natural condition? But there would be the embankment at the mouth of Marrickville Flats.
1681. But that embankment would be an artificial embankment, which you protest against? No; I do not protest against stopping the water from going up Marrickville Valley. That embankment would not be an obstruction of the river.
1682. But a portion of Marrickville Flats was originally under water, and Marrickville people might say, "We want a tidal river as well as the people of Cook's River"? Yes; I suppose we are all pretty selfish.
1683. Can you give us a rough idea of what that 109 acres would be worth? I should have to figure it out on paper.
1684. You cannot give us an idea of the value of that land? No, I cannot.
1685. *Mr. Roberts*.] Do you think that the value of the whole of the property within the Borough of Canterbury would be largely increased if the Cook's River Dam were removed? Yes; I believe that the whole district would be much improved, and that if any damage did result the gain would be much greater than the loss.
1686. Not only the property you own? No, the whole district.
1687. *Mr. Farnell*.] Do you know when the land that is subject to flood-water was sold? It has been subdivided and sold, I should say, during the last twenty years. I mean at Cook's River and Marrickville.
1688. Do you know whether any has been sold during the last six or seven years? I am sure there have been attempts to sell, if sales have not been made.
1689. Have any estates, however small, been cut up within five or six years in the Marrickville Flats? I do not know that there have been any subdivisions, because you may say that it was all pretty well subdivided in the boom time.
1690. That was before 1888? Yes.
1691. I mentioned that because you asked that legislation should be passed to prevent people from building on such spots? Yes; certain areas should be declared as being unfit for habitation.

1692. Do you know that there is a Municipal Roads and Streets Bill—a measure I got passed in 1889—<sup>J. W. Watkin, Esq.</sup> which makes it incumbent on the local body to see that due regard is paid to sanitation, and that the roads are properly laid out and made before consent to the sale can be given? Well, it is a pity it is not observed then. <sup>14 July, 1896.</sup>

1693. If it is made compulsory on the municipal bodies, a plan should be submitted to them first? A most wise measure. I fancy that most of that land was subdivided prior to your legislation. What I want is a law fixing a minimum area for allotments, and stopping the crowding of buildings on small areas of land. That is one of the curses of the suburbs. I remember pointing that out when the Width of Roads Bill was being made law, and so my hands are clean.

Benjamin Lee, Esq., Director of the Sydney Permanent Freehold Land and Building Company (Limited), sworn, and examined:—

1694. *Mr. Trickett.*] You also are a director of the Sydney Permanent Freehold Land and Building Co. (Ltd.)? I am. <sup>B. Lee, Esq.</sup>

1695. You have heard the evidence of Mr. Watkin? I have. <sup>14 July, 1896.</sup>

1696. Do you, or do you not, agree with his views? In his evidence he has largely anticipated what I purposed saying; but there are some points which he has not touched upon, on broad general grounds, which I shall be desirous of dealing with in a short statement, after you have examined me.

1697. Will you make your statement now? I should prefer to make it after my examination.

1698. How long have your company held land affected by Cook's River? For some years. I cannot state definitely. I have not been a director more than four years.

1699. Were you a director when it was bought? No, I was not, or I never would have bought it.

1700. It was bought when the tide was shut out from Cook's River? It was bought when the river was in the state it is now in, so far as the upper dam is concerned, but much more open to navigation by boats than it is now. Every year it is getting worse in that respect.

1701. Every year it is getting more silted up? Yes.

1702. But part of the scheme of the Department is to dredge the river, and improve it in that way—will not that have a good effect? I think very little of an annual or periodical dredging of the river when you have to go through that process frequently. It is much better to prevent any silting up if you can.

1703. With regard to rivers that are surrounded by sloping lands, and large population, is it not inevitable that there must always be a considerable quantity of earthy stuff washed into the river? Unquestionably. That is the experience all over the Colony. As it becomes settled upon, so do the streams become lessened in their force.

1704. And become polluted? Not necessarily—only where the population becomes very dense. Then, in my opinion, that should be met by legislation compelling those people to put their sewage somewhere else, and not into what the Almighty intended to be for the use of all—a free, fresh, and open stream.

1705. That is all very well in theory, but cannot be carried out in practice; for although you may deal with sewage in that way, you cannot deal with surface water that comes over roads and manured fields, and make it go into one channel, and be removed away;—if it goes directly into a river, does it not necessarily cause it to be polluted? Yes, necessarily.

1706. Do I understand that your evidence is merely from an interested point of view, the same as that of the former witness, or do you take a broader view of the subject? I take a much broader view. I prefer to leave out altogether the personal view, for my own personal interest in it is not very large.

1707. That being so, I ask you do you understand the proposals the Government have submitted for the improvement of Cook's River? I am not an engineer, but I have carefully read all the proposals, and I do know from experience, and say advisedly, that money has been absolutely fooled away and wasted by the Government tinkering to relieve immediate wants, instead of looking a generation ahead. I can give you several instances of that.

1708. What I want to know is, if you understand the proposal that is before the Committee? I do understand this last one, and I think it is a most intolerable and abominable one.

1709. Before you come to that sweeping assertion, I would point out to you that there are two proposals—the one that was submitted by Mr. Darley in the first instance, and then the alternative scheme to build a tunnel and sewer to Shea's Creek—do you understand that? I do.

1710. Do your remarks apply to both those schemes? Yes.

1711. Will you tell us, first of all, your objections to the scheme to lower the sill at Cook's River Dam, to put up a dam near Wolli Creek, and to construct fascine banks, and so on? My objection is on the main ground that it is only a temporary expedient after all—that it will not be effective for the future, but highly detrimental to the multitude of people who must occupy that area, and that you should look forward to that period, and not to the present, and that by opening the river as a whole, even if you have to resort to dredging it, and compelling owners of property on its banks to contribute towards the expense, I say that that would be a much more preferable course than to prevent the ingress of salt-water, which is my main objection to that scheme.

1712. You say that the river should be made navigable from its entrance, and that people should be called upon to contribute towards the cost? I do. In the old country there is a net-work of railways, and yet the canals compete profitably for a certain class of traffic where speed is not necessary, and where the charge is low, and I say that above all other places with which nature has surrounded Sydney, Cook's River is the place for manufactories of a certain class, which require a water frontage to enable them to get their produce down to the port.

1713. Well, seeing that you take that view, have you considered this portion of the question, that this dam at Cook's River has been erected for about half a century, and that people have bought land which at the present time they use for pasturage purposes and for growing crops? I think you can say very little about the pasturage.

1714. I can only say what people have sworn here—and that is all that guides us—and the evidence being that if the salt-water is allowed to come in, one landholder will have 100 acres, now used for pastoral and agricultural purposes, submerged by salt-water;—what would you say to that state of affairs? I would say it is simply nonsense. I know enough of that river-bank all the way up, from going along it, to know that a fascine embankment made with a few ti-tree bushes, of which plenty could be got, if used now, would give you a rise sufficient to keep out most salt-water you could anticipate coming in, unless there were a tidal wave. <sup>1715.</sup>

B. Lee, Esq. 1715. You admit this proposition then, that the Government, if they let the salt water into Cook's River, should prevent that salt water from going over lands which are now used for pastoral and agricultural purposes? I admit that no man's private property should be ruined.

14 July, 1896.

1716. You say, "Let the tidal waters in," but will not something be required besides that;—is not the river at the present time overgrown with weeds;—is it not full of shoals, and holes, and so on? It is full of shoals, I admit.

1717. And deep places here and there—how would you deal with those;—we had evidence the other day that a lot of holes were filled up with slush, and were very objectionable, and how would you propose to deal with all these shallow places—I suppose they ought to be scooped out? My idea is that the river should be widened and extended.

1718. Dredged? Yes; instead of spending perhaps £1,000,000, which they will do on useless railways. They would have a cheap highway, then, and a clearance of the river.

1719. I presume that you are only giving an ordinary layman's opinion on this subject—you have not gone into it from an engineering point of view? I do not pretend to do that. I only wish to give you my experience, and for you to take it for what it is worth.

1720. How long have you known this river? Personally, I have known it, though not very intimately, for fifty years.

1721. But how long is it since you have taken sufficient interest in it to say whether its sanitary condition has improved or otherwise? From visits that I have made to the locality—and my visits have been pretty numerous of late years for various reasons—for the purpose of getting a bridge or two constructed across it, and in connection with deputations to the municipalities immediately concerned, and, as resulting therefrom, interviews with the Government, and so on—I am pretty intimately acquainted with the present position of affairs, and also with the state of the river during the last four years.

1722. And those observations have led you to see that it has gradually been becoming more and more polluted? There can be no question about that.

1723. Do you not think that has been the result of the increased population around rather than merely the effect of this dam being at the entrance? Well, everyone knows that the more a stream becomes lessened, so does its liability to silt up more quickly increase.

1724. Well, the Government proposal, and the proposal that comes from Mr. Darley, the Engineer-in-Chief, being to lower the sill of Cook's River Dam 2 feet, and thereby accelerate the outflow from the river and make it pure, what is your view of that? I say take it away altogether; it ought never to have been there.

1725. Do you think that lowering the sill 2 feet and making the rush of water much faster will improve the river? It must tend to improve it. It could not make it worse, but I contend that the dam should not be there at all. The one scheme is only an expedient, and the other in my opinion would be permanent.

1726. Then you do not think that Mr. Darley's scheme would be permanent? I do not. Only temporary—only for a few years.

1727. You have talked about experience of other places—have you ever been to Parramatta? I was not exactly born there, but I have spent fifty years of my life there.

1728. Did you ever notice any dams at the river there? I know that for very many years there was a rise and fall of tide several feet at the Lennox Bridge, and many times have we, as boys and young men, bathed in that river, and from the moment that it was allowed to silt up, and they constructed the artificial concrete culvert down the river with the object of expediting the sewerage, they ruined the properties abutting on the river—they ruined the freeholds which became almost valueless for years,—and the result was that, after spending £8,000 or £10,000 on that concrete viaduct or open sewer, it was ultimately torn up at a further cost of thousands of pounds, and then the Engineer-in-Chief devised a flood-gate, forsooth, lower down. That flood-gate made it ten times worse. It lets it out, but would let nothing in. That was found to be ineffectual, and now you know from reports that the state of that splendid town is almost ruinous to health owing to the increased sewage from the asylums and other places having no means of getting away.

1729. You base your arguments on the case at Parramatta? That is one. For many years steamers landed their passengers at the old asylum. Howell's dam was a little above that, and there was a mill. There was a full flow of the tide with a rise and fall of several feet up to Lennox Bridge and the upper dam at King's School which separated the salt from the fresh water. That has since been made wider, and turned into a permanent roadway, and I contend that if that river upwards had had the stones removed from it, and the river had been allowed to flow freely up and down, you would never had heard of the enormous expenditure of public money which has been wasted there and the public health endangered, as it is in a valuable town like Parramatta.

1730. The position you take up is: Leave things in a state of nature, and make no improvements at all? I do not say "Do nothing at all," but I say do not interfere with nature by tinkering and making things worse, and although I am not an engineer, I say that in my opinion, valueless though it may be, my firm conviction from experience and from what I have seen, is that this is a mere temporary expedient, and will not meet the wants even of Marrickville. If the people there live in a hole they must expect to have water there unless it is pumped out, and if you construct public works on streams made by nature they should certainly be comprehensive, and not merely for the present day. I know it is said that "sufficient for the day is the evil thereof," but that is not the view that should be taken in matters of this character. You should go much further, and if so you would find that it is a great saving in the end.

1731. Would you kindly tell us briefly what your remedy for the state of things at Cook's River would be? I know of no other remedy, except to leave it open, give it greater access, remove obstructions, and if necessary make it deeper by artificial means, and make the owners of the land contribute towards the expense. I think that is a fair and reasonable view to take.

1732. I understand that you also say that where the tide, if let in, would submerge lands that have been used for a number of years for agricultural or pastoral purposes, a fascine bank should be put up to prevent those lands from being submerged? Yes, most certainly.

1733. *Mr. Wright.*] A portion of Marrickville lies very low? I am aware of that.

1734. If we were to restore Cook's River to its normal condition, it would inundate a portion of Marrickville? If Cook's River were restored to its original state, it seems to me that Marrickville would be no worse than it was before it was a town.

1735.

1735. But what would be the position of the poor men who have purchased land in Marrickville and built houses upon it? It seems to be a complete reservoir—the receiver of water at certain times. There is no outfall for it, and therefore it must be pumped out. You cannot drain it. B. Lee, Esq.  
14 July, 1836.

1736. But if the river were allowed to run into it it would always be a waterhole; and it is a waterhole now after heavy rain, until it gets drained at times through natural drainage and evaporation; but if you allow the salt water to go into it, it will always be a waterhole, and if people have bought land there, and in some cases paid good prices for it, and built houses, how would you compensate them—out of the public exchequer? If my proposal would necessitate the river being a constant source of injury to private properties, I have already said that I am not in favour of private property being ruined by any public works.

1737. But you see those people would be ruined? That is merely a matter of opinion—it may be yours, it is not mine.

1738. But the evidence before us shows that 109 acres would practically be under water at high tide? They had no business to build there then.

1739. But they may have bought that land in ignorance as to its position when the tide was up, and how would you propose to deal with those unfortunate people? I suppose they would be like a good many others, and look upon it as a loss. They should not have bought marine villa sites so hastily.

1740. In view of the Government determining to open Cook's River by removing the dam, and letting the tidal water flow in, what would you do to recompense those people? I think their properties would be largely enhanced from the proceeds they would receive from works that must necessarily be established on the river.

1741. I do not think you grasp the question. Take the case of a working man who has bought a couple of allotments and built a cottage, and has no other interest in the neighbourhood—perhaps works miles away from his habitation—what compensation would it be to tell him that the neighbourhood of Cook's River had benefited by the tidal waters coming in, when at the same time the tidal waters were covering his land, and to say to him "You must recognise that the benefiting of other people in the district must fully compensate you"? But is it necessary that should be the result.

1742. It appears to me that it would be the result if you made Cook's River as it originally was? I do not at all think that it is absolutely necessary that such a thing should be the result.

1743. But if such were the result? It should be remedied as far as it could be. If you do an injury by any work, I think that injury should be remedied as far as it is possible to do so.

1744. But who would you propose should compensate those people—the Crown or the residents of Cook's River? I have already said that persons receiving benefit from the improvement of their property should bear a portion of the expense, and that, therefore, should necessarily come in as a reward to those who would be injured.

1745. If the river were dredged out, do you not think that with the existing population, and the possibility of a largely increased population, it would only be a question of time when the river would be silted up again by ordinary storm-waters? I do not think so.

1746. Storm-water brings down street-sweepings, and other things that are washed into the river, and soil is also washed into the river? We have an enormous population in Sydney, and that has not been so extensive as you seem to think.

1747. *Mr. Roberts.*] Your views in connection with this question are the same as those put forward by Mr. Watkin? Practically, with the exceptions I have stated from past experience of the result of artificial works, on the Parramatta River, for instance.

1748. I understood that Mr. Watkin was equally opposed to any dams being erected, or any other obstruction being built? I may say, at once, that it was the fact of my seeing this lower dam recommended which raised my indignation on general grounds.

1749. Do you mean Undercliffe Bridge dam, or the dam across Wolli Creek? Principally, the Undercliffe dam.

1750. But are you aware that in the alternative scheme submitted to the Committee no erection of a dam at Undercliffe Bridge is contemplated, so that that would get rid of one of your objections to the scheme,—which simply contemplates lowering the sills at Cook's River Dam, and clearing out Wolli Creek and Cook's River by dredging; but you would rather see all obstructions removed, and Cook's River restored to its natural state? That is my view.

1751. Are you speaking merely as one having property there, or as to what you consider would be for the benefit of the whole of the district? For the benefit of those who come after us, during the next fifty years.

1752. *Mr. O'Connor.*] Do you know this place very well? Yes.

1753. Have you considered the main Departmental scheme of the Engineer-in-Chief—Mr. Darley? It is that which brought me here, and raised my indignation.

1754. You disapprove of that? Entirely; on general public grounds, for the future of the health of the persons who are to come after us; because of the obstruction of the natural stream—inevitably so, as exemplified by experience.

1755. Where do you live? At Annandale.

1756. But you know this place well? Yes. I have been over it frequently during the last four years, on deputations connected with bridges, and being a director of the company has also led me to go there.

1757. The future welfare of that large property in which you are interested depends on this scheme being properly carried out? It depends to this extent; that the property must be largely depreciated if the river were closed. That is inevitable, as it would damage any property.

1758. You are distinctly of opinion that if this scheme were carried out, it would materially damage the property belonging to the company of which you are one of the directors? That is not the view with which I have given my evidence.

1759. No, but that is your opinion? Yes.

1760. I take your evidence to be given on high grounds? That is my object entirely.

1761. *Chairman.*] Do you wish to add anything to what you have already said? There is one further illustration to which I wish to draw your attention. I have spent a large portion of my life on the Hunter River, where also a considerable amount of Government money has been fooled away. Wallis Creek is a tributary of the Hunter River, and within my recollection large sized vessels could go miles up to a place called Yarrabong. They used to deliver their cargoes and take in other cargoes, and then go down the

B. Lee, Esq.  
14 July, 1896. Hunter River to Newcastle. That was closed by a flood-gate at what is now known as Victoria Bridge. That flood-gate, in addition to being washed away once or twice, and being rebuilt at an enormous cost, effectually succeeded in destroying the whole of that stream which was previously navigable for miles, and it has become a filthy ditch, destructive of health, and within the last few years the Minister for Public Works has contributed a large sum of money to people there, to clear out the ditch, the navigation of which ought never to have been stopped.

1762. *Mr. O'Connor.*] You are of opinion that if that had never been interfered with that large expenditure would have been unnecessary? Utterly so.

1763. And they would be better off? Far better off. Then look at all the injury that has arisen from the artificial works constructed on the Hunter River. They want now to go on to private property on the other side, and to take away people's property that has been improved—reclaimed as it were by the artificial works made in the township. What used to be a running stream past a man's door became a sandbank and grass-paddock where he feeds his cows; and now they have the audacity to demand that that shall be taken from him, because they say that it throws water on works they have constructed on the other side. I do not think that impudence could go any further, and that is after spending enormous sums of money. All this goes to exemplify what I have already stated, namely the folly of interfering with natural water-courses, unless it is to give facilities for the water to get away more quickly.

WEDNESDAY, 15 JULY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.  
The Hon. CHARLES JAMES ROBERTS, C.M.G.  
The Hon. WILLIAM JOSEPH TRICKETT.  
The Hon. DANIEL O'CONNOR.  
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
JOHN LIONEL FEGAN, Esq.  
THOMAS HENRY HASSALL, Esq.  
FRANCIS AUGUSTUS WRIGHT, Esq.  
FRANK FARNELL, Esq.

The Committee further considered the proposed Improvement of Cook's River.

James Phillip Webster, Esq., A.M.I.C.E., Engineer and Overseer to the Borough of Marrickville, sworn, and further examined:—

J. P. Webster, Esq., A.M.I.C.E.  
15 July, 1896. 1764. *Chairman.*] Does the flood affect the lower side of the dam at Cook's River, and how high may it reach above high water? I have personally inspected Cook's River at the eastern side of the dam, also at the entrance to Shea's Creek, have taken levels, and am now in a position to verify my statement that there is no difference in level of water to be of any practical value.

1765. In other words, the flood-level will be as high on the seaward side of Cook's River Dam as it is at Shea's Creek, and, therefore, you can go up the estuary of Cook's River to where it is intercepted by the dam and get as good a discharge head as you can into Shea's Creek? That is so.

1766. The discharge-level will be the same? The ordinary high-water mark is the same. I will now deal with the flood-level. In flood the water rises at the entrance to Shea's Creek similarly to what it does at the eastern side of the dam. The greatest difference during the late heavy gales was 2½ inches, which I consider of no practical value. I found the flood-marks at both places, which I make 10 inches over ordinary high-water mark.

1767. So not only the high-water mark at the eastern side of the dam is on a level with that at the junction of Shea's Creek and Cook's River, but the flood-mark is the same also; therefore, whether it be affected by the tide or affected by the flood, the discharge at either place would be at the same level? Quite so.

1768. How far is it from Cook's River Dam to the mouth of Marrickville Flats? Half a mile, roughly.

1769. Have you taken the levels from the dam to the mouth of Marrickville Flats? Yes, I have.

1770. Between the dam and the entrance to Marrickville Flats there is a contraction of the river-banks? I do not admit that there is a contraction of the river-banks. There is a decrease in the size of the river, but then the drainage area decreases also.

1771. Can you give us any reliable information as to the difference between water-level opposite the mouth of Marrickville Flats and at the upper side of the dam? It is the same.

1772. Are we then justified in inferring that if the dam were removed, the high tide would be practically level from the mouth of Shea's Creek to the mouth of Marrickville Creek? Yes, you are, provided that a sufficient channel is left for the flood-waters or discharge of the drainage area of Cook's River.

1773. I was talking of high-tide floods. In flood-time what would be the difference in flood-level, supposing there were no impediment at the dam between the mouth of Marrickville Flats, in Cook's River, and the junction of Shea's Creek and Cook's River? None of any value.

1774. Therefore, in your opinion, the alternative scheme has been based upon a wrong contention? Yes.

1775. What, then, is the value of the alternative scheme? It is of no value whatever.

1776. If you rob it of the fall, can you urge anything else in favour of it? Nothing in favour of it, but a great deal against it.

1777. Will you again state what are your objections to the alternative scheme? My great objection to the alternative scheme is that it does not give a better outfall than the natural outlet at the mouth of Marrickville Valley. Another objection to it is that it is an artificial channel and is covered in, and has a fall that will not render it self-cleansing. The third objection is that the channel is too small to carry off the waters in a sufficient time to be of any benefit to the district.

1778. You have made a calculation? Yes.

1779. And you maintain that your calculation was correct? I do.

1780. *Mr. Lee.*] Then, if it were not sufficient to carry off the water from that flat, and if a dam were made at the mouth of the Marrickville Valley, the inundation of the buildings would continue? Yes, it would for a longer period than it does at present, and even longer if the river were widened and cleared and the natural outlet at the mouth of the valley were opened out.

1781. *Chairman.*] What do you consider would be a reasonable discharging area for Cook's River at the dam—what length of sluice-gate? 300 feet.

1782.

1782. The Departmental proposal is to reclaim by means of a fascine bank, and thereby contracting the present bed of Cook's River between the dam and the railway bridge; below the railway bridge in the present dam, there is what you may call a very fair receiving area that would aid in relieving the floods—a sort of collecting area;—is it a wise thing to contract that? Not at the present time, and looking at it from an economical point of view, it is not.

J. P. Webster,  
Esq.,  
A.M.I.C.E.  
15 July, 1896.

1783. Better clean it out? It would be better to clean it out, owing to the fact that reclaiming would be a costly work to carry out, and if it were carried out the value of the land, judging from the surroundings, would be low. I do not think it would amount to anything that would justify the expense.

1784. It might be some advantage also as a sort of receiving area for the water from Wollie Creek and Cook's River when the tide was rising? Yes, that is so. It would increase the impounding capacity above the dam, which is of some importance, and another thing that it would do is that it would leave a considerable extent of sluice-gates to be used, which, if it were filled up, would have to be closed and necessitate new ones being constructed on the southern side.

1785. You mean preserve the sluice-gates on the northern side to do as much as they can? Yes, as much as possible, thereby saving the cost of constructing new gates on the southern side.

1786. And you believe that it would be wiser to take the storm-water discharge down the drainage centre? Yes, the natural discharge.

1787. You understand, of course, that that will not do much more than alleviate the trouble—drain the flat quickly when the flood-waters come there, but will not prevent floods absolutely? It will not prevent floods absolutely, as I explained in my former evidence.

1788. It is, you think, the best you can do without pumping? Yes, and intercepting the high-level waters.

1789. *Mr. Lee.*] But neither of the present proposals would entirely relieve Marrickville? No. The only possible way to relieve Marrickville properly is by pumping.

1790. *Chairman.*] And by intercepting? Yes. By intercepting the waters from as large an area as possible and pumping a minimum quantity—that is, reducing the low-level area and making it of the least possible extent. The low-level area is comparatively a small area.

1791. *Mr. Lee.*] By pumping from where? The whole of the area would have to be pumped from the inside of the proposed dam.

1792. To throw the water over it into the river? Yes.

1793. And by a proper system of drainage the water could be brought down to that point from the low levels? The water from the whole of Marrickville, excepting some 400 acres on the west, which drains directly into Cook's River, gravitates to that point.

1794. You have had, I suppose, to consider a number of times this question of dealing with the accumulated waters at Marrickville? Ever since I have been in Marrickville it has been brought prominently before me, and I have taken a very great interest in dealing with the storm-waters.

1795. But you found it a difficult problem to deal with? Well, as a drainage problem, it is not a difficult one. It is a matter of expense.

1796. But as drainage by gravitation, it has been a very difficult matter? Yes; that is, allowing the whole of the waters to gravitate on to the flat.

1797. You have taken the precaution to satisfy yourself that if the alternative scheme were carried out it would be of no earthly use? I am positive of that.

1798. Therefore, after studying this question from every point of view, you have had to come to the conclusion that the only way to relieve Marrickville would be by putting a dam across the mouth of the valley to prevent the inflow of flood and tidal waters, and to erect sluice-gates sufficient to take away as much flood-water as the tide would permit, and to pump the balance? The main point is the lowering of the water-level at this side, so as to obtain the maximum fall.

1799. That is another point altogether; first of all you must prevent the inflow of water? Quite so.

1800. That would necessitate a dam there? Yes.

1801. And that, I presume, would deal with both flood and tidal waters? Yes.

1802. And once having prevented that, the question is how are you going to get out from inside the dam water which might be termed surface water? The only way to do that is to let it out at low tide, taking advantage of the falling tide to let it out.

1803. So there would not be a discharge for this in flood-time, if the surface water were to accumulate on Marrickville Flats and Cook's River were in flood, and therefore the discharging power at that particular time would be practically nil? It would be very small indeed.

1804. Do you think that flooding by surface water would last only for a short time? Yes.

1805. But still that short time would be quite sufficient for the inundation of those buildings in the low-lying places? I quite realise the fact that a scheme such as the one under consideration would minimise the liability to flooding.

1806. But still, even if that is carried out, some of those buildings would still be inundated? During excessive storms.

1807. So the Committee are to consider that no matter what scheme may be carried out, or even if your proposal be carried out, there will still be an accumulation of water about Marrickville, but not so much as there would be under present circumstances? Yes.

1808. And nothing will remove that speedily except pumping? That is so.

1809. *Mr. Humphery.*] In reply to Mr. Lee, you spoke of the difficulty of a gravitation scheme; what you really mean is that a gravitation scheme is impracticable, do you not? A gravitation scheme to relieve Marrickville Flats at all times from being flooded is impracticable.

1810. Nothing but a pumping scheme would be effective? Nothing but a pumping scheme, and the intercepting of the high-level waters.

1811. So, as a matter of fact, both the original scheme and the alternative scheme, in your opinion, would not free Marrickville wholly from water lying during flood-time on the lower part? It would not completely.

1812. On that point you are quite clear, are you? Yes.

1813. In your opinion will it be necessary to make any alterations whatever in connection with the railway embankment and the opening in it in carrying out the proposal for drainage? None whatever.

1814. That is your opinion, notwithstanding anything that may have been said to the contrary by other witnesses who have been examined? Quite so.

- J. P. Webster,  
Esq.,  
A.M.I.C.E.  
15 July, 1896.
1815. *Mr. Hassall.*] Would a pumping-plant erected at the earthwork dam at the end of the Marrickville Valley to keep out the water of Cook's River be more beneficial as a scheme for draining the valley than the alternative scheme proposed by Mr. Darley? To pump the whole of the 1,700 acres of the Marrickville watershed would be a work that I would not advise should be undertaken.
1816. Would the natural drainage of the valley gravitate to that earth dam put across to prevent the water of Cook's River flowing up the river? It would come to that dam.
1817. So that if a pumping-plant were erected there it would be better in that position than it would be at the point indicated in Mr. Darley's scheme? Undoubtedly.
1818. And it would save the expense of the construction of that channel? Yes; because the drainage of 180 acres would in that case have to be made to gravitate northerly.
1819. You would have to make provisions to drain the water back to that point? You would have to do that by artificial means.
1820. Whereas the natural drainage would go to the earthwork dam? Yes, that is the natural outfall.
1821. And surface water might be pumped from there into the river? Quite so.
1822. *Chairman.*] The water coming into Marrickville Flats comes from various municipalities, and if a discharge for flood-waters be constructed along Marrickville Flats, ought the expense of that to be a charge upon the whole catchment area? Decidedly so.
1823. Not upon Marrickville alone? No; because a considerable area of Newtown must for all time drain through Marrickville, and I should say, roughly speaking, that half of the Municipality of St. Peters also drains through.
1824. And for such a storm-water discharge those boroughs should be treated in the same way as the Government treat other municipalities with regard to their storm-water discharges? In my opinion they should be treated on precisely the same lines as the Borough of Marrickville should be treated. The only difference is that Marrickville has a larger area gravitating to Cook's River than the other boroughs have. It is only a difference in the area—no difference in the principle.
1825. It is a difference of detail, not a matter of principle? Not a matter of principle—only a difference in the area.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Improvement of Cook's River.

APPENDIX.

A.

[To Evidence of C. W. Darley, Esq.]

MR. CAMPBELL'S COMPLAINT REGARDING THE CREEK RUNNING THROUGH MARRICKVILLE VALLEY.

1 February, 1888.

I VISITED this locality in company with Mr. Campbell on 19th January. I visited it again in company with Mr. Stayton (by arrangement with the Commissioner for Roads and Bridges) this morning.

The creek referred to is the natural course for storm-waters from a large area in the three municipalities mentioned by Mr. Campbell; and in addition it carries a considerable quantity of sewage. Its course is much obstructed by growths, as well as in other ways; and towards its mouth where it falls into Cook's River above the dam, it divides into several channels, all of which are overgrown and inefficient. In its course there are two or three rather extensive swamps. The level of much of the valley is at or scarcely above high-water level; that of the river is usually 2 or 3 feet below high-water level, but in heavy rains rises to a foot or more above high-water, and then the valley is flooded, and, as Mr. Campbell points out, much of the sewage spreads over the flats. Thus nothing that can be done in the way of clearing and widening the natural channel will do anything towards preventing floods; and the works which of this kind are now being done by the Marrickville Council, consisting in cutting the creek to a uniform width of 14 feet and slightly deepening it, will aggravate any nuisance at present caused by sewage. The section ordered will ensure the arrest of solid matters and stagnation of the flow, which will be the more offensive in that it is to be spread out over a wide surface; and the work is being begun at the wrong end, in as far as the outfall is choked and nearly useless. In point of fact ratepayers' money is here being thrown away; and the example shows how necessary it is that such works should not be allowed to be begun until they have been submitted to and approved by a competent Board. As to the passage of sewage down this channel, nothing can be done to prevent it until the sewerage of the suburbs is done. It is very undesirable, as Mr. Campbell points out, that it should enter the river above the dam; but this cannot be helped. All that can be done at present is to ensure its falling into the river, and to prevent its being backed up along with flood-waters and spread over the lowest parts of the valley.

In the Report on the Sewerage of the Western Suburbs which has just been completed by Mr. Stayton, under the direction of the Commissioner for Roads and Bridges, and recently presented by the latter to the Minister for Works is a special section devoted to the prevention of floods in this valley. This Mr. Stayton proposes to do by widening and embanking the creek, and raising the level of the lowest land from 2 feet at the river end to 4 feet at Premier-street. In addition, and as a part of the sewerage scheme, the sewage now complained of is intended to be brought (along with much besides) to a spot near the mouth of this creek, where it will be raised sufficiently to gravitate to Webb's Grant. None but some such plan as this will remedy the matter complained of. Perhaps the Commissioner would forward to you a copy of the section in the report referred to, for the Board's further information, in which the matter is very clearly explained.

The President, Board of Health.

J. ASHBURTON THOMPSON, M.D.,  
Chief Medical Inspector.

A 1.

REPORT BY MR. G. H. STAYTON UPON MARRICKVILLE DRAINAGE.

Condition of Creek.

Department of Public Works, Sewerage Branch, Sydney, 19 July, 1888.

THE question referred to in the letter from Mr. G. H. Smith and others, dated the 10th instant, and from Mr. Curruthers, M.P., of yesterday's date, has received attention. The locality was viewed yesterday by the Engineer-in-Chief, accompanied by Mr. Alderman Graham and myself, and we inspected the creek or watercourse from Edgeware Road to Cook's River. The condition of the creek between Renwick-street and Cook's River is extremely foul, and from the abominable stenches which are given off by the putrid filth which has been allowed to accumulate, it cannot be regarded otherwise than as highly dangerous to public health.

In reply to the Minister's query "whether the case is as bad as represented," I do not hesitate to affirm that it is. It may also be stated that whilst the proposed sewerage scheme for the western suburbs would provide a permanent remedy, the present state of things is so bad that immediate action is necessary for the protection of the health of the inhabitants of the locality, and of those persons who pass over the creek to and from the railway station at Tempe.

To deal with the existing dry weather flow in order to temporarily relieve the nuisance forthwith, the following proposals may be considered, viz. :-

1. To open the tidal flaps at Cook's River Dam and allow the tide to flow in. This could be done occasionally, but always under inspection, so that overflows might be prevented at high-water. It is obvious that the addition of a large quantity of water would sweeten the condition of the creek, and, provided the obstruction in the bed of the creek near Premier-street bridge were removed to a depth of 18 inches, the foul water could be drawn off at low tide. The filth would thus be so diluted as to be almost inoffensive in the river. It would, of course, be necessary to remove the rushes and other obstructions from the water-way, and the operations would no doubt necessitate the use of fire and disinfectants to minimise the stench created by disturbing the mud. The low places at the sides of the creek where the filth now overflows (e.g.) near Premier-street bridge, should be at once filled in with earth to the level of the adjacent banks.
2. To remove the obstructions from the water-course near Premier-street, and to flush the creek south of Edgeware Road with the greatest available supply of water from the nearest mains, at least once a week during the existing dry weather.
3. To construct a pipe drain from below Premier-street, so as to discharge below Cook's River Dam—a distance of 2,600 feet. The levels of the creek are such, however, that it could not be effectually drained during dry seasons, even at low water; but apart from this the works would be costly to execute, and would take a considerable time to construct.

4. The abolition of Cook's River Dam, or rather the entire removal of the tidal flaps, and the construction of a dam or weir above the creek outlet, would enable the creek to be drained permanently into a tidal way. This scheme would necessitate considerable embanking and reclamation works at the broadwater part of the river between the Illawarra railway and the existing dam, so as to reduce the width of the water to a proper channel. The reclaimed areas might be utilised as recreative reserves or otherwise.

On the whole, I am of opinion that it would be the most expeditious plan to remove the beforementioned obstructions from the water-course, and to open the flaps at ebb-tide; at the same time giving the whole creek a copious flushing as described on the foregoing page. The tidal waters could then be admitted to the required level. These operations would only be necessary during extremely dry seasons.

GEO. H. STAYTON,  
Assistant Engineer for Suburban Sewerage.

A 2.

REPORT ON DRAINAGE AND PREVENTION OF FLOODS AT MARRICKVILLE VALLEY.

Sewerage Branch, Sydney, 2 April, 1890.

I HAVE perused Mr. Price's report and examined the plan and sections which he has attached; I have also visited and carefully examined Cook's River Dam, Cook's River from the Dam to the low-lying land, and the Marrickville Valley.

There can be no doubt that something should be done to carry away the stormwater off the Marrickville watershed, and prevent the flooding of the low-lying land on the Marrickville flats, but it is certainly a difficult matter to design such a scheme as will be both effectual and economical.

Mr. Price states that the flood-level of May 1889, at the Cook's River Dam was 5 ft. 5 in. above high-water mark, and as this appears to be the worst flood on record, a scheme that would carry away such a flood might be considered effectual.

Before any plan can be devised for effectually preventing this low-lying ground from being flooded, it will be necessary to ascertain the several causes that brought about such a high flood-level in 1889.

It would appear from the information given by Mr. Price in his report and sections, that the causes were as follows, viz :—

1. The chief reason was the phenomenal rainfall.
2. The flow of the river was obstructed by the sandbank at the railway bridge to the extent of 1 foot.
3. The level of the river was 2 feet higher on the inside of the Cook's River Dam than on the outside, showing clearly, as Mr. Price points out, that there was a second obstruction at the dam to the extent of 2 feet. It would therefore follow that if there had been no obstruction at the railway bridge, and the Cook's River Dam had been provided with sufficient openings or sluices, the flood-level at the Marrickville flats would have been 3 feet lower than was the case in 1889.

	Above H.W.M.
Flood level of Marrickville Valley, May, 1889 .. . . . . .	5' 5"
Deduct for obstructions that existed in May, 1889 .. . . . . .	3' 0"
Then flood-level of May, 1889, would have been .. . . . . .	2' 5"

Mr. Price, in his scheme, provides for removing the obstruction at the railway bridge, and by this means the flood-level at Premier-street is reduced to 4.5 above high-water mark. There does not appear to be any reason why the 2-ft. obstruction at the Cook's River Dam should not be similarly removed by inserting suitable sluices in the dam, and thus further reduce the flood-level at Premier-street to 2.5 above high-water mark.

Assuming that the river was deepened, and an adequate water-way provided at the dam, the large provision which Mr. Price proposes would not be necessary, and something less expensive might be substituted.

Mr. Price has designed the channels capable of discharging 2 inches of rainfall per hour, where, it has been found from experience in Sydney and suburbs, in the construction of storm-water channels under similar conditions, that 1 inch of rainfall per hour to flow off at once, is a liberal allowance to make, although more than this amount of rain may fall in an hour, the water does not all reach the channel at a faster rate than 1 inch per hour. Mr. Stayton has provided for  $\frac{3}{4}$  of an inch to run off at once, and I am of opinion that this is sufficient. It would therefore appear that the channels in question, supposing that it was desirable to construct three channels in the positions given, would only require to be half the capacity proposed.

When only sufficient rain falls to cause a small flow in the channels, and the water from any cause becomes stagnant, I have no doubt that three channels of such great widths would be found to be a serious nuisance.

After carefully considering Mr. Price's scheme, and comparing it with Mr. Stayton's proposal contained on page 26 of his Report on the Sewerage of the Western Suburbs, I have come to the conclusion that the channel suggested by Mr. Stayton is the best and cheapest method to deal with the difficulty, and would render Marrickville Valley free from floods, provided :—

1. That instead of the top level of the channel where it joins Cook's River being 2 feet above high-water mark it be 3 feet, and the top-level of the channel at Sydenham Road, 5 feet above high-water mark instead of 4 feet.
2. That Cook's River be deepened between the point where the channel joins the river and the dam.
3. That an adequate water-way be provided in the dam to allow the river to flow without interruption at that place.

By referring to page 2 of this report with diagram attached, it will be seen that by making the level of the channel proposed by Mr. Stayton, 3 feet above high-water mark at the point where it joins the river, even under such a combination of adverse circumstances as occurred in May last, the flood-level would be 6 inches below the top of the channel at that point, and 2½ feet below the top of the channel at Sydenham Road.

It would be necessary to convey into this channel the storm-water from the highlands: this might be done by laying pipes or constructing gullies, &c., at the intersection of the several streets and roads. Until the land was filled in, as proposed by Mr. Stayton, the ground below the level of the channel on the north side of the valley, would be drained by the present wrought-iron fluming. A small channel might be excavated for the same purpose on the south side of the channel. The cost of constructing the proposed channel, deepening the bed of the river, &c., would be, viz. :—

Excavation for channel, &c..... cubic yards	17,766	3/-	£2,664 18 0
Filling into embankments..... cubic yards	13,732	2/-	1,373 4 0
Sandstone concrete in channel bottom..... cubic yards	9,522	34/6	16,425 9 0
Turfing slopes of embankments..... square yards	18,951	1/6	1,421 6 6
Raising road levels.....			5,000 0 0
Four wooden bridges.....			960 0 0
Deepening the river at the railway bridge.....			1,000 0 0
Total estimated cost.....			£28,844 17 6

This is £8,844 17s. 6d. above Mr. Stayton's original estimate, and is caused—

1. Chiefly through providing a concrete bottom for the whole width of the channel, as per cross-section annexed, instead of a narrow strip only along centre line of channel. The concrete bottom for the whole width of the channel will carry the dry weather flow better, and will be more easy clearing, and prevent silting up and scouring.
2. Deepening the river at railway bridge.
3. Construction of four wooden bridges.

Compared with Mr. Price's scheme, Mr. Stayton's proposals would have the following advantages, viz :—

1. The area of land that would have to be resumed would be reduced from 220 to 176 acres.
2. No houses would have to be taken down.
3. No alteration to sewerage scheme for western suburbs.
4. No charge for maintenance, fuel, and general working expenses of pumps.
5. The position of no street would be altered—as in the case of Meeks-street, see Mr. Price's plan.
6. In order to raise the valley above flood-level as proposed by Mr. Stayton (exclusive of centre channel) other filling of 1,264,000 cubic yards, @ 2/6 £158,000 would be reduced to 725,227 cubic yards, @ 2/6 £90,653 7s. 6d.

But

But I consider it inevitable that this valley should be filled up, in order to put it into a good sanitary condition, and make the land available for building and recreation purposes.

Mr. Price's scheme would cost in all about £153,000, and £51,317 = £209,317. Mr. Stayton's scheme would cost in all about £90,653 7s. 6d., and £28,344 15s. 6d. = £119,498 3s. 6d., or £90,318 17s. less than Mr. Price's scheme.

7. As pointed out previously, these high level drains of such a great width would no doubt work well when there was sufficient water to cause a good flow, but on the other hand, supposing the rainfall to be small, and this small amount of water to carry with it a quantity of sewage matter off the streets and land into the channel, then the great area of channel would be a serious inconvenience and cause much nuisance. Whereas the channel proposed by Mr. Stayton would be only 53 feet wide at bottom, and have a concrete bottom which could be easily cleaned.

I attach a diagram on which are shown the proposed channel, the flood-level of May, 1889, and what the flood-level would be in future under similar circumstances if the works proposed in this report were carried out.

C. H. OILFSEN BAGGE.

### A 3.

#### MARRICKVILLE FLOODS.

Department of Public Works, Harbours and Rivers Branch, 19 April, 1890.

I beg to report that the class of work required to remedy the floods which cause so much trouble in this district is of no exceptional character.

There are in many countries large populations living on land similarly situated as to their relative levels to the tidal waters. It is well known that many are dependent on their dykes, which prevent the sea at high tides from flooding their country.

The chief difficulty in this Marrickville district is the great expenditure necessary to resume all the properties that are subject to these floods.

If this land were Government property and clear of buildings, sea-tanks and flood-gates could be constructed, and intercepting drains made, that would discharge above the tides. A central channel could be cut and turned into an ornamental lake, and the low grounds used for park purposes.

But I will conclude that it is not practicable for this land to be resumed by the Government, or that any interference should be made with the buildings on this land, and that the works that I have to suggest for your consideration are those that will at a reasonable cost give the greatest amount of relief to the high floods that interfere very seriously with so much public property.

The first work is the continuation of the dredging operations from Cook's River Dam to Botany Bay.

This work is authorised, and although only partially carried out, has already had the satisfactory effect of causing the levels of the tides at low water to be 2 feet lower at the dam than they were previous to the starting of these works.

The late Commissioner for Roads was aware of this fact, and acknowledged the great importance this would have in the drainage of this district.

The continuation then of this dredging becomes of the first importance, for the deepening of this wide channel that is now aligned with fascine banks will not only make it navigable, and of great value for commercial purposes, but it will also pass the flood-waters off much more rapidly.

The fact that this work in the lower river has already given an increase of fall at low water of 2 feet at the dam, and that this can still be increased by further dredging, suggests the second work that I propose should be carried out.

This is the lowering of the sills of the flood-gates in the dam these 2 feet. And inasmuch as the flood-waters are greatly impeded at present by the insufficient area of the flood-gates, the sills should not only be lowered, but ten additional flood-gates should be built, to hang loose with links from a higher frame, so that the flood-waters may have a perfectly free vent between the rise and fall of the tides. At present there is always a fall of from 2 to 3 feet through these gates at flood-time.

In the highest flood on record, last May, when twenty inches of rain fell in four days, the fall at high-water at this dam was at least 2 feet.

Mr. Price states in his carefully-studied report, that as the river level below the dam is raised by the tides and flood-waters 2½ feet above high-water, no system of sluices, or even clearing away the dam altogether, would protect the inundation of all lands less than 3 feet above high-water. This rise in the river only occurred once in twenty years, and that was the last May flood, and I am satisfied that if the river channel had been dredged to a uniform depth of 10 feet, low-water, and the sills of the gates lowered the required 2 feet, together with the additional flood-gates that I now refer to, this flood-water would not have accumulated in the river to anything like the same extent; and although very exceptional floods may occur once in twenty years, even then a much smaller area of land would be flooded, and such a flood would, when these works are completed, pass from off the land in much less time. In fact the water would nearly pass off with each tide.

The chief advantage of these new works would be the total relief from all ordinary floods that so often occur with only a moderate rainfall.

The works of dredging the lower river and increasing the number of flood-gates in the dam must also be supplemented by the third and last work that I can suggest as being practicable: that is, the deepening and widening of the river channel above the dam, as shown within the strong red lines on the accompanying plan. At present this channel is full of mud, and as the drainage of this district enters this pound, it is most necessary to have it dredged out, even on sanitary grounds.

The banks should be aligned with fascine work, and a small area of the now useless swamp land should be resumed, and the whole brought above flood level, the increased value of which would in a great measure recoup the expenditure.

Cook's River is the drain of the district; it is under the jurisdiction of the Government. At present the bed of the river is full of mud, and it is a legitimate and necessary work to clear this channel, and adjust the flood-gates, and continue the deepening of the lower channel, so that this river may be made of the greatest benefit to the people, and at the same time every possible obstruction to the free flow of the flood-waters removed.

I estimate the work of the flood-gates at £6,000, and dredging and aligning the river above the dam £8,000 = £14,000.

ALFRED WILLIAMS,

Assistant Engineer, Harbours and Rivers Department.

### A 4.

#### LOW-LYING GROUND, MARRICKVILLE.

Roads and Bridges Branch, Sydney, 25 April, 1890.

THIS place has been so fully described at various times that it is unnecessary for me to dwell on this part of the subject, suffice it to say these swamps cannot be other than a great nuisance, and injurious to the health of the surrounding population, more particularly to those who may have settled upon it.

The steps necessary to be taken to remedy this state of affairs must be considered from two points of view, engineering and commercial.

With regard to the former, there is no great difficulty in dealing with it, it is a matter of money; given *carte blanche* as to funds the engineering difficulties melt away.

The commercial aspect is, however, a much more difficult matter to deal with, and before my scheme is decided upon, I think this part of the question should be very carefully gone into by the Government Valuator.

At first sight it would seem that the proper thing to do would be to lower Cook's River Dam, and clean out the river, probably confining it within banks as has been done in the lower part of the river, but from a perusal of Mr. Price's report, it would appear that this would be of little use, as, during the late heavy rains the level of the water below the dam was actually raised to such a height as to cover a considerable portion of the swamp.

It may be said that this happened during exceptional weather; this no doubt is true, but it may and most likely will, occur again, and as the usefulness of a chain must be measured by its weakest link, the useful effect of this scheme must

must be looked upon in the same light. I do not think any scheme is worth considering which does not provide for the complete reclamation of the swamp, and for that reason I am of opinion there are only four ways which present themselves for remedying this very unsatisfactory state of affairs:—

1. Simply making a drain through the centre of the swamp.
2. Making this drain and filling up the swamp to high-water mark.
3. Making an embankment along Cook's River, catch-water drains around the swamp, and filling up to high-water mark.
4. Filling up to above flood-level and providing suitable drains.

The cost of these schemes I estimate roughly as follows:—1. £11,000; 2. £42,000; 3. £52,000; 4. £140,000.

The first scheme has nothing to recommend it; in fact, it is hardly worth being considered. It would perhaps make the swamp a little less unsanitary than it is at present, in that it would collect a great part of the drainage (that finds its way through the swamp to the creek), into one channel with a smooth surface and consequent ready get-away, but it would leave the swamp still liable to being flooded and practically useless.

No. 2 scheme is decidedly better, but as it would not make the place of any more commercial value than at present, I could not recommend the expenditure of £42,000; it could not be used for anything but a recreation ground, and even for that would not be desirable. The choice lies, therefore, between Nos. 3 and 4 schemes.

No. 3 has much to commend it; it would effectually drain the swamp, make it sanitary, and that for the comparatively moderate sum of £52,000. I am not sure, however, if it would increase to any great extent the commercial value of the place. To some extent it no doubt would; but I question very much if it would be desirable to allow houses being erected on that portion which would be raised to high-water mark; they would of necessity be damp and unhealthy.

No. 4 scheme is, of course, the complete one; but I fear the estimate, £140,000, puts it out of the running.

I think the proper course now to adopt is to submit schemes Nos. 3 and 4 to the Government Valuator for a report on the commercial aspect. If by any possible means of purchasing and re-selling this land a fair remuneration could be obtained for the larger outlay, there can, I think, be no doubt but that it would be the proper one to adopt. If not (which I think is very probable), I would recommend scheme No. 3.

I dare say for the increased value to the surrounding properties, some return might be obtained for this expenditure.

If either of these schemes were carried out, the nuisance which is said to exist in Cook's River would, to a very great extent, be done away with.

The Under Secretary, Department of Public Works.

ROBERT HICKSON.

[To Evidence of J. M. Smail, Esq.]

#### INTERCEPTION OF STORM-WATERS AT MARRICKVILLE.

Parliamentary Standing Committee on Public Works, Public Works Buildings, Phillip-street.

Sir,

I have the honor, by direction of the Chairman, to request you to be good enough to inform him if the storm-waters will eventually seek Marrickville Flat as a discharge, or whether they will be intercepted on the higher lands.

I have, &c.,

WALTER D. WHITE,  
Secretary.

J. M. Smail, Esq., Engineer-in-Chief, Water and Sewerage Board.

Sir,

The whole of the storm-water drainage of Marrickville Valley, viz., parts of Petersham, Newtown, Marrickville, and part of St. Peters, flows into Cook's River. It is not intended to intercept any of the water which now flows down on to the flats, except that which would fall on roofs and backyards of premises, which will be ultimately connected to the sewerage system.

J. M. S.

The Secretary, Parliamentary Standing Committee on Public Works.

[To Evidence of J. P. Webster, Esq., A.M.I.C.E.]

#### CONTEMPLATED IMPROVEMENTS TO COOK'S RIVER.—STATEMENT BY THE BOROUGH ENGINEER, MARRICKVILLE.

1. (a) Does the flood affect the lower side of the dam at Cook's River?  
(b) How high may it reach above high water?  
(a) Yes.  
(b) Observations on this point have never been taken by me; but from a record of the flood in May, 1889, the water-level on lower side of dam was 2 feet above O.H.W.M. An easterly gale was blowing, with exceptional tides, so that the whole of the 2 feet could not be attributed to the increase of the volume of water by reason of flood in the upper part of the river.
2. (a) Does the flood at present affect Cook's River at the junction of Shea's Creek?  
(b) Are there any flood marks over high tide level?  
(a) The flood water must affect the river at the junction with Shea's Creek even more so than it does at the lower side of the dam, from the fact that its course is abruptly changed southward for nearly a mile, thus running in almost a straight line with the alignment of Shea's Creek, and exposing the junction of the two to the full force of all gales blowing from south to east, usually the heaviest that are experienced. Also, that after changing its course it contracts in width and becomes about the same as that portion of the river between the dam and Shea's Creek. Thus, while the river has not increased in size or velocity, the volume of water has been augmented by the whole of the Botany watershed through Shea's Creek and the full force of a south to east gale working directly against the current.  
(b) Not to my knowledge.

3. What will be the cost of altering Cook's River Dam so as to give sluice-gates on proper principles right across the 300 feet?
3. For lowering sills of present gates and replacing same with new ones, £2,012. For leaving sills of present gates at present level, replacing present gates with new ones, and extending openings to 300 feet wide, £2,500. For new work all through with sills on an uniform level, £4,210.
4. What authority is there for the statement that a rise of 4 inches of water above will make suitable gates work?
4. My own opinion. If I remember correctly 4 to 6 inches was mentioned. My reason in this case is that the position of the gates is so sheltered by the course the river runs east of the dam that material of the lightest description can be used in their construction. The effectiveness of tidal gates hinges on the following, viz.—1st. Angle at which they are placed. 2nd. Weight of material in their construction. 3rd. Amount of friction caused by the principle of hanging.
5. The cost of reclaiming V-shaped piece of land on the north-east corner near present Sydney side of the sluice-gates?
5. Level of reclaimed land, 2 feet above O.H.W.M. ; cost, £9,375.
6. Cost of dredging Cook's River and Wolli Creek?
6. Including cost of dredge, £3,000.
7. Cost of V-shaped fascine bank to direct course of Cook's River and Wolli Creek?
7. Cost, £750.
8. Cost of Marrickville Dam?
8. Dam, £534 ; sluices, £410. Total, £944.
9. Cost of drain, 40 feet wide down valley from intake?
9. Sides protected with stone-facing. Cost, £2,403.
10. Cost of sluice-gate in Marrickville Dam?
10. £410.

J. P. WEBSTER.

4th July, 1896.

APPENDUM.

Since writing answers to questions marked 2 (a) and (b) I have personally inspected Cook's River at eastern side of dam, also at entrance to Shea's Creek, have taken levels, and am now in a position to verify my statement that there is no difference in level of water to be of any practical value. In flood the water rises at the entrance to Shea's Creek similarly to what it does at the eastern side of the dam. The greatest difference during the late heavy gales was 2½ inches.

I found flood marks at both places which I make 10 inches over O.H.W.M.

J. P. WEBSTER.

## COOK'S RIVER IMPROVEMENTS.

(MINUTE BY THE ENGINEER-IN-CHIEF FOR PUBLIC WORKS ON THE PUBLIC WORKS COMMITTEE'S RECOMMENDATION RESPECTING.)

*Printed under No. 23 Report from Printing Committee, 22 October, 1896.*

### Memo. by The Under Secretary for Public Works and Commissioner for Roads.

Department of Public Works, Sydney, 2 September, 1896.  
THE Minister would like to have Mr. Darley's report on the Public Works Committee's recommendation with regard to the Cook's River improvements.

R.H.,  
Under Secretary for Public Works and Commissioner for Roads.

Report herewith.—C.W.D., 5/9/96.

### Minute by The Engineer-in-Chief for Public Works.

Department of Public Works, Engineer-in-Chief's Office, Sydney, 5 September, 1896.

Cook's River Improvements.

THE estimate submitted by the Public Works Committee for the scheme they proposed was £15,000. I did not see the details of the estimate before the report was issued, so am in no way answerable for the figures. The Committee did not fix the width of the openings to be made in the Cook's River dam—their recommendation being to make them the necessary width. The least width I consider necessary for flood-gates is 300 feet. In my original scheme I proposed 300 feet clear opening as necessary, so it is obvious that even a 300-foot waterway, more or less obstructed with sluices, is the very least that should be provided for.

My estimate for this work is	...	...	...	...	...	...	...	£19,500
To which should be added, at least, for training and retaining walls	...	...	...	...	...	...	...	3,500

Cost, exclusive of proposed land resumption	...	...	...	...	...	...	...	£23,000
---	-----	-----	-----	-----	-----	-----	-----	---------

The Committee made no provision for disposing of the silt from the dredged channels. I provided for this in my original scheme, by proposing to resume some frontage above the Cook's River dam, and fixing a retaining wall behind which silt could be pumped. If this wall were continued up past the railway bridge to the Marrickville dam, all the silt to be raised from the river could be disposed of behind it. Unless this is done, the full extent of river-bed cannot be cleaned out, as the silt cannot be disposed of.

I attach a plan, showing the reclamation I refer to, and the land to be resumed, which only amounts to about 2 acres, and is but of small value.

I think the land, when reclaimed, would be of considerable value, having a long frontage to Cook's River Road.

C. W. DARLEY,  
Engineer-in-Chief for Public Works.

I take it Mr. Darley does not recommend the scheme as passed by the Committee.—R.P.H., 5/9/96. Mr. Darley. No, I cannot recommend the scheme as passed without amendment as above.—C.W.D., 7/9/96. Submitted.—R.P.H., 7/9/96. I should like details of Mr. Darley's estimate of £19,500 on this report.—J.H.Y., 1/10/96. Mr. Darley for estimate required by Minister.—Jno. P. (For Under Secretary for Public Works and Commissioner for Roads), 2/10/96.

## PLANS.

Plan I.—Longitudinal section of Darling River, showing proposed system of Locks and Weirs from Bourke to Brewarrina.

Plan II.—Showing tenure of land within 3 miles on each side of Darling River which will be benefited by proposed Locks and Weirs between Bourke and Brewarrina.

## PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

### CONSTRUCTION OF LOCKS AND WEIRS ON THE RIVER DARLING.

## REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of constructing Six Locks and Weirs on the River Darling, from Stony Point to Brewarrina," have, after due inquiry, resolved that it is not expedient the proposed work be carried out; and, in accordance with the provision of sub-section (iv) of clause 13 of the Public Works Act, report their resolution to the Legislative Assembly:—

1. It would appear that the first step taken in the direction of locking the Darling was the engagement of Mr. George Gordon, M.I.C.E., to report upon the subject on behalf of a syndicate known as "The River Darling Navigation Company." Mr. Gordon, in June, 1883, reported on the feasibility of constructing locks and weirs between Wilcannia and Wentworth. His report was to the effect that it was quite practicable to make the river permanently navigable from Wilcannia to Wentworth, but the company took no further action in the matter. About November, 1885, the Harbours and Rivers Branch of the Department of Public Works took the matter up, collected information, and prepared plans dealing with the subject, upon which the Engineer-in-Chief, Mr. Darley, reported in November, 1890. Exceptional rainfall and high rivers were the features of 1890 and 1891, and the question of constructing locks and weirs on the Darling was allowed to remain in abeyance until the middle of 1892, when it was referred to the Water Conservation Branch. In August, 1892, surveys of lock sites between Wilcannia and Menindie were put in hand, but three months later the work was temporarily abandoned owing to floods. In October, 1892, the Minister for Works instructed Mr. F. W. Ward, and Mr. H. G. McKinney, Chief Engineer for Water Conservation, to visit the Darling, and report on the whole question of the locking of that river and the utilisation of its waters. Their joint report was ordered to be printed on 18th January, 1893. The survey of sites, which had to be temporarily abandoned in December, 1892, could not, on account of the flooded state of the river, be resumed during nearly the whole of 1893. In December of that year the surveys were resumed on the Lower Darling, and in the succeeding month they were continued on the Upper Darling. This work was again interrupted by a flood in March, 1894, and a month later work had to be stopped on the lower part of the river also. In December, 1894, instructions were given for the preparation of plans of an experimental lock and weir at Bourke; on 29th March, 1895, sanction was given for calling for tenders for the same, that of Messrs. Kerle and Kerle, for £18,868 11s. 8d. being accepted. The contractors commenced operations on 10th June, 1895, and discontinued in November of that year, since when the Government have proceeded with the work. The scheme for locking the Darling between Bourke and Brewarrina was, on 11th December, 1895, referred by the Legislative Assembly to this Committee for inquiry and report.

Proposal to  
lock the  
Darling.—  
Departmental  
Statement.

Official  
description.

2. Under this scheme it was proposed to construct six locks and weirs on the River Darling, between Bourke and Brewarrina. Owing to the unstable character of the channel, and the great range of level from low river to high floods, the Chief Engineer for Water Conservation was of opinion it would be unsafe to construct weirs which would interfere with or obstruct the waterway. The proposed weirs would consist of a series of timber shutters, averaging about 11 feet in length by 3 feet 3 inches in breadth. Each shutter, when erect, would rest at its bottom edge against a hardwood beam, set in solid concrete sill, and would be supported by an upright trestle and a sloping strut, both of wrought-iron. When the river was at navigation level each shutter would be pulled forward till the sloping strut was disengaged from its rest, and would then fall back flat on to the sill. In flood-time the whole weir would rest flat on the river-bed, so that the only part of the work which would in any way obstruct the flow would be one lock wall. The presence of this obstruction would, it is said, in every case be more than compensated for by widening the channel at the weir and excavating the bed to give a level sill. As shutter weirs of this class have not been used for greater heights than 14 feet, those designed are all under this height and are a modification of the Chanoine shutters in use in several rivers in France and in the Great Kanawha River, Virginia, U.S. Adjacent to each weir would be a lock 200 feet long by 37 feet wide; the height from the floor of the lock to the top of the side-walls would be about 15 feet. The lift through the locks from one water-level to the next water-level would be about 6 feet. One of the lock-walls would be built in the bank and the other a short distance out into the stream. They would be composed entirely of concrete in the mass. There would be bays, each 6 feet in width, intended to regulate the flow when the river was low. Beyond the bays would be situated the weir proper, consisting of a series of timber shutters. The locks were designed to be 200 feet by 37 feet in the clear, which is considered sufficiently large to take an average river steamer and an average barge together. The length of river rendered navigable by the construction of locks and weirs from Stony Point to Brewarrina would be about 156 miles.

Estimated  
cost of  
original and  
alternative  
schemes.

3. The total estimated cost of the scheme was £121,100, the details being:—

	£	s.	d.
Excavation (soft) ... ..	5,301	12	0
„ (rock) ... ..	1,425	0	0
Concrete ... ..	76,831	5	0
Timber in lock gates, &c. ... ..	5,140	16	0
„ sheet piling ... ..	3,000	0	0
„ main piles ... ..	227	10	0
Wrought iron ... ..	5,100	0	0
Cast „ ... ..	4,500	0	0
Pitching ... ..	3,567	17	0
Ashlar ... ..	2,032	16	0
Gun metal ... ..	241	6	8
Lead in joints of hollow quoins ... ..	18	0	0
Tarring (three coats) ... ..	198	0	0
Lock-keepers' cottages ... ..	1,500	0	0
Punts and wire rope ... ..	1,200	0	0
Coffer dams and pumping ... ..	5,000	0	0
Total ... ..	£115,284	2	8
Supervision and contingencies ... ..	5,815	17	4
Grand Total ... ..	£121,100	0	0

An alternative scheme, at a cost of £108,000, was submitted by the Department to the Committee which involved a departure from the general design, as in this case, while the weir would be in the river channel, the lock would be in the Beemery Cowl. The length of this cowl is one mile and three-quarters, and the length of the river between its two ends is  $5\frac{1}{2}$  miles, so that when the river was low and the navigation passed through the lock, steamers would be able to shorten their journey by  $3\frac{3}{4}$  miles. The Beemery Cowl is occasionally used by steamers during high floods, but a considerable amount of excavation would be required to clear out its channel in places. This excavation has been allowed for in the estimate. The alternative scheme would substitute one lock and weir, with a 10-foot lift, for weirs 4 and 5 of the original scheme; and it would also involve an increase from 6 feet to 9 feet in the lift at Vincent's Rocks, and an increase from 7 feet to 8 feet in the lift at No. 6.

4. It was contended by the Engineer in charge of the scheme that the construction of a system of locks and weirs from Bourke to Brewarrina would conserve a large supply of water in the Darling which would be available for irrigation on both sides of the river; guarantee an abundant supply of good water to the town of Bourke; afford permanent water carriage between Bourke and Brewarrina, and, while providing cheaper carriage, save the cost of a railway to the latter place; materially enhance the value of the Crown land bordering on the river between those towns; and increase the traffic on the Great Western Railway.

Objects and advantages of original scheme.

5. The views of the Railway Commissioners, as expressed by the Goods Superintendent of the Department of Railways, are to the effect that any improvement of river communication north of Bourke might be regarded as tending to develop trade, and would be in the general interests of the community; that it would be an advantage to the Colony if the streams to the north of Bourke were made efficient waterways, as such would serve as feeders to the railway; and, further, that if public money were spent in the improvement of the river such dues should be levied as would pay interest on the capital sum expended. If the river were improved the settlers north of Walgett would, it is thought, send their wool by way of the Darling to the railway terminus at Bourke, that being the cheapest route, and thence to Sydney. When the Darling has been high, small steamers have proceeded as far as Mungindi, on the Queensland Border, and brought wool down to Bourke.

Views of the Railway Commissioners.

6. The Committee examined a number of witnesses in Sydney, and subsequently a Sectional Committee visited the site of the proposed works, and took the evidence of local witnesses. The fullest opportunity has been afforded to witnesses or others interested to place before the Committee any information relevant to the inquiry. In Sydney there were examined:—Mr. H. G. McKinney, Chief Engineer, Water Conservation Branch, Department of Mines, who stated the nature and objects of the scheme and explained the details of the Departmental plans; Mr. John Harper, Goods Superintendent, Department of Railways; Mr. Charles L. Shainwald, (Messrs. E. Rich & Co., Sydney and Bourke); Mr. R. D. Jones, Metropolitan Inspector of Stock, Department of Mines; Mr. H. C. Russell, B.A., C.M.G., Government Astronomer; Mr. J. W. Boulton, Superintendent of Public Watering Places and Artesian Water Supply, Department of Mines; Mr. T. W. E. David, B.A., Professor of Geology, University of Sydney; Mr. George Maiden, Manager, Messrs. Goldsbrough, Mort & Co. (Limited); Mr. E. F. Pittman, A.R.S.M., Government Geologist; Mr. J. C. H. Mingaye, Analyst and Assayer, Department of Mines; Mr. F. B. Guthrie, F.C.S., Chemist, Agriculture and Forestry Branch, Department of Mines; Mr. P. Scarr, Principal Assistant Engineer, Roads and Bridges Branch, Department of Public Works; Mr. J. Burt, Draftsman-in-charge, Information Bureau, Department of Lands; Mr. W. S. Campbell, Chief Clerk, Department of Agriculture; Mr. C. W. Darley, Engineer-in-Chief for Public Works; Mr. G. Colquhoun, Crown Solicitor; and Mr. Alexander Oliver, M.A., President of the Land Appeal Court

The Committee's inquiry.

7. The Sectional Committee's report is subjoined hereto. That Committee arrived at the conclusion, after carefully considering all the circumstances, that the proposed construction of locks and weirs on the River Darling is premature. The following is a summary of the report in question:—

Sectional Committee's report.

#### SUMMARY OF REPORT BY THE SECTIONAL COMMITTEE.

##### 1. Conservation of water for irrigation purposes—

- (a) The Departmental statement with regard to the suitability of the land available for irrigation settlement adjacent to the river was not borne out by investigation, because nearly all the river frontage is liable to inundation at irregular intervals for a sufficiently long period to destroy stone-fruit trees and even lucerne.
- (b) The paucity of the local demand for the products of intense culture and the distance from the metropolitan market would delay any rapid settlement upon irrigated areas.
- (c) The large areas of suitable and more accessible land not yet utilised creates grave doubt with regard to there being any great demand for irrigation farms in this district.

(d)

- (d) It is doubtful if conditions are favourable for extensive irrigation from a series of pumping stations.
  - (e) It is questionable if pastoral occupation at present can profitably give way to agricultural settlement.
  - (f) Irrigation operations are not likely to extend at present beyond supplying fodder for such animals as are kept for domestic use, or for the more valuable stock.
2. Enhanced value of Crown lands—
    - (a) It is not probable that the value of Crown lands adjacent to the river would be materially increased.
  3. River navigation—
    - (a) The traffic on the Great Western Railway would not be materially augmented by the construction of the proposed works, and any increase would arise through leakage from other lines.
    - (b) The traffic on the route between Bourke and Brewarrina from intermediate points is very limited.
    - (c) The present rates of river freights would not be appreciably reduced, and the river route could not be utilised for the carriage of stock.
  4. Water supply to the town of Bourke—
    - (a) There is no serious objection to the present supply, and the maximum improvement contemplated by the Government proposal will be effected by the weir in course of construction.
  5. Other matters considered by the Sectional Committee—
    - (a) It is claimed that the shutter or movable weir has obvious advantages over a fixed weir, but the principle should be tested by the weir at present in course of construction before extending operations.
    - (b) The water impounded by the Bourke weir should be sufficient to test the question of irrigation by pumping under favourable conditions.
    - (c) Irrigation by artesian water at Pera Bore appears promising. A thorough test should be made to demonstrate the efficiency of this method of irrigation.
    - (d) The locking of the River Darling for inland navigation is a matter of importance to several of the Colonies, which should participate in the cost, and this question could best be dealt with by a Federal Parliament.

#### THE AREA UNDER CONSIDERATION.

The area under consideration.

8. That portion of the Darling River specially under consideration extends from Brewarrina to Bourke, a distance of about 156 miles. Although the course of the river is sinuous, it preserves a generally western trend. The waters of the Bokhara, augmented by those of Cato Creek, and the Culgoa, are the main feeders to the Darling from the north within the parts proposed to be locked. The Bogan is the main tributary from the south. The summer level of the Darling may be stated approximately as 40 feet below the river banks, which, however, are subject to submergence at irregular times and for a sufficiently extended period to be disastrous to plant-life. The water-level is sufficiently high to permit navigation for about half time, taking one year with another. The unreserved Crown lands within leasehold areas adjacent to the proposed works are 81,139 acres in extent; unreserved Crown lands within reserved areas and reserves not held under special homestead, 451 acres; reserved lands, 131,051 acres; homestead leases, 124,278 acres; alienated lands, 12,487 acres. A return published in 1889 shows that about £80,111 have been expended on snagging the Darling; of that amount it is stated about £4,000 to £5,000 have been expended on the distance under consideration.

#### THE CATCHMENT AREA OF THE DARLING RIVER, ABOVE BOURKE.

Catchment area of Darling above Bourke.

9. The catchment area of the Darling River above Bourke, within the Colony of New South Wales, may practically be regarded as bounded on the south-west by the railway from Bourke to Nyngan; thence by the Bogan to its source;

source; thence to Molong, Orange, and Bathurst; thence following the main range to the Queensland Border; thence following the Macintyre River and the twenty-ninth parallel of latitude to the Culgoa River; and thence by the watershed of that river to the Darling. The area embraced within these boundaries is 73,400 square miles. The catchment area within Queensland is approximately 49,000 square miles; therefore the Darling River at Bourke is the surface outlet for the rainfall on an area of 122,400 square miles.

#### SUPPLY OF WATER FOR IRRIGATION AND RIVER NAVIGATION.

10. The scheme submitted to the Committee has two main objects in view:—
- (1.) The conservation of water for irrigation purposes.
  - (2.) The maintenance of uninterrupted river navigation.

Supply of water for irrigation and navigation.

The first, speaking broadly, means taking water out of the river for use upon the land; the second, the preservation of water in the river for navigation purposes.

In very dry seasons the Darling may become a series of lagoons only; the supply reaching it from the catchment area not being sufficient to preserve even a sluggish current. It therefore follows that, should irrigation assume considerable dimensions, it may become antagonistic to navigation, when one or the other must be suspended.

When proposing to utilise water for a dual purpose it should be made clear that the supply will be ample. In the opinion of the Committee the volume of water in the Darling is insufficient, during prolonged droughts, to sustain leakage at the weirs and locks, loss from evaporation, the withdrawal for extensive irrigation operations, and still preserve the level necessary for river navigation.

#### IRRIGATION BY CONSERVATION AND PUMPING UNDER THE PROPOSED SCHEME.

11. Nearly all the land on the banks of the Darling between Bourke and Brewarrina is subject to inundation at irregular intervals for a sufficiently long period to destroy plant-life, stone-fruit trees, and even lucerne. Adjacent to Bourke is an area of 3,000 acres above flood-level and suitable for irrigation purposes. The weir in course of construction should furnish a test of the commercial value of irrigation by conservation and pumping under the most favourable conditions in respect to water, soil, contiguity to population, and proximity of railway communication. Irrigation by river water might well be attempted here before committing the Colony to expenditure upon a large scale, for it may disclose difficulties not at present foreseen, in addition to those particularised in the Sectional Committee's report, as well as those to which reference is made in the clauses dealing with artesian irrigation.

Irrigation by conservation and pumping under proposed scheme.

#### ARTESIAN WATER SUPPLY.

12. It is necessary in expressing an opinion with regard to the extent of the subterranean water supply to emphasise the fact that at best the boundaries as at present laid down can be regarded only as a rough approximation. Recent investigations have much altered ideas previously held as to its extent. Professor David and the Government Geologist, when placing their valuable evidence before the Committee, emphasised the fact that the information upon which they based their opinions was fragmentary, and it was probable, with the knowledge that exploration in the past had caused previous inferences to be modified, that further knowledge would in many ways modify their present views, which were based upon admittedly scanty information.

Artesian water.

To make this clear, two instances may be quoted:—

- (1.) Recent investigations show that the eastern boundary of the intake beds in Queensland extend from Texas towards Toowoomba instead of from Texas towards Roma as previously supposed, with the reasonable inference of an extension further north. The additional area given by the alteration of boundary is not less than 19,000 square miles.

Three

Three years ago the Government Geologist of Queensland held the opinion that the intake beds west from Toowoomba had a width of about  $\frac{1}{5}$  of a mile. Eighteen months ago he expressed the opinion that the width was about 5 miles; and now the Government Geologist of this Colony states the greatest width to be not less than 200 miles.

- (2.) The Government Geologist of Queensland mapped out the Blythesdale Braystone (the lowest beds of the Cretaceous formations) as extending in a south-easterly direction from Roma towards Texas. The Government Geologist of this Colony is doubtful as to whether the Blythesdale Braystone outcrops in New South Wales, and expresses the opinion that the formation referred to near Texas is an extension of the Ipswich sandstone, and states that beyond all doubt the bores at Moree and Coonamble are through rocks of Triassic age, and should be classed as Ipswich sandstone formation. Therefore the artesian basin is not correctly stated as being bounded by a line crossing from Roma in a south-easterly direction to a point about 40 miles north-west from Texas, and thence west of Coonamble; but is approximately bounded by a line through Murphy's Creek, near Toowoomba, in a south-westerly direction through a point about 15 miles west from Texas, thence through Wallangra, Warialda, and generally in a south-south-westerly direction to a point west of Gilgandra. Previously it was supposed that only the Cretaceous beds were water-bearing, but now it is known that the Triassic beds, which are of the same age as the Sydney freestone, will furnish artesian water, and may yet provide the chief part of the supply.

The known extent of the water-bearing strata has, therefore, by recent exploration, been extended far to the east and south from previously laid-down boundaries, and it is probable will be further extended towards the south-west. To the north and north-west it is yet undefined in detail, but it is probable that generally speaking it is determined only by the northern limits of the continent. This vast supply of water, readily accessible in a country which is visited frequently by long periods of extreme drought, suggests probabilities which it is impossible to over-estimate.

#### VOLUME OF ARTESIAN WATER AVAILABLE FOR IRRIGATION.

Artesian  
water  
available for  
irrigation.

13. Although the quantity of water disappearing from the catchment area of the Darling into the underlying strata is so great as to be practically regarded as inexhaustible, the problem of its interception and utilisation depends upon many questions with regard to which there is but fragmentary knowledge. Information with respect to the area of water-bearing strata is doubtful, owing to the incompleteness of exploration. The discharge from an artesian bore depends upon hydraulic pressure, which again depends upon the level of the intake and frictional resistance, the latter being influenced by the fineness of the strata through which the water flows. Even the great question of eventual discharge is at present viewed as a question not yet completely solved. Subterranean water having found its level does not rest in porous strata, but sluggishly makes its way to the sea, it is believed both under the Gulf of Carpentaria and under the southern sea-board. Although the movement of the current is sufficient to keep the water fairly pure, the frictional resistance experienced in obtaining discharge aids in maintaining the hydraulic pressure which forces it to the surface when tapped by boring.

Since the area of the water-bearing strata is doubtful, the supply problematical, and the information with respect to the discharge inferential, it is evident that no statement accurate in detail can be made regarding the supply available, still there is no doubt that a vast quantity of water may be intercepted and utilised. Professor David states the area of land to which 20 inches per annum could be supplied for irrigation purposes might be regarded as approximately 1,000,000 acres. The Government Geologist believes it probable that twice that area might be utilised with the present known supply of artesian water.

Cost

## COST OF OBTAINING ARTESIAN WATER.

14. The cost of obtaining water by boring, in comparison with the results of the operation, naturally varies. The cost generally depends upon the depth of the bore—and depth does not necessarily decide the question of supply. Cost of  
artesian  
water.

Euroka Bore, at a depth of 1,543 feet, costing £2,045, delivers 3,000,000 gallons per day.

Kelly's Camp Bore, at a depth of 1,577 feet, and a cost of £2,104, delivers 600,000 gallons per day.

Osaca Bore, at a depth of 1,646 feet, and a cost of £2,368, delivers 350,000 gallons per day. It is reasonable to believe that the cost of boring will be much less as the methods become more ingenious and the amount of such work increases.

The capital cost of furnishing a sufficient supply of water for irrigation, on the basis of the cost of the Euroka Bore, would be £1 9s. 5d. per acre; on the basis of the Pera Bore, £5 4s. 7d.; on the basis of the Clifton, £2 13s. 1d.; on the basis of the Waanaaring, £10 10s. 11d.

The cost of water on the lowest of these bases is out of all comparison cheaper than the cost of water obtained by conserving and pumping. A fuller knowledge of the limits of the artesian supply should enable sites to be chosen where, with fair certainty, a supply would be cheaply obtained.

## SUITABLENESS OF ARTESIAN WATER FOR IRRIGATION PURPOSES.

15. This question depends upon three considerations—

- (1.) The constituents of the soil to which the water is to be applied.
- (2.) The quantity of deleterious matter in the water.
- (3.) The use to which the land is to be put.

Suitableness  
of artesian  
water for  
irrigation.

1. The land over large extents of country above water-bearing strata is suitable for irrigation, much of it being comparatively free from alkali. The conditions compare favourably with great areas of land which are successfully irrigated in America. Deleterious matter in the artesian water would, therefore, not be materially augmented by the presence of plant-destroying substances in the soil itself if the site be wisely chosen.

2. Artesian waters for irrigation purposes may for practical consideration be thus classified:—

- (a) Those containing less than 35 grains of alkaline matter to the gallon, which it appears reasonable to infer may be satisfactorily used for irrigation purposes; and
- (b) Those containing a greater quantity of deleterious matter than 35 grains to the gallon.

Speaking approximately, it appears that two-thirds of the bores supply water which may with fair success be utilised for the purpose of irrigation; the remaining one-third will necessitate the exercise of greater care and a larger expenditure in tith, and it will be well to delay experiments with them until success has been assured with the more promising waters.

3. The evidence is unanimous that water containing, as does almost the whole of the artesian supply, more or less carbonate of soda should only be used for irrigation purposes in cultivation in connection with a thorough system of deep drainage, carefully-prepared soil, and competent management. Any attempt to apply artesian water, unless under such conditions, will probably gradually charge the soil with quantities of deleterious matter destructive to plant-life. Therefore the artesian water in most cases should be used only for intense culture, and not under a system of broad irrigation to flood grazing areas.

The evidence taken on this question justifies the Committee in expressing the following opinions:—

- (1) The amount of artesian water which can be made available is sufficient to irrigate a vast area of land.
- (2) That much of the water may safely be used under proper control, upon skilfully-tilled suitable soil.

- (3) That much of it can be delivered on the land more cheaply than by a conservation and pumping scheme such as submitted to the Committee.
- (4) That it will be unwise to apply it for broad irrigation purposes without suitable drainage.
- (5) No irrigation settlement should be located at any bore without thorough investigation with regard to the suitability of both water and soil.

#### IRRIGATION SETTLEMENTS AT ARTESIAN BORES.

Irrigation settlements at artesian bores.

16. Notwithstanding the apparently promising results being disclosed at Pera Bore, there does not appear to be any special demand for the adjacent land for settlement purposes. The low price charged for a supply of water and for land, in comparison with such a settlement as Mildura, should enable the State readily to find tenants, but several of the farms have not yet been applied for. The reasons for this appear to be:—

1. The advantages of irrigation have not yet been realised.
2. The areas being situated in a portion of the Colony almost totally given up to pastoral settlement; there is therefore no supply of local farmers willing to make the test.
3. The paucity of the local markets for the products from intense culture.
4. The distance from the metropolitan market.

#### ARTESIAN BORES—COST AND RETURNS.

Artesian bores—cost and returns.

17. There are in existence in the Colony at present forty-six artesian bores, which have been constructed at a cost of £119,155. The yearly expenditure upon them is £2,083, and the annual return £1,282. Thus the Government, after an initial expenditure of £119,155 on artesian water, finds itself called upon to incur a yearly outlay of £800 to maintain them. The Committee recognise the advantages conferred upon the naturally waterless country by this artificial supply, and the great incidental advantages that thereby accrue to the State, but are of opinion that the benefits derived therefrom should be sufficient to render the bores self-supporting.

#### RIVER NAVIGATION.

River navigation.

18. For the past fourteen years the Darling River has been navigable on an average for half the year, the boats passing up and down stream free from toll and without serious delay. Various rates of freight are quoted, but a reasonable estimate with easy navigation may be stated at 20s. per ton. The quantity of freight is approximately 10,000 to 12,000 tons per annum between Brewarrina and Bourke, with very little intermediate traffic. With permanent navigation ensured, and assuming the imposition of a toll to recoup the outlay for interest, maintenance, and management of the proposed works, it is doubtful if the tonnage rate would be appreciably reduced. Most of the traffic of the district reaches the railways at Bourke or Byrock, and any increase in the revenue returns of the Great Western Line would be the result of leakage from the Northern systems.

The inhabitants of those districts most interested in obtaining the readiest way to market object to the proposal on the following grounds:—

- (1) Because it will only provide for a portion of the produce of the district.
- (2) Because stock (one of the great products of this pastoral country) cannot use it.
- (3) Because the time occupied in transit will be greater and the cost heavier than by direct railway communication between Brewarrina and Byrock.

#### AMOUNT OF WATER FALLING ON CATCHMENT AREA OF THE DARLING RIVER, AND ITS DISPOSAL.

Water falling on catchment area of Darling, &c.

19. The average rainfall, extending over a period of 16 years, upon the catchment area of the Darling, in New South Wales, is about 24 inches, and on the Queensland area about 30 inches.

According

According to the Government Astronomer, the amount of water which the Darling discharges at Bourke is less than 2 per cent. of that falling on this area, and is equal to about  $\frac{3}{10}$  of an inch per annum over the whole catchment area. The residue of 98 per cent. must be accounted for by evaporation, percolation, and subterranean drainage.

The evaporation from a water surface, such as a dam or river, in this locality is about  $59\frac{1}{2}$  inches yearly. Competent witnesses have informed the Committee that under the conditions obtaining over the watershed of the Darling, evaporation will account for but a small portion of the 98 per cent. unaccounted for in the discharge of the river at Bourke, and that a great proportion of it sinks below the surface.

The Darling being the discharging channel for only about 2 per cent. of the water which falls on the catchment area, and since much of the residue apparently goes to swell the volume of subterranean water, the importance of this supply, and the great part it will play in the development of the west, if it can be intercepted and utilised, becomes evident.

#### RIPARIAN RIGHTS.

20. Riparian rights in this Colony may be considered without reference to the rights of adjoining provinces. A riparian right may be described as a right of owners on either side of the stream to use the water for domestic purposes and for their cattle, and entitles landowners to insist that it shall continue to flow past their holdings as it would were the river in its natural state. The construction of weirs would, under certain conditions, have the effect of retaining water which, had they not been erected, would have found its way to the lower reaches, and thus the riparian rights of occupiers below these weirs may be interfered with prejudicially. In the absence of further legislation it is clear that the construction of weirs on rivers with a discharge as limited as, at intervals, is that of the Darling, would certainly lead to friction and litigation.

#### INLAND NAVIGATION.

21. Had the proposed works been justified by the local interests involved the Committee would have recommended their construction immediately the question of riparian rights had been comprehensively dealt with, irrespective of the national question of river navigation throughout the entire length of the Darling, but sufficient local justification does not at present exist. At a cost, estimated at £1,200,000, the Darling may be rendered navigable for a distance of 1,300 miles. Two results would probably follow such an expenditure:—

- (1) The transference of trade to Victoria and South Australia.
- (2) Interference with the railway revenue of New South Wales.

It therefore is not reasonable that the total cost of works which will much benefit the sister colonies, have the result of lessening the railway revenue, and transfer trade to business centres beyond its confines, should be borne by this Colony alone. The navigation of the River Darling is a matter which will be more comprehensively dealt with by a Federal Parliament, in which all interests would be fairly represented.

#### VIEWS OF THE COMMITTEE.

22. The Committee have endeavoured to make it clear that the great questions involved have not been controlled by the commercial aspect alone. The success of irrigation, notwithstanding its possibilities, may be delayed by extravagant expenditure which does not rest on a basis of competent management, for which the way has not been prepared by careful experiment. After full consideration, the Committee are reluctantly forced to the conclusion that it would be premature to recommend the adoption of the scheme referred by the Legislative Assembly to the Parliamentary Standing Committee on Public Works.

Resolution  
of the  
Committee.

23. The following extract from the Minutes of Proceedings of 28th and 29th July, 1896, indicates the resolution arrived at by the Committee :—

TUESDAY, 28TH JULY.

Mr. Wright moved,—“ That, in the opinion of the Committee, it is not expedient the proposed Construction of Locks and Weirs on the River Darling, as referred to the Committee by the Legislative Assembly, be carried out.”

Mr. Humphery seconded the motion.

The debate upon the motion was adjourned.

WEDNESDAY, 29TH JULY.

The adjourned debate upon Mr. Wright's motion,—“ That, in the opinion of the Committee, it is not expedient the proposed Construction of Locks and Weirs on the River Darling, as referred to the Committee by the Legislative Assembly, be carried out,”—was resumed.

The motion, after further discussion, was passed.

THOS. EWING,  
Chairman.

Office of the Parliamentary Standing Committee on Public Works,  
Sydney, 31 July, 1896.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

---

SECTIONAL COMMITTEE.

---

CONSTRUCTION OF LOCKS AND WEIRS ON THE RIVER DARLING.

---

REPORT.

---

THE Sectional Committee appointed to inspect, and take evidence in reference to the proposed construction of locks and weirs in the river Darling beg to report that they personally inspected the Pera Irrigation Settlement, the lock and weir in course of construction below Bourke, the proposed sites for locks and weirs at Stony Point and Beemery, the alternative site for a lock in the Beemery Cowl, and the proposed site for a lock and weir at the Fisheries, Brewarrina. The Committee also examined witnesses, and obtained information generally in regard to the project.

The Committee left Redfern Railway Station by the 8 p.m. train on Friday, 19th June, and arrived at Bourke at 6.30 p.m. the following day. On Monday, 21st June, they visited the Pera Bore, and inspected the Government experimental farm and adjacent homestead selections, examining Mr. Fred. Hersey, one of the settlers. The following day they inspected the work in progress at the site of the lock and weir now in course of construction in the Darling, 2 miles below Bourke, and later in the same day continued their inquiry at the Council Chambers, Bourke, when P. J. Biddulph, solicitor, Bourke; W. J. Holding, N.S.W. Government Appraiser; D. W. F. Hattan, N.S.W. Government Stock Inspector; and J. H. Thomas, manager, Winbar Station, were examined. The sitting was adjourned at 4.15 p.m., and resumed at 8.15 p.m. at the "Royal Hotel," when Mr. Ed. MacFarlane, District Surveyor and acting Chairman of the Land Board, was examined. The inquiry was continued at the Council Chamber throughout Wednesday, E. C. Millen, Council Clerk, Bourke; A. Harders, acting Sub-collector of Customs; Arthur Senior, wool-scourer; and E. D. Millen, M.P., being examined. On Thursday, 25th June, the Committee proceeded to Beemery *en route* to Brewarrina, passing the night at Beemery, and inspecting the site of the proposed lock and weir No. 4, and the site of the proposed alternative lock and weir to be substituted for Nos. 4 and 5. The journey was resumed the next day, a visit being paid to the homestead lease of Mr. Geo. Woods, at Yambacuna, who, by means of a windmill and a centrifugal pump driven by an 8-horsepower steam-engine, uses the water of an ana-branch of the Darling for irrigation purposes. Mr. Woods was examined at some length, and the Committee continuing their journey arrived at Brewarrina at 5.15 p.m. On Saturday, 27th June, the Committee met at the Court-house, Brewarrina, at 10 a.m., and examined the following witnesses:—H. L. Cathie, stock and station agent, Brewarrina; W. J. Jamieson, stock and station agent; W. A. MacVean, manager Quantambone Station; J. Mannix, homestead lessee, Cato Creek; J. H. Saunders, storekeeper; A. D. Kerrigan, agent for Messrs. E. Rich & Co.; P. D. M'Ellicott, W. C. Colless, hotel-keeper and homestead lessee; and A. Loder, stock and station agent. On Sunday the Committee were joined by Mr. W. Poole, Assistant Engineer, Water Conservation Branch, Department of Mines, by whom they were accompanied on Monday, 29th June, in a visit of inspection to the site of the proposed lock and weir at the Brewarrina Fisheries. Later, the Committee resumed their inquiry at the Court-house, and examined R. J. Kelly, chemist and druggist; W. Coleman, bridge care-taker; T. MacMahon, storekeeper; R. R. Machattie, pastoralist; and C. Crane, storeman for Messrs. E. Rich & Co. At 1 p.m. the Committee left Brewarrina, and arrived at Beemery at 4.30 p.m. On Tuesday,

30th June, the Committee, accompanied by Mr. W. Poole, made a further inspection of the site of the proposed lock and weir, at Beemery, and of the site of the proposed alternative lock in the Beemery Cowal, and continuing their return journey arrived in Bourke at 5.15 p.m. Next day the Committee, accompanied by Mr. Poole, proceeded to Stony Point, and inspected the site of the proposed lock and weir there, returning to Bourke in the afternoon. On Thursday, 2nd July, the Committee met at the Council Chambers, Bourke, at 10 a.m. and examined Mr. Jefferson, manager, Government farm, Pera Bore, and Mr. Seaver, Engineer-in-charge of works at Bourke lock and weir, concluding their inquiry on Friday with the examination of Mr. Poole and Mr. Macdougall, Inspector of Public Watering Places. Leaving Bourke at 7.50 a.m. on Saturday, the Committee arrived in Sydney early on Sunday, 5th July.

The advantages sought to be derived from the proposed works were stated by Mr. McKinney in his examination before the main Committee in Sydney (*Vide Evidence, p. 1*) to be—

1. The conservation of water for the irrigation of land on both sides of the river.
2. The supply of water to the town of Bourke.
3. Permanent water carriage between Bourke and Brewarrina, thus saving the cost of constructing a railway to the latter place.
4. Increased value to Crown lands bordering the river.
5. Increased traffic on the Great Western Railway.

The Sectional Committee have considered these advantages in what they deem to be the order of their relative importance, and in this connection is to be noted Mr. McKinney's assertion (Questions 12 and 15) that the "dominating purpose" of the scheme is to provide for irrigation.

The observations and inquiries of the Committee do not justify Mr. McKinney's expectation that 15,000 acres of land in immediate proximity to the river are available for close settlement and irrigation. With the exception of about 3,000 acres at North Bourke, and a similar area near Brewarrina, nearly all the river frontage between Bourke and Brewarrina is liable to inundation at irregular intervals. The several streams flowing into the Darling above Bourke drain an enormous area lying to the north and north-east, and a heavy fall of rain in Southern Queensland, and upon the western slopes of the New England table-land, is quickly followed by a rise in the main river and a flooding of the low-lying lands upon its banks. These areas are thus submerged, as a rule, for a considerable period, and evidence shows that such floodings destroy stone-fruit trees, and even lucerne. Where the land is not subject to flood, it is suitable for the growing of most varieties of fruit, and intense cultivation similar to that at Mildura might be followed. But the apparent paucity of the local demand, and distance from the metropolitan market, render it unlikely that any large area would be used in this way for many years, especially when it is remembered that equally good soil is to be obtained much nearer to Sydney, and in places where climatic conditions are more favourable for the operations of the agriculturist and the orchardist. Moreover, the raising of the river level as proposed would not materially lessen the cost of pumping water from the channel to the height necessary for its distribution over the cultivation area.

Mr. McKinney stated in his evidence before the main Committee that, if the proposed scheme be carried out, a demand will arise for Crown land at present unsuitable for occupation in small areas; but the opinion of local witnesses seemed to be that the country between Bourke and Brewarrina is better adapted for pastoral than for agricultural use. The attempts to settle population more closely by means of the homestead lease system have proved successful to a limited extent only in this district, but it does not appear to be necessary to repeat the reasons locally assigned.

It has been stated in evidence that materially enhanced value would accrue to the Crown lands bordering the river, by the conservation of sufficient water to admit of irrigation and to keep the river permanently navigable, and, therefore, that a charge should be levied for the right to take water to irrigate agricultural areas  
and

and for the flooding of the natural pasturage. Upon these points, however, a large majority of the witnesses were of opinion that the expected benefits would not follow upon the construction of the works. It was affirmed that Crown lessees could not profitably put under crop an area much larger than that required to provide in bad seasons for such animals as are kept for domestic use and for the more valuable stock; and that to irrigate grazing areas is commercially impracticable; nor is it apparent that the pastoral holdings in the district could then fairly be appraised at a higher rental than that at which they are assessed under present conditions, the river water being now available in sufficient quantities for those prepared to incur the cost of distribution by pumping appliances.

It did not appear to the Committee that the traffic upon the Western line would be greatly increased by providing a permanently navigable water highway between Bourke and Brewarrina. Possibly some of the wool which now finds its way to Narrabri would then come to Bourke, and thus give the Great Western Railway the advantage of additional haulage, and a little more traffic also might be obtained from the district to the north and north-east of Brewarrina, but the volume would not be appreciably increased, while the evidence taken at Brewarrina is strongly adverse to the proposal on various grounds, one of which is its failure to provide a means of transit for stock.

With regard to the local traffic, evidence was given to show that, of approximately 10,000 tons annually passing along the river between Bourke and Brewarrina, about 300 tons only were handled at intermediate points, while, although the river has at times been navigable for several consecutive years, the freight has never been less than 20s. a ton, and it may reasonably be assumed that even with a permanently navigable river, which might involve the imposition of tonnage dues, there would be no substantial reduction in the rates of carriage.

As to the necessity of providing an abundant supply of good water for the town of Bourke, the Committee were unable to ascertain that any serious complaint had been made by the inhabitants concerning the present supply; but in any case, the completion of the Bourke weir should impound a body of water sufficient in all seasons, and likely, by reason of its large volume, to be always of good quality. Therefore, the recommendation of the Committee cannot be influenced by this consideration.

Evidence has been received in support of the alleged superiority of the shutter, or movable, weir over the fixed weir; but, at this stage, any expression of opinion as to the relative merits of the two systems would be of little or no value, though the impression made upon the Committee was that movable weirs are less likely to seriously obstruct the course of the river in flood time, and possess the advantage of allowing the uninterrupted passage of vessels up and down stream during the periods when the river by natural flow is at navigable level.

Before any general scheme for locking the Darling is adopted, ample time should be afforded to test the effect of the construction of the Bourke weir upon the river channel, both above and below, and to ascertain if movable shutters become unworkable after long submersion. It is conjectured that any failure of the shutter weir could be remedied by the subsequent construction of a fixed weir, as the lock would be common to both designs. The construction of this weir will furnish the means of ascertaining the effect of water conservation in accomplishing that closer settlement of the Western District which it is anticipated by some witnesses would follow the completion of the proposed works. A comparison of the results with those obtained at the Pera settlement may determine the superiority of irrigation with river water over irrigation from artesian supplies.

At the Pera Bore, which the Committee visited, an area of 640 acres has been set apart by the Government for the establishment of an experimental farm, and to allow of small holdings being taken up under the perpetual leasing provisions of the Land Act of 1895. Twenty such blocks, each containing 20 acres, have been surveyed, and eleven of them have already been allotted, most of the tenants, at the time of the Committee's visit, having made considerable progress in the work of clearing the land and preparing it for cultivation. Some excellent fodder crops have been already obtained from the Government farm, and flourishing crops  
of

of vegetables were observed on the settlement areas, while the holders appear with good reason, considering their brief occupancy, to be confident that they will obtain profitable returns for their industry. The terms offered by the Government—5s. per acre per annum for the first five years, to be increased to 10s. per acre at the end of that period, with the right to use sufficient water from the bore for the irrigation of crops—should be sufficiently attractive to persons of limited means desiring to settle in the district, should lead to the whole area available being speedily taken up, and demonstrate if cultivation by means of irrigation can be profitably undertaken.

The Committee sympathise with those who would like to see settlement upon the Darling liberally though prudently assisted by the expenditure of Government money in providing adequate pumping machinery for the utilisation of the water of the river; but a practical opportunity for the discovery of the results likely to follow closer settlement and the application of "intense cultivation" will be furnished by the completion of the Bourke weir. This will conserve sufficient water for the irrigation of land adjoining the river for a distance of 25 miles, and will give a frontage of 50 miles to permanent water. Within this area are embraced about 3,000 acres of red, loamy soil at North Bourke, described by Mr. MacFarlane as suitable for small holdings. Such an area would be ample to determine the possibility of closer settlement in the district, and the alleged superiority for irrigation purposes, which has been insisted upon by some of the witnesses, of river as compared with artesian water. Persons acquiring irrigation areas here will have the advantage of the close proximity of the Western Railway when it becomes necessary for them to seek distant markets for their produce.

If it be the intention eventually to carry out a scheme of inland navigation, then the whole length of the Darling must be locked, and the proposed work can only be regarded as the initial step towards rendering the river navigable for about 1,300 miles, at a cost which the Committee have been informed would amount to nearly £1,200,000. The benefits resulting from this expenditure would, however, accrue principally to Victoria and South Australia, while the trade of New South Wales (the Colony undertaking the expenditure) and the earnings of her railways would suffer considerably by the increased competition of her southern and western neighbours, which the improvement of the Darling would facilitate. The Committee are therefore of opinion that it would be unwise for this Colony to engage in so lavish and disinterested an outlay until, upon the federation of the whole of the Colonies, the question can be comprehensively dealt with by a Federal Parliament, and the expense of the undertaking fairly apportioned.

Finally, the Committee, whilst endeavouring to avoid taking the contracted view which might arise from a consideration of the proposed work in its commercial aspect alone, and fully recognising the possibilities of irrigation, are forced to the conclusion that it would be premature to recommend the adoption of the scheme as referred by the Legislative Assembly to the Parliamentary Standing Committee on Public Works.

F. T. HUMPHERY,  
Chairman.

7th July, 1896.

# PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

## MINUTES OF EVIDENCE.

### CONSTRUCTION OF LOCKS AND WEIRS ON THE RIVER DARLING.

TUESDAY, 12 MAY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The HON. FREDERICK THOMAS HUMPHERY.  
The HON. CHARLES JAMES ROBERTS, C.M.G.  
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
JOHN LIONEL FEGAN, Esq.  
GEORGE BLACK, Esq.

The Committee proceeded to consider the proposed Construction of Locks and Weirs on the River Darling.

Hugh Giffen McKinney, Esq., Chief Engineer, Water Conservation Branch, Department of Mines, sworn, and examined:—

1. *Chairman.*] Have you a statement to make with reference to the proposal now under the consideration of the Committee? Yes; it is as follows:—

#### LOCKING THE RIVER DARLING.

##### *Historical Sketch.*

THE first action of a definite nature taken in connection with the locking of the river Darling was the engagement of Mr. George Gordon, M. Inst. C.E., to inquire into and report on the question on behalf of a syndicate termed "The River Darling Navigation Company." In June, 1883, Mr. Gordon presented to this Company his report on the construction of locks and weirs in the part of the river between Wilcannia and Wentworth. The immediate object in view was to determine whether that portion of the river Darling could be rendered permanently navigable, at such cost that the works would be remunerative to the Company. In regard to this Mr. Gordon arrived at the conclusion that it was quite practicable to render the river permanently navigable from Wilcannia to Wentworth, but no further action was taken by the Company he represented.

The subject seems to have remained in abeyance till about November, 1885, when it was taken up by the Department of Harbours and Rivers, by direction of the then Minister for Works. A considerable amount of information was collected and many plans were prepared by that Department, and the conclusions based on these arrived at by the Engineer-in-Chief were embodied in a Report, dated 27th November, 1890.

The years 1890 and 1891 were years of exceptional rainfall and high rivers, and it was doubtless in a large measure owing to this that the question of constructing locks and weirs on the river Darling was allowed to remain in abeyance till 20th July, 1892. Up till this time the river Darling had been regarded merely as a great highway for the carriage of produce, while its capabilities as an aid to production were either allowed to remain in the background or were omitted altogether from consideration. It was manifest from the reports of Mr. Gordon and Mr. Darley that the works required to make the river Darling permanently navigable were not warranted by the amount of traffic which could reasonably be anticipated. The question had therefore to be treated from a different point of view, and on this account it was referred to the Water Conservation Branch. In August, 1892, by direction of the then Minister for Works, surveys of lock-sites between Wilcannia and Menindie were put in hand, but about three months after operations were started the work had to be temporarily abandoned on account of floods.

In the beginning of October, 1892, the Minister for Works instructed Mr. F. W. Ward, and Mr. H. G. McKinney, Chief Engineer for Water Conservation, to visit the river Darling, and report on the whole question of the locking of that river and the utilisation of its waters. The result of the investigations thus authorised was the joint report, which was presented in due course to the Minister, and was ordered to be printed on 18th January, 1893.

The survey of sites, which had to be temporarily abandoned in December, 1892, could not, on account of the flooded state of the river, be resumed during nearly the whole of 1893. In December of that year the surveys were resumed on the Lower Darling, and in the succeeding month they were resumed on the Upper Darling. The work on the latter part was again stopped by a flood in March, 1894, and a month later work had to be stopped on the lower part of the river also.

In December, 1894, instructions were given for the preparation of plans of an experimental lock and weir at Bourke, and the necessary surveys and borings were at once put in hand, plans were subsequently prepared, and on 29th March, 1895, sanction was given for calling for tenders. On 18th April, 1895, tenders were opened, and that of Messrs. Kerle and Kerle for £18,868 11s. 8d. was accepted. Messrs. Kerle and Kerle did not make a start with their contract till 10th June, and they finally stopped work when a rise in the river occurred early in November.

The following extract from the Votes and Proceedings of Parliament shows the last step taken by the Minister in regard to the project for the construction of locks and weirs above Bourke:—

Construction of Locks and Weirs on the River Darling.—Mr. Sydney Smith moved, pursuant to notice, "That it be referred to the Parliamentary Standing Committee on Public Works to consider and report upon the expediency of constructing six locks and weirs on the river Darling from Stony Point to Brewarrina."—Debate ensued.—Question put and passed.

##### *Objects and advantages of the proposed works.*

The construction of a system of locks and weirs from Bourke to Brewarrina will have the following advantages:—  
1st.—It will conserve a large supply of water in the river channel which will be available for irrigation on both sides of the river.

2nd.—It will guarantee an abundant supply of good water to the town of Bourke, a question of which the importance was made manifest by the experience of 1885, 1888, and 1895.

H. G.  
McKinney,  
Esq.  
12 May, 1896.

H. G.  
McKinney,  
Esq.

12 May, 1896.

3rd.—It will afford permanent water carriage between Bourke and Brewarrina, and, while providing cheaper carriage, will save the cost of a railway to the latter place.

4th.—It will materially enhance the value of the Crown land bordering on the river between those towns.

5th.—It will increase the traffic on the Great Western Railway.

In regard to the first of these advantages, it is necessary to explain that in the driest seasons, when patches of irrigation are most valuable, the supply in the river, under existing circumstances, falls so low that the practice of irrigation to even a moderate extent would scarcely be allowable. It has also to be borne in mind that as a river like the Darling becomes low, the proportion of loss increases. Hence the construction of a series of weirs and locks has the double advantage, so far as irrigation is concerned, of conserving a large quantity of water, and at the same time increasing the available supply by diminishing the loss which otherwise would take place. The value of plots of irrigation on pastoral estates is steadily becoming better understood, and the necessity for irrigation to ensure crops on small holdings in the Western District is generally recognised. Approximately, the quantity of water conserved by the weirs from Stony Point to Brewarrina will be nearly one thousand millions of cubic feet—about 6,250 millions of gallons. This is equivalent to a foot in depth over nearly 23,000 acres.

The guarantee of a permanent supply of good water to the town of Bourke is one of the minor advantages of the project. Considering, however, the growing importance of that town, and the fact that on more than one occasion the quality of the water when the river was low was far from satisfactory, the improvement which will arise from the proposed works is well worth bearing in mind.

The provision of permanent water carriage between Bourke and Brewarrina will save the cost of the proposed railway from the latter place to Byrock. The length of this line would be 55½ miles, and the cost might be taken at about £140,000, but on this subject it will be best to have the evidence of the Chief Engineer of the Railway Construction Department. Regarding the cost of carrying goods over this length of railway the Traffic Manager of the Railway Department is the best authority. Regarding cost of traffic it may be stated that the average cost of haulage on the inland waterways of France is slightly less than one fourteenth of a penny per ton per mile. In England the cost of haulage on the inland waterways varies from one-seventh of a penny to one-twentieth of a penny per ton per mile. The record which gave these figures in the *London Engineer* added that steam haulage on canals costs half as much as horse haulage, and is twice as quick. Mr. Bartholomew, an English authority of much experience on this subject, ascertained that the cost of canal transport in England varies from one-fifth of a penny with horse haulage to one thirty-fourth of a penny for steam tugs carrying cargoes. The very small rate of fall in the river Darling, namely, about 3 inches per mile, is a most favourable circumstance so far as traffic is concerned. Comparatively few locks are required, and high lifts are unnecessary, so that the outlay is small in proportion to the length of river dealt with. As an instance of the effect of the canalisation of an occasionally navigable river, the case of the river Main, in Germany, may be mentioned. By the construction of works which gave a minimum depth of 6½ feet of water, or half a foot more than the minimum depth proposed in the case of the river Darling, the traffic coming to Frankfort increased from about 11,000 tons in 1885 and 1886 to 250,000 tons in 1887, and about 400,000 tons in 1888. The river trade here competes to some extent with the railway traffic, but notwithstanding that, the latter increased by 36 per cent., whilst the above-mentioned increase occurred in the former. Whilst in the case of a sparsely settled country like that bordering on the Darling, such rapid development cannot be looked for, it has to be borne in mind that in the western district two of the most potent factors in retarding settlement are want of cheap carriage and want of water, and that the proposed works will in an important degree meet these wants.

The accompanying map, showing the classes of tenure of the land within 3 miles of that part of the river Darling within the sphere of influence of the proposed works, gives a clear idea of the direct interest of the Government in the construction of these works.

The land included within the limits mentioned comprises the following areas:—

	Acres.
Unreserved Crown land within leasehold areas .....	81,139
"    "    within reserved areas .....	451
Reserves not held under special or homestead lease .....	131,051
Homestead leases .....	124,278
Alienated land .....	12,487
In the map the areas effected by the Bourke lock and weir are also shown, and they include the following:—	
Unreserved Crown land within reserved areas .....	1,200
Reserves not held under special or homestead leases .....	53,512
Homestead leases .....	3,088
Alienated land .....	8,300

The areas affected may all be classed as fertile alluvial land.

While the fifth advantage arising from the proposed works, namely, the increase of traffic on the Great Western Railway can be relied on to a certainty, its extent is difficult to estimate even approximately. In a report of the Railway Commissioners which was issued in 1893, a comparison was made between the railway revenue obtainable from 10,000 acres under wheat cultivation, and that from the same area used as a pastoral holding. Average conditions were assumed in both cases, and the conclusion arrived at was that the railway revenue derivable from cultivated land is more than thirty times greater than that from land used for pastoral purposes.

The conditions which will exist on the Darling when the works are complete will afford a much greater contrast than the average conditions assumed by the Railway Commissioners. The country in its natural state ranks low for pastoral purposes, whereas under irrigation the soil is much above the average in productiveness. The length of river directly affected by the locks and weirs from Stony Point to Brewarrina will be about 136 miles: but as the greatest obstacle by far to continuous navigation between Walgett and Bourke is the rocky bar at Brewarrina, the project now before the Committee is much farther-reaching in its effects than the locking of any other similar length of the river Darling. To make this clear it is sufficient to state that steamers from Walgett cannot cross the Brewarrina rocks till the height of the river on the Barwon gauge near Walgett is about 22 feet, whereas less than half this depth is sufficient for through navigation, irrespective of the bar at Brewarrina.

The great drawback to river traffic on the Darling, and to settlement on the river, is the uncertainty of transit. In times of flood, or even during any rainy period, the roads are almost impassable, and in the dry seasons, which generally prevail, food is scarce and expensive. These uncertainties render road traffic at all times expensive, and sometimes precarious. The river is frequently not navigable for long periods, and this naturally adds materially to the cost of river traffic, and renders it more or less untrustworthy. The elimination of this element of uncertainty in regard to traffic, and the provision at the same time of a permanent supply of water for irrigation purposes, will necessarily have a most important effect in inducing settlement and increasing production. It is, I think, well within bounds to expect that in the near future, there will be 100 acres of irrigation to every mile in length of the river, and this would mean an area of 15,600 acres for the part now specially considered. The direct effect of the increased production on the railway and river traffic arising from this would be very considerable, even if it be assumed that this irrigation would be merely an adjunct to pastoral occupation. The great value of irrigation for this purpose is well understood by some of our pastoralists. They have found by actual experience how important even a moderate area of irrigation is, when judiciously used, to assist in tiding over bad seasons, and to furnish the means for what is commonly known as "topping up" fat stock for the market. It is scarcely necessary to point out that such provision as this warrants heavier stocking of the whole of a pastoral estate, so that the indirect effect of the irrigation may be even more important than its direct effect.

The known capabilities of the Darling district suggest other directions in which important development may take place when a permanent supply of water and permanent river traffic are assured. The land near the banks of the Darling produces excellent fruit, and this fruit is ripe several weeks before the fruit grown in the neighbourhood of Sydney. Fruit-growing is extensively carried on with success in America in places certainly not more favourably situated than the part of the river Darling now under consideration will be when the locking is complete. The best fruit-growing districts in America have a climate similar in several respects to that of the western district of this Colony, and the opinion has been given by some experts that that district is better adapted than any other for producing fruit—especially citrus fruit—for export. These facts are stated here merely as significantly suggestive of future developments. It is not necessary for the purposes of the project now recommended to take them into account in any degree, but it is desirable to mention them as indicating developments which may take place with the aid of the proposed works, and which cannot take place without them.

In

In connection with this question of the increased traffic there is one point more which it may be well to mention. It may be urged that while the proposed works will bring increased traffic to the Great Western Railway, they form merely a part of a scheme for the complete locking of the whole of the river Darling, the effect of which would be to take away trade from this Colony. Even granting that this is correct, it has to be borne in mind that the construction of locks and weirs in an uncertain river like the Darling is necessarily a slow operation. Unless an exceptionally long period of low river occurs the completion of the works now proposed cannot take place for several years. Further up the river the sites as far as Walgett have actually been surveyed. It is natural to anticipate that the works of most importance to this Colony would be first taken up, and this would mean that the length from Bourke upwards to Mungindi and from Bourke downward to a distance of about 300 miles by river would be dealt with before any works would be undertaken on the Lower Darling. This shows that the question of permanent through navigation is too distant to have any weight as against present needs.

H. G.  
McKinney,  
Esq.  
12 May, 1896.

*Nature and principles of the project.*

The conclusion arrived at after a very complete inspection of the river Darling was that owing to the very unstable character of the channel and to the great range of level from low river to high floods it would be unsafe to construct weirs which would interfere with or obstruct the waterway, and that it would be very expensive as well as unsafe to carry the works to above flood level. It is only right to state that while these conclusions were independently arrived at, and were published in January, 1893, in the report of Mr. F. W. Ward and Mr. H. G. McKinney, already referred to, practically identical conclusions were arrived at previously by Mr. George Gordon, M. Inst. C.E., on his inspection of the part of the river from Wentworth to Wilcannia. The works now proposed are in accordance with these principles, and the details while adapted to the circumstances of the case are designed on principles which are found to work successfully in other countries and particularly in France and America.

The weirs in every case consist of a series of timber shutters, which on an average are about 11 feet in length by 3 feet 3 inches in breadth. Each shutter, when erect, will rest at its bottom edge against a hardwood beam, set in solid concrete sill, and will be supported by an upright trestle and a sloping strut, both of wrought-iron. When the river rises to navigation level each shutter will be pulled forward till the sloping strut is disengaged from its rest, and will then be allowed to fall back flat on to the sill. During floods the whole weir will thus rest flat on the river bed, and the lock gates will be open, so that the only part of the work which will in any way obstruct the flow will be one lock wall. The presence of this obstruction will in every case be more than compensated for by widening the channel at the weir and excavating the bed to give a level sill. As shutter weirs of this class have not been used for greater heights than 14 feet, those designed are all under this height.

The size adopted for the locks, namely, 200 ft. x 37 ft. in the clear, is sufficiently large to take an average steamer and an average barge together. There are a few steamers trading on the Darling which cannot enter a lock of this width, but these are used chiefly, if not entirely, from Bourke downward. Even if the whole length of the river were furnished with locks of the size and weirs of the description proposed, these steamers would not be in a worse position than they are at present, as the weirs will be open when the river is navigable under existing conditions. In fact, the conditions for such steamers would be materially improved, as it would be possible to open the weirs in succession and allow them to pass down whenever the flow in the river would warrant this course. On the whole it did not appear in the first place that the circumstances justified the further outlay required for wider locks, nor in the second place that the construction of steamers of such width on the paddle-boxes should be encouraged.

*Estimated Cost of Proposed Works.*

Item.	Unit.	Quantity.	Rate.	Amount.
Excavation (soft).....	cubic yard	70,688	1/6	£ 5,301 12 0
„ (rock) .....	„	9,500	3/-	1,425 0 0
Concrete .....	„	32,350	47/6	76,831 5 0

„ sheet piling .....	„	10,000	6/-	3,000 0 0
„ main piles .....	foot (lineal) .....	700	6/6	227 10 0
Wrought iron .....	cwt. ....	2,550	40/-	5,100 0 0
Cast .....	„	3,600	30/-	4,500 0 0
Pitching .....	square yard .....	10,978	6/6	3,567 17 0
Ashlar .....	„	3,696	11 -	2,032 16 0
Gun metal .....	lb .....	2,896	1/8	241 6 8
Lead in joints of hollow quoins .....	cwt. ....	12	30/-	18 0 0
Tarring (three coats) .....	square yard .....	3,960	1/-	198 0 0
Lock-keepers' cottages .....	No. ....	6	£250	1,500 0 0
Punts and wire rope .....	No. ....	6	£200	1,200 0 0
Coffer dams and pumping .....	„	„	„	5,000 0 0
	Total .....	„	£	115,284 2 8
Supervision and Contingencies .....	„	„	£	5,815 17 4
	Grand Total .....	„	£	121,100 0 0

The following plans are submitted for the information of the Committee:—

- (1.) An outline map of the colony, showing the sites of the proposed locks and weirs.
- (2.) A section, showing in outline the effect of the proposed works, and showing also the flood level of the river and the ground lost at the sites.
- (3.) A plan showing the tenure of the land to a distance of 3 miles on each side of the Darling River throughout the part directly affected by the proposed works.
- (4.) General plan of the Bourke lock and weir, which is the type on which all the other works are being modelled.

WEDNESDAY, 13 MAY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.  
 The Hon. CHARLES JAMES ROBERTS, C.M.G.  
 The Hon. WILLIAM JOSEPH TRICKETT.  
 HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
 JOHN LYONEL FEGAN, Esq.  
 THOMAS HENRY HASSALL, Esq.  
 GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of Locks and Weirs on the River Darling.

Hugh Giffen McKinney, Esq., Chief Engineer, Water Conservation Branch, Department of Mines, sworn, and further examined:—

H. G.  
 McKinney,  
 Esq.  
 13 May, 1896.

2. *Chairman.*] I understand that the construction of the proposed works will throw open the Darling for navigation for 181½ miles above Bourke? Yes; with the assistance of the Bourke lock and weir.
3. The contract now being carried out near Bourke opens up about 25½ miles? Yes.
4. That is what is known as Kerle and Kerle's contract? Yes.
5. Will you supply the Committee with any information which you may have with regard to the law of riparian rights in this colony? I will procure that information.
6. Can you tell us what amount has already been spent upon the Darling in snagging? I will let you know that to-morrow.
7. What works have been carried out at Wilcannia and Menindie? The only work carried out at Menindie was the construction of a dam at the entrance to Menindie Lake. There was nothing done in connection with the locking of the river there.
8. The dam was intended to throw water into Menindie Lake? The water flowed into Menindie Lake when the Darling was in flood, and the intention of the dam was to keep it in the lake.
9. Was the dam a success? No; I believe not. I think you will find the matter referred to in the report presented by Mr. Ward and myself, and with which I will furnish the Committee. I will also let you have Mr. Gordon's report and Mr. Darley's report.
10. Is not the work at Bourke now suspended? They have started again with a view to carrying it out partly by day labour and partly by contract.
11. The work undertaken by Kerle and Kerle was exactly similar to that which is now proposed? Yes.
12. The two main reasons for the proposed work are to provide for navigation and to provide for irrigation? Quite so.
13. Does it not strike you that these two purposes are to some extent antagonistic, because, while a certain amount of water is required in the river for navigation, irrigation takes water out of the river? Yes; I am aware of that. The same question has cropped up in connection with the Indian canals, where in some cases canals that might have been made navigable were not made navigable because it was considered that irrigation should be the main purpose in view, and that navigation would interfere with that object.
14. With so small a rainfall as there is in the Bourke district, there must come a time when navigation and irrigation must stand in antagonism there? Undoubtedly.
15. Which then is the dominating purpose? I think that irrigation should be.
16. If you are forced to a conclusion, that is your statement? Quite so.
17. But you think that in general the locks will be sufficiently replenished by the water flowing from the catchment area to enable you to carry out both schemes? Quite so. I do not think that any difficulty is likely to occur within a considerable length of time; but a period may be looked forward to when it will occur.
18. Is it your opinion that the rights of the people who go upon the areas which will be rendered irrigable should be clearly defined, and that the rights to the water-way should be clearly defined? It would be advisable.
19. Can you furnish the Committee with a statement as to the amount of water that flows from the watershed above Bourke? I will let you have that information.
20. And how much of the rainfall runs through the river at Bourke? I will get you the discharge of the river at Bourke.
21. You propose by this scheme to create six big lagoons; have you the bank levels along each reach of the river that you propose to lock; will there be any opportunity for the water to escape? There is no place where that can occur. In fact an inspection proved very disappointing, because we could not find a single place from Walgett to Wentworth where we could let the water escape by a weir of moderate height.
22. *Mr. Humphery.*] Is a pumping station necessary for this scheme? It will be necessary to pump the water required for irrigation in every case.
23. *Chairman.*] What height will it have to lift the water in order to irrigate the various irrigable areas? I will get you that information. I can make out a statement as to what the lift will be at each weir.
24. You consider that you will be able to irrigate any land within 3 miles of the river? Yes, as a general rule; but it is not contemplated that under any circumstances the whole area within 3 miles of the river should be irrigated.
25. Will you tell us the total area within 3 miles of the river which you could irrigate if you had sufficient water? I will furnish the information.
26. With such storage arrangements as you propose to make by means of these weirs, how much land could you expect to irrigate along the 150 miles of river frontage? About 100 acres to every mile of frontage. That is not making allowance for the constant filling of the weirs from the flow of the river.
27. Knowing the amount of water that will pass into the weirs under ordinary circumstances, how much land would it be reasonable to put under irrigation there? That is the kind of question which will crop up one of these days if the contemplated Water Rights Bill is introduced. It will then be a matter for consideration, how much water can be allowed for any part of the river. The discharge at that point and the loss further down will have to be taken into account. The question is one to which I could not give an answer at once.
- 28.

H. G.  
McKinney,  
Esq.  
13 May, 1896.

28. How much will the productiveness of the district be increased? I consider that the whole of the water stored in the weirs might be used on the adjacent area, but I could not answer straight away as to what area could be irrigated with the water constantly flowing along the river. Of course I can take the discharge of the river and make out what area could be irrigated from the ordinary flow, distributing that area along the lengths enclosed by the locks, and some calculation of the kind will have to be made when the whole matter comes to be considered; but I am not prepared to give an answer straight away.

29. Can you make a calculation for us? Yes; I can give you an approximate estimate.

30. *Mr. Lee.*] Will the water conserved in the proposed weirs be sufficient to irrigate 15,600 acres? Yes.

31. Can the irrigable area be extended? Yes; but it will be necessary first to look into the question of the river discharge.

32. *Chairman.*] How will the riparian rights of people below the sites of the proposed locks and weirs be affected? If we diminish the quantity of water now going to them, they will, as the law stands, have a ground of complaint. Some authorities say that the ground of complaint is not tenable unless actual damage is proved.

33. *Mr. Wright.*] If your weir caused the river below it to run dry, in what position would the Government be? Well, the people below would have to prove that the weir had caused the river to run dry. If they could not prove that, they would have no grievance. As a matter of fact the existence of a weir would cause them to get more water than they got before.

34. *Chairman.*] A riparian right, as you interpret it, entitles the holder of land fronting the river to the same quantity of water, and the same purity of water as he would enjoy by the river taking its natural course? That is so.

35. Therefore any works which you carried out which prevented such enjoyment might render you liable to a prosecution for damages? Yes, and to expense if actual damage could be proved; but a summary of the law on the subject prepared by the President of the Land Court shows that some of the highest authorities in England hold diverse opinions in regard to it. The position we take up is that the people of Wilcannia will get more water after the weirs are constructed than they get under the present circumstances.

36. Have you any information with regard to the amount of traffic above Bourke, and as to how it would be affected by this scheme? I cannot give you such information at first hand, though I received a statement on the subject from Mr. Shainwald, of Messrs. Rich & Co., at Bourke. I think it would be well for the Committee to examine him themselves. Mr. Harper, the Railway Goods Superintendent, has also been through the district, and could give you information on this point.

37. If your scheme is carried out some of the boats now trading below Bourke will have to tranship their cargoes because they will be too large to go through the locks? Only a very few will be in that case. I will prepare a statement showing the size of the steamers now trading on the Darling.

38. Do you intend to keep the river open for navigation while these weirs are in course of construction? We do not intend to interfere with the navigation. We can make our arrangements in such a way as not to interfere with the navigation, and that is what we propose to do.

39. Will it be possible to construct these weirs without interfering with the navigation? The interference would be very slight.

40. Would there be any interference? I think that on the whole we might fairly say that we could keep the navigation open continuously. We can manage so as to make the navigation no worse than it is under natural circumstances.

41. Is the cost of keeping the river open for navigation included in the estimate of £121,100? That estimate covers everything.

42. *Mr. Wright.*] If there is only one steamer a day plying between Bourke and Brewarrina, can you so construct your weirs as not to interfere with it? Yes; we will stretch wire ropes across the river from bank to bank and lower the materials from them. I have only the plan in outline, and have not had an opportunity of going to Bourke since it has been commenced. These wire ropes can easily be disengaged if the river rises to such a height that they would come in the way of steamers.

43. Your weir will be practically a dam across the river? It will only be a dam up to the level of the bed of the river.

44. *Chairman.*] Will you describe the type of construction for these locks and weirs? The method of construction is shown on the plan before the Committee. In the first place, there is a lock on the right bank of the river, 200 feet long by 37 feet wide, while from the floor of the lock to the top of the side-walls will be about 15 feet. The lift from one water-level to the next water-level will be about 6 feet. One of the lock-walls is built in the bank and the other is built a short distance out into the stream. They will be composed entirely of concrete in the mass. Passing on across the river there follow bays, each 6 feet in width. These are intended to regulate the flow when the river is low. If there happens to be a very small quantity of water passing down we will drop boards into grooves, and thus keep it up to the proper level. Beyond the bays comes the weir proper, which falls down into the bed of the stream. The weir consists of a series of timber shutters, which in time of flood will lie flat on the river bed, but when the river falls below navigation level these shutters will be lifted in succession. The shutters will have a very strong framework in order to withstand the shocks to which they may be subjected, and there will be a moderately thick sheathing. There will be a mass of concrete let in from the bay to the left bank, rising up to the level of the river bed, and that will act as a sill for the shutters. The shutters will each be fastened to a framework in the concrete, and, when erected, will stand at an angle of 70 or 75 degrees with the flow. The framework will be made of timber. At the back of each shutter will be an almost vertical trestle, with a sloping strut to support the shutter. These will both be hinged, and there will be a large hook at the bottom of the inside of the shutter, which, being pulled forward, will disengage the strut and allow the shutter to fall.

45. What model have you followed in this construction? We have followed the style of what are called Chanoine shutters, with a modification introduced by Pasqueau. A similar arrangement is being used in the great Kanawha River, in Virginia, and in several rivers in France.

46. Have you seen these shutters at work? I have seen something of the kind at work, but not exactly the same thing.

47. *Mr. Wright.*] Will the construction be similar to that of the weir near Warren? No; that is an ordinary over-shot timber dam. There will not be the slightest resemblance to it.

48. How is any possible stoppage of work provided for in the estimate? It is provided for in the item "Coffer dams and pumping, £5,000."

THURSDAY, 14 MAY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERT.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.

CHARLES ALFRED LEEF, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of Locks and Weirs on the River Darling.

Hugh Giffen McKinney, Esq., Chief Engineer, Water Conservation Branch, Department of Mines, sworn, and further examined:—

H. G.  
McKinney,  
Esq.  
14 May, 1896.

49. *Chairman.*] You have certain information to give us? Yes; in reply to a number of questions which were asked yesterday. In the first place, I was asked what amount had been spent in snagging the river Darling. The best information I can get on this subject is from a return which was called for by Mr. Hoskins in the Legislative Council in May, 1889, which shows the amount of expenditure up to that time to have been £80,111 11s. 1d. So far as I am aware, there has been no snagging done since, or, if any, very little.

50. Where was that snagging done? Almost the whole of it between Wentworth and Wilcannia.

51. Very little has been spent upon snagging above Bourke? Nothing at all, except a small amount for the taking out of a number of snags last year or the year before.

52. How much has been spent upon the length of the river which will be affected by the proposed work? I do not think more than £400 or £500 has been spent there. Yesterday I was asked to get a copy of the report made by Mr. Ward and myself, dated 18th January, 1893, but I find that your Secretary is already in possession of copies of that report. I hand in, however, a copy of a report by Mr. Darley on the locking of the Darling, and a report on the same subject by Mr. George Gordon, M.I.C.E., which appears on page 12 of the appendices to evidence attached to the First Report of the Royal Commission on the Conservation of Water. I was also asked as to the drainage area of the Darling, and the quantity of rainfall there. The joint report of Mr. Ward and myself contains a map showing that drainage area, and the Committee have already a large map showing the drainage area of the Murray, upon which appears a tabulated statement of the rainfall on each catchment area. I have lately received from Mr. J. B. Henderson, hydraulic engineer, the most recent returns of the Queensland rainfall, and I will compare these returns with former returns, and give the Committee the result within a few days. I was also asked about the capacity of the locks. The total capacity of the locks, with a 7-ft. lift, will be 106,344 cubic feet, or 664,650 cubic gallons. The quantity of water which will flow out of the lock when the lower gates are open will be 53,900 cubic feet. I have here, too, a statement showing the size of the river steamers in the western districts:—

The dimensions of the steamers trading on the Darling and Murray Rivers are given in the following tabular statement:—

Length, including rudder, in feet	No	Width, including paddle-wheels, in feet.	
		Minimum.	Maximum.
Not exceeding 67 in length	5	24½	30
Exceeding 67, but not exceeding 77	8	24	35½
Exceeding 77, but not exceeding 88	10	26	35½
Exceeding 88, but not exceeding 98	16	27½	37
Exceeding 98, but not exceeding 108	18	28½	35½
Exceeding 108, but not exceeding 118	14	31	36½
Exceeding 118, but not exceeding 128, which is the maximum	7	30½	37

The "Emily Jane" is 38 feet across paddle-boxes, and the "Florence Annie" is wider.

The number of river steamers which would not go through a width of 37 feet is inconsiderable, and not one of them, so far as I know, trades above Bourke, though a very broad steamer has come as far as Bourke.

53. Can you tell us how many boats are required to carry on the trade of the Darling? Mr. Shenwald would give you that information much more accurately than I can.

54. What sized boat would get through your lock? Any boat that was less than 37 feet, outside width.

55. And what length? None of them approach the length of the lock. I have here, too, a letter by Mr. Alexander Oliver, now president of the Land Appeal Court, published in the *Herald* of 22nd July, 1885, and dealing with riparian rights. Touching upon the same subject, I have brought a copy of the Progress Report for 1891 of the Water Conservation Department. At page 24 of this report appears a paper dealing with the matter. In regard to two of the other points referred to, namely, the proportion of rainfall at Bourke, and the amount of rainwater going down the Darling, I have not had time to prepare the information.

56. Will you find out for us the yearly evaporation at Bourke? Yes; we could ascertain that fairly well from Mr. Russell's evaporation gauges at Bourke. [*Witness here explained a working model of the movable shutters intended to be used in connection with the proposed weirs.*] Finally, I hand in a report of the Railway Commissioners, making a comparison between the amount of railway traffic that might be expected to arise from pastoral occupation, and the amount that might be expected to arise from agricultural occupation.

57. *Mr. Humphery.*] In arriving at your estimate of £121,000, did you consider the detailed cost of each lock separately? Yes.

58. How many locks do you propose to construct? Six.

59. Exclusive of the one at Bourke? Yes.

60. What do you estimate the Bourke lock will cost? We still adhere to our estimate of £19,500.
61. Have you made an estimate of the value of the work already done? When the contractors ceased work we went into the question as to which was the best way to continue the construction of the weir. I got Mr. Wade to see what materials were on the ground, and what work was required to complete the undertaking, and to give a statement of the position of affairs. Having dealt with the matter in detail, we came to the conclusion that we should be able to finish the work at our own estimate, or within it.
62. You estimate that £19,500 will be the total expenditure? Yes.
63. Does that include the usual percentage for supervision? Yes. We have a very good foundation at Bourke. It is one of the best places we have, so far as foundation is concerned.
64. What will be the annual cost of maintaining that lock? I have not got the figures with me now. I made a general estimate, and averaged the cost for the whole series.
65. Have you made a separate estimate of the cost of maintaining each of the seven locks? We have made a separate estimate for the Bourke lock, but not for the others.
66. Do you estimate that the cost of maintaining the other locks would be similar to the cost of maintaining the Bourke lock? No.
67. Which would be the most expensive of the seven locks? I think locks "4" and "5." There are good sites at Stony Point and Vincent's Rocks; but the two sites above that again are inferior.
68. In arriving at the estimate of £120,000 for the whole scheme, I suppose you prepared a detailed statement showing the cost of each lock? Yes.
69. Can you get those statements for the Committee? Yes; I will have them copied.
70. What would be the distance in a direct line from Bourke to Brewarrina? From 70 to 80 miles.
71. And from Byrock to Brewarrina? Fifty-five and a half miles.
72. The length of river which you propose to render navigable between Bourke and Brewarrina will be between 150 and 160 miles? Yes; from Stony Point upward.
73. How do you propose that the Government shall reimburse itself for the cost of the annual maintenance of this scheme? I consider that the indirect advantage which will be gained by the work to be the most important consideration. A demand will arise for Crown land there which at present is unsuitable for occupation in small areas.
74. Will you explain the altered conditions which will cause a demand for the Crown land there? Under present circumstances the state of the river is always very uncertain, and an owner of land in the district would scarcely be warranted in going to any considerable outlay to provide pumping machinery for an irrigation scheme; but if these locks are constructed he would always have an assured supply of water. Then, too, under present circumstances, the uncertainties of traffic are very great. This scheme would remove those uncertainties.
75. When you speak of the uncertainties of traffic, do you refer to the river navigation? Yes.
76. Do not the railway and the roads afford necessary facilities for traffic? No. There are frequently great difficulties in connection with road-travelling. In a bad season road-carriage is very expensive, because the roads get bad, and there is neither feed nor water for animals.
77. Do you think that a railway from Byrock to Brewarrina would give the facilities for traffic which you propose to give by this scheme? A railway such as you describe would give fewer advantages than the proposed scheme, and would cost more.
78. What would such a line cost? I have been informed that it would cost about £140,000.
79. As against £120,000 for your scheme? Yes.
80. But would not the Government be reimbursed for their expenditure on a railway by the earnings of the line? That is a point upon which Mr. Harper's evidence would be more serviceable than mine; but it should be borne in mind that two services would be rendered by a navigable river and only one service by a railway line.
81. You propose, by a series of locks between Brewarrina and Bourke, to gather the traffic at Bourke? Yes.
82. You do not propose to charge tolls at the various locks? That is a matter which has not yet been fully considered. I do not know what the policy of the Government would be on that point. I know that in France navigation is perfectly free, and no doubt the system they have pursued there has been of great benefit to the country.
83. Beyond the indirect benefit to which you have referred, you do not see any way of reimbursing the interest and annual cost of maintenance? No. There is the improvement to the value of the land to be considered, and the increase to the railway traffic.
84. How will the railway traffic be increased? The carrying out of the proposed scheme will bring more settlers into the district, and from that cause I anticipate a very considerable increase in the railway traffic.
85. You spoke yesterday about the possibilities of irrigation, supposing the river water were kept to a certain level. Was it your idea to establish large irrigation farms, or to afford facilities to owners of adjacent property to irrigate at their own cost? My idea was to afford facilities to adjacent landholders to irrigate at their own cost.
86. Have you taken into consideration the cost of irrigation schemes where the water used has to be pumped? Yes. I went into that matter in considerable detail when Mr. Ward and I prepared our report, though I have not considered it since. At the time we went into it as carefully as we could.
87. Do you know of any pumping scheme in Australia which has been a success? I know of several such schemes.
88. Will you mention them? The best I know upon a pastoral estate is that of Mr. Wills Allen, on the Namoi. He irrigates from 500 to 600 acres of land.
89. Did you ascertain what the cost of that scheme was? I think he spent about £3,000 upon his pumping-plant.
90. Do you know what the annual cost of maintenance is? No; but he informed me that he was perfectly satisfied with his arrangements. He has had the scheme at work for nine or ten years, and he is increasing his irrigated area.
91. Do you know of any other such scheme on a large scale? There are none in this colony on a very large scale. The Government are starting irrigation works at Wentworth. They are the first works of the kind that we have commenced.
92. How much has been expended there? The expenditure is only beginning, but I expect that we shall ultimately

H. G.  
McKinney,  
Esq.  
14 May, 1896.

- H. G. McKinney, Esq.  
14 May, 1896.
- ultimately expend between £4,000 and £5,000. We intend to pump from the Murray River.
93. Will you reticulate by means of open cuttings or by pipes? By open cuttings.
94. Will £4,000 include the cost of reticulation? Yes.
95. How many acres do you expect to be able to irrigate? The plant will be capable of irrigating about 1,500 acres; but we only estimate to irrigate 1,000 acres in the first instance.
96. What height do you lift the water? The average lift will be 25 or 27 feet.
97. Did you visit the Mildura works? I have been there several times.
98. You are quite familiar with that scheme? Yes.
99. Has it been a success, financially? No; though there is a place near by where a similar scheme has proved a financial success. At Lord Ranfurly's place, at old Mildura, there is a scheme which is managed in the proper way. He has a separate pumping-plant, and separate channels; and I have heard, on the best authority, that his place is very remunerative, and that he is highly satisfied with it.
100. *Chairman.*] He grows oranges? More lemons than oranges.
101. Have you ever seen the open drains which Messrs. Chaffey constructed at Mildura? Yes.
102. You know what happened with them? They were very badly designed in the first instance, and, when it was found that they did not carry the water properly, the defect was set down to crayfish. The impression I received at Mildura, however, was that the crayfish were very much maligned.
103. What height were Messrs. Chaffey lifting the water—75 feet, in three lifts? Some of the water was lifted higher than that. I think they had what they called a 90-ft. channel. I do not know any place in this colony where irrigation works which have been undertaken in a practical and business-like way have not proved successful.
104. *Mr. Humphery.*] We want instances where irrigation by means of a pumping scheme has proved successful? Nearly all the irrigation schemes I have seen in this colony have been shockingly mismanaged.
105. It is your opinion that irrigation schemes here have proved failures through the inefficiency of those in charge of them? Quite so. It is exceptional to find a properly managed irrigation scheme in this colony. I have only seen two such schemes connected with pastoral estates here, the one I just mentioned and Mr. Gatenby's on the Lachlan.
106. *Mr. Trickett.*] That is at Forbes? Not far below Forbes.
107. *Chairman.*] How is the irrigation in the valley of the Nile carried on? Almost entirely by gravitation.
108. What about California? There is a great deal of pumping done there, though there are also a great many gravitation schemes.
109. Are the pumping schemes, where water has to be lifted 30 or 40 feet, able to compete with the gravitation schemes? No, they are not, when the general conditions are the same.
110. Would it be possible, with the conditions which we have in this Colony, for the crops produced under a pumping scheme to compete with those produced under a gravitation scheme? Before a pumping scheme is adopted, care should be taken to see that the ground it is proposed to irrigate is suitable.
111. Can you tell us to what heights water would have to be lifted on our western rivers? The average lift would be about 35 feet. At Bourke you will find several people irrigating by pumping from the river. Mr. Wood is one of them.
112. Will you get for us a list of irrigation schemes at work in other parts of the world, where water has to be lifted from 30 to 40 feet? Yes.
113. *Mr. Humphery.*] In your statement you say that all land within 3 miles of the river will be benefited by the proposed works; will you explain why they will be so benefited? Well, on any estate in the back country, if water can be used to irrigate crops grown to provide fodder, the holding must be considered to be improved, even for pastoral purposes. Even in that way the construction of these works would benefit the land there.
114. The statement that all land within 3 miles of the river would be benefited rests upon the assumption that the owner of that land has a river frontage? Yes; the owner would require to have access to the river.
115. Should we not deal with this scheme simply as a scheme for improving navigation? I do not think that is a fair way of regarding it.
116. Must we look at it from two points of view: first, as to the direct improvement of the land fronting the river, by the facilities afforded for irrigation; and, secondly, as to the improvement of navigation? I think so. With regard to the distance at which land would be affected by the scheme, I might point out that it is the opinion of Mr. Wills Allen that the whole of his property, comprising 40,000 acres, materially benefits by his having 500 acres under irrigation.
117. *Mr. Black.*] Would we be justified in recommending the proposed expenditure simply to improve the river navigation? Looking at the scheme merely as one for opening up the river to navigation, I do not think the expenditure would be justifiable.
118. *Mr. Humphery.*] Have you been over the country between Byrock and Brewarrina? I have been over some miles at each end, but I have not been over the whole length.
119. Do you know if the soil and climate there are suitable for the production of wheat? About Brewarrina there is land which would be suitable for wheat, but I think that between the two places named, a good deal of the land is liable to floods.
120. You say that the carriage of the productions of agricultural occupation may be regarded as thirty times more valuable than the carriage of the production of pastoral occupation, so far as the railway earnings are affected? I have quoted that opinion from the Railway Commissioners' Report.
121. Do you think that the land which could be made available for agriculture by an irrigation scheme would be suitable for the production of wheat, and that wheat could be grown at a profit? Mr. Ward made considerable inquiries into that question, and he came to the conclusion that wheat could be profitably grown there. I do not think, however, that that would be the class of production generally gone in for. I think that in the first instance lucerne and wheaten hay would most likely be produced.
122. Would not that be for local consumption? At the outset it would be entirely for local consumption.
123. That would not contribute any traffic to the railway? Not from that production; but the carrying capacity of the runs in the district would be materially increased, and that again would increase the railway traffic.

124. For what periods has the Darling been unnavigable at Bourke? In 1885 it was not navigable for fifty-two weeks; in 1886, for twenty-two weeks; in 1887, for fourteen weeks; in 1888, for forty-one weeks; in 1889, for twenty-eight weeks; in 1890, for two weeks; in 1891, for one week; in 1892, for twelve weeks; in 1893, for one week; in 1894, for twelve weeks; and in 1895, for forty-four weeks. The river for the period commencing with 1890 was at a high level for a longer time than is usual since records have been kept, and the statement I have just made gives a more favourable idea about it than would be given by longer records. In a letter which I have had from Mr. Shainwald he says "We have had no navigation for ten months prior to February, 1896."

H. G.  
McKinney,  
Esq.  
14 May, 1896.

125. I suppose that the scheme now under consideration is merely a small instalment of the expenditure which will be necessary in order to make the whole length of the Darling navigable? Quite so, though it may be regarded as a scheme complete in itself. It will add a very extensive area to the district which contributes traffic to the railway at Bourke. It will make the river navigable to a considerable distance above Brewarrina, and that will have a material effect in drawing traffic from Queensland.

126. Have you estimated the cost of making the entire river navigable? Yes; an estimate is given in the report prepared by Mr. Ward and myself. We there estimate the cost of rendering the river navigable from Walgett to Wentworth would be £1,226,000.

127. What is the distance from Bourke to Wentworth? Practically 900 miles.

128. That is your estimate of the total cost of rendering that portion of the river navigable? Yes, from Walgett to Wentworth; my estimate was made out at the beginning of 1893, and I have no doubt that the work could now be done for less.

129. We are to understand that the proposed works will be of a local rather than of a general character? Quite so.

130. *Chairman.*] What would be the cost of fixed weirs? Well, my opinion is that fixed weirs would have a great effect in changing the course of the river. I think that the rocks at Brewarrina are to a great extent responsible for Cato Creek. The river would make its way across the lowest bend in the neighbourhood. In going down the Darling on one occasion, I had an excellent opportunity of seeing how new channels were made. In places I saw the river just beginning to flow across the necks of bends; in other places it had made a cutting 4 or 5 feet deep; and in other places the steamer went through the cuttings which had been made. In some places these cuttings were due to so slight a cause as a fallen tree.

131. Does this appear to you to be reasonable for a storage reservoir? It is the best available under the circumstances.

132. Is it likely to prove satisfactory? I think so. In the first place, it is the best available; and in the second place it is the general experience that there is no tendency for alluvium such as that of which the valley of the Darling is composed to silt up above a weir. One of the most objectionable points about weirs is that rivers are liable to silt up above them. In this case there is not that danger.

FRIDAY, 15 MAY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.  
The Hon. CHARLES JAMES ROBERTS, C.M.G.  
The Hon. WILLIAM JOSEPH TRICKETT.  
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
JOHN LIONEL FEGAN, Esq.  
THOMAS HENRY HASSALL, Esq.  
GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of Locks and Weirs on the River Darling.

John Harper, Esq., Goods Superintendent, Department of Railways, sworn, and examined:—

132. *Chairman.*] What is your position? I am Goods Superintendent in the Railway Department.

133. You are aware of the proposal before the Committee? Yes.

134. And you are prepared to give some information in regard to it? I am prepared to answer any questions, as far as my knowledge is concerned. I have prepared no special information.

135. *Mr. Trickett.*] You are aware that this is a proposal to construct six locks and weirs on the River Darling, from Stony Point to Brewarrina, at an estimated cost of £120,100; I suppose your evidence is submitted with regard to the business aspect of it—as to what revenue is likely to be derived? No; I cannot give that evidence. My purpose here is to explain that as far as the Railway Commissioners whom I represent in this matter are concerned, they regard any improvements of river communication from the north of Bourke as tending to the development of trade, and as being in the general interests of the community.

136. That being so, you come here from the Commissioners to show that it would be an advantage to the colony if the streams lying north of Bourke were to be made efficient waterways, to act as feeders to the railway line? That is the object.

137. Would you state to the Committee in what way you think that benefit would accrue if the river were improved? We find under the existing natural conditions of the river that a very large portion of the produce of the district lying immediately to the north of Brewarrina, and north and east, almost as far as Collarenebri, finds its way to the river, and thence to the Bourke railway station. Given a favourable condition of the river, we know that the rates obtained by that waterway are so low that they must operate in the interests of producers.

138. What are the rates of carriage now by this route? When I happened to make an investigation into a matter entirely outside of this subject a short time since, I found that the prevailing rate between Brewarrina and Bourke—150 miles—was 12s. 6d. a ton.

J. Harper,  
Esq.  
15 May, 1896

- J. Harper,  
Esq.  
15 May, 1896.
139. That is by punt or steamer? By steamer. I also find that during the season 1894-5 there were 3,600 tons of wool, or, roughly speaking, equal to about 20,000 bales, delivered by that route at the Bourke railway station. We have also found in our experience that when there has been an exceptionally good river small steamers have been able to proceed as far as Mungundi, on the Queensland border, and deliver produce at Mungundi, and bring wool to Bourke. We have also found more frequently that steamers were able to get beyond Walgett to Collarendabri and deliver supplies there. The steamers get the great bulk of the Walgett traffic, amounting in 1893 or 1894 to 12,000 bales of wool, which was shipped at Walgett. That wool was brought down to Bourke and sent to Sydney. If this state of things prevails with the difficulties of navigation as the river exists now, we think that if the river were improved the people north of Walgett would send their wool down the river to Bourke, that being the cheapest route, and thence by railway to Sydney. We are forced to the conclusion that river carriage must be necessarily cheaper than either road or railway carriage.
140. You state that this traffic would come by river if the river was always navigable;—where does it go to now? Last year it was carried at a much greater cost by land. A great deal came into Narrabri. This wool season has been the first for five years when there was no practicable river.
141. Then if the wool still comes to the New South Wales railways, whether the seasons are dry or wet, where will the advantage to the railways come from? It must come if the people to the north are able to utilise that stream when it is available, and do not use any other except when it is not available.
142. It will give increased intermediate railway haulage? Yes. So long as that river is navigable, so long will the people utilise it. While the rate from Narrabri to the seaport is £3 10s., the rate from Bourke is £4 per ton.
143. Therefore the Department gets the increased tonnage? Yes; but still the users of the railway are content, as indicating the difference between road carriage and river carriage, to pay the higher rate. Unfortunately, we know what the effect of upstream navigation is. We know that, as a matter of fact, traffic has been delivered at Wilcannia, and has been offered as far as Bourke, the charges being Wilcannia 30s. a ton, Bourke £2 a ton.
144. From where? From Goolwa, in South Australia. Very little traffic from the Upper Darling ever finds its way to Echuca. The great bulk of it goes to South Australia.
145. That being so, if the river is made navigable from Bourke to Brewarrina and further north, is there not a danger that when once the goods get on to the steamer they would be carried away to another colony? No; we do not think that, for the reason that during the last few years no wool from the north of Bourke has been shipped from Bourke below, while as far down as Louth the traffic has come up stream to Bourke. Of course there are conditions controlling the wool traffic. It may be that Sydney is a more favourable market, and advantages in that direction will sometimes induce people to pay higher rates than they otherwise would.
146. Taking the two means of transit to the shipping port, you think the goods are more likely to be transhipped at Bourke than taken and sent down the river to another colony? That is our experience. In the year that I have quoted, of the 20,000 bales which we sent away not a single bale passed Bourke.
147. Seeing that there is a possibility of advantages in the way of transit if the navigation of the river is improved, is it not one of the very first considerations whether the cost of providing that transit should not in some way be compensated for to the Government? That is my distinct personal opinion; but in this matter I am not authorised to speak for the Commissioners.
148. Mr. McKinney, in the paper which he read yesterday, quotes the case of France, where the charge for haulage on the canals is about 1-14th of a penny per ton per mile; in England from 1-7th of a penny to 1-20th of a penny; in Frankfurt he says that 400,000 tons are being carried on the canals—400,000 tons at 1-8th of a penny per mile come to £208 a year;—do you think it is desirable from a monetary point of view to go to this huge expense to make these rivers navigable? I do not know whether that would be the only consideration; there may be other considerations.
149. But looking at it purely as a commercial matter, could you say that it would be desirable? I do not know that those rates could be considered applicable here under different conditions.
150. You mentioned a charge of 12s. 6d. for 150 miles, that is a penny per ton on the present railway? This is on deadweight carriage; I do not know whether those other charges are on the same scale.
151. At one penny per ton it would take a tremendous lot of carriage to pay the interest? I think that the boat carriage would certainly stand more than 1-8th of a penny.
152. It has been pretty strongly affirmed on several occasions that this project would not be justifiable entirely from the traffic point of view;—do you agree with that? No; it opens up rather a broad issue.
153. I will read this sentence from Mr. McKinney's paper:—"It was manifest from the reports of Mr. Gordon and Mr. Darley that the works required to make the Darling permanently navigable were not warranted by the amount of traffic which could 'reasonably be anticipated';—do you agree with that? No; but I would explain myself. It means this—that the people of that district are entitled to cheaper communication with ports of shipment for their produce or with a market. The question is how to get it. There are various railway proposals which I need not speak of just now. Assuming that it was decided to build railways there, the users of the railway would be expected, in common with others, to pay interest on the capital cost as well as working expenses, so that if a method can be adopted of providing a cheaper means of communication for the people there, who require better means of reaching a market, I should imagine on broad general grounds that the cheaper method will be the better one.
154. But you cannot have a river or canal to every man's door, so that you would want roads to the river, and would not that be an additional expense to the Government? I do not think so. As a matter of practical experience there are roads already to the principal shipping points. The woolsheds and stations are on the river, and practically they would have the means of carriage at their doors.
155. Have you personally visited that country? Yes; I have been up the river as far as Brewarrina, and I have followed the river as far as Walgett.
156. What were you there for? Other matters connected with the Commissioners' interests.
157. Did you inquire into this project whilst there? No. I was called upon to report upon a proposed railway extension to Brewarrina.
158. When you were at Bourke, did you see the weir that had been commenced there? I did.
159. Would you care to give an opinion as to the size of these proposed weirs? No; I prefer not to express an opinion on that matter.

160. You merely state in a general way your impression as to these navigable streams being desirable feeders to the railway? My desire is to place before the Committee the experience that we have had, that is, that when there is an available river it is used, notwithstanding the greater distance.

J. Harper,  
Esq.

15 May, 1896.

161. You speak of the experience in the Department,—what experience have the Department had? Ever since the line was opened to Bourke in 1882.

162. In any other part of the country? We have also had it at Narrabri.

163. In no other river except the Darling? Unfortunately we have had too much experience of the Murrumbidgee. Nature has provided there what is wanted on the Darling.

164. *Mr. Lee.*] I suppose that the 20,000 bales of wool that came down the river were pretty nearly the whole produce of the district? It represented at that time the produce from the east of the Culgoa. Everything between the Culgoa and the Warrego came down by road. Wool coming from the east of Collarendabri, and the east of Walgett, found its way into Narrabri. To what extent it may be controlled by permanent water being given to Walgett I am not prepared to say.

165. If there were permanent navigable water from Walgett to Bourke, could that 20,000 bales be largely increased? I think it would. It is very hard to say what kind of vessels they would employ under those circumstances. It will take probably four steamers from Walgett to Brewarrina, where the wool is transhipped, to represent one full load to Bourke. About 400 bales are being carried from Brewarrina to Bourke. The steamers are small and of slow speed. They have to tranship the wool at Brewarrina and cart a mile to get over the bar.

166. Your statement is made on the presumption that there would be no competing railways? Yes.

167. But if a railway is extended from Narrabri to Walgett, or by way of Mudgee to Walgett, would it not interfere? It would be a matter for the serious consideration of the Committee which is the better means of serving the community and the less costly.

168. What is the distance from Walgett to Sydney, from Bourke to Sydney, and from Walgett to Newcastle? The distance from Bourke is 50½ miles, and the rate per ton for wool is £4. The distance from Walgett to Sydney is 476 miles, and the rate for wool from there would be more than the rate from Bourke, but I cannot tell what conditions would control it. The distance from Walgett to Newcastle is 376 miles.

169. Therefore, the rate on wool to that port would be considerably less than it would be from Bourke to Sydney? Yes; but I have been trying to point out to the Committee that notwithstanding that, we find that wool has found its way *via* Bourke to Sydney.

170. If the wool rates are based on the same scale, the rates from Walgett to Newcastle must be considerably less? The rate from Walgett to Newcastle and Morpeth is £3 per ton.

171. That is £1 per ton less than the Bourke rate? Yes.

172. What would be the steamer rate from Walgett to Bourke per ton? I think that in 1893 it was carried for £1 per ton.

173. If £1 per ton were added, that would be £5;—that would still show a large margin in favour of the direct route to Newcastle? Yes.

174. I should like to place this position of affairs before you: In the event of this scheme being carried out, and affording permanent navigable water, and in the future it is determined to extend the railway to Walgett, what position would you be in at Bourke as far as the Upper Darling traffic is concerned? I do not know. That would be a matter for the Railway Commissioners to administer as a question of policy.

175. I think you misunderstand me;—supposing that eventually the railway is taken to Walgett, is there not an extreme probability of the traffic being divided—one portion going down the Darling, and the other by the railway from Walgett to Newcastle? No doubt.

176. Is it not a fact that the port of Newcastle is being very largely improved to admit large ships to take the produce of the north and north-western country? I have heard that it is so.

177. Is not Newcastle the natural port for the north-western country? May I answer that question by another;—is not the water-way the natural means of carrying heavy produce.

178. I should like an answer to my question? I would rather not offer an opinion on that point. I consider it a matter of policy.

179. Could you show the Committee whether and how far the Victorian rebate system extends into the country proposed to be served by this water-way? The Victorian rebate of 46 to 61 per cent. starts a little west from Angledool, and it may be said to affect the country south of the Queensland border from Mungundi, following the river to Walgett, thence south to Nugal, then to Carinda, then by a line parallel to the Barwon River, as far as Tarcoola, then nearly parallel to the Darling River almost to Wilcannia, then picking up the 144th parallel of latitude, down to the Lachlan junction. All the country in the north-western districts of New South Wales is affected by the reductions in question.

180. How long have these rebates been in force? Ever since 1880.

181. And has it, to your knowledge, affected the trade—has it diverted it from our railways? No; by dint of hard fighting we have managed to secure the greater portion of it.

182. If any traffic were diverted, to what station in Victoria would it go? As a matter of fact, I may state that very little of that traffic ever found its way to Victoria. The Darling traffic goes to South Australia. The Murrumbidgee traffic is the traffic which finds its way to Victoria.

183. If it found its way to South Australia, the traffic would derive no benefit from the rebate rates of Victoria? South Australia has a similar system.

184. Then we have both those colonies fighting against New South Wales? The mileage over which the traffic is carried in South Australia is comparatively small, but their rebate percentages are equal to those of Victoria.

185. Have you noticed whether, when the Upper Darling was navigable, that much traffic went to South Australia? No; not from above Bourke. As I have said, we have held our own. Traffic which has been carried as far as Bourke by river may have been redistributed, but it is exceptional for carriage to go beyond Bourke.

186. Is it within your knowledge that the Sydney merchants are shipping goods to South Australia, and thence to Bourke, at considerably less cost than you can carry them by railway? Yes; but not always to their own satisfaction.

187. Is it not a fact? It is a fact.

188.

- J. Harper,  
Esq.  
15 May, 1896.
188. You say that it has not been entirely satisfactory? Not judging by our experience.
189. Has not the trade, without mentioning the upper trade of the river, been continuing for some years, and is it not now continuing? Yes.
190. Therefore, it must be satisfactory in the aggregate, although occasionally shipments may not be? Yes.
191. That sort of business is now going on, and seriously competes with the railway? Yes. But pardon me for saying this. I have pointed out that if Bourke has distributed goods received there they have gone up stream. If communication is open to Walgett, whatever proportion comes to Bourke will reach both Brewarrina and Walgett. I mention that to indicate that if Walgett were connected to-morrow by rail it would be as important to control that distribution as it is now.
192. But supposing the river were made permanently navigable, would not the traffic now carried on profitably between Bourke and Sydney be carried on to Walgett? I do not think so, if a proper method were adopted of charging for the services rendered by the improvement of the river.
193. If the river were made navigable would not the traffic which has to stop short of Bourke now be carried on to Walgett? I do not know, as far as that is concerned, that it would block it to any great extent, because at the present time they have from Bourke to Brewarrina a light class of boat capable of navigating the upper reaches of the river. If a boat can get to Bourke it can generally get to Brewarrina.
- 193½. If the trade can be carried on by means of the river to a point at Bourke profitably, because of its lower rate than the railways, it is evident that the traffic will be continued to Walgett, the railway thus being deprived of it? If, as I have already stated, we find that the whole of the wool traffic under the conditions you have mentioned finds its way to Bourke, then to Sydney, if an improved river were given would that alter the conditions.
194. I was going to ask that question? My opinion is that it would alter it in favour of transit to Bourke.
195. But if the traffic towards Walgett increased, would it not of necessity follow that there would have to be return loading for the boats and that the rates would be even lower than they are at present? Where the improved water was, certainly.
196. Therefore, would it not, instead of being a feeder to our line at Bourke, probably be a sucker? We do not think so. We think this: If public money is spent in the improvement of that river such dues should be levied as will pay interest on whatever money has been expended.
197. Do you anticipate that it would increase the number of stock? I cannot say what the conservation of water and its distribution might do.
198. But you rely entirely on the extra traffic that might be brought? I do not anticipate any great increase in the stock traffic, because we find that the mileage from Bourke to Sydney is about as much as stock will bear.
199. So long as you are not threatened with another railway to compete from some other point, you are tolerably clear that there will be a very large increase of traffic by this water-way? I am clear that the improvement of the water-way would give New South Wales the control of the traffic from Bourke, even assuming that the railway were built to Walgett.
200. Which would be an invaluable route in time of drought, and also in times of heavy weather? Yes.
201. Are you authorised by the Commissioners to make any definite statement to the Committee, that it appears to them that there should be some sort of auxiliary like this, to enable them to command the traffic? No. I am authorised to say that they regard any improvement of the internal waters in the direction proposed as a very desirable thing.
202. *Mr. Clarke.*] What benefit would it be to the country at large to have this system of locks and weirs carried out? There is no doubt that the people in the district between the Queensland border and Brewarrina are entitled to easier communication with Sydney than they have at present by road. This seems the cheapest method of affording it, and to give them the cheapest carriage is the best thing they can have.
203. I believe it is intended to utilise the waters of the Darling for irrigation purposes? Yes, so I understand.
204. What would be the principal article of produce on the river? At present it is wool, stock, and station supplies.
205. Are you of opinion that stock could be driven down the river to Bourke cheaper than by travelling from Brewarrina? No doubt if good water is obtained, but the whole of that country is splendid travelling country for stock.
206. What is the population of the Brewarrina district? It is officially returned at about 2,000.
207. Where do they get their supplies from? From Bourke.
208. If this system is carried out, would it not involve extra expense to the people of Brewarrina? No; I do not know what the existing rates are, but they were down as low as 12s. 6d. This was under the conditions of an uncertain stream. Given a certain stream and the possibility of better boats, a cheaper and a more improved service may be formed.
209. Can you state whether this is the commencement of a system to be driven further down towards Wentworth? No; we have no idea about the policy. I have come here to tell as nearly as possible what the effect may be on our traffic.
210. You cannot say whether it is intended that this system should be carried further? No. I am not aware that the Commissioners have been consulted on the matter.
211. If a light line of railway were made from Brewarrina to Byrock, would that not be more convenient and less expensive to the people in that particular neighbourhood? The estimate of cost is £140,000, I have already mentioned that the river is now the means of transit between Bourke and Brewarrina. Assuming that we get a good river, and traffic carried at a reduced rate, the total revenue on that line would not pay more than the working expenses. That is assuming that we get the whole of it. The river carriers, under normal conditions, charge 12s. 6d. a ton; but if they had to fight against the railway it would be much less. If a steamer and barges can carry 300 bales for 12s. 6d. and make the round trip in five days, it is not a bad transaction. The capital cost of a steamer and two barges is about £2,500, and the weekly wages are £15.
212. What is the distance from Brewarrina to Byrock? Sixty miles by road.

213. Would it not be the means of the people in the neighbourhood of Brewarrina having to pay extra railway carriage to Bourke than water carriage from Bourke to Brewarrina? They would have to do that if the railway were built. They would have to pay extra carriage between there and Byrock.

214. I suppose the traffic is carried by team? No, by river. The team rate is almost prohibitory. Last year it was £2 a ton as against 12s. 6d. by river.

215. Do you think it would be a good thing for the whole district if this system of locks and weirs were carried out? I think so from a traffic point of view. But underlying the whole thing is the larger question of conservation of water.

216. *Mr. Fegan*] Had you seen the scheme before us before you came here this afternoon? No.

217. You are aware that this scheme has two objects—one the utilisation of the land by irrigation, and the other affording better transit? Yes.

218. If the scheme is carried out, do you not think it will make a large tract of land, from which we get nothing at present, fruitful, and be the means of giving greater trade to our railway at Bourke? That is my firm conviction.

219. What is the character of the soil? You could not imagine richer soil than this anywhere in the world.

220. Yet it is like a desert for want of water? Yes.

221. There are very few people settled on it? They are principally homestead lessees or pastoral tenants. When I was there—in a time of drought—the general impression was that the lessees would have to abandon their holdings.

222. Yet thousands of pounds have been spent to make the holdings a success? Yes.

223. Do you not think, then, that the project is a very good one? I view it, from my personal knowledge of the back country, as an extremely valuable idea.

224. I suppose the people there desire a system of irrigation to be carried out? That is the general impression in the back country.

225. You say that the soil is very rich there? Yes.

226. And if a scheme like this were carried out it would induce people to settle on the banks of the Darling? I am not prepared to offer any opinion on irrigation. Almost every year enormous quantities of fodder and other produce, which I am sure the soil is capable of producing if it had moisture, are carried to Bourke at great cost to the people.

227. Do you think that if the scheme were carried out it would induce closer settlement? I think so.

228. Therefore that would mean a greater amount of trade to be done, not only on the river, but also on the railway? Yes.

229. I suppose you have some idea of the extent of the Crown lands about there? I know that most of the land is leasehold.

230. I suppose you would not give an opinion as to whether a toll or tax should be put on the river traffic? Personally, I think it would be only a fair thing, just as harbour and other dues are imposed.

231. The charges would be heavier on this side of Bourke? Heavier in proportion to the extent of river used.

232. You would impose tolls with the object of forcing traffic on to the railway line? Not necessarily for that, but to get a fair return for the money expended.

233. The line from Bourke to Brewarrina would cost £140,000? That is about the estimate.

234. That expenditure would only do one thing—afford means of transit—there would be no irrigation in connection with it? If the rates were cheaper the people would prefer the river.

235. The time has arrived when something should be done with that great area of land by means of irrigation? I should like to see it done, and I think it is time that the magnificent internal streams which we have should be properly utilised.

236. I suppose you know the rainfall in that district? The average is 19 inches taking it all through.

237. *Mr. Hassall*.] You are only here to give evidence as to the effect which the locking of the river will have upon the railway traffic? That is all.

238. Where would you expect the traffic that you say would be attracted to Walgett to come from? I think the area from which it would come would extend to Queensland if we had a permanent river to Walgett. There would be a class of boats put on the river which would reduce the freights considerably.

239. Do you think you would attract traffic from the St. George district? I think so.

240. Do you not think it extremely probable that when the railway is extended to Moree, the bulk of the traffic from Mungundi will come into the line there? We hope so; but at the same time we place great hope, not upon the traffic to the north-east, so much as the traffic due north.

241. The traffic you depend upon would be traffic coming down from the Narran, Bokhara, Birrie, and Culgoa Rivers? Yes.

242. That would concentrate at Brewarrina? Yes.

243. The traffic from the Balonne River would naturally gravitate to Brewarrina? Yes.

244. Then the question arises that with a full river do you think it would follow the course of the river right away down? It is very hard to predict what might happen. Our experience is that while every year up to last year they have had navigable rivers, no wool has passed Bourke.

245. Do you think that the locking of the river will be preferable to running a line of railway from Byrock to Brewarrina? I think so. If a railway were made from Byrock to Brewarrina it would be a question of freight. We should simply have to fight the river. I need hardly say that if the line were made and we had to pay interest on £140,000, the cost of maintenance and working expenses, the rates on the railway line would not compare favourably with the rates on the river. The railway would have to be maintained in competition with the natural stream, which during the last five years has carried practically the whole of the traffic.

246. *Mr. Black*.] The Government would get the profits from the railway, but they may not get any profits from the river? We should not get the profit, because we should not get the traffic.

247. *Mr. Hassall*.] I understood you to say that you had a trip down the river? Yes; between Byrock and Brewarrina.

248. Did you follow the river for any distance? Between Bourke and Brewarrina, and between Narrabri and Walgett.

249. From what you saw of the country, do you think that the land would be used to any extent for irrigation farms? I could not say. If it were it would be to grow lucerne and fodder crops.

250. You would not expect any additional carriage on the railway from what would be grown on the river? Yes; instead of losing 40 per cent. of the wool, which we did last year, it might be saved if we had fodder crops.

- J. Harper,  
Esq.  
15 May, 1896.
251. If crops were grown on the banks of the river, do you think they would truck it on the railway to any other place? I may mention my own experience. I paid 14s. at Brewarrina for a bag of chaff. I think any one would be glad to sell a bag containing less than three-quarters of a hundred weight of chaff at that price.
252. But if fodder is wanted to keep stock alive, you naturally suppose that it would be produced there? Yes.
253. I presume you anticipate some benefit to be derived in this way, that instead of the sheep dying on the run they will be conveyed by rail? Yes.
254. You are aware that artesian bores have been put down in the country which water a large extent of land, and the same effect would be produced by these locks? I do not know what is going to arise from the river being locked and water being distributed in ara-branches and channels. I know what has arisen from a small weir being formed on the Lachlan. The Willandra Billabong is now a very different thing from what it used to be when I first knew it. The people are now asking to have the weir made higher to send the water further back.
255. Would you expect the traffic between Walgett and Coonamble to drift into Walgett? No.
256. You rely on an increased traffic immediately to the north of the Darling? Yes.
257. After due consideration the Commissioners have come to the conclusion that that would be a profitable work to carry out? They are not in a position to judge whether it would be profitable, but they think it is a work which they might safely recommend without any figures to support it beyond our actual experience of what the river is doing.
258. I presume you would not advocate the locking of the river below Bourke? That question has not entered into consideration. The Railway Department have advocated the locking of the river as far as Wilcannia.
259. *Mr. Roberts.*] Is there a very large traffic through and around Brewarrina in that country to the north of the Darling? Yes; Brewarrina is the centre of a splendid district. It is some of the best country in New South Wales.
260. Do large quantities of wool come down to Brewarrina? Yes. Of that 20,000 bales which I spoke of, 12,000 or 14,000 came into Brewarrina.
261. Do you think the time has arrived when some improved means of transit should be afforded to the people out there towards the Queensland border? I think so. One reason is that the rates vary according to the state of the river from 12s. 6d. to 30s. a ton. This is brought about by the uncertainty of the state of the river. If you can make the conditions equal and certain it will be a very great benefit to the people.
262. And you think that one of two things should be done, that either the navigation of the Darling should be improved or a railway should be constructed from Brewarrina to a point on the Great Western Railway? I would not like to say that. I should not like to recommend a railway that would not offer an immediate prospect of paying. If a railway were made, we should find the river a very formidable competitor when attempting to pay interest on capital and working expenses.
263. Are you in a position to say that that estimate of £140,000 has been gone into faithfully and accurately? I think so.
264. In very level country, such as that of the surveyed line from Byrock to Brewarrina, would it not be a fair thing to assume that the line could be constructed for £1,500 a mile? I could not say. That is an engineering question.
265. If this scheme now under consideration were carried out, would it facilitate the transit of wool to another colony? I do not consider so.
266. Is it not a fact that wool has been taken from Bourke to one of the neighbouring colonies when the state of the river would permit it? Yes; that was in the years gone by.
267. How long ago? I do not think any wool has come from Bourke for the last five years.
268. What is the point nearest to Bourke from which wool is now taken in large quantities to another colony? Winbar, 150 miles below Bourke. Next above that come the Dunlop and Courallie station, 140 miles from Bourke. The wool from there comes to Sydney, *via* Bourke.
269. If this scheme is carried out, will the traffic of the Great Western Railway be enlarged? I think it would. Traffic would come from Queensland, which we do not get, and which we shall not get by the Morce station.
270. Where does it go to? It goes to Queensland by St. George. That is a subsidiary consideration. The real consideration is the serving of the people in that large district, one of the best in New South Wales, but eminently unsuitable for railway purposes.
271. It is not so well adapted for railway construction as the route to Bourke? No; there are a great many water-courses, which in times of flood open out and cover the country from the Warregal to the MacIntyre, and which would render railway construction very expensive.
272. I suppose you frequently have to visit Bourke on official business? Yes.
273. Does Bourke suffer from a poor supply of water in dry seasons? The last time I was there the water was very indifferent. When the Darling gets low the water is inclined to become brackish.
274. Then one important feature of the scheme would be that an abundant supply of water would be given to the people at Bourke? I should not regard it as a very important feature. It does not often happen that the river is so low as that.
275. One great feature is that it would do away with the necessity for the expenditure of something like £140,000 in making a railway to Brewarrina? Yes.
276. *Chairman.*] You told Mr. Trickett that 3,600 tons of wool came down the river to the depôt at Bourke? Yes.
277. If this scheme was carried out would that be much increased? I expect it would be.
278. Can you give any idea of how much? I could not.
279. You stated further that the rate was 1d. per ton per mile? Yes.
280. Then for this 156 miles—that would come to a little over £2,000? Yes, £2,200.
281. The estimated cost of this work is £121,100; therefore, if the gross return from the traffic coming down the river were made a State asset, it would represent 2 per cent.? I have not worked it out.
282. Would the Commissioners regard it as a wise expenditure to add the cost of the work to the railway debt and they to undertake the charge of the river traffic from Brewarrina to Bourke? I think the  
Commissioners

Commissioners would be very willing to take over such a river as that between Brewarrina and Bourke at a cost of £120,000 if it was made permanently navigable, and they were authorised to charge tolls which would recoup them for the interest on expenditure. It would be infinitely preferable to taking over a line from Byrock to Brewarrina at a cost of £140,000.

283. If it was made a good waterway the Railway Commissioners could run it at a profit? I am not going to say that; but the Commissioners, I think, would prefer to accept the river at a cost of £120,000 to accepting the railway at a cost of £140,000.

J. Harper,  
Esq.  
15 May, 1896.

TUESDAY, 19 MAY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.  
The Hon. CHARLES JAMES ROBERTS, C.M.G.  
The Hon. WILLIAM JOSEPH TRICKETT.  
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
JOHN LIONEL FEGAN, Esq.  
THOMAS HENRY HASSALL, Esq.  
GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of Locks and Weirs on the River Darling.

Charles L. Shainwald, Esq., Inspector of Branches (Messrs. E. Rich & Co., Merchants and Forwarding Agents, Sydney and Bourke), sworn, and examined:—

284. *Mr. Lee.*] Have you an extensive knowledge of the Bourke portion of the business of your firm? Before being general inspector of their branches I was manager at Brewarrina and at Bourke from 1882 to 1894.

C. L.  
Shainwald,  
Esq.  
19 May, 1896.

285. You understand the proposal into which the Committee are inquiring? Yes.

286. Has your business necessitated your travelling along the river, or in its locality? I have frequently been compelled to travel between Brewarrina and Bourke, both by road and by river. I have travelled north to Walgett and south to Wilcannia, both by road and by river.

287. Is the river navigable between the places you have mentioned? Not at the present time.

288. Is any portion of it navigable at the present time? At present it is navigable from Brewarrina to the Collawaroy Rocks, a distance of about 40 miles.

289. How far would it be from the Collawaroy Rocks to Walgett? 140 or 150 miles by river, and 60 or 65 miles by road.

290. Are there any steamers trading upon the upper part of the Darling? There are now lying tied up at Brewarrina steamers which trade regularly north from that place to Walgett. They are not trading there now, because of the low state of the river.

291. It has been part of your business to secure produce from the part of the country which will be affected by the Government proposals, and to forward it to Sydney? Yes.

292. At what distances from the river has produce from the stations there found its way to Bourke? Taking Bourke as a starting-point, we have had wool from Mungundi on the north and from Woolerina, a station in Queensland, on the north-west. Woolerina is the furthest part to which we have traded, and is about 180 miles from Bourke. The proposal before the Committee would not, of course, affect the whole of the country south of a line joining those two places.

293. We want to know how far the trade of that part of the country would be affected by the proposal under consideration? I look upon the proposal as part of a scheme for improving the river as far as Walgett.

294. But we wish to deal simply with the scheme as proposed now? The present scheme would not affect traffic as far north as Mungundi, though it would affect traffic as far as Walgett. I would draw the limit at Walgett and Woolerina. Taking Bourke as a starting-point, the area affected in a north-westerly direction would be from beyond the Queensland border, north of Goodooga, and then down towards Walgett.

295. If the suggested improvements were made, Walgett would be the shipping place for the country to which you refer? Walgett and Brewarrina.

296. What is the usual state of the river between Stony Point and Brewarrina? It depends upon the season. In 1884 and 1888 the river was barely running there, and, in places, you could walk over it.

297. In dry seasons that part of the river is utterly unnavigable? Yes; it is simply a chain of waterholes then.

298. Would the same remarks apply to the river above Brewarrina? I have never seen the river above Brewarrina absolutely dry. The natural bar at Brewarrina keeps the water back.

299. But, although the river is not dry, there is not sufficient water for navigation there? No.

300. How often have you seen the river between Stony Point and Brewarrina unfit for navigation? There was no single year when I was there throughout the whole of which the river was navigable.

301. Can you give us an opinion as to what would be the result of making the river permanently navigable? My opinion is that, if the river were locked, a large increase of traffic could reasonably be expected, because, in the first place, there would be a certainty of transit. The difficulty at the present time is that before we can get the traffic to the river the water has run away, and traffic, therefore, selects other routes.

302. What effect would the locking of the river have upon the trade coming from the district you have described? It would have the effect of permanently increasing the volume of the traffic.

303. The volume of the traffic towards what centre? Towards the railway terminus at Bourke. I consider that a further increase might naturally be looked to, because irrigation would be possible along the river-banks.

304. But in confining ourselves to the question of traffic, do you think that if a permanent water-way were made there the traffic which now finds its way down the river to Victoria and South Australia would be diverted to Bourke? Very little of the traffic from the district north of Bourke passes Bourke.

305. Then the locking of the river would practically have no effect upon the traffic below Bourke? No.

306. Whatever effect it might have would be confined entirely to the country above Bourke? To the country north of Bourke.

307.

C. L.  
Shainwald,  
Esq.

19 May, 1896.

307. Can you give us any idea of the present volume of traffic at Bourke? The following is a return of the river traffic at Bourke for the three years 1892, 1893, and 1894:—

	1892.	1893.	1894.
<i>Up-stream.</i>			
Freight from Bourke to Brewarrina and district .....	Tons. 2,192	Tons. 2,078	Tons. 1,893
Freight from Bourke to Walgett and way, passing through Brewarrina north .....	1,393	1,021	790*
<i>Down-stream.</i>			
Wool from Brewarrina and district.....	Bales. 15,960	Bales. 14,592	Bales. 12,749
Wool from Walgett and way, through Brewarrina to Bourke railway terminus ...	12,285	12,528	12,322

\* This falling off is due to the fact that in 1894 the river was not navigable north of Brewarrina for a considerable period.

308. That statement is absolutely correct? Absolutely correct. The figures were taken from our own books.

309. Do the returns which you have given show the business transacted by your own firm? The whole business of the year.

310. As transacted by all the forwarding agents? Yes.

311. If the river is not locked, I presume that the traffic will continue to come to Bourke? It will come intermittently.

312. If the river is locked, to what source do you look for an increase of traffic? The traffic will increase, because of the regularity of transit and the certainty of navigation.

313. Is there not included in your return, traffic from stations in Queensland and north of Brewarrina? Yes.

314. How will the locking of the river increase that traffic? Because now, when the river is not navigable, that traffic goes in other directions.

315. The locking of the river will not increase the carrying capacity of those stations? That return does not show the whole of the traffic upon those stations.

316. Where does the rest of their traffic go to? Some of it finds an outlet in Queensland, while some goes from Walgett to Narrabri.

317. Under what conditions would it go to Narrabri? When the river is not navigable.

318. For various reasons it suits them to send it to places other than Bourke? Purely to get to market.

319. Your argument is that if the river were permanently navigable the whole of that traffic would come to Bourke? Yes.

320. If it all came to Bourke would the returns be doubled? I do not think so.

321. Would they be increased by 50 per cent.? I think they would.

322. The route that the traffic would take in dry seasons would depend largely upon the probability of getting grass and water? Yes, upon the state of the roads, and the speediness with which produce is taken to market by the railway is a great consideration. If there is no river, they send their produce from Walgett to Narrabri, carting it a distance of 140 miles; but when there is a river it goes down to Bourke in five days, and another three days take it to Sydney.

323. What is the distance by road from Walgett to Bourke? 145 miles.

324. And from Walgett to Narrabri is 125 miles? I thought it was more.

325. Will you explain why wool should go from Walgett to Narrabri instead of to Bourke? Because the railway freight from Narrabri is less than from Bourke.

326. Why does any of the traffic come to Bourke, seeing that the distance it has to travel that way is longer? For two reasons; first, because of the speediness at which it can get to market, and, secondly, because of the cheapness of the river traffic for transit.

327. Do you know if there is a specially reduced railway rate for wool coming from Bourke to Sydney? I could not say. £4 0s. 3d. is the rate for greasy wool.

328. Is that rate lower or higher than the rate prevailing on other lines? It is the same as the rate on other lines.

329. Do the Commissioners offer special inducements for station produce to come to the railway at Bourke? Not from this district.

330. Do they allow large discounts or rebates? I could not answer that question.

331. You are not aware of any? I cannot say that I am not aware of any; but I could not very well answer the question.

332. Do you mean that it would be an interference with your business arrangements? No. If I could see the relevancy of the question, I would answer it.

333. Do the Commissioners offer special inducements for produce to come to Bourke? I would rather not answer that question.

334. Would not the export duty in Queensland operate against Queensland produce coming to Bourke? It would to some extent.

335. To what extent? We could overcome it if there were permanent river transit, because we could reduce the river rates to meet it.

336. You could compete more satisfactorily if the river were locked than you can now? Yes.

337. If you had a permanent water-way you would be in a position to snap your fingers at the Queensland export duty? I think so.

338. If the railway were extended to Walgett from any point on the main line, what effect would it have upon this traffic? My opinion is that when the river was navigable it would compete with such a railway.

339. Would I be correct in inferring that if the proposed scheme were carried out it would be unwise to extend the railway to Walgett? I should certainly say so.

340. You think that the extension of the railway to Walgett or to Brewarrina ought to be considered along with this proposal? Yes.

341. And in your opinion the locking of the river would be of more value to the colony than an extension of the railway to either Brewarrina or Walgett? Most decidedly.

342. Have you seen much of the irrigation that has been done in America? I have seen something of what has been done in California, in New York State, and in some of the central States.

343. Have you been there recently? I was there only a few months ago.
344. Would you care to express an opinion about the possibility of irrigating the Darling country? I could only say generally that I think the country there is suitable for irrigation.
345. You understand that the water would have to be pumped? Yes.
346. Irrigation in California is carried on chiefly by gravitation? For the most part.
347. Hence its cheapness? Yes.
348. You are of opinion that the soil in the Bourke district is suitable for the growth of many things if irrigated? Yes.
349. Do you think that the locking of the river would give a store of water sufficient for the purpose? Yes.
350. If the proposed scheme were carried out, do you think it would be possible for Victorian and South Australian steamers to convey goods as far as Walgett? I do not think they would be more likely to do so if there were a lock than they are now.
351. At the present time the state of the river compels them to stop at Bourke? Not necessarily. When they get to Bourke they can go north of Bourke.
352. But only at intervals, and frequently at long intervals? Yes.
353. At the present time even Sydney merchants are sending goods to Bourke by way of South Australia and Victoria more cheaply than by rail direct? I would not say that that is the general practice, but it has been done.
354. Is it not a fact that the brewers have been doing it for a considerable period? I know that one firm of brewers has been doing it.
355. If we provided permanent water above Bourke, would not the steamers that now find it profitable to trade to Bourke find it profitable to trade above Bourke? They would be in no better position if the river were locked than they are now.
356. Would they not be able to convey return loading down the river to the coast more cheaply than it could be brought by way of Bourke? I do not think so. If that were the case, why is it not being done now. One strong reason why it is not done is that the insurance is very heavy. From Brewarrina to South Australia is a three-weeks' run, and the insurance on wool comes to between 22s. 6d. and 30s. a ton.
357. Is there much traffic from Bourke down the river? There is very little traffic from Bourke south which passes out of New South Wales. The following is a return of the traffic between Bourke and Wilcannia:—

Wool inwards...	{	1892	...	...	...	9,750 bales.
		1893	...	...	...	9,550 "
		1894	...	...	...	7,200 "
Merchandise outwards	{	1892	...	...	...	1,760 tons.
		1893	...	...	...	950 "
		1894	...	...	...	762 "

The falling-off in traffic we attribute entirely to South Australian competition.

358. Your argument is, that if a permanent water-way is established above Bourke, it will very largely increase the railway traffic at Bourke? I cannot say that it will very largely increase it, but it will increase it.
359. If dues were charged upon the river, that would have the effect of raising the freights? That would, of course, depend upon the amount of the dues; but they would be counterbalanced by the cheaper steamer freights on the locked river.
360. Supposing the dues were sufficiently heavy to cover the cost of maintenance and the interest on the outlay? I could not deal with that point.
361. You look at this matter from a very broad point of view? I look upon this as a national scheme.
362. And you consider that many good effects may flow from the carrying out of the proposal—irrigation, closer settlement, and the bringing of country into occupation which is almost devoid of habitation now? I think that the scheme would open up a much greater area to settlement; that it would increase the railway traffic; and that it would give the residents of the district better opportunities for sending produce to the metropolis.
363. *Mr. Clarke.*] Will the water that is stored up be used for irrigation? I cannot give any expert opinion upon the subject of irrigation. I can only give evidence as to the traffic of the district.
364. If that country were irrigated, what crops would be grown there? I can only speak generally, and say that the soil is good and the land eminently adapted for irrigation.
365. Has irrigation been carried on in the district? Some small areas in the neighbourhood of Brewarrina and Bourke have been irrigated. Proof of the value of irrigation is given by the Pera Bore settlement, eight miles from Bourke.
366. Has that settlement been successful? I would not say that it has been financially successful, but they have grown some very fine crops there. The settlement is as yet in its infancy.
367. What description of goods would be carried on the river if the river were locked? The chief traffic inwards has been with wool, and outwards with station supplies, machinery, and so on. I do not think that the nature of the traffic would differ if the river were locked.
368. Is there any possibility of the river being utilised to convey stock north of Brewarrina to Bourke? We are in a position to do that at the present time.
369. Would it be cheaper to bring stock in that way than to drive them? No; but in a dry season we could shift them in that way if the river were navigable.
370. Would a railway from Byrock to Brewarrina serve the public better than the locking of the river? I think that the river would always be a competitor with such a railway, and that, of the two proposals, the locking of the river would be the cheaper, and would best serve the community at large.
371. Would it be to the benefit of people living between Bourke and Brewarrina and further north to have the proposed scheme carried out, rather than to have a railway to Brewarrina? I cannot say that it would be preferred by the townspeople, but it would be better as a matter of State policy.
372. Do any of the settlers north of Bourke object to the scheme? As far as I know, the residents of the towns, being personally interested, would prefer a railway.

C. L.  
Shainwald,  
Esq.

19 May, 1896.

373. I suppose the Bourke people would like to have the scheme carried out? My evidence is *ex parte* evidence. I would like to see the work done, because it would cause Bourke to become a larger centre.
374. Do you think there would be any danger of the river overflowing and following other channels? That is a matter upon which I could give no opinion.
375. Is it a fact that the Darling is liable in many places to flow in new channels after a flood? When the river is very high the river will find new channels, but it is not a swiftly-flowing stream. The water lies over the country for miles and miles for weeks.
376. *Mr. Hegan.*] You are acquainted with this country? Only generally.
377. You would not be prepared to speak as to the character of the land on each side of the river? No.
378. You do not know how many sheep it will carry to the acre? At present the runs there are very large, and there is an average of about one sheep to 8 or 9 acres.
379. Do you think that under a proper system of irrigation that land could be made to carry nine or ten sheep to the acre? Irrigation would certainly increase the carrying capacity of the land.
380. Is it not a fact that on each side of the river the land is fairly good, and that when rain comes the vegetation shoots up almost at once? Generally speaking the land is as good as any in the district.
381. There is land in the district I suppose which feeds three or four sheep to the acre? I do not think that any land in that district will carry three sheep to the acre, season out and season in.
382. Do you not think that irrigation would convert these large tracts of land to cultivable areas and to good pastoral areas? I should say that irrigation would considerably increase the value of the land to the Crown, but I could not give an expert opinion as to the extent of that increase of value.
383. That increase of value would help to repay the cost of the work? I think so.
384. Would you give us the benefit of what you saw of irrigation during your travels? I can only speak generally as to what I saw in Southern California. All the systems of irrigation I saw there were gravitation systems.
385. They were carried on by private enterprise? Entirely.
386. The State had nothing to do with them? No.
387. But the holders made them very payable? Yes; I have seen land bought in Southern California for about £1 per acre and sold for about £30 an acre.
388. Do you know of any irrigation settlement that has been a failure? Well, there is Mildura; but I think that place was managed on wrong lines. I know one person there who has not done very badly. He is getting the same price for his dried fruits as the imported article realises.
389. What is the distance between Walgett and Brewarrina? About 85 miles.
390. Do you not think that the natural course of traffic from Walgett is to Narrabri? Not when the river is navigable.
391. As a matter of public policy you think that this scheme should be carried out, not only to provide for irrigation but to give increased traffic to the railway at Bourke? Yes.
392. You think that if the scheme were carried out it would increase the amount of traffic coming from the southern parts of Queensland? Yes.
393. Have you ever heard that the people have asked for a work of this kind? No; but I think that the scheme should commend itself generally to the settlers of the district, though not so much to the townspeople.
394. Have you heard an opinion expressed in favour of a railway to Brewarrina, in place of the proposed scheme? I think the Brewarrina people would prefer a railway. They would like to see the locking of the river proceed from Brewarrina north.
395. A railway would only provide means of transit;—it would give no facilities for irrigation? That is so.
396. *Mr. Hassall.*] What was your experience of the river while you were living in the district? In 1884-85, and in 1888-89, the river was not navigable for the best part of the year.
397. But in other years it has been fairly navigable? In some years it has not been navigable for six months out of the twelve.
398. What advantage will be derived from locking the river? I believe that it will increase settlement along the river banks, and lead to the irrigation of the adjoining land.
399. How could settlement be increased along the river banks? At the present time the bulk of the river frontages is unalienated.
400. But are you aware that most of that land is under lease for twenty-eight years? Well, I do not want to give evidence upon that point at all; I only came to speak about the traffic.
401. I understand from your evidence that if the river were made navigable between Bourke and Brewarrina, the bulk of the goods consumed in that district would go by rail to Bourke, and then up the river? Yes.
402. Have you a knowledge of the river above Brewarrina? Yes; generally.
403. If the river were made navigable to Brewarrina, would there be any great difficulty in getting to Walgett? Beyond the Collawaroy Rocks the difficulties would be the same as they are now. Traffic from Walgett would be as likely to come to that point as to go to Narrabri, because it is nearer.
404. I suppose you are aware that the distance between Walgett and Brewarrina is about the same as between Walgett and Narrabri? No; it is not so great between Walgett and Brewarrina.
405. What is that distance? About 85 miles by road.
406. Then it is 50 miles nearer Narrabri? Yes; with a better road.
407. In what way is the road better? There is more grass, and the road is better for traffic.
408. You think that if the river were navigable to Brewarrina traffic from Walgett would go to Brewarrina and thus on to Bourke? A portion of it would. I do not say that all of it would. There are a good many selectors beyond Walgett in the direction of Narrabri who would send their produce to Narrabri, because they would be as near to Narrabri as to Brewarrina.
409. Do you think that people would send their produce by road to Brewarrina, thence by river to Bourke, and thence by rail to Sydney, when they need only send it to Narrabri, and thence 350 miles by rail to Sydney? I think that if the river were locked, a large portion of the traffic from the district towards Walgett would come to Brewarrina, and thence to Bourke.
410. What is your principal outlet for goods from Bourke now? We send to all the stations as far as Walgett, and slightly north of Walgett, and to some places in towards Narrabri.

C. L.  
Shainwald,  
Esq.

19 May, 1896.

411. Do you serve any great part of the Narran, Bokhara, Birrie, and Culgoa districts? Pretty well all of that country.
412. Brewarrina is the depôt for those people? Yes.
413. You think that if the river were navigable as far as Brewarrina they would send their produce to Bourke? Yes.
414. Do you think that if the river were navigable to Walgett it would attract any of the traffic out towards St. George? I do not see why it should not.
415. You think that the natural facilities would cause it to drift that way? Yes.
416. If a railway were constructed to Walgett, what effect would that have upon the river traffic? The river would compete with such a railway, and I do not see how the freights could repay the cost of construction. If now, when the river is not locked, we can bring produce by water from Walgett to Bourke, and thence by rail to Sydney, what sort of revenue would such a line have.
417. Do you think that the people of Walgett would be satisfied with the arrangement you propose? That I cannot say.
418. Do you think the people at Bourke would be content to send their produce round to Sydney by way of Adelaide? I do not think they would like to do that.
419. Then if the line is constructed to Walgett, there is a probability that it will be practically useless? I do not see how it could earn sufficient revenue, because of the competition of the river.
420. Do you think that the proposed scheme is preferable to a railway from Byrock to Brewarrina? How could the cost of constructing such a line be repaid by its earnings when there is the river to give constant competition. We can carry goods by river from Bourke to Brewarrina, and Brewarrina to Bourke for as little as 12s. 6d. a ton, though the regular rate is 20s. a ton. If the river were permanently navigable, we could carry goods for 7s. 6d. or 5s. a ton, while the railway could not carry goods at that price.
421. Is not Brewarrina the distributing centre for the large pastoral district to which I have alluded? Yes.
422. The produce from that district, if the proposed scheme is carried out, will have to go along the river to Bourke, and then come back part of the way on the railway? Bourke is as much the depôt for that district as Brewarrina is. Bourke is as near the Narran and Birrie country as Brewarrina is.
423. If there were a railway to Brewarrina would those people go to Bourke? In a great many cases Bourke would be as near as Brewarrina.
424. If there were a railway to Brewarrina would not the bulk of that traffic go to Brewarrina? That is quite true.
425. You say that it would be beneficial both for the Bourke traffic and the traffic from the country north of Bourke, to have the river made permanently navigable between Bourke and Brewarrina? Yes.
426. Do you think it would be advantageous to improve the river higher up than that? Looking at the work as a national scheme, I should say, yes.
427. In the event of there being a full river, would the water back up in the Culgoa or Bokhara for any distance? I do not think so.
428. Do you think it would be beneficial to improve the navigation along the Barwon towards Collarandabri and Mungundi? I look upon that as part of the national scheme.
429. You think it would be better to improve the river upwards rather than downwards? Yes.
430. *Mr. Roberts.*] Does the 50 per cent. of traffic which you say would be gained by Bourke if the proposed works were constructed now to go to Queensland? No, it is not lost to this colony altogether. The bulk of it goes to Narrabri.
431. But we should get some of the traffic that now goes to Queensland? Yes; from Goodooga north.
432. You have looked at this scheme from the point of view of the commercial advantage to be obtained by giving permanent water-carriage? Yes; purely from that point of view.
433. You look upon the question of irrigation as of secondary importance? Not necessarily; but I am more familiar with the commercial aspect of the case.
434. Does Bourke suffer now from a scanty water supply? Yes, at times; because the river is the only source of supply. You cannot get fresh water by sinking wells.
435. Then the locking of the river would be of great advantage to Bourke? Yes. The Department of Mines tried three bores within a mile or two of the township, but in each case they were unsuccessful.
436. When the river is low the quality of the water is unsatisfactory? Yes; it is very bad.
437. Has the Darling any tributaries between Bourke and Brewarrina? Yes; the Bogan and the Culgoa.
438. Is the Culgoa ever navigable? No; although we have been up it nearly as far as the junction of the Birrie. We did not keep to the river channel, however.
439. How far is that? Thirty-five or 40 miles by road.
440. *Mr. Wright.*] Your company has practically a monopoly of the river traffic? Very nearly.
441. How many boats does it employ altogether? Fourteen or sixteen.
442. Do you bring much up the river from South Australia? Not a great deal.
443. There are not many boats trading on the lower part of the river? Not between Wilcannia and Bourke. Most of our boats trade from Bourke north, and from Wilcannia to South Australia and Victoria.
444. If the insurance on wool is £1 2s. 6d., what is the percentage? I reckon the value of wool to be £150 per ton. That would be 20s. or 25s. per cent.
445. Is not that a higher rate than used to prevail? Well, the rate used to be higher before 1884.
446. You are aware that certain rebates have been allowed by the Railway Commissioners on goods to and from Bourke? Not rebates.
447. You are perfectly cognisant of the fact that the Commissioners have rebated the whole amount of the border tax on Queensland goods? No, I am not. They have not rebated the whole amount of the border tax.
448. Have they rebated £2 a ton on Queensland wool? That I cannot answer.
449. Have not considerable concessions been made to your firm for large consignments of goods—sugar, for instance? No concessions have been made to our firm. We have paid the rates published in the rate-books.
450. You have received a rebate on 100 tons of sugar? There has been no rebate. We have paid the published rates.
451. The sugar was carried for less than the rate for an ordinary truck load? The Commissioners have made special rates for large parcels forwarded at their convenience.

- C. L. Shainwald, Esq.  
19 May, 1896.
452. The Commissioners will carry consignments of 100 tons for less than the charge for an ordinary truck load, and you have received the benefit of this arrangement? We have not received any more benefit than anyone else.
453. Your constituents have received the benefit of the arrangement? Anyone can avail themselves of the arrangement.
454. You have got up sugar at the lowest rates? We have got up sugar at the lowest rates disclosed by the rate-book.
455. Has not traffic been diverted to Bourke by reason of these cheap rates? The object of the Commissioners in making these rates is to meet the Queensland competition. Similar concessions were made to the Victorian traffic.
456. Are you aware that the Commissioners have only given a concession of 15s. a ton to Narrabri, as against £2 to Bourke? Well, they have given the same concession to places competing with the Victorian traffic.
457. Do you know what rate is charged for wool from Narrabri? The present rate is £3 as against £4 from Bourke.
458. The rate from Narrabri to Sydney is £4 5s. a ton, and from Bourke to Sydney, £4 0s. 6d. a ton? Well, the river traffic is not affected by any concessions given by the Commissioners.
459. Are you aware that Brewarrina would be 30 miles nearer to Sydney than Bourke is if the line were taken to Brewarrina? No; it would not be nearer to Sydney than Bourke is. The river would compete with the line. The earnings of the railway would not pay for the cost of construction, because the Commissioners could not well charge increased rates.
460. What competition would there be if the rate were the same to one place or the other? Places on the river between Bourke and Brewarrina might go to either terminus.
461. What about the Narran traffic? That traffic would go to Brewarrina.
462. You do not agree that the special concessions given to Bourke have induced a larger traffic over that line than it would otherwise have? No.
463. Then how is Bourke competing with Narrabri? It only competes with Narrabri when there is a river.
464. You think that if the river were locked, and the railway rates made the same on all lines, you could take all that traffic? I think its natural course would be to go down the river.
465. You think that the traffic from the Mungundi district should go 400 or 500 miles down the river, and then 500 miles from Bourke to Sydney by rail, instead of going direct to Sydney? I think that is its natural course.
466. I understand that you favour the locking of the river as far above Walgett as possible? Yes.
467. In order to utilise the river for navigation, and, possibly, for irrigation? Yes.
468. I understood you to say, in reply to Mr. Fegan, that irrigation would increase the number of sheep in the Bourke district? I said that it would increase the value of the land along the river.
469. Have you had any experience, or have you read, of irrigation being employed for grazing purposes? No.
470. Have you heard of irrigation being successfully adopted in America for the raising of cereals? Yes; in California wheat and corn are grown by irrigation.
471. There I understand all the irrigation is done by gravitation? Yes.
472. Do you think you could grow wheat if you had to raise the water by artificial means? I have seen very little cultivation done by pumping.
473. If a company were formed to cultivate 10,000 acres of wheat by irrigation by means of pumping, would you take shares in it? I should not be afraid to support it.
474. Would you take shares in it as a speculation? I do not claim to be a speculator.
475. *Chairman.*] The traffic coming down from Brewarrina to Bourke would reach the New South Wales railway system somewhere? Yes.
476. Therefore, the proposed locking of the river would concentrate at Bourke traffic that now goes partly to Narrabri and partly to the western line? Yes.
477. Would the proposal materially affect the amount of produce reaching our railway system? Not very largely.
478. Do you think that tolls should be collected on the river when locked? I do.
479. What would be a fair toll to levy? It will have to be a tonnage charge; but I could not give you an opinion now.
480. What traffic would be required on the river to give a fair return? That I could not say without going into the figures.
481. How do you distribute now when the river is not navigable? By teams.
482. What do you pay from Bourke to Brewarrina? The present rate of carriage is from 40s. to 45s.
483. And when the river is up? Twenty shillings for large lots, 25s. for small consignments; but with a permanent river, the charge would be lessened by one-half.
484. *Mr. Hassall.*] River tolls included? No.
485. *Chairman.*] With permanent water, would 10s. a ton be a fair charge? Yes; that rate would pay very well.
486. Therefore the locking of the river would lessen the cost of carriage to people at Brewarrina by 30s. a ton? Yes; in the dry periods of the year.
487. What is the carriage from Byrock to Brewarrina? About £2 a ton.
488. Could all the traffic that would come to any part of the river between Bourke and Brewarrina go to either Bourke or Brewarrina readily? Yes. The roads are the same in either direction.
489. *Mr. Wright.*] And the river would be the same if locked? Yes.
490. *Chairman.*] Would it be more expensive for teams coming from the north or north-east to make Bourke or Brewarrina, than to make the banks of the Darling, or some other point;—would the main body of the traffic tend towards the townships, whether the river were locked or not? Yes.
491. *Mr. Wright.*] What is the insurance between Brewarrina and Bourke at the present time? I think about 5s. or 6s. per cent. That is nearly 10s. a ton upon wool.

THURSDAY, 21 MAY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
HENRY CLARKE, Esq.	GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of Locks and Weirs on the River Darling.

Richard Davis Jones, Esq., Metropolitan Inspector of Stock, Department of Mines, sworn, and examined:—

492. *Chairman.*] Have you a knowledge of the Darling River? Not a very great knowledge, though I have been on the Darling. I know more about the Lachlan River. R. D. Jones.  
Esq.
493. Do you know the Darling River from Bourke to Brewarrina? No. The only places on the Darling to which I have been are Wentworth, Wilcannia, Bourke, and on the upper river, where it is called the Barwon—Walgett. 21 May, 1896.
494. *Mr. Clarke.*] Do you know the nature of the country in the locality of the proposed works? Not between Bourke and Brewarrina.
495. But you know country which is similar to it;—all the country out in that district is about the same? It is much of the same character.
496. Do you think that live stock could be carried more cheaply along the river, if the proposed scheme were carried out, than they could be driven. I do not know about that; I do not think they could.
497. You think it would be cheaper to travel live stock from Brewarrina to Bourke, a distance of 70 miles, by road than to send them down the river? Well, I have no idea of what the charge would be for carrying stock by water. If the season is good and there is plenty of grass and water, you can travel stock along an ordinary road at a very reasonable expense.
498. Do you think the construction of the proposed locks, and weirs, would be a public benefit or otherwise? I think it would be a public benefit. My knowledge of the absolute benefits derived by conserving water in dry country, such as this, leads me to think that the scheme will be of immense value to the colony generally. It would very largely favour settlement.
499. If tolls are not to be charged upon the river, that would be in favour of sending stock that way, instead of travelling them? I think it would.
500. If a railway were constructed from Brewarrina to Bourke, would it be cheaper to send stock by it than by water? I fancy that the water carriage would be the cheaper. It is in all other cases.
501. Do you think that irrigation in the neighbourhood of the proposed locks would prove profitable? I think it would. So far as I know it has been found profitable wherever it has been practised. I have seen its results in other dry parts of the interior.
502. What kind of crops would be produced there if the land were irrigated? Feed for stock would be grown. Lucerne is largely cultivated for that purpose, and I have seen it grown very successfully upon the Lachlan. I was thirty-five years in that district.
503. Do you know of places in this colony, or in Victoria, where irrigation has been a success? Where it has been tried on a limited scale upon the Lachlan it has been a success, and notably at Mr. Gatenby's place, about 25 miles below Forbes. It has not been carried on upon a very large scale in that district; but where tried it has been very successful.
504. Do you think that the Darling country would be capable of producing cereals? Yes; I am sure that it would, and wheat more particularly.
505. Would it pay to send cereals from that district to Sydney? I think it would pay to send wheat. Oats require a rather different climate from wheat.
506. They must be grown for hay? Yes.
507. *Mr. Fegan.*] You have had a great deal of experience in connection with the pastoral industry in this colony? Yes.
508. You have been the manager of large holdings? Yes.
509. You know the scheme before the Committee? I looked at the plans just before the meeting of the Committee.
510. I suppose that you are entirely in sympathy with some such move as is proposed? Certainly; I always have been.
511. Have you had any experience of irrigation? Not personally, though I have seen it tried.
512. You know the Lachlan district better than the Darling? Yes, because I have lived there for the greater portion of my life.
513. Is irrigation being carried out there by private individuals? Only in a small way. Mr. Gatenby's scheme is the largest that I know of about there. Mr. Edols, of Burrawang, also irrigates. He has been irrigating lucerne and small paddocks to feed stud stock and better-class sheep for the last twelve or fourteen years.
514. What has been the success of the system? The system has been a decided success.
515. Do you know what it originally cost? I do not.
516. Is it a pumping or a gravitation scheme? A pumping scheme.
517. From what source is the water obtained? From what is known as the Burrawang Lagoon. The same gentleman has irrigated other paddocks from the Lachlan River.
518. And has he, by means of irrigation, kept the stock in good condition during times of drought? Yes. Irrigation has saved him very large losses.
519. Do you think that if irrigation is found to be generally successful, it will revolutionise the pastoral industry. There is no doubt about that.
520. Do you know much of the country on the Barwon? No, but I believe that it is very similar to the country on the Lachlan.

- R. D. Jones, Esq.  
21 May, 1896.
521. Your remarks about irrigation on the Lachlan will apply to the Darling? Yes, the country on the Darling is very similar. There is, perhaps, more red soil about the Darling.
522. The scheme before us has two objects—to irrigate the land near the banks of the river, and to make the river navigable throughout the year; do you think that the Government would be recouped its expenditure, because of the increase of value of land along the river which will take place? I daresay it will, indirectly.
523. The land which is irrigable, could be leased at higher rents and cheaper carriage would induce closer settlement? Yes; because the persons living there would be able to make larger profits.
524. You understand what droughts are? Yes; when I was quite a young man the droughts of 1866 ruined me. I have seen as many droughts as anyone of my age, and as severe droughts. I have seen the Lachlan so dry that you could not get a drink in it for a stretch of a mile and a half.
525. You think the Government should try to carry out some scheme which would protect pastoralists and agriculturists against droughts? Yes; I think that the Government, if they undertake such a work, will deserve the thanks of the public.
526. You think that it would be comparatively easy to help the people in this way? I think so. The Lachlan is a fair stream under ordinary circumstances. It is very much bestrewn with timber, but that could be cleared away without much trouble.
527. What has been the effect of irrigation at the two places you have mentioned? It has improved paddocks which, in ordinary seasons—and down there ordinary seasons are dry seasons—would only carry a sheep to about  $2\frac{1}{2}$  or  $3\frac{1}{2}$  acres. Those paddocks, having been subdivided, sown with artificial grass, and irrigated, will now keep ten or fifteen sheep to the acre; in fact, the sheep cannot eat them down. The feed is sometimes so abundant that they have to take the sheep out, because, as you know, the delicate part of the merino is his foot, and the damp land affects their feet.
528. Where land is irrigated a man is not weighed down with anxiety in seasons of drought? No. It must be remembered, too, that the condition of wool is affected by the condition of the animal upon which it grows.
529. It is proposed to spend £121,000 upon this work;—do you think the scheme is worth a fair trial? I think so. I think that, inasmuch as irrigation has been successful on a small scale, it will be successful where the undertaking is larger.
530. Have you seen any irrigation scheme which has been a failure? I have not.
531. Do you know anything about the Mildura settlement? No; I only saw it from a distance, on my way from Euston to Wentworth.
532. Is it your opinion that irrigation schemes, if carried out scientifically, will make these large arid tracts useful and profitable? No doubt about it. Irrigation is what we require. A dry country is practically useless without water.
533. In one sense a scheme like this would be better than a railway? I think it would in two senses. It provides means of transit whereby produce may be taken to the railway, and it puts the country in a condition for producing something for the railway to carry.
534. Protecting people from the great losses which now occur because of droughts? Yes; just now they are languishing from droughts in a great many parts of New South Wales. I have seen some dreadful accounts from Bombala, and that district, and when I was in Hay on Easter Monday, the country was looking very bad. Since I was there, however, they have had good rain, and in warm weather the country rapidly improves after rain.
535. *Mr. Roberts.*] Have you ever been into the country lying north of Brewarrina towards the Queensland border? No; I have only been out towards Wanaaring on the Paroo. I have not been in the country of which you speak.
536. Have you ever been to Brewarrina? No.
537. Are you acquainted with the country between Walgett and Bourke? No, I have not been along there; but I suppose it is like those portions of the Darling country which I have seen.
538. Is the Darling country fertile in character? Yes, it would be very good if they had water.
539. If the land were irrigated it would grow almost anything? I think so.
540. Can you give the Committee any information as to the number of stock coming down to Brewarrina from the country out towards the Queensland border? Not from memory. I should have to turn up the records in the office to get that information. Cattle more than anything else come that way.
541. Have you ever given any consideration to the question of locking the Darling? No; I should have paid more attention to the scheme if it had been proposed to make these locks on the Lachlan.

Hugh Giffen McKinney, Esq., Chief Engineer, Water Conservation Branch, Department of Mines, sworn, and further examined:—

- H. G. McKinney, Esq.  
21 May, 1896.
542. *Mr. Lee.*] You have furnished the Department of Mines with more than one report upon the question of locking the Darling? Only one report was published.
543. Did you not report upon the subject in 1891, and again in 1893? The matter was referred to by me in a general report upon the question of water conservation, prepared for the Minister in 1891. At that time I had only a very limited amount of information at my disposal. The special report published in 1893, was prepared after a very elaborate investigation of the whole subject.
544. What is the Committee to understand as the primary object of this scheme? I regard the provision of permanent water at an improved level as the more important object.
545. Had this matter received much consideration by your Department prior to the suggestions made by the Railway Commissioners? I do not know what suggestions the Commissioners made. I do not recollect having had any suggestions before me.
546. Have not the Commissioners, from time to time, referred to the desirableness, in the interest of the Western Railway, of locking the Darling? I believe they have; but I have only seen such statements in the newspapers. I have not read any reports upon the subject.
547. Were you moved to propose this scheme largely in order to obtain more traffic for the railway, or in order to conserve water to be used in other directions? I look upon the conservation of water as the more important object; but the other is also a matter of importance.
548. Once the water is conserved it will be possible to use the river for the advantage of the Railway Commissioners? Quite so.

549. But you attach a much higher importance to the scheme because of its effect in increasing settlement in that distant part of the country? Quite so.

550. The late Mr. W. C. Bennett, at one time Engineer-in-Chief for Roads and Bridges, held that the main function of the western rivers was not so much the carrying of produce as the production of something to carry:—do you endorse that opinion now, having had the advantage of further investigation? Yes; that opinion was given by Mr. Bennett a very long time ago, during the course of an investigation about railways.

551. It was at one time held by Mr. Darley and other engineers, that it would be advisable to lock the whole river from Wentworth upwards; but of late years, the section from Wentworth to Bourke has been practically dropped? For the time, I understand.

552. And the attention of the engineers has been devoted to that portion of the river lying between Bourke and Brewarrina? Yes; as I understand, the greatest combined advantage can be had there.

553. Therefore, we now have a definite estimate of the probable cost of the scheme as shown on the plans before the Committee? Quite so.

554. At page 21 of the report issued in 1891, you say—

Keeping in view the objects for which works for water conservation on the river Darling are proposed, the following would be legitimate sources of revenue on account of these works:—(1) Rights to pump water for irrigation from the river Darling, and the lagoons connected with it; (2) rights to pump from lakes or other natural depressions into which the waters of the river would be diverted; (3) irrigation by direct flow through natural or artificial channels from the river; (4) increase in the value of land due to the works; (5) navigation tolls.

You go on to assert that if the supplies calculated upon were obtained you would have sufficient water to irrigate 220 acres to every mile of river frontage? Much higher weirs than are now thought advisable were then contemplated. The quantity of water now proposed to be stored is much less.

555. That would account for your statement the other day that you will be able to irrigate 100 acres for every mile of river frontage? Yes; I hope that it is understood that that is the area which could be irrigated merely from the water stored up.

556. You also state in your report that a pumping license, equivalent to 5s. an acre, would be a very reasonable thing to insist upon, and that this alone would bring in a revenue of £50,000 per annum;—how do you make up that estimate? Simply by reckoning how much 5s. an acre would come to on 200,000 acres.

557. But 200,000 acres is a very large area, and it is a question whether you will have water enough in your weirs to irrigate that area? The quantity of water stored up would not be sufficient to irrigate that area; but the area which could be irrigated from the natural flow of the river, in addition to the water stored up, would greatly exceed it.

558. Do you propose that every freeholder in the district shall pay a pumping license, whether he uses the water or not? No; I propose that everyone who uses the water should pay. The ideas expressed in the report have been very much modified since, and I may mention that the Secretary for Mines and Agriculture has given notice of his intention to introduce a Bill dealing with the question of giving rights to take water from rivers. That Bill covers the whole matter dealt with here. This report is merely a forecast in which certain things are assumed.

559. Well, the Committee want to know why you estimated the probable revenue from pumping licenses at £50,000 per annum? As a matter of fact, if a permanent supply of water were provided on the Darling, it would be worth the while of the people there to pay that rate for it.

560. You base your estimate on the assumption that every person using water for irrigation purposes would pay a pumping license fee of 5s. per acre? Yes.

561. And you assume that 200,000 acres would be irrigated;—what ground had you for that assumption? Well, this report was made in the earlier stages of the investigation.

562. Does subsequent research confirm the opinions which it sets forth? On the whole it does not; but the circumstances of the case are sufficient to account for that. In this country every possible obstacle has been placed in the way of those who want to use water, while in America every facility is given to them. I do not think that our settlers are less enterprising than those in the western states of America, and I know that under similar circumstances the American settlers would be willing to pay that amount for irrigation.

563. On broad grounds any person who is able to obtain sufficient water at all times for 5s. per acre per annum would be obtaining it cheaply? Not under all circumstances. There are circumstances under which irrigation would not pay.

564. But if a man could get permanent water at that rate he would be getting it very cheaply? I think so.

565. Therefore your estimate is not excessive? No.

566. But you are not prepared to say how many people will avail themselves of this water? No.

567. That would depend very largely upon the settlement of the Crown land along the river? Yes.

568. Will you let the Committee know what rates were charged at Mildura for water? For the first eighteen months no water rates were levied, and most of the settlers there thought they were to get their water for nothing. But, after that, a rate of 6s. per acre was imposed, the people being informed that that amount was necessary to meet the expense of pumping. Next year a rate of 12s. per acre was struck, and the year following a rate of £1 per acre, and then the people struck also. That was when the crisis came.

569. But they had magnificent pumping machinery there? They had very fine pumping machinery, though the circumstances under which that machinery was worked were by no means very favourable.

570. When you made your estimate upon a charge of 5s. per acre, did you take into calculation the fact that the people using the water would in addition have to pay the cost of pumping? Yes; the 5s. per acre would only be the rate paid to the Government. This matter, however, has been modified by subsequent policy. In this connection I should like to read an extract from a report of the United States Census Office, dated 20th August, 1892, which is referred to in a paper upon the progress and position of irrigation in New South Wales, read by me before the Royal Society, and which I will now hand in for the information of the Committee. The extract to which I refer is as follows:—

The average value of the land irrigated in 1889 with the improvements thereon, is found to be 83.28 dollars per acre, and the average value of products for the year stated is 4.89 per acre. By correspondence with over 20,000 irrigators, fairly distributed throughout the arid and subhumid regions, it has been ascertained that the average first cost of irrigation is 5.15 dollars per acre, and the average value placed upon the water rights, where separable from the land, 26.00 dollars per acre, or

H. G.  
McKinney,  
Esq.

21 May, 1896.

H. G.  
McKinney,  
Esq.  
21 May, 1896.

over three times their original cost. The average annual expenditure for water, as distinguished from the purchase of water rights, is 1·07 dollars per acre, and the average cost of the original preparation of the ground for cultivation, including the purchase of the land at the Government rate of 1·25 per acre, is 12·12 dollars per acre. By applying with necessary modifications, to the enumerator's returns, the averages obtained for each separate State and Territory, it has been found that in round numbers the total investment in productive irrigation systems utilised in 1889, in whole or in part, was up to June 1st., 1890, 29,611,000 dollars. Their value at that date was 94,412,000 dollars, showing an apparent profit of 64,801,000 dollars, or 218·84 per cent. In the same manner the aggregate first cost of the irrigated areas with their water rights, not including the farms of the subhumid States has been ascertained to be 77,490,000 dollars, and the value of the same on June 1st., 1890, 296,850,000 dollars, showing an increase in the value of land and water rights of 219,360,000 dollars, or 283·08 per cent. In other words, the land irrigated in 1889 was worth nearly four times what it cost, no allowance evidently being made for failures. The total expenditure for water, including the maintenance and repairs of ditches, in the arid states in 1889 was 3,794,000 dollars, and the total value of products 53,057,000 dollars.

571. *Mr. Wright.*] Those are all gravitation schemes? Nearly all of them are, though there are many artesian wells and many pumping schemes also.

572. *Mr. Lee.*] The next source of revenue to which you allude is derived in exchange for the right to pump from lakes and other natural depressions into which the water can be diverted;—can you tell the Committee what you estimate to be the probable revenue from that source? That information would not be of much value now, in view of the provisions of the Bill to which I have referred. You will, however, find a list of the lakes along the Darling and of the cubical contents of each at the end of the report furnished by Mr. Ward and myself.

573. You are not in a position to tell us the probable revenue from that source? No.

574. The third source of revenue is derived from irrigation by direct flow through natural or artificial channels from the river;—can you tell us approximately the probable revenue to be derived from that source? It would be a very difficult matter to get that information.

575. These are probable sources of revenue, but they are indefinite? It is practically impossible to estimate the revenue from these sources. All revenue obtainable will depend very largely upon the settlement of the district and the rates charged.

576. Your fourth source of revenue, which in your opinion is the most important, is the increase in the value of the land, owing to the carrying out of the proposed works. Perhaps you will fully explain that? Even where land is used only for pastoral purposes if a small area is irrigated not only is the value of the irrigated area increased, but the value of the whole area is increased. For instance, if on a property of 10,000 acres, 500 acres were irrigated, the value of the entire holding would be materially increased.

577. But if it were a leasehold area, the rent would be subject to reappraisalment at certain periods, and consequently the leaseholder in incurring expenditure for irrigation would simply be increasing his rental? Undoubtedly, but he would increase his income still more.

578. Did you attach any importance to the fact that Crown lands may be enhanced in value? Basing my estimate upon the experience of the Western States of America, I assume that the value of the unalienated Crown lands would be materially increased.

579. That increase of value, although it would go to the State, through the medium of the Department of Lands, would do nothing towards directly recouping the expenses of this work? Any work that increases the productiveness of the land and makes settlement closer must provide more traffic, not only to the railway but for the river, and this indirect return would probably more than compensate the Government for their outlay.

580. If the value of the Crown lands on the Darling is increased by 5s. an acre, the money will go to the Lands Department? That is so; but it does not matter very much whether it is the Department that incurs the expenditure or some other Department that gets the advantage, so long as there is an advantage.

581. You hold that the work would contribute to the general prosperity of the country? Quite so.

582. And that should cover all minor considerations? Quite so.

583. Your fifth source of revenue is the navigation dues;—I should like to know whether it is proposed to charge river dues? I do not know what the policy of the Government is in regard to this matter. Individually, I think, that such dues should be charged. There are precedents both for collecting dues, and for not collecting them. Which precedents the Government will adopt I cannot say.

584. If dues were charged the people who used the river would simply be asked to pay for services rendered? Yes.

585. Just as they would be asked to pay rates if they used the railway? Exactly.

586. The question then resolves itself into this;—what revenue is the country to get to recoup the working expenses, and the interest on the money expended on this scheme;—have you any proposal to make which will enlighten the Committee upon the point? I can only give it as my individual opinion that dues should be charged, but I should like to consult the Department further before making any definite statement.

587. You are aware that the question of river dues has been mooted from time to time in the past? Yes.

588. I think that at one time a Bill was submitted to Parliament dealing with the subject? I am not sure about that, but I know that the question has been raised in Parliament.

589. Can you give the Committee any idea as to what led up to the proposal to charge river dues? I think it was largely because of the great expense which had been incurred in snagging the Lower Darling.

590. Which work rendered the river more navigable for South Australian and Victorian steamers? Yes.

591. Then the railway consideration came in? Yes.

592. The Railway Commissioners advocated that something of the kind should be done? They favoured the locking of the Upper Darling. When Mr. Ward and I were preparing our report, he called upon the Commissioners about the matter.

593. Unless revenue is derived from some source, how are these locks to be maintained and worked? In regard to that matter, I should, perhaps, mention that in France they have adopted the principle that rivers and canals should be considered highways, and therefore be free from tolls. In that country they have spent an enormous amount in improving their inland navigation; more I think than in any other country in the world. They consider that the indirect benefits obtained from the improvement of the rivers are so great that the Government should carry out the work and make no charge for it. I do not quite agree with the principle, however, because I do not think that it is a fair one.

594. The maintenance of these locks will be a very costly matter? It will not be very costly.

H. G.  
McKinney,  
Esq.

21 May, 1896.

595. Will they not be subject to great damage in times of flood? No, because there is very little to be damaged. Practically the shutters are the only part of the work liable to be damaged, and, as they will be plain and simple in construction, it would not be difficult to replace a damaged shutter at any time.

596. But a certain amount would have to be paid annually for maintenance and to provide wages for the men in charge? The amount would be merely nominal as far as repairs are concerned.

597. Have you estimated what it would be? It would be about £250 per annum for each combined lock and weir. That includes everything.

598. There are six locks and weirs? Yes, I reckon that in some cases two men will be required constantly, while in other cases only one man will be required. Probably the outlay for wages would be £150 a year or thereabouts, while repairs, painting, and so on would come to about £100 a year.

599. Even if no river dues were charged revenue could be obtained from pumping licenses, and in other ways which, at a very low calculation, would probably exceed your estimate of the cost of maintenance? Yes.

600. *Mr. Fegan.*] You had a large experience in India? Yes.

601. Can you give us the benefit of your experience in connection with irrigation settlements there? The style of settlement there is quite different from what it is here; but a great deal of my Indian experience would come in usefully here. Locks are pretty much the same all the world over. Those here proposed are similar to what we had on the Lower Ganges canal.

602. The locks and weirs there were chiefly for irrigation purposes? Irrigation was the great object in view there. Navigation was a very small matter, though the canals were found to offer a convenient mode of transit in the cotton season. Navigation, however, was looked upon as quite subsidiary to irrigation, and provided only a small amount of revenue.

603. Can you explain to us how navigation and irrigation come into conflict, as mentioned by you in your former evidence? Putting the matter broadly, for an irrigation canal you want as great a discharge as you can get. You want to have your water running at as great a velocity as the ground will stand, in order that your canal may be small in proportion to the quantity carried. With navigation, on the other hand, it is necessary to have the water still, very much as it will be on the Darling when the river is low. In India, even where the labour is cheap, they find it very laborious to get the barges up the canals. They generally allow them to float down with the current, but coolies have to be employed to drag them up.

604. What kind of country do these canals go through? In the North-West Provinces the land is generally in the hands of large holders; but in the Punjab there is a great quantity of land of which the Government is practically the holder. The principle there is that the Crown holds all the land, while the people are really Crown tenants, having to pay the rates which are assessed on the land.

605. Has irrigation there been a success? It has been a splendid success, both in the North-West Provinces and in the Punjab. Taking India as a whole, irrigation has been remarkably successful there. The canals, both in the North-West Provinces and in the Punjab, pay very much more than the interest on the outlay.

606. What rates are charged? There they charge by the acre, and by the crop—so much for sugar-cane per acre, so much for indigo, and so much for wheat. Some crops require more water than others, and some want greater regularity and attention than others. Indigo requires great regularity, and so does rice.

607. I suppose these canals have almost changed the face of the country there? Yes. In the first place, a famine is almost impossible there now, though the time was when they had very severe famines.

608. At regular or at irregular intervals? A general scarcity was not a common occurrence, but occasionally the scarcity was very severe.

609. How have the works affected the health of the people there? I do not think they have made any appreciable difference in that respect. Indirectly, they may have made a difference, because population has become very dense in the irrigated districts.

610. Is there any part of India or of America where you have seen conditions prevailing and soil similar to the conditions and soil on the Darling? There is great similarity between the climate of the Punjab and the climate of Bourke and Brewarrina, except that in the Punjab there are six or seven hot months in the year, while there are only three or four at Bourke.

611. You are well acquainted with the land on each side of the Darling? Yes.

612. What kind of land is it? As a rule it is very fertile.

613. How many sheep does it carry to the acre? It varies a great deal. I remember when I was up there hearing people say that 5 or 7 acres were required to carry a sheep.

614. What use could the land on each side of the river be put to if it were irrigated? That land will grow almost anything. It has grown lucerne in places remarkably well, and there are several patches of irrigated land on which wheat is grown. Then, too, it grows fruit splendidly. There is a Chinaman at Bourke who has taught the people what can be done up there.—he has done wonders in the way of fruit and vegetable growing. At Brewarrina, too, the Chinamen have a small patch of land which is remarkably productive.

615. I suppose this country would feel a drought very considerably? Yes; the seasons there are very irregular. It is not so bad there, however, as further to the west and south-west.

616. But it is so bad that settlement has decreased? I am not sure that there has been a decrease; but if there has been an increase it has been very small.

617. Nothing in comparison to the increase that has taken place in other parts of the country? No.

618. If the land is good, and the climate fairly good, there must be something radically wrong? Quite so.

619. What you believe to be wanted is a good system of irrigation? Yes.

620. And that is what you now propose to give? Yes.

621. *Mr. Hassall.*] Do you think that if there were a permanently full river the people on the Darling would be induced to go in for irrigation? I think so. They certainly would do so if an Act were passed giving them a recognised right to the water. At the present time anyone who pumps water from the river does so only on sufferance.

622. Do you not think that if the people there wished to irrigate they would do so under present circumstances? No; because they have no security at the present time. If a man were pumping from the river, and the water fell very low, his neighbour lower down might compel him to stop pumping.

H. G.  
McKinney,  
Esq.  
21 May, 1896.

623. Do you not know that a man is perfectly justified in pumping water out of the river when it is running? As the law stands a man has no right to pump out of a river.

624. Do you mean to say that a man owning land alongside a river has no right to pump out the water, supposing the river is running half bank high? Yes. A few years ago I was speaking to a well-known pastoralist on the Murrumbidgee upon the subject. I asked him if he was aware that he had no legal right to use his pumping plant, and he said that he knew perfectly well that anyone lower down could compel him to stop by threatening to apply for an injunction.

625. Well, in what way would you give people a right to take water supposing you locked the river? We want an Act passed to give that right. There is a Bill before the House at the present time for that purpose. That Bill, if passed, will enable the Government to give people the right to take water.

626. And you think that if a Bill were passed allowing the people to use the water, they would use it at once, without waiting for the river to be locked? Yes; but the Bill contemplates giving these rights only under certain regulations. These people will have to show that their pumping arrangements will not interfere with anyone else.

627. If the people felt the necessity for irrigation, would they not use the water that goes to waste when the river is running half or three-fourths bank high? A few of them do use it. I have a list of the places where there are pumping stations; but all these people take water at their own risk, and just at the time when they want it most, when the river is very low, someone who has a grudge against them might order them to stop, and they would have to stop.

628. Do you know any instance where such action has been taken? I do not know of any case where such action has been taken in connection with pumping schemes; but I know that people try to regulate their pumping so that they will not have to take much when the river is low, and thus lessen the risk of having an injunction taken out against them.

629. Do you think any person would prevent another from taking water from a river which was half full? Such a case is not likely to occur, of course; but it has often happened that people have cut dams simply to injure their neighbours, when their action could not possibly benefit themselves.

630. When you have your weirs will it not be necessary to keep the water in the river, in order to have sufficient for the navigation? The surface level above the weirs will be raised by 6 or 8 feet, and the river will keep at a steady level, which is a decided advantage to a pump.

631. Do you think that under ordinary circumstances people will be able to afford 5s. an acre for water? I do not know that there would be much use going into that question now in view of the Bill that is to be brought before Parliament. I base my calculation upon the American experience.

632. In addition to paying 5s. an acre, would the land-holder have to provide his own pumping apparatus? That was the original idea.

633. How far back from the river will you be able to send the water? It would not be advisable to send the water very far back if land suitable for irrigation could be obtained on the river bank, because of the waste in the channels. That has been the experience in Mildura.

634. But it has been stated that land lying within 3 miles of the river will be benefited? I consider that land even further away than that will be benefited, as I have already explained to Mr. Lee.

635. What you meant us to infer was that 500 acres of irrigated land would enable the holders of a large area to tide over a severe season? Yes; that has been the experiences in some places. Mr. Wills Allen, who would be a very desirable witness, would no doubt support that contention. At his place I saw 4,000 sheep on 200 acres, and they had been there for many weeks.

636. What was the crop? Lucerne.

637. You require pretty good land for lucerne? Yes.

638. Is the land along the Lower Darling equal to the land at Gunnedah? I believe that patches of it are very little, if at all inferior. Of course there are clay flats that should not be irrigated at all.

639. Do you not know that the land along the Lower Darling is not to be compared with the beautiful river flats about Gunnedah? I was on part of the Tapio Run near Wentworth, where they were trying how many sheep they could support upon an acre of lucerne. They kept on cutting the lucerne and feeding the sheep with it, and they found that in this way the land would support 23 sheep to an acre all the year round.

640. You contend that irrigation would materially increase the carrying capacity of this land? Yes.

641. And this would provide more traffic for the railway? Yes; and for the river.

642. And that if river dues were imposed the traffic on the river would pay interest on the cost of construction and working expenses? Exactly.

643. Do you not think that it would be more advisable to try and obtain artesian water? Artesian supplies are very good in their way, but the water obtained is more expensive than one might think. It is a very good artesian bore that will give a flow of 1,000,000 gallons, or less than 2 cubic feet per second, and that quantity of water, even with good management, would not irrigate more than 200 acres.

644. Therefore, to look to artesian supplies for irrigation purposes would be a failure? I would not say that.

645. *Mr. Black.*] What is the average cost of a bore? The Government bores cost from £2,000 to £3,000 each.

646. *Mr. Wright.*] I think you will find that private bores cost about £500? Well, there are very few places in this country where you can get water at anything like a moderate depth. Most of the Government bores start with a diameter of 8 or 9 inches and gradually decrease to about 5 inches.

647. *Chairman.*] Taking the experience of the colony generally, what does it cost to obtain a discharge of 2 cubic feet per second? I think about £2,000 on the average. In many cases artesian irrigation would be of considerable value. Every artesian bore, if properly managed, should be the centre of a patch of cultivation which would be very valuable in times of drought. One hundred acres of cultivated land would be a very good stand-by in such districts as those in which artesian boring is generally carried out. With this small amount of irrigation you might obtain a very large crop of hay.

648. *Mr. Hassall.*] Do you think it would be advisable to irrigate the land about these bores to grow forage for use in bad seasons? Yes.

649. Can you tell us whether the fact of the artesian water being mineralised would have a bad effect upon the soil? There are cases where such water would have a bad effect, but I understand that they are quite the exception. I have seen analyses of water from a large number of artesian bores, and I do not

not think any harm would be done by using such water. Certainly, if people irrigated one place one year and a fresh place the next year, instead of irrigating the same land continuously, no damage would be done even if the water contained a moderate quantity of mineral matter.

650. You would spell the land occasionally in order to enable it to recover from any bad effects of mineralised water? Yes. Cereals have been grown at a number of these bores very successfully. The chemist attached to the Mines Department has analysed a very large number of samples of water from these bores. He read a paper on the subject before the Royal Society, and I will send it to you.

651. Is the scheme proposed merely the initiatory step towards providing a perfect system of navigation upon the river? I have had surveys made for lock sites up as far as Walgett.

652. Then there is a probability of this locking being extended further? Yes; but in any case the work will take a considerable time to accomplish.

H. G.  
McKinney,  
Esq.

21 May, 1896.

FRIDAY, 22 MAY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of Locks and Weirs on the River Darling.

Hugh Giffen M'Kinney, Esq., Chief Engineer, Water Conservation Branch, Department of Mines, sworn, and further examined:—

653. *Mr. Roberts.*] Was it not in 1883 that Mr. Gordon reported to a company on a scheme somewhat similar to this scheme? Yes.

654. Did the company decline to proceed with the scheme on account of their inability to see a satisfactory return for the expenditure? I have no direct information on the subject, but I understand that that was the case. Their object in getting the work done was merely to make the river permanently navigable. They had no other object in view. In fact, Mr. Gordon mentions in his report that if the question of utilising the water were taken into account, it would put a new complexion on the matter.

655. Do you know what rates they contemplated fixing for navigation dues or irrigation charges? They had nothing in view as regards irrigation, because they had no right to use the water.

656. It was intended strictly for navigation purposes? It was intended purely for navigation, and if I am not mistaken, the movers in the matter were directly interested in the stations fronting the Darling from Wilcannia to Wentworth. They simply wanted to get their wool to market, and to get up their stores.

657. In your statement to this Committee you assume that you will be able to conserve about 6,250,000,000 gallons of water;—how long do you estimate that that quantity will last in a season of drought? I do not think that that question would really arise, because the flow in the river above Brewarrina has never been known to stop. It is only lower down the river that the flow has been known to stop. My expectation is that that supply will be constantly replenished.

658. Do you think that in a season of drought there would be a sufficient supply flowing in the river to provide an adequate quantity for navigation purposes? Yes; but it would be necessary to arrange that no pumping would be allowed to go on when the river fell below a certain discharge; in fact, the pumping rights on the Darling would have to be graduated according to the height of the river.

659. In the report which you furnished in 1893 in conjunction with Mr. F. W. Ward, you say:—

We suggest 5s. per irrigated acre as a reasonable rate; but it has also been shown that in twelve out of fourteen years a large flow during the spring months can, judging from the past, be depended on. Rights to pump from this flowing supply, on condition that work should be stopped when the reading on the gauge falls below certain specified heights might be granted subject to reduced license fees.

Did you mean to suggest a charge of 3s. per acre when the river was flowing, and a charge of 5s. per acre for conserved water when the river was not flowing? That suggestion was not made with the idea that the storage would ever be allowed to become empty, but with the idea that the Government, having conserved that quantity of water, should get credit for it, and get revenue corresponding to it.

660. When do you propose that only 3s. per acre shall be charge? It was only a suggestion that when the river got higher and the supply was more abundant that a diminished charge could be made.

661. That is 3s. when the river was flowing, and 5s. for conserved water? Yes. The rates will depend very largely on the Bill dealing with riparian rights. The report from which you quote was prepared after an inspection at the end of 1892; but the whole question of water rights and pumping rights from the rivers, and such matters, are dealt with in the Bill which is now before the Assembly. In our report we suggested an arrangement which seemed to us to be a fair one.

662. Did you consider how the navigation dues would be collected,—would it be merely in the form of lockage dues? We thought that the Government had a fair claim to navigation dues, quite independent of lockage dues.

663. Did you suggest any rate? No.

664. In view of the fact that the entrances to the northern rivers are improved at a very large expenditure of public money, and that no charge is made in respect of such public works, do you think it is likely that the people along the Darling will be prepared to pay navigation dues? If no charge is made in respect of the works on the coast, there might be an objection made to the imposition of any charges on the Darling River. In a certain measure the circumstances are different. In one case it is tidal waters chiefly which are dealt with. Still it does seem to me to be a question whether the one case is not a precedent for the other. I think it would be perfectly fair for the Government to collect a rate in each case.

H. G.  
McKinney,  
Esq.

22 May, 1896.

H. G.  
McKinney,  
Esq.  
22 May, 1896.

665. In the one case the harbours are dredged, and the entrances to the river are cleared without any rate being levied upon the people who are directly benefited by the expenditure? It involves a question of State policy; but it seems to me that it would be perfectly fair to collect a rate.

666. You admit that probably no navigation dues would be collected? My opinion is that they should be collected.

667. Do not you think the people would look upon the river as a highway in the same way as they regard a river where the entrance has been improved and the sand-banks removed? Probably they would; it is a matter of State policy.

668. I think you stated that in France these streams, where locks and weirs have been erected, are looked upon as highways? They are.

669. And no charge is made? That is not the general rule.

670. Are dues imposed? Dues are imposed in Russia; I have a note of the dues which are collected in different European countries where there is inland navigation. I am almost certain that France is the only country in which such dues are not collected.

671. Will you furnish that information to the Committee in the form of a return, stating whether the works were erected by the State or by private enterprise? Yes.

672. Did the Water Conservation Department call for tenders, in 1895, for an experimental lock and weir at Bourke? Yes.

673. Did you prepare the plans and specifications? They were prepared under my direction.

674. Why is it termed an experimental lock and weir? That is what it was termed in the papers. The idea was that it would form a model for others that were to follow.

675. Have you any doubt as to its efficacy? I have none.

676. Are the works which are now being considered by the Committee based upon similar plans and specifications? There are slight alterations in small details, but the whole principle is the same, and the general design is the same.

677. Have you inspected the work which Messrs. Kerle and Kerle contracted to construct for £18,800;—is that work going on at the present time? It is just being started, directly under the Government.

678. Have Messrs. Kerle and Kerle thrown up the contract? Yes.

679. Is the work progressing satisfactorily? It is only within the last four or five days that we got the temporary dam up to about water level. We have been getting the materials on the ground and making all arrangements to push on the work quickly. The river is low enough to carry on the work, but the place all round the foundation is very muddy, and it is difficult for the carts to work. It may be another week before we get into full swing.

680. When will the work be completed? If we have anything like the good fortune which Kerle and Kerle had, we shall have the work completed in three or four months.

681. You have no doubt that the lock and weir will come up to your expectation? No.

682. Had you, prior to drawing your plans, seen similar work in any other country? I had the immediate charge of the building of several locks, the style of which is very similar to this one, and as to weirs, I must have had a couple of score of them to build in my time. The weirs were different, certainly, in some respects from this weir.

683. Have you gone through all the details of the proposed works which you estimate, I see, to cost £121,100? I went through all the details in regard to one lock and weir, and these have been prepared in my office I believe with every degree of care.

684. Based on the tenders you received for the work which is now going on? Yes.

685. Will you explain what increased traffic will accrue to the railway from this work? We anticipate as a result of these works that settlement will be promoted to a very considerable extent, that it will pay people to take up smaller areas, and that it will also pay people to irrigate areas of land. The irrigation of these areas will increase the stock-carrying capacity of the country along the river, and that will increase the traffic materially, and so will closer settlement and cheap carriage. These are all elements intending to increase the trade.

686. You assume that an agricultural population will probably be settled upon the banks of the river? To a certain extent. But even supposing that an agricultural population do not settle there; supposing that they resort to a certain amount of irrigation as an adjunct to pastoral occupation, that I believe would add very materially to the traffic. I do not think that the members of the Committee could do better than go up to Gunnedah and see the works belonging to Mr. Wills Allen. It would give a good idea of how irrigation can be carried on in connection with pastoral work.

687. You think that pastoralists would combine agriculture with sheep-farming? Probably for the irrigation of fodder crops.

688. Principally for home consumption? Yes, in order to help them to tide over a bad season. I have heard from several very successful pastoralists that they consider that a very moderate area of irrigated fodder crops materially increases the carrying capacity of the whole run, because they feel safer as regards stocking-up.

689. Do you think the Government would get any increased return from the lands if this scheme were adopted? Yes, decidedly.

690. I suppose the value of the land, for a considerable distance, would be greatly increased? I think so.

691. You think that the Government would receive more indirect advantages than a direct financial return? Quite so. I think the indirect returns would really be the most important.

692. You think it is more desirable to carry out this work for irrigation purposes than for navigation? It is carried out for both purposes, but I think the increasing of the productiveness of the land is the more important object in view. Cheap carriage would tend to increase the productiveness of the land.

693. Have you any idea of the views of the residents on the river, or the views of the people at Bourke or Brewarrina? As far as I am aware they are pretty nearly all in favour of this system of locking the river.

694. Does it not strike you that the Brewarrina people would prefer a railway to Byrock;—have you not heard it said that they would? That is just possible. Very often the people in country districts prefer whatever causes the expenditure of a larger sum in their neighbourhood. The railway would be the more costly of the two things, and I suppose would bring more money into Brewarrina for the time being. It is very likely that the Brewarrina people would not look beyond that phase of the question.

695. Have you heard on the spot that the people of Brewarrina would prefer a railway to Byrock? I have not heard them say so, but I could quite understand that some of them at least would say so.
696. The Bourke people, probably, favour the river scheme? Yes; and I think the people generally along the frontage do too. After all, it is the people who now occupy the land and the people who will occupy the land who have to be considered more than the people in the towns.
697. Have you heard any of the residents express their willingness to pay navigation dues or irrigation charges for any benefits they may derive from this scheme? I recollect some of them telling me that if they had a definite right to a certain quantity of water they would be quite willing to pay a fair sum for that water. I have been told that frequently, but it was said more especially with reference to a Bill dealing with water conservation.
698. You stated that the present lock and weir would be finished in three or four months;—how long do you think it will take to carry out the proposed locks? The Darling is a very uncertain river. But supposing that Parliament approves of this scheme, I could start the next two locks—the one at Stony Point and the one at Vincent Rocks—within ten days.
699. You would not like to say how long it would take to carry out the whole scheme? No. But supposing that I could start a month hence with the two locks I mentioned, and the river kept low, I could have those locks finished in six months from the time I started, and if I got a second period of low river, I could finish the next two locks in another six months from that time.
700. Given favourable weather, I suppose the whole work could be carried out in about eighteen months? Yes; but we could not hope for the river to remain so low for the whole of that period. We are bound to have some interruptions.
701. *Mr. Wright.*] Have you looked up any information for the Committee as to irrigation works in Australia that are paying? I have looked up my notes. I can mention only a moderate number of such works. I can cite fruit orchards where irrigation pays. I really know of only two good instances of well-managed irrigation on pastoral stations—at Mr. Wills Allen's, and at Mr. Gatenby's at Jemalong. These are the only two instances of irrigation of this kind on an extensive scale which has been managed in a rational way.
702. Have you an intimate knowledge of Victoria? Yes.
703. Are the various water trusts which were formed in Victoria, and which borrowed large sums to conserve water for irrigation, prosperous? No; they are even worse than the towns in this country which borrowed large sums for constructing water-works.
704. Is it not a fact that the great irrigation schemes of the Victorian Government cost, either directly or through water trusts, £5,000,000, and that they have absolutely failed to produce any irrigation farms other than the two on the banks of the Murray? I do not think they have spent nearly half that amount. I think they have spent £1,500,000.
705. The Government have spent a certain sum directly, and the water trusts have borrowed money under Government sanction? The principle on which they went is entirely wrong. The lending of money to water trusts has been proved to be a complete failure.
706. Has the application of the money produced any successful result in encouraging irrigation? I believe it has, but the expenditure on the works has been far too great under the circumstances.
707. Is it a fact that the whole of the trusts are asking the Government to relieve them of their responsibilities because they cannot let the water which the people should take for irrigation purposes? I do not know. I was talking the other day to a Victorian gentleman in Sydney, and he said that last year a very large number of people would have been very hard pushed to remain on their properties but for the water which they got for irrigation. I do not at all agree with the policy they have adopted in Victoria in regard to Mildura or the irrigation trusts. I think in each case the policy adopted was wrong. On the other hand, I have seen a number of very successfully irrigated farms in Victoria. I know a number of cases where men from small beginnings have become quite independent by the use of irrigation.
708. Can you give the Committee any statistical information mentioning the names and the localities where this success has been achieved? I can mention a few places, and I can get more from my notes. It is a good many years since I visited these places. It must be 6 or 7 years ago.
709. I want a return of irrigation farms in Victoria which are carried on successfully still? I cannot tell you anything about their present state. I know that a number of them did extremely well up to the time I was in the colony.
710. Can you state how much the Government or the trusts charge for water per acre? I have not got the most recent charges. I will telegraph to Mr. Stewart Murray and get the information.
711. You have had considerable experience in India? Yes.
712. You are aware that the difference between Hindoos or Bengalees and Australians is very great? Yes.
713. In India labour is paid very little, and the irrigation schemes are carried out on an enormous scale? I do not know that water is obtained any cheaper there than it has been obtained in some places here. In India the cheapest water is obtained from the so-called inundation canals, but in the case of the large canals the rates are not very low. In my time the rate for irrigating sugar-cane was 6 rupees per acre, that is 12s., and the rate for irrigating wheat was 2 rupees and 12 annas, that is about 5s. 6d.
714. In those cases the water was delivered by gravitation? Yes.
715. Do you think an Australian farmer would pay you 5s. an acre for the water, and then pump the water from the Darling? I do not think the farmers of Australia are inferior to the farmers in the Western States of America—at least they ought not to be inferior. The climate is very similar to ours, we belong to the same race, and labour costs as much there as it does here.
716. In the great wheat-growing districts in America there are no irrigation works? If you will look up the report of the Select Committee in the United States Senate you will find it is stated that the crops irrigated successfully in the Western States include every kind of crop—from those grown in Norway to those grown in Egypt. They generally consider that they get much better crops where they use water. Unless it is admitted that the Australian is greatly inferior to the American, I do not see that there can be any possible doubt about irrigation paying here.
717. Have you studied the irrigation system of California thoroughly? I have read a good deal about irrigation in California and Colorado. I do not say that I know everything about it.
718. I suppose you are aware that all the modern irrigation for fruits and vines is subterranean irrigation? I beg your pardon; there is a great deal that is not subterranean. In fact some of the recent fruit-growers have come to the conclusion that subterranean irrigation is a mistake.

H. G.  
McKinney,  
Esq.

22 May, 1896.

H. G.  
McKinney,  
Esq.

22 May, 1896.

719. It is the most expensive system in its initiation ; but you will admit that it is the most economical way of using water for irrigation ? Yes.
720. Will you not also admit that the subterranean system must be more efficacious than the system of pouring water on the surface of the soil ? That is a question for an expert fruit-grower to answer. I know that some fruit-growing authorities say that they do not consider it is so beneficial to the trees.
721. In the report you wrote in 1893 in conjunction with Mr. F. W. Ward, you dwell extensively on the fact that along the Darling stone fruits, citrus fruits, and the vine are largely cultivated ? We mentioned that fact from actual observation.
722. And you also referred to the growth of these things with the assistance of irrigation ? Yes.
723. I suppose you are aware that on the eastern rivers tens of thousands of acres of land which is naturally irrigated by a rainfall, and is in every way suitable for the culture of the vine, stone fruit, and citrus fruit, are at the present time not utilised ? In view of that fact, do you think that it would be wise to go into the far west, and construct expensive irrigation works to do that which we can do on the coast without any artificial aid ? I do not see that the western country should be sacrificed for the benefit of the coast districts. The conditions in the west are, in many respects different, and I have no doubt that they would find that they could produce some fruits there better than those fruits could be produced on the coast.
724. In your report you also express your belief that water will be taken by sheep farmers plentifully at a cost of from 6d. to 1s. per acre ? I should certainly say that they would be glad to get the water at that rate.
725. From your knowledge of the topographical features of this country, do you think it is possible for a man to make any attempt to irrigate a large sheep run ? There are a few cases where a man could irrigate a considerable area, but those cases are remarkably few.
726. River flats ? Down for instance on the lower part of the Lachlan or the lower part of the Macquarie, where the river banks are a good deal higher than the land adjoining.
727. But to irrigate a large area would it not require an extensive outlay in ditches to lead the water ? A considerable outlay. The most extensive irrigator a few years ago in the colony among pastoralists was Mr. James Tyson. He expended a good deal in the construction of channels for that purpose. He is generally credited with not being rash, and entering into speculations. I was told on good authority that he had spent not less than £15,000 on the Lower Lachlan.
728. From your personal observations of the country do you think it would pay a sheep-farmer to incur the expense of making ditches or channels to irrigate a very large area, and to pay 6d. or 1s. per acre for the water ? It would not, except under very favourable conditions.
729. Unless he had large flats near the river ? It all depends upon the conditions.
730. You are aware that there are large flats on the banks of the Darling known as grey or blue slate, with a stiff clay soil ? I believe so.
731. You could not irrigate that country ? It is unsuitable for irrigation.
732. As regards the irrigation schemes in California, I suppose eight-tenths of them are gravitation schemes ? A large proportion of them are gravitation schemes ; but there is a good deal of irrigation from artesian wells there. In the western states many hundreds if not thousands of artesian wells are used for irrigation purposes.
733. What would it cost a man to irrigate say 10,000 acres, three times a year, on the banks of the Darling ; what would it cost him for pumping supposing it was flat land ? I could not say on the spur of the moment.
734. Supposing that he had to lift the water an average height of 25 feet to irrigate 10,000 acres three or four times a year ? The irrigation of 10,000 acres would be a tremendous undertaking by pumping in one place.
735. Supposing he had to lift 4 inches of water three times a year to irrigate 1,000 acres ; what would it cost to lift that quantity ? Roughly, perhaps 5s. or 6s. an acre ?
736. Would it pay a man to incur that expense ? For certain kinds of crops I think it would, supposing that he increased his production in proportion to his expenditure.
737. Does 10s. an acre exceed the cost which is paid in most countries for water, or is it less ? I do not think it is much different. I believe it is slightly higher than the average in the United States. It is not pretended at all that the conditions are anything like as favourable for irrigating from the Darling as they are for irrigating from the Murray or the Murrumbidgee.
738. Do you think it would cost from 10s. to 12s. an acre to irrigate from the Darling ? Yes ; speaking roughly.
739. You admit that no man could afford to irrigate his land at that cost, unless it was for producing cereals, fruits, or vegetables—he could not afford to irrigate ordinary land for pastoral purposes ? Not simply for grazing, but for a good class of fodder crops I believe it would pay.
740. Where you had a deep alluvial soil which would grow lucerne, it would pay ? Yes.
741. It would not pay a man to irrigate stiff clay soil ? A man with good judgment would not attempt to irrigate such land.
742. You are quite satisfied about the construction of the proposed weirs ? Yes.
743. Was the weir you are constructing disturbed or interfered with at all by the slight fresh in the river some time ago ? It was.
744. Was any damage done ? Where there was excavation done for putting in concrete a certain amount of silt was washed into the excavations.
745. That had to be filled up ? Yes.
746. The clearing out of the silt would not cost much ? No.
747. The contract was for £18,800. About how much has been paid to the contractors ? About £6,600.
748. Have they done a third or a fourth of the work ? Roughly speaking I should say less than a fourth.
749. Still you are satisfied from your personal knowledge that you will be able to complete the work by day labour at about their estimate ? Not altogether by day labour. We are using piecework and petty contract as far as we possibly can.
750. I understand that it is not sufficiently advanced to try the shutter principle ? No. Most of the work which has been done is in connection with the lock walls.
751. You have no doubt as an engineer that the weir will be a success ? None at all.

H. G.  
McKinney,  
Esq.  
22 May, 1896.

752. There will be no danger of its being pounced upon by a big flood in the night time unexpectedly and swept away? I have no fear of that kind. It is a much easier river to deal with than any rivers I know of on which these weirs have been tried. The floods in the Darling rise very slowly. There is always ample opportunity to get information. The only occasion when the river rises at all suddenly is when a phenomenal rainfall takes place, like what occurred in 1885. But to meet that contingency the weirs will tilt and allow the water to flow over.
753. In view of the state of the law regarding riparian rights, at the present time the Government could not sell water very well? They would not be in a good position in regard to riparian rights.
754. Could not a dozen men below the lock petition against the Government utilising the waters of the river? They probably would. But any man would hesitate about going to law with the Government on that subject.
755. I think you stated yesterday that anyone could get an injunction to prevent any person from taking water from a river or creek. You have heard of the Yanko Creek case? Yes.
756. A large quantity of water was taken out of the Murrumbidgee to supply the Yanko Creek, and the people of Hay tried to restrain the station people from diverting the waters of the Murrumbidgee into that creek, but they did not succeed? I know that in the case of Colombo Creek, the owner of a certain station said he intended himself to cut the dam leading into Colombo Creek from Yanko Creek. I know it was considered that the only way to deal with the question was to bring Colombo Dam under the Public Places Watering Act, and to proclaim the dam to be a public watering place.
757. You have no recollection of the people of Hay moving to restrain the people on Colombo Plains from allowing the water to overflow? I was present at a conference on the ground near Yanko Creek at the end of 1884. The Hay people did protest against certain works being undertaken, but finally they withdrew their protest when it was explained that the proportion of water to be taken would be extremely small—about 2 or 3 per cent.
758. The works were authorised by me when I was Minister for Works? Yes; the improvement of Yanko Creek was authorised by the Government.
759. As an engineer with a large experience of irrigation works, you think that if these works are successfully carried out on the Darling River, there will be a great chance of the water being utilised for irrigation purposes? I do.
760. You think, that at the present rate of wages, people could afford to use water at a cost of 10s. per acre? For certain crops they could. In fact they could pay much more than that rate for certain crops. I know a man who has spent £200 on a pumping plant and piping to irrigate 10 acres, and he is well pleased with his investment.
761. In your evidence yesterday you spoke about the irrigation works at Mulgoa;—do you know that country? I know it very well.
762. Would you consider a clay surface, with a shale bottom, a suitable place for carrying out irrigation works? I would not. I was not aware that that was the nature of the ground.
763. *Mr. Black.*] On an irrigated area the expense of cultivation is necessarily greater than it is on an unirrigated area, all other things being equal? Yes.
764. Therefore, the irrigated area to be successful must either produce greater crops than the unirrigated area, or else it must supply a want in the local market which has been hitherto met by bringing products from a great distance? Precisely.
765. Do you think that with irrigation the land near the Darling under cultivation would produce greater crops than are produced without irrigation in areas now under cultivation elsewhere? I consider that when irrigation is practised there, it will supply fodder and probably grain crops to the district, for which they have to pay high rates now.
766. Will there be a local market for their produce? There will for a certain quantity of fodder and things of that kind. It does not seem reasonable that they should be taking up lucerne from Sydney and importing things from Victoria when they grow these things on the ground.
767. If there were a surplus product there, do you think that after paying the cost of irrigation and water carriage and railway carriage it could compete in the large markets of this country with products which were grown nearer to those markets, and which were not rendered dearer by the cost of irrigation? I believe that in certain items they could.
768. What are the items? I believe there is a season of the year when it would pay to send fruit from the Darling to Sydney. I have seen grapes at Bourke three weeks before they appeared in Sydney, and very good grapes too.
769. Do you think fruit-growing is a pursuit which would be entered into largely there? I do not.
770. Do you think it will induce the settlement of other persons who will grow fruit? I think there is a very fair chance of its bringing a number of them there. Certain places in Western America, which are not as suitable as the Darling, have been occupied by fruit-growers.
771. With regard to heavy floods,—is there any danger, during the subsidence of a heavy flood, of the river cutting a new channel for itself? It frequently does that.
772. Would not that, perhaps, in many cases render your locks and weirs useless? No; we have to take every care in the selection of the sites to avoid anything of that kind.
773. You think you can select your sites in such positions that your weirs would not be rendered useless by the floods cutting new channels? I do.
774. Is there any danger of the locks getting silted up during heavy floods? I do not think so. I think there will be a certain tendency to scour in the channels immediately below the locks. For that reason a considerable area of the bed of the river below the locks will be protected by pitching. I do not think there is any likelihood of the depositing of silt.
775. Is there any danger of the depositing of timber? I do not think so. There is not a great deal of floating timber in the Darling. When it came down the river it would go right over the top of the works.
776. Is it not possible that there will be a fall which will deposit timber there? It is improbable. There is very little timber deposited along the river. There is always a chance that a log, as the river goes down, may get caught in that way.
777. Do you propose to construct your locks by cutting across the bends of the rivers? No; it is better to avoid these bends, because it is nearly always low ground there. As far as we can we select a straight reach of the river. At Bourke the straight reach is only about 400 yards long.

- H. G. McKinney, Esq.  
22 May, 1896.
778. Your lock will be slightly curved? No, it will be quite straight. We select a straight reach of the river whenever we can, so that there will be a steady current and no tendency to silt up more at one point than at another.
779. In your estimate, instead of estimating the cost of the weirs at so much, you simply give the aggregate cost of material? Yes.
780. Is there any reason for doing that? That appears to be the usual custom.
781. I thought the other was the custom? In the case of a new railway which was referred to the Committee the different items I observed were lumped together, and I followed the same practice.
782. Is your estimate of £121,100 supposed to cover the total cost? Yes.
783. Does "supervision and contingencies" include labour? No; each amount represents the total cost of that particular item.
784. Not only material, but labour? Both material and labour. For instance, concrete includes supplying the materials, mixing the concrete, and putting it in position.
785. I do not see any estimate of the cost of survey, snagging, and dredging;—are they included also? I did not include the cost of original surveys. The expenditure was not heavy.
786. I suppose there will be other surveys before you begin the work? No; at every site we have taken borings.
787. You have decided the position of every lock? We have decided the position of all the locks.
788. Will there be no preliminary engineering expenses as well as the expenses of snagging and dredging? I do not contemplate any.
789. If, by locking the river, it is made possible for steamers to run regularly, the average tonnage per month would be 1,000? I do not think it would.
790. Do you not think that the people who are likely to take advantage of the cheapness of river carriage will order their stores to be landed while the river is running, and that they will order supplies of sufficient magnitude to carry them over possibly a dry season? That is done to a certain extent now. If there were permanent navigation a great deal of the traffic which goes now by road would go by river.
791. Presumably also there would be increased settlement? Quite so.
792. You think the tonnage carried on the river during the intermittent periods, when it is running full enough to permit of navigation, may become an average tonnage, or may even fall below the average? My idea is that there will be a steady increase.
793. *Mr. Humphery.*] Have you prepared a return for the Committee showing the details of the cost of the locks? I have.
794. *Chairman.*] Have you brought any statement in regard to the soakage? I do not recollect being asked to get that information. It is very difficult to get the information in the case of the Darling. It would be impossible from the nature of the river to furnish any calculation which would be reliable.
795. Can you make an approximate statement? No. At some places beds of sand crop out on the river-bank. The water goes back to a certain extent in these beds, and when the river falls below them it oozes out and goes back into the river. That fact would complicate any return about soakage.
796. Have you brought any statement with regard to the evaporation? I have ascertained the amount of evaporation. I was unable to get the figures for Bourke or Brewarrina. As far as I can understand the evaporation gauges have been removed from those places. In 1893 it was 63 inches at Walgett, 61½ inches at Wilcannia, and 63½ inches at Dubbo.
797. The mean of these three would be a main average to take? It would be pretty nearly 63 inches.
798. Have you brought a statement in regard to the amount of water which comes into the river at Brewarrina? I have a discharge table for Bourke. Our discharge observations are much less complete for Brewarrina than for Bourke. It is not a good place for taking discharges, as the currents are very much influenced by the presence of rocks.
799. Will you furnish the Committee with a fair approximation presently? Yes.
800. Do you know what comes down the Culgoa? We have no discharges for the Culgoa.
801. Do you know what comes down the Bogan? No. We have no information as regards these rivers, because it is only in flood-time that they bring anything worth speaking of into the Darling.
802. Do you know the amount which comes down the Bokhara? No. As regards the tributaries of the Darling between Bourke and Brewarrina, we have no information on that head.
803. Have you the discharge at Bourke? I have the discharge at Bourke in the form of a diagram, which I will hand in.
804. Have you any levels from Bourke up to the Culgoa, the Bokhara, Calt Creek, or the Bogan, into which water, to a greater or lesser extent, will be backed up by the erection of your weirs? I have levels at different places crossing these rivers; but I have not a regular line of levels in any case up the channels.
805. You cannot tell us accurately the area of your impounding basins which will be created by the weirs? Not accurately; but we have enough information to show that in comparison to the quantity of water stored in the river channel the quantity held up in these different channels by the weirs would be very small.
806. We can regard your statement as a correct approximation? Yes.
807. You cannot tell us how far your weirs will force the river up any of these tributaries of the Darling? No; I know it is only a short distance, because they are all more or less silted up near the mouth.
808. Can you cite any place in the world, where irrigation has been a commercial success, where the water has to be lifted a height of 35 feet? There is a multitude of instances.
809. Will you furnish the Committee with a list of the instances? I will endeavour to get the list of the places in Western America, because the conditions there are very similar to the conditions here, and the cost of labour is very similar.
810. That is a list of places where they lift the water a height of 35 feet, and where irrigation is a commercial success? Quite so. While it might pay handsomely to irrigate one class of crop, it might be a complete failure to attempt the irrigation of another class of crop. Irrigation might pay handsomely where water was pumped 50 feet if it was for an expensive class of crop.
811. From the Departmental report on artesian boring, I find that the flow from the Native Dog Bore which cost £1,000 to put down, will enable an area of over 1,280 acres to be irrigated to the extent of 20 inches per annum; £10,000 expended in the vicinity of that bore will enable an area of 12,800 acres to be irrigated.

irrigated; your expenditure, presuming that it is all incurred in the interest of irrigation, in order to give a like area a like amount of water, is over £100,000; while at the Native Dog Bore the water comes to the surface or above it, you have to lift your water a height of over 30 feet to get it on to the surface;—do you see the point of my remarks? The figures in regard to that bore certainly surprise me. I do not know who is responsible for the figures—I know that I am not.

H. G.  
McKinney,  
Esq.

22 May, 1896.

812. If these figures are at all an approximation, by artesian water, provided that it is suitable for the purpose, you get for £10,000 for irrigation purposes a supply of water equal to the amount you impound for £100,000, without including the cost of pumping? That certainly is a very exceptional bore. A very successful artesian bore does no doubt give cheap water.

813. Over such areas of land as you propose to irrigate from your weirs, a flood, will pass at any exceptional rainfall? In the case of very exceptional floods like that of 1890, or that of 1870.

814. If you irrigate land which floods will not reach, you have to pump your water a greater height? Yes. Generally speaking, it is likely that irrigated land will be flooded at times, perhaps once in fifteen or twenty years.

815. There will be some damage to be considered then? Yes, but at remote intervals.

816. The good result to the traffic of that portion of the colony would be the saving of the heavy rate of carriage from Brewarrina to Bourke;—it means the substitution of a good river for a bad road? Yes.

817. According to Mr. Shainwald the amount of traffic using the river in 1892 was about 8,000 tons; the work proposed to be constructed in order to enable that tonnage to reach Bourke or Brewarrina regularly will cost £4,000 a year interest; and the maintenance of the work in connection with the locks will cost £1,500 a year, so that without taking into consideration any undue expenditure it will cost £5,500 a year in order to get 8,000 tons of produce to use satisfactorily the river between Brewarrina and Bourke;—in other words, it will cost the State 15s. for every ton that goes down, that amount, of course, being lessened if the traffic increased much? I see that.

818. If every ton of stuff using the river would cost 15s. to the State it would be reasonable, provided we regarded purely the question of carriage, that the State should charge dues to that amount per ton? If it were regarded purely for the benefit of navigation and nothing more.

819. With regard to carriage, Mr. Shainwald has also informed the Committee that 10s. a ton will possibly be a fair thing to charge, and therefore the cost from Brewarrina to Bourke would mean 25s. a ton;—he also stated that when the river is pretty good they take freight up the river for 20s. a ton;—does it not follow that at these times, when they would have the advantage of the river being up, they would be better off than they would if the State made a fair charge for doing this work under the new system? I will think over that aspect of the case.

TUESDAY, 26 MAY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.  
The Hon. CHARLES JAMES ROBERTS, C.M.G.  
The Hon. WILLIAM JOSEPH TRICKETT.  
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
JOHN LIONEL FEGAN, Esq.  
THOMAS HENRY HASSALL, Esq.  
GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of Locks and Weirs on the River Darling.

Henry Chamberlaine Russell, Esq., C.M.G., B.A., Government Astronomer, sworn, and examined:—

820. *Chairman.*] Do you know the Darling, between Bourke and Brewarrina? I have not been along the river, although I have been to Bourke. I know the character of the river, so far as it affects my work.

H. C.  
Russell, Esq.,  
C.M.G., B.A.

821. Can you tell us the boundaries of its catchment area above Bourke? The catchment area above Bourke is practically bounded by the railway from Bourke to Nyngan; thence by the Bogan to its source; thence to Molong, Orange, Bathurst; thence to the main range, following that range to the Queensland border; thence following the Macintyre River till it crosses the 29th degree of latitude; thence by the 29th parallel to the Culgoa, and thence to the Darling.

26 May, 1896.

822. Water falling west of the Culgoa will not reach the Darling above Bourke? No.

823. Can you give us the area of the district enclosed within the boundaries you have mentioned? Approximately the area of that district is 73,400 square miles. Of course you will observe that I have said nothing about the large drainage area of the Darling which is in Queensland. The Queensland area contains approximately 40,000 square miles.

824. Have you tables which show the amount of water passing down the Darling for a period of years, and at various times in the year? I have that information tabulated, but I have not brought it with me.

825. What is the average rainfall upon the New South Wales portion of the catchment area of the Darling? The rainfall on that catchment area varies from 18½ inches to 35½ inches in the neighbourhood of Armidale.

826. What would be a fair average? The average of 16 years is 24.59 inches.

827. And what is the average rainfall upon the Queensland drainage area? 30.28 inches. The Queensland rainfall does not differ materially from the New South Wales rainfall.

828. What proportion of the rainfall reaches the Darling at Brewarrina? Less than 2 per cent.

829. Would the same remark apply to Queensland? Yes. I think so.

830. What amount passes down the Darling at Bourke;—would you give us the information for a term of years? I have that information for Bourke. Bourke is the only place where the quantity of water can be accurately determined, because that is the only place where I have a section of the river. The volume of water passing down the Darling at Bourke is 2,350,000,000 tons of water equalling ⅓ of an inch of rain over the catchment per annum.

H. C.  
Russell, Esq.,  
C.M.G., B.A.

26 May, 1896.

831. What information have you to give us about the evaporation in this district? The following table shows the total yearly evaporation at Walgett since 1886. The average evaporation during the last ten years has been 59½ inches, while the average rainfall during the same period has been nearly 23 inches.

Year.	Wind.		Evaporation.			Total rain.	Mean shade temperature.
	Total number of miles.	Average per day.	Total evaporation.	Average per day.	Greatest evaporation on any day.		
		miles.	inches.	inches.	inches.	inches.	° Fah.
1886	38,625	109	60·798	0·167	0·561	28·35	67·7
1887	33,139	99	54·194	·148	·524	27·62	66·9
1888	32,560	103	65·252	·179	·567	9·79	68·2
1889	32,784	105	58·952	·162	·480	32·02	68·6
1890	27,816	84	48·281	·132	·734	32·22	65·7
1891	28,123	99	54·780	·150	·521	24·95	64·9
1892	30,282	92	64·534	·177	·471	14·59	68·5
1893	27,050	95	63·017	·173	·504	20·45	66·3
1894	30,429	88	57·327	·157	·468	21·84	68·1
1895	25,318	81	68·153	·187	·530	17·58	67·1
Means and Extremes...	Mean, 30,613	Mean, 96	Mean, 59·529	Mean, 0·163	Extreme, 0·734	Mean, 22·99	Mean, 67·2

832. The effect of the evaporation in comparison with the rainfall is a net loss of about 37 inches? Yes.

833. Were not some experiments made in England, during a great number of years, to determine this question of evaporation? Yes; but I think the most exhaustive experiments have been made in India.

834. What was the result of the Indian experiments? I have not got any particulars about them; but I have particulars about some experiments made in England by Sir James Lawes.

835. Have you any idea as to how much of the water which falls upon the catchment area of the Darling percolates far below the surface? Well, no experiments have been made; but nearly the whole of the rainwater disappears below the surface. We know that less than 2 per cent. of it goes into the rivers.

836. Can you give us any opinion as to what becomes of the rest? I think nearly the whole of it goes into the ground. In some places the water disappears as fast as it falls. For instance, nearly the whole of the rain falling in the neighbourhood of Lake George disappears in that way. The rise of the lake is due to the quantity of water falling directly on to its surface. In any ordinary rain the whole of the water falling upon the catchment of Lake George sinks underground.

837. But there is some evaporation? Yes; though I cannot ascertain how much.

838. There is no information available? The only information available does not reach the question at all. It consists of some experiments which I have made at the Observatory, in order to see what the evaporation is from shallow surfaces of soil.

839. How would you view a statement of this kind: "That no filtration takes place on an average during five months of the year in England; and that periods of seven months frequently occur during which the water falling from the clouds is evaporated before it can pass to a depth at which capillary attraction and subsequent evaporation takes place"? I have no experience. I know that a great many experiments have been made in England to ascertain what they call there the water level;—that is, the depth to which you must sink your well in order to find water. I am not at all sure that the results of those experiments would be available for our purpose, because the rainfall in England comes down as very light rain, much lighter than it does here, while rain falls much more frequently.

840. The water falling on the catchment area of the Darling disappears so rapidly that you have no doubt that only a very small proportion goes off in evaporation? Yes; I find that as soon as the ground surface dries after rain to the depth of half an inch, evaporation practically ceases.

841. Do you know the extent of the cretaceous formation in which the artesian water is found? No.

842. Does it embrace the greater part of the water-shed of the Darling? I understand that it embraces a large area, but I have no personal knowledge of it. Recently water has been found in other formations besides the cretaceous.

843. Do you regard our subterranean water as an abundant supply? Yes, as an extremely abundant supply. The word "abundance" is rather indefinite in this sense. If irrigation by means of underground water became general, and wells were established at short distances, the experience here might be the experience of some parts of England, as in the neighbourhood of Liverpool, where they found the water-level to be sinking. I do not think we are in a position to state yet how much water is actually available from underground sources. There is an enormous quantity, but I should not like to say how much.

844. If 93 per cent. of the rainfall reaches this great subterranean reservoir, there must be a huge supply? There is one important point upon which we have no data at all. This subterranean source must have an outlet into the ocean somewhere. That, I take it, is proved by the fact that during all the generations and years that have passed, water has not been found coming up to the surface anywhere inland except in minute quantities from a few mud-springs. But water has always been soaking into the ground, presumably at the same rate as it does now. That being so, it must be that it ultimately finds its way into the ocean somewhere.

845. Is it not a fact that fresh water is found in the ocean on parts of the South Australian coast? Yes, and fresh water runs out through the limestone there; but I do not think we can estimate the quantity conserved until we know more about the outlet. Or, to put it in another way, we may go on making wells until the level of the water begins to fall in all the wells: then the outflow of the wells will be the measure of supply, for it is evident as much is coming out as goes in.

846. The water conserved must be subjected to a good deal of pressure to rise as it does? Yes.

847. You believe that we have a very large subterranean supply which is continually being replenished, but you have no definite data to enable you to say exactly what are its dimensions, or whether its permanency would be affected by its use to a large extent for irrigation purposes? Its permanency I think would not be altered; but its quantity would.

848. Although we shall always be able to get some water from this source, you do not know whether we should be able to get an unlimited supply or supply sufficient to irrigate the vast western interior? I do not think that that question can be answered yet.

849.

849. Would you regard it as a safe thing to expect a permanent supply sufficient to irrigate 50,000 acres? I should think so.

850. Or perhaps ten times that area? Possibly.

851. Do you know anything with regard to the quality of this subterranean water? Only what I have read about it.

852. You can express no opinion as to whether its mineral ingredients would unfit it for irrigation purposes? No; I cannot answer that question. I hand in a map upon which is marked the average rainfall upon each square degree of the catchment area of the Darling in New South Wales, the greatest quantity of rain that has fallen in any year, and the least quantity of rain that has fallen in a year.

853. *Mr. Wright.*] How far back do your authentic records go? We have records of the rain measures from 1871 or 1872. I also hand in a pamphlet containing a diagram showing the character of the floods in the Darling at Bourke up to 1896.

854. *Chairman.*] Would the conservation of water in a narrow strip such as the Darling have any climatic effect upon that portion of the colony? I think not.

855. Would the conservation of water in depressions such as there are in the western districts have any climatic effect? When they commenced irrigation in Italy, in the valley of the Po, large areas were involved, and the engineers expected a considerable increase of the rainfall, but the water conservation did not affect the rainfall in the least.

856. Has deforesting an effect upon the rainfall? The general opinion is that to cut away trees is to decrease the rainfall; but personally I am convinced that that is a mistake. It is the rainfall that makes the trees, and not the trees that make the rainfall. I have investigated the matter in this colony, as far as I have been able, by placing rain measures in cleared patches and in open plain country. One experiment showed that there was less rainfall in a clearing in the middle of a large scrub than upon the surrounding stations.

857. But experiments made in Australia have not been carried on for a sufficient length of time to make them of value? Of course their value is curtailed; but it is possible to make experiments with a bias, and I think that the way in which some of the experiments made in Europe have been conducted is open to question.

858. It is your opinion that any conservation of water and consequent increase of foliage will have no effect upon the climate? The existence of water, or of plants evaporating water into the atmosphere, simply saturates the air immediately above; but the whole atmosphere is shifting to the eastward at the rate of 300 or 400 miles a day. So that what water is evaporated at Bourke to-day is immediately over the coast to-morrow, and over the ocean next day.

James William Boulton, Esq., Superintendent of Public Watering Places and Artesian Water Supply, Department of Mines, sworn, and examined:—

859. *Mr. Fegan.*] Are you acquainted with the scheme before the Committee? No.

860. Are you acquainted with the country about the Darling? Yes; I know the Darling pretty well.

861. From Bourke to Brewarrina? I know it pretty well from Bourke to Walgett, and from Bourke to Wentworth.

862. Have you any bores near Bourke, or near Stony Point? We have a bore at Gidgea Camp, within 5 or 6 miles of Stony Point, another at Walkden's, and another at Pera. One of these is on the Bar-rington Road, another on the Hungerford Road, and a third on the Wanaaring Road.

863. Have you a bore at Walgett? Yes, the Euroka Bore.

864. What supply of water does it give? The Euroka Bore, which is the last put down, gives about 3,000,000 gallons a day, the Gidgea Camp Bore gives 7,000 gallons a day, Walkden's 200,000 gallons, and Pera 610,000 gallons a day.

865. What is the depth of these bores? Pera is about 1,100 feet, Gidgea Camp is about 2,050.

866. Have you noticed any decrease or increase in the supply? There has been a slight increase at Gidgea.

867. Have you noticed that after a good fall of rain the supply decreases or increases? The increase is due more to atmospheric pressure. The increase at Gidgea Camp came after we had carried out an experiment there with a water-lifter. I fancy we must have cleared out the interstices between the rock and the casing.

868. What strata did you go through? The usual cretaceous clay, then through the drifts, and then through about 700 feet of slate rock.

869. What is the water at that bore used for chiefly? Entirely for watering travelling stock. I think the tenant has a small garden, but it is not sufficiently large to do very much.

870. Have you noticed whether the water has improved the place or not? It has, of course, improved the place very much.

871. There is nothing in the water which is detrimental to vegetation? I think not. The carbonate of sodium, which is present in nearly all this water, varies very much in different bores. Some of them have so much of it that we should not attempt to use the water for any permanent irrigation.

872. Can you give us an analysis of the water from this bore? Yes; the chemical composition of the water in Walkden's bore is as follows:—

Chemical composition.	Grains per gallon.	In 1,000 parts.
Silica	1.330	0.0190
Sodium carb.	37.026	.5289
Potassium carb.	1.215	.0173
Calcium carb.	.999	.0142
Magnesium carb.	.254	.0036
Sodium chlor.	9.290	.1327
Alumina and ferric oxide	traces	traces
Total solid matter	56.113	.7157

873. What revenue do you get from Gidgea Camp Bore? £100 a year. It is under lease to a tenant.

874. What charge does he make for the water? He charges the regulation rates—10s. per 1,000 for sheep, 1d. a head for horses and bullocks, 4d. for camels, and ½d. for pigs.

875.

H. C.  
Russell, Esq.,  
C.M.G., B.A.  
26 May, 1896.

J. W.  
Boulton,  
Esq.  
26 May, 1896.

J. W.  
Boulton,  
Esq.  
26 May, 1896.

875. What is the next bore? Walkden's, on the Hungerford Road. That bore is 1,604 feet deep, and gives a supply of 200,000 gallons a day. It is under the charge of a caretaker, and is situated 7 or 8 miles from Bourke, and 9 or 10 miles from Stony Point.
876. Has there been a decrease or an increase of the supply since the bore was put down? We have not noticed any variation.
877. Is any irrigation done with it? Only what the caretaker does for his garden.
878. What is the next bore? Pera Bore, on the Wanaaring Road. It is 7 miles from Bourke, and about 12 miles from Stony Point. The bore is 1,154 feet deep, and gives a supply of 615,000 gallons a day. It is at this bore that we have a settlement.
879. A homestead settlement? Yes.
880. Can you give us any information with reference to the irrigation that has been done there? Six hundred and forty acres of land were set apart.
881. What kind of land is it? Very good red soil; beautiful sandy loam.
882. What is the quality of the water? It is very good.
883. Similar to that coming from the other bores? I think it is better. The only two ingredients in the water from these bores, which are inimical to plant life, are carbonate of soda and chloride of sodium. Of the first there are present only 33.118 grains per gallon, and of the second, 7.690 grains per gallon. You must remember that there is no alkali in this soil. The waters obtained from the American bores show a smaller percentage of carbonate of sodium, but the soil there contains a large proportion of alkali.
884. What has been the result of irrigation at this settlement? We have eleven tenants there, each of whom holds a 20-acre block. They have all got the best part of their land cleared, and crops and vegetables planted, and are doing very well.
885. How long is it since the settlement was established? It was only started last July. Fifty-seven acres have been reserved as a farm for the Government.
886. What crops have they grown other than vegetables? Sorghum, maize, Kaffir corn, planter's friend, and broom millet, all of which are doing well. The sorghum has been placed in ensilage stacks, and is smelling as sweet as possible. I was there yesterday.
887. What are the terms under which the land is held? The people there pay an annual rent of £5 per block, and for that they get a supply of water equal to an annual rainfall of 35 inches.
888. How do they obtain the water? The water runs from a flume, and is delivered to them on their blocks in three places.
889. There are no pumps used? No.
890. Does the Government deliver the water at one corner of the block? We deliver it from the three places on the line of flume bordering the blocks. The people make their own connections with the flume.
891. What is the opinion of the people there about the settlement? They seem to be fairly well satisfied. They think they will make a "do" of it, as they call it.
892. They are satisfied that it is much better than to depend upon the rainfall? Yes.
893. You are satisfied that this small settlement will be a success? Yes; I think it will. I think they are working in the right direction.
894. What do they do with what they grow;—have they a market for their produce? They have not attempted anything of that sort yet. They supply their own horses, but that is all at the present time. They have a market in Bourke for any fodder that they can grow, and a market for vegetables in Byrock. With regard to the broom millet, there is a great opening for that. I had some of the millet sent to Sydney and made up into brooms, and I find that there is a profit of 9s. per dozen to be obtained. I reckon that that crop will give a return of from £15 to £20 an acre to the settlers. The people on the Manning told me that their return was somewhere about £15 per acre. There is a very large consumption of brooms in Bourke—from 500 to 900 dozen in the year—and there is a man here who will go up and manufacture them if the settlers will guarantee him 25 tons of stuff.
895. Are they attempting to grow any fruit there? Yes; but mostly fruit for drying, such as apricots, raisin grapes, Zante currants, prunes, and figs. The trees are making very good progress. It must be remembered that we started in the middle of one of the most extreme droughts that ever visited the colony, and when the heat was so great that it killed even men.
896. Do you think that these people will be able to make a living off 20 acres of land? Yes; in America they reckon that a man will make almost a competence out of 40 acres.
897. I suppose these people will be able, if they see their way clear, to take up blocks of 40 acres? No; I think the Act prevents them from doing that.
898. Are they employed at anything besides farming? Yes; they engage in carting, and take any odd work they can get.
899. What would have happened if there had been no water? Without water that country would not carry a sheep to 10 acres.
900. Cultivation would not have been possible? No; you might get some result from a bit of cultivation—perhaps once in seven years.
901. The land would be almost valueless without the water? Yes.
902. What is the next bore? The Euroka Bore. Its depth is 1,542 feet, and it gives a supply of 3,000,000 gallons in the twenty-four hours.
903. Is the water good? It is beautiful water; and I think that when it has been analysed it will perhaps be found to be better than any other artesian water. This bore is 14 miles from Walgett on the Coonamble Road, and 140 miles from Bourke.
904. Are you trying any irrigation there? We have not done anything yet, but it is proposed that something shall be done. We are running the surplus water through some settlers' land into the Castlereagh.
905. Has the water improved the land? Yes, and we may be able to make some permanent arrangement with the settlers. We have done so at another bore.
906. Your experience is that these bores have been of great assistance to settlement? Yes; there are only one or two bores, and they are situated near Wanaaring, where the proportion of soda is so great as to prevent irrigation being carried out. The water from these bores would make things grow for a time, but afterwards it would kill everything. It is, however, very good water for stock, though the supply is not very large.

J. W.  
Boulton,  
Esq.

26 May, 1896.

907. What position does the river stand in while the bores are giving this large supply of water? At the present time the river is below summer level.

908. Almost dry? There is a fair stream in it, but it is not much better than a ditch.

909. But these bores have given all the water necessary, and with careful use will make cultivation possible in these dry parts? Yes.

910. You think that although our experience may be very little, it should induce us to make further experiments with a view to getting water for irrigation? Yes; there is no question about that. We had a farm at the Native Dog Bore. It was carried on by the Department for a short time, and then leased as a going concern to the man who has it now. It is situated 4½ miles from Bourke, but the Department decided that it was too far from Bourke to be used for experimental purposes. There are 26 acres under cultivation there.

911. *Chairman.*] What rent is the Department getting for it? £90 2s. 6d., I think.

912. What did it cost? About £1,000.

913. *Mr. Humphery.*] How many acres of land are there attached to the bore? 640 acres.

914. *Mr. Fegan.*] For how long have you been getting 3,000,000 gallons a day from the Euroka Bore? Only a very short time. That bore was started in December last.

915. I suppose you cannot tell us if the water is inexhaustible? I think it is. All our experience points to the fact that this water is practically inexhaustible.

916. How much land could be irrigated by the water from this bore? From 1,200 to 1,400 acres, taking no account of the natural rainfall, which is about 14 inches in the year up there. The bore is situated on a beautiful black soil plain.

917. *Mr. Hassall.*] What is your experience with regard to the result of putting down these bores. Has land, otherwise of very little value, become occupied to any extent? There is no doubt that the bores have been of incalculable benefit to the country, and have greatly increased the value of the land. It naturally increases the carrying capacity of a run to have water running through it. Some of the drains that have been made carry the water from the bores 26 and 50 miles through the stations adjoining. To have such a drain through your land is better than to have a double frontage to a river, and in a lambing paddock I would sooner have one of these drains than any other kind of water-supply. The settlers themselves are thoroughly impressed with the value of this supply, and we have now applications from three distinct groups of settlers—two of them in the Gwydir district—offering to pay the Government 5 per cent. upon the cost of the bore, and 2 per cent. to form a sinking fund if the Government will put down the bore. The Minister has these propositions under consideration now. In one case about 73,000 acres are represented, and in another about 36,000 acres. The proposition which comes from Mercadool is being held over pending the settlement of the land case.

918. What is the greatest number of homestead leases served by an artesian bore? There are only two artesian bores that I know of upon homestead leases, the one is Mr. Rushton's, at Yantabulla, and the other is Mr. Barton's. At Moongulla Bore we have made an arrangement with four homestead selectors to deliver water at their boundary, while they take it to the different homesteads. They have cut about 60 miles of drains, and we give them two days a week clear run of the bore. They pay us £20 a year each.

919. I presume that they run the water into tanks? Yes, from tank to tank right through their holding.

920. What was the cost of the Moongulla Bore? I think nearly £5,000. Besides that, we have three 29-acre blocks and one 5-acre block on the section. Those people pay the same rental as is paid at Pera. Then a wool-scourer pays ¼d. per 1,000 gallons for all the water he uses, and I suppose he will use 700,000 gallons a day. We take the water after he has done with it and use it for irrigation purposes. We have a small farm there of 12 acres, upon which we are growing all sorts of things.

921. Does your revenue amount to a fair percentage upon your expenditure? No; but I think that it will.

922. Is there any chance of other homestead lessees being served? Yes; we could serve any on the other side of the road, though I think that that land all belongs to Moongulla Station. When it is thrown open for selection there will be a better chance. We started the same arrangement at Dungle, and have supplied two stations there with water.

923. That country, although good grazing land, is practically valueless in dry times? Yes, and the men of whom I have been speaking would have had to move their stock, if they could not get water at the time they did. The cost of the bore was £4,728 10s., the casing being extra, and bringing the total cost up to £6,838. The depth of the bore is 2,570 ft.

924. *Mr. Humphery.*] Does the total cost include the expense of maintenance up to date? No, that is, outside the total cost of putting down the bore. The bore is one of the most expensive in the colony.

925. *Mr. Hassall.*] What return do you get from that bore at the present time? I will furnish the information. With the information that we have now, we can follow certain lines and depend almost with certainty upon getting a large volume of artesian water at comparatively shallow depths.

926. These bores have opened up a large area of practically dry country which hitherto had not been available for close settlement? That is so.

927. The discovery of artesian water has practically overcome the difficulties of settlement there? Yes; these bores make close settlements possible where it was not possible before.

928. You think that when the Department has more experience, it will be able to develop this country so as to get a fair return for its expenditure? Yes; you cannot estimate the indirect effect of these bores. They have opened up the three roads that run to Bourke from Southern Queensland, and made it possible to travel stock upon them in any season. A few years ago I remember that Messrs. Rich & Co. had to send out teams with tanks to water stock with which they wished to take along special loading. It is only eighteen months ago that I had to drive 95 miles along the Wanaaring Road with only one drink for the buggy horses, and now on that length we have three flowing bores. The establishment of these bores ought to tend to draw the Southern Queensland trade to our metropolitan market.

929. The bores were put down, not so much to provide water for agricultural purposes, as to enable stock to exist in this part of the country, and to travel through it? That was the primary object of the bores, but where we have had a large supply of water we have extended our operations, and have shown people what can be grown there with water.

930. Do you think that irrigation along the Darling will ever be entered into to any great extent? You can see it done at some of the stations now in a small way.

J. W.  
Boulton,  
Esq.  
26 May, 1896.

931. Do you think that irrigation will ever be gone into on a large scale for the purpose of cultivating cereals and fodder for sale, and thus create any great traffic upon the river? I hardly think so. I think that if anything is done it will be in the direction of the intense culture of fruit—something easily portable that will bring a high return for the outlay.

932. Has cultivation been a failure at any of these bores? No. While the water has a rather large percentage of alkali, the soil has none at all, so that our soil and water combined are superior to the American soil and water combined. Analyses of the soil round the Pera and other bores where we have irrigated show that the quantity of alkali present is almost nil. The soil about Moree contains not a trace of alkali.

933. Which do you think would be better—to spend £150,000 in locking the Darling, or to spend the same sum in putting down artesian bores? That is a difficult question to answer. No doubt it is a great advantage to have a river open for traffic. I remember that years ago, when I lived on the Darling, from 1875 to 1879, our wool was stuck there for over two years. We could not get it away, because there was no river. Of late years the river has kept up better.

934. *Mr. Roberts.*] Can you tell the Committee what the various bores have cost? The following return will give you that information:—

1. Number of flowing wells (four in progress)	...	...	...	...	33
2. Number of pumping wells	...	...	...	...	13
3. Number of failures	...	...	...	...	4
4. Number in progress	...	...	...	...	12
5. Number let, but not commenced	...	...	...	...	23
					85
Less bores included twice	...	...	...	...	4
					81
Total...					
6. Total depth bored to date	...	...	...	84,809 ft. 6 in.	
7. Total cost of forty-five bores completed	...	...	...	£119,155 5s. 1d.	
8. Total depth of bores completed	...	...	...	69,614 ft.	
9. Average cost per foot of bores completed	...	...	...	£1 14s. 2d.	
10. Average depth of bores completed	...	...	...	1,513 ft. 4 in.	
11. Total cost of twenty-eight flowing wells	...	...	...	£74,377 9s. 5d.	
12. Total depth bored of flowing wells	...	...	...	40,008 ft.	
13. Average cost per foot of flowing wells	...	...	...	£1 17s.	
14. Average depth bored of flowing wells	...	...	...	1,428 ft. 10 in.	
15. Total cost of thirteen pumping wells	...	...	...	£35,832 19s. 1d.	
16. Total depth bored of pumping wells	...	...	...	18,407 ft. 3 in.	
17. Average cost per foot of pumping wells	...	...	...	£1 18s. 11d.	
18. Average depth of pumping wells	...	...	...	1,415 ft. 11 in.	
19. Estimated supply from thirty-three flowing wells	...	...	...	18,747,505 gallons per diem.	
20. Estimated supply from thirteen pumping wells	...	...	...	500,000 gallons per diem.	
21. Estimated supply from forty-six wells	...	...	...	19,247,505 gallons per diem.	

There are 105 private wells in the country, the output from which is about 38,000,000 gallons, while the output from the forty-six Government wells is 24,000,000 gallons. There are also twelve bores in progress at the present time.

935. What is the total income of the Department? About £5,000. The expenditure on tanks, wells, and bores throughout the colony has been nearly £500,000; but then there are a great number of tanks which do not pay a cent of rental. I will furnish a return showing the total expenditure on the bores.

936. *Chairman.*] What was the reason of the failures which you have had? We were right on the edge of the Cretaceous formation, and got down to bed-rock.

WEDNESDAY, 27 MAY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL PEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of Locks and Weirs on the River Darling.

Tannatt William Edgeworth David, Esq., B.A., Professor of Geology, University of Sydney, sworn, and examined:—

T. W. E.  
David, Esq.,  
B.A.  
27 May, 1896.

937. *Chairman.*] Are you prepared to express an opinion with regard to the artesian water supply of this colony and of Queensland? Having been engaged on the geological survey of New South Wales for some years before I accepted my present position at the University, where I have been for five years, I have some knowledge of the artesian water-beds both of New South Wales and of Queensland. I have written out a short statement giving a rough calculation, which I have made for the information of the Committee, of the probable total amount of artesian water that may be drawn upon in New South Wales in the future.

938. Will you read it? It is as follows:—

The underground supplies of artesian water in New South Wales are entirely dependent on the rainfall, and the amount of water which could be drawn from the beds annually without tending to exhaust the supply would be about equal to the quantity which annually percolates into the artesian water-beds. Obviously, if the annual outflow is at all in excess of the annual inflow the tendency will be to exhaust the underground supply. If

If therefore the average annual inflow is known, it will be possible to calculate the average annual outflow. It is now known that there are two distinct sets of beds in New South Wales and Queensland, which yield artesian water.

T. W. E.  
David, Esq.,  
B.A.

The newer and upper set may be termed the Lower Cretaceous, and the lower and older the Triassic, or Trias-Jura. The supply of water to the artesian beds depends, therefore, (1) on the rain falling on the exposed edges of the porous beds belonging to these two sets of artesian formations; (2) on water of rivers flowing over the outcrops of these formations and leaking into the artesian beds.

27 May, 1896.

It is impossible to do more than approximate very roughly to the amount of water annually draining into these artesian beds.

If the length of outcrop of the Cretaceous porous-beds in New South Wales be 350 miles, and the width 5 miles, that is about similar to the width of the artesian-bearing Lower Cretaceous beds of Queensland, there would be a superficial area of about 1,750 square miles available as intake for water draining into the Cretaceous rock, and this amount might possibly be doubled if the intake area of the Triassic (Trias-Jura) series (in which latter the Coonamble and Moree bores are situated) be added. This would total 3,500 square miles. If the average rainfall over this area is 22 inches, and it be assumed that one-half of the rainfall percolates in this area, this would yield 1,500,000,000 (fifteen hundred million) gallons per day of water to the artesian beds. If to this be added 500,000,000 (five hundred million) gallons per day on account of water leaking in through rivers, the daily average inflow would amount to, roughly, about 2,000,000,000 (two thousand million) gallons per day.

It would probably not be possible to draw the whole of this quantity of water daily from the artesian wells of the present and future without lowering the hydraulic grade, and rendering some wells sub-artesian which are now artesian.

It might, however, perhaps be assumed provisionally that 1,500,000,000 gallons (fifteen hundred million) gallons daily is a very roughly approximate estimate in the present state of our knowledge of the total quantity of artesian water supply available.

If the present daily flow of the wells be 50,000,000 (fifty million) gallons, it should be possible to increase the yield perhaps by thirty times the present amount without seriously impairing or weakening the subterranean water supply.

The gist of my report is that it would be possible to increase our artesian wells thirty times without seriously impairing the supply of water.

939. *Mr. Hassall.*] Can you give us an idea of the extent of these artesian beds? I might preface my remarks by stating that the Government Geologist is in possession of later information upon the subject than I am, especially with regard to the Triassic beds, as he has lately been engaged in surveying the boundaries of these beds. These artesian water beds commence probably in the Gulf of Carpentaria, and skirt the western spurs of the mountains of Queensland, until they cross the boundary between Queensland and New South Wales, somewhere below Bonshaw, about 80 miles to the west of the northern railway line. The area tinted green on the map shows approximately the space which we know to be occupied partly by the Cretaceous artesian beds, and partly by the Triassic artesian beds. In view of recent discoveries, however, the boundary should be extended a good deal to the south-east, because when the map was drawn, it was supposed that only the Cretaceous beds were water-bearing. It is now known that the Triassic beds which are of the same age geologically as the Sydney sandstone, are also water-bearing.

940. *Chairman.*] May not further exploration extend the limits of this area? That is possible. Mr. Pittman is of opinion that the area needs to be extended towards Hay and Balranald.

941. *Mr. Hassall.*] Then that area would practically embrace the valley of the Darling? Not only the valley of the Darling, but also a considerable portion of the catchment area of its tributaries.

942. *Mr. Wright.*] And the Lachlan? I do not know that much of the Lachlan country would be included within the artesian basin.

943. *Mr. Hassall.*] What are the boundaries of the artesian area? Very roughly, the boundary would come down from the Queensland border to within a short distance to the east of Moree. Yetman would be within it. From Moree it would go towards Narrabri, thence to Gilgandra, on the Castlereagh, and thence to Narromine. Then, I think, the boundary is shown upon the map in fair accuracy as skirting round Nevertire, leaving a loop in Warren, near the centre of it, and then trending northwards to Brewarrina, and so on to Oxley's Table-land and Byrock. Thence west the district extends between the Queensland border and about 30½° S. latitude as far as Mount Brown.

944. *Mr. Wright.*] Does the boundary line come down as far as Cobar? I have never been to Cobar; but I know the character of the rocks near there, and they are not artesian rocks, nor likely to contain artesian water.

945. *Mr. Hassall.*] The discovery of artesian water in the belt of country between Moree and the Macintyre River, rather upset the then existing theory about artesian water? It very much added to our knowledge on the subject. It showed that there was a lower series of rocks which was also water-bearing.

946. Does that lower series extend beneath the Cretaceous formation? I think it will be found to extend under a large part of the Cretaceous area.

947. It will give us two sources of supply instead of one? Yes. You have one source of supply beneath another. It is like having a tank with a false bottom, and both compartments containing water.

948. Is the water-level of the Triassic series equal to that of the Cretaceous series? Possibly so. The intake is higher.

949. What is the source of supply of the Departmental bores which are near the coastal range;—would it be created by percolation? Yes, by the percolation of rain water and the leakage from rivers flowing over the porous formation.

950. You assume that the outlet of the Triassic formation is away to the westward, might it not be to the eastward? No. This porous formation could not double underneath the impervious rocks, which are far older than the water-bearing strata.

951. Then the artesian water must be confined to the western slope? Yes.

952. If the supply of water in the Cretaceous formation should ever give out through too many wells being sunk into it, would it be possible to put the same bores down deeper, and so strike water in the Triassic formation? I think that probably that could be done over a large area of the Cretaceous basin. But, since the newer series overlaps the older series one cannot definitely state that the older series would always be reached; though we know from bores that have been put down that the older series has a very large extent, and therefore, it is probable that the supply of water which it contains could be drawn upon by sinking anywhere over a very large part of the area of the Cretaceous formation.

953. I suppose that your knowledge of our rivers leads you to the conclusion that a large quantity of their water must escape into the artesian beds? Yes.

954. You have seen at the head of many of our rivers magnificent stretches of water running practically all the year round, while further west the river seems to dry up and disappear? Yes, I have noticed that.

- T. W. E.  
David, Esq.,  
B.A.  
27 May, 1896.
955. The Macquarie and the Big River seem to become smaller and smaller as you get down? Yes.
956. You would naturally conclude that a great portion of the water of these rivers must sink into the underground reservoirs? Yes, the water is lost by percolation.
957. Have you any information to give us as to the distance between the two sets of water-bearing strata which you have referred to? We know that the Triassic strata are about 2,000 feet in thickness. I do not know that they have ever at any place been proved to be much thicker than 2,000 feet, and I should think that the outside limit of their thickness would be 3,000 feet. The Cretaceous strata vary very much in thickness. You might tap the water-bearing horizon at a depth of 150 feet, or you might have to sink 2,000 or 3,000 feet. If you wished to sink through the Cretaceous formation to the Triassic formation you might have to go another 2,000 feet before you obtained any supply, though you might not have to go more than 1,500 feet. By sinking 4,000 or 5,000 feet one ought to pass through both the Triassic and the Cretaceous formation.
958. The distance between the two sets of strata would vary very much;—the Cretaceous formation would be of an undulating character? Yes. If the clay-bed above were very thick, you might have to bore a considerable distance before you tapped the Cretaceous sandstone, and you might then have to go through 1,000 feet of clay before you came to the Triassic sandstone. You would always have to go from 1,500 to 2,000 feet, even under the most favourable circumstances, if you were on the Cretaceous rocks, and wished to tap the Triassic source of supply.
959. Does the Triassic formation undulate in the same way as the Cretaceous formation? The Triassic rocks lie, I think, in wide shallow basins, separated here and there by hillocks, or even by submerged ranges of impervious rock.
960. You think that we could, with perfect safety, put down thirty times as many artesian bores as we have at the present time? Yes.
961. So that if we had one hundred bores to-day, we could safely put down 3,000? Yes, provided they drew water in the same proportion as the present bores. Mr. Jack, the Government Geologist of Queensland, in a paper which he read last year to the Australasian Association for the Advancement of Science, very much extended his estimate of the artesian water available in Queensland, as compared with a former estimate. He originally estimated that the width of the strip of Cretaceous rocks was only one-eighth of a mile; but last year he told us that he had surveyed the strip and found that its width was about 5 miles. When he made his first report he thought that the amount of water then being taken from the Queensland artesian supply, namely, 100,000,000 gallons a day, was just about as much as drained into the basin, and that it would not be possible to increase the number of the wells without impairing the supply. After this survey, however, which substituted facts for theory, he was able to state that he thought it would be possible to increase the present outflow at least forty times.
962. *Mr. Roberts.*] In view of the quantity of artesian water to be obtained in our western districts, do you think it a matter of necessity to utilise the river Darling for irrigation purposes? I could hardly answer that question without taking the time to calculate how much water will be required to irrigate a certain area, and I should want some figures showing the area required to be irrigated.
963. *Chairman.*] It appears that to put 20 inches of water upon 610 acres of land, would require a supply of 347,830,400 gallons. You say that the supply of artesian water available is 2,000,000,000 gallons a day? I would sooner call it 1,500,000,000 gallons. A flow of 1,000,000 gallons a day would irrigate about 1 square mile, and therefore a flow of 1,500,000,000 gallons a day would irrigate 1,500 square miles.
964. A little over 1,000,000 acres? Yes. At the same time, I should like those figures to be taken only as approximate.
965. But, accepting the basis which appears to be laid down by the Department of Mines in their report upon artesian boring, it would appear that about 1,000,000 acres could be irrigated from our artesian water supply? I think so.
966. *Mr. Roberts.*] Could you estimate the cost of obtaining this supply? It could be estimated by ascertaining the cost of the total number of feet bored up to the present time, and multiplying it by thirty.
967. Is the water tapped by the artesian bores virtually a stream? It is virtually a stream in the form of an underground sheet. If it were an impounded basin the water would be highly mineralised and brackish.
968. Can the supply be looked upon as inexhaustible? If the present number of bores were increased to such an extent as to draw out about thirty times the amount of water now taken, probably as much would be taken out as was draining in, and then if any more were taken out the wells would cease to flow.
969. In regard to the scheme before the Committee, do you think it would be better to carry it out—remembering that for irrigation purposes it would be necessary to pump the water to a height of 35 feet—than to rely upon artesian boring. I should not like to express an opinion upon that subject.
970. *Mr. Humphery.*] Would it be possible to have a series of bores between Bourke and Brewarrina, within 3 miles of the river, which would provide an abundant supply of water for irrigation purposes? I am not quite sure as to what are the limits of safety, so far as the placing of one artesian bore near another is concerned. I do not think it would do to put two large bores within half a mile of each other.
971. The distance between Bourke and Brewarrina is about 60 miles by road, and 150 by river, and we have been told that the water of the Darling could be used for irrigation purposes within 3 miles of the river; can you tell us what artesian supply could be obtained within that area? You could get artesian water at intervals throughout that area.
972. But at about what interval? Without knowing exactly the depth of the bores there, I could hardly tell you.
973. Approximately? Well, the bores might be 5 miles from each other; but I should not like to make a definite statement without first entering into a calculation.
974. When you were estimating the available quantity of artesian water, did you take into consideration the probability of a number of bores being placed between the Darling and Milparinka? Yes.
975. Has that country been tapped? Yes; a good deal of water has been drawn from that district.
976. How many bores have been put down there? That I could not say; but a great many.
977. Have you any knowledge of that country? I have not been over that country myself.
978. Has artesian water been obtained as far out as Mount Browne? I am not prepared to say how near to Mount Browne artesian water has been obtained.
- 979.

979. Your estimate covers the whole supply to be obtained in the area you have already referred to? Yes; I think the map issued by the Department of Mines shows that there are some bores rather close to the Mount Browne district.
980. *Chairman.*] Do you know the character of the bed of the Darling? Only close to Bourke.
981. Would there be any percolation through it? Over considerable areas there would not be percolation, because of the hard clays which form the bed in places. The bed of the river is partly porous and partly impervious; but I could not give you any exact information unless an actual survey were made.
982. Is any such information available? If there is you could get it from Mr. Pittman.
983. Your statement with regard to the artesian water is briefly this: that if the water got away too readily there would be no head to raise it to the surface, while if it was obstructed altogether there would come a time when no more would be absorbed? Yes; the beds would become supersaturated, and the water would become brackish from the want of circulation.
984. But it is assumed that, with considerable difficulty, the water gets away somewhere—most likely to the south-east coast of Australia? Or to the Gulf of Carpentaria—most likely in both directions.
985. If a considerable quantity of water were taken from the water-bearing strata, would the tendency be for what is left to become highly mineralised? It would be likely to become less mineralised.
986. Therefore, there is reason to believe that, as we use the artesian water, it will get better, and not worse? Well, only to a limited extent; because, after all, the circulation would only be very slightly accelerated by the artesian bores.
987. But, no matter how we may draw from the artesian supply, the water is likely to remain good in quality? Yes.
988. Can you give us information with respect to the quality of the water already obtained? I would rather leave that to others. I have seen chemical analyses of the water; but I have not had an opportunity of judging as to its effect upon plant life. I believe that the Department of Agriculture has established a farm near one of these bores, and has tested the use of the water for irrigation—I have heard, with very satisfactory results.
989. Mineralised water might not affect the soil for one year, or even for half a dozen years; but subsequently it might destroy its value for agricultural purposes? That is so.
990. Can you tell us where such a difficulty as that has disclosed itself, and what means have been adopted to get rid of it? In the United States of America they have been troubled with an excess of alkali where they have been using artesian water for a great number of years. The trouble has been caused chiefly, I believe, by the presence of carbonate of soda in the water.
991. Carbonate of soda also occurs in our artesian water? I do not think that our artesian water contains so much of it as the American artesian water contains after it has been used for irrigation.
992. *Mr. Wright.*] Here the trouble is caused by chloride of sodium? No; there is only a small quantity of chloride of sodium. I think it is a negligible quantity.
993. If artesian water is continually being used upon soils largely charged with alkali, will not the supply itself become affected? I do not think so. The artesian wells in Algeria have been flowing for forty years.
994. A great deal of our western country is greatly charged with alkali; if you irrigate it, will not the alkali be taken down through the soil so as ultimately to destroy the supply? To get rid of the alkali trouble you would have ultimately to mix powdered gypsum into the water.
995. Would not the percolation take the alkali through the soil into the underground supply? No; it would never get back to the original source. Speaking generally of our artesian water and its mineral constituents, I might say that it compares very favourably with the artesian water in other parts of the world—for example, with the artesian water used in the north-west States of North America, and in Algeria.
996. Therefore, a comparison of the various soils for which it is required would enable us to find out what risk we run in using it? Yes. Mr. Guthrie, of the Department of Agriculture, could give you information in regard to character of the soil in the western district; and Mr. Mingaye, of the Department of Mines, has analysed the water.
997. *Mr. Black.*] You said something about this water returning to the ocean;—in artesian boring is water ever struck below the ocean level? Yes, very frequently. The bottoms of most of the bores in Queensland and in New South Wales are below the level of the sea. For instance, the surface level at Bourke is less than 400 feet above sea level, but the bores near there go down nearly 2,000 feet.
998. Does the pressure of water increase with the depth? The pressure does not increase in direct proportion to the depth. It depends upon the height of the intake and the frictional resistance.
999. If the diameter of a bore is increased very much, would that lessen the pressure? It will somewhat, but not to a very great extent.
1000. If you increased the diameter of a bore from 3 to 6 inches, or from 4 to 8 inches, would there be a decrease of pressure? I could not give you a reliable answer upon that point without knowing what the surrounding conditions were.
1001. Supposing the diameter of a bore were increased from 3 to 12 inches? Then, no doubt, the water would not come so fast; but a great deal would depend upon the porous nature of the ground. If the sand beds below were very porous, you might increase the diameter of the bore to 12 inches without affecting the pressure; but if, on the other hand, there is much resistance to the flow in the beds, a 3-inch bore would drain for a certain radius, and any larger bore would decrease the pressure.
1002. Possibly the longer a bore remains in use the less effective it is and it might in time come to be inoperative? I do not think that is likely. Actual experience of bores that have been running for forty years seems to show that as long as the pipes are kept clean the pressure is uniform.
1003. You were speaking of bores of a moderate size? Yes.
1004. But supposing a bore were as large as 3 feet in diameter? I do not think it would be wise to sink a bore of that diameter.
1005. The better way would be, where a large quantity of water was required, to sink several bores? Yes.
1006. What are the reasons why the water rises with such force in the artesian bores? It is simply due to hydraulic pressure. The pressure is no more than one would calculate it to be by taking the level of the inlet and the level at which the water is tapped, making allowance for frictional resistance. Very much depends upon the fineness of the sediment through which the water is flowing.

David, Esq.,  
B.A.

27 May, 1896.

James William Boulthbee, Esq., Superintendent of Public Watering Places and Artesian Water Supply, Department of Mines, sworn, and further examined:—

J. W.  
Boulthbee,  
Esq.  
27 May, 1896.

1007. *Mr. Roberts.*] Yesterday you were asked to furnish a return as to the cost of the artesian bores put down in this colony, and the revenue derived from them? Yes; that information is contained in the return which I now hand in. [*Vide Appendix*].

THURSDAY, 28 MAY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
HENRY CLARKE, Esq.	GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of Locks and Weirs on the River Darling.

George Maiden, Esq., Manager, Messrs. Goldsbrough, Mort, & Co., Ltd., sworn, and examined:—

G. Maiden,  
Esq.  
28 May, 1896.

1008. *Chairman.*] Have you a knowledge of the country between Bourke and Brewarrina? Yes, extending over something like thirty years.

1009. *Mr. Roberts.*] Are you familiar with the scheme before the Committee? I have not made myself very much acquainted with it, but I have taken a cursory glance at it.

1010. When were you last in that part of the country which it will affect? Twenty years ago.

1011. You have not visited it since? No.

1012. Was the Darling a navigable stream when you knew it? Yes.

1013. Were steamers employed upon it? Yes.

1014. Where were they trading? Principally from the Lower Darling to Bourke, bringing goods from South Australia and from Echuca.

1015. In those days where did the Bourke wool go? Some of it to South Australia and some to Echuca.

1016. I suppose the position which you occupy causes you to keep this part of the country in your mind? We have large interests in the district.

1017. As a business man, do you see any need for the proposed work? I think that if carried out it would give a great boon to the people upon the Culgoa, Bokhara, and Narran, and would tend to draw a good deal of traffic down to feed the river at Bourke.

1018. Where does the produce from that district go to now? It comes down in drays, making the western line somewhere about Byrock. A good deal of it would go to Bourke.

1019. Does any of it go to Narrabri? Some of it would branch off to Narrabri; but I think that if the river were locked it would cease to go that way. It would of course depend upon the freight, however, though river charges are generally very light. Speaking generally, I think the scheme would be a good one for the district as a whole, and to the people upon the river more particularly. If part of the river is locked, as proposed, that will keep a permanent supply of water for a long way up, and would allow a more easy flow after light rains.

1020. And more produce would go to Bourke than goes there now? I think so.

1021. I suppose that it would also make a great saving of time in getting to market as far as the people to the north, out towards the Queensland border, are concerned? No doubt about it. At present, if a very wet season sets in out there, it is difficult to get anything along the roads.

1022. Is there a very large traffic between Brewarrina and Bourke? I do not think so. There is a fair amount of traffic; but not a great amount. The traffic would go to Byrock from Brewarrina.

1023. If the river were locked, the traffic would go to Bourke? No doubt about it.

1024. Would you favour the construction of a railway from Byrock to Brewarrina, in preference to the proposed work? I think it would be preferable to expend money in locking the river.

1025. Would you be favourable to the imposition of tolls upon the river? That is a matter which I have not considered.

1026. Have you in your possession any figures giving the amount of traffic to Bourke? I have not.

1027. You could not tell us how many bales of wool passed from Brewarrina to Bourke last year or the year before? No; but such information is available.

1028. Do you know the rate of carriage from Bourke to Brewarrina, or from Brewarrina to Byrock? I do not.

1028½. Would £2 be a fair thing? It would be somewhere about that. I could get you the information.

1029. You favour the locking of the river in order to make it navigable, so that produce could be carried by water at a lower rate—say, 10s. a ton? I should think that would be the effect. Water carriage is always cheaper than rail carriage.

1030. Do you think that 10s. a ton would be a fair rate for carriage from Brewarrina to Bourke by river? Yes.

1031. Do you look upon this work as one which must at some future time be extended as far as Walgett? I should hardly recommend its extension to Walgett, because I understand that the railway is going to Walgett.

1032. Will the locking of the river as far as Walgett make a railway to Walgett unnecessary? I do not think it would be wise to prevent a railway from going in the direction of Walgett? I think that the railway should be taken from Narrabri in the direction of Walgett, because such a line would pass through some of the finest country in Australia.

1033. Why would you recommend the construction of such a line in preference to the further locking of the river? The railway goes to Narrabri now, and not to extend it into the country to which I refer would be robbing one of the finest grazing districts in the colonies of its rights.

1034. If wool and other produce could be carried from Walgett by river at a cheap rate, do you think that it would be necessary to make a railway to Walgett? There are other considerations. There is a valuable

G. Maiden,  
Esq.  
28 May, 1896.

- valuable district beyond Walgett which has a strong claim to a railway. I have no interest in this matter. I simply give you the result of conclusions at which I have arrived after eighteen to twenty years experience.
1035. *Chairman.*] You say that although you regard the locking of the river as an important work, having regard to its effect in so storing water, possibly up as far as Walgett, you do not look upon it as obviating the necessity of a railway extension from the north-western line to that place? Quite so.
1036. *Mr. Roberts.*] Even if it were decided to lock the Darling as far as Walgett, a railway to that place would still be necessary? Yes.
1037. Have you had any experience of irrigation in any part of the world? Not much.
1038. Have you ever been in California? No.
1039. Do you think that this scheme should be favourably viewed from what I may term the irrigation point of view? I have no doubt that it will be of immense advantage in that direction as time goes on.
1040. But you have not given the subject of irrigation much consideration? Not very much. I have only considered it in a general way.
1041. Have you seen any of the artesian bores which have been put down in this Colony? No; but there are two or three such bores on some of our securities, and the reports I get speak very favourably of them.
1042. *Mr. Wright.*] You have had a large experience of wool-raising as well as of wool-selling? Yes.
1043. Do you think a man could pay 5s. an acre for water to irrigate land upon which he wished to graze sheep? I do not.
1044. If it has been stated in evidence that sheep-farmers would pay 5s. an acre for water for that purpose, and pump it themselves, do you think that that statement is correct? I do not think that they would pay that price for water, considering the present condition of the country and of the wool market.
1045. Do you think it would pay a sheep farmer to have his land flooded for 6d. or 1s. an acre, he cutting his own trenches and pumping the water? It might pay to irrigate patches; but it would not pay to irrigate generally.
1046. Do you think that irrigation will take place on a large scale in connection with grazing land? I do not think so.
1047. Do you think that a man who had a good river flat would be likely to cultivate 300 or 500 acres of lucerne for winter feed for his stock if he could irrigate his land? There might be exceptions; but I do not think it would be generally done.
1048. You are aware that Mr. Wills Allen has cultivated some hundreds of acres in this way? Yes.
1049. Do you think that the same thing will be done along the Darling if water is conserved there? The conditions of soil upon the Darling are quite different.
1050. Experience shows us that very large crops can be obtained from that district when the land is irrigated? But you must not forget that the climatic conditions on the Darling are different from those which prevail where Mr. Wills Allen has his estate. You get a rainfall at the latter place which you do not get on the Darling.
1051. But, if you have water artificially conserved, it does not matter whether you get rain or not? I think that the water which falls upon the land in the shape of rain is better for it than any other.
1052. Small patches of land which have been irrigated by artesian bores in this district have produced phenomenal crops of lucerne, vegetables, and so on? Yes; but you must take into consideration the expense. What is being done now is done under the most favourable conditions, because the land irrigated is close to the source of supply. If that land were 10 miles off, the question of expense would arise.
1053. Do you think that a squatter having 500 acres of very rich land on the banks on the Darling would be likely to pay 5s. per acre for water in order that he might grow lucerne upon the land, he having to pump the water himself? Not as a rule.
1054. Do you think that it would pay a man to do that? I do not think it would.
1055. You say that the wool from the Narran and the Bokhara now comes in to Bourke, and that if the river were locked that traffic would be increased, and the people there would have cheaper carriage? I did not say that the locking of the river would increase the traffic. I said that the work would be a great boon to the people out there, and should give them cheaper carriage.
1056. What do you think of the construction of a railway from Byrock to Brewarrina? I said that I thought it would be better to spend the money in the way now proposed.
1057. Because the locking of the river would serve two purposes—it would conserve water, and would provide a highway? Yes.
1058. Do not the exceptionally low rates charged upon the Bourke line tend to divert traffic to Bourke which would otherwise go to Narrabri? To a certain extent they do.
1059. But you do not think that the north-west country will be properly served by being provided with water carriage to Bourke and railway carriage from Bourke to Sydney? How could the territory between Narrabri and Walgett be served in that way.
1060. If the river were properly locked it might be made navigable as far as Collarendabri? Even then you would want a railway. I look upon that district as having the finest class of settlers there is in the colony.
1061. You approve of the locking of the Darling because it will effect the conservation of a large quantity of water, because it will create a highway for traffic, and because it will provide means for irrigation? Principally because it will make the river navigable, and will conserve a large quantity of water.
1062. You do not attach so much importance to the question of irrigation? To my mind, that is a secondary matter at the present time.
1063. *Mr. Black.*] Have you given the question of irrigation any study? Not much.
1064. If the settlers along the banks of the river used the water of the river to irrigate their land, do you think they would have a local market for their surplus produce? Not with the present population.
1065. Do you think they could compete in the metropolitan markets with produce grown on naturally-watered land, and on which the cost of long railway carriage had not to be paid? Certainly not.
1066. You are not inclined to think that this scheme is commendable because it would bring about the conversion of large areas of land from pastoral to agricultural occupation? To my mind, that is a minor consideration.
1067. It must be a minor consideration, and cannot be an immediate consideration? And cannot be an immediate consideration.

- G. Maiden,  
Esq.  
28 May, 1896.
1068. *Mr. Humphery.*] Is there any loss of wool to the railway by reason of the higher rates charged between Narrabri and Sydney, comparing those rates with the rates between Bourke and Sydney? No; there is a gain of wool, because the Bourke rates draw the Queensland wool. That is their object.
1069. It is a matter of policy, and the lower rates augment rather than diminish the earnings of the railway? Yes, because they draw Queensland wool, which would otherwise not come this way. The differential rate charged on the Bourke railway is so charged in order to get the Queensland wool. It is not necessary to make a differential rate on the Narrabri line, because the Queensland railways take the wool from that part of Queensland to the north of Narrabri. If the rate from Narrabri were proportionately equal to the rate from Bourke, some of the Queensland wool would be drawn to Narrabri; but it would not be drawn to Narrabri to the same extent as Queensland wool is drawn to Bourke, and the quantity of it would not be sufficiently large to make it worth while for the Commissioners to lower the rate.
1070. You rather favour the construction of a railway from Narrabri to Collareendabri;—have you considered the proposal to extend the line from Nevertire through Warren to Coonamble, and thence to Walgett? I have not considered it; but I know the country through which such a line would pass.
1071. Of the two proposals, which would you favour? Both districts have large claims.
1072. If the railway were taken to Walgett you would not want a railway to Collareendabri? To my mind you would. There are two districts having distinct and separate claims.
1073. If the railway were extended from Narrabri to Collareendabri, would you want a line from Nevertire to Walgett? Yes.
1074. Would not the lines compete with each other? No.
1075. Could not Walgett be used for a terminal dépôt as well as Collareendabri? No. There is a very large district between Nevertire and Walgett which should be served by a railway, and another large district between Narrabri and Collareendabri, which should also be served by a railway. The latter line would also tap a large extent of back country not drained by the first line. There would not be the necessity to take the line from Coonamble to Walgett if the river were made navigable.
1076. You do not think it would be necessary to extend the railway beyond Coonamble? It would not be necessary, though it would be a great convenience to the district.
1077. In your opinion would it be politic to proceed beyond Coonamble? I do not think it would.
1078. You think that sufficient railway facilities would be afforded to these districts, if a line were taken from Nevertire to Coonamble, and another line from Narrabri to Collareendabri? Yes; between Coonamble and Walgett the country would be very difficult for railway construction, because it is often flooded for miles back. I have ridden through it, 4 miles out from the river, when the water has been up to my horse's back.
1079. *Mr. Trickett.*] I understand that your chief reason for supporting this scheme is that it would improve the navigation of the river, and give facilities for the carriage of goods? Yes.
1080. The official who speaks for the Government gave this evidence in putting the scheme before us: "Looking at the scheme merely as one for opening up the river for navigation, I do not think the expenditure would be justifiable." Do you agree with that opinion? Not only would you improve the navigation of the river, but you would store an immense quantity of water, which I think is a necessary thing to do. I went down the Darling once when it was almost dry for a stretch of a couple of hundred miles, except where there were holes.
1081. You think this scheme would be carried out regardless of any revenue that it may produce? I think it should be preferred to the alternative railway proposal, which, I understand, will cost £140,000.
1082. Have you seen Mr. Wills Allen's property? I only know of it.
1083. Do you know if irrigation has proved a successful venture there? I heard it spoken of as fairly successful.
1084. We have had it stated in evidence that his property, which consists of 40,000 acres, has been materially benefited by the irrigation of 500 acres; how could that result come about? You might get 500 acres of land which would be suitable for irrigation; but at the same time you might not get 40.
1085. I understand from an answer which you gave to Mr. Black, that you did not think that irrigation would be much used on large areas? No; it would not pay.
1086. People will not give 5s. an acre a year for the privilege of using water? I do not think so.
1087. *Mr. Lee.*] When you were speaking about the necessity of constructing a railway from Narrabri to Collareendabri, had you in view the line now being constructed to Moree? I had.
1088. Do you not think that line will meet the requirements of the district to which you referred? In a measure, but not wholly. That line runs just on the edge of the good country.
1089. But it is bound to serve a large part of that country because it will bring it within 20 miles of railway communication? It will serve it in the same way as the railway from Narrabri serves it.
1090. Do you not think that if there is to be any quantity of Queensland wool diverted to this colony it will come to our line by way of Moree? Wool grown to the north of Bourke is not likely to come to Moree. Our company is interested in wool grown upon the Warrego. That wool would certainly never go to Moree. All the stations up there will come to Bourke.
1091. But what about the St. George country? The wool from there would go to Narrabri.
1092. Is your firm in the habit of receiving wool from that country by way of South Australia or Victoria? No.
1093. You do not receive consignments which have been sent down the river to South Australia, and thence on to Sydney by steamer? No.
1094. Does the wool go to Victoria? Some of it does.
1095. Is that wool coming from the north of Bourke? It would come from the north-west of Bourke.
1096. Would it be influenced in this direction if the Upper Darling were kept permanently navigable? Only the wool from the borders of that territory.
1097. That wool is outside the district which will be affected by the locking of the Darling? To a very large extent it is.
1098. We must not look to that part of the country for a large additional traffic? No.
1099. I suppose there was a very small settlement in the country between Bourke and Brewarrina when you knew it? There was none.
1100. There is not very much now? There are a few homestead lessees.
1101. That land is used principally for grazing purposes? Yes.

1102. Are you of opinion that if there was a permanent supply of water in the Darling between Bourke and Brewarrina, closer settlement would ensue upon the banks of the river? I do not think it would alter things materially.

G. Maiden,  
Esq.

28 May, 1896.

1103. Is that country capable of producing fruits of various kinds? I think it would produce anything on the face of the earth.

1104. Do you think that with an abundant supply of water for irrigation, there would be closer and more profitable settlement? I do not think so. The towns there are very small, so that there would be no great local demand for anything produced, and the distance would prevent anything from being sent to the metropolis.

1105. Without water that country is valueless. What would it be capable of if were irrigated? It would be very productive.

1106. Is it capable of growing the vine? Yes; I have seen splendid grapes grown there.

1107. Would it grow stone fruits? Yes.

1108. Do you think they would grow there as well as at Mildura? I think so.

1109. Is there any reason why they should not? None at all.

1110. With an abundant supply of water there would be no limit to the possibilities of that country? Quite so.

1111. But you are concerned more with the question of traffic? Yes.

1112. Is it your opinion that notwithstanding what may be our future railway policy, it would be a wise thing to lock the Upper Darling? I think it would.

1113. *Mr. Clarke.*] What are the principal reasons why you approve of this scheme? Because of the convenience which it would prove to the producers of the district in contrast to the alternative proposal of a railway from Byrock to Brewarrina; secondly, because of the amount of water which would be conserved. If 150 miles of water were permanently conserved, and light rains fell in the New England district, the river would flow very easily, and the water would be carried all the way down.

1114. I suppose that cattle and sheep rearing is the principal industry of the district? Wool is the chief product.

1115. If the river were locked between Bourke and Brewarrina, would it pay to carry live stock along it in steamers? No, and I do not think any necessity for that would arise.

1116. You think that in ordinary seasons it would be cheaper to drive the cattle? The only time when there would be any need to convey live stock by steamer would be when the whole country was flooded, and at such times you would have great difficulty in getting into Brewarrina.

1117. Do you think it would be possible to grow cereals in the district? Yes.

1118. Would there be a local market? I do not think so.

1119. Would it not cost too much to send locally grown produce, and particularly wheat and oats, to Sydney, and other places along the railway line? I think that if there were any profit to be obtained in growing these things in the district they would be grown now at Bourke. Seeing that nothing is done now, I do not know that any difference would be seen if the population were thicker.

1120. It would not pay to irrigate large areas for pastoral purposes? No.

1121. Do you not think that it would be very expensive to pump water from the Darling for irrigation purposes? Yes.

1122. Do you think it would prove a financial success? I do not.

1123. Do you think it would be cheaper to irrigate from artesian wells? It would be cheaper.

1124. If the river were locked right down to Wentworth, would not that take away a large amount of trade from New South Wales and give an advantage to South Australia? No doubt it would.

1125. Although such an arrangement might benefit the people near the river, it would injure the trade of the colony? I should not recommend the locking of the Darling below Bourke, until after the colonies have federated.

1126. Do you think that a railway from Brewarrina to Byrock would be of as much advantage as the construction of the proposed scheme? I think that the carrying out of the proposed scheme would be better for the district, and for the public generally.

1127. But would it not impose an extra charge upon the people of Brewarrina to compel them to send their produce along the river to Bourke, and then bring it back by rail to Byrock, instead of taking it direct by rail? The water carriage would be infinitely cheaper than rail carriage, and under the present differential system of railway rates, the charge from Bourke to Sydney would be the same as from Byrock to Sydney.

1128. *Mr. Fegan.*] I understand that the population in this district is now very sparse;—do you think that if facilities are given for navigation and for irrigation it will become much more thickly populated? No doubt the tendency will be for the population to increase.

1129. And the Government would recoup itself for what it expended upon this scheme by the extra value of the land there? That would depend upon the results obtained from irrigation. If irrigation there turned out as badly as it has done at Mildura, there would be no great danger.

1130. Was not the failure of Mildura caused to a great extent by the quarrels between the various parties interested in the place? Yes, to some extent; but in any case the results have not been satisfactory to those who have embarked in the enterprise.

1131. Seeing that in America and in India irrigation has been carried on with great success, do you not think it would be made successful upon the banks of the Darling? In India labour is much cheaper than it is here, while in America they seem to know more about the fruit-growing business than we know, and are more energetic.

1132. Then it is not altogether the system that has failed at Mildura? Well, the success of irrigation depends altogether upon its cost.

1133. Wages are pretty high in America, are they not? Yes; I think they are higher in Australia than in America.

1134. Therefore, with able men at the head of affairs, irrigation should be carried on as successfully on the Darling as at any other place? Yes. I believe it ought to be where the conditions are suitable.

1135. Would not successful irrigation increase the value of land on the Darling? In a measure.

1136. And would not this increase in value materially help to pay for the cost of carrying out the scheme before us? It should do so.

1137. You think the scheme is worth a trial? I do.

1138.

- G. Maiden, Esq.  
28 May, 1896.
1138. *Mr. Hassall.*] If this scheme were carried out, would not Brewarrina become the natural depôt for the traffic from the Bokhara, Narran, Birrie, and Culgoa Rivers? Yes.
1139. Is not the district watered by those rivers the great wool-producing district in that part of the colony? Yes.
1140. That district extends for a considerable distance into Queensland? Yes.
1141. If the river were made navigable, do you think that more wool would be attracted from that district;—do you think that wool would drift in from the Warrego? That all depends upon how far the scheme will suit the people lying back from Brewarrina.
1142. Do you think that the proposed expenditure is justifiable in view of this large expanse of wool-growing country that it would serve? I do.
1143. You think that it would be better to carry out the proposed scheme than to expend, perhaps, a larger amount of money in making a railway from Byrock to Brewarrina? Yes.
1144. You think the country would be better served by the locking of the river? All those places out back would be better served by the proposed scheme, and in locking the river you would be commencing a national work.
1145. If the river were locked between Bourko and Brewarrina, would the effect be to fill up the upper reaches when light rains fell in the New England district? Yes.
1146. And during flood-time the water would be thrown back into the ana-branches, and thus reach a large extent of back country? Yes.
1147. There are a great many ana-branches which would be filled in this way? Yes.
1148. You do not think that agriculture will be entered upon to a large extent on the banks of the Darling? I do not think so.
1149. You think that people will only cultivate a few specially suitable patches as they do now? Yes; for their own immediate use.
1150. Perhaps they will do as Mr. Walls Allen has done—cultivate a few hundred acres to provide food as a stand-by for bad seasons? Exactly.
1151. There will be no general irrigation entered upon? I have not the slightest doubt that there will be no general cultivation along the river between Bourke and Brewarrina. I do not think that the present holders will be swept away, and that the land will be used for growing vegetables and cereals.
1152. Agriculture will not be entered into upon such a scale as to provide additional river traffic? I do not think so.
1153. But it is advisable to commence locking these reaches of the river? Yes; I think it is worth a trial.
1154. With a view to extending operations later on? Yes.
1155. Are you aware that a steamer has been up as far as Mogil? Yes; but to improve the river for navigation as far as that place would require the expenditure of a great deal of money upon snagging.
1156. When the rains are heavy, and the flood-waters are out, it is practically impossible to travel on wheels throughout that country, but if the river were permanently navigable people could use it for sending their produce away, and bring supplies back? Yes.
1157. Therefore, as an alternative to a railway, it might be advisable to incur expenditure upon this scheme? Yes. I favour the locking of the river, primarily because I think that it will be a good national undertaking, but more particularly because I think it is preferable to the alternative railway proposal.
1158. You are aware that the carrying capacity of that district is being materially increased by the boring for artesian water which has taken place? Yes.
1159. Do you not think that this will largely increase the output of wool in the course of time? No doubt it will.
1160. And this scheme will be beneficial in providing means of conveyance at present lacking? Quite so.

James William Boultsbee, Esq., Superintendent of Public Watering Places and Artesian Water Supply, Department of Mines, sworn, and further examined:—

- J. W. Boultsbee, Esq.  
28 May, 1896.
1161. *Mr. Roberts.*] When the Committee adjourned yesterday afternoon you were about to read some extracts showing the progress of irrigation in America? Yes; I have here some extracts from a report by Colonel Richard Hinton, which was published in 1892. Colonel Hinton was an expert, appointed by the Washington Government, to inquire thoroughly into the question of artesian wells and underflow. He went into the subject most exhaustively, and I think you will find that the extracts which I have named are pertinent to your inquiry:—

Artesian water is used more extensively for irrigation purposes in California than in any State in the Union, as at the end of the year 1891 it was estimated that out of 100,000 acres irrigated from artesian wells west of the 97th meridian 50,000 acres were in California. Irrigation with artesian water for raising all sorts of fruit, lucerne, vegetables, and, to a small extent, of grain, has been practised for years, and can be looked on as a permanent success. This water, however, is generally too valuable to be used for the cultivation of grain, and is mostly devoted to the intense cultivation now so largely carried on in fruit-growing districts.

Engineer W. Hall, in his report on Perris Irrigation District, dated August, 1891, states:—

Between 1880 and 1884 the canal of the Riverside Colony was a line of demarcation between land worth no more in the market than £2 per acre, and other readily saleable at £50. Those above the canal were without irrigation, and there was but a vague hope of ever securing it. But the building of the Upper Riverside or Gage Canal (source from artesian wells), in 1885–86, made water-rights available for these upper lands; they paid a big bonus for the water privilege, and are now selling at £40 to £100 per acre, without improvements.

Professor R. T. Hill, in his report on the occurrence of artesian and underground water in Texas, Eastern New Mexico and Indian Territory, west of the 97th meridian, published in 1892 by the U.S. Agricultural Department, says of the artesian waters of the Black and Grand Prairies, the greatest artesian belt of Texas:—

In no portion of the country has there been a grander development of artesian wells than in the past five years in the Grand and Black Prairie regions of Texas. At numerous places throughout its extent magnificent flows of water have been secured, and what ten years ago was in many places a poorly watered district now abounds in magnificent artesian wells, which supply water to cities and farms in quantity large enough to make many new industries possible, besides furnishing water to irrigate many thousands of acres. The wells vary in depth from 50 to nearly 2,000 feet, with every intervening depth. They also vary in volume, or flow, from less than a gallon a minute to a thousand, and in pressure from nothing to maximum. The purity of this artesian supply for domestic purposes and its healthfulness gave Fort Worth

an enviable superiority which her rival cities were not slow to imitate, and as a result of her success nearly every city and village in the Grand and Black Prairie region, and in fact throughout the State, made artesian experiments. A few of these were put down in unfavourable locations and were failures, but hundreds more were successful, and to-day most of the cities of the State, which, before this artesian epoch, were without good water are supplied with an abundance. The industrial uses to which these waters are at present put are many. At Waco, hundreds of sewing-machines in clothing factories, electric motors, wood-working machinery, and other small industries are run by the pressure of wells, without wasting the water by the use of small and powerful California wheels. When the high cost of fuel in Texas is considered, this use of artesian water becomes a most important factor. The greatest use of this water at present is the fact that it brings the hitherto poorly-watered farming and grazing lands an abundant supply of water for domestic and stock purposes, making small farms of 100 acres or less possible where until recently subdivisions of large bodies of land or ranches were impossible. The value of these wells for irrigation has been demonstrated by the modest farmers of Paluxy Valley, who, by their own humble methods and without previous knowledge of the subject, are now quadrupling the yield of cotton and grain. A farmer at Paluxy stated to me that his 10 acres of cotton yielding nearly two bales of 500 pounds each to the acre, was far more profitable and easily worked than 100 acres which he had until recently cultivated in Alabama.

Irrigation from the artesian wells is at present successfully practised in the Paluxy region, and the largest and most prosperous city in Texas, San Antonio, is built upon and about an irrigation enterprise which has most profitably and successfully utilised the underground waters for nearly 300 years, affording occupation for all the mission settlements in the past, supporting hundreds of gardens at the present, and destined to be of great value in the future.

Every drop of water from these springs and wells can be utilised for irrigation, and when the people of the region appreciate the fact that each gallon of water has a specific value in agriculture, as has a pound of coal in industrial enterprise, not one drop of this water will be allowed to escape unutilised, and the agricultural wealth will be enormously increased.

From the information furnished by Colonel Hinton's report (page 129) I gather that the celebrated fruit ranch of Riverside, in San Bernardino County, California, derives a portion of its water supply from artesian wells. There are 12,000 acres under fruit at this ranch served by twenty-seven artesian wells which are known as the Gage system, yielding a flow of 11,000,000 gallons per diem. These wells are grouped at distances varying from 10 to 700 feet apart within an area of 700 acres. The water is flumed down to the land to be irrigated. The success of this system has encouraged others, and there is now in progress an undertaking of a similar nature known as the Whittier system, located in the Upper San Gabriel Valley, comprising fourteen wells (*vide* page 126). The works, which are not yet completed, consist of 11 miles of cement channel, and 6,200 feet of fluming on piles and trestles. In the San Louis Valley there are 3,700 flowing wells within an area of 8,000 square miles; the Alamosa town well, in the same valley, is described as the principal source of supply for the 30 miles of irrigating ditches within the corporate limits of Alamosa (*vide* page 153). In Utah, the artesian wells in the Salt Lake Valley were first used for irrigation about seven years ago, since when the area of cultivation has increased from 25 to 35 per cent. In Kern County, California, is a remarkable group of fifty-four wells within an area of 252 square miles, which yield the enormous daily supply of 61,000,000 gallons; and it is interesting to compare the extent of our artesian water-bearing formation, estimated at some 60,000 square miles, with no more perhaps than 150 artesian wells upon it, with the figures relating to the San Louis Valley and Kern Valley above quoted. In Texas there are more than 1,000 flowing wells, and it is stated regarding them in the report quoted that "their vast capability and adaptability for making secure agriculture, always rendered uncertain in high temperature, even when the rainfall, if properly distributed, is ample for industrial use, has just become a matter of general understanding." To go nearer home, in Hawaii, on the margin of Pearl Harbour, 20,000 acres of rice, and large areas of bananas, are under irrigation from artesian wells, in addition to which power is provided for several large mills (*vide* page 426). The immense strides made in Algeria are perhaps too well known to refer to. Page 16 of the same report puts the number of artesian wells west of the 97th meridian in America at 13,695. The subdivision of the land at Pera, in small areas, is following out the principle adopted in America by most of the large irrigation companies. Colonel Hinton states in his report on page 19:—

A land sale that took place quite recently in San Bernardino Co. illustrates the progress of the small farm. At this sale, conducted by a company which has constructed irrigation works in a field heretofore regarded as unpromising, over 8,000 acres of land were disposed of at an average rate of \$65.34 per acre. Of this land, 2,600 acres were disposed of in 10-acre blocks; nearly 1,400 acres were sold in 20-acre parcels; a few other sales were made at 40, 50, 60, 70, and 80 acre divisions.

On page 28 he states:—

Without artificial conservation and distribution of water, Riverside, like other prosperous settlements of San Bernardino Co., would have no real value for farm purposes. It would have taken 800 acres of its area to support a ranche man or hunter, and 25 to poorly feed one broad-horned steer. About 6,000 people now live in the greatest of comfort, even luxuriously, on 6,000 acres of land.

On page 32 he states:—

The most successful utilisation and reclamation for irrigable areas within our public domain has grown out of the establishment of colony and co-operative life in some modified form. It was quite certain, then, that more rapid progress in reclamation will be secured through a system of land laws which will subdivide the irrigable areas by homestead divisions of from 20 up to 160 acres, according to location and adaptation to fruit, vegetables, cereals, and forage plants.

In connection with the Algerian wells, I might perhaps mention that artesian-boring was first started by the French military authorities in that country for strategical purposes. The first well put down had a flow of about 1,200,000 gallons. The French Government afterwards gave the Biskraa and Oued Rirh Company a very large area of land upon which that company put down artesian bores, and at the present time they are irrigating about 4,000 acres of palm-groves entirely from this supply. The quality of water obtained is, however, very inferior to the water obtained in New South Wales, and some of it is hardly potable as far as human beings are concerned. Biskraa is becoming a regular health resort for English people. It is, I think, within four days' journey of London. I was also asked yesterday what was the total daily flow from our artesian bores. The present supply is from the forty-six Government wells, 24,000,000 gallons; from four wells which are flowing, but which are not completed, about 1,000,000 gallons; and from the 105 private wells, 38,000,000 gallons; or a total of about 63,000,000 gallons per day.

1162. Irrigation seems to have been a very great success in America;—do you know any reason why it should not be a similar success in this country? No; the only disability we should be under is our want of population, but I think that will come.

1163. How many landowners contribute the £1,292 which is the total revenue derived by the Government for the artesian water which they supply? There are eleven people at Pera who pay for water, four at Moongulla, and seventeen tenants of other bores.

1164. Do all the people to whom artesian water could be conveyed take advantage of it? No; I do not think it is generally known amongst them that the water is available.

1165.

J. W.  
Boulbee,  
Esq.  
28 May, 1896.

- J. W. Boutbee, Esq.  
28 May, 1896.
1165. Does not the Department make it known through the Press that water is available at certain points? The works are periodically advertised.
1166. Have you been over the country between Bourke and Brewarrina? Yes, on this side of the river; but not on the other side.
1167. Would you like to express an opinion upon the proposal before the Committee? No; I could not do so. I know that it is all good rich country there, and I have heard that the owner of Beemery Station has put in 100 acres of wheat this year.
1168. Do you know Mr. Wills Allen's estate near Gunnedah? No; I have not been there.
1169. You think that the reason why the artesian water has not been more generally used is that people do not know that it is available? Yes, and have no knowledge of how to apply it. Agriculture in that part of the country has hitherto been almost unknown. The people have confined their efforts to the growing of a little hay for the station horses and to the cultivation of a few gardens.
1170. Do you think that the price charged for water by the Department—5s. an acre—is considered too much? I have not heard any complaints about the charge.
1171. What do the Chaffey's charge for water? I could not tell you; but I understand that the cost of pumping, cultivation, and everything came to about £6 an acre.
1172. Do you think that if the water of the Darling were conserved a large amount of settlement would take place there? I think so eventually, but I think it will take a few years before there is much settlement there.
1173. Do you think the people living within 3 miles of the Darling would be willing to pay pumping licenses to enable them to use the water? The station people might, but I think it would be a matter of years before the small holders would do so.
1174. You do not think they would go in for agriculture even if water were plentiful? I think they would in a few years' time, when the benefits of irrigation became fully recognised.
1175. Then do you look upon this scheme as premature? No; I do not think that any work of this kind can be premature. We must get the people educated up to the advantages which it will give. It was a long time before they got the American people to take hold of the advantages of irrigation, but now it is going forward with a tremendous rush.
1176. How long is it since irrigation was successfully adopted in America? Within the last twenty or thirty years.
1177. Most of the irrigation there is done by gravitation. Almost entirely.
1178. In every case, is a charge made for the use of the water? Yes. Most of the work is done by private enterprise—speculative companies acquiring a right to the land to be irrigated and making the necessary works. The land is then sold in parcels with a water-right pertaining to it.
1179. Is it a fact that in California land which was purchased for £1 an acre has sold for £30 an acre? Yes, and land that has been purchased for £2 an acre has sold for £50 an acre. Orchards in full bearing have been sold for as much as £100 and £150 an acre.
1180. What would be the original upset price of the land—£1 an acre? I think less than that. I think that in the unsettled portions of the States you can get land for about 5s. 6d. an acre.
1181. What are the principal fruits grown in California? Twenty years ago the growing of the raisin grape was entered upon at Fresno, and that place now supports a large population entirely devoted to that industry. A great many oranges and other citrus fruits are also grown there. The number of citrus trees in California is something over 4,000,000. The people also grow lucerne to a very large extent, while peaches, plums, and fruits of that kind grow to perfection.
1182. Is not the soil in the western parts of New South Wales as fertile as the Californian soil? I should think it would be better soil. I have always supposed it to be a long way ahead of the Californian soil.
1183. And equally suitable for the growth of the fruits you mention? I think so. A great portion of the soil that we are irrigating at Pera has the same nodular limestone sub-soil as that which gives its peculiar properties to the soil in the Bordeaux district. Such soil is admirably suited for the growing of grapes of all descriptions. I look forward to seeing the growth of raisin grapes become a very valuable industry at Pera. There would be a very good local market in the district, and I think that Messrs. Rich & Co. would take all that the settlers would grow.
1184. Do you think that sufficient water for irrigation purposes can be obtained from artesian bores without going to the river Darling? I think so for some years to come.

FRIDAY, 29 MAY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.  
The Hon. CHARLES JAMES ROBERTS, C.M.G.  
The Hon. WILLIAM JOSEPH TRICKETT, Esq.  
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
JOHN LIONEL FEGAN, Esq.  
THOMAS HENRY HASSALL, Esq.  
GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of Locks and Weirs on the River Darling.

Edward Fisher Pittman, Esq., A.R.S.M., Government Geologist, Department of Mines, sworn, and examined:—

- E. F. Pittman, Esq., A.R.S.M.  
29 May, 1896.
1185. *Chairman.*] You have furnished the Committee with two maps and sections? Yes; both actually represent the same thing. The black patches represent the lowest beds of the Cretaceous formation, as mapped by Mr. Jack, of Queensland.
1186. Is that over the Queensland border? Yes; at the time that Mr. Jack mapped this—that is about eighteen months ago—he was of opinion that it represented the lowest beds of the artesian water-bearing basin, and he ran them up, as he supposed, to the New South Wales border. I then went north with the object of trying to trace these beds down through New South Wales. I first went up to Roma *via* Toowoomba for the purpose of becoming familiar with these rocks. I then came to Stanthorpe, and went west from there.

When

When I got down west of Texas to the southern extremity of these beds, which have been mapped by Mr. Jack as the Blythesdale Braystones, that is the lowest beds of the Cretaceous formation—I found that they differed considerably from those at Roma. From subsequent careful examination I came to the conclusion that they are not the Blythesdale Braystones, but the Ipswich coal measures. I had previously examined those measures at Ipswich, west of Brisbane. I then traced these rocks down through New South Wales. I found that they extend east of Yetman, through Wallangra, Warialda, Tery-hi-hi, to the east of Narrabri, and thence in a more or less south-south-westerly direction, so as to take in Coonamble, and through Terabile Creek, as shown on this map.

E. F.  
Pittman, Esq.,  
A.R.S.M.  
29 May, 1896.

1187. You mean it is an extension of the Ipswich sandstone? Yes; I have yet to prove whether or not the Blythesdale Braystones outcrop in New South Wales. I think it is extremely doubtful; at the same time I am not in a position to say. It is the lowermost bed of the Cretaceous basin. In Mr. Jack's opinion it was the bed which formed the intake of the artesian water. Mr. Jack has traced it for 700 miles. Just before I took this trip a bore had been very successfully put down at Moree. An examination of the rocks brought up in that bore proved that the water was not obtained from the Cretaceous rocks, but from the Ipswich sandstone. Subsequently I examined the core of the Coonamble bore, and found the same fossils in that proving that that and the Moree, and since then another bore put down between Narrabri and Moree, at a place called Woolabrar, were put down through rocks of Triassic age.

1188. *Mr. Wright.*] Does the Ipswich sandstone belong to the Triassic age? Yes. The conclusion one arrives at from this work is that instead of the artesian basin being bounded by a line which comes from Roma in a south-easterly direction, to a point about 40 miles north-west of Texas, and thence down to the west of Coonamble, as shown by the junction of the red and green tints, it really comes through Murphy's Creek, thence in a south-south-westerly direction through a point 15 miles west of Texas; thence across through Wallangra; thence to Warialda; thence generally in a south-south-westerly direction to a point west of Gilgandra.

1189. As shown by the portion tinted red in the map of New South Wales? Yes. These beds between Texas and Yetman I found had an altitude of 1,200 feet. Generally speaking, between that point and Rocky Creek they are found at high altitudes. The conclusion I have arrived at is, that the catchment area of the artesian beds, so far as New South Wales is concerned,—that is to say the intake area—is situated between Narrabri and Texas. But of course the New South Wales artesian basin is largely fed from the catchment area of Queensland. At the same time the portion between Narrabri and Texas supplies a large quantity.

1190. *Chairman.*] What does the pink tint over the Queensland border represent? The Triassic or Ipswich coal measures.

1191. Is that water-bearing? Yes.

1192. Does the pink tint shown on the southern side of the New South Wales border represent the same formation? Yes; and is therefore water-bearing.

1193. What does the green tint represent? Desert sandstone.

1194. Is that also water-bearing? Not in the sense in which we use the words at the present time. It is a very absorbent rock—the beds lie horizontally. It drinks in the rainwater which soaks through to the water-bearing formation.

1195. Is the water-bearing formation underneath the portions coloured green? Yes.

1196. What is the portion coloured black, north of the New South Wales boundary? That is all shown by Mr. Jack as Blythesdale Braystone.

1197. Is the black shown near Roma the Blythesdale Braystone? Yes.

1198. Do you think that what is shown near Texas is wrongly named by Mr. Jack, and in your opinion it is the Ipswich sandstone? Yes.

1199. What does the green hatching on the New South Wales map represent? The old boundary of the Cretaceous basin as tentatively laid down by Mr. Wilkinson. It was necessarily guesswork to a great extent.

1200. Will that have to be extended to the west? Yes; but I cannot tell you where—it is not tested. The general conclusion that one draws from this is, that instead of the boundary being from Roma to Texas, the boundary runs approximately from Murphy's Creek down to Texas. That gives us an additional 200 miles in a straight line of intake beds by a width of pretty well the same distance. How much further north it goes I cannot say.

1201. What additional area does that give? About 19,000 square miles. When I say that this gives an additional intake area, you must understand that it has never been proved anywhere between Roma and Toowoomba, because the Queensland authorities always assumed that the Blythesdale Braystones were the eastern boundary of the artesian water. Although they put down two bores, one at Brisbane, and one at Laidley, one may say that they resulted unsuccessfully. They got a little artesian water in one, but it only gave 8,000 gallons a day. It was not potable water, it contained too much salt. From that they appear to have concluded that artesian water could not be obtained in these Triassic rocks in any quantity. I think one bore was about 1,500 feet, and the other about 2,000.

1202. If they had gone further, would there have been a different result? No, I think the conditions were unfavourable for artesian water. Although that area to the east of the Blythesdale Braystone, in Queensland, has never been proved, we have proved the same rocks within the New South Wales border, with four or five different bores with great success, so I think there can be no doubt whatever that the whole of that area between Roma and Gowrie Junction to the west of Toowoomba will be also artesian water-bearing. All the conditions there are favourable. At Spring Bluff, above Murphy's Creek, the altitude is 1,537 feet, at Toowoomba there is an altitude of 2,000 feet, and then there is a gradual fall westward to Roma, where the altitude is 978 feet. So that the fall of the country is all favourable to artesian water supply. I brought away samples of these rocks from Spring Bluff on the eastern side of Toowoomba, and I found that they were extremely porous, and their composition is in every way favourable for forming intake beds for artesian supply. Then we have proved that the same rocks in New South Wales are largely artesian water-bearing.

1203. *Mr. Wright.*] Can you state the total area of the artesian water-bearing country as far as it is known in New South Wales? I have not taken it out in figures, because at the present time I have not finished tracing or mapping it.

1204. Are you fairly familiar with the geology of the western country? Yes, with a great portion of it.

E. F.  
Pittman, Esq.,  
A.R.S.M.  
29 May, 1896.

1205. What is the area known to be water-bearing now? It is shown on this map by brown tinting. That is the map showing the occurrence of the Ipswich or Triassic rocks. It shows the eastern boundary down to about Nevertire. Then from there it appears to go in a somewhat north-westerly direction, practically up to the Bogan River. The south-western boundary has never been traced.
1206. Are you familiar with the bores put down in various parts of that country? Yes.
1207. Have bores been put down west of the Darling? Yes, from Bourke to Milparinka.
1208. Take your lowest southern portion at Nyngan, how far do you know the artesian water area to extend due west from there? I cannot give you anything south of the Darling.
1209. How far north-west from Nyngan? That is the same thing. We have no successful bores between Bourke and Nyngan.
1210. Are there no successful bores at Killara? Yes, there are some.
1211. Does not that prove that the Cretaceous formation extends as far south as that point? Yes; I think so. My own idea is that a channel of the Cretaceous formation comes right down through Wilcannia.
1212. Will you show the Committee from the map what lines you think the Cretaceous formation follows from place to place? I can only answer approximately. I think the boundary of the artesian basin would probably be found to follow generally a north-westerly direction from Nyngan to the Darling somewhere near Brewarrina. Then it follows down on the northern side of the Darling, and it will probably flow down the Darling somewhere about Wilcannia. There will be a channel along the Darling south of Wilcannia right down. I believe it will go down the Darling under the tertiary beds to the south-western corner of that colony. I think that is one of the outlets. That is not based on definite knowledge; it is my opinion. I think that west of Wilcannia the southern boundary of the Cretaceous basin would extend in the direction of Morphett's Creek, that is about 120 miles west of Wilcannia.
1213. Will you trace it north or north-west? All north of that I regard as the Cretaceous basin proper.
1214. Right across to the north of Australia? Yes. Of course there are patches where bores will not be successful.
1215. Can you give us any further information from your researches as to the outlet of this Cretaceous formation? Yes, there is an outlet on the north to Port Darwin.
1216. I presume that if there is an outlet to the south, the formation would traverse the whole length of the continent? Yes.
1217. So that the whole colony would be intersected by this formation? Yes.
1218. Would that area yield an immense supply of artesian water? Yes.
1219. Have you considered what the possible supply would be? I have never tried to calculate it, because I regard it as a waste of time at present. But it has been done by others. Mr. Jack attempted some three or four years ago to go into the question. At that time he thought the intake beds only had a width of about one-eighth of a mile. Eighteen months ago he found they had an average width of 5 miles. I think it is now probable that they have an average width from Toowoomba to Roma of 200 miles.
1220. Is all that area absorbent of water? Yes, I think so.
1221. If your theory is correct as against Mr. Jack's, the amount of water that would be drained would be very large? Yes.
1222. Do you think that for all practical purposes the Cretaceous formation would give an inexhaustible supply of water? It is a difficult question to answer in one sentence. I think that as long as the rainfall continues to be anything like the average rate it has been in the past there would be no possibility of exhausting the artesian water supply, but I can conceive that if we had a prolonged drought lasting for a number of years the supply would most likely give out temporarily.
1223. If it has been stated to the Committee by scientific men that the present supply derived from the bores can be readily increased thirty-fold, do you think that that is an over-estimate? Not at all.
1224. With our present drain upon the artesian water supply do you think that any possible drought, such as we have ever heard of, would seriously affect it? No.
1225. On the other hand, if they were tapped very largely, and there were a very prolonged drought, you think it is possible to diminish the supply? Yes.
1226. What do you mean by a prolonged drought? I do not think a twelve months drought would affect the water supply unless the number of bores was very largely increased.
1227. Is not twelve months absolute drought almost unprecedented? Yes.
1228. In this colony in 1839, 1840, and 1841, there was what was known as the three years drought when the waters of the Macquarie and other rivers dried up;—would such a drought seriously affect the artesian water supply? I am inclined to think not, for this reason, that these recorded droughts really did not affect the high lands of the intake beds to the same extent as they did the western plains.
1229. When you speak of a drought, you mean a drought over the whole of the intake portion of the colony? Yes, which I can scarcely conceive possible.
1230. So that the question of a drought may be put aside? Yes. On that point I may be allowed to read the following remarks by Mr. Jack, in his paper.

We have shown that an intake at sufficient altitude to account for the flow of water in the artesian bores of the west exists along the eastern margin of the Lower Cretaceous, and having found a simple explanation in agreement with known physical laws, I go no further in search of another. I have argued that the loss of water by the Darling River, and probably a similar loss of water by the western Queensland rivers, proves that the water-bearing strata must lead into the sea, and hence, that unless the strata be periodically replenished, the sea-level would ultimately become the level to which the water would rise. A drought sufficiently long to bring about this result, would, no doubt, have for a prior result the destruction of the greater part of the land fauna of this part of Australia including the *genus homo*. Far short of this, however, we can conceive of the temporary diminution, or cessation, of the flow of some at least of our artesian wells. The amount of water contributed to the water-bearing strata of the Lower Cretaceous formation every wet season, by such rivers as the Darling, is so great, and consequently the amount of leakage into the sea is so great that the quantity abstracted by the artesian wells, large as it is, and even if it were ten times greater, is insignificant by comparison. Finally as the leakage into the sea is so vast and is entirely beyond human control; the drought on our underground supply made by artesian wells is not worth controlling. I make no apology for the fact that my views on this important question are not those which I held twelve months ago.

When he made those remarks his idea as to the area of the intake beds was very much smaller than mine is now.

1231. Is it usual that sandstone formation should contain artesian water? Yes; all the water we get in the artesian basin is in the sandstone. The water-bearing rock itself is of sandstone.

1232. As all the eastern portion of New South Wales is composed of sandstone, is there any likelihood of water being found further east than we have it? No. The Triassic artesian basin is bounded on the east by Palæozoic rocks (carboniferous formation) which occupy a large area. The Triassic rocks, however, form a considerable basin on the Clarence and Richmond Rivers, and this would probably be found to be artesian water-bearing.
1233. What is the formation you have mentioned? Carboniferous or Gympie claystones.
1234. Still is it not of a sedimentary character like the sandstone here? Yes; but it is lying under different conditions. In the first place, it is not porous; in the second place, instead of lying in a basin, it is lying upon end.
1235. Have you had much experience of the artesian water obtained from our bores? I have been around a great many of them.
1236. Is it considered good? Yes; for domestic and irrigation purposes, and it is also used for wool-washing.
1237. Do you think that if we tapped the artesian water so as to allow us to irrigate a large area of the colony it would seriously affect the supply? That is a question about which I could not give a definite opinion. I think a very large amount of irrigation could be done with artesian water.
1238. Do you think it is suitable for irrigation? Yes.
1239. Do you think there is any fear of exhausting the supply of artesian water? It stands to reason that if you covered the colony with bores at a distance 10 feet apart you would exhaust it. It would all depend upon the number of bores.
1240. Would it be safe to irrigate 2,000,000 acres? I should certainly be inclined to think that it would be safe, but I have not considered the question in detail.
1241. Do you think we could safely use sufficient artesian water to irrigate 1,000,000 acres in the western country? Yes.
1242. *Mr. Trickett.*] The scope of our inquiry is rather in the direction of irrigation by means of the River Darling than by artesian water;—would you be prepared to give an opinion as to which you think would be the more preferable mode to adopt? It has never come within my province to consider the question. Although I think the capabilities of artesian irrigation are very large indeed, if any one had asked me without notice which I thought was the most advisable, I should be inclined to think that irrigation from the River Darling would be better, because that would combine other very great advantages, such as providing a waterway.
1243. Do you think river irrigation would be preferable? If one had to leave out other considerations, I am not so sure of that. I can quite understand, for instance, that there might be difficulties in elevating the water from the river in a considerable number of cases, whereas the same objection would not apply to the artesian bores. On the other hand, it might not be possible to get artesian wells in many places where it might be desirable to have irrigation. For instance, on the southern side of Bourke, between Bourke and Menindie.
1244. Do you agree with what we have generally heard, that very little of the rainfall in that district passes down the River Darling? Undoubtedly.
1245. What becomes of the rainfall? I think a large proportion of it sinks into the Cretaceous rocks.
1246. Does it remain there or disappear? It disappears.
1247. How does it disappear—downwards or by evaporation? I think the greater portion of it disappears downwards. It is absorbed by the Cretaceous sandstone.
1248. As far as you are able to express an opinion, do you not think there is practically an inexhaustible supply of artesian water in the district proposed to be dealt with by this scheme from Bourke to Brewarrina? Not on the southern side of the river; on the northern side I think there would be.
1249. Why is the supply not so good on the southern side? The Palæozoic rocks crop out, and the Cretaceous beds do not exist. At Brewarrina the Palæozoic rocks crop out on the southern side.
1250. Is this kind of country sufficiently sloping to give a good supply if the water is abundant? I think it could be managed in the majority of instances. We might occasionally get some areas that would not have a sufficient fall, and trouble might result in some cases from alkali, but not in the majority of cases.
1251. To what extent would this country be improved for pastoral purposes by means of irrigation? I can only say that where I have seen it tried the improvement has been very marked.
1252. Would that be for agricultural purposes? Or for grazing purposes.
1253. Where have you seen the result? At several places on a small scale near Narrabri. There is the Tibbereena Station, within 2 miles of Narrabri. It is done by pumping river water, and it is private enterprise. It is on a comparatively small area of about 100 acres. It was used for growing lucerne.
1254. Is it practicable in this flat country to irrigate thousands of acres for the purpose of improving the whole of the country for pasturage by means of artesian water? I should think so.
1255. Is that country suitable for the formation of canals and drains for the purpose of irrigation;—is the soil sufficiently impermeable to carry the water? Some tracts of country on the western plains are very different from others. Where you have sandy soils undoubtedly the water would soak away, but the sandy tracts alternate with marls or clays which would retain the water.
1256. Supposing the water was kept running for some considerable time, would there not be a skin formed on the soil which would prevent the water from soaking away? That is very probable. It would depend largely upon the solid contents of the water.
1257. Is there a large tract of country there well suited for irrigation? I think so, on the northern side of the river.
1258. Is not the growth of trees in particular localities indicative of a large amount of water underneath? I do not know of any rule to that effect. I have often heard people in the country make statements like that, but it is not my experience.
1259. Do you think irrigation by means of the river, or artesian water, is preferable to making large dams and trying to store the water in those districts? I should think so, on account of the large amount of evaporation on the western plains.
1260. Would it be practicable to store the water? Not to any large extent.
1261. *Mr. Lee.*] Have you had occasion to investigate the intercolonial rights to the waterway of the Murray? No.
1262. Can you say what is now supposed to be the boundaries of the colonies? I have always heard that the southern side of the river was the boundary of this colony.
1263. Do not the Victorians claim a certain portion of the river-bed? I am not aware; but I am under the impression they have always said it ought to be so.

E. F.  
Pittman, Esq.,  
A.R.S.M.  
29 May, 1896.

- E. F. Pittman, Esq., A.R.S.M.,  
29 May, 1896.
1264. *Mr. Roberts.*] Are you familiar with the country between Brewarrina and Bourke? I have been down there. I have never been from Walgett to Brewarrina.
1265. Upon the occasion of your visit was the river navigable at Brewarrina? Yes, from Bourke.
1266. Was the subject of locking the Darling brought before you in any way? No.
1267. When there, did you have occasion to consider whether it would be a wise step? I could not help forming that idea myself, seeing the difficulties of transport in the north-western country between Menindie and Brewarrina. It struck me that it would be a great advantage to the settlers to have a navigable highway between Bourke and Brewarrina.

John Charles Henderson Mingaye, Esq., Analyst and Assayer, Department of Mines, sworn, and examined:—

- J. C. H. Mingaye, Esq.,  
29 May, 1896.
1268. *Chairman.*] What office do you hold? Analyst and Assayer to the Department of Mines.
1269. Have you made analyses of the water obtained on the western plains from artesian bores? Yes.
1270. Are you aware of its qualities as compared with the quality of water of a similar character used in other countries? Yes.
1271. Is it likely eventually that the use of such water from ordinary artesian wells in the west will be injurious to the soil and destructive to plant life, and can you also give us information as to the experience in America in regard to similar water? The bore waters vary considerably with regard to the total solids. Some of them contain only about 35 grains of solid matter to the imperial gallon, while others contain 300 and 400 grains to the gallon. Waters containing from 30 to 60 grains per gallon can, without doubt, be used for irrigation purposes, providing they are carefully used. Where these waters are used the total solids must be taken into account, and also their composition. The chief constituent of many of the bore waters is carbonate of soda. That is not the best of constituents, but at the same time I do not think the quantity is sufficient by any means to condemn them for use. For domestic purposes water containing from 30 to 40 grains per gallon can be used. If any kind of water is swamped on to a place, and there is no chance of drainage, it is bound to act injuriously on vegetation. If care is used, and there is proper drainage, I see no reason why a number of these saline waters should not be used.
1272. *Mr. Black.*] Even if the water is drained off will it not, as a rule, leave a deposit behind? Not to any extent, if there is proper drainage, such as practised in America and in other places. There they have underground drainage, and they leach these salts formed by the evaporation of the water, then by flooding they are carried through and conveyed away by sub-drainage.
1273. Would it not be possible to filter this water? No; they are soluble salts, there being practically no matters held in suspension.
1274. *Chairman.*] Have you any information as to the suitability of this artesian water derived from analysis, and have you a knowledge of the effect of water on soil? I have before me about thirty analyses of different waters.
1275. How do they compare with water used for irrigation in other parts of the world? In some cases our artesian water contains a little more solid matter than the American water, while in other cases our waters contain much more solid matter. Some of the American waters, such as the Tulare Lakes, contain from 76 to 84 grains to the gallon of total solids.
1276. Do you regard all solids as injurious matter? No.
1277. State the grains of injurious matter? There is very little in the water I have mentioned—only 35·0 grains to the gallon. In the Tulare country there are from 20 grains to 60 grains per gallon of injurious matter.
1278. Have these been satisfactorily used for irrigation for a number of years? Yes. Unfortunately in the case of a number of these analyses the amount of injurious salts is not given. As far as American waters are concerned, a large number of them have been used for irrigation, and they have been a great success, although they contain these alkaline carbonates. By the use of chemicals you can neutralise the effects of those alkaline carbonates. Sulphate of lime or gypsum is used on the land proposed to be irrigated.
1279. *Mr. Black.*] How is it applied? On the surface of the ground and ploughed in.
1280. In the places mentioned, when they find the artesian water is injurious, are they able to deal with it? Yes; they have dealt with it in many cases, and got very good results. They have cultivated all kinds of fruit and cereals in some of the arid districts.
1281. How does the soil there compare with the soil in our western districts? Many of the soils in America are already alkaline before the water is applied. With regard to our soils, there is very little alkali in them, so far as they have been examined.
1282. Are you of opinion that our artesian waters do not carry sufficient deleterious matter to cause them to be regarded with apprehension? I would not say that it is not deleterious. It is not a good salt to have in the water. There is more in the New South Wales water than in the American water. But one great thing in favour of their use is, that the soils here are not already alkaline as is the case in America.
1283. Taking into consideration the quality of the water and the soil here, is there any serious risk in irrigation from artesian water being eventually unsuccessful consequent upon the poisoning of the earth? Waters containing from 30 grains to 60 grains of total solids can be used without any fear of their proving corrosive to plant life or to the soil, providing they are carefully used.
1284. What deleterious matter would there be in the water? Carbonate of soda. In the water from Kelly's Camp Bore there are 35·081 grains to the imperial gallon of sodium carbonate.
1285. Is one-half a fair proportion to put down as the deleterious matter in our water? No, it varies very much.
1286. *Chairman.*] May I put your evidence in this way;—in starting an irrigation settlement which would be dependent on artesian water, should the soil be carefully chosen and the well be carefully tested, and should extreme care be taken in dealing with the area. That being done, can we obtain soil and water to enable the settlement to be carried out permanently without any danger? I think so, without doubt. The water should be carefully used. Water containing from 30 grains to 60 grains of solid matter to the gallon can be used without fear. There must be a proper system of drainage, and the soil must be properly tilled.
1287. By a proper system of drainage do you mean a proper system of tilth? Yes, and sub-drainage also.
- 1288-9. *Mr. Clarke.*] Is artesian water considered good for irrigation purposes in all parts of the colony? I should not think so. 1290.

1290. In the event of artesian water being used for irrigation continually, would it be injurious? Not if it is carefully used. It would not be dangerous if the water only contained from 30 to 60 grains of solid matter to the gallon.

J. C. H.  
Mingaye, Esq.  
29 May, 1896.

1291. Is the water obtained from artesian bores as good for irrigation as ordinary river water? No.

1292. *Mr. Lee.*] Have you had occasion to analyse the water from the Darling River? No.

1293. Do you know whether it is suitable for irrigation? I have no doubt in my own mind that it is suitable, but I have never tested it.

1294. *Chairman.*] Will you furnish the Committee with the following information—(1) Analyses of the artesian waters of New South Wales, with regard to solids and deleterious matter, and a comparison of these with American artesian waters used for irrigation. (2) A list of the bores from which the water has been analysed, and a statement as to which would be unsuitable for irrigation purposes. (3) A statement with regard to the method necessary to adopt to prevent the saline matter eventually affecting the soil? Yes, I will furnish the information as soon as possible.

James William Boulton, Esq., Superintendent of Public Watering Places and Artesian Water Supply, Department of Mines, sworn, and further examined:—

1295. *Chairman.*] You have some information with regard to the cost of irrigation at Mildura? Yes, I have a letter, as follows.—

J. W.  
Boulton,  
Esq.  
29 May, 1896.

Dear Sir,

Victoria, Mildura, 30th October, 1895.

In reply to your favour of the 15th instant, we beg to say—there are about 10,000 acres being now cultivated. It is very difficult to give any average return as there are but five blocks in full bearing.

Average holding,—15½ acres; average cost per acre, £50. Area in cultivation, 10,000. Yield per acre, £25 to £40. Cost of production, which includes cultivation and water rates, £6 per acre per annum.

Planted area—Vines .....	About 3,000 acres.
Apricots .....	2,100 "
Peaches .....	1,500 "
Other deciduous fruit.....	1,000 "
Oranges.....	900 "
Lemons.....	1,000 "
Lucerne, &c. ....	500 "
Total .....	10,000 "

With regard to the yield per acre, apricots when in full bearing will produce from 6 to 8 tons per acre. Vines according to the pruning and class of fruit required, from 3 to 10 tons per acre.

(Signed) CHAFFEX BROS. (Limited).

James W. Boulton, Esq., Department of Mines and Agriculture, Sydney.

1296. *Mr. Black.*] Have you had an opportunity of observing the difference between crops produced on land naturally watered, and land which has been irrigated? I have seen the ordinary wheat and lucerne crops of the colony, and I have seen the lucerne and maize grown on irrigated land.

1297. Which do you think gives the greater return? I think the irrigated land does. But it must be remembered that where the soil is cultivated with the natural rainfall the climate is altogether different from what it is in the west. The soil where the artesian bores are gets quite hot, and it is really a hot bed where water is applied thus forcing growth.

1298. Do you think the reason for the difference is not so much the qualities of the soils as the fact that the sun has more growing power in the west? I think there is also something in the difference of soil. In the west it is virgin soil, whereas a great deal of the soil which is now cropped in other parts of the colony has been heavily cropped for years.

1299. Do you think that if the irrigated land is under crop for a number of years the crop would lessen? Yes; unless you added to the soil what has been taken out of it. It should also be borne in mind that in a great many of the artesian waters there is a fair percentage of potash salts, which are splendid fertilisers. Mr. Mingaye in a report which he made stated that the amount of potash salts contained in these waters was beneficial to plant life.

1300. Would not the difference between naturally-watered and artificially-watered crops be due to some extent to the fact that the supply of water on the irrigated land was regular? Yes; and at the time when the plant most required to be watered.

1301. Under these favourable circumstances, do you think that the increased return is sufficient to pay for the extra cost of irrigation? Yes, ten times over. According to the letter which I have just read, at Mildura they are getting a return of £35 to £40 an acre from dried apricots alone. They prepare them and export them. In South Australia I have heard that the return from the cultivation of olives runs up as high as £90 an acre.

1302. *Chairman.*] What is the rainfall at Mildura and at Bourke? I think the rainfall at Bourke is higher than at Mildura. I will supply accurate information on the subject.

1303. *Mr. Black.*] In the case of products grown at Bourke, do you think they could compete in the open market with products grown close at hand, when you add the cost of carriage and the cost of irrigation? You can get water carriage from Bourke to Adelaide for about 10s. a ton when the river is up. That would not be a very serious handicap.

1304. Unless you locked the river very much nearer to Adelaide than Bourke, you would not have the river always open? Not always; but there would be an alternative market at Sydney.

1305. If you had to pay 15s. a ton for the railway carriage in addition to the cost of water carriage, do you think that the product would sell in the Sydney market at a profit? I think there would be such an increased production as would enable you to compete with other parts of the colony, especially in the class of products I have spoken of, such as raisin grapes, currants, &c.

1306. Do you think the proportionate increase of crop would not only pay the cost of irrigation, but in addition pay the cost of water and railway carriage to market? I think so, in the case of these special products. Then there is a very fair local market.

1307. Do you think that the local market is capable of extension? Yes; because it will tap the whole of the south-western district of Queensland. There would be a market there for dried apricots, prunes, raisins, and other fruits, also for chaff and maize. A large stock of lucerne could also be grown.

1308. From your report on forty-six bores I find that the revenue per annum is £1,292 9s. 4d., and the expenditure including wages £2,083 18s. 6d., showing an annual loss of £791 9s. 2d., exclusive, I presume, of interest on the capital expended? Yes.

1309.

J. W.  
Boulton,  
Esq.  
29 May, 1896.

1309. Is that only a preliminary loss which will vanish? I think so. When the value of the works is understood, I think they will be a source of profit.

1310. How long have some of the bores been established? The longest about four years. The most recent in that report is Wanaaring. That was completed about a month ago. About seventeen bores are returning revenue; others are not yet finished—we have to erect the pumping appliances.

1311. Do some of the bores which show no revenue show a heavy expenditure? Yes; that is unavoidable.

1312. *Mr. Lee.*] What is the reason for pumping? They are not flowing wells. At one the water rises within 8 feet of the surface, at others within 2 feet of the surface.

1313. *Mr. Black.*] In some cases do you strike water that does not rise to the surface? Yes; we always strike a supply of water before we get on to the artesian water. There are sometimes five or six different supplies of water (some of them artesian) before the main supply is tapped.

1314. In some of these cases you may go down a depth at which you expected artesian water, and you find you have a supply which has not a sufficient flow to come to the surface? Yes; in some of these bores we have gone far deeper than we needed to go. We did so for the purpose of ascertaining the geological formation. We went down 2,000 feet in the Pack Saddle Bore. I believe the supply of water in that bore was struck somewhere about 1,200 feet.

1315. If you had not gone so far down for the purposes of exploration would the water have risen to the surface? No.

1316. Can you make a calculation on the surface, as to whether you may expect to strike water which, at its source, is at such an altitude as to have sufficient power to rise to the surface? Yes, but all your calculations may be upset. You may get on to submerged peak of Palaeozoic rock, with a stratification at a high angle and intruding through the floor of the Cretaceous bed. That peak may be higher than the horizon of the water. We should then have to sink to the right or left to obtain a flow.

1317. How is the land held in the vicinity of most of these bores? It is mostly under pastoral lease.

1318. May not that account very largely for the fact that so little use is made of the bores? Yes.

1319. Would it not be more advisable that this heavy expenditure should be incurred in districts used for agricultural purposes, or on Crown lands available for settlement? Yes, there is no doubt about that. There is an immense area of land now being thrown open in the central division, all of which will become available for homestead settlement. My own impression is, that, if we were to start a series of bores to water a number of selections, the Department of Lands would be able to derive a far greater rental than they will under other circumstances. Water is the most expensive improvement on these properties.

1320. Seeing what little use has been made by pastoralists so far for the purposes of agriculture of the water obtained from artesian bores, do you think that they are likely to make much use of the water which would have to be pumped from the Darling? On most of the stations where they have artesian bores of their own, they have done something in the way of irrigation. On Belalie Station, there is a considerable area under irrigation, also at Weilmoringle Station and several others.

1321. But is not the number very small compared with the total number of stations? Yes.

1322. How do you account for the big neglect of the bores which are provided by the Government? I think the stations have only put in sufficient crops to meet their own requirements. They have not given the matter consideration in a broader way.

1323. Do you know anything of the chemical action of water which contains a heavy proportion of deleterious solids. Does it rot out the roots of vegetation? Where the soda is present in large quantities it acts in the same way as caustic—it would destroy plant life. The great thing is to avoid the direct application of any of these highly alkaline waters to the plants. That is where the system of thorough irrigation comes in.

1324. Therefore, the American system of irrigation from beneath would be preferable almost always in connection with artesian water? Yes; they do not altogether use it under that system. They also use the flooding system. The flooding system is used mostly in lucerne paddocks. Lucerne absorbs a large quantity of this soda or alkali. Sugar-beets and turnips will absorb nearly all the soda that the water contains. Aëration of the water is absolutely necessary. If you apply the water direct from the bore, it does not do half as much good as when it has been exposed to the air.

1325. How do they propose to aërate it? Simply by spraying it. Free oxygen is totally absent from the water when it first comes up.

1326. The water from the Darling would not be deleterious? No; there would be no harm unless the soil was heavily charged with alkali. You would, however, have to provide some system of sub-drainage, because if the water did not get away the salts would come to the surface.

1327. *Mr. Humphrey.*] In the return which you have furnished of the revenue and expenditure in connection with the bores, I find there is one bore at Bourke the depth of which is 1,457 feet; it cost £2,270, and you have against it the word "failure";—can you give any explanation in connection with that? The bore was a very difficult one to put down. There was a great deal of casing used. It was one of the earliest bores sunk. It was through beds of drift and hard rock—600 feet of the latter. The contractor had to put down four or five holes before he finally succeeded in getting through the drift, or whatever it was that blocked him.

1328. What was the reason for discontinuing the bore? Professor David reported on it, and said it was hopeless to go on. We were drilling in Palaeozoic rock.

1329. Is not that within the area which you say should contain artesian water? Yes; it is at the Bourke trucking-yards to the south of the river. We have another bore about 16 miles from that one, in which Mr. Pittman found deposits of the Upper Cretaceous rock, and he thought it was a likely place, and we are going on with it at the present time.

1330. How far is the nearest successful bore to this abandoned one? Seven or eight miles. The Pera Bore, the Walkden Bore, and the Gidgea Camp Bore are all about the same distance; they are on each of the three roads leading out of Bourke to the north and west.

1331. The failure of this particular bore may be attributable to some local cause? Yes; it is quite evident from Professor David's report that the bore at the trucking yards was located on a submerged ridge of Palaeozoic rocks.

1332. There is a bore at Clifton with a flow of 2,000,000 gallons; it was put down at considerable cost; why have you no caretaker there? The man at the next bore—Osaka—is looking after both. They are about 30 miles apart, and they are in the extreme north-west of New South Wales. The traffic there cannot be much until we have the whole road completed and watered. It is an exceedingly dry track.

1333. How far distant is it from the nearest railway station? Over 200 miles.
1334. So that it would not be possible to profitably carry on any agricultural pursuits there? No.
1335. Is any use being made of the water at present? No.
1336. Why is there no return from this bore? There is no settlement near it.
1337. Why was the bore placed there? To open up the road. It was put down primarily in the interests of travelling stock.
1338. Was it a site selected by the Department for any special reason? No; except that it was convenient for travelling stock.
1339. Do travelling stock make any use of it? They will not until we complete the watering of the road. There are two other bores to complete. It is one of the most arid portions of New South Wales.
1340. At Coonamble there is a flow of nearly 2,000,000 gallons per day; what use is being made of that water? The townspeople are using a portion of it; they pay half the cost of the bore. It is our intention, in connection with the Department of Lands, to supply water to a very considerable area of land there.
1341. Is any use being made of it at present for agricultural purposes? No.
1342. How long has that been completed? About a year.
1343. Has anyone applied for land in proximity to the bore with the object of using the water? No; we have had to wait until the Department of Public Works completed their work for the supply of the town, until we knew what water was available for use for irrigation.
1344. Has the artesian water available for some time past being used to any extent for agricultural purposes? No; but it will be.
1345. Can you give a general reason for the apparent neglect of this great aid to agriculture? We have not been in a position to deal with it properly.
1346. If anyone wanted this water would you not supply it? We should if the people applied for it. But I fancy the people there understood the reason was that we were waiting on the Department of Public Works for the completion of their work.
1347. You have 50,000,000 gallons of available water which can be supplied by gravitation, yet little or no use appears to have been made of it. Can you give any explanation? I do not believe the people realise what they have in their midst. They do not know what an enormous asset they possess.
1348. You have apparently a daily supply of 50,000,000 gallons almost unused. If you had 100,000,000 gallons would the condition be changed? Not at present.
1349. Can you give any other reason except that the people do not realise the benefit? No; you cannot impress a pastoral population with the benefits of agriculture.
1350. Do you think the only way to utilise this artesian supply is to bring a railway into proximity with it? Yes, there is no question about that; and also by educating the people as we are trying to do in a small way by establishing little farms and showing what can be grown. In a few years' time we shall do better.
1351. Are some of the bores now not far distant from existing railways? Yes; the Pera bore is within 7 miles of Bourke.
1352. That is not used? That is where we have a small settlement.
1353. *Mr. Clarke.*] Is all this immense quantity of water allowed to flow away? No; it is shut down, if not required.
1354. *Chairman.*] We wish you to supply the Committee with information in the following shape: Mildura land is valued at £50 an acre, that is a rental of £2 10s. per acre, the annual charges are £6 per acre, making a total yearly cost of £8 10s. per acre. I want you to supply us with a statement of the bores which have been put down in this colony, the efforts you have made to lease the land, the conditions and terms, and the success that has attended your efforts. Also state whether there is a reasonable probability of your being able to find people to go on the land near any of these bores. We want you to take any of the districts in America, such as Riverside, Dakota, Los Angeles, or any of these places, and give us a brief statement with regard to the water, soil, cost of production, the value of the land, and the products. Write a paragraph also with reference to the procedure you intend to adopt with regard to establishing settlement at any bore, say near Bourke, the cost of distributing water, what the product is to be, and how it is possible with a sparse population, not sufficient to justify the establishment of works for the drying of fruit, for the people to get rid of their products. Also draw out a statement showing that you offer people the same kind of land, and the same opportunities with regard to water supply, charging only the cost of the water, plus 5s. a year rent, while at Mildura people have to pay £8 10s. an acre per annum.

TUESDAY, 2 JUNE, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.  
The Hon. CHARLES JAMES ROBERTS, C.M.G.  
The Hon. WILLIAM JOSEPH TRICKETT.  
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
JOHN LIONEL FEGAN, Esq.  
THOMAS HENRY HASSALL, Esq.  
GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of Locks and Weirs on the River Darling.

Frederick Bickell Guthrie, Esq., F.C.S., Chemist, Agriculture and Forestry Branch, Department of Mines and Agriculture, sworn, and examined:—

1355. *Chairman.*] Have you an analysis of the soils of the western districts of this colony? I have two or three analyses of soils from the neighbourhood of several of the artesian bores in that district.

1356. Have you compared those soils with the American soil where artesian water is used? I can make a general comparison, although I have brought no data with me.

1357. Can you speak as to the danger of applying to these soils water in which there is a large quantity of carbonate of soda? Yes, I can speak generally upon that point. I have here some notes referring to soil

F. B.  
Guthrie, Esq.

2 June, 1896.

soil obtained in the neighbourhood of the Native Dog Bore. The full analysis of that soil is published in the *Agricultural Gazette*, part IV. The samples were sent to me in order that it might be ascertained whether the soil was good for agricultural purposes, and, more especially, whether it contained much alkali. Sample No. 4 was a mixture of soil with a deposit of sodium carbonate from artesian water equal to 6 per cent. of the entire mixture. The presence of sodium carbonate in the soil to this extent is undoubtedly harmful; in fact, in clay soils one-tenth per cent. of this salt has been found to render the ground untillable. In a sandy soil, however, such as the one under consideration, this objectionable quality is less marked, and there is no doubt that, within certain limits, the presence of a small proportion of alkali is distinctly beneficial. This is chiefly due to the fact that the soil is directly enriched, owing to the property possessed by sodium carbonate of disintegrating the soil, and thus increasing the supply of soluble plant-food, while the process of nitrification is greatly favoured by alkalinity. Against these advantages which it possesses when present in small quantities must be set off the damage done by it when present in excess. It dissolves the humus substances—among the most important of the soil ingredients—and it is quite possible that the whole of the humus may be dissolved and washed away through the soil. It attacks the roots of the plants, corroding and dissolving the bark, and ultimately the wood. It renders tillage operations difficult, and often impossible. Carbonate of soda, when mixed with clay, forms an exceedingly tenacious mass, and the effect of continuous ploughing is to leave the land in hard lumps. Professor Hilgard, of the Californian University, has devoted many years to the study of this question, and we are indebted to him for most of the information obtainable upon this subject. The remedies recommended by Professor Hilgard are—(1) tillage to prevent too rapid evaporation; (2) drainage to wash out and remove the salts; (3) chemical correctives. I made a further examination of a mixture of seven cultivated soils, also from the neighbourhood of the Native Dog Bore. These soils had been irrigated for the previous eighteen months with the bore water, and had borne crops of different natures. The soils were of a sandy nature, mechanically good, and chemically fair. Two of the seven had a slight alkaline reaction, the remaining five being neutral. This justified the inference that the sandy nature of the soil, combined with the method of irrigation adopted, had prevented the accumulation of alkali at the surface. Of five analyses of the soil from the neighbourhood of the Pera Bore, three were very slightly alkaline, and the others were neutral, or slightly acid. They are all good soils, well supplied with plant-food, in excellent mechanical condition, and all but one practically free from alkali. Three of them are particularly good grape soils. Apricots should do well on most of them, though pears and figs, which are less susceptible to alkali, would probably be found the most suitable fruit crops. Cereals would be less desirable than deeply-rooted crops, and such crops are specially desirable which present a large area of leaf surface to check evaporation. Having regard to the fact that it is intended to irrigate these soils with water from the Pera Bore, the nature of this water and the nature of the subsoil must be taken into account. For an analysis of the water I am indebted to Mr. Mingaye. It contains 45 grains of solid matter per gallon, of which 33 grains consist of carbonate of soda. An examination of the subsoil shows it to be remarkably free from alkali, the alkalinity, calculated as carbonate of soda, being only about 0·1 per cent. This freedom of the subsoil from alkali is a particularly encouraging sign, since it is only reasonable to suppose that the effects would be first noticeable in the lower portions of the soil. It indicates also that, provided accumulation of alkali at the surface is prevented, there is no danger of the subsoil becoming unduly charged. In other words, the alkali is readily leached out beyond the reach of the roots. There is, therefore, in my opinion, no danger to be apprehended from the presence of sodium carbonate in the soil, as long as there is free circulation of water, and undue surface evaporation is checked. The analysis of a sample of soil from the neighbourhood of the artesian bore at Moree shows that soil to be quite neutral. Chemically it is fairly rich, and particularly rich in lime and potash—its chief defect being its great stiffness. That soil is an uncommonly stiff clay, and will require special treatment to overcome its stiffness.

1358. Is the water from the Moree Bore good? I believe so.

1359. Have you received an analysis of that water from Mr. Mingaye? I have no such analysis at hand. The water from the Pera Bore is more strongly charged with alkali than any other which has been used for irrigation in that district. I also reported upon six samples of soil from the Wentworth irrigation area, at the confluence of the Darling and the Murray. That soil is sandy and fairly supplied with plant-food, and is admirably adapted for irrigation. The percentage of potash is particularly high, and, in regard to capacity for water, capillarity, &c., the soil is good, and may be expected to be fertile. Under irrigation it should yield good results with any of the crops suitable for irrigation culture.

1360. *Mr. Black.*] Have you any knowledge of the country lying between Bourke and Brewarrina, and in proximity to the Darling? No; I have not been there.

1361. Have samples of the soil in that locality been sent to you? I have examined soil from the neighbourhood of the Pera Bore, which I think is the nearest place. To a great extent, the soils from the neighbourhood of the Pera Bore and of the Moree Bore are similar.

1362. Is the character of the soil as evinced by your analysis of the samples from the Pera Bore suitable for irrigation by artesian water? It may not be suitable for irrigation by all artesian waters.

1363. I mean by artesian water similar to that obtained from the Pera Bore? Provided that the drainage is good, that suitable crops are grown—that is, especially crops which prevent too much evaporation, and the soil is kept in good tilth, I believe that any of the sandy soils will stand the most alkaline of our artesian waters for almost any length of time.

1364. Would the application of gypsum neutralise the bad effects of alkaline deposits? I think that the application of gypsum would be merely temporary in its results, and I believe that the experiments of Professor Hilgard, in America, and of others in India, show that there is no cure but drainage, coupled with irrigation. If the soil has become alkaline, the cure is to irrigate with as good water as is obtainable, and to thoroughly drain. The use of gypsum is recommended, but it is not intended as a complete cure. Good drainage reverses the order of things, which brings about the accumulation of alkali.

1365. With drainage such as you speak of, I presume that the water running off carries with it the alkali, and therefore, the soil is only charged with the amount of alkali contained in the water it absorbs? The alkali is not liberated until the water reaches the surface, and a soil that is bad with alkali, having a white incrustation upon the surface, may, lower down, show no alkali at all.

1366. Then there is no deposit from filtration? No.

F. B.  
Guthrie, Esq.,  
F.C.S.

2 June, 1896.

1367. The deposit is caused only by evaporation? Yes; when the solution reaches the surface the water evaporates, and leaves the salt behind.
1368. Even with good drainage there will be a slight amount of alkali deposited? I suppose that even with the best drainage you will not be able to avoid evaporation.
1369. Would it be possible to construct some appliance which could be used at intervals to remove the alkaline deposit from the surface of the soil? That has been done in India, and also in California, where the deposits are very bad.
1370. I suppose the soil at the Pera Bore would give much better results if irrigated by river water than if irrigated by water from the bore? It certainly would not require so much attention if irrigated by river water, and I should say would probably give better results.
1371. There would be no danger of the deterioration of the soil through deleterious substances being left in it by the river water? No.
1372. But may not the river water take up alkali from the soils with which it comes into contact, and so have a deleterious effect if used for irrigation? I have no doubt that that would be a very likely thing to happen, but I doubt if such water would be charged to anything like the same extent as the bore water is.
1373. Are there any instances of large rivers whose waters are strongly alkaline? I have never heard of any. I do not think a large body of water like a river, however slowly it might flow, would be likely to contain relatively much alkali.
1374. And a river having run in practically the same channel for centuries, would be likely to have washed from its bed and from its banks any alkaline deposit that may originally have been there? Yes. Besides the water in a river is continually being replenished by fresh water, whereas the artesian water is practically stationary, and the carbonate of soda is washed into it.
1375. *Mr. Lee.*] Under these conditions would not river water be more suitable for irrigation than bore water? Certainly.
1376. *Mr. Black.*] It is more suitable primarily, and after lengthy use would increase in suitability at a yearly ratio? Yes, I think so. I believe that in the long run river water would improve the land because it would deposit fertile salts upon it.
1377. The tendency of artesian water is to deposit deleterious instead of fertilising substances? Quite so. That tendency would always have to be combated.
1378. Where land was irrigated for pastoral purposes, drainage on an extended scale would not be likely to be carried out, owing to considerations of expense;—do you think that under those circumstances a lengthy use of artesian water would be likely to be successful? A good deal would depend upon the nature of the soil. If it were a loose sandy soil I do not think that much danger would arise. In sandy soils the water rises rapidly, but it never rises to such a height as it does in clay soil.
1379. Is the soil in the neighbourhood of the Pera Bore of a sandy character? The samples I obtained from the Pera Bore were nearly pure sand.
1380. Then, if the country between Bourke and Brewarrina is similar to that in the neighbourhood of the Pera Bore, it would be possible to irrigate it for grazing purposes with artesian water for a lengthy period without harm to the herbage? I should not like to answer that question, because I have no experience of the action of this water after a long period, though I should not anticipate that there would be any trouble. If the soil in the district to which you refer is of the same nature as the Pera soil, and the artesian water there not more highly charged with alkali than the Pera water, I should not anticipate any trouble, even after a long period of irrigation without drainage.
1381. Nevertheless, the river water would be preferable? I think so.
1382. *Mr. Clarke.*] Is the soil in the neighbourhood of the Pera Bore likely to be benefited by irrigation? I think so, distinctly.
1383. What crops could be grown upon that soil? Am I to take into account the nature of the water to be used for irrigation.
1384. If the soil in the neighbourhood of Pera Bore were irrigated, what crops would it be suited for? I think such things as ordinary vegetables, especially marrows, squashes, and large leaf crops of that kind. It is not wheat-growing country; but the soil would be good for deep-rooted crops. Lucerne would do very well, and grass ought to do well, while it would be excellently suited for many fruit-trees.
1385. Is the water derived from the artesian wells equal in quality to that which could be obtained from the Darling? It would be quite as good if it did not contain an excess of alkali. The Pera Bore water contains a large proportion of sodium carbonate, and one would have to be careful in its use on that account.
1386. *Mr. Hassall.*] Is the Pera Bore the nearest bore to the river? It appears to be so, judging from the map.
1387. Have you any analyses of the water from the Moongalla Bore? No.
1388. Have you any analyses of the river water? No.
1389. Then you have not compared the two? No.
1390. Are you aware that when the river is very low the water becomes brackish? That is a very common occurrence in the interior. I should not be surprised to hear it of the Darling.
1391. How would you account for it? I think it arises from the concentration of the water. When the river is not being supplied with fresh water what water is in it gradually evaporates and concentrates.
1392. Evaporation would have practically the same effect upon the river water that it has upon the bore water? After long evaporation you would get similar water from the river to that obtained from the bores. The water left in the river when it is very low is gradually becoming similar to bore water.
1393. You say that artesian water is as good for irrigation purposes as river water, provided there is no excess of alkali;—what is an excess of alkali? I should be inclined to say that about 30 grains to the gallon would be called an excess. That quantity would, in the long run, become injurious if it were allowed to remain in the soil. Even a smaller quantity would become injurious if not drained away.
1394. But you think that with a perfect system of drainage there would be no difficulty in irrigating successfully with bore water? I do not think that there is any reason to anticipate any difficulty.
1395. Even if you irrigated with river water, it would be necessary to drain the land? I think so. I think that even the best water would, after a time, become injurious if there were no drainage.
1396. Whatever water you use you would obtain better results by having your land perfectly drained? I think so.

F. B.  
Guthrie, Esq.,  
F.C.S.  
June, 1896.

1397. Therefore, if you intended to irrigate, no matter where you proposed to obtain your supply of water, it would be necessary first to properly trench and drain the land? It would be preferable.

1398. *Mr. Roberts.*] Have you compared the soil of our western district with the soils of irrigated countries in other parts of the world? Yes. I have not got the data with me; but I have compared them generally for my own edification.

1399. Can you give the Committee any information upon the subject? I have compared our soils with Californian soils which suffer from alkali, and our soils compare very favourably. We have no alkaline soils such as they have in America and in India, where there are large tracts upon which alkali has accumulated.

1400. Do you see any reason why irrigation should not be as successfully carried on in this country as in America and in India with artesian water? No; the conditions are more favourable here, because we have a clean soil to deal with, whereas in America and India they often have alkaline soils.

1401. We are told that if the scheme before us is carried out the land within 3 miles of the river can be irrigated with the river water;—would much more satisfactory results be obtained by using the river water than by irrigating the water from the artesian wells? There would be no danger of harm arising from the use of the river water.

1402. What harm would arise from using water from the bores? There would be a danger of alkaline deposit, against which you would have to take special precaution. If you used river water you would probably have to take no special care with regard to drainage or with regard to the crops you wished to grow, whereas with alkaline water you would have to be very careful in both directions.

1403. *Mr. Wright.*] What would be the effect of irrigating land for ten years to a depth of 20 inches with water containing 10 grains of alkaline matter? With a sandy soil and good drainage, and assuming you grow such crops as would prevent surface evaporation, I do not think there should be any injurious effect.

1404. What kind of drainage do you think would be necessary? Subsoil drainage.

1405. You would want to trench the land and put drainage pipes into it? Yes.

1406. That would be a very expensive process? It would.

1407. And make it impossible to grow anything but high-priced crops? Except for small areas.

1408. Do you think that, without subsoil drainage, the ground would be destroyed in ten years by the accumulation of alkali? I think there would be a danger of such a thing happening, though I cannot speak definitely, because I have had no experience.

1409. But I presume that if a similar quantity of river water were used, the land would be fertilised? Yes, river water would be preferable.

1410. Have you ever analysed any soil where the boree or myall grow? I am not sure.

1411. What is the analysis of the soil from the Moree Bore? The subsoil there is slightly alkaline and very rich in lime. The Gidgea acacia grows in that district. The ash of that tree is nearly pure carbonate of lime—that is, chalk.

1412. I suppose you have no knowledge of irrigation? No practical knowledge at all.

1413. I gather from what you have said that the soil near the Pera Bore will only be suitable for certain kinds of crops? Yes; it would not grow cereals well.

1414. And, unless perfectly drained, it would in two years become so charged with alkali as to be useless? There would be a danger of its becoming charged with alkali, but it would probably take longer than two years before it became injurious.

1415. *Chairman.*] How long has the oldest of your irrigated areas been in existence? I will supply that information.\*

1416. Are you aware if the application of mineralised water has any bad effect upon our soil? No.

1417. *Mr. Trickett.*] If this artesian water were stored up in large reservoirs, to be afterwards used for the purposes of irrigation, would it become less or more objectionable? I do not think that the storing of it would have an effect upon it, but if gypsum, that is, sulphate of lime, were put into the reservoirs the water would be purified.

1418. Has that plan been adopted in other countries? Yes; it has been largely adopted.

1419. Is it a practicable thing to do on a large scale? I do not know whether it would be practicable to store the water in tanks or reservoirs, but it would be quite practicable to place boxes filled with powdered gypsum in the channels in which irrigated water was flowing.

1420. Is that done? Yes.

1421. If this artesian water were stored in very large quantities, would it not be a very expensive process to purify it? I do not think it would be practicable to purify it by storing it, but if you were obliged to conserve it in that way there would be very little additional cost in purifying it with gypsum, because in some of these places gypsum is pretty abundant.

1422. *Chairman.*] What would you regard as bad water for irrigation purposes? Water containing about 30 grains of alkaline matter to the gallon.

1423. There would be danger in using water containing more than that amount of alkali? Well, say 35 grains to the gallon.

1424. What would you regard as suitable water? Water containing anything below 20 grains to the gallon.

1425. How much alkaline matter does the Pera water contain? Thirty-three grains to the gallon, I think, though I believe that that water has been used for some time with good results. At the same time, I think it is quite on the margin. I do not think that water which was much more alkaline could be safely used.

1426. If water having 35 grains of alkaline matter to the gallon is harmful, it would surely be better to start irrigating from a supply much less alkaline? Certainly.

1427. If you had to deal with the matter you would choose the best soil and the water which contained the least number of grains of alkali to the gallon? Undoubtedly.

1428. Under proper control it is possible to make irrigation with artesian water successful? I think so, certainly.

\* NOTE (on revision) :—The Native Dog was the first to be used for irrigation about 1862. The length of time that has elapsed since then is hardly sufficient to bring about any great difference in the nature of the soil. That it has not done so is proved by the fact that the irrigated crops still thrive in this area.

Percy Scarr, Esq., Principal Assistant Engineer, Roads and Bridges Branch, Department of Public Works, sworn, and examined:—

1429. *Chairman.*] Have you brought a sketch showing the set of the traffic towards Brewarrina and Bourke? I have brought a tracing, showing in full red lines the roads mentioned in the accompanying statement. This statement gives a list of the roads converging at Bourke and Brewarrina. Those marked with an asterisk are mail routes. Five roads are in receipt of yearly subsidies, while the others are more or less improved and have the principal creeks and rivers bridged. [*Vide Appendix.*]

P. Scarr, Esq.  
2 June, 1896.

James Burt, Esq., Draftsman-in-Charge, Information Bureau, Department of Lands, sworn, and examined:—

1430. *Chairman.*] What maps have you brought to show the surveys which have been made between Bourke and Brewarrina? I hand in the county maps of Gunderbooka, Narran, Cowper and Clyde.

J. Burt, Esq.  
2 June, 1896.

1431. Do those maps embrace all the country between Bourke and Brewarrina? Yes; on both sides of the river.

1432. And they furnish the latest information? No; it would be necessary to chart them up to show all the recent alienations, but there has been very little alienation along the river. The land there is mostly held under lease.

1433. Then the maps are practically correct? Yes.

1434. Any alterations would be only matters of detail? Yes.

1435. Have you brought a survey of the Darling? Yes; from Brewarrina to Bourke. It is shown on the tracing I now hand in.

1436. When was that survey made? Part of it was made in 1860, and part in 1875.

1437. Does the course of the river so surveyed show any marked difference from its present course? We have had a comparison made between the original survey of the river and its position as shown by recent surveys of measurements along it, but so far as we can ascertain there is no evidence to show that there has been any alteration in the course of the river. It is possible that there may have been such an alteration, but we have no evidence to show it.

1438. The river is pretty much now as it was 30 years ago? Yes.

1439. *Mr. Lee.*] Do you know the map before the Committee, which shows the tenure of land within 3 miles of the river? That map is, I believe, a compilation from our maps, although I have no knowledge of it. It is on the same scale as the maps I have just handed in.

WEDNESDAY, 3 JUNE, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.  
The Hon. CHARLES JAMES ROBERTS, C.M.G.  
The Hon. WILLIAM JOSEPH TRICKETT.  
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
JOHN LIONEL FEGAN, Esq.  
THOMAS HENRY HASSALL, Esq.  
GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of Locks and Weirs on the River Darling.

Hugh Giffen McKinney, Esq., Chief Engineer, Water Conservation Branch, Department of Mines, sworn, and further examined:—

1440. *Chairman.*] Have you a further statement to make? Yes; I have prepared a statement in reply to various questions which were asked during my previous examination, though it is not quite as full as I should like it to be. With reference to Question 671, I find that a general duty or toll of a quarter per cent. on the declared value of goods carried is charged on all cargo passing along the waterways of the Russian Empire. On one of the principal canals in Belgium, a toll equal to about one-twelfth of a penny per ton per mile is charged. This is a canal on which the traffic is very heavy. There seems to be no fixed system on which tolls are levied. In a recent proposal for a direct canal from the Forth to the Clyde, in Scotland, the toll was assumed at the high rate of three farthings per ton per mile. I find that in Italy, as well as in France, no tolls are levied on any of the waterways. With regard to the construction and control of inland navigation works, the United Kingdom appears to be the only country in which the Government leaves such highways entirely to private enterprise. I could not lay my hand upon any definite information as to the tolls charged in England, because the inland waterways there are all in the hands of private companies. Some of them are in the hands of railway companies, which have an interest in making them unsuccessful. In the course of my examination by the Committee I have been asked many questions as to whether irrigation by pumping is remunerative; whether it would not be much preferable to irrigate by gravitation; whether crops produced by means of lifted water could compete with crops grown on land which did not require irrigation; and several other questions of a like nature. I wish to point out to the Committee that such questions cannot be satisfactorily answered in a general way. The difficulties in the way are similar to what would arise in answering the questions whether it pays to use bone-dust as a manure; whether crops raised by the aid of bone-dust can compete with crops raised on rich land which does not require manure, and so on. In regard to the question whether it is not preferable to irrigate by gravitation, it is necessary to bear in mind that, as a general rule, headworks of a more or less expensive character are required to divert water from a river. Then it generally happens that expensive cuttings have to be made before the water reaches such a level relatively to the adjacent land as will render flow irrigation possible. Unless, therefore, the water thus furnished be utilised on a scale commensurate with the outlay on headworks and deep cuttings the results are not satisfactory. In such cases, if water is obtainable by pumping at or near the land intended to be irrigated, it might prove much more satisfactory to pump the water than to bring it by gravitation. Another point in connection with this has to be borne in mind and that is, that when water is used in the immediate neighbourhood of the source of supply the loss by percolation and absorption is reduced to a minimum. Thus, when water is brought

H. G.  
McKinney,  
Esq.

H. G.  
McKinney,  
Esq.

3 June, 1896.

brought from a considerable distance, as is usually the case in gravitation works, the proportionate loss greatly exceeds that which occurs with an ordinary pumping scheme. I have also been asked the question whether I know of any country where irrigation by pumping is successfully practised. In reply to this, I find that, as a general rule, every country in which irrigation is resorted to can show instances of successful irrigation by pumping or lifting the water by appliances of some kind. In India such irrigation has been practised on an enormous scale, from time immemorial, and the case of Egypt is similar in this respect. In Italy and the United States pumping for irrigation has been successfully adopted on a considerable scale. In India the wells vary generally from 10 feet to 60 feet in depth. In the parts of the Punjab with which I was familiar the depths ranged generally from 25 to 45 feet in depth. The appliances used for pumping are of a very clumsy description, and notwithstanding the cheap labour by which they are worked, the cost of the water is very high judged by the standard at which water could be delivered by pumping from any of our western rivers. In Egypt similar primitive appliances are extensively used, but in recent years British and other capitalists have introduced a great number of pumping engines with which water is raised and sold to the cultivators. In the United States not only are steam pumps increasing in number and favour for irrigation purposes, but, in addition, windmills are being erected for this purpose in immense numbers. The area of lift irrigation in the Madras Presidency is about two millions of acres, in the North-West Provinces it is about 360,000 acres, and in the Central Provinces 120,000 acres. In the Cawnpore district, where irrigation is extensively practised, many of the wells used are 60 feet deep. I have with me a copy of the *Scientific American*, in which it is stated that 2,000 farmers in Texas are now raising water for irrigation purposes by means of windmills. In regard to irrigation from wells, I was asked to quote instances in which irrigation was successfully practised by pumping from depths of 35 feet or more. There are hundreds of thousands of acres in India irrigated in this way with very primitive appliances, which make the raising of the water very laborious and costly. Indian, Egyptian, and European instances may all, however, be objected to on the ground that conditions are different to those existing here. The best places to rely on for a reply to the inquiry are America and Australia. In regard to the former, I have been unable to find details of depths from which water is pumped in the numerous places in which irrigation by lift is practised in the Western States; but I have met with the statement in the irrigation papers that irrigation by pumping where the soil is suitable is practised for lifts varying up to 50 feet. I may be permitted to point out that the difficulty in replying to this inquiry is similar to what I should experience if I were asked whether I knew of any place where cultivation was successfully carried on with the aid of bone-dust or other manure, which was brought from a distance of over 10 miles. I might feel assured that there were numbers of such places, but I should have difficulty in obtaining details. Fortunately, in this colony we have several instances of pumping successfully from such depths. In the first place there is a considerable number of instances on the River Darling where water is pumped under much less advantageous circumstances than will exist when the locks and weirs are constructed. One of these irrigators published a letter in the *Sydney Morning Herald* of 27th of last month, in which he expresses himself as highly satisfied with his operations. In the course of a trip by steamer from Walgett to Wentworth, I saw a succession of patches of irrigation, and had an opportunity of going over the irrigated land at Boorooma, Winbar, and one or two other places.

1441. *Mr. Lee.*] Was the irrigation you saw between Walgett and Bourke or between Bourke and Wentworth? It was scattered all the way along the river. The first place at which I saw irrigation practised was above Walgett. At Narromine, on the Macquarie, Mr. W. O'Neill has for a number of years used a well over 50 feet deep for providing a supply of water for irrigation with most satisfactory results. On the Kameruka Estate, water was pumped to a height of 246 feet for irrigating lucerne, and in seasons when hay was expensive it was considered that irrigation paid under even such disadvantageous conditions. The question is simply one of the value of the produce as compared with the cost of water, and on this point some of the most experienced irrigators in Victoria have given the opinion that even for cereals it will pay to irrigate if the cost of the water amounts to £1 per acre of crop. In connection with this subject, I find that in reply to Question 701, I mentioned that on pastoral estates the only irrigation I have seen which was carried out on a considerable scale, and in a business-like manner, is that on the properties of Mr. Wills Allen and Mr. Gatenby. I wish to add that I have seen many instances of successful irrigation on pastoral estates, but they were more in the nature of successful experiments, being as a rule on a small scale. It is only right to add that I understand there are some instances of successful irrigation on a considerable scale which I have not seen. As regards instances of successful irrigation in Victoria, I have concluded that the best reply I can give is to refer the Committee to the report of the first irrigation conference held in Melbourne in 1890. I am aware that the area of irrigation has considerably extended in Victoria since then, but the report mentioned is the latest of its kind which I can obtain. With regard to the cost of pumping, I went carefully into the matter some years ago when inspecting irrigation which was entered in the competition for National prizes. The total lift at Mr. Wills Allen's irrigated farm at the time of my last visit was about 31 feet. For the purpose of comparison with charges from canals, I calculated the cost of supplying a flow of 1 cubic foot per second, and found that the annual cost of this quantity, after allowing for interest and cost of working the plant, was about £70. At Mr. Gatenby's property the total lift at the time of my inspection was 23 feet, and the cost of a flow of 1 cubic foot per second was about £50. In a paper published by Mr. George Gordon, member of the Institution of Civil Engineers, he gave a statement of results of experiments and calculations which he had made to determine the cost of pumping 1,000 cubic feet of water. The results arrived at were as follows:—For a 6 feet-lift, 0·19d. per 1,000 cubic feet; for a 24-feet lift, 0·32d.; for a 25-feet lift, 0·42d.; for a 39½-feet lift, 0·83d.; and for a 100-feet lift, 12½d. These figures are in substantial agreement with those I obtained. In the 39½-feet lift, Mr. Gordon's are equivalent to a cost of £109 per annum for a flow of 1 cubic foot per second, while my estimate of the average cost of this quantity for the 31-feet lift was £70 per annum. Mr. Gordon's result for a 24-feet lift is equivalent to an annual charge of £42 per annum, as compared to my estimate of £50 per annum for a 23-feet lift. Mr. Gordon's result for a 25-feet lift is £55 per annum for 1 cubic foot per second. I may add that in my estimates in the two cases referred to I concluded that the annual cost of a cubic foot per second in Mr. Wills Allen's case was likely to vary from £60 to £80, and in Mr. Gatenby's case from £45 to £70. Making ample allowance for defects in working, a flow of 1 cubic foot per second should irrigate 60 acres of lucerne, and produce on suitable land five or six fair crops in a year.

H. G.  
McKinney,  
Esq.

3 June, 1896.

1442. In your calculations you have allowed for interest upon the plant and working expenses, and have made an annual charge? Yes.

1443. Have you made a deduction for depreciation? Yes.

1444. *Chairman.*] From your experience of irrigation in this colony, what would be a fair amount to regard as the yearly water cost of irrigating such land as we have on the Darling? I think that £1 per acre per annum would be a fair allowance.

1445. *Mr. Wright.*] You proposed to charge a pumping license fee of 5s. per acre;—would the cost of obtaining water be £1 in addition to that for pumping and distribution? Yes; though in all probability the engines used for the pumping plant could also be used for sawing wood, running chaff-cutters, and for other purposes, and that might be reckoned in some measure as a set-off against the cost of irrigating.

1446. *Chairman.*] Will you tell us what is being done at Hay in the way of irrigation? At the present time things are at a standstill there. The Municipal Council of Hay was constituted an irrigation trust under the provisions of the Hay Irrigation Act. They obtained possession of about 12,000 acres of land, which had previously constituted the temporary common there, and they asked that I should report on the best way of irrigating it. I visited the irrigation area, as it was termed in the Act, and I recommended that the water should be pumped from a place just outside it. That place was better than any site within the irrigation area, and I was told that the trustees would have no difficulty in purchasing it. After they had purchased it, they asked that I should take the necessary levels for an irrigation scheme. I had those levels taken, and afterwards I had a plan prepared on which they were shown. I pointed out that that plan was so complete that the trust could easily have the best lines of channels marked out by following it, as contour lines were drawn all over the plan. They decided at last, however, that I should have the lines of channel marked out on the ground. I had that done, and all the information I had acquired was handed over to the trust. The trust then decided to take up the matter itself, and carry it out with funds that would be raised locally. The first step the trustees took was to change the pumping site. They adopted a place much nearer to Hay, and on much lower ground than the place which I had recommended, and they departed still more from my recommendation in buying a second-hand pumping plant, instead of a new one. The pumping plant which they bought was unsuitable. They also found that, having gone on to lower ground, it would be necessary to construct either a flume or an embankment. They decided to construct a flume, which, in order that it might be as cheap as possible, they made very light, and a high wind some time afterwards threw it over. Then for some purpose, which I could never quite understand, they made a reservoir, which is in an unfinished state now, and they want the Government to assist them in completing the scheme.

1447. What has been the expenditure up to date, and what will it cost to complete the work? The amount that appears to have been expended up to date is about £4,300, and I am engaged at the present time in preparing an estimate of the cost of completing the scheme, which will probably be £1,500, more or less. It is not the cost of the scheme that will be the greatest disadvantage; it is rather the unsuitable character of the pumping plant for the work which it has to perform.

1448. How high are they going to lift the water? Their lift has been increased by some feet, owing to the change which they made in regard to the pumping site, and it now averages about 27 or 28 feet. The maximum lift will be 34 or 35 feet.

1449. Will you give us a brief outline of what has been done at Wentworth? At Wentworth the conditions were very similar to what they were at Hay. The Wentworth Municipal Council was constituted an Irrigation Trust, and obtained possession of the temporary common there, the intention being to cut the land up into small areas for irrigation purposes. The Trust employed an engineer and a manager, but it was very unfortunate in several ways, and particularly because, owing to the financial crash, it was not able to carry out the idea of raising funds for the construction of the necessary works. After considerable delay the Trustees therefore decided that their best plan would be to petition the Government to dissolve the Trust. That has been done. The Government has taken over all the liabilities, and the assets of the trust, together with the powers conferred upon it by the Act, and has let contracts for the supply of pumping plant, and for the construction of a pumping well and engine-house, both of which are now in process of being carried out.

1450. *Mr. Hegan.*] Prior to this, were you consulting engineer to the trust? In a manner I was. The Government, under the provisions of the Wentworth Irrigation Act, had to approve of any scheme brought forward. The trustees brought forward a scheme which was much too expensive, and to which there were other objections, though the objection on the score of expense was sufficient to destroy it.

1451. How much did the trustees expend? They obtained an overdraft from the bank for preliminary expenditure, and the total amount which they expended, with interest, amounted to about £1,100.

1452. What was the amount of the overdraft? £1,000.

1453. Which the Government would have to pay? Yes. The people there showed themselves to be very public-spirited, and made themselves personally liable for the advance. They also intended, if things had not gone wrong in financial matters, to raise the capital necessary to carry out the work. The terms of the Act gave the Government power, if it considered it necessary or advisable, to dissolve the Trust, and in doing so they took over the 10,000 acres of land which belonged to the Trust.

1454. But which originally belonged to the Government? Yes. The Act also gives the Government power to pump from either the Darling or the Murray.

1455. Which the Government had before the land was handed over to the trust? No doubt they had the power, but it was not defined.

1456. Taking all things into consideration, this has been a bad bargain for the Government? It has been an unfortunate affair. The Government are only getting back what they gave.

1457. But they have £1,000 to pay in addition? Yes; the average lift at Wentworth will be 25 feet or a little over.

1458. *Chairman.*] You are going to pump from the Murray there? Yes.

1459. You will not go to Fletcher's Lake? Not at the present time. I think Fletcher's Lake was left outside the Trust.

1460. But it is on the common? I do not think it is. It was not included in the temporary common on that side. There are one or two other points to which I wish to refer. I was asked by Question 704 if it was not a fact that the Government of Victoria had spent over £5,000,000 on irrigation works, and I have received a statement which shows, I think, how that amount may have been arrived at. The sum of  
£4,545,000

- H. G. McKinney, Esq.  
3 June, 1896.
- £4,545,000 includes what has been spent upon schemes connected with country towns water supply, and also the cost of the great Coliban scheme at Bendigo. The amount of money spent by irrigation trusts was about £927,000.
1461. Under £1,000,000? Yes; but there was a great deal spent by town trusts and rural trusts, and mixed trusts.
1462. *Mr. Wright.*] For irrigation? No. In the case of the so-called Water Trusts the money was generally expended to provide water for stock and domestic purposes.
1463. But, if I am not wrongly informed, a number of small subsidiary schemes in Victoria were originally designed to supply water for stock, and also for irrigation purposes? The sum expended by the mixed trusts was about £386,500.
1464. Can you tell us what practical work has been done in the shape of irrigation by the expenditure of this money? I have no recent information upon the subject, although I know that a certain amount of irrigation has been done. In my former evidence I mentioned that a great deal too much money had been expended in Victoria upon works of this kind. I did not mean by that statement that the works had been extravagantly or wrongly constructed; but that they had been in advance of requirements.
1465. You contend that the money was spent injudiciously? Quite so.
1466. Can you get us information as to the effect of this expenditure in Victoria—as to what irrigation has been done, and whether that irrigation has been successful or the reverse? I have been able to get a good deal of information about the work of private irrigationists; but there seems to be no late information available as to what has been done by the Government. The great work on the Goulburn, where they have a weir which cost over £100,000, is not doing one-tenth of what it should do.
1467. *Chairman.*] Do you know how many acres of irrigation there are in Victoria? I have not been able to ascertain that. In the report of the Irrigation Conference of 1890, mention is made of the number of cases in which individual irrigationists have been very successful; but I have been quite unable to obtain any recent report. Another point upon which I was asked to obtain information was as to the extent to which water would be backed up in the tributaries of the Upper Darling, supposing that the proposed scheme were carried out. In the Bogan the backing up would be scarcely worth taking into account. In the Culgoa the water would be backed up about 2 miles. In the Bokharra the backing up would not be worth taking into account. In the Marra Creek the water would be backed up for about 2 miles, and in the Macquarie River it would be backed up for about 6 miles.
1468. What effect would the weir below Brewarrina have upon Cato Creek? Cato Creek will not be affected, neither will the Tarrion Creek.
1469. What effect would the construction of the proposed work have upon the billabongs along the river? As a rule very little, because in most cases the billabongs take out at a high level. There would be a certain amount of backing up in them; but that only means that so much more water would be stored, though the quantity stored would not be so large as to justify a special survey to determine it.
1470. How does the country to the north of that portion of the river under consideration—take for instance the part between the Culgoa and Bourke—slope? Towards the river.
1471. Are the banks higher than the surrounding country? The greater height of the banks is noticeable in places, but the fall-away at the back is not so great as it is on the Murrumbidgee and the Lachlan.
1472. Then, if water is lifted to the height you mention, it will not submerge land which is not now usually flooded? No; the weirs will not be sufficiently high to cause any inundation.
1473. You propose to construct seven weirs in order to allow for the rise of from 40 to 45 feet between Bourke and Brewarrina? Yes.
1474. If it were possible to have a fewer number of weirs there would be a saving in construction and in maintenance, and the quantity of water stored would be greater? Yes.
1475. I understand that you have not allowed for higher lifts because you object to placing immovable weirs in the Darling, and the shutter weir which you propose to use would not be suitable for a greater height than that allowed for in this scheme? I should not like to say that the shutter weir would not be suitable, but I did not like to venture beyond instances which I know of.
1476. You regard this form of construction as not likely to be easily manipulated if the weirs were made higher? I should not like to say even that. I know that the shutters would become heavy and difficult to work, but I am not aware that the use of them in higher weirs than I propose has been objected to in any way. I do not, however, care to go beyond precedents.
1477. Will you tell us why it is absolutely necessary to have a movable weir? I came to the conclusion that fixed weirs were objectionable after I had made a thorough inspection of the river in flood time, and after I had seen how easy it is to change its course. I then found the river to be changing its course in numbers of places, and in some cases the steamer went through the new channels which had been made.
1478. We were informed yesterday by the Department of Lands that, so far as they could judge from their plans, there had been no change;—I suppose you refer to changes in detail? If a flood were to take place now I could point out dozens of places where a change was proceeding rapidly. Of course the river does not go to a very great distance from its ordinary course, but the tendency of its flow is to cause loops, and in flood time the necks of land round which these loops wind are cut through.
1479. Although changes are continually going on, it is possible that surveys for alienation purposes would not be sufficiently close to enable the Department to take notice of them? Yes; I think that, as a rule, the surveys along the Darling have not been carried to any great detail. A great deal of the land has not been surveyed in small portions, so that it would be easy to overlook moderate changes in the river.
1480. Supposing you could get from Bourke to Brewarrina by having a lift of 10 or 12 feet at each weir, would that be likely to submerge the surrounding country? No.
1481. Your only objection to such a plan is on the ground of construction? Quite so.
1482. Are there no sites where permanent weirs could be safely constructed? I think there is no place where a permanent weir would not be more or less objectionable. The only place where I should propose to make a permanent weir is at Brewarrina. The design I intend to adopt there allows a permanent weir to be carried across at what is the mean level of the top of the rocks. At that place there are large boulders lying above the solid rock.
1483. *Mr. Lee.*] With reference to the extent to which ana branches and other depressions of the surface are likely to be filled if this scheme is constructed;—I suppose your estimate is based upon the assumption that there will be seven weirs? Quite so.
1484. Can you tell the Committee where these depressions are situated? I have noted their position; but I have not sufficient details to enable me to estimate the quantity of water which could be stored in  
any

any of them. I noted all the principal outflows and inflows, but to make a survey of them would be a very laborious piece of work, which it did not seem to me the circumstances would quite justify.

1485. The distances between the weirs are given on the map as follows:—Between No. 1 and No. 2, 25½ miles; between No. 2 and No. 3, 9¼ miles; between No. 3 and No. 4, 37¼ miles; between No. 4 and No. 5, 25½ miles; between No. 5 and No. 6, 26½ miles; and between No. 6 and No. 7, 9 miles. Why are locks Nos. 2, 3 and locks Nos. 6 and 7 placed in such close proximity? Because the natural fall of the river is greater between those places. Although the fall of the Darling, taking it as a whole, is very uniform, there are some lengths in which it varies considerably. In one length you might have a fall of 4 or 5 inches to the mile, and in another length, a fall of 2 inches to the mile.

1486. If it became necessary to reduce the number of weirs, could you safely dispense with No. 2 and No. 6? I do not think so. They are at places where there is a considerable fall in the river.

1487. If you had to reduce the number of weirs, which of them could you dispense with? Either the weir at Beemery—No. 4—or No. 5.

1488. Could you safely dispense with any more without destroying the general efficiency of your scheme? I think not. I looked carefully into the matter to see what change could be made. That part of the river below Beemery is very low, and it would be possible to put a weir between No. 4 and No. 5 which would hold up sufficient water for a long distance back.

1489. If weirs No. 4 and No. 5 were omitted, would the depressions on the surface be filled with as much water as if the scheme were carried out as now proposed? There would not be much difference, because the weir that would take the place of the two weirs which were omitted would be higher than either of them, and the quantity of water stored is increased as you increase the height of a weir, because the river widens out.

1490. Would your shutters be able to stand with an increase of height? I think so.

1491. Would heavier stonework be necessary? The foundations would have to be slightly heavier.

1492. Would heavier work be required for the locks? Slightly heavier work; but the alteration would not add materially to the cost of the locks.

1493. Would it impair navigation at all? No. We should have to fix the weir at a sufficient height to keep a minimum depth of 6 feet in the river.

1494. What do you estimate to be the average cost of a weir and lock? About £20,000. Some would cost more and some less.

1495. What would No. 4 and No. 5 cost? They would be about the most costly, because the foundations in those places are worse.

1496. What do you estimate that they would cost? Speaking from memory, the cost of either of them would be £2,000, or £3,000 more than the cost of the lock and weir at Vincent Rocks.

1497. An increase of not more than 12 per cent.? Not more than that. There is a saving in cost by reducing the number of weirs at that particular place.

1498. A reduction in the number of weirs would not necessarily mean the destruction of the scheme, either so far as navigation, or so far as irrigation was concerned? No.

1499. In proposing the scheme, you thought it desirable to so plan it that no possible difficulty could arise in the future? Quite so; I wished to keep within cautious lines.

1500. As this is to a certain extent an experimental work, could you not submit a proposal by which the end in view could be obtained at a minimised cost? I could do that before the end of the inquiry.

1501. *Chairman.*] How much water have you directly above your shutters? The depth varies slightly, but it is about 12 or 13 feet, as a rule. I thought seriously of having only one weir instead of weirs No. 4 and No. 5, and my reason for deciding to place this scheme before the Committee as it is now was that I wished to keep within precedents and on very cautious and safe ground.

1502. Keeping well in view the experimental nature of this work, you are of opinion that a scheme could be prepared which would serve the same ends at considerably less cost? Yes; I believe that a reduction in cost could be made by altering the scheme in the way suggested.

1503. As this is an experiment, would it not be wise to proceed slowly? Well, the river is so uncertain that we shall be compelled to do so. We could start at any time with the Stony Point and Vincent Rocks weirs; but before they were finished and it was time to go on with another weir, there would probably be a flood, so that, under any circumstances, we shall be able to see how the Bourke lock and weir will work before commencing weirs in the position of No. 4 and No. 5.

1504. *Mr. Lee.*] What view was held in your Department as to the intercolonial riparian rights of the Murray and the Darling;—do you consider that New South Wales is entitled to the whole of the water-courses of the Darling and of the Murray? Well, of course, part of the watercourses of those rivers is outside the boundaries of the colony.

1505. Do you act under the division laid down in the Constitution Act? The Constitution Act leaves matters on the Queensland border in a different position from those on the Victorian border. The whole of the River Murray on the Victorian border lies within New South Wales.

1506. It is so claimed and held by us? It is claimed but not held.

1507. The claim is disputed by Victoria? Yes; but Victoria has no grounds for disputing it.

1508. As a matter of fact Victoria exercises the right to take whatever water she requires? Yes.

1509. So that practically Victoria does not recognise our claims? No.

1510. Were you able to obtain information from the Minister in regard to the subject of tolls? I did not succeed in seeing the Minister about it, but I saw the Under Secretary, and his opinion was practically what I have expressed.

1511. But you have no definite information? No; I have not yet been able to obtain any definite information from the Minister upon the point.

1512. *Mr. Wright.*] Mr. Williams in his report says that to erect a lock and a weir on one channel of the river is not practicable, and that such a work would be a complete failure? I differ from that opinion, and so does Mr. Gordon. I may mention that Mr. Williams selected a certain site for a lock and weir on the River Darling; but when I passed the place in a steamer during flood time, the river was flowing in four or five different channels.

1513. *Mr. Humphery.*] In a report before us, on the locking of the Darling, I observe that it is proposed to place the locks across the necks of land round which the river winds. In this matter you differ from Mr. Darley and Mr. Williams. Will you give us your reasons for your opinion? In the first place, the formation

H. G.  
McKinney,  
Esq.  
3 June, 1896.

H. G.  
McKinney,  
Esq.  
3 June, 1896.

formation of new channels across the necks of bends is going on constantly, and a very slight obstruction in the river increases the process. Then, too, necks of land round which the river winds are generally very low, and the effect would be, if the locks and weirs were placed as suggested in the report before you, that in flood time the water would create a scour along each of the outside walls of the locks. Unless there were heavy embankments on both sides of the lock a channel would be scoured through the neck of land in which it was situated parallel with each wall, so that the lock would be left standing by itself.

1514. Would the same thing take place if the locks were made as you propose to make them? No; because the natural conditions are not interfered with. The suggestion contained in the report before the Committee would, if carried out, seriously interfere with the natural conditions of the river. I know that in some cases the course of the river has been changed by a tree which has fallen into the loop of a bend. If a falling tree would change the course of the river, much more would a permanent weir do so. I believe that the bar across the river above Brewarrina has had a great deal to do with the formation of Cato Creek.

1515. What would be the difference in cost between the two arrangements? The plan suggested in the report would be more costly than that which I propose, because the intention was to carry the lock walls up above flood-level.

1516. Have you had any experience in connection with the construction of shutters, such as those you now propose to use? No. I have undertaken the construction of many weirs, and of a number of locks; but not with shutters precisely similar to these. These shutters have come into use in America only in comparatively recent years, though before that they were in use in France. There are one or two movable weirs of the kind in England; but until lately, England was very much behind in these matters.

1517. Can you tell us where there are movable weirs of the kind you propose? They are in operation in France, in America, and in India.

1518. Have they been a success? Yes. The *Scientific American*, of 1st August, 1891, shows a movable weir on the Ohio River at Davis Island, Pittsburgh. It is on a very much larger scale than those which I propose.

1519. How is that weir worked? In the same way as we propose to work the weirs on the Darling.

1520. Are the shutters of similar width and design to those which you propose? The shutters are very similar in design.

1521. *Chairman.*] Are they in every instance made of wood? Yes; in every case that I have seen any mention of.

THURSDAY, 4 JUNE, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
HENRY CLARKE, Esq.	GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of Locks and Weirs on the River Darling.

John Charles Henderson Mingaye, Esq., Analyst and Assayer, Department of Mines, sworn, and further examined:—

J. C. H.  
Mingaye, Esq.  
4 June, 1896.

1522. *Chairman.*] You have a statement to make upon various points which were suggested to you when you were last before us? Yes; I was asked for analyses of the waters from the various artesian bores of this colony, having regard to the solid and deleterious matter contained in them, and for a comparison of those waters with the waters used in America for irrigation. I hand in a tabulated statement showing the composition of the waters from forty-one artesian bores [*Vide Appendix D*], and a second statement showing the salts contained in them which, if present in excessive quantities, are considered detrimental to plant-life, together with a list of the bore waters which would be useful for irrigation if carefully used and certain precautions taken to which I shall refer later on. [*Vide Appendix D1.*] A third statement [*Vide Appendix D2*] gives analyses in tabular form of American artesian and lake water which is used for irrigation. With regard to the first statement [*Vide Appendix D*] the water considered unsuitable for irrigation is marked with an asterisk, while that which is considered questionable is marked with a dagger. The number of bores in which the water is unsuitable is seven. The method considered necessary to adopt to prevent the saline matter in the water from eventually interfering with the soil is a thorough system of underground drainage, so as to procure a preponderance of the downward motion of the moisture, thus by occasional leaching of the soil, dissolving out a quantity of the alkali salts on the surface where it is most injurious. Under-drainage is the general and absolute correction for the alkali. To flood the land, and cause under-drains to be laid reasonably apart, which shall have run some time will, to a great extent, end the trouble, not only for the time being, but for years—providing that soluble beds of alkali do not exist at some depth below the surface. The soils, especially if they are clayey, should be ploughed deep and pulverised thoroughly, and prepared for underground and deep drainage. With regard to the rotation of crops, by which is meant planting of root and forage plants which are known to absorb these alkaline salts, and thrive in soil containing alkali, Professor Hilgard has shown that beets, carrots, and many other root-crops

root-crops and forage plants are known to absorb a large amount of these alkaline salts. In a valuable paper entitled "Australian Salt-bush" (*Atriplex Semibaccatum*) a forage plant for alkali soils, by M. E. Jaffa, Ph. B., Instructor-in-Charge of the Agricultural Laboratory, University of California, the following information is given:—"A perennial herb, very much liked by sheep, thus considered among the best saline herbage of the salt-bush country. Mr. W. Farrer pronounces this herb as wonderful for its productiveness and its drought-resisting power. At the experimental station near Tulare, the herb, or bush, has been planted with excellent results in some of the worst alkali spots of the station grounds; single plants having reached a diameter of 16 feet in one season. The yield of a full cut is about 20 tons of green material per acre. The large proportion of ash in the bush, and the fact of the plant yielding such excellent results in some of the worst alkali spots is one of great interest. It was found on analysis of the ash that 550 lb. of the air-dried matter contains about 110 lb. of mineral ingredients. Of this extraordinary amount of ash, nearly 44 per cent., or about 48 lb. is common salt, and about 15 per cent., or 17 lb. more is soda in other combinations; in the crude ash mainly in the form of carbonate of soda. The amount of potash, lime, and phosphoric acid are relatively small, thus rendering the salt bush excellent for "desalting," or freeing the soil from objectionable soda compounds." By the use of gypsum (calcium sulphate) in small quantities the corrosive action of the alkali formed in the soil can be remedied to a great extent by the conversion of the carbonated alkali into the "white," or neutral alkali, which is much less injurious than the "black," *i.e.*, alkaline carbonates and organic matter. The water could also be freed to a great extent from the carbonated alkali prior to use, by slowly passing the water through a length of troughing containing coarse gypsum (plaster of paris) which will alter the character of the salts into neutral salts. If it is a question as to the use of these waters in preference to river waters for irrigation, there can be no comparison between them, as the latter contain less total solids in their composition, and the solid matters are, as a rule, practically free from the carbonated alkali. On comparing the analyses tabulated of the American artesian and lake waters used for irrigation (*Vide Appendix D 2*), it will be observed that the waters from the Kern and Tulare Lakes contain a large proportion of carbonated alkali and other salts. The carbonated alkali varies from 16 to 77 grains per Imperial gallon, the other salts from 18 to 138 grains per gallon, while the artesian bore water yields from 3.36 to 23.16 grains per gallon. In looking at the question of the employment of our artesian waters for irrigation purposes it must be borne in mind that the American and Indian soils in the arid districts already contain alkali or "reh," consequently an alkaline water is added to soil which is already alkaline. As far as I have been able to find out, many of our soils in the arid districts are of a good depth, and excepting in a few cases, no sign of alkali has made its appearance in the surface of the soil. Professor Hilgard points out that even the strongest water in the Tulare Lake, near its southern end, is not so strong as to injure the roots with which it comes in contact, so long as it is not concentrated by evaporation. This water yielded 101.328 grains per gallon of total solid matter, of which 33.5 grains per gallon consisted of carbonate of soda, and 45.42 grains per gallon of other salts. We cannot get over the fact that in the Tulare and Kern country, great difficulties have been experienced in the treatment of these soils, which appear to be due largely to the alkali already contained in the soil in a soluble state. The fact also has been considered that in the arid districts, no other water is available for irrigation, there being a large amount of surplus water over and above that required for watering travelling stock. The water has been used on experimental stations, and it has been found that by irrigation it is possible to grow root and forage plants; it is, however, in after years that any difficulty may arise, if care is not taken that the soil is not saturated with these alkaline salts. If the water is carefully used, the soil properly prepared, and deep drainage given, with occasional leachings, combined with the use of gypsum, and the crops carefully selected, the waters, a list of which are given [*Appendix D 1*], can be used.

J. C. H.  
Mingaye, Esq.  
4 June, 1896.

1523. Of the forty-one bores you have mentioned you think the water from one-third of that number should not be used for irrigation, at any rate not for the present? I should not like to speak with certainty about the water marked doubtful.

1524. But in the remaining cases you regard the water as suitable? Yes; some time ago I wrote to America to ascertain from the United States Geological Survey Department if they could tell me the limit of salts which unfitted water for use for irrigation purposes. The reply I received to my inquiry was as follows:—

No systematic examination has been made of waters used for irrigation. Owing to the necessities of the case, all waters available are tried even to those which are almost of the character of very weak brines. Of course a great deal depends on the character of the soil and the cultivation, one man apparently succeeding where another man "burns" his crop. I do not think that the limit as regards alkaline contents has as yet been ascertained by chemical analysis. As you are doubtless aware, pure waters are not considered as valuable for irrigation as muddy waters. The presence of fine silt in the water is commonly supposed to indicate the absence of alkaline salts in notable quantities, and thus the muddy waters are valued, not only for the fine silt which they carry, but also for the absence of injurious earthy salts. I have seen, however, in places where no other water could be had the farmers using a clear water, decidedly alkaline to the taste, and one which, in the long run, must be destructive to plant life. When the salty crust has accumulated on the surface, however, so as to be perceptible to the eye or taste, the farmers give the soil a thorough washing, and in Utah, for example, plant the fields to the rank woody white clover which seems to thrive where the more valuable forage plants will not. Analyses of the waters of some of the principal rivers of California are given by Professor E. W. Hilgard, University of California, Berkeley, Cal., in the volume on Cotton production of the 10th census of the United States, and doubtless by correspondence with him other analyses could be obtained.

1525. Then the only way in which a definite opinion can be formed of the real value of our artesian water for irrigation is by practical experiments? To a certain extent, though the water from many of the bores could, without doubt, be used without ill-effect, if ordinary care were taken.

1526. You emphasise the fact that, while in America in a number of cases the application of water containing soda to the land increases and augments the quantity already in the soil, in most cases in this colony there is in the first instance no soda in the soil? Yes; our artesian waters certainly contain a fair amount of alkali; but so far as I have been able to learn, the soil does not appear to contain alkali in any quantity. In India and America, however, they are in many places dealing with soils already alkaline.

1527. *Mr. Wright.*] You have spoken of the farmers in America washing the alkali out of their land. How can they do that if they have nothing but alkaline water to use? They go in for underground drainage. They occasionally leach with artesian water, and then flood the alkali out, which would show as a white or dark deposit on the surface of the land.

1528. *Chairman.*] Would it be a wise thing to allow artesian water in any quantity to find its way into the bed of the Darling? Without doubt, no. I have one other statement which I should like to make,

J. C. H.  
Mingaye, Esq.  
4 June, 1896.

and that is in regard to the total solid matter in the water of some of our rivers. With regard to those numbered 1 to 14, I got the information from Mr. Hamlet, the Government Analyst. The statement is as follows:—

Total solid matter present in river waters, &c., New South Wales.

	Grains per Imperial Gallon.
1. Macintyre River (Inverell water)...	21.28
2. Moree Creek	15.00
3. Namoi River	26.00
4. Apsley River (Walcha)	12.04
5. Murrumbidgee River at Wagga Wagga	7.42
6. Wingecarribee River	6.02
7. Wollondilly River (Goulburn)	30.80
8. Bega River	17.36
9. Billabong Creek (Parkes)	18.48
10. Hawkins' Gully (Tenterfield Water Supply)	15.54
11. Middle Creek (Inverell Water Supply)	14.00
12. Dumaresq Creek (Armidale Water Supply)	10.08
13. Castlereagh River	15.96
14. Hawkesbury River (where supply for Richmond will be taken)	7.56
15. Parramatta River Water (about dam)	12.00
16. Stephen's Creek Water Supply (Broken Hill)	21.42
17. Belabula River, Clifden Run	29.34
18. Fish River (near Jenolan Caves)	7 to 10

NOTE:—From 1 to 14 are obtained from analysis made by Mr. W. M. Hamlet, F.C.S., &c.

1529. The water in a creek is influenced by the character of the watershed from which it comes? Yes.
1530. Water coming from sandstone country would be different from water coming from basaltic or limestone country? Yes, certainly.
1531. Referring to the list you have just read, which of those rivers obtains its water from country most like the Darling country—Stephen's Creek? I do not think any of them obtain their water from similar country.
1532. How do these waters compare with the artesian waters? The quantity of solid matter is less, and there is not so much carbonate of soda in them; in fact, if there is any at all, it is only one or two grains per gallon. The greatest amount of solid matter present is in the Wollondilly at Goulburn, where the water contains 30.80 grains of solid matter to the Imperial gallon.
1533. But not deleterious solid matter? No.
1534. How much solid matter does the Murrumbidgee contain? 7.42 grains to the gallon.
1535. Is not some of our artesian water valuable because of the amount of potash it contains? Yes.
1536. So that while the carbonate of soda is bad for plant life, the potash contained in the water is good for it? Yes, but while the potash is present in the form of carbonate of potash, it is as deleterious as the carbonate of soda. It is, however, altered by the action of gypsum, and then becomes of great value to the soil.

James William Boulton, Esq., Superintendent of Public Watering Places and Artesian Water Supply, Department of Mines, sworn, and further examined:—

J. W.  
Boulton,  
Esq.  
4 June, 1896

1537. *Chairman.*] You have a statement to make in regard to various matters which were brought under your attention by the Committee when you were last before us? Yes. In the first place I was asked to obtain a comparison of the rainfall at Bourke and at Mildura. I have not been able to obtain a record of the rainfall at Mildura, nor of the rainfall at Wentworth, which is close to it; but I find that the rainfall at Lake Victoria is 11.47 inches per annum, and at Avoca 11.40 inches per annum. Those places are very close to Wentworth, and their rainfall might be taken as a fair guide to the rainfall in the district. The rainfall at Bourke is 16.27 inches per annum.
1538. Then the rainfall at Mildura would be about 11 inches per annum? Yes. I was also asked to obtain, if possible, a comparison between crops grown upon land naturally watered and crops grown upon irrigated land. The following comparison is compiled from the *Statistical Register* and from Colonel Hinton's report, and shows a larger yield of certain crops upon irrigated land.

Average yield per acre under natural rainfall of produce, specified hereunder, in New South Wales.

Crop.	Average yield.	Season.	Crop.	Average yield.	Season.
	bushels.			tons.	
Wheat	10.9 per acre	1894 and 1895	Onions	2.08 per acre	1894, 1895
Maize	27.0 "	"	Turnips	5.1 "	"
Barley	17.2 "	"	Mangold Wurzel	7.3 "	"
Oats	18.4 "	"	Sugar cane	18.6 "	1895
Other grain—			Tobacco	11.4 "	"
Rye	15.2 "	"	Grapes (table)	2 "	"
Millet	11.2 "	"	Oranges	940 dozen per acre	"
	tons.		Lemons*		
Hay	1.10 per acre	1895	Peas and beans	3 bushels per acre	1894, 1895
Straw			Pumpkins	3.6 tons per acre	1894 and 1895
Green food	2.2 per acre	"	Melons		
Potatoes	2.83 "	"			

\* NOTE.—It is estimated that over 3,000 dozen of fruit to the acre can be obtained from fair sized trees in full bear

Hinton's

Hinton's report, page 115, shows the increased yield of certain crops on irrigated land. Corn average yield without irrigation, 25 bushels, yield with irrigation, 1888, 75 bushels; 1889, 66; 1890, 40. Seed cotton, pounds, 200 to 500 without, with irrigation, 1888, 2,200; 1889, 3,000; 1894, 4,000. These results obtained on same land. I should also like to read the following extract from the *Western Herald*, of Wednesday, 3rd June, 1893, which refers to an exhibition in the Bourke show of products grown at the Pera settlement:—

J. W.  
Boulton,  
Esq.  
4 June, 1896.

It appears there was no entry in the class for the best collection of agricultural produce, but there really was the best show in this line that has ever been seen on the Bourke show ground. We refer to the magnificent exhibits from Pera Bore. In the grandstand pavillion the very first exhibit encountered upon entering at the northern door, was that of Pera Bore settlers. Although not assuming vast proportions, the exhibit was beautifully arranged, and covered a deal of ground in the way of variety. The members of the settlement who exhibited were Messrs. Andrews, Betteridge, D'Apice, E. C. Millen, Muuro and Pullbrook. The exhibits were composed of sorghum—early amber cane, sorghum saccharatum or black-seeded sorghum, planter's friend, red Kaffir corn, white Kaffir corn, and teosinte (a single stool.) Vegetables—cabbage, carrots, round and long red beets, radishes, turnips, white and Swede; tomatoes, the largest we have ever seen; Canadian wonder French beans, and Yosemite wax beans. Early rose potatoes; three pumpkins, king of mammoth, crown, and sunbeam; pie melon, citron melon, and red-seeded melon for preserving; ice cream water melon and green fleshed rock melon (a keeping variety which may be stored until winter or even the following spring). Mango melon or vegetable peach; custard squash; also two varieties of cow pea, whip-poor-will and white or edible; Japanese buck wheat and long red mangold wurtzel. This exhibit was undoubtedly a very fine one, and the Pera Bore settlers are to be warmly congratulated upon their enterprise, and more especially upon the perfection of growth attained. It must not be forgotten that the settlers have had very considerable difficulties to overcome, and it augurs well for the future success of the colony that the settlers themselves are working so harmoniously together, and join hands in showing the public what their combined energies have accomplished. In another pavilion were exhibits from the Government farm at Pera, and also from the Hawkesbury Government farm. These were very attractive and nicely arranged, the produce exhibited being as follows:—Ensilage (made from sorghum), Kaffir corn in seed, second crop and sacked; early amber cane, planter's friend, lucerne (green, baled); lucerne (chaffed); broom millet, carrying seed and threshed; brooms manufactured from the millet grown on the farm; cow pea vines, cow pea vines (chaffed); black and clay-coloured cow peas. Vegetables—Swede, Munich, and Nepal turnips; French beans, red beets, mangold wurtzel, pie and citron melons, cucumbers, marrows. Fruit, jams, &c.: Rosella fruit, wine, jam and jelly; pie-melon jam; vegetable marrow preserved; citron melon preserved. The presence of this produce at the show proves that those who were in charge of the Pera Government farm at its initiation did excellent work, and we can only sincerely regret the fact that the late Mr. D. C. Macdougall did not survive to see the result of his labour, as it was presented to the public at the late show. Of course we do not detract from the work performed by Mr. Jefferson since he has been in charge; there is no doubt that he knows his business, and is doing it, and next year we hope to see an exhibit of farm produce second to none in any show in the colony, and feel satisfied that our hope will be verified.

With regard to a question asked at the end of the last meeting, we have at the present time completed by the Department so far as the work of boring is concerned, forty-six wells, seventeen of which are leased under the provisions of the Public Watering Places Act of 1884, ten are in the hands of caretakers, and the balance pending erection of pumping appliances and completion of works and dedication of the land, no caretaker is employed. Twenty-nine of these wells are flowing wells, four are failures, and thirteen are sub-artesian, that is the supply does not overflow the surface. Several of the bores now in progress which are not included in the list submitted are flowing wells. The conditions of lease are that the tenant has the right to use the surplus water over and above public requirements, no restriction being made in regard to the purposes to which it may be applied, an area of 640 acres is fenced in and set apart as a tenant's lease. The tenant may retain the charges which are fixed by regulation for the sale of water to stock. The leases are offered by public tender. The tenant is required to put at least four acres under irrigation, and if required, to reserve a small area of land upon which he can grow such experimental crops as the Department may desire. The period of lease is five years and is limited by the Act. So far seventeen bores are leased under these conditions. At certain of the bores, for instance at Pera, the land has been subdivided into 20-acre blocks, which are offered with a supply of water for irrigation under the Homestead Selection provisions of the Crown Lands Act, and under the special conditions hereto attached and at a rental of £5 per block per annum. Eleven blocks have been selected. An area also is reserved by the Department for experimental work. At another bore, Moongulla, four blocks have been leased under the Public Watering Places Act on the same monetary terms as at Pera, and arrangements have been made for supplying the neighbouring homestead lessees (four) with water for stock purposes. At Dungle Ridge Bore the same proceeding has been initiated. The bores open and available for lease have been regularly advertised in the *Government Gazette* and local papers. They have been undertaken primarily for the supply of water for travelling stock purposes, the question of irrigation from them in the first instance and in regard to the earlier bores being unconsidered. Attention is now being given to this phase of the question under the Minister's direction. The isolated positions of many of them and their great distance from any commercial centre, and the absence of inclination on the part of the population, generally used to pastoral pursuits, and an ill-defined fear as to the unsuitableness of the water for irrigation, and a lack of knowledge as to its application and insufficient tenure, have all been causes which have militated against the leasing of the bores with a successful financial result; the result has been that we are receiving rentals based upon the probable receipts for watering stock, the irrigation value of the water being unrecognised except in a general way. The necessity for some practical demonstration which would, it was hoped, efficiently provide for the use of the surplus water over and above public requirements, led to the establishment of the Native Dog Farm which, upon the successful completion of the Pera Bore, was owing to its distance from Bourke abandoned as an experimental station and was leased. The prejudices and lack of knowledge which I have referred to, I think in some measure have also interfered with the progress of settlement at Pera. The whole district is now, I may say, standing aloof watching the result. Of that I have the most sanguine anticipations, and when once the possibility of a return such as I anticipate, and which should be easily attainable under such favourable conditions as are offered is demonstrated, the problem is to a large extent solved. Cereals, their by-products and fodder, comprising oats, wheat, bran, pollard, maize, chaff, straw, hay, &c., sorghum, Kaffir corn, lucerne, potatoes, onions, pumpkins, &c., melons, cucumbers, besides the whole range of vegetables, tomatoes and small fruit can be grown. Viticulture for the production of raisins, currants, grapes, &c., the latter and melon fruits which can be landed six weeks or 2 months earlier in Sydney than from any other sources, should afford a considerable revenue. The cultivation of oranges, lemons, olives, and such as apples, pears, stone and other fruits, apricots, peaches, &c., for canning and drying, should be abundantly profitable. The cultivation of the broom millet can be made a profitable source of revenue as I have already shown. The local market in Bourke is far larger than is generally known, and through the

J. W.  
Soulthoe,  
Esq.

June, 1896.

the courtesy of Messrs. Rich and Company I have been furnished with the following summary of the firm's consumption, for 1894 and 1895, of the products I have mentioned, and I have added the Sydney market prices for the same on yesterday's quotations:—

products.	1894.	1895.	Sydney Market Rates.	Amount. 1895 Consumption.
	tons.	tons.	£ s. d.	£ s. d.
Oats <sup>o</sup> .....	260	260	0 2 6 per bus.	1,820 0 0
Wheat* .....	50	50	0 4 0 "	370 0 0
Bran* .....	80	100	0 0 9 "	700 17 6
Pollard <sup>2</sup> .....	150	70	0 0 9 "	291 7 6
Flour <sup>o</sup> .....	1,200	1,100	10 10 0 per ton	11,550 0 0
Maize .....	60	600	0 2 6 per bus.	3,000 0 0
Chaff .....	600	2,100	5 0 0 per ton	10,500 0 0
Straw .....	60	70	3 10 0 "	245 0 0
Hay .....	50	75	5 0 0 "	375 0 0
Potatoes .....	250	270	3 0 0 "	810 0 0
Pumpkins .....	30	30	0 0 8 per doz.	.....
Onions .....	30	24	7 0 0 per ton	168 0 0
Barley (no record) .....	.....	.....	.....	.....
Dried Peas (no record) .....	.....	.....	.....	.....
				£20,920 5 0

\* Oats, wheat, bran, pollard, and flour from Sydney to Bourke go at A rates, viz., 35s. 4d. per ton + 20 per cent., now equal to 42s. 5d. per ton; for the other products a net rate of 35s. 4d. is charged.

From Bourke to Sydney the rate is 14s. 9d. for 6-ton loads, for less, 20 per cent. is added. Chaff, straw, and hay, Sydney to Bourke, in 6-ton loads, £3 17s. per truck, or lesser quantities £1 15s. 4d. per ton. The following products were also consumed by the same firm on the average of the preceding three years:—

Fruits.	Quantity.	Sydney Market Rates.	Amount. 1895 Consumption.
			£ s. d.
Dried apples .....	1,400 lb.	6d. per lb.	350 0 0
Dried apricots .....	3,000 "	7d. "	87 10 0
Currants .....	60,000 "	4½d. "	1,000 0 0
Raisins .....	40,000 "	4½d. "	750 0 0
Canned fruits .....	5,500 "	7s. per doz.	80 0 0
Jams .....	35,000 "	3s. 6d. to 6s. per doz.	692 11 0
Honey .....	4,000 "	3d. per lb.	50 0 0
Brooms .....	200 doz.	9s. to 18s. per doz.	135 0 0
Dried pears .....	No record.	5d. per lb.	.....
Dried peaches .....	"	5d. "	.....
Dried cherries .....	"	6d. "	.....
Bottled fruit .....	"	7s. per doz.	.....
			£3,145 11 0

The two amounts £20,920 5s., and £3,145 11s., thus give a grand total of £24,065 16s.

To these prices may be added freight from Sydney to Bourke (3rd class rates) at £11 5s. 4d. per ton for single tons, in 6-ton loads £7 10s. per ton; return rates are the same for dried apricots, canned fruits, and jams. Currants, raisins, dried apples go under 2nd class rates, £8 1s. 9d. per ton for single tons. Honey is carried at £3 1s. 9d. per ton, or £6 9s. 11d. per ton for smaller lots. For comparison with these rates, I am informed by Colonel Bell that American freight rates may be taken generally as a quarter less than in New South Wales. This return simply represents the consumption of one firm who, in forwarding it, state "our firm intends erecting flour-mills at Bourke when the wheat production warrants it; we consider it within the realm of practicability." This return does not touch upon the consumption of vegetables in Bourke. In addition to this there would be a limited market at Byrock, the whole of the vegetables for which town are grown on the Bogan, at Gongolgon, by Chinamen, and are carted 37 miles by road to Byrock. So much for the local demand which would tax the resources of more than one settlement like Pera. In addition to the direct local market, the following return prepared from Coghlan's Statistical Register, 1894, shows there is a large home consumption of these products:—

Imports of 1894.		Value.	Value.
Fruits (green) .....	£98,416	Pickles and sauces .....	£41,401
" (dried) .....	11,701	Preserves (includes canned fruit, ginger, &c.) ...	9,124
Almonds, nuts, &c. ....	7,732	Spices .....	6,719
Dates .....	8,155	Tobacco (unmanufactured), not including cigars	
Rice .....	67,745	and cigarettes .....	16,535
Potatoes .....	96,421	" (manufactured) .....	76,441
Jams and jellies .....	10,744	Vegetables .....	15,822
Linsced .....	2,911	" (preserved) .....	3,223
Mustard .....	24,561	Maize .....	6,601
Linseed oil .....	35,255	Hay and chaff .....	108,999
Olive oil .....	2,257	Currants and raisins .....	42,150
Salad oil .....	5,657		
Onions .....	28,700	Total .....	£727,270

The question of irrigation of large areas of lucerne for stock fattening and of products for hog raising must not be lost sight of. Californian and Mexican stock-raisers have recognised that with irrigation of lucerne they can increase the carrying capacity of their ranches by 20 per cent. One canal in Fresno County, California, 30 miles in length—the Chowchilla canal—is used solely for irrigating natural grasses. The area of irrigated land in America under lucerne is very large, and is stated to carry ten to twenty sheep to the acre if cut for them, and 8 to 10 tons per acre is a common yield. The present Sydney market rate for this is 50s. a ton. I have found it a matter of considerable difficulty to compile the information regarding American conditions and cost of water in comparison with those offered here.

The

J. W. Boulthbee, Esq.  
4 June, 1896

The American soils are, I think, speaking in a general way, of a much lower grade and more difficult to treat than our western soils. The soils of the Western American States are poor, and frequently calcareous and alkaline, but upon them are raised grain, lucerne, and fruit. Upon the mesas or higher table-lands heavier loam is found and better results obtained. The table given shows the products from the more representative irrigating States—Colorado, California, New Mexico, and Utah. On reference to it it will be seen that the cost of water to the user varies much, but is generally higher even than the rate charged by us for land and water combined. I find that at Riverside the cost of water is 12s. per cubic foot per second for twenty-four hours. At Pera our rate is about 7s. for the same right, but it includes in addition rent for the land. Labour, as far as I can ascertain, is about the same as here, viz., general labour, from 6s. to 8s. per diem; farm labourers, £50 to £80 per annum; artisans, from 10s. to 16s. per diem (D Report, p. 16). I am of opinion that there is distinctly room for more settlements of the Pera class in the neighbourhood of the western centres of population, where the land carriage is not high, and where communication either by rail or river is available to the seaboard or metropolitan markets. The bores at Moree and at Walgett, Wanaaring, Coonamble, &c., afford facilities, and I have no doubt but that they will form a nucleus for further extension. The water can be applied to the land without great expense, and the work could be done far cheaper on a larger scale on a system of grouping the wells as at Riverside. The cost of land transport for the weighty plants for long distances helps in a great degree to keep up the present high price of boring. The fluming which delivers the water direct to the settler at Pera has been erected at a cost for 8,072 feet of £807, or somewhere near 2s. a foot. The products I have mentioned as consumed in Bourke can be grown generally locally by irrigation at a large profit; the dried fruits, canned fruits, and expensive articles, such as asparagus and strawberries, broom millet, all seem to me to be capable of production at such rates as will render the men independent and comfortable. The erection of works for fruit-drying does not appear to me a necessity; the climate is sufficient to do all that is required. Low sheds for stacking the trays at night or in rain would be required, but they need be no expensive adjunct. I have already quoted a letter showing the cost for irrigated land at Mildura, and the *Gazette* notice herewith shows the prices charged at Pera. The difference is large, and I am more than hopeful that as our experiments at Pera mature, and the market becomes known, settlement will proceed. We only require skill and care in the use of the water, and a certain amount of encouragement and education to the struggling settlers at Pera, to make a success of an experiment initiated under the most difficult and unfavourable conditions to imagine. The experiment is, I may say, simply touching the fringe of the subject. The following is an extract from the *Government Gazette* giving the conditions under which land can be leased at the Pera Settlement:—

Department of Lands, Sydney, 13 July, 1895.

NOTIFICATION SETTING APART CROWN LANDS FOR HOMESTEAD SELECTIONS.

His Excellency the Lieutenant-Governor, with the advice of the Executive Council, directs it to be notified that, in pursuance of the provisions of the 10th and 13th sections of the Crown Lands Act of 1895, the Crown Lands comprised within the blocks hereunder mentioned are hereby set apart for Homestead Selections, and shall be disposed of under the provisions of the 13th and following sections of the said Act.

It is further notified that, in pursuance of the provisions of sections 13 of the Crown Lands Act of 1895, the under-mentioned blocks of land will be available for Homestead Selection on and after 15th August next, subject to the general provisions of that Act, and to the following special conditions:—

The Crown to deliver water for irrigation purposes on each block at such times as may be arranged in the proportion of 21,000 gallons per block daily, but the total supply on any one day not to exceed the proportion for thirty days nor the capacity of the distributing channels, nor the supply available from the bore.

At least 4 acres of each block to be cleared and 2 acres cultivated during the first year after confirmation, and the whole block to be cleared and 10 acres cultivated within five years from that date, and subsequently maintained in cultivation.

Each block to be fenced with a substantial post and wire fence within twelve months after confirmation.

Each block to be kept free from rabbits, Bathurst burr, and other noxious animals and weeds.

An annual return to be supplied to the Crown as to the growth and yield of produce.

All flumes, earthworks, &c., in connection with the supply of water from the bore, and also the rabbit-proof ring fence, to remain the property of the Crown, and each selector to be liable for any damage caused to the same by his default.

The right of entry for repairs is reserved, also the right of way without compensation for all main distributing channels. The right is reserved to refuse to supply water to isolated blocks.

Selectors will be allowed to water their stock at the Public Watering Place at half the usual rates, and to purchase nursery stock, vine cuttings, seeds, and trees from the Crown at current market rates.

J. H. CARRUTHERS.

LAND DISTRICT OF BOURKE.

NOTE.—The blocks marked with an asterisk are leased

On

J. W.  
Boulton,  
Esq.

On and after the date above-mentioned, application for the above blocks may be made to, and lodged with, the local Crown Lands Agent. The application must be accompanied by half a year's rent in advance, and a survey fee as above specified; or if the applicant desires to defer the payment of the survey fee, then by one-third of the total amount thereof. For homestead selections without residence before grant, the annual rent, until issue of the grant, shall be three and one-half per centum of the capital value, and the full amount of the survey fee will have to be paid with the application. [Ms. 95-5,424 Dep.]

I also hand in a return showing the value and the yield of crops grown in America by means of irrigation, the area of land irrigated, the cost of the water per acre to the user, and the cost of maintenance per acre to the user. [*Vide Appendix.*] The counties I have chosen are, I think, typical of the different American soils. The analyses of the Coonamble Bore water and the Bourbah Bore water, which you have not yet had, are as follows:—

<i>Coonamble Bore.</i>		<i>Bourbah Bore.</i>	
Depth 1,020 feet. Total solid residue dried at 220° Fahr.,		Sodium carb. . . . .	23.36 grains per gal.
5,306 grains per gallon.		Silica . . . . .	1.26 " "
Composition of the dissolved solids.		Calcium carb. . . . .	1.12 " "
Sodium chloride . . . . .	6.91 grains per gal.	Sodium chloride . . . . .	2.96 " "
Do carbonate . . . . .	40.00 " "	Potassium . . . . .	trace
Calcium . . . . .	1.12 " "	Magnesium carb. . . . .	0.84 " "
Chlorine as chlorides . . . . .	4.20 " "	Loss on ignition . . . . .	1.96 " "
Nitrogen as nitrates . . . . .	traces		
Total solids (dried at 220° Fahr.) . . . . .	53.06 " "	Total solid residue . . . . .	31.50 " "

1539. *Mr. Humphery.*] Has any land been cultivated by the use of that water? No.

1540. Is it the opinion of the Department that the water is unsuitable for use? No; I should not be afraid to use water having as much sodium carbonate as 45 grains to the gallon.

1541. *Mr. Lee.*] You are specially charged with the management of the artesian water supply of the colony, and appear to have taken a very large and wide view of the possibilities of cultivation by the use of that water. I take it that the object of your evidence has been to show the Committee what can be done by the proper application of artesian water, and to show us further that we have, in this colony, artesian water which is suitable for irrigation. I should therefore like to know what are the actual results which have been obtained here. Taking the Pera Bore as an example—because there appears to have been more cultivation done in the neighbourhood of that bore than in anywhere else;—we are told that it has a flow of 610,000 gallons per diem;—how many acres of land would that quantity of water irrigate? We have calculated that it will irrigate the whole of the Government farm—which comprises 57 acres—and 10 acres out of each 20-acre block. That is 237 acres in all.

1542. That bore cost £1,487 17s. 8d., the interest upon which amount, at 4 per cent. per annum, would be £59 10s. We have been told that the revenue derived is £87 12s. per annum,—does that include the £5 derivable from those who take up blocks? Yes.

1543. That £5 goes to the credit of the Lands Department? Yes.

1544. I presume that the Government farm pays no revenue? No.

1545. The amount derived from the twenty blocks at £5 each would be £100? Yes; but only eleven blocks have been leased.

1546. Then how do you make up the balance of £32 12s.? That is the amount derived from water supplied to travelling stock.

1547. The yearly expenditure in connection with the bore is £466 3s.? Yes, including the wages of the manager of the farm and three assistants.

1548. If there were no Government farm at Pera, and the water were required for irrigation purposes, how many men would it take to attend to the bore? One.

1549. At what wage? Six shillings a day—about £104 a year. It must be remembered that the revenue derived from artesian water for stock purposes depends entirely upon the season.

1550. I want to ascertain whether irrigation, by means of artesian water, can be made to pay? Well, we are at this disadvantage, that we have no practical experiment to fall back upon, within our own experience, which will give us any figures in evidence of the value of such irrigation. In a year's time we may be in a position to put very convincing figures before you.

1551. If the 57 acres of land now held by the Government contributed towards the revenue at the same rate as the other blocks, what amount would you derive from them? A little over £10 a year.

1552. So that if the bore were under the management of one man, it would cost the Department £104 a year, and would return a yearly revenue of £65? Yes; if no more blocks were leased.

1553. How would it be possible, under such conditions, to extend the system of irrigation with artesian water? I think it would be found that if the system could be carried out on a larger scale the bores could be made more cheaply. If we had a series of wells, grouped so that a larger area of land could be irrigated, we could get the bores put down for 50 per cent. less than what we are paying now.

1554. Do you think that it would be possible, within a few years, to put down these bores more cheaply than they can be put down at the present time? Yes; that agrees with our experience.

1555. But I should like to know how the system can be continued in the future if the country is to get no adequate return for its expenditure? It is not the direct return that we look to so much as the indirect return. The value of an initiatory experiment such as this cannot be calculated upon a cold monetary basis.

1556. It is only fair to say that, although the work may not at the present time give a large direct return to the State, it is having the effect of settling land in a remote part of the colony, and of making cultivation possible where it would not be possible under other conditions? Yes; there is no question about that.

1557. Do you think that the artesian water in this district could be used for the production of almost any kind of crop? For almost every crop.

1558. Do you think that it could be used to grow cereals? There is no question about its being possible to grow wheat with it; but I do not think that wheat would pay to grow there.

1559. Why? American experience shows that it is better to have small holdings with intense cultivation, producing higher-priced products, such as stone fruit, raisins, currants, and so on. The return which I have handed in shows that while wheat will give a profit of from £2 to £6 an acre, fruit has given as much, I think, as £312 per acre.

J. W.  
Boulbee,  
Esq.

4 June, 1896.

1560. Therefore, in that district, attention must be given to the production of fruits suited to the climate and of the highest value? Yes. A great many of the large wheat-ranches in America are now being cut up and disposed of in small holdings.

1561. Is there not another reason why cereals would not pay in the district of which we are speaking? I think the climate would be rather warm for wheat.

1562. Cannot wheat be grown as well in other parts of the country under natural conditions? Yes.

1563. Consequently, it would not pay to grow wheat by means of irrigation? No.

1564. Is it not a well-ascertained fact that wheat-growing will not pay except where large areas are cultivated? Yes.

1565. It would be out of the question to grow cereals in from 10 to 12 acre blocks? Yes. I believe that the growing of lucerne would be a profitable industry there, as it is in America, where it is used especially for fattening beasts.

1566. You look a considerable distance into futurity when considering the usefulness of this work? Yes.

1567. You anticipate that when the population of the colony has trebled itself, there will be a demand for land to which water can be supplied? I think it is more than possible.

1568. The present free selector aims at obtaining as much land as he can possibly get hold of; but upon these irrigation areas men will have to be content to make a living out of the small holdings? Yes.

1569. It would be advantageous to the country to have a large population making its living by the cultivation of small holdings? I think so. That has been the effect in America, according to the experience of irrigation settlements there.

1570. Your return shows there are 17,000,000 acres of irrigated land in America? Yes; I believe that in India they irrigate about 30,000,000 acres.

1571. Do you know in what areas the land is held? I think the holdings are very small, and that very few exceed 640 acres.

1572. Have you any reason to suppose that a series of artesian bores could be put down in close proximity to that part of the Darling which it is now proposed to lock? I think so, on the northern side of the river.

1573. And to what distance from the northern bank? From the northern side of the river almost up to the Queensland border. On the south side of the river we have not had any success with our bores.

1574-5. In other parts of the world irrigation has been done by means of gravitation. If the river is locked as proposed, it may throw the water back to such an extent that a much less severe lift would enable the water to be used for irrigation purposes;—do you consider that whether the Darling is locked or not, the system of obtaining water by means of artesian boring should not be abandoned? Certainly I do.

1576. You think that we shall require the water from both sources? I think that both means of obtaining water can be followed.

1577. Since irrigation by means of river water at any great distance from the banks of the Darling will be practically impossible, there is a great extent of country upon which artesian water may be used to very great advantage? I think so.

1578. *Mr. Hassall.*] The operations necessary for providing artesian supplies are practically in the infancy of their development? Quite so.

1579. You have not had sufficient experience to enable you to estimate correctly the minimum cost of the work, or what return is required to make it satisfactory? No, we cannot do that yet.

1580. You contend that the indirect benefits conferred by the discovery of artesian water more than counterbalance any expenditure incurred in connection with it? I think so.

1581. Has the discovery of artesian water in these outlying localities had the effect of opening up roads which before were impassable in dry weather? Yes, some of the roads were utterly impassable before.

1582. Thus the work has had the effect of attracting to Bourke a great deal of stock which would otherwise never have come there? Yes. This year, for the first time, stock has been moved from Milparinka to Wannaring.

1583. What extent of country will the road to Milparinka open up? It opens up the whole of the south-western corner of Queensland. Before, the direct trend of the traffic from that district was towards Wilcannia or Menindie or Cockburn, and so to South Australia; but I think that the effect of the opening up of the road to Milparinka will be that stock will come down to Tibooburra from the Warri or the Wompah, and turn into Bourke *via* Wannaring, or possibly, instead of going straight to Bourke, it will turn off at the 75-mile bore and go down to Louth, and so to Cobar, Byrock, or to Ginalambone. As you begin to get nearer to Bourke there are alternate roads leading towards the railway line.

1584. With regard to the experimental farm at Pera Bore; do you think that a good return could be obtained by selling the produce raised there to teamsters and others? Yes. I might mention that the settlers are now buying sorghum ensilage from the farm for horse feed.

1585. The Government have not yet decided to cultivate the land in order to obtain produce for sale? No.

1586. The farm is regarded simply as an experimental one? Yes, purely for the education of the people.

1587. If it proves successful is there not an extreme probability that the return obtained for the produce grown there will counterbalance the expenses of management? Yes. The Wagga farm more than pays for itself, and I see no reason why this farm should not do so, especially when we come to get our dried fruits in.

1588. In that district, in dry times, the carriers are compelled to carry feed with them? Yes. They will start out from Bourke with, say, 3 tons of loading and 1 ton of feed. If they could get the feed at the different bores they could carry so much more loading, as they would not require to carry feed.

1589. So that if feed were grown at these bores it would be a help to the carriers and profitable to the people growing it? Yes.

1590. But the whole matter is now in an experimental stage? Yes; though I believe that the possibilities of the western country under irrigation are beyond the wildest dreams of the people out there.

1591. Do you not think that the artesian water could be carried by means of gravitation over the surface of the ground more cheaply than water could be pumped from the river? Yes; you could probably put down a bore for the amount that you would have to pay for 2 or 3 miles of fluming.

1592. Experience goes to prove that irrigation by means of artesian water is as profitable, if not more profitable, than the system of pumping water from a river? Yes, and it competes with America in some degree, with the gravitation scheme.

1593.

J. W.  
Boulton,  
Esq.  
4 June, 1896.

1593. But the artesian bores in the district to which we are referring are not so numerous as to enter into competition with the scheme we are considering? No.
1594. You have no bores along the banks of the river? No.
1595. You are engaged in putting down bores along the principal roads leading into places like Bourke? Yes.
1596. And those operations have had the effect of opening up the country and making traffic possible which was impossible under natural conditions? Yes.
1597. *Mr. Clarke.*] Do you think that the locking of the Darling would be beneficial, apart from the question of irrigation? I should think it would be very advantageous to have an open waterway there.
1598. The scheme, if carried out, would give a good water supply to Bourke and to other places along the river? Naturally, the damming of the river would increase the supply of water.
1599. Is there a good water supply at Bourke at the present time? I believe that water is pumped from the river into a large tank, and is taken from that tank by means of gravitation for the reticulation of the town.
1600. *Mr. Loe.*] You consider that the principal crops that will be grown in that district are lucerne and fruits? Yes, and others I have named.
1601. Chiefly for local requirements? Yes.
1602. Would it pay to irrigate grass lands? I could not offer an opinion upon that point; but I know that it pays to do it in America. They have a canal there over 30 miles long, which is used to convey water for the irrigation of natural grasses; and there is a similar canal in Kern county. They have found that the irrigation of the natural grasses increases the carrying capacity of the country by 30 per cent.
1603. *Chairman.*] What is the depth of the soil at the Pera Bore? I think that it is from 2 feet 7 inches to 4 feet deep there.
1604. What is the nature of the subsoil? There is a calcareous nodular subsoil.
1605. Is there a sufficient depth of soil to meet the requirements of irrigation? The question was gone into, and we considered that the depth was sufficient. At Moree there is nearly 30 feet of beautiful black soil, with a gravel bed underlying it.
1606. Will you ascertain for us the depth of this soil at the various bores and the nature of the subsoil? Yes.
1607. *Mr. Wright.*] Is any irrigation being done at the Moree Bore? No.
1608. Which bore gives the largest discharge? The Euroka Bore, which has a discharge of about 3,000,000 gallons a day.
1609. What area of land would that supply of water irrigate? About 1,400 acres—possibly more.

Walter Scott Campbell, Esq., Chief Clerk, Department of Agriculture, sworn, and examined:—

W. S.  
Campbell,  
Esq.  
4 June, 1896.

1610. *Chairman.*] Has the use of artesian water for irrigation, in this colony, so far been satisfactory? Extremely so.
1611. So much so as to cause you to view the work with favour? Certainly.
1612. Are you prepared to express an opinion as to what will be the eventual result of applying this water to the soil? My idea is that the work will convert the western district into a paradise.
1613. You believe that the eventual result will be satisfactory? Certainly.
1614. What do you think is the future of the country west and north-west of Bourke, if it is irrigated? I think that country will have a magnificent future, and that thousands and even millions of people will be supported there. I think that that district would support a couple of millions of people, and I believe that 20 acres would be quite sufficient for a man and his family to live upon. I think that one point has been overlooked in calculating the distribution of water, and that is that with more cultivation less water would be required than is generally supposed. I heard from Mildura, yesterday, that in some places where they cannot get much water they have been working away with their ploughs and harrows, and they now find that they can do with less water than they at first thought possible. Therefore, I think that the calculations which have been made here are a little beyond the mark, and that the water supply from the artesian bores will irrigate larger areas than is supposed. I think that the people here do not know much about the proper use of the water yet. It was for that reason that I pressed hard for the establishment of an experimental farm at the Pera Bore, and I think we should go on with this work a little more before we encourage settlement too much, though I have no doubt in my own mind that the results will be most satisfactory. Of course we have had the advantage of the experiments which have been made at the Native Dog Bore, and one or two other places with which I have been connected from the beginning. I think that the results so far are very satisfactory, and that the mineral matter in the water will not affect vegetation prejudicially. As a matter of fact these mineral constituents are exceedingly favourable to the growth of some kinds of vegetables—cabbages, turnips, and so on.
1615. Where do you anticipate getting the necessary population. I understand that you have had difficulty in leasing the land at the Pera Bore? Yes, because people are not yet sure about what can be done. We have not been at work there for more than a year, and so have not had time to show them what can be done. I think in another two years the result there will be marvellous.
1616. And that the same thing will happen in our western district that has happened in districts in America formerly regarded as absolutely valueless? Quite so. The growth of population in places such as Southern California, has been wonderful.
1617. Is the country there as sterile as ours? It is frightfully sterile. My son, who was in charge of an 80-acre farm out there, has just returned, and he tells me that the alkali is something dreadful, and that walking over the ground you are covered with white powder. That alkali does not come from the artesian water, but was originally in the soil. In America they irrigate chiefly with water taken from rivers and other natural water courses.
1618. *Mr. Trickett.*] Have you had any experience of irrigation with water taken from the Darling? Not so far as the Department is concerned; but I have seen a great deal of irrigation upon the Darling on small areas which has been very satisfactory.

1619.

1619. Irrigation to what extent? Well, the areas were only small—perhaps half a dozen acres, perhaps 10 acres.

1620. Looking at the character of the soil near the Darling, do you think it would be possible to carry the water from the river for any considerable distance? So far as I remember the land at the back is lower than that immediately upon the banks of the river; but I have no definite knowledge on the subject.

1621. Have you any knowledge with regard to the carrying out of large irrigation works in any country? No; Mildura is the largest irrigation scheme we have in these colonies.

1622. Is it not a fact that before commencing large irrigation works surveys should be taken of the surrounding country, so that it may be seen how the water may be made available? Quite so.

1623. Do you know whether any steps of the kind have been taken in connection with the scheme now before the Committee? I have no knowledge upon the subject.

1624. All the irrigation schemes in this colony are on a very small scale? I believe that Mr. Wills Allen has attempted irrigation upon rather a large scale.

1625. What kind of crops would be likely to be grown between Bourke and Brewarrina, if the land there were irrigated? A great variety of fruits—oranges, apricots, figs, grapes, almonds, and stone fruits.

1626. How does the climate in that district compare with the climate at Mildura? I think they have 4 or 5 inches of rain more at Bourke than at Mildura.

1627. But would the climate there be favourable to the growing and drying of the fruits you have named? Yes.

1628. Is the temperature at Bourke the same as it is at Mildura? I think it is a little higher, and they do not get so many frosts there. I think it would be even more suitable for drying than the Mildura climate.

1629. Can you tell us whether irrigation would be likely to be carried on in order to improve pastoral country? The only objection I can see to it is the cost of pumping, which I think would be pretty considerable.

1630. You think the expense would be a deterrent? Not altogether.

1631. But it would be a considerable item? Yes.

1632. What would a man have to pay per acre for irrigation if he got the water from the Government? That is rather a difficult question to answer. I think that the people at the Pera bore should be able to realise from £15 to £20 an acre profit; but there are so many factors to consider.

1633. You have not gone into the question as to whether it would pay the Government to construct the proposed work? No.

TUESDAY, 9 JUNE, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.  
The Hon. CHARLES JAMES ROBERTS, C.M.G.  
The Hon. WILLIAM JOSEPH TRICKETT.  
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
JOHN LIONEL FEGAN, Esq.  
THOMAS HENRY HASSALL, Esq.  
GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of Locks and Weirs on the River Darling.

Cecil West Darley, Esq., Engineer-in-Chief for Public Works, Department of Public Works, sworn, and examined:—

1634. *Chairman.*] You have had an opportunity of seeing the plans before the Committee? Yes; I looked at the plans. C. W. Darley,  
Esq.  
9 June, 1896.

1635. You have previously had the question of locking the Darling under your consideration? I reported upon the subject of locking the Darling between Wentworth and Bourke in 1890, and I have a knowledge of the scheme now proposed.

1636. You have had an opportunity of reading the evidence in reference to this scheme which has been given by the Water Conservation Branch? I saw Mr. McKinney's explanation of his scheme.

1637. The view he takes as to the best way of bringing about the desired result differs from the way you suggested? His scheme is different from the scheme which I proposed six years ago.

1638. *Mr. Lee.*] The proposal is to place a series of locks and weirs in the River Darling at stated intervals between Bourke and Brewarrina;—have you had an opportunity of inquiring into the nature of the proposed works? I have read Mr. McKinney's statement, so that I know what he proposes to do.

1639. The Committee would be glad to have, in the first instance, your opinion upon the proposed method of constructing the weirs? My opinion is that movable weirs are not suitable for a river like the Darling? That is why, after very careful consideration, I proposed the construction of fixed weirs.

1640. What do you bring under the definition of movable weirs? Weirs that fold down or open to allow the water to pass.

1641. Have you seen the model of the shutter proposed to be used by Mr. McKinney? Yes; shutter weirs have been used in other parts of the world, but chiefly in France, on the Seine, where the conditions are very different from the conditions prevailing upon the Darling. The banks of the Seine are comparatively low. Its flood waters only rise 7 or 8 feet. Any higher rise than that would almost go over the banks, and, if the water level were seriously increased, the adjacent country would be flooded with every fresh. Therefore, fixed weirs are not admissible there. On the Darling, however, the summer level of the water is something like 40 feet below the top of the banks, and a weir 10 feet high would not seriously affect the flood waters. Speaking in general terms, the effect of such a weir would be that with every foot of rise in the river a mile above it there would be the rise of an inch upon the weir.

1642. After the water has risen a certain height over the weir, the weir ceases to have any effect upon it? For a certain number of feet the water on the weir will only be lifted about one-twelfth of the height to which

C. W. Darley, Esq.  
9 June, 1896.

which the river has risen a mile above the weir. When the water going over the weir reaches a certain height the water below the weir rises to the same level, and the weir becomes what is termed "drowned." If the water were 6 or 7 feet above the weir, the weir would not affect the surface. Taking an average section I estimated that a weir in the Darling 10 feet above summer level would only raise the maximum flood-water above the weir about  $1\frac{1}{2}$  inch.

1643. You are strongly of opinion that it would be inadvisable to adopt a movable weir? In my opinion, a movable weir of any form is open to many grave objections in a scheme of this kind. The first cost is only a portion of the ultimate cost, because it will require a considerable staff of men—it is very hard to say how many, but certainly not less than four—to manage the weir. With a flood coming down you could not send men long distances to attend to the weir. You must have them upon the spot.

1644. What would be the probable effect of floating timber and debris upon these movable shutters? I think that timber would cause a considerable amount of injury. That is the recorded experience of other countries. The shutters are always liable to be damaged by floating material coming down the river.

1645. Is there much floating material coming down the Darling at flood time? At times there is a good deal of drift-wood coming down.

1646. If the shutters of a movable weir were struck by drift-wood they might either be fractured or displaced? They would be left in an unworkable condition.

1647. You think that the shutters would be liable to injury? There would be a very great liability to injury from drift-wood.

1648. And if they were injured it would be a most difficult matter to replace them, and at the same time conserve the water in the river? Of course you could not repair the shutters until the water had fallen to a low level, and thus you would lose a great deal of water. You cannot conserve water very well in weirs of this kind, because you cannot make the shutters tight. These weirs would run dry in a very few months.

1649. Why? The shutters are only about 3 feet wide, and you must have a space between each shutter to enable you to work them.

1650. So that the leakage would be very great? It would be very serious indeed. The leakage would be more than the river was carrying. I do not think the shutters would hold up the water at all. On the Seine they had the shutters 4 inches apart, but there was so large a flow through that they narrowed the space down to 2 inches, which was as little as they thought safe. I find that a weir, such as is proposed by Mr. McKinney, if fixed with spaces of 2 inches between the shutters, would lose 160,000,000 gallons a day. Possibly smaller spaces between the shutters would be sufficient, but they have not attempted to adopt smaller spaces upon the Seine.

1651. Would it be possible to construct these shutters with an overlap? No; movable weirs are constructed in the old country where there is no great rise of flood water, but I can show you the statements of very eminent engineers which go to prove that they should not be constructed unless you are able to have an overhead bridge from which to work them. They are now giving up these shutters, and are adopting what is known as the roller or curtain shutter, which rolls up on to the bridge. When the curtain is rolled down, the weir is comparatively water-tight. I think, however, that an overhead bridge would be altogether inadmissible upon the Darling.

1652. It would be impossible? Yes. In every case where these shutters have been a success it is in places where they have been able to erect a bridge above the flood level, and where the maximum flood level is 6 or 8 feet above summer level. I do not know of a case where they have been successfully used in a river rising occasionally 20 or 30 feet above summer level.

1653. Can you quote any authority to support your testimony? This is what Professor Gaudard, a French engineer who has had much experience upon the Seine, says upon the subject:—

For weirs frequently raised and lowered a footway was generally adopted; now, from the moment that it existed and could render support to the needles, this simple attachment, sufficient for small heights, supplanted the Chanoine shutters. These shutters were still appropriate for navigable passes, but when their height exceeded 10 feet, it was advisable to replace the winch large by a movable footway, and hence arose the question of seeking to use the frames (Fermettes) as supports for the wall at the dam, and so dispensing with the props and trestles of the Chanoine system. This was what had been done by Messrs Boulé and Caméré; the needles being found too heavy, these engineers had substituted the more easily managed curtains, constituting formidable competition with the older shutters. The Tavernier system, with an upper fixed bridge, was more ambitious than those with the movable footways. It had been recommended for the Rhone, by Mr. Pasqueau, on account of the stones and gravel brought down by that river, impeding the lowering of the frames on the bed. This type of weir, in fact, did not allow of any delicate parts lying on the river bed.

Mr. L. B. Wells, in discussing the paper from which the above extract is taken, said:—

The author had, in 1880, questioned Mr. Wells' view of the trustworthiness of the French movable weirs; but seeing that French engineers were still altering their type, he felt certain there must be some good cause for dissatisfaction. The reports in 1873, by Messrs. W. Forsyth and W. R. Manning, M.I.C.E., to the Board of Public Works in Ireland, dealt with the needle weir, the water pressure weir, the pontoon-barrage, the drum weir, and the shutter weir, each of the systems being in use. The author stated that shutters had given place to needles, and needles to curtains, while now the need was acknowledged of a fixed overhead bridge for working the weir, to which the frames were hinged, not at the bottom of the river, as in the older weirs. The latter type commended itself to him; still the grave objection of a multiplicity of parts remained. These, he thought, would be liable to derangement, to damage by floating bodies, and to become unworkable during frost.

Mr. F. G. N. Stoney, who introduced one of the best forms of lifting weirs that has yet been introduced, says:—

Whatever form of movable weir was used, it should not shut into the water, nor down on the bed of the river when open.

Mr. Caméré, speaking of a weir put up at Pose, says:—

Its working had left nothing to be desired, and it had proved one thing that deserved to be recorded, namely, that no system of weir with parts lowered on the bed of the river, could have been capable of satisfactory working under such conditions as had occurred at Pose. In this case the quantity of debris of all descriptions—grass, branches, snags, whole trees brought down and arrested by the dam—was such as would have rendered almost impossible the working of any weir whose main parts were under water, especially as regards the frames.

The whole tendency is to discard weirs that drop into the water, and to adopt weirs drawing up to an overhead bridge. I found it very hard to get the opinion of engineers who have had charge of these works, and also to get a statement as to the number of men required to work the movable weirs. I find, however, in volume 60 of the Minutes of Proceedings of the Institution of Civil Engineers, that Mr. Howard Unwin

Unwin has made this statement, speaking of the Midnapore weir, which is constructed on a pattern similar to the Chanoine pattern, simpler in working, but more costly. C. W. Darley,  
Esq.

The back shutters were then raised by being hauled up, one by one, by a chain worked from a crab-winch fixed on a 50-ton barge moored in front of the line of shutters; the end of the wrought-iron strut behind dropped of its own accord into a recess on the floor as soon as the shutter was vertical. 9 June, 1896.

That part of the arrangement is exactly similar to what is shown by the model.

This operation was completed in two or three hours. The front shutters were then hooked down, and it was sometimes a tedious business, as the men were working up to their necks in water, and had to dive down to remove any silt or gravel which prevented the shutters from lying perfectly flat. After they were all in position, being weighted by a piece of kentledge, the disengaging gear was worked, and the hooks retained the shutters ready for the next operation. The working of the shutters took from ten to twelve hours, and the permanent establishment consisted of fifteen lascars, with a few extra coolies during floods to secure the plant on the weir. At all times it was a matter of anxiety to those in charge in case a sudden fresh should come down in the middle of the operation; but for some years it had been carried on successfully, and during the past season the shutters were worked without the slightest hitch or injury.

1654. Then, even with a large staff, the work appears to be carried on with great difficulty? Yes. That weir was a very long one, but the principle is the same in every case.

1655. The weirs proposed on the Darling are fairly long? Yes; but the difficulty remains the same whether the weir is 100 feet or 600 feet long. It is only the matter of a little more time. Mr. Vernon-Harcourt, speaking of the weirs on the Seine, says—

Similar weirs were erected about the same time for the navigation passes on the Marne, but a foot-bridge carried on movable frames was substituted for the barge to carry the crab for closing the shutters. This alteration was found so desirable that it has since been introduced at most of the movable shutter-weirs.

They were obliged to introduce movable weirs on the Seine to prevent the water going over the banks.

1656. In a stream the maximum rise of which has been obtained, it might be possible to erect an overhead bridge to enable you to work movable shutters, but where the maximum rise is not known you have no guarantee that your foot-bridge may not be under the water at a time when you want to work upon it? There would be no guarantee. I think that a foot-bridge is practically out of the question, where you have a rise of 40 feet. As an engineer, I could not recommend any form of movable weir in a river like the Darling.

1657. Not of any type? Not of any type.

1658. Even if you so arranged the shutters as to prevent leakage? No. On the other hand I think that fixed weirs would be found peculiarly suitable for the Darling.

1659. If a big flood were coming down the Darling, would the whole of these movable weirs be laid down by the water at one and the same time? One big flood would lay them all down.

1660. But would they all be depressed at the same time? Not necessarily at the same time. Directly a wave of a certain height passed over the weir, it would reach the shutters, and they would then have to be tripped.

1661. And the men in charge would have to take advantage of the falling of the water to replace the shutters? Yes.

1662. Under ordinary circumstances would a staff be required for each of the weirs? Yes; there would have to be a large staff at each weir. You could not move the staff from one weir to another quickly enough.

1663. The shutters would "feather" or tilt automatically? Yes.

1664. But manual labour would be required to replace them? Yes.

1665. You wish to accentuate the difficulties of replacing the shutters? You would have to get the shutters up again when the river commenced to fall in order to conserve the water. You would have to have men standing by in a barge to fish for them, and to pull them up, and in this country I do not think the work could be done with fewer men than four. You must have your barge very strongly moored in front of the weir, because of the current, and every shutter you put up would increase the strength of the current, so that if you were not careful you might have the barge drawn through.

1666. If any of the shutters were damaged a tremendous leakage would ensue before it could be repaired? Yes.

1667. How long would it take to empty the weir with the amount of leakage you speak of? I am only speaking of the experience on the Seine. I do not know what space Mr. McKinney proposes to leave between his shutters.

1668. *Chairman.*] Let us take it for granted that the space between the shutters is 2 inches, which, you say, experience has shown to be the minimum space that can be used? What I said was that on the Seine they had originally spaces of 4 inches, which they afterwards reduced to 2 inches. Allowing 2 inches between each of the thirty-three shutters, I calculated that 162,000,000 gallons per day would pass through the weir.

1669. How much water goes along the Darling at Brewarrina? I have seen the river when there was not anything like 160,000,000 gallons a day passing down at Bourke.

1670. Then your impression is that unless the shutters were closer together the weirs would empty themselves? I think so. At times the Darling is almost stagnant. In wet seasons, of course, you could let the water go through.

1671. *Mr. Lee.*] Let me now pass on to the question of fixed weirs. First of all, I should like to know whether a proposal to raise the water of the Darling 11 feet above summer level would be in keeping with the contour of the banks of the river? I do not see any objection to permanently raising the height of the water 11 feet.

1672. Would 11 feet be the limit? Experience shows that weirs put across a river at intervals do not raise the flood-level to any serious extent.

1673. You think that 11 feet would be a very safe limit to adopt in the Darling? I think so, the banks there being so high.

1674. How would you suggest that fixed weirs should be constructed? When I originally dealt with this matter I looked upon the Darling as rather too narrow to allow of the construction of weirs and locks at the same place in the bed of the river, and I might briefly state the reasons why I came to that conclusion. On the Seine they have invariably selected places where there are islands, and have put the navigable pass and lock on the one side and the weir on the other. But with a narrow river like the Darling, in which the flood water comes down with a velocity of 4 miles an hour, and sometimes more, a vessel

C. W. Darley,  
Esq.  
9 June, 1896.

vessel missing the lock entrance, might be swept broadside on to the weir and rolled over it, supposing the lock and weir were placed side by side. I found, however, that on the Lower Darling it would be possible to make the locks in the necks of the bends of the river, putting the weirs in the river itself. There may be places above Bourke where it would not be feasible to do this, but wherever possible, I should endeavour to make such an arrangement, in order to protect navigation, and to give the whole width of the river for the weir.

1675. The danger of which you speak would only exist when the river was in flood? Yes; but as you approach a lock, there will always be a draught, which, if you do not have your lines made fast quickly, will sweep a barge side on to the weir.

1676. *Chairman.*] The mouth of the proposed lock is against the by-wash? Yes.

1677. Do you think that it is a wise thing to have the by-wash near the mouths of the locks? I think it would be better away. Naturally there would be a strong flow to the pass, which might draw a vessel broadside round.

1678. *Mr. Wright.*] In constructing a weir, you would construct it below the level of the banks? Yes; the water would always pass over a solid weir.

1679. *Mr. Lee.*] You are of opinion that if it were determined to lock the Upper Darling, it would be wiser to place the weirs in one position and the locks in another? Where it could possibly be done, I should recommend that course.

1680. But would not the arrangement involve additional expense? I went into the matter some years ago, and according to my estimate, it would not be much more costly than the scheme before the Committee? The excavations could be made comparatively cheaply, and you would get more solid ground for the lock work.

1681. Do you know of other places where similar arrangements have been made? I do not know of any case where a river like the Darling has been dealt with.

1682. The conditions of the Darling differ very greatly from the conditions of other streams where locking has been adopted? Very much.

1683. Your opinions are based upon personal knowledge, and upon your experience of the Darling? I am speaking from my personal knowledge, and am giving you the conclusions I have arrived at from my own observations.

1684. If you adopted fixed weirs, the navigation as a matter of course would always have to go through the locks? Yes; except in flood-time when there was sufficient water going over the weir.

1685. Of what material would a solid weir be constructed? Of concrete chiefly.

1686. Would not the drift timber affect such a weir? No; a concrete weir will stand a very heavy impact. We have two such weirs upon the Nepean and the Cataract. We have had 10-ton rocks pass over the Nepean weir, and have had 70 feet of water passing over it without injuring it.

1687. Do you know anything about the weir which is being constructed at Bourke? No.

1688. It is not under your supervision? No.

1689. Would there be any difficulty in obtaining suitable foundations in the Darling for solid weirs? You would have to select rocky bars, and these the surveys show to exist at frequent intervals.

1690. Would it be fair to assume that concrete weirs upon such a foundation would stand the wear and tear of every flood? They would be quite safe against floods. Special precautions would have to be taken to prevent the bank from being washed away at the ends of the weir, but similar precautions have to be taken in connection with all river work.

1691. Have you examined the design of the proposed lock placed before us? I have looked at the sketch of it.

1692. Are you able to tell us whether it is designed on modern principles, and would answer the conditions of the Darling? There is one matter which I cannot help thinking has been overlooked. Mr. McKinney states, in page 3, of his evidence:—

When the river rises to navigation level each shutter will be pulled forward till the sloping strut is disengaged from its rest, and they will then be allowed to fall back flat on to the sill. During floods, the whole weir will thus rest flat on the river-bed, and the lock-gates will be opened, so that the only part of the work which will in any way obstruct the flow will be one lock wall.

I have had a great deal to do with locks, but I am quite unable to see how you could open the two lock-gates at the same time.

1693. Must the lock-gates open upstream? Yes; you could open either the upper or the lower lock-gates, but I cannot see how you could open both pairs of gates unless you applied very great force.

1694. From an engineering point of view, you are of opinion that there is some mistake? I say that with that design navigation through the lock would be impossible at a certain stage of the river level.

1695. *Mr. Black.*] But even if the flood-gates could not be opened, navigation would not be prevented, because the weir would be down? No.

1696. *Mr. Lee.*] Would the water impounded by the shutters be sufficient to prevent the opening of the two lock-gates? You could open one pair of gates, and leave them open, but there would be a head then against the other pair, and a very small head would prevent you from opening these gates. You could not open both pairs of gates at the same time whenever the river was running.

1697. But is not the proposal to leave both of the lock-gates open in flood-time? Yes; but I do not know how you are to open them.

1698. They could be opened before the water rose to a certain height? You could not open them both at the same time, so long as there was any flow in the river. You must have the same level of water on both sides of the gate before you can open it. I have spent a good part of my life upon canals, and I know something about the working of lock-gates.

1699. If the shutters were down, would it not be possible for the men to open the gates before there was any great pressure? If you had sufficiently strong machinery, you could pull the gates open against any pressure, but under ordinary circumstances you could not open them.

1700. You assert that it would be an engineering difficulty to open these gates if there was a flow of water down the river? If the water on one side of the gate is an inch higher than the water on the other side, there will be considerable pressure against the gate. If the difference in height is only very small you may open the gates an inch or two, but the moment you do so you create a strong current, which slams the gates shut against you. If you let go the weir, you would have a quick flow in the river, and you would have a head of several inches between the gates. You could open either the upper or the lower pair of gates, but you could only open one pair at a time.

1701.

1701. Do you say that the design from that point of view is defective? No, I do not say that; but you would not be able to make use of the lock to allow water to run down the river. You would have to content yourself with allowing the water to pass over the weir.

C. W. Darley,  
Esq.  
9 June, 1896.

1702. But do I understand that in times of partial flood, when there is only sufficient water passing down to create a current, and not sufficient to make it necessary to let go the weir, there will be an engineering difficulty in opening the lock-gates so as to allow of vessels passing through? No; you could always do that, but you could not open both gates at the same time. In letting vessels through a lock you open one pair of gates at a time. Whenever the water rose over the top of the lock you would not be able to use it, and vessels would then have to go over the weir.

1703. Do I understand that no matter how the weirs were constructed, or how the locks were constructed, there must be a stage in flood-time when navigation would be suspended? I think I am wrong in saying that navigation would be suspended. Navigation might not be able to go through the lock, but it might possibly go over the weir.

1704. Will the lock be higher than the weir? If the water is over the lock I think navigation will be able to go over the weir, though, of course, you would have to let the shutters go. The gates are designed on the old balance-beam principle, which has been adopted on all the canals in the old country.

1705. What is your opinion as to the policy of locking the Upper Darling? When I reported upon the locking of the Darling generally, I pointed out that I could not anticipate any immediate return from the work; but my general impression is that it would provide a very valuable and extensive piece of water for inland navigation, which could be made serviceable at a comparatively small cost. In no part of Europe have 1,000 miles of inland water been opened for navigation for anything like so small a sum as the locking of the Darling would cost. Of course, the colony may not be ripe for the work yet, but the day must come when it will be very desirable to provide for inland navigation. Nothing tends to settle population more than cheap carriage, and before the days of railways America was largely developed by the improvement of her rivers and canals. I look upon this as a national work, though I do not anticipate that it could be made to pay. I do not know that undertakings of this class pay, or are expected to pay. It is for wiser heads than mine to say whether the day has come when this work should be undertaken, but I think that the day will come when it must be undertaken. With regard to irrigation, I have my own opinion about that. I think that to some extent navigation and irrigation are antagonistic. If you use all the water for irrigation, you will not have any for navigation. Sufficient water would be conserved to allow of a moderate amount of irrigation, but with large pumping schemes you would not have sufficient water for navigation.

1706. Since you first reported upon this subject, the question of opening up the country with railways, and of watering it from artesian bores, has come to be more understood;—does that cause you to modify your opinion in any way? Only so far as it lessens the possible usefulness of locking the Darling for irrigation purposes. I think it would be cheaper to utilise the water from the bores for that purpose, and those who have paid special attention to the matter say that the artesian water will last. If irrigation is extensively practised out there, population must increase, and then better means of conveyance will be required. This better means of conveyance you would obtain by locking the river.

1707. It is proposed to construct six weirs between Bourke and Brewarrina;—could the same object be obtained with fewer weirs? I propose to have 10-foot lifts, and that would allow you to have only four weirs, instead of seven, between Bourke and Brewarrina.

1708. *Chairman.*] Would not a 10-foot lift mean a 15-foot weir? In my original scheme I proposed to have 16-foot weirs, giving a 10-foot lift, as you will see by referring to Appendix 53 of my report.

1709. Having in view the friable nature of the soil upon the Darling, do you think that in flood-time the water would cut a channel round the ends of the weirs? We should have to take proper precautions to prevent that. In locking the whole river there would be a very large saving in having 10-foot lifts, instead of any lower lifts.

1710. Is it necessary to have as many weirs between Bourke and Brewarrina as are allowed for in the scheme before us? By adopting 10-foot lifts you would save three weirs, and you would conserve more water.

1711. What would be the effect upon the surrounding country? There would be no bad effect. A weir 10 feet high in the bed of the Darling would only raise the flood-level about 1½ inch.

1712. Would four weirs conserve sufficient water to make the river navigable right along? Four weirs would give the same minimum depth as is proposed to be given by the scheme before the Committee, and would impound 117 per cent. more water.

1713. Would the cost of the scheme be increased or decreased? It would be decreased, because there would be fewer weirs to construct.

1714. But the weirs would be of larger dimensions? Yes; but foot for foot they would be cheaper. In my report I showed two designs, subject to alteration hereafter as circumstances may require.

1715. If you were submitting designs for the work under consideration, you would propose four weirs? Yes.

1716. *Mr. Fegan.*] What would be the life of a lock in the Darling? If properly constructed the only thing that could perish would be the timber gates, and there are lock-gates in the old country which have been in use for over 100 years. The lining planks might require repairs. The life of any perishable part of the lock would be the life of good ironbark timber.

1717. Therefore, the first cost would be the only cost? Yes; and one man would be quite sufficient to attend to each lock.

1718. But, if the scheme before us were adopted, three or four men would have to be employed at each lock, or twenty-eight men altogether? Yes. Of course you might make use of the men about the neighbourhood in some other way, but I do not think you could handle a movable weir with fewer than four men as a permanent staff, with extra men in flood-time. I have had no personal experience of these movable weirs, so that I do not know how few men could work them. You must have a punt, which must be strongly anchored, and you would require men to lay out the anchors. I think that four would be the minimum number required.

1719. Do you know the country about the Darling? I have been to Bourke, and I have been to Wentworth, but I have not been along the river much.

1720. Do you think that the construction of locks and weirs below Bourke would be the means of sending our trade to South Australia? I think that the subject is one upon which the Railway Commissioners should have

C. W. Darley, Esq., have a voice, and that tolls should be charged, which would prevent much trade from going out of the country.

9 June, 1896, 1721. You do not believe in having a free river? I think that it would be perfectly legitimate, if the colony undertook the large expense which would be necessary to carry out the work, to take such steps as would prevent her trade from being injured. The up traffic might be allowed to go through free, but the down traffic should have to pay tolls.

1722. You would make a difference between the up traffic and the down traffic, so as to give trade to the railways? Yes.

1723. Have you been able to give much attention to the subject of irrigation? Not much.

1724. *Mr. Hassall.*] The movable weirs in France and in other places have been adopted where there is a constant flow of water? In nearly every case.

1725. They are used to keep the water at a sufficient height for navigation? Yes; but the loss by leakage is not a serious matter there.

1726. The water passing down those rivers would not contain so much sediment as the Darling water contains? The Darling water contains a great deal of sediment.

1727. Therefore, a movable weir in the Darling would probably be silted up? No; because I think the velocity of the water would prevent the sediment from accumulating; but bits of stick and other things might settle down and cause trouble. I would not anticipate much difficulty from the sediment contained in the water.

1728. But with movable weirs in a river like the Darling you would gradually lose all your water by leakage? I think that in a long dry season the river would fall back to its normal low-water mark.

1729. The Darling practically dries up at times? Yes.

1730. Therefore, you do not think that the movable weir would be suitable for that river? I do not.

1731. I think you said that fixed weirs would be constructed of rock and cement? Yes.

1732. There would be very little danger of such weirs being injured by floating timber? None whatever.

1733. There would be no obstruction to traffic;—when the river was high the traffic would go over the weir, and when it was low it could go through the lock? Yes.

1734. Would the stream ever be too strong to prevent the working of the locks? No; you could always work one gate at a time.

1735. As a practical engineer, you think it would be inadvisable to go to the expense of constructing movable weirs? As an engineer, I would not recommend it. I might mention that the piers of the Bourke bridge offer almost as much resistance to the water as a weir such as I propose would offer.

1736. You think it would be cheapest, and a better form of construction, to have the weirs in the bonds of the river and the locks across the necks of the bend? I think so; in some places it would save 2 miles to go through the lock.

1737. Do you think that the work could be done as cheaply upon that plan as upon the plan submitted to the Committee? The whole work could be carried out as cheaply. While I would construct very substantial weirs, I would make fewer weirs than are proposed in the scheme before the Committee, and the maintenance would be less.

1738. You would only require a lock-keeper at each lock, who would have the assistance of the boat hands when necessary? Yes. I know of places in the old country where there are no lock-keepers at all. There is one place in South Wales where there are seventeen locks in 4 miles of canal, and, although there is a very heavy coal traffic upon that canal, there are no lock-keepers employed. The boatmen do all the work themselves. Out on the Darling, however, you would have to have lock-keepers. I made my original estimate pretty full, and I have revised it by using the prices adopted by Mr. McKinney. Mr. McKinney makes his six locks cost £121,000, and I would make four locks cost £110,000.

1739. And you think that four locks would answer the purpose of six? Yes.

1740. The weirs being made a little higher? Yes.

1741. *Mr. Roberts.*] Will you explain the statement that the Darling could be rendered navigable for less than has been paid in Europe to render similar streams navigable? Well, the average fall in the Darling is only 3 inches to the mile, so that the locks could be placed 40 miles apart, whereas upon most of the European rivers they have had to put their locks much closer together. I cannot find any instance where navigation has been opened up for 1,000 miles for as little as it would cost on the Darling.

1742. Do you think that the Government would be able to collect tolls upon the Darling? I pointed out in my report that I did not anticipate that the tolls obtainable would be sufficient to pay interest upon the expenditure.

1743. Any benefit that would accrue from the work would be an indirect benefit? Yes. In Europe they very rarely charge tolls at all. On all national canals no tolls are charged.

1744. That is especially the case in France? Yes; the canals are all free there. The State does not look for a return.

1745. I think it is fair to assume that no direct revenue would be obtained here? I do not think that the country would obtain any direct return worth speaking of.

WEDNESDAY, 10 JUNE, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.  
 The Hon. CHARLES JAMES ROBERTS, C.M.G.  
 The Hon. WILLIAM JOSEPH TRICKETT.  
 HENRY CLARKE, Esq.

CHARLES ALFRED, LEE, Esq.  
 JOHN LIONEL FEGAN, Esq.  
 THOMAS HENRY HASSALL, Esq.  
 GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of Locks and Weirs on the River Darling.

Cecil West Darley, Esq., Engineer-in-Chief for Public Works, Department of Public Works,  
 sworn, and further examined:—

1746. *Chairman.*] Do you desire to make any statement before the Committee proceed with their examination? I think it is due to the Committee that I should say a little more in defence of my suggestion that fixed weirs should be adopted in the Darling. In my original report I expressed the opinion that fixed weirs should be placed in the Darling in preference to any form of movable weir. The objection has been raised to fixed weirs that the river is apt to silt up behind them, but that has not been the experience in England upon the Severn, the Weaver, and the Thames, where fixed weirs have been very largely used with the most complete success. It has been found, indeed, that the presence of a weir, instead of tending to cause a river to fill up, creates a scour, which deepens the river; and, as bearing upon this subject, I should like to read a statement which occurs on page 75, vol. 60, of the Proceedings of the Institution of Civil Engineers. Mr. W. Parkes, quoting Mr. Leader Williams, the engineer of the Manchester Ship Canal, says:—

C. W. Darley,  
 Esq.  
 10 June, 1896.

"At Holt, an old barge, which had been laid up as useless by the contractors, got adrift, and sunk in 10 feet of water, 20 yards above the weir. It continued undisturbed during the short-water season, but the first heavy fresh raised it from the bottom, and laid it upon the upper sill, there not being sufficient water to carry it over. Another proof of the uninterrupted action of the undercurrent is that the bottom of the channel, immediately above the weirs, not only maintained its original depth, but has been scoured out in some instances to a depth of 2 feet." It was, therefore, evident that two or three years after the works had been completed there was nothing of the evil which Mr. Walker had anticipated. In place of the accumulation which he expected to find there was actually a deepening, and this barge was brought up by the flood and carried away to the weir.

There have been many similar cases which illustrate that the effect of the weir is rather to deepen than to shoal the river above them. Further on Mr. Parkes, again quoting Mr. Leader Williams, says:—

"On comparing the original section of the river, made in 1842, before the weirs were erected, with a series of transverse soundings taken at 16 feet from the head of the weir, it was found that the depth of the channel had been actually increased 3 feet to 5 feet. On taking longitudinal soundings 1½ mile up the river it was again found that the depth had been increased the whole distance 3 feet to 5 feet. The same effect had been produced in the whole of the pools between the weirs; the channel, indeed, was deepened to such an extent that the banks which had stood for many years previously had in some places fallen in from the increased energy of the current having scoured out the bottom." This was some fifteen or sixteen years after the weirs were erected, and surely there was plenty of time during that interval for the anticipated deposit to have taken place if there had been any tendency towards it; but the tendency was evidently in quite an opposite direction, namely, to scour out the river.

1747. What is the reason for this scour? The velocity of the bottom current is slightly increased above the weir. Mr. J. T. Harrison, an eminent engineer in the old country, and a man of long experience in harbour and river works, makes this statement:—

Some years ago he had occasion to consider carefully the action of the weirs on the Thames, Severn, and other rivers; he therefore ventured to offer a few remarks on the subject. One great advantage of fixed over movable weirs was that they were self-acting. True, Mr. Vernon-Harcourt pointed out that movable weirs might be "to a certain extent made self-acting"; but the movable weirs which he described were not generally so, and when required to be moved by manual or other labour they were open to serious objection. They were at times kept shut until mischief was done, or they were opened without proper notice being given to those who had charge of the weirs below, and serious injury was done by the artificial flood thus created, and the water overflowing the lands below. There was a notable case of this mischief at Great Marlow. Fixed weirs, properly constructed, were not liable to such contingencies. The prevention of land-flooding on many rivers in England had become a matter of urgent importance, and the great question was, could these floodings be prevented without interfering with, or doing away with, the navigations and the mills, for the benefit of which they were employed? His conviction was that fixed weirs, properly constructed, in connection with those river improvements, necessary for navigation, and desirable even for mills, deserved the merit claimed for them "of actually increasing the rate of discharge and diminishing damage from floods."

I should also like to read a note by Mr. Baldwin Latham:—

Fixed weirs might be used in some rivers without detriment, provided the banks of the stream were high, and the water was impounded at a level well below the surface of the adjacent land.

That touches a point I wished to impress upon the Committee yesterday. On the Darling we have high banks, and the water is impounded well below them. It was the absence of such conditions that compelled the French engineers to adopt movable weirs. On the Seine the banks are low, and they could not afford to raise the flood-level. On the Darling, however, if we raise the summer level in steps of 10 feet, it will not affect the flood-level. It is for this reason that I think that fixed weirs would prove eminently suitable on the Darling, and thus the costly maintenance, and still more costly management of the movable weirs, would be saved.

1748. Shutter-weirs have been adopted to meet the case of rivers exactly the reverse in their conditions from the Darling? Yes, to meet the case of rivers having low banks.

1749. *Mr. Black.*] Do you think it would be possible, by flanging the shutters of a movable weir, to prevent the escape of water, or would that arrangement be dangerous when you were lowering the shutters? You could not have flanges, because the shutters must pass over each other at all angles. You could not possibly put any kind of flanges on the shutters.

1750. Could not the difficulty be got over by having movable flanges? It would be got over by caulking up the weir for that matter, but then the weir could not be operated in case of need.

1751. Even if movable flanges were adopted the amount of supervision that would be required in order that flood-water should be permitted free passage would make the system too expensive? Any attachment of that kind would want to be managed with great judgment, so as to allow of the weir being operated when a flood came; but the whole advantage of movable weirs is to have them automatic.

1752.

C. W. Darley, Esq., 1752. What space would it be necessary to have between the shutters in order to allow for the swelling of the wood? On the Seine they originally allowed 4 inches, but they afterwards reduced the space to 2 inches.

10 June, 1896.

1753. That space would be diminished by the swelling of the wood? It is not so much the swelling of the wood that has to be taken into account, but you cannot make a nice mechanical fit with shutters which are resting on the bottom of a river. A little tilting of a hinge, caused by a stone or piece of stick getting underneath, would throw one shutter over on to its neighbour, and that would prevent two shutters from acting.

1754. Yesterday you said that when the river was running 4 or 5 miles an hour a boat missing the lock might drift against the weir, and thus be overset;—if the river was running at that rate, would not the shutters of the weir be down? The shutters of the weir do not fall until there is a certain height of water passing over them. I was referring to the first of the flood-water. The floods come down the Darling in a series of waves, running at the rate of about 4 miles an hour. The navigation pass would be open, so that there would be a considerable draught close to the lock, and through the pass. This might catch a boat, and swing it round, and there might not be enough water upon the weir for the boat to pass over, in which case it would lodge on top of the "feathered" shutters.

1755. Do you not think it would be possible for the captains of river boats to make fast to the banks until the danger was over? When they are going down stream they like to take advantage of the floods. On a journey of 1,000 miles they would not like to tie up and lose the flood.

1756. But under certain circumstances it would be better to go slowly and to avoid danger? Yes; but I look upon the river as a public highway, and we have no right to do anything to it that would put a serious obstruction in the way of vessels going down it. If we constructed works which would make it necessary for the shipping to tie up until the flood ceased, I think we should be doing an injustice.

1757. Did I understand you to say that shutter-weirs were in use on the Rhine? I did not mention the Rhine—I mentioned the Seine.

1758. Is the Seine, where these weirs have been constructed, a swiftly-running river? Not very. It is, to some extent, a tidal river.

1759. How fast does it run? I do not know what the velocity of the Seine is. There, in most cases, they have placed the locks on one side of an island and the weirs on the other side. They have, as far as possible, selected places where they could keep the locks away from the weirs.

1760. The Seine has not the tortuous course of the Darling; it would not be possible to cut across bends there? No; but there are a good many islands or middle grounds, and in a good many cases the locks take one channel of the river, and the weirs the other. It is a wide, flat river, with shoals and islands in the middle of it.

1761. Is there, among the appendices to your report, a plan of any locks and weirs proposed to be constructed between Bourke and Brewarrina? No; my report only dealt with the river between Wentworth and Bourke.

1762. The river pursues the same tortuous course above Bourke as below it? I have not studied the matter, but I know that there are some bends there. I cannot say that suitable sites could be selected for such locks and weirs as I propose on the lower river. If such sites could not be found, you would be forced to put both the locks and the weirs in the channel of the river.

1763. What is the average length of locks when constructed parallel with the course of the river? In the proposal before the Committee I think the length is 200 feet. In my proposal the length is 132 feet.

1764. But what about the locks you proposed to construct across the necks of bends? They would only be 132 feet long; but there would be a canal giving an approach at each end which would vary in length according to the width of the bend.

1765. Locks constructed in the middle of bends would not be more expensive, and would probably be less expensive than locks constructed in the bed of the river? I think that the lock itself would be less expensive, but there would be more excavation to do. That, however, could be done cheaply.

1766. The construction of the canals would be an additional expense? Yes.

1767. The canals would be very expensive where a distance across a bend was very great? In none of the cases referred to in my report is the distance very great. I think that the place of which a plan is shown in Appendix 52 is one of the widest bends.

1768. What would be the length of the canal there? About 1,500 feet.

1769. How much soil would have to be removed in the construction of that work? I have no information with me now, but I can supply it.

1770. Would the soil removed be used for an embankment? My intention was to utilise it to fill up some lagoons, and to raise the ground in the neighbourhood.

1771. Would the lower end of the canal be empty of water, except when the lock was opened? No.

1772. Then it would be below the level of the river? It would be 6 feet below the level of the river.

1773. When the river was at its normal height, both ends of the canal would be full of water? Yes; so that shipping could navigate the canal.

1774. Is there any danger of locks, such as you propose, being rendered useless by the river changing its course? I do not think so. You can always watch for that and prevent it.

1775. Is there not danger, in cases like the Darling, of the river changing its course in flood-time, especially if it meets any obstruction? If a river took a short cut above the lock and weir, that would render them useless, but it might occur in any case, and steps would have to be taken to prevent it.

1776. But would not a fixed weir, being a permanent obstruction, increase the danger? Not at all, because we do not materially raise the flood-level. I showed yesterday that a weir, giving a 10-foot lift, would only raise the flood-water  $1\frac{1}{4}$  inch. Of course, if we saw that the river showed a tendency to cut through the bank we could stop it.

1777. You could prevent it? Yes; we could put a wall across wherever the river showed that tendency.

1778. But you could not prevent it in time of flood? The Darling never alters its course in one flood. The Hunter, which runs through much softer country, does not alter so quickly as that unless the bank has been cut into. Then it must be borne in mind that my locks would be placed in the cut-off where the river would be likely to flow, and would be protected by concrete work. Once the river crossed the lock it would keep to the channel, because the material excavated from the lock would make a bank on either side above flood-level.

1779. Is there any danger of the earth round the walls of the lock being scoured away by the action of the water in flood-time? There would always be that danger with any structure placed in the river, if it were only a pile bridge. We should have to take precautions against it.

1780. Is not the danger so great as to make the desirability of constructing locks in this fashion very doubtful? I do not think so. It is simply a matter of adopting proper precautions.

1781. You think that the danger is not so great as to make your scheme inadvisable? I do not think so. I do not think that there is more danger in connection with my scheme than in the scheme before the Committee, if so much.

1782. You said yesterday that if the scheme before the Committee were carried out navigation would, at certain times, be blocked, because it would be impossible to open the lock gates, and the flood-water would not have risen a sufficient height to lower the shutters? I was explaining to the Committee that it would be impossible to open both lock gates at the same time, unless the river were almost stagnant.

1783. Would it be possible, under your system, to open both lock gates? No; there would be no necessity for it.

1784. Then the navigation would be suspended in that case too? 'No; because when the water is running over the top of my lock gates navigation across the river would be possible. I referred to the matter yesterday because of a statement in Mr. McKinney's explanation of his scheme, which I read to the Committee. The difference between the height of my lock gates and the height of my weir would be very much greater than the difference between the height of Mr. McKinney's lock gates and the height of his weir. When my lock gates were submerged there would be something like 12 feet of water passing over the weir.

1785. Then is your weir so much lower than the proposed shutter weir? No; but my gates are higher than Mr. McKinney's gates.

1786. I understood you to say yesterday that with Mr. McKinney's scheme there would be a stage in flood-time at which navigation would be impossible? I only remarked incidentally that, having looked at the plan, I believed that there would be a stage at which navigation might be stopped for a time.

1787. Under certain circumstances, I suppose that would be true of any scheme? Not with higher lock gates.

1788. Then if the height of the lock gates in the system before the Committee were increased the difficulty would be got over? That would necessitate the recasting of the scheme to a great extent.

1789. *Mr. Humphery.*] From a return laid before the Committee, it appears that the river Darling was open for navigation for eight months in 1886, for nine months in 1887, for nearly the whole of 1890, for the greater part of 1891 and 1892, for nearly the whole of 1893, and for a great part of 1894. It appears to me that the solid advantage offered by Mr. McKinney's proposal, as compared with your scheme, is that when the river is at navigable height there would be no necessity to use the locks? But at the same time you would be losing the water which it is proposed to impound for irrigation purposes.

1790. That would not matter whilst the river is not running below the level of the tops of the weirs? Well, if there were any objection to the use of locks, there might be something in that.

1791. Would you have six or seven locks between Brewarrina and Bourke? I would only put in four.

1792. Would it not be a great convenience to be able to dispense with the locks for a long period in each year? The locks could only be dispensed with in flood-time, and the floods do not last very long.

1793. What depth of water would be required in the river to render it navigable? Somewhere about 8 feet.

1794. According to the report before us the river was at that height for the periods I have mentioned, without the use of weirs? There can be no possible objection to the use of locks, because a vessel can pass through them with very little delay. I do not see that there is anything gained in the way you suggest.

1795. Would there be any difference in the annual cost if it were found necessary to use the locks during only (say) half the year? There would be a larger saving where you had a fixed weir, because then you would have to employ only one man at each place for the whole year.

1796. In your opinion there can be no comparison between the fixed weir and the shutter-weir system? That is my opinion.

1797. It has been suggested by Mr. McKinney that it would be possible to close the apertures between the shutters if the water were leaking away very fast? I think that something might be done in that way; but you would have to be careful that you did not prevent the working of the shutters in flood-time.

1798. In a report on the subject, to the Minister for Works, it is stated that the construction of high weirs cannot at present be entertained, and that the construction of fixed weirs, or of works of any kind which would interfere in any degree with the flood section of the river, would involve much risk and expense;—what is your opinion with regard to that? I have expressed the opinion—and I have shown that it is the opinion of many eminent engineers—that there is no objection to fixed weirs. I think that the experience of the old country is worth more than mere expression of opinion out here. Experience elsewhere shows that there is no objection to fixed weirs.

1799. Touching the construction of locks, it is stated, "The velocity of the current across the neck of a bend is greater than that of the normal current of the river, and, consequently, there is a tendency to erosion in the former case which would have to be guarded against in the whole length of a lock cutting in such a site. Under any circumstances this would involve a heavy outlay; but when it is considered that, generally, such cuttings would be in friable alluvium, and that the land on both sides of the cutting would be below flood-level, it is difficult to see where such outlay would end?" I would point out that the material excavated from the canal would raise the banks above flood-level, and prevent that crossing. 1800. It is further stated, "If the lock walls in such a position were carried above flood-level the obstruction thus presented to flood-waters would create a tendency to scour behind these walls as well as their down-stream ends, so that in every flood precautions would have to be taken to prevent the formation of channels across the bend at both sides of the lock channel." What remark have you to make upon that statement? Wherever you construct a lock you must observe certain precautions, but I think that you are more likely to get solid and firm ground in the middle of a bend than in the bed of a river. There is risk to be provided against whenever you undertake any form of construction in or near a river, but I think that in this case the risk would be less when the lock was constructed in the middle of a bend than when it was constructed in the bed of a river.

C. W. Darley, Esq.  
10 June, 1896.

1801. This is another quotation, "If a permanent weir were constructed in the river channel, and a comparatively small channel cut through the neck of a bend adjacent to the weir, it is evident that a strong tendency would be created in the river to enlarge the cutting across the bend"? The cutting is again blocked by the work connected with the lock. If the water rose over the lock gates it would be concentrated in the channel formed by the banks of the canal.

1802. Yesterday you spoke about there being a risk of vessels being drawn against the weir, supposing the proposed scheme were carried out. I find a sentence to this effect, "The only objection that can be raised to the arrangement of having the lock and weir combined is that steamers or barges might be drawn against the weir by the current. This objection, however, does not hold good, as the weir would be opened before the depth of water on its crest exceeded 2 feet, and there would be almost still water down to the lock gate." Does that answer your objection? That is not in accordance with the design which I looked at, because there is an open pass between the weir and the lock wall in which there would be a strong current. Before the shutters tilted the water would be running over the weir with very considerable velocity. If there were only 6 inches of water going over the weir the velocity would be very considerable, and the shutters will not feather until the water rises 6 inches or more over the top of the weir.

1803. Therefore you think that your objection holds good? Yes. Apart from the weir, two passes are shown through which the water would run with great velocity.

1804. With regard to the item of cost, your estimate includes £250,000 for dredging the river and £25,000 for snagging and clearing the river banks;—would any part of that expense be chargeable upon that portion of the river between Bourke and Brewarrina? The report to which you refer deals only with the river between Wentworth and Bourke.

1805. Would any expense have to be incurred in snagging and dredging the river between Bourke and Brewarrina? That will depend upon the depth required. With high weirs less dredging will be required than with the low weirs.

1806. Do you think that provision should be made for that expenditure in an estimate of the cost of the scheme? I think that something should be allowed for the improvement of the river.

1807. What do you think would be a fair sum to allow? I do not know. I have not seen a detailed survey of the river, nor have I been on it above Bourke.

1808. In the report to which I have already referred, mention is made of a dam constructed at a cost of £1,600 on the Tally Walka, which runs through part of Killara Run. When the flood of 1879 occurred, a new channel deeper than the old one was cut by the water in one day, and the water flowed past the dam;—would a similar occurrence be as probable in connection with your scheme as in connection with Mr. McKinney's scheme? You have the same risk with every construction you make, and you must take precautions against it. Many of the dams made by the squatters up country do not allow of proper provision for the by-wash. You must design your work properly, and take every precaution against injury.

1809. Risk will exist whatever system be adopted? Yes; it is common to all systems.

1810. *Chairman.*] Do you know anything about the Menindie dam? That dam was made under the most extraordinary circumstances. There was a great outcry at the time in Sydney about the necessity of finding employment for labourers, and it was said—I think by the Member for the district—"If you only put a dam at Menindie Lake you will conserve a vast quantity of water." Therefore, although there was then a very high flood in the Darling, some 100 men were sent to Bourke, and then down the river to Menindie, to make the dam. If any one had a difficult task, it was the engineer who had to construct that dam upon a river in high flood. The dam had to be made by tipping bags of sand into the river, and, considering the circumstances, has been a very fair success. It is only fair when speaking about the thing as a failure to remember this explanation as to the circumstances under which it was constructed. I believe that a good part of the dam is still holding, but another channel has since be deepened.

1811. *Mr. Hegan.*] When was the dam made? About 1884, I think; but I really forget the date.

1812. *Mr. Humphery.*] In any case, a similar result would not be likely to occur on the Darling? No.

1813. You say that if fixed weirs were constructed only one man would be required at each lock? One man would be sufficient for each lock and weir.

1814. What is your lowest estimate of the annual cost of maintaining the proposed locks and weirs, movable shutters being adopted? I have had no experience of the cost of maintaining and managing movable weirs, and I do not think that many engineers in this country have had such experience. Yesterday, however, I quoted from a report by Mr. Unwin, who has had charge of one of these weirs in India, and who speaks of a permanent staff of fifteen lascars being required, with extra men in flood-time. Assuming that one European is the equivalent of four lascars, I think it would be safe to say that, considering the work to be done, at least four men would be required on the Darling. All the engineers who have had the management of these weirs speak of their liability to get out of order. Every log coming down the river is apt to injure the shutters, so that a certain amount of expense in connection with repairs must be anticipated.

1815. The annual cost of maintaining a system in which movable weirs are used would be much in excess of the cost of maintaining a system of fixed weirs, is that so? That is my opinion.

1816. In your report in 1890 you estimate the cost of the locks to average £23,000 each and weirs £5,000? I estimated that each set of locks, weirs, and lock-keepers' houses would average £28,400.

1817. Are you prepared to reduce that estimate now, having regard to altered conditions? You could take £2,000 off each set. I made an approximate estimate, based upon current prices of material and labour, according to which it would be possible to construct each set for £26,300.

1818. Then the cost of locks and fixed weirs required between Brewarrina and Bourke would be about four times that? Well, Mr. McKinney has six lifts of 7 feet each. If you had four lifts they would have to be 10 ft. 6 in. each, so that the cost of the scheme on my estimate would be 4.2 times £26,300, or £110,400, as against £121,000 according to Mr. McKinney's estimate.

1819. *Chairman.*] You stated yesterday that your locks would impound 117 per cent. more water than would be impounded by Mr. McKinney's weirs in this case? Yes. I have a diagram showing the difference.

1820. And at certain points the lift from the river level to the top of the banks would be less? Yes.

1821. The Pera Bore delivers 610,000 gallons per diem at an elevation of, I suppose, about 10 feet above the surface;—what would be the cost of lifting the same quantity of water from the Darling, the average lift

lift being 35 feet? Looking up various statements as to the cost of pumping in different places, I found that in a number of cases in England where the pumping was more or less continuous the cost is a trifle over  $\frac{1}{4}$ d. per 1,000 gallons lifted 100 feet high. The cost of doing similar work at the Crown-street pumping station here, where the pumping is more or less intermittent, has been  $\frac{1}{4}$ d., or nearly  $\frac{1}{4}$ d.; while if you follow the American authorities the cost there would be about two-thirds of a penny. Therefore, I have taken the cost of pumping water from the Darling as  $\frac{1}{4}$ d. per 1,000 gallons lifted 100 feet high, because, so far in the interior, repairs and stores will be more costly, and will increase the expense. On that basis I have estimated that the capitalised cost of raising 610,000 gallons per diem 35 feet high would come to £5,400.

C. W. Darley,  
Esq.  
10 June, 1896.

1822. That is the permanent value of the flow of the Pera Bore? Yes.

1823. £5,400 covers wages, fuel, replacement, and everything? Yes; it is the annual expenditure upon the capital value. For the purpose of comparison I put the cost of the bore at £2,000.

1824. Have you any information with regard to the flow of the Darling? No.

1825. Do you know the discharge of any of the tributaries entering it between Bourke and Brewarrina? I have no correct information upon that point.

1826. *Mr. Humphery.*] It has been stated that in France no tolls are charged upon the state waterways. That being so, do you think it would be reasonable to charge tolls upon the river between Bourke and Brewarrina? In America tolls are charged, and tolls are charged in England. You might, of course, make this a national work, and throw the river open to navigation free of charge, as has been done in some parts of France.

1827. Do not most of the waterways in France belong to the State? In France they throw most of their waterways open to navigation free of charge; but that practice is not universal. Toll is charged upon most of the large canals in America, and, I think, upon all the canals in England.

1828. You make no recommendation in your report upon the subject of tolls? No.

1829. *Chairman.*] It is a matter of State policy? Yes.

1830. Are you prepared to express an opinion upon the question of riparian rights? No.

1831. The weirs might, in a dry season, impound what little rain fell on the catchment area and prevent it going down the river, as it would under natural conditions;—that would interfere with the riparian rights of the people below? Such a thing as that might happen, of course.

1832. Not only might it happen, but it would be sure to happen? Of course every time the locks were opened a certain amount of water would be allowed to pass down the river, though not very much.

1833. The question of riparian rights should be considered? I think so.

1834. Have the riparian rights of the other colonies ever received any serious consideration? I do not think that the riparian rights of the other colonies would be interfered with by the construction of weirs in the Darling. You must not divert the river water, but you can impound it.

1835. A riparian right is the right to demand that the water flowing down a river under natural conditions shall not be diminished in quantity or affected in quality by the action of any person? The quantity of water flowing down the river would not be interfered with if the river were used only for navigation purposes. It would be interfered with if irrigation were undertaken.

1836. *Mr. Fegan.*] You have said that vessels have a right to go down the Darling;—how has that right been conferred upon them? It is an understood rule that all vessels have an unrestricted right to pass over naturally navigable water. The Board of Trade in England have recognised that rule, and where a railway company seeks to cross navigable water it insists that the company shall either build a bridge of a certain height or allow an opening through which vessels may pass.

1837. Therefore, if the Government carried out the proposed scheme they would be prevented from charging tolls? You can charge for improving the navigation, but you cannot interfere with the right of vessels to travel along the river. That was shown the other day by the action of some people who pulled down part of an obstruction near a weir in order to enable them to get their steamer through.

THURSDAY, 11 JUNE, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of Locks and Weirs on the River Darling.

Hugh Giffen McKinney, Esq., Chief Engineer, Water Conservation Branch, Department of Mines, sworn, and further examined:—

1838. *Chairman.*] You were present at Mr. Darley's examination by the Committee, and had an opportunity of hearing the evidence given by him? Yes.

1839. You desire to make a statement with regard to that evidence? Yes. By request of the Committee I have had the section now exhibited prepared to show an alternative arrangement of the locks and weirs between Brewarrina and Bourke, by means of which one lock and weir can be dispensed with. When going into the question as to the sites which should be adopted, I had no hesitation in deciding on those at Stony Point, Vincent's Rocks, No. 6, and Brewarrina; but in regard to No. 4 and No. 5, I had doubts as to the best course. The chief reason for recommending the arrangement adopting No. 4 and No. 5 was, that I had successful precedents ready at hand for shutters of the maximum size required. The scheme was thus designed on lines the safety and practicability of which were not open to reasonable doubt. But as a considerable saving in cost could be effected by the alternative design, it was only after weighing the points for and against each design that I decided in favour of the six locks instead of five. The scheme submitted to the Committee I estimate will cost £121,100, while the alternative scheme

H. G.  
McKinney,  
Esq.  
11 June, 1896.

H. G.  
McKinney,  
Esq.  
11 June, 1896.

scheme can be carried out at a cost of £108,000. The alternative scheme involves a departure from the general design, as in this case, while the weir would be in the river channel the lock would be in the Beemery Cowl. The length of this cowl is  $1\frac{1}{2}$  mile, and the length of the river between its two ends is  $5\frac{1}{2}$  miles, so that when the river is low and the navigation passes through the lock, steamers will be able to shorten their journey by  $3\frac{1}{2}$  miles. The Beemery Cowl is occasionally used by steamers during high floods, but a considerable amount of excavation would be required to clear out its channel in places. This excavation has been allowed for in the estimate. The alternative scheme would substitute one lock and weir, with a 10-foot lift for weirs 4 and 5 of the original scheme; and it would also involve an increase from 6 feet to 9 feet in the lift at Vincent's Rocks, and an increase from 7 feet to 8 feet in the lift at No. 6. Regarding the practicability of working the increased lifts, I observe that in the locks and weirs on the Great Kanawha River the lifts vary from 7 feet to 9 feet; and I have no doubt that a 10-foot lift could be worked more easily on the River Darling than a 9-foot lift on the American river mentioned. If the Beemery Cowl be utilised as the navigable channel during low river, when the lock is in operation, the river channel would be used when the weir is open. Regarding objections to movable weirs which were raised by Mr. Darley, I am well aware that there are different opinions as to the relative advantages of fixed and movable weirs. English engineers have been slow in adopting the latter, and it is to be noted in this connection that in regard to the utilisation of rivers and of inland waterways generally, England is greatly behind France and America. The study of the question in England was greatly stimulated by the publication of a standard work on the subject of rivers and canals by Mr. L. F. Vernon Harcourt, M. Inst. C.E., and by various papers since published by the same author. As long ago as 1882, Mr. Vernon Harcourt called attention to the fact that shutter weirs of the Chanoine type had been largely used in France, and were being introduced with success in America. Further on the same authority adds, that with the adoption of the double-grooved shoes—that is the system of working now adopted in the scheme before the Committee—the Chanoine shutter weir is “perfectly manageable and easy of maintenance.” The writings of Mr. L. F. Vernon Harcourt and the invention of a very successful movable weir by Mr. F. G. M. Stoney, M. Inst. C.E., have had the effect of bringing movable weirs into increased favour and use in the United Kingdom. Objection has been raised to the movable weir on the ground of cost in working. From the simplicity and moderate dimensions of the proposed weirs and the slow rate at which changes in the level of the River Darling occur, I fail to see how any considerable expense in working can occur. The only cases for which I have been able to obtain full details of the cost of working locks and weirs of a similar design, are for works on a much larger scale situated on the Great Kanawha River, in America. The range of level of that river is as great as that of the Darling at Bourke, and it is liable to sudden rises and falls, so that on all grounds the circumstances are much more difficult. The locks on the Great Kanawha River are 350 feet long by 50 feet wide, and the weirs range from 400 feet to 670 feet in length. The traffic too is heavy, and much trouble is experienced in winter from ice. The average number of men employed at a lock and weir under these circumstances is about five, the actual numbers varying from four to seven. I have no doubt from the particulars given that the labour required at a lock and weir on the Darling will not be more than a-fourth or a-fifth of that required at a lock and weir on the river referred to. Mr. Darley mentioned a case in which fifteen coolies were required for the working of a movable weir on one of the Indian rivers. I am quite prepared to accept Mr. Darley's information on this point; but it must not be overlooked that there is no comparison between the case of the Darling and that of rivers like the Sone or the Godaver. In regard to the relative advantages of fixed and movable weirs, Mr. Darley quoted from a volume of the Proceedings of the Institution of Civil Engineers some opinions of an engineer of high standing in favour of the former. I wish to bring to the notice of the Committee an extract from a report of a speech by Mr. Baldwin Latham, one of the leading hydraulic engineers in England, on the same subject. The extract is as follows:—“In flat districts liable to floods, a fixed weir might raise the height of the floods and in such cases movable weirs had a decided advantage over a fixed weir; and it was to be hoped that they would be brought into general use in this country, as in many places they could be adopted with advantage.” The report of that speech appears in volume 60 of the Proceedings of the Institution of Civil Engineers. It was objected to the arrangement of locks and weirs proposed, that both gates of a lock cannot be opened. In reply to this I do not anticipate any difficulty in opening both lock gates when the river rises above navigation level. When the river rises to that level locks will not require to be used, and therefore the shutters will be opened down. When the river is allowed to flow freely through the weir space and the side bays, the water will be at practically the same level at both ends of the lock, and there will therefore be very little difficulty in opening the gates. In a river with a more rapid fall, and a greater velocity, there would undoubtedly be much difficulty in opening both gates, but the condition of affairs in the Darling is very different. At about navigation level the mean velocity in the river is only about four-fifths of a foot per second, or say half a mile per hour, and as the fall in the surface of the water averages only about 3 inches per mile, the difference of level at the two ends of the lock will not be perceptible. The point has also been raised that there will be a period during which navigation will be interrupted by the weir sills. This impression was doubtless due to the appearance of the sill of the Bourke Weir on the plan. In regard to the question raised, the navigation is really governed by the bed-level at a considerable distance away from the weir, the sill being really not above mean bed-level; but independent of this, it has to be borne in mind that as the quantity of water flowing in the river increases the side bays will be opened, and the height from the water below a weir to that above will diminish. Hence, while 6 feet is the minimum depth on the lower side of every weir, the depth when the shutters are lowered will be at least 2 feet more than this. A very important point in connection with the scheme before the Committee is that so far as navigation is concerned, existing conditions are not interfered with—that is to say, the proposed work will not impede navigation under any circumstances. This is an obvious advantage which the movable weir possesses over a fixed weir; but it is unnecessary for me to refer to this point further as it was clearly brought out in the examination of Mr. Darley, by Mr. Humphery. There are two points to which I have not yet been able to do justice, in reply to questions put by the Committee. One of these related to the value of the river traffic, and the other to the increased value of Crown land. In regard to the latter point, while in my opinion the construction of the proposed works would be warranted solely on account of their effect in stimulating settlement and production, details

regarding

regarding this point can best be obtained from Mr. McFarlane, District Surveyor, and Acting Chairman of the Bourke Land Board. In regard to the cost of the works relatively to the cost of the present traffic, I do not think this is the sole, or even the principal point to be taken into account. A point not mentioned previously, is the possibility of utilising the power which will be available at each of the weirs. I did not consider it necessary to go into details in regard to this, but there can be no doubt, that, in the course of time, this power will have considerable value.

H. G.  
McKinney,  
Esq.  
11 June, 1896.

1840. *Mr. Clarke.*] You heard Mr. Darley say yesterday that upon the Darling fixed weirs were preferable to movable weirs;—are you still of the contrary opinion? Yes.

1841. Can you give us any reasons for preferring movable weirs? A permanent weir is a barrier to navigation. It stops navigation until the river rises to a considerable height over the top of the weir. With movable weirs there is no such interruption. As soon as the river rises to the height at which it is ordinarily navigable, the movable weir can be allowed to fall, and navigation is then unimpeded.

1842. Are not movable shutters liable to injury? I do not think so. They are very simple in their construction, and I believe would give less trouble than would be caused by the cutting away of the banks and the creation of new channels, which would be the result of the construction of permanent weirs.

1843. Would the expense of attending to the locks and weirs you propose be greater than the expense of attending to the locks and weirs Mr. Darley proposes? I reckon that it will be necessary to employ from one to two men at each lock and weir, according to the position. If Mr. Darley's scheme were carried out, one man would be sufficient for each place; but at the same time it might be necessary to employ 100 men for some months in repairing the mischief done by a flood.

1844. Mr. Darley stated that it would require four men to attend to each of your weirs? That is quite a mistake. It must be remembered that the Indian rivers are incomparably larger than the Darling. The Sutlej in flood would be some miles wide. The Godavari carries far more water than the Darling carries. Therefore, while fifteen coolies might be required to manage a weir upon one of those rivers, two would probably be sufficient on the Darling.

1845. Are you satisfied that the movable weirs you propose would answer all purposes, and not be much more expensive than those proposed by Mr. Darley? Yes; they would be less expensive in the end.

1846. Do you think that it would cost more to irrigate from the Darling than to irrigate with artesian water? If you could always guarantee the success of the artesian bore, and could obtain water at a moderate depth below the surface, irrigation by artesian water would be cheaper than irrigation by pumping. But, while the first is a purely speculative thing, the other is a certainty. You may put down three artesian bores unsuccessfully, whereas in irrigating from a river you have your water in sight, and know what difficulties you have to contend with. There is a good deal of gambling in connection with the putting down of artesian bores. The difference between the two systems is the difference between gambling and investment.

1847. Are there not artesian bores at Bourke? Yes; but there have been great failures in the neighbourhood of Bourke.

1848. Are you of opinion that the locking of the Darling between Bourke and Brewarrina will be of more advantage to the public than the construction of a railway from Byrock to Brewarrina? I think that the locking of the river is the more important work.

1849. *Mr. Hassall.*] Have you made any calculation as to the amount of water which will pass through the openings in your movable weirs during twenty-four hours? In regard to that matter, notwithstanding the objection taken by Mr. Darley, I have come to the conclusion that, if anything, it would be better to have a little more space between the shutters. You want to allow a certain quantity of water to flow down the river; but you could stop the flow very simply if you wished to do so. Upon the French rivers they simply stick down boards on the inside of the weir, over the joints, and the pressure of the water keeps them in position. I lately requested my assistant, who is in charge of the Bourke lock and weir, to ascertain what would be the best way of stopping this flow, and he reported to me yesterday that he thought it very likely that piping, such as gas-piping, would be as cheap as anything we could get, and would be the most durable and the handiest thing to deal with. Still the circumstances in which anything of the kind would be required will be very exceptional. The only year in which I have seen the river in so low a state as to require such an arrangement was 1885, though no doubt similar conditions have prevailed before.

1850. If the water were running very low, and there were every prospect of a continuance of the dry weather, it would be necessary for someone to be constantly supervising the arrangements for preventing the escape of water? An intelligent man in charge of the lock and weir would be able to do everything wanted. I consider that at the Bourke lock and weir it would be necessary to keep only one man.

1851. Would not something be needed to keep the boards from slipping to one side? I do not think so. The pressure of the water is constant, so that the boards would not be likely to slip. If they did, a man upon the spot would very soon put them right again.

1852. What would prevent the boards from rising? The boards would either have to be made of hard-wood, or they would have to be weighted near the lower end.

1853. Would you have a staff of men at each weir to raise the shutters, or would you have a barge to travel down the river, fixing each weir as you came to it? The idea was to have a barge at each weir, but I am not very sure that I will not be able to dispense with that. I have, however, allowed for a barge at each place—a rough barge with a winch on it. Still I may be able to dispense with that by using tackle connected with a wire-rope.

1854. Then it will be necessary to keep men at each lock? Yes. The number of times in a year that the weirs require to be moved is very small; perhaps not more than three or four times. In a place like Bourke the man in charge could easily procure whatever extra assistance he needed.

1855. Would there not be a danger of a sudden rise in the river bringing down a large quantity of timber, which would knock the weir out of shape? No, because the weir would be lying at the bottom of the river.

1856. But a rise might occur, and it might not be thought advisable to lower the weir, because there was no telling how high the fresh would be? Whenever notice comes of a considerable rise in the river—and the men at the weirs can obtain that notice days and even weeks beforehand—the weirs can be lowered to let the flood-water pass down. I do not think such a contingency would arise as damage being done to the weir by timber.

1857. There might be a sufficient rise in the river to bring a lot of timber on to the weir, but not sufficient rise to clear the weir? Very few moderate rises bring down timber. It is only when the river is in high flood that any considerable quantity of timber comes down. 1858.

H. G.  
McKinney,  
Esq.  
11 June, 1896.

1858. A fixed weir would not be likely to be injured by such a thing? In a manner a fixed weir would be more dangerous, because there would be a greater probability of timber coming down and sticking on the weir, causing a serious obstruction, which would have to be promptly cleared away lest it should turn the channel of the river when the next flood came down.

1859. But would it not be easier to get rid of this obstruction where you had a fixed weir than where you had a movable weir? There is no risk of having an obstruction of this kind on a movable weir.

1860. That would depend a great deal upon the men who had to manage the weir? It would be looked upon as the first duty of these men to let go the shutters as soon as news came of a rise to a certain height at some place higher up the river.

1861. What great advantage is obtained by letting go the weir, that is, as far as navigation is concerned. You must impound a certain quantity of water to enable navigation to continue? With fixed weirs at 10 feet high, the river would have to be 6 feet over the top of the weirs, or 16 feet deep, before steamers could go down uninterrupted, whereas the ordinary depth required for navigation is only about 9 feet. With movable weirs, however, the shutters would be let go whenever the river reached its present navigable level.

1862. Supposing there were a sudden fall in the river? Such a thing is very uncommon.

1863. If a sudden fall occurred when the weirs were down, you might be unable to impound sufficient water to enable you to carry on navigation? I do not think that such a contingency is likely. The only case of a very rapid rise in the river that I know of occurred early in 1885, when 10 inches of rain fell in Wilcannia in about twelve hours, and almost the same quantity fell at Bourke. The river then rose rapidly until it was two-thirds bank high. That rise, however, was due solely to the local rains.

1864. An abnormal fall of rain sometimes occurs upon a particular watershed; for instance, a large quantity of water might come down the Bokhara, or the Birrie, or the Namoi. That will cause a sudden rise in the river, and the river might fall almost as rapidly, in which case, if you had all your weirs down, you might not be able to get them up again in time to save sufficient water for navigation? I do not think there is any likelihood of that.

1865. A movable weir must lose a certain amount of water by leakage? We purposely allow a certain quantity of water to flow through.

1866. But when the flow in the river ceases, what precautions can you take to preserve the water impounded by the weirs? I do not see that a movable weir is in any worse position in that respect than a fixed weir.

1867. But the movable weir leaks, and the fixed weir does not? One advantage I expect to get from having water stored in the river is, that there will be a better supply available below than there is at the present time, because the loss by percolation will be less. I might mention that, although the river has stopped running below Bourke, it has never stopped at Brewarrina, and I do not think it has stopped between Bourke and Brewarrina.

1868. I have known it to be dry on the Barwon and on the Namoi which are the two chief sources of supply? In 1885, it was very nearly dry at Walgett, and on the Namoi, but there was then a very fair stream running between the rocks at Brewarrina.

1869. Do you think it would be possible to impound any large volume of water in the ana-branches and cowals between Bourke and Brewarrina? In some cases it might be possible.

1870. Have you had a careful survey made? I have not had a complete survey of all the billabongs made, because it would be a tedious matter, and I do not think it is required at this stage. But in going up the river I noticed that the people holding the land had in places put small dams in the billabongs to prevent the water from flowing back to the river.

1871. Would it be possible to keep the water in by using flood-gates? Most of the billabongs run out at a very high level. Many of them will not run until the river is 20 feet deep or more. Cato Creek runs at a comparatively low level; but, so far as my recollection serves me, there must be 16 or 17 feet at Walgett before it will run. I know that there must be 23 or 24 feet before the Tarrion will overflow.

1872. Does that water come back into the river? In very high floods, part of it does. A good deal remains in the Tarrion.

1873. Are there any natural storage reservoirs along the river? There are places where water could be stored in considerable volume, and the flow back to the river stopped.

1874. What I should like to know is how you will provide against the waste from the weirs? 1885 is the worst year of which I have any record, and in that year the volume of water flowing past Brewarrina, although very small, would have been sufficient to keep up the navigation. I admit that there is something in the point you have mentioned, but you are looking to the case which I do not think would occur more often than once in twenty or thirty years. Lower down, towards Wilcannia and Menindie, the supply has failed more frequently.

1875. *Mr. Roberts.*] I understand that you have reconsidered the scheme which you originally put before the Committee? At the request of the Committee, I again looked into an alternative scheme, which I had considered before submitting this scheme. That scheme is shown on the plan before the Committee.

1876. You estimate that the alternate scheme will cost £108,000, as against £121,000, which was the cost of the original scheme? Yes.

1877. That saving has been brought about by doing away with one weir and lock? Yes.

1878. Do you feel satisfied that the new design would prove as satisfactory as the original design? It is perfectly practicable, but I proposed the other design because it was on more cautious lines.

1879. After consideration, you are prepared to recommend the alternative design? I believe that it would be a perfectly safe thing to carry out; but I prefer the original design, because I think it would be more easily worked.

1880. Have you good foundations for all the weirs? The foundations are good at Stony Point, Vincent's Rocks, and at Brewarrina, and fairly good at the site of No. 6 weir; but the foundations at sites Nos. 4 and 5 are indifferent, while the same thing might be said of the foundation at the site of the alternative weir.

1881. Your faith in movable weirs has been in no way shaken by Mr. Darley's evidence? Not in the slightest.

1882. Is it not a fact that, with fixed weirs, double the quantity of water can be impounded? No doubt, more water would be impounded if Mr. Darley's proposal were carried out, but I believe that in the end it would be found that the advantage had been very dearly bought, because I cannot help thinking that, in a river like the Darling, fixed weirs would be a constant source of danger and expense.

1883. In what way? In a country like that, where the soil is very friable and easily worn away by the wash of the water, any permanent obstruction has a tendency to cause the river to cut out new channels. The opinion of Mr. Baldwin Latham, which I quoted to-day, bears out that remark. What he says as to the kind of country for which movable weirs are suited would apply to the Darling country.

1884. I think Mr. Darley said that his scheme could be carried out for £110,000. In comparing the cost of the two schemes I suppose you refer to the primary cost? No; because I anticipate that if Mr. Darley's scheme were adopted the floods would cause great damage, and that would necessitate extensive expenditure upon repairs.

1885. You said that fixed weirs stopped the navigation;—could not the shipping always go through the locks? Of course the locks could be used; but with movable weirs there would be no necessity for using the locks whenever the river was at its ordinary navigation level.

1886. I think Mr. Darley said that the expense of managing movable weirs and locks would be greater than the expense of managing fixed weirs and locks? A larger permanent staff would be required, but the movable weirs would be found more economical than the fixed weirs, because they would cause no obstruction to the flood-water. With fixed weirs you might occasionally have to employ 100 or 200 men to repair the mischief done by a flood.

1887. In flood time the shutters of the movable weir would lie on the bed of the river? Yes.

1888. They might lie there for six months? Yes.

1889. *Mr. Black.*] Did you ever know a flood to last as long as six months? Yes, in 1890, the flood-water stayed up for a longer period than that; but such a thing is exceptional.

1890. After the shutters had been lying at the bottom of the river for so long a period, would they be workable? I think so. We are taking every precaution by providing gun-metal bearings, and by having the iron work thickly painted to prevent rust. I do not think there would be any trouble in working the weirs.

1891. Have you seen these shutters in actual use? No, not exactly this kind of shutter. We worked with movable weirs in India, but we simply used drop-gates, such as I propose to adopt for the side bays with which I intend to regulate the flow of the river. The kind of shutter which I propose to use for the weir has come more into use of recent years, since I left India.

1892. *Chairman.*] Where are those shutters successfully used? They have come largely into use in America. I quoted an opinion of Mr. Vernon-Harcourt to-day in regard to movable weirs. He is one of the best authorities in England upon the subject, and he says that with the Pasqueau modification the working of the weirs is both safe and easily managed.

1893. *Mr. Black.*] I suppose the flood-waters are only likely to pick up timber when the river overflows its banks? Yes, as rule.

1894. If the bed of the river has been properly snagged, and the overhanging trees cut down, that will be so? Yes.

1895. Has that work been carried out on the Darling? I believe that the worst snags were taken out from this part of the river two or three years ago. I suggested that the work should be done while the river was low, and it was done by the Works Department.

1896. The timber picked up by the flood-waters would, in many cases, be intercepted by the standing timber before it got into the river channel? Yes; as a rule, there are trees pretty near the margin of the river, which would prevent timber from floating into the river.

1897. You propose to have five men stationed at each weir and lock? No; Mr. Darley, basing his opinion upon the Indian experience in a certain place, said that four or five men would be required; but I think that not more than two men would be required, and that near the towns, where extra assistance can be obtained, one will be sufficient.

1898. Would that number of men be able to minimise the risk of injury to the weir by guiding floating timber towards the bank? The quantity of timber coming down the river is not very great, except at times of extraordinary flood. I went down the river when it was more than three-fourths bank high, and the quantity of floating timber then was very small.

1899. You have made no reply to Mr. Darley's statement about the loss of water through the interstices of your weir? The point was referred to by Mr. Clarke, and I pointed out that these spaces would be left with the double purpose of allowing play for the shutters, and of letting a certain quantity of water flow down the river.

1900. What will the space be? We have allowed an inch between each shutter.

1901. You think that that is not having them dangerously close? I do not think so. I have been looking into the matter quite recently, and, as we are carrying out this work directly under the Government, I am not sure that we will not increase the space a little. I think that would give us greater power of regulating the flow of the river.

1902. Will there be no danger of the wood swelling? The swelling would be very little.

1903. Will there be no danger of the shutters canting? Not if they are properly put up, and properly worked.

1904. Is there no danger of two adjoining shutters warping, or of two shutters being thrown towards each other in such a way as to make it impossible to get them into line? I do not think so.

1905. Will it not require great exactitude of construction and great strength of material to prevent the shutters from getting out of position? No doubt they would have to be strong, and so they will be.

1906. Your objection to the fixed weir is that it must, under some circumstances, impede navigation? That is only one objection. I should not like to say that it is the main objection.

1907. What is your main objection? I think that the most important objection is that a fixed weir would cause erosion of the banks in places, and that thus there would be a danger of the river changing its course.

1908. Mr. Darley does not attach any importance to that view of the matter? Mr. Darley said that a fixed weir would not cause a rise in the flood-level of more than a few inches; but a rise of 1 or 2 inches in the flood-level of the Darling would have a serious effect in causing a scour. The banks of the Darling are composed of material deposited there by the river, and whenever the water has a greater velocity than it had when that deposit was made, the banks are likely to be eroded. Another matter arising out of Mr. Darley's evidence is the question of the construction of the dam at Menindie. I quite agree with Mr. Darley that that dam is very well constructed, considering the circumstances. When I spoke of it as a failure, I did not mean that that was the fault of those who constructed it; I merely referred to it as a case

H. G.  
McKinney,  
Esq.  
11 June, 1896.

H. G.  
McKinney,  
Esq.  
11 June, 1896.

case in point in connection with the action of fixed weirs. The presence of that dam caused the cutting of a new channel. When I was at Menindie the dam was still in position, but a new channel had been cut which was quite as deep as the old one. That sort of thing is likely to occur wherever permanent weirs are constructed in the Darling.

1909. *Chairman.*] Is the Menindie dam as high as the top of the banks? Yes; and when a high flood occurred it covered the land round about.

1910. Mr. Darley said yesterday that the top of his weir would not be within 20 feet of the top of the bank. If the Menindie dam were level with the banks, a different state of things existed there from that which would exist if Mr. Darley's scheme were carried out? No doubt there is that difference; but the Menindie dam shows how easily a new channel is made. A very slight increase in the velocity of the flood-water will cause erosion. Of course the two cases are not quite parallel.

1911. *Mr. Black.*] What was the height of the Menindie weir? From 15 to 18 feet.

1912. *Chairman.*] How high are the banks there? The weir was constructed in an outflow channel from the river to Lake Menindie.

1913. Did the dam go right up to the top of the banks? Yes; and the whole country was overflowed. Some slight cause directed the water into one particular channel.

1914. *Mr. Black.*] A new channel was formed there? Yes.

1915. Could not that have been prevented by having a sort of by-pass? It is a very difficult place to make a dam of any kind. The difficulty could be got over by having a wide overfall weir; it would be a very expensive matter.

1916. *Mr. Humphery.*] How many shutters will be in each of your weirs? From thirty to thirty-five.

1917. Thirty-five openings of 2 inches each are equivalent to an opening of more than 6 feet? Yes.

1918. Would not a very large body of water flow through an opening of 6 feet? Yes; but we shall want as large an opening as that in ordinary conditions of the river. When the river is 3 or 4 or 6 feet above summer level we should not only want that opening; but we should also have to allow a considerable volume of water to go through the side bays.

1919. Would not that seriously diminish the impounded water? It takes a flow of something like 1,400 or 1,500 cubic feet per second to keep the river at navigation level, and a considerable opening would be required to provide for such a flow as that.

1920. At all events, you have considered the matter? Yes. If we increase the size of the openings, it will be principally to let a larger quantity of water pass through.

1921. Would it not be necessary to make provision for stopping that outflow upon occasion? Of course, when the supply in the river was getting low, we would gradually close the side bays, and we could also close a few of the openings in the weir.

1922. In the joint report of yourself and Mr. Ward, it is mentioned that the cost of dredging the Darling was estimated by Mr. Darley at about £250,000;—will it be necessary to expend any money in dredging the river between Brewarrina and Bourke, in order to give effect to your scheme? There are a few places where we should have to take a little off, but they are so very few that the matter is hardly worth taking into account. There is one place a short distance below Brewarrina, and another a short distance below Vincent's Rocks.

1923. The matter is not of sufficient importance to render it necessary to make special provision in your estimate? No.

1924. Mr. Darley allows £25,000 for repairing the banks between Wentworth and Bourke? I do not anticipate that any expenditure of that kind will be necessary between Bourke and Brewarrina.

1925. Do you think that your estimate is ample? Yes.

1926. *Mr. Trickett.*] Mr. Darley seems to think that a scheme of this kind, having regard to its probable cost and the revenue that would probably be derived from it, is premature;—what are your views upon the subject? I do not think that it is premature. I do not think that it was premature when Mr. Darley made his report. If the Darling is to be opened up, it will be by works of this description.

1927. Then you would look upon this as a national work, not as a revenue-producing work? I do not anticipate that the chief benefit derived from the scheme will be the revenue directly returned by it. I anticipate a much larger indirect benefit.

1928. What revenue would be derived from the whole traffic upon the Darling in one year from Brewarrina to Wentworth? I have no direct information upon that point.

1929. Mr. Darley says that he found from the Sub-collector of Customs at Wentworth that in 1888 the whole of the tonnage going down the river only amounted to 12,000 tons;—do you know how much of that traffic would go along that part of the river affected by your scheme? I think that Mr. Shainwald has given you the details of the traffic on that part of the river.

1930. Will not the water which runs away through your weirs greatly impoverish the supply available for irrigation purposes? Not at all. Under any circumstances it would not be allowable to stop the water entirely. If permanent weirs were constructed, the surplus water would flow over the top, instead of going through the interstices of the weir, as with movable weirs.

1931. But with permanent weirs the water will only flow away when the river is higher than the tops of the weirs, while with movable weirs it would be always running away? Yes; we would allow it to go through. I would point out that such weirs as we propose to construct could be constructed without any change in the law affecting riparian rights, and the rights of navigation. But if permanent weirs were constructed, I think that, as the law stands, anyone could destroy them.

1932. Might it not happen that more water was running through the interstices than was coming into the river? That could be regulated. First of all the side bays could be gradually closed, and then, if necessary, some of the spaces between the shutters could be closed by sliding down boards in front of the weir.

1933. Is that a known mode of dealing with these weirs? Yes; it is the simplest way of stopping the flow. A man would simply have to go along the front of the weir in a boat, and slide down the boards wherever they were required.

1934. Have you had a general survey made of the country surrounding this stretch of the river, to see how the water will flow there? I have had levels taken on both sides of the river, and I do not think there would be any difficulty in finding suitable places for starting your irrigation operations; in fact, people have found them already. They are already irrigating there on a small scale.

H. G.  
McKinney,  
Esq.

11 June, 1896.

1935. Are you able to say definitely that if the water were pumped from the river it would flow over the adjacent land? Yes, if proper sites were selected. There is a great deal of flat land there which would not be suitable for irrigation. Not far from where the Macquarie runs in there is a great deal of country which could not be satisfactorily irrigated, because of the risk of its becoming swampy.

1936. How would you deal with that kind of country? I should not attempt to irrigate it. It would be quite sufficient to irrigate the land that was suitable without taking the water on to land that was unsuitable for irrigation.

1937. How do you get the water to flow over the ground which you wish to irrigate;—does it not soak in very fast? On some grounds you lose more water than upon other grounds, and some kinds of channels will lose more water than other kinds of channels. The channels which they made at Mildura lost an enormous quantity of water. They were very shallow, very wide, and the slope was very small. Those are all bad points from an economical standpoint.

1938. Do you keep on irrigating whether the weather is fine or wet? Certainly not. A great deal of judgment must be exercised, because mischief may be done by irrigating land just before a heavy fall of rain.

1939. Would not the drains sometimes carry water and other times allow it to soak through, according as they were being used or not? Yes.

1940. Is not that a great disadvantage? That must be expected, because the channels are not in constant use. Where they have large irrigation works, as in India, the distributories run constantly throughout the year, except during the four or five weeks in which they are being cleaned, and the people on either side are allowed to take the water for so many days at a time. The channels in the fields are not constantly running.

1941. Have you instanced any places where irrigation on a large scale is being carried on by the Government? All the large irrigation canals in India were constructed by the Government.

1942. And anywhere else? The Government have done something in Italy, but not very much.

1943. Is not all the work in America done by private enterprise? Yes, but the people there get very extensive rights, which they do not get here.

1944. What kind of rights? In some of the American States a man holding land fronting a river is allowed to take as much water as the irrigation of his land requires, and under that system the frontages are very quickly taken up.

1945. But their rivers are very much larger than ours, so that the Government could afford to grant such rights there? If the first settlers upon the Murrumbidgee had been able to obtain their land for 5s. an acre, and to take as much water as they liked from the river, a great deal of irrigation would have been done there. In America, people can get land for 1½ dollar per acre and the right to take as much water as is required to irrigate their land, and thus private enterprise is stimulated.

1946. I suppose the water would be conveyed along flumes from the river? In many cases it is pumped. Of course large works have been constructed for the purpose of bringing the water on to the ground by gravitation wherever that is possible.

1947. One of the large American flume companies stated before the Water Conservation Commission in 1885 that the minimum charge there was 5 dollars per acre per annum;—is not that a very great deal? Yes, but that is where the right to water has been sold by the original holders, and great troubles have arisen from that cause. Certain companies have acquired extensive water-rights, and they sell or lease the water to other people.

1948. *Mr. Black.*] It would be possible for a company to buy out the water-rights of all the people on the river frontage? I believe that it would.

1949. Has that ever been done? I do not know; but very large monopolies have been created which have given rise to a great deal of trouble.

1950. Then you would think it inadvisable for the Government to bestow or sell the absolute right to raise water from the river? I think it would be quite right for the Government to let such rights upon equitable conditions.

1951. I said to sell or bestow an absolute right? No, it would not be wise.

1952. *Mr. Trickett.*] You do not think that every farmer would have to erect his own pumping plant? No, it pays much better to have a large pumping plant, making an equitable charge for the distribution of the water.

1953. Have you considered what this charge should be? Yes, I have given it a good deal of attention. In that part of the country if you irrigate you get a crop; but if you do not irrigate you get no crop. Therefore, it would sometimes pay to give a considerable amount for the water.

1954. An officer connected with the Department of Mines told us that although there are a great many bores in this district the water is very little availed of for irrigation? I think that that is largely due to the want of information, and of enterprise on the part of the people.

1955. Is it not the duty of the Department to let the people know that the water is available, and to educate them as to its use? So the Department does, in season and out of season.

1956. And yet they will not take the water? I think that a large number of these people do not read much, and do not trouble themselves about the matter. While in America the tendency has been to stimulate irrigation in every possible way, here the tendency has been to keep it back.

1957. It has proved of advantage in America to have water-distributing companies? Yes, it has led to a very remarkable development of the Western States.

1958. Do you know whether these companies are prospering? Many of them are. The way in which the land has been rushed, even in the very out-of-the-way places, shows that the undertaking must be decidedly profitable.

1959. A gentleman connected with the Department of Agriculture said that millions of people would settle in this district if irrigation works were started there? I must confess that the very slow way in which the people have taken to irrigation, even where they had water at their very doors, has been a source of great disappointment to me. If we had a little of the enterprise of the American people, things would be different.

1960. *Mr. Lee.*] You object to fixed weirs because of their tendency to cause not so much the erosion of the banks as the cutting of new channels? Yes.

1961. The proposed shutters are about 11 feet long? Yes, about that. In some cases a little more.

- H. G. McKinney, Esq.  
11 June, 1898.
1962. What would be their height in a straight line from the bottom? A little over 10 feet.
1963. Mr. Darley's fixed weirs would be 10 feet high? Yes.
1964. Would there not be the same danger of new channels being cut if your weirs were constructed as if Mr. Darley's weirs were constructed? No, because in flood-time the movable weirs would be lying on the bottom of the river.
1965. What causes the cutting of channels—an increased height of water or an obstruction under water? To a certain extent, both. The flood-water would be obstructed by fixed weirs, because a certain amount of the section of the river would be taken up by the weir. A slight increase in the height of the flood water increases its velocity.
1966. With the permanent 10-foot weir the water would flow freely directly it rose to the top of the weir, but it would have to be 2 feet over the 11-foot shutters before the shutters would feather? Yes; but the erosion of the banks would take place, not when there were only 12 or 14 feet of water in the river but when there were 30 or 40 feet.
1967. If there were 40 feet of water in the river, would it signify what kind of weir you had? That when I think the presence of a fixed weir would have an effect upon the banks.
1968. What is your opinion as to the danger of steamers striking on your weirs in flood-time? There would be no danger, because in flood-time the steamers would be able to go over the weirs.
1969. Does your objection to fixed weirs apply only to fixed weirs in the Darling or to fixed weirs generally? It is an objection which applies, as Mr. Baldwin Latham has put it, in all flat country where rivers are liable to overflow their banks. In a country like the Darling, where the banks are easily eroded, the objection applies very strongly.
1970. Are your proposed locks and weirs inseparable? Not absolutely. For instance, the alternative lock is put in the head of a coveal, while the weir will be in the river channel.
1971. But you consider it advisable to retain the original arrangement at other places? Yes.
1972. Still you do not adhere to it as a rigid principle? No.
1973. You agree with Mr. Darley to some extent? Yes; it is not absolutely necessary that the locks and weirs should be placed alongside each other.
1974. You do not anticipate the danger to steamboats which Mr. Darley thinks will result from your arrangement? No; I do not see that there would be any danger with movable weirs. The arrangements for the working of the weirs will include the stretching of a wire rope across the river immediately above the weir, and this will act as an additional protection to the shutters.
1975. If it were found on further examination that it would be advantageous to still further separate the locks from the weirs, you would be prepared to make the change? I think that, as a rule, it would be objectionable to make a change. If there were special cases in which it would be advantageous, it could be done; but, speaking generally, it would be better to have the locks and weirs together.
1976. You propose to save £40,000 by taking away two of the locks and weirs, and to spend £27,000 in substituting a larger lock and weir? Yes.
1977. *Chairman.*] Would a lock in the neck of a bend be as safe as a lock in the channel of the river adjoining a weir? Speaking generally, it would not.
1978. Is there an insuperable objection to putting locks in the neck of a bend? No; but having seen the Darling in high flood, I came to the conclusion that it would be objectionable to put the locks in the necks of bends.
1979. Have you any information with regard to large and successful irrigation enterprises where the water has to be pumped to a height of 35 feet? I know that has been done, but I have not been able to lay my hands upon any details.
1980. Can you furnish us with the information? I will try to do so.
1981. Would £6,000 be a fair estimate for a 10-foot fixed weir in the Darling? I think that a fixed weir could be constructed there for that amount.
1982. Five such weirs would cost £30,000, and would conserve enough water to irrigate 12,000 acres;—that being so, it may be assumed that enough water to irrigate 1,200 acres could be conserved at an expenditure of £3,000;—1,200 acres is the area of land which could be irrigated by the water supplied from the Pera Bore; but to raise that quantity of water from the Darling would cost £5,400;—adding to the cost of conserving the water £3,000, the cost of pumping it £5,400, you get a total cost of £8,400, which must be put on to the capital value of the 1,200 acres irrigated, allowing nothing for the cost of distribution and maintenance;—that would mean a capital value of £7 per acre? There is not the slightest doubt that a successful artesian bore gives a cheaper supply of water than you could obtain from the river; but you do not get successful artesian bores in all parts of the country.
1983. The cost of the Pera Bore was, approximately, £1,400, therefore, on the calculation I have just made, to irrigate 1,200 acres with river water would cost £8,400, while to irrigate the same area from an artesian bore would cost £1,400? Yes; but you must remember that you might put down four or five bores unsuccessfully. In making a comparison of this kind, consideration ought to be taken of the cost of unsuccessful bores.

WEDNESDAY, 17 JUNE, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHRY.  
The Hon. CHARLES JAMES ROBERTS, C.M.G.  
The Hon. WILLIAM JOSEPH TRICKETT.  
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.  
JOHN LIONEL WEGAN, Esq.  
THOMAS HENRY HASSALL, Esq.  
GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Construction of Locks and Weirs on the River Darling.

George Colquhoun, Esq., Crown Solicitor, sworn, and examined:—

G. Colquhoun,  
Esq.

17 June, 1896.

1984. *Chairman.*] I believe you have a statement to make to the Committee with reference to four questions which have been submitted to you, and upon which the Committee would like to have your opinion? The first question which I have been asked to answer is, to give a definition of the rights of the Crown, and of the private individual, in the waters of the Darling. I apprehend that that question involves the consideration, to a very great extent, of the rights of the Crown with reference to the water running down the rivers of the colony, and which find their way to the sea, either through outlets on the east coast of the colony, or, by way of the River Murray, through South Australia. I think it is generally known that, so far as tidal rivers are concerned, the property in the soil of those rivers is vested in the Crown. No doubt the owners of private lands bordering such tidal rivers have certain riparian rights, which may be governed by a variety of circumstances arising from conditions of time, locality, necessity, and many other things. For instance, in a recent case in the English courts, where a person claimed to be entitled to a wharf in the River Thames, and to have that wharf jutting out into the river, it was held that the Fishmongers' Company, in erecting their premises, could not be permitted to interfere with that wharf, or with the approach to it. With regard to tidal waters, it may be said generally that the property in the soil underlying them vests in the Crown absolutely. In non-tidal waters, the owners of adjacent land are entitled to the soil under the water as far as the middle of the stream. I am speaking now of the law of England, and I may mention in passing that the English law knows no right of property whatever in water, but only the right to use water; for it stands almost as a matter of reason that there can be no right of property in a thing which is here this minute, and may be 100 miles away soon after. That is the position which obtains in the old country, and it goes so far as this, that a proprietor owning land on each side of a stream has upheld his right in the courts to erect a pier in the middle of that river for the purpose of carrying a bridge over it to connect his works on one side with the railway on the other. In such a case it was decided that the owner was entitled to erect a pier in the river, and to put a bridge over the river, so long as he did not interfere with the general rights of others to navigate the stream. This leads up to the question, "What are riparian rights?" I think that riparian rights may shortly be described as the rights of owners on either side of the stream to use the water passing by them, and to insist that that water shall continue to flow past their land in the same volume as it would flow by if the river were in its natural state. Owners of land upon the banks of a stream are permitted to take water from the stream for their domestic use, and for the use of cattle owned by them. I do not mean to say that such an owner would have the right to divert water for an irrigation scheme to supply feed for 10,000 head of cattle; but he would be permitted to draw sufficient water to provide for any cattle he might require for domestic purposes. There are other rights that a riparian owner may have. He may divert the water for, say, the use of a mill, so long as he returns it to the stream again in such a way that others lower down may receive it in due course. It must be borne in mind that, wherever a river is navigable, though not necessarily a tidal navigable stream, the right to use it for purposes of navigation belongs to every individual in the community. Any person is entitled to take a boat down every navigable river in England, and every river in this country which is capable of carrying a boat is, as it were, a water highway, which every member of the community has the right to use. This right is not to be obstructed by any one, either by a private owner on either side of the stream, or by the Crown. I say "or by the Crown," for this reason; the Crown is the trustee of all navigable rivers, for the benefit of the public generally. Having mentioned what riparian rights are in England, it may, perhaps, be as well to mention a very serious doubt which arises in this colony from the circumstances connected with our rivers and the surrounding properties. I think an exaggerated notion has gone about that every person who owns land bordering upon a stream has by law—he certainly has not *ex necessitate rei*—a right to the soil up to the middle of the stream. It has generally been supposed that that is a universal and irresistible position; but I venture respectfully to submit that it is not. I think that if the position is thoroughly examined, it will be found that, in several instances, it has been entirely ignored by the English Courts, and it should be ignored here to a greater extent, because of the nature of our rivers. The proprietors of land adjoining a river have the right to navigate that river; but I do not think they have an absolute right to the soil up to the very middle of the stream.

1985. *Mr. Trickett.*] Would you regard the river Darling as a navigable stream? It is capable of navigation. There are a good many differences of opinion as to the meaning of the word "navigable." Some people consider that a river is only navigable if it is flowing; but I think that any stream is navigable which is capable of carrying a barge or vessel of any kind. In my own mind I have no doubt as to the Darling being a navigable stream.

1986. Did not the case of Lord *versus* the Commissioners of Sydney decide the point that owners of adjacent land have a right to the soil as far as the middle of the stream? No. In that case, which is reported in 12 *Moore P.C. Reports*, the Privy Council, I think, did not decide whether the owner had a right to the soil as far as the middle of the stream.

1987. I thought that case decided that if a river were a navigable river, and also one in which the tide ebbed and flowed, the owners of adjacent land were entitled to the soil up to the middle of the stream? I think the Privy Council avoided that point. The case was capable of being decided on other grounds, and was, I think, so decided. The second question is as to how this colony will be affected by draining from the rivers in adjoining colonies? I confess to not being quite capable of understanding the exact meaning of that question.

1988.

G. Colquhoun,  
Esq.  
17 June, 1896.

1988. What the Committee want to know is, how this colony would be affected, if, by using great quantities of water for irrigation, we diminish the flow of water in rivers passing down to another colony? Supposing you were to erect a weir and construct irrigation works which would deprive those below of a large quantity of water, how would you be affected? With regard to riparian rights, the owner of land adjoining a river is entitled to have the usual volume of water passing by his place without diminution; but you cannot test that question in the same way where the rivers are continually liable to floods, and I think that the definition would have to be considerably modified to meet the circumstances of this colony.

1989. *Mr. Black.*] The owner of land adjoining a river is entitled to have the same quantity of water passing by his ground each year? No, not each year. He is entitled to the natural flow of the river. That might be 100,000,000 gallons a day one year, and only 1,000,000 gallons a day another year.

1990. Of course, the owner of land adjoining a river suffers no infringement of his rights if there is a natural cessation in the flow of the river; but would he have any cause of complaint if you artificially regulated the flow? Such a regulation of the flow might be beneficial to him, because a regular flow would be better than a flood at one time, and only a trickling of water at another? I said that a person owning a mill was entitled to the water from the stream for the use of the mill, provided he allowed it to flow back to the stream again.

1991. If the Government by the construction of locks and weirs hold back the flood-waters of a river, liberating them so as to cause a nearly equal flow all the year round, will those living lower down the stream have any cause of complaint? I think that if a dam were erected, either by private individuals or by the Crown, which, to put an extreme case, actually impounded the whole of the water, it would be an interference with the riparian rights of people lower down the stream. That really answers the question. It is all a matter of degree.

1992. *Chairman.*] We want to be clear as to whether it is necessary to come to any arrangement with any of the other colonies before taking water for the purposes of irrigation? I do not see how we can interfere with the neighbouring colonies. If we impounded water immediately upon the border line, they might say, "You may do this in your own colony, but we will not allow you to do it here." I do not suppose that such a question has ever arisen. I do not remember ever coming across any cases of the kind before.

1993. If New South Wales took large quantities of water for irrigation purposes, she might interfere with the supply required for the South Australian irrigation colonies? I do not know that I shall be right in saying, first come first served, but I think that we have the first legal right to use the water. Cases of this kind have occurred in England. The first occupant of certain land has been in the habit of taking a certain quantity of water out of a river, and people coming afterwards have interfered with his doing so; but this interference has not been permitted, although the second comers have an original right to take the same quantity of water from the stream as is taken by the first occupant. I think I am right in saying that there have been cases of that kind. I apprehend that your question means this: Has the Crown the right to impound up into a large lake a quantity of water which might be serviceable to the other colonies, but without interfering with the rights of the owners of land in this colony? In reply to that I say that I think we have the right to do what we like with our own. I do not think we are bound to consider the position in which a neighbouring colony, hundreds of miles away from the scene of operations, will stand if we impound a large quantity of water at a certain point. If an objection were raised by an adjoining colony, no one could say exactly what were the sources of supply which furnished water to that colony. We may catch at a certain point all the water that is given to us there, and so long as we permit the people in our own colony living along the banks of any stream in which water has been impounded to have the proper natural use of that stream, I do not see that there is any legal reason why we should not impound the water.

1994. *Mr. Trickett.*] Does not the principle apply that no one has a right to use the water flowing in a stream to the prejudice of another, either above or below him? If those who had a right to the use of such water dammed up the water to such an extent as to cause it to flow over the lands of a stranger, that stranger would have a right of action. But that right of action would accrue apart from the right of using the water. He would be injured by misuse of the water.

1995. If it is a misuse to throw water back in the way you describe, is it not equally a misuse to prevent it from flowing past land lower down the stream, or to diminish the volume that would naturally flow past such land? I have already said that the proprietor below is entitled to have the quantity of water flowing past his land that would flow past it under natural conditions. I do not mean to say that any one has the right to catch surplus water and throw it on to his own land to the detriment of another private owner. I am sure that no one has that right. I am speaking of the Darling River, and of the right to utilise the water of that river for irrigation purposes. If the work of irrigation is to the prejudice of any private owner, the consent of that private owner must be obtained, or he will have ground for complaint—that is, unless legislation steps in. Of course, if all the land is Crown land, there will be no private owner to contend with. If, in impounding the water, you somewhat reduce the volume of the flow, the amount of injury that is done may be merely nominal, and cases of the kind have arisen in England in which merely nominal damages have been given. It is merely *injuria sine damno*.

1996. The Committee is considering a scheme for locking the Darling so as to improve the river for navigation, and to allow the water in it to be used for irrigation purposes. Do you think that legislation would be necessary to give the Crown the right to carry out such a scheme? I think there should be some authority. It would, perhaps, be a little dangerous to take such action without legislative authority. When they wanted to conserve the Thames, they had to go to Parliament for authority to do it. I certainly think it would be advisable to get Legislative authority for this work, and then any plaintiff would find it rather difficult to substantiate a claim against the Crown.

1997. Were you consulted about the Water Rights Bill now before Parliament? No, and if I had been I should have declined to advise, because it is no part of the duty of the Crown Solicitor to advise upon such matters.

1998. Do you care to give an opinion upon it? No. I might perhaps give a wrong opinion, and I might afterwards have to sit in judgment upon such an opinion.

1999. You were not consulted in regard to the Bill, and you do not wish to give an opinion upon it? No. In this country it is very doubtful whether our grants permit the owners of land adjacent to a river to own the soil as far as the middle of the river in every instance.

2000. In Victoria they generally make some reservation in favour of the Crown? The tendency of our early grants was not to give the soil as far as the middle of the river. I have known grants in which 100 feet frontage has been reserved, even at Armidale. The next question I was asked was to give a *précis* of the

the legislation upon the subject of riparian rights in vogue in other countries where irrigation is practised, and to state the scope of the rights of the Crown and of the private individual in this regard. This is such a wide order, that I am unable to accommodate the Committee in regard to it. We know very well that there have been disputes in connection with some of the large rivers in America. In connection with the Mississippi, for instance, there was a dispute between the United States Government and the Spaniards; but that was rather as to the right of navigation than of irrigation. There was no question as to the right of persons to go up the stream: but disputes arose as to the manner in which navigation was to be carried on. These disputes were settled by convention. Again, on the St. Lawrence, a similar dispute arose. There the right of navigation was admitted; but there was a dispute as to the mode in which it was to be carried on. I think it would be impracticable to ascertain the laws of the different nations in respect to riparian rights. There are a good many laws governing the riparian rights of people on the Rhine, and on a good many of the rivers in France; but I do not think a knowledge of them would be of any use to the Committee. I have not been able to satisfy myself about this matter, because I have not the necessary books to look into, nor have I had the time to consider such a very large question. Anyone who wants to study the question at all will find an excellent chapter in "Wheaton's International Law," which deals with it. The last question was,—What are the claims, if any, sought to be set up by the adjoining colonies with respect to the Murray River. I think it is generally well known that the Constitution Act defines the boundary of the colony of New South Wales as being on the southern side of the River Murray. That is a geographical boundary, and it brings the waters of the Murray within the territory of New South Wales; but, inasmuch as the Murray is for many hundreds of miles a navigable stream, I do not think that the right of navigation is taken away from the inhabitants of South Australia, or from the inhabitants of Victoria. The question as to the mode in which they may navigate it of course arises, just as it arose on the Mississippi. The question was first raised somewhere about the year 1860, in connection with the imposition of border duties. On the 4th August, 1864, a letter was written by the Chief Secretary of Victoria to the Colonial Secretary of New South Wales, in reply to a letter from the latter to the former dated the 8th June, which bore solely upon the establishment of border duties. The Chief Secretary of Victoria, in the letter to which I refer, expressed his "regret that in seeking the assistance of this Government in the matter of Customs duties on goods crossing the Murray into New South Wales, your Government should have embarrassed the subject by raising for the first time the larger and more important question of the control of the river, and denying the right of Victoria to the free and unrestricted use of its waters for her own commerce." That led to a variety of correspondence, and ultimately, a deputation came from Victoria about the matter. Some agreement appears to have been entered into on 15th April, 1865, when there were present as representing New South Wales the Hon. Charles Cowper, the Hon. John Bayley Darvall, and the Hon. Thomas Ware Smart; the Victorian representatives being the Hon. James McCulloch, the Hon. Archibald Michie, and the Hon. George Verdon. It was then unanimously agreed that certain articles should form the basis of an agreement between the respective Governments of New South Wales and Victoria, the first of those articles being in these words, "The Government of New South Wales does not contend for exclusive jurisdiction over the waters of the Murray." Looking through the papers I do not see that there has been any further question in regard to the matter, except with reference to the ownership of two islands in the Murray near the South Australian border. These islands had been for some considerable time claimed by Victoria, and Victoria was receiving the rent for them. On the matter being brought before the Government of New South Wales, a survey was made, the result being that the islands again became New South Wales territory, it having been proved that the southern branch of the river was its main bed.

G. Colquhoun,  
Esq.  
17 June, 1896.

2001. That declaration would not affect any question of boundary? No. The Chief Secretary of Victoria only wrote about the denial of the right of Victoria to the free and unrestricted use of the Murray for our own commerce. My impression is that, under the rules of international law, Victoria has a right to use the Murray for her own commerce; but not to the detriment of this colony. That is how the question arose about the border duties.

2002. You think that Victoria has an absolute right to use the Murray? I do; but not to use it in such a way as to interfere with our fiscal arrangements, or anything of that kind. For instance, if Victoria purposed invading Queensland, she could not bring her army over the Murray without our consent.

2003. Has Victoria the right to take water from the river? I do not think that we need trouble ourselves about that, though it might affect South Australia.

2004. I judge from your remarks that anything done by this colony in the way of locking the Darling is not likely to cause claims for compensation to be made by the sister colony of Victoria? I do not think that any such claims will be made by the sister colonies.

2005. I understood you to say that people living on the banks of a river have a right to use the water for themselves and for their stock? Yes; that is such stock as they employ for domestic purposes. I do not mean all the stock running over one of the large leasehold areas that we call stations.

2006. That is their only right? Yes, I think so.

2007. Do you think they have the right to take water for irrigation purposes? No; if that right were conceded to them, they would be able to divert the river by means of flumes, to convey the water to some distant part.

2008. Seeing that their riparian rights are of this limited character, do you think that this proposed scheme would give the people on the river any claim for compensation? I think it is possible that they might have some claim, but as to the extent of that claim I should not like to speak.

2009. It would be very small? Yes, without any actual damage.

2010. Although the claim might be created, it would be so small that it would not be advisable to press it? I do not think it would be advisable to allow any such claim to be made. If there is any likelihood of the claim being made, the Crown should be protected. The Crown is only the trustee of these waterways, and as a trustee it should be protected.

2011. Therefore, some protective legislation should be passed before we enter upon any large scheme of the kind into which the Committee is now enquiring? I think that some such legislation should be passed before any work of the kind is entered upon.

TUESDAY,

TUESDAY, 21 JULY, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	HENRY CLARKE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	CHARLES ALFRED LEE, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	JOHN LIONEL FEGAN, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.	

The Committee further considered the proposed Construction of Locks and Weirs on the River Darling.

Alexander Oliver, Esq., M.A., President, Land Appeal Court of New South Wales, sworn, and examined:—

A. Oliver,  
Esq., M.A.  
21 July, 1896.

2012. *Chairman.*] I understand that you desire to limit your evidence to the question of riparian rights? Yes. The first point upon which I understand the Committee wish information is the international aspect of this question. The Murray, as I daresay the members of the Committee are perfectly well aware, has been specifically handed over to New South Wales by the Constitution Act, therefore, there is a broad distinction between the intercolonial rights *quoad* the Murray, and *quoad* the Darling. The Darling is a tributary or affluent of the Murray, and no Imperial legislation has been passed which affects it. For that reason I think that we have a freer hand in dealing with the Darling than in dealing with the Murray; in fact, in my opinion, our hand is absolutely free with regard to the Darling. I do not think that it is possible that South Australia, which is the only country that might be affected by works on the Darling, could be seriously injured by such works, because the volume of water pouring down the river must be so immense that it would be practically untouched by any irrigation scheme, though this is a matter for an expert to give evidence upon rather than for me to speak of. Of course, if there were a drought simultaneously in Queensland, New South Wales, Victoria, and the lower part of South Australia, the flow of water in the Murray—say, at Renmark—might be appreciably diminished; but no such drought has ever yet occurred.

2013. You are of opinion that the supply of water in the Darling is so ample that it is not likely that friction will arise between the colonies in regard to irrigation, and that therefore New South Wales will have no need to fall back upon any rights of possession which she may have? Yes. Then, too, it would be quite impossible to say how much South Australia was injured, if at all, by the taking of water from the Darling, because she gets her supply from the Murray after the Darling has flowed into it. I mentioned Renmark because there is an irrigation colony there, which is vitally concerned with the height of the water in the river. I do not think that there could ever be any difficulty with South Australia because of any works carried out on the Darling. However, as I said before, I am no expert upon these matters. With regard to the legal question, that is a very different thing. I take it to be the law that the whole of the water-course of the Darling legally belongs to New South Wales, and that this Colony has the entire right and control over the waters of the Darling. But if there were any sensible diminution of the water flowing past a place in South Australia—say, Renmark—or any pollution of that water, it might be held, on principles analogous to the principles underlying the ordinary common law, that South Australia had cause of complaint. I make that remark on the assumption that the people of a State in the aggregate have riparian rights analogous to those possessed by private individuals; but in all parts of the world with which I am acquainted, any difficulties arising in this way have been settled by convention.

2014. *Mr. Trickett.*] There was a convention about the Murray once? There was an attempt at a convention, but I do not know that it ever came to anything. We had trouble with Victoria in connection with her border duties, and also in connection with Pental Island. I do not think that the Pental Island difficulty ever went to the Privy Council as an appeal of law; it was the subject of arbitration here. Sir John O'Shaughnessy was the Victorian arbitrator, and Sir Edward Deas-Thomson was the arbitrator for this Colony, and the Privy Council decided that Pental Island belongs to Victoria, apparently upon the evidence that the channel between Pental Island and Victoria was only an ana-branch and that the real bank of the Murray, and therefore the boundary of Victoria, was the shore of Pental Island which fronted New South Wales. Whenever in other parts of the world difficulties of this kind arise, the usual way of deciding them is by convention. Such conventions have been held in the States of America, in Europe, and in every part of the world.

2015. *Chairman.*] In your opinion, when the whole of these colonies deal with these matters in conference, there will be some recognition of inter-state obligations? Yes; at the same time I wish to say that, so far as I know anything of the international law on this subject, the whole control of the Darling belongs to this Colony, and her right could not be challenged. That is all I have to say about the Darling in regard to the international aspect of this question. Other points may arise with regard to the Murray, Dumaresq, and the Macintyre. With regard to the riparian rights of the holders of land upon the Darling I have had sent to me the evidence of the Crown Solicitor. I have read that evidence, and, as I do not wish to express opinions here which are not supported by the highest authority, I have made some extracts from the reports of cases decided by the Privy Council, the House of Lords, and other courts of high authority. While I have the highest opinion of the Crown Solicitor as an accomplished lawyer, I would point out that he came before the Committee as the Crown Solicitor, and as Crown Solicitor he was concerned in conserving all possible rights of the Crown. Therefore I apprehend that it is only right and fair that his evidence should be considered in that light. I am under no such obligation or "official equation," that I am aware of. In the first place, when Mr. Trickett asked Mr. Colquhoun about the case of *Lord versus the Commissioners of Sydney*, I think that that gentleman was under a wrong impression as to what that decision was. For the past twenty years I have paid much attention to these matters. I do not know that I am a specialist. In the English law—I do not speak about the American law—there is not much to collect which is physically applicable to our special conditions.

2016. *Mr. Trickett.*] What do you consider to be the rights of the owners of land on the banks of the Darling? That raises the very serious question, whether the owners of land adjoining a river which is not affected by the tide, but which is subject to public rights of navigation, can avail themselves of the common law presumption, and are entitled to hold *usque ad medium filum aquae*. That is a point which has never been determined judicially, so far as I know, in this Colony with regard to non-tidal but navigable rivers,

rivers, though it has been with regard to highways. The nearest approach to any decision upon the subject is in the case I have already quoted—Lord *versus* the Commissioners of Sydney. That case decided—and there is no doubt of this—that in regard to a non-navigable, non-tidal stream the holder of a Crown grant took with it ownership of the soil under that stream, *ad medium flum*. What the Privy Council would not decide, and what the Crown Solicitor probably had in his mind, was whether riparian rights depended upon ownership of the bed of the creek or only upon ownership of the land as far as the bank. The Privy Council would not give a ruling upon that point because it was not necessary for the decision. They were of opinion that by its language the grant itself carried with it ownership of the land to the middle thread of the stream. That case, however, only determined the law with reference to non-navigable, non-tidal rivers. Now we have to do with a non-tidal but navigable stream.

A. Oliver,  
Esq., M.A.  
21 July, 1896.

2017. Did not the decision in Lord's case lay it down that the river must be non-navigable, and not subject to the ebb and flow of the tide? That was not laid down as part of the principle of the decision; but those were the facts, and there may always be an attempt to distinguish that case from any concerning a river such as the Darling. The facts were that the stream was non-tidal and non-navigable; but is the law applicable in that case applicable where the stream is non-tidal but navigable? The Privy Council in its decision, which was given by Sir John Coleridge, did not lay that down as a ground at all. The decision itself is applicable to the Darling; the facts are not.

2018. Will you give us your opinion as to what are the rights of grantees from the Crown of lands situated on the banks of the Darling? Of course, we must suppose a grant in the usual terms: "On the Darling," "bounded by the Darling," or with some equivalent words, that is, with no reservation, either expressed or implied, so as to bring it on all-fours with the grant in Lord's case. Assuming such a grant, the question is—What would the law, as laid down by a court of highest authority, declare? Here we come to the crux, and there is no disguising the fact that it is a crux. In England they have no such water-course as the Darling; and therefore the law as it has been evolved there may fairly enough be argued to be inapplicable to such a stream as the Darling. The judges of seven or eight of the States in the American Union have made the distinction, and have refused to apply the English common law to their rivers. For example, that has been done in Pennsylvania, Tennessee, the two Carolinas, and other States whose names I have forgotten. On the other hand the English common law in its entirety has been held applicable in such States as New York, Massachusetts, Illinois, Connecticut, Indiana, and others. The preponderance of authority there is in favour of the English common law doctrine, and even a large river like the Mississippi has been held to be non-navigable because it is beyond the influence of the tides.

2019. Is that a recognised decision? Yes, and a most important decision. It was given by the Supreme Court of Indiana, and I shall presently hand in some authorities which you will see support what I say. The preponderance of opinion in the American Courts, both in number and in value, is strongly in favour of the English law.

2020. Then your opinion runs in the direction that the owners of land on the banks of the Darling have property in the soil to the middle of the stream? That is the American law, and I take it that it is a fair answer to those who contend that the English law has no applicability here to say that in America a majority of the States have adhered to the English law. The American streams more closely resemble ours than anything you can discover in England. In England, at a very short distance from the embouchures of the rivers, navigation is carried on by means of locks and canals, and the law there has been settled for years, that, whether a stream is navigable or not, if it is not influenced by the tides, the riparian owners of land on each side of it are presumed to be entitled to the soil of the bed of the river up to the middle thread. That opinion has been held ever since the time of Lord Hale, and has been affirmed over and over again. I do not remember any recent case in which it has been disputed in England. According to the preponderance of legal opinion, the Darling is not navigable in law, though it may be navigable in fact. As I have already pointed out, it has been decided in America that the Mississippi is a non-navigable stream throughout the State of Indiana, while a similar decision has been given in regard to the Hudson. One of the reasons given for these decisions in America is, that it is better that this land should belong to some one than that it should be a sort of no-man's land, as it would be if it belonged to the State.

2021. Has there been any decision upon the point out here? None, that I am aware of; and I think I should have known if there had been. The Land Appeal Court has held, following the authority of Lord's case and others, that at a certain part of the Nepean, between Penrith and Richmond, where the river is, as a matter of fact, non-navigable, the owner of land granted by the words "on the Nepean" was entitled to the land *ad medium flum*. There was an appeal to the Supreme Court, but it was dismissed on a preliminary objection. The case came to the Appeal Court as a reference from a land board for direction. The Appeal Court went into it fully, with the result that I have stated, and the Crown, feeling aggrieved, asked the Appeal Court to state a case to the Supreme Court; but their honors the judges would not entertain it, because they thought that it was merely academical. The case to which I refer is known as *Waldron's case*.

2022. What right has a man to so deal with the water of a stream as to diminish the supply passing by the property below him, or to throw back water upon land above him? It appears to me that we must be guided by the common law of England. There are many parts of the Darling where the bed of the river must still belong to the Crown.

2023. *Chairman.*] When the Crown holds land on both sides of a river it also has the property in the bed of that river? Yes.

2024. When the Crown owns land on one side of the river, and a private owner owns the land on the other side of the river, half the bed of the river belongs to the Crown and half to the private individual? Yes, I think that would be the decision of the highest authorities. Supposing the Crown constructs works in the bed of the river on its own soil, where no question of *ad medium flum* ownership occurs, this may have two effects—the water may be so dammed back as to flood the land of owners higher up the stream, while the supply to owners lower down the stream may be diminished. This amounts to an infringement of the rights of these owners, or what the lawyers call *injuria*; but the compensation which riparian proprietors would get for such injury would only be in proportion to the actual damage sustained. But I apprehend that works of the kind of which I am speaking would be the subject of various remedies. They might amount to the creation of a public nuisance, or of a private nuisance, and might, according to the nature of the nuisance, be the subject of abatement or of an injunction, an information, or of an action for damages. The Crown would have no more right to damage the property of a private riparian owner than

A. Oliver,  
Esq., M.A.  
21 July, 1896.

than another private individual would have. But there are many things which the Crown could do which, although on the first appearance they might as public nuisances import damage or injury, would really inflict only inappreciable and no special damage, and in such a case the party aggrieved would have no remedy by action, though he might by information filed by the Attorney-General. Of course, under certain circumstances, there would also be the remedy by Abatement.

2025. *Mr. Trickett.*] That being so, do you think it would be desirable, before constructing locks and weirs on the Darling, to bring in legislation to prevent harassing law actions? Unquestionably. I may add that in nearly every case I know of elsewhere such works have had the support of legislation.

2026. Another matter to be considered is the effect of forcing back water into ana-branches and similar depressions? If you could be sure that the work would result in no appreciable damage to any one, legislation would not be necessary.

2027. But these works, although advantageous by conserving water for future use, might be detrimental to people living on the banks of the river? Yes. I know the Darling pretty well; I have travelled on both sides of it all the way down, and I think it would be rather a difficult thing to find a place where you could construct a dam without the possibility of doing a good deal of damage to the property of some adjacent owners if a flood should occur.

2028. If, by reason of the construction of one of these dams the river were to cut a new channel for itself through private property, the owner of that property would have an action for compensation? There is not the least doubt about it.

2029. And I daresay you have noticed that that is not at all an impossible condition? Not at all. The same thing has happened over and over again in America.

2030. With what result? I am not prepared to say what legal proceedings have followed, but frequently in America a very slight interference with the river has made it deviate very considerably from its course. That may or may not be an advantage, but in most cases it would cause injury.

2031. Looking at all these points of difficulty, do you think the Committee would be justified in recommending that before the Government commenced any scheme of the kind into which we are considering legislation should be introduced to cover their actions? I think there is no doubt about that. I forgot to mention what might be the position of the Crown in regard to any obstructions to navigation. Works might be constructed by the Crown on its own soil, which might, nevertheless, obstruct the navigation of the river. The right of navigation is a public right, and is paramount to every other right, and any work carried out by the Crown which obstructed navigation would be a public nuisance.

2032. *Chairman.*] Could I, as a landowner on the banks of the Darling, put up a wharf in the river? Undoubtedly, if it was erected on your own ground, and did not affect the navigation of the river, or obstruct the flow of water, or do any other consequential damage. You would put up such a wharf at your own risk. The right to put up a wharf would be controlled by the public rights of navigation.

2033. Can you define this right of navigation? It is the right of anyone to go to and fro on the river, make fast to its banks, and anchor where he likes. The man who put up a wharf in the Darling which projected more than a few feet from the banks would do it at his own risk, and if any steamboat master found that it was an obstacle to navigation he could pull it down, but at his own risk, because any man who abates a nuisance does so at his own risk, and that risk is by no means an inconsiderable one. The master of a steamboat might, if he thought necessary, get the Attorney-General to file an information, or he might go to the Court of Equity for an injunction to prevent the erection of a wharf—in fact, he would have plenty of remedies. In Spain and in Italy the State has taken over the beds of these watercourses; but that has not been so here, and in the absence of much needed legislation we have to consider what the common law on the subject is.

2034. *Mr. Trickett.*] How are these difficulties got over in the old country, where there are so many canals and locked rivers? When you get past the influence of the tides on the English rivers, you generally find the water conserved by a system of locks, and, as a general rule, the right to use the tow-path is regulated by legislation, while the watercourse is put under conservators. There are some rivers where there is a customary right of towing, arising from immemorial user. Many watercourses—for instance, the great Bridgewater Canal—are the subject of legislation, in which every matter has been elaborately dealt with.

2035. This all points to the necessity of having similar legislation here? Yes; if the State embarks in any considerable works in anticipation of, or without, legislation a large harvest of law suits will be reaped by some people.

2036. You told us a little while ago that the people down stream would have a right of action if their water supply was interfered with? If the interference amounted to a public nuisance, they could not maintain an action without proof of special damage, and they would be so informed by any counsel advising them. If it was a legal injury accompanied by actual special damage they would get substantial compensation, proportionate to the amount of damage suffered.

2037. The same principle of law would operate if any land was swamped, or submerged by the damming back of the river? Yes; the rights of the upper riparians would stand on the same level as those of the lower riparians.

2038. When the Sectional Committee was recently at Bourke the Darling was a dirty, torpid, narrow, muddy stream;—supposing the construction of weirs materially decreased the supply of water lower down the river the people affected would have ground for an action for compensation? Yes. Supposing a man had a mill, or a wool-washing plant, below the weir, and the river level was so lowered that he could not use the water, actual damage would be done to him, and he would have a right to bring an action to recover compensation, unless the State had protected itself by legislation. I look upon most of these rights to the soil of the Darling as not meaning very much; that is to say, if an act were passed vesting the soil of the Darling in the Crown, subject to the payment by way of compensation of such amounts as might be due to any riparian proprietor who had been deprived of his land by the action of Parliament, I do not think the amount of compensation which would have to be paid would be very large. As a rule the proprietors on the Darling would not be affected by such an Act. These rights are rather illusory; they do not mean much. If I had been consulted with regard to the Water Rights Bill, I should have advised that the Bill should vest the whole of the freshwater river beds in the Crown, and to provide that where any person was injured by the operation of the statute, and could prove injury, he should be entitled to such compensation as the Courts might award. That provision has been made over and over again in England and elsewhere, and that some such legislation is necessary here I have not the slightest doubt.

2039. *Mr. Lee.*] The right to the soil under a river might not mean much, but the construction of a weir

might

might limit the quantity of water flowing in the river below it, and might cause lands above it to be subject to the risk of floods? Yes, that would be a very serious matter; but it would be a question for experts to determine what would be the probable results of the work.

2040. *Mr. Trickett.*] The Darling is the drain of all the north-western country, and the construction of locks and weirs in it might have the effect of restricting the flow? Yes, unless the by-washes were properly constructed. The flood-water of 1890 came principally from Queensland. The rainfall in this Colony had not been very great. That flood, although the water rose perhaps not more than 18 inches above the bank at Bourke, caused immense disaster to pastoralists. The country out there is so level that it is difficult to find an eminence 20 feet high.

2041. *Mr. Humphery.*] Your opinion appears to be that legislation should precede the construction of the proposed works? Yes; or any important works in the bed of the Darling.

2042. It is an extremely hazardous thing to proceed with such works now, pending legislation? I should think so—very hazardous.

2043. *Mr. Roberts.*] You appear to hold quite a contrary opinion to that of the Crown Solicitor on the question of the rights of adjoining owners to the soil in the bed of the stream? I do.,

2044. You hold that if a man owns land on the banks of a river, he has a right to the soil up to the middle of the stream? I would rather say that that is the law as laid down by judges of authority.

2045. Has the owner of land on the banks of a river a right, by virtue of that ownership, to use the water of the river without the consent of the Crown? He has what the lawyers call a *usufruct*, that is, the use of the water without any ownership in it. He can take it for the purposes of his tenement, so long as he takes only a reasonable quantity, and does not diminish the supply of those below. Water, like air and light, is a thing in which you cannot have any property; you can only use it, and you must only use it in such quantities as not to interfere with the rights of others. That seems a vague definition, but it is as far as the law of England has allowed itself to go. If a man has a frontage of 100 chains to an intermittent stream, can he irrigate 50,000 acres, or water 20,000 sheep? That is to say, can he take a larger quantity of water than is proportionate for the length of his frontage? The tendency of the English courts is to say, "No, he can not"; but they are not able to say how much he may take. All they are able to say is that, when he takes such a quantity as to inflict injury with special damage upon any one below the person damaged has a remedy against him.

2046. Can a man take water from a river for irrigation purposes? Yes, for irrigating his own land, provided he does not take an excessive quantity in comparison with his frontage. The judges have said that he can take so much water as, allowing for absorption by the soil, will still permit the riparian proprietors below to have a supply brought to them without appreciable diminution. A man might take 10,000,000 gallons from a stream which was constantly running, and probably 3 miles below you would see no diminution in the supply. The quantity which may be taken depends largely on the size of the stream. A man might take an immense quantity from the Murray, but from a very small stream he could only take a correspondingly small quantity. Our law is to some extent founded on a scriptural basis: you must do to others what you would that they should do unto you.

[Mr. Oliver then handed in some extracts from English and American Cases and Text Books. *Vide Appendix.*]

A. Oliver,  
Esq., M.A.  
21 July, 1896.

## PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

## Construction of Locks and Weirs on the River Darling.

## APPENDIX.

## A.

[To Evidence of C. L. Shainwald, Esq.]

RETURN showing Days the Darling River was navigable from 1st January, 1882, to 26th May, 1896, inclusive.

Year.	Days open.	Days closed.	Percentage open during Year.	Year.	Days open.	Days closed.	Percentage open during Year.
1882	84	281	23	1889	190	175	52
1883	44	321	12	1890	354	11	97
1884	21	345	06	1891	282	83	77
1885	31	334	08	1892	247	119	68
1886	222	143	61	1893	337	28	92
1887	269	96	74	1894	282	83	77
1888	82	284	22	1895	54	311	15

Average for fourteen years, 49 per cent.

During 1896 to date, 25th May, the river has been navigable for seventy-one days and closed for seventy-five days, and is at present not navigable.

As emphasising the irregular character of navigation and its dependence almost wholly on tropical rains, which are purely fortuitous, it may be added that the months of the year during the past fourteen years in which navigation has been most frequent are January and February.

## B.

[To Evidence of J. W. Boulbee, Esq.]

RETURN showing Cost, Annual Revenue, and Expenditure in connection with Government Artesian Bores.

[To Evidence of P. Scarr, Esq.]

COACH Routes and other Roads from Bourke and Brewarrina, with Explanatory Diagram.

Road.	Distance.	Remarks.
	miles.	
* Bourke to Wilcannia, via Louth, down river Darling .....	250	Not scheduled.
* Bourke to Wanaaring, tends westerly from Bourke.....	113	Scheduled £300, 95-6.
* Bourke to Hungerford (on Queensland border), N.W. from Bourke.....	126	Scheduled £300, 95-6.
* Bourke to Barrington (on Queensland border).....	80	Scheduled £400, 95-6.
* Bourke to Brenda, up Culgoa .....	110	(About) not scheduled.
* Bourke to Brewarrina .....	68	(About) not scheduled.
Bourke to Cobar .....	100	(About) not scheduled.
* Brewarrina to Walgett .....	140	£280 on 95-6 schedule.
* Brewarrina to Byrock (on railway) .....	60	(About) not scheduled, but improved.
Brewarrina to Nyngan (on railway).....	140	(About).
* Brewarrina, via Bundabulla, towards Brenda .....	73	(About).
* Brewarrina to Bokhara or Goodooga (on Queensland border).....	80	(About) not scheduled, but improved.
Brewarrina to Enngonia.....	75	£150 on 95-6 schedule.

PERCY SCARR,

Principal Assistant Engineer, Roads,  
23/5/96.

The Secretary, Parliamentary Standing Committee on Public Works.

[To Evidence of H. C. Russell, Esq., C.M.G., B.A.]

AVERAGE DISCHARGE OF RIVER AT BOURKE, EVAPORATION, PERCOLATION, AND RAINFALL OVER THE DARLING CATCHMENT AREA.

Sir,

Sydney Observatory, 5 June, 1896.

I am sorry for the delay in supplying the information you desire, but I did not get the Queensland data until 2nd June, and since that date I have made all speed to get the information desired.

Taking the average river at Bourke for fifteen years, it comes out an average for the year 10 feet 1 inch at Bourke. That represents a discharge of 2,350,000,000 tons of water passing Bourke per annum; this represents water equivalent to a rainfall of 0.30 inch, or 30 points as it is commonly called, over the watershed. Average actual discharge of river at Bourke

The average rainfall for the same period (I omit 1890, because the flood could not be measured) of fifteen years 23.81 inches. I have really no means of ascertaining the loss by evaporation and vegetation. In Europe about two-thirds of the rainfall is lost by evaporation and percolation. The Murray carries away 30 per cent. of the rain; it is therefore similar to the average European river. We may then I think assume that the Darling would, but for special percolation, carry off 30 per cent. of 23.81 inches rain, that is 7.04 inches over the watershed.

In reply to the questions at the meeting of Committee when I was examined, I have shown that the highest river on record (average for year), 29 feet 1 inch average flood, only carried off the equivalent of 1 inch of rain over the watershed. On the assumption we have made above, that is, that it should, in order to be like other rivers, carry off 7 inches of rain, it is obvious that there ought to be water for seven rivers as big as the Darling at Bourke in 1879, that is—equal in cross section to the Darling at Bourke, and an average depth of water of 29 feet.

Now an inch of water over the Darling catchment is equal to 771,836,000 tons of water.

My section of the river is for Bourke only, and the only river feeding the Darling, at or rather between Brewarrina and Bourke that I have measures of is the Culgoa, and of that I have no section, and measures only at Goodooga, so that I cannot say how much water the Culgoa discharges into the Darling, but assuming that it discharges the same proportion of the rainfall that the whole catchment of the Darling above Bourke does, which is I think a fair assumption, although the map shows that some of the rivers that ought to discharge into the Culgoa run out on to plains and are lost; probably it is safe to neglect these as the area is not large, about two square degrees. Including these, the Culgoa on the above assumption, viz., that it discharges the same proportion of its rainfall that the whole catchment of the Darling above Bourke does, the quantity of its discharge into the Darling amounts on the assumptions made to 1,175,000,000 tons of water. The whole quantity passing Bourke I make 2,350,000,000 tons per annum. The average rainfall on the Culgoa is 30.28 inches and in New South Wales Tributaries 24.59 inches. Estimated discharge of the Culgoa.

As to the quantity that in times of big floods would come in I do not see any way to arrive at it because the river overflows its banks, but to continue the process of estimating I should think at least three times as much in each, that is from the Culgoa and the Darling.

The loss from the soil by evaporation I have endeavoured to estimate in the first part of this letter that it is probably two thirds of the rainfall. To arrive at it exactly would be a difficult matter, and require years of experiment. I will think the matter over again, and if anything occurs to me which might be of use to you I will send it. Two-thirds of rainfall lost in all probability would still leave seven times as much as passed Bourke in 1879.

As to the amount of percolation.

Lake George furnishes some data of value in estimating the quantity of rainfall that becomes running water. The lake is situated in the main range, and the elevation of its surface water is 2,200 feet above mean sea-level. Since February, 1885, I have had on it a self-recording gauge which shows every change of level; and this shows that in all ordinary rains—1 to 2 inches—the lake gets nothing from its catchment, the rise in such rains being just equal to the rainfall. Early in 1885, a very heavy rain storm passed over the lake, which the various rain gauges about slow to have been 8 inches to 9 inches; assuming, therefore, that the average fall over the catchment was the smaller quantity—8 inches—I find that the lake rose only 1½ inches, that is, 3½ inches more than that which fell directly into it. The catchment of the lake is twelve times the area of the lake; and since the lake rose from the drainage of this exceptional storm—only 3.5 inches—it follows that ¾ or 0.29 inches over the catchment is the quantity out of 8 inches of rain, that is, 3 per cent., which found its way into the lake. It must be borne in mind that on both sides of the lake the hills rise abruptly from the water, and that they are for the most part rocky, and with very little soil over them, and that they form a continuation of the range from which the main supply of water for the Darling comes. The country was dry when this storm came on, for it was in the great drought of 1884-5-6, and it shows how much of the rain may disappear even on the mountains, and bears out the experience on the Darling, where such a small fraction of the rain finds its way into the river.

RESULTS of Experiments in England to determine the proportion of the Rainfall which sinks down to feed the underground supply.

When in England I visited Rothamstead, in order to make myself acquainted with the work which has been done there for Sir James Lawes; they have been extremely costly. Dr. Gilbert, F.R.S., a gentleman of great ability, supported by a small army of assistants and the unlimited funds supplied by Sir James Lawes, has carried on a work there for about fifty years, which is unequalled by that done in any other part of the world, even where such experiments have been carried out for Governments.

One of the questions which it was determined to investigate was—How much of the rainfall sinks down to the underground waters? In order to test this, three brick and cement chambers were constructed, each having an area of soil equal to one thousandth of an acre, that is, 6 feet 7 inches x 6 feet 7 inches, the tops of these were 2 in. above the soil, to prevent water running in. The first had in it 20 inches of soil; the second 40 inches; and the third 60 inches. In each case the bottom was provided with a number of pipes which lead the water to the same outlet. Where the water was protected from evaporation and measured at regular intervals several ordinary rain gauges were placed near.

I asked if, in each case, a mass of soil in its virgin state had been cut out and lifted bodily into the prepared chambers; Dr. Gilbert said no, that was unnecessary, for he had found by experiment that soil that has been broken up settles down under rain and ordinary circumstances to a condition which was so far as these experiments were concerned to all intents and purposes equivalent to that of virgin soil.

When I was there in 1887, the result of sixteen years work on these experiments was available, and it was found that the gauge with 20 inches of soil allowed to pass through 48 per cent. of the rain; 40 inches of soil allowed to pass through 50 per cent. of the rain; 60 inches of soil allowed to pass through 45 per cent. of the rain.

The fact that the 40-in. gauge allows more water to pass through than the 20-in. gauge, shows that the soil in the two was not exactly alike, but the average of the three shows that from 40 to 45 per cent. of the rain went to underground water supply.

AVERAGE Rainfall over the Darling Catchment Area.

New South Wales.		Queensland.

J. W. B.—17/7/96.

## G.

[To Evidence of Alexander Oliver, Esq., M.A.]

## RIPARIAN RIGHTS, ENCRAGEMENTS, PRESCRIPTION, ADOPTION OF COMMON LAW.

LORD HALE, in the treatise generally attributed to him (*De jure maris et Brachiorum ejus*), lays down the law thus: "Fresh rivers of what kind soever, do, of common right, belong to the owners of the soil adjacent, so that the owners of the one side have, of common right, the propriety of the soil, and the owners of the other side, the right of soil or ownership, unto the *flum aquæ* on their side. And if a man be owner of the land on both sides, in common presumption he is owner of the whole river according to the extent of his land in length." The existing law is no more than an evolution from the law as thus enunciated.

"It is a settled principle in the English law that the right of soil of owners of land bounded by the sea, or on navigable rivers where the tide ebbs and flows, extends to high-water mark; and the shore below common, but not extraordinary high-water mark, belongs to the State as trustee for the public; and in England the Crown, and in this country the people, have the absolute proprietary interest in the same, though it may, by grant or prescription, become private property. The public have, at common law, a right to navigate over every part of a common navigable river, and on the large lakes; and in England, even the Crown has no right to interfere with the channels of public navigable rivers. They are public highways at common law. The Sovereign is trustee for the public, and the use of navigable rivers is unalienable. But the shores of navigable waters, and the soil under them, belong to the State in which they are situated as Sovereign. The right of Sovereignty in public rivers above the flow of the tide is the same as in tide waters; they are *juris publici*, except that the proprietors adjoining such rivers own the soil, *ad flum aquæ*. But grants of land, bounded on rivers or upon the margins of the same, above the tide water, carry the exclusive right and title of the grantee to the centre of the stream, unless the terms of the grant clearly denote the intention to stop at the edge or margin of the river; and the public, in cases where the river is navigable for boats and rafts, have an easement therein, or a right of passage, subject to the *jus publicum* as a public highway. The proprietors of the adjoining banks have a right to use the land and water of the river as regards the public in any way not inconsistent with the easement; and neither the State nor any other individual has a right to divert the stream and render it less useful to the owner of the soil. It would require an express exception in the grant, or some clear and unequivocal declaration, or certain an immemorial usage, to limit the title of the owner, in such cases, to the edge of the river. Where a stream is used in a grant as a boundary or monument, it is used as an entirety to the centre of it, and to that extent the fee passes. *Primâ facie*, said the Vice-Chancellor of England (in *Wright v. Howard*, 1 Sim. & Stuart 190), the proprietor of each bank of a stream is the proprietor of half the land covered by the stream. If the same person be the owner of the lands on both sides of the river, he owns the whole river to the extent of the length of his lands upon it." 3 *Kent's Commentaries*, p. 545, 9th Ed.

In 1858, in the case of *Miner v. Gilmour*, which was an appeal from the Court of Queen's Bench, in Lower Canada, Lord Kingsdown, delivering the judgment of the Judicial Committee (12 Moore's Privy Council Reports, at page 156), laid down the law of England, which was practically the same as the French-Canadian law, thus: "By the general law applicable to running streams, every riparian proprietor has a right to what may be called the ordinary use of the water flowing past his land; for instance, to the reasonable use of the water for his domestic purposes, and for his cattle, and this without regard to the effect which such use may have in case of a deficiency upon proprietors lower down the stream. But, further, he has a right to the use of it for any purpose, or what may be deemed the extraordinary use of it, provided that he does not thereby interfere with the rights of other proprietors, either above or below him. Subject to this condition, he may dam-up the stream for the purpose of a mill, or divert the water for the purpose of irrigation. But he has no right to interrupt the regular flow of the stream, if he thereby interferes with the lawful use of the water by other proprietors, and inflicts upon them a sensible injury." Since the delivery of this judgment English judges have always recognised the right of a riparian proprietor to extraordinary as distinguished from ordinary use of the water of a running stream. [And cf. *Lord Norbury v. Kitchen*, 9 Jurist (N.S.), p. 132; *Stockport Waterworks v. Potter*, 3 H. & C., 300; *Ormerod v. Todmorden, &c.*, L.R. 11, Q.B.D. 155.]

In the year 1859 an important case went on appeal from our own Supreme Court to the Privy Council, and is reported in the 12th volume of the P. C. Reports, p. 473. In that case (*Lord v. the Commissioners for the City of Sydney*) the Privy Council held, reversing the judgment of the Supreme Court, that a Crown grant made in 1810 of land bounded by a non-navigable creek passed the soil of the creek *ad medium flum aquæ*, inasmuch as the description of boundaries in the grant did not exclude from it that portion of the creek which, by the general presumption of law, would go along with the ownership of the land on the banks of the creek. The City Commissioners (the respondents) had appropriated, under Act of Parliament, the water of this creek, and by diverting it materially diminished the quantity, withdrawing the supply by which the mill was worked, and the stream in general which was used for woolwashing and other purposes, besides that of turning a mill. The law, as laid down by Chancellor Kent in the passage already quoted, was adopted by Sir John Coleridge in delivering judgment, who said, "Tried according to these principles (*i.e.*, those laid down by Kent), it appears clear to their Lordships that the description of the boundaries in this grant does not exclude from it that portion of the creek which, by the general presumption of law, would go along with the ownership of the land on the bank of it. The Crown had the power of granting it; no reason can be assigned why it should have reserved what might be directly and immediately useful to the grantee, and could scarcely have been contemplated as of any probable use to the Crown, and thus, too, in an infant colony where it was the manifest and avowed policy to encourage settlement and the cultivation of land by grants on the easiest and most favourable terms." [See also *Tilbury v. Silva*, L.R. 45 Ch., Div. 98.]

In 1851, Baron Parke, in *Embrey v. Owen*, 6 Exch. Rep., p. 360, said, "The law as to flowing water is now put on its right footing by a series of cases beginning with *Wright v. Howard*, 1 Sim. and S. 190, followed by *Mason v. Hill*, 3 B. and Ad.

Ad. 304, and ending with *Waud v. Waud*, 3 Exch. 748, and is fully settled in the American Courts, see 3, Kent's Commentaries, sect. 52, pp. 439-445," and that most learned and accurate Judge proceeded to quote from Kent the passage following:—And it is an exposition of the law which has frequently been since adopted in English Courts.

"Every proprietor of lands on the banks of a river has naturally an equal right to the use of the water which flows in the stream adjacent to his lands, as it was wont to run (*currere solebat*) without diminution or alteration. No proprietor has a right to use the water to the prejudice of other proprietors, above or below him, unless he has a prior right to divert it, or a title to some exclusive enjoyment. He has no property in the water itself, but a simple usufruct while it passes along. *Aqua currit et debet currere ut currere solebat*, is the language of the law. Though he may use the water while it runs over his land as an incident to the land, he cannot unreasonably detain it or give it another direction, and he must return it to its ordinary channel when it leaves his estate. Without the consent of the adjoining proprietors, he cannot divert or diminish the quantity of water which would otherwise descend to the proprietors below, nor throw the water back upon the proprietors above, without a grant, or an uninterrupted enjoyment of 20 years, which is evidence of it. This is the clear and settled doctrine on the subject, and all the difficulty which arises contests in the application. The owner must so use and apply the water as to work no material injury or annoyance to his neighbour below him, who has an equal right to the subsequent use of the water, nor can he, by dams or any obstruction, cause the water injuriously to overflow the grounds and springs of his neighbour above him. Streams of water are intended for the use and comfort of man; and it would be unreasonable, and contrary to the universal sense of mankind, to debar every riparian proprietor from the application of the water to domestic, agricultural, and manufacturing purposes, provided the use of it be made under the limitations which have been mentioned; and there will, no doubt, inevitably be, in the exercise of a perfect right to the use of the water, some evaporation and decrease of it, and some variations in the weight and velocity of the current. But *de minimis non curat lex*, and a right of action by the proprietor below, would not necessarily flow from such consequences, but would depend upon the nature and extent of the complaint or injury, and the manner of using the water. All that the law requires of the party, by or over whose lands a stream passes, is that he should use the water in a reasonable manner, and so as not to destroy, or render useless, or materially diminish, or affect the application of the water by the proprietors above or below on the stream. He must not shut the gates of his dams and detain the water unreasonably, or let it off in unusual quantities to the annoyance of his neighbours. Pothier lays down the rule very strictly, that the owner of the upper stream must not raise the water by dams so as to make it fall with more abundance and rapidity than it would naturally do, and injure the proprietor below. But this rule must not be construed literally, for that would be to deny all valuable use of the water to the riparian proprietors. It must be subjected to the qualifications which have been mentioned, otherwise rivers and streams of water would become utterly useless, either for manufacturing or agricultural purposes. The just and equitable principle is given in the Roman law: *Sic enim debere quem meliorem agrum suum facere, ne vicini deteriores faciat.*"

In 1893, in a very carefully-considered judgment, the Land Appeal Court of this Colony held, upon the authority of the last-cited case, and of *Micklethwaite v. Newlay Bridge Company*, L.R. 23 Ch., Div. 133, that a Crown grant made in 1803 of land "on the river Nepean" passed to the owner of the land so granted the soil of the river *ad medium filum aque*. (*In re Waldron*, 3 L.C.C., p. 144.) The Court found in that case that at the point in question the river Nepean was both in law and in fact a non-navigable river; but as to whether the presumption of *ad medium filum* ownership could apply to a navigable river (like *e.g.* the Darling) the Court expressed no opinion.

But, by a series of cases in the English Courts, it may now be considered as settled law that the presumption of law is, as to tidal rivers (and these alone are *in law* considered to be navigable), that the soil or *fundus* is vested in the Crown, while the presumption as to non-tidal or non-navigable rivers is that the soil belongs *ad medium filum* to the riparian owners. [See as to this per Lord Selborne in *Lyon v. Fishmonger Company*, L.R., H.L. 1, at p. 682.] "The most material differences (said his Lordship) between the stream above and the stream below the limit of the tides are that in an estuary or arm of the sea there exist, by the common law, public rights in respect of navigation and otherwise which do not generally, in this country, exist in the non-tidal parts of the stream; and that the *fundus* or bed of the non-tidal parts of the stream belongs generally to the riparian proprietors, while in the estuary it belongs generally to the Crown." [See also per Lord Wensleydale in *Chasemore v. Richards*, 7 H.L.C., 349; and *North Shore Railway Co. v. Pion*, 14 H.L.C., 612.]

The English common law rule of riparian ownership above tide has been adopted in America, in the States of New York, Massachusetts, New Hampshire, Connecticut, Maine, Maryland, Virginia, Ohio, Indiana, Illinois. In some States, such as Pennsylvania, Tennessee, N. and S. Carolina, and Alabama, the rule of the common law rule has been held inapplicable.

But the *Court of Errors*, N.Y., in *Commissioners of Canal Fund v. Kempshall*, 26 Wend. (N.Y.) 404, is the most elaborate and learned decision on the question, and it decides in favour of *ad medium filum* ownership above H.W. mark in navigable inland rivers.

(1866.) Upon the question of encroachment by one riparian proprietor on the alveus of a stream, and how far the same can be resisted by another, *Bickett v. Morris*, L.R. 1, Sc. App. 47, is an important authority. *Bickett v. Morris* has recently been explained and distinguished by Cotton, L.J., in *Kensit v. G. E. Railway Co.*, L.R. 27 Ch., Div. p. 131:—"What was decided in that case (said Lord Justice Cotton) was that what interferes with the channel of the river was a matter which would be actionable unless the Court were satisfied that there would not be any injury resulting from it either then or at a future time; and in such a case as the flow of water, which is so difficult to deal with, it would be a difficult case to determine whether what had been done would or would not produce any injury. If there was a reasonable prospect that it would produce any damage to the opposite or lower riparian owners, then that would give a right of action, although no actual injury was shown to have resulted from it." [In these cases the act complained of was not in the nature of a public nuisance.]

(1875.) Lord Cairns (L.C.) in *Swindon Water Co. v. Wilts and Berks Canal*, L.R. 7, H.L. 697, laid down the law thus:—"Undoubtedly the lower riparian owner is entitled to the accustomed flow of the water for the ordinary purposes for which he can use it; that is quite consistent with the right of the upper owners also to use the water for all ordinary purposes, whatever portion of the water may thereby be exhausted, and may cease to come down by means of that use. But, further, there are uses no doubt to which the water may be put by the upper owners, *e.g.*, uses connected with the tenement. Under certain circumstances, and provided no material injury is done, the water may be used, and may be diverted for a time by the upper owner for the purpose of irrigation. This may well be done, and the exhaustion of the water which may thereby take place may be so inconsiderable as not to form a subject of complaint by the lower owner, and the water may be restored, after the object of irrigation is answered, in a volume substantially equal to that in which it passed before. Again, it may well be that there may be a use of the water by the upper owner, for, I will say, manufacturing purposes, so reasonable that no just complaint can be made on the subject by the lower owner. Whether such a use in any particular case could be made for manufacturing purposes connected with the upper tenement would, I apprehend, depend upon whether the use was a reasonable use. Whether it was a reasonable use would depend, at all events in some degree, on the magnitude of the stream from which the deduction was made for this purpose over and above the ordinary use of the water.

Upon this, Coulson and Forbes' "On Waters," comment thus:—"A riparian owner is, therefore, at liberty to pen back and divert temporarily the waters of a stream flowing through his lands in a reasonable way, and for reasonable purposes connected with his tenement, provided he does not thereby injure his neighbours, and no action will lie for such obstruction unless the complainant can prove actual damage. Where, however, the purpose for which the water is taken is not reasonable, or not a use connected with the riparian tenement, the taking is an invasion of a right of property; and whenever an injury is done to a right, actual perceptible damage is not indispensable as the foundation of an action, but it is sufficient to show the violation of the right, and the law will presume damage. (*Embrey v. Owen*, 6 Exch. 353, per Parke B, p. 363, *Swindon Water Co. v. Wilts and Berks Canal*, *ubi supra*.)

So Lord Blackburn in *Orr Ewing v. Colquhoun* (2 App. Ca. 556, with which cf. *Miner v. Gilmour*, 12 Moore, P.C. 131), said:—"The owner on the banks of a non-navigable stream has an interest in having the water above him flow down to him, and in having the water below him flow away from him as it has been wont to do; yet I apprehend that a proprietor may, without any illegality, build a mill-dam across the stream within his own property, and divert the water into a mill-lade without asking leave of the proprietors above him; provided he builds it at a place so much below the lands of those proprietors as not to obstruct the water from flowing away as freely as it was wont, and without asking leave of the proprietors below him, if he takes care to restore the water to its natural course before it enters their land,

Whether

Whether a riparian proprietor may use the water of a stream for the purposes of irrigation, if he again return it to the stream with no other diminution than that caused by the evaporation and absorption attendant on irrigation, appears to depend on the circumstances of each particular case. Thus, in *Embrey v. Owen* (*ubi supra*), where it was proved that the diversion was not continuous, and that it caused no diminution cognizant to the senses, the Court held that this was not, under the circumstances, such an unreasonable use as to be prohibited by law. Where the defendant diverted water from a river for the purposes of irrigation, and the amount of water was not thereby diminished, but the water arrived so late at the plaintiff's land below that he could not use it fully for irrigation purposes, it was held that this detention of the water by the defendant was a use of it which was in its character necessarily injurious to the natural rights of the plaintiff as a riparian owner, and therefore a ground of action.

(1876.) In *Lyon v. Fishmonger's Coy.*, L.R. 1 App. Ca., the point which the Privy Council did not care to decide in *Lord v. The Commissioners of the City of Sydney* (*ubi supra*) was finally determined, their Lordships holding that the right of a riparian owner to the use of the stream did not depend on the ownership of the soil of the stream.

A watercourse has been defined judicially to be *flumen vel cursus aqua*, water flowing in a channel between banks more or less defined. It is not, however, necessary to constitute a watercourse that the water should flow continually, as a channel may be occasionally dry, but it must appear that the water flows usually in a regular channel, and has a well-defined and substantial existence, the law making a distinction between a regular flowing stream which at certain seasons is dried up, and those occasional bursts of water which in times of freshets and melting of snows descend from the hills and inundate the country. It might be a question whether the Bogan, Warrego, or Paroo is in law a watercourse, but the evidence would probably point in the affirmative, although each appears only to be a stream in time of flood; but if a rainfall which is not heavy enough to produce a general inundation of the adjoining country causes the Warrego or Paroo to flow between banks capable of being defined, it would appear to be a watercourse for all riparian purposes.

Every watercourse, according to a very learned authority on the subject (the American text writer, Mr. Angell), consists of—1, the bed; 2, the bank or shore; 3, the water. The bed of a river, said Lord Campbell, is the *alveus*, as distinguished from the shore and from places where flood-waters occasionally collect. The bank is the outermost part of the bed in which the river naturally flows.

With regard to the applicability of the Common Law as laid down by English Courts to the circumstances of this Colony, it may be observed that colonists from England carry with them from the mother country so much of the Common Law and the Statute Law as is applicable to their new situation, also they enjoy the rights and immunities of British subjects (per Lord Wensleydale, in *Kielly v. Carson Moore*, P.C., 84).

And cf. here, sec. 24 of 9 Geo. IV, c. 83, which enacts "All laws and statutes in force within the realm of England (at 25th July, 1828) shall be applied in the administration of justice . . . so far as the same can be applied . . . and as often as any doubt shall arise as to the application of any such laws or statutes, it shall be lawful for the Queen, by and with the advice of. &c. &c., to declare whether such laws or statutes shall be deemed to extend to New South Wales, &c. . . as to make and establish such limitations and modifications of any such laws and statutes . . . as may be deemed expedient. Provided always that in the meantime and before any such ordinances shall be actually made, it shall be the duty of the Supreme Court, as often as any such doubts shall arise, upon the trial of any information, or action, or upon any other proceeding before them, to adjudge and decide as to the application of any such laws or statutes, . . . &c."

In *Cooper v. Stuart*, 14 App. Ca. 286-291, Lord Watson said:—"The extent to which English law is introduced into a British Colony, and the manner of its introduction, must necessarily vary according to circumstances. There is a great difference between the case of a Colony acquired by conquest or cession in which there is an established system of law, and that of a Colony which consisted of a tract of territory practically unoccupied, without settled inhabitants, or settled law, at the time when it was peacefully annexed to the British dominion. The Colony of New South Wales belongs to the latter class. In the case of such a Colony the Crown may, by ordinance and the Imperial Parliament, or its own Legislature, when it comes to possess one, may by statute declare what parts of the common and statute law of England shall have effect within its limits. But when that is not done the law of England must (subject to well-established exceptions) become from the outset the law of the Colony, and be administered by its tribunals. In so far as it is reasonably applicable to the circumstances of the Colony, the law of England must prevail until it is abrogated or modified either by ordinance or statute." As to the limitation of applicability or otherwise, Lord Cranworth, in *Whicker v. Hume*, 7 H.L.C., 124, said:—"Nothing is more difficult than to know which of our laws is to be regarded as imported into our Colonies. Who is to decide whether any law is adapted to the situation of the Colony?"

On this cf., Westlake's Private International Law, p. 137. Webb says:—"Thus the artificial right of riparian proprietor to the river-bed, *ad medium filium* (unless expressly reserved), holds in a new Colony where it is suitable to the circumstances; that is where the object is to encourage settlement and the cultivation of the land by grant on the easiest and most favourable terms from the Crown, in whom full right is vested." (*Lord v. Commissioners of Sydney*, 12 Moore, P.C. 498.) (Webb's Imperial Law, 2nd Ed., p. 21.)

Mr. Webb thinks that the true effect of 9 Geo. IV, c. 83, sec. 24 is "that it introduced all the laws, &c., of England into New South Wales that could be reasonably applied to New South Wales in 1828, and would, so far as they can be reasonably applied, when the question arises."

Prescription regulated in England by 2 and 3 Wm. IV, c. 71 (not adopted here), therefore, any prescription in New South Wales must be by common law, and so it might be held there must be (1) actual user; (2) constant and peaceable user; (3) usage from *time immemorial*, i.e., the beginning of Richard I reign; (4) must be certain and reasonable; (5) must be laid in a man and those whose estate he hath, or in a man and his ancestors, &c., &c. Every prescription presumes that a grant has issued and been lost, and therefore the thing must be a grantable one.

Kent says, at p. 574, "The natural right to the use of water (riparian rights at common law) may be abridged or enlarged or modified by *grant or prescription*. Though a stream be diminished in quantity, or corrupted in quality, by means of the exercise of certain trades, yet if the occupation of the party so taking or using it has existed for so long a time as to raise the presumption of a grant, and which presumption is the formation of title by prescription, the other party, whose land is below, must take the stream subject to such adverse right; and 20 years exclusive enjoyment of the water in any particular manner affords, according to the English law, and the law of New York, Massachusetts, and several other States, presumption of such a grant," and see the note (c) to the text in Kent [Probably in this Colony, when the question of prescription at common law shall be raised for definitive adjudication, it will be held, by analogy to the principles adopted in American Courts, that the same period which destroys a right of entry on land under the Statute of Limitation ought to be presumed to have created a prescriptive right to a water easement. This opinion is submitted on the ground that the principle of "Prescription" would be recognised by our Courts, and, in the absence of any statutory regulation of that principle as in England, and the impossibility of introducing in a Colony the common law fiction of immemorial usage or legal memory, that the Courts would adopt the Statute of Limitation principle which so many of the Supreme Courts of the American States have adopted.]

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

CONSTRUCTION OF LOCKS AND WEIRS ON THE RIVER DARLING.

TAKEN BEFORE THE SECTIONAL COMMITTEE.

MONDAY, 22 JUNE, 1896.

[The Sectional Committee met at the Pera Bore Settlement, at 3 p.m.]

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (CHAIRMAN).

THE HON. WILLIAM JOSEPH TRICKETT.  
CHARLES ALFRED LEE, Esq.

THOMAS HENRY HASSALL, Esq.  
GEORGE BEACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Sectional Committee proceeded to consider the proposed Construction of Locks and Weirs on the River Darling.

Mr. Frederick Hersey, farmer, Pera Bore Settlement, sworn, and examined:—

*To the Chairman:* Before I came to the Pera Bore Settlement I was at Louth, where I commenced operations in 1892. My chief market while at Louth was the shearing sheds. I supplied the sheds for 30 miles round with vegetables. I had 3 acres of land under cultivation at Louth, and was working on my brother's place. I used a wool-scouring plant that was there, and I had a Tanyce pump with a 3-inch delivery. When the river was low I had to lift the water 40 feet.

*To Mr. Black:* There was any quantity of wood close at hand which I used to supply the furnace. If I had employed an engine driver, the working of the pump would not have cost less than £75 a year. I found that once the native weeds were killed, the ground did not require very much cleaning. Two hoeings a year kept it perfectly clean. Root crops, such as carrots, parsnips, and turnips, did remarkably well, while some of my cabbages averaged 20lb. in weight. I could not have irrigated more than 4 acres with the pumping appliances I had at Louth. It would cost about £130 to irrigate there but a portable engine and boiler would have done the work much better. During the first year I was by myself; but for the last three years I employed a man at £50 a year and his rations. I kept no accounts of my earnings; but during the four seasons I spent at Louth I had two trips round to Adelaide and Melbourne. I went down to the Melbourne Cup and I was away three months. I had nothing worth speaking of when I started at Louth, but of course there was plenty of fruit and vegetables to help me along. My fruit-trees were very successful except the apples. I was under very little expense for living while at Louth.

*To Mr. Trickett:* I supplied the shearers and rouseabouts for 30 miles round at 1s. 6d. a week. While I grew crops all the year round, the time when I grew heavily was when shearing was on.

*To Mr. Lee:* I was at Louth during some very hot summers. I was there during last summer, for instance, and I found that vegetables would not do well in the hot weather. Melons and pumpkins do well enough, but other things are affected by the heat.

Mr.  
F. Hersey.  
22 June, 1896.

*To the Chairman:* During the three years I was at Louth I earned nothing except in the way I have told you.

*To Mr. Lee:* I left Louth because the ground I was working was not my own. It belonged to my brother-in-law, and he asked me £125 a year for permission to use 20 acres, which was too much. I should have stopped there if I could have made a better arrangement.

*To Mr. Trickett:* While I was at Louth I was working on the halves system.

*To the Chairman:* In that way I paid my brother-in-law a good deal more than £100. Last year my cheque from Dunlop alone came to £40 odd. I believe that I gave my brother-in-law over £200. Louth was worth £1 a week or nearly so.

*To Mr. Hassall:* When I could come to no satisfactory arrangement with my brother-in-law, I was going to start at Redbank; but then I thought it advisable to come up here. My brother-in-law supplied the engine and pumping plant and the cart and horse.

*To Mr. Lee:* I should not have taken up land at Pera if the water were not supplied; but I think I should do very well here. I think the soil is as good as that at Louth; but I have not grown anything upon it yet, because I have been here only about eight weeks.

*To Mr. Black:* I do not think that the bore water is as good as the river water for irrigation purposes. It has some mineral in it, and is inclined to cake the soil. I see that it has already done so in some places. The soil will want to be continually worked. I do not think that it will cake as much with the river water. In using water from the bore, it will be well to use it moderately, so that it may drain away quickly.

*To Mr. Trickett:* The crops grown here by my neighbours have done very well. The water does not appear to have been injurious to them.

*To Mr. Wright:* I have noticed no deposit upon the surface of the soil where artesian water has been applied. I have used the water for washing purposes, and I find it softer than rain water. I think that

- Mr. F. Hersey. there is soda or something of that kind in it, because cabbages and peas when boiled in it turn green, just as they do when soda is put into the water.
- 22 June, 1896. *To Mr. Lee*: I have grown better vegetables at Louth than the Committee saw in the adjoining paddock. I think that the holder of the adjoining land is not working his ground properly. At the same time, I see nothing to discourage me; in fact, it is quite the reverse. My principal market is at Bourke, and when there is a steamer on the river I will send to Wilcannia. If a square mile of country were put under cultivation, more would be produced than would be sufficient to supply the whole district. 5
- To the Chairman*: I intend to plant fruit-trees and vines, and while they are growing I will cover my expenses by producing vegetables. When the fruit-trees come to maturity, I will have the fruit to fall back upon. This year I intend to put in 5 acres of fruit-trees, principally stone fruits, and 2 acres of 10 vines. I grew potatoes at Louth, but I took a good deal of trouble with them. I intended to try them again here.
- To Mr. Lee*: I found that at Louth the potatoes grown upon a piece of black soil were waxy, while those grown on red soil were mealy. I took up my present holding in March last, and I hope to have half an acre of peas ready for market in September. If a man likes to put in growing crops, he need not wait 15 very long for a return. In three weeks or a month I intend to put in a lot of tomatoes, melons, and so on. At Louth I was never a week without money coming in.
- To the Chairman*: I had the full use of the pumping plant at Louth, and I was able to put 2 acres under lucerne.
- To Mr. Lee*: I do not think that the charge made by the Government for the land and water at Pera 20 Bore is excessive. If I could not afford to pay £5 a year for my block, it would not be worth while to try and do anything with it. I could have paid my brother £50 a year for the 20 acres. At Louth I grew 8 acres of wheat without irrigation. Of course if I had had to pay for the pumping, I could not have paid £50 a year for the land at Louth.
- To Mr. Trickett*: I intend to cultivate 16 acres of my present holding, using the remaining 4 acres for a 25 paddock. I intend to put 2 acres under broom millet. I have altogether 20 acres on a perpetual lease. I pay £5 a year rent, but at the end of five years the rent is to be increased to £10. That amount includes the cost of water.
- To Mr. Wright*: I regard the terms as very liberal, especially if it is proved that the ground will stand continual drenching with mineralised water. I have had no experience of the effect of such water, but 30 from what I have heard, I do not think it will have a bad effect upon the soil.
- To Mr. Trickett*: The soil will require some manure. I intend to use bone-dust for the fruit-trees. I will be able to get it moderately cheap from the local meat works.
- To the Chairman*: At Louth I manured the land from the very first. I do not think that vegetables could be grown on this land successfully for more than a year without manure. 35
- To Mr. Hassall*: I think that settlements of this kind are likely to be taken advantage of by the people. The work of irrigation is carried on very simply. No machinery is required, and all you have to do when you want water is to pull up a plug and let it run out of the main flume on to the land. Married carriers might be induced to settle on places of this kind. A great deal of their time which is at present useless to them might be employed in growing crops to provide feed for their horses. 40
- To Mr. Trickett*: I do not think that it would pay to grow cereals on the banks of the Darling, even though irrigation were provided for by the establishment of a pumping plant, of which people could avail themselves, because there is no market for such produce. Very few kinds of produce would carry any distance.
- To Mr. Lee*: Of course I would sooner be situated on the banks of a permanent stream, because that 45 would provide a means of sending produce away cheaply, and the water would also be better. Under similar conditions I would prefer to have a river frontage. I do not know that I can pay £1 an acre for such land, however. I certainly could not pay 5s. an acre for the right to take water from a river.
- To Mr. Wright*: None of the settlers here have got any return yet. Last year they had a very unfavourable season. 50

TUESDAY, 23 JUNE, 1896.

[The Sectional Committee met at the Municipal Chambers, Bourke, at 11.45. a.m.]

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (CHAIRMAN).

The Hon. WILLIAM JOSEPH TRICKETT.  
CHARLES ALFRED LEE, Esq.

THOMAS HENRY HASSALL, Esq.  
GEORGE BLACK, Esq.

55

FRANCIS AUGUSTUS WRIGHT, Esq.

The Sectional Committee further considered the proposed Construction of Locks and Weirs on the River Darling.

Philip James Biddulph, Esq., Solicitor, Bourke, sworn, and examined:—

60

- P. J. Biddulph, Esq. *To the Chairman*: I am quite ready to answer any questions that may be put to me by the Committee, but I can only speak in generalities. I have resided in Bourke for upwards of thirteen years.
- 23 June, 1896. *To Mr. Trickett*: I believe that a series of properly constructed locks would make the Darling permanently navigable between Bourke and Brewarrina. Since I have been here, the river on two, if not on three occasions, has altogether stopped running at Bourke, and at Fort Bourke station the banks have had to be "brushed" to keep the sheep from straying from one side of the river to the other. Navigation has always been intermittent. In its present state, the river cannot be relied upon for permanent navigation. I do not know what the feeling of the Brewarrina people is in regard to the project into which the Committee are inquiring; but, so far as I am in touch with the people of Bourke, I know that they are in favour of the river being locked. I have learnt from conversation with people here, that they are of opinion that it would be unwise to make a railway from Brewarrina to the Western line, because the locking of the river would make it serve equally well as a feeder to that line, and it is assumed that the locking 70

locking of the river would be cheaper than the construction of a railway, while the annual cost of maintenance would be less. I have not heard the question of the imposition of dues discussed; but I should think it would be only fair to impose such tolls upon the river as would recoup the Government for the expenditure necessary to make it navigable. These tolls would have to be paid by people who sent their goods along the river. I cannot say, however, that the carrying out of the proposed works would, to any extent, increase the value of the Crown lands adjoining the river between here and Brewarrina, because, at the present time, there is always sufficient water for the purposes of stock-raising. No doubt, with a large permanent supply of water in the river, irrigation would be assisted; but I cannot say to what extent people would avail themselves of the opportunity to irrigate. The progress of the district cannot be regarded as having been retarded because of no steps having been taken up to the present time to improve the river; but the improvement of the river would be an advantage to the town. The proposed works, however, affect the Brewarrina people chiefly. The principal benefit to be derived from the scheme is the certainty of transit from the Brewarrina district to Bourke. At the present time a great deal of the trade from that district goes to Byrock. Of course, when the river is up, it comes to Bourke. Very large cargoes of wool come down when the river is up, and if the channel were permanently navigable, no doubt it would be cheaper to send produce by that route always. With regard to the climate of the district, there is only about four and a half months of very hot weather during the year, the hottest months being January and February. In those months agriculture could hardly be engaged in except with the assistance of irrigation, and a great deal of irrigation would be required, especially in a summer like last summer. Occasional crops do very well; but there is always a great risk in undertaking to grow anything. With irrigation, lucerne grows well in the district. To make a certainty of any crop you must irrigate, though without irrigation you would probably get one crop out of three. I believe that any person who wished to irrigate would be willing to pay the suggested charges. Five shillings an acre for the right to pump the water seems to me a small charge, and a fair charge. I do not think, however, that sheep-farmers would be willing to pay from 6d. to 1s. per acre for water to improve their pasturage. They can take as much water as they like now for nothing, and they irrigate to some extent; but I do not think they could afford to pay a charge for the water. The sheep-farmers have as much as they can do to get along at the present time. Land having a frontage to the river carries one sheep to from 2½ to 5 acres; but in some cases more land is required to carry a sheep. I think that irrigation would be used only for the purposes of agriculture, and I should say that the soil near the river banks is suitable for agriculture with irrigation. At the present time the only place at which irrigation is carried on close to Bourke is about 2 miles below the town, near the weir which is being constructed. The land there grows very fair crops, I believe. There is a great deal of country similar to that which the Committee saw at the Pera Bore settlement, close to the river banks, though it only occurs in patches. There are areas of red soil within a few yards of the river. With water I believe you could grow anything here, except the fruits belonging to a cold climate. The market, of course, would be limited, except in times of drought, when there is always a very great demand for produce. Of course there might be a market for dried fruits in the metropolis; but I question if produce could be sent so far at a profit. At the present time, when the river gets very low, the water becomes objectionable. The town of Bourke relies upon the river for its water supply, and for that reason it would be an advantage to have the river locked. Now, when the river gets very low, weeds grow up from the bottom, and the water becomes very offensive, although there has always been a sufficient quantity of it. There has always been 6 or 7 feet of water in the middle of the river, even in the driest times, and therefore we have had sufficient water for household purposes, though it is only water of a kind. I do not think the Government can expect any great increase in the value of pastoral land from the carrying out of these works, although they may be able to sell certain land for irrigation farms. I was here in 1885, 1888, and in 1895. In 1885 the water was not laid on to the town; we only had a water supply given to us in 1887. To Mr. Lee: I know the country north of Bourke as far as Barrington. In good years, when the river is navigable up to Walgett, the whole of the trade of that district, and even as far as Mungundi, drains here. As a rule the river is not navigable all the year round, and between Brewarrina and Walgett it is navigable for shorter periods than between Bourke and Brewarrina. When there is no river the traffic finds its way by team to Byrock, though I do not know where the line of demarcation could be drawn between the traffic coming to Byrock and the traffic going to Narrabri. If there were permanent water, and thereby cheaper rates—and my experience is that water carriage is always cheaper and better than road carriage—the traffic would come to Bourke from as far up as Mungundi. Of course a railway to Walgett would deprive the river of a certain amount of traffic. Besides, Walgett is only 60 or 70 miles from Brewarrina, and traffic from Brewarrina might go that way by road, if the river were not navigable. The river, of course, is very uncertain. I have seen it unnavigable for almost two years, and then it has been navigable for three years at a stretch, with one small break. No doubt a permanent waterway would have the effect of determining the course of traffic to some extent, though I am sceptical about an increased value being given to pastoral holdings in the district by the proposed work. Some of the graziers, at the present time, grow lucerne under irrigation to provide horse-feed, and possibly in the future they may irrigate to provide feed for sheep; but they have not done so yet to any extent. No doubt if it were commercially possible they would have done so; but I think it would be out of the question to irrigate for grass. Nearly the whole of the land on the river is Crown land. In my opinion the settlement at Pera will be more successful than a river settlement will be, and I do not think that in our time there will be much more settlement along the river, because I do not see where the people would have a market for their produce. For that reason, I attach more importance to the locking of the Darling for the purposes of navigation than to allow of irrigation.

To Mr. Black: I think that the settlement at Pera is more likely to succeed than any river settlement, because our experience in the flood of 1890 was, that where the flood-water covered the land it killed all the stone-fruit; and I think that dried fruits would pay best to cultivate in a climate like this. Of course the interference by flood-waters would depend upon the height of the banks upon which the farmers settled. In some places the land on the banks might be frequently covered. We had a very high flood in 1890, the water coming into a great part of the town; and then, a month afterwards, another high flood, which all but entered the town. The success of a river-side settlement would also depend upon the cost of pumping water from the river. The water from an artesian bore rises up above the level of the land, and can be easily distributed over it; but to irrigate with river-water you have to pump to a considerable

considerable height. Of course a settlement upon the river banks would have the advantage of cheap water-carriage; but the Pera settlement is only 7 miles from a railway, which is not very much. You might have to go some miles up the river to get a suitable position for an irrigation farm. Of course it would take pretty well a day for a man to come in from Pera with produce and go back again; but then, on the other hand, the man living alongside the river would not always be sure of having a steamer at hand to send his produce by. With regard to the likelihood of a market being obtained to the north in the direction of Cunnamulla and the Queensland border, supposing there was steady production, I have included that in the local market. In the term "local" I include the whole district. With increased settlement there would be an increased demand, and I think that the locally-grown produce would be able to command the local market. I have made no observations as to the tendency of obstructions in the river to divert the course of the water; but I have heard it said that a very small thing will change the course of the channel, and I know that the soil of the banks is very soluble. When the river is very low the water is clearer than when it is running. At such times, if you let the water stand in any vessel, it becomes somewhat offensive to the taste. I have not noticed that there has been any epidemic at Bourke when the river has been low; but people then always rely on rain-water as much as they can. I do not think that a fixed weir would have a bad effect upon the water, because, although it might prevent the river running at times, there would be such a large body of water conserved as to be always fresh. Now when the river gets very low the salt-springs act upon it, but, with a large body of water, their influence would not be felt.

*To Mr. Hassall:* I think that if the proposed scheme were carried out traffic would be attracted to Bourke from the Birree, Culgon, and all the country in that direction. Of course, if a railway were constructed to Brewarrina, it would intercept a great part of the river traffic. I do not think that people would send wool past Brewarrina to Bourke by river if they could put it on the train at Brewarrina, because in all probability the rate of carriage from the two places would be the same. At the present time there are differential rates imposed with the object of attracting the Queensland traffic to our railways, and of preventing our traffic from going down the river to South Australia and to Melbourne, and if the line were taken to Brewarrina those differential rates would still have to be charged. If a railway were constructed to Brewarrina, it would be foolish to lock the river, because the merely local traffic between Brewarrina and Bourke would be of very little importance. With regard to irrigation, I think that if there were an assured market small areas might be cultivated; but irrigation would not be undertaken to any great extent. I should not think that there would be sufficient irrigation to recoup the Government for the cost of the work. There would practically be only the local market to supply, because the cost of rail and river transit would destroy any chance of competing successfully in the metropolitan market with the producers of districts nearer to the coast. There are a number of bores round which the land is similar to the land round the Pera Bore, and, of course, if the bore-water were used to irrigate that land, the settlers there would immediately strive for the trade of the district, and it would be difficult to successfully compete against them. The stuff grown near the various bores would have a better chance of selling, because it would have less carriage to bear. It is the cost of transit that kills production in the interior. I could not speak as to the advantages of a fixed weir over a movable weir. A great amount of silt is brought down by the river; but I could not say what effect it would have upon the shutters of a movable weir when submerged.

*To the Chairman:* I do not think that settlers on the river bank could pay 25s. an acre for their land and the right to pump water and compete successfully with settlers obtaining land and a supply of water from the artesian bores at 5s. an acre, nor do I think that the carrying out of the proposed works would give any immediate increase in the value of Crown land on each side of the river except, perhaps, just where irrigation colonies were started, although even there you would have to sell the land at a low price in order to encourage irrigation. If it had been worth their while, no doubt many people would have already used the river water to irrigate their land, and the work of irrigation has been undertaken in some cases for small crops, such as patches of lucerne. I do not think that there would be any increase in irrigation if the proposed works were carried out. The only chance of irrigation would be where people could get the water at a very low cost, but even then they would have to be assured of a market. In all cases the want of a market would be an obstacle to successful settlement. Any increase which might be obtained in the value of Crown lands along the river, by making the river permanently navigable, would be very slight; but if there were any, it would probably be taken into consideration by the Land Board. On one occasion I believe it was necessary to use sand-bags in order to protect the town water-supply. I think the pipes got silted up. With regard to the homestead leases in the district, I think that from Beemery to Brewarrina, on the east side of the river, all the people are homestead lessees. In the event of the construction of a railway to Brewarrina, no doubt those people would use that line. At all events, those who are nearer Brewarrina would use it. Settlers equally distant from Bourke and Brewarrina might go to either place.

*To Mr. Wright:* If the Water Conservation Branch estimated that 15,000 acres between here and Brewarrina would be irrigated, supposing the river were locked, I do not think that the estimate will be realised. No doubt the scheme would provide a good supply for the town of Bourke, that is, it would make the water better than it is now, but, generally speaking, it would not greatly improve the supply. It would, however, give permanent and cheap carriage between Bourke and Brewarrina, and it might increase the traffic on the western line, though nearly all the traffic of the district comes to the railway now, either at Bourke or at Byrock. If the traffic on the western line were increased, no doubt traffic would be taken from the branches of the northern line.

William James Holding, Esq., Government Appraiser, Bourke, sworn, and examined:—

W. J.  
Holding,  
Esq.

23 June, 1896.

*To the Chairman:* I am of opinion that the proposed works will conserve a large supply of water in the river channel which will be available for irrigation on both sides of the river. They will guarantee a good supply for the town of Bourke, and will provide permanent water-carriage between Bourke and Brewarrina, and carriage at cheaper rates than now obtained. I have not been to Brewarrina, though I have been to Byrock. I do not know the Darling above Bourke, but I know it below Bourke as far as Wentworth, and I know the whole of the Murray. While I think that the locking of the Darling will, in the distant future, enhance the value of Crown lands on both sides of the river, I do not think it will do so in the near future. At the present time the western railway intercepts most of the traffic from this district,

district, from Wilcannia upwards. The traffic from the country below Wilcannia passes along the lower river. For some considerable time I have devoted a great deal of attention to irrigation, with the result that I have found that, by the use of water and the exercise of ordinary intelligence, some of the best tropical productions in the world can be obtained here, though, unfortunately, notwithstanding the good quality of the productions to which I refer, there is at the present time but a poor market. This is my thirty-third summer on the Darling. When I went to Wentworth I commenced irrigating, in order to grow vegetables. I grew the first cabbage and the first oranges that were produced on the lower river, and I have gone on step by step, until now I have sufficient land under cultivation to make it necessary to use a steam-engine and windmills for the work of irrigation. I undertook this work first, as I have already said, in order to grow vegetables, because vegetables could not then be bought in the district. In a few years, however, I had more fruit than I required, and I sold the surplus to advantage. At the present time I have about 12 acres under irrigation, and, although I have kept no account of my expenditure and the returns obtained, I know that some time back I was carrying on the work at a profit. I have not the data with me which would enable me to say how much I obtained from each acre under irrigation; but I know that until late years the growing of fruit paid very well. Latterly the market has fallen off, and the product is of very little value. This is to be attributed, in the first place, to the want of population—people left Wentworth. Then Mildura came along; but, before that, we had South Australia as a competitor. Fruit has been sent from South Australia as far as Bourke in the olden times. We could not compete with South Australia, because they produce their fruit under natural conditions, while those who cultivated at Wentworth had to pay the cost of the machinery and labour necessary for irrigation. In the early years I made a very good profit on my work, and the fruit we produced was superior to what came from South Australia. With regard to the proposal before the Committee, to lock the river to provide for irrigation, I think that if population can be induced to come here the scheme is a good one, and should recommend itself commercially; but I am afraid that the necessary material could not be got together to work the land to advantage. By that I mean that good, industrious men and men who have a certain amount of knowledge could not be obtained to do the work. My idea is that, in the immediate future, the benefit of locking the river will be derived from giving better navigation and rendering traffic on the river certain. A waterway can always compete successfully with a railway. My home is at Wentworth; but my occupation has taken me all over the Lachlan district, the Darling district, and the Warrego district.

*To Mr. Lee:* I am thoroughly acquainted with the character of the soil from Wentworth to Bourke, and up to about Kenilworth, and I know the country back from the river, on the western side, though not on the eastern side. I look upon the soil immediately on the banks of the river as fit to grow anything with irrigation. I do not entertain the idea that even some presumably competent persons entertain, that the soil here is too stiff to cultivate. At any rate, if other conditions were favourable, there would be no doubt as to its suitability. I have been an appraiser since 1867. No doubt, if the river were made permanently navigable, parts of the country now sending produce by other routes to a market would send it to Bourke, because there would be the certainty that once they got to the river banks they would have immediate despatch to market. If there were navigable water, the producers could take advantage of the river at any time under ordinary conditions, tapping it at its nearest point. As far as the country itself is concerned, teams can travel through it nearly anywhere, except that occasionally there is very heavy sand to be met with. On the Murray they ship wool or any produce they have, wherever it is most convenient to take it to the river-banks, and the same thing would be done here. Then, too, if the river were rendered permanently navigable, the traffic which now comes to Bourke only occasionally would come always. I do not attach much importance to the scheme from a settlement point of view. At present there is very little settlement on the banks of the river—comparatively none—and I presume there would be no inducement for the people to settle; one reason why the people would not settle here being that the river in its natural state is very uncertain. At times there is a fair amount of water, occasionally there are floods, and, at very long intervals, there is scarcely any water at all. That would make irrigation under natural conditions very difficult. I think that small settlements would follow if the Government offered suitable land on the banks of the Darling under similar conditions to those given at Pera. There would be no settlement at Pera if there were no water there, and probably none if the Government had not given the people special facilities. People could not pay 25s. an acre for land on the river bank and then pump the water themselves. Under suitable conditions, however, I think settlers on the river banks would have as good a prospect of success as the settlers near the artesian bore at Pera. I think that if suitable conditions were offered, small settlers on the banks of the river could make a comfortable living, but there would have to be some limit to their number, because of the want of a market. Otherwise I fear there would soon be over-production, because the expense of railway carriage would, I think, prevent them from competing in outside markets. Of course, if there was much production in this district, people would obtain locally a great deal of what they now import from elsewhere, but, at the same time, the local market would not be a large one. At Wentworth I have gone in for dried fruits—raisins, currants, apricots, peaches, nectarines, apples, and pears—but I have not been able to find a profitable market of late years, because there has been no demand. Mildura, too, is a competitor now, but even before Mildura came into the field our market had fallen off. I am still struggling on, but the return has not been sufficient to pay for the labour required. With regard to the prospects of settlers in this district, I think that fruit-growing should occupy very little attention. There are many other products which would pay a small settler a long way better than fruit. In this climate two crops of potatoes can be obtained in a year, onions would be a most profitable bulb, and other root crops might be grown for making bacon. To my certain knowledge hundreds of tons of bacon come from Warrnambool and South Australia to places on the Darling; but that bacon might be produced locally. I think that the locking of the river is the proper way to proceed, if you wish to induce settlement, and as long as the money is discreetly used I think the undertaking will be a wise one. Although small settlement may not take place to any great extent at first, it will gradually increase in course of time.

*To Mr. Wright:* I am aware that all the wool which is grown in the district lying between Bourke and the Queensland border, north and north-west, comes into the river now, either at Brewarrina or at Bourke. I am not aware that there is an export duty of £2 a ton upon wool going from Queensland into New South Wales; but such a duty would practically prevent the exportation of any large quantity of wool from Queensland. If the proposed work were carried out, I think that we might get a little increased traffic from

W. J.  
Holding,  
Esq.  
23 June, 1896.

from the country further west, though probably that wool would come into Bourke direct. I am inclined to think that the carrying out of the proposed work, would offer an inducement to settlement, and that the district is so far away from other producing centres that the local market is not likely to be much affected by outside competition. At Wentworth I had to face, not only outside competition, but a decrease of population. The pressure of the times has caused a large number of persons who formerly were consumers to remove from the district. While we had consumers we could compete with people from outside, because the quality of our productions was far superior to that of the imported article. The only conclusion to arrive at in regard to the condition of things at Wentworth, is, that the demand is not equal to the production, and the market is overstocked. I account for the competition of South Australia on the principle that anything cheap sells more quickly than a better and dearer article. Here, the attempt at closer settlement must go on quietly and steadily, by small degrees. If the Departmental officers estimate that 15,000 acres will be put under crop between Bourke and Brewarrina, I can only say that it will take very many years before so large an area of country is dealt with in that way. I do not think that Crown lessees are likely to cultivate lucerne in areas of 400 or 500 acres, because it would cost too much money. In addition to the cost of water, there would be the cost of labour and other expenditure. My experience in growing hay on the river is, that it does very well when the season is good enough to give you any crop, which is about three years out of every five. On the lower river we get either a very good crop, or none at all. I do not know what they do here, but lower down the river immense stacks of hay are kept for use in a bad season. Even with cheap water I do not think the squatters are likely to grow lucerne for the feeding of sheep. That was tried on the lower river for stud-sheep, but it ran into too much money. In some isolated cases it might pay, but it would depend altogether upon the locality. If you got a suitable piece of land the expenditure might be justifiable; I do not think however that irrigation will be generally followed for this purpose. I know the Pera Bore Settlement, and I think that the kind of settlement that you have there is likely to extend,—the local consumption ought to be large enough to require a dozen such settlements, and people getting their land and water cheaply ought to be able to compete with outside sources of supplies. In my opinion the most important reason for carrying out the scheme is to provide for navigation.

*To Mr. Black:* At Wentworth I hold purchased suburban land. I have gone to the expense of erecting windmills and a steam-engine; there are only 12 acres in my block, though I would have taken more land if I could have got it. My steam-engine cost about £230, while the windmills cost about £50 each. The holding however is not sufficiently large to keep that plant permanently employed. Even if I had a larger area of country I would not extend my operations now, in view of the present depressed state of the times. Of course it would be possible by fluming to carry the water a long way from where I raise it. At the same time the conditions here are much more favourable than the conditions on the lower part of the river. If a large area were rushed into the market here, and an attempt was made to force irrigation, I do not think that the result would be successful; but if efforts are made to carry the thing on in a quiet, steady, and practical manner, they will ultimately prove successful. Earlier in the examination I said that the fruit produced at Wentworth was superior to that imported from South Australia, and I wish to be understood that it is still superior. The fruit imported from South Australia has not improved in quality; it is no better now than it was thirty years ago. The cause of my failure at Wentworth was not due either to the improvement of the South Australian products, or to the deterioration of my own. The productions of the Lower Darling rival those of the great and boasted Mildura, and our exhibits have taken many first prizes away from the Mildura people. No doubt the comparative absence of small settlers from this district is largely due to the fact that land has not been available, while people who would be prepared to irrigate small areas have not had the necessary funds to pay for the erection of a pumping plant. If the Government would go to the expense of erecting pumping plants, there might be some increase of settlement in the district; but it would depend entirely upon the price charged for the water. Then, too, as I have said, there is not the class of men available. I have found that at Mildura very many failures have resulted from the want of necessary knowledge on the part of those commencing as agriculturists. Lots of men who started there with capital have since become beggars, because of their want of the necessary knowledge. That having been the case at Mildura, it would probably be the same here. At the same time, an industrious man with intelligence, and a certain, though perhaps only a limited, knowledge of agriculture, ought to be able to make a fine living for himself and his family on 20, 30, or 40 acres of ground here. Men can only become trained agriculturists by experience. If in a community of orchardists there is a number of men who know how to work, they will teach others who are studious and industrious. I would recommend delay in a large scheme of this kind upon the principle that

Vessels large may venture more,  
But little boats must keep near shore.

An intelligent man having a good neighbour will soon gain sufficient knowledge to enable him to work his holding properly and satisfactorily, and thus in time you would have a superior class of men able to do the work required of them.

*To Mr. Hassall:* If the scheme were carried out as proposed, there would be a strong agitation to have the river locked further down. I think that the Government would do wrong to confine the improvement of the river to one place. This should be a national undertaking, and in the end it would be very successful. Of course, if the river were locked all the way down, traffic would go to Victoria and South Australia. There will soon be a railway from Swan Hill to a point very near Wentworth. The Victorians are making superhuman efforts to bring that about, so as to tap the trade of the Darling. I suppose that there is too much of that sort of thing going on to suit the trade of New South Wales. Nearly every vessel passing Wentworth belongs to Victoria or to South Australia. We have some hawking boats; but the general cargo boats are owned in South Australia or Victoria. They take wool away when the river is navigable; but I do not think any wool goes down the river from above Wilcannia. Wool coming down the river from Brewarrina would be unloaded at Bourke, and sent on by train; but wool coming to the river anywhere below Wilcannia would be sent on to the other colonies. The Broken Hill railway commands a large area of the Wilcannia country. There is an immense number of teams on the road to and from Broken Hill, and from various parts of the Wilcannia district. Wilcannia just now is entirely dependent for her supplies upon Broken Hill, and those supplies come first from South Australia. If the river was navigable, those supplies would come by boat, and Wilcannia would be a distributing centre.

Water

W. J.  
Holding,  
Esq.

23 June, 1896.

Water carriage can always compete with land carriage. A boat will take 500 tons of goods from Morgan or Murray Bridge to Wilcannia at a merely nominal price because, as a rule, back loading is to be obtained. I think that the Government are commencing at the right end in starting this work; but the river should certainly be improved right down. I do not think it would be necessary to lock the river 5 above Brewarrina; but that is a point upon which I am not competent to give an opinion. With regard to the soil of the district, I should say that the river bends are the best for cultivation, and the ground on the higher banks for residences. Stone-fruits are entirely destroyed by flood-water. I have known an orange-tree to be three months in the water and not suffer; but stone-fruit is killed by flood-water, unless that water runs off very rapidly. The best stone-fruit up here, that is, the apricot, is most easily 10 killed. The climate is specially suited for apricots. The land in the river bends is, in many cases, low-lying; but the soil will stand any amount of cultivation without recuperation. There is the risk of losing a crop by a flood; but floods do not come often. The mere submergence of the land at times will not do any very material injury. A man might occasionally find it to his interest to make a dam to stop the current, although he would not attempt to keep the water off the land. I have known the river 15 to cease running during the time I have been in the district. In my early days, a steamer, for nearly three years was laid up near Bourke, with a whole cargo of wool on board. On the other hand, I have known the Darling to be open to navigation for seven consecutive years. I think that a movable weir should be constructed in the Darling. The great dam they have on the Goulburn is a sort of shutter dam. It can be used as a dam, or it can be elevated. The drawback to a fixed weir would be the silting. On 20 the Darling you ought to construct a dam which you can lift up or shut down. You must be able to create a scour to prevent any silting up. I do not think that a movable weir, when not in use, would run any risk of being silted up, because I think there would always be sufficient water at command to wash away any silt. When the steamers are stranded in the river they manage to get rid of the silt by creating a scour with sand bags: and you could create a scour in the river, where you have a 25 movable weir, simply by elevating one or two of the shutters. The drawback to a fixed weir would be that the silt behind it would choke up the channel. The depth of the river channel would be reduced for miles back if the silt could not get away. I saw that exemplified in connection with an ana-branch some time ago. The river would eventually become so shallow as to interfere with navigation. A weir, such as the weir in the Goulburn, in Victoria, prevents this silting up. A good deal of the Goulburn runs 30 through hilly country; but the lower Goulburn is in flat country. I have seen the Darling running 5 miles an hour on the lower river, when the Murray has been down.

*To Mr. Trickett:* I am not aware that the proposed scheme is estimated to cost £121,000; but, if that is so, it is too much. I do not see any possibility of any reasonable return for so large an expenditure. The chief source of revenue would be the local revenue, and for some time to come there would be no 35 sufficient local market. It will depend upon the nature of the produce grown as to whether an outside market will be sought for. I am afraid that the products grown by irrigation in this district would not be able to compete with outside sources of supply. Of course the producers in the district will use the river as much as they can, if only to avoid extra handling; but water carriage is always cheaper than rail carriage. In this district there would be water carriage for only part of the way, and rail carriage for the 40 rest of the way; but to Wentworth only water carriage, and the goods had therefore only one handling. This scheme is justifiable as an attempt to establish population in the district; but it will not be remunerative for a long time to come.

Daniel William Field Hattan, Esq., Inspector of Stock, Bourke, sworn, and examined:—

*To Mr. Wright:* I have lived in the district for forty years: that is, the district extending from the mouth 45 of the Darling up to Bourke; and for some years I had Yanda Station, near Bourke. With regard to the proposal before the Committee, I think that it will benefit the residents of the district by providing cheap water-carriage, but I am not competent to say whether it will advance irrigation. Nearly all the country between Bourke and Brewarrina is liable to flood. Two branches of the Bogan come in on the one side of the river, while the Culgoa comes in on the other side. Of course there are often long periods 50 when we have no floods. No doubt this scheme will encourage population by providing cheap carriage; but I think that if people went in for irrigation they would have difficulty in getting a market for what they produce. I do not think the Government would be justified in doubling the rents of the Crown land along the river if the scheme were carried out. The stock raisers along the river would reap no great advantage from the scheme, except, perhaps, cheap means of transit, and I do not think they would 55 be likely to go in for irrigation to raise fodder for their stock, or, at least, not to any large extent. We have proved beyond all doubt that the land will grow anything; but up to the present time there has not been much irrigation tried. If people could grow fodder by means of irrigation, they would be able to fatten more stock, and the improvement of the river would enable them to get them away to market. I think that it would pay a man within 25 miles of Bourke to put from 300 to 500 acres under lucerne, in order 60 to "top up" his stock before sending them to market, and there are many hundreds of acres which could easily be irrigated because the land is so flat. I am inclined to think that it would pay the lessees to take the water at the Government charge—5s per acre per annum for agricultural land, and 6d. or 1s. per acre for grass land. If one man went in for irrigation and was successful, others would soon follow, and in this way small settlement would be encouraged. I think that if the Government threw open small 65 blocks of land on the river bank under the same conditions that they are selling land at Pera, it would encourage settlement. Of course there is no local market; there would be only the metropolitan market. We irrigated a little of the station and we found that we were able to grow lucerne, and wheat, and all kinds of fruit—apples, oranges, peaches, and nectarines. Notwithstanding our distance from the seaboard I think that with irrigation we could supply our local wants and send produce to the coast. No doubt 70 irrigation would facilitate the "topping up" of stock, and the combination of cultivation with grazing ought to be readily followed. At the present time we get our butter from Sydney. None of our dairies go in for butter making. Last summer we had to import our milk. We got it from the Fresh Food and Ice Company. You could keep no cows here then, unless you supplied them with artificial food. I think that the revenue derived by the State would be sufficient to pay interest on the cost of the scheme. 75 *To Mr. Black:* With a constant supply of water, the dairying industry here would become stable, and with it would gradually grow the bacon and ham industry. At the present time there is hardly a station between here and Wilcannia which has not a little irrigation farm for the purpose of providing hay for use

D. W. F.  
Hattan,

Hattan,  
Esq.  
23 June, 1896.

use in bad seasons, and, no doubt, if pastoralists could get water from the river at a low rate, these cultivation areas would be increased. At the present time when the river is low it is very costly to pump water from it, because of the high banks. I am not competent to say whether 5s. an acre would be overmuch to pay for the water; but I should not think so. I think it would pay to irrigate land at a moderate charge, in order to grow chaff. Chaff is sent here now from Orange and Bathurst, and even 5 from New Zealand and Tasmania; but, with irrigation, much better chaff could be grown locally. A great deal of the chaff that we import is of bad quality. I am not able to offer an opinion as to the relative merits of fixed and movable weirs. I have noticed that after a flood the river channel changes sometimes. Large rents are cut out across the bends; but these diversions are not permanent, and they do not interfere with navigation. They do not become permanent, because the obstruction which causes 10 them, is generally removed. If the obstruction was a fixed one, the diversion would be permanent. If you make a fixed dam in a watercourse, the river is bound to find another channel in times of flood. You have plenty of instances of that kind on the Warrego. In flood-time ana-branches are often cut deeper than the original channel. The majority of the pastoral lessees in this district are favourable to the scheme. 15  
*To Mr. Hassall:* As to the settlement which might be attracted to the district by the carrying out of the proposed scheme, it would have to exist upon the grazing and the dairy industry. I do not think that people could make anything by growing fruit. I think irrigation would be followed in order to fatten stock for market; but the cost of raising the water has prevented much irrigation hitherto. The higher you have to raise the water, the more expensive it is. I think that by lessening the lift 10 feet, you would induce people to go in for irrigation more. I think that people growing produce here would be 20 able to send it to Sydney, where it ought to be able to compete successfully with the produce from other districts. They could make butter here; but only in the winter months. I do not think it would be found profitable to grow hay, except to feed carriers' cattle in times of drought. Hitherto people have not been educated up to the advantages of irrigation; but I think that the improvement of the river would be a factor in their education. Still, I have only a limited knowledge of irrigation myself. 25 I cannot say whether people within 5 miles of the river would be content to have the betterment principle applied to their holdings, supposing this work was carried out. The difficulty that will be found in settling this district is that the country is low and liable to flood. There are other parts of the Colony better adapted for closer settlement. All the country between Bourke and Brewarrina is liable to flood, and in some places the land is covered with water for a considerable distance back from the river. Both the 30 Bogan and the Culgoa have very low banks, and in some places the flood-waters go back 10 or 15 miles. There are a few high spots in which the soil is a red sandy loam.

*To Mr. Trickett:* Any advantage which the State would get from the carrying out of the scheme would be because of the extra number of stock which would be fattened, and the increased traffic that would come to the railway. I think that the Crown tenants should pay a slightly increased rental if the work 35 was carried out; but they could not pay a very high rental. Land purchased from the Crown ought to command a better price, because the carrying out of the proposed works would make it more valuable. If they had to pay a license fee for using the water I do not think the Crown tenants could pay an increased rental. It is very doubtful if sheep-farmers would pay 6d. and 1s. an acre for water to improve their paddocks. I should not like to pay that amount if I was still engaged in pastoral pursuits. I do 40 not think it would be possible for a man to irrigate a large sheep run from the river. The chief source of revenue must come from the water supplied for irrigating small holdings, though I could not say how many small holdings there would be in the district within two years after the completion of the proposed works. I daresay 100,000 acres would be taken up, providing that land was thrown open for small settle- 45 ment within the reach of water. Five shillings per acre for a pumping license seems a great deal to pay for water when you add the actual cost of pumping. I think that, if we had irrigation, dairying would be done in the district, because feed could be grown for the cows. For six months in the year we could carry on dairying for local consumption. I agree with Mr. Holding that the benefits to be derived from this scheme would be chiefly of a local character.

*To Mr. Lee:* I think that the pastoral tenants would be prepared to pay a higher rent for their land if 50 the scheme were carried out, because they would then be able to grow sufficient feed to allow them to "top up" their fat stock in a much shorter space of time than it can be done with the aid of natural grass. At the present time they would not go to the expense of doing this on any large scale, although each station has a small irrigation plant. The improvement of the river would keep streams such as the Bogan and the Culgoa always full of water, and would enable small settlers to take up the land out there. If the 55 Government established pumping-stations at various places on the river, I think that people would be much more inclined to go in for irrigation. I think that would be an inducement not only to the small man, but to the large holder, and would lead to a larger area of land being irrigated. The filling up of rivers such as the Bogan and the Culgoa, and of numbers of small depressions, would be of advantage to the run-holders. The area affected by the proposed works is comprised in ordinary pastoral holdings. 60 Practically, the whole country is Crown land. Hitherto the homestead leases have not been a success in the district, and they have not led to an increase in the number of stock. Some of the homestead leases are in the hands of the original lessees; but most of them are in the hands of financial institutions. I do not think it is likely that this country will be largely settled until the available land in the Eastern and Central Divisions is taken up, though the day must come when it will all be settled. The capabilities of this district are very large, if we can only get water, though I doubt whether there is at present a sufficient market to induce people to come here. In my opinion, the settlement of the Darling country is only to be brought about by the conservation of water. Therefore, the scheme is a step in the right 65 direction, though there is no prospect of an immediate return to the Government. Comparing irrigation with artesian water with irrigation from the river, it must be remembered that the water taken from the artesian bores enables you to irrigate places a long way back from the river, while you cannot send the river-water any great distance back, except at a very large cost. At the same time, irrigation from artesian supplies is not antagonistic to river irrigation. River water is much more suitable for irrigation than artesian water. I think that all the water that can be conserved, whether by putting down 70 artesian bores or by locking the river, should be conserved. If the river were made navigable from Brewarrina to Bourke, we should get a great deal of the trade that now goes to Narrabri. I do not think much wool would go down the river past Bourke. Any wool coming to Bourke would go on to Sydney by rail. The railway to Bourke has diverted traffic which formerly went to the other other

other Colonies; but in good seasons the river competes with the railway. I think, however, that the locking of the Darling would diminish that competition. There is not so much wool going down to Adelaide now as went there in former years, when there was no railway. People will not run the risk of sending wool down the river; the insurance is too high, and the accidents are too numerous.

D. W. F.  
Hattan, Esq.

23 June, 1896.

5 *To the Chairman*: I think that a good deal of the traffic that now goes to Narrabri from the Birree and the Bokhara would come to Bourke if people could make use of the river.

*To Mr. Wright*: A good deal of the wool from the Birree and the Bokhara comes to Bourke now. A number of the pastoral lessees between Bourke and Wilcannia have erected pumping-plants at their own cost. I cannot say what the average cost of a pumping-plant is: but we worked with an eight horse-power engine and a Tangye pump. They use centrifugal pumps. I should think that the complete plant for irrigation on a small scale would cost from £600 to £900. The maintenance is not very much. They generally keep an engineer, but he does other work also. The engine is used to drive the pump, and also, in most cases, to drive the shearing machinery. I should think a fair charge for the labour required would be £150 per annum. It would be out of the question for a small settler to provide his own pumping-plant.

10  
15 The only way would be for the Government to supply the water. I do not think that the river-water will be used any more than it is at present, if people have to provide their own pumping-plant. We have proved beyond all doubt that river-water is much better for irrigation than well-water, though if artesian water could be obtained within 3 miles of the river for one-fourth or one-fifth the cost of river-water, it would be much better. Comparing the position of settlers at Pera with that of settlers under similar conditions on the banks of the river, the Pera people have the great advantage that their land is not liable to inundation; whereas people on the banks of the river would generally be liable to be flooded. As a rule, the red-soil country is not flooded, while it is quite equal in quality to the soil on the river-banks.

*To Mr. Black*: We could grow chaff in this district to feed horses, and I am sure that it would pay. We should be able to find a market for chaff, which would consume as much as is now imported.

Jocelyn Henry Thomas, Esq., Manager, Winbar Station, sworn, and examined:—

*To the Chairman*: Winbar Station is about 90 miles below Bourke, and about 15 miles below Louth. Irrigation was commenced there by the manager who preceded me; but I have a fair idea of what the work costs. We commenced to irrigate, because in the severe drought of 1883 and 1884 we found that

J. H. Thomas,  
Esq.

23 June, 1896.

30 we were paying £18 a ton for the carriage of horse-feed from Nyngan. During that drought it cost us about £2,200 for horse-feed, and we thought we could grow it more cheaply than that. The result has been that we have grown it more cheaply than we could import it. We have now about 8 acres under cultivation. The pumping-plant is placed near the river, at a point where the banks are now about 45 feet above the water-level. The cost of the plant, including the pump, belting, pipes, and engine, would be about £600. There is an open drain running down the middle of the cultivation area, and we have gates to divert the water as we want to use it. The annual cost of the work is about £46 Os. 8d. a year, and our principal crop is lucerne. We have about 6 acres under lucerne, and the rest of the ground is under wheat. We value our fodder at what we would have to pay for it in times of drought, and we store it until we want to use it. By irrigating every four weeks, and attending to the land properly, we get

40 about 6 tons of lucerne per acre. We get about 36 tons of lucerne from the 6 acres, and about 4 tons of wheat from the 2 acres. The following is my estimate of what it cost us to do this work:—

	£	s.	d.
Engineer, eighteen days, at £2 per week .....	5	6	8
One man looking after irrigation, eighteen days, at 30s. per week.....	4	0	0
45 Three men harvesting crop, eighteen days each, at 30s. per week .....	12	0	0
Twenty-five cords of wood, at 6s. 6d. per cord .....	8	2	6
Two gallons oil, at 5s. 6d. per gallon .....	0	11	0
Original cost clearing, fencing, ploughing, levelling, and making drains, at £10 per acre, £80; interest .....	4	0	6
50 Original cost of pump, piping, and belting, £200, at 6 per cent. per annum.....	12	0	0
	£46	0	8

I do not allow anything for wear and tear of engine, as it is used and was bought for working scouring-machine. Forty tons can be produced by irrigating six times during the year. The size of pump used is a 10-inch centrifugal, driven by

55 12 h.-p. engine.

Instead of having to pay £6 or £7 per ton for hay, we grow our own supplies, and thus effect a great saving. The price of wheaten hay in Bourke during the drought was £5 17s. 6d., and then there is £3 a ton for carriage. If the river were running, the carriage would only be 25s. a ton; but it is very seldom that the river is running when we have a drought. I reckon that I saved £500 last drought. I was able to

60 feed twenty-five horses for fifteen months off on the produce of the 8 acres which we irrigate.

[The Sectional Committee, at 4.15 p.m., adjourned until 8.15 p.m., when they met at the "Royal Hotel," Bourke.]

Edward MacFarlane, Esq., District Surveyor, and Acting Chairman of Land Board, Bourke, sworn, and examined:—

65 *To Mr. Black*: I first arrived at Walgett, on the Namoi River, on the 26th March, 1879, and travelled about 120 miles down the Barwon. I arrived in Bourke after the flood of 1879, and I first went to Louth in 1880. 1881 was the first year that I went to Brewarrina, and in 1887 I travelled down the river from Bourke to Wilcannia. In 1889 I followed the river up to Wilcannia from Menindie; in 1893 I followed the river road up and down from Brewarrina to Walgett; and in 1894 I followed the river down

E.  
MacFarlane,  
Esq.

23 June, 1896.

70 from Menindie to Cuthero. I have travelled not once, but several times over the whole of this district. In assessing the value of Crown lands we always take into consideration all the contributory circumstances of the case. If by the damming back of the river the billabongs were kept full, we should take that circumstance into consideration to exactly the extent that the country was or was not benefited by it. With regard to the floods in the river, I first saw Bourke just after the flood of 1879 had passed off. I was

75 in Bourke during the whole period of the 1890 flood; and at different parts of the river I came in contact with the flood of 1893, which was within 2 or 3 feet of the flood of 1890. I have known three floods

E.  
MacFarlane,  
Esq.

23 June, 1896.

which I considered to be large floods during the last seventeen years, and during the same time I have known two periods of extreme drought—1884 and 1888. In 1884 the river was practically a chain of waterholes; and in 1888 it was almost a chain of waterholes. In the first of these years Bourke was a smaller town than it is now, and relied mostly for its water supply upon wells, but in 1888 the water supply was very bad. I was a member of the Municipal Council at the time, and, with other aldermen, took precautions for protecting the supply by constructing a sand-bag dam at the site of the present weir in order to throw 2 or 3 feet more into the town supply. The water at that time was slightly brackish and unpleasant. There was no absolute stagnation, because even when the water was not flowing over the surface there was underground percolation. The extent to which the quality of the river water has affected the health of the town has never been known to me professionally. There has been a little typhoid, and a little diphtheria, but there has never been an outbreak of disease at Bourke such as occurred at Dubbo. I think that the locking of the Darling will be beneficial to the district both as a means to cheap water-carriage, and as a means to irrigation. I have no hesitation in saying that I favour it, providing that the cost is proportionate to the result to be gained. If I were told that the cost of locking the Darling between Bourke and Brewarrina was about equal to the cost of a railway from Byrock to Brewarrina, I would favour the locking of the Darling. By the construction of a railway only one object is gained, while by the locking of the river two objects are gained. The locking of the river would improve the Bourke water supply; it would give the means for cheaper transit; and would lead to the establishment in the future of irrigation settlements. I think that if the water was available small settlers would come to the district; but they would come slowly. The success of three or four men would do more to bring population than anything else. I think that for the success of the scheme it would be well that settlement should grow slowly. In my opinion, it would pay every station in the district to cultivate a certain area of country, because I hear it stated in evidence constantly that horse-feed is an item in the annual expenditure. We hear that it costs the stations from £300 to £600 a year for horse-feed as a regular thing, and they could grow that feed for about one-third of the price. When they find that they can grow feed cheaply, they will grow it, not only for their horses and for the cows which every station should keep, but for their stud-sheep and, ultimately, all the best stock. At the present time some of the stations have to employ men to cut down the mulga and supplejack and other edible scrub for the stock. Considerable sums are spent in this way, amounting to hundreds of pounds; but the results are not satisfactory. The food thus supplied is not altogether suitable to the requirements of the animals, and the sheep sometimes die. In any case there is not the growth of fleece that there should be. Large sums of money would be saved if the run-holders grew hay and stored it against periods of drought. I think it would pay them to do this. If a man has wool of a class that is known and sought after in the home markets, it is well not to let it deteriorate in any particular, and thus the feeding of the sheep would pay indirectly, by keeping up the quality of the wool. The bulk of the fruit consumed in the district is imported, and the bulk of the vegetables; therefore, there should be employment here for a certain number of market gardeners and orchardists. At Gongolgon there is an excellent Chinese garden which is irrigated, and a similar place at Angledool. There are also gardens in other parts of the district. The Gongolgon garden supplies the district lying within 30 miles of it, I suppose, though the population nowhere is very large. In the 60,000,000 acres comprised in my district there are not more than 40,000 people. There is a large market for chaff throughout the district at all times in the year, and for two reasons. The country is now heavily stocked with sheep, so that there is very little grass to spare, and the rabbits also tend to drive horses on to chaff. The working horses throughout the district must now be fed with chaff. At present we are having a very good season, and a good many horses are turned out; but, as a general thing, the horses in this district require to be fed. In bad seasons people have to do with fewer horses. With regard to dairying, I may say that last summer we were supplied with milk twice a day; but I do not know of any locally-made butter except goats' butter, which is only made in small quantities. I think that in the very hot weather we should always have to get our butter from places where the climate is cooler. I do not think it would be generally possible for us to compete in the metropolitan markets with our surplus products. We are not very much earlier than Sydney. The climate seems to be particularly suitable for table grapes; but I have seen no wine grapes tried. Good orange crops have been grown, and lemons grow very well. I have not seen any shaddocks; but passion-fruit grows excellently. I know the character of the soil along the banks of the river. It is a grey cretaceous clay, and I think rather too clayey for a ploughing soil. I know no patch of red-soil country between Bourke and Brewarrina on the eastern side of the river; but the patch at the Pera Bore Settlement extends almost to the river at North Bourke. In this connection I should like to read part of a report which I sent to the Minister on the 18th September, 1893, in regard to a piece of country near the Darling River and the village of North Bourke:—

Of the part between the Barrington and Eangonia Road and the Darling River, about 30 acres in extent, two-thirds is a high-level area of red, deep, alluvial soil, once timbered with gidgea. This part above flood-level affords an excellent site for a pumping station, school, and any general buildings of a settlement. The remaining third, the actual frontage, is a grey cretaceous clay soil liable to inundation, and so situated that a cutting for the natural flow of water from the river to within a short distance of a pumping station on the red soil could be easily and cheaply made.

All the land to the west of the road, about 3,000 acres in extent, is high, the greater part a very rich red, deep alluvial soil, densely timbered with gidgea, broken with very small plains; the remainder is thick mulga country on a red alluvial soil, apparently not so rich. Among the mulga is scrub of various kinds. The whole area produces salsolaceous herbage, where the timber is not too thick to permit any grass or herbage to grow. There is also box ludda and belah timber, but not to any extent.

The gidgea, a strong hard timber of the *Acacia* family, indicates excellent soil. It is very useful for fencing, for posts for rough sheds, for rails, for blocks for wooden houses, also for firewood, and to some extent for fancy turners' work; it usually grows so thickly in favourable country that pasture plants do not appear in any quantity amongst the trees, so that country heavily timbered with gidgea is not useful for pasturage, till the timber has been destroyed, when very valuable grasses thrive in good seasons. At least 1,500 acres of the area under consideration are useless for grazing purposes, on account of the density of the gidgea thereon, so that the clearing of this land for agriculture, and the use of the timber thereon would be a public benefit. Good hay crops have already been secured in the neighbourhood of cleared gidgea country without irrigation.

The mulga timber on this area is not of the best kind, and it is on a soil more sandy and not quite so good as that on which the gidgea grows. To some extent it could be used for fencing or firewood. If the scrub and undergrowth were removed this would be excellent pastoral country. When entirely cleared it would be also suited for agriculture.

The whole of the area is above any ordinary flood. I believe it was above the 1890 flood. I feel sure that the greater part of it was not flooded then; also, that any part flooded, if any, was only so for a very short time, and to a very shallow depth—not more than a few inches—so practically liability to inundation is not a factor in the case.

The whole area has been rabbit infested; even now there are many rabbits on it. This closely timbered red country is an excellent home for rabbits.

The

The country is suited for settlement in small areas, with an artificial water supply, and is susceptible of very great improvement. Its withdrawal from the reserves will not in any way prejudicially affect them. In its present state the whole area would not carry profitably one sheep to 10 acres for a year in ordinary seasons; but by killing off timber, fencing, and water supply, it could be improved to carry a sheep to 3 acres, without irrigation or cultivation. By agriculture, without irrigation, it could be made to return one good crop in two years on the average.

The site is suited for settlement, as the place is healthily situated, though very hot in summer; as the soil is good; as permanent water is within reasonable distance; as the furthest point is not farther than 8 miles from a railway station; and as there is also a good local market for fodder crops; and as the ordinary conditions of occupation cannot be applied to it in such a way as to produce settlement, or the much needed improvement of the area.

E.  
MacFarlane,  
Esq.  
23 June, 1896.

10 If you grew lucerne under irrigation I should think you would get about six crops in a year; but I could not say how much you would get to the acre. I should say that you could keep from four to six sheep on the hay from an acre of lucerne. I have been writing a report upon some land which I think, under irrigation, would keep at least four sheep to the acre. There are times in the very hot weather when you would get nothing at all from a lucerne patch; all you could do would be to keep the lucerne growing.

15 Lucerne, in this district, wants rain, as well as water artificially supplied. The pumpkin grows in dry weather; pumpkins, pie-melons, and water-melons, in a good season, will grow to very great perfection here without irrigation. If a man wished to grow pumpkins to feed the sheep, he would have to irrigate, because he could not count upon getting rain. The uncertainty of the rainfall in this district is even a greater drawback than its limited quantity. For that reason, a permanent supply of water which can be

20 used for irrigation is most valuable.

*To Mr. Hassall:* This is almost entirely a pastoral district, the principal stock being sheep, and all schemes for the improvement of the district would appear to have for their object the making of the pastoral industry more secure, and enabling it to be carried on more cheaply. Any agriculture done here must be under a system of irrigation, and to assist the great pastoral industry. If the proposed scheme

25 is carried out settlement will be only slow; but in the course of years, as the district becomes more thickly populated, small settlement, such as is contemplated by the Government proposal, will follow. I do not think that the locking of the Darling will bring about very great results in this direction immediately. I cannot say why people have not cultivated a larger area of land in this district; but in a recent inquiry a pastoral tenant, in support of a contention as to the worthlessness of this country, said

30 that a certain crop cost him £20 a ton, while the cost of carriage only for bought produce came to £16 a ton. When the matter was gone into further, we found that, taking an average of five or six years, the cost was about £8 a ton to get a crop, while the carriage came to £8 or £10 a ton for bought produce; but, notwithstanding this, the man said that he was determined to give up growing anything more. What he had grown was grown without the aid of irrigation. I do not think that the mere raising

35 of the water-level 10 feet would have much effect in increasing the area under cultivation in this district; but directly the water gets down below ordinary summer level it becomes very hard. If there were always 10 feet of water in the river, the probability is that it would never get hard, and that would make a great difference to people wanting to use it for their gardens. I do not think the proposed scheme would induce people to pass better country to come out here. To induce small settlement you must have

40 three or four successful settlers. At North Bourke there are some thousands of acres which could be taken up to-morrow. I have already recommended that something should be done with that land. I am certain that there will never be a rush for land in this district; the growth of population will be gradual. Most certainly if the scheme were carried out there would be an agitation for the improvement of the river further down. People will ask for anything if they have the most remote chance of getting it. It

45 appears to me that the object of the scheme is to feed the railway line. If you went as far as Louth you would bring wool from there to Bourke; but during the last seven years they have only missed twice in bringing their wool here with the river in its natural condition. The scheme, if carried out, would make Bourke the depôt for the district. The Brewarrina people would sooner have a line constructed from Brewarrina to Byrock. I do not belong to Bourke any more than I belong to Brewarrina or any other

50 town; but I find the railway here, and I say that that circumstance must be considered. If the railway had been taken to Brewarrina in the first instance, it would have been different. The locking of the river will do very little at the present time to increase the value of the country along its banks. The river has never utterly failed between here and Brewarrina, and the lessees would resent any attempt to increase their rent because of the construction of this work.

55 *To Mr. Trickett:* I am sure that there would be no sufficient revenue in the near future from the expenditure of £120,000 on this work. I am not of opinion that sheep-farmers would willingly pay 6d. or 1s. an acre for the use of water to irrigate grazing land. With regard to lucerne, you could get six crops per annum up here with irrigation, and without any rain at all; but a timely fall of rain would make a great difference to those crops. Lucerne will keep alive, but it will not do its best in hot weather

60 without rain. By the locking of the river you get better water, and have it more evenly distributed; but I am not prepared to say that in the near future any large revenue would be derived from the increased value given to the land. The land at North Bourke is suitable for settlement by the small holders, and it was for settlement of that kind that I recommended it. Irrigation will only pay as an adjunct to a large pastoral holding, or to a large industry of some kind. There is no outside market; in fact, a man would

65 have very little market unless he provided it for himself. The station-owner, the wool-scourer, the big contractor, or anyone having a large number of men to feed, could always make his garden pay. With regard to the land at North Bourke, I think that carriers, teamsters, and men of that kind, could take it up in small areas, make their homes there, and grow chaff for their horses in their spare time. Now that most of the camels have gone there are a good many teams in the district. I do not know of any other

70 land, except that at North Bourke, close to the river between here and Brewarrina, which is similar to the land at Pera. Most of the country is a grey cretaceous clay. I cannot express any opinion upon the question of tonnage dues.

*To Mr. Wright:* I think that in course of time people are bound to try and turn part of this district into an agricultural district; but it will be a matter of time. First one person will come, and then

75 another. I was informed by Mr. J. T. Gibson, of the Western Engineering Works, who has made a very fine vegetable garden and orchard, that the expenditure paid him very well, because he could supply what he grew to the persons employed by him; but that the local market was limited. A great many of our cabbages come from Victoria. The Pera Bore Settlement I look upon as an experiment pure and simple, and although I take the greatest interest in it, I should not like to express an opinion with regard to its chance

E.  
MacFarlane,  
Esq.

23 June, 1896.

chance of success until I see how the people get on there. I do not think that 15,000 acres of land between here and Brewarrina are likely to be irrigated just yet, even if the proposed scheme is carried out. No pastoralist would pay 5s. per acre per annum for the right to take water from the river. It would cost him 18s. 4d. per acre to pump the water, and adding the license fee, his expenditure would come to £1 3s. 4d. per acre per annum. Very little direct revenue will be obtained from the scheme. I see no immediate prospect of a large return from the land to be affected, nor do I see any prospect of any large increase of settlement just yet. 5

*To Mr. Lee:* My answers will apply ten years hence. I do not think that in ten years time there will be sufficient settlement in the district to give much revenue to the State in return for the benefits conferred by this scheme. The land between here and Brewarrina is mostly under pastoral and homestead lease. These leases terminate in twenty-eight years from 1885. Any land required for closer settlement can be resumed under the provisions of the Act of 1895; that is, if it is within 10 miles of the town. If 15,000 acres were required between here and Brewarrina they could be easily obtained. There is that area suitable for irrigation within 3 miles of the river banks. Not many of the homestead leases between here and Brewarrina are in the hands of the original selectors. Going up the river you pass through Mooculta leasehold area, where you will not find a homestead lease; then you get to Beemery, and a few miles above Beemery there is a number of homestead leases, all fronting the river. The number of homestead leases applied for in this district during the present year is 33. I was at Brewarrina on the 6th June, and there we dealt with twenty-nine applications for homestead selections and settlement leases. Of these the Board confirmed twenty-five. The areas applied for varied from 500 to 10,000 acres. Fourteen or fifteen applications were for land near Brewarrina, upon part of the Brewarrina Common recently thrown open for selection. The rest of the land is scattered about in various parts of the district. All the land thrown open at Brewarrina for homestead selection this year was taken up at once, and for some of the blocks there were four or five applicants. People like to keep near the town; they do not want to go away from the towns. These applications were all made by people more or less connected with Brewarrina. As families grow up they must throw out shoots. These people will engage in carrying, and do other things of that kind. With regard to the Government providing water for small settlers on the river, I would point out that water can be supplied more cheaply at Pera, but there are still nine blocks there which are waiting for people to take them up. Then, too, the land on the banks of the river is liable to inundation, while the land at Pera is not. The flood-water could be banked out; but people would sooner go where there is no risk of flood. Eventually the country must be populated, and then people will be compelled to do for a livelihood things which they will not do now. People will sooner go where they can have a gravitation supply, and where their land will be beyond the reach of floods, than where there is only a pumping supply and land will be liable to inundation. If small settlement is to be established along the river it will be impracticable for every man to provide his own pump. There must be a community of interest in the pumping machinery. It would make it easier for the settlers if the Crown pumped the water; but I do not think that even that would induce close settlement upon this particular river at the present time. What will induce it in the future will be the pressure of necessity. My views as to the settlement of this district are that it will be used for pastoral purposes for many years, though it will be improved, and gradually, as population increases, the soil must be brought to its greatest production by the use of water. It is too early to take a very large step in the way of providing water just yet. If you determine to construct a railway to Brewarrina, I say "do not lock the river"; but if you must spend £120,000, I say, "lock the river in preference to making the railway." I think, however, that neither work is necessary at the present time. I do not see what is to make either the one or the other necessary. 45

*To the Chairman:* The people of Brewarrina can take their produce to Byrock as easily as to Bourke, though, of course, if the river were permanently navigable, the cheapest thing for them to do would be to send their produce to Bourke. There is not sufficient traffic to justify the construction of a railway from Byrock to Brewarrina, and it appears to me that there is not sufficient traffic to justify the expenditure of £120,000 in improving the navigation of the river. In my report I recommended that only 300 acres should be offered out of 3,000 acres which, in my opinion, would be suitable for cultivation, because I considered that they would have quite enough to do to get rid of the produce of 300 acres. The approximate cost of providing pumps, boilers, main distributing channels, and engineer's house for such an area would be about £3,000. I estimated that 408,375 gallons of water would be required for each working day—about two-thirds of the estimated flow of Pera Bore. The cost of irrigation, distributed over 600 acres, would be 18s. 4d. an acre; that is, allowing for wages and fuel, but not the interest on the capital cost. I have no doubt that a Government supply could be given much more cheaply; 11s. 8d. an acre was for fuel. An experimental irrigation area should be tried upon the completion of the present weir. 55

*To Mr. Black:* It would be possible to create small settlement areas on the river between Bourke and Brewarrina without any disturbance of existing tenants that is worth consideration. You can always take a reasonable area out of a pastoral property for sound purpose. For instance, the Pera Bore Settlement was taken out of the Fort Bourke run. There are no large reserves on the river. There are some small reserves to allow access to water; but there is no reserve in any one place containing 600 acres. The reserves contain about 100 acres, or some area like that, and they have all been offered for annual lease. 60

WEDNESDAY, 24 JUNE, 1896.

[The Sectional Committee met at the Council Chambers, Bourke, at 10 a.m.]

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (CHAIRMAN).

5 The Hon. WILLIAM JOSEPH TRICKETT. | THOMAS HENRY HASSALL, Esq.  
 CHARLES ALFRED LEE, Esq. | GEORGE BLACK, Esq.  
 FRANCIS AUGUSTUS WRIGHT, Esq.

The Sectional Committee further considered the proposed Construction of Locks and Weirs on the River Darling.

10 Ernest Charles Millen, Esq., Council Clerk, Bourke, sworn, and examined:—

*To the Chairman*: I entered upon my present office in March, 1890. The rental value of the improve- E. C. Millen, Esq.  
 15 ments in the municipality at the beginning of February, 1891, was £31,781, while the capital value of unimproved land was £65,000. The area of the municipal district is 44 square miles. During the municipal year 1891-92, the amount received from general rates was £1,930. During the flood year we  
 15 got very little revenue, and when I entered upon my present position there was a lot of arrears. The rental value of the municipality in February, 1892, was £36,500; the capital value of unimproved land, £63,000; and the amount of rates received, £1,608. In 1893 the rental value of improved properties and the assessments upon the capital value of unimproved properties amounted to £37,700, while the revenue for the year was £1,500. In 1894-5 the rental value was £39,000; the capital value, £59,000;  
 20 and the revenue, £1,552. In 1895-6 the rental value was £33,420; the capital value, £47,893; and the revenue, £1,340. These values are fixed by two sworn valutors appointed by the Council. For this year the assessments are, upon the improved properties, £31,000; the capital value of unimproved land is fixed at £47,430; but only a small proportion of these rates has yet been received. There has been a  
 25 drop in the value of improved property since 1891. In some cases the rental values have dropped from 25 to 50 per cent. I do not know what the present population of the district is; but when the last census was taken it stood at 3,155, and we reckon that there are now about 180 or 200 more people in  
 the district. The meat-works brought a great many people here, and so has the work in connection with the weir. Until we got the last rainfall we had a severe drought here; the water was then very low, and almost undrinkable; you could smell it as far away as the railway station, when the wind was blowing in  
 30 that direction; the smell was caused by the weeds which grow in the river when the water is low. I cannot say that any epidemic was produced by the bad quality of the water; but a former medical officer in the district said that the water was not fit to drink. For the town supply it is pumped directly from the river, and is not filtered. The district boundaries do not include any homestead leases; but they include the garden at the weir, and a farm at Picnic Point, near North Bourke, where they go in for  
 35 dairying, and irrigate lucerne for their stock. In 1885 I crossed the river with 10,000 sheep, but I do not know anything about it in 1888. The supply of water we have at the present time is very inadequate, and when the river is very low we can hardly keep the town going. We have two Worthington pumps, but the height to which the water has to be raised is a great strain upon them. The Council is of opinion that the proposed scheme would materially assist in supplying the town with water in the hot  
 40 weather, but they have not passed any resolution in regard to it. Of course the town supply will only be affected by the completion of the weir which they are now making below Bourke; it will not be affected by the weir at Stony Point, or any of those higher up.

*To Mr. Trickett*: The Council is not in a position to take any steps towards providing a better water supply than that which we have at present. We understood that at Hay they had erected a larger tower, and  
 45 we wrote for a copy of the plans and specifications; but owing to financial difficulties, we have not been able to do anything yet. The arrangements which we have now for pumping and storing the water were carried out by the Government. We put a dam at the site of the present weir on one occasion, when the water was running very short, though I was not in Bourke at the time.

*To Mr. Wright*: I believe that the construction of the weir below Bourke will throw the water back as  
 50 far as Stony Point. That will be sufficient to meet all the requirements of the town of Bourke, so far as a water supply is concerned.

Mr. Andreas Harders, Acting Sub-Collector of Customs, Bourke, sworn, and examined:—

*To the Chairman*: The following is a statement of the Customs revenue collected at Bourke for the last  
 five years:—

55 CUSTOMS REVENUE collected at H.M. Customs, Bourke, 1891-5:—

	£	s.	d.
1891 .....	29,320	9	3
1892 .....	27,383	16	1
1893 .....	20,051	1	10
60 1894 .....	19,896	13	7
1895 .....	15,668	16	8

NUMBER OF STEAMERS arriving at Bourke, with Bonded Goods, &c., from South Australia and Victoria:—

	Value of Goods Imported.
65 1891.—25 steamers .....	£47,136
1892.—14 steamers .....	30,477
1893.—20 steamers .....	34,312
1894.—20 steamers .....	38,468
1895.—1 steamer .....	2,485
To 23rd June, 1896 (half-year).—3 steamers .....	6,017

70 I think the river was only running for a few weeks in 1895.

*To Mr. Black*: I believe that most of the steamers coming here are owned by Messrs. E. Rich & Co., though a good many are owned in Victoria.

*To Mr. Wright*: There is no river now. The 9th April was the date when the last steamer left.

To

E. C. Millen,  
Esq.  
24 June, 1896.

A. Harders,  
Esq.  
24 June, 1896.

- A. Harders, Esq.  
24 June, 1896.
- To Mr. Lee:* My returns are only for goods landed at Bourke. The quantity of goods landed depends entirely on the state of the river. The bulk of the goods come from South Australia, though some come down from Sydney that way. In 1895 about £300 worth came from Sydney.
- To Mr. Wright:* No boots came that way.
- To Mr. Lee:* Bulk ale sometimes comes that way. Sydney merchants may take advantage of the river at 5 times; but their action in the matter depends upon a variety of circumstances. Goods coming here from South Australia come to Bourke partly for local consumption and partly for distribution.
- To Mr. Wright:* The statement which I have just read includes goods coming from Sydney as well as goods coming up the river. It includes all the goods.
- To Mr. Lee:* The Customs Department here takes no notice at all of the trend of the river traffic. There is not a great quantity of bonded goods coming by rail from Sydney for despatch down the river, though there is a good deal exported to Queensland. Very little of the bonded goods going to Queensland go any part of the distance by steamer.
- To Mr. Wright:* A good deal of the sugar used in Queensland is Queensland sugar bonded through. It is taken by team direct from Bourke.
- To Mr. Lee:* Bourke is a distributing centre, not so much for the country down the river as for the district all round. The traffic from the country north and north-east of Bourke generally comes to Bourke, in dry seasons on drays, and in good seasons by the river. Sometimes it comes from as far as Walgett by river.

Mr. Arthur Senior, wool-scourer, near Bourke, sworn, and examined:—

- A. Senior, Esq.  
24 June, 1896.
- To the Chairman:* I know the proposal under consideration, and I know the river well. I think that the proposed works would be a means of opening up the country, and advancing the prospects of the district, and I think that they would contribute towards the revenue of the country. At times there are scores of tons of stuff which cannot be delivered, because we have no available carriage except the camel teams, and the horse teams, and the prices given for freight scarcely pay the men for feeding their horses. If the river were improved it would be a great advantage to the wool traffic and other traffic from out back. We have been terribly handicapped in one way and another in competing with the traffic from the back country so far. The completion of the proposed works would advance, not only the interests of the town of Bourke, but the interests of the district generally. I have been a wool-scourer for about eighteen years, and my industry has been fairly profitable, though we have had reverses at times. I used to be 120 miles down the river. I cannot say that I, individually, would be benefited by the construction of the proposed works.
- To Mr. Hassall:* If the river were locked, industries would spring up along the banks. People might go in for irrigation, combined with small settlement. Small areas might be irrigated and cultivated, and the rest of the land used for grazing, and then, in bad times, what was grown on the irrigated area could be used for feeding the stock. I think that under those conditions land might be cut up into small holdings. Men settling on the river would go out shearing part of the year, and make as big a cheque as they could, and then they would go home and cultivate their land. At present, we have only the local market; but the proposed works will bring a certain amount of population, and, if we carry the thing out systematically, we may be able to compete with some of the towns down the line. We could not compete with towns down the river, because they would be practically in the same position as we should be in. I know a place down the river where a man has a private garden, and last year he made £150 by cultivating only a few acres. He took his produce to the different stations round about. The settlers near the artesian bores may supply the shearing sheds round about; but they could not cart their vegetables 60 or 70 miles away. If the river were permanently navigable, a steamer could leave Bourke to-night and be in Brewarrina to-morrow morning, and, with a constant river, there would probably be a boat every day. Produce could be taken from Brewarrina to outlying districts, though, of course, the longer vegetables are in transit, the worse their condition becomes. Still the steamer rates are very low. With a system of irrigation, the country would grow anything. A few years ago we did not have to exercise ourselves about the matter at all, because we could get any amount of money; but now people have to take to small things and go in for everything from which they can get anything at all. You could not go in for an extensive scheme of irrigation; but there is a small market. Of course there are many people who would not have the means to buy an engine and boiler to pump their own water; but no doubt, if the scheme were carried out, some settlement would be induced. The principal object to be gained is the improvement of the river for navigation purposes.
- To Mr. Black:* The state of the river never interferes with my work; but the man who was there in 1883 and in 1884 had to dam the river to keep sufficient water near his pumps. Last year was the worst I ever experienced. The water was terrible, its bad condition being caused by the low state of the river and the mineral springs in the banks. You can scour with it; but it takes so much more material to bring the water to a proper consistency. If there were a large body of water in the river, the salt springs would be forced back. Green weeds grow half across the river at times.
- To Mr. Lee:* I have never been engaged in agricultural pursuits, and I do not know very much about agriculture; but I am now trying a little on a small scale. I have been one trip up towards the Queensland border, and I think that the improvement of the river would influence traffic in this direction which does not now come here. I think that if the river were improved, it would drain all the country up to Goodooga and round there. I can hardly say which I would choose if I had to decide between a railway from Brewarrina to Byrock and the locking of the Darling; but, of course, water carriage is cheaper than railway carriage, and cheap transit is the basis of all successful commerce.
- To Mr. Trickett:* I possess a freehold about 2 miles below Bourke, and, when in full work, I use from 70,000 to 80,000 gallons of water a day. The effluent I put upon the land, though we used to let it go back into the river. This year I am getting an extracting machine to take out the yolk and grease, so so that they may be used for soap-making. If the river were dammed, my business would not affect the water.
- To Mr. Wright:* When the weir below Bourke is completed, I shall have an abundant supply of water, and there will be a good supply for the town. I think that the improvement of the river will have a tendency to bring the pastoral traffic to Sydney. I think that traffic will very likely come from the Queensland

Queensland border. I do not think that the duty on the Queensland wool will affect the traffic much, so long as the run-holders can get a good sale for the wool. I do not know much about the traffic of the district. I do not know whether the conservation of water in the river will do much to increase the value of the land adjoining the river; but I think that ultimately it will have that effect.

A. Senior,  
Esq.

24 June, 1896.

5 Edward Davis Millen, Esq., M.P., sworn, and examined:—

*To the Chairman:* I am a journalist and Member for the Electoral District of Bourke. I am familiar with the proposal before the Committee. I had not intended to make any statement before the Sectional Committee; but I have been so long interested in this subject, and have such an intimate knowledge of the district affected by the proposal, that I think I should do so. The Brewarrina district is unquestionably the finest pastoral district in the Western Division. It has the heaviest settlement, and, in my opinion, has developed to such a stage as to entitle it to some better means of communication than now exist. There has always been, and is now, a demand which I regard as legitimate for railway communication with the Western line. I view this proposal as an alternative to that. The railway proposal, if carried out, would offer the advantage of better transit; but would not offer, as the improvement of the river does, that advantage coupled with an abundant supply of water. Further, unless the Railway Commissioners undertook to carry traffic on such a railway at less than cost, they could never control the trade of the district, except in the dry times, because the river, when flowing, must always obtain the traffic. In other words, to construct the railway would be to construct it for half the traffic; to lock the river would be to lock it for all the traffic. The question of the revenue to be derived from this work might be considered in this way. I do not pretend that at the present moment the State would derive a direct revenue sufficient to pay interest on the cost involved. Neither would it derive such a revenue from a railway, and the point I submit for the consideration of the Committee is, whether the loss involved in any improvement of the river would not be less than the loss involved in constructing a railway. Then, too, there is the indirect advantage which the State would derive from this proposal. In spite of the statements which have been made to the Committee, that there would be no added value given to the Crown lands of the district, I may say that that is opposed to all experience. If it were not so, every railway that we have constructed would stand condemned. The facilities given for the transshipment of produce must add to the value of the land, and, as this land is the property of the State, the periodic re-appraisements should enable the State to reap some of that added value. It is possible that land immediately upon the banks of the river might not have any increase of value given to it by reason of the additional supply of water, but all the land the traffic from which would drain to the river would have an added value by reason of the cheaper carriage. As to the effect that a water supply has in adding to the value of land, I think you can desire no stronger instance than that of Pera Bore. That land was offered at £1 an acre before the settlement was established; but by supplying it with water a capital value of £20 an acre has been given to it. £400 is the departmental value of each 20-acre block, and it is a valuation which at least ten settlers have regarded as extremely reasonable. I should like to read one or two quotations from an American Official Report on this matter, because I take it that what has happened in one country might under roughly similar circumstances happen here. I quote from the Labour Bureau Report of Kansas State, America, issued by Engineer Hinckley. He says that the State of California appointed—

E. D. Millen,  
Esq.

24 June, 1896.

40 A State Engineer, with an appropriation of \$100,000, for survey and investigation of two years. As the result, 1,000,000 acres of desert land are now worth \$150,000,000, a value of \$1,500 for each dollar invested. The State of Colorado took similar action, and 900,000 acres of barren land became worth \$60,000,000, and the agricultural productions, with only ten years of irrigation development, have for years exceeded that of her gold, silver, lead, iron, and coal combined. So in the arid States 3,500,000 acres of the desert have become worth \$300,000,000. The above figures are based upon average values. There are thousands of acres in California that are worth ten times the average, because they are more intelligently handled. For example, while the average value of southern Californian lands under irrigation is only \$150 per acre, there are plenty of orchards that are paying annually from \$1,000 an acre upwards, annual profit; and there are plenty of potato lands in Colorado that pay \$500 a year per acre.

Some questions have been asked as to the effect likely to be obtained by diverting traffic from Narrabri. Walgett is, roughly, 90 miles east of Brewarrina by road. The traffic likely to be attracted to Brewarrina, as the head of the river, would embrace country the eastern limit of which would reach Walgett naturally. If the river were running under natural conditions the traffic would come from Walgett, and from the north and east of it. The effect of the locking of the river upon that traffic would not extend beyond midway between Brewarrina and Walgett. The area likely to be affected by the river runs some distance into Queensland, but how far, one cannot say without knowing the conditions of the Queensland lines. It is a question of the concessions offered by our railways, and by the Queensland Government. I have no reason to suppose that the construction of the proposed works will divert any Narrabri traffic this way. The traffic that comes here now will come here when the river is flowing, whether you carry out the proposed work or not. As throwing some little light upon the general opinion entertained regarding this proposal, I may say that I know the feeling of the people in Brewarrina very well. They are opposed to this proposal; but it illustrates the general belief in water carriage to know that they are strong advocates of the locking of the river from Brewarrina upwards. They believe that the railway should be taken from Byrock to Brewarrina, and that the river above Brewarrina should be locked to form a feeder to the railway. The result of my sixteen years' experience in this district—an experience gained, not only by knowing the men of the country, but by having been a settler myself—is that the only small settlement possible in the Western Division is very small settlement with cultivation. Homestead leasing has been a distinct failure. The only small graziers who have made a success are men who have had special advantages or special aptitude, or who have emerged from the state of the small land-holder into that of the big land-holder. The effect of the locking of the Darling River upon irrigation would be twofold. It would increase facilities by raising the level at which water could be obtained, and it would give a much greater advantage by creating a certain water supply. At the present moment the state of the river has retarded irrigation operations. Every man who wished to irrigate has been confronted with this difficulty, that at the time when he wants most water—that is, during droughts—there has been the danger that he will have none, and when his pump is required to do most work the water is so low as to make it necessary to consider whether any sufficient area can be irrigated with it. If provision is to be made for irrigation, we must remember the peculiar industrial conditions which exist in this district. We have gathered round Bourke some 500 carriers, with the majority of whom I am personally acquainted. Most of these men

E. D. Millen, men will admit, if spoken to, that they are working, taking one year with another, largely to pay forage bills  
 Esq. incurred with the storekeepers during dry times. Most of them have a knowledge of farming, but not of  
 24 June, 1896. irrigation, and they express the wish to become small land-holders in order that they may grow forage  
 for their horses and make homes for themselves. Generally, a carrier, when he has finished his trip, finds  
 that the proceeds are swallowed up in payment of the bills incurred either in maintaining his own house- 5  
 hold at home or in providing forage for his teams on the road. Opportunities for irrigation would enable  
 carriers to grow all that they require that can be produced from land, and if these opportunities present them-  
 selves in favourable localities, a very large settlement—that is, comparatively—would follow. Whenever  
 land has been thrown open in the immediate vicinity of the towns here it has been simply rushed. Four  
 and five applications have been lodged for single blocks, to which no water is supplied, and most of these 10  
 blocks have been taken up by men belonging to the class to which I have just referred. I do not think  
 it is outside the province of the Committee to consider the moral effect which settlement of this kind  
 would have upon the population. At the present time the men to whom I am referring have no chance of  
 becoming anything better in the future than they are to-day. They cannot become squatters. If they  
 become homestead lessees, it means, sooner or later, financial ruin to them. The only chance they have 15  
 of doing anything for themselves is, by the State offering such facilities as could be given by supplying  
 water to the land. The question may be asked, “Why has no settlement taken place hitherto?” One of  
 the reasons why no settlement has taken place is that Bourke, like the rest of the Colony, has, up to the  
 present, been living in a state of fictitious prosperity, due to the influx of borrowed money. Untillate years  
 all the stations have been receiving large advances to enable them to make improvements, just as the Colony 20  
 has borrowed money to carry on public works. Men have, therefore, found it more profitable to give their  
 services in the work of constructing tanks and other station improvements, and have got higher prices for  
 their labour than they can now command. Hitherto they have been free from that pressure which seems  
 essential to the opening up of new industries. Another reason why no settlement has taken place is that  
 we are distinctly a pastoral population. The present occupiers of the land have little inclination for, and less 25  
 faith in cultivation. The prejudices which the larger holders have against small settlement are too well  
 known for me to do more than refer to them. Perhaps the greatest obstacle to settlement has arisen from  
 our land laws. Although the State owns millions of acres in the district, a man wanting land for irrigation  
 cannot go and select it except at the Pera Bore. With regard to irrigation, it is necessary to remember  
 that isolated settlers are hardly likely to succeed. For the purpose of raising water economically, it is 30  
 necessary that irrigation settlers should be grouped together, as the larger the supply raised the less it costs  
 per unit. Hitherto no opportunities have been given for the establishment of settlements which could supply  
 water to themselves or allow a private capitalist to come in and start a scheme similar to that of Mildura,  
 but on a smaller scale. Yet agriculture is advancing in this district. A few years ago it was a very rare  
 thing indeed to find a garden or any cultivation at a homestead. Now it is very rare to go to a station 35  
 at which some cultivation is not being done. I cannot for the moment think of more than two stations  
 in this district on which there is no cultivation. Although many doubts have been started as to whether  
 irrigation pays, it is a suggestive fact that those who have tried it never drop it, but are increasing their  
 irrigation area. A few years ago a man was laughed at if he used a plough in this district; but to-day  
 I know of many pieces of land—one containing 150 and another 200 acres—under cultivation. The 40  
 prejudices which exist here, and the want of knowledge of the possibilities of cultivation in a dry climate,  
 are very similar to those which existed in the dry parts of America. The land here is regarded only as  
 suitable for pastoral purposes; but the first irrigationists in America, the Mormons, selected the Salt  
 Lake country because it was one of the most forbidding spots they could find, and they hoped, therefore,  
 that it would repel intruders. The land there is so alkaline that they had to wash it. The only hope of 45  
 settling this district, of doing anything more to it than leaving it to be occupied by sheep ranches, is to  
 provide for the settlement of small areas by means of irrigation. It is evident that we must have facilities for  
 small settlement before we have such settlement, and it is idle to suppose that people will come and sit down  
 on the banks of the river waiting for the State to commence the work of water conservation. Facilities must  
 first be offered to the people, and then, no doubt, the people will come. Until the State does what no 50  
 private individual can do, you cannot expect settlement here. I want, now, to make a comparison between  
 artesian water and the supplies obtained for irrigation by pumping from the river, and in doing so, I make  
 the statement that, except in particular localities and to a limited extent, the supplying of water by pumping  
 is the only way in which any great area of country can be irrigated. It is cheaper to supply water by  
 pumping under the conditions which exist here than by using artesian wells. The Government figures 55  
 as to the cost of artesian bores give the aggregate cost of the bores and the aggregate supply of water;  
 but there is no indication of the small percentage of that water which is suitable for irrigation, which is  
 available close to land suitable for irrigation, and which is present in sufficient quantities to render irriga-  
 tion possible in a locality where the settlers have a market for their produce. I understand that the cost of  
 pumping is estimated by the Departmental expert at £1 an acre, with 5s. an acre added for a license fee. 60  
 If you take the aggregate cost of artesian wells, and divide it by the number of the few wells that could  
 be used for irrigation purposes, it will be seen that the cost of supplying artesian water is greater than  
 the cost of pumping would be. At Pera Bore the added value of a block is £19 per acre. At 5 per cent.  
 that would mean 19s. a year for the use of the water. If the full cost of the bore were charged—and we  
 cannot have a Government farm at every bore to be debited with half the cost of the water—it would be 65  
 found that the total cost to the State of supplying the water is fully £3 per acre; a much higher cost  
 than would be necessary with a pumping scheme. Of the forty-six bores put down by the Government,  
 at least twenty-eight are absolutely unsuited for the purposes of irrigation, or require pumps to raise the  
 water. Of the balance, some are situated in places where you can have no settlement, and others have  
 other drawbacks precluding settlement. One drawback to the use of artesian wells is this, that you can 70  
 never use a bore up to its full capacity. The flow at Pera is roughly 600,000 gallons a day. For all  
 purposes of calculation 1,000 gallons per day per acre is a sufficient water supply for irrigation purposes,  
 and on these figures the Pera Bore would be able to irrigate 600 acres. But it cannot irrigate that area,  
 because you cannot keep the bore permanently flowing, and you have no reservoir. Nor can you make a  
 reservoir big enough to conserve the daily flow until you require to use it in big quantities. The cost of 75  
 constructing a reservoir of sufficient size would so add to the cost of the scheme as to make it, except in  
 special circumstances, prohibitive. The highest success obtained in irrigation is as the result of the  
 application of water at the right time. If you have a bore which can only supply a limited area in a  
 given

given time, that area must be regarded as its full capacity. Pera Bore is probably capable of irrigating 240 acres; but I very much doubt whether it could do so unless a reservoir were constructed. Another drawback to the use of artesian water is that all of it is, to a certain extent, mineralised, or has some ingredient which is not beneficial to agriculture. I must not be understood to say that it is sufficiently injurious to prevent its use; but it would render necessary some expenditure in applying a counteractant. On the river bank, drainage would be easy and natural, and all experience shows that you cannot have irrigation cultivation for any length of time without drainage. That, so far as the bores are concerned, may render it necessary to have a pumping plant for the purpose of drainage, even where you have not to pump to raise the water. As to irrigation settlement on the banks of the river, it would be easy to turn the drainage from them into the billabongs, and thus return it to the river, or even, if necessary, to make a ditch leading back to the river. The question of drainage would be a very different one on the plains, at a place like Pera. I do not know where you could get rid of the water there.

To Mr. Wright: Sooner or later, judging from the American experience, the water sinking through the earth and being drawn up again by capillary attraction will, on evaporation, leave accumulated on the surface of the soil the mineral ingredients now distributed through 2 or 3 feet of the soil. We have occasionally heavy falls of rain in this district which would be quite sufficient to leach the soil; but the difficulty is to drain off the water. That difficulty would not exist where settlements were alongside the river; but it would be very great where, as at Pera, the country all round is practically level. The bore nearest to Bourke is the Pera Bore, 9 miles from here. There is no other bore within a reasonable distance, at which it would be possible to establish an irrigation settlement. Walkden's Bore is the next nearest; but it gives so small a supply that, while a solitary settler might do a little there, there is no room for much settlement, while the soil in places is so shallow as not to make it likely that an experiment of that kind will be made there. At Gidgea Camp Bore the supply is insignificant, and the Department recently sent up pumping machinery to thoroughly test the bore. The lessee of the bore has asked for a decrease in his rent, because the supply is not sufficient for irrigation purposes. The next bore is Sibraas, 18 or 20 miles out. It has a flow of 700,000 gallons a day. The next bore is Kelly's Camp, 30 miles from Bourke; it has a flow of 600,000 gallons a day. Then comes the Native Dog Bore, 40 miles from Bourke, with a flow of 500,000 gallons a day. These bores, by reason of their distance from Bourke, the central market of the district, are unsuited for irrigation purposes, because the cost of carrying produce in from any settlement there would render farming operations unprofitable. The Department of Mines has endeavoured to obtain water closer to the river, but has always failed to do so, and private enterprise has made the attempt with similar results. The flows from the bores, so far as they have been ascertained, indicate that the nearer you approach the river from a northerly direction the more uncertain becomes the flow of water. Pera Bore is the only place at which a substantial supply of good water has been obtained anywhere close to the river. As another reason why no settlement can take place round these bores for the present, I might add that the bulk of them are leased for ten years. I need not refer to the bores on the Wanaaring Road, because the water there is too bad. In one place, where the Department keep a man at a cost of £104 a year, he has to go some distance to get his own drinking-water. In connection with artesian supplies there is always considerable risk of the water failing; and here I propose to read some statements as to the experience in America which show that bores there have failed, involving very serious consequences. At Yantabulla, in this district, the Department put down a bore, the flow of which has decreased from something like 300,000 or 400,000 gallons a day, to a miserable trickle of 7,500 gallons a day. When the present tenant took it over the supply had already gone down to 27,000 gallons a day; but when water was first struck the Departmental estimate was nearer the larger figures which I have given. At Wangamana, 70 or 80 miles from Bourke, the supply has failed altogether, and I know of one or two other cases where the owners of private bores suspect a reduction in the flow. I should like to draw the attention of the Committee to what has happened in America with regard to artesian bores. I wish to read from the United States Geological Survey Report. A Commission was appointed to inquire into the whole subject of artesian water and irrigation, the President of the Commission being Major Powell, and he states generally upon the subject of artesian irrigation:—

Something can be obtained from artesian wells, but not a very great amount. The experience from artesian wells fully warrants what I am stating now. They have been bored at different places in the world, and used for irrigation wherever they could be used; and it bears out the statement I make, that the supply from artesian sources is always limited; is always comparatively small; and that no great area can be irrigated thereby. If all the artesian wells in the world, which are used for irrigation, were assembled in one county in Dakota, they would not irrigate that county. \* \* \* We see an artesian well in the arid country, with a bore of 4 to 6 inches, pouring out a fine stream of water; and it looks a large stream, and strikes the eye with a good deal of force; but when you actually compute the amount of water it supplies you find that amount is small.

One of the first essentials to success in an irrigation settlement is that there should be a sufficient number of settlers to enable them to co-operate with each other much in the same way as the dairy farmers do. An isolated fruit-grower cannot very well handle his product to advantage; but where there is a sufficient number of settlers gathered round one place to be able to control in common the machinery required for making fruit-boxes, for grading and drying the fruit, and for carrying out all the necessary operations connected with the industry, there is a reasonable prospect of their making a good living. To supply a large settlement you would require either a big artesian well or a number of such wells. We have no artesian well which gives a supply big enough for the purposes I have indicated, and this is what Major Power says on the subject of multiplying wells:—

If a series of neighbouring wells be bored at the same level, the individual discharge of all the wells is progressively diminished and the total discharge is at first progressively increased, but the limit of discharge for the locality is finally reached, and then the boring of additional wells gives no advantage. If two wells in the same vicinity head at different levels, the one at the lower level discharges more water than the other, and the flow of a well, or of a group of wells, may be entirely destroyed by the sinking of new wells at a lower level. The same effect is produced by pumping water from these wells which is equivalent to a discharge at lower level.

I have here some figures which show what happened when they began to multiply wells in America. I could refer to eight or ten similar instances; but I only propose to quote the case of Rockford. The first well sunk there yielded 1,000,000 gallons; another well was sunk, and the two yielded 2,000,000 gallons; a third well was sunk, and the three yielded 2,600,000 gallons; a fourth well added 400,000 gallons; and a fifth well brought the total supply up to 3,500,000 gallons. A private well was afterwards drilled a

E. D. Millen, Esq., mile away, at a level below the city wells, and the supply given by the city wells immediately fell to 2,500,000 gallons. It is further stated:—

24 June, 1896.

If the supply of water impaired by multiplication of wells is restored by pumping, the capitalisation of the cost of pumping must be added to the cost of the plant in making a computation, and in such case the investment may be disastrous.

Major Powell is speaking of boring where the cost is one-half or two-thirds lower than what it is in this country. He expresses the opinion that the quantity of land which may be irrigated from artesian sources is very limited, and he supports that statement by this remark:—

In California the wells are used for irrigation in three counties only, and it is stated by the State Engineer that less than 3,000 acres are irrigated. In Utah about 2,000 acres are irrigated from these wells. In each of the other counties named the extent of irrigation (artesian) is very small.

From official figures published by the United States Agricultural Department, I find that there some 8,000,000 acres of land are under irrigation, excluding what is "under ditch", that is, capable of being irrigated but not so irrigated. The area irrigated by artesian water is roughly 100,000 acres. As to the possibility of irrigating around artesian wells, I do not want the misapprehension to go abroad that we should not utilise the water there; but the area available for the purpose of settlement and irrigation is, as I have shown, necessarily limited. Opinions have been expressed on the question whether fixed or movable weirs would be the better to adopt in damming the river. I have not the slightest doubt in expressing an opinion which is the result of my observation on what has taken place, that the construction of a fixed weir in the Darling would entail injurious consequences. At every position in the river where there is a permanent obstruction such as the rocky bar at Brewarrina, and other similar bars which cross the river at irregular but frequent intervals, there is evidence to show that the water is trying to bite its way through in some other direction. At Brewarrina and Collawaroy there are rocky bars, and immediately above them the river has formed the channel known as the Cato Creek on the north side, and the Tarrion on the south side. To a less pronounced extent the same thing is going on over the whole length of the river channel of which I have any knowledge, that is from Tilpa to Mungundi. The questions as to what can be paid for the use of land and water for irrigation purposes is very much misunderstood in a district where people are in the habit of getting land for nominal rents and taking from it produce of very small value. The return from lucerne, it is safe to estimate, would be here from £15 to £20 or £25 per acre, according to the suitability of the land and the intelligence of the man who cultivated it. The cost of clearing land here is unduly high, because the business of clearing is a new one. The men engaged in the work have little of the experience and none of the appliances which tend to reduce the cost in other districts where the work is understood. The cost of land is very small, and adding the cost of clearing and preparing and the cost of water, taking the Departmental figures, the purchaser would have to pay very little to get a crop compared with the value of that crop. The total cost to the producer who irrigated would be much less than the nominal rental now paid by the grazier compared with what he takes off the land. When irrigation is understood here, men will be able to pay the rent demanded by the Crown, and as much as £4 and £5 per acre for the use of water. Other produce which can be grown here will command a much higher price than lucerne. I am speaking now from practical knowledge which I have gained by irrigating small parcels of land under extremely adverse conditions as to plant and suitability of soil. The opinion prevails that some rain is necessary for the growth of lucerne and other crops; but my experience is that crops which you can irrigate, and lucerne particularly, do best in the driest and hottest summers. The increased heat coupled with the water which you give them is conducive to rapid growth. At Torallie Station, 40 miles down the river, in one of the worst years we have known—1888—I saw lucerne cut three weeks after the previous cutting, and the owner informed me that he had obtained eight crops in the twelve months. At Brewarrina, on soil less suited for irrigation and for the growth of lucerne, I obtained even better results, which I attributed to the fact that the area was smaller and was more closely attended to.

*To the Chairman:* The conditions necessary for settlement would be created by the completion of the weir now in course of construction below Bourke, so far as the area affected by that work is concerned.

*To Mr. Hassall:* The reason that the system of homestead leasing has been a failure is that the amount which a man could make out of a block of 10,240 acres, using it for pastoral purposes, was not sufficient to give him a good living and to pay interest on the capital involved. I think that it would be better to have smaller areas and to work them intensively rather than extensively. While many of the homestead lessees have water frontages, the majority of them have not. It would be possible to use some of these water frontages for irrigation; but the majority of homestead lessees in the district know nothing of agriculture and less of irrigation, and not one man in ten has sufficient money to pay for the erection of a pumping plant. To make irrigation a success, we must have what the Americans call the colony system. In this way water can be raised much more cheaply than where each settler pumps water for himself. I think that if small settlement was made possible, carriers and others would take advantage of the opportunities afforded. A little while ago I submitted a proposal to the last Government for the throwing open of an area of land at north Bourke, and I gave the names of seventy men who were willing to settle there; but there was then no law which would enable them to get the land under the conditions they required. One of the first conditions necessary for small settlement is a permanent supply of water; this would be secured by the carrying out of the proposed scheme. Another is that land should be available, and this is provided for by the Act of 1895. I would expect other settlement besides that undertaken by carriers; but I referred to the carriers, because they constitute a large body of men who would be inclined to take up these blocks in the early stages of irrigation settlement. There is a prejudice against artesian water which may or may not be well founded, and, to account for the fact that all the blocks at Pera have not yet been taken up, it must be remembered that in the initiation of new enterprises the majority of people, with a caution which is perhaps commendable, stay back until they see results. Then, too, the people here do not understand small settlement. Agriculture is struggling to be born in this district; people are waiting to see what is going to happen. Until you give facilities for coming to the district people will not come. I do not know any district which is better for agricultural purposes than this is. Under irrigation we could grow fruit here almost with the certainty that Providence would not interpose with an untimely fall of rain, and destroy our crops just as they were ripening. As to Mildura, I think the place will ultimately be a success. The settlers there had to give Chasley Bros. £20 an acre for their land, and they purchased, as many

many people have purchased in this Colony, more land than they could afford to work, availing themselves of the time-payment principle. The railway brings into the district £70,000 worth of produce which could be grown locally. If every man who went on to the land grew £200 worth of produce, there would be an immediate local market for 350 adult male settlers, or, adding the usual complement of wives and children, 1,750 souls would be maintained, which would increase the population of Bourke by about one half. The more you produce, the more you increase the demand for what is produced. In reply to the question, "why has not someone already taken advantage of the available market?" I would say that there must be a starting point somewhere. There was a time when no one raised wool in this district. Then somebody started it, and everyone rushed the district. There was a time in our own life-time when not one pound of wool was grown in the district. The district will be used for wool growing until people discover that something else will pay better. Hitherto the great problem has been the water problem. That problem has now been solved, and the next problem which presents itself, and which will take a few years for solution is how to utilise the water which has been conserved to produce food for stock. There is no reason why the local market should not be supplied with locally grown produce, and I contend that we can also supply the outside market. Higher priced products such as fruit, which can be produced under the conditions prevailing in this district much more profitably than in cooler districts, will stand the carriage to outside markets. My difficulty is, not to find a market for the produce, but to get sufficient produce raised to allow of economical handling. In America it has been found that the most successful results have been obtained by sending fruit to a central factory, where it can be handled with the proper machinery and appliances at a minimum of cost. In California the average rainfall is from 6 to 8 inches a year, but here we have from 15 to 16 inches a year, so that we should only require two-thirds of the artificial water that they would want. So far as soil is concerned, the best American authorities agree that one could not fatten a beast off their soil naturally, but we know what our soil can do. The Americans are now taking produce grown in California and shipping it to England, then out to Australia, and finally it is sent up here from Sydney, and, as I am disinclined to believe that our people are inferior to the Americans, I see no reason why we should not compete with them in the London market. The cost of carriage is counter-balanced by the lower cost of the land. I know the report of Colonel Hinton. He is the head of a department in America, much as Mr. Boulbee is here. Major Powell was appointed to preside over a commission enquiring into the whole matter of artesian supplies. The two gentlemen are diametrically in opposition. One is a scientific man, and has the advantage of the scientific evidence which was given before him, the Commission having existed for two or three years, and surveyors and geologists have come before them. Colonel Hinton, though an official of considerable knowledge, is, I think, much more interested in keeping up the reputation of his department than in arriving at a proper verdict as to the conditions which prevail. With reference to the remarks of Professor Hill as to the development of the artesian belt in Texas, the same thing applies here. In no part of New South Wales has there been a grander development than by artesian water. I do not deny the advantages of artesian supplies, but I say that the conditions render the supply from the bores unsuitable for large settlement. For various reasons there are only one or two bores at which cultivation can be carried on successfully. With reference to the statement that North Bourke was the only place at which land was practically available for an irrigation settlement, I daresay that the witness who made it, if asked whether he could find land available for the purpose under the provisions of the Act allowing for resumption for public purposes, would probably say that there is any quantity of land which could be taken without serious disturbance to the interests of anyone. I could mention twenty spots which are eminently suited for settlement; but before you can expect settlers to apply for it you must make it available. It is only a question of resuming a small portion of ground. The man who holds 250,000 acres of land is not seriously affected if you take 5,000 acres away from him. If the Government would give me the right to a portion of land on conditions as favourable as those given by the Victorian Government to the Chaffey Bros., I could find the capital to carry out the work. I commenced my advocacy of the proposal from a navigation point of view; but I pointed out that the water you conserved would cost you nothing. If the scheme were carried out, it would provide access to an important district, and you would have water conserved which would cost you nothing. The locking of the river would give to the richest pastoral district in the Western Division what it is entitled to, namely, easy access to market. The opinion of the people of Brewarrina is worthy of consideration. If the Railway Commissioners affirm that they would lose greatly by the making of the railway, there would be an injury done to the State if that line were made. The people of Brewarrina district are entitled to some means of getting to market, and it is for the Government to say whether they will give them better navigation or a railway. Government have to consider whether the district would be better served by a railway from Byrock to Brewarrina, which would not allow of irrigation, or by the proposed improvement of the Darling, which would allow of both irrigation and navigation. The biggest landowner in the district is the State, and surely some consideration must be given to the interests of the State, even as against the interests of a few private landowners in the town of Brewarrina? Human nature is the same at Brewarrina as elsewhere. Having lived there for a long time, I am of opinion that the producers are anxious to get a double road to market. The river often runs now under its natural conditions, and, if a railway were constructed, and the river were up, the people of Brewarrina would play off one against the other.

*To Mr. Trickett:* In America the Government does not carry out irrigation. It only gives facilities to private individuals for doing so. The principle there has been for each individual state to pass a general law under which private charters may be obtained. Private individuals come in and acquire certain rights. The general practice has been for those who propose to start a large irrigation colony to acquire a sufficient area of land. They then construct the necessary water-works, and sell the land, together with a right to water. The Chaffey Brothers obtained their experience at the Ontario colony. Most of the capital invested in the Western irrigation States has been eastern capital. Having calculated the probable outlay that would have to be incurred in connection with a fair-sized irrigation area, which I have taken to be 5,000 acres, I find that water can be supplied for less per acre than the Departmental estimate. In considering what men can pay, you have to take into account the price at which they will obtain their land, and the yield which they are likely to get from it. I have no reason to doubt that people could give as much as £5 per acre for land and water combined; but it is not necessary to charge that price. If the State undertook the work of supplying water, all that would be required in return would be a fair interest upon the outlay involved. All the land which would be benefited by the cheaper carriage resulting from the construction of the proposed works would be increased in rental at every

Esq.  
24 June, 1896.

periodic reappraisal, because the Land Act provides that the Land Board shall take into consideration the cost of carriage in determining the rental of Crown lands. As carriage goes up, rental comes down. With regard to the imposition of navigation tolls, I would point out that the rental for the Crown land would vary according to the tolls charged on the river. You can get a return from the proposed expenditure, either in the shape of increased rent or in tolls. If a man's rental is £150 a year, and his carriage costs him £50 per year, you ought to increase the rent to £125 a year if you reduce the carriage to £25 a year. There is a reappraisal every seven years. I see no objection, however, to the imposition of tolls. If we are to have any large amount of irrigation in this district, over and above isolated settlements such as that at Pera Bore, which may be eminently successful, the supply of water must come from other than artesian sources. The expenditure of £1,487 on the Pera Bore was to gain three objects: A supply of water for travelling stock; sufficient water for a Government experimental farm, and sufficient water for the settlement. Part of the cost should, therefore, be debited to the Travelling Stock Account, part against the Government Experimental Farm, and the rest against the settlement. With regard to evidence given by a witness yesterday as to the result of his attempts at irrigation, I would point out that the district in which he was living became depopulated, and it also had a very powerful rival in Mildura. He could not raise water as cheaply as they could raise it at Mildura with their more powerful machinery. Mildura, as a private venture of the Chaffey Bros., has come to grief; but I do not consider the settlement a failure. The pastoral industry just now is not very bright; but we do not consider it a failure, because many of those engaged in it are practically insolvent. The greatest benefit which would result from the carrying out of the proposed work would be the solution of the great problem, how to settle the Western Division. The ultimate benefit which will result if we can induce irrigation in this district will outweigh the benefit of cheap carriage although that is a very great benefit.

*To Mr. Lee:* I see no objection to the imposition of river tolls for the purpose of obtaining a return from the expenditure upon the proposed work, but in proportion as you levy tolls you will collect less rent from the people who send their produce along the river. To my mind it is immaterial whether you get your return by imposing tolls or by increasing rents. The rents here are fixed by a board of appraisers, after a consideration of the factors which determine the question. I contend that the State will be justified in collecting tolls as payment for services rendered; but, if it collects tolls, it will not give that cheaper carriage which the people here would otherwise have, and which would increase the rental value of the Crown lands. As to the danger of traffic being taken direct to South Australia on a river on which there are no tolls, our experience has been against that, the percentage of the total traffic going down the river past Bourke being very small, while traffic comes up the river to Bourke from places distant 120 and 130 miles by road. If there were no Government farm at Pera the Government would be put to less expense in connection with the management of the bore. One man would be more than sufficient to do all that was required there, and you would not be entitled to charge the whole expense incurred upon his account against the settlement, because his services would be required, even if there were no settlement, as caretaker of the bore and to regulate the supply of water to travelling stock. If the Government wished to economise they could make an arrangement with one of the settlers to look after the bore for perhaps £20 a year. The farm was established to encourage settlement and to induce people in the district to take an interest in cultivation. The land adjoining was thrown open for settlement on the 13th August last, when the Bourke summer was just commencing; but they got to work on the Government farm a little earlier. I am of opinion that so far the results have been encouraging, and the settlers seem to be of the same opinion. As the bore was put down to provide a public watering place, the country would have to pay interest on the outlay, whether there were a farm there or not. In my evidence I do not wish to convey the impression that there is a probability of a general decrease in the flow from the artesian wells, because I do not think for a moment that we have reached the limit of our artesian supply. My remarks were intended to counteract to some extent the belief that we can do wonderful things with these bores. If 15,000 acres were occupied and irrigated, the population of the district would be very largely increased, and the increase would follow on an expenditure altogether insignificant in comparison with the amount which is being expended in settling the present population on the land. I do not know of any part of the country where with irrigation a more certain return could be obtained from agricultural pursuits. Here a man is his own providence, by using his own watering can. We have at Pera a flooded-out Manning River man who believes that the conditions are more certain here than those which we had to face in the Eastern Division. No one can, in the absence of legislation, do the work of irrigation for themselves, and, with the river in its natural state, no one would attempt to do it on a large scale, when most water was required the supply would be at its lowest. If the Government erected pumping machinery, those in charge of a settlement would, when the first drought occurred, have to do what the Municipality of Bourke did in 1888, namely, put in a temporary dam below the point of intake. You must conserve the water before you proceed to carry out any irrigation scheme. It would not pay the individual settler to erect his own pumping plant, and in the absence of some controlling authority he can hardly co-operate with other settlers. I think that the Government should either give facilities which would enable private enterprise to step in, or do what is necessary to establish irrigation themselves. The isolated settler cannot, except in a small way, and in growing things for his own use, make a success of irrigation. I think that the Government would be justified in erecting a pumping station. With regard to the market that there would be if produce were raised, I would point out that our home market seems to be far ahead of any produce possible in the immediate future, and it is idle to discuss what the market will be 5 or 10 years hence. I take it that the market is here for all the produce that will be raised immediately, or within a reasonable period. With regard to the construction of the various locks and weirs, I think that whenever the river was in a favourable condition it would be better to proceed with the construction of all the locks and weirs simultaneously. It would be to lose a golden opportunity to construct one at a time. I see no reason why the locks and weirs should not be let out in pairs, the construction of them all to go on simultaneously. It seems almost opposed to common sense, if you make up your minds to carry out the work, to say that only one lock and weir shall be made at a time. Of course, if the engineers have doubts as to the effect of the construction of these works upon the river, caution will be the necessary policy to pursue. With regard to the construction of the proposed works, I think that it would be advisable, if the conditions were favourable, to seize the golden opportunity to push on with it without delay, lest a series of wet years should follow, when you could do nothing. If the engineers were to idle, a flood might come down and cause a long delay.

To

*To Mr. Wright :* In reply to the objection that it is now some years since the booming times of the country's prosperity, I would say that you cannot get the people out of one set of habits in a year or two. Those who are now living in the district are many of them in a very impoverished condition. A good deal has already been done in the way of irrigation and cultivation. I think that, in the interests of the district, the locking of the river would be better than the construction of a railway to Brewarrina. Besides, if you can concentrate traffic in one given channel, you can handle it more cheaply than if you distribute it over many channels. The Commissioners get a certain return now from the line to Bourke; but they would require a larger return to make a line to Brewarrina pay. It does not follow that the people on the Culgoa and Bokhara would be saddled with any additional carriage if they had to bring their produce by river to Bourke. Assuming that the Commissioners now charge £4 to carry wool from Bourke to Sydney, if they had to provide interest on a line to Brewarrina they might have to charge £4 10s. to carry wool from Brewarrina to Sydney. If, however, that wool could come down a permanently locked river, and pay only 7s. or 8s. a ton, the people sending it would effect a saving. Then, too, as you reduce the risk on the river, the insurance rates will fall. Produce has been taken to Brewarrina for 12s. 6d., and, with a better class of boat, the rates would come down to 7s. With regard to the £70,000 worth of produce, which I said was imported into this district by the railways, I may say that I obtained from the Secretary to the Railway Commissioners, figures as to the quantity of produce imported, and then made the calculation myself. After the river is locked, one of two things might be done: The State might provide pumping machinery to lift the water on to the land, or private enterprise might be allowed to come in. Unless the State or the capitalist steps in, irrigation can go on only upon a very small scale. Except in a few isolated cases, it would be impossible for the individual irrigator to provide for his own requirements. In reply to the question whether people would come from more settled parts of the colony, where there is a better rainfall, and where the heat is not so extreme as it is here, I would point out that the graziers came here, although they could have got estates nearer the coast, and I dare say other people will follow their example. The first thing we have to do is to feed the population living in the district. No sane man has any idea of settling the whole of the Western Division under irrigation; but the question arises whether you have not certain portions of land here which would carry a population of irrigators. I think that the district might very well supply itself with vegetables and fruits, and have a good deal to export as well. If the American can afford to ship his produce to London, and then out here, I am prepared to believe that, with our cheaper land, with the exceptional advantages which the Government can offer, and with the enterprise of our people, we can compete with them. Although the American producers have 60,000,000 people to feed, while we have only 1,250,000, the proportion of the producers to the consumers is about the same in each place. Whether you have protection or not, the producers of this country must, sooner or later, face the producers of other countries in outside markets. Our wool producers and our stock producers have already done so, and our farmers will have to follow their example. In starting irrigation here, we should have first the home market to supply, and I think that if the Americans find it profitable to send their products here, we ought to be able to find a living in supplying our own people. In other places the people have to pay much more for their land than we should have to pay here. At Wellington you have to pay £5 an acre for land, and you have no water supply. You take off that land 10 or 12 bushels of wheat to the acre, and this wheat is worth 2s. 6d. a bushel. At Mildura you pay £20 an acre for the land. Notwithstanding that, however, Mildura will be the success so soon as the men who have paid too much for their land get out of their difficulties, or are succeeded by people with more capital. It is possible to get figures to show that the gravitation schemes in California cost more than it would cost to pump the water from the Darling. The cost involved in creating a work has to be considered as well as the annual cost of maintenance. In California people can carry on irrigation successfully at four times what the work would cost here, and I think that our people will do at least equally well under much more favourable conditions. As I have already said, it seems to me immaterial how the Crown collects revenue to pay for this work--whether it imposes tolls, or increases the rent of Crown lands. The Land Board would only increase the rentals of Crown lands in the district to the extent to which it is proved that they were benefited by the scheme. Crown lands are appraised every seven years. Most of the holdings are being appraised now, though some of them will not be appraised for one or two years. I think that the whole work should be constructed at once, and that advantage should be taken of a low river to push on with it. I think that there is hope of successful settlement in this district without any spoon-feeding by the Crown. I do not believe in spoon-feeding, because I am of opinion that, given the necessary conditions, the people may be left to work out their own salvation. I attach considerable importance to the Pera Bore Settlement as an object lesson, because, if it turns out a success, it will induce other people to enter upon similar occupation. I do not see that there need be any antagonism between the small people and the large people; but there is land in this district which could be settled without disturbing the large pastoralists in any way. The land upon which water could not be used might be left as it is. It would be better for all parties if there were less earth hunger, and the land were used more.

*To Mr. Black :* The artesian bores were put down for public purposes, to provide water on the stock routes. That is considered to be a public purpose, much as the making of a road, or the constructing of a bridge is considered as such. I approve of the efforts of the Government to open up back country roads. I am not aware, however, that the Government ever put down a bore for the purpose of establishing a settlement. It was only an afterthought; but it is a further reason for approving of the putting down of artesian bores. I would approve of the Government purchasing pumping plant, to be used by settlements of irrigators on much the same principle as the Government now carries out the supply of water to country towns. That the repayment of money expended in that way is to some extent problematical is the fault of the Government in not insisting upon prompt payments. With regard to homestead leases, the tendency has been for them to be acquired by a few men. The management of five, six, or even ten homestead leases costs very little more than the management of one or two, if there are ten homestead lessees, nine of whom fail while the other is successful, he is probably able to acquire their properties at less than their value. Not one out of every ten homestead lessees has established himself and made a comfortable home.

*To the Chairman.]* I favour the erection of pumping machinery by the Government, the cost to be repaid by a charge made on the land irrigated. I admit that the area of land which will be irrigable upon the completion of the Bourke weir will be sufficient for experimental purposes, at least for the present; but

E. D. Millen,

E. D. Millen, Esq.  
24 June, 1896.

I would point out that there are people further up the river who might desire to do something in the way of irrigation. Knowing the Brewarrina district, I think that the people there are entitled to an easy road to market. I think that improved river navigation is the best thing you can do for them. I do not share the opinion of Mr. MacFarlane that neither the locking of the river nor the construction of a railway is necessary at the present time. The opinion has been expressed that a permanent weir would silt up. 5  
Although, for reasons I have given, I think that the construction of permanent weirs in the Darling would be a mistake, there need be no fear of silting up in this river. The soil held in solution is such a fine vegetable deposit that, wherever the water strikes against an obstruction, not only is no silt deposited, but a big hollow is made in the bed on the up side. This I am told does not occur in any other river. The proposal to construct fixed weirs is made by gentlemen who have not sufficiently regarded the character 10 of the river.

FRIDAY, 26 JUNE, 1896.

[The Sectional Committee met at the residence of Mr. George Woods, Yambacuna, at 12:35 p.m.]

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (CHAIRMAN). 15  
 The Hon. WILLIAM JOSEPH TRICKETT. | THOMAS HENRY HASSALL, Esq.  
 CHARLES ALFRED LEE, Esq. | GEORGE BLACK, Esq.  
 FRANCIS AUGUSTUS WRIGHT, Esq.

The Sectional Committee further considered the proposed Construction of Locks and Weirs on the River Darling. 20

Mr. George Woods, homestead lessee, Yambacuna, sworn, and examined:—

Mr. G. Woods. To Mr. Trickett: I am a sheep farmer and irrigationist, and a soap manufacturer. My homestead lease is situated on the south bank of the Darling, and on the main road from Bourke to Brewarrina. It is 44 miles from Bourke and 16 miles from Brewarrina. Fronting my property is a lagoon having a circumference of about 2 miles. In the year 1887 I made a dam to impound the water in this lagoon, 25 and prevent it running back into the river.

To Mr. Hassall: When full, the lagoon contains about 20 feet of water. There are about 14 feet of water in it now.

To Mr. Trickett: Besides the homestead lease I have a special lease for which I pay £10 a year. It comprises about 70 acres of land surrounded by water. I have been here ten years. I took up the land 30 with another man. We paid £150 for the improvements that were on it, though they consisted only of fences. Since then I have improved the property by putting up a residence, a pumping engine of 8-horse power, a windmill, a granary, a soap manufactory, and a wool-shed, and have divided it into ten paddocks with wire fences. There are over 30 miles of fencing on the property. Since the last appraisalment I have been paying 3d. an acre for the land. I would be willing to pay even more for the land if I could 35 irrigate. I could pay 5s. an acre for the land that I irrigate; but, taking the whole holding, I think the rent is too high. I have appealed against the appraisalment, but the appeal has not been decided yet. There are two homestead selections here, comprising 20,000 acres. The soil is all black soil, and about one-third of it is covered with Coolabah scrub. It is all good grazing land, and, if you could irrigate it, it would be good agricultural land. We have ring-barked 2,000 acres, and I have about 120 acres cleared. 40 There is lignum scattered throughout the country, but even where it grows is good country for grazing purposes. At the present time we have 8,000 sheep, but we could not carry anything like that quantity last year. Last year we could not carry 2,000 sheep, and we had to feed them on scrub. We have had four dry seasons since 1891, and last year was exceptionally dry. The average carrying capacity of the run is about 4,000 sheep, or one sheep to 5 acres. I started to irrigate here in 1888. When the natural 45 rainfall is not sufficient we irrigate 40 acres round the homestead, but this year I increased the area to 70 acres. Last year, when we had no rain, I grew 40 acres of wheat, and irrigated it at a cost of 10s. per acre. We got a very good crop of hay. A great deal of the wheat was fed down by the stock, but the rest of it I made into hay. By feeding the animals we lost no stock at all last year, but I boiled down a number. The heavy rain that fell killed most of the stock that died, but all the stock would have died if 50 I had not fed them. This time last year I was cutting green barley for milking cows, and for my horses and rams. I kept all these animals alive in that way, and a number of paddock sheep as well, though I could not say how many. That 40-acre block fed an enormous number of stock. My surplus sheep I sent away to another property on the Queensland border, and when I brought them back I boiled down what I could not keep alive. Of course if you boil down your sheep you do not get as good a return from them as if you sent them away as fat sheep. If I had a larger pumping plant and more water I could keep all the sheep I have on the place alive. About a mile further down there is a big lagoon, and if I could get water into it I could irrigate thousands of acres, and feed not only my own stock, but a lot more. I could keep ten sheep to the acre on irrigated natural grass, and with the produce of cultivated land. It would not pay only to irrigate the natural grass. If I could irrigate this area that I speak of, 60 I would grow wheat and other crops upon it. Johnson grass will keep ten sheep to the acre. The expense of irrigation would not be very much. The ploughing and harrowing could be done for about 5s. an acre; and the sowing, if I sowed wheat, would cost another 5s. an acre. I could feed ten, and perhaps twelve sheep to the acre on wheat.

To Mr. Wright: I could feed that number of sheep for five or six months in the year, though the expe- 65 riment has not been tried in the district.

To Mr. Trickett: A number of people chance the seasons. It pays them to cultivate if they only get a crop every second year. In 1886, 1887, and 1889, I grew splendid crops without any irrigation. There were three good seasons in the first five years that I spent here. It would be very expensive to carry water far back from the river. If we could tap artesian water, I reckon that it would pay to feed stock 70 in dry times. The cowl to which I have referred goes back from the Darling until it joins the Bogan, so that, if you could keep water in it, you could irrigate the country for miles. If the water were within 20 feet

Mr.  
G. Woods.

26 June, 1896.

feet of the surface, when raised to that level by pumping, you could carry it back 3 or 4 miles by using fluming. At the present time the prices of wool and of fat stock are very low. Last year the Colony lost 10,000,000 sheep. Of course, if your stock are valuable you can feed them, but if they are not valuable it is better to put them into the pot. I have not gone into figures to ascertain what it would cost to feed 5 a sheep all the year round on irrigated land; but I think it would not be more than 1s. 6d. a head. I reckon that it would pay me to give 6d. or 1s. an acre for water to improve my paddocks. If you have the water within 30 feet of the surface, you can work a centrifugal pump. When you cannot work a centrifugal pump the expense is greater. I would be willing to pay 6d. an acre for water if I could get it within 20 feet of the surface. If the water were pumped for me to a distributing level, I could pay 5s. an acre.

10 Of course, if you blocked the river too much there would be a danger of creating large floods which would injure the country. We sometimes get too much water now, and at times when we do not want it. It would pay best to grow fruit and produce and sugar-cane on irrigated land. We can grow sugar-cane and wheat here, and dairying could be carried on for six or eight months in the year. I think we could find a market in Sydney for our produce; but it would be a question of rents *versus* carriage. The rents being 15 reasonable, I believe that dairying would pay here. No doubt the land in the district would be worth more if the Government conserved water and raised it to a distributing height. If I had the means I would irrigate a couple of thousand acres, perhaps more. I believe that irrigation would pay better than anything else. The first cost of my windmill—and I erected it myself—was £50. It cost £28 less in Sydney. The steam-engine and pump together cost £150, and the shed cost another £50, including the piping. The engine 20 I bought second-hand very cheaply. That plant will irrigate 2 acres a day, or 3 acres if the ground is not very dry. The windmill only irrigates the garden, and supplies water for domestic purposes. For a crop of wheaten hay two drenchings are sufficient—one in April and the other in August. This cost 10s. an acre for labour and firewood and the work of distribution. My irrigation cost me £1 an acre per crop of hay. A great deal of my hay was fed down by the stock, but one patch, which was not very good, 25 went about 2 tons to the acre. If I had a choice I would not keep sheep at all; I would go in for irrigation. In that way I think I could make more money out of 300 acres than I do now out of 20,000 acres. I would grow chaff, and I would go in for butter, eggs, pigs, and produce of that kind. I think there is room for a number of people to engage in that industry here. I consider that if I could go in for irrigation I would be working on sure lines. Under present conditions you get a good year and make a lot of 30 money, and then you get a bad year and lose it. Before I came here I was living in the Inverell district. They have a better rainfall and better land there; but they have no railway communication. I got disgusted with the district, and I thought I would try fresh fields. When we came here first we did very well, because stock commanded a good price. At the present time, however, unless a person has good sheep, and works very economically, he loses, because of the dry seasons. It is not a paying concern if 35 you borrow money. Here I only employ one man besides the members of my own family; that is except at shearing time. If it were not for my soap manufactory, my wool-scouring, and so on, I could not make a living at all. If the river were permanently navigable I could save £40 a year in the cost of transit. At the present time we pay 10s. a ton when the river is navigable, and then there is the insurance. The lowest price I ever paid for land-carriage to Bourke was 30s. a ton.

40 *To Mr. Wright:* I pay 10s. a ton from river bank to river bank, and then there is 2s. 6d. or 5s. a ton to be paid at Bourke. For road-carriage, I have paid as much as £3 a ton, and on the river I have paid as much as £1 a ton. In wet weather the teams sometimes take weeks to get over the country. If the river were permanently navigable, I would be willing to pay anything up to 5s. a ton for tonnage dues, because I reckon that with certain navigation we could get freight for about 5s. a ton.

45 *To Mr. Lee:* If water were conserved above Beemery, we should be able to erect a larger pumping-plant, and to irrigate more land. The lagoon in front of my place was dry when I came here. Of course, if the river were conserved, irrigation would be a certainty, and I could take water from the river as well as from the lagoon. The river level would have to be raised to within 20 feet of the top of the banks. If the proposed works only raised the river level about 6 feet they would be no advantage from an irrigation 50 point of view. I can irrigate about 100 acres from the lagoon. I could irrigate from the river, but it would cost more. During the ten years I have been here I have only twice seen the Darling so low that you could cross it. That was in 1885-6 and in 1888. I think that 15,000 acres of land suitable for irrigation, and near to the river banks, could easily be obtained between here and Bourke, especially if they took in the dry Bogan. The dry Bogan enters the Darling about 6 miles above Bourke, and if it 55 were blocked, you could irrigate a large area of land. If the river level were increased only 7 feet, I do not know that any land could be irrigated between here and Bourke, except at great expense. If the Government supplied land and water for 5s. an acre, I would sooner be a settler in an irrigation settlement than engaged in any other industry. I do not see, however, that there is any need to cut a man down to 20 acres. A man would require 200 acres. In such a settlement the people would be able to 60 raise chaff, butter, and other produce, to supply the Bourke market. Fruit should pay better than anything else—apricots, peaches, and other things, all of which grow very well along the Darling. I do not think that people would leave a district like the Inverell district to come to this district; but there are a number of people already here who are not doing anything, and who might be employed. There is a market in England for most of the things that we could produce—for butter, fruit, poultry, bacon, and 65 preserved meat. The prices are low; but I do not know that that market is unremunerative. In considering the competition of the Hunter and South Coast districts, you must remember that the rents there are much higher than the rents here. Land at Bodalla costs £40 an acre; but I cannot see how they can make dairying pay on such land. I think the conservation of water in this district would lead to a lot of settlement. We want different people from those who are here now. The men who own stations here 70 are not very much in favour of irrigation. Station managers have told me that sooner than feed their stock by means of irrigation they would cut their throats. If I had the means, I would sooner go in for irrigation here than do anything else. I like the place, the climate is splendid in the winter-time, and you would be surprised at the variety of products that can be grown here. All animals do well here. So far we have not been very successful; but then we have a very small area under cultivation. If we could 75 extend our irrigation area the place would pay a lot better; 40 acres are not enough to have under irrigation. It is cheaper to pay 10s. an acre to irrigate land than to pay the rents which are charged on the coast; and this land is quite as good as the coast land. I think that if you had everything on business lines, you could grow sufficient produce to feed your sheep, and you could make it pay.

To

Mr.  
G. Woods.  
26 June, 1896.

*To Mr. Wright:* The proposed increase of the water level in the Darling to 6 feet would be of no advantage to me for irrigation purposes. The only chance I should have would be when the flood-waters filled the billabongs. I do not think that the estimate of the engineer, that the Government would get 5s. an acre for the water used on cultivated land and 1s. and 6d. an acre for water used on grass land will be realised. The river level has very often been within 20 feet of the surface; but there has not been much irrigation. The only advantages I can see to be obtained from the work will be cheaper water-carriage. As far as the benefit of having water for the stock is concerned, I would point out that the river has never yet been completely dry. There has always been enough water in it for the stock. I would sooner have the river locked than see a railway constructed to Brewarrina. If such a railway were constructed the river would compete with it very seriously in good times. A lot of wool goes by river now to Melbourne and Adelaide. If the river were locked, I do not know that more wool would be sent out of the Colony than goes out now, because the breaks in the navigation would render it easier to stop at Bourke. As far as irrigation is concerned, I would sooner see the dry Bogan dammed. If the Government cut up 3,000 acres of the land at North Bourke into suitably-sized farms, and supplied water at 5s. an acre, I think the land would be taken up. It would not be very expensive to dam the dry Bogan, and such a work would enable a large area of land to be irrigated. The banks of the dry Bogan are lower than the banks of the Darling. If people could get water with a 10 or 12 feet lift, I think that irrigation would be carried on extensively.

*To Mr. Hassall:* The only advantage that I would get from the locking of the river would be cheaper freight. That advantage would be equal to about a half-penny per acre, distributed over the holding. In my opinion, irrigation with artesian water will be found much cheaper than irrigation with river water, and will enable us to compete with places nearer Sydney.

*To Mr. Black:* Pretty well all the land along the river bank is of the same character as my land; but a lot of it is subject to floods. Such land would be unsuitable for irrigation. Very nearly half the land is beyond the reach of flood, except such floods as that of 1890. To make it possible to irrigate from the river cheaply the water level would have to be raised 25 or 30 feet. A group of irrigationists, if they obtained a suitable position, might work an expensive pumping-plant as a joint concern, and thus raise water at a reasonable cost. The more the plant was kept in use the less the proportionate cost of pumping. Nearly all sorts of fruit grow well with me. We have apricots, peaches, and nectarines, but they want a good deal of draining. Grapes do very well, and do not require very much drainage. Quinces do well, and figs do remarkably well. Grapes ripen here very early. I have had ripe grapes at Christmas. I have not many peaches, but some of them ripen very early. Apricots ripen quickly. We have ripe apricots at the end of November. I do not think that 20 acres is sufficient for one man to support himself on, unless he uses it as a market garden. Twenty acres of fruit would give a splendid living, and that area would be sufficient for poultry farming, but it would not do for dairying, and scarcely for pig-farming. If the Government laid the water on to the land the people in this district could pay 5s. an acre for it.

*To the Chairman:* We have grown lucerne in this district. We had 6 acres under lucerne, but the native grasses overpowered it. It can be irrigated six times a year, at a cost of about 5s. an acre for each drenching. It takes about 6 inches of water to saturate the ground properly; that is, about 125,000 gallons. The ground in which we grew the lucerne was not too suitable for it. It wants a sandy soil. There is such land near the river, but the expense of clearing is very heavy. The land which we had under lucerne has a clayey subsoil. I think you could keep from ten to fifteen sheep on an acre of lucerne all the year round. 1,000 acres of irrigated land would keep 12,000 sheep, and you would require about 2,000 acres more on which to run the sheep.

*To Mr. Wright:* I would take the sheep from one paddock to another. I would not feed the lucerne down too closely.

*To the Chairman:* I would have the paddocks subdivided, and always spell some of them. If you could do that on a large scale you would make sheep-farming more of a certainty than it is now. I think that there is quite sufficient land within 25 miles of Bourke to supply the local market if irrigation is adopted, but I am not sure that the construction of the Bourke weir will conserve the water at a sufficiently high level to induce people to pump it. I am satisfied that there would be no difficulty in irrigating a very much larger area than that estimated by the engineer, if the river were properly locked. At the same time a great deal of that land is subject to floods, and there would be a danger of losing the crop. When the Darling is up it covers all the lignum swamps. About half the land from here to Bourke is above flood level, and suitable for irrigation.

SATURDAY, 27 JUNE, 1896.

[The Sectional Committee met at the Court-house, Brewarrina, at 10 a.m.]

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (CHAIRMAN).		
THE HON. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.	60
CHARLES ALFRED LEE, Esq.	GEORGE BLACK, Esq.	
FRANCIS AUGUSTUS WRIGHT, Esq.		

The Sectional Committee further considered the proposed Construction of Locks and Weirs on the River Darling.

Mr. Henry Loraine Cathie, stock and station agent, Brewarrina, sworn, and examined:— 65

Mr.  
H. L. Cathie.  
27 June, 1896.

*To Mr. Lee:* I have been here eleven years and have a pretty general knowledge of the district, and of the trend of the traffic in the district. All the traffic from the north of Brewarrina as far as the Queensland border, and north and east of the Culgoa River, and from the other side of that river comes to Brewarrina and goes from Brewarrina to either Bourke or Byrock. That includes stock traffic as well as produce. All the traffic from a large area of very excellent squatting country comes here. The extension of the railway to Moree will not affect the country which I describe. The traffic will still come to Brewarrina. Neither would that country be affected by the construction of a railway to Walgett. A line taken

taken by way of Warren to Walgett would also be too far east. Probably some of the traffic which now comes from the north-east might drift to Walgett, if a railway were made to that place; but none of the traffic from the north and north-west would go there. When traffic reaches Brewarrina, its ultimate destination is determined by the state of the roads and the amount of feed to be had. If there is anything like a flood in the river, it is almost impossible for teams to travel to Bourke, and then stuff goes to Byrock. There is only a difference of about 5 miles in the distance between the two places. I think that the road to Byrock is in a better state than the Bourke road; but there is more feed and water on the Bourke road. Occasionally wool and other station produce is shipped from here to Bourke by steamer. In the year before last, and for two or three years back, the bulk of the wool went from here by steamer to Bourke. I suppose in 1892-3-4 30,000 or 40,000 bales per year were loaded at Brewarrina and taken by river to Bourke, and the river was almost continuously navigable for nearly four years. There was a good river from 1890 up to last year. The rate of carriage from here to Bourke by road has varied considerably during the last few years. At one time, when the Carriers' Union was in existence, the rate was a great deal higher than it is now. At the present time they are bringing loading from Byrock for £1 a ton, and stuff can be got from Bourke for 30s. a ton. They take the wool down in a good season by steamer for £1 a ton; but there is an extra charge for putting it on the railway trucks at Bourke. Under present conditions the difference between the road rates and the river rates, even if the river were made permanently navigable, would be very slight. As far as the road traffic is concerned, I do not think that it would pay to take stuff at less than £1 a ton, and it is questionable if it pays at that. Of course, with permanent water and certainty of transit, it is likely that the river rates would be reduced. The smallest settlement that we have in this district is by homestead lessees. They each hold 10,240 acres. It is very questionable whether, taking them generally, they have been successful. I do not think that the country on this river is suitable for any large scheme of irrigation. To my mind it is very doubtful if areas of sufficient size and suitable for irrigation could be obtained near the river; I mean country beyond flood-level. The only farms that I know of, which have been successfully worked in the district, are the Chinese gardens near Brewarrina. The soil between here and Bourke is principally black soil; there is very little red soil. Most of the country is under water in times of anything like a high flood. In many places you cannot get near the river for miles, and there are only a few high points which are above the water. If irrigation were attempted, sites would have to be selected which are above flood-level; otherwise the waters would destroy the cultivation. In times of high flood there is a great deal more than a foot of water over most of the country near the river banks; and in 1890 the flood-water stood at its highest for at least a fortnight. Such floods would destroy irrigated farms. If flood-water went over Incerne and remained on it for a day or two, it would not destroy it; but if it remained on it for a week or two it would destroy it. In 1890 there was from 18 inches to 2 feet of water over the Chinese garden here. That water remained there for from ten days to a fortnight, and killed all the stone-fruit in the garden. We had to replant the garden after the flood. The orange trees and the older vines lived. Every two or three years we have what you might call a high river. The flood of 1886 was a high flood; but the flood of 1890 was one of the highest known. In my opinion, the flood of 1886 would have destroyed all the irrigation in the district, except in a few favoured spots, and the flood of 1890 would have done the same thing. Floods of that character spread over the whole of the low country between here and the Bogan. Of the locking of the Darling and the construction of a railway to Brewarrina, I should prefer the latter. I think that the proposal to lock the Darling is very much before its time, and for more reasons than one. If irrigation farms could be successfully worked on the Darling, where would the farmers get a market for their produce. At the present time we can land farm produce in Brewarrina—that is, horse feed and everything of that kind—much more cheaply than it could be grown here by irrigation. Butter has sometimes been made here in the winter-time; but it has never paid people to sell it for less than 1s. 3d. per lb., although we can get it more cheaply than that from Orange. It is hard to say how the country would progress under a system of water conservation; but I think it will be time enough fifty years hence to lock the Darling. The question with me is, can irrigation be successfully followed on the Darling unless water is taken some distance back from the river? I doubt if any large area of land can be obtained close to the river which is not subject to floods. You might get a point on the river which was not under water during the flood of 1890, but it would not contain more than 20 acres. I do not think that anything like 15,000 acres of land suitable for irrigation could be found close to the river between here and Bourke.

*To Mr. Wright:* It is rather difficult to say what proportion of the wool clip going from Bourke to Sydney by rail passes through Brewarrina. Last year the clip was considerably lighter than it was the two previous years. The quantity shipped through Brewarrina to Bourke previous to last year was a little over 30,000 bales. The wool going to Bourke comes from the district about Brewarrina and north of it. The country about Bourke and to the west has not been very satisfactory for wool-growing during the last two years. The cost of sending greasy wool from Brewarrina to Bourke by river, including handling at Bourke and insurance, would be 26s. or 27s. a ton. I never heard of wool being taken from wharf to wharf on the river for less than £1 a ton. If a railway were constructed from Byrock to Brewarrina, this would be a very large trucking station. I consider Brewarrina one of the best pastoral districts in the Western Division. An extension of the railway to Walgett would not affect the country to the north or to the north-west in the slightest. I do not think that anybody would care to pay 5s. an acre for the right to pump water from the river, nor do I think that the Crown lessees would like to have their rents increased because of the benefits to be derived from the locking of the river. The cultivation of a very small area would supply all local wants, an area of from 400 to 500 acres would be quite sufficient. The Railway Commissioners would have to carry any surplus produce for nothing to enable producers to find markets elsewhere. It is all black soil from here to the Bogan, and then red-soil country to Byrock. There would be no engineering difficulties in the way of constructing a railway, and only two bridges would be required. The distance from Brewarrina to Byrock is 60 miles, and from Byrock to Sydney about 450 miles. I think that a railway from Byrock to Brewarrina would pay expenses within the next twenty years. Of course, it is argued that the railways already get all the produce that comes from this district. That is very true; but no railway could be made in the Western Division which would have better prospects of paying. At the present prices of construction I think it would be only a very short time before such a line would begin to pay. The only low country through which the line would pass is that between the Tarrion Creek and the Bogan River; but I do not suppose that the water

Mr.  
H. L. Cathie.  
27 June, 1896.

was more than 2 feet deep over the whole of that country during the big flood. I do not consider that a railway if constructed would prove a danger to the town by damming back the flood-waters, because plenty of getaways could be constructed, and the town is built upon high land. I think that the country higher up the river is similar to the country here. The people of Brewarrina and of the district generally are nearly all opposed to the locking of the river. Speaking for myself, I think that it would be a waste of money to lock the Darling at the present time, and no doubt that is the feeling of the district. 5

*To Mr. Hassall:* Brewarrina is the depot for the pastoral properties lying to the north and north-west, embracing the country on the Bokhara, Birree, Narran, and Culgoa Rivers. The wool clips from that country all gravitate to Brewarrina. When there is a river they go from here by steamer to Bourke; when there is no river they go either to Bourke or to Byrock. The Commissioners make no difference in the railway charges between Girilambone and Bourke. With regard to merchandise coming this way, the bulk of it comes from Bourke. The bulk of the merchandise is handled at Bourke by Messrs. E. Rich & Company. The locking of the river would be the means of throwing the whole of the trade into the hands of one firm. Messrs. E. Rich & Company are the only persons who have a fleet of boats on the river now. No doubt the locking of the river would lead to monopoly. I do not know of any patches of red country near the river similar to that at North Bourke. The main road from Bourke to Brewarrina keeps near to the river most of the way, though in places it is 3 or 4 miles from the river. In bad weather, when the floods block the Bourke road, people travel up the south side of the Bogan from Bourke, and then come across here on higher country. That makes a difference of 10 or 15 miles in the distance, but the surveyed road from here to Bourke cannot be travelled in flood-time. With regard to the road to Byrock, it is very rarely that the coaches are unable to get through with the mails; but in 1890 you could take a boat from here to the Bogau, a distance of 25 miles. When you get to the red-soil country you are on dry land all the way to Byrock. The raising of the river-level 10 ft. might save a little in the cost of pumping; but the saving would be very small. If you wished to irrigate a piece of land which was above ordinary flood-level you would probably have to lift the water 35 ft. if the river was low. I am just about to erect a pump myself, and I know that it will take 35 ft. to lift the water to the top of the bank. The river at the present time is 30 or 40 ft. below its banks, and if the water were only raised 10 ft. I cannot see that that would offer a great inducement to settlement. 10 15 20 25

*To Mr. Trickett:* Brewarrina is a great traffic centre. The proposal before the Committee would make Bourke the great centre. At the present time when the river is navigable all the wool goes by steamer to Bourke. The insurance on wool sent by river would come to about 6s. per cent. Of course the cost is made very low by insuring the wool straight from the sheep's back. When the road is fairly good the rate for taking wool from here to Byrock is about £2 a ton. It might occasionally be taken for less than that, but that would be a fair average price to allow. As far as water for pastoral purposes is concerned, I think that there is enough in the river now for all pastoral purposes. I do not think that water is likely to be used for flooding pastoral lands. If it were used in that way it would be likely to do more harm than good. If a series of weirs were constructed below Bourke the trade of this Colony would probably drift to South Australia. 30 35

*To the Chairman:* I never heard of traffic on the river being taken for less than £1 a ton. If the rate had ever been 12s. 6d. a ton I should have known of it. With regard to the probable earnings of a railway to Brewarrina, I would point out that although the rate might be the same from Brewarrina as it is from Bourke, that would only be for wool going down. I do not think that other merchandise would be carried at the same rate. If the railway were constructed to Brewarrina a great deal of the traffic that now goes to Narrabri would come to Brewarrina. That would give the Commissioners the advantage of 100 miles of additional haulage. There might not be much advantage in that so far as wool is concerned, because the rate is the same from Girilambone as from Bourke, but there would be additional earnings for other merchandise. If the Brewarrina line secured part of the wool that now goes to Narrabri, it is only reasonable to suppose that back loading which now goes to Narrabri would come here. I consider that if a railway were made to Brewarrina, and there were no railway to Walgett, we should get the traffic from within 30 miles of Walgett and up from beyond the Queensland border. I consider that if the railway were brought to Brewarrina this would be the largest trucking station on the Western line, and it would catch all the Queensland traffic. At the present time, a station 40 miles up the river, having fat stock to dispose of, would probably drive them to Nevertire or to Dubbo; but if there were a railway at Brewarrina they would come here. In that way the Commissioners would earn more. Of course, when the river is navigable there is no team traffic; but during the five years that the river was navigable there was no substantial reduction in the cost of transit between Bourke and Brewarrina. As to what I said about one firm enjoying the monopoly, of course there would be nothing to prevent anyone from putting steamers on to the river if they had the money to do it. 40 45 50 55

Mr. Walter George Jamson, stock and station agent, Brewarrina, sworn, and examined:—

Mr. W. G.  
Jamson.  
7 June, 1896.

*To the Chairman:* I have resided for two years in Brewarrina, and I have lived eleven years in the district. *To Mr. Wright:* Before I came to Brewarrina I was on the Culgoa. I know the Culgoa and the Birree country. The country to the east of the Culgoa is very good; the country on the west is inferior. A good deal of the traffic from that district goes to Byrock through Brewarrina; a small part of it goes to Bourke. I do not think that irrigation would be assisted very much if the river-level were permanently raised 6 feet. The land on the banks of the river is most unsuitable for agriculture, because, to a great extent, it is low-lying and subject to inundation. Back from the river there are patches of high land. The soil within a reasonable distance of the river is mostly black soil. There is not very much loose open soil. I do not think that the country is suitable for irrigation, even if a sufficient area could be obtained above flood-level. I do not think that Mr. Woods has made a success of his irrigation. A railway to Byrock would be of much greater benefit to the district than the locking of the river. Of course the railways get the traffic now, but they do not get paid anything more for it. If there were a railway to Brewarrina, I think they could charge a special rate. I think that the people would be only too glad to pay 15s. a ton more for the carriage of their wool if they could send it direct from Brewarrina, and I should think that would be sufficient to pay interest on the cost of the line. I have had some experience of irrigation upon a station. There was a large bore there in connection with which they started an irrigation farm. I was in charge of the farm for about six months. They grew enough produce, though at 60 65 70 75

Mr. W. G.  
Jameson.

27 June, 1896.

at a pretty heavy cost, to feed their horses in a dry season. Lucerne and wheat were grown. The only expense besides that incurred in cultivating was for making drains. I do not think that many people would pay 5s. an acre for the privilege of pumping water from the river, nor do I think that Crown lessees would pay 6d. or 1s. an acre to pump water for flooding their grass land. I do not think that many people  
5 would go in for growing lucerne on the banks of the river if they could get water, because they would not be able to dispose of it after they had grown it. There would be no outlet for produce when grown. I should think 200 or 300 acres would grow sufficient produce to supply the whole district. At times there is a large consumption of chaff in this district. That happens when there is a very dry season. Some of the stations grow their own hay; but only to a small extent. They cultivate from 10 to 15 acres. The  
10 demand for chaff is not so great now as it was five or six years ago, because many of the pastoral holders grow their own hay.

*To Mr. Black:* I do not think that the river would compete for the traffic with the line from Brewarrina, because I do not think that carriage by river could ever be less than £1 a ton, while if you could send  
15 for 5s. a ton, it would go that way; but how then could the locks be maintained. The rate of carriage by steamer at present varies from £1 to 25s. Carriage by rail direct would be cheaper than carriage by steamer and then carriage by rail.

*To Mr. Hassall:* The country about Brewarrina is much superior to the country further south, so far as I know it. The number of sheep in the district at the end of last year was 11,354,082; the area of the  
20 district is 32,915,112 acres; the number of cattle in the district was 11,148; and of horses 4,814. The principal stations lie north, north-west, and north-east of Brewarrina; Brewarrina is the natural depot for those stations, and the stock routes all trend this way. Stock would truck at Brewarrina by preference; the roads to Brewarrina from the north-west and north-east are better than the roads to Bourke. People even come from Barrington through Brewarrina in preference to going to Bourke, because of the better  
25 state of the roads. They go on from here to Byrock. I do not think the locking of the river would make any difference in the destination of the cattle now coming here. With regard to the railway rates, they are the same for Byrock as for Bourke; but a difference is made in the rates for back carriage. I do not think that the locking of the Darling would be of any great benefit to this district. A very large part of the traffic of the railway from Brewarrina to Byrock would be with  
30 live stock. The locking of the river would not affect that traffic. If we had a railway here Brewarrina would be one of the largest trucking depôts in the Western division. We have a large common, and a great extent of good country all round. A great number of people come in here for their supplies. There are several stations on the Queensland border and in Queensland, such as Yerambah, Currawillinghai, and Woolerina, which at present send their wool either to Narrabri or to Charleville, but which  
35 would send their wool to Brewarrina if the railway came here. It is about 150 miles from Brewarrina to Currawillinghai, and about 250 miles from Narrabri to the same place. I think they go through Walgett. If a railway were constructed to Brewarrina, I think that that traffic would come here, because there would be a slight saving in the carriage. A good deal of wool comes here when the river is full. In one year the cattle crossing here numbered 78,000, out of about 90,000 which passed Barrington, a place  
40 which is supposed to be on the Bourke road. Cattle come here by preference, because the road is better than the road to Bourke. I have affidavits, which the Committee can read, which speak as to the extent of the flooded country between here and the Bogan. It was asserted that the floods would seriously interfere with the construction of a railway over that country, and these affidavits were made by people residing in the district to repel that assertion. The affidavits were made by Mr. Collis,  
45 and by Mr. Lindsay who was living at Charlton, on the Bogan. I am pretty well acquainted with the country round here. I hardly think the soil between here and Bourke suitable for irrigation. If water were conserved in the river, I do not think that people cultivating along the banks would be able to find a market for their produce. The local market is at present supplied from Bathurst and Orange. We have had oats and wheaten chaff landed here in times of drought for £5 5s. a ton. I do  
50 not think it could be grown for less than that in the district, and it would possibly cost more. On the station where I was it would cost a good deal more than that to grow produce, taking into consideration the outlay involved in constructing drains and in clearing the land. It is only about one year in every five that any produce is required in this district. It is only in exceptional years that anything is imported, except perhaps a few tons of chaff for racehorses, or something of that kind. I do not think that it is  
55 likely that 15,000 acres would be irrigated between here and Bourke, if the proposed scheme were carried out. The locking of the Darling would not be of the slightest benefit to Brewarrina, and I do not believe that it would be any benefit to Bourke.

*To Mr. Trickett:* When the river is navigable it is always used in preference to the road, either to Bourke or to Byrock, and I do not see that the carriage of goods by steamer would benefit the Government at all.  
60 I do not think that the State would get much in the shape of license fees for the right to pump water. As for the increase in the value of land, most of the lessees are grumbling and appealing against the present rents. Neither do I think that the State would get much from navigation tolls. In my opinion a railway to Brewarrina would be a more profitable investment than the locking of the river. The railway  
freights would be very much greater than any tolls which could be charged on the river. I am sure that  
65 people would gladly pay an extra rate if they could get their wool carried from Brewarrina by rail. On wool alone they have to pay about 30s. a ton now, including the insurance, that is from here to Bourke, and if they could get it taken to Byrock for 15s. a ton they would save.

*To Mr. Lee:* I do not think that irrigation would pay in this district. A number of years hence it may pay; but at the present time I do not think that we could compete with the outside markets. I am not  
70 aware that cultivation is discredited amongst pastoralists, but it does not pay. They have their own gardens as a rule, and their little cultivation paddocks. I should think that 30 per cent of them have gardens, and about as many grow fodder for their horses. As a rule they only cultivate a few acres, however. Irrigation is possible, but it does not pay, except in very small areas. I do not say that the country is not capable of being turned to better advantage than at the present time. It is quite capable  
75 of better things, but it is not expedient at the present time to make any change. I favour the construction of a line from Brewarrina to Byrock because it would be better in the public interest than the locking of the river, and I do not think that the district is sufficiently well served at the present time. The approaches to Bourke are so bad that very often in dry seasons stock cannot get there, whereas they can come this way easily. They can get here in any season. I think that the locking of the river would mean  
throwing

Mr. W. G.  
Jameson.  
27 June, 1896.

throwing £120,000 away. We have a navigable river now for 3 years out of every 5. Besides, I think that a railway would encourage small settlement. When a railway runs close to one's door, settlement is bound to follow. In reply to the objection that the railway to Bourke has not created a small settlement in the district, I would say that the country through which it passes is not so suitable for small settlement as this is. It is not such good country. I do not think that the providing of permanent water would give as much 5 impetus to the development of the country as a railway to Brewarrina. For one thing, you could only carry dead weight by the river, whereas, if there were a railway to Brewarrina, we could truck live stock here. In very dry times there is no grass, and it is impossible to drive stock to the western line. Stock often have to be moved to save their lives. The Bourke route is favoured to some extent because we get cheaper carriage by the river than by road, and, as the railway rates are the same to Bourke as to Byrock, 10 it is more convenient to bring goods back that way. If a railway were made here, I suppose that in time it would be taken on to the border—up through Goodooga, I should think—through comparatively easy country. There is a sort of red rise nearly all the way from here to Goodooga. Unless some line of that sort is made, a good deal of the traffic will go to Queensland as soon as the Queensland railway comes to Cunnamulla. I have never known the Darling or its main tributaries to be so dry that there has 15 not been enough water for the stock.

*To the Chairman:* The wool from this district should, I think, be trucked at Brewarrina instead of at Bourke, that being the most economical method, both for the producers and for the country itself. With regard to the intermediate settlement to be benefited between Brewarrina and Byrock, there is Lindsay Brothers' place. There are only a few stations between here and Bourke on the south side of the river. 20 I have a list of some of the stations from which the wool would come. Bangate would send 1,000 bales; Angledool, 1,000 bales; Nullewa, 400 bales; Currawillinghai, 1,000 bales; Milroy, 1,300 bales; Weilmoringle, 1,500 bales; and there is a number of others. From Queensland we should get about 4,000 bales. A great deal of that wool now goes to Narrabri.

Mr. William Armstrong MacVean, Manager, Quantambone Station, sworn, and examined:— 25

Mr. W. A.  
MacVean.  
27 June, 1896.

*To Mr. Black:* I have not been very long in the district, but I know the river-frontage here. I think that a system of artesian bores would be found better for irrigation purposes than the locking of the river. The vast expense of irrigating from the river would always prevent people from raising much agricultural produce here; while the floods to which the district is liable would ruin persons engaged in agriculture. To send wool to Bourke now costs about 27s. 6d. a ton, including what you have to pay for 30 putting it on to the railway trucks; and I think that if the river were improved, and tolls charged upon it, there would not be a great difference in the rates. I am of opinion that a railway would serve the interests of the district better than the locking of the river. The rates might go down a little if the river were locked; but I do not think they would go down very much. If there were extreme competition they would go down; but there would be no knowing how long such competition would last. No doubt 35 if the steam-boat owners could run their boats constantly, they could carry on their business more cheaply. At the present time there is not much difference between the road rate and the river rate. Taking the cost of insurance into consideration, the two are about the same. Of course if the river were always navigable, river carriage would be the cheaper; but I do not see that the Government would get any return from the locking of the river. There would be some chance of getting a return from a 40 railway; but there would be no chance of getting anything from the river. I do not say that the railway would pay very much; but I have not gone into the figures. I am not prejudiced as a local resident, or by having interests on the river. I do not think it would pay to raise water from the river to irrigate the land on the banks. The market would be flooded directly a man had started. I do not think that a railway from Brewarrina to Byrock would be interfered with by the floods. That country is not intercepted 45 by any watercourses of any consequence. There are only two main watercourses; I think that culverts would provide for the others. I cannot say to what depth that country is covered with water in flood-time. Whether a line to Brewarrina would pay or not would depend very much upon the style of railway they constructed. A cheap line might be made to pay, and there would be no necessity to put up expensive stations. The chief traffic on the line would be wool and stock. I do not think there is any prospect of wheat being 50 grown, because the seasons are too uncertain. I am not well up in farming, however. I have only done a little cultivation to raise produce for station use. It would pay me to grow feed for the horses, and so on, in bad seasons, but not for the other stock; it would not pay for sheep. It is questionable whether even the cutting down of scrub pays at times. At present prices it is not worth keeping some sheep alive. The market price would not allow of sheep being artificially fed. It will not pay to feed sheep artificially. 55 In a bad season it would be better to boil them down. I do not think that station-owners would take water from the river to irrigate the land for the purpose of raising fodder crops. The rate of carriage by road to Bourke is about 30s. a ton, and by river, in ordinary times, from 22s. 6d. to 25s. a ton. The river is the speedier mode of transit. Wool is insured from the sheep's back to the market. I should think the insurance would be twice as much on wool going by river. The risk is always considered greater. 60

*To Mr. Hassall:* On our station we have 75,000 sheep and a few cattle and horses. Last year we sent away a little over 1,000 bales of wool. I was not here at the time; but I think that part of the wool went to Bourke, and some of it may have gone to Byrock. Messrs E. Rich & Co. got the contract, and they carried the wool to Sydney. The wool traffic goes through their hands principally, because they have a monopoly of the whole district. I believe they have special rates to offer people. I do not know if 65 there is any particular reason for their being able to give concessions, except that they have been successful in their business. They are a very big firm, and in that way they may keep others out. They can carry more cheaply than we could carry ourselves. I have been getting my back loading from Bourke through Rich & Co. I do not think that the locking of the river would improve our station to any extent. I do not know that the river has ever been dry. There is always plenty of water on the frontage, and 70 no difficulty in getting water for the stock that I know of. I do not think that the raising of the river level 10 feet would be very much improvement, though, if the river level were permanently raised, the country might be flooded more. In 1890 a rise of an inch or two would have caused the whole country to be flooded. The locking of the river would not cause us to go in for irrigation to improve the carrying capacity of our run. There is plenty of water in the river now, if people wanted to irrigate. We have 75 bought a little forage for station use and we grow a little ourselves. We can cut enough bush hay to meet

meet our requirements, together with what crop we grow. I have cultivated 25 acres this year, and am depending upon the natural rainfall. They get two crops out of three in this district, and that will keep us supplied. I do not think that under any circumstances we would do much irrigation. If the scheme were carried out we should not be willing to pay an increased rental for any advantages which it might offer. I do not see that the betterment principle should be applied along the river. You might apply it to the travelling stock route and charge travelling stock something, because the stock route goes along the bank of the river. The locking of the river would not benefit us, nor do I think it would benefit others places along the river. I am not of opinion that people would take advantage of the great volume of water to go in for irrigation. If people settled here and irrigated they would have no market for their produce. A person growing produce under irrigation could not compete with a man who did not require to irrigate. I think that people living in the cooler parts of the country could cultivate more cheaply than anyone in this district. To ask people to go in for irrigation here is only encouraging them to sink their money in the land. Of course if the river were permanently navigable it would be of benefit to the district, but it would not be any great benefit. Everything would then go to Bourke, providing there were no other means of communication. If there were a railway to Byrock, stuff would go there, unless the river were cheaper. Brewarrina is the natural outlet for the produce of the north. 300,000 sheep and about 10,000 head of cattle have passed through the run this year, and it has not been a heavy year for travelling stock. The sheep came from the south-west of Queensland. All the stock make in this way in preference to going to Bourke, there being better water and better grass. There is not much feed in towards Bourke

Mr. W. A. MacVean.  
27 June, 1896.

*To Mr. Trickett:* I do not think that water would be taken by sheep farmers to flood their pasturage at a cost of 6d. or 1s. an acre. It is out of the question altogether to irrigate a sheep run. It would not pay to do it. I have never come across anyone who paid a rate of 12s. 6d. a ton for river carriage.

*To Mr. Lee:* The only irrigation I have done on the station has been for a garden. I have not had very much experience of irrigation. My remarks about its not paying to cultivate under irrigation in this district referred to the cultivation of fodder. I am not aware that £100 has been obtained as the proceeds of an acre of fruit grown under irrigation in America. I know that this climate is reputed to be a very good one for dry fruits, and fruit could be grown here under irrigation. Of course there is a vast difference between growing fruit and growing oats and wheat. I have only been eight or nine months in this district. I came here from Riverina.

*To the Chairman:* We did not store grass hay in Riverina for feeding sheep, and I do not think it would pay to do it here. The return you get for sheep will not allow you to do that sort of thing. I believe that people have done it; but it has not paid. There is less loss by risking the seasons than by attempting to provide against bad seasons.

35 Mr. James Mannix, homestead lessee, near Brewarrina, sworn, and examined:—

*To Mr. Hassall:* My homestead lease is situated on the Cato. It crosses the Cato near the junction of the Barwon. I have a frontage to both creeks. The lease is situated about 18 miles from Brewarrina. I have been in the district for about eighteen years. Before starting as a homestead lessee, I was engaged in dam-making and tank-sinking. I have a pretty good knowledge of the country, and I do not think that the proposed work will be beneficial to the district generally, because the cost is too great. It might be of some advantage to me personally; but it would be a loss to the country at large. There is a flood here nearly every four or five years, and then there are only a few odd patches which are not flooded. I know all the country down to Bourke; but I speak rather of the country up towards Walgett. The country from Brewarrina to Bourke is similar to that between here and Walgett, and just as likely to be flooded. The country about Brewarrina is mostly low lying, and covered with Coolabah. There may be a few red ridges. The clayey soil is too cold for things to grow well in it. I have grown potatoes. The tops grew well, but the potatoes themselves were very small. I and my partner have 7,000 or 8,000 sheep on two homestead leases. My partner is always doing contract work—dam-sinking, fencing, and so on—while I look after the sheep. There is just a living to be made out of a homestead lease; but that is all. I have to do most of the work myself, except at shearing times, and outside work is very useful for providing a little cash. In 1890, we put two cows on what we believed to be the highest part of our run, and left them there, but when we came back they were drowned. Only one little corner escaped, and it did not contain 30 acres. At that time I took my sheep about 40 miles out, on to a ridge. Another man in the district lost 7,000 sheep which he had left on our land. I do not think that people could go in for agriculture here. I would not do so, and I was brought up on a farm, near Wollongong. I do not think that the locking of the river will induce settlement, because there is not much land available for cultivation. There are odd patches of land, such as that which Mr. Wood has selected; but there is nothing very much. Mr. Wood's land is just about as good as anything between here and Bourke. One might do a little irrigating to make a small garden; but the market is not sufficiently large to consume any large quantity of produce. I would not irrigate land to raise produce for feeding stock in bad times. It would be cheaper to sell the sheep and get them out of the road. I do not think that there will be a large population settled on the river for the next fifty years. I only know one piece of good country between here and the Cato public house. It is on the banks of the river, and pretty high. I consider that a railway from here to Byrock would be more beneficial than the locking of the river, and would meet the requirements of the district better.

Mr. J. Mannix.  
27 June, 1896.

Mr. James Howe Saunders, storekeeper, Brewarrina, sworn, and examined:—

*To Mr. Trickett:* I am carrying on business in Brewarrina, and have been here for the last seven years. Before that I was engaged in mercantile pursuits in Sydney. I believe myself to be well acquainted with the district generally. I am in a large way of business, and get my goods from Sydney by railway to Bourke. When the river is up they come from Bourke by steamer, otherwise they come by road. We also get a large quantity of goods from Byrock when the river is not running. When the river is running, it is generally used to convey goods from Bourke to Brewarrina. The average rate then is £1 a ton for merchandise from Bourke to Brewarrina, and a similar charge for wool going back. Sometimes a small concession is made where there is a very large consignment. I have never known the rate to be as low as 12s. a ton. For team loading we pay in good seasons from 30s. to £2 a ton from Bourke, and from 25s.

Mr. J. H. Saunders.  
27 June, 1896.

Mr. J. H. Saunders.  
27 June, 1896.

25s. a ton from Byrock. A concession is sometimes made for large quantities. I believe that at the present time if I gave a man 20 tons to bring over, he would bring my goods for £1 a ton. That is as cheap as the river carriage, and I have never known the river rate to be less than £1 a ton. The roads now are in excellent travelling condition. With regard to insurance, wool is generally insured from the sheep's back without regard to the way in which it is carried. There is no insurance on goods coming by teams. This is the first season that the river has been closed for more than a couple of months at a time, during the seven years that I have been here. This year it has not been running since January. Sometimes when we are quite sure of a river which will bring our goods through without risk, we have things sent round from Adelaide or from Melbourne. For general merchandise that saves about one-third of what we should have to pay if we brought it by rail to Bourke and then by river. Certain special lines of goods are carried by rail at a lesser price than general merchandise. The river is largely availed of for getting goods as far up as Bourke. We have to order so long beforehand if we want goods up that way, that we do not bring our goods up the river so much. If the river were permanently navigable to Brewarrina, that means of transit would be likely to be availed of more. We could get our goods round from Sydney and right up the river; but, as a rule, we generally purchase in Melbourne or Adelaide, if we are bringing things up the river. If the river were made permanently navigable, it is inevitable that it would greatly assist the trade of Victoria unless charges were imposed with a view to keeping the traffic in our own Colony. With regard to the state of the road, I consider that we are never likely to have a delay of more than a week in getting goods from Bourke. On two occasions when rain has fallen the journey has taken three weeks instead of the usual one week. The road from here to Byrock is better than the Bourke Road. The first 28 miles from here to Gongolgon passes through black soil; but for the rest of the distance we have a perfect road over gravelly red soil. Goods come through that way in four days. For railway construction, the country between Byrock and the Bogan is almost as easy as it is possible to have. There would have to be a bridge at the Bogan, and then the line would pass over some 10 miles of low country, where the water lies occasionally to a depth of a few inches. Perhaps altogether there are 15 miles of low country, and then you get to the good country again. There is no current in flood time, when the water is lying on that country. I should think that an embankment 1 foot high, with openings to let the water away, would be sufficient for a railway line. I get about 700 tons inwards per annum. My business is chiefly inwards. I am not a carrying agent; but I can say generally that there is a very large amount of traffic between Brewarrina and Bourke. The greater part of our traffic at the present time goes by way of Bourke. If a railway were constructed from Brewarrina to Byrock, I should be very willing to pay a special rate between Byrock and Brewarrina equal to what I pay to have my goods taken to Bourke now. We pay £1 per ton now to get things taken to Bourke, and it would be worth our while to pay £1 per ton to the railway to get things taken to Byrock. In the absence of competition, the steamers charge £1 a ton for river carriage, and it would be much better to send by rail if we could do so for the same money. In sending direct by rail we should save so much handling. At the Bourke end we have to pay about 3s. 6d. a ton for the handling of the goods and their conveyance from the river to the railway station. It is a question whether the Bourke railway should not be extended to the river. If we had a railway to Byrock, it would be used in preference to the river, other things being equal, because we should save so much handling. Besides the actual cost of handling, there is always the risk of loss through breakages consequent upon rough treatment. It is very likely that the present river charges are higher than the charges would be if the river were permanently navigable. We are practically in the hands of one carrying company on the river, and that company has now pretty well a monopoly. Attempts were made to run other steamers; but, owing to the want of a large fleet of boats to do the work for the rival company, people preferred to continue to do business with the original company. I daresay wool comes in here from about 100 miles round under present circumstances, and Brewarrina would be a still larger centre, if the river were permanently navigable, or if we had a railway to Byrock. I favour the construction of the railway, in the first place, because less handling of goods would be required; in the second place, because there would be quicker despatch; and in the third place, because there would be a reduction in cost. Another reason why I should like to see a railway constructed is that it would enable us to move our stock in times of drought. The locking of the river will not facilitate the moving of live stock. This is, I believe, the principal stock route in the Western division. Since I have been here, there have been times when stock would have been removed if it had been possible, and the runs would thus have been relieved; but people could not drive their animals any great distance. The steamers continue to run on the river until they cannot pass a point about 7 miles from here. After that, we will not take the risk of sending goods by river. The damming of the river as far as Bourke might take the trade to the other colonies. Very often goods come as far as Bourke by steamer, but we cannot get them any further. I have had goods stopped at Bourke. If the proposed scheme were carried out, we should get more things up from the other colonies. If the river were permanently dammed as far as Wilcannia, it would be still easier to get things up from the other colonies. Navigation all the way up would then be almost a certainty. If the river were dammed all the way to Wentworth, heavy tolls would have to be imposed to keep the traffic from leaving the colony. The only way in which revenue can be received from the proposed works, is by charging tolls on the river, and they would have to be pretty heavy to pay interest on £120,000. People have gone in for irrigation in this district only to a very small extent, because there is no necessity for it, and it will not pay. The districts nearer the coast can supply us much more cheaply than we can supply ourselves. We get our flour from Dubbo, Wellington, and Milthorpe; butter comes from Mudgee and Sydney, and our forage comes principally from about Orange. The local Chinamen supply garden produce. There are three Chinese gardens here. The population of Brewarrina at the present time is about 450 or 500 persons, and the Chinamen's gardens give an ample supply of vegetables. If 15,000 acres were cultivated in this district, there would not be the slightest chance of a sufficiently large local market to consume the produce, and we could not compete with the producers of colder districts. On the Tarrion, Mr. Olsen has an irrigation farm, but he has been there only a very short time. He has sent in a little forage, which we are very glad to get. I do not think that the district is suited for agriculture at all. It is a pastoral district. Of course, with irrigation, small patches could be cultivated for local requirements, and the supply might create a larger demand. I daresay dried fruits could be produced here, but the cost of growing would be more than they would be worth. If there were sufficient demand for dried fruits, there is nothing to prevent people from producing dried fruits here now. The raising of the river level would

save them a little in the cost of pumping, but I do not see what other advantage it would give them. I do not think that the Government will obtain a large return from this work. People here are very glad to get artesian water where there is no natural water, but where they are near a river I have not heard them express any desire to see water conservation undertaken by the Government. I do not think they would be willing to pay from 6d. to 1s. an acre for irrigating their land. It does not pay them to cultivate for the sake of their sheep. They cultivate to get fodder for their horses. I am not prepared to say that the runs here are improved as much as they could be. They might be improved by ringbarking and fencing, and more water might be obtained by putting down bores away from the frontages. It would not be practicable to carry water to any great distance from the river by fluming. From my point of view it seems to me that in considering this scheme the question of irrigation may be dismissed altogether, as it really has no value. The only question is, should the river be locked with a view to improving it for navigation purposes. I think the Government will get very little return from the charges for water taken for irrigation purposes.

*To Mr. Wright:* The charge for carrying wool from the steamer to the train at Bourke is, I think, about 3s. 6d. a ton. That has to be added to the river freight, making it altogether about 23s. 6d. a ton. People would much sooner pay £1 a ton to be able to send wool direct by rail to Byrock. Although there has been competition on the river I have not known the rates to be reduced below £1 a ton, though I believe that private arrangements have been made to take loading at a little less. I cannot imagine it possible that if the river were made navigable the steamer rates to Bourke would be 5s. a ton. I believe that the people would be prepared to pay a special rate between here and Byrock, if the railway were made to Brewarrina. The Chinamen grow fruit as well as vegetables in their gardens, and there is another garden at Gongolgon. I do not know what its area is, but I should think 5 or 6 acres. I do not think that there is any possibility of this country growing cereals under irrigation.

*To Mr. Black:* Goods are sometimes sent from Brewarrina to Byrock now. We can send to Byrock by carrier for anything down to 25s. a ton, and if the river freight continued as high as it is now, we should be quite willing to pay 20s. a ton for goods going by rail to Byrock. Of course, if the carriers only charged 15s. a ton, and the railway freights were 20s. a ton, we should send by the carrier, or if the river were cheaper we should send by river; but a rate of 15s. a ton would ruin the carriers. I cannot say whether the earnings of a line between Byrock and Brewarrina would pay the cost of maintenance in twenty years.

*To the Chairman:* I do not favour the locking of the river between Walgett and Wentworth, though as a business man it would suit me better. I would favour the construction of a railway from Brewarrina to Byrock, and the locking of the river between Walgett and Brewarrina. Of course, if the river were locked all the way down, traffic could be prevented from leaving the Colony by the imposition of heavy tolls. We bring up our goods by what we find to be the cheapest route, the length of time occupied in transit, and the effect of frequent handling being considerations with us. We give a certain value to speediness of delivery and safety. I am inclined to think that boiling down operations would be facilitated here by the construction of a railway.

*To Mr. Wright:* If the railway rate from Brewarrina to Byrock were 15s. a ton the carriers could not compete. Taking everything into consideration, I do not believe that the river people would find it profitable to carry for a lower rate than that. I know pretty well the profits which are made on the river, and I believe that if the rates were reduced to 15s. a ton the steamer companies would be working only for wages.

Mr. Andrew David Kerrigan, Agent for Messrs. E. Rich & Company, Brewarrina, sworn, and examined:—

*To the Chairman:* I am a native of Brewarrina, and have been with Messrs. E. Rich & Company for fourteen years. I have a full knowledge of the traffic of the river. The present traffic between Bourke and Brewarrina is 10,000 tons—4,000 tons up stream, and about 6,000 tons down stream. The present rate for the carriage of wool is 25s. a ton delivered on the trucks, and including all charges except insurance. The insurance sometimes comes to 6s. per cent. That is the lowest rate that I know of. The rates for ordinary merchandise vary from £1 to 25s. a ton. For wool the Commissioners charge the same rate from Bourke as from Girilambone. If a railway were constructed to Brewarrina I think that a few more hundred tons of wool would come in from the north. The 10,000 tons to which I have just referred would go by train if the railway were here, and there would be a little more. Charging the present rates, the revenue derived from the carriage of that wool would be about £10,000 a year. I do not think that a steamer company could afford to carry anything between Brewarrina and Bourke for less than 10s. a ton, even if the river were locked. Wool and merchandise come in here from the north, north-west, and north-east. There are only about 300 tons of intermediate traffic between here and Bourke. I think that the present fleet of boats would be sufficient, even if the river were permanently navigable. During the last four or five years we have averaged between 27,000 and 30,000 bales of wool between Brewarrina and Bourke; that would be from 5,000 to 6,000 tons. Then there would be about 4,000 tons of merchandise.

Mr. Patrick Dowling McElligott, Brewarrina, sworn, and examined:—

*To Mr. Lee:* I have resided in the district for the last twenty-six years, and have travelled through it pretty well. Since I first came here the population has increased considerably. When I first came to Brewarrina there was scarcely a fence between here and the Gulf of Carpentaria. Produce going from the district was then sent up the Bogan River, through Warren, Dubbo, Orange, and so on. That was the route up to the time of the opening of the railway to Bourke. The traffic now goes chiefly to Bourke and to Byrock. I do not think that the locking of the river would greatly benefit pastoral industry here. Ever since I have been here there has been sufficient water in the river for the stock. Of course it would be a good thing to have the river permanently navigable between here and Bourke; but I do not see that it would be any great advantage either to the squatters or to the residents of Brewarrina. The pastoral men here are fairly well served at present, but in times of drought they have to pay high rates of carriage. They would best be assisted by a light line of railway from Byrock to Brewarrina. There has been a great deal of small settlement in the district since I came here, that is, if you call the occupation of homestead leases small settlement. I cannot say how many homestead lessees there are in the district now, but all the

Mr. P. D. McElligott.  
27 June, 1896.

the land thrown open has been taken up. There have not been many homestead leases abandoned. Homestead lessees may be considered small settlers in comparison with the large station owners who preceded them. There have been a few 640 acre men, but they have not got on very well. I am not totally opposed to the locking of the river, but I consider that the construction of a railway line would be more beneficial, both to the town and to the district. Personally I am not very much concerned about either. I think it is very unlikely that there will be much agricultural settlement and irrigation here. It would be a good thing if such occupation could be established, but I fail to see where agriculturalists would get a market. I myself have had no practical experience of farming or of irrigation, but it is my opinion that agriculture is out of the question so far as this country is concerned. A railway from Byrock to Brewarrina would open up the country lying between this town and Byrock, and it would bring in more traffic from the back country. I have always understood that settlement follows railway construction. Such a railway would make Brewarrina the depôt for all this district, and would enable the people here to get their produce to market more cheaply. The passenger traffic between Brewarrina and Byrock would be considerable, and would add considerably to the revenue. At the present time there are four coaches a week running to Byrock. Some years ago five or six gentlemen in the district offered to become guarantors for the cost of constructing a light line of railway from Byrock to Brewarrina with a fair percentage. At the time I was chairman of a railway league. I cannot say whether those gentlemen are prepared to make the offer again now, but I believe that such a line would pay. I have not gone into the figures.

Mr. Walter Charles Colless, hotelkeeper and homestead lessee, Brewarrina, sworn, and examined:—

Mr. W. C. Colless.  
27 June, 1896.

*To Mr. Wright:* I have been about thirty years in the district. I do not think the proposed locking of the river would be of any advantage to the district, or would induce settlement here. If people wished to irrigate, there is already sufficient water in the river. I do not think that any pastoralist would be willing to pay for taking water out of the river to swamp his paddocks with. It does not seem to me that small settlement such as they have at Pera Bore is likely to increase much in this district. I do not think that agricultural producers here could compete with people in other parts of the district where the seasons are regular. In my opinion the soil is not suitable for irrigation, nor do I think you could find 100 acres which in flood time would not be covered with water. I do not think that Mr. Woods' irrigation has been financially successful. The Government would not sell much water at 5s. per acre per annum. If people wanted to irrigate, they could get the water now for nothing. The country north of Brewarrina is very good grazing country, in fact Brewarrina is the natural depôt for a very rich district extending a good distance west. In my opinion a railway would be more beneficial to the district than the locking of the river. It would increase the export of stock and of wool, while Brewarrina is naturally a better depôt than Bourke. If a railway were constructed to Brewarrina, I believe the people here would be willing to pay a special rate of 15s. a ton, though I think the steamers could compete against that rate, if the river were navigable. Still they do not carry stuff at that price now. The teamsters could not compete at 15s. a ton. The country between here and Walgett is similar to that between here and Bourke, and I do not think that the nature of the settlement here is likely to alter much. From here to Gongolgon is black soil country. Beyond Gongolgon you get into stony red soil country. In my opinion Brewarrina is progressing. The district is being cut up into smaller holdings, and the number of homestead lessees has increased. Land has been taken up here under the Act of 1895, but principally by the townspeople. The construction of a railway would bring more traffic from Queensland in stock and wool, and would increase population. In my opinion the people here could, in good seasons, cut and store sufficient natural grass to feed their working stock in bad times, without irrigating at all. This year I cut and stacked as much hay as I thought would satisfy me, and stations near to where I am cut about 40 tons. My brother cut about 30 tons of hay, and he could have cut 100 tons if he had wished. At Bundabulla they do not irrigate; they do at Boorooma. I think that a man without irrigation would get a crop about three times out of five. The country is now used principally for grazing. No one has tried anything else on a large scale, though the stations grow a little produce for their own use. A man named Plowman grew a crop for a year or two. It would not pay people here to irrigate, because they could not compete with the producers in other places. There is some land vacant to the west of the Culgoa, but it is very poor country. The country east and north to the Queensland border is very good and is pretty well all taken up. I do not think that the locking of the river would greatly increase the traffic; but a railway would no doubt attract Queensland traffic. Stock which now goes to Nyngan and Nevertire would, in bad seasons, come here to be trucked, if there were a railway to Brewarrina. Such a line would take all the traffic from the country this side of the border. I do not know how it would affect the Queensland traffic. If there had been any prospect of making money from agriculture, I would have tried it; but the inducement has not been sufficient. My people were among the first to take up land in this district. My father came out here about thirty-seven years ago.

Mr. Andrew Loder, stock and station agent, Brewarrina, sworn, and examined:—

Mr. A. Loder.  
27 June, 1896.

*To Mr. Black:* I have resided in Brewarrina for twelve months, and have been in the district pretty well all my life. I was born just above Walgett, but I was out of the district for twelve years, away at school. If a railway were constructed to Brewarrina traffic would be drawn here from about 150 miles N.E. and N.W. I do not think that Mr. Kerrigan's estimate of the intermediate traffic between here and Bourke—300 tons—is too low. There are only two stations and a few homestead leases there. If the railway were brought to Brewarrina a great many cattle would be trucked here in bad seasons, though in good seasons they might travel further along the line. The best stock route is towards Nyngan or Nevertire. In bad times stock has to travel from here to Byrock without anything to eat, unless scrub is cut up for them, and they must be pretty good when they start to stand the wasting. A few sheep are sent from here to the Bourke chilling works. I am not aware that any attempt has been made to send sheep by steamer. I do not think that agriculture is likely to flourish in the district for the present. I know that at one station on the river they grow lucerne, and it costs about £15 a ton, whereas they could buy as much as they liked landed here for about £5 a ton. The land in this district is pretty well all leased land, but I do not think the squatters have been afraid to cultivate it for fear that there might be

be an influx of agriculturists. I never heard such an idea spoken of. The pastoralists have not under-  
 taken agriculture because they would have no use for any produce they might grow, except perhaps for  
 a few working horses. Some of them have had to irrigate paddocks for their stud stock. I do not think  
 it would pay to grow crops to feed a large number of sheep in times of drought. It would pay better to  
 5 get rid of the sheep at half-price. Large sums of money have been spent in cutting down the mulga for  
 the sheep. It has cost some of the very large stations below Bourke about £100 a week to cut scrub,  
 and then the stock have died from eating it. £1,000 spent on growing feed for sheep would perhaps  
 save £500 worth of sheep. I think that people nowadays know that their sheep are not much better  
 than those of their neighbours. Of course they keep a few valuable sheep for stud purposes. It might  
 10 be advisable sometimes to preserve a certain strain, but only if it could be done at a reasonable cost.  
 Before spending money on growing artificial feed you would have to consider whether it would not be  
 cheaper to lose all your sheep and replace them with others after the drought.

Mr. A. Loder.  
 27 June, 1896.

MONDAY, 29 JUNE, 1896.

[The Sectional Committee met at the Court-house, Brewarrina, at 10 a.m.]

15

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (CHAIRMAN).

The Hon. WILLIAM JOSEPH TRICKETT.  
 CHARLES ALFRED LEE, Esq.

THOMAS HENRY HASSALL, Esq.  
 GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

20

The Sectional Committee further considered the proposed Construction of Locks and Weirs on the  
 River Darling.

Mr. Richard James Kelly, chemist and druggist, Brewarrina, sworn, and examined:—

To the Chairman: I have resided twenty-nine years in Brewarrina and four years in Bourke. Altogether  
 I have been here thirty-three years.

25

To Mr. Hassall: I have not had any experience of irrigation or of cultivation. I have an intimate know-  
 ledge of the country between here and Bourke. It is chiefly black soil country. Now and then there are  
 patches of red soil. The soil on the north bank is similar to that on the south bank of the river. I  
 consider it all low-lying flooded country. It would be impossible during floods like those of 1864 or  
 1890 to proceed to Bourke by the surveyed road. You would have to go round by Byrock. The only  
 30 cultivation in the district that I know of, besides the Chinese gardens, is that of Mr. Woods, who suffered  
 to a small extent by the flood. The Chinamen here raise a very fair quantity of fruit; but in the flood  
 of 1890 the whole of their garden was destroyed. The owner claimed £600 or £700 from the Govern-  
 ment because he said that their attempts to save the bridge brought the flood-water on to the garden.  
 A very large number of trees were destroyed by the flood, and part of the land was afterwards abandoned  
 35 altogether. The people in charge of the garden made a bank all round it to keep the flood-water out;  
 but the water rose over the bank. I saw the garden directly after the flood, and it seemed a perfect  
 wreck, while the man in charge told me that he had lost over £100 by the flood. I do not think there is  
 likely to be much irrigation or cultivation done on the banks of the Darling, because the land lies too low,  
 and the settlers would be liable to severe losses. Then, too, I think that produce could be supplied from  
 40 outside markets much more cheaply than we could grow it here. They can get oranges here for 6d. and  
 8d. a dozen; but the Chinamen charge 1s. 6d. and 2s. a dozen for those they grow. They tell me they  
 have to charge this price because of the enormous cost involved in keeping the garden going. I have  
 bought produce from Maitland more cheaply than it could be grown here. Labour is dear here, and, as  
 a rule, the seasons are very bad. I took up a selection some years ago, and I am satisfied that it would  
 45 not pay. I made an attempt at cultivation in a small way, but I found that I could buy things more  
 cheaply than I could grow them, taking everything into consideration. I do not think there would be a  
 sufficient market in the district for very much produce. The demand for forage is limited. It is only  
 now and again that any forage is required. The horses here are turned out as a rule. There are 20  
 or 30 turned out for one that is fed. When we want hay and chaff we can import it more cheaply than  
 50 we can grow it. When there is a very bad drought the working horses have to be fed. All the other  
 horses are sent somewhere where there is grass, but in the majority of cases they die. I do not think  
 that the raising of the river level 10 ft. would offer any inducement to settlement. There may be  
 occasional pieces of good land between here and Bourke, but I think that in the flood of 1890 even they  
 were covered. Of course the locking of the river would give cheaper carriage than that you can get by  
 55 teams. During the greater part of the time that I have been here the river has been much in the state  
 in which it is at present. There have been years when the river has been navigable for practically the  
 whole 12 months. That has been notably the case of late years. Of course a navigable river is an  
 advantage to Brewarrina people, because the carriage by steamer is a shade cheaper than carriage by the  
 teamsters. There may be a difference of 5s. or 10s. a ton. Then, too, goods sent by steamer get here  
 60 two days sooner than goods sent by road. I do not think the residents would like to have the betterment  
 principle applied to their property, because I do not believe that the scheme would increase the value of  
 land to the extent estimated by the Government officers. A permanently navigable river would be a  
 slight advantage to people living on the river; but many of those who live on the river have told me that  
 they do not want to see this work carried out. The manager of Boorooma Station told me that he would  
 65 not use the river. I think that the locking of the river would be a complete failure, and a waste of public  
 money. I made a personal protest to the Minister for Mines when the Bourke weir was commenced. It  
 is a fact that a firm having its headquarters in Bourke practically controls the river traffic; but it would  
 be an advantage to the business people of Bourke to be able to get their goods brought up by river,  
 because they would get them more quickly by steamer than by dray, and in very wet weather teamsters  
 70 cannot travel. No doubt, with the locking of the river, the trade of this district would be pretty well  
 controlled by one firm. It is pretty well controlled by that firm now. In my opinion it would be a  
 monstrous absurdity to spend £120,000 in locking the Darling. I believe that the construction of a  
 railway to Brewarrina would benefit the country more. There are hundreds of people in favour of a  
 railway line to every two or three in favour of the locking of the river. A good deal of traffic comes in  
 here

Mr.  
 R. J. Kelly.  
 29 June, 1896.

Mr.  
R. J. Kelly.  
29 June, 1896.

here from the country lying to the north; that is cattle, sheep, and wool. The people living out in that direction have told me that they are not in favour of the locking of the river, so that I imagine they would not derive much advantage from it. I think that the construction of a railway would bring more traffic to Brewarrina. With a railway we would get a very large revenue from the traffic coming from stations on the Queensland border. Wool comes to Brewarrina from distances of 100 and even 120 5 miles. If the steamers are running, it goes on by river to Bourke, but if there was a railway to Brewarrina it would be trucked here. The pastoralists do not care to pay for insuring their wool on the steamers, and they do not like the double handling. I am certain that people would not object to pay the extra rate of 15s. a ton from Brewarrina to Byrock. The average amount of wool passing through Brewarrina is 30,000 or 35,000 bales, representing 5000 tons, while the inward traffic amounts to 6,500 10 tons. The number of stock in the Brewarrina district, according to the Stock Inspector's return for 1895, is 1,371,470 sheep, 16,164 cattle, and 4,765 horses. The postal returns, including telegrams, stamps, and money orders came to £9,998. The land revenue derived from Brewarrina district is £28,318 per annum, which the Crown receives from 37,000 pastoral leases containing a total area of 2,588,401 acres. From 17 occupation licenses, embracing an area of 418,520 acres, the Crown receives 15 annually £2,556; from 153 homestead leases, containing 1,405,669 acres, the Crown receives a revenue of £15,000 a year. There are 90 conditional leases, containing 145,402 acres, from which the Crown claims an annual rental of £1,784. The total revenue of the Lands Office last year amounted to £48,000. I think that the Government ought either to make a road between here and Byrock, or make a railway. If a railway were decided upon, very little land would have to be resumed, because at present it is nearly 20 all Crown land.

Mr. William Coleman, caretaker of the bridge at Brewarrina, sworn, and examined:—

Mr.  
W. Coleman.  
29 June, 1896.

*To Mr. Trickett*: I have been caretaker of the bridge for five years, and I have been in the district for twenty years. During the heavy flood of 1890 I was working on the Billabong Bridge. I do not keep a record of the readings of the river gauge. We did not get a good river until 1890. Before that there 25 was about two years' drought and one year's flood. From 1886 to 1893 we only lost one season. A little wool went down last year, and a little went down the year before; but this year none has gone down. The last steamer went down about three months ago. Two came up during a short flood. I have noticed that the river as a rule washes away on the northern side and makes up on the southern side. The deck of the bridge is 50 feet above the bed of the river. The highest flood I have seen came to within 4 ft. 4 in. 30 of the deck of the bridge. In 1890, the flood-water was 3 inches deep on the platforms. I have only raised the drawbridge once during the last twelve months; but in the wool season, if the river is navigable, it has to be raised frequently. In good seasons wool comes down from Coliarondabri and Mogul Mogil sometimes. The river is generally navigable between Collawaroy and Brewarrina; but I have seen steamers stuck for a couple of days on the Brewarrina rocks through being in too great a hurry to cross. 35 The erection of a weir at Brewarrina would not make the river navigable to Walgett, unless it considerably raised the height of the water at Collawaroy Rocks. At the present time steamers could not get across those rocks. There is not much timber coming down the river at flood-time. If I am away for a day or two during a flood, I may have a little difficulty with the timber for about half-an-hour; but generally there is no difficulty in keeping floating timber away from the bridge. The current is very slight. In my 40 opinion if any obstruction were placed in this stream the river would silt up a great deal. There are places in the main channel—for instance, below the woolshed—where it silts up in flood-time; but directly the water drops again the silt is washed out.

*To the Chairman*: I have not noticed any great changes in the river channel since I have been here. I have only seen the gradual change that I have mentioned. 45

*To Mr. Wright*: I cannot say if that change is going on for the whole length of the river. I can only speak of the river about the bridge. That is the only place where I have taken notice of it.

Mr. Thomas MacMahon, storekeeper, Brewarrina, sworn, and examined:—

Mr. T.  
MacMahon.  
29 June, 1896.

*To Mr. Lee*: I have resided twenty-one years in Brewarrina, and I was in Gongolgon for a couple of years. I hardly think that the proposed scheme if carried out would be a payable affair. In most parts 50 of the river there is always sufficient water for irrigation purposes, even at times like the present; and, if the scheme were carried out, pumping appliances would be necessary to raise the water from the river to a height from which it could be distributed over the adjacent lands. I hardly think that the results which might be obtained from the scheme would be commensurate with its cost. If land were thrown open for settlement within 3 or 4 miles of each side of the river, people might be induced to come here; 55 but the settlement would be only patchy. I do not think that 15,000 acres would be settled, nor, in my opinion, would the squatters make use of water. At Quantambone, and along the Cato, where there is sufficient water for irrigation purposes, nothing of the kind has been attempted. If irrigation were carried on in any large scale, the local demand would not be sufficient to absorb whatever produce was raised. In dry seasons there is a good demand for produce. I do not think that the western country is 60 capable of carrying small settlement. The population here is not sufficiently large to allow of irrigation to any great extent. If people could send their produce to market from this district, they would settle here. Of course, people could grow produce here, that is horse feed and fruits. The climate is suited for fruit drying, and, no doubt, that industry could be entered upon. If the Government laid out small settlements, such as that at Pera Bore, no doubt people might be induced to come here; but they must 65 have funds to go into a thing like that. I think that the western country is purely a pastoral country, though I do not say that it will always continue to be thinly populated. No doubt in time the country will be cut up into small areas. The land is undoubtedly good. I do not think that the district would get much benefit from the locking of the river, because at the present time we are getting carriage from Byrock by team cheaper than we could get it by steamer from Bourke. A railway would undoubtedly be 70 very much better for Brewarrina than an improved river. I think that such a line would materially increase the traffic from the back country. No doubt a railway would do more for the settlement of this district than the locking of the river. In answer to the objection that there is no small settlement along the Bourke line, I would say that our country is better for small settlers. At Bourke, if they want irrigation, they have every advantage now, because they near a railway. 75

Richard

Richard Randolph Machattie, Esq., grazier, Brewarrina, sworn, and examined:—

*To the Chairman:* I at one time represented this district in the Legislative Assembly. It was then included in the Bourke electorate.

R. R.  
Machattie,  
Esq.

29 June, 1896.

*To Mr. Wright:* There is no doubt that the proposed scheme would make the river navigable; but I do not see that it would confer any decided advantage upon the district. I do not know that carriage to Bourke by river is cheaper than carriage by road to Byrock. I have paid, when the river was full and there was competition, no less than 25s. a ton for carriage to Bourke by steamer. I believe that on one occasion I had stuff carried for £1 a ton; but the general rate is 25s. a ton: that is, for goods up and down, even when there is competition. To send wool costs, I think, 30s. a ton, and you could send it to Byrock for about the same price. I have had wool taken to Byrock by team when there was no river for less money than I have had it taken by steamer to Bourke when there was a full river and competition. At present the river is navigable for 17 miles above Brewarrina. There is plenty of water as far as the Collawaroy Rocks. Under normal conditions river navigation is always interfered with here by a rocky bar known as the Fisheries, though I cannot see that it would be much advantage to the district if that bar were removed. It would be of no advantage to me personally. With regard to the irrigation aspect of the proposed scheme, I do not think that there will be any irrigation, except in the very distant future. I do not see that there is any possibility of the Government getting people to pay license fees of 5s. and 1s. an acre for the privilege of taking water from the river. I do not think the land is suitable for cultivation. Of course there are small patches here and there having a sandy formation which would be suitable for growing crops; but I do not know that areas of 100 acres or even 50 acres could be got. No matter how much water you pump on to the land, I do not think you could make a certainty of cultivation by irrigation. I have a good personal knowledge of this district. I was first in charge and second in charge of the survey during 1863, 1864, 1865, and part of 1866. North Bourke is the first red sandy point on the river that I know of. Then there is similar land at Brewarrina; but I do not know of any other land of the kind on the river. There is a very high point near Beemery station; but I cannot speak as to the character of the soil there. The bulk of the soil in the district is cretaceous clay, and it would require engines of incredible power to fill up the enormous caverns and cracks which occur in summer time. The Chinese garden here is composed of made ground. It was fairly low; but, having a dam around it, an enormous quantity of sand was floated into it, and stayed there. I have a small irrigated garden at my own house. I do not think that many people would be willing to come into the district to take up 20 or 30-acre farms. Mr. Olsen has a small irrigation plant on Willis' property, on the Tarrion; but I know that within the last month he has been unable to sell the produce grown there. Three years ago I got a splendid crop of hay under natural conditions, and I thought I would do fairly well with it; but I found that they could send up chaff from Orange and other places down the line for £2 a ton less than I could grow it here. The seed was very expensive, and it is difficult to get ploughmen here, and altogether the expense attached to a small experiment of that kind is very great. Down the country they grow hay for next to nothing. Down there I could get a man to do everything for from 10s. to 12s. a week. One would think that a local man could compete with producers who are handicapped by long train carriage, but that is not so. Besides, the market here is very small. This is not a very good season about Brewarrina, and numbers of us have been out looking for country. Five miles up the Narran, and for miles up the Barwon, there is not a blade of grass; but the Bourke people say that it is the most wonderful season they have had. Over there they have had 7 inches of rain as against our 1.50 or 1.70 inches. I would rather see a railway constructed to Brewarrina than the proposed locking of the Darling. As matters have stood of late years every pastoralist has been compelled to stock his country as fully as possible. The price of stock has fallen so much that one could not exist and maintain a family otherwise. When bad times come the stock is lost, but if there were a railway at Brewarrina the pastoralists and homestead lessees—and this is one of the best selected districts that we have—would stock with more confidence, knowing that they could at any time send away 1,000 sheep if they wanted to do so. It is an exceptionally good homestead lease that will carry 3,000 sheep, and at present, if we are overstocked, we have no chance of getting our sheep away. Stock could not be sent from here by the steamers. A railway would be of advantage to the country to the north and to the Queensland country almost as far as Cubby. This is the natural stock route from Queensland. I believe that if we had a railway prime mobs of 100, 200, and 300 head of cattle which now go to Bourke would come here. The stock route in Queensland is from tank to tank, over very indifferent country. From Queensland here the route is from creek to creek. When they come to Brewarrina they can follow the Barwon to the Marra, and the Marra to the Bogan. A great deal of stock go down to Warren, but a railway here would, I think, divert that traffic. I do not think that this country is likely to be taken up for agricultural purposes, either in my time or in that of my children. I can distinctly say from experience that this climate is not suitable for stone fruit. The excessive heat is too much for the trees, no matter how much water you put on to their roots. If you spray water on to the trees, they will blister and die at once. We have exceptionally hot winds during January, February, and even as early as November, and the fruit then shrivels to nothing. Then, too, the white ant attacks the apricot and the peach trees. A tree will apparently be in beautiful health and about to bear, but next day it will be down, and if you examine it you will see that the ants have got under the bark. In a small garden we lost thirteen or fourteen stone-fruit trees last year. The plums did not suffer so much, but apricots and peaches are not worth growing, even for your own use. You can grow anything belonging to the citrus tribe here, but you cannot grow apples. The vine will grow if saturated with water, but then the grape has no flavour. I speak from my own experience. I think that there is no possibility of 400 or 500 agriculturists settling on the banks of the Darling. If they did settle here they would have no market for their produce.

*To Mr. Lee:* I am of opinion that the country west of the Darling is not suitable and never will be suitable for irrigation. The formation of the soil and the excessive heat will destroy all chance of successful cultivation. I know nothing about the crops grown in foreign countries; I speak as to the cereals and fruits I know in Australia. I have given great attention to these matters for years past. I was here first in 1857, though I did not come here permanently until 1862. I was at the Fisheries, Brewarrina, on the first Sunday after the 13th April, 1857. I rode up then from the junction of the dry Bogan. We surveyed the country below there for 400 miles. We surveyed the New South Wales Illara,

R. R.  
Machattie,  
Esq.  
29 June, 1896.

Illara, Paroo, Cuttaburra, and Warrego, and defined the Queensland boundary on those rivers. In my opinion, if you dammed the cowals you would render this country more expensive to work than it is now, that is, if it continued to be used for pastoral purposes. Instead of being able to look after your boundaries by riding about on a horse, you would have to go about in boats, and you would require punts to shift your sheep. As far as the Barwon is concerned, it is a mistake to believe that the flooding of the billabongs produces grass. The flood-water leaves *debris* all over the country, and there are large areas which have not yet recovered from the flood of 1890, and perhaps never will. For years past I have not altered my opinion about this country. I have never left it for eleven years, but I have not seen anything to alter my belief that we require light lines of railway to provide access and egress. What earthly good would irrigation have been during the heat wave which we had last summer. 5

*To Mr. Trickett:* There has been no great reduction in freight when the river has been continuously navigable. When the river is full the teamsters do not compete; in fact, they cannot. I do not think it is likely that we would have goods carried for 7s. 6s. a ton if the river were made permanently navigable, because when Rich & Company and Wright, Heaton, & Company both had steamers on the river, and steamers were coming here from Adelaide, there was no reduction, although the river was running for four 15 years. The only way in which the Government could get a return for the proposed expenditure would be by running steamers themselves or by charging tolls. If the railway were brought to Brewarrina, I should be willing to pay an extra rate on goods carried to Byrock, because of the advantage which such communication with the metropolis would give me. Such a line would be availed of for stock as well as for wool. Then, if there were a flood, or if the season were bad, we could always get away. 20

*To Mr. Black:* Stone fruits ripen here somewhere in November—October and November. We have hot winds from November, that is, excessively hot winds; but we have hot winds from the end of September. *To Mr. Wright:* If the railway were taken to Brewarrina, I would be willing to pay an extra rate of 15s. a ton on goods carried to Byrock.

Mr. Charles Crane, storeman, Messrs. E. Rich & Company, Brewarrina, sworn, and examined:— 25

Mr. C. Crane, *To Mr. Trickett:* Up to the end of last October, I kept a register of the readings on the river gauge, but I gave up doing so, because £5 a year was deducted from my salary. I supplied the figures to the Department from year to year. Those are the figures appearing in the official report. They are correct. 29 June, 1896.

THURSDAY, 2 JULY, 1896.

[The Sectional Committee met at the Council Chambers, Bourke, at 10 a.m.] 30

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (CHAIRMAN).	
THE HON. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
CHARLES ALFRED LEE, Esq.	GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.	

35

The Sectional Committee further considered the proposed Construction of Locks and Weirs on the River Darling.

Mr. John Smith Jefferson, Manager, Government Farm, Pera Bore, sworn, and examined:—

Mr. J. S.  
Jefferson.  
2 July, 1896.

*To the Chairman:* Besides being manager of the Government farm, I have charge of the distribution of water to the settlers near the bore, and of the public watering-place there. I have occupied my present 40 position since 1st February.

*To Mr. Black:* I have had experience of irrigation in California. I was connected with irrigation work there for about seven years. Irrigation there is chiefly done by gravitation; I have had experience of irrigation from artesian supplies, and of irrigation with river water. My experience of irrigating from artesian supplies in America was, that no deleterious effects followed the use of that water, and the results 45 were very satisfactory. I have known artesian water to be used for irrigation for six or seven years continuously. In the generalty of cases no bad effects follow, but, of course, everything depends upon the character of the water used. In America when water is much charged with alkali, they think it necessary to drain the ground. The amount of drainage necessary depends mostly upon the nature of the subsoil. There might be deleterious matter in the subsoil which would be brought to the surface by evaporation if the 50 surplus water was not drained off. I never heard of any attempt being made to scrape the alkali deposit from the surface of the ground. Such a process would be very expensive. So far as my knowledge of the Californian soil goes, it is not superior to the soil in this neighbourhood. The irrigation settlements in California are generally very prosperous. They have railway communication with their market, and also water-carriage. The Fresno settlement, where I was, has been very successful. It is 150 miles from San 55 Francisco, and its main output goes there. There is also a local market. Since I left California, I have heard that direct communication to the coast has been opened up. A local market is found for nearly all lucerne grown in the settlement at Fresno. I believe that they charge 1½ dollar per 100 lb. for conveying dried fruits to San Francisco. After my American experience, I am of opinion that this locality is undoubtedly suitably for irrigation. The red loam soil is preferable to the cretaceous clay. My knowledge 60 of the district is limited, but I understand that on the banks of the Darling there is quite a large area of red soil. I should not call the Pera soil volcanic. It is a red loam, and varies from a sandy loam to a clayey loam. I believe that, as a rule, the red soil is higher than the cretaceous black soil, and less likely to be flooded. Floods, in my opinion, do more harm than good. The good effects derived from a flood are overcome by the disaster with which it is attended. I have heard about the failure of the Mildura settlement; but 65 I have not been there. The statement that one of the causes of failure was excessive downward filtration, or seepage, is probably correct. I could believe that only 50 per cent. of the water pumped from the river reached

Mr. J. S.  
Jefferson.  
2 July, 1896.

reached the point of distribution. I understand that at Mildura the main channels were attacked by crawfish, and this caused a leakage. The downward filtration at Pera would be very slight indeed. I made a drain there round a block 6 ft. square, and kept it filled with water for twenty-four hours, and at the end of that time the water had not reached the middle of the block. There were a couple of feet in the middle of the block perfectly dry, the lateral seepage having been only 2 ft. The amount of loss from a ditch would depend largely upon the way in which that ditch was constructed. A newly-made ditch will allow the water to seep away freely, whereas a ditch that has been in use for six or eight months, especially if it has been puddled and graded, will not allow half as much to escape. The seepage at Pera will be very slight. With properly-constructed ditches it will be immaterial. I do not think it will equal 25 per cent.

10 If the Committee desire me to do so, I can make some experiments to ascertain the downward filtration in the red soil at Pera and in the cretaceous clay in the neighbourhood, and I will embody the results in a statement, and send it to the Committee in Sydney. I could not give you the exact figures as to the cost of irrigation by gravitation per acre per annum in California. The men who sell the land there usually sell a water-right with it. They do not charge for the water at so much per acre. Some of the

15 larger corporations sell the land with a perpetual water-right attached. In other places the companies charge for the water, and I believe that the average price is £1 per acre. I could not tell you off-hand what it costs per acre per annum to irrigate with artesian water in California. It is more expensive than irrigation by gravitation. At a place of which I had charge, we did not keep an account of the expense of irrigating from a well 200 feet deep, but I know how many acres per day we irrigated, and how many men

20 were required for the irrigation work. It was not a flowing well, but the water came to within 25 feet of the surface. We pumped sufficient water to irrigate about four acres of trees per day. Three men were entrusted with the work; one managed the engine and pump, and two managed the water. These men earned a dollar per day each and their board. The ground irrigated was much more uneven than that at Pera. There were low places 8 feet in depth, round which we had to carry the water in furrows. I

25 might add that on that place, with a rainfall of eight inches and two irrigations, the apricot trees grew 7 feet in one season. The orchard to which I refer was planted about six years ago, it had not come to bearing when I left the district. I do not think the ordinary settler, who attempted to work alone and unaided, would be able to bear the expense of pumping. I think it would be a profitable investment for a number of people to settle on the banks of the river and to work a pump for the common use. I do

30 not think the raising of the river level 8 feet by means of weirs would make much difference in the cost of pumping from the Darling; I am not well acquainted with the river banks. I cannot give the cost of raising water per foot, though I will try to supply it. An engineer would be likely to give you that information. The water we have at Pera contains a considerable percentage of carbonate of soda, which is injurious to all plant growth; and then, too, there is very little humus in the Pera water. River water,

35 where you can get it, is also preferable to artesian water, because its fertilising properties are greater. I do not think it will be necessary to drain at Pera for years to come. The drainage in connection with the bores will depend largely upon the quality of the artesian water and on the quality of the soil. The subsoil at Pera is nearly all lime. I cannot say whether that is likely to improve the water. The soil at Pera has a tendency to cake after water has been put upon it; but a similar effect follows a fall of rain.

40 I have a slight acquaintance with the red soil at North Bourke. I should judge, from a casual observation, that it is superior to the Pera soil. I have not been far back from the road, and could not say positively whether the contour of the ground is suitable for irrigation channels; so far as I know, it is. That country is very close to the river. I have not made any examination of the cretaceous clay soil in this neighbourhood; but I believe it would be suitable for certain crops. It would grow lucerne and

45 certain kinds of fruit profitably. Of course, if the subsoil were too stiff to allow the roots to go down, lucerne would suffer in times of drought. I know nothing as to the depth of this soil. In California fixed weirs are used for damming the water channels. The soil there is principally sedimentary, and in many places is similar to that on the banks of the Darling. The watercourses are dammed near their source, and to the irrigating canals where the banks are high, so as to give sufficient fall. We do not dam the rivers

50 where they are running through flat country. If we did they would probably cut out fresh channels for themselves. Where the banks are liable to flood, I think that it would be advantageous to adopt weirs which could be opened to give egress to flood-water. The cost of irrigating at Pera depends largely upon the crop that is being grown. Irrigation for vegetables is very expensive. We have grown no vegetables except for our own use. The cost of irrigating four acres for a fruit crop would be 15s. for the making

55 of temporary furrows, and the wages of two men for one day, that is 14s., for distributing the water; a total cost of 29s. for watering four acres once. It is only necessary to irrigate a fruit crop four times, or possibly five times, a year. The total cost of irrigating such a crop would be £7 5s. a year for four acres. I think that is decidedly inexpensive. I think fruit grown here would be able to compete successfully with fruit grown in other places under natural conditions. The fact that fruit here would mature

60 earlier than in other places enters partly into my reason for making that statement, but only to a very small extent. I think that competition would be possible without taking early maturity into consideration. I could not now say what it costs at Pera to irrigate for fodder crops. It would take a man with a dray a whole day to bring produce into Bourke and return, but if the roads were bad it might take him twice as long. For that reason a settlement at North Bourke would be much more favourably situated.

65 To Mr. Hassall: My experience in California leads me to believe that irrigation can be profitably undertaken in New South Wales for the production of fruit, lucerne, and other produce. I do not hold the opinion that it would be necessary to confine the production to articles that could be easily carried, such as peas. I think that sufficient fruit could be grown at Pera under irrigation to justify the erection of a small cannery after a few years. The production at Pera will, of course, cheapen the local

70 supply. I think there is room for a number of irrigation settlements in this district. The advantages they have in California are no greater than we have here. The climate, however, is more certain. One of the most paying industries that could be started in connection with irrigation here would be fruit culture and fruit preserving; not so much canning as drying. The future of the fruit industry in New South Wales to-day is much brighter than it is in California. Dealers in dried fruits in Sydney—such as

75 Horderm and others—told me that they were paying about 8d. per pound for imported Californian fruit. We can grow fruit profitably at from 5d. to 6d. per pound. In four years' time I understand the duty will be taken off fruit, making the wholesale price in Sydney 6d. per pound, and this will leave us a good margin of profit. Peaches, apricots, and prunes could be grown very well here. The difference in weight between

Mr. J. S.  
Jefferson.  
2 July, 1896.

between fresh fruit and dried fruit varies. Six or 7 pounds of fresh peaches make 1 pound of dried peaches;  $2\frac{1}{2}$  pounds of fresh French prunes make 1 pound of dried prunes; 5 pounds of fresh apricots make 1 pound of dried apricots. Nine-tenths of the fruit produced in California is dried. The amount of fresh fruit sent to San Francisco is a mere bagatelle compared with the quantity of dried fruit which is sent there. The black soil of this district would be suitable for certain kinds of fruit, but the red soil is more generally suitable. If the State were to go in for irrigation on a large scale I think it would be best to get the water from the river. I do not think there will be 100 miles of land irrigated to every mile of river frontage in this district. 5

*To Mr. Trickett:* For fruit-growing and for fruit-drying the conditions which prevail here are much better than those which prevail in any other part of the Colony, so far as my knowledge of the Colony goes. We have a longer and drier summer than they have elsewhere. With a dry, hot climate, the finest quality of fruit is produced, and such a climate is necessary for fruit-drying. Then, too, we are six weeks earlier than the Sydney market, and later varieties mature better. Of lucerne, I believe we can grow two more crops in a year than could be grown in most parts of New South Wales. Then, too, the dairying industry could be started here. One of the finest dairies in California is situated near Bakersfield, Kern county, one of the hottest parts of California. I have not spent a complete summer in Bourke. I have talked to one or two of the growers here, and I believe that the failure of the trees during hot weather is due more to want of water and proper management than to anything else. I have visited Mackenzie's garden, and I have seen the stone fruits there. They are not looking well. I am aware that such trees are very subject to the ravages of the white ant, but I believe that the same difficulty is experienced in other parts of New South Wales. I believe that stone fruits will be found most profitable here, notwithstanding the experience of the past. In irrigating an orchard we form a basin round each tree, and fill it with water. Such crops as lucerne are flooded. A settler at Pera pays 5s. per acre per annum for his land and the water supplied to him, but I could not say what it costs the Government to supply that water. I have not seen the same terms given in America. Most of the irrigation schemes in America are by gravitation which would point to the fact that it is a more inexpensive way of supplying water. There is a great number of people at each place. Things are done on a much larger scale than at Pera. The water rights in California are not generally held by the farmers themselves on a mutual benefit principle. A private corporation is formed, which secures the right to dam a river and to distribute the water to an irrigation colony. In many cases these corporations own the land, through which they construct an irrigation canal and sell to the colonists, giving each of those who buy from them a water right. In other cases the companies simply supply the water, and charge so much per acre per annum for it. I do not think that many people would be ready to sign a bond promising to take water if the Government said that they would only supply water in the event of a certain number of people subscribing for it. Naturally people would be very cautious in such a matter. As the result of the operations of these water companies in California land in many places has increased to twenty times its original value. If it were demonstrated that a few men could make a profitable living by irrigation in this district others would follow. It must necessarily take time to settle a district like this. I have never made any examination to ascertain the area of land available for irrigation between here and Brewarrina. If the soil was so porous that the water sank rapidly through it, that would be a disadvantage. I have never been up the river above Bourke. The soil at Pera will not require to be manured for the next seven years. Of course, after growing exhausting crops such as sorghum for a few years, it will be necessary to supply certain ingredients to the soil, but crops such as lucerne will not require any manure. In California hardly a man uses manure, except such as is supplied by his barnyard, and most of the soil there is inferior in regard to the amount of plant food it contains to that of Pera. 45

*To Mr. Wright:* The Sacramento Valley is a vast level plain 400 miles long and 150 miles across. The undulations there are slight.

*To Mr. Trickett:* Undoubtedly any soil will be worn out by constant cropping. In my opinion this would be a good district for raisin growing. Raisins would be grown simply to supply the Australian demand.

*To Mr. Leo:* The selectors at Pera hold homestead selections, upon which the payment is £5 per acre for a 20-acre block for the first five years, or  $1\frac{1}{2}$  per cent. on the capital value of the land. I do not know what the value of land is in this district; but I should not like to give £1 an acre for land that was not supplied with water. The farmers at Pera are really paying 5s. for their land and £4 15s. for the water. After five years these people pay  $2\frac{1}{2}$  per cent. upon the capital value of their land, and, if you exclude the expenditure in connection with the Government farm, the revenue derived from them will go a long way towards paying interest on the cost of supplying water to the settlement. The settlement is not yet twelve months old, but the results obtained so far are very encouraging. During my residence in America I was mostly in California; I spent a short time in Oregon. I was four summers in Fresno county; I was there through the raisin season and the fruit season; I was with the California Fruit and Wine Company, a San Francisco syndicate, which held 640 acres under irrigated fruit. The land was irrigated by river water brought on to the ground by a large watering ditch owned by a private company. At the present time there is a glut in the raisin market in California, and the profits of the growers have dropped one-half. While I lived in Fresno the average return from raisin vineyards was 100 dollars per acre net profit, or £20 per acre. Raisin growing has been overdone in California. At the time I speak of the prices were steady, and the average return from raisins was what I have given. Providing a farmer knew something about raisin growing and raisin making, he could realise £20 an acre under irrigation. I would recommend farmers here to go in for raisin growing to a small extent, say a couple of acres in a 20-acre block. I am satisfied that there would be a local demand for a limited supply. Of course, if too large an area were cultivated there would be over production, and prices would go down. The damage done by floods depends usually upon the kind of crop which is covered by the water. It would be very inadvisable for anyone to attempt to grow stone fruits upon land liable to be flooded. I have heard that the land between here and Brewarrina, close to the river, is liable to inundation; but I believe that is only at very rare intervals. In the Sacramento Valley the river rises every ten years and floods the land, but that does not prevent fruit-growers from raising profitable crops there. They can risk a flood every eight or ten years; and besides, there are many sorts of fruits which will stand flooding. At the same time, a man who had settled upon high land would have an advantage over a man who settled on low land. In choosing an irrigation area I would select high land. I understand the land at North Bourke is above flood-level but I believe the red soil country is the highest in the district. I think the piece of land at North

North Bourke would afford an excellent opportunity for proving whether irrigation could be carried on here under a pumping scheme. I believe the soil there is equal to the Pera soil, judging from its general appearance; but I have not examined it; the river water would be better than artesian water. So far as my knowledge of New South Wales goes, I know of no better place where one could attempt the

Mr. J. S.  
Jefferson.

2 July, 1896.

5 experiment.

*To Mr. Wright:* In California I was engaged in agriculture, as a supervisor and a user of water. I could not tell you the chemical analysis of the artesian water in California. If the surface soil at Pera became surcharged with carbonate of soda to any injurious extent, bad results could be prevented by the application of gypsum. Notwithstanding what I have said about the small amount of seepage at Pera, I do not think that the evaporation there would be very great. I was speaking of the seepage from puddled ditches; but, of course, the water when applied to the ground would be put on to loose well-ploughed soil which would absorb and hold the moisture. With regard to the probability of this district being settled before districts nearer the coast, of course if there were better land and better natural conditions on the Macquarie, the Lachlan, and other rivers, that would militate against people coming here; but our climate is greatly in our favour. From 90 to 100 degrees is the average summer heat in Fresno. At Los Angeles the temperature is milder. Fresno is in the middle of the St. Joaquin Valley. For five weeks I have known the temperature in Fresno to be over 100 degrees in the day-time. Summer lasts there from six to seven months, and the yearly rainfall is about eight inches. It rains there in the winter-time. The last rains generally come about April. I came to New South Wales in February, 1895. Since I came here I have gone as far as the source of the Hunter River, and have a thorough knowledge of that part of the country. In fact, I know nearly every farmer living there. Very little of that country is suitable for irrigation. The soil is good, but it is not suitable for irrigation. The country is hilly, with small pockets of farming land; back from the rivers there is no farming land at all. It is very suitable land for grapes and for fruit. It is not as suitable as this country for the production of fresh fruit. I have not seen the Lachlan or the Macquarie, nor do I know the country along the western line, except as I saw it from the train. Fresh fruit in California is worth from 1 cent to 2 cents per lb. We could not compete in fresh fruit with districts nearer Sydney; but I am convinced that the fruit-grower in the Western district has a better financial prospect than the grower in the Parramatta district, because of the better climate and the fact that he can dry his fruit. Of course, fruit can be dried artificially. It is dried in America; I have dried it there. The man who has a blazing sun under which to dry his fruit will dry it at one-tenth of the cost that would be required if an evaporator were used. Evaporated fruit obtains the highest prices. Eleven of the blocks at Pera have been selected. Even without the farm I daresay the Government would have to pay a man £100 a year to reside at Pera and look after the public watering place. As that amount would have to be paid in any case, I do not see that it should be debited against the settlement. Travelling stock pay for the water they take; but the revenue derived in that way is very small. I believe that in some places the bores are farmed out. I am satisfied that the Government would not get £20 or £30 a year rent from the Pera Bore, if the ground surrounding it was in the state that it was in 12 months ago. I do not think the Government could afford to give people land for 5s. an acre and supply them with water, supposing that water had to be pumped. I do not know of any case in California where water is supplied

40 so cheaply.

*To the Chairman:* It is usual in renting a bore to give the lessee a lease of 640 acres surrounding it. The rent for the land is included in the rent for the bore. The rent for the 20 blocks at Pera, if they were all occupied, would be £100 a year, and at the end of 5 years it would be £200 a year. £100 a year would have to be paid by the Government in any case to support the caretaker of the bore, and therefore £100 would be left to go towards paying interest on the Government expenditure at Pera. The land there without water would be practically valueless. I cannot tell you, without making calculations, what would be the maximum quantity of water required to irrigate the Government farm and 400 acres of leased land. I think it would be necessary to run the bore day and night to do that. In my opinion the supply now given by the bore will be barely sufficient. I think that the whole outflow of the bore—610,000 gallons a day—could be used without imperilling the supply. We have not tested the outflow with a view to ascertaining if it is diminishing; but it seems to me that the flow in the flume is the same to-day as it was 6 months ago. I am still of opinion that no manure would be required at Pera for some years. Mr. Hersey was speaking probably rather of vegetable plots than of land used for fruit-growing.

*To Mr. Wright:* Fruit properly irrigated will carry quite as well as fruit that is not irrigated.

55 Thomas Whitchurch Seaver, Esq., B.E., Acting Assistant Engineer, Water Conservation Branch, Department of Mines, sworn, and examined:—

*To the Chairman:* At the present time I am acting as Assistant Engineer in charge of the lock and weir at Bourke. My business in the office is designer. I was engaged in the design of that work. The greater part of the lock is now constructed, and, for the last five weeks we have been taking out the silt which was deposited by a flood that broke in when Kerle and Kerle had the contract. I had nothing to do with the fixing of the site of the lock, and I have not seen any of the sites of the proposed locks and weirs, though I am familiar with the scheme into which the Committee are inquiring, on paper. To prevent erosion of the banks, the wing walls are to be carried in 43 feet to meet the hard shale, so that before the work could be interfered with the river would have to wash away 43 feet of soil on either side. Weirs on the Darling should be self-acting, or at any rate movable, for the following reasons: 1st. By lowering the shutters, when there is sufficient water in the river, all obstruction to navigation is done away with. With a fixed weir, of course, all the traffic must pass through the lock. 2nd. It interferes with the normal condition of the river, causing the deposit of silt, as in the case of the Bourke lock, and may, perhaps, change the course of the river. The water coming down the river is heavily charged with silt, and any stoppage of the current, as by a dam, would cause that silt to be deposited. We have a small coffer dam round the works at present in progress, and the last flood filled it right up to the top with silt. A fixed weir would act in the same way. Of course silt has been deposited in the river under natural conditions; but with a high weir I think that silt would be deposited in the bed above it. A fixed weir is more likely to change the course of the river than a movable weir, because at times of flood a movable weir would be lying at the bottom of the river. Of course a fixed weir 15 feet high would not cause any obstruction to a flood 30 feet high; but such a weir would certainly obstruct the water when the

flood

T. W. Seaver,  
Esq., B.E.

2 July, 1896.

flood was only 3 or 4 feet above it. The flood that deposited the silt at the weir below Bourke was only 10 or 12 feet high. Any fixed weir in the river would increase the velocity of the current. Supposing the river were running in its natural condition, 20 feet high, and the velocity were 1 foot a second, if an obstacle was placed in its way the velocity would be increased, and would be all the greater just above the level of the weir, and at a weak part of the bank. That is what caused the scouring at Gin Gin. 5

*To Mr. Black:* The erosion of a bank consequent upon the obstruction caused by a fixed weir need not necessarily occur in the vicinity of the weir, though that is where it is most likely to occur. Of course, the river might change its course any distance back.

*To the Chairman:* With a fixed weir there is a great fall over the top, and that fall will have the effect of undermining the weir. Thus, at a dam on the Cape Fear River in America, 16 feet high with a fall of 10 feet into 6 feet of water, with a bottom of soft shale rock, in the course of a few years a cavity was formed to such an extent that the dam fell into it. The velocity of approach in the Darling is very small compared with the velocity of the fall on the lower side of the weir, and that is why, in designing our weir, we fixed the point of the revolution of the wickets in such a place that the water could not rise more than 15 inches above them. Of course, steamers more than 37 feet wide will not be able to go through these locks, and, if fixed weirs were adopted, could not pass up and down the river at all; but with movable weirs we could let them pass by dropping some of the shutters. I agree with Mr. Darley that when a flood rises to twice the height of the weir, the weir will make very little difference; but when the flood-water was rising it would greatly increase the velocity of the river. Directly the water on the lower side of the weir gets as high as that on the upper side the danger disappears. A fixed weir would not affect the river if the river were running a banker. I cannot say why it was determined to construct the weir at Bourke instead of at the Fisheries, Brewarrina; but the site at Bourke is, I think, the best that could be got. The American authorities say that the damaging effects of a fixed weir disappear when the river rises to twice the height of the weir; but that does not affect the question. The danger exists when the height of water passing over the weir is only 2 or 3 feet. Mr. Darley says that the danger disappears when the river rises 6 or 7 feet above the weir; but I do not think that it disappears until the water has risen nearly twice the height. When there are only 2 or 3 feet of water passing over the weir, there is likelihood of a scour being caused in the bank just above the weir. I do not think that the shutters of a movable weir would be liable to injury from floating timber in times of flood. It would be very improbable that a piece of timber would lodge on the wickets when they were lying on the bottom. In India the rivers invariably silt up above the fixed weirs, and they use scouring sluices to prevent it. Neither do I think that there will be any danger of the submerged wickets being so covered by mud and silt as to make it difficult to raise them. Silt was deposited at the site of the lock because the coffer-dam there acted as a fixed weir. The submerged wickets would cause no obstruction to the flood. The sill at the bottom of the river would be about 3 feet high, and that might cause the river to silt up to the level of the top of the sill; but there would be no mud deposited upon the shutters themselves. Mr. Vernon Harcourt—I suppose the greatest living authority on movable weirs—says that the Chanoine shutter-weir is easily managed, while the success of the system is shown by its extension. The Department had not gone into the question of the Brewarrina weir when I left town. We dealt with Stony Point, Vincent's Rocks, and Beemery, but not with Brewarrina. I understood that the original idea was only to render the river navigable as far as Brewarrina. The design for the Brewarrina weir is, I believe, being prepared now. The average height of the banks of the Darling is about 45 feet, and the river-level, if the proposed scheme is carried out, will be 13 feet from the bed. I do not think that the increasing of the river-level would make much difference to the cost of pumping, though it will decrease the height to which the water has to be raised. With regard to the pumping, I think that in summer-time we could utilise the power of the water falling over the weirs. That has been done with great success in Italy, France, and Spain, and is about to be done in America. When these weirs were first invented, a space of 4 inches was allowed between the shutters, and in dry times they put down planks to prevent the water escaping. We allow only 1 inch between our shutters, and I propose to close the apertures where necessary with a round wooden board loaded with lead. That would give a fall on the lower side of the weir of 8 or 10 feet, and every cubic foot per second of that fall would equal one horse-power. The weir could be made to give, speaking theoretically, 200 horse-power, and it would be very easy to make it yield 30 or 40 horse-power. One of the simplest ways of using up power would be by means of a turbine working a centrifugal pump. In this way you could get practically unlimited power, and more power than you would ever use. Of course when the shutters were down these pumps would not work, because there would be no fall of water; but they could have been working for several months past. Still, if the wickets were down and it was necessary to pump water for irrigation purposes, there would be no difficulty in putting up the shutters for a day or two. We could get a fall whenever we needed it except during flood-time. I do not say that we could work a centrifugal pump right through the year; but we could work such a pump for a great many months in the year. I have estimated that it would cost £600 at each weir to put in turbines and centrifugal pumps. We would have to make a concrete chamber at each weir. 55

*To Mr. Wright:* In this way we could get the water to any height. A cubic foot of water per second will irrigate 100 acres. I could not tell you at the present moment what power would be required to lift an 8-inch column of water 40 feet, but, with a fall of 6 feet, you get an almost unlimited horse-power, or, at any rate, more than you would want to pump the water required for irrigation purposes. Hydraulic rams could also be used. They have been used to pump 400,000 gallons a day. An hydraulic ram takes no looking after, and will work with any head of water. It will deliver one-seventh of the water going through it up to four times the fall. The ram would be placed about 4 or 5 feet from the river-bed. Supposing there were 280 cubic feet of water passing down the river every second, with a 10-foot fall, an hydraulic ram would raise 40 cubic feet a second 40 feet high. Hydraulic rams are now only used for irrigation on a comparatively small scale, and the largest of them only delivers 400,000 gallons in the twenty-four hours; but in America they put in five or six close together. At the present time the river is very low; but there are 250 cubic feet a second going down, and 1 cubic foot a second would irrigate 100 acres. The rams would work until the difference between the level of the water on each side of the weir was less than 2 feet, when they would cease to work. I think that the cheapest way of irrigating would be by utilising the fall in some such way as I have described. This country is very different to the old country, where the seasons are all clearly defined. Out here if you are able to give the subsoil a good 75

good soaking several times a year it does not matter so much when the water is put on. When there was a great deal of water in the river the probability is that the seasons would have been good, and therefore not so much water would be required for irrigation. If it were necessary to irrigate all the year round a steam-engine could be used as well as an hydraulic pump. I think that a turbine and a centrifugal pump would not cost more than £600 or £700 for each one. The hydraulic rams take no looking after, and the men in charge of the locks could attend to the turbines. Mr. W. H. Graves, C.E., one of the prominent engineers of California, says that the utilisation of the water-power of canals is a subject which must claim attention as the country progresses. On the Crappone Canal, in France, which has a capacity of from 350 to 500 cubic feet per second, there are thirty-three mills. On the Marseilles Canal there are 107 mills, and 20 per cent. of the revenue of the canal is derived from these mills. The Verdon Canal, in France, develops 2,000 horse-power; the Henares Canal, in Spain, develops 3,630 horse-power for nine months in the year, and 1,450 horse-power for the rest of the year, and the rent obtained amounts to £1 per month per horse-power. As far as the fall of the water is concerned, the conditions on the Darling would be the same as they are on those canals. I have not had any personal experience of any pumping scheme such as I have referred to, nor have I had any experience in the construction of locks and weirs, except during my connection with the Department in the last six years. My information has been obtained principally from reading, and I have a knowledge of what is being done in other parts of the world. There would be no danger of the pitching in the locks being destroyed by floods. The stones will be very heavy, and besides when there is a flood in the river the bottom velocity is very small. I do not think the scouring in the locks would be sufficient to carry away the pitching, but, in any case, the danger would be greater with a fixed weir. We have provided a concrete apron in front of the weir, standing out about 20 feet. I think that it is perfectly safe to have the locks alongside the weir. That is the practice followed in all the French canals. I would not recommend it if fixed weirs were employed, because I think that they would cause a silting up in front of the lock. I do not think that there is any chance of the locks being injured in flood-time, and we calculated that when the lock-gates were opened and the wickets were down the sectional area would be equal to the natural area of the river. In France and in Spain in some places breast wheels are used; in America they use floating water-wheels in places. I think it would be possible to get sufficient power to irrigate 100 acres of land with hydraulic rams. Up to the present time hydraulic rams have only been used in a small scale. They have given perfect satisfaction when supplying up to 400,000 gallons a day, and Professor Threlfall told me that he did not know of any reason why they should not be used to give a larger supply. The river in which movable weirs have been most successfully used is the Ohio, in America, where the conditions are similar to those of the Darling. That river in summer-time is a chain of waterholes, and in the winter-time there are floods. In America fixed weirs are sometimes made of timber. I think that shutter-weirs are most suitable for a sluggish river. The Darling deposits a large amount of silt, but with a rapid river the deposit is not so great. With a fixed weir they have to use scouring sluices, and, if these are not properly placed, there is a distinct danger of silting. We can easily cause a scour at any place by managing the shutters.

FRIDAY, 3 JULY, 1896.

40 [The Sectional Committee met at the "Royal Hotel," Bourke, at 9:30 a.m.]

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (CHAIRMAN).

The Hon. WILLIAM JOSEPH TRICKETT.  
CHARLES ALFRED LEE, Esq.

THOMAS HENRY HASSALL, Esq.  
GEORGE BLACK, Esq.

15 FRANCIS AUGUSTUS WRIGHT, Esq.

The Sectional Committee further considered the proposed Construction of Locks and Weirs on the River Darling.

Ormond Campbell Macdougall, Esq., Inspector of Public Watering Places, Bourke, sworn, and examined:—

To Mr. Hassall: Only the high land between Bourke and Brewarrina is suitable for an irrigation settle-  
ment. The construction of the weir below Bourke will throw the water back about 20 miles beyond North  
Bourke. North Bourke will, therefore, be a very suitable spot for an irrigation settlement, the only  
better place being at Redbank, about 30 miles below the weir, which is not affected by this proposal.  
About 40 acres have been cultivated at the Native Dog Bore, 17 at Enugonia, 4 at Belalie, and 8 at  
Barrington. Fodder plants were grown first—lucerne, Hungarian millet, sorghum, and maize. Then we  
tried an experimental wheat plot, obtaining 35 bushels to the acre. My district begins at Hungerford, on  
the Queensland border, and from Goodooga it comes into Brewarrina, thence to Nyngan, thence past Cobar,  
and so to Hungerford. It contains an area of about 150 by 200 miles in extent. In my district there are 58  
public watering places (26 bores and 32 tanks). Twenty-four bores and 4 tanks have been constructed during  
my term in this district. In my work of inspection and supervision of these I travel by my own conveyance  
from 5,000 to 8,000 miles annually. It is now between four and five years since the question came up as to  
whether or no the artesian waters in this district were good for irrigation purposes, and I was requested by the  
Superintendent of Public Watering Places (Mr. J. W. Boulton) to lay out small farms at the Native Dog and  
Barrington Bores. This I did to the extent of 4 acres at each place in ¼-acre blocks. I planted sorghum,  
planters' friend, Hungarian millet, maize, and lucerne, and the results were good. Later on an experiment  
with wheat yielded 35 bushels to the acre; this wheat was sown on the 16th June, cut 17th November, and  
received three waterings, the season being dry. Since then both the Native Dog and Barrington Bore farms  
have been enlarged, the former to about 40 acres and the latter to 8 acres. In July, 1893, I laid out  
farms at Belalie and Enugonia Bores, and a larger number of forest and fruit trees were planted  
at those two bores as well as at Barrington and Native Dog Bores, and the results were first-class. The  
Hon. Sydney Smith, Minister for Mines, visited the Native Dog Bore in January, 1895, and I had the  
pleasure of placing before him grapes, peaches, and apricots grown on vines and trees planted eighteen  
months previously. From these different bores I also sent to Sydney very fine samples of water and  
rock

Macdougall,  
Esq.  
3 July, 1896.

rock-melons, pumpkins, &c. Water-melons up to 65 lb., rock melons to 25 lb., and pumpkins to 75 lb., all sound and of excellent quality and flavour. The Native Dog, Engonia, and Belalie Bores are on red ground, and the Barrington Bore on black ground, and I may state that I found it harder to keep the black soil in good order than the red. I have heard it stated that artesian water cakes the land after flooding more than other water, but I disagree with this entirely, for by experience I have proved that there is no difference, and that the land, unless cultivated, will cake just as much with rain or river water as artesian. I have also heard it stated that there is a great danger of the artesian supplies giving out. I am, of course, not in a position to state definitely whether that is likely to take place or not, but my opinion is against it, and I am sure that in all cases in this district or Colony that good and sufficient reasons can be given for such happening. My experience, which is, of course, only of from four to five years, teaches me that the artesian water is first-class for irrigation, for at those places named the trees are in as good condition to-day as after their first season. As far as the scheme for locking the Darling between Bourke and Brewarrina is concerned, I am, of course, only acquainted with it from what I have heard and read. I think there can be no doubt as to the usefulness of the work, but as to whether or no it would pay interest, I am not prepared to give an opinion. I think it would enhance the value of the Crown lands for several reasons, viz., regular and cheaper carriage, the filling of lakes, lagoons, and creeks back from the river, and by giving a better chance for irrigation to those who choose to try it; but I am not prepared to say if many or few would take advantage of the water for the latter purpose. Probably some day some pastoralist will perhaps try feeding or fattening stock artificially, and, if with success, others will follow the example. We know that in other parts of the world it is done with success, and it might pay at all events to top them up here by such means, especially if what I have been told is true, namely, that half-a-ton of sorghum hay will feed a sheep for one year, and that 50 tons of such a crop can be grown per acre, for if half-a-ton will feed a sheep for the year, a large number per acre could be topped up. I have never seen any artificial feeding done, for all my experience amongst stock has been on the Darling River, and the country west and north of the river. I know that it is only of late years that residents of the western district have thought of cultivation in any way, but they are now finding out the benefit of growing crops and they may perhaps by-and-bye consider it worth while to go in for cultivation on a large scale, but whether by artesian or river water depends upon the position of their land. Apart from cultivation or irrigation I consider the locking of the Darling a great work, for, during my thirty years experience in this and the Wilcannia districts, I have known the people to be at pretty well starvation point and consuming such bad flour that in ordinary or good times they would give to the pigs, for it generally happens that a low river and bad season come together, and at such times land carriage is very high. I have known flour at Wilcannia to be as high as £100 per ton and potatoes 1s. per lb. I have seen the Darling about there so low that you could walk for long distances in the bed of it, and I have seen fish dead in thousands, and stacks of wool on the banks and in sheds for two years. I do not look upon irrigation from the river or artesian bores as in any way antagonistic to each other, because cultivation at the bores can be carried on where water from the river could not be forced to. I think if more cultivation was carried on at the different bores it would tend to cheapen land carriage, because under existing circumstances in a dry season, a carrier taking, say, 6 tons of loading would probably put on as well 2 tons of fodder. Whereas if he could rely upon gathering what he wanted for his team along the road at fair prices, he could put on a full load for freight. The primary object for putting down bores has of course been to water the travelling stock routes, but as the supply is far in excess of the requirements there is no reason why the water should not be used for cultivation purposes. I have had to pay as much as 4d. per lb. for chaff and 25s. per bushel for oats at Wanaaring. We have a bore at that place with a flow of 400,000 gallons of good water, and therefore cultivation at that bore would necessarily cheapen horse-feed, and the same can be said of many other places. The bores that I have mentioned, viz., The Native Dog, Engonia, Belalie, and Barrington, are now leased at £90, £52, £25, and £40 respectively. I have a fair knowledge of the country along the Darling from Brewarrina to Wentworth and think most of the country between Bourke and Brewarrina very subject to flood; the best land in my opinion is just beyond North Bourke; there is also a fine lot of land at Redbank, but that is of course below the lock now being constructed. With reference to the diminishing of artesian bores, I may mention three bores that have diminished in flow, viz., Wongomana Station Bore, Yantabulla Government Bore, and Coomba Station Bore. In the Wongomana case the bore was put down to a depth of 1,400 feet, the water was struck at 1,200, and the casing put down nearly to the bottom, therefore partially shutting off the supply, I am certain if the casing was pulled to just above water-level the bore would flow as at first. In the Yantabulla case the original supply was 67,000 gallons, and has diminished, but the bore was put down in mud spring country and the water I am sure is escaping and going past the bore. In the case at Coomba, the water was struck at 2,100 feet and the bore eased to 1,200; the bore filled up and choked. It was then cleaned out and cased down to the water, and has been running for the last five or six years at the original flow of 3,000,000 gallons, the figures above are as they were given to me, although I cannot vouch for their accuracy, I think they are correct. The produce raised at the various bores is either used there, or sold to carriers and others passing by, or to people living in the towns in the vicinity of the bores. At Barrington the bore is leased to the late caretaker, at a rent of £40 a year. He collects the watering fees. There are over 400 acres of fenced land there, the farm containing 8 acres. There is a great deal of stock travelling that road, but they water at the Warrego in ordinary times. Before the bores started there was very little irrigation; but now many squatters go in for it. A few irrigate, but as a rule, they chance the seasons. Thousands of tons of fodder brought here by rail go out to the back country. The producers at the bores might more than supply the travelling public; but not all the station demands. The stations in time will probably supply their own wants. There is very little demand for land in the neighbourhood of the Government irrigation bores, on the roads leading towards Queensland. There would have been more demand for land at Pera, had there not been an unfounded report in circulation that the flow of the bore has fallen to 100,000 gallons daily. In my opinion the flow has not diminished in the least, nor is there any likelihood of a diminution. Most of the Government bores are shut down, but owing to bad territory we cannot shut some of them down. One at Barrington, when shut down, burst out 90 feet away, and so did that at the Native Dog. There are contracts at present let for about six bores. People are always anxious to lease the bores, but the term of five years is regarded as too short. With a longer term the applications would increase. It would be better, in my opinion, to allow the lessees of bores to hold

hold 40 acres as a permanent lease, and the balance on an annual occupation lease, in order that other applicants for land might not be excluded.

To Mr. Lee: In my opinion for many years in this district irrigation by means of artesian water will continue to develop, and after that it may spread to the river banks.

O. C.  
Maddougall,  
Esq.  
3 July, 1896.

5 William Poole, Esq., Assistant Engineer, Water Conservation Branch, Department of Mines, sworn, and examined:—

To the Chairman: I am in charge of the weirs and the works in Macquarie district. Previous to taking my present position I made extensive surveys in connection with the proposed locking of the Darling between Wilcannia and Menindie, and Bourke and Brewarrina. The reasons why Bourke was chosen as the site for the first lock and weir were, so far as I know, that water might be provided for an irrigation settlement at North Bourke, and that an experiment in weir construction might be afforded, to ascertain the difficulties likely to be met with and the cost of the work. When the Walgett River gauge reads 9 ft. to 9 ft. 6 in. light-draught steamers can navigate from Walgett to Brewarrina. This height of river will enable steamers to pass the Collawaroy Rocks. Steamers can navigate from Brewarrina to Bourke when the official gauge height at Brewarrina is 8 feet. The river at Brewarrina has to be 18 feet on the official gauge before steamers can pass the Fisheries (Brewarrina Rocks). The following table shows the state of navigation of the Darling between Bourke and Walgett during the years 1891 to 1894 inclusive:—

W. Poole,  
Esq.  
3 July, 1896.

Year.	River Darling Open for Navigation.		
	Bourke to Brewarrina.	Brewarrina to Walgett.	Across the Fisheries at Brewarrina.
20 1891 .....	31 weeks .....	34 weeks .....	20 weeks.
1892 .....	28 " .....	29 " .....	18 "
1893 .....	52 " .....	50 " .....	25 "
1894 .....	38 " .....	36 " .....	23 "

Taking the wool season as being August to November inclusive, or about seventeen weeks, the Fisheries could be crossed by steamers during that period for nine weeks in 1891, fifteen weeks in 1892, nine weeks in 1893, and four weeks in 1894. From the foregoing figures it will be seen that the period during which steamers and barges can cross the Fisheries, is but a small proportion of the time that the river is open to navigation from Walgett to above the Fisheries, and from below the Fisheries to Bourke. It is thus seen that the Fisheries cause a great obstruction to the free navigation of the river between Bourke and Walgett, necessitating during the busy wool season a transhipment of goods at Brewarrina. Firms or owners of single steamers are then precluded from enjoying the full benefits of trade between Bourke and Brewarrina. The navigation heights of the river have been ascertained from various river captains trading on the river. The periods of navigation have been ascertained from the navigation heights and the river height record in the Annual Rain, River, and Evaporation Reports issued by Mr. Russell. There are very few steamers trading on the western system of rivers Murray, Darling, Murrumbidgee, &c. that will be unable to pass through the Bourke Lock, the steamer "Florence Annie" being the only regular trader to Bourke that cannot do so. The overall measurements of a large number of the steamers and barges were taken by myself and transmitted to the Chief Engineer. It is not likely that there will be any increase in length and breadth of craft now trading on the river, the narrow tortuous course of the river precluding such increase. During my experience on the river in selecting lock sites, surveying its course, and in taking soundings along its bed, I have had opportunity to see the river in all its stages, from extremely low to flood. The Darling carries but little floating timber or other debris, and during the period which the shutters of a movable weir would be in operation, that is, raised, I have not seen a single piece of timber floating in the river. During the flood of May and June, 1894, I travelled by steamer from Wilcannia to Bourke, and had ample opportunity of observing the river; but very few floating logs were seen. During those periods, when the shutters of a movable weir would be raised, the river water is generally perfectly clear, carrying no silt in suspension. A small amount of sand would, however, be rolled along the bed of the sandy reaches. There are many rock and other hard bars of varying height in the bed of the Darling which act as weirs. The highest and best known of these natural bars is the Fisheries at Brewarrina (known also as the Brewarrina Rocks or Brewarrina Falls). During periods of very low river the Brewarrina Rocks maintain the water in the river above them at a height of about 11 feet above the water below them. I have carefully examined many of these natural obstructions, most of them by survey, and find that on the up-stream side of all of them there is a long deep hole, in some cases more marked than in others. In no case have I found the river above these obstructions silted up level with them. The following are the principal obstruction that have been examined by me, Brewarrina Falls, Stony Point, Vincent Rocks, hard bar, just below Bourke wharf, Wilcannia Rocks, Eight-mile Point Rocks, Culpaulin Rocks, Christmas Rocks, and a hard bar at Mulcrenery. Some of these rock bars have a narrow passage past them, cutting into one of the banks; but as these small passages silt up during fresh, and only wash out during very low stages of the river, they cannot in any way affect the silting up or scouring out of the large holes which often extend for many miles above the bars. In many cases there is a large deposit of sand in the reach just below many of these rock bars. This is notably the case at Brewarrina Rocks, Wilcannia Rocks, and Eight-mile Point Rocks. Strange to say, the finding of these large holes above the natural bars on the Darling, is contrary to the experience on Indian and most other rivers. The rivers in India and most other countries, are, however, of a different nature to the Darling; they are in comparison, broad, shallow, and with one or more main channels, which shift about within the banks. The Darling is a narrow stream, with a single channel, that is (excluding flood-channels), with deep well-defined banks, which for hundreds of miles vary but slightly in their width apart. The water of the Darling being confined within one well-defined deep channel, is able to keep its bed clear of deposit down to its normal hydraulic bed-level. The silt carried in suspension by the waters of the Darling is of a very fine sandy nature. In case some or most of the lowered shutters of a movable weir are covered by silt the raising of one shutter would cause a scour round its sides, which would soon clear the next shutters of any deposited silt, the

W. Poole,  
Esq.  
3 July, 1896.

the next shutters could then be raised and the washing-out process continued and so on until they are all raised. As the sill of the weir will be raised somewhat above the bed of the river it is not very likely that any deposit of silt will take place upon the lowered shutters. In case a channel is cut across a bend and a lock placed in it, the lower end would soon silt up unless a large amount of water is allowed to pass through this cutting. This is seen when the river cuts a new channel for itself across a bend; the two ends of the deserted bed soon silt up, whereas the rest of the old bed, now a lagoon, may remain fairly deep for many years. Examples of this are numerous along the Darling River. The material of these large bends is usually of a very fine silty nature; this has been ascertained by trial bores put down under my supervision. There are many lagoons between Bourke and Brewarrina which can be dammed and utilised for storage for irrigation in the same manner as that at Yambacuna visited by the Sectional Committee. These lagoons usually abut on to land which is equally suitable for cultivation as that at Yambacuna. The most suitable site for irrigation is the large extent of red-loam country which comes on to the river at North Bourke. There is a very large area of this soil which could be made use of. It is also so situated that water could be conveyed on to the highest ground by means of fluming, &c., at no great outlay or trouble. The pumping station could also be located that it could be protected from the highest flood at a small cost. Although this high red country adjoins the river, there is, except at the Bourke Bridge a narrow strip of flooded land between the river bank and the red loam which is above flood-level. The whole area of the red loam above referred to, is above the highest flood-levels. This is the only place between Bourke and Brewarrina, that is above maximum flood-level. The country at North Bourke is by comparison, generally of a higher class than that at Mildura, while the former is covered by scrub which would admit of inexpensive clearing, as compared with the mallee that exists at Mildura. The land at North Bourke is slightly undulating, but will not require the high pumping lifts that exist at Mildura. The greatest height to which water would have to be pumped at North Bourke would probably not exceed 50 feet above summer level, this height will, on the completion of the Bourke weir be reduced to about 40 feet as against 75 feet at Mildura. The extreme left might be made in one lift, with one pumping station only at North Bourke as against several lifts at scattered pumping stations at Mildura. I spent a week at Mildura, and had an ample opportunity of examining the place and comparing it with other localities on the Darling, with which I was acquainted, suitable for irrigation. Most of these places on the Darling, in soil, and in natural features for water distribution compare most favourably with the irrigation settlement at Mildura. There are places along the Darling where the red loamy country, which is above maximum flood-level, is touched by the river. At these places there is an almost unlimited extent of country which is eminently suitable for irrigation settlement. There are places between Bourke and Brewarrina which are only covered by such extreme floods such as those of 1864 and 1890, floods which occur about once in twenty-five years. These places are between the mouth of the Waraweena Creek and mouth of Culgoa River, on Quantambone, about 4 miles above Becnery, and at several places on the right bank of the river a few miles below Brewarrina. Beside these places there are many patches of country such as that at Yambacuna where cereal and fodder culture could be carried on; these latter places are only covered in high flood.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

**THE RIVERS MURRAY AND DARLING.**(PETITION FROM CERTAIN RESIDENTS ON, PRAYING THAT THE RIVERS BE KEPT IN A FIT  
CONDITION FOR NECESSARY TRAFFIC.)*Received by the Legislative Assembly, 28 October, 1896.*

To the Honorable the Speaker and Members of the Legislative Assembly of New South Wales.

The humble Petition of the undersigned residents on the rivers Murray and Darling,—

RESPECTFULLY SHOWETH:—

1. That the present condition of the rivers Murray and Darling within this Colony, owing to the accumulation of snags, is neither safe for navigation nor compatible with the just claims and interests of your Petitioners.

2. That during the last fifteen years nothing has been done by the Government to keep the rivers in a fit condition for the necessary traffic.

3. That during the above term mentioned large sums of money have been collected through the several Customs Houses, from goods carried on the rivers Murray and Darling, and that the beds of the rivers are being filled up with trees and snags impeding navigation, and unless the rivers are in half-flood navigation is unsafe, and if compelled to carry by land the cost of carriage would be a very high rate and the delivery uncertain.

4. Your petitioners, therefore, pray that your honorable House will be pleased to cause such steps to be taken as will most effectually remedy the evils complained of.

And your Petitioners, as in duty bound, will ever pray.

[Here follow 107 Signatures.]

Question.

- (1.) WHARFS, JETTIES, &C., AT NEWCASTLE:—MR. T. R. SMITH *asked* THE SECRETARY FOR PUBLIC WORKS,—What amount of money has been expended on wharfs, jetties, &c., at Newcastle, during the last twenty years; also the amount of revenue received during the same period for wharfage dues, &c., at Newcastle?

Answer.

Expenditure, £189,113. Revenue—Wharfage rates, £16,750 3s. 2d.; tonnage rates, £114,046 12s. 4d. Total, £180,796 15s. 6d.

The Superintendent, Labour Bureau, to The Minister for Labour and Industry.

Sir,

I have the honor to submit the fourth annual report of the Government Labour Bureau, from 18th February, 1895, to 17th February, 1896. In doing so I regret to report the depression mentioned in my third annual report still exists in the industrial life of the Colony.

Want of employment has been keenly felt by a great many during the past year. It has not, however, proved peculiar to this Colony. The wave of depression which has been passing over this and the other colonies during the last five or six years has not yet expended its disastrous force, the effects of which have proved severe on all trade, commerce, enterprise, and investment, with the result that labour and industry have felt it most.

The severe drought experienced during the latter part of 1895 had also disastrous effects, especially on the labours of those employed in mining, farming, and pastoral pursuits. Conditions have somewhat changed, however, and the prospects of the future are brighter. The copious rains which have been general throughout the Colony during the last month will be of immense benefit, and (if you will permit me to state) with a fixed policy let us hope matters will improve. More confidence will ensure more trade and create more employment for the people. There can never be true prosperity with thousands of unemployed in our midst.

The thirty-five agencies which you established in the principal towns of the Colony on the 1st March will enable the head office to acquire a better knowledge of the unemployed question in the country, and will assist in decentralising the operations connected with solving the unemployed problem, than which there are few questions (if any) of greater importance at the present time. Public meetings, conferences, organisations of the unemployed themselves, and numerous writers in the Press have endeavoured to solve this most difficult question. Many of the suggestions were impracticable, and many were chiefly appeals to the Government to employ them on the lands and public works, which would prove but a temporary relief, and would tend rather to aggravate than permanently solve the difficulty.

The best remedy or scheme propounded, in my opinion, is that of water conservation and irrigation, which was referred to in my report of 1893.

A general scheme of water conservation and irrigation (as adopted in other countries) would be best if designed in districts in those dry portions of the Colony where it is necessary. The work could be carried out in sections, by gangs of men under strict supervision. Tools and plant could be furnished by the Government, and charged for or rented.

With a view of making this a scheme for permanently settling the unemployed on these lands, and establishing thereon homes for themselves and families, all those employed on the general scheme would receive a lease of sufficient area (say 30 to 50 acres) to maintain his family. The said land to be part of, and irrigated with, the district scheme. Payment would be by day wages or by piece-work where possible, and as may be agreed upon. Each man, or gang of men to work in periods of one month on the scheme, and one or two weeks on his own selection, improving and cultivating it, and making his future permanent home. Some little assistance may be required at the beginning. Such a scheme of irrigation would afford industrious men with energy and perseverance an opportunity to succeed. And when the scheme is completed (if not before) thrifty men from the ranks of the unemployed should be independent of Government relief, and in a short time should become successful and permanent producers, cultivating what they have by irrigation converted from a barren to a fertile soil.

A thorough and efficient scheme of water conservation and irrigation would no doubt be costly; yet its results would be so beneficial (as great as those already achieved in other countries) that it is almost needless to add the Government would be recouped, and hundreds of thousands of acres of land now barren and useless would be rendered fertile and productive, rearing, on its richness, settlement it is now unable to induce.

A scheme called "Homestead Association," for absorbing the unemployed on these lines, is in operation in the Colony of Victoria. The work on which they are employed is the draining and reclamation of swamp lands. The men are employed every alternate fortnight on the Government works, and a fortnight on their own selections, improving same. The following is an extract of a report on the above subject forwarded to the Honorable the Minister in 1895:—

"These exist chiefly where there is some Government work proceeding. At present there are a number of associations which surround reclamation works carried on by the Government in drainage, &c. The settlers get a fortnight's work on Government works at drainage at so much per yard, and are able to earn about from 35s. to 50s. per week, and every alternate fortnight must work on their selections in improving same. This system, I am informed, is very successful, where it can be carried out; and report speaks very favourably of a number of such settlements."

Before leaving the subject of irrigation and water conservation I may give an illustration in a small way of its beneficial effects. During my visit to the Bourke district recently I had an opportunity of seeing the Pera Bore, situated on the Wanaaring Road, about 9 miles from Bourke. It is on a block of 640 acres of Crown land—rich chocolate soil, and with an abundance of water will grow anything. Raisin-making, among other industries, should prove to be profitable work in the future here, as the general conditions of soil and climate appear to be naturally suited for it. There are hundreds of thousands of acres of this rich agricultural land in the Western District held as pastoral runs for sheep which, if irrigated, would produce sufficient crops of cereals and all kinds of fruit to supply almost the whole Colony, while the local consumption alone, of forage in times of drought in the surrounding districts would prove a source of considerable income. The small irrigation farm surrounding the Pera Bore is certainly a splendid object-lesson.

The Government is farming about 57 acres out of the block of 640, and, though only commenced some twelve months ago, the greater portion is cleared and planted with a variety of crops. The fruit-trees will in a short time give a prolific yield. The greater portion of the area is cut up into 20-acre lots, which can be taken up on a perpetual lease at a rental of £5 per annum for the first five years and £10 per annum after. Several of these lots are already taken up. Houses have been erected, and clearing, fencing, planting, &c., are going on. Each lessee is entitled to 21,000 gallons of water daily, which is carried in flumes over the selection. The effect of plenty of water on this rich soil in this warm climate is really wonderful. Once the rough work of clearing, &c., is done, the rest is comparatively easy. All that the lessees have to do is to till, plant, &c., keep the land clear, and look on the crops growing. To an industrious man with a family, life could be made easy, comfortable, and independent. The land at present will only carry on an average four to five sheep to the acre, giving a return of from 10s. to 12s. 6d. per acre. With irrigation the same land will give a return of from £10 to £20 per acre, and even in some classes of produce, &c., as high as £40 if markets could be found. This would open up a large and profitable field for employment.

In my interview with Mr. Jefferson, who is in charge of the Government farm and bore, he spoke very hopefully of the results he anticipated from this experiment. He has had some thirteen years' experience in irrigation in California, where, he informed me, there were immense areas of land similar in soil and climate to those of the west which, by irrigation, had become productive, and were enhanced in value from a few shillings to from £20 to £40 per acre.

I sincerely believe from what I have seen and read of what irrigation has done that while the outlay of bringing into operation a comprehensive scheme of water conservation would be necessarily large, ultimately the increased return from the land would, as I have already stated, recoup the Government amply, and give employment and help to settle an army of willing workers who at present find employment difficult to obtain, and who only want the opportunity to establish happy, peaceful, and independent homes throughout the western parts of our Colony.

I might also be permitted to mention another work which, if the Government thought wise to carry out, would absorb and permanently settle on the lands of the Colony a large number of unemployed. I refer to the clearing of scrub lands in the Bogan district. There are thousands of acres of rich agricultural land in that district so densely covered with scrub as to prevent it being utilised for settlement in consequence of the heavy cost of clearing, &c. If this work were carried out on the same lines indicated for irrigation it would achieve a like beneficial result. Works of this character would open up vast areas of country for settlement, and would necessitate roads or light railways. The latter, so often spoken of as being urgently required in many parts of the Colony, could be carried out by the unemployed on the same scheme of settlement as already described. If these works could be put into operation it would absorb all or most of the unemployed able and willing to work, and at the same time give them the opportunity of becoming individually useful and independent colonists.

Unfortunately, in addition to those of the unemployed able and willing to work, there is a large number roaming about the city and in the parks—anywhere but earning or endeavouring to earn their living—a class who do not like work, and apparently never intend to do any if they can help it. These never-do-wells are to be found in all large cities. In prosperity or adversity we have the loafer, who too often through the use of strong drink and other bad habits and associations has lost his self-respect and manhood ;

has

## 3.

has degenerated and become a disgrace to his fellow-man and a nuisance and danger to society. I regret to say (and it may be considered harsh, but it is nevertheless true) that this class is encouraged in laziness and idleness by mistaken charity. These are the men who give the most trouble at the Bureau; and there is only one way of correctly dealing with them—they must be either made to work or starve. They have the excuse in times of depression that they cannot get work; but when it is provided for them they refuse to accept it. These are the men who should be placed where they would be compelled to earn their living. These remarks do not apply to the men who accept work at the Church and School Lands at Randwick, or the relief works at Centennial Park.

The best remedy I can suggest for the loafing class is the establishment of Industrial Homes, such as are in existence on the continent of Europe, especially in France, Germany, and Holland, where, as a recent traveller from Australia on the Continent remarked, "a beggar is not to be seen in the streets," the established "Homes" leaving to their choice the two alternatives already suggested—work or starve.

A system of this kind is in operation in Victoria. It is called "Labour Colonies," and was referred to in my report to the Hon. the Minister, in June, 1895, on the unemployed in Victoria, of which the following is an extract:—"In Victoria 800 acres of land are set apart, and any man, instead of becoming a vagrant or a loafer, can apply to be sent to one of the colonies, where they get shelter and are fed; but must work and obey the regulations. They get 1s. 6d. per week wages, and are fed at a cost of about 2s. 6d. per week, for which each man cultivates the land given. All varieties of vegetables are grown, which are sold and go to support the colony. They can leave when they like, and if they can secure work elsewhere are assisted to it. Employers apply for men who have been on the settlement for some time and give evidence of their ability to work for their living. Thus they come and go, and the city is relieved of a large number who otherwise would be leading a life of idleness—begging, and perhaps stealing for a living, and who have thus the means of keeping them from roaming about the streets, and in many cases of becoming again respectable citizens."

There is also a considerable number of old men in and around the city and suburbs who are past heavy manual labour, but who are able to perform light work for a living when they can get it. Many of these have families to support, and notwithstanding the severe criticisms passed on the sand-shifting in levelling the land for building sites at Centennial Park, to these, and to a large number of professional men (clerks, accountants, engineers, shopmen, &c.), unable to do hard manual labour, it was simply a "Godsend" during the severe winter months of last year. Without this work they and their families would have starved, or have borne the reproach of living on charity as paupers. No doubt abuses crept in (but none of a serious nature) through numbers of undeserving men who managed by misrepresentations to get on to the relief works. But hundreds of deserving families sincerely and thankfully appreciated the action of the Government for providing them with the means of earning a living at a time of such great distress.

I am still strongly of opinion it is much better for themselves and the country generally that these old people should be provided with light work (where practicable) than to be separated and relegated in their old days to pauper asylums.

### Fossicking.

The number of men sent out fossicking for the year ending 17th February, 1896, was not so great as that of the previous year, chiefly owing to the drought, it being of little use as an industry without plenty of water. Several of those who were doing fairly were compelled to cease owing to this. The late rains have, however, again given an impetus to this industry, and at the present time there is a considerable increase in the number of applicants going fossicking. The number sent out this year amounted to 7,093, as against 10,718 for the previous year, being a decrease of 3,625 for this year.

Fossicking as a recognised industry has been in operation for a little more than three years, during which time no less than 22,327 men have been assisted and sent out. Many of those sent out have done well; others fairly well; while others, again, have made "tucker," as they say themselves. A large number of them have combined fossicking with other work, and, settling down, have sent for their families, and have made homes in the country. In this way from 600 to 700 families have been sent to join them. It will be noticed that the value of gold won in the Colony since the fossicking system was introduced by the Bureau has been steadily increasing, as the following large totals will show:—

Year.	Oz.	Value.	
		£	s. d.
1891 .....	153,336	558,305	12 3
1892 .....	156,870	569,177	17 4
1893 .....	179,288	651,285	15 8
1894 .....	324,787	1,156,717	7 7
1895 .....	360,165	1,315,920	0 0

Although comparatively few miners' rights issued on credit have been paid for, the owners of them have been to a large extent able to purchase rights in the following years, and so obtain the necessary title to work their ground, thus also increasing the public revenue to an extent it would not otherwise have been. The unemployed fossickers who have been at all successful have greatly relieved the strain upon the public purse, and have benefited themselves and the Colony generally.

### Wages.

The Bureau does not interfere in the rate of wages or terms of employment. All it does is to bring employer and employee together, leaving it to the parties themselves to make their own arrangements; but from the numerous letters received from employers who require labour, and stating the wages they will give, it is evident there is a tendency to reduction in some of the callings. All applications for labour from employers in the country will in future be referred to the agent of the district; and if he is unable to supply the demand the head office will endeavour to do so.

### Refunds.

### Refunds.

The amount received as refunds of railway fares this year is £4,235 19s. 6d.—nearly double the sum received the previous year. This is chiefly owing to the large number of men sent forest-thinning, whose fares were deducted from their earnings. The total sum refunded is £10,526 1s. 3d. This is from the time the refund system was first inaugurated—a period of three years and six months—and speaks well for the large number of men assisted and sent to work. There is, as might be expected, a large amount still owing—over £40,000. Every opportunity is taken of collecting arrears of payments, by the frequent issue of circulars. The country agencies will in future assist in this direction where possible.

### Relief.

Relief work has been a very heavy item in connection with the Bureau during the year. The levelling of the land for building-sites at Centennial Park was commenced in March, 1895, and was originally intended to give relief to the destitute unemployed—clerical and professional men who were physically unfit for hard manual labour. Last winter proved to be one of the most severe ever experienced in the Colony, and employment was very scarce. In consequence the rush for work at the park was enormous, and trebled all anticipations. The general drought of last year was also a considerable factor in the increase of unemployed on the relief works, and, as a consequence, the average number working at the park increased from 1,000 to 2,500 per week. In the depth of winter as many as 1,500, and sometimes over that number, were working daily for rations and rent. With such a large number to manage and control (many of them the worst characters in the country), the task at times proved very trying and even dangerous—taxing the patience, temper, and tact of the Superintendent and staff to the utmost degree. With such a number, naturally, abuses of a minor character crept in, but were speedily expelled. Pressure and influence were brought to bear in many instances in favour of persons who had been proved undeserving, and I was frequently subjected to abuse by those who should have known better, for endeavouring to do my duty in carrying out the instructions of the Minister. When men were allowed to work for rent a rush was occasioned by single men and others who were undeserving and unworthy. Notwithstanding systematic inspection, a number of these contrived by misrepresentation and falsehoods to get on to these works for a short time. Many of them sold their rent and ration orders to raise money which no doubt was spent in drink. Owners of property and others of sufficient means would appeal to be allowed to go to the park for rations and rent, and, when refused, it was really surprising the numerous letters these people would produce from well-meaning citizens in their favour, clearly showing how easily a large section of the best and most charitable in the community are deceived by such characters as these.

My experience in the administration of Government relief has proved beyond doubt that it is not those who are loudest in their cry for work, or those who make the greatest demonstration for Government relief, are the most deserving. Large numbers of married men with families—men who by some unfortunate cause, retrenchment, accident, or sickness, are suddenly reduced to poverty, and whose habits and callings to a large extent unfit them for the rough and tumble of life—are ashamed and often too proud to beg, and will suffer privations almost to death rather than seek charity. Hundreds of these, unable to obtain clerical or light employment, gratefully availed themselves of the provision the Government had thus made (even though temporarily) to enable them to earn a living for themselves, their wives, and children, and to secure shelter over their heads during the severe winter months, without incurring the taint of pauperism.

In addition to the Centennial Park relief works, extensive ones were and still are being carried out by the Government, such as those on the Church and School Lands at Randwick, which has afforded work to thousands. It is being done by piecework, and although the wages earned by a large number are not great, it is because those employed were not used to or capable of doing the work. The prices paid are pronounced by experts to be fair, and good men accustomed to the class of work should be able to earn from 5s. to 7s. per day. Numerous additional works were carried out by the Government chiefly in the interests of the unemployed, as will be seen by the attached tabular return. Referring back to the works in connection with the Church and School Lands at Randwick, it may be mentioned that not more than two-thirds of those selected fortnightly turned up at the works to start. Many of them preferred to go to the park for rations.

Over £6,000 were expended in giving a week's wage work to married men and three days to single men as assistance during the Christmas season, £2,000 of which were spent through the Bureau, who afforded single and married men work at the park at 5s. per day. I know this proved a very great benefit to hundreds of families, while a few of the single men made irregular use of it, and would have been better without.

### Expenditure.

The year has been characterised by an unusual amount of agitation (clamour and noise), by a section of the unemployed and others, as to how little the Government were doing on their behalf, and what they should do. As a refutation to much of what has been said, I have prepared a tabular return showing the different works that have been commenced, and the expenditure incurred thereby, for one year, in the interest of the unemployed. Most of these have been carried out by the Bureau and the others by the Works, Mines, and Railway Departments, by men selected by the Bureau. In addition to those classified, there have been other Government works to which large numbers of men selected by the Bureau have from time to time been sent. I am convinced I am right in saying that no other Colony, or all the Colonies put together, have done as much to alleviate the distress of the unemployed in one year than New South Wales. By the tabulated statement referred to it may be seen that the expenditure on works in aid of the unemployed for the twelve months ending February, 1896, is set down at £201,591 4s. 1d., made up in sums respectively as follows:—Centennial Park Relief Works: £30,131 1s. 2d., which includes cost of rations worked for, restaurant meals, rent disbursements, and special work on wages during Christmas season, when £2,000 were expended at the park. Other special wages work done during that season amounted to £4,113, and included improvements to Art Gallery approaches, Cockatoo Island, Shea's Creek, Bunnerong Road, Church and School Lands, Botany Wharf, and Berowra Road. The expenditure on other works during

during the twelve months (paid for by day labour and piecework) is £64,899 3s. 8d., and includes Church and School Lands, Shea's Creek, Rozelle Bay, Woolloomooloo Bay, Muddy Creek, Cook's River, and Temora Road. The amount expended in free rations for urgent and special cases is £493 15s. 4d., and that for night shelter £231 12s. 9d. Fossickers' rations came to £41 18s., and were only granted to those applicants who were without means to purchase any. Special grants to municipalities for necessary works and to benefit local destitute unemployed amounted to £1,710 2s. (which sum, being supplemented by the respective Councils £1 for £1, represents double that amount), and includes the following places, viz., Greta, Waratah, Plattsburg, Hamilton, Adamstown, Merewether, Carrington, Wickham, Raymond Terrace, New Lambton, Lambton, Wallsend, Stockton, Broken Hill, West Maitland, East Maitland, Goulburn, Singleton, Liverpool, Smithfield, Fairfield, Lithgow, Queanbeyan, and Bourke. The whole of these municipalities were visited by me, under instructions, during the year, and the circumstances of the distressed unemployed were in each case reported to the Minister.

The cost for passes by rail and steamer this year amounts to £19,023 3s. 4d., of which £4,057 12s. 2d. has, so far, been refunded, and payments in reduction are steadily being made by many of those so assisted. The amount set down for forest-thinning is £50,000, and the special arrangements made, whereby the families of the absent men at this work have been able to obtain temporary assistance and rations, until money is sent to them, have been a boon to hundreds who otherwise were in a most distressed condition; but arrangements have now been made which, instead, enable these families to draw a portion of the men's pay, who sign orders for same to the Forest Inspectors, who forward them on to the Bureau. The railway deviation works caused an expenditure of £35,000. Special provision was made for rations for families in distress, and, as in the case of the forest-thinners, was greatly appreciated. It may here be noted that notwithstanding the liberal provisions made to give employment on railway deviations at day wages of 6s., out of 416 sent no less than 114 left their work—abandoned it—whilst others were dismissed for various reasons. These are the men I referred to as crying for work the loudest, and wanting it the least. The work is provided for them, and they refuse to keep at it, preferring rations to work.

These items make up the total named of £201,591 4s. 1d.

The numerous letters and personal expressions of grateful thanks from families who have benefited, at a critical time, are a sad testimony, showing that what must have proved a terrible and calamitous time has been safely tided over by a well-timed expenditure, and which, though large, may be claimed as a judicious one under existing circumstances, combining, as it did, works of a useful and necessary character with others from which a return may be anticipated eventually, and together resulting in relief afforded and pauperism avoided.

### General.

The number of unemployed registered at the Bureau was 14,062 (or 487 more than the previous year), of which 5,450 were married men, with 11,755 children depending on them. Single men registered amounted to 8,612. The total number assisted and sent to work for the year amounted to 20,576, or 4,196 more than the preceding year, and 6,514 more than the number registered during the period. This is mainly owing to the large number of passes issued to country places to applicants who have not been registered in addition to those who have been registered during previous years. There is a decrease of 3,625 in the number of fossickers sent out, owing no doubt to the drought, the effects of which have already been mentioned, the total number for the year being 7,093, as against 10,718 for that of the previous.

The number of arrivals from the other Colonies, &c. (996), show a decrease of 105 to those of the previous year, when 1,101 were recorded. By applicants supplying incorrect information (in the fear that the truth would disentitle them to the privileges extended to those of longer residence), I have no doubt a much larger number than that quoted passed through. The number of those registered at the Bureau who were arrested for drunkenness and other offences (whose tickets were taken from them and forwarded to me by the police) is 321, or more than double that of the preceding year, when 153 were reported.

It seems strange, but is nevertheless true, that there are some unfortunates in the community who, however poor and destitute, as soon as they earn any money get drunk, and find their way to the lock-up.

The average daily attendance of unemployed at the Bureau during the greater portion of the year has been very large. Many months it averaged daily from 1,500 to 2,500, but it has fallen off considerably during the last few weeks, only from 300 to 500 attending.

The conduct of the men, particularly the single men, while engaged on the relief works at the park was, I regret to state, very rowdy indeed at times. They gave, as already mentioned, a great deal of trouble to myself and staff, and a firm hand had to be exercised in dealing with them, and drilling them into discipline and order. Many have thought my measures for dealing with them too harsh, but it should not be forgotten that many of these characters were bad and dangerous, and in their own interests, as well as ours, definite and strict measures were absolutely necessary.

JOSEPH CREER,  
Superintendent.

\* Wages.—Except where otherwise shown, wages have remained about the same so far as has been recorded. In the cases referred to there has been a decrease, though not to any marked extent.

† Fossickers.—The year of drought has been the primary cause of the falling off in numbers going out fossicking. Forest-thinning, railway, and other Government works have also helped to keep the number under this head lower than it would otherwise have been. Many who have earned money on these works have gone out fossicking on their own account, while others have seized the opportunity of going to the West Australian fields.

Refunds.—The total amounts refunded for passes are—1893, £1,135 16s. 1d.; 1894, £2,076 10s.; 1895, £2,477 15s. 8d.; 1896, £4,235 19s. 6d.; total, £10,528 1s. 3d.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

**THE UNEMPLOYED.**

(RETURN SHOWING COST OF, SINCE 1891.)

*Printed under No. 4 Report from Printing Committee, 11 June, 1896.**[Laid upon the Table in answer to Question No. 17 of 27th May, 1896.]***Question.**

17. THE UNEMPLOYED:—MR. W. H. B. PIDDINGTON *asked* THE MINISTER OF PUBLIC INSTRUCTION,—
- (1.) What is the total sum paid for the relief for the unemployed on—1st, Shea's Creek; 2nd, Centennial Park; 3rd, railway fares; 4th, forest-thinning, from commencement of work to date?
  - (2.) What has been the total cost to the country of the unemployed for the years 1892, 1893, 1894, 1895, 1896 to date?
  - (3.) Since the establishment of the Labour Bureau country agencies, what sum has been expended for the relief of the unemployed in the country districts?

**Answer.**

(1.) Total expenditure on Shea's Creek, Muddy Creek, and Cook's River, to 26th May, 1896, £227,243 (including the cost of resumption, viz., £22,880). It is pointed out by the Works Department that a greater part of the above amount was expended on works that can hardly be termed "relief for the unemployed." Centennial Park to 30th May, 1896, £33,234. Railway fares, £50,759 4s. 1d. Of this amount, £30,000 may be put down to railway tickets granted to fossickers. Forest-thinning, £47,200. The whole of this amount, however, cannot be regarded as expenditure for the relief of the unemployed.

(2.) Total cost of unemployed for the years 1892, 1893, 1894, 1895, 1896 to date:—

	£	s.	d.
1892 .....	2,674	11	6
1893 .....	5,832	1	0
1894 .....	8,037	6	2
1895 .....	3,690	0	2
1896 .....	1,267	10	0 to date.

Total ..... £21,501 8 10

These amounts show the expenditure in city and country for the relief of the unemployed through the Labour Bureau in the years named, but are exclusive of railway fares and the expenditure on the Centennial Park. They include the cost of free rations, rations to fossickers, miners' rights, bed and meal tickets, municipal subsidies, &c.

(3.) Relief for the unemployed in the country districts, £470 15s. 5d. This sum represents money actually paid since March last, but the balances of a number of municipal grants still remain to be expended in the country districts.

**THE UNEMPLOYED.**

(PETITION FROM CERTAIN UNEMPLOYED OF THE CITY OF SYDNEY AND ITS ENVIRONS, PRAYING FOR WORK AT FAIR AND REASONABLE RATES.)

---

*Received by the Legislative Assembly, 5 August, 1896.*

---

To the Honorable the Speaker and the Members of the Legislative Assembly of the Colony of New South Wales, in Parliament assembled.

The humble Petition of the Unemployed of the City of Sydney and its environments,—

HUMBLY SHOWETH:—

Your Petitioners are electors of the said Colony, and are in distressed and destitute circumstances owing to their inability to secure employment, thereby preventing them earning sufficient to support themselves and those dependent upon them.

That it is a well-known fact that the prevailing distress is widespread and unequalled in the history of this Colony.

That, in the opinion of your Petitioners, it is a duty incumbent upon the representatives of the people to mitigate the said distress by finding employment on profitable works for those who only ask leave to toil, and to dispense with charitable assistance (however kindly meant) either from the present Government or from any other source or sources whatsoever.

Your Petitioners therefore pray that your Honorable House will, irrespective of party ties and obligations, unite and provide work at fair and reasonable rates for the unemployed of this Colony.

And your Petitioners, as in duty bound, will ever pray.

Signed on behalf of the Unemployed of New South Wales,—

[Here follow 10 signatures.]

1896.

EXTRACTS FROM THE VOTES AND PROCEEDINGS OF THE  
LEGISLATIVE ASSEMBLY.

VOTES No. 64. TUESDAY, 6 OCTOBER, 1896.

9. PITT TOWN SETTLEMENT :—Mr. Hughes moved, pursuant to Notice,—
- (1.) That a Select Committee be appointed to inquire into and report upon the abandonment of the Pitt Town Settlement scheme.
- (2.) That such Committee consist of Mr. Carruthers, Mr. O'Reilly, Mr. Dick, Mr. O'Sullivan, Mr. Watson, Mr. Rose, Mr. Price, Mr. Ashton, Mr. Kelly, and the Mover.
- Debate ensued.  
Question put and passed.

VOTES No. 73. TUESDAY, 27 OCTOBER, 1896.

7. PITT TOWN SETTLEMENT :—Ordered, on motion of Mr. Hughes, that the following Message be carried to the Legislative Council :—

MR. PRESIDENT,—

The Legislative Assembly having appointed a Select Committee on "Pitt Town Settlement," and the Committee being desirous to examine the Honorable Benjamin Backhouse, a Member of the Legislative Council, in reference thereto, request that the Legislative Council will give leave to its said Member to attend and be examined by the said Committee on such day and days as shall be arranged between him and the said Committee.

*Legislative Assembly Chamber,  
Sydney, 27th October, 1896.*

17. PITT TOWN SETTLEMENT :—Mr. Speaker reported the following Message from the Legislative Council :—

MR. SPEAKER,—

In answer to the Message from the Legislative Assembly, dated 27th October, 1896, requesting leave for the Honorable Benjamin Backhouse, a Member of the Legislative Council, to attend and be examined before a Select Committee of the Legislative Assembly on "Pitt Town Settlement," the Council acquaints the Assembly that leave has been granted to its said Member to attend and be examined by the said Committee if he think fit.

*Legislative Council Chamber,  
Sydney, 27th October, 1896.*

JOHN LACKEY,  
President.

VOTES No. 81. THURSDAY, 12 NOVEMBER, 1896.

8. PITT TOWN SETTLEMENT :—Mr. Watson, for the Chairman, Mr. Hughes, brought up the Progress Report from, and laid upon the Table the Minutes of Proceedings of, and Evidence taken before, the Select Committee for whose consideration and report this subject was referred on 6th October, 1896; together with Appendix.
- Referred by Sessional Order to the Printing Committee.

12th November, 1896.

---

PROCEEDINGS OF THE COMMITTEE.

TUESDAY, 20 OCTOBER, 1896.

MEMBERS PRESENT:—  
Mr. Dick, | Mr. Hughes,  
Mr. O'Reilly.

Mr. Hughes called to the Chair.  
Entry from Votes and Proceedings, appointing the Committee, *read* by the Clerk.  
Committee deliberated.

[Adjourned till To-morrow, at *Two* o'clock.]

WEDNESDAY, 21 OCTOBER, 1896.

MEMBERS PRESENT:—  
Mr. Hughes, | Mr. Watson.

In the absence of a quorum, the meeting called for this day lapsed.

THURSDAY, 22 OCTOBER, 1896.

MEMBERS PRESENT:—  
Mr. Dick, | Mr. Kelly,  
Mr. Hughes in the Chair. |  
Mr. Watson.

James Watson called in, sworn, and examined.  
Witness withdrew.  
William Musto called in, sworn, and examined.  
Witness withdrew.

[Adjourned till Tuesday next, at a *quarter to Three* o'clock.]

TUESDAY, 27 OCTOBER, 1896.

MEMBERS PRESENT:—  
Mr. Dick, | Mr. Kelly,  
Mr. O'Reilly, | Mr. O'Sullivan,  
Mr. Hughes in the Chair. |  
Mr. Watson.

Harry Packwood called in, sworn, and examined.  
Witness withdrew.  
William Reginald Stanley (*Clerk in charge of the Rabbit and Labour Settlement Lease Branch, Lands Department*) called in, sworn, and examined.  
Witness withdrew.

[Adjourned till To-morrow, at *Three* o'clock.]

WEDNESDAY, 28 OCTOBER, 1896.

MEMBERS PRESENT:—  
Mr. Kelly, | Mr. O'Sullivan,  
Mr. Hughes in the Chair. |

Entries from Votes and Proceedings, containing Message to Council requesting leave for the Honorable Benjamin Backhouse to attend and be examined before the Committee, and Message from Council granting leave to its said Member to attend and be examined if he think fit,—*read* by the Clerk.

William McGuire called in, sworn, and examined.  
Witness withdrew.  
Thomas Thornton called in, sworn, and examined.  
Witness withdrew.  
William Musto recalled and further examined.  
Witness withdrew.

[Adjourned till To-morrow, at a *quarter to Three* o'clock.]

THURSDAY, 29 OCTOBER, 1896.

MEMBERS PRESENT:—  
Mr. O'Sullivan, | Mr. Watson,  
Mr. Hughes in the Chair. |

William Reginald Stanley recalled and further examined.  
Witness withdrew.

[Adjourned till Tuesday next, at a *quarter to Three* o'clock.]

TUESDAY,

1896.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON THE

PITT TOWN SETTLEMENT.

THURSDAY, 22 OCTOBER, 1896.

Present:—

MR. KELLY, | MR. WATSON,  
Mr. DICK.

W. M. HUGHES, ESQ., IN THE CHAIR.

James Watson called in, sworn, and examined:—

1. *Chairman.*] Were you on the Board of Control of the Pitt Town Settlement from its inception? No. J. Watson.
2. How long after the inception of the Board were you placed on it? About eighteen months after it was formed. 22 Oct., 1896
3. Had the site for the Settlement been definitely decided upon before you were on the Board? Yes; I have taken an interest in it from the start. I know all its goings on, having been secretary of the movement.
4. You were a member of the co-operative committee which was responsible for the agitation which brought about the establishment of the village settlement? Yes; I was secretary of it.
5. And you have been in close touch with the whole movement from the beginning to the present time? Yes.
6. Who was responsible for the selection of the site for the settlement? It was recommended to Mr. Copeland, the Minister for Lands, by Principal Thompson, of the Agricultural College.
7. Are you aware whether any alternative site was considered by Mr. Copeland? Not that I am aware of.
8. Have you been up to the settlement? I have been there from the start.
9. Have you any personal knowledge of agriculture? No; we engaged an expert.
10. What is your opinion of the site as an eligible place to establish a co-operative settlement of this kind? The site was a bad one; but it could have supported forty families, provided they had irrigated.
11. In your opinion irrigation was essential to success? Yes; I fought for that.
12. Have you ever consulted any of the settlers in the immediate neighbourhood who were there prior to the advent of the Pitt Town men;—have you taken their opinion as to the possibilities of the soil up there without irrigation? I have spoken to those who were experts and knew something of it.
13. I mean the private settlers? I knew none of them.
14. I should like you to explain why, in your opinion, the settlement was a failure? I may mention that the village settlement was an experiment, and you will admit that to carry out an experiment you must have the best material. To my mind it seems to be in a nutshell. One question is: was the land suitable? and secondly: were the best men selected for it? These two questions are most material with regard to the matter. In my opinion, neither of these two requisites were to be found at the Pitt Town Settlement.
15. *Mr. Kelly.*] In the first place the site was not a good one, and in the second place the most suitable men were not selected? The men were selected at haphazard. I may mention that the committee of which I was secretary selected 700 men, out of which number ten or a dozen got through the Board of Control and the Labour Bureau. They would not go through the Labour Bureau at that time. At the start of the affair they seemed to have an objection to it. The men were persuaded by some of us to go  
and

J. Watson.  
2 Oct., 1896.

and try, but the whole thing, in the opinion of the majority of the committee of which I had the honour to be secretary, was that they were not selected in the manner in which they should have been; that is to say, the men who had established the movement and were partly responsible—in fact, on whom odium and ridicule had fallen—were not consulted with regard to it—that is to say, the selection of those who should go on the Board of Control and other things. Since then I have had to take my ideas from what I saw on the settlement, and what I learned in conversation with members of the Board of Control. When I got on the Board of Control myself it was composed of Civil Servants. I discovered that not one man except myself was in sympathy with co-operation. The Minister for Lands asked me to come in and help to save it from failure. Then I said it would do no good without water, and suggested two schemes for the supply of water. One from the lagoon some distance from the Settlement, and the other from Cadai Creek.

16. *Chairman.*] Do you attribute the failure of the scheme to the unsympathetic attitude of the members of the Board towards the principle of co-operation? My own opinion, gathered, not from hearsay, but from close observation, is that there has never been any intention to give the scheme a fair trial.

17. On whose part? I have not been able to discover, but there is someone in the Department who has been blocking the whole affair. I believe that both Mr. Copeland and Mr. Carruthers have been misled; but who the party is who misled them I have never been able to get at. I may relate my experience to the Board of Control.

18. *Mr. Watson.*] The Board of Control, of which you are a member, was the second Board of Control, composed almost exclusively of Civil Servants? Yes.

19. Then there was another composed of farmers and Civil Servants, who gave it up in disgust? As far as Mr. Taylor was concerned, I was met with the utmost courtesy; but by the others, when I first went there, I was never welcomed in any shape or form. Of course I did not mind that much, but I have been amongst illiterate men, and I have met with more decency, as I call it. I thought I was going amongst gentlemen, and I got amongst worse men, as far as that is concerned. I will simply say that not one man knew anything about co-operation or was in sympathy with it. I have had a theoretical knowledge of these things, and a little practice.

20. *Mr. Kelly.*] The other members had not much practical experience or theoretical knowledge? I was on the second Board of Control composed of farmers. I travelled all the way from Sydney once a month, sometimes twice a month, to attend the meetings.

21. These were farmers? Local farmers, exclusive of settlers. From inquiries at Windsor I was informed that the farmers have been opposed to the common being taken away from them. They knew no more about co-operation than the Civil Servants did, and they seemed to me to retard the progress of it. I should not like to charge anyone unless I was justified; but the selection of those men was very suspicious, and also their conduct afterwards. One of them, who is now Chairman of another Board of Control at Wilberforce, is a man totally unfit to guide or control men. I had the men at my command by just using a little diplomacy. He undid all the work that I had done by his brutality. As Chairman he stopped the rations of some of the best men, and he made the place a pandemonium. The forest thinning then came on, and the men went away broken-hearted. There has been something at work to undermine the whole thing.

22. How long was the second Board in operation? Two or three months. Of course it was in existence before I went there.

23. *Chairman.*] Do you think that if each settler had been on his own account the scheme would have been more successful? No. Of course that is a matter which has been unfortunately placed in a very queer position by the Press of the city. I have tried to put it straight, but they will not insert the letters. If this Committee includes the Wilberforce Settlement in their inquiries they would discover something ridiculously wrong there.

24. What we want to do is to find out the cause of the failure of the Pitt Town Settlement; if that is to be done by investigating the circumstances surrounding other Settlements, undoubtedly the Committee have power to do that? I will give one instance to show a peculiarity which will explain the thing for itself. Some time ago Mr. Butler, Chairman, stated at the Board of Control in Windsor that I had been in the Domain and spouting elsewhere, and writing to the papers complaining about the system, and they were going to invite two reporters up there and myself. Two reporters were invited. The reporter for the *Daily Telegraph* spoke of the two systems, condemned the Pitt Town system, and eulogised the Wilberforce Settlement. One settler came to me and asked if I was connected with the Pitt Town movement. I said, "Yes." He said, "Were you invited to Wilberforce?" I said, "No." The result was, I wrote to the *Daily Telegraph* contradicting a deal of their arguments, but the letter never appeared. This gentleman also stated to me that if it was known that he had come to see me they would find some means to throw him off the Settlement, as they did others who spoke their minds.

25. *Mr. Watson.*] Have they a system of individual blocks of land at Wilberforce? Yes.

26. Do they have any co-operative system as between owners of individual blocks? I believe they have.

27. Is it a system of volunteer co-operation? Yes.

28. Any one may assist if he pleases? Yes.

29. At this town it was not so? No. I may mention that I myself, although a co-operator, am quite willing that the individual system should be placed side by side with the co-operative. I endeavoured to get the remaining settlers, after some of them had gone to forest thinning and other work, to get their own blocks, and I assisted in it, but I did not succeed. Here is a copy of a letter that was sent to the settlers from Mr. Wilson, the Acting Under Secretary for Lands. This was when Mr. Carruthers had been speaking strongly about the place. I understand that Mr. Carruthers went there and told them that the place was unfit for settlement, and that he would have them shifted. That took a deal of heart out of the men. The letter is as follows:—

Sir,

Department of Lands, 29 January, 1895.

As it is thought that the opinions regarding the Labour Settlements at Wilberforce and Pitt Town with which the Minister has been credited in the daily papers may have had the effect of unsettling the residents upon these areas, and of reducing whatever energy they have been employing in connection with the various works upon which they are now engaged, I have the honor, by the direction of the Secretary for Lands, to inform you that, in carrying out any contemplated changes, the claims of the thrifty and industrious settlers will alone be considered; and in the event of it being decided to start similar enterprises under conditions more conducive to success, the opinion of the Board as to the merits of each individual member of the present Settlement desirous of a transfer will in the first instance be sought.

## SELECT COMMITTEE ON THE PITT TOWN SETTLEMENT.

I may also point out that no interference will take place with such of the settlers as desire to continue in occupation of the land when Government aid is no longer forthcoming, due regard being had to the necessity that may exist for a reduction in the area of the present reserve consequent upon the limited number of people that may desire to remain.

J. Watson.  
22 Oct., 1896.

(Signed) H. H. WILSON,  
Acting Under Secretary.

You will find that some of the settlers have received notice to quit.

30. *Chairman.*] Have not all of them? Every one that was there.

31. The settlement is practically now void? Yes; I resigned my position owing to what I discovered when I paid a visit to the town and was trying to get a few men to keep together and see if they could not make a living. They were nearly all men with very large families.

32. Did any settlers express a desire to remain under the conditions specified in the letter? Yes; between twenty and thirty.

33. How did they express it;—did they communicate with the Minister in the usual way? Yes; some as individuals. I believe twenty applied to be allowed to work co-operatively. I wrote to the Minister myself, backing up their claim individually and co-operatively.

34. The point to be made clear is this: This letter sets out that any man, when Government aid is withdrawn, who chose to go on would be allowed security of tenure; that is independently of the question whether they should or should not work collectively;—what I want to know is, was the Minister made acquainted with their desire? I believe so. Letters were sent by the settlers.

35. I suppose that any of the settlers who have vacated the Settlement would be able to prove that? Yes.

36. What was the reply of the Minister? That I could not say. It has been an evasive one, as far as I know.

37. You know that they were sent an order of ejectment? I have been off the Board of Control since these things occurred.

38. You have seen an order of ejectment since? Yes.

39. So it would seem that the answer of the Minister was unfavourable? Yes. I was going to mention the reason why I resigned from the Board of Control. It is a very important thing. Government money has been spent there and wilfully wasted. I wrote to the Minister for Lands stating my reason, and went up there to see how things were going on. In going past the orchard I found the pigs and cattle inside the orchard. I made immediate inquiries, and the men told me that they were all taken away into the bush wood-cutting, and they were told to let them go, but they fenced them up; but when they were away some one knocked the fences down.

40. Was the character of these improvements important? They were important because of the destruction of property. I reported the matter, and the Secretary of the Board of Control, Mr. Taylor, said he would lay it before the next meeting of the Board. I told him that he ought to have it stopped at once. I sent in my resignation because I saw that they were only lumbugging the men, and I would not be a party to it.

41. We want to make it clear, if it can be done, that this Settlement did not pay because of any inherent defect in the co-operative system;—if the Wilberforce scheme is going ahead, and a reason of that is that it is on an individualistic basis, do you think that a visit to Wilberforce would show how it was? It would show that it would require the expenditure of a fortune before it ever became important.

42. *Mr. Kelly.*] How many men are there at the Wilberforce Settlement? I could not tell you. I visited there once with an expert, and his opinion was that it was useless to endeavour to establish anything there. The cost would be something enormous, and the men who are on that Settlement are amateurs. Bega and Wilberforce have been spoon-fed by the Government to a far greater extent than Pitt Town.

43. *Mr. Dick.*] Do you know that of your own certain knowledge? Yes.

44. *Mr. Watson.*] They got more per head? I believe so.

45. *Chairman.*] Do you think that the Wilberforce Settlement is situated more favourably? No; there is no comparison. Wilberforce is a barren desert, and Pitt Town has patches of good ground; and the present area at Pitt Town, with water, according to the opinion of experts, could support forty families.

46. Was there any estimate of the cost of irrigation at Pitt Town? I believe there is one in connection with the Lands Department.

47. Did anyone refuse to do it? The reply of the Department was that it would be too costly and would not suit.

48. Was the site of the Pitt Town Settlement worse than the land of the surrounding Settlements? There were not many settlers about there. They were further on the flats. It would have been better if the settlement had been by the creek.

49. It was badly selected? Yes.

50. And was there excessive niggardliness in regard to funds on the part of the Department? The money was doled out to the first Board of Control in such a manner that they were unable to hit out. They were the people who recommended irrigation, but they were told that it would not suit.

51. *Mr. Kelly.*] I suppose that by this the Department began to see that the site was an unsuitable one;—do you think that was the reason? The committee, of which I am secretary, thought it would be a splendid ground for training people who had no knowledge of farming or agriculture, and that they could be drafted off into suitable places. That is what we recommended at Pitt Town to the Minister for Lands—that it should be used as a labour farm, where men would go and learn farming as they are doing at the Hawkesbury College. It would have been suitable for that. An expert stated that the amount of work that was done in the first eighteen months was marvellous—clearing was done, dams were sunk, and fencing was done. No one has contradicted that statement. In the first season rain was plentiful, and every settler had all his own vegetables, and the cattle were being fed; but afterwards—the second year—the seasons were bad. It seemed to rain everywhere but at Pitt Town. The result was that the settlers had nothing in their garden. It cost £10 a week to feed the cattle, and everything was in a bad state. I never thought that the men could do the work which they did, and they were men who had never seen one another before.

52. *Chairman.*] There must have been a few black sheep; but do you consider that the majority of the men were hardworking, industrious men? They were really first-class men.

53. Of course care was taken in the primary selection? That I could not say.

54. As a matter of fact, is it not generally considered that farming is not immediately remunerative—not for the first season or two? Yes; it is seldom remunerative on poor ground, for several seasons.

- J. Watson: 55. The Minister should have known that for the first year or two it was an experimental effort, which could hardly be expected to be self-supporting. How long was it before the Minister withdrew his protection from it? I understand that the present Minister at his first visit took the heart out of the men by telling them that he was going to find a better place for them, and they said what is the use of working when they were told that they were going to be shifted. Of course I insisted that they should do their eight hours a day, and they did it. I do not think the Minister for Lands thinks the place at all suitable, and he has never shown a desire to carry it on.
56. Do you think that better results would have been achieved if there had been a mixture of individualism and co-operation—if each individual could have had so much land of his own, and had had something in common with the rest of the settlers? Not at all.
57. You don't think there was any loafing? I have not seen any myself. There have been charges in regard to that.
58. So you regard the failure as primarily due to the bad site, and, secondly, to the total lack of sympathy on the part of members of the Board of Control, and, thirdly, to the want of irrigation? Yes.
59. But in spite of that, twenty families would have been able and were willing to stay, and would have made a respectable living had they been permitted? There is not the slightest doubt about that.
60. *Mr. Kelly.*] At the time the Minister visited the Settlement and made this statement, how many men were on the place? Between eighty and ninety families.
61. Did he take any steps to carry out that promise? I believe not.
62. And it took the heart out of these men? So they say.
63. From that time I suppose the Settlement began to dwindle? I managed to get it up a little bit, but when Mr. Butler became Chairman he disorganised the whole body. The women were going to throw him into the dam. It shows the state that he put the place into when he suspended five men. When I went to inspect the work I found it all first class.
64. You regard the incompatibility of the feelings of the later Board towards the selectors as one of the causes of the failure of the Settlement? It was the principal cause of what has been made much capital of outside—that is to say, that the men killed the settlement. I say that they did nothing of the sort. Had the men been treated as they should have been the two or three objectionable ones that may have been there could easily have been got rid of.
65. What has become of those eighty or ninety men who were there? Some of them went forest-thinning.
66. How many went forest-thinning? Thirty or forty families. I could not say exactly.
67. They were drafted out by the Government? Some left the Settlement, but there are families, I believe, there now. Twenty wished to remain and to hold their land co-operatively. One man wrote to me from Gannain, in the Narrandera district, asking if I could get a piece of Government reserve for them to settle upon.
68. *Mr. Watson.*] As individuals or co-operatively? Both; I was inundated with letters. They all looked upon me as Job's comforter.
69. You say that you wrote to the Minister for Lands? I wrote to him, and I got all the information that I could. I received a communication from the department to say that the leases for that place would not be up in time, and that the men would have to go to ballot for other places the same as anybody else.
70. *Mr. Kelly.*] Do you know the state of the majority now at Pitt Town? No; I have not been there for the last six months.
71. Is there anyone in charge? I believe there is a Mr. Hutchison in charge.
72. The site has been handed over to the Labour Department? I believe there is a superintendent in charge.
73. *Chairman.*] I have a letter from Thorhmah;—do you know him? Yes.
74. He states that he supported himself, his wife, and family by getting firewood prior to being driven off the settlement. On his  $\frac{1}{2}$ -acre block he kept poultry, and it was of great assistance to him, and by means of this help he was able to live; but since he has been driven off the settlement into Windsor he is no longer able to live by getting firewood, and he is destitute, and this he attributes entirely to the conduct of the Government in ousting him from the land;—is that the case in reference to these settlers? I believe so.
75. You think it would have that effect? There is a number of them about town who can get nothing to do, and who are worse off than ever.
76. He says, "If we had been allowed, we would have stopped and eked out a living, no matter how precarious"; also, "God knows that the Pitt Town settlement was large enough for those who were willing to accept a small part";—do you regard the department as being very harsh? Yes.
77. What they did was extraordinary and inconsistent in the face of their letter? Yes.

William Musto called in, sworn, and examined:—

- W. Musto: 78. *Chairman.*] Were you one of the first settlers at Pitt Town? No; I went up there about six months after it started.
- 22 Oct., 1896. 79. What do you know about this matter? I went there on the 29th December, 1893.
80. You are a married man? Yes.
81. Were you put to very great inconvenience, not to speak of hardship, by your ejection by the department? Very much.
82. Would you have been able to get a living if you had been allowed to stay on the land? I believe we could have got a living quite as well as the people in the district.
83. How much land had you fenced-in and cleared? About 2 acres fenced, and 1 acre cleared and trenched. Before I went up there I had to appear before the Board in Sydney, and I was told that I should have an allotment of about a quarter of an acre; and I was given to understand that I could do what I liked with it, to improve it under certain conditions laid down by the Board. It had been previously occupied by a settler, who vacated it. Although there was nothing done on the ground when I took the land, as soon as I went there I set to work and grubbed it thoroughly, taking out every stump and every tree. I went up there with the full determination to try and make a home for myself and family. When I got there I saw that there was trouble. They were trying to eject a man for some misconduct, and the place was in an uproar.

uproar. I took no notice of that. I was very anxious to settle down, as I had gone there for that purpose, to make a home for my wife and family. I had no ambition to take any part in the deliberations of the committee. I tried to keep even away from that, and put all my time in improving my surroundings, and I did so to a very large extent, which was admitted by the people in the district.

W. Musto.  
22 Oct., 1896.

84. *Mr. Watson.*] That was work done by you outside the time when you were working for the Settlement? Yes. I may say that I could be seen working with a flare light up to 9 o'clock at night, and always taking advantage of the moonlight nights and Sundays.

85. Each man was expected to keep his own allotment in order, and to grow vegetables, doing his own work after his eight hours' work on the settlement? Yes; and, as it appeared to me, a man was foolish who did not do that. If he did it, it helped himself and helped the Settlement. By growing enough vegetables for himself, he required less from the Settlement. From some of the men I should say that a bad choice was made in the selection, and there were men who were so avaricious as to grasp everything they could lay their hands on. We had to sign a document pledging ourselves to do certain things, and if we failed to do that the law was stringent enough to deal with us severely. I think the authorities were to blame for not having more firmness in enforcing the regulations. I put in a very comfortable nine months there. Although we had no money, we had plenty to eat and drink. I am not a strong man, but I have a certain amount of intelligence, and what I lack in strength I make up for in other ways.

86. *Mr. Kelly.*] Were there many who improved their land? Yes.

87. What proportion of them? Fully half of them. I tried to encourage them. I was put to work in the gardens, although I had no previous knowledge of anything of the sort. They looked to me to try and settle them, and to the best of my ability I did it. There were men who, no matter how hard you tried to encourage them, did no good. We went to work fully determined to adhere loyally to the Board, and to carry out their regulations, which we did, though in a number of cases very much against our own judgment. But we had to recognise a head, and we knew that if we did not things would be a good deal worse. There was a great deal of difficulty in getting the money that was wanted.

88. *Mr. Watson.*] That is the money sent to the Board of Control;—the settlers got no money, did they? The settlers had no money whatever—only rations. My allowance at that particular time was 14s. worth of rations a week.

89. That is on the basis of so much for each child and for yourself and wife? Yes; 1s. each for five children.

90. That was 5s. to the children and 9s. for yourself and wife? Yes; of course, whilst things were plentiful the place went on very well, although enemies of the movement tried to make out that the men were lazy, and always fighting amongst themselves. I made it a point, whenever I saw a stranger on the Settlement, of ascertaining what he thought about us—whether he thought we had done what we ought to have done for the number of men there, and the answer always was that we had done good work.

91. There was a tremendous amount of labour lost in conserving water? There was virtually no water when we went there.

92. *Mr. Kelly.*] You have left a permanent supply of water there? Yes.

93. *Mr. Watson.*] How many dams were put in by the settlers? I suppose six or seven dams, some of them very large ones. I suppose that, altogether, their carrying capacity is about 10,000,000 gallons.

94. Do you know how many acres of land were cleared by the settlers and cultivated? I should think about 500 acres were cleared.

95. And a lot was cultivated? Yes.

96. And there were some miles of fencing? Yes, about 40 miles of fencing.

97. That is ring-fencing and subdivisions? Yes, chock and log, and some posts and rails. That was independent of the settlers' own fencing round their allotments. Then there was a sawnill put up.

98. And a dairy? Yes; that kept one man going all the time, and there is a certain amount of labour expended in building a church.

99. Anyhow, they had to put up their own buildings? Yes. As far as I could make out, before I went there the Board had been unfortunate in the selection of the superintendent, who was a man who drank. He was continually the worse for drink, and had to be shifted on that account. Then one of the men was appointed—Mr. Waite—although I do not think he had much previous knowledge of the business. It seemed to me, when I went there, that the men, for some reason, had taken a very strong dislike to him, inasmuch as he did not seem to show the amount of firmness that was required to govern such a large body of men. They were sent out into the bush to look after themselves.

100. *Mr. Dick.*] We wish to find out why these Settlements are successful in some places and unsuccessful in others;—do you think it would be a good thing for the Committee to go to New Zealand and examine the settlements over there? As far as my experience goes, not having given the question a great deal of consideration before I went there, I should not hesitate to go on a similar undertaking, provided that there was a better selection of men made to form the settlement.

101. What about the settlement over in New Zealand? As far as I have been able to gather, there are some settlements there on different lines. I will give one instance with which I happen to be acquainted personally, to show the class of men that are put on. I was at one time working for the Harbours and Rivers Department, and when I went to the Pitt Town Settlement, to my surprise I found that a man with whom I had worked in the Harbours and Rivers Department was there. He was a man who would drop his tools and go off to some other department, and not the slightest notice would be taken of him. The man was insane, but he had influential friends. On the Pitt Town Settlement he was sent out burning off, and on the hottest day in summer he would come to work wearing a coat down to his heels, but with no shirt on. When he was burning off rubbish he would have about 100 small fires all around him instead of one big fire, and he would leave all those fires and walk 2 miles back to his hut to get a match to light his pipe.

102. *Mr. Kelly.*] There was no proper selection of men? No.

103. *Mr. Watson.*] What number of men would there be there who would not do a decent day's work? A very small proportion. Then you have to take into consideration that the people in the district were up in arms against the settlement coming there at all.

104. The farmers of the district that had previously had the use of the ground as a common, free of charge? Yes.

W. Musto.  
22 Oct., 1896.

105. *Chairman.*] To what do you attribute the failure of this settlement—to the bad site, the want of irrigation, or the lack of sympathy on the part of those who were on the Board of Control, or do you attribute any part of it to the co-operative principle;—do you think it would have been better if there had been no co-operation, but each had had his own land? The bad site had something to do with it.
106. Do you think that if the land were irrigated the Settlement would have been more successful? I do.
107. Do you think the management and the Board of Control, by their unsympathetic attitude, had anything to do with the failure of the settlement? I am confident of that. The whole thing depended on the way the regulations were administered. Had they been administered firmly, it would have stopped a great deal of irritation, and had the money been forthcoming when wanted.
108. Do you think that the Settlement would have done better if it had not been on a co-operative basis than if each had been on his own account? Under the circumstances no doubt it may have been.
109. *Mr. Kelly.*] Co-operation had nothing to do with the failure? I do not think that co-operation had a fair show. It appeared to me that the authorities were over-anxious to kill it from its inception. That is what appeared to me as one who had not studied the question of co-operation at all, but who had signed an agreement to honestly carry out the principle. That is my honest conviction. I believe that the authorities were over-anxious, backed up by the people in the district, to kill the thing.
110. *Chairman.*] In reference to co-operative schemes in general, you regard it as of first importance that the men should be of the right sort? I do.
111. Were these people of the right sort? No.
112. In what way were they lacking? They seemed to have picked them up in a haphazard way.
113. You believe that with a proper selection of men the co-operative principle on a good decent site would be a success? Yes, I do.
114. *Mr. Watson.*] Were you one of the men who stayed there to the last? I was.
115. Were you there when the letter was received from the Under Secretary for Lands to the effect that those who were there would not be disturbed? Yes.
116. And the men in consequence of that regarded it as a certainty that they would be left there? Yes. I myself went to work again on that permission. Some forty of the men had left at this time, and we got permission from the Superintendent, who was the official mouthpiece of the Board, to enclose a larger area than we had previously held. We did that and put stuff in the ground, and although it was acknowledged that some of us were on the worst ridge in the whole district I was able to produce almost any vegetables.
117. After doing all this you were ejected and refused permission to remain on the land? Yes, distinctly told by the Minister in person that if we did not leave—he told this to my wife—the roof would be taken off our house.

TUESDAY, 27 OCTOBER, 1896.

Present:—

MR. KELLY,  
MR. O'SULLIVAN,

MR. DICK,  
MR. O'REILLY.

W. M. HUGHES, ESQ., IN THE CHAIR.

Harry Packwood called in, sworn, and examined:—

H. Packwood.  
27 Oct., 1896.

118. *Chairman.*] What connection have you had with the Pitt Town Settlement? I was there as a settler almost from the first inception, or from within fifteen or sixteen days of the time it started.
119. How long is it since you left the Settlement? I left it twelve months ago.
120. Were you compelled to leave it, practically? I was compelled; there was nothing else for me to do. I could either do that or go forest-thinning; but I did not go there to thin forests, I went there to make a home for myself and family.
121. Would you have been able to make a home if you had been allowed to stop there? If I had been allowed my own way, I should have had a home for myself, and have been there now.
122. Were there many other settlers in the same position as yourself in regard to that? Yes.
123. Do you consider that the action of the department was prejudicial to the interests of the men as well as to the idea of co-operative Settlement? We were not allowed to do or have a say in anything. We had to carry out what we were told to do. If we were told to climb a tree we must climb it; but when you climb a tree too often it does not do.
124. Can you fix the blame upon any particular individual? I could not do that. First, the soil was very poor; but if we had had proper management it could have been made very different from what it was. I am only basing my ideas upon my own little plot of ground. I could have grown nearly anything had I been allowed.
125. Did anyone stop you? I was given the idea that if I grew a certain amount more than I required that they would have to go into the communal property, the same as bees were ordered.
126. Information has been given respecting men who were getting a living by cutting firewood whilst they had those little plots of ground, and that they were just able to make a living, paying no rent, but that being turned off the Settlement they are now practically destitute;—were you one who cut firewood? I cut many hundreds of tons upon the Settlement. When it was on its last legs, as a settler I did nothing but cut firewood—from the time that the saw-mill, which was a white elephant, was erected, and it was only fit for the scrap heap, as it was obsolete.
127. Do you consider that the failure of the Settlement was due to the principle of co-operation? No; but I do not think co-operation can be carried out with such a large body of men as were there. If you had up to twenty men, you would have a better chance. In the Settlement I could pick out twenty men that I would have faced anything with. There are a lot of men of the same principle as myself—nothing in the shape of work daunted them; but if you are connected with a man who cannot do his work it is not encouraging.

128. You do not think that the principle of co-operation can be successful unless each individual has an opportunity of selecting his men? There should not be more than twenty, and there might be as few as six men. H. Packwood.  
27 Oct., 1896.

129. Why do you believe that twenty men should be the maximum? You would be better able to agree with twenty men than with 100. You would know every man's faults and his temper; but where you have a great number, some old and worn out, and others disabled, some of them are so crotchety that you cannot get on with them.

130. If the soil had been better, and the principle of co-operation had not been so recklessly applied, even then trouble would have crept in? It did come from the very first. A certain class of men there wanted to domineer over the others. If you had only a small number, you could exclude objectionable persons, and you need not allow certain persons who are actually drones to domineer over the others.

131. Do you not think that the work may be done very much more profitably with combined labour than by individual efforts? Undoubtedly I do.

132. If a man has capital, and can employ a number of men, it is a matter of indifference; but if a man has no capital, the only way to remedy it is to combine with his fellows to get the labour done? I went to the Settlement to make a home for myself and family. I had every expectation that it would be a success. I thought that the larger the number there the better, but when I got there I found it was otherwise.

133. What number of drones would there be? I should say about 25 per cent.

134. *Mr. Kelly.*] Your idea was that they were unsuitable for the purposes of co-operation? You could not say anything. If you saw a man, and you knew that he had not done a fair day's work, you could do nothing on the subject, because they said they had done their best. An individual employer would have exacted more labour, or have turned them adrift. But we could not do that with the bad settlers. You could not turn a man away, although you knew that he did not do sufficient work, as long as he said that he did his best. No doubt they did; but some of them were not fit to be there. I recognise that in pioneering you want the bone and sinew of the Colony to make it a success. When I was clearing I hurt my back, but I do not think they believed that I was sick, though I really was. Another man could be laid up for four or five days, and we were told that he was actually sick. They would not believe that I was sick. Had there been a strong man instead of a poor weak man to take my position the work would have gone on, but as it was my place was vacant. You could not put an old man in my place.

135. *Chairman.*] Do you think the management could have done away with the difficulty by efficient supervision? Yes; if we had had a man like Mr. Tresseder, or Mr. Vaughan Jenkins, who I admit had a failing. If Mr. Tresseder had been there he would have made a difference in the Settlement. One of the great faults of the place was favouritism. As soon as the superintendent was appointed to fill Vaughan Jenkins' place he appointed foremen. There was no necessity for that, and as soon as the men got to be foremen there was a little officialism, although we all went there equal to each other. When men were put over others then they started to talk, and if a man was a boss of a gang he seemed as if he were an employer of labour. If you made a remark you were reported to the Board, and you were accused of grumbling, and a person does not like to be always grumbling. If we had had Mr. Taylor at the head of affairs, Mr. Stanley, or Mr. Watson—some officer to whom the men would have listened, or stated their grievances—a better state of things would have resulted.

136. *Mr. O'Reilly.*] What do you mean by saying that a man spoke to you as if he were an employer of labour? I was doing my best. We were all there on equal terms. An employer, if he thought I was not doing sufficient, would say, "Hurry up there; I want you to straighten yourself out a little bit." This man was exactly the same, but he took good care that he did not do the work himself.

137. Do you not think that some guiding authority, even if elected by yourselves, is necessary in a concern of that sort? Had we elected these men we would have abided by the result with pleasure.

138. *Mr. Watson.*] Do you think that if you had had a say in the election there would have been more obedience shown? Yes; and we should have got a far better class of men, I am sure. I was put a short time on the huts, and there were two carpenters working on the huts who had been taking contracts in the city to the amount of £7,000 or £8,000. A bricklayer's labourer was put over them, and he was telling them how to build the huts. I think that was wrong. When putting up these huts we began one at 9 o'clock in the morning, and we put up three huts, each four hands taking seven hours, frame work only. Our idea was to get everybody housed as soon as possible. But as soon as it was found out that we were getting the huts put up so rapidly we were knocked off, and somebody else was put on. I came to the conclusion that we were doing it too rapidly. That work was going on day after day after that for nearly twelve months, and it got to be a saying on the settlement, "One nail, one slab, one day." A man was working with me named Dunne, and I reckon that ten days or a fortnight would have been sufficient for us to put up those huts; but a number of men were employed on them for nearly twelve months.

139. *Chairman.*] Do you think the work would have gone on faster and better if the men had selected their own overseers? I do.

140. Do you not think that the practice of selecting your own overseers, and thus making the overseers dependent upon the goodwill of the men, might do away with the tone of authority which an overseer might use to those under him? The idea of co-operation was that we were all to work for each other. If a person goes with that idea it requires no tone of authority; it is every man trying to do his very best.

141. That idea did not answer in New Australia, because people will not work for one another? That body of men was too large, which proves that 100 was too large to co-operate.

142. You believe in co-operation if proper persons are selected to carry it out? Yes; with a certain limit as to the number. Some men might work well together, whilst other would not.

143. Then you believe that men should be selected who have an affinity towards each other? Yes.

144. Do not you think that good faith is required and good discipline? Yes, and somebody at the head who will act fairly. That is where we failed. Our great failure was owing to favouritism. There should have been a man at the head who could command respect. They do not require to use severity.

145. *Mr. O'Reilly.*] If the only severity was to tell you to "hurry up," would not your own selected overseers be bound to use the same language to you? If the men had elected an overseer they would have worked more amicably with him.

146. That is to say, he would have done more—what you wanted? I will just give you an example: I was working with a gang of men log-fencing, and the men could not put up more than sixteen panels a

day—

H. Packwood. day—nine men and two horses. Another man used to come when the head of that gang was sick and take charge, and he could knock up twenty-two panels a day. That shows that he worked amicably with his men; but the other man always had a little dodging round in the bush, getting the lines straight and doing siding; but the other one went to work in the same way as the other men—with his axe.

27 Oct., 1896.

147. *Mr. O'Sullivan.*] You admit that a man can only do his best;—possibly the man who was "doing siding" was doing his best? That may be; but as he had so much to say we did not think so.

148. *Chairman.*] Here is an important thing: In a privately-conducted enterprise if a capitalist undertook the work he would put at the head of it a man who had some acquaintance with that sort of thing—an expert—and the thing would have been a success or a failure, according to whether there was sufficient capital, whether the ground was suitable, and whether the man put in authority was of the right sort. According to you, none of these were important conditions were there—the ground was not suitable, there was not sufficient capital, there was no irrigation, and the persons in authority were totally incapable, so that practically it is not a test that has proved the failure of co-operation, because, under these conditions, individual effort would have failed also? Yes.

149. Could anything have made it a success under the conditions of the soil there? Not financially, but it would have shown better results.

150. Could anything have made it a success with the kind of overseers you had? I am doubtful.

151. Even supposing it was individual effort, instead of co-operation, it would fail equally? Yes; but it may have been better carried out, no doubt.

152. This is not to be regarded as the failure of co-operative efforts, but as the failure of one of the methods by which co-operation has been applied? Yes.

153. You say that there should be no promiscuous gathering of men with only one thing in common—namely, their distress—put upon bad soil, with overseers conspicuous for nothing so much as their incapacity? Certainly not; and that to expect co-operation to be a success under these circumstances is monstrous.

154. What do you think of the causes of the failure of the settlement? I should say the first cause was bad soil.

155. What do you think was the second and the chief cause? Want of water. We had a suitable place for irrigation. We got 25 acres bordering down to the Long Neck Lagoon, and we ought to have had a Tangeve engine and pump. One was offered, I believe, for £200. I could have run half-a-mile of pipes myself down in a day, and when we came to a road we could have put them under the road, and put the water right through to the proper site, all on the estate.

156. What do you think was the third cause of the failure—bad management? Yes. But we had so many managers—one management did one thing, and another management did another thing, through gross ignorance. Each wanted to do just the contrary to the other. The greatest show of any management was by Mr. Tresseder, who came on the place, and, I believe, had the good will of all the men—at least of 75 per cent. of them. He was the most practical man we had. If we had had him from the beginning there would have been a Pitt Town Settlement now, and not a dreary waste of desolation as it now presents.

157. Did the men work harmoniously under him? Yes.

158. They recognised him as a man who understood his business? Yes. He walked over the soil, and he said, "I will put tobacco here," "I will put lucerne there." He looked at the soil, and he knew what it would produce, and was considered by the industrious settler the right man in the proper place, but a terror to the drones.

159. Have you had any practical experience of agriculture prior to this Settlement scheme? My only experience of agriculture was when I was a lad. I belong to an agricultural family; all my mother's people are farmers. My father has been for some years—over thirty years—head gardener for Sir Bernard Semuelson—and I worked on a farm. I often thought that I should like to go in for producing Turkey rhubarb; I saw the inception of that industry by a man and his wife. It is an industry that grew until eighty or ninety people were working at it. The rhubarb grown was sent to Turkey, and afterwards sent back to England as the real Turkey rhubarb. Opium poppies (the large white) were also grown. I have seen hundreds of acres of them, and acres of henbane, which is considered a noxious weed here; also liquorice roots and roses.

160. Do you think that any of these things could be produced upon such a Settlement as that at Pitt Town? I have an idea that they could. I should have gone in for an acre of them to see how the soil suited if I had stayed there and been allowed. I would have found out what constituents these particular things took from the soil—whether oxygen, carbon, or potash. I should have gone in for tobacco growing and drying, and the drying-house would have been suitable for drying rhubarb. Of course these industries could have been started on a small scale at first.

161. Were there many men on the settlement with a prior knowledge of agriculture? I think there was a pretty fair sprinkling.

162. Were there any who had had experience of brickwork? Yes.

163. You say that 75 per cent. of them were decent, hard-working, reliable men? They were when I went there first. I never saw a better body of men than they were to stand up in a field together. And the Pitt Town and Windsor people admired the men very much, yet we came to an ignominious failure—not our fault though.

164. I suppose that the conditions under which they lived had a material effect upon them? It had. I was a walking ragman. The only things that I got there in the shape of clothes myself were one flannel and a pair of socks.

165. *Mr. Watson.*] Do you reckon that your experience there was of any value to you? I do.

166. How would it be of value to you? First of all, I never had much experience of clearing before, but I reckon now that I could clear with anybody. I never knew until I heard Principal Thompson tell us that all plants have food to live upon, and that feeding plants is exactly the same as feeding birds. They each require different foods to be a success. These things must be worked out scientifically, and must be looked at straight in the face to be a success.

167. You think that all you have learnt will be of value to you in the future? Yes; if I can get an opportunity to use my knowledge, but I do not see much show of it at present.

168. *Chairman.*] You emphasise the fact that in spite of the drawbacks you could have got a living if they had let you alone? One or two of us might, to the disadvantage of other settlers. I have always made

a hobby of poultry, yet I was not allowed to go near the poultry farm. I have been the colleague of one of the most successful breeders of game fowls in the Colony for over ten years. The Superintendent gave orders for me to make out plans of a poultry yard. Then they put another man into it. The poultry were taken ill, and I told the man what would cure them, but he would not listen to me. They were in a disgraceful state, and the Superintendent should have looked after them, but he did not, and to save the lot from dying they were drawn for in lots by the settlers, by order of the officials.

H. Packwood.  
27 Oct., 1896.

William Reginald Stanley called in, sworn, and examined:—

169. *Chairman.*] What are you? I am a clerk in the Lands Department, at present in temporary charge of the Rabbit and Labour Settlement Lease Branch.

W.R. Stanley.  
27 Oct., 1896.

170. Were you secretary of the first Board of Control of the Pitt Town settlement? Yes.

171. Were you brought into intimate connection with the members of the Board and with the settlers? I was.

172. Do you know anything of the settlers? I know the majority of them fairly well.

173. What is your opinion of them as a body; Mr. Packwood has stated that when they first appeared they were regarded with astonishment and admiration by the surrounding settlers, and that they were a fine body of men? They varied very much; they were an assorted collection. There were some very fine men amongst them, and some very inferior men, both as to physique and brain power.

174. Do you think they were suitable for the business they were engaged in? Some were and some were not.

175. What percentage of them, do you think, would be suitable? I think, with regard to the selection of the men, that a more searching inquiry into the antecedents and characters of the men to be enrolled as members of the labour settlement should be a *sine qua non*—a condition precedent to enrolment.

176. *Mr. Kelly.*] You consider that men should not be taken haphazard? Certainly not.

177. *Mr. Watson.*] Are you able to say what percentage of those men were unsuitable? I should say that about 25 per cent. of them were unsuitable.

178. *Chairman.*] Do you regard the experiment as a failure? No; I cannot say that I do, altogether. I think it has been a useful experiment, and from the experience gained here and by Queensland, New Zealand, South Australia, and Victoria, with regard to village settlements, a good system of village settlement might be eliminated.

179. Was not this experiment carried on under conditions which practically militated against its success, and if these conditions could be avoided in future might it not be successful? No doubt many of them could be avoided.

180. The character of the soil is admitted to be bad; what do you think is the chief reason of the failure of the Pitt Town Settlement;—was it owing to the men, the managers, or the Board of Control? It is hard to say.

181. *Mr. Watson.*] It is a fact that the management was unfortunate, in so far as it was frequently changed? The constant changing of superintendents was an unfortunate necessity.

182. The management;—there were three Boards were there not, and three superintendents? There were three Boards and four superintendents.

183. *Mr. Kelly.*] Why were the changes made;—was it on representations from the men or from the Minister? In one instance the superintendent was removed partly at the suggestion of the Minister; but if that suggestion had not been made, the Board would have taken steps for his removal. That was Mr. Tresseder. The Board contemplated his removal, owing to certain charges that were made against him.

184. *Mr. Watson.*] Have you got the minute-book? Yes.

185. Have you the pass-book of the Board of Control of the Pitt Town village settlement? Yes.

186. From that, can you give the Committee an idea of how the money was paid to the Board of Control by the Department? Yes; I can supply dates and amounts.

187. Will you give the sums which were paid and the intervals between? On the 25th July, 1893, the first instalment was paid—a sum of £25, to meet the preliminary expenses of the Board. On the 1st September in the same year a further sum of £500 was placed to the credit of the Board. On the 29th of the same month the sum of £1,000 was placed to the credit of the Board; and on the 22nd December following a further sum of £791 1s. 9d. was paid.

188. In December, 1893? Yes. I can explain the odd sum. A payment had been made by the Department on account of the Board to the railway authorities for freight, and the advance of the Board was therefore less by that amount. The next advance, consisting of £250, was the 23rd February, 1894; on the 10th April, £250; on the 22nd May, £250; on the 6th July, £250; on the 24th August, £750; on the 29th September, £370; on the 29th November, £500; on the 14th December, £500; and on the 18th February, 1895, £750; and this was the last payment to the first Board of Control. The next payment, of £505, was on the 28th March; the next, of £750, on the 27th April; and on the 21st August, £250, which was the last advance received from the Treasury.

189. You have not got anything to show the expenditure in connection with that;—do you remember how much of that money was spent in plant and materials? I am afraid I have not got the balance-sheets here.

190. Up to the end of September, 1893, £1,500 was paid in;—could you give us any idea how that was spent? Unfortunately, the pass-book is no guide to it. It merely gives the numbers of the cheques and their amounts. It does not mention names. I have a general recollection of some of the items. There is an item of £105 19s., which was paid to a man named Kember for horses and drays. Another item, of £142 18s. 9d., was paid to Holdsworth, Macpherson, & Co. for implements, &c.

191. *Mr. Kelly.*] I suppose there would be iron roofing? No; there was not much roofing purchased. The only roofing purchased was a kind of black felt, which did not answer the purpose. That was got by Mr. Vaughan Jenkins.

192. What were the houses covered with? Bark.

193. *Mr. Watson.*] The felt was used for a few houses? Yes. Here is an item in the minute-book for the 27th September, 1893, about the time of the receipt of that £1,000. The amount of this item is £343. It was passed for the payment of accounts. I have a book here which will furnish particulars of such payments.

- W. B. Stanley. 194. Can you give the general tenor of these accounts, as to whether they are for provisions, implements, stock, or anything like that? On the 27th September a sum of £343 was passed on account of provisions. The bulk of this money was for the payment of accounts for material or provisions supplied.
- 27 Oct., 1896. 195. Not in the way of plant, speaking generally? In the various statements that I have prepared, all implements—picks, shovels, and articles of that sort—would come under the category of plant.
196. There are a number of items here in the book which you have produced;—there is an account, "George Waite," one for Holdsworth, Macpherson, & Co., one for Foley;—I take it that these are payments for food, tools, &c.? Yes, except Waite's, which would probably be for incidental expenses.
197. I notice an amount of £546, under date 2nd August, 1894, D. Mitchell, Moses, Holdsworth, and Macpherson;—I take it that these items were for food and tools? Yes; there are four headings under which expenditure has been classed in the balance-sheets which I have prepared. Plant includes cost of all tools, live stock, waggons, ploughs, and everything which would be used in developing the settlement and of the carriage thereon. The next item is that of maintenance, which includes the purchase of food of every description, clothing, boots, carriage of supplies, flour, and so on. The next item is that of improvements, and under that heading is included all expenditure in the purchase of iron, ironwork, nails, timber, seed, and fruit-trees of every description. The fourth heading is that of working expenses, including salaries, wages, advertising, travelling expenses, and sundries of every description. With some of the balance-sheets there is an analysis made of the various items under the head of working expenses, including, in addition to the above, the cost of printing, stationery, travelling allowances, either to members of the Board or the settlers, carriage of parcels, and any other incidental expenses. These have all been analysed, but I have not followed out the same process with regard to the last balance-sheets. The expenditure has been less, and the inspectors did not require the information, and as I had more work than I could possibly manage I did not go into the question of analysis. The balance-sheets are all prepared, and my books have been audited by the Treasury inspectors.

WEDNESDAY, 28 OCTOBER, 1896.

Present:—

MR. KELLY, | MR. O'SULLIVAN.  
W. M. HUGHES, ESQ., IN THE CHAIR.

William M'Guire called in, sworn, and examined:—

- W. M'Guire. 198. *Chairman.*] You were a settler on this Settlement? Yes.
- 28 Oct., 1896. 199. From the beginning? From about a month after the beginning.
200. In your opinion, what was the cause of the failure of the Settlement? Bad management.
201. Will you explain to the Committee how this bad management showed itself principally? First of all when I went there we had a superintendent of the name of Jenkins, and he used to direct us where to go. We sometimes would be a couple of hours waiting around his tent in the morning, and he, whilst in bed, would direct us where to go to work. To the best of my opinion he was then lying in bed because of the effects of drink. I saw him on several nights drunk.
202. Do you think that if there had been better management the Settlement would have been successful? I could not exactly say that. There would have had to be more care in the selection of the men.
203. What is a fair percentage of the men who were fit for the Settlement? I should put it down at about 75 per cent.
204. You think that they were men who were suitable for the work? Yes; about seventy-five out of every 100 would be pretty fair men for the work.
205. Would that include malcontents, men who loafed and who would not work as well as those who were incapable of working? The best men never got any encouragement at all. Those who did were men generally who used to side with the superintendent. He did not care whether you worked or played—whether you laid down or not.
206. Which superintendent was that? Mr. Waite, the second superintendent.
207. He evinced really no proper care of the men there? No; if you let him alone, he would let you alone, and you could do whatever pleased yourself.
208. You consider the soil is all very bad? I do not think it is very bad. I think it is good enough for a man to make a living there. As regards the firewood I could cut between 4 and 5 tons a day, and I could have made a living in doing that, but I was prosecuted for it.
209. Have you had any experience of agriculture either here or at home? Very little.
210. Have you had any experience of bush-work? Yes.
211. Any amount? Yes.
212. You have had experience of rough general work? Yes.
213. You yourself were quite competent and capable of doing any work you might be asked to do? Any work I might be put to.
214. You regard, then, the chief cause of failure as being bad management? Yes.
215. Do you think that if the land had been irrigated, the Settlement would have been more successful? In my opinion there are plenty of people around there living on not such good land which has not been irrigated at all. There is one piece over 100 acres called a sheep station, which is lying idle, and which is as good land as you would get on the Hawkesbury, excepting the Pitt Town Bottoms, and which would grow anything.
216. Men running independent Settlements were capable of living on the same kind of land? Yes; not as good land.
217. And some as good as the Pitt Town Settlement? Yes.
218. Did you receive a letter from the Department of Lands, dated 29th January, 1895, as follows:—  
[Letter read]? Yes.
219. Were you led to believe by that letter that you would be permitted to stop there if you so desired? Yes.
220. As a matter of fact, in this other communication you say that you were getting a living by cutting firewood? Yes.
- 221.

221. Selling it to people in the adjacent town of Windsor, and so on? We sold it to the carters for 1s. a ton, and what they made afterwards was, of course, their own. W. M'Guire.
222. You were assisted to get this living by reason of the fact that you were paying no rent for your little holding, and only by paying no rent, and living as you were, you could get a living? Yes. 28 Oct., 1896.
223. As soon as they turned you off the holding you collapsed? They did not turn me off the holding. I am still in possession.
224. I believe you have a copy of a letter which you sent to the editor of the *Freeman's Journal*? Yes; it was published in the *Freeman's Journal*. It is as follows:—

Dear Mr. Editor,

Pitt Town Labour Settlement, 13 October, 1896.

I take the liberty of writing to you those few lines, in regard to how the Pitt Town labour settlers have been treated by the present Government. There is now remaining on the settlement seven settlers. I have now been out of work for this last two months, and a Mr. T. Curry, another settler, came to me and asked me to do a day's work for him, and he told me for to chop down an old fence that was enclosing his allotment, and that he would give me a day's wages for it. I then cut it down as he desired me, the fence belonging to him, that he erected in his own private working hours, which hundreds can testify. I may also point out to you that I wrote to the Minister, Mr. Garrard, pointing out to him that I and my family are on the verge of starvation, and I have had no reply back, asking him for permission to cut firewood on the Settlement, so as to keep myself, wife, and six children from starving, until such time as I can obtain work. I also asked him for work in my letter about a fortnight ago, and I have received no reply from him since. I also enclosed the summons to him, asking to know was it with his consent I had been summoned, but he only enclosed the summons back to me, with no reply whatsoever about work or permission to cut the firewood. I also pointed out to him that I only had earned 15s. this last two months to keep a wife and six children on. I may also point out that he has closed the public school on here, so as to drive the settlers off the place, there being more children here than the Act requires to keep a school. I also enclose you a copy of a promise that the present Minister for Lands has given us, and also the summons I received. I was fined 10s., and 6s. 6d. cost of Court; total, 16s. 6d., which I could not pay, so I had to go into Windsor Gaol for forty-eight hours. Now, Mr. Editor, I will leave you to judge for yourself how we have been treated, hoping that you will be kind enough to expose this in your valuable paper to the public at large.

I shall feel for ever grateful to you if you will be kind enough to forward on those correspondence to Mr. Hughes, M.L.A., as I am sure he will expose this in the House.

I remain, &c.,

WILLIAM M'GUIRE.

225. Do you know, of your own personal knowledge, that other settlers have been as harshly treated as you were—I do not mean that they have been sent to gaol, but that they have been turned off the Settlement? Yes; I know there was one, whose house was pulled down by Mr. Waite.
226. As a matter of fact, were the men told that, if they did not clear out, the roofs would be taken off their houses? I was not there at the time.
227. But it is common talk amongst the settlers who have remained there until the last? Yes.
228. About how many of you were willing to stay? There are only half a dozen families on the Settlement now.
229. How many were willing to stay a little while ago—were there not about twenty or twenty-five families? More than that, if they had got an opportunity to stay.
230. Did some of the settlers have enclosed places, with fruit-trees and cultivated blocks? Yes.
231. And did not the department by their foolishness allow cattle or something to get in and destroy some pounds worth of property? Yes; the garden that belonged to the whole Settlement was allowed to be treated in that way. The fences were broken down in all directions, and the cattle got in.
232. This was the result of many hours of patient labour on the part of the settlers? Yes.
233. And the cattle were allowed to get in? Yes.
234. What object could the department have in doing such a thing as that—had the settlers done anything particularly wrong, were they there illegally? Not that I know of. The only particular object they had, I think, was that there were a certain number of men who were left there, and got a saw-mill to see if they could make a living with it. I contend that the reason why they did not make a living with it was because they were only allowed a certain amount, no matter what they earned, and it was only a bare existence which they were getting. They were given no encouragement, and they only tried to earn that amount, and would not earn any more.
235. It brought them all down to one level? Yes.
236. You reckoned that you could get more working for yourself? Yes.
237. Do you consider that the department has dealt unnecessarily harshly with you? I do.
238. And that you could have got a living if they had left you alone? Yes; I am quite sure of that.
239. They say they want the land—what do they want it for? To turn it into a casual labour farm, I believe.
240. They say the Settlement failed, because the land was poor—what do they then want the land for? They cannot say that. They never gave any individual settler a chance to succeed. I could make a living there alone from rearing fowls and pigs if I were allowed.
241. Have you lost your faith in co-operation owing to this? Yes.
242. But after all you must admit that it did not have very much of a show? I must admit that.
243. With an unsympathetic department the co-operation did not have much chance? No; the men were not carefully selected enough.
244. One witness said yesterday that he would recommend that gangs of men who should select each other, and who would harmonise one with another should be taken, not more than twenty in a lot? I think that would be fair. If they were to know each other's working ability it would be better.
245. Do you think that any scheme would fail if men were taken haphazard? Yes; if they were brought together as strangers I do not think it would ever succeed.
246. Do you attribute the failure of the Settlement to the unfitness of the men, or to the badness of the management? I put it down chiefly to the bad management.
247. Do you think that if another co-operative scheme were suggested, under which the men were more carefully selected, and if the management were better, you, would be inclined to throw in your lot with them? I would if I knew the working ability of the men.
248. Do you think that the department had any real sympathy with the scheme? I do not think so, for I have written dozens of times myself to both Ministers.
249. They spent some £8,000 on the Settlement from beginning to end. I suppose you are aware that the greater portion of that money was spent on mere "tucker," just keeping the Settlement going, feeding and providing plants and tools for the Settlement? I do.
250. In short, there was no capital available for production? I do not think they were ever self-supporting.

W. M'Guire. 251. Have you written to the department in reference to your being put in gaol for wood-cutting? No, I have never written to Mr. Garrard about that; but lately I wrote to him asking for permission to cut firewood. I shall have to go to gaol again for cutting firewood if he does not give me permission. This is the reply I received. I did not ask for permission to cut firewood on the Settlement, but any place where he would let me, no matter where it is.

28 Oct., 1896

252. You wrote to the Minister then and he replied? Yes; he replied as follows:—

Sir,  
Department of Labour and Industry, Sydney, 16 October, 1896.  
In reply to your letter of 5th October, again requesting permission to cut wood, or for work on the Pitt Town Labour Settlement, I am directed to acquaint you that the Minister for Labour and Industry cannot see his way to grant your request.

I have, &c.,

T. B. CLEGG,  
Clerk-in-charge.

Mr. W. M'Guire, Pitt Town Labour Settlement.

253. He could not see his way clear? No. I reckon that if he is keeping it for the unemployed, I am one of the unemployed.

254. Mr. O'Sullivan.] What is being done with that land now? They are not doing anything with it at the present time.

255. Have they turned all the old settlers off? They have all left themselves, excepting the six families there now.

256. What are they doing? Living there—that is all.

257. Are they cultivating the land? No.

258. Did the department turn you off? No; they gave me notice to quit some ten weeks ago, but I did not leave.

259. They are going to utilise the land now for a casual labour farm? Yes.

260. You said, in reply to the Chairman, that there was a want of sympathy on the part of the Governments with the Pitt Town Settlement? Yes.

261. Was that want of sympathy exhibited by both Governments? In regard to Mr. Copeland, I should say that he could have taken steps to see that there was a proper man at the head of affairs. Even if the Board of Control were not practical men, things would have been better if the settlers had had a practical man over them.

262. But Mr. Copeland did appoint a Board of Control? He did; but I do not think there was a practical farmer on the Board.

263. Did they not exhibit some sympathy with the Settlement? Yes; but the superintendent was only a navvy.

264. Who appointed him? The Board of Control. We drew Mr. Copeland's attention to the matter and held several meetings to see if we could get a man appointed who was an expert at that work.

265. Did you complain to Mr. Carruthers when he came into power? Yes.

266. Did he take any steps to make matters better? No. I have written to him often about the road work. The superintendent used to put labouring men over the carpenters, and he put a brickmaker over the navvies doing the road work. Men who did not know anything about the jobs he put over men who had had experience in such work, and things went to the bad.

267. The men put over the Settlement appear to have been appointed, not for their fitness for the work, but for some other reason? I think it was through influence, and nothing else.

268. You say you have had a taste of co-operation, and would not care to go on again with it unless you selected men as colleagues? I would have to know the men's working ability before I would go on again. I should expect that every man would do as much as I did, or very near it, otherwise it would be only crushing me between the lot.

269. But what is to become of all those who could not come up to your standard? Let them have a Settlement of their own.

270. On a lower standard? Yes.

271. Do you not think that if that plan were carried out you would have one portion of the community worse off than another portion, and you would gradually develop into an aristocracy? I do not see that.

272. Judging by your physical capacity, I should imagine that you would be one of the first selected? But I would have to work harder to get that.

273. But your lot of good men would be getting richer than another lot, who were weaker men;—would it not be a better plan, for humanity as a whole, to intersperse the men and let some of the stronger men take the weaker men with them? There was too much of that there.

274. What is the conclusion that you have arrived at after a trial of co-operation;—do you think that it is absolutely essential to have a strong and abiding faith first in the principle of co-operation? Yes.

275. And then to be amenable to discipline in order to give it a fair trial? You may be a very strong co-operationist, but it is of no use being a strong co-operationist unless you are able to do the work.

276. Every man can only do his best? Yes, that is all.

277. We cannot all do as much physical work as men like you and some others apparently can? I admit that, but there were plenty of men there who could do it but would not do it.

278. Supposing, for example, that you had a Settlement of 200 men, and they were all doing their best, and all working on the co-operative plan, do you think it would be possible to achieve success provided that they had a strong faith in the principle of co-operation, and were also willing to submit to discipline in order to make it a success? I think it would, provided that all the men were treated alike—that there was no favour shown to one man more than to another.

279. Then some of the dissatisfaction to which you have referred arose from what you believe to have been undue consideration given to some over others? That is the very thing—favour shown.

280. Was there no method by which you could stop that? I did not see any method, because there seemed to me to be a certain ring of people, and it was no use reporting or doing anything else.

281. Where were the Board of Control all this time? I do not like to mention any names, but I put Mr. Backhouse down chiefly as the cause of the failure of the settlement.

282. Why? In the first instance he kept a man continually there who was unfit for the position he occupied.

283. Who was that? Mr. Waite.

284. You say that Mr. Backhouse's keeping him there led to a good deal of dissatisfaction? It led to dissension amongst 80 per cent. of the settlers.

285. Did the members of the Board very often go there? One or two came now and again—I suppose once a month or once in two months. W. M'Guire.
286. Was there not systematic and regular supervision of the Settlement by the Board? No; only the superintendent. 28 Oct., 1896.
287. The Board went there only at fitful intervals? That was all.

Thomas Thornton called in, sworn and examined:—

288. *Chairman.*] You were a settler on the Pitt Town Settlement? Yes. T. Thornton.
289. From the beginning? No, not from the beginning. 28 Oct., 1896.
290. Will you tell the Committee what you think was the cause of the breakdown of the settlement? I consider that the cause was the bad management, most of all.
291. Do you think that the bad soil had anything to do with it? Well, it was not what you would call first-class soil. But I consider that if it had been properly worked the produce might have been better.
292. Have you ever been a farmer or a selector? Not in this country, but I was a farmer in the old country. Since I came to this country I have kept a dairy and a wood yard, and that sort of thing.
293. In your opinion what was the character of the men who were there? There were some who belonged to a poor class of men.
294. What percentage of good men would you say were there? About two-thirds of them.
295. When you say the management was bad, in what direction do you mean;—were the managers incompetent? I consider that the managers were not competent for the work.
296. Did they know anything about agriculture? No; they did not.
297. Had they any knowledge of dealing with bodies of men in any capacity at all? I do not think so. The men in power there had no more idea of setting men to work than those who had never seen men work, and who knew nothing at all about agriculture.
298. Could you have made a living on the ground if you had been allowed? Yes.
299. How long have you left? A year ago last September.
300. Did you leave because of the department giving you notice? Yes. We were told that we could not get any more rations, and we would have to go somewhere else.
301. You have not been to Ganmain, have you? Yes; I went to Ganmain with the forest thinners.
302. You think you could have made a living at the Pitt Town Settlement if you had been allowed to stop there? Yes.
303. I suppose you received a letter, in common with the other settlers, leading you to believe that those who stayed on would be allowed to remain after the Government aid had been withdrawn? I did not receive such a letter.
304. What is your opinion now of the principle of co-operation;—have you lost any faith in it at all? Not at all. I think that co-operation, if the men there had stuck to their work and had done it properly, would have been a success. As regards a lot of the ground I think it was very good ground, and could grow a lot of stuff. We could have made a tremendous lot of money with pumpkins, melons, and other things which grew well. We had sorghum 15 feet high—a splendid crop.
305. *Mr. Kelly.*] You might have sold it if things had been managed properly, or have utilised it? If things had been managed properly it would have fetched a lot of money. Before I left, the cattle were starving through the forage being wasted.
306. Who was the manager when you went there? Mr. Waite.
307. *Mr. O'Sullivan.*] Where did you sell your produce? There was never much sold. I think that some wood was sent to Sydney. Several lots of wood were sold in Windsor, and we had tons of pumpkins, but the men at the head pulled them before they were ripe and put them in a barn, and they went rotten.
308. That was from want of knowledge of how to deal with pumpkins? Yes.
309. Had not your superintendent any knowledge by means of which he could direct you in these matters? No; he did not know a pumpkin from a melon.
310. I cannot understand how it is that you allowed all these troubles to go on without their being corrected? The first potatoes that were put in I spoke about it, but you were not allowed to speak; you had nothing to do with it, and when they found that I knew a great deal about agriculture, and that I was interfering with the men who were at the head, and telling them how things should be done, I was put in the stables to look after the horses—off the ground altogether.
311. Then I am to understand that because you were interfering in matters that required correction, you were removed to some position where your advice would not be of very great service? Yes; I had nothing to do with it then, and had to look after the horses. Whilst I was in the stables Mr. Tresseder came, and he certainly understood his work, both as regards agriculture and horticulture, and if it had not been for drink I suppose he would have been a better manager than he was.

William Musto recalled, and further examined:—

312. *Chairman.*] You desire to put in some papers? Yes, as follows:—
- Sir, Department of Lands, Sydney, Board-room, 9 June, 1896. W. Musto.
- I have the honor to inform you that at a meeting of the Board of Control, held on the 8th instant, you were disenrolled as a member of the Labour Settlement at Pitt Town, in consequence of the receipt of written notice from the Minister for Lands, to the effect that the Board of Control is to be dissolved, and that the Labour Settlement Area is to be converted into a casual labour farm. 28 Oct., 1896.
- In view of these circumstances I am directed to request that you will vacate the settlement forthwith.
- I have, &c.,  
HENRY C. TAYLOR,  
Honorary Secretary.
- Mr. W. Musto, Pitt Town.

- Sir, Department of Lands, Sydney, Board of Control, 13 June, 1896.
- I have to inform you that the Board of Control has decided to dispose of the small amount to their credit, by granting a bonus equal to one and a half week's allowance at the authorised rate, to such of the men as were disenrolled consequent upon the intention to close the settlement.
- The amount that you will be allowed will be paid on application to me, upon it being shown that you have vacated the Settlement.
- I have, &c.,  
HENRY C. TAYLOR,  
Honorary Secretary.
- Mr. W. Musto, Pitt Town. The

W. Musto. The money they had in hand was money we had earned in the usual way on the settlement. We had some six months or more previously told the Government that we wanted no further assistance. We were only receiving what we actually earned by the sale of wood and other things which we grew on the Settlement. Three weeks prior to receiving that paper they had given us no money whatever. Some people in the train told me that the officials had distinctly told them that they were going to starve us out. They kept the money back three weeks, and then coolly told us, on our vacating the settlement, that only on those terms would they give us a small amount, which in my case amounted to 18s. 9d. a week and a half's rations, at 12s. 6d. a week at that time. Some time ago the matter was brought up in the Assembly. The Board tendered their resignation, with a recommendation that the whole of the plant and stock should be sold. As soon as members of the Settlement saw that they called a meeting of the settlers and deputed three of the settlers to go to Sydney. I was one of the number, and we interviewed Mr. M'Gowen, and he brought the matter before the Assembly; but prior to his bringing it before the Assembly, Mr. Taylor, who is Secretary of Village Settlements, was sent for by Mr. M'Gowen in the lobby. We had represented that we could put out so much wood per week, and its conveyance would result in so much revenue to the railway, and, so that there should be no further expense, we suggested that all that would be necessary would be to give the district ranger the power of supervision. Mr. Taylor, when we represented that we could cut so much wood, said, "But you know, Mr. M'Gowen, that these men are not supposed to cut firewood for a living." After the matter had been brought before the House, the Premier promised that something should be done, but this was all we could ever get as to the terms upon which we could go on:—

Sir,

Department of Lands, Sydney, 20 November, 1896.

Referring to your letter of the 14th instant, respecting matters connected with the Pitt Town Labour Settlement, I am directed by the Secretary for Lands to inform you that arrangements have already been made whereby it is hoped that the members of the Settlement may be enabled to make a living off the land.

I have, &c.,

WM. HOUSTON,

Under Secretary,

(Per W. M.)

S. Burdekin, Esq., 197, Macquarie-street, Sydney.

Mr. McGowen brought the matter before the House. You will see from that letter that some arrangements had been made, but although we were mostly interested, we never knew, even up to this day, what arrangements we were to work under. However, on the promise of the Premier, we went back and put so many men on the land—so many with horses, and so many men at wood-cutting. We put in crops, and afterwards they were going on favourably. We had a splendid season. Mr. Taylor came when everything was going on swimmingly, and in the presence of the settlers said, "Mr. Waite, these men must do nothing else but cut firewood for a living." Mark the change of front. He told Mr. McGowen in the lobby that we were not supposed to cut firewood for a living, but when he found that we were making fair progress on the farm and in cutting wood on the Settlement, he locked up the garden-tools and said that we must not do anything else but cut firewood for a living. That virtually shut down the place, for the men lost all heart. Finally, all the tools were sold. I also wish to hand in this letter:—

Sir,

Department of Labour and Industry, Sydney, 11 August, 1896.

I am directed by the Minister for Labour and Industry to give you formal notice to quit the premises now occupied by you, your wife, or family on the Crown lands, parish of Pitt Town, recently dedicated as a casual labour farm, and deliver up possession of the same on or before Saturday, the 22nd instant.

I have, &c.,

T. B. CLEGG,

Clerk-in-Charge.

Mr. Wm. Musto, Pitt Town Casual Labour Farm.

THURSDAY, 29 OCTOBER, 1896.

Present:—

MR. WATSON,

MR. O'SULLIVAN.

W. M. HUGHES, Esq., IN THE CHAIR.

William Reginald Stanley further examined:—

W. R. Stanley.  
29 Oct., 1896.

313. *Mr. Watson.*] You have an abstract of expenditure at the Pitt Town Settlement for the first five or six months by the Board of Control? For the first six months.

314. Can you give the Committee the total amounts spent under the different heads? Yes; under the heading of plant the expenditure amounted to £582 3s. 3d. Under that of maintenance, £1,036 7s. 7d.; under the heading of improvements, £118 7s. 2d.; and under the heading of working expenses, £303 17s. 2d.

315. That makes a total in the six months of how much? £2,040 15s. 2d.

316. And the amount due from the department under the Act for the Settlement was how much? £2,330, I think.

317. Practically, that £2,330 was the capital which the Board had to work upon? Yes; except the revenue which was derived from the sale of wood.

318. Can you give the Board any idea of the amount that was allowed per settler each week to be spent in rations? The amount varied at different times.

319. What was the scale for the first six months of the Settlement? The average allowance was 4s. for each adult male, 2s. for each adult female; for one child over six years, 2s.; for more than one child over six years, 1s. 9d. each; for one child over 12 months and under six years, 1s. 6d.; for more than one child over 12 months but under six years, 1s. 4d. each; and for each child over 6 months and under 12 months, 1s.

320. Was any proposal made by the Board to the Minister in regard to getting sufficient money to carry out a scheme of irrigation? I think not; there was a scheme of irrigation submitted by the Board to the Minister.

321. Can you tell the Committee under what circumstances the site was selected? Yes; I believe it was on the report of Mr. F. Turner, F.L.S.

322. Was the site selected by the Minister on the recommendation of Mr. Turner? Yes; he was an expert.

323. Was it not afterwards found that the land was not suitable for the purposes of a Settlement, as far as the quality of the soil was concerned? It was stated that the land was unsuitable.

324. I believe that the settlers towards the close of the period of the Settlement were advised that even if the settlement broke up as a co-operative one, or on its then basis, they would still be given an opportunity of continuing there on some other basis? Yes.

325. They were given to understand that they would be allowed to continue under some form of occupation? Yes; they were so informed by letter.

326. Has any application been received to your knowledge from any of the settlers to be allowed to continue in occupation since the date of that letter of Mr. Wilson's? I could not say.

327. Could you give the Committee any idea of the amount of time put in by the settlers in conserving water? Many of them must have been at work for months; in fact, up to the last minute almost, the question of the construction of dams and the conservation of water generally was receiving attention.

328. It was a necessity, because of the lack of permanent water on the ground? Yes.

329. And would take up a considerable proportion of labour which might otherwise have been expended in reproductive effort? Yes.

330. Of course, to that extent, the site would be unsuitable for the purpose of getting an immediate return? I should think so.

331. Can you give any idea of the amount of land cleared;—they have the valuation, have they not? Yes.

332. Can you give the valuations at the different periods;—several valuations were made—one was made when the Settlement was in full swing, others later on, and again towards the finish? The latest valuation under the original Board was made in February, 1895, and the value of all the improvements, stock, plant, and horses was then stated to be £5,991 14s.

333. Among the items there are 120 residential and other huts, valued at £960? Yes; that would be at the rate of £8 each.

334. Then I find these items:—Superintendent's cottage, £40; buildings, £271; sixteen dams, with 7,000 yards of excavation, £350; fencing to the value of £929; cultivation of land, £1,155; for the clearing of land not cultivated, £960;—I presume that that would be a fair valuation, the value not being unduly raised or diminished? The valuation was made by the conditional purchase inspector for the district, and he would value these works for the Board in the same way as he would value any other departmental work.

335. *Chairman.*] These trees, fencing, and clearing come to about £3,000, and the whole of that has been entirely thrown away, and cattle have been allowed to break through the fences and destroy the whole thing;—was that done by order of the Board? Certainly not, so far as I am aware.

336. It is an undoubted fact that the cattle got in and destroyed thousands of trees? It could not have been done with the authority of the department so far as I am aware.

337. What did the department intend to do with this cleared and fenced land which was cultivated? I cannot say.

338. After spending £3,000 in clearing, fencing, and cultivating this land, did they calmly propose to let it go to waste again;—did they propose to do anything at all? Not to my knowledge.

339. There were acres of land that cost thousands of pounds to get ready for cultivation;—surely they could not propose that that should become common land again? I cannot say, but I think not.

340. You have no power in regard to the Settlement—you were unable to direct anything to be done? I merely held a subordinate position.

341. Was Mr. Taylor an executive officer? Yes; he was the honorary secretary to the Board of Control.

342. *Mr. Watson.*] He was the advising officer to the Minister during a considerable part of the existence of the Settlement, and he was the only officer to whom the Minister looked for advice in connection with it? For reports and information as to the progress of affairs.

343. In this sum of £6,000, set down as the value of improvements, I believe there is nothing included for the value of growing crops;—Mr. Brown, the inspector, says that he cannot attempt to estimate the values of them? Yes.

344. I believe that the inspector in making his report states that he does not include any estimate of the value of the growing crops? It appears so from the report.

345. At the time that this valuation was made of £6,000, there had been expended a sum of £6,700, of which sum £6,200 had been advanced by the Crown? Yes; that, I think, is correct.

346. So that if these figures are correct the Crown had an asset of £6,000 to represent an expenditure of £6,200? Yes.

347. Have you the valuation of the improvements on the settlement as on the 26th October, 1894? Yes; and also a valuation made on the 20th August, 1894.

348. That would be a year after the starting of the Settlement? About thirteen months after.

349. According to that statement what was the total value of the improvements? £4,353.

350. Can you give any idea of how much at that time had been expended by the Crown on the settlement? £4,470 had been expended. On the 23rd August the sum of £4,080 had been granted.

351. Can you say, from the bank-book, how much of that had been paid away? At that time there was a balance in hand of £713, but there were outstanding liabilities, which would go far to absorb it.

352. You had, practically, spent the amount which had been granted? The Board had.

353. And they had against the amount granted to them an estimated value of £4,353? Yes; as stated in the valuation.

354. The inspector made some comments as to the improvements in his report to the Minister? Yes; he says: "There were improvements, working plant, and live stock upon the land, which I value at £4,353, as detailed herewith. This is exclusive of a large amount of small tools and stock in store, a detailed list of which I was informed would be forwarded to the department."

355. Again, as in his report previously, he takes no account of the growing crops? No.

356. Do you produce a copy of the regulations of the Board of Control governing the Settlement? I do. This is a copy of the regulation, with all amendments, as approved by the Governor and Executive Council.

W. R.  
Stanley.  
29 Oct., 1896.

TUESDAY, 3 NOVEMBER, 1896.

Present:—

MR. O'SULLIVAN, | Mr. WATSON,  
MR. KELLY.

W. M. HUGHES, ESQ., IN THE CHAIR.

The Hon. Benjamin Backhouse (a Member of the Legislative Council), sworn and examined:—

Hon. B.  
Backhouse.  
3 Nov. 1896.

357. *Chairman.*] Do you wish to make a statement? I should like to give a short statement, a *résumé* of the proceedings of the Board from its inception until it sent in its final resignation. I would just premise that in 1892 there was a very large amount of poverty existing, and a committee was formed with the view of endeavouring to obtain from the Government such assistance and such concessions in the way of land as would enable a number of the people to be put on village settlements in the country wherever it might seem most desirable. Just at this juncture the Rev. Dr. Tucker from Melbourne came here, and illustrated what they were doing in Victoria. This gave a considerable impetus to the movement, and the Committee, of which I was a member, got up what turned out to be a very large meeting in the Town Hall, at which Sir Frederick Darley presided, and there were seventy or eighty influential men on the platform, and I suppose 5,000 people in the body of the Hall. That was on the 22nd May, 1893. At that meeting a village committee was appointed, principally to induce the Government to frame an Act and get it passed by Parliament, in order to achieve the purposes at which we aimed. Several Bills were drafted by the Committee, and submitted to the Minister for Lands, and ultimately, as you are aware, an Act was passed which was not absolutely in accord with the suggestions of the Committee, but which was sufficiently nearly so to induce them at once resolutely to set to work under it. Dr. Roseby drafted, and the Committee eventually published, this epitome of the Labour Settlements Act, with suggestions for establishing and working the settlements. The summary of this epitome is as follows:—

## CO-OPERATIVE LABOUR SETTLEMENTS.

EPITOME of the "Labour Settlements Act," with suggestions for establishing and working the Settlements, put forth by the Committee appointed at the public meeting, held in the Town Hall, Sydney, 22nd May, 1893.

The following are the names of the above-mentioned Committee:—

Rev. J. Bennett Anderson; George Ashcroft, C.E.; Benjamin Backhouse, H.A., R.I.B.A.; Octavius C. Beale; P. J. Brennan; Hon. J. M. Creed, M.R.C.S., M.L.C.; Alfred DeLissa; Henry Egan; F. Flowers; F. B. Gipps, C.E.; Rev. E. Harris, D.D.; John Hefner; W. A. Holman; E. J. H. Knapp; Rev. J. D. Langley; H. H. Lusk; Percy R. Meggy; R. McKillop; Henry W. Parkinson; Rev. Thomas Roseby, LL.D.; H. H. Simmonds; Thomas Symons; Arthur Vernon; Rev. G. T. Walters; J. Chris. Watson (President, Trades and Labour Council); James Watson; J. V. Wiley; W. Wooldridge.

*Adopted Monday, 19th June, 1893.*

IN view of the fact that several letters have appeared in the Press, making inquiry concerning the character and scope of the Labour Settlements scheme, and especially in view of the fact that these inquiries are being constantly made by persons applying to the Committee to join the proposed settlements, the General Committee, elected at the public meeting in the Town Hall, on 22nd May, 1893, has deemed it advisable to publish the following, partly by way of explaining the meaning and scope of the Labour Settlements Act, as understood by the Committee itself, and partly by way of offering suggestions which they have had under consideration towards making the scheme a success. The purpose of this paper is to set forth partly what *may* be done, and partly what it seems to the Committee had *best* be done, under the provisions of the Act.

1. The main, though not exclusive, object of the scheme, as formulated in the Act, is to provide the means of living for the present large number of persons out of employment, and, for the most part, without means, by settling them (in sufficient numbers in each case to form a Village or Industrial Settlement) on suitable blocks of land, under the direction and management of a "Board of Control" appointed by the Government, and consisting of not more than sixteen nor less than eight persons, of whom one-fourth may be females.

2. The Board of Control, having charge of one or more distinct Settlements, will be a corporate body, with perpetual succession, so that it may carry on continuously the work of placing groups of settlers on Crown lands. For this purpose the Government will grant leases to these Boards for any term not exceeding twenty-eight years, and renewable for a like term. The Act makes no provision for purchase, and it will not be possible, in any case whatever, to purchase these lands. The tenure will be exclusively leasehold. No rent will be payable for the first four years, but at the expiration of that time, along with the rent charge, the Government advance will also become repayable, at the rate of 8 per cent per annum, covering both principal and interest.

3. The duties of the Board of Control will be to enrol such settlers as it may think fit at its absolute discretion, or as provided by regulations, and in such numbers (for each settlement) as the Minister may approve, which settlers must be, whether men or women, of full age if unmarried, or heads of families. The amount of the advance granted to the Board by the Government will be calculated on the basis of £15 in the case of unmarried settlers, £20 in the case of married settlers without children, and £25 in the case of a settler the head of a family with *dependent* children. But although the advance is calculated on this basis, it is not intended that these sums of money should be given to the settlers. The total loan-grant will be held and used by the Board for the benefit of a Settlement as a whole. The various industries under the Board's control will all be co-operative. The Government advance will be used for the purpose of purchasing tents, tools and seed, for setting up a Dairy Farm, and for maintaining the settlers until there has been some substantial return for their field labour, which can hardly be the case for several months.

4. It will be evident that a Settlement, even as thus aided by the Government advance, will be unable to maintain itself until this return from field labour comes in, without substantial aid from public subscriptions. Let it be considered, however, that the position of a large number of these settlers would, under ordinary circumstances, be a severe and constant drain on public charity while the present industrial depression continues. We cannot see men, women, or children starve; and if the bread-winner is unable to find employment, his family can only be supported by public or private charity. And how much better it is for us to help people to help themselves than to feed them on the bread of idleness.

5. The Government advance, *with public subscriptions added*, will barely cover the cost of the preliminary outlay above mentioned, with perhaps the maintenance of the settlers for half a year; the settlers will, therefore, have to occupy themselves at first in doing such work as promises a speedy return. The Dairy and Agricultural farm will come into early prominence. Firewood selling and charcoal burning, Poultry-raising and Bee Culture will also help the Settlement to add something to its scanty resources. But it will be a great help if the Settlement is sufficiently near some already established centre of population, to enable the settlers to get work outside. The Board will probably prescribe a certain number of hours work per week—probably 48 hours—to be done, as in the service of the Board itself, for the benefit of the Settlement as a whole. All "outside" work will be under the control and regulation of the Board; as much so as that done within the Settlement itself, and it will only be undertaken as part of the co-operative work of the Settlement. But the Board should carefully guard itself in the acceptance of this "outside" labour against competing injuriously, at a lower wage, with workmen unconnected with the Settlement.

6. Beyond the number of hours work fixed for each member by Regulation, a member's time will be his own.

7. There is a provision in the Act under which the Board may sublet portions of its leasehold land to settlers on prescribed conditions. The settler may thus have a home of his own, and something on which to bestow his leisure time and labour. And there is a further express provision in the Act conserving his interests in this regard, even if the Settlement itself should be disbanded.

## SELECT COMMITTEE ON THE PITT TOWN SETTLEMENT.

Hon. B.  
Backhouse  
3 Nov., 1896

8. The Board will have full power to disenrol settlers and to admit new settlers from time to time. It may establish industries. It may make regulations for the cleanliness, good order, and government of the Settlement, and for apportioning the work to be done by the settlers, fixing their wages, emoluments, or profits on as equal and equitable a scale as possible, having regard *inter alia* to the number of dependent children in each family; and there can be no distribution of profits till the cost of maintenance of all the settlers with their families has been provided. Superintendents will be appointed by the Board, with large discretionary powers, so that unworthy or idle settlers may be expelled, and the good order of the Settlement maintained. The Settlements, there is little doubt will, in all cases, exclude the sale of intoxicating liquors.

9. It seems to the Committee that, wherever possible, it will be well, from considerations of economy, to choose the Superintendent from among the settlers themselves. But it will be a wise economy, failing a suitable man being found among the settlers themselves, for the Board of Control to appoint an agricultural expert, at moderate remuneration, to undertake this duty. It would seem further advisable that one member of each Board of Control should be an experienced farmer. And the case seems also one in which the Government, out of their own scientific staff, might make provision for such instruction to be given in agriculture, irrigation, &c., as may be of material assistance to these settlements, especially at the start.

10. The Committee understand that it is the purpose of the Minister to give the settlers in all cases direct representation on the Board of Control. These *resident* members of the Board—for such they will doubtless be—will probably act a kind of Works Committee, and as the local representative of the Board on the settlement itself.

11. A knowledge of human nature easily suggests the difficulties incident to co-operative Settlements of this order. In spite of the vigilance of the Board of Control, undesirable persons will doubtless find entrance; and where people are associated together as strangers, there will be bound to be instances of jealousy, discontent, or disaffection; and where any money is to be distributed it will be hard to keep off the indolent and dissolute. But the Board have full power, in the last resort, which it is expected it will exercise, to expel drones and mischief-makers. And the settlers themselves will see how entirely it is in their own interest to get rid of those who will not work. The Act very properly provides the swift sharp remedy of cancellation by the Government of mismanaged or hopelessly abortive Settlements.

12. The desire of the Minister for Lands appears to be to grant to the Board which will be nominated for the metropolitan district, leases of land as near as may be to Sydney itself, and to towns near Sydney. 1,000 acres of land might in some places maintain a labour Settlement consisting of from fifty to 100 enrolled members. In other cases the area must be proportionately larger. It is very likely that, as the scheme expands (and the operations of these Boards are intended to be continuous and perpetual) some large areas of land along the courses of rivers, and now in private hands, will be resumed to be dedicated to industrial settlement.

13. The provision in the Act concerning the establishment of suitable industries may hereafter lead to co-operative mining.

14. All settlers shall, on their enrolment, pledge themselves to abide by the principles on which each Settlement is founded, and by the regulations made under the Act, whether by the Government or by the Board of Control, and to live an industrious, peaceable, and sober life, and to do their best to enhance the general welfare.

15. It will be well for the Settlements at first to confine themselves to simple industries, leaving more elaborate ones requiring machinery until sufficient funds have been accumulated to use them with success. But they should avail themselves to the utmost of all methods which science and experience suggest in carrying on industries. Farming should not be slovenly, but, as far as may be, intensive, and conducted on scientific principles. It should not allow its operations to be scattered over any impracticable area. Regard should be had from the start to do all that is possible to make the Settlement bright and attractive. Ample opportunities should be offered, under proper regulations, for social intercourse, amusement, and recreation. No permanent residence will be permitted on the Settlement, except, of course, that of settlers and their families, with any such instructors, inspectors, or superintendent as may be appointed by the Government or Board of Control, and expressly permitted under the terms of their appointment to reside there.

16. In the selection of superintendent or foremen of works it will be well for the Board of Control to proceed with extreme caution. The success or failure of the scheme will largely depend on the character and experience of the resident superintendent, and it would be well to make the appointment purely temporary until the suitability of the person selected is established.

17. Though the Act is mainly intended to serve as an outlet for unemployed persons without means, there is nothing in it to prevent persons with small means from forming a co-operative Settlement under some of its provisions, accepting, *e.g.*, the provision of freedom from rent for four years, even if they decline the Government loan. In that case the Board would naturally relax the stringency of its control, and leave the settlers largely at liberty to manage the affairs of their own Association. The Board of Control is fully empowered to concede that liberty.

18. The essential features of the Scheme may be briefly summarised:

- (1) It is essentially a leasehold system. It is not intended to let the land pass into private ownership.
- (2) It is essentially co-operative. So many hours work per week must be done by each enrolled settler for the Settlement itself. And the aggregate profits are only divisible after all persons in each settlement have received a fair allowance for maintenance.
- (3) The Settlement will be largely dominated by the idea of equality. As near an approach to this will be arrived at as is equitable and possible.
- (4) The Settlement, as at Mildura, will have no alcoholic liquor sold within its borders.
- (5) The settlers, for purposes of order, economy, and successful organisation, will be trained to habits of obedience to industrial and civil authority; they will lose none indeed of their privileges of Australian citizenship; but they will have voluntarily submitted themselves to industrial direction, and will have to take their assigned places and do their assigned work, in exactly the same way as in any industry carried on by private ownership. But the great difference will be that all the proceeds of the labour of the settlers will belong to themselves alone.

NOTE.—The above scheme, it may be noticed, deals with a certain definite type of village settlement, *viz.*, that which may be described as *fully co-operative or communal*. There is no doubt that these industrial settlements will generally conform to that type. But it is to be observed that the Minister for Lands favours the establishment also, under the provisions of the Act, of *partially co-operative settlements*, on the joint stock principle; the Act distinctly provides, however, that *in all cases* the actual maintenance of the whole body of settlers, with their families, is to be a first charge on the Settlement as a whole.

It may later be found expedient, as suggested by the Minister for Lands, to establish a Labour Settlement in the neighbourhood of Sydney as a temporary training settlement, continually receiving new settlers from the ranks of the unemployed, from which those who have acquired sufficient knowledge and experience may be continually passed on to *permanent* associated Settlements on larger areas in the Colony, but the Committee is of opinion that it would be desirable to give full trial, in the first place, to the system of permanent settlement.

JAMES WATSON, Hon. Secretary,  
Committee Rooms,  
Town Hall, Sydney.

BENJAMIN BACKHOUSE, } Joint Honorary  
J. CHRIS. WATSON, }  
OCTAVIUS C. BEALE, } Treasurers.

Every man that applied to join the proposed Settlement (and there were some 500 or 600), was furnished with one of these epitomes, so that he could read it and determine whether he would work under the Act, and under regulations of this kind. I have underlined in red some of the parts of the document, which, I think, should be most carefully considered. A Board of Control was appointed by the Government who selected five members of the Village Committee, *viz.*, Messrs. Benjamin Backhouse, H. H. Lusk, Rev. Dr. Roseby, Rev. G. T. Walters, and J. C. Watson, and appointed five other gentlemen, *viz.*, the Very Rev. Dean Slattery, Messrs. R. Nott, S. Sullivan, H. R. Jones, and J. Creer quite outside us with whom we had had no previous communications, and of whom we had no knowledge, except that we knew them as citizens. They were not gentlemen who were originally identified with the movement. I will also mention that the Village Committee had received, on a printed form from each applicant, something like 700 applications from heads of families and others desirous of being included in any village scheme that might

Hon. B.  
Backhouse.  
3 Nov., 1896.

might be formed. As soon as the Board was appointed we found by the Act (some thought unfortunately) that all applicants had to send in their applications through the Labour Bureau. I believe that we lost a good many excellent would-be village settlers on that account. The Act provided for that procedure, and the Minister insisted on its being carried out. To show how carefully we went to work, I may mention that on the 15th July this advertisement was inserted in the newspapers:—

#### LABOUR SETTLEMENTS.

A MEETING under the Board of Control will be held in No. 7 Room, at the Temperance Hall, on Wednesday next, July 19th, for the purpose of seeing personally all applicants for enrolment, commencing at 2 p.m., in the following manner:—

The names of applicants from A to C, from 2 to 3 p.m.; D to F, from 3 to 4 p.m.; G to K, from 4 to 5 p.m.; L to O, from 5 to 6 p.m.; P to T, from 6 to 7 p.m.; U to Z, from 7 to 8 p.m.

That was very tedious and laborious work. The Board divided themselves into small committees, and sat there until a late hour at night, to get through the work. Every applicant was seen; everyone was asked whether the "Epitome" placed in his hands was in accordance with his wishes, and every one whose application was entertained assented to it. There were one or two who had a little money, but we were requested to deal first with the absolutely poor people, and generally those with large families were to have the preference. The consequence was that we selected the full number, viz., 100, the settlement was to accommodate. Speaking from memory, there were about ninety heads of families, with their wives and children, and ten single men. The latter happened to be remarkably good men, and I mention this because they figure in the history of the Settlement later on. To prevent confusion, the people were gradually sent up to the Settlement, commencing on the 29th July, 1893, when three pioneers were sent up; and from day to day, subsequently, 100 settlers were gradually, in small batches, to prevent confusion, brought on to the ground.

The 23rd September, 1893, was a red-letter day at the settlement. On that day the Settlement was officially inaugurated. I will go back a little. During the interim (appointment of Board and present date) I, with two or three others, had been deputed by the Board to visit the settlement with the Government Surveyor, for the purpose of examining the land and fixing a site for the village. I ought to have said that we had no voice in the selection of the land. That was handed over to us. We were told, in effect, "There is land for your Pitt Town Settlement on the Pitt Town Common—2,100 acres; it has all been properly surveyed, and is ready now for you to occupy it." We took a great deal of trouble in selecting a site for the village, and looking over 2,000 acres of land was not a very light task. I have not the original plan with me. I cannot find one half of the plans that were prepared, but I found several, which I have placed on the walls now before you for the Committee's use. We selected a site which the surveyor pointed out as, in his opinion, the best on the settlement area. It was situated in a sort of amphitheatre of gently declining hills, opening in a horseshoe form on the Dural Road. The horseshoe form was first laid out sufficiently large in order to have 100 allotments on its margin, the low land in centre of the "horseshoe" to be ultimately recreation ground and for public use, each settler to have an allotment for himself, to provide a cottage, and to grow a few vegetables on his own account; not to be too large in area, but such as each settler could work and keep in good order in his spare time. By this arrangement the settlers' allotments were in view of each other; not as in a rectangular plan, where they would be back to back and front to front, but each "holding" in view of the rest, so as to promote a neighbourly feeling amongst them. When we came to lay it out, we found the ground such that to keep the allotments on about the same level (see plan) we had to run up the depressions of ground, in order to place the houses on an equality, so that some should not be low down, some inferior and some superior. We wanted to get a feeling of equality with regard to the allotments, so that there should not be any grumbling afterwards. Then I prepared various plans (before you) for log, slab, brick, or stone cottages, and for the commencement, the back and inferior rooms were put up, all being put sufficiently far back so that the finished building would not encroach on a building line laid down. This laying-out was all done by one of the settlers—a surveyor. He had to peg out every allotment, to number every allotment, to place a line where the cottages were to approach the main road. Every detail of sanitary arrangement was gone into; nothing offensive was allowed to run into the ground below, and everything was carefully and fully provided for.

Then the time came for allotting. We succeeded in this, and had a sort of gala day, as before stated, on the 23rd September, 1893—the inauguration of the Settlement. The settlers balloted for the allotments which they were to occupy. The Minister for Lands attended and helped us by his presence. Mr. Copeland was very much surprised even then with the amount of work done, but it was about the only time that we got any warm encouragement from the Minister. Called upon, as Chairman of the Board, to open the proceedings, I select this paragraph from what I said on that occasion:—

"Incidentally I may point out that it is not the intention that this Settlement should enter into competition with the hard-struggling farmers, wood-cutters, &c., around it, at least only in a very modified form, and that only until it becomes self-supporting. The intention is to form a state or colony to produce all that is required for the settlers' own use, so that they may enjoy what they produce without its being appropriated by others."

Mr. Copeland said:—

It was with very great pleasure that he had visited the Settlement that day. He did not expect to find the place so far advanced, but he would now go back with much stronger hopes of this very interesting experiment turning out successfully than he should have had had he not come there. \* \* \* The eyes of the world were on this Settlement, watching to see how the experiment would turn out, and he had no doubt if it was a success there would be many other similar Settlements in different parts of the country. They were well situated near the railway, and had a market in the vicinity. The soil was good, and now the success of the whole thing was entirely in their own hands.

I should like to say, parenthetically here, that sixteen months afterwards Mr. Carruthers went up to the Settlement, and declared that the soil was absolutely unsuitable. Thus we had two very different statements—one at the beginning, and the other at the tail-end of our undertaking. So much interest was taken in the undertaking that the *Daily Telegraph* published a plan of the Settlement. We knew from the first that the amount of money that would be available under the Act would not be sufficient; therefore, following up the very enthusiastic meeting which we had at the Town Hall on the initiation of the movement, we convened another meeting in the same hall (and several thereafter in other places), but, unfortunately, the public did not respond as they did on the first occasion. Instead of there being 5,000 or 6,000 people present, there were only 300 or 400. This was a great damper. I mention this to show

Hon. B.  
Backhouse.

3 Nov., 1896.

show that it was necessary to go to the Minister for Lands, which we did on the 13th January, 1894, by a deputation, to ask that the authority of Parliament might be obtained for a further grant for the settlement. During the interview Mr. Copeland said that "the scheme was not his scheme." I mention this to show the want of sympathy. He seemed to say, "This scheme is not my scheme; my scheme was different," and probably would have been successful, but this scheme I have my doubts about. That was the inference.

Then the water difficulty faced us, and although we had dams formed, dry weather set in, and there was a great deal of trouble in reference to water, though the settlers were never absolutely without water. The dams were increased, and there is one there now which forms a beautiful lake. A large quantity of water was stored on the ground, which before that was absolutely waterless. When we found this difficulty, we went to the Minister, and asked him to extend our land to Cattai Creek, by granting 300 or 400 acres from the Settlement on to the creek in order to get to the water. We proposed to give him some land nearer the railway in exchange for some of the land on Cattai Creek. The Minister said he would consider the matter, but eventually we were told that it could not be granted—the land was too valuable, and had to be sold.

I daresay you have been told that there were valuations of the work from time to time, and that the value of the work done, &c., was equal to, if not in actual excess of the cost, even under the difficulties under which beset us. To meet a difficulty in the ration allowance, the token system was introduced, and a man who was entitled to 4s. or 5s. worth of rations was given tokens for such amount, with which he could purchase a little butter, medical comforts, jam, or any other article which he might prefer. It was no addition to what they were allowed, but if they could do with less (meat, for instance, which the Board encouraged), they could use their tokens for the purchase of any little luxury of that kind.

About, or after, August, 1894, the settlers were addressing the Minister behind the back of the Board, and this led, ultimately, to a great deal of trouble. As you may imagine, these men were expecting that the Minister, through some political influence outside, would be induced to intervene, and circumvent the Board itself, and that they would be able to establish themselves to some extent independent of the Board. When we found this out we at once mentioned this to the Under Secretary for Lands, and pointed out that any communication from the settlers we thought should have been handed to the Board, and the settlers should have been written to by return post, and told that they had no right to communicate with the Minister, and that their letters had been handed to the Board. That would have enabled us to control matters in a way that was necessary for efficient government. I again and again told the settlers, as in the early stages of the Settlement, when everything went on pleasantly, "If you continue to stick together, and to work together, as brethren, I believe that, notwithstanding the ground is not what it ought to be, success is certain," and I still think it would have been so. But I also constantly said that unless they intended to do that they had better pick up their traps and leave the Settlement.

Regular and periodical visits and instruction by experts from the Agricultural College were a great want. I may mention, also, of which perhaps you are aware, that the press generally were against us from the commencement, and a portion of the press was absolutely hostile. I mention this because I think it operated in a way to injure the Settlement, or to prevent it from attaining that success which it might otherwise have attained.

Then comes another difficulty: we could not get the money paid to us to enable us to pay our debts. We went into debt to the amount of £400 or £500 from time to time, expecting long before we got so far as that that we should have received an instalment. What several members of the Board felt, especially those in favour of having a sawmill, was that all the money should have been placed at our disposal from the first. If it had been, many matters could have been managed very much better than they were owing to the money being doled out in this way. We had to threaten to resign on several occasions before we could get money passed to our credit. Notwithstanding all this, we pushed on and did our best.

The erection of a large hall for general purposes was suggested. I at once prepared plans for a hall, which are here on the wall. The hall is 60 feet by 30 feet, and it has advanced so far as to show what a commodious structure it would have been on completion. The walls are 14 inches thick, and are now about 6 feet high. The Rev. Mr. Ayling, who was very good to the settlers, got up a subscription to enable the settlers to get things which they could not make themselves. They made the bricks and most of the other things necessary, because we had among the settlers all kinds of tradesmen. The hall stands on an eminence, and is seen from any part of the village.

358. *Mr. Watson.* That hall was to be arranged for outside the expenditure of the Board? Yes, possibly, but the actual building work was done after the resignation of the Board, but the new Board, I understand, provided the rations whilst the men were doing the work.

359. Were they working during settlement time on the hall? Yes, I think so; they, the settlers, felt the want of a hall to meet in very much, and for amusement, for intellectual and religious purposes. We know that it was really necessary, and had made all provision for it before resigning.

There was a little Catholic church proposed, and a design was prepared and is here, a rustic picture, but it was not carried out.

I should like to go back for a moment to the commencement of the Settlement to say that some of us then thought that poverty would have been a sufficient bond of brotherhood amongst the settlers, but in that we were mistaken. We found first when the men went up there that they were all agreeable, and worked together agreeably, but we had "all sorts and conditions of men." The Board found from experience that the men ought to have been differently selected. If we had had men amongst whom there was some amount of freemasonry, whether it was a religious bond or any other, as long as they were friends, the undertaking might have been a greater success. These men were all clamorous for getting out of the town. We had 600 or 700 heads of families where we could only accommodate 100. When a number of men had fallen almost as low as they could fall, one would think they would have said, "We will make a fresh start," and that their poverty would have bound them together. It was not entirely the men's fault, and I do believe that we should have got over that had we had the sympathy that was expected.

Mr. Carruthers, in January, 1895, visited the Settlement, and he said "he was convinced that a mistake was made in selecting that locality, and that the soil in both places (Wilberforce and Pitt Town Common) was utterly unsuitable. This had at once a most depressing effect on the settlers. Some of the men,

Hon. B.  
Backhouse.  
3 Nov., 1894.

men, he said, had not been as active as they might, but that the majority had taken an intelligent and unceasing interest in their work." The present Minister for Lands now said that the land was absolutely unsuitable, though the former Minister for Lands said that it was good land. I believe that Mr. Copeland was influenced in saying that by Mr. Turner, the expert, who reported that the land was very suitable. Before we saw it we had that report, and we were delighted at the prospect of making a start on good land.

The Board, of course, framed regulations under the Act, and one that is the key, as it were, to the principle of Settlement, says (clause 22, sec. 3) :—

"The maintenance of the members of the Settlement and their families shall in all cases be a first charge upon all funds in the hands of the Board, and upon the proceeds of the labour of the Settlement."

To show the carefulness of the Board, and that we went to work in a business-like way, we required every settler to sign an agreement before sending him to the Settlement, which is a schedule to these regulations; and each man was supplied with a copy of the regulations.

SCHEDULE REFERRED TO.

I, \_\_\_\_\_, on being enrolled as a member of the Labour Settlement at \_\_\_\_\_, under the Board of Control having charge thereof, do hereby agree and undertake to abide by the principles upon which the said Settlement is established, and to conform in all respects to the rules and regulations made under the Labour Settlements Act, 1893, or any amendments thereof, whether made by the Governor in Council or by the Board of Control; and I pledge myself to live a sober, industrious, and peaceable life, and at all times to do my best to promote the general prosperity and well-being of the Settlement; and I do this upon the understanding that failure on my part to fulfil these conditions or obligations renders me liable to disengagement.

Witness—

(Name)

Date.

I mention these things to show the care that was taken by the Board to ensure success.

As soon as Mr. Carruthers became Minister for Lands Dr. Roseby and I sought the first opportunity to see him, and have a chat regarding the Settlement. This took place on the 14th September, 1894, and we were pleased, as the interview seemed very satisfactory. Afterwards, on the same day, I wrote to the Minister (copy of the letter follows). Before sending it I submitted it to Dr. Roseby for perusal and correction if necessary. I hand in reply. This disappointed us, and among other things, serves to show that our complaint of want of sympathy was justified :—

"A"

Dear Mr. Carruthers,

Hotel Métropole, Sydney, 15 September, 1894.

Referring to our private interview with you yesterday (Dr. Roseby and self, for which as members of the Board of Control of the Pitt Town Co-operative Settlement, we offer you our best thanks), we understand that the following suggestions made by us were assented to by you :—

1. That for reasons stated, the Board shall continue as at present constituted, excepting only that the vacancy caused by Mr. Lusk's retirement be filled by the appointment of Mr. James Watson.

2. That (we having laboured so strenuously for the past two years, and have every hope, if not interrupted, of making our work succeed, and prove that village settlement is practicable) if any alterations are recommended to you, or contemplated by you, they will not be decided upon without our being first consulted, and our reasons for or against invited, and that letters or reports received by you would be sent to us for perusal and comment.

3. The Settlement has 100 enrolled heads of families, and this number originally authorised by Mr. Copeland has been uniformly maintained. At the time of passing the first amending Act, a few men had left the Settlement to try their luck elsewhere, leaving their wives and families for a time on the Settlement. Not succeeding, the men quickly returned. Dr. Roseby and self spoke to Mr. Houston about this, and he at once said that he would support the capitation allowance for the full number. The honorary Secretary will write you on this, as he promised to do.

4. That Dr. Roseby's reply to a minute in reference to the Board having employed a junior at 10 shillings per week was considered satisfactory by you; and that, in this connection, it was mentioned that the newspapers the junior collects and despatches daily to the Settlement are worth quite the amount of his small salary.

It was also incidentally mentioned that the books, &c., kept by Mr. Stanley for the Board are always open to, and are frequently inspected by, the officers appointed by the Government, and that these officials have been warm in their praise as to the correctness of the books, &c., and as to the admirable manner in which everything is so clearly shown. In addition, it was stated that there are men on the Board (I especially refer to Messrs. Nott and Rooke-Jones, the auditors) who are constantly supervising the accounts and making periodical audits, and that our balance-sheets are regularly furnished to the Department, consequently we suggest that the Board should be left untrammelled to deal with the business generally.

Briefly I would refer to a few words spoken as to our experience in the management of the Settlement so far, the noticed effects and proposed remedies, and the principles by which we are guided. As to remedies, we may have to ask your approval of a slight alteration in our own regulations in respect to the creation of the "Committee of Advice."

As to the principles for future operations :—

- a. It appears that a large majority of the settlers that we are dealing with cannot be advantageously allowed for some time to come, but a very small degree of self-government, our management will doubtless in time lead the settlers to self compulsion on the lines of order and regularity, and themselves fitted gradually to take the management of their affairs into their own hands and ultimately to dispense with the services of the Board.
- b. That to help able-bodied men to keep themselves and their families decently by their own industry in such an organisation as we are managing, is for the Colony at the outset, and certainly in the long run a great deal cheaper, and a great deal more humane than to keep them in misery and idleness.
- c. That production in this organisation should be largely for consumption by the settlers and their dependents—each receiving as wages a draft on the store he is helping to fill and replenish—a token system is now in operation to this end, and many of the benefits of full co-operation will be illustrated by it.
- d. That a number of such organisations, ultimately federating, may form the nucleus of a future co-operative commonwealth.
- e. That by perseverance on the lines we are working and by the experience so far gained, we are helping to build anew, under fraternal principles (cramped, however, by the limitations and hardness of the existing and competitive system), on lands away from towns under clean and wholesome conditions, a society that will combine the advantages of town and country, and contribute to the material well-being of the people.

I am, &c.,

BENJAMIN BACKHOUSE.

"B"

Sir,

Department of Lands, Sydney, 21 September, 1894.

With reference to your letter of the 16th instant, on the subject of the suggestions made by yourself and Dr. Roseby in the course of an interview that took place on the previous day, I have the honor, by direction of the Secretary for Lands, to inform you that he certainly declines to accept your letter as a correct version of the interview or of any results arrived at, but that he has considered the suggestions made, and is dealing officially with them one by one, as appears best for the public interest.

I have, &c.,

F. H. WILSON,

Acting Under Secretary

Benjamin Backhouse, Esq., Hotel Métropole, Sydney.

When

When we found that the men were getting demoralised to some extent, through the action of the Minister, mentioned before, in permitting complaints to be made to him behind the Board, and knowing also that we had been disappointed with regard to the land, and many other things, I went with Dr. Roseby to the Minister. Other members were not able to give so much time to it as we were. Mr. Watson was not able to do so. He was in active business, and we were compelled to meet in the afternoon, when he could not attend, without neglecting his avocation, therefore Dr. Roseby and myself took a very active part in the matter; and when this difficulty was apparent to the Board, we went to Mr. Carruthers and suggested there should be a limited number of men retained at the Settlement, men who were strictly in favour of conducting the Settlement on the lines on which it was established. There were twenty-five or thirty families in that position. Mr. Carruthers said, "If you have any suggestions to make, put them in writing." Fortunately, I had written out before what we suggested. It ran as follows:—

Hon. B.  
Backhouse.  
3 Nov., 1896.

Rough Draft.— Suggestions by Chairman and Hon. Secretary, Board of Control for carrying on the Pitt Town Co-operative Settlement.

Suggested,—

27 January, 1895.

1st. To carry on the settlement on the established lines with as many settlers as are willing and may be approved (probably not much in excess of twenty-five families), and that the ground may be made to support.

2nd. The Government to use any of the vacant huts, as occasion may arise, as temporary accommodation for healthy destitute unemployed it might decide from time to time to send up from Sydney or elsewhere, in preference to granting them rations from the Labour Bureau. The men so sent should work as probationers on the Settlement until they are eligible for being drafted off to other settlements. A satisfactory arrangement (probably that of charging the actual cost of such temporary settlers) could be made with the permanent settlers and for repayment of such labour supplied, and the amount refunded eventually to the Government in like manner to that of the loan of money under the Act. The settlement being close to Sydney, it is suggested that it is well suited as a depôt or training ground to test the *bona-fides*, suitability for association, and capabilities of unemployed workers or applicants for assistance. New Settlements might then be successfully formed from selected workers in batches from time to time from the temporary settlers, by some such arrangement as outlined above. Agitators, idlers, and chronic growlers, &c., could be excluded, the presence of such having retarded the Pitt Town Co-operative Settlement hitherto.

That was the recommendation to the Minister, and Mr. Carruthers said he would give it consideration, and would communicate with us. We waited about a fortnight; and went to him again, when he said that he had not had time to decide what he would do, but that he would not do anything without first letting us know. To this day we have heard nothing more about it. The Board at last resigned, and I have here the correspondence setting forth clearly what led to its resignation. We were asked to disenroll the single men, before alluded to, and to get rid of them. We were asked first, in a polite way, whether there was any objection. I replied that the objection was that the Act did not allow us to disenroll men unless they had misbehaved themselves, and these particular men had been less cost to the settlement than, and had done as much work as, the others, and that they had done it in a brotherly spirit, for the benefit of the whole, and that certainly they were the least entitled to be disenrolled of any on the Settlement. We then received a letter to say that they must be disenrolled. Something had been said in the Upper House that the single men should not have any allowance. I then replied that a special meeting should be called immediately to consider the matter, and let the Minister know the result. I called a meeting, and whilst it was taking place we received a letter to say, in effect, that it was not necessary to call a meeting, that the Minister's orders must be carried out. The Board then sought to see the Minister. He sent word that he was unable to see us; we went again, but he returned to us the same answer; we then retired to the Board Room and sent in our resignations. The correspondence is as follows:—

PITT TOWN LABOUR SETTLEMENT.

To the Editor of the Herald.

Sir,

Wednesday, 27 February, 1895.

In view of a reported interview with the Minister of Lands contained in your Saturday's issue, it has appeared to Mr. Backhouse and myself that it might be well to publish so much of the correspondence with the Board as bears upon the subject.

It will be seen that the instructions of the Minister were distinctly to disenroll the single men. This, under the regulations, would involve their immediate dismissal from the settlement. It was to this act of injustice, not so much at the dictation of the Minister as of the Legislative Council, that the Board refused to make itself a party.

I am, &c.,

THOMAS ROSEBY,

Hon. Sec. to the Board of Control.

The following is the correspondence:—

Sir,

Department of Lands, 16 November, 1894.

In view of the recent amendments made by the Legislative Council in the Bill to amend the Labour Settlements Acts, whereby the payment of further advances to Boards of Control on behalf of unmarried persons would be prevented, I have the honor, by direction of the Secretary for Lands, to inquire whether there is any special reason which can be advanced in favour of the retention of single men as members of the settlement.

I have, &c.,

F. H. WILSON,

Acting Under Secretary.

Benjamin Backhouse, Esq., Chairman, Board of Control, Pitt Town Co-op. Settlement, Sydney.

To the Acting Under Secretary for Lands,—

Lands Department, 17 November, 1894.

Sir,

In reply to yours of the 16th instant, it appears to me that the reason for the retention of the single men on the Pitt C. Settlement is that they, in common with other members of the settlement, have been enrolled under the Act, and cannot be disenrolled so long as they comply with and are obedient to the Act and the regulations.

I have, &c.,

BENJAMIN BACKHOUSE,

Chairman of Board of Control.

Sir,

Lands Department, 6 February, 1895.

In the absence of any advice on the subject it is presumed that no steps have yet been taken by your Board to disenroll the single men who are members of the settlement; and as it appears from statements made in the Legislative Council that the Government was not disposed to supply further funds to the support of this class of settlers, I have the honor to inform you that the Secretary for Lands has decided that the single men must be disenrolled, and that aid to them must be stopped.

I have, &c.,

F. H. WILSON,

Acting Under Secretary.

Benjamin Backhouse, Esq., Chairman of Board of Control, Pitt Town Co-op. Sett., Sydney.

Sir,

Hon. B.  
Backhouse.  
3 Nov., 1896.

Sir,

In reference to your letter of the 6th instant, stating that the Minister has decided that the single men at the settlement must be disenrolled, and that further aid to them must be discontinued, I have the honor, by direction of the Board of Control, to inform you that the matter is under careful consideration, but that the final decision upon it has been deferred to a full meeting of the Board, which will be convened as soon as it has been placed in a position to meet outstanding claims, by the payment of the advance of £750 referred to in your letter of the 2nd instant, as having been brought under the notice of the Treasury on that date.

I have, &c.,

W. R. STANLEY,  
Secretary, Board of Control.

The Acting Under Secretary, Department of Lands, Sydney.

Sir,

In reply to a letter from the Secretary to the Board, stating that the matter of the disenrolment of certain members of the Labour Settlement, at Pitt Town, is under careful consideration, and that the final decision thereon has been deferred to a full meeting of the Board, I have the honor, by direction of the Secretary for Lands, to inform you that his decisions are not subject to the Board's review, and, having decided in accordance with a pledge to Parliament, that aid to single men must be discontinued, there is no course but for the decision to be given effect to.

I have, &c.,

F. H. WILSON,  
Acting Under Secretary.

Benjamin Backhouse, Esq., Chairman, Board of Control, Pitt Town Co-operative Settlement.

Dear Mr. Carruthers,

Board of Control, Pitt Town Settlement, 20 February, 1895.

In reply to your communication of the 6th instant, informing the Board that the Secretary for Lands had decided that the single men must be disenrolled, and requiring us to disenrol them accordingly, I am directed to inform you that the Board have passed the following resolution, which, if the opportunity had been presented, it was the intention of the Board to present to the Minister to-day in person:—

"1. By the regulations it is provided that persons disenrolled shall receive compensation for work done. The Board has hitherto treated all the settlers alike, and therefore feels that under these circumstances it cannot disenrol men without compensation, who legally and equitably stand on an equality with the other enrolled settlers.

"2. Under the difficult and painful circumstances which have thus arisen, consequent upon the Minister's communication of the 6th instant, the Board desires that its resignation of the 14th November, 1894, be accepted without further delay, and respectfully declines to perform any further duties in connection with the settlement."

I have, &c.,

THOMAS ROSEBY,  
Hon. Secretary, Pitt Town Settlement.

The Hon. the Minister for Lands.

We continued to act long enough to hand the matter over to another Board, of which I think Mr. Taylor was Chairman. I may here remark that I believe this Board did not disenroll the single men we were requested to disenroll. Up to that time we had had something like £6,000. £1,400 or £1,500 was, I hear, expended subsequently in what actually was the destruction of the Settlement. Up to that time things were compact and in very good order. The land was cultivated, some 4,000 fruit-trees were planted and thriving, and everything was going on very fairly well, a large number of vines were planted, and the Settlement was in a very healthy state. A large number of the huts were afterwards sold for firewood or at firewood price, 5s. or so each. I understand that during this expenditure of £1,400 or £1,500 they were selling huts and implements for trifling sums. We had purchased an incubator, a very excellent second-hand article, at a cost of £7 10s. It was very cheap at that. I understand that incubator was sold for 10s.

After the Board resigned Mr. Taylor reported to the Minister, most unfairly I thought, in reference to the position of the Settlement. Dr. Roseby, as ex-Hon. Secretary, replied to that, and I have here the report and the reply. One paragraph of Dr. Roseby's reply I will quote:—

"I do not deny that families can perhaps be maintained for less. But I shall feel glad at any rate to have no responsibility for bringing down the standard of living for those settlers to something approaching more nearly the Chinese. How paltry in this connection is the mention of currants, Friar's Balsam, tobacco leaf, and Beecham's pills? Are there no invalids on the settlement—no little children? Must they never have any pudding with currants in it? Are they to be forbidden to smoke? They paid for everything out of their scanty tokens. I am sure it was never intended that these village settlers should be treated as if they were prisoners in Darlinghurst Gaol. The only crime of which they are guilty is that of being poor."

With regard to the tokens, I may mention that a man received about 5s. a week and a woman about half that, and children in proportion. Most of the large families had not more than 10s. worth of tokens a week, and we know that they could not live sumptuously on that amount.

360. *Mr. Watson.*] The goods were supplied, I believe, at wholesale rates, plus the freight? Yes, I believe so. A sub-committee, of which you were a member, had charge of that. I think that Mr. Taylor's report was a most unfair one.

361. Did Mr. Taylor evince any desire to advance the Settlement whilst acting as adviser to the Minister, and whilst the Board of which he was a member was in existence? I think the statement I propose now to make will answer that.

During the time that we had charge of the Pitt Town Labour Settlement it was not a failure. Men and grown-up children worked for their living, and they earned all that they received. They did substantial work, which might have been useful to anyone, but especially to the settlers themselves. I maintain that if our recommendations had been carried out the Pitt Town Settlement could have been carried on notwithstanding all the drawbacks. From time to time the Government valued all the settlers' labour and fencing, clearing, &c., and it was worth at least what it cost to maintain the settlement, whilst substantial benefit accrued in the improved physique of the settlers. Some of those poor men went up there mere wrecks, but in three months they were comparatively strong, hearty men. The children taken from the slums of the city were educated. During the nineteen or twenty months that the first Board of Control had charge there were 100 families, some 450 persons, living in a wholesome country life, and the virtue and good order of the Settlement were equal to the average, if not above, that of the people outside. The disorder which did arise the Board could have more effectually dealt with if the Board had received the help and sympathy to which it was entitled. Had we had a scientifically trained man told off to assist the Superintendent I am sure the results would have been much more satisfactory. There was an advantage in taking the people from their bad city surroundings, and I claim that as a credit as against the cost of carrying on that Settlement. It would have cost the Government probably £2,000 or £3,000 had the men remained in town. One of the things which prevented the Settlement from succeeding as it might have done is shown by the fact that two Ministers who were charged with the administration of the Act never believed in the thing, and never treated it as though they

Hon. B.  
Backhouse.  
3 Nov., 1896.

they expected it to succeed. I remember some of the settlers saying on several occasions, "Do you think we shall get any more money? If not, we shall have to remove." There was nothing certain about it, and there is also the fact that settlers had been permitted to complain secretly to the Minister, thus the discipline of the Settlement was taken out of the hands of the Board. We found it then necessary to alter our regulations. If we had had a little more hold upon the settlers, a little more stringency, we could have educated them, so that at the end of four years, when rent had to be paid, the settlers would have been able to take the management into their own hands. I refer you to paragraph "A." in my letter, 15th September, 1894, to Mr. Carruthers. What they wanted was strict discipline, until a good advance had been made in the settlement. I have not gone into the matter as fully as I might have done, but I have touched upon some of the principal points.

362. *Mr. Watson.*] I asked you a question as to the attitude assumed by Mr. Taylor, who was acting as adviser to the Minister. Did he ever evince any desire to help the idea of co-operation? I would much rather that you got the answer to that from him. My impression is that he was very much against the principle, that is to say, he had no belief in it, and that was the unfortunate position in which we were placed, as Mr. Taylor was the Minister's adviser, in reference to almost everyone who could help us. I feel that the Minister, having some gentlemen who were giving their time to it, and who were working hard to make it a success, might have said, "Can I help you? I should like to see this thing succeed. If there is anything I can do I shall be very glad." If we had had sympathy of that kind there might have been a different result.

363. *Mr. O'Sullivan.*] You complain about the settlers writing to the Minister, which Minister did they write to? To Mr. Copeland, and I believe it was continued after Mr. Carruthers took office.

364. And they wrote to both Ministers secretly? Yes, but it commenced in Mr. Copeland's time.

365. Did they write to complain of any want of attention on the part of the Board,—of any fault to be attributed to the Board? No. I think the first trouble arose in this way. Mr. Waite, one of the settlers, a very excellent man, was appointed after the paid Superintendent left as Superintendent without pay. He evinced such active zeal, and worked so hard that the Board proposed to give him some trifling amount, but he at once said as a true co-operator "No, I would rather take my stand in the Settlement and be one of the co-operators." He was a stranger to the Board before he went there, but we found such sterling good qualities and capabilities in the man that we had no hesitation in appointing him Superintendent. We found at first that all the men were most loyal to him, and that they were pleased that one of their members had been appointed Superintendent, but in three months time a different state of things developed. They got a little annoyed at their Superintendent, and thought they could have a better one.

366. *Mr. Watson.*] Some of them? Yes, some. There was always a great number attached to him, and loyal right through. A section began to grumble, and they thought there was favouritism; but the Board could see no evidence that it existed—quite the contrary,

367. *Mr. O'Sullivan.*] Do you think that was the cause of the settlers writing to the Government? Among other things it was. I think they wished him to be removed, and the Board too.

368. Some of the settlers blamed the Board;—they attribute the failure partly to the Board, and one charge is that of favouritism? That of favouritism was absolutely wrong.

369. Did you enforce your regulations too harshly? No; we were remarkably mild—too mild—and we found that would not do.

370. Who was it that made the complaint about the settlers buying Friar's balsam, Beecham's pills, jam, and other delicacies with their tokens? That was after the Board resigned. It was in a report to the Minister by Mr. Taylor.

371. *Mr. Watson.*] With regard to buying jams and other things, I suppose that a settler who desired to have little luxuries would have to go without something else in order to get them? Exactly so. It was not allowed as an extra. The settler who bought those things would have to pinch himself in some way—generally in meat, which could be done with advantage.

372. You said that whilst the Government was spending £1,500 on the Settlement the huts were being sold for firewood, and other destructive work was being carried on? This is what I have heard; but I think you can get evidence that huts of three rooms were sold for 5s. or 6s. each.

373. Who gave orders for that? I do not know. That was after our time.

374. For whom was Mr. Taylor acting? For the Government.

375. For the Minister for Lands, Mr. Carruthers? Yes. You can get all the particulars from Mr. Taylor as to what took place after the resignation of the Board.

376. *Mr. O'Sullivan.*] You have stated what you believe to be the cause of the failure of the Settlement; have you included all the reasons for the failure? Perhaps not, but the main cause was want of sympathy with the movement from persons outside the Board. Not a single man of influence or the public at large helped the Board.

377. Do you think that the men themselves had faith in the co-operative principle? When they started they had, they said so, and the "Epitome" given to them to read at first, and the copy of the Regulations given to them when they signed the agreement is evidence of this.

378. Some of the men have stated that they regard co-operation as a failure in that Settlement, but that they would be willing to try it with a selected few; do you think that the men themselves had faith in the co-operative principle? After experience it turned out that some of the men had faith in it and knew what it was, but some did not know what it was, and do not to this day. They began to clamour as the children of Israel clamoured against Moses. Had we had the sympathy and assistance that we ought to have had, we could have educated the men up to it.

379. Do you think you would have dragged the Settlement through if the settlers had lost faith in the co-operative principle? We could have drafted some of the unsuitable ones off to other work, as recommended to the Minister in the paper I have read.

380. Then you would simply have had the survival of the fittest? The survival of those impressed that co-operation was the best thing for them.

381. We were making a test of the Pitt Town Settlement, as to whether the principle could be applied to humanity; you say it can be applied to a selected few? Yes. Had the men been united and friendly they might have made it a success; but they were opposed to each other, and jealousy crept in.

382. What was to be done with all those who are not amongst a selected few? They were free agents,  
and

Hon. B.  
Backhouse.  
3 Nov., 1896.

and could retire. They were not deceived; they had a printed document put into their hands to read, and if they had said we do not believe in the principle their applications would not have been considered. 383. The Settlement was started to see whether it could be safely applied to dealing with the unemployed difficulty, and now you seem to admit that it can only be applied to a select few? This was a matter of experience with us. We found subsequently, that had these men met together and discussed the matter, and gone on to the Settlement as mates, they would probably have done much better.

384. The point I want to get at is, whether the Settlement has had a fair trial as an experiment to show whether the principle can be applied to the unemployed people of the country? I say distinctly that it has not had a fair trial; that is why it failed.

385. One reason, you say, is that the men were not a selected few; and you said that if they had had a sort of freemasonry or a religious bond they might have succeeded? Yes; if Catholics, or Presbyterians, or members of any other denomination had formed themselves into groups they might have succeeded.

386. You had no religious differences? No; but you could not expect Catholics and Weslevans to unite heartily together, as they would amongst members of their own denomination. Our great drawback was not having the support, sympathy, and aid of those around us who were able to help us, but did not do so.

387. *Mr. Watson.*] By those, you mean the officials? Yes; principally those who administered the Act. I think the Ministers took the inactive part which they did on the advice of someone in whom they had confidence—probably someone in the office—and that advice was against the principles of the settlement.

388. As regards the failure of the Settlement, in what proportion do you think it was due to the fact that the land was of poor quality and water was non-existent? It is difficult to estimate that. Had we had good land and a supply of water the men would have had better heart in the work.

389. Do you think it would have given a better chance of success? Undoubtedly.

WEDNESDAY, 11 NOVEMBER, 1896.

Present:—

MR. DICK,

MR. J. C. WATSON,

MR. KELLY.

W. M. HUGHES, ESQ., IN THE CHAIR.

Rev. Thomas Rosoby, LL.D., F.R.A.S., sworn and examined:—

Rev.  
T. Rosoby.  
11 Nov., 1896.

390. *Chairman.*] Do you wish to make a statement? I should like in the first place to indicate in what respects it seems to me the Settlement was not a failure. I should like to indicate some features of the system that I think show that there were, after all, elements of success in it. In the first place, there were 100 families, roughly speaking, placed on the settlement, and the men themselves and their children did not "eat the bread of idleness." It is a great mistake indeed to think that there was anything about the system that pauperised those who were interested in it. Those men worked for their living. Then the Government appraisalment shows that the value of their labour, estimated as the value of any other labour would be, fell not far short at any rate of the amount advanced. Their huts, and the amount of fencing they did, clearing, the roads which they made, and water conservation—the aggregate value of these, according to the Government appraisalment, fell not far short of the amount of money advanced by the Government to the Settlement. Then it was really a labour settlement. That, I think, is a point to which sufficient attention has not been directed. It is the name given to the Settlement in the Act itself; and, as a labour settlement, it was only a failure inasmuch as the land selected was unsuitable for such a purpose. It turned out that the land was only suitable for orchard purposes. Of course, it was originally a common, and the timber left on it by the residents around who used it as a common was only good for firewood, the best having been cleared away before; and the distance from Sydney, the low rates ruling, and the railway charges, made firewood-getting unremunerative. There was left a margin, I understand, of something less than is a ton in connection with that industry; and yet, practically, whilst the crops were growing, and the orchard trees were growing, that was really the only means of maintaining the settlement. Then, further, the hundred families there lived a wholesome country life; their children were educated; there was neither drinking nor gambling allowed on the settlement, and there were few serious complaints of idleness. I feel disposed to emphasise that. I think it speaks well for the general character of our labouring community, that amongst 100 men, somewhat indiscriminately gathered together, working under the conditions that there prevailed, under the surveillance of one another, there were so few serious complaints of idleness. A policeman only visited the Settlement two or three times in the course of two years, and there were on the Settlement no social scandals; the virtue and good order of the Settlement were far above the general average. Further, these people received considerable training in agriculture, from which they would have derived still more benefit had the land itself been agricultural. That, I think, was really the capital mistake made in starting the Settlement. I may say that it was a mistake for which the Board was in no way responsible. The land was selected for us under expert advice by the Minister. I have always felt that the great mistake was that the land was not suitable for an agricultural community. There was a demand for immediate results, yet we were planted on orchard land, where it was unreasonable to expect any return under five or seven years. Then, moreover, these people were a burden on the charity of the community before they were sent there; and many of them became a new burden upon it when the Settlement was practically disbanded. I think that a very important thing to emphasise, because, as a matter of fact, whilst they were maintained on the Settlement they were maintained living an industrious life. As far as we could see, when these hundred men, selected out of about 500 applicants, when these men were selected, they belonged hopelessly to the class of the unemployed, and the chances are that, had they not been maintained on the Settlement in work, they would have been maintained in the community to a large extent in idleness. I pass on to notice, secondly, to what the failure of the Settlement was its due. I should like to speak of that. First, it was not due to any inherent weakness of socialism, for it was not really a socialistic experiment. The Board consisted in part of men who had not the least sympathy with socialism, yet those gentlemen worked with us in hearty co-operation until the Board resigned. There were gentlemen upon that Board with whom we worked, with the greatest cordiality, and who gave us the greatest assistance in carrying out the work of the settlement, who had no sympathy with socialism whatever. They stood by the scheme as  
· being

Rev.  
T. Roseby.  
11 Nov., 1896.

being an experiment in co-operation. There was, of course, an element of co-operation in the scheme, but the scheme was rather that of a mild despotism than of socialism. You can hardly imagine two things more absolutely the antithesis of one another. The Board had absolute control. They might disenroll any settler, and the settlement was subject to regulations made, not by the settlers, but by those controlling them. Second, the failure of the settlement was not due, as is commonly supposed, to internal dissensions. I may qualify that statement a little later on; but I may begin by saying that the families, amongst one another, kept the peace, and then, as for academic discussion among them (home rule was a very common subject of discussion, and political economy also), there was really no more of acerbity about these discussions than there is in similar discussions elsewhere, and really no more harm in them. I qualify this statement, however, by saying that some serious disaffection there did exist, but it arose from attempts to get behind the back of the Board by writing to the Minister. Third, the real causes of the settlement's failure. It seems to me, Mr. Chairman, that the real causes of the failure were these:—An experiment carried on with men on the lowest social grade, with no means, and no social coherence, could only be expected to succeed under specially favourable conditions—namely, good land, Governmental and public sympathy, and steady and adequate help. All these conditions were wanting. First, the land foredoomed the experiment to failure. Old residents and surveyors to whom I spoke at the very inception of the experiment on the spot, declared that the Settlement would be a failure. They, from their better knowledge of the land than we possessed, from their own experience, declared that on such land it was impossible to carry on a successful experiment of this nature. The land was declared to be orchard land, and not very good at that; but for agriculture, it was alleged to be wholly unsuitable. Secondly, the Government never believed in the thing, and never treated it as if they hoped or expected it to succeed. Third, the help given was given so fitfully, and so uncertainly, that the Board several times resigned because we were not certain but what we should be made personally liable. That is practically the statement which I feel it incumbent to make to you in regard to the fortunes of the Pitt Town Settlement. I should like to say in respect to Waite, whose name has been mentioned in the course of the proceedings of the Committee, that I have formed a very high opinion of Waite, both as to his personal character and his capacity for dealing with large bodies of men. As to his establishment as Superintendent of the Settlement, I must say that I never altered my opinion about Waite from the start, except to think better of him. It is quite true that there was occasionally friction—sometimes serious friction—between himself and a certain portion of the settlers—certain elements upon the Settlement; but we could always trust to the straightforwardness and probity of Waite; and, on the whole, we considered, especially as compared with the success of others in the superintendency, that Waite's influence upon the Settlement was throughout an influence helpful to the Board and promotive of the best interests of the Settlement. I should like also to say, in respect to the statement made as to the infrequent visits of the members of the Board to the Settlement, that that statement is incorrect. Some one or other member of the Board made frequent visits to the Settlement, and in respect to the labour that was involved, especially to the officers on the Board of Control, I can only say—and I specially single out Mr. Backhouse in this statement—that their attention to the Settlement was unremitting—their attention to its needs and its complaints. That attention was, by Mr. Backhouse especially, daily bestowed.

391. *Chairman.*] You spoke of the frequent visits of the Board—what were the average attendances? I should think that the Settlement was rarely without a visit from some member of the Board once a week.

392. What, in your opinion, was the chief cause of failure? You did not, perhaps, catch the last part of my statement. I attribute the failure of the Settlement to the fact that the land was unsuitable; that the Government never really believed in the thing, and never treated it as if they hoped or expected it to succeed, and that the help given was given so fitfully and so uncertainly.

393. Which of these two causes was the greater in bringing about the downfall? I should feel disposed to say that under any management, or under any favourable circumstances whatever, it was impossible for the settlement to be a success, because the land was unsuitable.

394. We have been told that some of the private settlers living on land there had been successful from individual effort with a fair amount of capital;—how do you account for that? I cannot speak on a matter as to which I could only offer a conjecture, but it would appear to me that in the case of settlers in the neighbourhood, who settled at an earlier period, they would, of course, have much better timber to send to market; they would have not only firewood, but timber really useful for building, and that kind of thing, and they may have been able to rely upon dairying, and so on. Of course I cannot speak from any real knowledge of that matter, but I am perfectly certain, from the accounts given by those who know the land best, and by our own actual experience in endeavouring to work the Settlement, that the experiment was an absolutely hopeless one on that land.

395. *Mr. Watson.*] Is it not probable that the earlier settlers would get the best of the land that was available? Undoubtedly.

396. *Chairman.*] You think that the land used for the Settlement was even worse than the surrounding land? I have no doubt that it was.

397. With reference to what you said of the scarcity of timber, how does that tally with the settlement later on starting a saw-mill and cutting up firewood for sale;—was there not a certain amount of timber, by cutting which a living could be made? There was firewood, and it was for cutting firewood that the saw-mill was started, but there was very little useful timber. Timber useful for the arts for example, and for building, all that had been culled away before our Settlement was started. It was a common, and the best of the timber had been taken.

398. You consider that the good timber having been taken off the land was really a serious drawback? In default of agriculture as a means of keeping the Settlement going, we naturally turned to the timber that was growing on the land as a source of revenue; and we were very much disappointed on taking stock of it to find that it was only a residuum, and was only available for firewood. The return in the matter of firewood was something less than a shilling a ton when all expenses were paid.

399. Of course you would not have turned your thoughts to cutting firewood had the land been suitable for agriculture? No.

400. In your opinion the badness of the land was the chief cause of the failure? Undoubtedly.

401. But bad management had something to do with it? In what way?

402. In this way: of course, you and those who are sympathetically inclined did not any time form a majority of the Board? Yes. The Board of Control, I may say, almost up to the last two or three meetings,

Rev.  
T. Roseby.  
11 Nov., 1896.

meetings, was practically unanimous in all the actions it took in relation to the Settlement. The bad management to which you refer was the capital mistake in the first instance of selecting unsuitable land. That, no doubt, was a capital mistake, but that was not the act of the Board of control. It was the act of the Minister only. Let us say this in respect to the action of the Minister, that he was guided in that respect by expert advice.

403. As a matter of fact, agriculture has now reached the stage at which it may be termed almost an exact art, and amongst those superintendents that you had was there a man who had any knowledge at all of agriculture, or who knew how to deal with large bodies of men? There were two gentlemen appointed successively as superintendents before we fell back upon Mr. Waite at all. Mr. Waite was our last superintendent. There were two other gentlemen who preceded him, both of whom, I believe, were very competent to carry on works of that nature, both of whom had considerable experience in agriculture, but expert knowledge in agriculture was completely thrown away upon land that was unsuitable for agriculture.

404. But, at the same time, it is not to be denied that it is upon land that is called unsuitable that expert knowledge is most useful;—upon good land, of course anybody can succeed? Yes: but still, as you know, that intense culture is only remunerative under circumstances wholly different to the carrying out of any experiment of this nature, with people who, to start with, had only a very elementary knowledge of the thing at all.

405. Had you any skilled men? There was Mr. Vaughan Jenkins and Mr. Tressider. They were men really skilled in agriculture.

406. Were they there constantly? They lived on the Settlement, and directed its operations on the spot.

407. How long were they there? Mr. Vaughan Jenkins was there three or four months, and Mr. Tressider for a longer term; I should think about six months.

408. It appears to me that it was hopeless to expect the Settlement to succeed on any other basis than one of intense culture; here were men who did not wish to compete without outsiders at all;—seventy-five per cent. of them were able to do the work if properly directed, and witnesses prior to yourself, say that bad management had a great deal to do with it? I have no doubt. I would not have dissented from that statement myself. I have spoken in the case of those two gentlemen of their knowledge of agriculture, but in other respects there is no doubt that their management of the Settlement was anything but a success.

409. You speak of this as being only partially an experiment in socialism, and you say that you regard it as a kind of mild despotism? Just so.

410. Do you regard the failure of the Settlement or the closing up of the Settlement as evidence of the failure of co-operation? Certainly not. I believe that if an experiment of this nature was started, with such modifications of course as experience would suggest, upon good land, and was sustained by a Government that was in sympathy with the scheme, that heartily believed in it, and that worked it with a view to success, an experiment of this nature might be made a splendid object lesson in showing how to get rid of a great deal of the trouble and anxiety occasioned by this army of unemployed. I am very strongly of that opinion.

411. Do you regard the action of the department in compelling those people who were actually willing to remain on the Settlement, some twenty-five or thirty families, when the Government aid had been withdrawn, do you regard the action of the department in ousting them, as consistent with a real desire on the part of the department to establish these people in a way to get their own living? I should not like to speak harshly of the action of the department in dealing with these men, although I think that the action of the department was mistaken. If they had kept a few men upon the Settlement, such as might have some prospect of remuneratively working it, and made a sort of nucleus for something further, a sort of dépôt, I think the Settlement might have been made very serviceable indeed in helping us out of our industrial difficulties.

412. Do you know that it is proposed by the Department of Industry to transform the settlement into a casual labour farm? Yes.

413. *Mr. Watson.*] Is it a fact that the first Board of Control recommended to the Minister some time prior to their resigning that the number of men on the Settlement should be reduced, and that the reduced number should be given an opportunity to make a living, which would perhaps be possible, even though the land was bad? That is so.

414. Do you think that that reduced number, somewhere about twenty-five families, would have been able to make a living if the recommendation had been carried out? I think it is not improbable that they would. They would have a larger area, and might be able to select the most suitable parts of it.

415. And would have the benefit of the improvements already made? To be sure.

416. In addition to which there would have been the same community of interests, the men being mutually selected? To be sure.

417. You have spoken of the fitfulness of the manner in which help was given to the Settlement. I presume that you were referring to the amount to be paid by the Government towards the keep of the settlers? The way in which we felt it, whether it was due to the action of Parliament or of the department, was that we were sometimes left wholly uncertain as to when we should receive the necessary subsidy, or how much it would be, or even whether we were going to get it at all, and that introduced an element of uncertainty into the whole thing, to such an extent that the Board was on several occasions on the point of resigning, and did, in fact, send in its resignation, because it was without ways and means to carry on the settlement.

418. Do you think that that was due to any want of sympathy on the part of the officials of the department in the general scheme? I am quite sure that neither the Minister nor the heads of the department had any belief in the scheme, or worked it with any hopefulness that it would be a success.

419. *Mr. Kelly.*] How long after the initiation of the Settlement did it dawn upon the Board that the soil was altogether unsuitable? Not for some months. I should think not till we had made actual trial of the Settlement, and even then, the cultivation being confined to the best part of the Settlement, the results were really delusive. There were, of course, many things grown upon the Settlement which, when exhibited to us, seemed to show that something might be made of it as an agricultural settlement, but as a matter of fact this cultivation was only on the very best part of the Settlement. The area was extremely limited, and it gave no proof at all that the Settlement as a whole was suitable.

420. Do you think it would be an explanation of the department's want of sympathy with the scheme to  
take

take the supposition that they became convinced that the site was unsuitable, perhaps before the Board did? About that I am not sure. A good deal was said in Parliament about the unsuitability of the land, and though we combated the statements made in Parliament at first, relying as we did on the expert testimony that the land was suitable, still they may have influenced to some extent those who had control of the purse.

Rev.  
T. Roseby.  
11 Nov., 1896.

421. Was it ever considered, at any time, that you should get a change of site? We made strong representations to the department once or twice, with the view of altering the boundaries of the Settlement in order to include better land, but the Minister refused to make any alterations.

422. There was better land available? There was.

423. And the department refused it? They refused it. I do not complain of their refusing it altogether. They had possibly in view the idea of selling the land to make more out of it for the public exchequer. I doubt whether it would have made any difference in the end.

424. *Chairman.*] What led to the resignation of the Board? That which led to the final resignation of the Board was the resolution of the Government to do an illegal thing, to dismiss from the Settlement certain settlers whom we had no power to disenrol. According to the Act we were only empowered to disenroll for certain definite reasons. Those reasons were entirely wanting in the case of those unmarried men. There was no other way of sending those men off the Settlement. Moreover, it was felt that it was an unrighteous thing to do. Those men, not having the encumbrances of men with families, helped to keep the Settlement going. They rendered disproportionate assistance, and it seemed an ungrateful thing, after their rendering more than their share of help towards making it a success, that they should be dismissed on grounds which had no justification in the statute.

425. Did you feel that the conditions were becoming so strained that you could not remain a Board any longer? We felt that we were called upon to do an unreasonable thing, and really an illegal thing. I may say that it would have been a great pleasure to many of us to have carried on the experiment if we felt that we were sustained by the sympathy of the Administration, but we felt that we were carrying on something in which the Government itself did not believe—that they did not sympathise with us in carrying on the experiment, and some of us began at last to feel a little weary of it.

426. Did the Board which was appointed after your Board resigned disenrol the single men after all? I really do not know.

427. Would it have been an illegal act? I believe it would. We had no power to disenrol settlers except on certain grounds laid down in the Regulations. We could not disenrol them on the grounds of mere convenience.

Benjamin Backhouse further examined:—

428. *Chairman.*] Have you anything further to say upon this subject? The first superintendent appointed was Jenkins, the second was Waite, and the third was Tresseder; the fourth was Waite. That was their order. The first superintendent, as Dr. Roseby has just mentioned, proved unsuitable in the opinion of the Board.

B. Backhouse.  
11 Nov., 1896.

429. Is it true, as alleged by one of the witnesses, that Mr. Jenkins was often intoxicated? I could not say so from my own knowledge. It was common rumour, and his actions gave strong colour to it. I should like to point out that the Board of Control took great pains to obtain a good and suitable man, after selecting from a number of applicants. We then reported to the Minister, who had to approve of the appointment and the salary to be paid. There was a proposal to remunerate Mr. Jenkins in some other way; but the Minister objected, and said that there were plenty of men to be had at £3 a week, and that was the stipulation for Jenkins' services. Then came Mr. Waite. He was certainly one of the best settlers that we had, a thoroughly capable, conscientious, good man. We made application that Waite, not being an expert in farming, although a peculiarly good all-round man, should have the periodical assistance of an agriculturist from the Agricultural Department, but he did not get it, and that was one of the elements of non-success. It came occasionally, but there was no regularity about it, and no one took the interest in it that was required. When some of the settlers began to object to Waite as superintendent, Mr. Waite himself asked to be relieved from the position, and applications were invited by the Board for a paid superintendent, and Mr. Tresseder, out of a number of applicants, was appointed. As a manager of men, and as an agriculturist and horticulturist he had high testimonials, and had previously held a Government position. We found that he was not a success, and we again fell into a difficulty with regard to a superintendent. When Mr. Waite was asked to resume the position, which he did, and held it until within about two months of this date. I referred to the saw-mill in my evidence the other day. I think Dr. Roseby will bear me out when I say that my feeling was that, unless we wanted a saw-mill for the settlers to work for themselves, it was a mistake to get one. The commercial element on our committee was pretty strong, and the minority fell in with the proposal. As Dr. Roseby has pointed out, there was great unanimity amongst the members of the Board, because the minority easily gave in to the majority. A large majority were in favour of the saw-mill. I think I was almost alone in my views on that matter. I said, true to my sentiment, when the Settlement was started, that it should be self-sustained, that it should work for itself, and keep itself, and that a number of these settlements might federate and make a commonwealth. I said, "We are not going to compete with the poor wood-cutters and others in the locality, even if we could by means of the saw-mill, as that would be contrary to the principles of the Settlement."

## PITT TOWN SETTLEMENT.

## APPENDIX.

SUMMARY of Receipts and Expenditure of the Pitt Town Labour Settlement from the 13th July, 1893, to the 8th July, 1896.

<i>Receipts.</i>		£	s.	d.	<i>Expenditure.</i>		£	s.	d.
To Colonial Treasury .....		7,691	1	9	By Maintenance.....		5,999	0	7
Wood sales .....		850	1	0	Plant .....		1,234	8	6
Sale of bricks .....		88	12	3	Improvements .....		474	5	7
Sale of vegetables, stores, &c. ....		12	2	6	Working expenses .....		1,244	11	4
Produce sales .....		28	0	10	Cartage of wood.....		74	11	7
Sale of sundries .....		1	1	3	Rushes for brickmaking .....		2	0	0
Smithy account .....		10	4	11	Refund to Treasury .....		1	0	9
Tare, discount, and refunds .....		21	1	5					
Rent of room and paddock .....		16	7	6					
Postmaster's salary.....		4	6	10					
Cleaning latrines at school .....		17	1	3					
Sundries .....		9	16	3					
Sale of sheepskins .....		33	10	11					
Road-making .....		210	0	0					
Village settlement committee .....		72	0	0					
Sundry collections and subscriptions .....		14	9	8					
		£9,079	18	4			£9,079	18	4

NOTE.—A further advance of £13 18s. 3d (making up a total of £7,705) was made by the Treasury to recoup the Department of Lands for moneys paid for freight to the Railway Commissioners on account of the Board of Control.—W. R. STANLEY, 12/11/96.

RECEIPTS and Expenditure of the Pitt Town Co-operative Settlement as to 31st December, 1893.

<i>Receipts.</i>		£	s.	d.	<i>Payments.</i>		£	s.	d.
From Colonial Treasury .....		2,316	1	9	Stores for maintenance, &c., including rail- way freight on settlers' goods.....		1,043	10	9
